 1101. If the mine were properly taken up and managed, with the latest appliances, it would pay? So far as my knowledge of the mine is concerned I should have no hesitation, if I had the capital, in starting to-morrow.
 1102. How much capital would it take? At the very least about £8,000.
 1103. Less than that would not do? I would not undertake it with less.
 1104. *Mr. Hassall.*] Are the five reefs running parallel to each other? Yes.
 1105. At what distance apart? About 15 feet.
 1106. What is the underlay? They vary in the underlay.

Mr.
R. McEwan.
12 Sept., 1896.

- Mr. R. McEwan. 1107. What is the trend of the reef? North and south, underlaying to the east.
 1108. Were you working these reefs in the one shaft? Yes.
 1109. *Chairman.*] Can you speak of the lime deposits here? The whole of this lime is merely the last deposit of the marine action. There is no stratified lime, but the whole of the flats are underlaid with limestone of very good quality. I tested it by using it at the works.
 1110-11. You have everything to hand for the development of the mine except money? Yes.

MONDAY, 14 SEPTEMBER, 1896.

[The Sectional Committee met at the Public Hall, Lake Cudgellico, at 9:30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Duncan Erskine Mackellar, manager, Wooyeo Station, sworn, and examined:—

- Mr. D. E. Mackellar. 1112. *Mr. Hassall.*] Have you been long in the district? I have resided in the district for the last sixteen years. I have known it for the last twenty years.
 1113. What progress has the district made in that time? Considerable progress.
 1114. What is the size of the property which you manage? About 196,000 acres.
 1115. Carrying how many sheep? Very few, because of the bad seasons. We have been carrying a large number of sheep. The average carrying capacity of the country would be between 50,000 and 60,000 sheep.
 1116. Do you suffer much from the rabbits? We have suffered a great deal from the rabbits since 1888.
 1117. Can you cope with them at all? Yes; we can keep them down on good country by netting and poisoning. We can keep them down as long as the country is good enough.
 1118. Have you subdivided your run into smaller paddocks for the purpose of protecting yourself against the rabbits? Yes. We are consolidating and subdividing.
 1119. And you find that in this way you can cope with the rabbits more easily? Yes. It is a mistake to have too big an area.
 1120. In your opinion, is it easier to cope with the pest on small holdings than on large holdings? Yes. I should say that blocks of from 5,000 to 7,000 acres would be large enough. They would be quite as large as you would want, where you had to deal with the rabbits.
 1121. Do you know the country through which the proposed line passes? I do not know much of the country north of Euabalong. I know all the country about Euabalong and Condobolin on both sides of the river. Out west I only know it as far as Hillston.
 1122. Do you think that the proposed line would benefit this part of the Colony to any extent? I consider that a railway anywhere within 20 or 40 miles of the town will benefit it.
 1123. The extension to Condobolin will be of benefit to you? Yes, decidedly.
 1124. Where do you send to from here? Our nearest railway station is 120 miles distant. The extension of line to Condobolin will bring us within 62 miles of a railway.
 1125. How far in the direction of Hillston will that extension benefit the country? I should say that it would benefit the country all the way to Hillston, and it will benefit the country on both sides for a considerable distance.
 1126. Is the road from Hillston to Condobolin a better road to travel than that across to Whitton? It is.
 1127. What water supply is there on the Whitton Road? It is a very bad road, and goes through pine country. In wet seasons it is very boggy, and the track is bad. The only water there is in tanks.
 1128. Have you had any experience of cultivation in this district? We have been cultivating for a number of years for the use of the station. We have fruit trees and a vegetable garden. I consider that the soil and the climate here will grow almost anything.
 1129. With the natural rainfall? Yes. The average rainfall for the last twenty-one years has been 17.60 inches.
 1130. Have you any other evidence to give? A railway would be of immense advantage to the district, by enabling us to dispose of our fat stock. In good seasons our stock route is so bad that we cannot get our stock to market in good condition. In bad seasons we cannot shift out stock at all, and the supplies and forage are only to be obtained at very high prices.
 1131. Was it in consequence of the high price of forage that you started agriculture upon the station? Yes; we grow our own crop when we can. In really bad times we have no access to the railway, except over very bad roads. We are no better off in that respect now than we were fifteen or sixteen years ago.
 1132. Can you depend upon the seasons? If we take a proper season we can get a fair crop. We only missed last year, and then we got only half a crop. Last year was the worst season we have had on the river.
 1133. What has been the return per acre? Last year the return per acre would not be more than 10 cwts. In former years we have got 1½ and 2 tons of hay to the acre.
 1134. That would pay? It would not pay well. You would want more than that.
 1135. Do you think that wheat-growing would pay about here? I think so; but I cannot speak personally of wheat-growing, because we have never gone in for it.
 1136. What sort of a wool clip do you get, both as to quality and as to quantity? It is very good wool-growing country—healthy sound country.
 1137. Do you have to use salt? Yes, in the back country, 20 or 30 miles from the river, where there is pine. On the frontage we do not use salt, because we have saltbush in places.
 1138. Do you think that the carrying capacity of this country would be increased if there were a railway? The railway would not make any difference in the carrying capacity of the country, but the country would be

be more fully used if we had access to a market. A much larger area would be put under crop if we had the means of disposing of the produce. At the present time we are 120 miles from the nearest railway, and that is a big handicap with bad roads. There are thousands of acres here which are fit for cultivation, and a large area would be put under crop if we had railway communication.

Mr. D. E.
Mackellar,
14 Sept., 1896

1139. How would a line from Grenfell down towards the lake and then on to Hillston suit this part of the country. Would it suit it better than a line running at the back of Euabalong? I consider that it would. I know the country from here to Forbes on both sides of the river, though I have never been to Grenfell.

1140. That is good country? Yes, I believe so. I have always heard it described as such.

1141. Do you know the country between Cudgellico and Temora? Yes; it is all good agricultural country.

1142. As good as the country coming down from Condobolin? It is not quite as good as the frontage country; but it is good country. It is something like the country down to Coolaman.

1143. The rainfall towards Temora is a little greater than it is here? I should think so; but I do not know.

1144. Which in your opinion, would be the better line? For the requirements of Lake Cudgellico and the district, I should say a line coming down from Condobolin on the southern side of the river, or a line from Grenfell.

1145. Could there be a more suitable route than that proposed by the Department? By crossing at Condobolin and going down the southern side of the river to Lake Cudgellico and Hillston the line would, I think, serve the greater part of the people.

1146. Do you think it would be worth while to take the railway beyond Hillston to Menindie or Broken Hill? I cannot say. I should say that in the interests of the Colony at large, it would be an advantage.

1147. Even if we lost £40,000 a year upon it? That would only be at the start. I think that eventually the line would pay. The land belongs to the Crown, and the railway would induce settlement.

1148. The railway would not get rid of the rabbits? I think it would assist us to get rid of them, because it would enable us to turn them into money. At Whitton they send them to Sydney by the truck load. We might find a market at Broken Hill for the fish from the Lake.

1149. Which is the best land—that on on the river, or that lying further back? For agricultural purposes that lying back from the river. On the frontage, the land is subject to floods.

1150. Have you tried any cultivation by means of irrigation? No.

1151. In your opinion why has the district gone back? The only occupation here has been grazing. The country is at present not suitable for anything but grazing, and farmers cannot succeed for want of access to market. Then, to, the rabbits have been a great trouble. They are the greatest trouble we have ever had, but I think we shall see the end of them.

1152. Are any of the first selectors still here? There are a few of them still in the district, but not many.

1153. Was the land, thrown open after the 1884 Act, taken up, or was it abandoned? A good many of the resumed areas have been taken up; but the selectors have sold out again and have left the district.

1154. Why? Because they have been unable to make a living. Sheep farming is a failure here on 2,560 acres with the seasons and markets that we have had for the last ten years.

1155. I suppose that many of the selections have fallen back into the hands of the original lessees? They have been sold, and there are a good many in the market now. Land can be bought here very cheaply if it is wanted.

1156. *Mr. Trickett.*] What is the lowest price per bushel at which it would pay to grow wheat here? A farmer at Gunbar told me that he could deliver wheat at Carrathool railway station for 2s. 2d. a bushel, and make it pay.

1157. How far would it have to be carried? Thirty or 40 miles.

1158. Is the Gunbar land better than this? I do not think it is as good for agricultural purposes. It is open country.

1159. Can they use the roads in wet weather? They have to study the seasons. The state of the roads is sometimes a drawback.

1160. Can you give us any instances of long delays? Not in connection with the drawing of wheat. I think that, as a rule, the farmers store the wheat until the roads are fairly good, and then they take it to the railway.

1161. Is there anything else you would like to say? Sydney is now almost our only market for fat stock, because the Victorian Stock Tax has closed the Victorian market to us.

1162. Would anything you produced be sent from here west towards Broken Hill, supposing a railway were extended in that direction? Fat stock?

1163. Yes? I very much doubt it.

1164. Only wheat and flour would be sent? Flour might be sent.

1165. It is the eastern connection that you value? Yes. There might be a local demand.

1166. How much per acre does it cost you to deal with the rabbits? I consider that it takes about £250 per annum to keep down the rabbits on our holding. That does not include the cost of wire-netting.

1167. How many miles of rabbit-proof fencing have you on your property? Fifty or 60 miles altogether. It costs on the average about £60 a mile.

1168. The cost of the netting itself would be about £33 a mile? More than that—between £38 and £40.

1169. That would make £2,400 for netting? Yes, for 60 miles of fencing. Of course you must remember that many of the fences were erected specially to deal with the rabbits.

1170. Would 3d. an acre be sufficient to put down as the cost of killing the rabbits? That would be nearer it.

1171. What do you do with your fat stock? Since the rabbits came we have had no fat stock. In former years large numbers went to the Melbourne market.

1172. You cannot send any to Melbourne now? No, because of the Stock Tax.

1173. *Mr. Hassall.*] In your opinion will not the rabbits be an annual charge upon the land? Yes, as long as there is a large area of waste Crown lands. The only way of dealing with the rabbits is by subdividing the country, and unless the country is good it does not pay to fence it. On the average we take from 7 to 10 acres of the Crown land to carry a sheep.

1174. That is why a lot of the country on the northern side of the river has been thrown up? The cost of keeping the rabbits down has been more than the country is worth.

Mr. D. E. MacKellar. 1175. There is a large area of country which is now practically useless, and there is no prospect of a return being obtained from it? Not until a large amount of money has been spent in improvements. The stock routes here are so bad that when we have sheep we cannot drive them to the railway and keep them in condition.

14 Sept., 1896.

1176. Mr. Trickett.] How would you view an Act of Parliament making it compulsory for the holders of the land to deal with rabbits? I consider that the great failure of the present law is due to the want of compulsory legislation. If every landowner were compelled to kill the rabbits on his run that would lessen the evil very much.

1177. But it would be necessary for the Crown to deal with their land? Yes; there are many men whose land adjoins unoccupied Crown lands who cannot afford to fence, but who could afford to poison the rabbits upon their own land. The Crown land, however, serves as a breeding place from which the adjoining land is constantly stocked.

1178. Are you troubled with noxious weeds? We have the Bathurst burr, and weeds of that kind; but no poisonous weeds.

1179. The great thing against the district is the presence of the rabbits? Yes; they have been a trouble for some years.

1180. Mr. Fegan.] And the absence of railway communication? Well, without railway communication the small selector cannot thrive. There are lots of things which we could turn into money if we had a railway. For instance, there is any quantity of good pine here for which there might be a market at Broken Hill. We could send a great deal of pine away from this district. Coming from Condobolin the Committee passed through the following runs:—North Condobolin, Gulgoa, Kiacatoo, Booberoi, Euabalong, Errebendery, and Wooyeo.

Mr. Albert Henry Connor Volkman, farmer, near Lake Cudgellico, sworn, and examined:—

Mr. A. H. C. Volkman.

14 Sept., 1896.

1181. Chairman.] What area have you? 1,245 acres.

1182. How long have you been here? Just past five years.

1183. What have you been growing on your farm? I am experimenting to a great extent. I find that the soil is capable of producing almost anything that the farmer requires for his own use or for market.

1184. What will it produce? Wheat, hay, grapes, and fruit.

1185. What area of wheat have you experimented with? Fifteen acres.

1186. What returns have you had? Last season we could not put in a reasonable area because the country was very heavily timbered; but my first return induced me to extend my area. It showed me that wheat could be grown at a profit either for grain or hay, supposing a market were obtainable here. My estimated average return is about 15 bushels per acre. That is for four years including last year, when the season was exceptionally bad. Last year I had only 6 acres; but the crop turned out remarkably well. Fifteen bushels per acre is very good for this climate. My soil, which I think is typical of the soil in the district generally, is fairly good, as I can prove by an analysis which I obtained when I first came here.

1187. What could you afford to grow wheat for here? That is a very difficult question. I maintain that wheat can be grown at a profit in conjunction with other work, and it would not take a very large area to support a man and his family.

1188. What could you afford to grow wheat for? I think it could be grown very profitably for 3s. 6d. a bushel, provided there were railway communication to a market, and that the place of delivery was not so far distant as to make the freight absorb a great part of the price.

1189. Three shillings and sixpence a bushel delivered at Lake Cudgellico would pay? Yes.

1190. How far could you afford to carry the wheat to a railway station? Thirty or 40 miles. When I spoke of 3s. 6d. a bushel paying, I had in my mind a holding of 1,000 acres, which, in my opinion, would maintain a family in any part of the district. Unless you had a large area it would be impossible to make a living with wheat at 2s. 2d. a bushel.

1191. If a man had 1,000 acres, how much would he cultivate for wheat? About 100 acres, and his average yield would be about 12½ bushels to the acre.

1192. For that wheat he would get a gross return of about £225 or £2 2s. an acre? Yes.

1193. What would it cost him to cultivate an acre? If he sowed evenly, thinly, and early, he would require about 1½ bushel to the acre, and that would cost about 4s. 6d.

1194. What would the rest of the work cost? The cost of ploughing, harrowing, and sowing the seed would be about 15s. an acre. After he had gone on for several years it would cost less.

1195. Can you give us the average cost? Taking everything into consideration, he could not cultivate for less than 15s. an acre. That is not including seed.

1196. Including seed the cost would be 19s. 6d. an acre? Yes. Then he would have to garner his crop. This is a new district, and here I think that would cost 5s. or 6s. an acre.

1197. Taking it at 5s. 6d. an acre, the total expenditure would be 25s. an acre, and the return £2 2s. an acre? Yes.

1198. What about your fruit trees? I find that nearly any variety of fruit-tree will grow well in this district, and I am of opinion that fruit can be grown at a profit. The kinds that do remarkably well are the deciduous kinds. Vines thrive luxuriously, so much so that I am extending my area, because I consider that the outlay will be very profitable.

1199. What sort of land is your selection? It is composed of a red loam.

1200. What was the timber on it originally? Yarran and pine.

1201. Have you any water close to where you are? There is an overflow from the river into a small lake called the "Sheet o' Water."

1202. A line running from here direct north to the Lachlan would pass west of your holding? North by west.

1203. Have you had any experience in farming? I have been brought up upon the land. I have been experimenting in connection with soils and their cultivation, and the thoroughness of systems, almost ever since I have been able to think about the matter.

1204. Where did you get your experience in the first instance? At Sandhurst.

1205. Were you farming there? My father was.

1206. How does this land compare with that of Sandhurst? Very favourably.

1207.

1207. Do you think that wheat will do as well here as in the Bendigo district? Yes; I have recently been in that district, and I find the soil here is much better. Mr. A. H. C. Volkman.
1208. Therefore, with a good means of communication to a market the farmer could live here? Yes. 14 Sept., 1896.
[The witness here produced a return dated 14th April, 1893, giving an analysis of soil made by the Department of Mines. The analysis showed that the soil was well suitable for the purposes of agriculture.]
1209. What is the country like, going north from the Lachlan to Mount Hope; say, for the first 20 miles? The country from Euabalong to Mount Hope is good average soil right through. There are several places where there is a little mallee; but this is not a material disadvantage. There are soils in the mallee which I contend are equal to almost any of the red soils on or about the Lachlan River. At Mount Hope you get into a granitic formation. The average rainfall out there is only 17½ inches. I have found that fruit-trees, vines, and cereals can be grown there just as well as here.
1210. Do you think that the country between Euabalong and Mount Hope is as good as that about Lake Cudgellico? Yes, on the average.
1211. Do you know anything about the mineral deposits of Mount Hope? The country is metalliferous right through.
1212. Has it been proved that the deposits are permanent? I think so. Mount Hope has been open since 1881, and they have been working there almost continuously since that time. The deposits seem to be fairly good, and regularly defined. There is a branch line of the same lode at South Mount Hope, and I think that it is likely to prove permanent. That district would very materially assist a railway. Its present exit is to Cobar, 84 miles distant. The whole of the country lying north between Condobolin and Hillston is comprised within resumed areas. The rabbits there have to a great extent eaten themselves out, and a railway would probably allow people to take up the country and make decent homes upon it. As for the mallee country, very much of it is good; though some of it is not fit for occupation, because the sand upon it is too deep.

Mr. Robert Orr, pastoral tenant, Lake Cudgellico, sworn, and examined:—

1213. *Mr. Trickett.*] What is your area? 30,000 acres.
1214. How much of it is leasehold, and how much freehold? It is all leasehold.
1215. How long have you been in the district? Since 1881.
1216. Have you been carrying out farming operations? I have been engaged principally in grazing.
1217. What number of stock have you? From 5,000 to 7,000 sheep, as a rule, and some cattle and horses.
1218. What farming do you do? We grow hay for our own use.
1219. Where is your place? At Wargambegal, about 6 miles from Lake Cudgellico.
1220. What has been your experience in this district? I came here with money, and I will leave it without any. The rabbits have been the cause of my fall.
1221. When did they come here? In 1887 or 1888.
1222. Up to then you got on fairly well? Yes. The first year I took delivery I paid £40 a ton for chaff. There was a general drought throughout the district then.
1223. What did you do with your stock during the first three years? From 1882 to 1887 the stock did fairly well.
1224. Where was your market? Sydney and Victoria.
1225. You used to be able to drive your stock in those days? We generally sold them as stores.
1226. You did not go in for fat stock? No.
1227. How did your wool go to Sydney? From June. Whitton is now our nearest station; but when the line is extended to Condobolin we will send there.
1228. Do you think that but for the rabbits you would have got on fairly well? Yes; I am sure of it.
1229. Until the rabbits came you did fairly well? Yes. I think every man in Riverina has had the same experience as I have had.
1230. What are your views with regard to the proposed extension of the railway? South of the proposed line there is a great deal of good agricultural land which could be turned into use. It is only a rabbit warren at the present time. I have had a lot of experience in Australia as a farmer, and for wheat growing this climate is as good as any I know of in Australia.
1231. And the rainfall too? Yes. Every part of the world has its drawbacks. In some places you get too much rain, and in other places not enough. During the last fifteen years I have had only two failures of crops—last year, and in 1882.
1232. Have you ever gone in for wheat growing as a means of living? Not in this district. There is no market for wheat here.
1233. You have had experience of wheat growing in other districts? Yes.
1234. Where? At Kyneton in Victoria.
1235. Were you successful there? Fairly successful. No farmer is entirely successful. We made a fair living. I thoroughly understand the business.
1236. And you are able to say that this would be a good wheat-growing country? I think that a better class of wheat would be grown here than is grown at Kyneton. Wet country does not grow the same class of wheat as dry country.
1237. At what price per bushel could a man afford to grow wheat? With the facilities we have for putting it in, from 2s. 6d. to 3s. a bushel would pay.
1238. What area would a man require to make a living on? In the present state of Riverina the smaller a holding is, and the better improved, the more likely is a man to make a living on it. 1,000 acres is quite enough for a man to have. Any man who has more than 1,000 acres cannot cope with the rabbits.
1239. Did you agree with what Mr. Mackellar said in regard to the cost of dealing with the rabbits? No. I do not think I could cope with the rabbits with an expenditure of 2s. 6d. an acre. I would not take 10s. an acre and undertake to cope with the rabbits in this locality. If you offered me 10s. an acre to eradicate the rabbits on 320 acres of ground, I would not accept the contract.
1240. Do you think that the holders of land should be compelled to deal with the rabbits? I would not make it compulsory. If they do not deal with the rabbits, the rabbits will deal with them. If you levied a small tax upon every inhabitant of New South Wales, and gave a small bonus for the destruction of the rabbits,

Mr. R. Orr.
14 Sept., 1896.

Mr. E. Orr. rabbits, you would make every man, woman, and child a rabbit. I have tried everything except fencing, and I find everything a failure. In Victoria if you fence in your holding the rabbit inspector has no control over you.

14 Sept., 1896.

1241. But you think some compulsory legislation is necessary? Yes; but I think that the only satisfactory way of dealing with the pest is to offer bonuses for the destruction of rabbits.

1242. A close population would deal with them? I do not think so. The population in this town is pretty thick, but sometimes you see the rabbits running about the streets like fowls. I have seen the same thing at Hillston, at Mossgiel, and at Ivanhoe.

1243. With small holdings and better means of communication you think there is a fair chance for a man to make a living in this district? Yes. At the present time a man with 100 sheep cannot afford to drive them to Whitton. The expense is great, and there is also a considerable loss of condition. With a railway he could afford to send his sheep away, and he would then be able to pay a higher rent for his land.

1244. If you had fenced in your land, could you have destroyed the rabbits? I could have reduced their number; but they will be an everlasting tax.

1245. You do not think you could suppress them, even on a 30,000-acre block? I am certain that I could not. I am going to throw up half my holding.

1246. Are you going to fence the other half? Yes.

1247. Have you any water on your property? Only in tanks.

1248. Do you consider this expensive country to clear? It is expensive. All timbered country is expensive to clear, but, as a rule, the thicker the timber the better the country.

1249. What will it cost to clear this country? I should think from £1. to 25s. an acre on the average. In some places it would not cost so much. There would be no engineering difficulties in the way of bringing a railway here from Condobolin.

Mr. Joseph Campbell, farmer and grazier, Euabalong Station, sworn, and examined:—

Mr. J. Campbell. 1250. *Mr. Fegan.*] How much land do you hold? 25,000 acres.

1251. How long have you had it? For ten years.

1252. What kind of land is it? It is good red chocolate soil. It is good country generally; but the back portion of the run is scrubby and covered with mallee.

14 Sept., 1896.

1253. Have you anything under cultivation? At the present time we have over 300 acres under cultivation.

1254. Under wheat? Yes, and oats.

1255. Have you tried wheat for any length of time? Yes; for the last eight years.

1256. Have you been successful with it? Yes; in every season but 1888. Last year I had a fair crop, and I was able to strip 8 bushels to the acre.

1257. Do you call that a fair crop? Yes; in such a season as last. An average crop would be from 12 to 14 bushels. In 1884 I had 18 bushels to the acre.

1258. Do you grow much hay? This year I will use most of my crop for hay. I expect to have 200 tons.

1259. What is the market value of that hay? At the present time it would be worth £7 per ton.

1260. What is the average price you have received for wheat? In 1884 I stripped 1,000 bags; but I could not sell it even at 1s. 6d. a bushel. I sent forty bags of English barley and ten bags of wheat to Sydney, and my net return was £10. I sold the balance for 1s. 9d. to a storekeeper at the lake.

1261. What would be a paying price? With the appliances I have now I could make wheat growing pay at 3s., or a little less, per bushel. I daresay it would pay at 2s. 6d. a bushel.

1262. If you got that price, would you extend your area? Yes.

1263. Have you any sheep in your run? 9,000, including lambs.

1264. How many acres are there to a sheep? When I came here, and for the first three or four years, I was carrying 18,000 sheep; but during the last few years the rabbits and the drought have reduced the number of my sheep to 9,000, and I am barely able to carry that number. I put the greater part of the blame upon the rabbits.

1265. How many acres do you give for depasturing your sheep? At least 4 acres to the sheep. With ordinary seasons it is different.

1266. Were the rabbits on your holding when you came here? No; but they came shortly afterwards. I fenced the whole of the boundary with wire netting. Some of the fences cost £70 a mile. Since then I have subdivided the holding into several paddocks.

1267. You can cope with the rabbits now? They are still bad; but I keep working at them.

1268. Do you think that compulsory destruction of rabbits should be insisted upon? Every man who holds land should be compelled to keep the rabbits down, and so should the Crown. Some men here do nothing to destroy the rabbits, and as soon as I get my rabbits killed rabbits come on from other land.

1269. Where do you send your produce? This year I am sending my wool to Whitton.

1270. What do you pay for carriage? £3 a ton.

1271. When the railway comes to Condobolin you will pay less? Yes.

1272. Do you think that with a railway here it would make things better for you? Yes, a great deal.

1273. Would it conduce to further settlement? Yes.

1274. In the first place it would reduce the cost of carriage? Yes.

1275. In this way it would enable you to get your fencing materials and other supplies more cheaply, and would give you better facilities for sending produce to market? Yes.

1276. Do you think that the line would pay in the course of time? Yes. I think that if a line came here a large number of farmers would settle in the district. I do not see why men should not do as well here as elsewhere where they have not got such good land.

1277. If you had railway communication, would you have much more stock upon your land than you have now? I have stock which I would send to the Sydney market, but which I cannot now get away. If a drought sets in we cannot get our stock away, and they die.

1278. How far should the line be taken? I think it should go to Hillston at any rate.

1279. By the original route or by the deviation? I would be in favour of the southern route.

1280. There are no engineering difficulties in the way of constructing the line? No. There would have to be a bridge at Condobolin.
1281. You do not care what kind of railway is made so long as it serves your purposes? I think the cheaper the line the better.
1282. Have you farmed elsewhere? No.
1283. You have been fairly successful? Yes; and I would have done well if it had not been for the rabbits.
1284. Even without a railway? Yes; but the railway would have been a great boon.
1285. I understand that you have been successful in growing potatoes? Yes. I have also grown peas and other vegetables.
1286. Where is your market? I have only a local market.
1287. If everybody grew for the local market? Then there would be no return.
1288. How is your holding watered? I have a frontage to the Lachlan and to the Booberoi Creek.
1289. Every landholder is not so fortunately situated as you are? No.
1290. How do the others get on? Some of them have good tanks.
1291. How deep have you to sink in order to get water? I should think you could get water at a depth of 80 or 100 ft.
1292. What is the price of sinking? About £1 a foot for the first 100 ft.
1293. Do you agree with previous witnesses in regard to the treatment of rabbits? Rabbits are much more easily kept down on some runs than on others. I think that I could prevent the rabbits from doing much harm on my 25,000 acres. We will always have the rabbits. About £4,000 has been spent upon wire netting already, and with that and an annual expenditure of £200 I can keep the rabbits down.
1294. *Chairman.*] That would be a total annual expenditure of about £600? Yes. Those who have not been in this part of the Colony do not know what we have to contend with. Good country is being totally destroyed.
1295. Do you know anything about the Mount Hope country? I have been there from Euabalong.
1296. With railway communication, what is the smallest holding that a man could live upon? A man could live upon 1,000 acres fairly well. If he had a ready market he could live upon 640 acres.
1297. That would be with mixed farming and sheep breeding? Yes.

Mr.
J. Campbell.
14 Sept., 1896.

TUESDAY, 15 SEPTEMBER, 1896.

[*The Sectional Committee met at Merri-Merrigal Homestead at 8.30 a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

THE HON. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. John Broatch, manager for Messrs. John Sanderson & Co., Merri-Merrigal Station, sworn, and examined:—

1298. *Chairman.*] How long have you been here? About twenty months.
1299. Do you know the lower Lachlan generally? Yes.
1300. What is the full area of the company's holding? There are 40,000 acres on Moolmain; 48,000 acres on North Euabalong; 80,000 acres on North Wooyeo; 243,000 acres on Merri-Merrigal; 40,000 acres on Uabba; and 80,000 on Moolbong.
1301. How much of this land is in the Central Division and how much in the Western Division? All these holdings, with the exception of Merri-Merrigal, are in the Western Division and Moolmain.
1302. What is your tenure in the Western Division? Twenty-one years. We do not occupy the resumed areas at all. The resumed areas are not included in the figures I have given you.
1303. How is the land between Euabalong and the Willandra Billabong held? About half the area is held by the squatters under leases terminating in 1918; the residue is in the hands of the State and is not occupied.
1304. What kind of country is it? The soil is a sandy loam. It is all covered with dense pine and other scrubs.
1305. Is there any mulga? There is none in this district. Along the frontage it is all box flats.
1306. The frontage on the northern side of the river is inferior to this land? Yes.
1307. It is backed up with pine and mallee? Yes.
1308. Does that country extend far back? The mallee extends right through to Mount Hope.
1309. What would it cost to render the sandy country fit for the plough? I do not think it would take very much to make the country that is covered with pine scrub fit for the plough.
1310. What proportion of pine scrub is there? I suppose about two-thirds is pine scrub. It is all fit for wheat growing, except the country on the ranges.
1311. Is there a large area between Euabalong and Willandra which is fit for wheat growing? Yes.
1312. As much as we saw on the southern side of the road coming down yesterday? Yes; though there are not so many ranges or hills.
1313. There are some hundreds of thousands of acres fit for wheat growing? Yes.
1314. Have you seen country under wheat in other parts of this Colony or Victoria? Yes.
1315. Is the soil in Victoria as good as this? Yes.
1316. Is it as easily rendered ready for ploughing? I do not know.
1317. This country is rabbit infested? It is heavily infested.
1318. What would it cost per mile to put up a rabbit-proof fence? £50 or £60. That is a new fence.
1319. If you had the fence up, what would it cost you to net it? About £40 a mile.
1320. What proportion of Merri-Merrigal is freehold? About 40,000 acres.

Mr.
J. Broatch.
15 Sept., 1896.

1321.

Mr.
J. Broatch.
15 Sept., 1896.

1321. What is the extent of the resumed area? About 110,000 acres. We have an occupation license of the other half.
1322. Will you describe the country on Merri-Merrigal? On the river, which is where the freehold is situated, we have black-soil country, suitable for agriculture or for pastoral occupation, but most suitable for the latter.
1323. That country extends 3 or 4 miles back? About 4 miles back. A good deal of it is liable to be flooded when the river is high.
1324. What about the land at the back? It is pine country, with red soil. It runs about 30 miles south.
1325. Speaking generally, is it suitable for the growing of wheat? Yes.
1326. Is it as good or better than the land to the north? I think it is somewhat better.
1327. The rabbit trouble exists there? Yes.
1328. What is the rainfall here? On the average, about 18 inches.
1329. Is that sufficient for wheat in this soil? Yes.
1330. Have you seen crops grown in this vicinity? Yes.
1331. Have they been successful? To a great extent, though there have been failures.
1332. Is it as safe here as in other parts where wheat-growing has proved successful? I would not like to say that, because we have not the rainfall; but it is seldom that there is a failure.
1333. Do you believe that there is sufficient rainfall here to grow wheat? Yes. I have been fifteen years on the Lachlan, and I have only seen one failure. Every year, except one, we have had a very good crop.
1334. What would the return be? We only go in for hay-growing. I cannot tell you what the yield would be per acre. We have had about 2 tons to the acre.
1335. You have lived at Mossgiel? I have lived at Moolbong, which is half way between Mossgiel and Hillston. That is all good land.
1336. What is the rainfall there? About 15 inches.
1337. Would there be failures in the crop there? They have been pretty successful; but only on picked spots of land. I think that country wants a heavier rainfall than this country.
1338. Can you express any opinion upon the country through from Lake Cudgellico? No.
1339. This country could at one time be pretty heavily stocked? Yes.
1340. What effect has the coming of the rabbits had upon its carrying capacity? I reckon that if we did not expend money in keeping down the rabbits, they would take possession altogether, and the carrying capacity would be nil. Even with the money that we have spent, the rabbits have reduced the carrying capacity of the country about 30 per cent. We are doing all that is possible to keep them down.
1341. What additional expense in fencing has the coming of the rabbits entailed upon Merri-Merrigal? About £11,000.
1342. What is your yearly outlay upon the rabbits? About £500.
1343. The £11,000 represents not only the cost of fencing and improvements, but the cost of killing the rabbits for a number of years? Yes.
1344. What has been the cost of the wire netting? About £8,000.
1345. How many acres have you dealt with? 200,000.
1346. This expenditure has simply checked the rabbits? That is all. Unless we kept on spending money the carrying capacity of the run would, in the course of a few years, be nil.
1347. Supposing you spent £1,000 a year on the rabbits? We would be able to do a little more; but we would not eradicate them.
1348. Will they never be kept perfectly in check until the holdings are small? My experience is that the bigger the holding the better the rabbits are kept down, because there is more money at command. The subdivisions should be small.
1349. Has the pine scrub increased much of late years? Yes, on resumed areas.
1350. It has grown up within the last ten or twelve years? Within about twelve years. Of course once the pine is "rung" it is done with.
1351. What does the ringing and the scrubbing cost? From 2s. 4d. to 2s. 6d. an acre.
1352. The resumed area, where it is covered with pine scrub, would have to be "rung" at a cost of 2s. 4d. an acre before it would carry anything; and it would have to be fenced to keep off the rabbits? Yes.
1353. What is the extent of the resumed areas adjoining Merri-Merrigal? There are about 1,200,000 acres in one block. Immediately west from our purchased land there is a great tract of country running down south about 30 miles, and out to the east, embracing that area. That country is at present the home of the rabbit and the wild dog, and is covered with pine.
1354. Would that country be fit for wheat-growing if people could get it cheaply? The greater part of it is wheat country.
1355. It would pay people to put in wheat if they had the means of communication? Yes.
1356. Under present conditions no one will look at this country? It has been lying there since 1884, and no one has looked at it. It extends from the Lachlan to within 20 miles of the Murrumbidgee.
1357. Is there not any land within 20 miles of Hay? The land along the Hay line is taken up; but, 20 miles back, this land has not been taken up. The country I speak of is very much the same class of country they are growing wheat on at Hillston.
1358. Do you think that if a railway were put through this country it would be taken up? A good deal of it would be taken up. Around places like Hillston I suppose a few thousand acres would be taken up. I do not know exactly what the country is like between Forbes and Euabalong. There might be settlement along there.
1359. Where does your wool go? To Whitton.
1360. Where will it go after the completion of the line to Condobolin? I think to Condobolin; but that will depend upon the railway rates.
1361. How far is it from here to Condobolin? About 94 miles.
1362. And from here to Whitton? From the Shed it is about 90 miles. The road to Condobolin is the better, because it is close to the river.
1363. What do you do with your fat stock? We send them to market; but generally they leave this place fat, and before they get to the railway they are stores.
1364. *Mr. Hassall.*] Will the extension of the line to Condobolin be of advantage to you in this respect? Yes; because we should have better country through which to drive our stock.

1365. *Chairman.*] From a pastoralist's standpoint a railway would give you cheaper carriage for your wool, and would enable you to dispose of your fat stock to better advantage? Yes.
1366. From the agricultural standpoint, agriculture so far from a railway as this is impossible, but the soil is good enough; and there is sufficient rainfall to produce crops with certainty? Yes.
1367. The State has here a vast area of land which is fit for occupation, and you believe that if good terms were offered to selectors a large part of it would be taken up? Yes.
1368. This State property is at present the home of dogs and rabbits, and is covered with pine scrub, and must remain in this condition until it is taken up? Yes.
1369. What is your idea with regard to the compulsory destruction of the rabbits? I am greatly in favour of it. The Government, of course, should take the responsibility of killing the rabbits upon Crown lands. I think that if the provisions of the original Act had been in force, the rabbits would not have done so much harm.

Mr.
J. Broatch.
15 Sept., 1896.

TUESDAY, 15 SEPTEMBER, 1896.

[The Sectional Committee met at the Homestead, Hunthawong, at 8 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Alexander Cumming, homestead lessee, sworn, and examined:—

1370. *Chairman.*] How long have you been in this district? Since 1870—Twenty-six years.
1371. *Mr. Trickett.*] Do you know the country from Condobolin coming along the route of the proposed line? Yes, and for 50 miles beyond this place.
1372. Will you describe the country through which the proposed line would pass? For the first 20 miles out of Condobolin I should say it would go through swampy land, 10 miles out from the proposed line there is good high land, but close to the line the land is not adapted for agriculture. It is too swampy.
1373. Is the good land you speak of red soil country? Yes. There are a good many hills there.
1374. What is the character of the timber? Pine, box, and yarran. I am speaking of the country out from the line. The line itself is mostly on the plains. For the next 20 miles the line would go through fair, high, red land—open pine country—though it has nearly all been ringbarked. From there on it is mallee for between 40 and 50 miles, until you get to Roto. Some of it is good mallee, and some of it is very bad. Further on as far as I know it is good, high, red ground. That is from Roto out to Trida.
1375. How does the country along the deviation compare with the country along the proposed route? The land is better for agricultural purposes. I do not like the land along the river frontage for agriculture. You want to get further back if you require good wheat land.
1376. Within what distance of the river is the land suitable for agriculture? Within about 8 miles of the river. To within 20 miles of the Murrumbidgee it is good agricultural land, except on the hills.
1377. Do you consider the southern route by way of Euabalong and Lake Cudgellico as preferable to the northern route? I do not like that route at all from Condobolin. I think you could tap the country more easily by coming from Temora, and in that way you would go through better land.
1378. But of the two routes from Condobolin which would be the better? Undoubtedly the southern route, by reason of the character of the land, and because the country is in the Central Division, and therefore more available for selection. The country in the Western Division would not be available without special legislation.
1379. What prospect is there for close settlement and farming in this district? When you get out on the plains I do not think the country is good for anything else except farming. It is all good wheat-land, and would maintain a population if means were provided for getting away the produce. They could grow wheat at a profit for 2s. or 2s. 3d. a bushel.
1380. How many acres do you think there would be available for wheat-growing? Between Temora and this place I think they reckon that, taking out the hills, there are 3 to 4,000,000 acres suitable for wheat-growing.
1381. There is ample country if only there were a market? Yes.
1382. What is the present position of this district? If things do not mend, everyone in it will have to go down, unless the price of wool and stock go up permanently.
1383. Why? Because those who have conditional purchases cannot afford to pay 1s. an acre for their land. The country will not maintain enough stock to allow them to pay that price, and it is too expensive to grow wheat, because of the distance from market.
1384. Why has there been such a terrible collapse in this district? Because of the drop in the prices of wool and fat sheep.
1385. And because of the bad seasons? I do not think that the seasons are any worse than they were, although the rabbits have deteriorated the grazing capabilities of the country. They growl at this season, but it is no worse than 1876 was.
1386. The district generally has decidedly gone back? It is going down hill, except where people are near a railway station, and are able to make money out of their surplus wheat. The others are all going down hill. There are scores of selections about the Lake which you could buy for 5s. an acre, although 14s. and 15s. an acre has been paid them. The banks have scores of properties there which you could get at a considerable reduction upon what they have advanced.
1387. Do you see any means of improving this state of things? The only hope I have is in wheat. I think that wheat could be grown here at a profit, but a man starting must be in a position to live a year upon the land, and to buy all the machinery necessary. A man could keep a farm going with £200 at the present price of machinery; but he could not start without having at least £300 or £400.
1388. He would want from £300 to £500 as a stand by? Yes.

Mr.
A. Cumming.
15 Sept., 1896.

- Mr. A. Cumming. 1389. What do you think it would cost to clear the pine scrub? I think that with stump-jumping ploughs 3s. or 4s. an acre would clear it. They just cut the timber down enough to let the stripper go over it, and then, in the course of a year or two, the stump-jumper takes it all out. The rainfall here is better than the rainfall in the mallee district of Victoria, and the land is better.
1390. What area have they there? The average area there would not be more than 640 acres. Some, like Mr. Lascelles, have more.
1391. Do you think that a man could live on that area? Yes; but on no smaller area.
1392. Will he have to farm the whole of his land? No; he would have to spell some of it, and in times of drought he would have to feed his stock with straw.
1393. A great many witnesses have put down the depression in this district to the rabbits? They have done no injury to agriculture in this district, and with a larger population, although there would always be a few rabbits, there would not be much to fear. I would not be frightened of the rabbits if all my neighbours did as much as I do—the Crown included.
1394. Are the rabbits as troublesome now as they used to be? No; because we have learnt how to deal with them. The poisoned pollard has been the most effective means. Last year, with the assistance of the drought, we destroyed 90 per cent. of them, and it would take them two years even if they were let alone to breed up again.
1395. Closer settlement must be of very slow development in this district, and in the meantime the pastoral country must be subject to the rabbit pest? I think that if a railway were to come to Hillston a lot of this land would be rushed by Victorian and South Australian selectors. They are only getting 8 bushels to the acre where we get 14 bushels.
1396. Mr. Hassall.] This land is practically unknown to them? They really do not know anything about it.
1397. Mr. Trickett.] If 1,000 men took up selections here, that would absorb only 640,000 acres? Year by year the number of selectors would increase. There are men now cultivating 100 to 150 acres who, if they could get their produce away, would treble and quadruple their area. If I had a railway within two days' waggon drive, I would start wheat growing as soon as I could get the proper machinery.
1398. You think that the great thing to encourage settlement is good means of communication? I think so. That is the only help for this district. The Lachlan valley is one of the future granaries of the world. I did not commence as a wheat man at all; but I see now that there is nothing else for it.
1399. As you have not been very prosperous as a grazier, you would go in for wheat growing, supposing you could get a market? I would go in for wheat to try and save myself. Of course, a man growing wheat on a 10,000-acre block with the leases we have would be better off than a man in the Central Division who paid 1s. an acre for his land. We only pay 1s. 6d. per acre per annum.
1400. A good many witnesses have favoured the compulsory destruction of rabbits—what is your opinion on the subject? I believe in every man killing his own rabbits; but you might make legislation so severe as to ruin the poor man. If the destruction of rabbits was made compulsory, the Crown should be made responsible for the rabbits upon Crown land.
1401. If half a dozen people neglected to destroy the rabbits, their land would become a breeding place from which their neighbours' land would be supplied? Yes. Everyone should be compelled to do his share; but nothing will ever rectify matters until we have local boards worked in the same way as the Stock Board is worked.
1402. Mr. Hassall.] Do you not think it would be as well to give the Stock Board control of this matter? Well the Stock Board is not much good. We are asked to give our opinions, but no one ever knows whether they are taken or not. About every two months we have a meeting and discuss all sorts of questions, and there is an end to it.
1403. Mr. Trickett.] Do you know anything about the mining resources of the district? There is any quantity of copper at Mount Hope; but fuel is rather expensive there now.
1404. Mount Hope would be about 25 miles from the proposed railway? Yes.
1405. Would the railway be of any use in bringing fuel to the mines? I should not think so. The railway would help them in sending down their copper; but 25 miles would be a long way to cart fuel.
1406. Are the Mount Hope copper mines very extensive? They have very large deposits of copper; but they have only been worked in a primitive way.
1407. You do not think they could be looked to much as a source of revenue to the line? I do not think so, unless the line went closer.
1408. Is there much likelihood of gold being found in this district? There are indications of gold all the way from Wyalong to Mount Allen, and the same lead goes right on to Cobar. You will get a prospect of gold anywhere along the ridges.
1409. You spoke, just now, about a line from Wyalong to Hillston? I think that such a line would go through more agricultural land than the line you are considering, and it would keep away from the frontages, where the land is often flooded, and where a large portion of it is purchased. The Committee to-day have come through 30,000 and 40,000 acres of purchased land. With the exception of a few reserves, all the river frontages are purchased.
1410. The route you mention would open up entirely new country? Yes. I do not know anything of the country more than 20 miles from the lake; but I do not think there is any large area of purchased land there.
1411. What is the character of the country? It is much the same as that which I have described, except for the hills.
1412. Such a line would give direct communication? Yes, I think so. The proposed line would suit me better; but studying the interests of the district, it would be best to bring the railway from Wyalong.
1413. What about the country from here to Hillston and Mossiel? From Hillston to Mossiel it is nearly all plain country—splendid grazing country.
1414. Do you think there would be any possibility of getting trade for a railway west from Condobolin? I do not think so. Fifty miles out you would trench upon the Bourke line.
1415. I suppose they could grow produce as well at Hillston as at Cudgellico and Euabalong? Yes, and, if anything, better. A railway there would cut off the Victorian competition. From Big Willandra the wool this year is going to Hay, and then down the Murrumbidgee to Echuca. A difference of 5s. a ton would catch that wool. Last year the wool from Merri-Merrigal went on to the steamers.
1416. If the proposed railway were taken to Menindie, would that secure the trade? No; because a great deal of wool would go down the Darling.

1417. *Mr. Fegan.*] What would be the first cost of putting in wheat after the land had been cleared—I mean for ploughing? 2s. 6d. to 4s. per acre.
1418. Have you had any experience in South Australia? Yes.
1419. How many years were you there? Four.
1420. Have you had any experience in Victoria? Not much.
1421. There is hardly any comparison between the South Australian land and this land? This is far better wheat-growing country, but it is not better grazing country.
1422. What is the average yield there? Seven bushels.
1423. How many people have left the district since you have been here? A great many.
1424. Why? Because of the rabbits and the fall in prices.
1425. Do you think that with railway communication a lot of their difficulties could be got over? I think that if they had had sufficient capital to buy machinery they would be able to make a "do" of it.
1426. Do you think they would have left their holdings if they had had better means of communication? I do not think so.
1427. The great part of their misfortune has been owing to the want of a market? Yes.
1428. How do you get your fat stock to market? I sell my stock locally.
1429. If you cannot sell them locally they become a dead loss to you? Yes. Many a time when there is a glut locally I could sell them in Sydney if I could get them there.
1430. But since you cannot? I hang on to them.
1431. And in a bad season you lose them? Yes.
1432. You have 2,300 acres of conditionally purchased land? 1,100 acres of conditionally purchased land; the rest is conditionally leased land.
1433. With railway communication you could put your land to better use? Yes; or I could let it on the halves system.
1434. Is that system in operation in this district? No, not here; but I could get a man to come here to-morrow if we had a railway.
1435. With a railway you could stock your land better? By farming I would be able to keep sufficient hay to feed stock on in bad seasons.
1436. And the railway would help you to send your fat stock to market? Yes.
1437. You would thus be able to save the grass for the following year? We could ease the paddocks, so as to make things surer for what stock were left.
1438. Have you tried fruit growing? Only in my garden.
1439. How does it do? With irrigation, very well.
1440. The rainfall is not sufficient? I think not.
1441. *Chairman.*] There are huge areas of unoccupied land along the Departmental route? Yes.
1442. But you described that land as inferior to the land lying between the Lachlan and the Murrumbidgee? Certainly.
1443. You do not think that the open land is so good for wheat growing? It is better for grazing.
1444. We have been informed that the plain land, after it has been opened up for a year or two, gives fairly promising returns? I doubt it.
1445. From between here and Lake Cudgellico, what runs have we passed through? Wooyeo and Cappa. Then you passed through Rossi's Gap, and came on to Merri-Merrigal, and so on to Hunthawong. There are something like 1,500,000 acres of no man's land between the Lachlan and the Murrumbidgee.
1446. Can you tell us what some of these stations were carrying some years ago, and what they are carrying now? Wooyeo station shore 120,000 sheep at one time, and now I do not think they have 25,000. Merri-Merrigal shore 110,000 sheep one year; but I think they have only about 40,000 sheep now.
1447. Is it the same through the whole of the Lachlan valley? Yes; until you get up to Burrawang, and Kincaroo. There they are doing better than ever. They shear 60,000 sheep on Kincaroo now, and they used only to shear 12,000. They have not the rabbits there.
1448. Would it be easy to bring a line from Temora through Wynlong to Hillston? Yes.
1449. Is it all good country there? Yes, with the exception of the ranges.
1450. Wynlong is 80 miles south-east of Lake Cudgellico? Yes. A line taking a bend in towards Lake Cudgellico would go through some splendid country.
1451. At Hillston the agricultural land ceases? Yes; except in occasional patches.
1452. Where is the agricultural land on the other side of the Lachlan? If you go out to Roto you have it on the right of the proposed line—good red land.
1453. From Hillston to get on good agricultural land you have to go 30 miles north to the Willandra Billabong before you pick it up? Yes.
1454. What is the timber out there? Pine, yarra, and box.

WEDNESDAY, 16 SEPTEMBER, 1896.

[The Sectional Committee met at the Homestead, Hunthawong, at 8:30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Alfred William McPherson, manager, Hunthawong and Willandra stations, sworn, and examined:—

1455. *Mr. Fegan.*] How long have you been here? Nearly six years.
1456. How many sheep have you? 30,000.
1457. How many acres? About 200,000. Our stock was much reduced by the drought.
1458. How many droughts have you had since you have been here? We have had droughts for two years running. The drought started at the beginning of 1894.

Mr. A. W.
McPherson.

16 Sept., 1896.

- Mr. A. W. McPherson.
16 Sept., 1896.
1459. Have you any wheat? 200 acres.
1460. How many years have you been growing wheat? More or less, ever since I have been here.
1461. What is your average crop per acre? I never grow wheat for grain. I use it all for hay.
1462. Are you well acquainted with the country about here? Fairly well.
1463. How far do you know it? I can speak of the country within a radius of 50 miles.
1464. What is it like? North of the Willandra Creek it is pretty well all mallee, porcupine, &c., with stony hills. To the west it is black with stiff soil, and to the south and east it is red-soil pine country.
1465. South and south-east is first-class country? Yes. The country to the north is very poor; but to the west there is rich soil.
1466. Would half of it be good land? Yes.
1467. The other you would class as second-class land? Yes.
1468. Have you any other stock besides sheep? A few horses and cattle.
1469. They are chiefly for your own use? Yes.
1470. What are the prospects of this district? I think there is a big future in front of it.
1471. Do you send any stock to the railway? Yes; this year I should be sending about 10,000 fat wethers to Carrathool for the Sydney market.
1472. What about the wool? The wool goes to Melbourne, down the Murrumbidgee from Carrathool.
1473. Do you think the proposed railway would be conducive to settlement? I do not think so. The route is not one that I favour.
1474. Are you in want of railway communication? Yes.
1475. From what point? From Temora to Hillston.
1476. Do you know the country between here and Temora? I know it for 50 miles from here. It is all red ground.
1477. You do not think there would be any difficulty in the construction of the proposed line? No.
1478. Is the country there as flat as it is here? I cannot say.
1479. The road from here to Condobolin is fairly flat? Yes.
1480. If a line were taken from Temora to Hillston, what population would it serve? It would create a population by opening up a lot of country now lying idle.
1481. Will not the line to the north do the same? No.
1482. Would the proposed deviation open up good country? Yes, around Lake Cudgellico.
1483. Would the deviation be more serviceable than the northern route? Yes. I do not believe in a northern route.
1484. Are the landholders about here in a prosperous condition? No; they are mostly in the hands of the banks.
1485. Why is that? Because of the droughts, and because they are so far away from a market.
1486. Do the rabbits trouble you much? They have done so. We have gone to immense expense in destroying them.
1487. What do you pay to deal with the rabbits? Speaking for Hunthawong alone, the amount paid for rabbit destruction from 1884 to 1894 was £2,255.
1488. How many acres have you in this holding? 120,000. There is the cost of wire netting to be added to the figures I have given you.
1489. How much per mile would that be? About £42 a mile. We have spent about £1,852 upon wire netting.
1490. Have you got the rabbits fairly under now? Yes; we have got them down well.
1491. All you want now are fair seasons and railway facilities? Yes. This is good enough country if you can get good seasons.
1492. Could you grow wheat during the drought? Yes, in the red-soil country. Wheat will not grow in the black stiff land without rain.
1493. What other experience have you had? I was on the Darling, at Tapio.
1494. There is a lighter rainfall there? Yes.
1495. You never tried wheat there? No; we could do nothing with it there.
1496. You followed pastoral pursuits there? Yes. We had a bigger area of country and less stock.
1497. Have you had many losses with your sheep since you have been here? Yes, this year and last year, especially this year.
1498. What is the chief reason why the rabbits have got such a hold here? I think because of the carelessness of the holders of the land.
1499. Do you think that compulsory legislation should be passed compelling men to kill their rabbits? I would compel every man to kill his own rabbits; but the Government should also be compelled to kill their rabbits.
1500. Do you think, if a railway were constructed, a large number of people would settle here? There is no doubt about it.
1501. I suppose the great difficulty is in disposing of the fatlings? Yes; and in getting away stock in bad seasons when there is very little grass.
1502. With the railway you could send away your surplus sheep and save the grass for what was left? Yes.
1503. You think that some kind of a line should be constructed to give greater facilities to the people? Yes.
1504. What does it cost you to send to Whitton? We send right to Melbourne for £5 a ton.
1505. What would it cost you to drive to Carrathool? About 2s. 3d. a head.
1506. Will the sheep depreciate in transit? Yes. They do not improve on the road, and the knocking about on the trucks does not improve them.
1507. You cannot tell us the extent of the resumed areas about here? No; but it is very large.
1508. Has anybody left the district lately? Not that I know of.
1509. You do not know of anybody who has thrown up his holding? No.
1510. *Mr. Hassall.*] A railway coming down the frontage would have to pass through purchased land? Yes.
1511. And a line coming from Temora would pass through Crown lands? Yes, and through good land. I judge from what I have heard of that country that that is where the line should be taken. If I had to give a vote for either line it would be in favour of the Temora line. 1512.

1512. *Mr. Trickett.*] How do you account for the depression in this district? I account for a good deal of it by the presence of the rabbits, and I think that holders pay too much for their land, and have taken up more land than they can deal with. They have been too greedy for land. Then there has been the fall in the price of wool. There are men out back who have told me that if they had had this land they would have got on alright. They undertook too much. I think that trading too much on credit has killed a lot of them.

Mr. A. W.
McPherson.
16 Sept., 1896.

1513. If they had had small holdings the rabbits would have been a minor difficulty? Yes; an energetic man could easily have dealt with them. Our inspector told me that the Willandra holding was at one time the worst he ever saw; but yesterday he only met with about twenty rabbits on the whole of the run. I have destroyed them there in millions.

1514. *Mr. Fegan.*] If the settlers had been satisfied with less land they would have required less capital, and would not have had to mortgage their property? Yes; the land is good enough; it is the people who have been too grasping.

WEDNESDAY, 16 SEPTEMBER, 1896.

[The Sectional Committee met at the Court-house, Hillston, at 2.30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT, | JOHN LIONEL FEGAN, Esq.,
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Benjamin Varcoe, miller, Hillston, sworn, and examined:—

1515. *Mr. Hassall.*] How long have you resided in this district? About twelve years.

1516. Have you a pretty thorough knowledge of it? South from Hillston I have a good knowledge of it. I do not know so much of the country to the north.

Mr.
B. Varcoe.
16 Sept., 1896.

1517. Are you well acquainted with the country around Hillston? Yes.

1518. Within a radius of 20 miles? Within 50 miles.

1519. Are you acquainted with the country through which the proposed line would go after leaving Condobolin? I am not well acquainted with that country.

1520. How much wheat can you deal with per annum? Since the mill has been started, which is about eight years, I have put through, I think, about 30,000 bushels.

1521. Could you deal with any larger quantity? Yes, a much larger quantity. We do not work more than five months in the year, and then only for short hours.

1522. What is the quality of the land here for wheat-growing;—is it suitable? Very suitable. I have been farming in the Colonies ever since 1840, and I do not think I have seen better tracts of land for agricultural purposes than that south of the river here.

1523. Extending where? As far as Gunbar.

1524. How far west? You do not go far west before you get into the pastoral country—the plain land.

1525. How many miles from here? I should think about 20 miles west from here you begin to get out on to the plains.

1526. And how far east? I am not acquainted with the country for more than 20 miles east. As far as that it is good agricultural country; but I am not acquainted with it further on.

1527. That is as far as Hunthawong? Yes, out in that direction; there is good agricultural country there.

1528. Have you any knowledge of the country between there and Lake Cudgellico? Very little. I have only passed over it twice.

1529. You think that the land with which you are acquainted will compare favourably with any land beyond out towards Lake Cudgellico? I think it would compare favourably with that land. There are some very rich patches about the lake, but it is not uniformly good as the land to the south is. There is no poor land, and no waste land.

1530. Is there much scrub about Hillston? Yes; there is a great deal of scrub out to the south-east, at the back of Hunthawong.

1531. And away to the westward it is similar country? Yes.

1532. We are to understand that the land which would be available for settlement around Hillston is to a certain extent scrubby, but of very good quality? Yes; of very good quality for agriculture.

1533. What is the annual yield per acre? About 12 bushels has been the average for the last eight years. In some seasons it would be more, and in others not quite so much. Last season was a bad one. I have here a sample of wheat which I brought from the mill this morning. It is one of the best samples I got last year.

1534. What is the quality of the wheat grown here? It is of good milling quality. The millers in Sydney prefer it, I think, to any other wheat grown in the Colony.

1535. Is that because it is thin-skinned? I think it is because it is grown in a dry climate. It produces a stronger flour.

1536. It is a full grain, and of good flavour? Yes.

1537. How does the frontage land compare with the back land, so far as wheat-growing is concerned? The frontage land is not so good as the land at the back. Although the ground is strong, the climate is hot, and the grain is often shrivelled. On the country to the back it fills better.

1538. The scrub country is more suitable for wheat-growing than the land on the frontage? Yes.

1539. Do you think a large area would be put under wheat if the railway came here? I have no doubt that the whole of the scrub lands at the back, which are valueless at the present time, would be taken up immediately if there were railway communication.

1540. Have you any idea of the extent of the back land available? No; I have never gone into figures with regard to it.

1541.

- Mr. B. Varcoe.
16 Sept., 1896.
1541. Have you any idea of the number of farmers settled about Hillston who are making a living by growing wheat? I have no figures; but, speaking generally, I think that between 10,000 and 15,000 acres are under crop this season.
1542. Do you think that that area could be largely increased? Yes.
1543. Do you buy the whole of the wheat grown in this district? Since the mill started I have purchased about one-third of the wheat grown in the district.
1544. What is done with the rest? It goes to Sydney.
1545. It is carted to the nearest railway station? Yes.
1546. What station is it delivered at? Generally to Carrathool.
1547. What is the cost of carriage between here and Carrathool? About 6d. a bushel. That is what the farmers out back pay. Of course some of the farmers live 20 miles on the way to Carrathool.
1548. What is the cost of carriage from Hillston itself? Very little goes from Hillston. I purchase more of what is grown near the town.
1549. Do you think the proposed line would be of any great advantage to the district? I do not think that it would be of any advantage to the wheat-growers of the district;—in fact, I do not think the people would avail themselves of it.
1550. Would it be too far away? It would be too far to the north.
1551. Do you think that this district should have railway communication in order to bring about its full development? Yes. If we had railway communication it would open up a large tract of country, and would be of great advantage to the State.
1552. Which would be the most suitable point from which to extend the main southern line to this district? From what little I know of the country up above I should think an extension from Temora would open up the best agricultural land. I have been told that there is a very large quantity of good agricultural land there.
1553. You only speak of that land from hearsay? Yes, not of my own knowledge.
1554. In your opinion, a line to benefit this district should come from the southern line instead of from Condobolin, passing on the north side of the Lachlan? That is my idea.
1555. Are you the only miller in the district? Yes. There is no other mill nearer than Condobolin.

Mr. Samuel Nixon, farmer, Gunbar, sworn, and examined:—

- Mr. S. Nixon.
16 Sept., 1896.
1556. *Chairman.*] How long have you been at Gunbar? Fourteen years.
1557. How large is your holding? Between 5,000 and 6,000 acres.
1558. How much have you under cultivation? 1,400 acres.
1559. How much had you two years back? Between 1,200 and 1,300 acres.
1560. For some years past you have cultivated a large area? Yes.
1561. What do you do with your wheat? In most cases I send it to Sydney.
1562. What is the rate of carriage from Gunbar to Carrathool? About 1s. 6d. a bag.
1563. What is the railway carriage to Sydney? About 1s. 8d. a bag.
1564. That makes 3s. 2d. a bag for the whole distance? Yes.
1565. There are four bushels to the bag? Yes.
1566. So you should say 9½d. per bushel? About that.
1567. At what price must wheat be in the Sydney market to give you a profit? About 2s. 6d. a bushel.
1568. Therefore you could grow wheat here at about 1s. 8½d. per bushel? Yes; on a large scale it might be grown at that price. Last year I sold 1,500 bags delivered at Carrathool for 1s. 11d. a bushel.
1569. You know the country from Gunbar to Hillston, and from Hillston to Lake Cudgellico, and also the country lying north-east from Gunbar? Yes.
1570. Is there much land there similar to that upon which you can grow wheat for 1s. 8d. a bushel? Yes.
1571. What is the area, roughly? It extends to Lake Cudgellico on the east; between 30 and 40 miles southward, and about 15 miles to the west.
1572. That country is pretty much the same as the land upon which you are growing wheat at present? It is very similar.
1573. The area you allude to would be about 400,000 acres? I believe that, in reality, it is much greater.
1574. What kind of country are you working on? It is timbered country, intersected with plains.
1575. Box timber? No; mostly pine, wilga, yarran, and a few of the scrub trees.
1576. What is the soil? A red loam.
1577. Is it sandy? No.
1578. Do you know the country to the east, going from Gunbar towards Wyalong? Yes; that is very similar country; but when you get about 30 miles east from Hillston there is not the same extent of good country. The country there is more broken, and has stony ridges on it. About Hillston there are from 20,000 to 30,000 acres of wheat-growing country. That country extends south 30 miles, and east and north-east about 20 miles. There is one unbroken tract of good wheat-growing country.
1579. North of Wyalong, what is the country like? It is more broken country, with stony ranges. There is some very rich country.
1580. What proportion of good country is there? I should think 75 per cent.
1581. The rainfall here is 19 or 20 inches? 16 inches.
1582. Have you experienced any severe losses because of the smallness of the rainfall? No. I have now had thirteen crops, and there has been only one failure.
1583. What has your average crop been? Between 11 and 12 bushels.
1584. Where were you farming before you came here? In Deniliquin—about 25 miles west from Deniliquin.
1585. What did you do with your wheat there? I sold it to the Deniliquin mill.
1586. How does this land compare with the land at Deniliquin? I think this is the better land.
1587. How does the rainfall compare? It is a little less.
1588. Do you think that wheat-growing here would be more satisfactory to the farmer than it is in the vicinity of Deniliquin? Yes; this country is more adapted for wheat-growing than Deniliquin is. You get better returns with 1 or 2 inches less rainfall.
1589. If a railway were constructed through this country, do you think the Government could count upon its being taken up? I think it would be taken up readily.
- 1590.

1590. Where would the people come from? I should think the railway should be extended from the southern line, anywhere south-east of Hillston. Mr. S. Nixon.
1591. Where would the men come from to take up the land? They would be chiefly Victorian farmers. 16 Sept., 1896.
1592. The opportunities offered here being better than those offered in the mallee country? Very much better.
1593. Do you think the Government could depend upon population coming here? Yes, if railway communication were provided. Only last year there was a difficulty in getting wheat taken to Carrathool, because of the dry weather.
1594. If proper means of communication were provided, the Government could get rid of their land? I have no doubt of it.
1595. What is the wheat return of Deniliquin? About the same as it is here—11 or 12 bushels.
1596. Supposing you had your choice, would you settle here or about Moama? I think I should prefer Moama.
1597. Why? That country will carry so much more stock, though I do not know that it will grow wheat better than this country will.
1598. But speaking from an agricultural point of view? I would give this country the preference.
1599. The farmers about Moama do well enough? Some of them are doing well.
1600. Is there anything further you can tell us? I do not know that there is. The drawback to this country is the want of means of communication.
1601. Do you think a railway serves an agricultural district fairly well if it comes within 30 miles of it? Yes; but the closer it is the better.

Mr. William Thomas, farmer, near Gunbar, sworn, and examined:—

1602. *Chairman.*] Where do you live? About 40 miles south-east from here.
1603. East of Gunbar? Yes.
1604. *Mr. Trickett.*] How long have you been in this district? Two years and nine months.
1605. Have you been engaged in farming during this time? Yes.
1606. Where did you come from? From Clare, in South Australia, about 90 miles north of Adelaide.
1607. Were you engaged there in growing wheat? Yes.
1608. What area had you under wheat? Between 2,000 and 3,000 acres.
1609. What was the rainfall there? About 20 inches.
1610. How many bushels did you get to the acre? A few years before I came away we went down to about 4 bushels to the acre. The land was worn out.
1611. When the land was in good working condition, what would it yield? From 12 to 20 bushels.
1612. Am I right in saying that your reason for leaving was that your farm was worked out? Yes.
1613. And you came up here to take up new country? Yes.
1614. What is your present holding? 5,000 acres.
1615. What is the tenure? I have a scrub lease. It was all green timber when I came here—belar, pine, yarran, box, and mallee.
1616. What improvements have you effected? I have cleared about 150 acres. We have about 30 acres under crop and about 30 acres fallow.
1617. Have you had a crop off this land? No, the rabbits took the first crop I had, and the second year I could not put in anything because the rabbits took all my feed and I lost half my horses.
1618. You are not able to give us any information about the producing qualities of the soil? I am quite certain about the producing qualities of the soil. If I had not been you would not have found me here.
1619. If you have done nothing so far how are you going on? I am living in hopes. The rabbits ate the crop the first year.
1620. How are you going to cope with the rabbits? By putting up wire netting.
1621. How does this soil compare with that of South Australia? On the average it is better. This land is all a red loam. In South Australia it was clayey heavier land.
1622. This land is eminently suitable for wheat-growing? Yes.
1623. Are you out of reach of the flood-waters here? Yes.
1624. What is the rainfall? From 16 to 17 inches I believe.
1625. Do you think that that will be sufficient? Quite sufficient.
1626. What is the rainfall in South Australia where they grow wheat? In the majority of places it is only about 14 inches. I have lived in such districts.
1627. How did you do there? We averaged from three to four bags when the land was new.
1628. You think the rainfall here would be ample? Yes.
1629. Can you give the Committee the benefit of any inquiries you may have made in this district? I look upon the district as suitable for wheat-growing—that is the country between where I am and Yalgogrin. I travelled through that country.
1630. What are the successful crops you have seen in this district? I have seen some very favourable crops—12 and 16 bushels to the acre.
1631. Do you look upon that as a fairly paying yield? Yes.
1632. What would be the lowest price at which you could grow wheat? About 2s. 6d. a bushel on the ground.
1633. Was that about what you got in South Australia? I have sold wheat for 1s. 10d. a bushel there.
1634. What is a fair price to pay? With a fair crop we looked upon 2s. 6d. a bushel as a paying price.
1635. You think that Mr. Nixon considerably understated the amount? Well, he has his land better cleared than I have. He is in more favourable circumstances than I am.
1636. How many acres do you intend to put under wheat? That is very hard to say. As I get along I will increase my area. The place is very rough where I am.
1637. What has been your experience with the rabbits? Well, I have lost half my horses through the rabbits.
1638. You think that with small settlement and persistent working a man can compete with the rabbits? I feel sure of it.
1639. Do you think there should be a law compelling everyone to destroy this pest? I think that such a law would be a very good one.

Mr.
W. Thomas.
16 Sept., 1896.

- Mr. W. Thomas.
16 Sept., 1896.
1640. You think that it is not fair for one person to be allowed to breed rabbits to the disadvantage of his neighbours? Yes.
1641. What distance have you to cart your wheat in South Australia? About 7 miles.
1642. How far can a farmer profitably cart his wheat? From 15 to 20 miles.
1643. After that it becomes rather a heavy tax? Yes.
1644. How does the wheat grown in this district compare with the South Australian wheat? Very well indeed. It is quite as good as the South Australian wheat.
1645. It is very thin-husked wheat? Yes; and millers have told me that it makes a strong flour.
1646. You think there is a good outlook for the farmer here? Yes.
1647. Did you breed sheep in South Australia? Yes; I combined grazing with agriculture.
1648. Will you combine the two here? Yes, when I can.
1649. I suppose you had a ready market in South Australia for your surplus produce? Yes, because I was near the capital.
1650. Is it not a drawback to a small holder to be so far from a railway as you are? Most decidedly.
1651. Do you think that grazing would prove valuable here in conjunction with farming? Yes.
1652. Do you think that the farming population would increase here considerably if there were better means of communication? I feel sure of it.
1653. Have you heard any of your old neighbours say that they would come here? Yes. It is the want of railway communication that keeps them back.
1654. In South Australia do they send the wheat to the capital to be milled, or is it milled locally? It goes direct to the seaboard.
1655. Therefore you are not in the hands of the local miller? No.
1656. That is of great advantage? Yes.
1657. Are you going to wire-net the whole of your holding? No, only part of it.
1658. Will not that leave the other part a breeding place for rabbits? As soon as I get the scrub rung I will wire-net the whole of it. It is no use to wire-net the green timber.
1659. Why do you think people would come from South Australia to settle here? If the land here were let to them on good terms they would flock over as soon as they were sure that the railway was coming.
1660. You think they would come here in considerable numbers? Yes.
1661. How many do you think would come? There might be 200 or 300.
1662. Is a good deal of the land in South Australia being worked out now? Yes.
1663. How long does wheat land last as a rule? It varies. Some of the best land in South Australia stood about thirty years, other land did not stand more than four or five years. It depended upon the character of the soil.
1664. Which lasts the longer—the light soil or the clayey soil? In my experience the soil which has a clayey appearance gives in soonest.
1665. Do you think the soil about here would be fairly lasting? Yes; I think it is a great lasting soil for cropping purposes.
1666. At one time you sold your crop at 1s. 10d. a bushel;—how many bushels to the acre did the land yield during that season? The first year it yielded 25 bushels to the acre.
1667. And the next year? Four bushels to the acre.

Mr. Joseph Rowe Varcoe, farmer, Hillston, sworn, and examined:—

- Mr. J. R. Varcoe.
16 Sept., 1896.
1668. *Mr. Fegan.*] How many years have you been in the district? Fourteen years. I have my fourteenth crop growing now. Previously I was farming at Deniliquin for eight years.
1669. What is the area of your holding at the present time? 1,920 acres.
1670. How many acres have you under cultivation? 324.
1671. Have you ever had a larger area than that? No; that is the largest area I have had.
1672. It is chiefly what? It is all wheat.
1673. How many bushels to the acre do you get? I suppose 13 or 14 bushels on the average.
1674. Have you had any droughts up here? Yes.
1675. How many in the fourteen years? The first five years were continuously dry.
1676. And was your crop a failure? No.
1677. The shortness of rain did not affect your crop very much? Well, we had light crops. I got as little as 8 bushels to the acre.
1678. What was your highest crop? Sixteen or 18 bushels to the acre.
1679. Do you run many sheep? Only a few for killing.
1680. Your experience has been chiefly in agriculture? Yes.
1681. Have you ever tried anything besides wheat? I have grown barley.
1682. Does that do well? Yes, it is very successful.
1683. How much a bushel have you got for your barley? 2s. 6d.
1684. And how much for your wheat on an average? I could hardly say.
1685. Has it paid you to grow wheat? Yes.
1686. How many bushels of barley to the acre does your land return? I think I have got about 20. It is some years since I grew barley.
1687. Why did you give up cultivating barley when it gave you larger returns than the wheat does? That year I got 4s. 4d. a bushel for my wheat.
1688. Do the rabbits damage your crop very much? Yes; I had a total failure one year through the rabbits.
1689. Have you coped with them now? I have my holding wire-netted now.
1690. What does it cost you to wire-net—I suppose your holding is all wired? Yes; it cost £14 14s. 7½d. a mile.
1691. Do you employ other means for getting rid of them? Yes; I poison them.
1692. What does that cost? My sons do the work, but if I hired a man to do it it would cost me £1 a week and his rations, and I suppose it would take him about six months in the year. That would be about £35.

1693. Where do you sell your wheat? Chiefly locally. I sent to Sydney one year.
1694. Did that pay you? Yes.
1695. What were you getting for it? I got 4s. 2d. a bushel for it in Sydney.
1696. Do you find your land less productive now than it was at first? No; it is quite as good as it was at first.
1697. Is your land similar to that in other parts of the district? Yes; it is similar to the country south of the Lachlan.
1698. How far from town do you live? Thirteen miles. The good country commences a mile or two from the river. The land on the river will not stand the drought like the land a few miles back. It requires a greater rainfall.
1699. What does it cost you per acre to sow your wheat? 6s. or 7s., I think, but I have never made it up. When the ground is once cleared a crop can be put in for 7s. an acre, or even less.
1700. How much a bushel will pay you? About 2s. a bushel, I think, if bought on the farm.
1701. I suppose you have had to take as low a price as that? I think 1s. 8d. a bushel has been the lowest price I have got.
1702. Does that pay you? I have never lost yet. I have always been making.
1703. Have you ever tried fruit on your land? I have a few trees.
1704. Is the rainfall sufficient for fruit? I have only had my trees in about three years, but, so far, they are doing very well.
1705. Without artificial watering? I have no water supply for them.
1706. How do you get your water? I have a well; but the water is brackish.
1707. I suppose the straw from the wheat you use for fodder? I burn all my straw.
1708. Would it not do for fodder? I daresay it would if I saved it; but I burn it to get it out of my road. It is not much good for food.
1709. Have you ever tried dairying? We milk a few cows.
1710. Do you think the country good enough for dairying? Yes.
1711. If a railway were constructed where would you look for your market? To Sydney.
1712. I believe that the people from some parts of this district send their wool to Melbourne? Yes.
1713. Do you not know why? I suppose they can get it there more cheaply.
1714. What is your nearest railway station? Carrathool.
1715. Do you send any of your wheat to Sydney? I did one year.
1716. The local miller takes all you can grow? Yes.
1717. It pays better to sell to him than to send to Sydney? It is about the same thing in either case.
1718. If a railway were constructed would you extend your farming operations? Yes; it would give me a little more encouragement.
1719. It would make it easier and cheaper for you to get to market? I would save about 5d. a bushel.
1720. And you would put stock on the land you do not use for agriculture? Yes.
1721. With a railway you would be able to get your fatlings to market? Yes.
1722. A line to Hillston would induce people to put larger areas under cultivation? It would bring land into use that is now lying waste. This waste land is a great nuisance to me, inasmuch as it is a breeding-ground for rabbits and wild dogs.
1723. Is there much Crown land about here? Yes; it is Crown land all round where I am.
1724. What is your opinion with regard to legislation to compel the destruction of rabbits? I would rather have no legislation, and allow people to fight the rabbits as well as they could. My experience is that the rabbit inspectors are almost as great a pest as the rabbits. If the ground were all held by private individuals they would kill the rabbits themselves.
1725. If there were a railway here would the land be taken up in smaller areas? Yes.
1726. That would help to keep the rabbits down? Yes.
1727. You do not believe in legislation? No.
1728. Do you think the proposed line would suit the people of Hillston? The line on the south of the river would suit them better. Such a line would serve good agricultural country.
1729. Have you heard an agitation for a railway from some other point? Yes, from Temora via Wyalong.
1730. Have you any knowledge of the country between these two points? No.
1731. Why do people advocate the extension of the line from Temora? Because we think that the country is more level and less expensive to work.
1732. Do you think it would be possible to get a more level line than that from Condobolin? An extension from the southern line would render it unnecessary to take traffic across the Blue Mountains.
1733. But supposing the country between Temora and Hillston is hilly? I think it is the same as the country from Condobolin, but I have no personal knowledge of it.
1734. Have you any knowledge of the country between Condobolin and Hillston? No; I only know the country around Hillston?
1735. Do you expect a market out west in the event of the proposed railway being constructed? I have not looked at it in that light, though you might get a market in that direction.
1736. Do you favour the extension of the line beyond Hillston? I am not in a position to give an opinion into that point.
1737. I suppose you think that what may be a blessing to the people of Hillston should also be given to other people? Yes.

Mr.
J. R. Varcoe.
16 Sept., 1896.

Mr. Thomas Cadell, Inspector of Stock, Hillston, sworn, and examined:—

1738. *Mr. Hassall.*] How long have you been stationed here? Nearly eight years.
1739. What is the extent of your district? It starts from the leasehold area of Gunbar and goes to within 5 miles of Nynagee. East and west it extends from 4 miles this side of Cudgellico to about 15 miles this side of Mossiel.
1740. What stock are depastured on that area? The average for the seven years has been 909,000 sheep, 4,000 cattle, and about 3,000 horses. Besides that there is an average of 160,000 lambs a year. There are about 1,000,000 acres of abandoned resumed areas in the district. That land, at a low estimate, will carry about 180,000 sheep. The average clip of wool for seven years has been 6½ lb. to the sheep, and for lambs 1¼ lb. About 80,000 fat sheep leave the district every year.

Mr. T. Cadell.
16 Sept., 1896.

1741.

Mr. T. Cadell.
16 Sept., 1896.

1741. Where are those sheep sent to? Sydney and Melbourne.
1742. Where are they trucked? At Carrathool and at Deniliquin. Some of them are trucked at Hay, but most at Carrathool. 2,363 tons of wool are sent away from this district yearly, and if the abandoned resumed areas were stocked, about 480 tons more would be sent. This is a sheep country. There are no cattle runs in the whole district.
1743. What is the character of the country generally? It is fairly good country except in the northern part of the district, where it is all timbered. In the southern part of the district it is mostly open plain.
1744. How much of the district is good—two-thirds? For stock-growing, about two-fifths.
1745. And the balance? The balance is timbered country. A great deal of land to the north of the river is covered with pine scrub. Of course, a great portion of the leasehold areas has been scrubbed.
1746. What is the general carrying capacity of this country? The plain country, a sheep to 2 $\frac{3}{4}$ acres; for scrubby country, a sheep to 5 or 6 acres.
1747. Has the carrying capacity of the country increased or decreased during the last seven years? It has decreased about 25 per cent.
1748. Why? Because of the rabbits and the growth of the pine scrub.
1749. Do they suffer much here from bad seasons? Yes.
1750. Is this country thickly infested with rabbits? Not at the present time. Country that has been abandoned is thickly infested; but the leasehold areas are not very thickly infested.
1751. The waste Crown lands are practically the breeding-ground for the rabbits and help to increase the pest? Yes.
1752. Do you think that legislation to compel the destruction of the rabbits would be beneficial? Yes, if the Crown were compelled to destroy its rabbits.
1753. Have you been consulted with regard to the rabbit question? I have to send in monthly reports as to the state of the rabbits in the district.
1754. Are the rabbits increasing or decreasing? They are about stationary. Just now they are breeding up, because people are shearing and cannot afford time to attend to them.
1755. Would the construction of a railway here have any effect in causing the occupation of waste land? A railway brought down on this side of the river would, I think, answer the requirements of the district.
1756. Have you any knowledge of the country through which the proposed line passes? Yes; as far as Euabalong on the northern side of the river, and as far as Lake Cudgellico on the southern side.
1757. What description of country does the proposed line pass through? Dense mallee for the most part.
1758. Is there any chance of settlement in that country? The great trouble would be to get water. The mallee country is bad holding ground, and the water found below the surface is brackish.
1759. Are there good patches? In odd places.
1760. In your opinion that country is not suitable for close settlement? No. All the wells on the northern side of the river, without any exception, are brackish and unsuitable for human beings. The mallee country especially is a bad holding ground.
1761. Do you think the expense of clearing the land will deter people from occupying it? I do not see that. A lot of the mallee country could be used for wheat-growing.
1762. But not for any other purpose? No.
1763. Are you aware that that country is locked up until 1918? That is the extent of the leaseholds.
1764. The leasehold areas, as a rule, comprise the best country? Yes.
1765. Do you think there is any possibility of a close settlement on the route of the proposed line? No.
1766. Therefore, the line would practically be running through waste land? Yes, for hundreds of miles.
1767. Do you know anything of the country beyond Moss-giel, in the direction of Menindie? No, I do not.
1768. What area of land is there available for settlement on the southern side of the river? When the leases fall in there will be over 1,000,000 acres available for settlement within 50 miles of Hillston.
1769. Do you know the country at the back of Merri-Merrigal? Yes; there is a very large area of country available at the back of that run, and at the back of Hunthawong.
1770. You know that country pretty well? Yes.
1771. Is it suitable for agriculture? Yes, with the exception of the hills.
1772. Would one-fourth of the whole area be embraced in the hilly country? It would take up 50,000 acres, I expect.
1773. That leaves an enormous area still available for settlement? Yes; over 1,000,000 acres.
1774. Do you know the country towards Temora, and towards Grenfell? No.
1775. Is the country you speak of very heavily timbered? Yes, in places.
1776. Are there any open patches? Yes; with pine scrub.
1777. Can that be easily dealt with? Yes, very easily. The cost of killing the scrub is about 1s. 6d. an acre.
1778. What is the water supply? You can get water anywhere there in tanks or wells.
1779. You can get water by sinking? Yes, at about 100 feet; but in many cases it is only fit for stock.
1780. Is it good holding country? Yes.
1781. It is different from the country to the north? Yes.
1782. There would be no difficulty in obtaining a water supply there? None whatever.
1783. You think that that country is suitable for settlement? Yes.
1784. Is it all good wheat-growing land? Yes; it is all the same right through, except the river frontages.
1785. Would a line to Hillston intercept any of the principal stock routes, and divert traffic to Sydney which now goes further south? It would intercept all the stock routes from Queensland to the Murray.
1786. Do you think it would be used to any great extent in sending stock to Sydney? That I am not prepared to say.
1787. Where do the stock go that come through here? They make to Carrathool, or, if they are going to Victoria, to Deniliquin.
1788. What cattle pass through here—stores or fats? Very few cattle come through here, because they have to pay for water at the tanks.
1789. Has the stock tax on the Victorian border had any effect in reducing the cattle trade? I think it has.
- 1790.

1790. The bulk of the stock traffic now comes to Sydney? A good deal of it does.

Mr. T. Cadell.

1791. What route would you suggest for this line as most likely to serve the district? To serve the farming industry alone, the line should be brought from Temora, though a line from Condobolin on the southern side of the river would answer the same purpose.

16 Sept., 1896.

1792. Would not the proposed deviation pass through a large amount of purchased land? No; it would pass at the back of the purchased land. It is all Crown land where it goes, except near Condobolin. I do not know anything about the country at that end. From Lake Cudgellico to Hillston, it would go through Crown land.

1793. It is a matter of choice? Either line would, I think, suit the district equally well.

1794. You do not think a line on the northern side of the river would benefit the district to any extent? No, and there would be no settlement along that line. The following is a list of the abandoned resumed areas in that district:—

	Acreage.
Cowl Cowl, resumed area	161,622
Coan Downs	232,174
Hunthawong	110,113
Merri-Merrigal	110,953
Roto	151,690
Yathong	123,100
Merri Merriwa, leasehold and resumed	46,860
Marrooba, resumed area	31,320
Willandra	27,000
Wangarou	16,100
Wangaron	15,160
South Merrowie	6,206
Aggregate abandoned areas	932,298

1795. *Chairman.*] Why do you think a line from Condobolin *via* Lake Cudgellico would suit this district as well as a line from Temora? Either route would pass through Crown lands available for settlement. There is no necessity for the line to pass through the freehold land right on the bank of the river. The further back the line comes the better it will serve any settlement that may take place. The best wheat-growing land is away from the river. In speaking of the number of stock in the district I deducted those the wool from which is sent to Cobar. The wool of about 150,000 sheep is sent to Cobar.

Mr. James Macbeth Fullerton, storekeeper, Hillston, sworn, and examined:—

1796. *Chairman.*] You have a fair knowledge of this district? Yes.

Mr. J. M.

1797. Where do you get your goods from? Sydney now, generally.

Fullerton.

1798. Which way do they come? Through Carrathool.

16 Sept., 1896.

1799. What do general goods cost you per ton from Sydney to Carrathool, and from Carrathool to Hillston? On an average goods can be landed here at £8 a ton. If you work on the truck system you get them a little cheaper.

1800. How much of the £8 is for road carriage? On an average, £3 is for road carriage.

1801. Do you distribute goods out back towards the Willandra and Mossgeil? Yes. Just now that the river is running we get a good bit of stuff from Victoria.

1802. What rebate do you get for goods from Victoria? The heaviest rebates we get are on sugar, but to get them we cannot take less than 20 tons at a time.

1803. What rebate do you get on 20 tons of sugar? £1 a ton we were paying for the last lot. We can get it landed at Carrathool from Melbourne for £3 10s. a ton; that is much the same as the truck rate from Sydney. The Railway Commissioners charge £20 a truck.

1804. How far is Carrathool from here? We call it 80 miles.

1805. You find that the freight from Carrathool to Melbourne is no less than the freight from Carrathool to Sydney? It depends upon the class of goods. The galvanised iron, wire, sugar, and salt—it is as cheap to go to Melbourne as to Sydney. General goods come more cheaply from Melbourne.

1806. What can you get from Melbourne more cheaply than from Sydney? General goods. They cost £30 a truck from Sydney, or £5 a ton. Lately they have reduced the price to £3 10s. a ton. With river insurance and taking into consideration the knocking about that goods get on the steamers it is just now about £1 a ton cheaper to get goods from Melbourne than to get them from Sydney.

1807. If the railway were brought to Hillston, would the whole of your trade be done with Sydney? It would all depend upon the freights, but if there were a line from Temora I think I could get things more cheaply from Sydney. I am strongly in favour of the Temora line, because it passes through such an immense area of agricultural land, and would bring about closer settlement.

1808. If the railway were brought to Hillston, would it control the whole of the trade of this district? Yes, and it would get a large amount of trade that now goes to Melbourne.

1809. You have no doubt about the future of this place if with proper means of communication? None whatever. I have great faith in the place, otherwise I would not have stopped here so long, or have invested so much money in it. I have been farming here for many years, and I think I am in as good a position to express an opinion as anyone. From the knowledge that I possess, and my correspondence with people looking for land, I have no hesitation in saying that I think that within five or six years the whole of the land within 20 miles on each side of the line would be occupied if a railway were brought here from Temora.

1810. Do you know the country through which the proposed line goes? Yes.

1811. What is it like? It is not much for agriculture. I have travelled a great part of the line so far as Ivanhoe.

1812. From the Willandra to Euabalong, is it unfit for agriculture? It is inferior country—dense mallee dry and ridgy in parts.

1813. What do you think of the proposed deviation? It would pass through very fair land; further out from the river the land is excellent, splendid agricultural land.

1814. How much merchandise comes to Hillston in twelve months? I could not say.

1815. What is the population of the municipality? About 400 now.

- Mr. J. M. Fullerton.
16 Sept., 1896.
1816. You regard this purely as a grain country? There is also the wool to be taken into consideration. If the railway came here the farmers would alter their system altogether. I believe a lot of them would go in for cross-breeds. This is excellent country for crops, and people would go in more for fattening stock if they could be sure of getting them away. The greater part of the wool from this district goes to Melbourne, but a railway here would intercept almost the whole of it. The greater part of the merchandise used here at present comes from Sydney.
1817. Are you able to speak definitely as to the suitability of the district for wheat growing? Yes. It is sixteen years since I commenced farming myself, and I have been at it continuously ever since. I have 640 acres, 200 of which are under crop.
1818. How many failures have you had? Only one, and then I was eaten out by the rabbits.
1819. Have there been any failures on account of the drought? There have been partial failures. If a railway were brought here large freezing works would be established, because this is on the verge of the fattening country.
1820. Hillston would be the terminus? We do not ask that Hillston should be the terminus of the line.
1821. Can you give us any authoritative information with regard to the proposed establishment of freezing works? We cannot commence operations until means are provided for getting the stuff away cheaply.

THURSDAY, 17 SEPTEMBER, 1896.

[The Sectional Committee met at the Court-house, Hillston, at 10 a.m.]

Present:

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. William Smith Arnott, post and telegraph master, Hillston, sworn, and examined:—

- Mr. W. S. Arnott.
17 Sept., 1896.
1822. *Chairman.*] How long have you been here? Eight months.
1823. *Mr. Trickett.*] Have you any statistics to produce? The number of letters posted last year up to the 31st December was 84,270, and the number of telegrams transmitted, 5,049; the revenue from the sale of stamps was £743; from telegrams, £387; from money orders and postal notes, £49; or in all, £1,179. That is a fair average of the work done for the last five years. Last year the number of deposits was 360, amounting to £4,519 15s.
1824. Has the amount of these deposits changed very much? No. Last year was a very good average year.

Mr. Robert Walter Stewart, Mayor of Hillston, sworn, and examined:—

- Mr. R. W. Stewart.
17 Sept., 1896.
1825. *Chairman.*] How long have you been here? Since 1878—eighteen years.
1826. You have a good knowledge of the district? Yes.
1827. *Mr. Fegan.*] What is the area of the Municipality of Hillston? I think it would embrace about 32,000 acres.
1828. What is your revenue? Something under £500.
1829. And your expenditure? About the same. We spend what we have.
1830. You are not in debt? We are not in debt.
1831. Have you any knowledge of the acreage under crop in this district? It is something like 20,000 acres.
1832. What is the chief crop? Wheat.
1833. Is there any other crop? Nothing worth mentioning.
1834. What is the return per acre? From 12 to 15 bushels.
1835. I suppose you have a ready market for your wheat? No; there is a surplus over and above the local demand.
1836. Where is your market? Sydney is the market which we have been trying to get.
1837. Have you been successful there? We have been able to sell wheat there, but the cost of sending it to market is more than we can afford to pay. It costs 1s. per bushel to send wheat from this district to Sydney. 1,000 acres of wheat would yield, averaging 12 bushels to the acre, 333½ tons. That, at 5d. per bushel, if sent to Sydney, would give a return to the railway of £250. The same area—1,000 acres—under sheep, allowing 5 acres to the sheep, would carry 200 sheep, and they would yield, averaging the fleeces at 6½ lb., 1,300 lb. of wool, or a little more than half a ton. That, if sent to Sydney by railway, would give a return of something less than £5 a ton.
1838. How many acres of grazing land are there in this district? Yesterday it was stated that there were something like 1,000,000 sheep in the district, and if we allow 5 acres for the sheep that would give 5,000,000 acres of grazing land. If the railway were brought into this district, however, I think we should take wool off more than 1,000,000 sheep, although I take that number as the basis. Estimating that 100,000 of these sheep will be sent away as fat stock, and allowing 6½ lb. as an average fleece, there will be something like 2,600 tons of wool from the 900,000 sheep that are left. This wool at the present time costs us £6, £7, and £8 a ton to land in Sydney, according to the distance which it has to travel; but, supposing the freight by rail was £6 a ton, that would give a return to the railway of £13,000. Now we pay £8 per truck to send sheep from Carrathool, and it costs us £1 a hundred to send them to Carrathool. Instead of driving them over dry roads in hot weather, we would rather pay £1 a hundred extra to the railway, that would mean for 100,000 fat sheep £9,000 revenue. In order to show the probable revenue that would be derived by the line, I have worked out certain figures which might be made larger, but which, even if they are decreased, will still show a handsome income. I take 1,000,000 acres of land as the area that could be made available for close settlement, and better land is not to be found in New South Wales. The exact

exact area would be 1,600,000 acres. That is the area of land lying within 10 miles on each side of a line from Temora to Hillston, a distance of 130 miles. This country is valued by the Crown for homestead selections at from 7s. 6d. to 15s. an acre; but with a railway its value would be restored to £1 an acre. That would mean a revenue to the Crown of £12,500 in deposit money alone. After five years the Crown gives a certificate, and the payment is doubled, which would make the annual revenue £25,000. If from half this area 12 bushels of wheat an acre were obtained, there would be 6,000,000 bushels of wheat to send to the Sydney market. That, at 5d. a bushel, would give to the railways a return of £125,000. Yesterday witnesses were asked where people would come from to take up this land. They are coming from Victoria and renting land on the halves system.

Mr. R. W.
Stewart.
17 Sept., 1896.

1839. Has any land been worked on that system in this district? No. The Government are giving us land on more advantageous terms than we have had before, so we are not reduced to these straits; but when land is thrown open there is a perfect rush for it, and it has to be allotted by ballot. The Victorians have complained that they are at a disadvantage under this arrangement, by having to ballot against single men whose fathers already have land in the district. The Minister has asked leave to introduce a Bill to provide what I may call special legislation to deal with these cases; but there is no necessity for that. A railway to this district would open up what will be eventually the granary of New South Wales. People from Victoria will be able to obtain land here such as they cannot get in their own Colony. I think that the line as shown on the map is very absurdly placed. If the object is to get to Broken Hill, it can be seen at a glance that the line should go from Cobar. A line coming here should come from Temora. With regard to the deviation, I admit that it would serve the present population, but that is very small. The northern route skirts the best of the grazing country, while the deviation skirts the agricultural country. You could get into good agricultural land coming from Greuffell; but a line from Temora would come through the middle of it. I have travelled over the country between Hillston and Yalgogrin, which is halfway to Temora, and I know it to be good agricultural land, because I have seen the crops obtained from it.

1840. Is it plain land or hilly country? It is undulating country. There are some hills, but the area is not very much reduced by the hills. There would be no difficulty in constructing a railway there, because Providence has left gaps for the purpose. Water, too, is easily obtained. I know places where you can dip it up from the wells from the surface.

1841. What kind of timber is there? Various kinds—pine, belar, box, wilga, and mulga. The timber is pretty thick in some places, but there is a good deal of nice open country. At one time it was all open; but the pine has overgrown a good deal of it. The pine country is, however, easier to clear, and when once cleared it is always clear. There is a stock route across, and after a flock of sheep has travelled over, carrying with them grass-seed, I have noticed the same pasture in places there as we have here. I consider that the construction of a railway would so encourage population that the rabbits would soon be effectively dealt with. The country has spent enough upon rabbit inspectors and in paying for scalps to build half-a-dozen railways; but population is the only thing that will effectively cope with the rabbits. I spoke about 1,000,000 acres being taken up for agricultural purposes, but it must also be remembered that the construction of a line would encourage the taking up of land, and no doubt improvements would be effected in work done upon resumed areas that are now abandoned. With a railway, I do not think we should have any unemployed, supposing men were willing to work.

1842. You have travelled 70 miles from Hillston southward? Yes.

1843. That is all good agricultural country? Yes.

1844. And there is fair water and good pasturage for sheep? Yes.

1845. Do you not think that Broken Hill should be connected with the railway system of this Colony? I do not say that it should not; but I do not know why the railway should go to Broken Hill.

1846. What is the population of this town? About 500.

1847. Do you know the population of Broken Hill? It might be 5,000, or it might be more. I know it was very large some time ago.

1848. Do you not think that a large population like that should be offered the same facilities as the people of Hillston are asking for? I have no objection to their having a railway, but the line will have to run through very inferior country to get there.

1849. Do you think that if a line is taken to Broken Hill that will keep back the Hillston line? I do not think so. I think that a line could be taken from Temora to Broken Hill.

1850. Do you think that a line from Hillston to Broken Hill would pay? A line from Temora to Hillston would pay.

1851. Do you know the country about Grenfell? Yes; I was there for two or three years. I do not know Temora, but I know Cootamundra.

1852. You do not know the country between Temora and Yalgogrin? No.

1853. Is the country through which you travelled, 70 miles south from Hillston, as easy for railway construction as the country between here and Condobolin? Yes.

1854. You say it is all Crown land? Yes.

1855. Has it ever been thrown open for selection? Not specially.

1856. What is your reason for thinking that if a railway were brought to Hillston there would be a rush for land here? Because in the mere hope of a railway applications are to be made for 70,000 acres.

1857. Is land likely to be thrown open in this district soon? There are 30,000 acres which it is intended to offer, and not one acre will be left after the first Lands Office day. People are hanging back until they hear what the decision will be in regard to the railway. When people say to me "I shall want 40,000 acres of this land if it is decided to make a railway," I know that the land will be taken up.

1858. Is it a fair statement of the case that the complete earnings of the line from wool will be £13,000 a year? I think it is absurd in the extreme to attempt to say what the return will be. I do not think the Commissioners' estimate is a fair one. I can give a pretty fair idea as to what will happen, taking certain figures as a basis, but I would not fix the return at £20,000, or at £100,000.

1859. You think the figures you have given are more correct than the estimate of the Railway Department? I think they are more likely to be right.

1860. What kind of soil is there from Hillston 70 miles south? Good red loamy soil, and soil that has been well tested. I have taken notice of these things for fourteen or fifteen years, and I understand farming.

Mr. R. W.
Stewart.
17 Sept., 1896.

I have had experience in it for over twenty years, and I suppose I have been connected with it for nearly fifty years. The soil is of a lasting character, and when thirteen or fourteen crops have been taken off it the last crop is as good as the second. I know one place where the land was taken up in 1868 that has since been cropped at least twenty times without ever having been manured.

1861. Have you any idea of the rainfall here? Seventeen or 18 inches. The route from Temora to Hillston has been surveyed.

1862. When? Some years since. They have been over it two or three times.

1863. Have you had to fight the rabbits during your time? Yes. We not them off and kill them within the enclosure.

1864. Are you in favour of legislation compelling land-holders to cope with the rabbit pest? Yes; and I know that the district generally is favorable to such legislation, because at a meeting of the Pastures and Stock Protection Board I was instructed as a delegate when going to Sydney to advocate compulsory destruction and simultaneous action.

1865. For what reason? If one man fences in his holding with wire netting he should not be damaged by the action of a neighbour who allows his rabbits to breed. The rabbits are one of the most damnable pests we have.

1866. Have many holdings been thrown up here? Yes; there are millions of acres in the resumed areas.

1867. Is the land good? Yes; but there is not enough encouragement to keep the rabbits down. If wool were 1s. a lb. I think they would be kept down.

1868. Has any land been given up because of the distance from market? Land has not actually been given up. People are hanging on to it in the hope of something turning up; but they have had to run into debt, so that the land is almost as good as given up. People cannot live upon it.

1869. Do you know anything about the probability of meat-freezing works being established here? I have heard a man say that it would be done, and that he would do it. I think that he is a man who generally does what he says, and I know that he would find the means.

1870. Where are they to be established? Here is a place for them. We happen to be very centrally situated here between the pastoral and the agricultural country.

1871. Where would the stock come from to supply these freezing-works? From the country on the northern side of the river. It is all good fattening country.

1872. *Mr. Trickett.*] The route which we are considering has been proposed as a line midway between the Cobar and the Hay line. The Commissioners urge that it would serve country lying between these two lines which is not at present served? The proposed line would leave the pick of Riverina lying to the south of it, so that the trade of Riverina would still go to Melbourne.

1873. The Secretary to the Railway Commissioners urged that the land on the banks of the Lachlan was the best country to be served? I do not agree with that in an agricultural sense.

1874. You think that the country between Temora and Hillston is much better for agriculture? Yes.

1875. You spoke of the country 10 miles on each side as likely to be served by the proposed line;—do you think it would pay people to send their produce a greater distance than that? Yes. At the present time we have given £1 an acre for land about here; but owing to the representations that have been made as to the difficulties of transit, the Crown has been willing to reduce the price, and land is now available at 7s. 6d., 10s., and 15s. an acre. If there were a railway here, I think the value of £1 an acre would be restored to the land, because you could grow wheat here, and the land would then be worth the money.

1876. But the expensive improvements that are now necessary would be equally necessary if you had a railway? They might be necessary, but men do not mind spending money upon improvements if they can get a return for the expenditure.

1877. What do you put down as the expense of cultivating a 640-acre block? I think that to make a start here a man would want £300 or £400. It takes £50 a mile to fence this land. Yesterday a witness stated that he could grow wheat at 1s. 8d. a bushel; another witness stated that he could grow it at 2s. a bushel; and a third witness that he could grow it at 2s. 6d. a bushel. All were perfectly correct, but one man happened to have 1,000 acres in, and he roughs it a bit, while a good deal of his land is open country and ready for the plough. Another man takes up a scrub lease; he knows that the land is good, but he knows the expense of clearing, and therefore he wants a little more for his wheat. With regard to the inwards tonnage of Hillston, Mr. Fullerton imports 620 tons per annum, and I estimated the other places do about the same. The cost of carriage averages about £7 a ton.

1878. From how far out west would the railway draw in the traffic? From Mossgiel and Ivanhoe.

1879. But in good seasons, when the river was up, the trade would always go to the river far west? Yes; but most of the northern country would send here if the railway came to Hillston.

1880. You do not think that the proposed railway would be the great draw that the Commissioners contemplate? No; it only skirts the good country.

1881. Do you think that the traffic would continue to go to the main line centres? Yes.

1882. What is the total tonnage here? About 1,200 tons. I think we pay £3 6s. 8d. between Hillston and Carrathool.

1883. Do people suffer much inconvenience in getting to the railway, or is the road a good one to travel? The roads are fair, but far.

1884. You made some reference to the halves system? The Victorians are renting land from the squatters and growing wheat upon terms. They give the holder of the land so much, and keep so much; but it would pay them better to take up Crown land. They would not continue to be the tenants of private people if they could get Crown land.

1885. *Chairman.*] With what place do the people of Grenfell want to be connected? At the time I was there there was an agitation for a connection with Cowra.

1886. What is the country like between Grenfell and Cowra? It is pretty rough.

1887. Would it be a heavy line to make? Not a very heavy line.

1888. What is the country like from Grenfell to Young? It is very similar. There is some nice agricultural country between Grenfell and Young. It is not so rough as from Grenfell to Cowra.

1889. What is the country like between Grenfell and Forbes? It is really good land. I have ridden over it.

1890. Your knowledge of the country appears to be limited to a line west from Wyalong? Yes. My knowledge extends to a distance of 70 miles east.
1891. You do not know the country between Temora and Wyalong? No.
1892. Wyalong lies pretty well west of Grenfell, and if there were an easterly connection from Hillston we should have to consider whether it would be better to go easterly to Grenfell or south-easterly to Temora? Yes. I cannot tell you anything about the country between Grenfell and Wyalong.
1893. One hundred and thirty miles of new line at £2,200 a mile would cost, roughly, £300,000? Yes.
1894. The area of country within 20 miles of such a line would be about 1,500,000 acres? Yes.
1895. Four per cent. on £300,000 would be £12,000 a year? Yes.
1896. That would be something over 1d. per acre for the total area benefited? Yes.
1897. Do you think the rent could be increased to the extent of 1d. an acre if the line were made? I certainly think so.
1898. What does a conditional purchaser pay for land close to a railway? Anywhere now he has to pay 2s. per acre deposit.
1899. What is the average rent of conditional leaseholds? 1½d. per acre. All the people round here have been paying 2d. If the rent is fixed at 1½d. or 1¼d. they consider themselves pretty well off.
1900. Can you tell us what the selectors pay for their conditional leaseholds in other parts of Riverina, where the land is similar to this, and within 10 miles of a railway? They pay as high as 3d. and 4d. an acre. In many places they are paying 3d. an acre and are using the land for grazing.
1901. They could pay more than that if they were using it for agriculture? Yes. I know land for which rent is paid for grazing which has been assessed at 3d. an acre.

Mr. R. W. Stewart.
17 Sept., 1896.

Mr. William Cowley, Government Land Tax Assessor, Hillston, sworn, and examined:—

1902. *Mr. Hassall.*] Have you been assessing the land in this district? Yes.
1903. For how long? For the past two months.
1904. What is your opinion as to the value of the land here? It varies considerably.
1905. Are you assessing its value for grazing purposes only? For grazing and for agriculture. I am simply assessing the purchased land and the land in course of alienation.
1906. What is that land suitable for? The land on the northern side of the river is almost all pastoral land.
1907. And likely to remain so for some years to come, because of the tenure? Yes.
1908. What about the land on the southern side of the river? From 15 to 20 miles to the south of Hillston there is a good deal of agricultural land.
1909. Have you had any experience in valuing land in other parts of the country? No; but I have had a good deal of experience in working land.
1910. How does this land compare with land similarly situated in other portions of the Colony? There is a great deal of land south and south-east and east from here which is very suitable for wheat growing.
1911. What would the waste Crown land in this district be worth if it could be utilised for agricultural purposes,—what rental could you fairly ask for it? The value would be considerably increased if the land were within reasonable distance of a railway.
1912. Supposing there were a prospect of the railway coming to the district? I think that a good deal of land would be worth from £1 to 25s. an acre.
1913. You think that the rental could be based upon a capital value of from £1 to 25s. an acre? Yes; speaking with regard to a great part of the land.
1914. You think that the land in this district would be taken up if railway communication were afforded? Yes.
1915. Do you think that settlement would increase here? Yes; there is a good deal of land available which would be taken up.
1916. By whom? I could not say where the people would come from; but I believe that the land would be taken up if there were proper facilities for getting the produce away.
1917. You have no knowledge of the intention of Victorian or South Australian farmers to come here? No.
1918. If the line were taken on the northern side of the river, would that add to the value of the land on the southern side? Not a great deal, because the people here would not be much nearer the line than they are now.
1919. The only way to develop this country would be to construct the railway either from Grenfell or Hillston, or from some point on the southern line running on to Hillston? Yes.
1920. Do you think the proposed deviation would be of any great advantage to the district? I dare say it would.
1921. Not so much as a connection by another route? It would not pass through such good farming land.
1922. You think there is a larger area of good farming land between Hillston and Temora or Grenfell than in the direction taken by the proposed line? Yes; there is a very large extent of farming country between Temora and Hillston, though there is a piece of that country that I have not been over.
1923. Have you been over the country west from Hillston? Yes, for about 40 miles.
1924. Is that country equally good? That is the pastoral country.
1925. The agricultural country extends south and east from here? Yes.
1926. There is a very large area of land available which would be taken up if better means of communication were afforded? I think so.

Mr. W. Cowley.
17 Sept., 1896.

Mr. Arthur Caldwell Sawtell, sergeant of police, Hillston, sworn, and examined:—

1927. *Chairman.*] What are the boundaries of your district? It includes Lake Cudgellico, Euabalong, Mount Hope, Gilgunnia, Gunbar, Mossgiel, and Ivanhoe.
1928. What is the distance between Euabalong and Ivanhoe? Roughly speaking, about 150 miles.
1929. What is the distance from Mount Hope to Gunbar? 120 miles.
1930. How many people are there in this district? I should think there are 900 in Hillston, and I would allow 300 for every other town; but I could give you no idea as to the number of people on the stations.

Mr. A. C. Sawtell.
17 Sept., 1896.

- Mr. A. C. Sawtell. 1931. Do you know the country along the route of the proposed line? I know Mount Hope, Ivanhoe, Wilcannia, and Silverton.
- 17 Sept., 1896. 1932. How does the country east from the Willandra and Mount Hope, going towards Condobolin, compare with the country from Hillston east? It is not nearly so good for agricultural purposes.
1933. Do you know the country between Hillston and Grenfell? No; I only know the country for 40 or 50 miles in that direction. That is all good land. It is better than the country to the north.
1934. How would you describe the land to the north? It is pastoral country, and scrubby in places, with mallee.
1935. You have no doubt that it is inferior to the land lying east and south-east of Hillston? I have no doubt about it. It strikes me as anomalous to run a line across to Broken Hill, seeing that federation is in the air, when Broken Hill is only 200 miles from Port Pirie. With regard to the settlement of the country about Hillston, I believe that there is a great exodus from Victoria here. I base that opinion upon what I have seen at Jerilderie. The land here is not quite so good as at Jerilderie, but there is more of it available. Nearly all the land in the Jerilderie district has been alienated.
1936. Is any of the land there leased? Some of it is leased under the new homestead leasing system at 6d. per acre.
1937. Is it readily taken at that? Yes. Its capital value is assessed at £2 an acre.
1938. How far is it from Jerilderie? Out towards Berrigan. About Berrigan they are asking £3 an acre for land.
1939. What area do they hold for farming purposes down Berrigan way? 640 acres is considered a large area for a farmer. 320 acres is, I think, ample there.
1940. 640 acres would be ample here? I think so.

Mr. Samuel Nixon, farmer, Gunbar, sworn, and further examined:—

- Mr. S. Nixon. 1941. *Chairman.*] I understand that you desire to make a statement to the Committee? I may state that during the summer months I have been appraising special areas on the Murray, and I have had many opportunities of speaking with people inquiring for land. I have spoken to them of this district, and its capabilities, but they say they have an objection to coming here because of the distance from market. At that time there was some agitation for a line, but there was great uncertainty as to whether it would come here. I am satisfied that if people knew that a line was to be made here, they would come in large numbers.
- 17 Sept., 1896. 1942. And they would be willing to pay rent for the land? Yes. This land would be readily taken up at a capital value of about 17s. 6d. an acre. That would be its value from an agricultural point of view if a railway were constructed. Without a railway it is valueless. It costs about 6s. an acre to get your wheat to market, so that you cannot cultivate here to any advantage. About Gunbar we are paying from 2½d. to 3d. an acre rent.
1943. Is the land similar to this? Yes.
1944. How far is that from Carrathool? Forty miles.
1945. Is much land available at Gunbar? No; there is no land available at the present time.
1946. Could the land all be leased for 2d. or 3d. an acre? Yes, readily.
1947. Is it reasonable to suppose that if a railway were brought here land could be leased at a fairly high price? I think it could be leased for 3d. or 4d. an acre. That is land within 10 miles of the line.

Mr. Thomas Cadell, Inspector of Stock, Hillston, sworn, and further examined:—

- Mr. T. Cadell. 1948. *Chairman.*] You have a statement to make with regard to the rainfall of this district? Yes. The average rainfall at Lake Cudgellico for eleven years has been 19.48 inches; at Hillston for eight years 17.72 inches; and at Gunbar for four years 19.31 inches. If the line were brought through what we know as Munya Gap, 20 miles east from here, through which a line has been surveyed from Temora, 500,000 acres of Crown land suitable for wheat growing would be served. The country between it and the Cudgellico Range is almost dead level.

FRIDAY, 18 SEPTEMBER, 1896.

[The Sectional Committee met at the Court-house, Hillston, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Robert Walter Stewart, Mayor of Hillston, sworn, and further examined:—

- Mr. R. W. Stewart. 1949. *Chairman.*] I understand that you desire to supplement the evidence which you gave yesterday? I wish to supplement my evidence with regard to the present position of the Hay line. For some considerable time, owing to the fact that from Narrandera to Hay the line passes principally through pastoral country, and runs parallel to a navigable river, that railway has not been paying, but lately the business has increased, and the line is now regarded as a paying concern. Companies owning sheep and wool in the district are entering into business relations more with Sydney than they have done in previous years, and both wool and fat stock are being sent to Sydney. For one man alone I paid £368 for trucks. That was in the month of August, and before October is out I shall have to pay another £160. He is a small man.
- 18 Sept., 1896. 1950. *Mr. Trickett.*] What do you call a small man? He is a homestead lessee. I have sent away some 7,000 sheep for him. He has more than 10,000 acres. The sheep do not cross into Victoria now because of the stock tax. I do not know of any sheep having gone to Victoria for the last two years.

1951.

1951. *Chairman.*] Because of the stock tax? Yes; and because the price of sheep in the Sydney market is improving.

1952. Can you tell us the cost of freight from Hay to Melbourne and from Hay to Sydney? It costs us 4s. 6d. to land a sheep in Melbourne from here, but we can land sheep in Sydney for 2s. 2d. each.

1953. What does it cost to drive them from Hillston to Carrathool? £1 a hundred if the number is large. That comes to 2½d. a sheep.

1954. If the railway came here you would be able to send your sheep to Sydney for 1s. 10d. each? Yes; but we would send by rail, even if the rate were as high as it is now, rather than drive the stock to Carrathool.

1955. *Mr. Hassall.*] Was the country the Committee were taken to see yesterday afternoon a fair sample of the country for some distance round Hillston? Yes. I suppose for 30 miles south and 70 miles to the east the country is the same.

1956. The Committee saw several farms yesterday;—I presume that the other farms in the district are similar in character? Yes; they are all good.

1957. *Chairman.*] Is there anything further you wish to add? With regard to Mr. Cadell's evidence, although the area referred to by him embraces a larger area than that under his control, a line to Hillston would obtain wool from other parts of the district besides its immediate neighbourhood. Gunbar is only 30 miles from here, and we would get that wool. We would also get wool from as far as Uabba and Merri-Merrigal.

1958. *Mr. Fegan.*] What timber have you here? Pine, principally.

1959. What is it used for chiefly? For building purposes almost entirely.

1960. Is there any timber about here which is fit for railway sleepers? Timber suitable for that purpose is not plentiful very near to Hillston; that is, if gum is required.

1961. Pine would not make good railway sleepers? No. It is good lasting timber in the ground; but it will not stand being spiked.

1962. How much per 100 feet is pine sawn at? Dressed, from 12s. to 13s., and in the rough for as little as 7s.

1963. Are there any saw-mills about here? Two.

1964. Are they doing a good business? There is always as much wanted as they can cut.

1965. Personally, you are not interested in the trade? No.

1966. How much timber is cut in the year? I could not say. The rate for wool from Carrathool to Sydney is £3 13s. 4d.

1967. *Chairman.*] What is it to Melbourne? I have heard that it is £3 15s. a ton.

1968. I suppose they are both cut rates? Yes; they are not always fixed.

1969. *Mr. Fegan.*] Can you give the Committee an estimate of the cost of making a close pine fence? That pine fencing—stubbing it is called—is dear fencing, and costs from £56 to £60 a mile. It is not so lasting as wire fencing, because the young timber rots and requires renewing. It would last about ten years, whereas the life of wire fencing might be taken as twenty years.

1970. It is not so good as wire fencing? No. It is not very substantial. It leans sometimes, and then the rabbits can get over it or through it. Wire-netting is much cheaper than it was. It can be landed here and erected for from £32 to £35 a mile, while the fence would cost about £25 a mile, making the total cost £55 a mile.

1971. *Chairman.*] The rate from Hay, per ton, is £3 11s. 7d. for dumped scoured wool, £4 3s. 9d. for undumped scoured wool, and £3 4s. for greasy wool? Not much undumped wool would be sent, except by small holders who have not the means of dumping it. New South Wales would be placed in a splendid position, as far as competition with Victoria is concerned, if there were a railway to Hillston. It is estimated that it now costs from £7 to £8 a ton to land the wool at either capital, and if the railway could take it from here for £5 10s. or £6 a ton there would be not only the saving in freight, but the saving in time and less risk. They will not have to cut the rates when the railway comes here. With regard to the land tenure in the Western Division, 10,240 acres is the maximum area of a homestead lease. 1d. per acre is paid as a deposit upon application, and the rent is then appraised by the Board.

1972. What is the usual rent charged? From 1d. an acre upwards. Across the river the rent is as high as 2d. an acre. The minimum area of a homestead lease is 640 acres. In the Central Division 640-acre blocks have been taken up as homestead selections, and they are let at a capital value of £1. If you comply with certain conditions—that is, if you fence or put up a house and live on the land yourself you pay 1½ per cent. on the capital value for the first five years, and at the end of that time you are entitled to a grant, and you pay a rental of 2½ per cent. upon the capital value of the land. A deputy pays 2½ per cent. on application.

1973. What would be the actual rental for the first period? About 3d. an acre.

1974. What about the scrub leases? The scrub leases run for ten years, with conditions and tenant right of improvements, and an extension of eighteen years can be obtained by asking for it.

1975. What do those lessees pay? The rent is fixed by appraisal. Some pay 1½d. per acre, and others less. With regard to conditional purchases—in the Central Division it is usual to apply for 640 acres, and to take three times that area as a conditional lease, but there is nothing to hinder anyone from applying for the whole area as a conditional purchase, because he has a right during the term to make the whole area a freehold. The conditional lease runs for twenty-eight years.

Mr. James Macbeth Fullerton, storekeeper, Hillston, sworn, and further examined:—

1976. *Chairman.*] I understand that you wish to add to your evidence? Yes. With regard to the carriage of goods, there is at the present time an advantage of £1 a ton in favour of Melbourne. That is for general goods. The wool traffic is worked by rebate.

1977. When wool is at Ulay, how much cheaper is it to send it to Melbourne than to send it to Sydney? At present there is a cut-throat rate, and it seems to me that if you had a good quantity to send you could pretty well make your own terms.

1978. Do you think that at Hay the Victorian people can beat the New South Wales railway system? Certainly not, if our railways were working on proper lines, which they are not doing. We have practically only one agency now to take charge of goods—Messrs. Permewan, Wright, & Co. 1979.

Mr. R. W.
Stewart.

18 Sept., 1896.

Mr. J. M.
Fullerton.

18 Sept., 1896]

- Mr. J. M. Fullerton. 1979. What do they charge to take goods to Melbourne? I could not tell you.
1980. We are informed that they charge £7 10s. per ton? A great deal less than that.
1981. £2 15s. a ton from Hay, and 5s. commission? It can be done for less than that.
- 18 Sept., 1896. 1982. What does it take to send goods from here to Sydney through Hay;—we are informed that it costs £8? The down rates are much cheaper than the up rates.
1983. What is a fair ruling rate? They do not charge commission to Melbourne. I could land wool in Sydney for £5 10s.
1984. If the railway were extended to Hillston, would there be any chance of wool paying £7 10s. a ton, and still going to Melbourne? No; the wool would go to Sydney then.
1985. What wool would go to Sydney if the line were constructed? Wool would go from Cowl Cowl, 20 miles down the Lachlan.
1986. The railway would serve an area bounded by a line extending from Cowl Cowl in a westerly and northerly direction past Ivanhoe, and then in a northerly and easterly sweep towards Gilgunnia; thence the boundary would come south-east to Mount Hope, and down to the Willandra Billabong? Yes; I feel thoroughly convinced of that.
1987. How many sheep are there in that area? I do not know; but there must be nearly 1,000,000.
1988. *Mr. Fegan.*] What is your opinion about compulsory legislation in regard to the rabbit pest? I would be in favour of it if the Government made itself liable for the rabbits upon Crown lands. It is a very annoying thing when you are killing your own rabbits to see other people allowing theirs to breed.
1989. What does the destruction of rabbits cost you? Last year it cost me £73 on a 10,240-acre block.
1990. You would be against compulsory legislation if the Crown were relieved of its responsibilities? Yes.
1991. Any compulsory legislation must apply to the Government? Yes. There should be no exemptions at all.

Mr. Thomas Cadell, Inspector of Stock, Hillston, sworn, and further examined:—

- Mr. T. Cadell. 1992. *Chairman.*] You heard the last witness describe the area which he thought a railway to Hillston would serve;—does it approximately cover the distance over which you exercise control? It is a little larger than that district.
- 18 Sept., 1896. 1993. How many sheep do you estimate that there are within that area? About 1,000,000.
1994. How many fat sheep would be likely to come off that country yearly? 70,000 to 80,000. It takes in a considerable area of good country.
1995. Would they use the railway at Hillston? Yes; they would come to Hillston if there were a railway here.
1996. Would the wool come here? Yes.
1997. Do you think that a railway to Hillston would beat the Victorian railways? That would depend upon the rates charged. On the Cobar line they charge extra rates, while others are charged special rates in order that they may send their wool in that direction.
1998. What is the freight from Hillston to Carrathool? About £3 a ton.
1999. If the Victorian and New South Wales railway systems are fighting at Hay, it stands to reason that if you save £3 a ton the New South Wales system will have an advantage to that extent? Yes.
2000. Would the New South Wales system be able to hold its own at Hillston? Yes.

Mr. Frederick Milthorpe, near Lake Cudgellico, sworn, and examined:—

- Mr. F. Milthorpe. 2001. *Chairman.*] Where do you live? Near Lake Cudgellico.
- 18 Sept., 1896. 2002. Do you know the country from Lake Cudgellico to Grenfell? I have been through it. I know more about Lake Cowal.
2003. What is the country like between Marsden and Grenfell, passing to the south of Lake Cowal? Grey box country—very good country.
2004. Is that what they call the Bland country? Yes.
2005. What is the country like from Grenfell, past Wooyeo, Marsden, Rankin's Springs, to Hillston? Grey box, hilly country. The great proportion of it is good, but there are some barren hills.
2006. Is it fairly level? No, a good deal of it is hilly.
2007. From Wyalong to Grenfell, what is it like? It is hilly for about 30 miles. Then you get on to good country.
2008. What is the first 30 miles from Wyalong east? Grey box and pine. It will grow wheat, but it is a bit quartzly.
2009. What is it for the rest of the way? It is hilly—passable country.
2010. Is the country between Wyalong and Grenfell better than the country between Wyalong and Temora? It is pretty much the same. The Bland country is better country than the Temora country.
2011. Do you think a line from Grenfell to Wyalong would tap better country than a line from Temora to Wyalong? The country is very much about the same. I do not see that it is any better.
2012. Where do the Grenfell people want the railway to come from? I cannot say.

Mr. George Milbourne Marsh, acting Crown land agent, Hillston, sworn, and examined :—

2013. *Chairman.*] I understand that you have some information to give us with regard to the tenure of land here? I have some information which may prove of interest to the Committee. The following table shows the number of applications for land for some years past :—

Mr.
G. M. Marsh.
18 Sept., 1896.

<i>Homestead leases.</i>					
Year.	No. of applications.			Area applied for.	
1890	24	141,718 acres.
1891	5	29,955 "
1892	6	22,324 "
1893	5	16,644 "
1894	5	14,508 "
1895	2	8,100 "
1896	3	10,800 "
					244,049 "
<i>Homestead selections.</i>					
1895	6	3,527 "
1896	6	3,840 "
					7,367 "
<i>Settlement leases.</i>					
1896	2	4,748 "
<i>Conditional purchases.</i>					
1893	1	320 & C.L. 960 acres.
1894	1	45 135 "
1895	3	464 450 "
1896	2	140 1,220 "

2014. What is the price of the conditional purchase land? £1 an acre. There are a few special areas here.

2015. What is the maximum area of the conditional purchases? 2,550 acres.

2016. And of a homestead lease? 10,240.

Mr. William Shakespeare Hook, farmer, near Hillston, sworn, and examined :—

2017. *Chairman.*] What area of land have you? 500 acres.

2018. How much have you under wheat? 150 acres under wheat and 30 under barley.

2019. What do you propose to do with your wheat? I will send it to Sydney.

2020. How? By road to Carrathool and then by rail.

2021. What will it cost you to get it from where you are to Carrathool? From 1. 6d. to 2s. a bag. That is what I have been paying.

2022. What would it cost you to bring it to Hillston? Not very much.

2023. How does wheat do here? It grows very well, so far as I have seen.

2024. What has been your return in the past? The highest return I have had is 32 bushels to the acre. That was from 50 acres on the farm on which I am now living.

2025. What kind of country is it? Pine country, with sandy soil.

2026. Is there much soil of this kind about the district? Any amount of it. It is timbered country, but the best you can get after it is cleared. I had 80 acres under cultivation, but part of it was older land, and was sown later. It gave me 20 bushels to the acre. The 32 bushels to the acre came off new land.

2027. Do you know the country going towards Temora and Grenfell? Yes, for about 50 miles.

2028. Is not that land pretty well as good as yours? After you go about 30 miles from here you get into the ranges, the land between here and there is as good as mine. The land in between the hill is almost superior to the land here, because it gets a considerable amount of rain from the hills, and a good deal of stuff is washed down on to it.

2029. Do you think a great deal of this land will be taken up when there is a railway here? I am positive of it.

2030. Is there anything else you would like to tell us? I am in favour of compulsory rabbit destruction, and more especially do I think the Government should be compelled to kill their rabbits. I have had a very bad neighbour in the Government for years.

2031. At what can you grow wheat? I think it would pay fairly well at 2s. 6d. a bushel, taking one year with another. I have only had one failure of crop for fourteen years. Except in that year I have always made my expenses.

2032. Where did you come from? Heathcote in Victoria.

2033. Would you as soon grow wheat here as at Heathcote? Yes; you can grow as good, if not better, crops here than where I came from.

2034. What is the wheat-growing land at Heathcote worth? At that time wheat was worth 2s. 6d. a bushel. The land was taken up at £1 an acre; but now it is worth £10 an acre. It is used now principally for dairying.

2035. You cannot tell us what is the capital value of the wheat land in Heathcote? No.

2036. Can water be obtained all over this country? On this side of the river you can get fresh water almost anywhere you sink. It may be deep, but it can be got, and the soil makes good holding ground. I have a well 110 feet deep, and there has been 90 feet of water in it for the last seven years.

Mr.
W. S. Hook.
18 Sept., 1896.

SATURDAY, 19 SEPTEMBER, 1896.

[The Sectional Committee met at the homestead, Roto Station, at 7.30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Thomas W. Hyndman, book-keeper, New Zealand Loan and Mercantile Agency, Roto Station, sworn, and examined:—

- Mr. T. W. Hyndman.
19 Sept., 1896.
2037. *Chairman.*] What is the area of this run? The leasehold area is about 155,000 acres, and the resumed area about the same.
2038. Are you doing anything with the resumed area? Nothing whatever. It has been thrown up.
2039. How many homestead lessces are there on Roto? None.
2040. What about Willandra Station? That is held mostly under pastoral and homestead lease.
2041. How many homestead leases are there? Four or five.
2042. The rest is within the leasehold area? Yes.
2043. West from that is North Merrowie? Yes.
2044. How many sheep are there on Roto at present? About 22,000.
2045. You have had more than that at times? Yes; we have shorn up to about 60,000.
2046. What is your average carrying capacity? Since 1890, we have not shorn more than 22,000.
2047. How is that? The land will not carry more.
2048. How do you account for that? By the presence of the rabbits, and the drought.
2049. You have not stocked up again since the bad seasons? No; we could not carry more. We would carry more if we could.
2050. Do you know the proposed line as surveyed by the Department? I know approximately where it comes through Roto.
2051. Can you describe the country passing in an easterly direction from Roto to the western boundary of Uranaway? Yes; it is all good country. That is about the edge of the good country. None of that land is inferior.
2052. What is the country like on Uranaway? The greater part of it is inferior.
2053. What about Gunninguldrie? I have described that as fair.
2054. What about Roto north-east? Bad; it is mostly all mallee.
2055. What about Murrin, north of the line? It is principally covered with small scrub, such as salt bush.
2056. What is the soil? Very good.
2057. What is the soil of Roto north-east? Sandy, with mallee.
2058. What is the country like at the back of Booheroi? That is beyond my knowledge.
2059. You see the line marked "A. B." on the plan—north from that what is the country like? From Coan Downs south towards our northern boundary the country is mostly dense mallee.
2060. Will you describe the country extending 20 miles north of the line A B? All the southern end of Coan Downs is dense mallee. On the edge of Marooba you come on to a dense sheet of mallee, then you come into more open country again.
2061. What about Tara? I think that all of Tara is good country. There are belts of ranges with nice open flats, though last time I was there the pine was springing up pretty thickly.
2062. What kind of soil is the southern part of Tara? Sandy.
2063. Is it good agricultural land? I think so, for wheat or anything like that.
2064. What is Dine Dine like? That is all good country; it used to be cattle country.
2065. Has the mallee belt run to the boundary of Coan Downs and Tara? Yes.
2066. Where does it get to on Murrin? In Murrin there are patches of mallee, but not much. It is mostly undergrowth—hop bush, ti-tree, and turpentine bush.
2067. From Roto, going east from about 30 or 40 miles, and a little to the north of the surveyed line, the country is principally mallee at times, for a width of 20 miles, with fingers of better country running up into it? Yes.
2068. When you get on to Murrin and north from Euabalong the country improves considerably? Yes.
2069. A considerable portion of the country is red soil, and might be utilised some day for agriculture? Yes, if they go to the expense of clearing.
2070. It is not a hopeful country? I should not think it was a hopeful country.
2071. *Mr. Hassall.*] Where does your wool go? We send it direct to Melbourne. The best goes in the grease, but we scour a certain portion of it. We send it to Carrathool, and thence by boat or train. It is taken by Messrs. Permewan, Wright, & Co.
2072. What is the freight? We are getting it down this year from £6 5s. right through.
2073. By river? Yes.
2074. What is the road carriage? The road carriage from here to Carrathool generally runs about £2 13s. 4d. The distance is about 105 miles.
2075. Do you regard that as a low rate? Yes. This year we are paying £3 7s. 6d. for uploading here from Carrathool.
2076. The boat and railway charges to Melbourne amount to £3 10s. 8d.? Something like that.
2077. Where does the mallee of which you have been speaking extend to? It extends through Marooba, and thence through Coombic, taking a small portion of Trida. Then it goes through Moullah and Yallock, which is poor country. Coombic is ridgy and rough, but there is some fair country there. The original line goes past our mulga block, and on to fair country, right through a homestead lease and part of Wangaron and Wangaroo.
2078. What is the country like between the Willandra and down on the Lachlan? That is all good grazing country with open plains. There might be an odd sand-hill or pine ridge. The timber is principally box and wilga.
- 2079.

Mr. T. W.
Hyndman.
19 Sept., 1896.

2079. The Willandra Wier throws the water up as far as Mossgiel? Yes.
 2080. How often does that weir run the water up as far as you are? The weir was only completed in 1891.
 2081. Have you had water ever since? No. The creek was dry last year.
 2082. How often, and for how long has it been dry since the weir was completed? Twice.
 2083. If the weir were raised 2 feet what effect would that have? I think the supply of water would be more permanent. The creek has been running since April, but it has not got to the Willandra Dam yet.
 2084. By the Morrowie Weir it is proposed to send the water up Middle Creek and into the Merrowie Creek, thence into Box Creek, and so into Lake Pitar Pungur and Lake Pika, the water eventually reaching the Lachlan again some 20 miles above Balranald? Yes.
 2085. With a good high fresh does the water run right through there now? Yes, with a good fresh, but I do not think it would go so far down.
 2086. Is there any danger of the line being interfered with by flood-water? Not that I am aware of. North of us there might be some swamps, but nothing to hurt the line.
 2087. What is the rainfall here? It averages a little over 15 inches. The following table shows the rainfall from 1878:—

Year.	Inches.	Year.	Inches.
1878	18	1887	24.46
1879	20.27	1888	8.84
1880	11.95	1889	24.35
1881	14.50	1890	17.56
1882	14.94	1891	20.39
1883	11.95	1892	13.72
1884	8.33	1893	11.99
1885	15.34	1894	24.00
1886	15.41	1895	10.60

2088. What are your rates of carriage? We get up general goods from Sydney to Carrathool for £5 a ton.
 2089. What is the rate for wool to Sydney? I cannot say. Our wool goes to Melbourne, but it costs us £6 5s. a ton.
 2090. Is that greasy wool? Yes.
 2091. The rate from Carrathool to Sydney is £3 4s. 9d. You are paying £3 10s. 6d. to send to Melbourne? Yes.
 2092. What would it cost you to get wool from here to Hillston? £1 a ton.
 2093. If there were a railway at Hillston, would it pay the owners of the station to send their wool to Sydney? I should think so.
 2094. How many tons of wool do you send away? The average for the last few years has been 30 tons.
 2095. So that if there were a railway at Hillston you would save £1 13s. on your road carriage, or about £50 on your clip? Yes.
 2096. Would that saving be sufficient to induce the company to send their wool to Sydney? It might; but these properties are under the Melbourne branch of the firm. They might transfer them to the Sydney branch.
 2097. Do you think it reasonable to suppose that wool from these stations and others in the locality would use the railway at Hillston? I think it would. At one time Coan Downs and other stations used to send their wool this way; but now they send to the western line. Coombie and Yathong send their wool to Melbourne. Coombie is 45 miles north of us.
 2098. *Mr. Egan.*] Did you get your stores from Melbourne before this year? No; we dealt locally. In bulk goods local people are very reasonable, and they suited us because we could get from them just what we required, and no more. No doubt, if the train were brought to Hillston, we would deal with Sydney.
 2099. *Mr. Trickett.*] How long does your lease run? It expires in 1918.
 2100. But half of the run is available at the present time for settlement? Yes.
 2101. I suppose the best land is in the leasehold areas? I think so, generally.
 2102. What are the prospects of this country from an agricultural point of view? Unless there is a long tenure the cost of land carriage and the bad seasons do not allow anything to be made out of it. The seasons here are very uncertain. You could not expect to get more than one crop in four.
 2103. Do you grow any crop? Yes; principally wheat. We had 70 acres in the year before last, and we only got about 16 tons of hay. Most of the wheat was barely a foot high. We have 70 acres in again this year.
 2104. Do you know what is the experience of farmers at Hillston? Some of them have done fairly well, and others have not. I think that the generality of them have not done well.
 2105. Do you think that from Hillston eastward there is sufficient rainfall to enable people to do tolerably well by growing wheat? I think so.
 2106. On this side of the Lachlan the rainfall is too small? Yes.
 2107. Do you consider that the land from Hillston westward is suitable for pastoral purposes only? Yes; this is a very dry belt. You may expect rain, but it never comes.
 2108. How have the homestead lessees got on out this way? I think most of them have been rather unsuccessful, but I believe that that is because they started on the borrowing principle. Those who started with a clean sheet have been very successful, but those who borrowed have gone down. We have experienced one or two bad seasons, and that has thrown them back. Of course they suffer just as the larger pastoralists suffer.
 2109. Is this the kind of country where you could fatten sheep for market? No; it is not a good fattening country. It is mostly good for store stock. You could breed sheep here.
 2110. The carrying capacity of this country will always be small? Yes.
 2111. It is absurd to think that the wool freight from out here would give a sufficient return to the railway? The return would be very doubtful. As you get towards Mossgiel and Kalferia, and out by Dundarra and Alma, you get good fattening country. The sheep fatten there quickly. North from here

- Mr. T. W. Hyndman. I never saw any fat sheep. You get good sheep, but the sheep are not equal to those that are fed on the plains. Very few send fat stock from these places.
- 19 Sept., 1896. 2112. *Mr. Fegan.*] How do you deal with the rabbits? In the summer we poison them wherever we can along the frontage. We have only a few tanks on the run, and in the dry season we give the rabbits water poisoned with arsenic. We used to use poisoned wheat very largely; but now we use phosphorised pollard, which is very effective. When the grass gets a little dry they take the pollard readily.
2113. How many acres were required for a sheep before the rabbits came here? Conn Downs was not heavily stocked when I went there, and they had about 30,000 sheep then, and they increased the number to 140,000 when they got it all fenced in.
2114. How many acres were there in their holding? They had then six 10-mile blocks. Here they generally allow five sheep to the acre.
2115. Have you rabbit-proof fencing here? Yes; it is all wire netted.
2116. How much a mile did it cost? It was very expensive, and cost about £33 a mile. We have not put up any lately, but I daresay we could get it now for £25 a mile.
2117. You are speaking of the wire netting apart from the fence? Yes.
2118. Are you able to keep the rabbits down? We have kept them in check; but I think the seasons have helped us a good deal. In 1890 the rabbits were so thick that at dusk you could knock them over with a stick.
2119. How much have you spent in destroying rabbits? We reckon that it has cost us something like £800, not including the wire netting.
2120. What do you use your wheat for? We grow it to get hay for the stock.

MONDAY, 21 SEPTEMBER, 1896.

[The Sectional Committee met at the homestead, Big Willandra Station, at 8.30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Arthur Laird, manager of Big Willandra Station, sworn, and examined:—

- Mr. A. Laird. 2121. *Chairman.*] How long have you been here? Three years.
2122. What is the area of the holding? 197,000 acres leasehold and 83,000 acres freehold.
- 21 Sept., 1896. 2123. How much is there in the resumed area? It is about the same as the leasehold area.
2124. How is it held? Mostly by homestead lessces.
2125. Do you grow any crops here? Only for hay.
2126. What crops have you had? We have had one good crop in the three years I have been here. 1893 was an average year, 1894 a good year, and 1895 a bad year.
2127. How many crops of wheat would they get here on the average? They might get one out of three.
2128. The soil will grow wheat? Yes; but the rainfall is very irregular.
2129. How far are you from Hillston? Thirty-five miles.
2130. How far from Hay? 110 miles.
2131. What is the freight to Hay? £3 a ton.
2132. What would it be to Hillston? £1 or 25s. a ton.
2133. If you could save £2 a ton would you make use of a railway at Hillston? I do not see how it would pay us. I expect the freight would be about £5 12s.
2134. I suppose you would send either to Sydney or Melbourne, according as it was cheaper? Yes; it would simply be a matter of cost.
2135. What stock have you? The average carrying capacity of the station would be about 70,000 or 75,000 as nearly as possible. I could shear 85,000 sheep in a good year. We are shearing 61,000 now.
2136. What would an average fleece weigh? I think the grown sheep would average about 7 lb. this year. Six and a half pounds is about the general average.
2137. *Mr. Fegan.*] What do you pay for rent? £1,197. We are appealing against the assessment.
2138. What does it cost you to kill the rabbits? £1,200 a year, and in addition there is the cost of wire netting.
2139. What does that cost a mile? It costs £56 a mile to put up the fence and to net it.
2140. *Mr. Trickett.*] Do you look upon this as good pastoral country? Yes.
2141. That is, if it is moderately stocked and the rabbits are kept down? Yes.
2142. Are the noxious weeds troublesome? They are in some years. They come in good seasons. The daisy-weed renders the country where it grows useless. The stock will not touch it, even in the very worst years.
2143. You carry on the destruction of rabbits systematically? Yes; we use every known method of destruction—poisoned pollard, poisoned water, and everything else.
2144. What do you think of the Rabbit Bill which is now before Parliament? I think it will be very hard if those who have wire-netted their runs have to pay a tax for the destruction of rabbits.
2145. You think that those who have done their best to keep the rabbits down should be exempt? Yes; if their holdings are netted in, and they can show that they are doing their best to keep down the rabbits.
2146. You would approve of legislation making the destruction of rabbits compulsory? Yes.
2147. Do you think it would be of benefit to the district if the Willandra Weir were raised a foot or two? I think it would; I think it would send more water down the creek. At the same time I think that something ought to be done to regulate the dams along the creek. I think that the holders along the creek should be allowed to know whether they can put dams and by-washes or overshot dams in the creek. There is a lot of work of that kind which I should like to do. The creek will be useless unless we are allowed to dam it.

2148. Is the water in the bed of the creek absorbed very quickly? Yes; even where the dams are. There is a dam on the Merrowie which will be dry before the present summer is over, if water does not come down the creek pretty quickly. Mr. A. Laird.
21 Sept., 1896.

2149. But water can be got by sinking? Yes; at a depth of 119 feet on the average.

2150. Is that good water for drinking? Most of it is. On the salt-bush country the water is brackish. The sheep do not do well on the salt water and salt bush together.

2151. During the last eighteen months you have been depending upon wells? Mostly upon wells; but in one or two of our paddocks we have had water in the tanks.

2152. *Chairman.*] Have they ever put down an artesian well here? They put down one at Holy Box, between Mossgiel and Ivanhoe; but it was not a success. They think it is not possible to get artesian water about here.

2153. *Mr. Fegan.*] You would give the rabbit inspectors power to act should a station neglect to wire net? Yes, I think so.

2154. You would have no objection to such a provision in the Act? No. I think it should be made compulsory for everyone to do his best to clear the rabbits. Of course, where there are sand hills and lignum country, it is very difficult to deal with the rabbits. They will not take the poison very well in the lignum.

2155. Have you any stock besides sheep on your holding? Only about 60 head of cattle. We have paid for as much as 80,000 rabbits a month at 1d. per scalp. These are the figures for those months in 1894, when we were paying for scalps:—

Month.	Scalp.	Month.	Scalp.
March	23,400	July	52,807
April	21,618	August	36,000
May	21,408	September	55,393
June	35,851	October	87,077

In November and December, and until the following March, we were poisoning with wheat and water. The figures above given refer merely to the number of scalps paid for. This year we paid for

Month.	Scalp.	Month.	Scalp.
March	728	July	13,745
April	1,368	August	13,338
May	3,573	September	8,700
June	3,410		

Since August, 1893, we have sent 348,000 skins to market; we have killed as many as 7,000 in two nights at one tank.

Mr. John Cumming, surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

2156. *Mr. Trickett.*] You are at present occupied in surveying the line from Condobolin to Broken Hill, and are located near Big Willandra station? Yes. Mr.
J. Cumming.

2157. You know the country between Hillston and Mossgiel? Yes. 21 Sept., 1896.

2158. It is quite level country, similar to that the Committee are now travelling through? Yes.

2159. And suitable for the construction of a light line of railway? For any kind of railway. There will be light earth works.

2160. You are of opinion that it would be advisable to use slight earth works, in order to prevent damage being done to the line by water lying on the ground after heavy rainfall? Yes.

2161. Do you know anything of the country westward? Not between here and Menindie. I know the country between Menindie and Broken Hill.

2162. What kind of country is it? The earth works will be very light. There are 16 miles of hilly country, and about 50 miles of level country.

2163. Will any box-drains or culverts be required in the level country? Not many.

2164. How much work have you done on the line? The 70 miles from Broken Hill to Menindie. I am only just starting on this section.

2165. What is the country like from Broken Hill to Menindie? The first 16 miles from Broken Hill is hilly.

2166. Is it timbered country? There is some box along Stephen's Creek for about 7 miles. The box might do for sleepers. Then there is shingle for ballast.

2167. What about the next stretch of country? The next 50 miles is hard flat country, with no timber on it that is of any use.

2168. Is there sufficient box to provide sleepers right through? I think so, as far as Lake Menindie.

2169. And in the first 16 miles there is plenty of shingle for ballast? Yes, in the bed of Stephen's Creek. I cannot say how deep the shingle is without trying it; but it must be several feet deep.

2170. What is the character of the occupation between Broken Hill and Menindie? Pastoral. The runs are very large. There are a few homestead leases on Stephen's Creek now.

2171. But when you get nearer to Broken Hill the pastoral holdings become very large? Yes.

2172. Is there any cultivation there? I did not see any.

2173. It is all dry country? Yes. The soil is good, but there is very little rain.

2174. Does the line of railway go close to the road? It goes within a mile or two of the old Menindie to Silvertown Road.

2175. I suppose there is very little traffic along that road? Very little. The coach traffic goes further to the south.

2176. *Mr. Hassall.*] What places are there between Menindie and Broken Hill? There is a hotel at Lake Speculation, then there is Kar's station, about 20 miles from Menindie, the "Quandong Hotel" about 35 miles from Broken Hill, and six selections on Stephen's Creek, about half way between the hotel and Broken Hill.

2177. *Mr. Fegan.*] Is there any population between Mossgiel and Menindie? Only at the station homesteads.

TUESDAY, 22 SEPTEMBER, 1896.

[The Sectional Committee met at the Court-house, Mossgiel, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Alexander Cameron, grazier, Mossgiel, sworn, and examined:—

Mr.
A. Cameron.
22 Sept., 1896.

2178. *Chairman.*] How long have you been here? I have lived in the district for twenty-two years.
2179. Are you interested in the district at the present time? Yes.
2180. Where is your holding? Thirty-three miles north from Mossgiel.
2181. What area have you? 10,000 acres.
2182. How many sheep have you? The number of sheep varies from time to time. I represent 20,000 acres, because my brother has a holding adjoining mine. We carry from 5,000 to 7,000 sheep.
2183. *Mr. Fegan.*] Have you any land under cultivation? Ten acres to grow feed for the use of the horses. I grow wheaten hay. I have never thrashed any wheat.
2184. How many bad seasons have you had since you have been in the district? The bad seasons vary so much in intensity.
2185. How many failures have you had through droughts? I should think one crop in three would be a failure.
2186. What is the average fleece? About 7 or 7½ lb.
2187. Where do you send your wool? To Melbourne usually.
2188. What is your nearest railway station? Hay.
2189. How many miles is it to Hay? 135 miles.
2190. What does it cost to send from here to Hay? Upon an average it costs about £4 a ton.
2191. What does it cost to send the wool to Melbourne? About £7 a ton on the average, including everything.
2192. Have you ever sent any wool to Sydney? I sent some to Sydney last year, and if there were a railway I would send to Sydney, even if the rate of carriage were a trifle higher, because of other considerations.
2193. What did it cost you last year to send your wool to Sydney? Last year road carriage was cheaper than usual. It cost a shade under £6 a ton.
2194. Why was road carriage cheap? Because there was plenty of feed. Last year I paid £3 5s. a ton for road carriage, and I have paid £5 10s. a ton. Last year I could have sent to Melbourne for £6 a ton. There was not much between the cost of sending to Melbourne and the cost of sending to Sydney.
2195. Then why did you send to Melbourne? There are business reasons. Last year I got a better price in the Sydney market. Then, too, I had bought sheep, the wool of which had always been known in Sydney, and therefore I sent it to Sydney.
2196. Are you troubled much with noxious weeds? No, we are almost free from them.
2197. Have you any poisonous weeds on your run? We have no weeds that are absolutely poisonous. There are some which provide very good food under ordinary circumstances, but which kill sheep if they are hungry. Clover will kill the sheep if they are very hungry and eat too much of it, but it is excellent feed.
2198. How do you get water? We sink tanks.
2199. I suppose you are not near the Billabong? No.
2200. How many tanks have you? We have about five tanks on the 20,000 acres.
2201. And plenty of water? Yes, we have never been short of water.
2202. How deep do you sink to get the water? We have no wells. We make our tanks 12 or 15 feet deep, and they fill with the drainage from the surface.
2203. Have you ever tried wells? No; but there are lots of them in the neighbourhood.
2204. Have they been a success? Yes. We get an ample supply.
2205. Do you not think that they are better than surface tanks? I do not think so. There is always a certain amount of expense in working wells.
2206. I suppose the tanks get dry in the summer time? Occasionally, in a very bad drought.
2207. What is the rainfall at your place? The average rainfall for the last five years has been about 14·80 inches, I think.
2208. Do you not think that that is a sufficient fall for wheat-growing? Yes, if it falls at the proper season of the year.
2209. Is the district prosperous or otherwise? It is not too prosperous, owing to the low value of our produce.
2210. Is that the only drawback? That and difficulty of transit are the only drawbacks.
2211. The want of railway communication has nothing to do with it? Decidedly it has. We are under a very big handicap at present because, in times of drought, we cannot get our stock away to districts where there would be feed. In 1888, when I was renting a good deal more country than the 20,000 acres which we now hold, I lost 7,000 sheep from pure inability to get them away. There was plenty of grass in other districts, so that if there had been a railway I would not have lost them. The losses which occur from droughts are enormous.
2212. You think that the district would be far more prosperous if you had railway communication than it is at present? Yes.
2213. Do you know the country between here and Ivanhoe? Yes.
2214. What is it like? It is splendid grazing country, and a good deal of it is fit for wheat-growing.
2215. How much of it is fit for wheat-growing—one-third or one-half? I should say at any rate one-third.

2216. South of Mossgiel, between here and Hay, what kind of country have you? It is all open downs country—good country.

2217. What kind of soil? Chocolate soil and black soil. It varies.

2218. With a fair rainfall it would grow anything? Yes.

2219. With railway communication this would be a very good district to live in? Very good indeed.

2220. Where do you get your supplies from? I always buy my supplies locally.

2221. Do you know the country west of Mossgiel? Yes, to within about 50 miles of Menindie. For the first 15 miles west of Ivanhoe it is open country, something like you see here, but with, perhaps, a little more timber scattered about it. Then you get into country still more timbered, and for 20 or 30 miles you go through heavily timbered country, the trees being principally belar and pine, and then the country opens up again. Here and there you have open country, and then belts of timber. Every acre of the scrub land is wheat-growing country; but not very good grazing country.

2222. Is that country leased? Yes; and lately homestead leases have been taken up within 70 miles of Menindie. That is an evidence that the country is fairly good.

2223. Are there any conditional purchases along there? No.

2224. With a ready market and railway communication, you could put more stock on the run? Yes; if I was quite certain of getting them away when I got into a difficulty. At present, if a drought occurs, I am practically yarded, and my stock must die, because I cannot get them away. I tried to get stock away in 1888, but they nearly all died because of the bareness of the roads and the great distance. Even if they are as fat as whales when they start, they lose a lot of condition in travelling.

2225. What is the country like between Mossgiel and Wyalong? The country is open plains pretty well to Hillston. In my opinion, it is all good country from here to Hillston. From Hillston, if you go up the river, you go through fine land until you leave the river and go east. From there it is timbered country.

2226. What is the timber? I think belar is the reigning timber. It is all excellent soil. I should think that at any rate one-half of the country between Wyalong and Hillston was wheat-growing country.

2227. Is it level country? Very level country.

2228. Are there any engineering difficulties in it? I should not think so. There is one little range which the railway would go through, but I do not think there are any engineering difficulties.

2229. Have you gone from Wyalong to Temora or Grenfell? No. I do not know the country much further than Wyalong.

2230. Have you been in the Bland country? No.

2231. Do you know anything of it by hearsay? Yes; I have always heard it spoken of as good country. I also know the country up to Euabalong. I consider that that would be all good country if it had means of transit for its produce.

2232. Have you been as far as Condobolin? I have been within 40 miles of it.

2233. Are you in favour of the deviation? So far as I know, I do not think there is much to choose between the two routes; but if I had to express an opinion it would be in favour of the southern route.

2234. Do you think that a railway from Wyalong would be better for the district? No, I think the line from Condobolin would be better; though as far as this district is concerned, I do not think it matters whether the railway comes from Temora or from Condobolin. I would be opposed to the construction of a line through Mount Hope, because such a line would go through very inferior country.

2235. You are aware that some people are agitating for a line from Grenfell or Wyalong to Hillston? From Temora to Hillston.

2236. But so far as you are concerned, you do not care whether the line goes from Wyalong or from Condobolin, so long as it comes near enough to Mossgiel to serve you? Yes. It does not concern me where it comes from.

2237. Are you personally much troubled with the rabbits here? Yes, we have been very seriously troubled with them.

2238. Is your run wire-netted? Yes, with the exception of a small area, which I hope to enclose very soon.

2239. What mesh do you use? $1\frac{1}{2}$ inch and $1\frac{3}{4}$ inch. I think that $1\frac{1}{2}$ inch is the very largest mesh that should be used.

2240. What is your opinion with regard to the Rabbit Bill now before Parliament? I consider it a fairly good Bill.

2241. Are you in favour of making the destruction of rabbits compulsory? Yes. The Bill says that the State should contribute from a fund voted by Parliament; but that leaves a loophole for escape, because it is our experience that Parliament will not always vote this money.

2242. How much would it cost you to deal with the rabbits? I should say that on the average it costs me £100 a year.

2243. That does not include fencing? No.

2244. What does your wire cost? It is a long time since I put up wire-netting. I think it cost me about £36 a mile.

2245. What would it cost now? To put wire-netting on an existing fence would cost about £24 a mile.

2246. I suppose you employ the usual methods of poisoning? Yes.

2247. Do you lose any sheep from poison? A few occasionally. They sometimes take the pollard; but of course we adopt means to prevent them from getting to the water. One factor that ought to have a good deal of weight with the Committee in coming to a decision in regard to the proposed railway, is the existence of an enormous area of unoccupied land to the north of Mossgiel. Between here and Cobar there are a great many acres of land which are now absolutely thrown up, and are not occupied by anybody. It will devolve upon the State, so long as these resumed areas are abandoned, to kill the rabbits upon them; but with a railway that land would be taken up, and the State would be relieved of the responsibility. The land in question is inferior for grazing purposes, but plenty of it is good wheat-land. At the present time it does not pay to keep sheep upon it.

2248. If a railway were made, would there be a prospect of that land coming into use again? I think so. The lands I speak of are 60 or 70 miles north from here. In times of drought they could not get stock away, and they would always have to pay high rates for the carriage of their wool. That takes away any small margin of profit there might otherwise be. At the present time these lands are the breeding-ground for rabbits and wild dogs, and a standing menace to the better land in the district.

Mr.
A. Cameron.
22 Sept., 1896.

- Mr. A. Cameron. 2249. The only way to deal with the rabbits is to have these lands taken up, and to have closer settlement? Yes. Even if they were taken up by the pastoral lessee, he would kill the rabbits; but, if they are not taken up, the State will have to kill the rabbits, and the expense of doing so will be enormous.
- 22 Sept., 1896. 2250. I suppose the rainfall on this country is not so large as the rainfall about Mossgiel? I think it is greater. As you go north-east from here the rainfall increases.
2251. *Mr. Trickett.*] Do you know that there is any quantity of abandoned land close to the railways of the Colony? Yes; but it may be much inferior to the land of which I am speaking.
2252. You do not think it probable that there will be small settlement upon the land you speak of? No; I would not say that it would be taken up in small holdings.
2253. If the railway were brought to Mossgiel, from how far west would it attract traffic? From 60 to 70 miles west.
2254. You told us that if there were a railway here you would be willing to pay more to send to Sydney than to send to Melbourne. Do you really mean us to believe that? Sydney is slowly but surely becoming a better market than Melbourne, and that would induce me to send to Sydney. Of course if the difference in freight was very large, that would get rid of the advantage to be derived by sending to a better market.
2255. You speak only of wool, not of wheat? I have never had very much to do with agriculture.
2256. You would not send wool to Sydney merely from patriotic sentiment? No; though if I could induce people to do a little to bring Victoria to her senses with regard to the stock tax I should be very glad.
2257. What is the country between Wyalong and Mossgiel suitable for? Most of the land between Wyalong and Hillston I passed over had a good deep soil, but it was rather heavily timbered for grazing purposes. When cleared it will be splendid country for wheat growing. I do not think I ever saw better land.
2258. And you think the rainfall is sufficient for wheat? I think the rainfall is quite good enough for wheat. It has proved itself sufficient at Hillston and at Gunbar, and further east it is still better.
2259. Do you know whether the station owners through whose property the line passes would be prepared to give the necessary quantity of land? I do not.
2260. What is there to make a railway here pay? I think that the increased production of wheat would be a very large factor in the traffic.
2261. You have not gone in for wheat growing? No, because the distance from market is too great; on my own holding I have grown as fine a crop as I ever saw in my life.
2262. How much do you get to the acre? I did not thresh out the wheat; but it gave about 3½ tons of hay, and would have threshed out a good lot of wheat.
2263. Is the rainfall here too precarious for successful wheat growing? I do not think so.
2264. It has been stated that the carrying capacity of this country has decreased 25 per cent. by reason of the bad seasons and the presence of rabbits? I think it has decreased to quite that extent by reason of the presence of rabbits; but, of course, there have always been droughts.
2265. We hear that everything is going back, whereas some years ago everything was prosperous? Then the value of our produce was greater, and we had not the rabbits to contend with. I think that will explain the whole thing.
2266. Do you think that the rabbits have come to stay, or do you think that they can be stamped out, and that the district will thus be brought back to a prosperous condition? I think that the rabbits, if they cannot be stamped out, can at least be reduced within manageable limits by closer settlement.
2267. Is the country good enough, considering the present prices of produce, to stand the expense of dealing with the rabbits? I think it is good enough, because the present prices are not likely to last for ever. We have had bad times in the past, and I think we will get good times again.
2268. Your opinion is that if hard-working men stick to the country, the country will stick to them? Yes, I think so, though some are unfortunate through no cause of their own.
2269. *Mr. Hussall.*] Do you not think that there is some other reason besides the want of railway communication, for the abandonment of these resumed areas? Yes; but the want of railway communication is a large factor.
2270. Do you think that if there were a railway there would be an influx of homestead leases? No, I do not think so; but I feel certain that the resumed areas would be taken up by the holders of the adjoining leaseholds.
2271. Do you know Gunninguldrie? Slightly.
2272. Are you aware that the resumed area there is assessed at 5s. per section;—If a man cannot make a living when that is all the rent he is charged, the country cannot be very good? I do not think the rent has much to do with it where there are other great disabilities.
- 2273-4. At Urana, Roto, and Willandra, the resumed area has been thrown up? Yes.
2275. Do you not think that if the State offered that land on long leases at a peppercorn rental, people might be induced to do something with it irrespective of a railway? I do not think so.
2276. But the construction of a railway would have the effect of opening it up? I think so. I think it is certain that a large number of resumed areas now out of occupation will be occupied if the railway is made.
2277. Do you think the country would be justified in constructing a line if there were to be an annual loss of £40,000 upon it;—would you go into a speculation of that kind? I would look at all the surroundings of the case, and I would consider whether a railway would not pay the community on a dozen different grounds. The State might lose in some ways and gain in other ways. I think that the proposed line would be a distinct gain to New South Wales, not only from a local but from a national point of view.
2278. Does that remark apply to the through line to Broken Hill? Yes; apart from local considerations the line ought to be made.
2279. For what reason? Well, in times of war, which may come upon us at any moment, such a line would be of immense benefit to the country.
2280. Then you look upon it as a national line? Yes; but, I think, that upon local considerations it should be made.
2281. The local considerations being what? That it would enable a lot of people who are now scarcely able to make a living to live better, and it would throw a large amount of land into occupation which is now

now idle, and upon which the State will have to spend a large amount annually in the destruction of rabbits.

2282. Would not the State offer such conditions as would induce people to take up that land? There is land within 50 miles of my holding which, if it were offered to me to-morrow for nothing I would not accept. It is too far from a railway, and too full of scrub and rabbits to make it payable.

2283. What is the smallest area upon which a man can make a living;—I am speaking of land near the proposed railway? I suppose 1,000 acres would maintain a family if it were farmed, and from 10,000 to 15,000 acres if it was used for grazing purposes. I reckon a 10,000-acre holding much too small for grazing.

2284. Therefore, before people could do anything with the resumed area the land would have to be let in double sized blocks? The abandoned resumed areas will only be put into occupation by the holders of the leaseholds adjoining them. They would not be taken up for small settlements for a very long time, even if there were a railway. I do not think you can offer them any terms in the way of lowness of rent that will induce them to take up the land.

2285. *Mr. Fegan.*] What is the difference between the present selling price of your wool and the price at which it was sold a few years since? It is about 30 per cent less now.

2286. What is the average price now? From 6½d. to 7d. per lb.

2287. At one time you got over 1s. a lb.? I do not remember that we ever got 1s. in this neighbourhood, because it is very heavy wool; but we have got 10d. and 11d.

2288. If they got 4d. more for their wool it would make a great difference in the position of the graziers to-day? Yes.

2289. In appraising the land, I suppose the presence of the rabbits is taken into consideration? It was at the last appraisalment, but not before.

2290. If there were no rabbits you would have to pay more rent for your land? Yes.

2291. This reduction in rent is equivalent to allowing you a certain sum to cope with the rabbits? I suppose it could be considered so.

Mr. Robert William Broughton, Acting Inspector of Stock, Mossgiel, sworn, and examined:—

2292. *Mr. Hassall.*] How long have you held your present position? Three months.

2293. How long have you known the district? I have been backwards and forwards to it for the last twenty-five years.

2294. Have you any statement as to the number of stock in the district? Yes, I can give you the stock returns from the office books.

2295. Where does your district extend to? It goes from here to Jumping Sand Hills, about 25 miles south, and takes in Trida, Moolah, Yallock, Keewong, Paddington, Nekaboo, Tiltargara, and Bulla. I run 80 miles towards Cobar from here.

2296. The district is about 100 miles across? Yes, it is about 100 miles by 100 miles.

2297. Do you join the Hillston stock district? Yes.

2298. What district have you on the west? Menindie.

2299. What number of stock have you in the district? According to the returns for 1895, there are 1,910 horses, 2,272 cattle, and 740,703 sheep. I suppose those are the lowest returns we have had for many years. Last year there were serious losses. The number of sheep shorn the year before last was 810,000.

2300. In addition to what went away as fat stock? Yes. It was estimated that 1,875 tons of wool were sent from the district, and about 75 tons of lambs' wool, or 1,950 tons altogether. In 1894, there were 500 tons more wool sent away. 389,793 sheep passed through the district during 1895.

2301. Where does the stock and wool go to principally? From one part of my district a good deal goes to Cobar.

2302. Where does the stock go? Principally to Victoria.

2303. In spite of the stock tax? Yes, they go to the boiling-down establishments, and to Victoria.

2304. Where does the wool go? To Victoria from this side of the district.

2305. To what place on the border does it go? To Balranald, Swan Hill, Hay, and some of it to Wentworth.

2306. The river is used to convey the wool to Victoria? Yes.

2307. Whenever it is navigable, and there is plenty of grass and water it will be used to a very large extent? Yes.

2308. Do you know anything of the country near Condobolin? No.

2309. Where does the country you know commence? At Euabalong.

2310. What is the country like running down to Hillston? I think that until you get to Gunninguldie it is good grazing and agricultural country. From the top boundary of Gunninguldie the country is inferior for grazing purposes. The country through Uranaway and Gunninguldie is inferior. It consists of mallee scrub, rocky ridges, and inferior grass country. You come on good open country again at Willandra, and then it is good grazing country right through Mossgiel, until you get about 15 miles the other side of Kilfera.

2311. Then you get into inferior grazing country? Yes.

2312. So you have a stretch of good grazing country running from Willandra through Moolbong, Mossgiel, Clare, and Kilfera? Yes. I do not know the country after you pass the Kilfera boundary.

2313. What is the carrying capacity of this country? About 10 acres to the sheep.

2314. What is the average carrying capacity of first-class country? About 5 acres to the sheep—5 to 6 acres.

2315. Do you get good sound heavy fleeces? The country grows good sound wool.

2316. Is the country itself sound? Yes, very sound, the soundest country I know. It grows good, sound, heavy wool.

2317. How does the selling price of this wool compare with that of other wool? The wool may not bring so much per lb. as wool grown down south, but there is a gain in weight.

2318. Has the carrying capacity of this country decreased or increased? Decreased.

2319. What is the reason for that? I think it is entirely due to the rabbits.

Mr. R. W. Broughton. 2320. Is the country thickly infested with rabbits? The rabbits are not as thick as they were; but the country has been overrun with them. Some of the country seems to me as if it would never recover. I think that the scrub country has suffered far more than the plain country. A few years ago the returns from some of the areas showed 30,000 to 35,000 sheep; but now those places are returning only from 8,000 to 10,000 sheep.

2321. In your opinion it will be many years before the country recovers, if it ever recovers? Yes.

2322. I suppose that nothing is done to try and eradicate the rabbits on the waste lands? No.

2323. Do you think it should be incumbent upon the Crown to adopt some measures for clearing the rabbits off the waste land? Yes. I think the Government should do their share in assisting those who have settled upon the land. The abandoned areas are the breeding-places for rabbits and dogs, and the nearer you are to such land the less valuable your property is. They first started throwing up the country 90 miles from here, and now they are gradually throwing up country closer and closer in. In the scrub country the expense of fighting rabbits is too heavy, so the holders keep on throwing it up.

2324. Is it possible for anyone living on land adjoining waste land to successfully cope with the rabbits? What ruined most people was the expensive way in which it was worked at first. We were bound to put on a certain number of men and to pay them whatever price was fixed by the Government. On my place I was compelled by the Government to spend more in destroying rabbits than I was receiving from the holding. When the new Act came into operation the people had already found cheaper and better ways of coping with the rabbits. They can deal with them now for one-fourth of what they used to pay, and every year they are getting better plans for destroying them. The rabbits will always be a big expense, though they will be able to keep them down.

2325. You think that those whose holdings are enclosed with wire-netting fences will be able to deal with the pest? Yes.

2326. Were you consulted by the Government with reference to the new Rabbit Bill? No, I am only acting temporarily.

2327. With the exception of a few spots on the resumed areas, no land will be available for settlement in this part of the country for twenty years, because the leaseholds do not expire until 1918? There is a great deal of country still open to homestead lease. People are very frightened to put stock upon this land, because they know that if a drought occurs they will not be able to shift their stock. On a big holding they have 5,000 or 6,000 fat wethers and the buyer buys them in one lot; but the small man cannot afford to drive what he has to market, because, with a small lot, the expense of taking them to Hay is too much. If there were a railway they could get their sheep away much more cheaply. I have seen good strong sheep start from here in good condition and die before reaching Hay, for want of something to eat. The stations are now running all their fat sheep down to the railway, because they dare not hold them.

2328. Have you any knowledge of the number of small holdings in the district? There are about fifty homestead lessees.

2329. Do they confine themselves entirely to pastoral occupations, or do they combine those with other pursuits? Some of them may have teams on the road; but I have not been here long enough to know.

2330. What do you know of the carrying capacity of the scrub country before the rabbit invasion? At one place where I was part owner and manager for eight years, I never shored less than 10,800 sheep, and I had 96,000 acres of inferior scrub land. During the last five years they have only run 1,000 sheep on the same property. In another place, where they used to shear as many as 40,000 sheep, and from 30,000 to 35,000 sheep on the average, during the last five years they have not shorn 8,000 sheep on the average. The area there is 128,000 acres. On Yallock, before it was nearly all fenced, they used to shear from 20,000 to 27,000 sheep, and one 10-mile block was never touched. During the last five years they have not averaged 5,000 sheep a year until last year, using all the blocks.

2331. What description of scrub do you speak of? Mixed scrub—hop-bush, mallee, ti-tree, yarran, pine, and box.

2332. Is the scrub spreading? No; the rabbits have killed all the edible scrub, and the country is clearer now than it was ten years ago, except for the pine.

2333. If the rabbits were got rid of what would the country carry? I have seen similar country which was eaten out, but, after being spelled for three years, it grew thicker grass than other country. At Paddington there are certain kinds of country which, after the rabbits have killed off all the low bushes, grow more grass than they did before; but it takes from two to four years spelling for that country to recover itself.

2334. The rabbits would have to be entirely eradicated, and the country would have to be spelled for three or four years before it would come back to its natural state? Yes. Some kinds of country recover more quickly than other kinds. The rainfall at Keewong averages over 15 inches. A record was kept there for twelve or fifteen years. The finest crops I have seen in Riverina were grown on Paddington, and between there and Cobarr. Once you get out that way you find country very suitable for agriculture, and better than the country here is. They supplied all their neighbours with wheat for poisoning rabbits, and carted some into Cobarr and sold it there. Paddington is 90 miles from Mossgiel.

Mr. Richard Haydon Cheriton, farmer, Mossgiel, sworn, and examined:—

Mr. R. H. Cheriton. 2335. *Chairman.*] How long have you been here? I took up this land in 1885; but I did not take possession until 1887.

2336. Where do you live? My land commences about 7 miles from here, at the junction of the stock route and the Willandra Creek.

2337. What area have you? 10,240 acres in my own name. I occupy 5,000 acres belonging to my sons.

2338. How many sheep do you run? Between 4,500 and 5,000. I scarcely ever go up to 5,000.

2339. What does your clip average? It varies very much. Some years we do not average more than 6 lb. I think a fair average is 7 or 7½ lb.

2340. Therefore, you have about 15 tons of wool to send away? Yes.

2341. What is your freight from here to Hay? I have paid various sums. One year I paid as much as £4 10s. a ton. Last year I paid £3 a ton.

2342. Is £3 a ton a fair thing? I think so.

2343. What would the freight be to Hillston? I have paid £2 and £2 10s. That was for carting flour, pollard, and timber.

2344.

2344. Would £2 a ton be a fair thing for wool? I think so, if we could get supplies from Hillston as well.

2345. From here to Sydney by railway, if the proposed line were constructed, would be about 500 miles? About that.

2346. We understand that it costs about £3 10s. a ton to send wool from Hay to Melbourne? That is not my estimate. I think it costs about £2 17s. 6d. to send it from Hay to Melbourne.

2347. What does it cost you to send your wool from here to Melbourne? I have not sent any to Melbourne the last few years.

2348. What would it cost to send it from here to Melbourne now? From my place about £6 a ton, including insurance.

2349. That would be about £3 a ton from Hay to Melbourne? Yes.

2350. The rate for greasy wool from Bourke to Sydney is £4, and it is reasonable to suppose that if a railway were brought to Mossiel it would be the same from Mossiel to Sydney;—that would mean a saving of £2 a ton to people living here? Yes.

2351. A railway would be valuable to you in enabling you to shift your stock? Yes, or to send away fat stock.

2352. Have you grown any wheat in this district? Yes.

2353. For how many years? I have grown wheat for hay ever since I have been here—about nine years.

2354. How many times did you get a crop? I cannot say that I have had a total failure in that time. I have selected land adapted for a dry climate.

2355. How many good crops have you had out of the nine? I think that four years out of the nine the crop has been fairly good.

2356. Every second year you get a reasonably good hay crop? Yes.

2357. Would it be the same if you were growing for grain? I think so.

2358. A farmer here might reasonably expect to get one crop out of two? Yes.

2359. On what kind of land do you grow wheat? On sandy soil mostly. I would not grow wheat on black soil.

2360. Nor on these wide open plains? No.

2361. Would you grow it on timbered country? Yes. There is nothing better than belar and pine country for wheat.

2362. It is not possible to send wheat away from here? I could not grow wheat in competition with farmers nearer a railway.

2363. How much have you under wheat? 120 acres. There is no local demand except for a bit of seed.

2364. If the railway came here more wheat would be grown? Yes; it would pay better than rearing sheep. With a railway I could get my stock to market. This is a greater advantage to the small holder than to the large holder. The small holder has only a few sheep to send.

2365. Have you been successful in obtaining water? Highly successful. I put two wells down in 1888. One is 96 feet deep, and the other 120 feet.

2366. What is the water like? Absolutely fresh. In the second well I had to go through 40 feet of rock after I got down 80 feet.

2367. Two bores have been put down in this country? Yes; one at Holy Box, and the other at Dolderei.

2368. With what result? I maintain that they have never had a fair trial.

2369. What capital would be required to take up a homestead lease in this district? No man can take up a homestead lease unless he has £2,000. A man is very heavily handicapped when he has to borrow. The great drawback to this district is that men have rushed in who have had insufficient capital. I have had to furnish four homestead leases for my sons, so that I know pretty well what it costs. A railway would bring about a great deal of settlement in this district, especially in the scrub land. I believe that the whole of that country is adapted for agriculture, and that hundreds of men will come from the more settled parts of the Colony to avail themselves of this agricultural land. I have been twenty-three years in this Colony, and for some years I was farming in Deniliquin. Men there were paying very large sums for rent, and were taking up land on the halves system. Some paid as high as 10s. an acre as rent. I think that the rainfall here can compare with that of any other wheat-growing district, such as the district to the north of Adelaide.

2370. But it would be better to have a few more inches? Yes. I have always maintained that where grass will grow wheat will grow. Our rainfall is not even; but it is better than the rainfall in parts of South Australia. Their average yield is from 5 to 7 bushels to the acre, but the average here is 15 or 16 bushels. In 1854 I reaped 5 bushels to the acre, but then prices were very different from what they are now.

2371. Is wheat-growing very profitable there? Well, people manage to exist; but land, however good it may be, will not grow wheat for ever, and when it becomes poor you must push out into fresh fields.

Mr. Alexander Wilson, farmer and grazier, Arlington, near Mossiel, sworn, and examined:—

2372. *Mr. Trickett.*] How long have you been here? Since 1891.

2373. Have you had experience in other parts of the Colony? Yes; I have been twenty-three years in different parts of Riverina.

2374. Why did you come here? Some years ago I had to travel my 7,000 sheep to summer country, and I lost all of them but 1,400 before I could get to a country in which there was grass. A friend of mine had about the same number, and he trained them to the same summer station and did not lose 2 per cent. For those sheep he got 9s. 6d. three months afterwards.

2375. How much land have you? About 9,000 acres.

2376. How many sheep? 5,500, including lambs. I rent the adjoining lease.

2377. What do you consider the carrying capacity of this land? That depends a good deal on the management. My brothers have been up here since 1884. They were about the first to wire-net, and they almost exterminated the rabbits. They increased the carrying capacity of their country very considerably.

2378. To what extent? Last year they had 8,000 sheep on two leases. They were the first to sell to the Freezing Company.

Mr. B. H. Cheriton.
22 Sept., 1896.

Mr. A. Wilson.
22 Sept., 1896.

Mr.
A. Wilson.
22 Sept., 1896.

2379. Their run is improved throughout? Yes; the quality of the bushes and of the grass has improved since the rabbits have been kept down. They have more summer grass there now than other people have.
2380. Is theirs average country, or is it particularly good? It is average country; one block is average country and the other is a little better.
2381. What water have they? Mostly wells. A test with the American boring machines has proved that at a depth of 130 or 150 ft. a large body of very good water can be met. They are irrigating an orchard from one of the wells. All through this country an enormous body of clear water is to be met with at a depth of 200 or 300 ft. There is an enormous supply of water in the district.
2382. Not an artesian supply? No; the water must be pumped. If you pump there is any quantity of water.
2383. Is not pumping expensive? Yes; but the machinery is becoming less costly every year.
2384. What are you doing on your holding? I am rather a newcomer in the district; but my experience is that it is hardly fair to ask anyone to speak about the capability of this country for wheat growing or for oat growing, because it has not been fairly tried. All that has been done is to chance a few acres for hay. At Arlington I have a piece of ground which is similar to the scrub country—a chocolate red ridge, close to the house. This ground, with proper cultivation and a very light sowing of seed, will grow wheat in the driest seasons, and it produces the finest quality of grain that I have ever seen. My father had a flourmill for twenty-five years, so that I know a little about wheat. The soil will not grow the heavy yields that they get about Wagga and Cootamundra. I do not think there is any doubt whatever that the resumed areas that are now the home of wild dogs and rabbits would be taken up for agricultural purposes if there were a railway. The country in its natural state does not seem to grow a first-class grass, but it is splendid country for crops.
2385. What is needed is population and the means of communication? Yes; I think the railway will bring population. The rush for land in Australia is getting so enormous that when people hear of this agricultural land they will come and settle on it.
2386. People would sooner take up land close to a market? Yes; but the case with which this land can be worked may lead to its being taken up before country nearer a railway.
2387. Have you ever engaged in wheat growing as a means of living? No, I have grown wheat for seed.
2388. You think that there is a large tract of country about here which is suitable for wheat growing, that the rainfall is sufficient, and that with access to market farmers would be induced to settle here? Yes. The scrub country is at present a menace to us because of the wild dogs there. The Government are breeding dogs to kill our sheep.
2389. You think that the State should take upon itself the duty of destroying these posts? Yes. The private individual would help the State greatly if a railway were made.
2390. *Chairman.*] You heard the evidence that only one crop out of two could be depended upon? Mr. Cheriton and myself differ very much in our style of sowing wheat; but as he is the older farmer I defer to him. I think with light sowing you could always get a fair crop—from 10 to 15 bushels a year on the average. There is a terrible amount of loss in sending fat stock to market. Wethers weighing 70 lbs. on the run will only weigh 40 lbs. when they get to market.
2391. People cannot afford to breed sheep because they cannot send them away? Yes. A great many people try to keep on what they call the safe side. The runs are not carrying as much stock as they could carry if there were a railway here.

Mr. J. Abrahams, storekeeper, Mossgiel, sworn, and examined:—

Mr.
J. Abrahams.
22 Sept., 1896.

2392. *Mr. Fegan.*] How long have you been in this district? 11 years.
2393. Do you get your goods from Melbourne or from Sydney? We get them from Melbourne, but recently we have got them from Sydney.
2394. What do they charge to bring goods from Melbourne? It all depends upon the class. Wool-packs and salt are carried at a shade lower on the New South Wales railways than on the Victorian railways. They cost us £3 5s. a ton from Melbourne and £2 19s. 10d. a ton from Sydney. All goods are sent from Melbourne for £3 5s. a ton, but from Sydney general goods are sent for £5 10s. a ton.
2395. Then why do you get your goods from Sydney? The drawback is not equivalent to the duties. In soft goods and fancy goods we can buy more cheaply in Sydney than in Melbourne, and in that way we save the difference in freight.
2396. How many tons a year do you get up? Roughly about 500 tons.
2397. That at £5 a year a ton would be something like £2,500 a year. Yes.
2398. What does it cost you to get things from Hay? From last December until June we were paying £6 a ton. Now we are paying £3.
2399. What is the reason of the reduction? This is a better season. Up to last June there was no feed upon the track.
2400. Is the district as good now as when you first came? I think so.
2401. Has any progress been made in it? Certainly since 1885.
2402. Has there been constant progress? During the last two years it has gone back.
2403. Owing to what? Owing to the low price of stock and of wool.
2404. Has the amount of your tonnage decreased? Yes, a little.
2405. Through what? There is not so much work going on now in the district.
2406. Have people left the district? A number of working men have left.
2407. Tank sinking and fencing is not being done now? Yes; but of course improvements will have to be made in the future.
2408. Do you keep a waggon going between here and Hay? No, we do not do any carrying.
2409. Is there a great amount of traffic between here and Hay? I think that altogether there are 200 teams.
2410. They carry wool and produce of every description? Yes.
2411. Supposing you sent a load of wool or merchandise from here, would it be taken for £3 a ton? At times you might get it taken for a little less.
2412. If the carrier was guaranteed a return load? Yes, and if there was plenty of grass along the route.

2413. Is there any water on the road? There are Government tanks, and 50 miles from here you cross the river.
2414. How do they get water between the river and Hay? From the Government tanks.
2415. Between the river and Hillston there are Government tanks? I have never been on that track.
2416. Are you conversant with the country between Hay and the river? Fairly well.
2417. What kind of country is it? Something similar to this in places—open country and chocolate soil.

Mr.
J. Abrahams.
22 Sept., 1896.

Mr. Angus Duncan MacInnes, storekeeper and homestead lessee, Mossgiel, sworn, and examined:—

2418. *Mr. Hassall.*] How long have you been in this part of the country? Between six and seven years.
2419. How long have you been storekeeping? Not three months yet.
2420. You heard the evidence of the last witness? Yes, I agree with his evidence.
2421. What area have you? I have one lease of 10,000 acres.
2422. How far from Mossgiel? About 21 miles north-west.
2423. What description of country is it? There is what we call red ground, salt-bush country, and on the creek a little lignum.
2424. No scrub? Practically no scrub. There are a few bushes, but no scrub country.
2425. What is your carrying capacity? On the average we run about 3,600 sheep all the year round. That is what I have carried since I have been there.
2426. Is it good sound country? Yes.
2427. Does it grow good wool? Yes, the wool is strong enough; but it is inclined to be light. I think the salt-bush has something to do with that. The fleeces are good, but the wool does not weigh as heavily as wool further south.
2428. What is the average weight of a fleece? I do not know. This year I have shorn 500 wethers already, and their fleeces average $7\frac{1}{2}$ lbs.
2429. Do you do any fattening? Yes, last year I had 4,000 wethers; I bought them about 1st February and I sold them about the middle of August fat.
2430. What were they when you bought them—good stores? Yes. I kept them during the autumn, and they got fairly low, but when the rains came they fattened again. They were the first fat sheep in the district. I sold them to the boiling-down proprietor. He took delivery at the homestead.
2431. Where did they go to? He trucked 2,500 in Hay and sent the balance to Moama.
2432. Are there many homestead lessees round you? Yes. The country from where I am to Mossgiel is pretty well settled by homestead lessees. There are, I think, thirteen just round me, and in between there and Mossgiel.
2433. Are you the original holder of your lease? Yes.
2434. Are the leases in this district generally held by the original lessees? Some of them are not.
2435. Have they been sold to other homestead lessees? Yes. The Act does not allow pastoral lessees to take over a homestead lease.
2436. Have you been fairly successful? Yes.
2437. Do you think the country is suitable for any other occupation besides grazing? Yes, in parts, if there were a market. In its present state it is not, because there is no market. The red ground will grow a fair crop. It will not grow a really good crop except in exceptional seasons. The distance from market precludes people from using it.
2438. With better means of communication people would be induced to go in for agriculture? I daresay they would.
2439. The question of cost would enter very largely into consideration? Yes. My idea is that the cost of carriage from here would be too great. I think other places would be able to compete against you.
2440. You are under the impression that people nearer the central market would beat you? Yes.
2441. So that there would be little inducement to enter upon agricultural pursuits, even if there were better facilities for sending produce to market? Yes. If the country became more populated there would be a market in our immediate neighbourhood. No doubt if facilities were given to people to settle here a local market would be created.
2442. But if people came here and proved the soil they would supply their own requirements? Yes; but under favourable circumstances a population might be settled here which would not be directly dependent upon agriculture for its livelihood.
2443. What other pursuits could people enter upon in this district? With a railway, the pastoral industry might be helped to a great extent, and a lot of country at present unoccupied would be taken up for homestead leases.
2444. Do you know the country that has been abandoned? I know some of it.
2445. Have you travelled much along the route of the proposed railway between here and Menindie? No, I have not been any distance to the north-west. I have not been more than 20 miles beyond Kilfera.
2446. What capital had you when you commenced as a homestead lessee? I laid out £1,100 upon the lease and fencing, and in making a tank, wells, enclosing yards, building a house, and in other necessary improvements.
2447. Did you have to make your fences rabbit-proof? I spent a little in wire netting. There are six leases there which are netted in a group.
2448. Have you coped successfully with the rabbits? We have been successful to a certain extent, and we do not now look upon the rabbits as a serious drawback. The bad season last year helped us considerably in destroying the rabbits, and at present they are not serious. Of course we cannot say that they will not increase again.
2449. Do you set apart a certain sum every year for the destruction of rabbits? No. When the rabbits are thick we give them phosphorised pollard and poisoned water. As far as we know those are the best means of dealing with them.
2450. I suppose there will be no chance of getting rid of the rabbits until some means are taken to destroy them upon the waste land? Yes; they breed on the waste land, and then go on to other land.
2451. Can they get into your holding, even though you are wire netted? Some of them do; but the netting is a great protection. The smaller rabbits get through, and some rabbits get over.

Mr. A. D.
MacInnes.
22 Sept., 1896.

- Mr. A. D. MacInnes. 2452. With regard to the sheep that you sold, how did they stand the journey in? The man who bought them gave me £25 more for them than he cleared. He lost that on the speculation. He said they wasted on the road.
- 22 Sept., 1896. 2453. Has he bought any from you since? Yes. Of course, though he loses on some, he makes it up on others.
2454. Would the construction of a railway increase settlement here? It would be a great benefit to the district. A railway would enable people to send away their fat stock, and the people with only a few sheep could send away a truck or two at a time.
2455. How many train-loads would be sent from this district in twelve months? I think over 100,000 fat sheep would be sent from this district in a good season.

Mr. Cecil Joseph Parsons, grazier, Mossgiel Station, sworn, and examined:—

- Mr. C. J. Parsons. 2456. *Chairman.*] How long have you been in this district? Fifteen years.
- 22 Sept., 1896. 2457. What is the extent of your holding? I occupy altogether 172,000 acres.
2458. What is the resumed area? 5,000 acres.
2459. What has become of the residue? It has all been taken up in homestead leases. The portion that is left is merely the stock route.
2460. How many sheep do you shear? Generally about 60,000, including lambs.
2461. Will you make a brief statement, from the pastoralists' point of view, as to the benefits likely to accrue from the construction of a railway to this district? I think that a railway here would be of immense benefit to the pastoralists generally, in enabling them to get their produce to market more cheaply and more quickly than they can at present, and in allowing them to send their stock away in times of drought. The losses from drought in this district have been something terrible in years past; but a railway would do a great deal to minimise them. It would also enable us to obtain horse-feed in bad times at much lower rates than we could get it at present. We have had on several occasions to depend upon outside places for horse-feed, and we have had to pay as much as £16 and £20 a ton for it. I spent £1,000 upon horse-feed one year.
2462. But the coming of the homestead lessee, who is partly an agriculturist, must do a lot to undo the evil you complain of? Yes; they frequently have hay for sale. The railway would be of great assistance to us in taking fat stock to market, and on this point I would like to speak of the enormous waste that at present occurs when stock are driven to market. Last year I sent 11,000 fat wethers to market. 5,000 of them I had frozen at Narrandera, because of the low prices prevailing in Sydney. Those wethers when they left here would average 70 lb., as I proved by killing and weighing some. At Narrandera, however, when killed, they only weighed 47 lb. without the fat, and the fat weighed about 10 lb. It is only reasonable to suppose that the sheep that were sent on to Homebush wasted in the same way.
2463. The loss would be equivalent to the loss of 1,800 sheep? About that. A great deal of this loss would be saved by the construction of a railway here. The loss occurs between here and Carrathool, and happens almost every year, because the state of the stock routes does not allow us to get our sheep to market in good condition. I have here some estimates prepared in view of the visit of the Committee, which, with your permission, I will read. With regard to the tonnage of the district, we have estimated that from the Ivanhoe sheep district, described by Mr. Broughton, the imports and exports amount to, approximately, 5,200 tons, including wool, and holdings bordering upon the district would probably send another 1,000 tons. There are about fifteen homestead lessees within easy distance of the line. The probable number of fat stock which would be carried from the district would be 100,000 per annum, or, allowing eighty sheep to the truck, about 1,250 truck-loads. It is very hard to say what the passenger traffic would be; but we put it down at fifty persons a week. Parcels and produce not already mentioned, including such things as chaff, timber, fat, tallow, hides, &c., we have put down as giving a revenue of £2,000 a year. That is only a guess, but we thought that it would be within the limit. We have also estimated the probable revenue from the 100 miles of line within the district. 5,000 tons at 24s. a ton equals £6,000. Then there would be 1,250 tons coming into the district from (say) Hillston and that direction, where timber and flour is obtainable. That at 12s. a ton would amount to £2,000. The passenger traffic to the district, allowing for it as 2d. per mile per passenger, would give £2,000; the wheat, chaff, timber, and produce would give another £2,000; making in all £12,000 as the probable revenue from that part of the line running from the eastern to the western border of the sheep district.
2464. The Commissioners only expect to get £22,500 from the line altogether? I think it is probable that if they came out here they would modify their views. I myself generally pay from £1,000 to £1,100 a year for carriage;—half of that would go to the railway. By far the greater part of the produce I have spoken of now goes to Melbourne; but it would go to Sydney if the proposed railway were constructed, and stores would come from Sydney. The benefit to the graziers in times of drought would be enormous, because they would be able to remove their stock to more favourable districts. There are approximately 1,000,000 acres within 40 miles of Mossgiel which are suitable for wheat-growing. Then, too, no doubt, freezing and boiling-down works would be established here immediately upon the construction of the line. A large revenue would also be derived from the carriage of rabbits to the metropolis. Then, too, in the northern part of the district there is a large area of unoccupied Crown land, which, no doubt, would be made use of if the railway were made. The line would also open up the Broken Hill market to us. In the event of war, it would be invaluable as a means of concentrating the troops at any point within the eastern colonies. I think that is a very important matter, and, in my opinion, the Government should not lose sight of the immediate prospect of war and of the necessity of being prepared for it. The proposed line would also shorten the mail-route between Sydney and Adelaide, and would be a step towards connecting it with the railway system of Western Australia.
2465. Is it a fair thing to allow 14 bales of wool for 1,000 sheep? I think 15 bales is the minimum.
2466. How did you fix your rate? We took one-fifth of the through rate. We have only taken the stations within the sheep district.
2467. The homestead lessees would benefit by the construction of the railway in the same way as the pastoralist would benefit? Yes.
2468. How would a railway benefit the agriculturist? I think a railway would make it possible to grow wheat in this part of the world at a profit. I do not say that it would be done, because we have heard that

that there is an enormous area of land suitable for wheat growing nearer the metropolis. Still that will not preclude this country from being occupied, and it is possible that wheat may be grown here at a profit.

Mr.
C. J. Parsons.
22 Sept., 1896.

2469. But not yet? I think it might be grown now at a profit.

2470. Do you recognise the great amount of competition that this district will have to meet? Yes.

2471. It is not likely that the land here will be much occupied until the population of the Colony becomes greater? In America they grow wheat in the western states and carry it to the eastern states, a distance of 2,000 miles, at a profit. If they can do that, we should be able to do it.

2472. What effect would the railway have upon the reclamation of the waste lands of this district? I think it would make it possible for a great part of these waste lands to be worked at a profit.

2473. Can you tell us how this country can be reclaimed? I have seen small areas reclaimed, and I take it that if the thing can be done in a small way it can be done in a large way. I have seen small areas which have been cleared of rabbits go back to a better state than they were in before the rabbits came here.

2474. On what terms could you afford to take this land from the Crown? I should expect to get it for nothing if I undertook to put certain improvements upon it, and to bring it back to a state of productiveness.

2475. What term of lease would you expect? I do not think it would pay anyone to touch it unless he got a lease of seven or ten years.

2476. Would you want tenant right in improvements? Yes, in permanent improvements such as water, and clearing of scrub.

2477. If the State gave a man fifteen or twenty-one years lease of this land, would it pay him to take it without tenant right in improvements? That is a question very hard to answer offhand. My idea is that if the Government were to give this land for a certain number of years for nothing men would be found to put money into it and to bring it into a better state than it was in before. I think, however, that the tenant-right in improvements should be recognised.

2478. You heard the evidence about the way in which the rabbits had depreciated the value of this land. Did you think it was correct? Quite correct.

2479. You heard it stated that the country wanted a rest, in order to recover from the injury the rabbits had done, and that after a rest it would return to a better state than it was in originally? Yes; that statement refers to the scrub country.

2480. What effect have the rabbits had upon the frontage? They have completely cleaned out the frontage. I have seen these plains looking as if they had been swept with a broom, but the rabbits do not permanently injure the plain-country. They kill the salt-bush and the cotton bush, but the country comes back quickly.

2481. But it is injured to some extent? Yes; the edible bushes are destroyed.

2482. What pasture was here when you first came? It was all cotton and salt-bush country, with the usual grasses. There was corkscrew grass, silver grass, star grass, Mitchell grass, blue grass, and other grasses of which I have not heard the names.

2483. With the exception of corkscrew grass, almost all the original pasturage has disappeared? I can hardly say. The cotton-bush and salt-bush have almost disappeared; but grasses have come in their place.

2484. What is your present grass? This year the principal grasses are silver-grass, trefoil, and barley-grass. We have not had sufficient rain to bring up any of the good grasses that usually come at this time of the year.

2485. Are the white flowering plants we have seen edible? They are not bad fodder. They will last right through the summer, and sheep will keep in good condition upon them. If rain falls, however, they turn black and lose their nutritive qualities.

2486. They are better than nothing? I would say that they are a good second-rate feed for stock. Stock get very fat on a lot of these flowering herbs; but they are not so permanent as grass.

2487. They are not altogether valueless? No. The daisy that you speak of is very objectionable when it gets very thick, and for many years past the whole country has been taken up by dense crops of it.

2488. It takes the place of better pasturage, but it is not altogether valueless? I think that will describe it. It has been suggested to me that nothing would tend to bring the waste lands of this district into use more than a railway.

Mr. Francis Samuel Brush, grazier, near Mossgiel, sworn, and examined:—

2489. *Mr. Trickett.* You have been in the room most of the day—do you agree with the statements that have been made, or would you like to add anything? I agree with most of the statements that have been made. What I wanted to touch upon was the proposed route of the line. The northern route goes right through my holding, but I fail to see why the line should be brought across the Willandra. The district would be equally served if the line went direct to Ivanhoe. That would be a shorter and less expensive route, and it would not be necessary to cross the Willandra.

Mr.
F. S. Brush.
22 Sept., 1896.

2490. Would the line be likely to be affected by the billabongs? Not if it went as I suggest.

2491. The question with you is whether the advantage of getting to Mossgiel is worth the trouble and expense of crossing the billabong? Anyone who has been over the deviation will know that it is the most expensive line to make. It goes through flooded country, but we want a line that could be made as cheaply as possible.

2492. A line further north would be constructed in the same way as a line from Condobolin to Euabalong. It could be a regular surface line? Yes.

2493. What is the population of this place? I do not know. It is a floating population and consists mostly of carriers. It would be inconvenient to have the line coming through my holding. The question was asked this morning whether the lessees would give their land without compensation. I should be very much against doing so. I would claim compensation at every possible chance I got, because the more we do the more we are charged by the Crown. They have raised our rents all round, although we have done more in this district to destroy the rabbits than they have done anywhere else.

2494. You think that if a line is made you will have the betterment principle applied to you in the shape of an increase in rent? Yes. Any saving in carriage that the railway might allow of would not compensate for the loss of land.

2495.

- Mr. F. S. Brush. 2495. Where does your wool go now? To Melbourne, through Hay and Echuca.
2496. If the railway were made to Sydney would you send the wool there? I do not think there would be much difference in freight at the prices quoted, and I would send it in the cheapest way.
- 22 Sept., 1896. 2497. Do you think there would be any objection to a surface line of railway, unfenced, going through your run? Yes, it would interfere with the stock and there would be a chance of the grass being set on fire.
2498. Are you favourable or otherwise to the construction of a railway? I am very unfavourable to the construction of the proposed line.
2499. Do you think that the construction of a railway in this district would be an advantage or otherwise? It would be an advantage to the individuals in the district.
2500. Would it be remunerative to the State? I do not think so.
2501. Mr. Fegan.] What land have you? 73,000 acres of Crown land and 6,000 acres of stock route, I am renting 10,000 acres besides.
2502. What are you paying for the stock route? I do not remember just now.
2503. If your land was free from rabbits, how much would your rent be increased? I reckon that the cost of destroying the rabbits is about equal to what we are paying for rent.
2504. What is your present rental? About £450 a year.
2505. If the rabbits had not taken possession of your land, do you think you would be getting it for £450 a year? Well, I would not do any good myself if I had to pay more.
2506. Perhaps somebody else could? No, they could not.
2507. You are not in favour of a railway passing through your property in any shape or form? No.
2508. Could not a railway come from Hillston without touching your place? Yes.
2509. Do you know the proposed line all the way from Condobolin? From about Euabalong.
2510. Do you know it between Euabalong and Hillston? Fairly well.
2511. What would the engineering difficulties there be? Flooded land. The water goes all over the country to the south of the river. You cannot tell where it will go, it spreads out on to us at Mossgiel.
2512. Is it flooded about Hillston? Yes.
2513. Is the proposed route flooded? Yes, all about there.
2514. Would the line be flooded if it were taken further south, or if it were taken north of the billabong? It is all flooded country from Hillston close up to Mossgiel, where the deviation joins the original survey. The worst part is from Euabalong to Hillston and about half way to Mossgiel.
2515. How high does the water rise? It comes on to the stock route and they have to cut the fences and come in upon our land. That is a terrible thing for us now that we have the rabbits.
2516. Could the line be taken by any cheaper route than that suggested? I think it should be taken north of the creek.
2517. Would not such a line be away from the populated area? North of the creek the country is all well settled.
2518. Is not a large portion of it held under lease until 1918? Yes; but it is just the same on the other side of the billabong.
2519. South of the river at Euabalong there is a lot of land open for settlement? There may be land available in the Central Division.
2520. That must be considered in constructing a line? Decidedly.
2521. Do you know how far the country is flooded out from the river? No; but I know that all the country from the junction of the Willandra and the Lachlan is flooded country, and you are never safe on it. It is all subject to floods. The dam which they have constructed is doing just what it was expected not to do. It has stopped the water from running down the Willandra, but it was intended to keep the Willandra full.
2522. A line from Grenfell to Hillston would avoid a great deal of the flooded country? Yes, so far as the Lachlan is concerned. I was referring to the land fronting the Willandra.
2523. How often is that country flooded? I cannot say, but you never know when it will not be flooded I have been a constant visitor here for years, and resident for over twelve months.
2524. During that time how often has the country been flooded? I have seen it flooded three times.
2525. Has much damage been done by the floods? The roads get blocked and we lose stock. It would be much more serious if there were a railway.
2526. You think that the line should go to Ivanhoe instead of to Mossgiel? The Hay line serves all the country 50 miles up above Booligal. If the proposed line were taken further north it would serve more country.

Mr. Alexander Cameron, grazier, Mossgiel, sworn, and further examined:—

- Mr. A. Cameron. 2527. Chairman.] You recognise that a considerable portion of the dotted line shown on the map may be located on flooded country, and that a considerable portion of the direct line is also on flooded country? Yes.
- 22 Sept., 1896. 2528. If it were necessary to locate the line on firm ground, would it have to be kept on the north side of the Willandra? Yes, you would have drier country if it were kept on the north side of the Willandra; but a line there would not suit the district so well. If the line went direct to Ivanhoe it would escape the flooded country, but it would not suit the district so well.

Mr. Henry Capewell, senior constable of police, Mossgiel, sworn, and examined:—

- Mr. H. Capewell. 2529. Mr. Fegan.] What is the extent of your patrol? It extends 45 miles east, 35 miles west, 35 miles north, and 30 miles south of Mossgiel.
- 22 Sept., 1896. 2530. What is the population of that district? The figures for December, 1895, showed the population to be 531, including twenty-five Chinese.

WEDNESDAY, 23 SEPTEMBER, 1896.

[The Sectional Committee met at Cane Grass Swamp at 2 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.]

Mr. Albert George Little, surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

2531. *Chairman.*] You are engaged in locating the line from Condobolin to Menindie? Yes.
2532-3. You are engaged now purely as a surveyor, and have no information to give us in regard to engineering matters? None whatever. All engineering matters are decided by the Engineer-in-Chief.
2534. Did you start at Menindie? Yes.
2535. Will you describe the country you have come through? From Menindie to Bulla Bulka the country is very inferior. The line passes through a large area of flooded country, covered with lignum, until it reaches the Talywalka Creek. Thence on to Bulla Bulka the country is one stretch of heavy sand, with fair pastoral patches in places. From Bulla Bulka to Mossgiel it is good average western pastoral country.
2536. What grades are you getting? One in 200 is the ruling grade.
2537. Can you get that grade as far as Mossgiel? Yes. The limit of curvature is 20 chains.
2538. The line as you are locating it lies north from that laid down by the Department? I understand that the line originally laid down is subject to revision upon actual survey. We are not bound by the line shown on the map. That line shows only the exploration made by Mr. Stawell. We have to locate the line in the best possible place, connecting with certain points, such as Menindie, Bulla Bulka, and Mossgiel.
2539. *Mr. Trickett.*] What is the extent of flooded country? I suppose that altogether it would be 5 or 6 miles.
2540. To what depth does the flood-water cover that country? I suppose that for 3 miles there would be only about 6 inches of flood-water.
2541. What embankments will be required? I cannot say how the Department intends to build the line. The Engineer-in-Chief will decide all important engineering matters. The timber on the line is generally belar, pine, sandalwood, mulga, mallee, and needlewood, and the usual shrubs—blue-bush, salt-bush, spinnifex, &c. There are belts of box, but the timber there is useless for sleepers. On the banks of the Darling there is red gum.
2542. But you think it is extremely doubtful that any good timber will be obtained until the Darling is reached? Extremely doubtful.

Mr.
A. G. Little.
23 Sept., 1896.

[The Sectional Committee met at the homestead, Kilfera Station, at 8 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. George Williamson, storekeeper, Ivanhoe, sworn, and examined:—

2543. *Mr. Fegan.*] How long have you resided in the district? Twenty-seven years.
2544. What is your nearest railway station? Hay.
2545. What does it cost you to bring goods from Hay to Ivanhoe? The rate of carriage varies with the season. At the present time we can get goods carried for £2 10s. a ton. We held a meeting at Ivanhoe the other day, at which a statement was prepared with a view to its incorporation in the evidence. That statement, with the permission of the Committee, I should like to read. It is as follows:—

Mr. G.
Williamson.
23 Sept., 1896.

At a meeting held at Ivanhoe on the 7th September, 1896, it was unanimously agreed that a deputation should wait upon the Works Committee, who are shortly to visit the district for the purpose of taking evidence upon the proposed construction of a railway from Condobolin to Broken Hill, and that in the event of the Committee not visiting Ivanhoe, as is reported, that the deputation should wait upon them in transit (probably at Kilfera Station). A good deal of information in reference to the proposed line has been collected, and a committee of local gentlemen has been deputed to place it before the Sectional Committee in the form of evidence. The substance of the information collected is as follows:—

- 1st. That it is understood that the main object in the proposed construction of this line is to obtain the most direct route from Condobolin to Broken Hill, and also the route that offers the least obstacles to its construction, such as water-channels, flooded and swampy country, &c.
- 2nd. That, in the opinion of such an authority as Mr. C. A. Goodchap (late Chief Commissioner of Railways in New South Wales), only by following the most direct route, and the one which would be the cheapest of construction, could this line be constructed on a payable basis.
- 3rd. That a direct route from Condobolin to Broken Hill (as proved by the map) is by way of Ivanhoe; and, moreover, the least expensive, as by following this route the line would cross all high red ground, and would avoid the many creeks, low flooded country, and other obstacles that would have to be contended with in following the route at present under trial survey—viz., by way of Hillston and Mossgiel.
- 4th. That a line constructed by a direct route would divide the country between the South-western and Cobar railway in its centre, thereby opening up a greater area of country and bringing railway communication within reach of a larger area of rich agricultural land.
- 5th. That this Committee are of opinion that this portion of the district, being surrounded by a number of stations on highly profitable land, is entitled to some consideration, and would therefore suggest that it is desirable that a trial survey be made of the direct route, so that it may be proved which is the better line to follow.
- 6th. That, in conclusion, we feel it our duty to point out that the present trial survey is being taken through a vast area of flooded country and innumerable creeks and swampy land, which makes the construction very expensive, as the flooded country would necessitate the building of long bridges and embankments.

Mr. G.
Williamson.
23 Sept., 1896.

The following table shows that a large amount of wool and a large number of sheep (exclusive of large stock) would be tacked annually in the event of this line being constructed :—

Name of Station.	Distance from Ivanhoe.	Number of Sheep.	Wool-clip in Tons.	Stock Exported.	Goods (Tons) Imported.
Mount Manara	45	20,000	60	5,000	10
Baden Park	60	40,000	120	10,000	20
Marfield	35	44,000	132	10,000	22
Kew	86	16,000	48	4,000	10
Yallock	60	24,000	60	5,000	10
Kajuligah	40	16,000	48	4,000	10
Ticehurst	12	24,000	72	6,000	12
Conoble	28	60,000	180	15,000	30
Trida	45	30,000	90	7,500	15
Murrumbong	35	7,000	21	2,000	5
Mossiel	32	60,000	180	15,000	30
Boondara	40	35,000	105	9,000	18
Gardenia	10	24,000	72	6,000	12
Abbotsford	8	14,000	42	3,500	7
Kilfera	15	100,000	300	25,000	50
Clare	50	90,000	270	22,500	45
Manfred	52	90,000	270	22,500	45
Homestead lessees		100,000	300	25,000	50
Ivanhoe township					200
Totals.....		770,000	2,310	223,000	591

NOTE.—All figures to average.

Estimated exports in addition to above, and exclusive of cereals, about 200 tons per annum.

2546. How far do you know the country round about Ivanhoe? I suppose for 150 miles.
 2547. What is it like? It is good agricultural country, the whole of it.
 2548. Will it grow wheat? Yes.
 2549. Is it all taken up? No.
 2550. What kind of soil is there? Red soil chiefly.
 2551. Wool is your chief export? Yes. We also sell sheepskins, rabbit-skins, tallow, hides, and so on.
 2552. Is the country 9 miles from Ivanhoe flooded? It is not all flooded country. Sometimes it is flooded within a few miles of the town.
 2553. To what depth? To a considerable depth in places.
 2554. What is the chief reason why you want a railway—to give greater facilities for getting to market, or to encourage settlement? We understand that the Government intend to make a railway from Con-dobolin to Broken Hill, to secure the traffic of Broken Hill.
 2555. I suppose you have been for some time trying to secure better means of communication for yourselves? No; this is the first agitation for a railway that we have made. We thought before that however much we agitated we would not get a line. It is only because the Government contemplate making a line to Broken Hill that we are moving in the matter.
 2556. Have you paid more than £2 10s. a ton to have goods brought from Hay? I have paid as much as £12 a ton.
 2557. Not recently? Within the last twelve months we have paid £6 a ton. We are getting things cheaper now, because there are so many wool-teams going down.
 2558. How far are you from Hay? 135 miles. This is the only time that loading has been so cheap. The average rate of carriage from Hay is £3 10s. a ton.
 2559. Where do you get your stores from—Melbourne or Sydney? Chiefly from Sydney.
 2560. What does it cost per ton from Sydney to Hay? £6.
 2561. That makes £9 10s. from Sydney to Ivanhoe? Yes.
 2562. With a railway to Ivanhoe you would expect to get things more cheaply than that? Yes.
 2563. Do you think that the climate is suitable for the growth of cereals? Yes.
 2564. What is your rainfall? I suppose the average rainfall is 12 inches.
 2565. Is that a sufficient quantity for wheat? I believe that it would grow wheat.
 2566. Are any people here trying to grow wheat? Yes.
 2567. On a large scale? No.
 2568. Only for hay? Yes.
 2569. It is not sent to market? No, it would not pay.
 2570. Do you think that if a railway were constructed people would put more land under cultivation? A railway would open up any amount of country.
 2571. Do you think that with 12 inches of rain people could grow wheat at a profit? Yes, if the rain fell at reasonable intervals.
 2572. You have had very little rain for the last few years? Yes.
 2573. With seasons such as you have passed through, do you think you could grow wheat? I think so.
 2574. Have any holdings in this district been thrown up? Not that I am aware of. I should be likely to hear of it if any were thrown up.
 2575. So that the people are fairly prosperous? Yes.
 2576. Then why do they want a railway? They have been waiting years for the chance of getting a railway.

Mr. Francis Villa, general storekeeper, Ivanhoe, sworn, and examined:—

- Mr. F. Villa. 2577. *Mr. Hassall.*] How long have you been residing at Ivanhoe? About eight years.
 2578. What is the population of Ivanhoe? About 100, including everybody.
 2579. What are the occupations of the people there? There are carriers and general workers—contractors who go out to take work and leave their families in town.
 2580. What quantity of goods do you import yearly? About 100 tons. 2581.

23 Sept., 1896.

2581. Do you supply the surrounding stations? Some of them partly.
2582. And the homestead lessees? Yes.
2583. And the population of Ivanhoe generally? Yes.
2584. Do you know the country pretty well? I know it well between Ivanhoe and Hillston, and Ivanhoe and Hay.
2585. Do you know it towards Menindie? No.
2586. Do you know the country north from Ivanhoe? Yes, for 40 or 50 miles.
2587. What is it like? Red sandy soil mostly. Some of it is rich red loam. It is all scrubby land.
2588. What kind of scrub? Belar, Yarran, needlewood, and many other varieties.
2589. Any salt-bush? Yes, in places.
2590. Is it good grazing land? I do not know much about grazing; but it is covered with good edible scrub.
2591. Is it better or worse than the country between here and Ivanhoe? I think it is somewhat better. The country between Ivanhoe and Hillston, following a straight line to Roto, is much better than the country following a straight line from Mossgiel to Hillston. The soil is better and the country is more level, and it is not subject to flood.
2592. Are there no ridges or creeks to cross? No.
2593. Are there no engineering difficulties? No, none of any sort. I have travelled that road.
2594. Do you think the country is suitable for close settlement? Yes.
2595. Is there any chance of the resumed areas being taken up? I think it will not be long before the resumed areas all along the line from Ivanhoe to Roto will be taken up.
2596. Do you know if any of the resumed areas have been abandoned? I think in some parts the rabbits have done such serious damage that the station-owners have withdrawn their sheep.
2597. Are you aware that the resumed area of Albermarle has been abandoned? No. Albermarle is outside our sphere.
2598. What about Tolarno? That is also outside our sphere.
2599. Can you tell me why people would take up land here if a railway were made when at the present time they are abandoning it? Although the land is of very little use for grazing, it could, if cleared, be put to very profitable use for agriculture. At present, however, there is no market for agricultural produce.
2600. Are the soil and climate suitable for agricultural pursuits? Yes.
2601. Have you taken into consideration the fact that millions of acres of equally good, if not better, land are available much nearer to the metropolis? Yes; we are not agitating for a railway, but we find that it is proposed to construct a railway to Broken Hill, and that the trial survey takes a detour from Kilfera South. We cannot see what advantage a line 30 miles to the south of us will do, especially when by taking the line straight across a better and cheaper route can be obtained. If the Committee had travelled by the southern route in flood-time they would have seen what I mean. The country in the north is dry even in flood-time, and there are no engineering difficulties to be encountered. Then, by keeping the line to the north, you intercept a lot of traffic which would otherwise go on to the Darling, and so to Adelaide. Further, a line to the south would take traffic from the Hay line. I think the balance of advantage is in favour of the northern line. We are not here to advocate the claims of Ivanhoe to a railway, we are here simply to ask that the safest and best line may be made. Of course, there are only about 100 people at Ivanhoe; but we think that it would be better for the country generally that the line should be taken by the route I suggest. Speaking from a personal knowledge of the country between Ivanhoe and Hillston, I say that there can be no question as to the immense advantage of keeping the line on the higher ground. The soil there is better.
2602. *Chairman.*] What does it cost you per ton to bring stuff from Adelaide and deliver it in Ivanhoe, as compared with the freight from Sydney or from Melbourne? For the last six or seven years the average freight has been £10 a ton from Sydney. From Melbourne, if you get it up by river, you can land it in Ivanhoe for about £8 a ton. From Adelaide, the last lot I got up cost me £5 10s. It is only the uncertain state of the river that prevents me from always getting things from Adelaide. The agents can land my stuff from Melbourne to Hay for about £3 10s., but the freight from Adelaide to Wilcannia varies from £1 10s. to £2 a ton. Sometimes it is less than £1 10s. a ton. I have paid £2 10s. a ton, £1 being the railway charge and 30s. being the steamer charge.
2603. What is the rate of carriage from Wilcannia to Ivanhoe? From £4 to £5 a ton.
2604. What is the rate *via* Wilcannia to Melbourne? I could not tell you. They take goods for nothing from Adelaide to Melbourne.
2605. Does any stuff at all come from Melbourne, *via* Wentworth, to Wilcannia? Yes; but I deal straight with Adelaide. The charge from Ivanhoe to Adelaide, *via* Wilcannia, is £6 10s. per ton.
2606. You do not know what it would be from Ivanhoe, *via* Wilcannia, to Melbourne? No; but Sydney and Melbourne firms will land most stuff in Adelaide for nothing.
2607. So we may assume that it would be about the same from Melbourne as from Adelaide? About the same.
2608. *Mr. Hassall.*] Do you say that it will be more expensive to bring the line across the billabong? I have not the slightest doubt that from Ivanhoe to Roto would be the straightest route.
2609. The line could be constructed more cheaply by that route than by any other? Yes.
2610. What is the timber along there? I have seen good pine, belar, mallee, and box.
2611. Is there any timber on it suitable for railway sleepers? We have discussed that point. Some people say that it would not be big enough for sleepers, and others say that it would. In my opinion a lot of it would be valuable for sleepers; but I do not know much about the matter. I have pulled up belar which has been under the ground for a number of years, in flooded country, and it has been as sound as when it was first put down. With regard to ballast, near Roto there are many places where there are small stones, and in the vicinity of Ivanhoe there is a lot of metal.
2612. Is the Ivanhoe district in a pretty sound condition;—are the people fairly well to do? I think it would compare favourably with any other district.
2613. You have no cause of complaint, so far as your business is concerned? Storekeepers in Ivanhoe have been seriously affected by the parcel-post arrangements; but the district is fairly sound, and would compare favourably with any similar district in the Colony.

Mr. F. Villa. 2614. *Mr. Trickett.*] Do you think that any traffic would come to Sydney from west of Ivanhoe if a railway were constructed? I do not think so. Beyond Ivanhoe it would be cheaper to send to Adelaide.
 23 Sept., 1896. 2615. *Chairman.*] Have you any idea as to the amount of ballast that could be obtained in any place;—can you give us any definite information on the subject? No. I have seen it in different places, but I never took any exact account of it. I think the railway would take all the traffic from the country halfway between Ivanhoe and Wilcannia every year; and when the Darling was not navigable, all the traffic would come to the line.

Mr. John Cameron, manager, Marfield Station, near Ivanhoe, sworn, and examined:—

Mr. J. Cameron. 2616. *Mr. Trickett.*] How many years have you been here? Eleven years.
 23 Sept., 1896. 2617. What is the area of your run? We have about 247,000 acres of leasehold.
 2618. And how much freehold? About 1,700 acres.
 2619. How many stock do you carry? 38,000 sheep. That is a fair stock for the present season.
 2620. Was any of the resumed area taken from you? We threw up the resumed area.
 2621. It is now lying idle? Yes.
 2622. In what way has your run been improved? It is subdivided into 5-mile paddocks, and tanks have been put in each paddock.
 2623. Is it wire-netted? Yes, the whole of the leasehold is wire-netted.
 2624. Where do you send your wool? To Wilcannia when the river is running.
 2625. How far is that? Ninety-four miles.
 2626. When there is no river where does it go? We send it to Hay—171 miles. The freight to Wilcannia is £3 5s. a ton, and to Hay £4 10s. a ton. The average price of carriage to Hay is £6 16s. 1d. a ton.
 2627. How far would you be from the proposed railway? If the railway went 9 miles south of Ivanhoe, I should be 43 miles from it.
 2628. Do you think that your wool would be sent by the line instead of going to Wilcannia? Yes, there is no doubt about it.
 2629. Can you give us the name of other stations nearer you, the wool from which would come to the railway? I think Mr. Lloyd would send his wool to the proposed railway instead of sending it to Cobar. Then there would be the Kajuligah and Yallock wool, and wool from other places through here.
 2630. What is the distance from Cobar to your station? 164 miles.
 2631. We were told by the stock inspector at Hillston, that the carrying capacity of this country had decreased very much of late—is that your experience? Yes.
 2632. To what extent? Between 30 and 40 per cent.
 2633. For what reason? In the first place, on our station we have lost all the cotton and salt-bush and blue-bush.
 2634. How? Through the rabbits and by overstocking.
 2635. Has the depreciation been chiefly due to the rabbits? In my opinion it is principally due to the rabbits. The 1888 drought seems to have had a great effect upon this country.
 2636. Have you done much to cope with the rabbits? Yes, we are always working at them. We have always a staff employed to deal with them.
 2637. About what do you put down for rabbit extermination every year? It would cost about £350.
 2638. Do you see any probability of their extermination, or will this be a permanent charge? I think it will be an annual tax upon the station. You can keep down the rabbits so that they will not affect the feed to any extent, but they will be an annual tax.
 2639. What benefit would a railway be to you? In a bad season, when the stock got low, we could send them away quickly without serious loss. At the present time we are often unable to shift them.
 2640. Are you prevented by reason of your distance from market from sending away fat stock? Yes, to a certain extent, in some years. This year if we had had fat stock we could have got them away, because the stock routes were in fairly good order.
 2641. When feed is bad, to what extent does the stock depreciate by being driven to market? I should say fully 25 per cent.
 2642. With better means of communication you would be able to stock up more, and to get rid of your fat stock rapidly? Yes, providing we got the season. If we got two or three droughts we would not be able to do much.
 2643. What is the average number of good seasons here? About one good season to three bad seasons. That has been my experience for nineteen years.
 2644. Then this is not likely ever to be a very thickly populated country? Now that the rents have been reduced, the lessees might go in for ringbarking to some extent. There have been substantial reductions in rent.
 2645. Have you made any improvements of that kind? No; I have not started yet.
 2646. Have you done any ringbarking or scrubbing? Not to any extent, except in the smaller paddocks, such as the horse-paddock.
 2647. Do you go in for cultivating any part of your run? I generally put in about 120 acres.
 2648. For what purpose? I grow hay for the use of the station.
 2649. Is any part of your holding suitable for agriculture? Yes.
 2650. How much of the 200,000 acres? I think that in fair seasons any of it would grow fair hay.
 2651. Would it grow wheat? I have never tried it to any extent. I tried a little once, and threshed it out. It came out all right. That was in an exceptionally good season—1889.
 2652. Has anyone else gone in for wheat-growing in this district? Yes; I have seen very good wheat grown in the district.
 2653. Regular crops or casual crops? For two or three years they have threshed the crop.
 2654. Would it be only one crop out of three that would be good? I have had a crop worth cutting for hay every year since 1889. I daresay about one in three would be a good crop with rain.
 2655. Would one crop in three pay the farmer? I think it would pay him if he cut it for hay.
 2656. To send to Sydney? Yes; or to places along the line where the crops happen to have failed.
 2657. You talk about having to send your sheep away in bad seasons;—would that often occur, and would it bring much revenue to the railways? I think so. In that respect, a railway would be of great advantage to the back country.
 2658.

2658. Do you think that legislation should be passed to compel every one to deal with the rabbits? I certainly think so.
2659. All your wool goes to Melbourne? Yes.
2660. None of it to Sydney? Not at the present time.
2661. You heard the last witness say that the railway would not be likely to pay anywhere west of Ivanhoe; that that trade would continue to go to the river? Yes; I dare say it would.
2662. How are you supplied with water? Principally by tanks. We have two wells on the holding.
2663. Has there been any boring for water? The station bored for water to a depth of 860 feet, but they did not strike anything.
2664. *Chairman.*] Were they in bed rock at that depth? They got on to rock which the machine was not strong enough to go through.
2665. *Mr. Trickett.*] Do you think the district has gone back of late years? I think so.
2666. Does that remark apply to both large and small land-holders? I think it will.
2667. I suppose it is chiefly attributable to bad seasons and to the rabbits? Yes.

Mr.
J. Cameron.
23 Sept., 1896.

Mr. Herbert Lloyd, manager, Baden Park Station, sworn, and examined:—

2668. *Chairman.*] How far are you from Ivanhoe? I am 60 miles north of Ivanhoe.
2669. What stock do you carry? Between 30,000 and 40,000 sheep.
2670. What area have you? 208,000 acres leasehold and resumed area.
2671. You are in occupation of the resumed area? Yes?
2672. What are you charged for it? $\frac{1}{4}$ of 1d.
2673. What is your tenure? We have applied to have the resumed area attached to the leasehold area until 1918, and I believe that that is being done.
2674. You agree with what Mr. Cameron said in regard to the difficulty of moving stock in dry seasons? Yes. In addition to that I might say that buyers of stock will not come out as far as I am, because of the difficulty of travelling. We are subject to heavy loss in times of drought, and we are cut off from the ordinary trading facilities which people who reside near a railway have.
2675. Have you had any experience in farming operations? I have had a good deal of experience in Victoria, and a little here.
2676. How many crops have you had? We have had crops for eleven years past.
2677. How many crops have been successful? Five out of the eleven, I think.
2678. You heard Mr. Cameron say that wheat growers here might expect one crop in three. Is that evidence correct? I do not consider this a fit country for growing crops. The seasons are too precarious. I do not think that a person could make a living by growing wheat here unless he had irrigation. The rainfall is not sufficiently good.
2679. What does the rainfall average here? For the last ten years it has averaged 11 inches.
2680. What is the largest amount that you have paid for the killing of rabbits in any one month? The largest amount paid for the destruction of rabbits was up to 1888, when the Government insisted upon bonuses being paid.
2681. What is the largest number that you have paid for in any month? In January and February, 1893, we destroyed about 40,000 rabbits.
2682. Do you agree with what Mr. Cameron said in regard to the deterioration of this country in consequence of the rabbits? Yes. I think it has deteriorated about 50 per cent.
2683. What was the run carrying when you first came here? Up to 64,000 sheep. At present we carry about 30,000 sheep. The country is not good enough for cattle. In the early days we had abundance of salt and cotton-bush, and edible scrub was available.
2684. If the rabbits could be exterminated, how long would the country take to recover? A couple of years. The salt and cotton-bush will never come back, but equally good grasses might come.
2685. *Mr. Hassall.*] The cotton-bush and salt-bush are absolutely destroyed? Yes; every vestige of them has disappeared.
2686. *Chairman.*] After two or three years' rest you believe that the country would recover? Yes; but it will never be such country as it was when there was salt-bush.
2687. Do you use salt now? Yes; a little.
2688. Does the wire fence stop the rabbits? I do not think so. I do not believe in the present wire netting fences at all. They are not rabbit-proof.
2689. Do you think the mesh should be smaller? On these large areas, once the rabbits are there it costs as much to keep them down inside the netting as if you were not netted at all. I have had proof of that on a 10-mile block.
2690. Will the ordinary wire net fence stop the rabbits? It will stop the great body of them, but some are sure to get through.
2691. What is the rate of carriage from Ivanhoe to Wilcannia? I should think about £4 10s. a ton.
2692. And to Hay? It would average about £5 a ton.
2693. What would it be from Wilcannia to Adelaide? The rate fluctuates a good deal. I have known it to be as low as 35s. a ton, but £2 a ton is a fair thing.
2694. That would make it £6 10s. a ton from Ivanhoe to Adelaide? Yes.
2695. What is the rate from Hay to Melbourne? I do not know.
2696. What is the rate from Wilcannia to Melbourne? About £2 10s. a ton.
2697. Therefore, from Ivanhoe to Melbourne via Wilcannia is about £7 a ton? Yes.
2698. Any wool going from Ivanhoe to Sydney would have to be brought for less than £6 10s. or £7 a ton? Yes.
2699. What is the freight from Ivanhoe to Hillston? About £2 10s. a ton, I believe; but I have no definite information.
2700. If there were a railway to Hillston, and wool was carried from there at £4 a ton, you would be able to get it to Sydney for £6 10s. a ton, which seems to be the cheapest rate at present? Yes.
2701. If the railway were brought to Hillston, would the people in this district use it? I for one would not use it; but if the line were taken to Broken Hill as proposed I should make use of it.

Mr. H. Lloyd.
23 Sept., 1896.

Mr.

Mr. Richard Cappur Webb, part owner and manager of Kilfera Station, sworn, and examined:—

- Mr. R. C. Webb.
23 Sept., 1896.
2702. *Mr. Hassall.*] What is the area of Kilfera? 832,000 acres, including the leasehold and resumed areas.
2703. Have you had any homestead leases taken up? We have had one conditional purchase.
2704. What stock do you carry? Generally from 80,000 to 100,000 sheep.
2705. Is it good sheep country? Only part of it. Less than one-fourth is good sheep country.
2706. Is it sound country? Very.
2707. Does it grow a good quality of wool? Yes, when you get the grass.
2708. And good fleeces? Yes, in good seasons. Everything depends upon the seasons. You could grow the finest sheep in the world here, if you could feed them.
2709. Have you any difficulty in getting your fat stock away? In ordinary seasons we cannot send them away after the end of October. For eight months of the year we are practically prevented from sending stock away because of the want of feed on the stock routes.
2710. What is the rainfall here? The average for twenty-four years is 12 inches.
2711. Has the carrying capacity of this run deteriorated very much? Yes.
2712. Since when? Since the end of 1887, or the beginning of 1888.
2713. Was that the time of the first rabbit invasion? That was the time of the great rabbit invasion.
2714. Then you had the drought of 1888? That did not affect us so much. The rabbits did all the harm.
2715. What steps did you take in the first instance to deal with the rabbits? We trapped them and paid bonuses for their destruction.
2716. What has been your annual expenditure in destroying this pest? Our expenditure on account of rabbits in 1887 was £12,679 19s. 9d. That represents approximately 1,000,000 or 1,500,000 rabbits.
2717. Are you in favour of the provisions of the Rabbit Bill now before Parliament? Partly. I believe that men who are netted in should be left alone. You cannot deal with the rabbits where you have to employ labour. We could not deal with them here if we had to employ men in large numbers to dig them out or to trap them.
2718. What do you find the best way of dealing with them? In 1889 we started to give them poisoned water, and when I saw the results I said that that was all we could ever do. It is the only way to deal with them in this country.
2719. Perhaps you are exceptionally well situated as to the operation? In the worst years we have had 150 miles of frontage to the Willandra, taking all the little lagoons and lakes off it to fence.
2720. Did you erect 150 miles of fencing? We erect temporarily about 50 miles every year. Two good men will do a mile and a half a day.
2721. Since you began to poison the water are you able to cope successfully with the rabbits? It depends upon the summer. If we have a showery summer it upsets us; but if we get December, January, and February dry we can clear off the great mass of rabbits. The rabbits will then probably not trouble us to any great extent for two years.
2722. Where does your wool clip go? To Melbourne.
2723. What is the cost of conveyance? This year the lowest price is £3 10s. from here to Balranald and £2 12s. 6d. from Balranald to Melbourne.
2724. Is Balranald better for you than Hay? It is about the same to both places. The rate for greasy wool is £6 2s. 6d. and for scoured wool £6 12s. 6d.
2725. Have you sent to Sydney? No. This is the first year that we have sent to Hay. Before we have always sent to Balranald.
2726. Did you ever send to Wilcannia or to Wentworth? No.
2727. Do you get your return goods from Melbourne? No; we get a good deal from Sydney. We are practically equally distant from Balranald, Hay, Menindie, and Wilcannia, but the road to Hay is better than any of the other roads. It is better country and better water. Hillston is 35 miles nearer.
2728. Do you think that the construction of a railway to this part of the Colony will tend to its further development? Not in the immediate future.
2729. Do you think there is any prospect of agricultural settlement taking place in these outlying places? It would be impossible unless there was a gold-field or something of that kind to supply it.
2730. The people here could not compete with others nearer a market? No.
2731. Do you know the route that the proposed line will take? I know it fairly well.
2732. Do you think that the country a little further north is better than that through which the line runs? Further to the north the country is better for railway construction, but it is not such good land for settlement.
2733. It is higher ground, level, and not subject to inundations? Yes; but it is pretty well all scrub country. It is inferior country.
2734. For agriculture? It is inferior whichever way it is regarded.
2735. The resumed areas of several of the stations along the route have been abandoned? Yes.
2736. Do you think there is any possibility of their being taken up under present conditions? Not the slightest.
2737. The men who used to hold them would be quite as likely to do something with them as anyone else? Yes. As a rule they have left thousands of pounds worth of improvements upon them.
2738. But, finding it impossible to cope with the difficulties they had to surmount, they abandoned the land? Yes. The country is too heavily timbered. The soil is good enough, but it would never pay for the labour of taking off the scrub.
2739. Is the country thickly infested with rabbits? If you took off the timber you could manage the rabbits.
2740. Do you know the country from Hillston in towards Temora? No; not at all.
2741. In the event of a railway being constructed to Hillston would it be of any benefit to this district? It would if the rates would compare favourably with the Melbourne rates. Such a railway would help us in removing our stock a good deal.
2742. From how far west would people use the line? I do not think that people much further west than we are would use the line.
2743. Would the people of Ivanhoe use it? Yes.
2744. From how far south would people go to Hillston? From below Mossgiel. Mossgiel would probably

probably be on the dividing line. Running north towards Cobar the country is so inferior that you could not expect very much traffic from it. No doubt if the line came in this direction we would send our wool by it to Sydney. We are trading more and more with Sydney every year. If the line went to Broken Hill wool would come from places west of us.

Mr.
R. C. Webb.
23 Sept., 1896.

2745. You heard the evidence given to-night—do you practically agree with what has been said? No. I do not agree with what Mr. Lloyd said about the country recovering. This country was all salt and cotton bush when I came here fifteen years ago. Of course, if you have any very choice grass stock will always eat it out first. The salt bush and cotton bush have not disappeared through overstocking. We can carry in an ordinary season from 80,000 to 100,000 sheep. The stock all deal with the worst grass last. They like the cotton bush best of all, and they like the salt bush worst. Once the sheep eat the salt bush off, once they eat the leaves off it, it never grows again. That is on the red soil. On the blue clay the sheep can eat it down and it will grow again from the roots. In bad years the sheep simply live on their fat for five or six months. In such seasons they will eat belar or in fact anything. For two years after I came here, and up to 1887, we carried from 180,000 to 210,000 sheep, and carried them fairly well. 1887 was the best year I ever saw. We had 185,000 sheep here rolling fat; but in 1888 we lost 53,000 sheep. The country that has had the worst usage since I came here—country that has been greatly overstocked and has always had the most rabbits—is now the best we have if we only get good falls of rain. It has been trodden up like a ploughed field, and nearly always overstocked, but after a good fall of rain it will carry three sheep to the acre. The country is better to-day than it was fifteen years ago, so far as carrying sheep in fair seasons is concerned. I am speaking of the open country. I look upon the scrub country—the thick scrub country—as simply useless. Baden Park is one of the best runs about here, with nice pine ridges. There is no thick pine. On timbered country, once you eat out the grass it never seems to grow again to any extent.

2746. *Chairman.*] With regard to the scrub country the rabbits have eaten it out and it will take some years to recover; but they do no harm to the open country? Yes. The country round Hay was similar to this country twenty years ago. It was covered with salt bush and cotton bush. The salt and cotton bush country lasts the longest, because the sheep leave those shrubs to the very last.

2747. In the open plains once the rabbits have destroyed the country it is as good as ever? It is not as good as ever, because it will never have the salt bush and cotton bush again.

2748. *Mr. Hassall.*] The rabbits destroy valuable edible bushes which never grow again? Yes, the rabbits have spoilt the country as a lasting country. It is now simply a grass country. If we get a bad season there is nothing to stand by, but when the rain comes the grass comes.

2749. Before the rabbits came you had a lot of saline shrubs which kept the sheep in good condition, but since the invasion of the rabbits those shrubs have disappeared? Yes. We have much finer grass now; but we have not the shrubs as a stand by.

2750. Is any ballast or timber obtainable in the district? There is timber about Hillston and Mount Hope. You can get ballast on Manfred, and on this run about 14 miles direct north from the line. The ballast I speak of is a sort of granite rock. You can get conglomerate water-worn rock, but it is further away.

2751. Would there be much stripping? No; but the rock is rather large. It is not gravel. On Manfred you would get ballast within 4 miles of the line.

2752. *Chairman.*] Do you believe that the question of artesian water has been thoroughly tested in this vicinity? I know of it only from hearsay. I do not believe that it has been thoroughly tested.

2753. *Mr. Hassall.*] Do you think another trial might advantageously be made? Yes. I think they should go down 3,000 feet.

2754. Do you say that in face of the fact that the geologists believe that they have got down to the primary rock? We have found the geologists wrong in many points before, and they may be wrong again. From what I have heard it pays the contractors to go about 1,200 feet and then stop. The bore gets a bit crooked and difficult to work, and then it is time to stop.

2755. Do you think the district has never had a fair trial in this respect? Yes; and there may be some truth in the report that the men do not want to go any further.

2756. Is there a mallee belt extending from the north of Euabalong West, about 8 or 10 miles north from Willandra, to some place north of Mossiel? That belt of mallee runs right down to the South Australian border. As far as my knowledge of the country goes, the map before the Committee (Hay district map) is correctly noted.

2757. I believe you are a great believer in wire netting? Yes; I do not contend that it absolutely prevents the rabbits from getting across the country, but it checks them. It stops all waves, though a few will get through. We have a 100-acre paddock in which we could grow a good hay crop, though there are thousands of rabbits outside.

2758. How, in your opinion, should the State deal with abandoned areas in the western country? It is difficult to devise any scheme under which they could be occupied advantageously to the State. We have only recently purchased a station known as Yallock. The resumed area was abandoned; but there are 138,000 acres of leasehold completely fenced and watered with a valuable well, woolshed, and all necessary buildings. The plant on the place could not be put there for less than £1,000. It embraces engines, saw benches, pumps, drays, ploughs, scoops, and household furniture and utensils. We paid £700 cash for the whole property, including some horses and sheep. This property was sold in 1886 or 1887 for £32,000.

SATURDAY, 26 SEPTEMBER, 1896.

[The Sectional Committee met at the homestead, Bulla Bulka, at 7.30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Angus McCallum, overseer, Tolarno Station, sworn, and examined:—

- Mr. 2759. *Chairman.*] What is the area of Tolarno Station? A little over 900,000 acres.
A. McCallum. 2760. How many sheep does it carry? About 100,000.
26 Sept., 1896. 2761. How long have you been here? About nine years.
2762. Have you grown any crops here? No; I cannot give you any information with regard to the crop growing here.
2763. Where have you seen crops grown? At Tolarno.
2764. What sort of crops do you get there? Very inferior.
2765. Is the climate suitable for growing crops? No.
2766. The country which the Committee have passed through to-day appears to be open belar country and undulating plains? Yes; to the south there is inferior country, with mallee and small belar belts.
2767. The good country seems to extend about 6 or 8 miles beyond Bulla Bulka—beyond that what is the country like? It is covered with mallee and porcupine, and small belar flats.
2768. And from there to Menindie? Box flat country, principally.
2769. Fairly good country? Yes.
2770. What is the rainfall here? Twelve inches is about the average for the last five years.
2771. With regard to the lake system here, I understand that there is a dam intercepting the water coming down the Tulyawalka from the Darling, and sending it along various creeks until it reaches Ratercatcher's Lake—how often have you known the water to enter Ratercatcher's Lake? I have no definite information; but, I believe, about six times during the last ten years.
2772. Do you know the country south from Sayer's Lake towards the Willandra? No.
2773. Would there be much difficulty in joining Sayer's Lake with the Willandra? I could not say.
2774. How many tons of wool do you expect to get from your 100,000 sheep? This year we have shorn only 86,000 sheep, and we will get about 1,350 bales of wool,—900 greasy and 450 scoured. The greasy wool weighs about 3½ cwt. a bale, so that there would be about 6½ bales to the ton. The scoured wool weighs about 2½ cwt. to the bale, and about 8 bales go to the ton. Therefore, we will have about 150 tons of greasy and about 56 tons of scoured wool, or a little over 200 tons altogether.
2775. What is the ordinary freight from Menindie to Melbourne? This station sends its wool to Port Adelaide.
2776. What is the cheapest rate to Port Adelaide? I do not know.
2777. What is the rate from Menindie to Melbourne? I have seen wool taken from £2 5s. a ton.
2778. That is a low quotation? About £3 a ton is the ordinary quotation.
2779. Is it cheaper to send to Port Adelaide? I think so, but I would not be quite certain. This is a South Australian owned station, and no wool has ever gone from here to Melbourne.
2780. *Mr. Hassall.*] You know the country through which the proposed line will run? Yes.
2781. What do you think of the project? I think it is a very stupid one. I do not see what benefit the line would do to anyone.
2782. Do you think it would serve neither pastoralist nor agriculturist? No.
2783. Are there many homestead leases on the resumed area of Tolarno? Yes, a great many on the Darling.
2784. They have river carriage? Yes.
2785. Are there any homestead lessees in the back country? Yes; four homestead leases were taken up this year about 25 miles from here. They are about 70 miles from the river.
2786. Are they improving the land? No, they are not doing anything.
2787. *Chairman.*] How do you get to Port Adelaide? By river as far as Murray Bridge, and thence by railway.
2788. How far is Murray Bridge from Port Adelaide? I think about 90 miles.
2789. What is the freight from Menindie to Murray Bridge? I cannot tell you.
2790. *Mr. Hassall.*] How will the homestead lessees out back get to a water supply? They will have to sink tanks.
2791. Is it good holding ground? Yes.
2792. What sort of grass country is it? Very good grass country. It will carry a sheep to 10 acres. If you improve it and subdivide it it will carry so many more sheep.
2793. Is this good drought-resisting country? No.
2794. In times of drought your pasture fails quickly—you have no good grass here that will stand tugging at? No.
2795. Where do you truck sheep going to Adelaide? At Mingary.
2796. How far is it from here? About 170 miles.
2797. What is done with them at Adelaide? They are sold at the sale yard.
2798. How far is it from here to Broken Hill? About 125 miles.
2799. You could truck from there? But it is cheaper to truck at Cockburn.
2800. Where do you send your live stock? To Broken Hill and to Adelaide. This year we sent a lot to Sydney.
2801. Which way would stock go to Sydney? They were trucked at Carrathool.
2802. How far is that from here? I am informed that it is about 200 miles.
2803. Did you send many sheep there? Only one flock—3,000 altogether.
2804. I suppose they deteriorated very much in going down? Yes.

2805. How much per cent? I could not say. I was not on the station at the time.
2806. Do you think the railway would be of any advantage in enabling you to move starving stock? I cannot see that it would. As a rule, anyone who has sheep up here for sale in bad seasons sells his strongest sheep because he gets a better price for them. They put the sheep they want to sell into the best paddocks. None of the stations round here would ever bother about sending sheep away.
2807. It would not pay? I do not think so.
2808. In a bad time I suppose a squatter hangs on to his stock until it is too late to send them away? Yes; they would not be worth sending away.
2809. *Chairman.*] What would you have to pay to send wool from here to Menindie? The sheep carry their own wool from here to Tolarno. They are all shorn at the head station on the banks of the river.
2810. *Mr. Trickett.*] Do you see any possibility of this back country being used for agriculture? I do not see the slightest chance of it.
2811. The rainfall is too small? Yes.
2812. To what depth have you sunk wells in order to get water? I do not know what sort of wells they have on this side of the river; but on this station there are no wells to speak of because of the lake.
2813. How far do you drive your sheep to get them to water? About 8 miles is the greatest distance. In other places they have to be driven 14 miles.
2814. Are you using the resumed area? Part of it.
2815. Is it fenced or improved in any way? It is fenced.
2816. What do you pay for it? I cannot say.
2817. Have any attempts been made to obtain water by boring? They are making their second bore now, and are down about 1,100 feet. The first bore went down 1,500 or 1,600 feet, and then they gave it up. There have been no results from the second bore yet.
2818. *Mr. Fegan.*] Are the resumed areas watered by dams? Yes; part of the land is improved.
2819. If anyone took up the land that was improved he would have to pay for the improvements? Yes.
2820. Have many of the edible shrubs disappeared in consequence of the advent of the rabbits? Yes.
2821. I believe that while the daisy-weed is not absolutely valueless it takes the place of more valuable pasture? Yes.
2822. How many horses on the run are blind? I could not tell you. My theory is, that the horses eat the rabbit-dung which gets mixed in with the grass at the edge of the lake. I believe the disease is not contagious, and it does not affect horses drinking at a tank. Horses, when they come in for water at a lake, stop to feed close by; but when they come to a tank they simply take a drink and go away again, because there is no grass round the tanks.
2823. Would 6,000 head of stock be sent away from here in the year? That would depend upon the year. In a good season I suppose quite that number would be sent away; but a good season may occur only once in five years.

Mr.
A. McCallum.
26 Sept., 1896.

Mr. George Jamieson, station employe, Tolarno Station, sworn, and examined:—

2824. *Chairman.*] How long have you been living in the district? Since 1879.
2825. What is your opinion with regard to the possibility of agriculture here? I should not think that the country was adapted for agriculture, because of the small rainfall.
2826. Have you seen any wheat growing in the district? No, not in this part.
2827. Is wheat ever grown here for hay? Yes.
2828. With what result? Sometimes there is a fair crop. About once in five years there is a fair crop.
2829. Have you seen the lakes dry? Yes.
2830. All of them? Yes; all the lakes on this and the adjoining run.
2831. Have you seen Ralcatcher's Lake dry? Yes.
2832. Have you seen Sayers' Lake and Bulla Bulka dry? I saw Bulla Bulka dry in 1885 or 1886, and it was nearly dry in 1879.
2833. When was the dam put on the Talywarka? I cannot tell you. Before I came here.
2834. Do you know the country between the end of the Willandra and south of Sayers' Lake? I know the country well between here and Killera.
2835. Is it low-lying and swampy? In most places.
2836. Would there be any difficulty in joining the head of the Willandra with Sayers' Lake? I do not think so. I believe it is all level country, but I have no information which would enable me to give a definite opinion upon the subject.
2837. How many fat stock have you sent away every year? Last year we sent 3,000 to Sydney, and about the same number to Adelaide.

Mr.
G. Jamieson.
26 Sept., 1896.

TUESDAY, 29 SEPTEMBER, 1896.

[The Sectional Committee met at the Court-house, Menindie, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Willie Davies, Accountant and Secretary to the Menindie Boiling Down and Meat Preserving Company (Limited), sworn, and examined:—

2838. *Chairman.*] How long have you been living here? Two years. Five years previously I was living near Broken Hill, which is practically in the same district.
2839. Where do you send the produce of your works? Hitherto we have sent to Adelaide.
2840. What is the freight from here to Broken Hill? From 50s. to 65s. a ton. Sometimes it has been impossible to obtain carriage at all.

Mr.
W. Davies.
29 Sept., 1896.

Mr.
W. Davies.
29 Sept., 1896.

2841. What is the freight from Broken Hill to the Border? The freight from Broken Hill right through to Adelaide is about 37s. 6d. a ton. That is for skins and wool. The consignees have always paid freight.
2842. Then from here to Port Adelaide by that route the freight would be about £5 5s. a ton? Yes, quite that.
2843. What is the freight from here to Murray Bridge? 15s. per ton.
2844. What is it from Murray Bridge to Adelaide? It depends upon the class of goods. The freight for tinned meat averages about 15s. a ton.
2845. That would be £1 10s. a ton for the whole distance? Yes.
2846. Do you send anything to Melbourne? No, the duty shuts us out of Melbourne.
2847. What would be the wool freight from here to Adelaide via Murray Bridge? It would be practically the same.
2848. Would £5 5s. represent the wool freight to Port Adelaide by way of Broken Hill? I think so.
2849. Do you send anything from here to Port Pirie? No.
2850. Can you get stuff to Adelaide as cheaply as to Port Pirie? Not quite. I think the freight to Port Pirie would be about 10s. a ton less.
2851. That would make it about £1 15s.? Yes.
2852. Do you know how much the Silverton Tramway Company get? No.
2853. From how far up the Darling does wool go to Murray Bridge? From nearly as far as Bourke.
2854. Is there one rate right through? The wool is carted to Wilcannia, and the rate is from Wilcannia.
2855. Is the rate the same from Wilcannia to Murray Bridge as from Menindie to Murray Bridge? It might be within 10s. a ton. It depends upon the height of the river.
2856. Have you any statement to make with regard to the enterprise with which you are connected? I have made it my business to ascertain the available surplus of stock in the districts to which we have access. By looking up the Government returns for the year before last, which are the latest printed returns available, I find that in the Menindie district there are 1,910,060 sheep.
2857. What district does that join on the east? I think it takes in Albemarle and Tolarno. Albemarle extends 50 miles east from the river. On the west the district extends to the South Australian border, a distance of about 130 miles.
2858. How far does it go south? To the bottom of Netley Station, about 45 miles from here.
2859. And how far north? To the northern boundary of Corunna, about 150 miles from here. South of the Menindie district is the Wentworth district. We draw sheep from that district because the South Australian and Victorian stock duty put up a barrier against their entry into those colonies. The number of sheep in the Wentworth district is 676,979, in the Wilcannia district 1,972,252; in the Wanaaring district 1,528,213; and in the South Western Queensland district 1,500,000; or in all 6,720,504.
2860. Do I understand that meat works are in existence at Wilcannia and at Bourke? Yes; but we have drawn supplies from all the districts I have mentioned. The natural increase of the sheep is at least 40 per cent. That gives an annual surplus of about 3,000,000 sheep. We estimate that we could buy 10 per cent. of that number, if we had facilities for getting our produce away from the works. We have not been able to do as much work as we could have done with proper facilities. Our operations comprise boiling down and meat preserving. New works have recently been erected and machinery is now being put up to increase the meat preserving business. If we bought 10 per cent. of the surplus sheep in the districts I have named, we should have an output of about 5,000 tons. The average weight of meat in a sheep is 6 lb., of fertiliser 10 lb., of tallow 10 lb., and the wool and skin should weigh 10 lb. Therefore, 300,000 sheep would give 5,000 tons of produce.
2861. What would be the tonnage of your inward supplies? We import meat cases, tin plates, tallow pipes, and now and again machinery. That comes to about 750 tons of packages.
2862. Would there be anything in the way of feed? There will be breadstuffs, &c., to maintain the population that the works will draw round them; but I have no definite figures about that. We could also preserve fruit and vegetables with the appliances that we use for dealing with meat. The processes are identical.
2863. Where do you propose to get your supplies of fruit and vegetables? Other witnesses will point out what can be grown here, and the irrigation aspect of the case.
2864. Do you deal in rabbits? Yes; during the last six months from 2,000 to 3,000 rabbits have been delivered every week.
2865. Is there a demand for potted rabbit? Yes, a greater demand than for any other form of preserved meat.
2866. Supposing a vast number of rabbits were available, could you sell them as tinned meat? We had inquiries the other day for 10,000 cases of rabbits. Forty-eight full-grown rabbits go to the case.
2867. Is there an unlimited demand for tinned rabbit? Yes, and there has been for the last two years. Ever since I have been at the works there has been a continual demand for tinned rabbits. We cannot get nearly enough rabbits.
2868. Why? There are no means of getting the rabbits brought in from a greater distance than 15 or 20 miles, and then only along the main road. The men engaged in the business of catching rabbits have so many difficulties to contend with. The rabbits often go bad before they get them to the works.
2869. You also deal in wild fowl? Yes; there is a great demand for preserved game.
2870. What sort of a supply have you? It is very irregular, and depends upon the state of the river. When there is plenty of water, wild fowl are abundant.
2871. Does the trade amount to much? It has not amounted to much in the past, because the river has been very low and there has been nothing to bring the wild fowl about.
2872. How many men will you employ at the works when they are completed? At least 200.
2873. What do you pay for the rabbits? One penny each for carcasses. The men keep the skins and get on the average about $\frac{1}{2}$ d. each for them.
2874. Can they live on that? They can make very good wages. One man has been making £3 a week. He is an expert trapper and has had five years' experience. If we had ready means of obtaining them we would enter into large contracts.
2875. Do you know what the state of the Darling has been for a period extending over a number of years? I know nothing of the condition of the river prior to my arrival here.

2876. How long does it take to get to Menindie from Murray Bridge, when the Darling is in good condition? From eight to fourteen days. I have known stuff to be three months coming up the river.
2877. Has the river been up pretty well during the last three years? No; it has been down nearly the whole time. For eight months last year navigation almost ceased, or else freights were up £4 per ton, so that it was almost impossible to send away anything at a profit. I came here in October two years ago, and from then to the following February the river was good. During that time 131,000 sheep were killed at the works.
2878. What freight did you pay when the river was good? From £1 5s. to £1 10s. Navigation ceased in April, and we were not able to ship anything then until January of this year. During that time all the stuff had to be sent by team to Broken Hill, and tallow, pipes, and woolpacks were brought out from Broken Hill. This meant turning away a lot of business, and although the stations round about were very anxious to have their sheep treated, it was impossible for us to undertake the work.
2879. If the railway had been constructed you would have used it to get either to Sydney or to Adelaide, whichever paid you best? Yes; we would have sent the produce to the best market.
2880. If Sydney had been a better market you might have paid a little more to get there? Yes.
2881. When the river was up, would you use the railway? It would be simply a question of freight and the interest on the value of the produce in transit. If you had a very valuable consignment of goods which it might take weeks to send down the river you would probably find it more profitable to send it quickly to market by railway.
2882. What is the freight from here to Echuca? About the same as to Murray Bridge. The South Australian and Victorian railways compete against each other for the trade.
2883. Are there any other works in the Western District similar to these at Menindie? Yes; works owned by the same company have recently been erected at Wilcannia.
2884. What effect would the railway have upon them? It would enlarge the scope of operations.
2885. Produce from Wilcannia would probably make for Menindie rather than Cobar or Broken Hill? Yes.
2886. Could they get to Menindie more easily than to Cobar or to Broken Hill? Yes; the distance is less, and the road will be better.
2887. Do you know what the carrying rate is from Wilcannia to Broken Hill? From £5 15s. to £20 a ton, according to the state of the road. I never heard of it being less than £5 15s.
2888. What would be the road carriage to Menindie? We have done that work with our own teams; but I have not heard any rates quoted. It would be done, I expect, for about £3 10s. a ton.
2889. What would be the rate from Wilcannia to Cobar? I do not know.
2890. What is the rate by river from Wilcannia to Menindie? From 12s. 6d. a ton. That is the rate we always pay.
2891. If the river were up you would use it? Yes.
2892. The river must beat the road carriage to Broken Hill? Yes.

Mr.
W. Davies.
29 Sept., 1896.

Mr. Ryan Charles Besley, manager, Menindie Boiling Down and Meat Preserving Company, sworn, and examined:—

2893. *Mr. Trickett.*] How long have you been here? I have been living here about three years, but I have been in the district for about seven years.
2894. As a grazier? As a grazier and stock-buyer generally.
2895. How long is it since you commenced operations in connection with meat-preserving? It must be nearly four years.
2896. You commenced in a small way? Yes, in a very small way; simply boiling down at first and canning the tongues. We fellmongered some of the skins, and sent the wool away scoured.
2897. You are now enlarging your business? Yes.
2898. How much are you spending? We are spending over £20,000 in plant, machinery, and buildings to carry on meat-preserving, fellmongering, and the working up of by-products.
2899. What can you turn out? From 5,000 to 10,000 cans a day. We can make and preserve that number of tins in a day. Of course, if we are filling 6-lb. tins we turn out fewer in a day than if we are filling 1-lb. or 2-lb. tins. We can make any shape and any size tin.
2900. Do you think this will be a continuous industry in good and bad seasons? Yes.
2901. What is your reason for thinking so? In very dry seasons like the present we would have more difficulty in getting sheep than at any other. We are now able to keep going both with sheep and cattle. The cattle come principally from Western Queensland. We buy them on the runs, and they follow down the Paroo, and from Wilcannia come along the river. We can always get them that way because there is always water in the river. We have purchased 5,000 cattle to be treated here, and these cattle are now on the way from Queensland. If we wished we could buy from 50,000 to 100,000 cattle straight away. At present, however, we cannot take large contracts, because we are not sure that we shall be able to deliver upon the date specified. In a good season we have an abundant supply; but even in a bad time we can get quite enough to keep us going. The stations round here are hemmed in. They cannot send stock to either South Australia or Victoria, because of the Border tax.
2902. Your industry may be looked upon as providing a good outlet for surplus stock in good seasons, and for all stock in bad seasons? Yes. In bad seasons they have to send their stock to us, and in good seasons they have such a large number that they are glad to sell us the surplus.
2903. It has been stated that the proposed railway, if constructed, would be valuable in carrying away thousands of starving stock to other parts of the Colony? A large number of stock could be sent away; but the class of stock that we kill are to a great extent old stock, which it does not pay to send away. It would not pay to send away old ewes or wethers.
2904. If the meat is sent away in tins the railway will not obtain so much revenue as if it carried live stock? No; but our works will consume a very small portion of the entire live stock of the district. We may boil down 500,000 or 600,000 sheep; but there will be tens of thousands of other sheep to be sent away.
2905. Is not a drought generally universal? Then the sheep die on the runs.
2906. But suppose they were sent away by railway? They would be sent to the various meat-works.
2907. Not to better grazing-land? They would send a good many away to other parts, because there are places which can carry more stock in these dry times than we can.

Mr.
R. C. Besley.
29 Sept., 1896.

Mr.
R. C. Besley.
29 Sept., 1896.

2908. Is it your experience that the shifting of stock pays? It pays sometimes to shift stock from the north of South Australia to the south. A big rain, say 2 inches, may come at any time, and then they can bring them back again.

2909. You are convinced that the industry in which you are engaged will be successful? Yes, I am sure of it. It will increase to three times the size that it is now if we are able to get the stuff away. This year we refused a contract with the Indian Government and several English contracts because we could not make sure of getting the stuff away in time. In all these contracts they bind you to send away so many thousand cases per month. Of course, if the river goes down, and you are prevented from sending your stuff away, that cannot be regarded as an excuse for breach of contract. One of these contracts amounted to thousands of pounds, and would have suited us very well. It was simply for the supply of beef and mutton.

2910. Are the figures given by Mr. Davies correct, so far as you know? Yes, I think so. It would be impossible to send stuff to Cobar from Wilcannia. You could not get it there for less than £8 or £10 a ton, and we could not afford to pay that.

2911. What could you pay a ton to send stuff to Sydney by railway? It would pay us to give the railway from £2 10s. to £3 a ton rather than continue to send it at the present rates to Port Adelaide. Large consignments run into a big sum of money, and we are completely out of this money until the stuff gets to Port Adelaide. If you could put it into Sydney in a day or two you could draw against it, and thus get the money to buy more stock. With a railway you could turn over your money more quickly.

2912. You could afford to pay even a higher freight to send to Sydney by railway than you now pay to send to Port Adelaide? Yes. Then, too, at Murray Bridge the goods get knocked about a good deal; whereas, if there were a railway, we could put them on the trucks ourselves, and they would go straight to their destination without handling or transhipment. At the present time our goods are very often left exposed in the hot weather, and tallow will not stand that.

2913. Could anything be done to prevent the trade going down the river? If the river was not snagged the traffic would have to go to the railway. From here to Wentworth the river is getting very bad. They are putting up the rates of insurance and everything else.

2914. If the river were left alone people would use the railway? Yes. In my opinion it will take half as much to snag the river as would make the railway. You have to keep working at the snagging all the year round.

2915. From what distance would graziers send stock to your works? In ordinarily fair seasons we get large quantities of stock from distances of 400 and 500 miles. We buy and sell our stock. At Bourke they buy nothing; they simply boil down on contract, and work for the good of the stations. We could take large quantities of stuff from southern Queensland, and we have now the offer of a great many sheep which we think of bringing down from there.

2916. In dry weather, can the sheep travel any distance? Coming from Queensland they follow the Paroo to Wilcannia, and then they follow the Darling.

2917. How far could you bring sheep from outlying stations? We could bring them from South Australia, and from places 50 or 60 miles to the east. All the Albemarle sheep came in from Victoria Lake to the river to be shorn this year, although it is a very bad season. The track that the Committee came over is an exceptionally bad one for stock.

2918. On what run is Menindie situated? On Kinchega.

2919. Is most of the land that the railway would pass through taken up by graziers and homestead lessees? A lot of it is open for selection, but it is held by the stations. I am quite sure that a very large quantity of wool would be sent in from here. At the present time wool is often carted from Menindie to Broken Hill. Although the freight is as high as £3 a ton it pays. Whenever the river was down the wool would go to Sydney, if there were a railway. It would never pay people to send to Broken Hill, and then to Adelaide. Adelaide is a small place, and there are not the same number of buyers there that there are in Sydney. Then, too, a great quantity of goods would be brought over the line. Sydney being a free port we can buy more cheaply there than in Adelaide, and, indeed, we buy a great quantity of our stuff there now. All our machinery was bought in Sydney, but everything bought in Sydney has to come *via* Adelaide.

2920. What do you think of this country as a grazing country? I think it is a first-class grazing country. We are subject to droughts; but it is first-class country. A proof of that is the number of sheep in the district. We have now had three really bad winters, so that this is the worst year we have had for fifty years. In ordinary seasons this is sound good country for sheep. They are subject to no diseases, and their wool is second to none.

2921. Could you assist grazing with agriculture here? Yes; I am satisfied that there is a good deal of this country which could be irrigated at very little cost.

2922. Then why has it not been irrigated? I do not know. We have got the Government to offer us a lease of Lake Pamamaroo. If the country was flooded it would afterwards carry ten times the number of stock that it now carries. Some of these lakes are very large, and go back from the river 15 or 20 miles.

2923. The inhabitants of Menindie once advocated a railway from Menindie to Broken Hill;—does that project still find favour? Yes. Both the Broken Hill and the Menindie people are very anxious to have a line made. At Broken Hill an immense quantity of wood is used, and they would use ten times as much there if the cost could be reduced from 18s. to about 10s. a ton, as it could be if there were a railway. They use wood in the furnaces in place of coal, and no doubt they would be able to get sufficient timber along the line to keep Broken Hill going for many years.

2924. Which way would goods go to the seaboard if a railway were made right through? They would go to Sydney if the freight were the same. The Silverton Tramway Company and the South Australian Government have cut their rates lately. The strong opposition of these people is a proof of what a railway to Sydney would do. There is very strong opposition to the proposed line. I feel certain that a line from Menindie to Broken Hill would pay well from the start. With regard to the other portion of the proposed line, I do not know much about it.

2925. A line from Menindie to Broken Hill would take timber, hay, and produce from the river to Broken Hill? Yes. Vegetables, fruit, and produce could be grown in abundance along the banks of the river if the Broken Hill market were available. Then, too, if the line were constructed, large quantities of low-grade

grade ores would be treated in Menindie. Of course, if the line stopped at Menindie the river would have to be snagged, and it would have to be kept snagged. Nearly the whole of the wool from Western Queensland comes down to Wilcannia, and a through line to Sydney would catch all that traffic. Wool which gets in early obtains higher prices than wool coming in late in the season, and people would be willing to pay extra freight in order to be in time for the first sales.

2926. Have you had any experience with irrigation? Only on a very small scale.

2927. Do you think irrigation would be successful here? We have told the Government that if they will offer us the Pamamaroo Lake for twenty years at a fixed rental we will spend £500,000 upon it as an experiment in irrigation.

2928. At the end of the term would you want to be paid for the improvements you have made? We should want a renewal of the lease. We would not care about handing it back again.

2929. Do you know of any accidents having occurred through the bad state of the Darling? Yes. Only a fortnight ago there was an accident near Tolarno, when a great many bales of wool were considerably damaged. As far as the river trade goes, we have been able to get the rates down to 15s. a ton. When we came here it used to be £2 10s. and £3 a ton; but as we had a large quantity of stock to send, and kept two boats going, we were in a position to have our rates very considerably reduced. It is hardly fair to call the rate I have spoken of the general ruling rate, because other people cannot have their goods taken at the same price. The ordinary grazier has to pay a much higher rate.

Mr. Wellington Coates, meat expert, Menindie Boiling Down and Meat Preserving Company (Limited), sworn, and examined:—

2930. *Mr. Fegan.*] How long have you been employed at the meat-works? Between three and four years.

2931. Have you had other experience? Yes; I was in the Adelaide meat-preserving works from 1872 to 1877. From there I went to Mr. Connell. I started the preserving-works for him.

2932. What information have you for the Committee? I think Mr. Davies and Mr. Besley have touched upon every subject that I could have spoken upon, and I entirely corroborate what they have said. There is, however, one thing I should like to mention, and that is the producing power of this country in good seasons. The first season I came here it was a most beautiful sight to see these flats which are now covered with dry dust covered with beautiful grass up to one's knee. The first lot of sheep that came from Tolarno—8,000—arrived in very low condition, and were turned on to a patch of this country about 2 or 3 square miles in extent. They were only out about six weeks, and were then put through, and they realised about 16lb. of tallow each. They were the first that we put through. They were converted in a few weeks from almost crawlers to fat sheep. With irrigation you could produce large quantities of fruit and vegetables—quite enough to supply the Broken Hill market; and I have no doubt that thousands of pounds are paid to South Australia every year for fruit and vegetables to supply Broken Hill, because there they have to depend entirely upon outside sources.

2933. Where do you get your fruit here? It comes from the Hill. A little is grown locally, but nothing worth mentioning. I have seen some of the finest vegetables in the garden attached to the boiling-down establishment that I have ever seen anywhere.

2934. It does not speak very well for Menindie if the people here have to get their fruit from Broken Hill? Well, no one seems to have sufficient enterprise to grow anything. They seem to think that because there is no market it is not worth while going in for things on a small scale.

2935. Do you know the road from Menindie to Broken Hill? Yes.

2936. What kind of country is it? It is all very good country. The only thing that is necessary is plenty of water. I consider that it is the finest country you could possibly have.

2937. If a railway were made from Menindie to Broken Hill, would that land be utilised in any way? I consider that it would be utilised as far as Lake Speculation—about 15 miles from here—for growing fruit and vegetables, and for growing fodder, such as lucerne, and even wheat, by means of irrigation.

2938. Do you know the country between Menindie and Mossgiel? No.

2939. Would it pay the Government to construct a line from Menindie to Broken Hill? Yes; I feel certain that it would.

2940. How many carcasses do you ship in the year? 150,000.

2941. How much wool do you send away? That is a matter with which I have nothing to do.

2942. Have you any idea of the traffic between here and Broken Hill? No.

2943. How many passengers do the coaches take? I should think eight or nine on the average.

2944. They run three times a week? Yes.

2945. Is that all the passenger traffic? Yes. No person will undertake the journey if he can possibly help it, because it is such a miserable trip. If there were a railway, however, a lot of people would come out from Broken Hill and live here, and the land here would be taken up. The population would be increased tenfold in a very short time.

2946. A great many people go to the Hill in hired conveyances? Yes.

2947. Are there many teams on the road? Yes; when the river is down there are a great number of teams.

2948. When the river is up there are very few? Yes.

2949. Do you not think that if a railway were constructed, and the river were navigable, traffic would still go down the Darling? No; I think that the railway would be used in preference to the river, because of the time it takes to go down the river.

2950. What is your highest output since you have been here? 1,000 tins a day is about what we have done up to the present time, but we have plant which will enable us to do ten times that quantity. As soon as our machinery is in good working order, as it will be in a few days, we shall be able to turn out 10,000 tins per diem. The average capacity of a tin will be 2 lb.

2951. Do you think the climate is suited for your kind of work? I consider that our position is a very good one. We are right in the district where the stock is bred. All we want are facilities for getting to market.

2952. Where does your stuff go? It goes all over the world. Most of it goes to Europe, but up to the present time we have always been behind-hand with our orders. We have not been able to supply anything like the quantity that has been asked for.

Mr.
R. C. Besley.
29 Sept., 1896.

Mr.
W. Coates.
29 Sept., 1896.

- Mr. W. Coates.
29 Sept., 1896.
2953. Have you sent any stuff to Western Australia? Yes.
2954. Do you supply the local market? Yes. Considering the population, there is a very good local market.
2955. Do you send any stuff to Broken Hill? Yes, we send a lot of stuff to Broken Hill.
2956. Is there a good demand for it there? Yes.
2957. So that there are fair prospects for your company? There is not the slightest doubt of it.
2958. Do you not find the stock grown in the district better than that which has been brought a considerable distance? I find that the quality of the meat here, both beef and mutton, is superior to that which I have used elsewhere.
2959. You deal in pigs here? Yes; we preserve a large quantity of pork sausage, and we mix pork with other things. A railway would be beneficial to us in connection with the rabbit business. In the summer-time we have great difficulty in getting fresh rabbits. The men cannot bring them in from any distance with a horse and cart.
2960. Are there any creeks between here and Broken Hill? There is the Quandong, but it is not a running creek.
2961. What is the width of it? I suppose about 100 feet.
2962. What is its depth? 4 or 5 feet.
2963. Is the country flat? There is a gradual rise from here to the Hill.
2964. Therefore the line would not be expensive to construct? I do not think it would. I think it would be a cheap line.
2965. Do you think a line from Menindie to Broken Hill would meet the requirements of the district almost as well as a line from here to Sydney? Yes; but it would be a great advantage to have a line from here to Sydney. This would be a splendid place if it had population.

Mr. William James Faust, storekeeper and commission agent, Menindie, made an affirmation, and was examined:—

- Mr. W. J. Faust.
29 Sept., 1896.
2966. *Mr. Hassall.*] How long have you been residing in this district? Close upon thirty years.
2967. What was it like when you came here? There was more money in it then. The squatters were spending money in fencing and dam-sinking.
2968. Do you think the district would carry a much larger population? Yes, if proper facilities were given.
2969. Are you not aware that the best of the land here is locked up until 1918? No; I believe that 50,000 acres have been set apart by the Government for irrigation.
2970. People do not appear to be anxious to settle on it? They wanted to do so; but they were told that they could not do so until the railway came here. A Broken Hill syndicate wished to take up land here, but they were told that they could not.
2971. Do you know of a proposal to construct a tramway from Menindie to Broken Hill? Yes; the contract was let for that work; but they could not raise sufficient money to carry it out. The Banks closed up very soon after the work was started, and there was no money available.
2972. Have you seen any land cultivated about here? Yes; small patches are cultivated in good seasons. I have grown a little patch of oats with stalks as thick as my little finger. That was without irrigation.
2973. Have you tried irrigation at all? Only for flowers.
2974. Do you think that the land would grow anything if irrigated? I believe it is the finest land in the Colony, and it would produce anything if it had water. I had a syndicate share in the private tramway enterprise which cost me £30.
2975. Would the proposed railway benefit the people of Menindie? Perhaps the railway would not pay straight off; but as population increased I think it would pay.
2976. Have you any knowledge of the country between here and Condobolin? Not further than Bulla Bulka.
2977. Do you think that country is suitable for close settlement? If artesian water could be obtained it would be good land to settle on. There appears to be splendid soil in the hollows.
2978. What would be the principal item of trade between Menindie and Broken Hill? I think firewood.
2979. And timber for the mines? Yes. This timber will stand better than the imported timber.
2980. Have you plenty of red-gum on the river? Yes, and about the lakes.
2981. Is it not a fact that that timber will compare favourably with almost any in the world for mining purposes? Yes. I am in the timber line myself, and I can say that the red-gum is better than any timber grown elsewhere—that is, for mining.
2982. What timber are they using at Broken Hill now? American pine.
2983. Red-gum would be much safer, because of its non-liability to combustion? Yes.
2984. Is it also a very durable timber? Yes, and will bear a greater strain than any other timber I know.
2985. What would be the cost of carrying the timber to Broken Hill by team? Teams could not carry it for less than 50s. a ton, and that drives it out of the market.
2986. If there were a railway it could be carried cheaply enough? I believe that if it could be carried at 7s. 6d. a ton it would be used for the mines.
2987. It is possible that if the railway were constructed people from Broken Hill would come to Menindie? Yes; I think that selectors would take up land here, and that miners would make homes here for their families.
2988. Have you any idea as to the tonnage of store goods which is brought to Menindie every year? Between April, 1895, and April, 1896, I imported 150 tons. Probably 50 tons of that came from Sydney.
2989. Do you know how much is brought into the town by other storekeepers? No.
2990. What does it cost you to bring your goods in? £1 a ton from Adelaide to Murray Bridge or Morgan, and about 30s. a ton for the steamer freight.
2991. What would be the freight by steamer from Sydney to Adelaide? 12s. 6d.; but there is a charge for commission and wharfage. It comes to over £3 a ton if you bring goods that way. The charge at Port Adelaide is 5s. a ton. The river charges also come to nearly 5s. a ton. They charge for storage, wharfage, and bills of lading.
2992. The total cost would be from £3 12s. 6d. to £3 15s.? Yes. If there were a railway we should save the insurance.

2993. What is the insurance? I cannot say exactly, but I think it is 3 per cent.
2994. Can you tell us what it would cost to convey wool to Sydney? I have not the least idea. It is being taken this season for £1 a ton from Wilcannia to Goolwa for shipment to Port Victor, that is being done by Messrs. Rich and Co.
2995. And other people have to bring their charges down to secure the traffic? Yes. Last year other steamers obtained £4 a ton from Albemarle.
2996. What would the charge be from Goolwa to Port Victor? About 5s. a ton I am informed; but the trouble is that it is very seldom that a boat goes there to load, except in ballast.
2997. What depth of water is there? There is plenty of water, and a breakwater a mile long; but the port is never used. Messrs. Rich and Co. are trying to run the other steamers off.
2998. Is it a fact that the other steamers have come up and have had to return almost empty? Yes; last week I saw a steamer returning with only about 50 bales of wool on board. She could have carried 1,800 bales; but they would not load it at the freight.
2999. Do you know what tonnage of wool is sent away from here? No; no statistics have been kept.
3000. I presume that all the wool goes away from here by river? Yes, when the river is up. It has been carried to Wentworth by teams for as much as £7 a ton.
3001. Is any wool taken to Broken Hill? I have not known any to be sent from Menindie; but from out back they send wool there.
3002. Are there many coaches running between here and the Hill? Four a week, besides some specials in shearing time. Last Saturday one coach went away with sixteen, and the other with eleven passengers.
3003. What is the average number of passengers carried? Five or six in each coach.
3004. Who are the people that travel? Some come for pleasure, and some for business.
3005. From Broken Hill to Menindie? Yes.
3006. If better facilities were offered do you think there would be more traffic? Yes.
3007. Have you any idea of the population of Menindie? No.
3008. As compared with that of five or ten years ago? The population has not increased very much. The school started with twenty-five children, and now they have sixty children.
3009. What are the principal occupations here? It is a labouring population chiefly. A good many stay here for a few weeks, and then shift again.
3010. What is the population of the town—about 180? I suppose about that.
3011. Was the population as great five or ten years ago? No; I think it is slowly growing.

Mr.
W. J. Faust.
29 Sept., 1896.

Mr. Samuel Klemm, storekeeper, Menindie, sworn, and examined:—

3012. *Chairman.*] How long have you been here? 18 years.
3013. For what periods is the Darling navigable? For the last three years the river has been down, but before that they had a seven years' run.
3014. Which would be better for Menindie, a permanent river or a railway? I would rather have a railway.
3015. Why? I think the Sydney market would suit me better. I deal largely with Sydney now.
3016. If the freights were heavy they might hamper your trading arrangements considerably? Yes; I recognise that.
3017. Is the Murray always navigable to Wentworth? Not always.
3018. How often has it not been navigable? It is likely to be down about March and April, and sometimes for three or four months.
3019. Taking ordinary years? I suppose on the average it is down for two months in the year.
3020. How far up the Darling can a boat come when the Murray is navigable? Only about 12 miles.
3021. If she got over the first 20 miles could she come up to Menindie? No.
3022. For a good many months in the year would a steamer fail to reach Menindie? You cannot reckon upon the river being navigable for more than about half the time.
3023. What quantity of stores do you import? During the last twelve months I have imported 250 tons.
3024. How far do you distribute them? For 50 miles round.
3025. How much comes into and goes out of Menindie? I suppose about 1,000 tons. Of course if the railway came the imports and exports would be increased very much.
3026. I suppose the wool all makes to the river at the nearest point? Yes.
3027. Do you agree with what was said by other witnesses in regard to the soil and climate? Yes; it is first-class soil.
3028. Is there anything you specially desire to refer to? With regard to irrigation, I know that the soil will grow anything. I have seen potatoes, onions, and wheat grown here.
3029. If you had water would things grow well? Yes. In a good season wheat will grow well with the ordinary rainfall.
3030. What is the average rainfall here? About 12 inches, and if we have a good season at all we can grow good wheat. There are thousands of feet of good timber on the river which if it could be got to Broken Hill would be used for fuel and mining supports.

Mr.
S. Klemm.
29 Sept., 1896.

Mr. Edward Haynes, manager, "Crown Hotel," Menindie, sworn, and examined:—

3031. *Mr. Trickett.*] How long have you lived here? Three years.
3032. Have you known the district for any longer time? No.
3033. What opinion have you to offer to the Committee with regard to the proposal under consideration? So far as our own business is concerned, we do most of our trade with Sydney; but we have great difficulty in getting the stuff round. We are put to great disadvantage in having to order large quantities at a time in order to get it up when the river is high. However, it pays us to deal with Sydney. In the first place the people round here like the Sydney beer which we import from Toohey and Co. There are three other houses in Menindie, and I presume that they do a similar trade. We import about £1,000 worth of stuff a year for our own house. Within 40 miles there are seven other houses, and I believe that most of them get their supplies from Sydney.
3034. They have to bring their goods round by way of Adelaide? Yes.

Mr.
E. Haynes.
29 Sept., 1896.

- Mr. E. Haynes.
29 Sept., 1896.
3035. What is the disadvantage in having to buy more than you want? This year we anticipated a good season but up till now it has not been good. The other day we got in 20 hogsheads of beer, but if someone does not drink it it will soon go bad. If we could send in our orders every week it would be better.
3036. At present you have to overstock? Yes.
3037. Do you ever lose your goods on the river? We have had them delayed for a considerable time. Last year some wine took eleven months to come from Albury.
3038. You are very often inconvenienced by delay in receiving goods? Yes.
3039. Can you tell us anything about the passenger traffic in and out from Menindie? The passenger traffic to Broken Hill would be large if there were a railway. On several occasions I have heard people say that if there was some easy means of transit they would come here more often, but they cannot stand the coach racket.
3040. What do they come here for? They regard this place as a sort of sanatorium, and the sport on the river is a great attraction. A lot of "leaded" people come here, and a week here makes a wonderful improvement in their condition. Now many have to go to Silvertown as a matter of compulsion, because there is nowhere else to go.
3041. What are the coach fares between Menindie and Broken Hill? From 7s. 6d. to 10s. per passenger. When there is no opposition they are much higher.
3042. What were the fares before you had opposition? £1 to 25s.
3043. Is this regarded as a healthy climate? As a very healthy climate. I am not sufficiently acquainted with the district to be able to point out the advantages which the pastoral industry would obtain from the construction of a railway, but, speaking conscientiously, I can say that the Broken Hill people are thoroughly in favour of the line here. Of course now when we cannot get things from Sydney we have to send to Broken Hill and to South Australia, but we prefer to deal with Sydney.

Mr. William Maiden, grazier, Menindie, sworn, and examined:—

- Mr. W. Maiden.
29 Sept., 1896.
3044. *Chairman.*] How long have you been here? Since 1862.
3045. *Mr. Egan.*] What is the extent of your holding? I have only about 12,000 acres.
3046. Have you had a larger holding? I have been interested in country round about, more or less, but I have not had any large holdings.
3047. How many sheep have you? At the present time very few, because the country is now very bad.
3048. How many acres are usually required for a sheep? About 10.
3049. You do not call this good country? With a fair season it is not too bad.
3050. Has your land ever carried more than 1 sheep to 10 acres? Sometimes for a short period it would carry a sheep to the acre. I have been dealing in stock principally. I do not keep them on the place all the time.
3051. You only keep them there for the time being? Yes.
3052. How many good seasons have you known in the 34 years you have been there? I do not think there has been three winters as dry as those we have just passed through. The country now is worse than I ever saw it before. It was better before it was improved than it is now.
3053. Have you used your land for anything besides sheep-grazing? No, I have not; but I have about 2 acres of garden in Menindie.
3054. What do you grow? Fruit and vegetables. The garden is leased by Chinamen.
3055. Are there any similar gardens about here held by Europeans? There is another garden on the river bank which is about the same size. All the stations have small gardens.
3056. Generally under the management of Chinamen? Yes, as a rule. They seem to do the work better than other men.
3057. Have any Europeans here tried vegetable-growing or gardening to any extent? Not to any extent. Mr. Byrnes has a good garden about 30 miles down the river. I believe that he has about an acre of oranges, besides a vegetable garden. He says that he can grow almost everything; but that it does not pay him to send produce to market.
3058. Do you know the country between Menindie and Broken Hill well? Yes.
3059. Is it level? It is all level. Broken Hill is 650 feet above Menindie, but there is a gradual rise, and the only hills met with are within 9 miles of Broken Hill. The engineer told me that he could get 1 in 100 all through.
3060. You were interested in the Menindie Tramway Company? Yes.
3061. The people here would not have troubled the Government to make a railway if they could have made one themselves? We wanted to make a railway to Broken Hill.
3062. Do you know the country from Menindie east? I have not been there for a great number of years. I know the country between here and Bulla Bulka. It is sandy dry country, with a good deal of scrub upon it.
3063. Are you troubled with blindness among the horses here? Yes, I think it is due to the presence of the melon. In olden times the Darling pea was very bad, but the melon seems to have taken the place of the pea. When everything is dead and dry the melon looks fresh and green.
3064. Have the rabbits anything to do with the disease? No. I believe that eating the melons brings about an inflammation of the stomach which kills the horses, if they do not go blind.
3065. What is the average rainfall here? I believe about 10 inches or under. For the last two or three years we have had no general winter's rain. There might be an inch of rain here and 25 miles away no rain at all. A heavy summer rain is useful, but it is not like a winter's rain.
3066. Would the railway be of any benefit to you in giving facilities for the removal of stock? It would be of benefit all round.
3067. Would not the people still use the Darling to send their wool away? In 1859 there were 100 or 200 men employed snagging the Darling. They used to work up as far as Wilcannia, because above Wilcannia there was scarcely any timber. The cessation of the work of snagging has made the river very dangerous. Not only are the snags an impediment to navigation when the river is low, but the overhanging branches of trees are dangerous when it is high.
3068. Unless the river is snagged it will in time become unnavigable? Yes.

3069. Produce would then have to be sent by the railway? Yes; that would improve the prospects of the line. The insurance companies do not care much about insuring stuff on the river, and if the water is below a certain level they will not insure it at all.

3070. For how many months in the year is the river unnavigable? It is very uncertain. Eighteen or nineteen years ago they used to have to cart their wool to Wentworth from 100 miles above Wilcannia. I have seen the river quite dry for eighteen months at a stretch. Now you cannot tell whether it is going to be down for two months or for twelve months. Its state depends upon the Queensland rainfall. The river is not down so often now as it was in years gone by. When the Silverton tramway was built I had contracts for sending coke and timber to Broken Hill. The mine people asked me if I could guarantee the river. They said that if the river would stop up they would bring the railway here, but I could not guarantee it. If the river had been anything like permanent, the line would have been brought to Menindie instead of to Silverton. Mr. Wilkinson, the geologist, some years ago advocated the construction of a railway from Broken Hill to Menindie.

3071. How would a railway benefit you as a homestead lessee? It would not benefit me to any great extent, because I would not have a great deal of stuff to send upon it. It would bring population here, and that might lead to an increase in the rentals.

3072. *Chairman.*] How much is Menindie above Wentworth? I believe about 62 feet. The river runs at the rate of about 3 miles an hour. The rate of freight depends a good deal upon the condition of the river, and whether there is a steamer coming back empty. I have paid £3 a ton from here to Morgan, and for merchandise I have paid £6, £7, and £8 a ton. The steamers charge whatever they can get. There is no standard freight.

Mr. Robert Scobie, saddler, Menindie, sworn, and examined:—

3073. *Mr. Hassall.*] How long have you resided in the district? Seventeen years.

3074. What reasons have you to offer in favour of the construction of the proposed railway? There has always been a vast desire in this district to have railway communication with the Barrier. A railway was proposed thirty years ago, when Mr. Broadribb was Member for the district. The electorate at that time extended from Bourke to Wentworth. A good deal later, when the Cobar line was under consideration, two of our people attended Broken Hill to give evidence before the Sectional Committee there. Prior to that, in 1884, we got up an agitation for a railway from Hay, *via* Menindie, to Broken Hill, and Mr. Wilkinson, the Member for Balranald, presented a petition to the House in favour of such a line. Since then we have endeavoured to get the Government to give us railway communication with the Barrier, and I have sent down statistics and information to our Member, but he declined to do anything, because the cost of making the line was estimated at £10,000 a mile. We thought that it would cost about £2,000 a mile. At the same time I applied for 50,000 acres on the other side of the river to be set apart as an irrigation area. The site was examined by Mr. Hall, who told me that he could give nothing but a favourable report. Later on a movement was set on foot, principally by old residents of the district who had migrated to Broken Hill, for a railway between the Barrier and Menindie in order to develop the district. I mention this to show that at no time have the Menindie residents been unaware of the importance of railway communication with the large centre of population lying so close to us. We are desirous of being the producers of many things which could be consumed in Broken Hill. The value of potatoes, garden stuff, vegetables, butter, bran, hay, and chaff imported into Broken Hill from South Australia amounts to £60,000 per annum. The importations of butter and eggs alone amount to £12,516 per annum. This means a revenue of £300 a week to the Silverton tramway. Fish is also largely required at the Hill by the mining classes and by those who are particular about a fish diet once a week, and we could supply fish by the ton if we had a railway. Grapes cannot be sent to Broken Hill through South Australia except by special concession; but we could produce them here with irrigation. There are at Lake Menindie 28,648 acres of land which could be irrigated with very little trouble. At Lake Cawndilla there are 22,840 acres, or, altogether, 61,000 acres which could be easily irrigated by gravitation. The natural flow of the river goes out back 17 miles to Lake Speculation. Two feet of water would be sufficient for 100,000 acres of tilled soil. At the present time about 5,000 tons of firewood are consumed at Broken Hill every month. Its present price is about 4s. 6d. a ton, but I believe the retail price is from 16s. to 19s. a ton. If we had a railway we could supply a great deal of that firewood. Now all the leather that is consumed in the western district is imported from South Australia and Victoria. Perhaps at Bourke Sydney leather may be used, but round here it is all South Australian leather. A large number of cattle, however, are slaughtered at Broken Hill and in this vicinity, so that tanneries could easily be established here. Soap and candle works would follow. The passenger traffic between Menindie and Broken Hill depends upon the fares. With a fare of 2s. 6d. you would have so many passengers that the coaches would break down. I have paid 70s. within the last three years, and I have travelled at 2s. 6d. The 10s. 6d. fare does not pay the coaches. A great many people travel on foot. When Broken Hill was first started, and the river fell, everything there became very dear; but since then competition has brought down the prices. I see by the local press that the South Australian Government have reduced the price formerly charged for concentrates to one-half, so that it is now 9s. a ton to Port Pirie, 10s. to Port Augusta, and 11s. 6d. a ton to Port Adelaide.

3075. *Chairman.*] Is that the through rate? That has nothing to do with the tramway rate; it is the rate from Cockburn. When I gave evidence before the Sectional Committee at Broken Hill I could only speak of very few selections having been taken up here; but since then a great deal of land has been taken up by small holders within 50 miles of Menindie. Between 300,000 and 400,000 acres of land have been taken up as homestead leases, and I believe the proposed railway would lead to an extension of the system. I was informed by the manager of the Menindie meat-works that he can procure the timber required for his cases at a much lower price in Sydney than in South Australia; and I have heard that soft woods can be procured more cheaply in the Sydney market. Mr. Ednie Brown, the late Director of Forests, stated, in regard to a trip down the Murray, that there were 1,000,000 feet of timber in sight. We have a great deal of hardwood in this district, and if it were taken to Broken Hill at a low rate we could sell it there. Then there is the water supply question. We hear constant complaints about the water at Broken Hill being polluted by what falls on the catchment area, and it is to be supposed that the town will ultimately require a better supply, which could be obtained from the Darling. If an irrigation settlement were established here we should be 150 miles nearer a port than Mildura is.

- Mr. R. Scobie. 3076. *Mr. Hassall.*] An irrigation settlement here would have to look to the Hill for its market? We would not require any other market, at all events, not at present.
- 29 Sept., 1896. 3077. Would there be much traffic to Broken Hill? There would be enough to add to the freight.
3078. As the South Australian people have already shown an earnest desire to obtain the trade by cutting down their rates one-half, it is probable that they are prepared to go still lower, and it is problematical whether the New South Wales railway could compete? Well, there are such things as retaliatory duties. Last year 150,000 passengers, including Cook's excursionists, travelled on the Silverton tramway. That is the only get-away from Broken Hill now; but if they could come this way I believe that the people of Broken Hill would give the Menindie route the preference.
3079. Can you give the Committee any information as to the permanence of the Broken Hill field? Nothing beyond what I have heard.
3080. Do you think a railway here could compete against a river? Water carriage can always compete against land carriage; but I think the certainty of the railway carriage would enable it to gain the day. This place is in its infancy yet, but when there is population here whose interests are centred in Sydney there will be a large traffic.
3081. If people can get goods from Port Victor more cheaply than from Sydney they will not send to Sydney? But if the New South Wales Government ceases to snag the river people will have to use the railway. The Government has already spent £100,000 in snagging the rivers, and it is an expenditure to which there is no end. I would advocate the blocking of the river.
3082. Up to the present the stations have all sent their wool down the river? Yes; more especially this year, when the rates have been cut to create a monopoly.
3083. You think the country round Menindie is suitable for closer settlement? I think that if there were a movable weir below the inlet to the Menindie Lake and above the outlet of the Talywalka, a very large area of land would be irrigable.
3084. When the river is half up will the water flow into Menindie Lake? Well, the creek is quite as deep as the bed of the river. The Menindie people objected to the original dam, because there was no provision for the inflowing of the water. My idea is that a weir should be made in the river like the Willandra weir in the Lachlan.
3085. If you once commence constructing weirs in the Darling would there not be an agitation for them all the way up? Well, it would not be necessary to do the whole of the work at once.
3086. Why is a weir necessary to Menindie? To give a head for irrigation purposes. We would then be able to till the bed of the lake.
3087. Do you think it would be advisable to construct a light line of railway from Menindie to Broken Hill? I think it would be a payable speculation; but I would prefer to see a national line constructed so that we could visit our own metropolis.
3088. Even if the State lost £40,000 a year on it? There might be an indirect benefit which would counterbalance the direct loss.
3089. A railway from here to Broken Hill would, you think, induce people to cultivate to supply the wants of Broken Hill? Yes.
3090. Where was the timber obtained that was used for the erection of the meat-works? In the vicinity of Menindie.
3091. Is there much of it? Plenty.
3092. What is the country like at Quandong? The soil is a red loam.
3093. How is it watered? There is no water except when Stephens Creek is flowing. There are small wells. Quandong is about 32 miles from Broken Hill.
3094. How far is Rockwell? Twelve or 13 miles.
3095. Is there any place between here and Quandong? There is a hotel and several homestead lessees at Lake Speculation. There is a large quantity of land still available on Kincheega Holding.
3096. Would that land be taken up if there were a railway? Yes. The people of Broken Hill are very desirous of settling away from the Hill.
3097. Have not the Broken Hill people a good water supply? They are crying out about its being polluted. The drainage of the place, unless it is kept away by dams, enters the catchment area.
3098. Has Menindie progressed or retrogressed? The great part of Menindie has been built in the last sixteen years. The place is progressing slowly but surely. All we want is more trade and more life. We want to be connected with the outside world, so that we can make use of our opportunities. Our interests are not looked after in proportion to the taxes that we have to pay.
3099. If a railway were constructed from here to the Hill, I suppose a good deal of traffic would come up the river to get to Broken Hill? Yes. People would prefer to deal with Sydney direct.
3100. You think that with a railway business relations would be transferred from South Australia to Sydney? Yes. You can get a better class of goods, and you can always fill an invoice in Sydney. That you cannot do in Adelaide. Now, however, we have to deal with Adelaide.
3101. What prevents you from dealing with Sydney? Greatly the difficulty of getting goods sent round. I tried to get things sent *via* Bourke; but that cost about 25s per cwt. The Sydney houses indent your orders direct from their head offices in Europe, so that the goods come up here unopened.
3102. Are any obstacles thrown in the way of the delivery of goods coming from Sydney? I have heard of such cases; but I have had no experience of my own. This is a long established town. We have first class soil round us, and there is a large population at Broken Hill which we could supply with provisions if there were means of communication. At the present time they use 400 gallons of milk at Broken Hill every day. We could provide one-half of that.

Mr. William Gardiner, Toorincaca Bore, near Menindie, made the following statement:—

- Mr. W. Gardiner. 3103. Messrs. Fair Brothers are putting down the Toorincaca Bore of which I am in charge, and which is situated about 32 miles from Menindie. Operations were commenced here on the 14th October, 1895, the object being to test this part of the country. The core shows for the first 90 feet (1) surface soil, (2) white clay. At this point we struck salt water. Then for 25 feet we passed through drift-sand, and at the depth of 115 feet entered sandstone rock. Five feet deeper we came upon blue, yellow, and light coloured
- 29 Sept., 1896.

coloured clays to a depth of 225 feet. Then to a depth of 315 feet we passed through drift-sand, and then to a depth of 556 feet through dark-coloured clay and yellow and red clay. Lower down the core showed—

- 556 feet quartz streak.
- 610 feet yellow rock with hard streaks of crystal quartz, then slate with quartz veins extending to a depth of 667 feet.
- 680 feet red sandstone.
- 785 feet slate.
- 810 feet dark and brittle rock.
- 896 feet rock with a greenish-yellow tinge.
- 950 feet dark slate with quartz veins.
- 1,038 feet grey rock with white specks.
- 1,110 feet slate with hard streaks in it.
- 1,142 feet hard, grey, brittle rock.

At this depth there appeared a change in the strata, but no proper sample has been obtained. Operations ceased on the 29th April, in consequence of the disarrangement of the machinery. Since then we have been fishing to recover the tool. For the first 225 feet there is a 10-inch casing, then to 465 feet an 8-inch casing, and then to 661 feet a 6-inch casing. Beyond this point there is no casing.

Mr.
W. Gardiner.
29 Sept., 1896.

FRIDAY, 2 OCTOBER, 1896.

[The Sectional Committee met at the Council Chambers, Broken Hill, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. John Souter, Mayor of Broken Hill, sworn, and examined:—

3104. *Chairman.*] What are you? An auctioneer.

3105. How long have you been living at Broken Hill? About eleven years. I have been Mayor since February last.

3106. Do you desire to make a comparative statement with regard to the position of Broken Hill? Yes. In 1896 the annual value of ratable property is estimated at £187,459. The number of houses in 1895 was just about the same as in this year. Our expenditure is something like £20,854. Our revenue is derived from a rate of 1s. in the £, the Government subsidies, and the sanitary rate, and the special endowment from the Government, which made a total revenue for this year of £20,854. With regard to the live-stock market, the butchers kill 120 head of horned cattle per week, and about 1,000 to 1,200 sheep, besides calves and pigs.

3107. Do you regard Broken Hill as being a town almost entirely dependent upon the mining enterprise? Yes.

3108. Do you recognise that the industry at Broken Hill in the future will be sending ore away from Broken Hill, and not coal coming to Broken Hill? I cannot say, but I think there will be ore going away.

3109. Do you think there will be much fat stock sent over the proposed railway, if made? During drought you can understand that it is very hard to travel stock to market. As the whole of our fat sheep come from the river districts during drought, it would be a great advantage to us if we had railway communication from there to bring the stock to market. It would certainly be a great advantage to the people of Broken Hill.

3110. I have before me a pamphlet to which your name is attached;—are the statements in that pamphlet correct? Yes.

3111. Do you believe that it would be possible to make Menindie Lake permanent at a small expense? Yes. I produce extracts from a report published in pamphlet form by a committee appointed by the Municipal Council of Broken Hill. It is a report on the proposed railway from Broken Hill to Menindie and Condobolin; it is dated 12th June, 1896. I regard the statements in it as substantially true. It is signed by me as chairman, on the 28th March, 1896. It is as follows:—

On the 12th June last the Municipal Council passed the following resolution:—That the Government be requested to undertake to have the Broken Hill to Menindie Railway carried out at the earliest possible time; and on the 11th instant the Council further determined to promote active steps being taken with a view to the immediate construction of the proposed railway, and the members of the Council whose signatures are appended hereto were appointed a committee to further inquire into and report upon the subject. A few days subsequently it afforded us much satisfaction to learn that Government surveyors had left Sydney for the purpose of surveying a proposed direct line of railway from Broken Hill to Condobolin,—some proof that the Government are aroused to the necessity of the hour, and recognised that trade should follow the easiest, shortest, and cheapest route in the interests of the country they govern.

Our instructions being to make but a short report, and aware that the Government are in possession of reports from their engineering officers, and of the evidence of the Committee that sat in both Houses of Parliament in 1892-93, in reference to the locking of the Darling River, and the construction of a railway from Menindie to Broken Hill, we can do little else than cursorily glance at some of the commercial, trading, social, and moral aspects of the subject.

As a primary consideration, owing to the level nature of the route and the absence of any engineering difficulties, the railway could be very economically constructed, and if carried out would result in Broken Hill and Menindie becoming connected with the chief towns of New South Wales, Victoria, and South Australia. The reply to the question—would it pay? can be well gauged by a careful consideration of the following figures in relation to the imports and exports for 1894 and 1895. Imports from South Australia—1894, £524,483; 1895, £514,239. Exports to South Australia—1894, £1,959,030; 1895, £1,917,354, showing for each year an excess of exports over imports of nearly one million and a half sterling. More than 400,000 tons of ore, bullion, &c., were exported in 1891 and 1895 (180,163 and 219,844) and carried over the South Australian railways.

The value of timber imported, principally foreign, and chiefly for mining purposes, was £184,348, thus:—

	1894.	1895.
Rough timber	£104,717	£77,902
Dressed timber	£730	£999

No

Mr. J. Souter.
2 Oct., 1896.

Mr. J. Souter. No less than 25,000,000 feet of timber are represented by the above figures, which, in lieu of importation, could be supplanted by timber from the forests of New South Wales, in character quite as durable and far less inflammable than Oregon timber, and become a financial benefit to the State by being carried over our own railways.

The importation of coke and coal in 1894 and 1895 was 213,332 tons, thus :—

	1894	1895
Coke	70,299 tons.	55,251 tons.
Coal	44,939 „	42,843 „

The declared values of the under-mentioned food-stuffs were :—

	1894	1895
Potatoes	£8,000	£5,821
Vegetables	£7,750	£6,845
Butter (331,671 lb.)	£10,917	£19,011
Eggs (334,000 doz.)	£5,566	£6,950 (417,000 doz.)
Bran	£6,538	£9,958
Hay and chaff	£13,840	£20,458

making an aggregate sum of £121,954 for the importation of the six particular food-stuffs referred to for a period of two years.

The above-specified produce could, on the opening of the railway to Menindie, be brought to the Hill from New South Wales, and in a very few years a much larger amount produced through the settlements of large and small farmers between Broken Hill and Menindie, who, as an illustration, could by dairying and poultry-rearing soon supply a large proportion of the £30,000 worth of butter and 9,000,000 of eggs, of the value of £12,516.

There exists no reason why the community of Broken Hill should continue to pay no less a sum than £300 per week to the Silverton Tramway Company for the carriage of food-stuffs alone.

Through the utilisation of the Darling immense volumes of water, in the vicinity of Menindie, could be supplied to the mining companies at a nominal cost per million gallons, which, notwithstanding the solution of the sulphide problem, will greatly facilitate, and with greater profit, the treatment of hundreds of thousand tons of low-grade ores; but, further, and, as your Committee believe, to be a matter of much greater national importance and value, the production of hundreds of thousands tons of produce for consumption at Broken Hill and exportation to England and elsewhere. Moreover, at an earlier or later period, a splendid supply of water could be obtained at a cost of 1s. or 1s. 6d. per thousand gallons, in lieu of 5s. per thousand gallons for impure water at present supplied to the town with more or less danger to the public health, by reason of the absence of proper filtration to prevent the existence of deleterious and organic matter and bacteria.

On the proposed line of railway, near Kais, and within 45 miles of Broken Hill, there exists a thick and dense belt of timber well adapted for fuel purposes, of which a sufficient supply could be obtained to meet the wants of Broken Hill and the towns and villages arising between there and Menindie for a period of twenty years.

The importance of a good supply of fish as an article of wholesome diet is beyond question. Fifteen tons and as many different kinds of fish could be landed at a cost only of 10s. per ton.

Considerably over 150,000 passengers were carried over the Silverton Tramway last year. Equally as great a number of journeys by railway would be made by the public of Broken Hill if the railway to Menindie was constructed. A small expenditure at this lake would make it permanent. The desire and necessity for change of air and scene has been unmistakably evinced by the fact of the large number of passengers that have taken advantage of the £1 excursion to Adelaide and back; and the great number of women and children travelling has proved that the inconvenience of so long a journey is no deterrent in the carrying out of such desire. Daily and Saturday to Monday excursion tickets would become very popular, while, at the same time, by the issue of workmen's tickets, trains being timed to meet the different working-shifts, a large number of miners would live at a greater distance from the mines, and some of the tradesmen of the town, through the issue of season tickets, would doubtless permanently reside at centres of population between Broken Hill and Menindie, travelling to and fro daily.

The carriage of crude ores for treatment at or near Menindie, together with the return of the concentrates therefrom to Broken Hill, for smelting at other places, could be effected for 6s. per ton; 1,000 tons of ore could be transferred to the London boats for about 12s. per ton, and food-stuffs at a proportionately cheap rate. The distance from Broken Hill to Menindie is 62 miles; to Port Pirie, 253 miles; and to Port Adelaide, 334 miles. The saving to the companies and the public in the cost of carriage would amount to at least a quarter of a million sterling.

As is well known, South Australia has for some time been on the alert in reference to the suggested direct railway communication between Broken Hill and Sydney, and a few days since, at a meeting of the South Australian Executive Council, it was decided that carbonate and lead-concentrates should in future be carried at the same rates as sulphides, viz:—to Port Pirie, 9s.; to Port Augusta, 10s.; and to Port Adelaide and Dry Creek at 11s. 6d.—just half the rates previously charged, which, of course, will give little or any profit, while much less rates would afford a good profit to the Government of New South Wales if the proposed line of railway be constructed.

Your committee are of opinion that the construction of the proposed railway, as supplying the missing link of connection between Broken Hill and Sydney, and New South Wales generally, will very much reduce the cost of living and vastly increase trade with all parts of New South Wales, and that it will settle a large population along the route of the railway, and lead to the establishment of many small industries; that it will prove a very valuable reproductive work, giving the opportunity to every unemployed man in Broken Hill and many other parts of the Colony, spurred on by self-respect, to turn his industry into wealth and capital, as also afford employment to many men physically incapable of hard work. Moreover, that it will in many ways bring about a healthier and happier environment or surroundings for the people; and, finally, that there exists no reason why over one million and a half sterling in value per annum (and probably reaching two millions sterling for the current year) of the products and manufactures of Broken Hill should to so great an extent continue to be carried by other than the railways of New South Wales, or that the vast financial benefit accruing therefrom should pass into other than our own national exchequer.

3112. Do you wish to submit any figures showing the position of the municipality? Yes. For the year 1896 the annual value of ratable property is returned as £187,459. The capital value is estimated at £778,072. The rate of 1s. in the £ on the annual value, less 10 per cent., yields £8,466. The total income for the present year is estimated at £21,392. The population is 20,584. The number of dwellings, 4,646. The figures for 1895 were as follows:—Annual value, £191,039; capital value, £833,206; total income, £20,845; population, 18,584; number of houses, 4,646; amount of rate, £8,653.

Mr. Charles Eley, Traffic Manager, Silverton Tramway Company (Limited), Broken Hill, sworn, and examined :—

Mr. C. Eley. 3113. *Mr. Trickett.*] Are you Traffic Manager of the Silverton Tramway Company (Limited)? Yes.

3114. Have you occupied that position for a long time? Yes, ever since the tramway started running its own traffic.

3115. I presume the object of your evidence is to show the volume of the traffic which passes over the Silverton Tramway on its way to South Australia? Yes; I presume you want the tonnage of the principal items.

3116. You are the manager of the Silverton Tramway, which runs from Cockburn, on the South Australian Border, to Broken Hill, a distance of 36 miles, and connecting with the South Australian railway? Yes.

3117. Where is the company managed? At Melbourne, by a local Board of Directors.

3118. Does the rolling-stock and everything else belong to the company? Yes; it has an interchange of rolling-stock with South Australia, the trucks running over both lines. It partly consists of our own rolling-stock, and by arrangement with the South Australian Railway Department there is a mutual use of rolling-stock. The gauge is 3 feet 6 inches, the same as the South Australian railway. 3119.

Mr. C. Eley.

2 Oct., 1896.

3119. How long has your railway been constructed? About nine years.
3120. What quantity of traffic do you carry? For the year ending June, 1896, we carried 232,309 tons of ore, 22,341 tons of bullion, 3,211 tons of wool, 13,676 tons of underground mining timber, 40,815 tons of coke, 49,061 tons of coal. That is the inward and outward traffic. The ore, bullion, and wool are outward, the timber, coke, and coal are inward traffic. I should like to point out that as far as the bullion, coke, and the greater portion of the coal are concerned, that will very shortly be a thing of the past, because it is well known that smelting at Broken Hill will within the next six months be done away with. Therefore, the traffic in bullion, and coke will cease, and of course the traffic in coal will be greatly reduced. If they do not smelt here, the traffic in coal is bound to be reduced.
- 3120½. Would there not be a considerable import of supplies, merchandise, and so on? Compared with the figures I have given, that would be scarcely worth talking about.
3121. Is the tramway used for the dispatch of live stock to any extent? No, very little; there is occasionally a truck of pigs, a truck of rams or lambs in the season, but very few. I do not think we have three trucks of live stock per week.
3122. What weight do your trucks carry? Six and six and a half tons.
3123. How many trucks to a train? Thirty-four outward, and thirty-one inward.
3124. Have you any figures with regard to the passenger traffic? I can get them. I have the passenger traffic to and from Sydney. We book right through to Sydney, and Sydney books through to this place. During the year ending 30th June, there were 132 passengers from Sydney and 156 to Sydney. Most of these were excursionists and school-teachers who went away during the Christmas holidays.
3125. Then you cannot give us any idea as to the passenger traffic? I can get particulars as to the passenger traffic, and I will supply the figures.
3126. With regard to the tonnage on your tramway—is it a constant or fitful traffic? It is getting rather more fitful than it was. Of course, there are large quantities shipped away from the Australian Colonies altogether; that depends on the shipping, and the ore is not sent down until the ships are ready.
3127. To what extent has it become irregular;—has it fallen off weekly or monthly? Day by day it falls off. I can give the percentage of the ore treated in the Colony, and the quantity shipped away.
3128. Where does the bulk of the coke and coal come from? The coal is from Newcastle. During the strike a little came from Leigh's Creek. I believe the coke is generally German.
3129. Does any considerable quantity of colonial coke come here? I do not think so.
3130. At any time during your experience have you ever been stuck up in your business by not being able to carry on the Broken Hill traffic? Never; we have always been able to cope with the trade.
3131. What would you consider to be a good tonnage for a day's work? It varies; perhaps 1,200 tons—that includes the flux which we carry in from Tarrawingee. It is a single line.
3132. Do you keep a record of the bullion sent away by each mine? There is only one mine smelting now.
3133. When they were smelting did you? Yes; but that would be going back a long time. At present, the Proprietary mine is the only one that is smelting locally.
3134. Do you state that in all probability, in a little while, the local smelting will cease? Yes, the smelting will be done away with so far as Broken Hill is concerned.
3135. Then there is very little probability of a large supply of coal or coke being required for Broken Hill? Yes; they will not require coke except for assay purposes.
3136. Will not coal be required for engine or domestic purposes? Yes.
3137. How much coal comes for smelting purposes, and how much for other purposes? The bulk of the coal used is for smelting.
3138. Then, as far as you are aware, there is no project to locally deal with these low-class ores? No; from what I can learn the sulphide ore will have to be treated on the sea-board.
3139. Will it be taken away in its native state, or will it be concentrated? Some will be taken away in its crude state, and low-grade ore will be concentrated.
3140. Will they not require fuel in order to do that? Not a large quantity, in proportion to what is required for smelting.
3141. Are you clearly of opinion that the ore will go to the coal, rather than that the coal will be brought to the ore? Most certainly.
3142. Does your tramway carry any of the firewood fuel which is used here? Yes.
3143. To any great extent? No; it comes just on this side of the border.
3144. Is that a permanent source of supply? No; the woodcutters say it will not last more than six months.
3145. Has the Silverton Tramway Company been a continuously paying concern? Yes, a fairly good one.
3146. Have you a balance-sheet with you? No.
3147. Is there one at Broken Hill? No; but I could get one from Melbourne.
3148. There is no doubt the company has been a successful one, and has paid good dividends? Yes.
3149. What is the total tonnage for the year you have just referred to? 361,413 tons.
3150. Is that a considerable increase compared with a few years ago? Yes; but the increase is on the lowest paying traffic we carry; the increase is in the ore. Bullion and everything else has gone down; ore is carried at a very cheap rate.
3151. You have only made up the statement to June of this year;—is that a fair average of the business done by the company? Yes; that is the actual business.
3152. But that is only for one year? Ore is continually increasing; that is the only item. With regard to all the other items it is a fair average.
3153. With regard to your future operations, would you mind telling the Committee if the company have entered into any negotiations with the principal mines at Broken Hill as to the future carriage of goods? I believe they have—I am told they have.
3154. Can you give us any particulars? The principal portion of the agreement is that all traffic going to or from South Australia will have to go over our line; but, so far as any traffic is concerned from Broken Hill to Sydney, providing this Condobolin to Broken Hill line is built, the mines have a free hand to send that traffic to Sydney. So far as my company is concerned, we do not fear the construction of this railway. This is the reason why we have not tied the hands of the company in any way. If you build the proposed railway, and the companies wish to send the ore to Sydney by that railway, they can do so.

Mr. C. Eley. 3155. If this contract has been entered into, are you at liberty to state the rates? I will tell you what I believe are the rates. Coal, 3s. 3d., from the border to the mine; coke, 6s.; timber, 6s.; bullion, 6s.; ore, 3s. 3d.

2 Oct., 1896.

3156. Can you give us what it will cost to get to the port? Ore, from the mine to Port Pirie, will be 12s. 3d. per ton from January; coal will be 17s., from the wharf to the mine; timber will be 32s. 4d., from the wharf to the mine; and coke, 29s. 4d.

3157. Is that on account of its bulk? Yes; that will make a difference of 9d. per ton compared with what we charge on ore at present, and 4s. 8d. for coal. That is on the tramway. I think there is only a difference of 1s. per ton with regard to the others.

3158. We have it in evidence that under your new arrangement it would cost to take coal from the South Australian wharfs to the mines 17s. per ton;—can you tell us authoritatively what the freight is for the coal from Newcastle or from Bulli, and the other southern mines, to the South Australian wharfs? We can buy it at Newcastle, and land it in trucks at Port Pirie for 13s. 3d. per ton.

3159. Then 13s. 3d. added to 17s. means that it will cost 30s. 3d. per ton for Newcastle coal, landed at Broken Hill? Yes; there is not the slightest doubt about that.

3160. Is that under a contract with a coal company? It is a contract with the Adelaide Steamship Company; they buy the coal, and they contract to deliver it in trucks at Port Pirie, and we contract with the Adelaide Steamship Company at Port Pirie.

3161. Is there a contract for reduced freights with the mining companies for seven years from the 1st January, 1897? Yes.

3162. Is that with all the mines? Yes, with every company of any consequence.

3163. Is that contract made? Yes, all have signed but one. That is what I have been told by a man who knows. That is not the Proprietary Company.

3164. Is it one of the smaller mines? It will be signed, but for various reasons they held it over for a short time.

3165. It will not affect the carrying out of the contract? No.

3166. With reference to what you stated with regard to the basis of this contract, is there any clause in the contract which would compel these people to send their ore and get their coal, &c., over your tramway if a railway were constructed from here to Sydney? Not that I am aware of.

3167. Is coke a very varying item? Yes, as soon as they stop smelting here we shall have none at all.

3168. What quantity of ore is shipped? Forty-one per cent. of the concentrated and crude ore that leaves Broken Hill is shipped either to England or the Continent.

3169. When the new process is started is that likely to continue? Yes, most certainly. When the new process is started they will have to go into the open market, and the English and Continental people will, no doubt, compete with them for it, so I do not see that it will make any difference.

3170. Then as far as you can see this new patent, and their being able to get coal at a reasonable price at Illawarra Lake, and smelting materials, and so on, is not likely to alter the present state of affairs? I do not think so.

3171. What leads you to that conclusion? The mines sell the ore in the open market, and if it pays the Continental and English people to buy it now I do not see what is to prevent them buying it in future.

3172. Are not the freights for long distances very cheap? Yes; I daresay you could get ore shipped from Port Pirie to Swansea or the Continent for £1 per ton.

3173. Would you like to state what it is that has spurred on your company to enter into a contract of this kind at the present juncture? Pressure from the mining companies.

3174. Has it nothing to do with this proposed railway? I can assure you honestly it has not. It is pressure by the companies.

3175. Do you really think that is the cause? I am as sure of it as that I am sitting here. There was no talk of sending the material to Sydney by railway. They were talking about trying to get an opposition line between here and Cockburn.

3176. Your contract is barely entered into now, and did not this agitation take place in March last? We had a previous contract.

3177. Was your previous contract about to expire? It had not quite expired. I think it had a year or a year and a half to go.

3178. Was the contract just about expiring, and therefore they entered into a new one? Yes.

3179. Have you any other figures that will be of use? I can give the cost of forwarding ore from Broken Hill to Newcastle. I am informed on most reliable authority that ore can be sent from Broken Hill, and landed in the bins at Cockle Creek, Newcastle, for 17s. 7d. per ton. I can also give the rates for wool.

3180. Are these fixed rates or variable rates? They are fixed rates which have been in force since 1894. The following is a list of the rates that prevail on the Silverton Company's line, they are through rates in connection with the other lines:—

Ox and after 1st June, 1894, or until further notice, the following reduced wool rates will be in force between Tarrawingee, Broken Hill, and South Australian sea ports:—

At per ton of 2,240 lb.—

	Greasy.		Scoured.	
	Undumped.	Dumped.	Undumped.	Dumped.
	s. d.	s. d.	s. d.	s. d.
Tarrawingee to—				
Port Pirie	46 0	41 0	61 0	51 0
Port Augusta	49 0	43 8	65 0	54 4
Port Adelaide	53 6	47 7	70 10	59 2
Broken Hill to—				
Port Pirie	36 9	32 6	48 6	40 6
Port Augusta	39 9	35 2	52 6	43 10
Port Adelaide	44 3	39 1	58 4	48 8

The above rates include loading, unloading, sheeting, and shunting.

Mr. C. Eley.
2 Oct., 1896.

3181. You have not entered into any fresh arrangement with regard to that traffic? No.
3182. Is the wool export from here large? No. 3,200 tons a year. It is not great compared with the traffic by the river.
3183. Whenever the river is available is it used for the wool traffic? Yes.
3184. Are you getting any wool traffic now? A little.
3185. As a railway manager, what is your experience with regard to wool—is it that when the river is navigable, that traffic never comes to the railway? My experience is that when the river is up the wool goes that way, and cut what rates you will—except you reduce them ridiculously low so that they will not pay—you never get the wool.
3186. With a constantly running railway, with a certainty of transit, with no possibility of being stuck up, do you not think that people would get into the way of using the railway in preference to the river for wool traffic? Certainly not. Even now, I believe that wool comes down the river from Bourke instead of going by the Bourke railway.
3187. *Chairman.*] What is the cost of freight from Menindie to Port Victor? Mr. Howell was interested in some meat works at Menindie, and he told me that he shipped his tallow from Menindie by the river to Murray Bridge, and it was trucked from there to Port Adelaide for £1 per ton.
3188. Would that be cheaper than to Port Victor? I do not think so. In going down to Port Victor you land the stuff on a railway which takes it to Port Victor which is only a short distance away. When it goes the other way it goes straight to Port Adelaide right to the ship's side.
3189. Would Port Victor be a cheaper way to ship than *via* Murray Bridge to Adelaide? I do not think there would be much difference. In sending stuff to Port Victor you would have to land it on a railway, and then it is trucked a short distance to Victor harbour.
3190. Do you think £1 a ton is the rate from Menindie to Port Adelaide? Yes.
3191. If that stuff came in from Menindie to this place, what would it cost to get down this way to Port Pirie? 25s. 1d.
3192. Is that the present rate for tallow? Yes.
3193. What is it for ore? 12s. 3d.
3194. Do you believe that ore would cost £1 from Menindie to Port Victor? I think so.
3195. Your price here is 12s. 3d., tallow from Menindie to Port Victor would cost £1, tallow from here to Port Victor would be 25s. 1d.? Yes.
3196. What would be the cost of transshipment from broad-gauge to narrow-gauge? One shilling per ton.
3197. What are the grades from Broken Hill to Cockburn? One in eighty; that is the ruling grade.
3198. What is your sharpest curve? One in fifteen on the main line.
3199. *Mr. Trickett.*] Did you start this as a surface railway? No.
3200. Was it ballasted at all times? Yes.
3201. Your line from Broken Hill to the Border is a ballasted line? Yes, it averages 8 inches of ballast under the sleepers, and in addition they are boxed up.
3202. How far apart are the sleepers? About 3 feet.
3203. How does the country between here and the Border compare with the country between here and Menindie? It is very similar country from what I have seen of it.
3204. That being so, do you think a surface railway might be constructed between here and Menindie with the earth scooped up about 6 inches? I would not like to try it in wet weather. The sleepers would sink in the mud; a teamster cannot go off the track here in wet weather, because his wheels would sink up to the axle.
3205. You think there should be some ballast on the line? Most certainly.
3206. *Chairman.*] Is there ever any trouble with your line? No; we started with it as a ballasted line.
3207. *Mr. Trickett.*] Was that the result of experience on the South Australian railways? I believe so, but I cannot say exactly.
3208. What did your line cost per mile? Speaking from memory about £3,000.
3209. At what rate do you travel? The average rate is about 20 miles; but I have travelled 40 miles an hour on the line.
3210. If a railway train had to travel only about 15 miles per hour, do you think it would be necessary to have the line ballasted? The same thing would apply. In wet weather you could not run over the country.
3211. When your line was constructed was the rate of wages higher than at present? Just about the same.
3212. *Chairman.*] Is your grade 1 in 80 both ways? Yes, that is the ruling grade; but it is a much longer grade coming from Cockburn than going away.
3213. Could you, without incurring very great expense, cut down the grade to 1 in 100? Yes.
3214. Is it only a matter of expense? Yes; and not heavy expense.
3215. With your present 1 in 80 grade could you make a stronger line and widen it to 4 ft. 8 in.? Yes; I think everything is strong enough at present.
3216. Would many buildings have to be moved back? None, I think.
3217. Do you think you could carry it right through? Yes.
3218. Therefore, do you think that at a slight expense, and with very little extra work, you could put down as good a line on the Silverton tramway as would be made by the New South Wales Government to connect Sydney with Broken Hill? Yes.
3219. What is the ruling grade from here to Port Pirie? 1 in 60 is their steepest grade, that is, towards Petersburg.
3220. Could that be cut out? Very easily; I am not quite sure that they are not going to do that now.
3221. Is that from Cockburn to Port Pirie? Yes; I believe they could get a grade of 1 in 100 down to Port Pirie.
3222. Therefore the South Australian Government could have a 4-ft. 8½-in. gauge railway from Cockburn to Port Pirie without any great expense? Yes.
3223. What is the distance from Broken Hill to Cockburn? Thirty-five miles.
3224. What is the distance from Cockburn to Port Pirie? 218 miles.
3225. The charge for that is 9s. per ton? Yes.
3226. That is ½d. per ton per mile? Yes.

- Mr. C. Eley. 3227. Therefore you are receiving twice as much per mile for doing the same work as the South Australian Government does? Yes, but they have a longer distance, and therefore the traffic can be carried more cheaply.
- 2 Oct., 1896. 3228. What is to prevent you if you are busy from doing it for the same money? Nothing; we would do it; if we had to cut we would cut.
3229. Does it pay South Australia to do the work for $\frac{1}{2}$ d. per mile? Yes, I know it does.
3230. Do I understand that according to this agreement all ore going east can go as the companies see fit, while all ore going west must use your tramway for seven years? Yes.
3231. Therefore, if New South Wales made a tramway from Broken Hill to Cockburn, the companies could not use it? That is the case.
3232. What is the penalty? I cannot say.
3233. Mr. Trickett.] Did not the South Australian Government first lay down their railway to the border with little or no ballast, and did they not have to expend a large sum of money in increasing the stability of the line or improving it when the traffic increased? Yes.
3234. When they came to increase the speed and when the tonnage increased, had they to improve the carrying character of the line? Yes; they spent thousands of pounds in improving it.
3235. Mr. Hassall.] In the event of your company being able to reduce the grade from here to Cockburn so as to make it 1 in 100, would you be able to carry ore at a cheaper rate and still make money out of the transaction? Most decidedly, because we could increase our load.
3236. So that in the event of coming into competition with a railway that may be constructed across the country from Condobolin to Broken Hill, do you think your company and also the South Australian Railway Department would be able to reduce the rates now charged? I do, most decidedly.
3237. Say the cost of conveyance of ore to Port Pirie is 12s. 3d. per ton,—what percentage do you think could be knocked off that charge, taking the whole distance? It depends upon the load; perhaps 10 per cent., but not more.
3238. In the event of the grades being reduced, there is no doubt that a reduction could be made? Certainly; you could carry a much heavier load to make up for it.

Mr. Lewis Oswald, general mercantile agent and sharebroker, Broken Hill, sworn, and examined:—

- Mr. L. Oswald. 3239. Mr. Fegan.] What is your occupation? General mercantile agent and sharebroker.
- 2 Oct., 1896. 3240. How long have you been here? A little over eight years.
3241. Have you a thorough knowledge of the requirements of Broken Hill? Yes.
3242. I suppose you have been to the markets of Melbourne, Adelaide, and Sydney? I cannot say I have been there, but I have been acting as agent with those markets.
3243. Can you tell the Committee what is the freight on any line for general goods from Sydney to Broken Hill? There is a fairly heavy line, well packed, easily handled—I refer to candles. There is a large consumption of them in the mines,—20,000 boxes of them are used in the mines, not counting the houses; a box contains 25 lb. weight. I represent the largest New South Wales manufacturer, which is with the Sydney Soap and Candle Company. In competing, I have to compete against foreign goods, also the Adelaide goods. I find in getting my candles round by water to Port Pirie thence by the South Australian and Silvertown tramway my freight compared with that of Adelaide is 50 per cent. higher, for instance they can land candles here from Adelaide at under $\frac{1}{2}$ d. per lb. From Sydney it cost me a fraction under 1d. per lb. Of course the only way which I am able to do it is there is a protective duty on candles. From what I can learn the freight from Port Pirie to Cockburn on goods coming into the country is greater *pro rata* than is charged on goods sent from Adelaide by rail to Cockburn. Of course the goods coming by way of Port Pirie come from outside colonies. The Adelaide merchants do not ship from Adelaide to Port Pirie, and thence by train, they send their goods direct from Adelaide to Broken Hill. I found that in several lines, such as wines and spirits, we could not compete here at all with South Australia, and I found that in various other mercantile lines that I had agencies for, we could not compete unless we had a protective duty. The excessive freight by water, and thence by rail, quite crippled the business.
3244. How do you mean you could not compete, is that in selling? Yes, I mean that my invoice price for the same class of goods had to be considerably lower in the Adelaide prices to give me a chance of competing with them owing to the excessive rates I had to pay.
3245. Can you buy candles more cheaply in Adelaide than in Sydney? No, they are invoiced on the trucks at about the same price as f.o.b. in Sydney.
3246. Then as far as prices are concerned there is no difference? No, perhaps my prices from Sydney are a little bit better.
3247. Therefore the consequence is that the people in Adelaide seem to have this particular trade? They have 90 per cent. of it. My own idea is that they have 90 per cent. of the general trade of the town.
3248. Chiefly on account of the freight and the distance? Yes.
3249. If a line were constructed from Condobolin to Broken Hill that would not make it any better? It would depend on how the freight across the country would compare with the freight by sea and thence by railway afterwards. I may state that to get a line like candles from Sydney and landed here in the cheapest possible way it costs £6 per ton, that is taking a fair class of goods, because they are handy and packed into as small a space as possible.
3250. Does not the length of time in transit make any difference? Yes; from the day goods are ordered to the day you receive them is never less than three weeks, and it generally extends over a month when you order them from Sydney. If you order them from Adelaide you get them up within a week.
3251. Do you find any difficulty in getting Sydney goods from Adelaide to Broken Hill? I always get them from Port Pirie.
3252. Do you find any difficulty there? I never have any difficulty.
3253. From the time they reached Port Pirie till they reach Broken Hill is there much delay? I cannot tell how long the goods are kept at Port Pirie.
3254. If you have a consignment of goods will you not be advised when they reach Port Pirie? No; only when they reach Sydney. I never hear anything more of them until my carrier advises me they are at the goods station.
3255. Have you ever had complaints that Sydney goods are kept back, and that Adelaide goods get quicker dispatch? No.

Mr.
L. Oswald.
2 Oct., 1896.

3256. Do you regard £6 per ton as a fair freight from Sydney to Broken Hill? No; but that is what it costs.

3257. Is that the cheapest carriage possible? Yes; and by getting goods in large consignments—some hundreds of boxes at a time. If I only got a small consignment it would run into something like £8 10s. per ton.

3258. So that a small trader could not deal directly with the port of Sydney? No.

3259. If £2 were added to small consignments, would it make it impossible for small traders to deal with Sydney? Yes; I have to get truck loads carrying 6 tons.

3260. I understood you to say that you get 20,000 boxes of candles yearly? No; that is the total quantity used in the town.

3261. Does that mean that £1,338 per annum are paid for candles alone from Sydney? No; the total consumption of candles at Broken Hill is 20,000 boxes per annum. The largest proportion of those comes from Adelaide; they are cut contract prices for the mines. I should say we get about 5,000 boxes of candles from Sydney in the year.

3262. What is the difference in the price of Adelaide candles as compared with Sydney prices? When you quote prices you have to take into consideration the quality. The Adelaide candle of the same quality as the Sydney candle is sold at about the same price for local consumption; but on the mines it is somewhat lower than the Sydney price, owing to the very large consumption. It is a cut price.

3263. You buy a large number of your candles, I understand, at Adelaide; what does the freight amount to from Adelaide to Broken Hill? I think it is a very slight fraction under 1½d. per lb., landed here. This is invoiced f.o.b. on board trucks at Adelaide. I think it is the one-sixteenth of a penny under the ½d.

3264. That is £4 13s. 4d. per ton? I know that is the price, although I never had them myself. I have seen the storekeeper's invoices, where the merchant got the freight as low as possible by sending a truck-load and dividing the lot between his various customers, and charging them *pro rata* for their share of the truck. It means about ½d. per lb.

3265. Then you get the freight from Sydney to Adelaide at £1 6s. 6d., and what is it from Adelaide to Broken Hill? 15s. to 17s. 6d., per ton, is the rate I pay from Newcastle to Port Pirie. It used to be 15s. per ton then. They go by cubic measurement.

3266. Do you get any other line of goods from Sydney? Yes; biscuits, wines, and spirits. The biscuits come at a very much heavier rate; the freight from Sydney is nearly 1½d. per lb. I was agent for Hacksall & Co. Biscuits are very light goods, and occupy considerable space; that is one of the heaviest freights charged on the railway. For bulk liquor the freight comes to something like 1s. 6d. per gallon. With regard to all the goods that come to Broken Hill for consumption, comparing Sydney prices with the cheapest water carriage, and then the charge from Port Pirie here, it is nearly 50 per cent. in excess of the charges for freight from Adelaide direct.

3267. Is that arrived at by comparing the distance? No; that is the absolute cost. The Port Pirie charges run up our expenses on account of the wharfage, carriage, handling, and transhipment.

3268. Would it be any benefit to the people of Broken Hill if the proposed line were constructed? If the freights were reasonable, the Sydney merchants would be able to compete in their own Colony a great deal better than they do at present, which would naturally be beneficial to the inhabitants here.

3269. Do you simply know the freight from Port Pirie to Broken Hill and from Adelaide to Broken Hill? I can give you the freight on one line. From Port Pirie to Cockburn, it is 57s. or 58s. per ton. I think it is 8s. or 9s. per ton from Cockburn here.

3270. So that considering the distance, the freight is excessive on the tramway? Yes, very excessive.

3271. Have the people here ever pointed that out to the directors? I cannot say.

3272. Can you tell us the reason why the people of Broken Hill asked for the proposed railway? I think the great reason is that they recognise that they are under the Government of New South Wales; but they are absolutely banished you may say from the capital of the country they belong to. I think that if there were a line that would come into competition with the line now in use we should get goods carried and passenger fares at something like a reasonable rate, instead of what they are at present.

3273. In other words, if the Government of New South Wales constructed that line, you would use it for no other purpose than to obtain a reduction in the freight charges from Broken Hill to Adelaide? That does not follow.

3274. Or if a line were made from Broken Hill to Condobolin you would use that line if it were the cheaper line, but not otherwise? I could not be expected otherwise.

3275. That is to say, you would use the New South Wales Government to force the Government of South Australia and the tramway company to reduce their freights? We would go on the common business view, that if competition came freights would have to be reduced. We also look at it in this way—if we want to go to Sydney we have to travel through two other colonies to get there; the return fare first-class, costs £13. By excursion rates last year it was £10 10s. first-class return to Sydney.

3276. What would be the steamboat fare from Port Pirie to Sydney? No passenger steamers run there. From Adelaide to Sydney it used to be from £4 to £4 10s.; but since the West Australian business increased so much the return fare is £5 10s. The fare from here to Adelaide is £4 18s. first-class return.

3277. Do you know the country between Broken Hill and Menindie? Yes, very well.

3278. If a line were constructed there do you think it would be the means of promoting settlement between here and Menindie? Yes; it would certainly open up the country to a certain extent, but I should not like to say to what extent.

3279. Do you think anyone would go out there and build villas or residences? No.

3280. Do you think they are better off at Broken Hill? Yes.

3281. Is not the rate of £6 per ton for candles about the highest? No.

3282. Is not hardware about £3 per ton? Yes; that is for heavy stuff, but I am speaking of general merchandise.

3283. *Mr. Trickett.*] Is there not a certain class of goods you can have carried for less than £6 per ton? £6 per ton is the whole freight from Sydney, including charges and everything.

3284. Would bulkier goods cost more? Yes; biscuits cost 50 per cent. more than candles. I think that you will find that the railway freight is £3 15s. per ton, absolutely for a distance of 253 miles.

3285. *Mr. Hassall.*] Have you any knowledge of special truck rates to Bourke? No.

- Mr. L. Oswald. 3286. The special truck rate to Bourke, a distance of 503 miles, is £41 for a 6-ton truck, which, of course, give a rate of £6 16s. 8d. per ton. The Commissioners say that if the same rate is applied to Broken Hill, owing to the distance that would have to be traversed, the charge would be £9 8s. 1½d. per ton, and we are told that is the lowest possible rate at which they can convey goods; would you patronise a railway if such a charge were made? Certainly not.
3287. Then, if the railway were constructed, as far as your business is concerned, you would not look at the proposed railway, but use the other line? Yes.

Mr. Charles Isaac, auctioneer and agent, Broken Hill, sworn, and examined:—

- Mr. C. Isaac. 3288. *Chairman.*] What is your occupation? An auctioneer and agent.
3289. *Mr. Hassall.*] How long have you been in the district? I have been at Broken Hill eight years. I was at Wilcannia four years. I was trading on the Darling River eleven years. My knowledge of the district extends over twenty-five years.
3290. Have you a good knowledge of the country over which the proposed railway will pass? Yes; I have driven over it many times. My first trip was from Dubbo. When the railway was extended there I drove from Dubbo to Walgett. From Walgett I came down to Brewarrina, and followed the Darling as far as Bourke, from there to Pooncarie, and through Booligal to Hay.
3291. Do you know the country between Broken Hill and Condobolin *via* Menindie? Yes; but I have not visited Condobolin.
3292. Do you know the country between Euabalong and Broken Hill? Yes, it is very good pastoral country; I could not speak with regard to its capacity for anything else. I am speaking from general experience in dry weather and wet weather.
3293. What is its carrying capacity? I could not say per acre.
3294. Do you think the country suitable for any other kind of occupation than pastoral? Certainly, if means for a water supply were found.
3295. Do you know that it is practically a dry country? Yes.
3296. Do you know that the water supply between the Willandra Billabong and the Darling at Menindie is practically an artificial water supply? It is very uncertain.
3297. Do you know that is also the case with reference to the water supply between Menindie and Broken Hill? Yes, it is very uncertain.
3298. Is it good holding ground for tanks? Yes, but it is all subject to evaporation and soakage.
3299. Is it not a very dry climate? Yes.
3300. Would not the tanks have to be very large, in order to withstand the drought? Yes, but recently many station-holders have made excellent provision for carrying stock, but in other portions of the country I admit the water supply is very uncertain.
3301. Are not the pastoral properties between Broken Hill and Euabalong all held in large areas? Yes, most of them, but a good many homestead leases have been taken up lately.
3302. Do you know under what control these properties are—private individuals or banking institutions? I know for nine months out of the twelve the owners used to reside on those properties.
3303. Do you think that those properties, as now held, are in a position to carry on works for water conservation to enable them to withstand the drought? Yes, undoubtedly.
3304. Do you think a man of small means, such as a homestead lessee, would be in a position to do so? He could only do so on a small scale.
3305. If a man had means to carry out the improvements absolutely necessary to occupy a dry country like that, would he not have enough money behind him to engage in some other occupation which would be a little more comfortable? Yes.
3306. Have you any knowledge of the traffic along the river? Yes, a great deal.
3307. Can you tell me what proportion of the country which would be traversed by the railway line would send produce down the river? I have never visited Condobolin, but there are very large properties about Hillston which now send their wool to Hay. They have to do so, because it is the nearest point where they can with certainty send it to market, but there are various other properties between Ivanhoe and Menindie, which would in all probability use the river as a means of conveyance.
3308. Is it not a fact that most of the woolsheds are situated along the river? Not on the big stations, only in the case of the river stations.
3309. Do not the river stations run a long way back? Yes. Were the river navigable, which it is not all the year round, there is not the slightest reasonable chance that the wool would be sent by rail, but it is very uncertain, and the pastoralist might have his wool kept on the bank of the river for two years. If a railway were running near these properties the proprietors would make use of it in order to avoid the uncertainty. Undoubtedly a large proportion of the stations would use the railway. I believe they would even pay two or three pounds a ton extra. If the river were falling rapidly they would prefer to pay the railway freight. As looking the river is a thing of the past they would utilise the railway.
3310. How many times have you known the river to be unnavigable for any length of time? I have known it to be so between eight and ten months, and for a portion of the time that was the case as far as Wentworth.
3311. Has the river been frequently in that state of late years? During the last four or five years there has been more water in the river than there has been since 1873.
3312. Is there likely to be any traffic in stock on the proposed line of railway? There is a great deal of travelling stock, but that all depends on the seasons. The rain being so partial the travelling of live stock to market is very uncertain, but a lot of stock starts from the Queensland boundary at Thargomindah and goes to Bourke. A great deal of the stock instead of going to a point where they can strike the railway come here and go down to Adelaide. Undoubtedly if there were a railway on the proposed route more stock would go that way than does at present.
3313. Would you advocate the construction of this railway? That is rather hard for me to answer. I would advocate the railway not as an immediate source of revenue, but as an ultimate one. On the route of this proposed railway you strike a number of stations of whose existence people are unaware. The traffic would be very large irrespective of the number of mines opened lately at Broken Hill for the treatment of silver ore. The traffic on the proposed route would be very great.

3314. Do you think there would be much passenger traffic? On several occasions I have had to go to Sydney, and I have had to travel right across from Ivanhoe to Hay, and on some occasions I have had to travel to Bourke.

Mr. C. Isaac.
2 Oct., 1896.

3315. Have you any idea whether this line will be used for the conveyance of ore from Broken Hill? That will depend entirely upon the rates charged. For one mine that was working a short time ago there are at present from fifteen to twenty; if these companies could get a marketable price for the ore, something that would pay them for their labour, there is no doubt the ore would go by the railway.

3316. Under all circumstances would it not go by the cheapest route? Undoubtedly if there were two means of communication the cheaper would get the traffic.

3317. Would not an increase in the carrying capacity of the country which was spoken about mean more expenditure than it is worth? That may be the case, but I maintain that notwithstanding all the evidence that has been given about smelting operations at Broken Hill ceasing in the near future, the increase in the amount of ore produced which will find its way to other smelting works will be sufficient to counter-balance the diminution in the supply of coal and coke. The question of freight of course arises again.

3318. Do you look upon the country between Broken Hill and Condobolin, leaving Broken Hill itself out of the question, as being likely to be able to contribute sufficient traffic to support a railway? I undoubtedly think that the stations lying on both sides of the proposed railway would send their wool by it if they were charged anything like a reasonable rate instead of allowing it to lie on the river bank for an indefinite period.

Mr. Alexander Stewart, General Manager, Broken Hill Proprietary Company, Broken Hill, sworn, and examined:—

3319. *Chairman.*] What is your occupation? Manager of the Broken Hill Proprietary Company.

3320. How long have you been manager? About two years.

3321. What number of men are employed in your mine? About 3,000 at the present time.

3322. Are you aware how many men are employed on the Broken Hill field at the present time? I cannot give much information on that point. I can merely give a rough estimate. I should say that there are about 4,500 employed on the mines altogether.

3323. In addition to the 4,500 men employed in the mines how many are employed incidentally, for instance wood-carters and so on? That is very difficult to estimate; there might be 500.

3324. Therefore 5,000 would cover the total number of men employed in the mines in this district. Of that number how many are connected with the Proprietary Company? About 3,300.

3325. Out of a total of 5,000 men employed the Proprietary Mine employs 3,300, and of miners alone the Proprietary Mine employs 3,000 out of a total of 4,500? Yes; and in these figures I include the men employed by the Tarrawingee Flux Company.

3326. That is the total number employed on the field? Yes.

3327. Can you state approximately what amount of ore you have produced per month during the last two years? To reply to that question I shall have to refer to documents.

3328. Do you know your yearly output? It has varied very much during the past two years. It did run about 300,000 tons per half year formerly, but that has been reduced very much during the last two years.

3329. What do you think it is reasonable to suppose the Proprietary Company will put out yearly in the shape of ore during the next twelve months? About 6,000 tons or 7,000 tons per week, or (say) 320,000 tons next year.

3330. How much do you think you will produce after that? That depends upon a great many circumstances, such as markets, and so on.

3331. Is it reasonable to suppose from your present information that the output is likely to keep up to that figure for a number of years? Yes; the mine can do it.

3332. Are you of opinion that the mine can keep on the same grade of ore for a number of years to come? Yes.

3333. Is it a question of competition, the price of silver, and other matters that cannot be calculated? Yes.

3334. But in all human probability that output would be kept up for a number of years? Yes.

3335. Outside the Proprietary Mine, what amount of ore do you think it reasonable to suppose will be raised during the next twelve months? I have not the remotest idea; however, I think it will be quite easy to obtain that information from the other mines.

3336. Can you say anything about the life of the Proprietary Mine at the present rate of output? No.

3337. Except that it will last a great number of years? Yes; it will last a great number of years as far as we can tell. Of course, the life of the mine depends on a number of things.

3338. Will you say that it will last twenty years? I should not like to mention the term of years at all.

3339. Does it look perfectly stable and wholesome as far as you can see? We have published figures recently for our shareholders, and I can give you a copy of those figures.

3340. You have told us that the Proprietary Mine employs 3,000 men, and that outside mines employ 1,500,—is it reasonable to infer that if your return from the employment of 3,000 miners is 350,000 tons of ore per annum that returned from the other 1,500 miners will be half that amount of ore? No.

3341. Would it be less or more? It would be more, because included in the 3,000 men whom we employ, there is a number of men occupied in the treatment of ores. In those mines where the total number of men is occupied in the extraction of ore, man for man it must mean a greater output. Out of the 3,000 men employed by our company, there may be 1,600 employed directly in the extraction of ore, and in those mines where they do not treat the ore at all on the spot, the number of men employed by them should be compared with 1,600 out of 3,000.

3342. Is it reasonable to suppose, therefore, that under present conditions the output from the Broken Hill field will be 700,000 tons per year, that is double the quantity produced by the Proprietary Mine? No; that supposition would not be altogether reasonable.

3343. What would be a reasonable inference as to the total output? You must reduce it again and get the proportionate number engaged in underground mining, and then take them man for man.

3344. What is the amount of ore that could be got altogether from the mine? I cannot say; I have no definite knowledge on that point.

3345. There is no doubt that more than 350,000 tons of ore per annum could be produced? I think if forced the Proprietary Mine could produce 500,000 tons of ore per annum. I do not know that it is advisable to do that at any time, but it could be done.

3346.

Mr.
A. Stewart.
2 Oct., 1896.

Mr.
A. Stewart.
2 Oct., 1896.

3346. In bringing about a saleable product from the mine coal and ore are used; in that production is there more coal required than ore? As a whole in treating a ton of ore I do not think the difference is very much. I would not like to state it definitely. I should be glad to look it up. In considering the ore as it comes from the mine I do not think there would be much difference.

3347. If we have been informed that it will take 3 tons of coal to deal with 1 ton of ore, do you believe that is not quite a correct statement? It depends upon how you deal with the ore.

3348. When we were examining Mr. Howell he gave the following evidence:—

The present output would increase considerably if there were direct communication with the seaboard of New South Wales? Yes. You are masters of the situation here, because you have cheap fuel which is the greatest of all considerations in the treatment of sulphide ores. Without cheap fuel you cannot work profitably a majority of the Broken Hill sulphide ores. Including coal for the manufacture of coke it takes about $3\frac{1}{2}$ tons of coal to treat 1 ton of sulphide ore; and coal costs delivered at Broken Hill about 35s. a ton, whereas the ore can be brought down for much less.

What do you think of that statement? I could not express an opinion upon it, unless I knew how the ore was to be treated. If Mr. Howell has made that statement he has in his mind some different method of treating the ore to what I have. Unless you can explain to me the details of the treatment of the ore I cannot express an opinion upon it. If you extract ore to export it at the nearest sea port you only require coal to take the ore out of the mine.

3349. We have a definite statement that the majority of the ore to be raised at Broken Hill in future will be sulphide ore;—is that correct? Yes.

3350. The next point is this—it takes about $3\frac{1}{2}$ ton of coal to treat 1 ton of sulphide ore;—is that correct? That depends altogether upon how the ore is to be treated, and to what extent it is to be treated.

3351. Do you think, taking mining operations on the whole, that more coal will be required in the process than ore upon which the coal is used? Do you mean the ore as it comes from the mine.

3352. As you are likely to work your enterprise? I should say that in taking the ore as it comes from the mine there should be very little difference weight for weight.

3353. Is it your contention, speaking from your present standpoint, that it is immaterial to the Proprietary Mine whether the ores go to the coal, or *vice versa*? What I maintain is that it is practically immaterial to the Proprietary Company whether the lead products of the ore go to the coal, or the coal is brought to the ore. If you deal with the zinc product you must take it to cheaper coal than you can possibly get here, but those two products, the lead and the zinc, can, and will be separated at the mines.

3354. You have told us that 350,000 tons per annum will in all probability be raised from your mine, do you desire us to understand that such a process is likely to be carried out with regard to the 350,000 tons of ore as will necessitate the use of 350,000 tons of coal? Yes, certainly.

3355. Will it necessitate the use of more than that? That is where the difficulty comes in; I can tell you to a ton if you separate the zinc from the lead.

3356. By the time you have ceased your operations and you have dealt with your ore, have you used a greater weight of coal than of ore? I would require to make it up specially; I never have made it up. We have adopted the method of dividing the ore at the mine into a silver and lead product, making up an average of 1 ton of coal to 1 ton of ore.

3357. Will you let us have the figures later on? Yes.

3358. We have not yet decided the question whether the coal is coming to Broken Hill or the ore is going from Broken Hill to the coal;—from your standpoint is that question in abeyance at present? Yes.

3359. It does not pay you to lose the zinc product? As a matter of fact, we have not recovered any zinc up to date.

3360. Does it pay you to lose it? Not if you can recover it at a profit. We do expect to recover it at a profit, and it is in the treatment of zinc that coal is required.

3361. Then Mr. Howell's statement is correct? I cannot say, but no doubt that is what he had in his mind at the time he made that statement.

3362. If the companies determined to recover the zinc product, would it not become necessary to make use of more coal than ore? Yes.

3363. Are not the large establishments on the eastern coast being erected for the special purpose of obtaining the zinc product? Yes.

3364. Is a silver mine likely to pay better if all the products are obtained? Yes.

3365. Is it reasonable to infer that the zinc will be saved, and that a large amount of coal will be used, and that the ore will go to the coal? Yes; There is one point, however, which comes in. If after you get the ore extracted from the mine, you can separate your lead product from your zinc product, it is reasonable to suppose that the zinc product will go to the coal; but it does not necessarily follow that the lead product will go to the coal.

3366. Then it is a question whether it is better to separate those products before you send away the ore? Yes.

3367. At present the products under consideration go by way of Cockburn and Port Pirie? Yes.

3368. Do you know what it costs you to get to Sydney? We have never sent any ore there.

3369. What does it cost you to get coal? I cannot say definitely, because we contract to get the coal at Port Pirie for 13s. 3d. per ton.

3370. What does it cost to get the coal from Port Pirie here? About 14s. 11d. per ton on the South Australian railway, and 4s. 8d. per ton on the Silverton tramway.

3371. Are those the present rates? Yes, I think they are; but I will give you the exact figures.

3372. Do you believe that 19s. 7d. is the total freight from Port Pirie? Yes.

3373. We know that 5s. or 5s. 6d. is the freight by sea, so that makes a total freight of 25s. 1d.? Yes.

3374. So that to get a ton of your product from your mine to the eastern seaboard would cost 25s. 1d.? No, a ton of product will cost double.

3375. Do you add the price of your product on to that? No; that is for coal only.

3376. What is the freight for your product? I do not carry the figures in my head. I think the present freight on the Silverton tramway is 9s. 9d. for bullion, and 4s. for ore. I think it is 11s. 10d. on the South Australian railway, that is, 15s. 10d. for ore.

3377. Adding 5s. 6d. on to that for sea carriage, that will be 21s. 4d. for sending the ore to the eastern seaboard;—is that the rate you are paying? We are not actually paying that. I do not know whether or not we can get those freights by sea. We have not sent any ore at all.

3378. Are you sure about 15s. 10d. per ton? I am almost certain.

3379. Then, if it would cost 5s. 6d. for sea carriage, the cost would be 21s. 4d.? Yes.
3380. Then, if the proposed railway would carry the material for 21s. 4d. per ton to wherever the coal is, the probability is you would send it by that railway? At any rate there would not be any loss in sending it.
3381. We have a pamphlet handed in by the Mayor of Broken Hill, in which it is pointed out that there is to be a rate charged of 9s. per ton from the Border to Port Pirie, and the manager of the Silverton Tramway Company has told us that 3s. 3d. per ton will be the cost from Broken Hill to Cockburn, so that will give a freight to the seaboard of 12s. 3d.;—do you know anything about that? Not officially. I have heard that there are such proposals in view, but I have not been advised officially, and cannot say whether that has been carried out.
3382. Have you any reason to doubt that it will be carried out? I have very little reason to doubt it; as a matter of fact, we have a rate of 9s. per ton for sulphide ore only.
3383. That is your principal product? No; at present it is oxidised ore.
3384. It is said that carbonate ore will be carried at the same rate as sulphide ore;—do you doubt that that will be so? I think it will be to the interests of the South Australian Railway Department to grant that rate.
3385. Therefore, instead of taking the freight at 21s. 4d. per ton to Port Pirie, we have to take it at 12s. 3d. per ton, with 5s. 6d. for sea carriage, which makes it 17s. 9d. per ton? Yes.
3386. Therefore the New South Wales railways would require to carry ore at 17s. 9d. per ton before it would pay you to send ore to such coal centres as you may desire to reach? That is so.
3387. That is the price you could pay at present without loss? Yes.
3388. What is the distance from Cockburn to Port Pirie? 218 miles.
3389. The South Australian Government in future will charge 9s. per ton, which is approximately $\frac{1}{2}$ d. per ton per mile—that is on a narrow gauge, with all the defects which generally attach to narrow-gauge railways. Do you infer that the New South Wales railways, with a 4-ft. 8 $\frac{1}{2}$ -in. gauge, could do the work cheaper than $\frac{1}{2}$ d. per mile? I have no doubt whatever that they can do it for less.
3390. Are you aware that the South Australian Government are making a profit at that rate? As a matter of fact, I do not know; but I imagine they are not making a loss, otherwise they could not do the work.
3391. There is no competition at present? No.
3392. And, therefore, they fix a rate which we may assume is a paying rate? Yes.
3393. Is there fair return loading from Port Pirie? Yes; all the coal is brought up.
3394. Is there about the same coming back as there is going down? No; not since the export of sulphide ore began.
3395. Does it approximately amount to the same? I should imagine that it is not more than half.
3396. Do you infer from the fact that a narrow-gauge railway can do the work that a New South Wales railway with a better gauge could do it more cheaply? Yes, that is a reasonable supposition.
3397. Let us look at the case from another standpoint: At Broken Hill we are 253 miles from Port Pirie. The South Australian Railway Department and the Silverton Tramway Company desire to maintain the trade; they have to carry a distance of 253 miles, while New South Wales has to carry a distance of, it may be, 600 or 700 miles. If the country for 253 miles can be as easily worked, from an engineering standpoint, as the 700 miles of country on the other side, it simply comes to be a question of the cost of sea carriage as against the cost of 450 miles of land carriage. The South Australian Railway Department and the Silverton Tramway Company have the power to put down a railway of a broader gauge, and if they are forced to do so they are likely to do so. Is it not reasonable to place the cost of sea carriage against land carriage for 450 miles? It is not altogether reasonable, because there is the other traffic that could be got by the railway which could not go by sea except at a much higher rate, and then there would be the saving of time.
3398. Would not the saving of time be important with regard to passengers and goods? Yes, of course.
3399. Has your company made an arrangement for seven years to use the Silverton Tramway for all stuff going to the westward? An arrangement is proposed which has not been completed yet, as far as I know.
3400. Is it completed as far as your company is concerned? I believe not.
3401. Is it to be completed? I do not know; that lies with the board of directors. But it has been proposed, and the details have been drawn out. As a matter of fact, I think it is not complete.
3402. It was stated in evidence this morning that that arrangement would certainly be completed? I believe, as a matter of fact, it is more than likely that it will be completed, but up to this date the agreement has not been signed.
3403. But it is highly probable that it will be completed? I think so.
3404. If that agreement be signed, and if a 4-ft. 8 $\frac{1}{2}$ -in. gauge railway be made from Menindie on to Broken Hill, and thence to Cockburn, your mine could not use it except for stuff going to the eastward? Really I do not know; I never heard it put in that way before. I think the ordinary reading of the agreement means that if the New South Wales Government make a railway to Broken Hill, and also to convey traffic to the South Australian railways, this agreement would prevent that. That is my own opinion.
3405. What is the agreement made for: have you really made an agreement that all ore going westward will use the Silverton tramway? Yes, that is so. I think if the New South Wales Government made a railway to the Border at Cockburn, so that there will be two lines to deliver at the same point, the Silverton tramway would not exist any longer.
3406. If you made an agreement for seven years with the Tramway Company, would it not have to exist for that term? I think if you promised to make a railway down to Cockburn it would defeat the agreement.
3407. When was the agreement made? We always had an agreement. I understand it was made to give encouragement to the company to make the tramway; it has been in existence all along. This is now only an extension of the agreement.
3408. But still it is binding for seven years? I think it is not signed yet.
3409. Can you tell us definitely what the agreement is? No.
3410. Does it apply only to ore, or to all goods? I really do not know about outside goods. I think for all general goods to be delivered to the town of Broken Hill the rates remain as they are, but I am not quite certain.
3411. Is this the case: That a number of people—some of them interested in the tramway company and some of them in the mines—met and formulated a certain scheme which would be satisfactory to both of them;

Mr.
A. Stewart.
2 Oct., 1896.

them; a tramway company cutting down its rates, and the great suppliers of freight in this vicinity agreeing to patronise the tramway for a term of years;—is that what it means, roughly speaking? Yes; I would say, roughly speaking, that is what it amounts to; but so far as I know, no one connected with the mines has ever contemplated the possibility of the New South Wales Government making a railway between Broken Hill and the Border of South Australia. If there is any such proposal, I think the sooner we know about it the better.

3412. Do you know the conditions of the Act constituting the Silverton Tramway Company? I have read them, but I do not remember them.

3413. Will you tell us as briefly as you see fit why you would advise us to suggest that a railway should be constructed from Sydney to Broken Hill, or why you would not advise us to do so? I see a great many advantages that would be gained by this district if it had direct communication with Sydney. When you leave here for Sydney at present you get to Adelaide and lose the best part of a day; then you leave for Melbourne, where you arrive after very slow travelling, and you lose the most part of the day there before you can go on to Sydney, whereas if there were a railway direct to Sydney by any of the proposed routes, it would tap all this district, and give us rapid communication.

3414. Your first point is speedy and easy communication with the metropolis, and the sympathy which is begotten of that? Quite so; and there are the material advantages which would be derived by having direct communication with the capital.

3415. What is your next point? Independently of the treatment of the ore, and the mode in which it may be treated, so long as these mines continue to exist we shall always require large quantities of coal and other stores which we might get much more cheaply by a railway direct to Sydney.

3416. Have you any idea as to the amount of coal that is used in smelting, and the amount used for motive power? I will be glad to give the figures later on.

3417. What coke do you use? Coke from Germany.

3418. Do you use colonial coke? Not now.

3419. Will you use it? Yes, if we get it delivered cheaply enough. It is a matter of £ s. d.

3420. While freight from Germany remains as it is, and also the quality, will you use that coke? Certainly, if we do not get a considerable advantage in the New South Wales price.

3421. Has German coke less ash in it than New South Wales coke? Yes, and it is much better physically. It is better coke.

3422. Do you know Lithgow coke? No.

3423. Is coke from Germany landed at Port Pirie? Yes.

3424. You will continue to use German coke unless the New South Wales people learn to manufacture better coke? Yes.

3425. What coal do you use? Newcastle coal.

3426. Why do you use it? Because we find it is the best.

3427. Is it better for the purpose for which you require it? It is the best, taking price into consideration.

3428. Can you express any opinion about Lithgow coal? No.

3429. Do you want a good coal for your purposes, or would a second-class coal do? It all depends on the price. Under some circumstances it might be better to use an inferior coal.

3430. Where does the wood come from which you use for mining purposes? It is all Oregon pine from America.

3431. What does it cost delivered at Broken Hill? About £3 per 1,000 feet at Port Pirie.

3432. Is that 6s. per 100 feet superficial? Yes, 750 feet to the ton weight.

3433. For how much per 100 feet could you get it here? I will supply that later on.

3434. Would you be prepared to use timber brought from Menindie? That has been discussed; if we could get it cheaply enough we would be glad to take it.

3435. Would you furnish some figures in regard to what it would cost at the Darling, and what would be the railway rate? I will make up the figures. This proposed railway from Condobolin to Broken Hill has always been such an indefinite quantity in the past that we never made any calculation in regard to it. If there were a possibility of obtaining timber at Menindie and of bringing it across by any railway that is to be made we would go into these calculations, but we have never been able to do so in the past.

3436. Would gum timber be much better to use than Oregon? It depends upon the kinds of gum. There was a New Zealand gum which we used in the early days, but it rotted very soon. I understand that ordinary red-gum would last very well.

3437. Would you use it in preference to Oregon if you could get it at the same price? No; we might do so if put in position at the mine at the same price, but it would be harder to cut, carry, and set.

3438. But taking all the circumstances into consideration—the durability of the gum timber and its less inflammable nature—would you use it at the same price? Yes.

3439. Would you use it at a higher price? Not at a much higher price. We might use it at a higher price, because it would be better than Oregon.

3440. Do you use much firewood at the mine? Not since the South Australian Railway Department reduced their freight.

3441. What does it cost to deliver it at the mine? 14s. 6d. per ton.

3442. We are informed that timber could be obtained between here and Menindie at 3s. per ton. The New South Wales railway rate would appear to be 3s. per ton; therefore firewood could be delivered at your mine for 6s. per ton;—would you use that portion of the line for the carriage of timber? Most certainly, provided it is of fair quality.

3443. How many tons of firewood are required to do the same amount of work as one ton of coal? Two and a-half tons.

3444. Therefore, if that statement is accurate, coal would require to be worth only 14s. per ton in order to be purchased by your mine, if there is an unlimited supply of wood? Yes.

3445. Coal would cost you £1 12s. per ton, speaking roughly; if you could get material to do the same amount of work for 15s. per ton, you would buy the material at 15s.,—therefore, would it not follow that as long as the timber lasted there would be considerable traffic in firewood from the eastward to Broken Hill? Yes.

3446. How much firewood do you think Broken Hill uses now? I do not know; we use none.

3447. Would you use firewood if you could get it at 6s. per ton? Certainly, in preference to coal, unless it is extraordinary firewood.

3448. If it could be supplied at 6s. per ton, would there be an enormous demand? Yes.
3449. Can you put it in tons? I think 10,000 to 12,000 tons per month. That would be for the whole field, exclusive of the smelting operations.
3450. Do you say that certainly 10,000 or 12,000 tons would be used per month? Yes, approximately.
3451. Is your statement to this effect—that the ore used in your mine costs 6s. per 100 feet at Port Pirie? Yes.
3452. Rapidity of transit was your second point;—will you go on to describe the benefits which would be conferred by a railway on this part of the Colony? The next point I had was in connection with coal; but we have been discussing that in connection with the substitution of firewood for coal. If you could bring us sufficient firewood from Menindie, there would be no reason for going beyond that place to supply us with coal except in small quantities for special purposes. Then there is the question of coke. It is indefinite as far as I am concerned, because I do not know what quality could be supplied.
3453. What price do you pay for coke? About 31s. at Port Pirie.
3454. Have you not already discounted that by saying that until New South Wales can make better coke you will continue to buy German coke? No, I say that if they would reduce the price sufficiently we would use New South Wales coke. The New South Wales people or the producers of coal in any district might not be able to improve the quality of their coke, but they might be able to reduce the price. If you could increase the facilities of communication they might be able to supply the coke at less cost. I do not know that I can say anything more about it, because the whole thing depends upon the rates.
3455. If you could get enough inferior coke at a sufficiently low price to compensate this inferiority would you use it? Yes, it is all a question of cost irrespective of the quality of the coke. The other points are all on the same line; before anyone can say anything about them we must know what rates will be charged.
3456. With regard to the large population here, if it were possible to bring it in touch with good land and water where vegetables could be grown would it not be beneficial to the town? Certainly. The only definite statement we can make depends upon those points which we do not yet know. What rates can you offer. If you can offer us lower rates than anyone else it will alter the whole question, and we must go into it from the beginning.
3457. We must take it for granted that you would regard the railway as a purely commercial undertaking? I think there is another view that might be taken of it, that is as a national undertaking.
3458. I am talking of your view as the representative of a company. You would use it if the New South Wales Government could give you rates which would pay you as well as any other railway? Yes, certainly.
3459. It is a question of how much you are prepared to lose for the purpose of patronising a State concern. If the freight is to be higher you certainly do not think that the railway could be expected to get traffic from Broken Hill eastward? Yes. With regard to coke I may say that German coke was 2s. cheaper per ton than English coke, so we bought the German coke. The price varies. We used English coke some time ago.
3460. Are you aware that 40 per cent. of the product from Broken Hill goes to Germany and other parts of the old world for treatment? I am not aware, but I imagine that is about the present export.
3461. Will the establishment on the eastern seaboard of large smelting works do away with that trade? Yes, that is probable.
3462. Is it probable that a vast proportion of the product will be treated in the Colony? Yes, I imagine that will be the case. The reason why a large proportion of the product goes to Germany or other parts of the old world is in order to obtain the zinc. Since the operations on the eastern seaboard are for precisely the same purpose, I infer that the amount which will leave Australia to be treated will be small.*

Mr. Ernest Boan (Messrs. Boan Brothers), Broken Hill, sworn, and examined:—

3463. *Mr. Trickett.*] What is your occupation? A member of the firm of Boan Brothers, drapers, &c.
3464. How long have you been in business here? About nine years.
3465. What amount of goods do you import? Roughly speaking, about £30,000 worth a year.
3466. Does that consist of general goods? Boots and drapery.
3467. Which way does the bulk of the goods come? From Sydney *via* Port Adelaide and Port Pirie, thence by rail.
3468. Do you deal entirely with Sydney? Not entirely; the major portion comes from Sydney, the rest from Adelaide and the home country.

Mr. E. Boan.

2 Oct., 1896.

* *NOTE (on revision):*—As promised, I now have pleasure in enclosing a memorandum setting out information desired by the Committee, which I trust may prove serviceable to you. You will observe that in my evidence of yesterday I stated the price of timber at £3 per 1,000 feet, the correct price is as shown in the accompanying statement. I also notice, in looking over recent quotations, that English coke has been lower in price than that of German manufacture. I imagine the two are obtainable at about an equal price—the differences that appear in the cost delivered at Port Pirie being due to difference in rates of freight. *Memorandum.*—The amount of coal of a quality equal to the best Newcastle (New South Wales) steam coal required per 100 tons of average sulphide ore as raised from the mine is approximately 93 tons. Of this, 9 tons is required in the extraction and dressing of the ore and other operations connected therewith, and 84 tons in the treatment of the ore for the recovery of its contained metals. From the information available in this office, it appears that of the total number of railway trucks employed in this and other mining companies' traffic between Broken Hill and Port Pirie, about 25 per cent. are returned empty from the port. With the existing rates this proportion of empties must increase in future. The cost of coke delivered in trucks on the mine during the past five years has been £3 12s. 2d. per ton. The cost of mining timber delivered on wharf at Port Pirie is £3 8s. per 1,000 feet superficial. The existing rates from Port Pirie to the mine are as follow:—

	South Australian Railways.	Silverton Tramway.	Total.
	£ s. d.	s. d.	£ s. d.
Coke	1 3 4	9 9	1 13 1 per ton.
Coal	0 14 11	4 8	0 19 7 "
Mining timber	1 6 4	9 9	1 16 1 "
Oxidised ore	0 11 10	4 0	0 15 10 "
Sulphide ore	0 9 0	4 0	0 13 0 "
Smelter ballion.....	1 5 9	9 9	1 15 6 "

Mr. E. Boan. 3469. As we are chiefly concerned with freights from Sydney, will you tell us what it would cost to get goods from Sydney? I have been looking through our carriage account, and I find that for twelve months the cost has been nearly £1,300, that is carriage alone from Adelaide or Port Pirie to Broken Hill, and not shipping charges.

3470. What does it cost you per ton to get your goods from Sydney? Roughly, about £7.

3471. How is that made up—what is the steamer freight from Port Adelaide or Port Pirie? There is no steamer freight at all. The goods are landed at Port Pirie or Port Adelaide, we have an arrangement with the warehouses, whereby they pay other charges, and we only pay the railway charges.

3472. Do I understand that these charges come to £7? Yes.

3473. Does the railway carriage for 253 miles cost that much? Yes, it is very bulky stuff.

3474. Is that a high charge on goods that take up a lot of room? It is the minimum rate at which they can manage it.

3475. I suppose you are aware that according to the rates for goods on the New South Wales railways the charge for the same distance as from Sydney to Broken Hill would come to considerably more than that? Yes.

3476. Are you a supporter of this railway? Yes; I should like to see it constructed.

3477. What do you think would be the advantages to the district and the advantages to the State, were a such a railway constructed? It would be a great advantage to the district by opening up the country. A large quantity of goods would come through from Sydney, that otherwise would not come here.

3478. But would they send goods that way if they cost more? Yes, a certain class of goods would be sent even if they cost more, even if they cost half as much again.

3479. What sort of goods? Very fashionable stuffs for which you cannot afford to wait three weeks or a month. We would be willing to pay almost double that rate for a certain class of goods. If it cost only a fraction more it would pay to get the bulk of our goods through by the proposed railway.

3480. I suppose there would be very little trade outwards from here in the shape of supplies? Nothing of consequence; there are a few stations near at hand, places within 100 miles of Broken Hill would probably do business here.

3481. Are there many others at Broken Hill in as large a way of business as yourself? In other lines of business I expect there are.

Mr. Oswald Septimus Maddocks, Sub-Collector of Customs for Willyama, sworn, and examined:—

Mr. O. S. Maddocks. 3482. *Chairman.*] What is your occupation? Sub-Collector of Customs for Willyama. The district embraces Broken Hill, Cockburn, Silvertown, and Milparinka.

3483. *Mr. Wegan.*] Can you give us a statement of the imports and exports? Yes, I have prepared a statement for the last three years, and for six months of the current year.

3484. Can you make a statement giving the Committee an idea of the amount of trade transacted in this district? I can only deal with the items one at a time.

3485. What is the value of goods imported into Broken Hill within the last three years? In 1893, goods from Sydney were imported to the value of £139,455. In 1894, £150,312 worth of goods were imported from Sydney; that is the value at the port of shipment, that is Sydney. In 1895 the value of goods imported from Sydney was £117,113.

3486. Can you give figures for the total trade done here? I will be glad to do so, but I should feel obliged if the Committee would allow me to go through the figures again for the sake of accuracy, as I received somewhat short notice to prepare this evidence.

Mr. Harold Butler Sweetapple, mining contractor's manager, Broken Hill, sworn, and examined:—

Mr. H. B. Sweetapple. 3487. *Mr. Hassall.*] What is your occupation? Mining contractor's manager

3488. How long have you been in business here? For nine years, but my firm has been in business here for about fourteen years. We supply all the mines outside the Proprietary Mine.

3489. Can you give an idea as to the amount of business you do in twelve months? About £36,000 worth is the turnover. We supply all the mines except the Proprietary Mine, with materials and goods.

3490. What do the goods principally consist of? Everything required in mining—explosives, iron, bolts, &c., nails, &c. We indent them from England, land them at Adelaide, and get them through from there.

3491. Do you import direct? Yes. I have figures showing the cost of carriage for six months, from the 1st of January last. We pay £2,219 to the railway alone, and out of that £710 was for coal from Port Pirie.

3492. Where do you get the coal from? Newcastle. Some came from Leigh's Creek, South Australia, but owing to its poor quality, very little, if any more, will be used here.

3493. Do you get any great proportion of goods at Adelaide? Yes; most of them come through Adelaide.

3494. Do you purchase largely at Adelaide, in addition to what you indent? Yes.

3495. Do you think that the construction of a railway from Sydney to Broken Hill, would be a benefit to you? Yes, we often get goods through from Sydney; but it takes a very long time to get them. We very frequently get big lines through from Sydney, such as galvanised iron.

3496. What is the rate of carriage on those lines between Sydney and Broken Hill? It comes to about the same as from Adelaide; but there is a slight difference in favour of Adelaide.

3497. What is the total cost of carriage from Sydney to Broken Hill? There are different rates for different classes of goods. For bulky lines like iron, it is about 90s. That is the rate through from Sydney, delivered at Broken Hill.

3498. What are your other rates? About £7 16s.

3499. Where would you expect the advantage to come in by getting goods carried direct across the continent from Sydney? There would be the quickness in delivery.

3500. Would you be prepared to pay a higher rate for carriage than you do at present? No, unless the goods were correspondingly cheaper in Sydney.

3501. If the Railway Commissioners say that the lowest rate at which they could carry goods by the proposed railway is £9 8s. 6d. per ton which would be for special truck loads of 6 tons each, would you be prepared to patronise the railway? No, that would be too much of an advance on what we pay at present.

3502. Of course that would be a material advance on the present price? Yes.

3503.

3503. No matter what mode of conveyance were provided, would you not in all cases adopt the cheapest route consistent with a reasonable time in delivery? Decidedly.
3504. Do you find any difficulty or delay in getting goods *via* Port Pirie from Sydney? Yes.
3505. Do you sometimes find a difficulty in the despatch of goods obtained in Sydney, as compared with goods obtained in Adelaide, when sent *via* Port Pirie? That is true, it sometimes takes three or four weeks to get goods from Sydney.
3506. Still, with all the delays thrown in, would you prefer the water carriage at the present low rates? I frequently go to Sydney for goods, because we can buy cheaper there. For instance, that is the case with cement, kerosene oil, and other articles of that kind.
3507. In the case of goods of that kind, it does not matter how long they are in course of transit? Yes.
3508. Taking into consideration the delay which may occur at Port Pirie, I suppose you arrange your business affairs accordingly? Yes.
3509. On an average, how many tons per year do you get through? I have not got the number of tons, but the cost of carriage for six months from the 1st of January last amounted to £2,219.
3510. Is that a fair average? It was a pretty good year, but I do not think it will be less next year.
3511. Then your average cost for carriage is about £4,000 per annum? Yes.
3512. And if that were increased 50 per cent. it would mean you would have to pay £6,000 per annum for the same goods? Yes.
3513. Would that not be too heavy a tax to pay for a railway? Yes.
3514. Would not the question of your dealing with Sydney, if a railway were constructed, resolve itself entirely into a question of railway rates? Yes.
3515. You would patronise the railway if cheaper, but otherwise you would not use it? Decidedly.
3516. *Mr Fegan.*] You have said that you can get several lines much cheaper in Sydney—what are they? Galvanised iron, cement, and kerosene.
3517. What is the difference in price for galvanised iron in Sydney as compared with Adelaide? I bought some to-day at £2 per ton less than I could have obtained it at Adelaide or Melbourne.
3518. That difference would assist you considerably in using the railway? Yes.
3519. What is the difference in the price of oil? It is 3d. a gallon cheaper in Sydney than in Melbourne or Adelaide.
3520. Would not that also materially help you to use the railway? Yes.
3521. What do they charge for conveying oil and so on? Take kerosene—I was speaking of ordinary machine oil, but in the case of kerosene 1d. per gallon would be a great saving on the quantity we get through.
3522. What do you give for kerosene oil at Adelaide with cost of carriage? About 9d. or 9½d. per gallon; at present, 9½d.
3523. Therefore in Sydney you get it 1d. per gallon cheaper? Yes; there are 8 gallons in a case, the carriage of that from Adelaide is exactly the same as from Sydney, getting it by boat to Port Pirie and thence by rail.
3524. Then carriage costs almost as much as the article itself? Yes.
3525. Would not that nearly pay the extra cost by railway; take, for instance, iron, the difference in price would pay the extra cost even at the high railway rate mentioned by Mr. Hassall? Yes; but I do not suppose we could always get these bargains; but, of course, we are always on the lookout for them.
3526. *Mr. Hassall.*] But if you could buy a line of goods at £5 per ton more cheaply in Sydney than elsewhere, would you not still take advantage of a cheap mode of carriage? Yes; most decidedly.

Mr. Patrick Quinn, hotelkeeper, Broken Hill, sworn, and examined:—

3527. *Chairman.*] What is your occupation? Hotelkeeper.
3528. How long have you been here? Seven years.
3529. Have you any statement which you wish to make to the Committee? Yes; I wish to show what freights I have to pay on the goods I import from Sydney. One ton 1 cwt. of bulk ale, delivered at Port Pirie on the railway trucks, cost 14s. 6d., from there to Cockburn the charge is 15s. 7d. per ton, from Cockburn to Broken Hill, a distance of only 35 miles, the charge is 53s. per ton; that makes a cost of £5 2s. 11d. from Port Pirie for a ton and a half of ale in hogshead. I produce another receipt showing the same rate: six cases of whisky 2 cwt. 2 qr. £2 10s. is the rate per ton from Cockburn to Broken Hill, and that makes the railway carriage £5 2s. 11d. on 1½ ton.
3530. Would you be prepared to pay at the rate of £5 2s. 11d. for 1½ ton of goods from Sydney by the proposed railway? Yes. When you are getting iron, or anything of that kind, it is all right; but beer and whisky do not get any better by being kept too long on the road.
3531. Do you pay £3 8s. 9d. per ton for beer? Yes. Six cases of whisky, landed at Port Pirie, cost 13s., it cost for carriage between Port Pirie and Broken Hill 18s. 7d., making a total of 31s. 7d. from Sydney to Broken Hill—that is, for 2 cwt. 2 qr.
3532. With rates at all approaching these, would you be prepared to use a railway if made between here and Sydney? Yes, at anything like that rate.

Mr. William Maiden, grazier, Menindie, sworn, and further examined:—

3533. *Chairman.*] Do you know the country lying east from Broken Hill? Yes.
3534. Where do you first strike the timber? You come across the first large quantity of timber about 35 miles from here; there is a very large extent of it. You can go as far north as you like, right up to the river, and it is all timber. When you get within 35 miles of the Darling you strike the timber, and from there down to the lakes and the river there is a great body of timber as far as you like to go, and all round the river, in the bends and flats.
3535. Do you believe there is an unlimited supply of timber there? I am quite sure of it.
3536. What is the class of timber? The first timber you strike is mallee, belar, sandal-wood, and spotted gum, and various other kinds that are all suitable for fuel. A large quantity of the timber is suitable for props, and for all kinds of mining purposes where round timber is used. It runs from 8 inches to 14 inches in diameter.

Mr.
W. Maiden.
2 Oct., 1896.

3537. Going towards the river, is there a large quantity of red gum? Yes; there is an unlimited supply of red gum and box, fit for ordinary operations in a mine. A great quantity was sent from there in the old days. All the round timber used in the mines came from Menindie.
3538. What is its quality? It is much better for carrying weight than any other timber, and it is cheaper to land here.
3539. That is, it would be with the railway? Yes.
3540. There is an unlimited supply of timber fit for fuel and for ordinary mining purposes 30 to 40 miles eastward of Broken Hill, and there is practically an unlimited supply up and down the Darling River? Yes. To show that it is good timber, and suitable for the mines, I may say that a great deal of it was sent here in the early days, until the mines made contracts in the present way.
3541. Then the road carriage became too heavy for large contracts? Yes.
3542. At what price could props be obtained at Menindie? They used to land them at Menindie and along the road for 6d. each.
3543. Could you compete with Oregon timber at 6s. per 100 feet? Yes; the props I speak of had to be 7 feet long, and 7 inches thick at the small end. We could compete with Oregon timber at 6s. per 100 feet.
3544. Is 3s. per ton for firewood in the district you speak of a fair basis? Yes.
3545. On what sort of country is this timber growing? It is all growing on Crown lands, none of it, as far as I know, is private property or under leasehold.
3546. Then, it is available for the Crown if they see fit to use it? Yes, under the Land Act, as we have it at present, the timber does not form part of a man's lease. By paying a license fee, any person is entitled to go on a homestead lease, or a pastoral lease, for the purpose of obtaining timber, and that license only costs £1 per annum.

Mr. Charles Thomas Hyde, wood merchant, Broken Hill, sworn, and examined:—

Mr.
C. T. Hyde.
2 Oct., 1896.

3547. *Chairman.*] What is your occupation? Wood merchant.
3548. Is there a large consumption of firewood at Broken Hill for domestic purposes? Yes.
3549. What quantity of firewood is consumed for domestic purposes in a year? About 15,000 tons.
3550. Is that obtained locally? Yes, all of it.
3551. At the present time what is the cost per ton retail? About 16s. per ton. I am in as good a position as anyone to know what is the consumption of wood for domestic purposes.
3552. Then at the present time what is the cost per ton retail? It averages all the year round 16s. per ton delivered in the yard.
3553. Is firewood very scarce near Broken Hill now? Yes.
3554. What distance have the carters to go? From about 15 miles to 30 miles. It is getting scarcer every year.
3555. Is the bulk of the cost incurred for cartage? Yes; a little comes in by the Tarrawingee tramway, and some by the Silverton tramway.
3556. Does it come that way to any great extent? We obtained a large quantity last winter by means of the Silverton tramway.
3557. Is timber which is brought in by that means cheaper than timber which is carted? No, it is rather more expensive.
3558. How is that? In the case of the timber which comes in by the trains the cutter has to cart it 10 miles; then they have to load up the trucks on the tramway, and there is cartage afterwards from the truck to the yard. There is therefore more handling, because the teams bring the timber direct to the yard.
3559. Do you know the supply of timber at Kars and the rest of that country? Yes, there is a good supply of firewood there, the best in the district. There is almost an unlimited supply as far as domestic purposes are concerned.
3560. What is the price of coal for domestic purposes? It has been sold as high as £3 per ton, the average price is £2 15s. per ton for Newcastle coal delivered. Recently there has been a slight reduction, and I suppose coal could now be landed at £2 5s. per ton. That is the present price.
3561. As wood can be got for so much less, I suppose very little coal is used? Not a great quantity of coal; it is almost all wood, but I do not know what people will do here if some better arrangement is not made for getting the wood. Last year we had a most difficult job in trying to supply our customers; it was more difficult than in any previous year. We paid as much as 18s. 6d. per ton last year for wood delivered by teamsters. No doubt next year there will be much greater difficulty.
3562. The wood you refer to is, of course, in a rough state? Yes; the consumer has to get it in a condition ready for burning; it averages 23s. per ton as cut firewood. A railway to Menindie would be the best method to supply domestic firewood. If there is not a railway made to Menindie I do not know what people will do for firewood. The South Australian Government will not allow any timber to be cut over the border—it is all reserved for mining purposes. There is a very great quantity of wood in South Australia about 45 or 50 miles from here, but teamsters are not allowed to cut any.
3563. Is that reserved for growing purposes? No, I think it all mineral country, and the timber is reserved for mining purposes at a future date.
3564. Is it kept as a forest reserve? Yes.
3565. What area of timber country is there? I cannot say, but there is a very large area with good timber on it. There are 40 miles square of good timber country, and lower down the line there is plenty of timber. Wood was always scarce, but at one time it was more plentiful than it is now. Gradually the wood cutters have had to go further back, and within a radius of 20 miles of Broken Hill you can scarcely get a good load of sound timber.
3566. Have you heard it stated how many tons per annum are consumed by the mines? The mines have not been consuming much wood recently.
3567. But what quantity did they use at one time? They did use a great quantity once, about 15,000 tons per annum at one time. During the last two years they have not used nearly that quantity, simply because it is too expensive. In fact, they could not get it at any price. They called for tenders, but no one tendered. We did the same ourselves last winter. The fuel supply is a very serious matter here.
3568. Do you think the people of Broken Hill would be willing to pay 33s. per ton for coal for domestic purposes? Yes, they would jump at it; they pay about 35s. per ton for coke.

Mr.

Mr. Jabez Wright, alderman of the Borough of Broken Hill, sworn, and examined:—

3569. *Chairman.*] What is your occupation? Undertaker's manager, and alderman of the borough.

3570. What do you desire to prove? That it is requisite to build a railway at least from here to Menindie.

3571. *Mr. Egan.*] Will you give us your reasons for that? First, there is the wood difficulty, which has been referred to by Mr. Hyde. Being a householder, I can realise the seriousness of having to pay 23s. per ton for wood. The second reason is, that being a man with a family, I am in the position of thousands of others who cannot get fresh fish to eat. There would be a very large demand for fish if the Darling River supply were available. Many have tried to supply the town with fish at certain seasons, but they have only succeeded to a limited extent. The fish has generally gone bad on the journey.

3572. Where do you get your fish from? People have tried to bring it from Menindie by teams; then vegetables and fruit have to be brought here from South Australia over a very great distance, south of Adelaide. To my knowledge, there are no vegetables grown for this market on this side of Adelaide.

3573. Would the country along the proposed line of railway supply that want? On the river it is an acknowledged fact that the various vegetables would grow to perfection. I have myself seen fruits of the citrus tribe growing on the river.

3574. How far from Menindie? On a homestead belonging to Mr. Burns, between Menindie and Tolarno.

3575. Was there a large area under cultivation? About half an acre. It was not a commercial undertaking with him, and he merely gave away the fruit to his friends. On the same homestead lease, on the river-bank, all sorts of vegetables grow splendidly. He had a small engine on the bank of the river with which he forced the water on to this small area.

3576. Are there seasons of the year when you cannot get vegetables at Broken Hill? No; you can always buy them at a price, sometimes as high as 9d. for a cabbage or cauliflower. I think potatoes can be obtained at about the same cost as in Adelaide, with the carriage added.

3577. Have you the slightest doubt that if a railway were constructed from here to Menindie, Menindie would become more of a fruit-growing and vegetable-growing country? I have not the slightest doubt about it. It would sustain a very large population if, in addition to a railway, there were a lock across the Darling.

3578. Do you think it would be the chief source of supply for fish, fruit, and vegetables? Yes, the only place from which it would come.

3579. It would produce all the timber, fish, fruit, and vegetables that you would require? Yes; and also horse-feed; we pay £6 per ton for chaff. The next reason why I think the railway should be constructed is, because it would confer a great benefit upon the men who are employed in the mines. Many men work on and save a little money, but not sufficient to enable them to start in any business in the town. Most kinds of business are overdone, and the miners work on till they are carried to the cemetery. I have known scores and hundreds of cases where men would have had sufficient capital to take up farms on the river if there had been a railway between here and Menindie. They could have filled up their time by fishing, and they would have been alive to-day, producing food-stuffs for us at a cheaper price. Another reason is, that I suppose it will naturally follow that as the ores obtained here become of a baser character more labour will be necessitated; and if men have to pay excessive prices for food-stuffs they will not be able to work at as low a rate of wages as if they could get the necessaries of life cheaper; therefore it is probable that many of the ores will remain in the earth.

3580. Then you think that a number of people would go from Broken Hill to Menindie to become producers of various articles which the people of Broken Hill require? Yes.

3581. Do you know whether or not that land is available for settlement? There has been a large irrigation settlement set aside in that neighbourhood by the Government. I think there is an area of 25,000 acres.

3582. Whereabouts is that? On the river; but I do not know exactly the place; it is somewhere near Lake Menindie.

3583. What is the area of the allotments? I am not aware.

3584. You are not sure that it is not all one allotment? I do not know.

3585. So you think there is sufficient land available to commence the industries that you have mentioned? Undoubtedly.

3586. Did you mention something about locking the river? There is about 30 feet of river-bank at Menindie, and I am informed that the river falls only about 1 inch to the mile. That would give a head of water of 30 feet, which would dam the river back for twelve times 30 miles, and give at six times 30 miles 15 feet of water. That amount of water would be available on both banks. There are billabongs which would overflow, so that damming the river would provide the means of irrigation to the back country. I saw enough during a trip I made down there to show me that when the water reaches a certain level it overflows into those places.

3587. So that it would be beneficial to the people of Broken Hill if a railway were constructed to Menindie from here? Yes. When the meat-works started sending pork here from Menindie, in order to get it away before it had time to get bad in the summer, it sweated, and it brought very little in this market. South Australian pork, which was brought from a long distance, sold at a higher price.

3588. Do you think that it would pay to grow vegetables at Menindie which would have to compete with those grown along the South Australian line? Yes; for two reasons. First, the long distance from Adelaide to Broken Hill, and vegetables have to be brought a considerable distance further away than Adelaide; secondly, the people who grow vegetables there have in most instances to rent their land, and, of course, we know they have to pay the high price that other people are prepared to pay for that land. Those two things show me that vegetables and horse-feed could be produced more cheaply and better at Menindie than they could be sold by bringing them all the way from South Australia.

3589. Do you think there would be a large traffic in horse-feed? Yes.

3590. In some of the mines, do they use a large number of horses? Yes; and there is a large number of horses used in the town. About twelve months ago, at Tolarno Run, I saw splendid wheat growing on a homestead lease.

3591. Would not all that depend on the rainfall? Yes; but with irrigation all things are possible. There is another way of looking at the railway proposal, and that is from a revenue and a health point of view. The people here naturally avail themselves of every opportunity of leaving this smoke-ridden district

Mr.
J. Wright.
2 Oct., 1896.

Mr.
J. Wright.
2 Oct., 1896.

district for a change of air. The only means available at present is a trip of about 3 miles by railway. If they went 40 miles out they would not get any better country to go to, and if they go in the direction of Silverton they only find the same class of country. On the last occasion when Caledonian sports were held about 3,500 people went to Silverton. Yesterday about 3,000 people went out to the recreation ground, and 2,000 of them went by the tramway. The price of the tickets was 1s. return, and the price to Silverton is 2s. return—that proves an attraction to a large number of people. Judging by these facts, there is no doubt that a large number of people would avail themselves of the advantage of a railway to Menindie.

3592. Do you think they would leave the recreation ground to go to Menindie? Yes; it is within an easy distance—70 miles.

3593. But is there not plenty of dust there? Yes; but dust is much better than smoke. There are many spots between here and Menindie which, with a railway, could easily be made very nice places, and the people here would largely avail themselves of them. Speaking as an undertaker, I know that a large number of people die here for want of fresh air. I know it would hurt my business if you built a railway, but at the same time it would bring more population. The fact which affects me principally is that I have to breathe the same atmosphere.

3594. Do you think the construction of a railway from Menindie to Broken Hill would be the means of inducing business people to build dwelling-houses along the line? Yes.

3595. Do you think they would prefer to go to some distance from the town? Yes.

3596. Are there any such places along the other line towards Cockburn? The Silverton Tramway rates are very excessive. There is a class of people in Broken Hill doing business who could live 35 miles out.

3597. You think that by constructing a dam on the Darling River, so as to keep Menindie and Speculation Lakes filled with water, that part of the country would become a favoured resort for the people of this town, and also a great producing district, which would be greatly to the advantage of Broken Hill? Yes, and it would create another class of people who would combine two occupations. It would enable people with families to take up a large area of land on the river Darling. They could come in here at stated periods of the year to work in the mines; they could devote the rest of their time in improving their homesteads; their families would be producing something on the land. Everything that people eat or drink here has to be purchased at a high price. We cannot keep a goat or a cow here.

3598. Is there not regular employment at the mines? No, it fluctuates; then men get bad through lead-poisoning very often. If we had a railway, instead of those men working on until they are taken to the cemetery they would probably go out to Menindie and recuperate.

3599. What is the death-rate here? Naturally, this climate is a splendid one, and if it were not for the fact that men get full of lead the death-rate would compare favourably with other places.

Mr. William Maiden, grazier, Menindie, sworn, and further examined:—

Mr.
W. Maiden.
2 Oct., 1896.

3600. *Chairman.*] Have you heard Mr. Hyde's evidence with regard to the supply of timber in this neighbourhood? Yes; and I think he has made a mistake with regard to the area of timber country available south-west of Cockburn. I know the country he refers to; it is within 25 miles of Cockburn. There is some mallee, but it is down the line some distance. The supply to be obtained at a reasonable distance below Cockburn would be very limited in extent, and it does not compare in any way with the supply on the Menindie side. The supply there would only last a short time.

Mr. Charles Counsell, shorthand-writer and accountant, Broken Hill, sworn, and examined:—

Mr.
C. Counsell.
2 Oct., 1896.

3601. *Chairman.*] What is your occupation? Shorthand-writer and accountant, resident at Broken Hill.

3602. How long have you been here? Two years.

3603. Did you prepare the pamphlet which has been referred to by his Worship the Mayor in his evidence? Yes.

3604. *Mr. Hassall.*] From what data did you prepare this pamphlet? I had personal interviews with several individuals who gave me information.

3605. You got information from various sources? Yes; as far as Menindie was concerned, Mr. Maiden gave me information; I got other information from data supplied to me by Mr. Maddocks and other gentlemen. I had to draw out a report from the best information I could get, and it was much longer than what appears in print.

3606. The first practical reason embodied in the report is that the level nature of the country would enable a line of railway to be made at a reasonable cost? Yes; I got that fact from the Parliamentary reports which have been published, and from reports of several engineers. The Government has obtained sufficient evidence on that point.

3607. The pamphlet says that the railway could be made very economically;—do you think it could be made for £2,600 per mile? From what I have heard I think it could be constructed for much less.

3608. I see that you state the imports for 1894 from South Australia as being worth £524,483, and for 1895, £544,239; and the exports to South Australia for 1894, £1,959,030, and for 1895, £1,917,354;—are those figures correct? They were furnished to me by Mr. Maddocks.

3609. Are the whole of the figures given here with regard to imports and exports correct, and can they be verified by reference to official reports? Yes; with the exception of the figures with regard to excursionists. I could not get that information from the Silverton Tramway Company, but I got some information with regard to previous years. I gave that approximately. I tried to get the figures in every case.

3610. With regard to vegetables, do you suppose that potatoes could be grown at Menindie? I think they could if you had a water-supply.

3611. Do you think they would grow there as well as in cooler climates? I think so, judging from the effects of irrigation in California.

3612. With regard to vegetables brought here from South Australia, are they grown by means of the natural rainfall or by irrigation? I believe they are grown both ways.

3613. Have you had any experience in growing vegetables by means of irrigation? Yes; but only in an amateur sort of way.

3614. I suppose you have heard of the experiment at Mildura? Yes.

3615.

3615. Did that turn out to be a success? Chaffey Brothers were not so competent as they were believed to be, but I have no doubt irrigation can be carried out successfully for the nation and the individual, but people must get instruction about it.

3616. Do you think you could induce people to settle in Menindie district who would have sufficient knowledge, experience, and capital to produce vegetables? I believe a fine lot of men with means at their disposal could be found here who would take up small areas between here and Menindie.

3617. And you say that the only thing that blocks them is the want of railway communication? Yes, and the want of a sufficient amount of water. The land there is useless without a water supply. When I came here I found out by inquiry that when men worked in the mines for any length of time they lost energy from the effects of the lead.

3618. Do you contend that the construction of the railway would give miners an opportunity of varying their occupation? Yes; many of them would live 14 or 21 miles away.

3619. Would not that be a question of water supply? I mean they would have their residences out of town in order to get rid of the bad atmosphere here.

3620. Is it not probable that smelting operations will cease in a short time at Broken Hill? Yes; but there will be lead poisoning under ground. A man ought not to work more than six hours at that kind of labour. In the Cumberland mines a man is not allowed to work unless he has a small plot of land which he cultivates. The two occupations prevent him from becoming affected by the lead.

3621. Do you think that the establishment of irrigation farms as a result of the construction of the proposed railway would result in one body of men working in the mines during the time that another body of miners were working on their farms? Yes.

3622. Are you aware that at present Lake Menindie is practically dry, so that it would be necessary to incur a certain amount of expenditure in order to conserve water there? No doubt that is the case, but the locking of the Darling River would remedy that at all times.

3623. You give figures showing that thousands of pounds worth of food are imported to the district year by year;—do you think that the Government should make some effort to provide communication between here and the river in order to give the people an opportunity of growing these supplies in their own colony? Yes. The cost of living here is very great. I am informed that the price of a 4-lb. loaf of bread at Adelaide at present is 5d., while here it is 8d. The charge on the Silverton tramway is in some cases more than the cost of the goods which are sent by it.

Mr.
C. Counsell.
2 Oct., 1896.

SATURDAY, 3 OCTOBER, 1896.

[The Sectional Committee met at the Council Chambers, Broken Hill, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Charles Eley, Traffic Manager, Silverton Tramway Company (Limited), Broken Hill, sworn, and further examined:—

3624. *Chairman.*] Do you produce returns showing the passenger traffic on your tramway? Yes. I now produce the following figures showing the whole of the passenger traffic. The Sydney bookings for the year ending 30th June, 1896, were:—

Mr. C. Eley.
3 Oct., 1896.

<i>To Sydney.</i>			<i>From Sydney.</i>		
1st single	...	12	1st single	...	22
2nd single	...	18	2nd single	...	16

Fares

Mr. C. Eloy. Fares Broken Hill to Melbourne. Single—1st, £6 13s. 0d; 2nd, £4 1s. 3d. Return—1st, £9 19s. 6d.; 2nd, £6 1s. 9d.
 3 Oct., 1896. Broken Hill to Sydney. Single—1st, £8 15s. 0d.; 2nd, £5 15s. 6d. Return—1st, £13 2s. 6d.; 2nd, £8 13s. 3d.
 Cook's excursion fares are: Broken Hill to Melbourne. 1st Return, £4 18s. 0d.; 2nd Return, £3 1s. 3d. Broken Hill to Sydney. 1st Return, £7 18s. 0d.; 2nd Return, £5 1s. 3d.

3625. Mr. Trickett.] Are the cheap excursions largely availed of? Yes, very largely. In addition to these, we are now arranging to run cheap excursion trains to Adelaide at £1 10s. first-class, and £1 second-class return. I find that I cannot get a balance-sheet as there is not one in the office, but you could get one at the Melbourne office. I also promised to get the rates by steamer from Port Pirie and Port Adelaide to Sydney, but I find I cannot get them here.

3626. Chairman.] You do not issue tickets in conjunction with the steamers, but only with the railway? Yes, that is all.

Mr. O. S. Maddocks. Mr. Oswald Septimus Maddocks, Sub-collector of Customs for Willyama, sworn, and further examined:—
 3 Oct., 1896. 3627. Chairman.] Do you produce statistics showing the imports and exports to and from Broken Hill during a series of years? Yes, they are as follows:—

COMPARATIVE RETURN showing principal Items, Quantities, and Values of Goods imported from South Australia.

Article.	1893.		1894.		1895.		1896 (half-year).

Excess of imports over exports to Queensland.		71,659	38,921	34,035	15,838

3628. Do those figures give a fair idea of the trade that passes over the border? Yes.

3629. This gives a comparative return of all the goods? Yes, for 1893, 1894, 1895, and six months of 1896.

Mr. Albert Alfred Brice, auctioneer, Broken Hill, sworn, and examined:—

3630. *Chairman.*] What is your occupation? Auctioneer.

3631. Are you engaged in the import of goods to Broken Hill? Yes, produce, fruit, and various other things.

3632. *Mr. Trickett.*] What kind of produce do you deal in? Butter, eggs, bacon, cheese, (chaff, to a certain extent, but not much), potatoes, onions, fruit, vegetables, and flour. I am a general produce merchant.

3633. Where does the bulk of your produce come from? South Australia.

3634. From Adelaide or intermediate ports? From all parts of South Australia. We also get produce from Melbourne, Tasmania, and Sydney.

3635. What do you get from Sydney? Butter, cheese, and bacon, that is about all.

3636. Seeing that Victoria is such a large producing centre for that kind of goods, how is it that you deal with Sydney? We do not at present, we only deal with Sydney when we cannot get supplied from the nearer colonies at a satisfactory price.

3637. You get your goods from South Australia when you are able to do so, that being the nearest place; when you cannot get them there you get them from Melbourne, and when you cannot get them there, you get them from Sydney which is a kind of last resort? Yes.

3638. If a railway were constructed from Condobolin to Broken Hill, would that help the Broken Hill people in any way with regard to the commodities in which they deal, seeing that the distance by rail would be rather long? It might be a benefit with regard to fruit, but of course it is very difficult to say. In produce everything depends upon the way in which the railway managers handle it, for instance, cream is nearly all spoiled on the railway. If it were handled properly by means of cool cars it could be brought here fresh, and the properties of the cream would not be spoilt.

3639. In the case of perishable products of that kind, would not they also be brought from the nearest possible point? Yes, we get them from as near as Cockburn, and as far as Port Pirie, and sometimes as far as Tarlec on the southern line.

Mr.
A. A. Brice.
3 Oct., 1896.

Mr.
A. A. Brice.
3 Oct., 1896.

3640. What is the volume of your business during the year? Approximately about 10,000 lbs. of butter are used per week all the year round; about 5,000 dozen eggs per week all the year round; 1 ton of bacon and 1 ton of cheese per week; fruit and vegetables are classed together, and it is very difficult to divide them. About 50 tons per week are used. That is the total consumption of these articles in this place.

3641. Have you any data to go upon with regard to these figures? Yes; that is as nearly correct as I can give them. We have always been handling these articles for the last nine years.

3642. According to your figures, about 260,000 dozen eggs are used in Broken Hill in the course of a year? Yes.

3643. In the returns submitted to the Committee in a pamphlet it is stated that the consumption of eggs here in 1894 amounts to 334,000 dozen, and in 1895 to 417,000 dozen;—do you think that those figures are an exaggeration? Yes.

3644. Were you connected with the Committee which drew up that report? No; I had nothing to do with it.

3645. Were you consulted in any way with regard to the figures? No.

3646. With regard to one item to which I directed your attention, does there not seem to be considerable exaggeration? Yes; but I have not over-estimated.

3647. Coming to the question of getting goods to Broken Hill, is the present system of transit by the South Australian railway and the Silverton tramway satisfactory? There is no other means of getting them, and they come as quickly as possible.

3648. What is your opinion with regard to the charges? I think they are about fair, consistent with properly carrying out the business. I know they go to a great deal of trouble in providing cool cars for butter without extra charge.

3649. They do the best they can to get the goods here in a proper condition? Yes. To bring butter from Port Adelaide to Broken Hill costs about $\frac{3}{4}$ d. per lb. To get it from Sydney to Port Adelaide costs about $\frac{1}{2}$ d. per lb., and rather less sometimes.

3650. With regard to the goods that you deal in, how do the prices to the consumer compare with the prices in Adelaide and Melbourne? During one part of the year the prices are controlled by a set of circumstances wholly different to those which prevail in another part of the year. At one time prices in Adelaide would be cheaper than here; at another season of the year Adelaide prices would be considerably higher. Here we have the benefit of two markets. If prices in Adelaide are cheaper, we get our goods there; if Melbourne prices are lower, the goods come from there.

3651. Therefore, with regard to the cost of living, the people here would not benefit much by the proposed railway? They would if it promoted cultivation on the Darling River. There would then be a considerable saving, because, at present, a large amount of goods perish during the long carriage.

3652. Are you of opinion that a railway from here, in the direction of Menindie, would develop the production of articles for local consumption? If the soil is suitable, as I am told it is, there would be a great inducement for people to undertake the growth of produce.

3653. That would develop the establishment of an agricultural population in that part of the country? Yes; there would be population there, alright.

3654. What other rates have you to pay for bringing up produce? Everything that is sold by the pound is just about the same. It is all of the same class.

3655. Do you import under a truck rate as well as a special carrying rate? Yes; the bulk of the goods comes up by truck.

3656. We have it in evidence that the Silverton tramway people and the railway people have made some fresh arrangement with the mining companies to carry their requirements at a reduced rate after 1st January, 1897;—is there any movement by the company in favour of such goods as you import? I have not heard anything about it.

3657. Do you not pay rather a high rate for the carriage of your goods? Yes, it costs a great deal; 1d. or $\frac{3}{4}$ d. per lb. amounts to a great deal of money. I suppose about £7 per ton.

3658. It appears that the reason for this new arrangement with the mining companies is because the mining people have asked for it;—have you and the other carrying agents made any representation that the tramway and railway should carry commodities required for the town more cheaply than they do now? Not recently.

3659. When have you done so? We have asked for concessions on various occasions.

3660. Have you been able to obtain them? Yes; they generally try to meet us.

3661. Do you consider the present charges fair and reasonable? In order to answer that question you would really want to know the whole expenses of working the railway and tramway. One penny per lb. is fair and reasonable, while they do not get too much profit.

3662. I do not mean with regard to the dividends of the company, but fair and reasonable with regard to what the consumer of the articles has to pay? Considering the great distance the articles have to come, I do not see that there could be much alteration.

3663. You say you get a certain class of goods from Melbourne;—do you know what the charges are from Melbourne to Adelaide, Adelaide to the border, and the border to Broken Hill? No; the cost of getting goods from Melbourne to Adelaide is about $\frac{3}{4}$ d. per lb. The cost from Adelaide to Broken Hill is $\frac{3}{4}$ d. per lb., but I could not state what is the charge proportionately from Cockburn to Broken Hill.

3664. Is not this the way—the charge for bringing goods from Adelaide to Broken Hill is very much out of proportion to the charge for bringing goods from Melbourne to Adelaide? They go by water from Melbourne to Adelaide.

3665. By railway, would it be as much in proportion? Yes; from Melbourne to Adelaide is a longer distance. We have not had much by rail, but I think that for some which we had by rail the cost was just about the same from Melbourne to Adelaide as from Adelaide to Broken Hill.

3666. As an agent, an intermediary between the producers and the public of Broken Hill, do you think that this proposed railway is desirable and is likely to benefit the people you deal with and the public of Broken Hill? Yes; I should say it would benefit them very decidedly. We should then be able to get away for a change in summer time at much less expense than we do at present.

3667. Would the passenger traffic be largely benefited by your being able to get away at reasonable fares? Yes; if the accommodation on the river at Menindie is good enough to encourage anyone to go there, and if they can get there cheaply—in fact, if they can get to any place where they can see trees and water and have some change. The majority of the people here get very little change. As far as the people working

working in the mines are concerned, it would be a very great benefit to them to be able to get away to the river. I should estimate that the traffic in that respect would be very large.

3668. Do you only speak from the local point of view, and not with reference to the through railway to Sydney? I am speaking from the local point of view.

3669. You think that the railway will be the means of developing the country within a reasonable distance of Broken Hill, where there is a water supply? Yes.

3670. You say that at Menindie, the soil being suitable, and there being water, produce could be grown to meet the requirements of Broken Hill;—can you tell us the nearest point in South Australia where the same articles could be grown to meet the necessities of Broken Hill? There is little or nothing on this side of Petersburg, which is about 180 miles from here.

3671. Would it be a considerable advantage to get a local supply? Yes. Petersburg could not supply much produce; but there are good producing districts further away.

Mr.
A. A. Brice.
3 Oct., 1896.

Mr. Francis Whysall, post and telegraph master, Broken Hill, sworn, and examined:—

3672. *Chairman.*] Are you post and telegraph master at Broken Hill? Yes.

3673. Do you produce figures showing the rainfall for a number of years and the business transacted in the Postal and Telegraph Department? Yes; the following are the returns:—

Mr.
F. Whysall.
Oct., 1896.

Broken Hill Rainfall.

Year.	No of wet days.	Rainfall (points).
1888 (from 1st May)	21	177
1889	59	1,643
1890	46	1,210
1891	55	937
1892	61	1,176
1893	49	985
1894	59	1,235
1895	42	718
1896 (to 30th September)	45	488
Total		8,568
Annual average ...		10.18

Telephone Exchange.

A Telephone Exchange was established at Broken Hill on 2nd March, 1891, with thirty subscribers. The number of subscribers at present is 147, and there are twenty (20) others waiting to be connected. The maintenance and rents collected during the last twelve months was, approximately, £950.

Telegrams.

The number of telegrams transmitted during the twelve months ending 30th June, 1896, was 46,359, the revenue derived therefrom being £3,796 16s. 9d. The number of telegrams issued during the same period was, approximately, 10 per cent. more than those transmitted.

The following is a statement of the business done in the Post Office, Money Order Office, and Government Savings Bank during the years 1894–1895, and from 1st January to 30th September, 1896:—

	1894.	1895.	1896 (1st January to 30th September)
No. of Money Orders issued	10,149	9,196	8,289
Value of Money Orders issued	£31,564	£29,453 18s. 1d.	£28,879 11s.
No. of Money Orders paid	2,969	3,397	2,911
Value of Money Orders paid	£11,122	£14,988 15s. 11d.	£13,833 16s. 11d.
No. of Savings Bank deposits	10,600	8,987	7,243
Value of Savings Bank deposits	£70,203	£60,185 4s.	£48,013 1s. 10d.
No. of Savings Bank withdrawals	2,907	3,340	2,504
Value of Savings Bank withdrawals	£59,202	£57,331 6s. 3d.	£48,351 3s. 11d.
No. of Postal Notes sold	6,443	9,481	8,796
Value of Postal Notes sold	£2,734	£3,942 9s. 10d.	£4,244 19s. 7d.
No. of Postal Notes paid	1,705	2,147	1,890
Value of Postal Notes paid	£628	£774 16s. 11d.	£712 1s. 7d.
Postage Stamps sold	£4,905	£4,600	£3,817 10s.
Duty Stamps sold	£184	£182	£167
Commission on Money Orders	£481	£418 12s.	£371 15s.
Private Box fees	£185	£120 4s. 9d.	£115 11s. 6d.
Private Bag fees	£35 14s.	£31 10s.	£31 10s.
Parcels despatched	5,797	6,860	6,085
Parcels received	5,909	6,959	6,223
Letters registered	12,154	12,922	9,359
Ordinary Letters posted	384,632	324,000	308,421

It will be noticed that the figures for the nine months ended 30th September this year in some instances almost equal those for the full previous year. When the extra three months' totals are added a decided increase all round will be apparent.

Mr. James Borneth Gluyas, general manager, South Silver-mining Company, Broken Hill, sworn, and examined:—

3674. *Chairman.*] What is your occupation? I am general manager of the South Silver-mining Company.

3675. *Mr. Fegan.*] How many men are employed in your mine? 375, all told.

3676. How many extracting ore? 230.

3677. How long have you been carrying on operations? About seven years.

3678. What is the area of your block? There are four 40-acre blocks—160 acres in all.

Mr.
J. B. Gluyas.
3 Oct., 1896.

- Mr. J. B. Gluyas. 3679. What is the principal product of your mine? Sulphide ore.
 3680. Do you use a large quantity of timber? Yes.
 3681. Where do you get your timber from? We use 10 by 10 Oregon pine.
 3682. How much a foot do you pay? Sixteen shillings per hundred feet.
 3683. Does it come from Port Pirie? Yes.
 3684. Is there a contract for it? Yes; Stenhouse supplies it at so much per 100 feet.
 3685. Do you send a great quantity of your ore away? Yes, all the concentrates, some to Port Pirie and some to Port Adelaide.
 3686. What is the freight to Port Pirie? Nine shillings from Cockburn to Port Pirie.
 3687. How much from Adelaide to Broken Hill? Eleven shillings and sixpence from Cockburn.
 3688. Do you get up anything else besides timber? Machinery, coal and fuel.
 3689. But does 9s. per ton clear you from Port Pirie here? That is all fixed in our Melbourne office.
 3690. Do you not know what prices you pay? We have nothing to do with the freight; it is paid for yearly by the company.
 3691. What is the freight from Broken Hill to Cockburn? I do not know.
 3692. I suppose you do not care about giving evidence? I do not care about it, of course.
 3693. How much coal do you use? About 65 tons per week.
 3694. How much per ton does it cost you? The figures are as follows:—Coal for 12 months ending 30 June, 1896, 3,278 tons; value, including carriage, £6,683 16s. Coal for 3 months ending 26 September, 1896, 1,011 tons; value, including carriage, £2,072 11s. Firewood for 12 months ending 30 June, 1896, 118 tons; value, £77.
 3695. How much did the coal cost you per ton? Some of it cost on an average 41s. We have had different contract rates. There has since been a reduction in the railway carriage.
 3696. What areas are you working? Blocks 7 and 8, an area of 88 acres.
 3697. What is the depth of your mine? 825 feet; that is the lowest level.
 3698. Have you proved to any greater depth? No.
 3699. Have you any idea if it is as good as at the present level? It is supposed to be, but I cannot see through the ground.
 3700. You are in the position of manager of the mine, and ought you not to have knowledge, to a certain extent, as to what is below;—do you say that it is as good as far as you know? Yes; a little better, if anything.
 3701. How much ore do you raise daily? 1,300 tons of crude ore per week. The following are statistics with regard to the mine:—

	Tons.
Crude ore raised for half-year ending 31st December, 1895.....	29,745
Crude ore raised for half-year ending 30th June, 1896	29,951
Crude ore production for year ending 30th June, 1896	59,696
Concentrates produced for above two half-years ..	{ 9,716
	{ 9,424
	19,140
Despatched for half-year ending 31st December, 1895	10,949
Despatched for half-year ending 30th June, 1896	9,116
Despatched for above two half-years	20,065
Crude ore raised for 13 weeks ending 26th September, 1896	17,158
Concentrates produced during same period	5,804
Despatched	5,018
Average number of men employed during year ending 30th June, 1896, 340.	
Average now employed, about 375.	
Carriage of ore—11s. 6d. per ton Port Adelaide, 9s. per ton to Port Pirie from Cockburn.	

3702. Do you send your concentrates to Port Pirie? Yes, and to Port Adelaide.
 3703. Do you send all of the ore away? Yes.
 3704. Have you entered into any agreement lately with the Silverton Tramway Company? Not lately.
 3705. Is it a fact that several companies have entered into a seven years' agreement? I do not know.
 3706. Speaking for your own company, has such an agreement been entered into? I do not think so.
 3707. If such were the case, would you not have been advised on the subject? Very likely, but I do not recollect it.
 3708. How much firewood do you use? None at all now.
 3709. Do you generally use coal for steam? Yes, and also for concentrating.
 3710. Is coal cheaper than wood, or is it better for the work? Coal is cheaper than wood.
 3711. What is the cost of wood? Sixteen shillings or 17s. per ton; 1 ton of coal is worth 2 tons or more of wood.
 3712. In the long run, do you find coal cheaper, although you pay £2 per ton for it? Yes; we cannot get wood very easily.
 3713. Have you heard anything about an agitation for a railway to connect Broken Hill with Sydney? I have heard it talked about several times, and I have seen about it in the newspapers.
 3714. Have you any opinion on the subject? That would all depend on circumstances.
 3715. Do you think it advisable that a line should be constructed to connect Broken Hill with Sydney? If it would bring freight down it would be.
 3716. Your idea is that if such a line were constructed it would be the means of inducing the South Australian Government and the Silverton Tramway Company to reduce rates? Yes.
 3717. Have you furnaces of your own at Port Adelaide and Port Pirie, or do you sell your concentrates? We sell our concentrates; we have no furnaces working.

3718. So that if a buyer gives you a satisfactory price you sell? I used to send it through Withers & Co.
3719. So that the greater portion of your ore goes to London? Yes; in fact all of it, that is the concentrates.
3720. How long do you think your mine at its present rate of output will last? That is a matter which a man cannot tell; I should like to live as long as the mine will last. The mine is alright; there is plenty of material there.
3721. The supply is almost unlimited? I believe the mine is permanent.
3722. You believe that it will last sixty years? I would not say that. It would depend on the quality of the ore.
3723. Do you believe that the quality of the ore is superior below the 800-foot level? It has been in silver.
3724. Up to the present time, how much ground have you worked out;—have you worked out half? No; about one-tenth part of it.
3725. How many years have you been working it? I have been there seven years.
3726. Then, can we say the life of the mine is likely to be 100 years? Yes, if it lasts as it looks now.
3727. Is that on the supposition that the mine for a certain depth lower down is as good as at the present time? Yes.
3728. Have you ever any trouble in getting rid of your ore? No; it is disposed of through Withers & Co.
3729. Do you get a ready market for all you are able to send? Yes.
3730. And for a long time to come, do you think you will get the same market? Yes; I do not know why that should not be the case.
3731. Have you a contract with Withers & Co. to send it there? Yes.
3732. For how long? I think for three years.
3733. When was the contract signed? It is now getting towards the end.
3734. Are you thinking of entering into the same contract again? I do not know. I have only to do with the management of the workings.
3735. Then you do not know exactly what the agreement is? No, only that it is so much per ton.
3736. So that at present, if a railway were constructed and ready for work, you could not avail yourself of it even if the rates were cheaper? I guess the company would as soon as their contract was up, but they could not do so until then.
3737. Have you any idea what proportion of the ore goes to Port Pirie and what proportion goes to Adelaide? About one-third goes to Port Pirie, and the remainder to Port Adelaide.
3738. Who takes the Port Pirie material? The same firm.
3739. So that that firm takes all your concentrates for a certain period? Yes.
3740. Do you use any coke? Very little, only for assaying purposes.

Mr. John Warren, mine manager, Block 10 Mine, Broken Hill, sworn, and examined:—

3741. *Chairman.*] What is your occupation? Mine manager of Block 10.
3742. *Mr. Hassall.*] How long have you known Broken Hill? I was here in 1855 at the outset.
3743. How long have you been managing this mine? Six years last March.
3744. Can you give me any idea of the mineral deposits on the main Broken Hill lode, or the size of it? It varies considerably.
3745. What is the length of it? Something like 2 miles in length in continuous workings.
3746. What is the average width of the lode? It varies considerably from a few inches up to hundreds of feet.
3747. With regard to your own mine—what is your area? 35 acres.
3748. Is the lode running right through? It crosses the corner near the surface. The underlay is in the property.
3749. What is the depth of your deepest shaft? 1,235 feet, reckoning the mouth of the first shaft from the top of the hill.
3750. Is that the deepest shaft on the field? No; the bottom of the shaft in the Broken Hill Extended is 200 feet below my 1,235 level.
3751. What is the depth of the lode there? It is small there; the lode itself may be just as large, but the ore body is contracted in that one place.
3752. As far as you have worked in the upper workings, have you a well-defined hanging and foot wall? The hanging wall is not defined—that is, it forms immense purses of ore which caused many people to form the idea that it was a saddleback, but it is not.
3753. Has it every appearance of being of a permanent character? There is no doubt about that.
3754. Is the ore of payable quality? Fairly payable at the present time.
3755. What description of ore are you working? Sulphides of lead and zinc.
3756. Is that the general quality of the ore? Yes.
3757. At the bottom of the deep shaft, have you a well-defined body under foot? The lode now is small. We cut through the productive part, but in driving north 100 feet the body became larger than the drive. We have not proved the width of it there, but there is a prospect of its opening out.
3758. Taking into consideration you have gone down 1,200 feet, what body of ore have you in sight? We have never formed any idea of its extent below the 600-foot level.
3759. How deep have you worked out? We are working now down to 600 feet. Having run the shaft down to 1,200 feet we thought that was depth enough to show the permanency of the lode. Then we adopted means to work the ground, and we are now working to a depth of 600 feet.
3760. Is there every prospect of there being many years profitable work judging by present appearances? Yes.
3761. You cannot approximately estimate the life of the mine? It would be nonsense to attempt it.
3762. How many hands do you employ? At present, 434, all told.
3763. What amount of ore is raised weekly or yearly? At present we are raising two classes of ore—that is, we are selling the best grade sulphide direct on the ground, and that is sent to Port Pirie at the rate of about 20,000 tons a year. That is the present rate of output.
3764. Will that be your average output for some considerable time? That is only the crude ore.

Mr.
J. B. Gluyas.
3 Oct., 1896.

Mr.
J. Warren.
3 Oct., 1896.

Mr.
J. Warren.
3 Oct., 1896.

3765. Then what about the concentrates? We are sending concentrates away at the rate of 11,000 tons per annum.

3766. That is at the rate of 31,000 tons per annum, the whole of which is despatched from here to Port Pirie? Yes, with a few exceptions, the ore is sold on the ground, and we have to send it wherever they get freight. The bulk of it goes to Port Pirie. We sometimes send a parcel to Port Adelaide.

3767. Do you smelt the ore? No, we have never done so.

3768. I presume you use a large amount of timber? At the rate of about 1,300,000 feet superficial per annum.

3769. Is that timber loaded at Port Pirie and dispatched to Broken Hill? Yes.

3770. Have you any idea as to what is the cost of conveyance? 36s. per ton.

3771. Do you use much coal? 6,772 tons per annum.

3772. What does that coal cost delivered at the mine? About £2 per ton. The freight has been 25s. 2d. from Port Pirie.

3773. The cost of conveyance from Port Pirie and the original cost bring it up to £2 per ton? Yes. There has been a reduction in that freight.

3774. And is there not to be a reduction from the beginning of next year? Yes, to 18s. 6d., which will make a sensible difference.

3775. The rates you have mentioned are what you have been paying? Yes.

3776. You do not require coke? No, only a couple of tons per month.

3777. Do you use wood? No, all coal from Newcastle.

3778. What is the price of wood as compared with coal? I think coal would be cheaper; I am so situated that it would be very awkward to get the wood in with teams. Another thing is the country is so dry that bark is objectionable at the mine.

3779. Would you prefer to carry on operations with coal as fuel in preference to wood, even if you could get wood at as reasonable a figure? Yes.

3780. Have you heard of a proposal to construct a railway from Condobolin to Broken Hill? Yes; it has been talked of here for some time past.

3781. Do you think there is any possibility of a railway constructed over 686 miles of country competing with the existing means of conveyance? I should be afraid to say so. I know what my own private opinion is.

3782. Say that the truck rates would be ½d. per ton per mile for that distance, which would bring the cost of conveyance of ore by train from Broken Hill to Newcastle up to about £1 12s. 6d. per ton, do you think your company could afford to pay that price for carriage as compared with the present rates? Not as long as we can get it done for about 13s. per ton.

3783. What is the cost of conveyance from here to Port Pirie? Under the reduced rate it will be 13s. per ton.

3784. Will that be after the beginning of next year? Yes.

3785. So that there will be no possible chance of the proposed railway, if that rate were charged, competing successfully for the carriage of ore from Broken Hill to Sydney? I should say no.

3786. Is it a positive fact that the companies here would not pay more than 10s. per ton extra for the conveyance of ore out of a feeling of patriotism? No.

3787. The shareholders like dividends? Yes; and so does everybody else, I think.

3788. If a line of railway were constructed from here to Menindie, giving you access to red gum timber on the Murray, and also hardwood which could be delivered here at about 8s. to 10s. per ton, would that induce you to use wood as fuel? Cheapness would tempt people to take good solid firewood.

3789. Do you think red gum would be more suitable for mining purposes than Oregon pine? The great difficulty with red gum timber is in cutting it up for use and placing it in position. It is too heavy.

3790. Do you find that Oregon from its lightness and durability is better? There is not much durability about it, but it acts as a shield to protect the men because it all goes with this immense pressure.

3791. Would not red gum stand the pressure better? It would to a certain extent, but red gum is very short in the grain. It stands a positive vertical weight, and immense pressure.

3792. Would not Oregon be rather dangerous in the event of any very great pressure coming on it? It gives plenty of warning.

3793. It splits before it goes? Yes, I fill in half the timber. I use the timber as a shield for the protection of the men, and I fill the space with mullock. No timber in creation would stand the pressure without being filled.

3794. *Chairman.*] At present the ore going from Broken Hill in one form or another finds its destination it may be in London or some other part of the old world,—with the completion of the works on the eastern seaboard, will the whole product at Broken Hill go to the eastern seaboard? It would all depend on the price they are prepared to pay.

3795. Are they prepared to do exactly the same class of work at Newcastle and on the south coast as is being carried out in the old world? We scarcely know what they are going to do. When they are prepared to pay a better price we will send the ore that way, and your railway will then have a better chance, but so long as we send these ores for despatch to England, they will not go round to Sydney or Newcastle.

3796. *Mr. Hassall.*] I suppose the position occupied by Block 10 is that you will sell your ore to anyone who will purchase it at a payable price? We call for tenders, and we sell to the highest tenderer.

3797. It does not matter to you what is done afterwards, the probability is that if you get a better price you will send it to the east coast? Yes; I think there is a fair prospect of the bulk of these ores going to those works.

3798. In view of the very large amount of money which is being spent on the eastern seaboard in the erection of smelting works, is it not probable that the great bulk of the ore will be treated there? Yes, there is every prospect of that with the new process.

3799. I presume some of the parties interested in the mines are also interested in that venture, and being keen business men would not spend so much unless there was a fair prospect of being recouped? I should say not.

3800. What is the freight from Port Pirie to the old country? I think it is about 28s. per ton.

3801. The freight is 5s. or 5s. 6d. per ton to Newcastle, therefore the gain in sending it to the east coast would be 22s. 6d. per ton? I am not posted up in that.

3802.

3802. Who purchases the ore from you? Harrold Brothers; they purchase twelve months output of concentrates, but the crude sulphides are sold at Sydney through Haeg & Co. for a continental company.

3803. *Mr. Trickett.*] Mr. Howell led us to believe that the Proprietary Mine alone would send 800,000 tons of ore to the works on the eastern seaboard. That is to say, that if the Proprietary Mine were worked to its fullest extent, it could produce 800,000 or 1,000,000 tons per year? I know nothing about the capability of the works, but it will depend upon the price they are prepared to give for these ores.

3804. Do you think such a volume of ore could be produced here? I should say so. It is only a question of labour.

3805. Has your company entered into any contract for the sale of ore for a certain period? Not to my knowledge; but we have nothing to do with these final arrangements. I have had no intimation of that kind.

Mr.
J. Warren.
3 Oct., 1896.

Mr. Randolph Adams, general manager, Central Mine, Broken Hill, sworn, and examined:—

3806. *Chairman.*] What is your occupation? I am manager for the Sulphide Corporation which owns the Central Mine. I am general manager of the mine.

3807. How long have you been here? Four and a-half years.

3808. What is the area of your mine? A little over 37 acres.

3809. How many men do you employ? About 380 or 400 men.

3810. What do you consider is a reasonable amount of ore for the mine to produce in a year? We have been producing about 50,000 tons of sulphide ore a year, that is crude ore, and preparations are being made by which the output will be very much increased, in fact, three times as much; that is, we expect to produce 150,000 tons.

3811. Do you regard your mine as being permanent? Yes, most certainly.

3812. Has your company some connection with the Sulphide Corporation? This mine is one branch of their business. We are establishing works at Cockle Creek, near Newcastle, for the treatment of sulphide ore.

3813. You are aware that a portion of the ore from Broken Hill now goes to the old world for treatment which is at present not possible in Australia;—can you tell us whether the new works at Cockle Creek or similar works will be able to treat the ore in the same way as it is treated in the old country? Yes, that is the intention.

3814. What is the rate of freight from Port Pirie to London and other places on the continent? I do not know, because I have nothing to do with sea freights.

3815. Is it reasonable to suppose that in future crude ore will be treated on the eastern seaboard? Yes; works have been erected for that purpose. Perhaps a certain portion of the ore at the early start will not go in that direction; that is, the high-lead products. It is quite possible they might be sold outright, but the works are being put up on the eastern seaboard specially to treat the zinc products.

3816. What proportion of lead will there be? Lead will be produced with the zinc. The ore will be treated first for the extraction of zinc; that will leave a smelting residue. They will also use a certain portion of the high-lead concentrates from Broken Hill to carry on the smelting works at Newcastle.

3817. Do you think that the ore will be sent by railway to Sydney or by way of Port Pirie? I think with full operations going on here, and also at the works on the eastern seaboard, about three-fourths of the crude ore raised will be shipped. I am speaking of the crude ore from the mine.

3818. Will the operations of the company be limited to your mine? Certainly not. They will be purchasers from other mines, and will act as a smelting company. Three-fourths of the crude ore raised here is for shipment.

3819. Is it reasonable to suppose that three-fourths of the ore raised on this field will be treated on the eastern seaboard? Yes, if the treatment results successfully all through. There are certain grades of ore with respect to which you could not take such a large proportion. I am allowing one-quarter for worthless material which could not be shipped from here. I consider that 3 tons out of every 4 tons can be utilised for final treatment.

3820. Will the operations at Broken Hill be limited almost entirely to the getting of ore in the course of two or three years? It will be confined to that, and also to the dressing of the ore for concentration. I consider that it will continue to be done here. It appears clear enough to me that can be done. There are large quantities of zinc products at present which are not treated.

3821. How many tons of coal are required to deal with a ton of ore in the whole of the process? I do not know; that entirely depends upon the special method adopted to treat the zinc ores.

3822. Take the concentrates first? For mining alone we consume 50,000 tons of coal per annum; that is for motive power alone. We are putting up a concentrating plant but it is not working yet.

3823. Would you have any objection to use wood fuel, and would not the use of wood versus coal depend upon the amount of motive power that you can get out of it? Yes, it entirely depends upon that.

3824. Would it suit you to use wood just as well as coal if you could get as much power out of the wood as you do out of coal? I should expect to get a little more out of the wood. I do not say that I would use it, but if I were going to use wood fuel I should want to get more out of the wood. It is not so easily handled as coal. Coal costs us approximately £2 a ton.

3825. In what proportion does wood compare with coal with regard to quantity? About 2½ tons of wood are equal to 1 ton of coal by weight. We have paid £2 per ton for coal but it now costs about 33s. per ton laid down at the mine. Wood at 14s. a ton is approximately of the same value as coal, but we cannot get it at that price.

3826. If you could get wood at 12s. per ton would you use it? Certainly. If you can save 2s. per ton on every ton of coal, wood should certainly be used.

3827. If the price of wood sank below 12s. per ton you would use it? If we could get it at 10s. per ton we would use it; that is on the assumption we could not get coal any cheaper than at present.

3828. What hope have you of getting coal cheaper? We have only the hope that it has been getting cheaper for the last twelve months; that has been the case in every contract, but I do not know if that has yet come to a stop.

3829. *Mr. Pegan.*] Is there not a possibility of its getting dearer? Yes, we experienced that during the strike.

Mr.
R. Adams.
3 Oct., 1896.

Mr.
R. Adams.
3 Oct., 1896.

3830. *Chairman.*] At present, do you use Oregon timber? Yes, entirely.
 3830½. What do you pay for Oregon timber at present? 16s. 6d.; that includes the rate for trimming the sets.
 3831. At the shaft-mouth, what is it worth? The price delivered at my works is 16s. 6d.
 3832. At what price would you require to get red-gum in order to induce you to use it instead of Oregon? I would not want to use it at the same price. I do not think it is timber that is so well suited for the work.
 3833. How much cheaper would you require to get it? There is a great difference in the character of the wood, and there would also be extra labour in handling it and getting it ready for mining work. For instance, there is a great deal of work in preparing the timber by hand underground. It is a very difficult thing for men to work by hand with hardwood.
 3834. First of all, red-gum is not so suitable for your purposes, because it does not give warning of danger as Oregon timber does? Yes; that is a most important thing.
 3835. Leaving that out, and taking into consideration the cost of working, the hardness of the wood, and so on, how much cheaper per 100 feet would redgum require to be, compared with Oregon, to induce you to use it? That is a question which I can hardly answer.
 3836. Would it require to be considerably cheaper? Yes.
 3837. Can you not put it in figures? I think the extra labour which would be required would make it quite a percentage item. It would have to be 10 or 15 per cent. cheaper than the other timber.
 3838. And would it then be doubtful whether you would use it? I would not recommend it.
 3839. A great deal of work has been done by open cut;—is that system likely to affect the amount of timber used? No; that would not be the case with the sulphide ore, which is the future ore. I think the open-cut system is simply doing away with the timber above where they were mining before, but it is not doing away with timber entirely. But in those upper portions of the workings there would not be a great deal of timber, because they could not afford to put in timber and filling, taking into consideration the class of ore.
 3840. Taking into consideration the contour of the hill, &c., what is the limit of the open cut? That is dependent on the nature of the lode.
 3841. What is your idea of the limit of the open cut? I should think about 300 feet.
 3842. How deep down are the sulphide ores proved at Broken Hill? About 1,400 feet.
 3843. Therefore the saving of timber by the open-cut system can only apply to one-fifth of the operations? It only applies to a large portion of the workings where timber would never be used even if the open-cut system were done with. It only applies to one-fifth of the workings, and it is not material in saving timber.
 3844. *Mr. Trickett.*] In the return which has been placed before us, coke has been put down as a very large item of import; with all the ore being sent away for treatment, will not that be reduced to a minimum? Yes; there would be practically none of it used. I am speaking with regard to the Central Mine.
 3845. Would not that apply to all the mines? Coke will only be brought here as long as the oxidised smelting ores continue.
 3846. Do you think the main product of Broken Hill in future will be the ore which will be raised? Yes; and a portion which will have passed through a course of dressing.
 3847. Will that be three-quarters of the ore raised? I am speaking of the operations of the Central Mine only. The balance of it will be made up of intermediate products. What I mean is that with the full operations going on the actual amount of ore raised will give about 75 per cent. for shipment. If the complete operation is not carried out further than the extraction of the lead it will vary from one-fourth to one-third of the crude ore—that is, leaving the zinc products in Broken Hill. If they are to be treated the other figure will represent the proportion. I do not know what they are going to do with all the zinc.
 3848. Does your product resolve itself into silver, lead, and zinc, of which zinc is the least valuable? Yes.

Mr. Richard Watson English, surveyor, Broken Hill, sworn, and examined:—

Mr. R. W.
English.
3 Oct., 1896

3849. *Chairman.*] What is your occupation? I am a surveyor. At present I am road contracting for the Government.
 3850. Do you know this district well? Yes.
 3851. Did you hear Mr. Maiden's statement yesterday as to the amount of timber available between here and Menindie and along the Darling? Yes.
 3852. Have you an intimate knowledge of that country? Yes.
 3853. Do you believe that his statement is absolutely correct? Yes; there is at least a 10-mile block covered with good timber within about 44 miles of Broken Hill. I made a line of road up to the 48-mile post, and there is abundance of timber there.
 3854. Is there timber as far as the Darling and from that point and up and down the river? Yes; at the Darling there is more timber. These are breaks between the point I have mentioned and the river, but up and down the river there is a large quantity of timber.
 3855. Is the timber there practically inexhaustible? Yes, for a great number of years to come.
 3856. Do you know the area of land bearing timber on the Adelaide railway line which was referred to as not being very far from Broken Hill? I have seen it as I have passed down the line, but I cannot express any opinion with regard to its area. I may state that the timber is now nearly cleared away from the neighbourhood of Broken Hill. From the north to the south and on the eastern side for about 20 miles the timber is all exhausted. Outside of that it would be very expensive to bring timber to Broken Hill.

Mr. John Fielder, builder, Broken Hill, sworn, and examined:—

Mr.
J. Fielder.
3 Oct., 1896.

3857. *Chairman.*] What is your occupation? Builder, resident at Broken Hill.
 3858. What evidence do you wish to give to the Committee? I wish to point out why I think a railway ought to be constructed.
 3859. *Mr. Trickett.*] Will you state your views on the subject? I think the railway should be constructed because I have seen a very large area of good land on the river which is suitable for growing vegetables and fruit; that is about Menindie. I have seen all sorts of fruit growing there, and I reckon it is the home of the grape, orange, and lemon. I once saw a melon grown at Albemarle which was 5 feet long.

3860. I suppose that was an irrigated patch of land? It was on a homestead which was irrigated. I have seen grapes, cucumbers, cabbages, and all sorts of vegetables growing there. I have grown potatoes there myself. Yesterday I heard doubts expressed as to whether potatoes would grow there. At one time I got a few potatoes and planted them: they grew very well, but not large. Potatoes will not grow large in hot climates. Lower down the Murray, about two years ago, I started an irrigation farm. I had to give it up because I could not get a market for my produce. That was below Wentworth, near Morgan.

3861. How far below Wentworth? 200 miles. I should like to say something about the passage from here to Sydney. It was stated by the manager of the tramway that only a few people passed over the line from here direct to Sydney. After all that is not to be wondered at. I have very often gone to Sydney, but I never know when I leave here that I am going to Sydney, because I do not know whether the people of Adelaide or Melbourne will not offer me such bargains as will induce me to spend my money in those places, instead of going on to Sydney.

3862. Do you think that a railway would be the means of establishing a loyal spirit among the residents here? Yes, and there would be a better trade for Sydney.

3863. Would a railway be a very great advantage to the residents here? Yes. We are in the centre of a very large mining district. I go about a great deal, and I see a great many little mines; they have sulphide ore, and they are carrying on work profitably. There is also gold in this district. I know a very large gold-bearing reef not far from here, and I produce samples of the reef.

3864. Is it close to Broken Hill and the proposed line of railway? It is, perhaps, 30 miles away.

3865. Are you of opinion that this district may develop into a gold-field? Yes. I have had these samples assayed at the Proprietary Mine, and they gave a yield of $2\frac{1}{2}$ ounces to the ton.

3866. Do you thoroughly believe in the progressive character of this district? Yes; it only wants water and a railway.

Mr. Ernest Fromen, produce merchant, Broken Hill, sworn, and examined:—

3867. *Mr. Fegan.*] What is your occupation? I am a produce merchant, selling fruit, vegetables, onions, butter, and bacon. We principally get cheese and bacon from Sydney.

3868. What is the freight for cheese and bacon? It costs us on an average from $\frac{3}{4}$ d. to 1d. per lb. to bring cheese and bacon from Sydney. That is the water and railway carriage combined.

3869. Where do you get your other produce? Potatoes principally come from Mount Gambier, a distance of 600 miles; that is during six months of the year. During the rest of the year they come from Adelaide and Tasmania. The cost of carriage from Mount Gambier is £2 3s. per ton. They are carried under a special rate to enable the Mount Gambier people to compete with others on the South Australian railways, and also with outsiders, for the Broken Hill trade. The longer the distance the cheaper the rate per mile per ton. It costs us £1 10s. 6d. to bring potatoes here from Adelaide, that is a distance of 330 miles. From Mount Gambier, a distance of 600 miles, would cost £2 3s. per ton. There are nearly 40 tons of potatoes consumed here per week.

3870. Of that quantity, how much do you sell? From 15 to 20 tons; we do pretty well half the trade. If potatoes were grown in New South Wales as cheaply, as a matter of business, if they could be landed here a little more cheaply than the Mount Gambier potatoes, we would take the potatoes from New South Wales. If potatoes were 5s. a ton cheaper at the present time at Sydney, we would bring them here.

3871. Would not that depend upon railway freight? Yes. When there was a protective duty of 10s. per ton on potatoes we imported them from Sydney, but we cannot do that now. Ten shillings a ton was a great handicap.

3872. Are you not, therefore, able to sell the potatoes more cheaply now? I do not know that that is the I maintain that it does not make any difference.

3873. Then who gets the benefit of the 10s.? The South Australian people. That is also the case with regard to butter. The South Australian farmers reap the benefit from the removal of the duty. We sell the butter by auction, and it is sold to the highest bidder.

3874. You do not retail it? No; I am a wholesale buyer and seller.

3875. Can you tell us how the people of Broken Hill would benefit, as far as produce is concerned, by the construction of the proposed railway? If the railway were constructed, there is no doubt that a great deal of the produce which is sent down to Sydney to be sold, say, half-way between Broken Hill and Sydney, would be sent on to Broken Hill and be sold here. Of course I cannot give any expert opinion on the subject, but probably people would be able to grow a large amount of produce at Menindie. On an average 50 to 60 tons of fruit and vegetables are imported here every week from South Australia. A great part of that, if not all of it, could be grown at Menindie, and be sent here.

3876. What does the produce cost you, per annum, landed here? I should say that from South Australia I take on an average about £26,000 to £30,000 worth per annum.

3877. That is one-third of the trade, so that we can reasonably put down the total at £90,000 per annum? Yes, in food products. That has nothing to do with farm produce, such as chaff or bran. It all comes from South Australia. I do not deal in those lines.

3878. *Chairman.*] Where is the nearest wheat grown on the Cockburn to Petersburg line? Thirty to 40 miles on this side of Petersburg. That, however, is not a fair place to mention. Jamestown or Torowie, about 185 miles from here, would be fair places to mention. You cannot depend on any supply. There is no doubt we would get nearly all our produce by the proposed railway if the rates were reasonable. That is to say, if we could get our produce in two days we would get all our fruit and vegetables from Sydney, because Sydney is the cheapest market.

Mr. Joseph Wilks, Inspector of Stock, Menindie, sworn, and examined:—

3879. *Mr. Hassall.*] What is your occupation? Inspector of Stock, in charge of the Menindie sheep district. Mr. J. Wilks.

3880. How long have you been stationed here? About seven years. 3 Oct., 1896.

3881. Can you give us the returns of stock in your district? I can give a rough estimate from memory. This year the average is about 1,100,000 sheep in the Menindie sheep district. There are about 11,000 head of horses and cattle.

3882. What is the carrying capacity of the country? There is a great portion of it open plains, and its carrying capability at the present time is about one sheep to 9½ acres. That is the average of the whole district. That is allowing for the ravages of the rabbits. 3883.

- Mr. J. Wilks. 3883. Has the carrying capacity increased or decreased during your term of office? I think it has decreased.
- 3 Oct., 1896. 3884. What is the reason for that? The increase of rabbits.
3885. Has that resulted in the edible scrubs being exterminated? Yes.
3886. Do you think the country will ever recover, or that any method will be devised to cope with the rabbits? I think so. I think if the Bill which is now before the House is passed, in the shape in which we all hope to see it, it will assist wonderfully in putting down the pest.
3887. In connection with that measure, will it be necessary for the Government to take steps to clear the Crown lands? Most decidedly. Every owner or occupier of whatever description ought to be compelled to take steps to destroy the rabbits.
3888. Would it be useless to make the owners destroy the rabbits on their holdings if the Government leaves the waste lands still infested by rabbits? There is no doubt about that.
3889. Is there much settlement on homestead leases in this district? A very great increase in this district within the last seven years.
3890. What is their principal occupation? Grazing sheep.
3891. The country is still occupied as pastoral territory? Yes.
3892. If a man takes up a homestead lease can he make a living on one lease? There is a number of lessees who have more than one lease, and they make a very fair living. Some make a fair living off one lease. Any man who is not tied up by having to pay big interest can make a fair living. Many of them, however, are paying heavy interest, and that makes it difficult for them.
3893. Is not the area of a homestead lease too small for one man to make a living? Decidedly, if a man has a family to keep.
3894. Is it your opinion that 1,000 sheep are not sufficient to enable a family man to make a living? Yes.
3895. What water supply is there, except the Darling River? It is all an artificial supply; there is no natural water supply.
3896. Is it good holding ground for tanks? Yes, taking the district right through.
3897. Is it a country suitable for settlement by men of small means? I think there is any amount of country suitable for a man who would hold 20,000 acres. I do not say the whole district is suitable, but there is a large area of country which is suitable for that purpose.
3898. If a man had to borrow money, in order to start, would it be hopeless? Yes, with the present price of produce.
3899. Where do the stock principally come to? There is a very large local consumption of fat stock.
3900. What number of fat stock is consumed in Broken Hill? The weekly consumption averages close on 1,500 sheep, and at least 120 head of large stock. During last week there were three sales. At one 150 head were sold; at another, 35; and at the third, 35.
3901. What is the rainfall in this district? I think the Government Astronomer puts it down at something under 11 inches.
3902. Then it is not a country suitable for agriculture? I should not like to say that, for this reason—I know the country about Hillston, Cudgellico, and Condobolin. At one time a man would be reckoned mad if he put in a crop there. Now, I know from my own knowledge, what crops can be obtained at Condobolin. I have known that country for twenty-eight years. I am told that crops quite as good are being grown down at Hillston. I should not like to say that the country here is not fit for agriculture, in view of those facts.
3903. Do you think the rainfall is sufficient to enable people to carry on agricultural operations? Not at present; but I do not know what alteration may come about.
3904. What sort of sheep country lies along the proposed railway line? It is as sound as any in the world, from Condobolin right through.
3905. Is there any disease prevalent among sheep in that district? No.
3906. What is the quality of the wool produced? It is merino; strong combing wool. It is a good serviceable class of wool of good quality. The country has a tendency to grow as large sheep as can be found in any part of the Colonies. In the old days I have seen them as fine a class for size as you could get.
3907. Is the principal product of the district wool? Yes.
3908. How is it situated with regard to a market? Taking the river stations from the river to the border, it all goes down to South Australia or Melbourne.
3909. Does it go by river? By river to Echuca. The principal part of it goes by river and rail to South Australia. Seventy-five per cent. goes to South Australia, and 25 per cent. to Victoria.
3910. Do you think, if this proposed railway were constructed, there would be any possibility of that wool being conveyed by the railway? I think there is a possibility that a large quantity of that wool would go by rail. There is not the slightest doubt that any pastoralist would prefer to sell his wool in the Sydney market. That is acknowledged by all pastoralists; and I meet a great many of them. They think that is by far the best market, and there is no doubt they would give it the preference. I go so far as to say that they would give it the preference if they had immediate facilities for going straight to market, so as to catch the early sales.
3911. Do you not think they would avail themselves of the low river rates and then send the wool round by sea? No. At present there is one thing that tells against the Sydney market here. At present the principal owners live in South Australia or Melbourne, and they naturally use those markets.
3912. Is it a fact that the principal stations in your district are held by Victorian and South Australian squatters? Yes.
3913. Would not their wool naturally gravitate to their own Colonies? Yes; wherever they do their financial business.
3914. Is it not problematical whether that wool would go by the proposed railway, or whether it would go by the present route? I think the greater portion of it would go to its natural market. The better market would secure it. It is an undoubted fact that Sydney is the better wool market.
3915. Would it not be greatly a question of cost of carriage? I think it would be necessary to fix a low freight, and then it would go to the better market.
3916. Is the country at present thickly infested with rabbits? They were low down in numbers in April last. I am rabbit inspector under the Act, and every month I have reported an increase since that time.
3917. Are they increasing in numbers at the present moment? Yes. 3918.

3918. How far do they extend in the direction of Burra Burra? I think they go pretty well down that railway line; at any rate I have seen them as thick over the border as they are here, but a great deal depends on the season. Mr. J. Wilks.
3 Oct., 1896.

3919. Do they go far north? In the northern part of this Colony they extend right up to the border. My district extends 150 miles up the South Australian border from here.

3920. Do you think it is necessary that some legislation should be framed to compel the destruction of the pest, and the Government should join in that work? Most decidedly. I have heard a lot said about the supply of horse-feed. I am of opinion, if the proposed railway were made, that Hillston would be able to supply all the horse-feed required as cheaply as it is landed here at present from South Australia. I have heard a lot said about the district of Petersburg supplying produce to this district; but I maintain we get little or nothing from Petersburg. Jamestown is about the centre of the market.

3921. *Mr. Trickett.*] Can you give us the area of your district, and tell us what district it joins? The area is about 17,000 square miles. It extends along the South Australian border; on the other side it is bounded by Bullabulka, taking in the whole of Tolarno and Albermarle stations. It is bounded by Wentworth, the corner of Ivanhoe, to the corner of Cobar districts. It is bounded on the other side by the Wilcannia and Milparinka districts.

3922. Can you tell us what is the tonnage of wool which goes from your district? Roughly speaking, over 3,000 tons.

3923. What about the cattle of the district? They are principally introduced. Those that are bred in the district are principally milkers. There is no cattle-breeding carried on to any extent in the district.

3924. *Chairman.*] Where is the line from which wool goes east to the Darling and west to the railway in your district? The dividing line between the river traffic and railway traffic in wool is approximately halfway between Broken Hill and Menindie.

Mr. Ernest Fromen, produce merchant, Broken Hill, sworn, and further examined:—

3925. *Chairman.*] How much milk comes into Broken Hill? I believe the milk consumed is about 350 to 400 gallons per day. The value of the milk is 1s. per gallon, and the carriage averages close on 8d. per gallon. Mr.
E. Fromen.
3 Oct., 1896.

3926. Where does it come from? It all comes from South Australia, as far down as Burra Burra, and it comes from a place as close as 20 or 30 miles from here.

3927. Do you do a large business in pigs here? Yes; during the winter we get pigs up from South Australia to sell in connection with our trade. We and other produce dealers sometimes sell as many as 200 pigs per week. They come from South Australia. Jamestown, 185 miles away, is the centre of the district. They are sent up here dressed.

SOUTH AUSTRALIA.

MONDAY, 5 OCTOBER, 1896.

[The Sectional Committee met in the Deputation Room of the Department of Public Works, Adelaide, at 3 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY BASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Alan G. Pendleton, Commissioner for Railways, Adelaide, South Australia, examined:—

3928. *Chairman.*] You are Commissioner of Railways for South Australia? Yes.

3929. Will you tell us what is the present railway rate for the carriage of ore from Cockburn to Port Pirie? Yes—9s. per ton for sulphides, and 11s. 10d. per ton for carbonate ores; but practically it is 9s. per ton all round, because the rates have been altered since the 1st October, and the same rates are charged for all ores as for sulphide ores. Mr. A. G.
Pendleton.
5 Oct., 1896.

3930. Therefore, if we are informed that from Port Pirie to Broken Hill the charge will be 12s. 3d. per ton, that will be fairly correct? After the 1st January next that will be correct.

3931. May we regard the arrangement as being virtually complete? Certainly.

3932. Is there no doubt in your mind that from Cockburn to Port Pirie is the cheapest outlet that South Australia can afford for the trade of the Barrier district, and therefore the consideration of any other outlet is outside the question? Yes.

3933. Are the back rates the same? The rate for coal is not so low; it is 13s. 6d. from Port Pirie to Cockburn. Coke is higher; it is 23s. 4d. per ton at present. As far as my personal opinion is concerned, twelve or eighteen months will see the end of the coke business, and the ore will be brought down to Port Pirie. I think the carriage of coal to Broken Hill will increase, because the mines will carry out larger operations in connection with concentration, and that necessitates a large consumption of coal. Most of the companies are erecting large concentrating plants.

3934. Why do you charge a higher rate for coal than for ore? Ore has been for some time a very special rate. We have not gone below the mineral rate for coal, but that may be a matter for consideration.

3935. Does the rate which you charge for the carriage of ore pay? Yes, in train-loads.

3936. Therefore coal would pay also in train-loads? Yes, certainly.

3937. And if forced you could carry coal at the same rate? Certainly. I notice in the evidence which has been published in our papers that Mr. Stewart stated that the consumption of coal at his mine was 12,000 tons per month. Now, the whole traffic in coal during the last twelve months was only 28,416 tons.

Mr. A. G.
Pendleton.
5 Oct., 1896.

3938. There is another way in which the Barrier mines use your railways—that is, to reach Dry Creek;—what rate do you charge for carrying ore to Dry Creek? The same as is charged to Port Adelaide—that is, 11s. 6d. for sulphides and 15s. 4d. for carbonates; but the same statement that I made recently, about the lower rate covering the bulk of the tonnage, also applies in that case—that is, 11s. 6d. will cover all the tonnage.

3939. Therefore 14s. 9d. per ton will take ore after the 1st January next from Broken Hill to Dry Creek? Yes.

3940. What is the ruling grade from Cockburn to Port Pirie? The worst is 1 in 60; that applies both ways. Then the grades are 1 in 74, 1 in 62, 1 in 60, 1 in 95, 1 in 136, 1 in 97, 1 in 96, 1 in 100, 1 in 60, 1 in 70, 1 in 61, 1 in 94, 1 in 88, 1 in 103, 1 in 80, 1 in 85, 1 in 82, 1 in 221, 1 in 118. Therefore the worst grade is 1 in 60. In connection with that I may say that a survey has been already made for the purpose of reducing that grade to 1 in 80 over a considerable portion of the route.

3941. How much would it cost to give you a grade of 1 in 100 all the way, or 1 in 75 right through from Cockburn to Port Pirie? I think it would cost about £50,000. The estimate which has been made for, I should say, quite half of it is £22,000, and I do not think it would cost more.* The grades are very satisfactory. Anything unsatisfactory is to be dealt with almost at once.

3942. Supposing you found that the 3-ft. 6-in. gauge could not compete with a rival railway, and, in order to put you on equal terms with the New South Wales Railway Commissioners, you desired to convert your railway into a 4-ft. 8½-in. gauge, what would it cost? It would be impossible for me to give you an estimate offhand, but I have no doubt I shall be able to do so before you leave Adelaide. I may point out that in dealing with heavy goods traffic I could carry as much on our present gauge as on a 4-ft. 8½-in. gauge.

3943. Could a line be constructed over such country as that between Petersburg and Cockburn without ballasting? In my opinion, certainly not.

3944. Have you had any experience in this colony with regard to the construction of railways in that manner? The only experience was on this particular line from Petersburg to Cockburn. It was passed by Parliament, and a contract was entered into to construct the railway as a contour line with a minimum of ballast—a formation line almost. Before the work was nearly completed there were several demands made that the line should be properly equipped for carrying fairly heavy rolling-stock, and run at a speed which would enable us to complete the journey to Silverton in a reasonable time. Thousands of pounds were spent for that purpose. I am perfectly certain that no heavy traffic can be conducted with safety over a line which is unballasted, and it is the falsest economy to attempt it, because you have your rails destroyed in fifteen months or two years.

3945. Your remarks apply to that class of country? Yes.

3946. Do you also make that remark in regard to any class of country? Yes; any class of country of which I have had experience, or in fact any class of country I have ever heard of. I would not run heavy traffic over a formation line without ballast. The rails would be hooped in a very short time; they would become bent at the joints.

3947. What amount of ballast would be the minimum which you would put on? I would prefer that you would ask that question of the Engineer-in-Chief. It is a technical point; but I do not think we should have less than 4 or 5 inches under the sleepers.

3948. Are the wharfs at Port Pirie under your control? No. Those that belong to the Railway Department are leased. There is one leased to the Broken Hill Proprietary Company, one to the Adelaide Steamship Company, another to John Darling & Son, and there was one leased to the British Company which has since passed into the hands of the Broken Hill Proprietary Company by arrangement.

3949. Is Port Pirie at present a good port? Yes, a very good port.

3950. What is the depth of water there? Fourteen feet at low-water abreast the wharfs.

3951. Dealing with Port Pirie first of all, is it perfectly secure and landlocked, and is there no serious send of the sea? It is perfectly secure. The port itself is 10 miles up from Port Germein, which is open to the sea. It is quite protected.

3952. What is the largest vessel which you could safely deal with at present at Port Pirie? I cannot give an opinion, because I have nothing to do with the handling of the ships. I only know, as a matter of fact, that large boats come there; but I would not like to speak as an expert in dealing with ships.

3953. With regard to the approach to the port, could you easily carry out works which would give 30 feet of water? It would be a question of dredging a channel. I do not know that the cost would be prohibitive, but I cannot give an opinion.

3954. *Mr. Egan.*] What is the amount of coal imported yearly for the railways of South Australia? I suppose 60,000 tons.

3955. Where do you land it? At various ports down on the south-east sea-board—also at Port Adelaide, Port Wallaroo, Port Pirie, and Port Augusta, according to contract.

3956. Is it delivered at the same price at all the ports? No; at Port Pirie it is 15s. 6d. per ton; at Port Adelaide, I think, it is 13s. 6d. It is best Newcastle coal.

3957. *Chairman.*] What is the distance from Morgan to Adelaide? One hundred and five miles.

3958. What is the freight for wool from Morgan to Adelaide? Nineteen shillings per ton for greasy dumped.

3959. Is that the class of wool that is principally carried? It is greasy almost entirely. The charge for undumped is 21s. per ton. That is a rate which applies only from Morgan or Murray Bridge, or Goolwa to Adelaide, or Port Adelaide.

3960. Do you know the river freights? No.

3961. From how far up the Darling, the Murrumbidgee, or the Murray do you get wool? If there is a fair river we get it from a very considerable distance, but I cannot state exactly what the distance is. I do not think we get it from Bourke. From Menindie we do.

3962. What is your rebate district? There is no rebate on that. There is only a rebate in connection with the Broken Hill wool to Port Pirie alone. There is a rebate of 7s., 6s., 5s. 9d., and 5s. 4d. on wool carted for a distance of 50 miles, to Tarrawingee, Broken Hill, Silverton, or Cockburn, and consigned to South Australian ports.

3963. What are your wool rates from Port Pirie to Cockburn? Greasy, dumped, 40s. per ton; undumped, 45s. per ton.

3964.

* NOTE (on revision):—The completed estimate, which includes a scheme of deviation, is £100,000, and this work is in hand.

Mr. A. G.
Pendleton.
5 Oct., 1896.

3964. Is there any rebate on supplies coming by way of Morgau, Murray Bridge, or Goolwa? No; the rates I have mentioned are special ones for the ports.

3965. Do you recognise that they are competitive rates? Undoubtedly they are competitive rates, which, personally, I should like to see abolished.

3966. There is another aspect of the river trade—that is, the approach from Goolwa to Port Victor;—what is the length of the railway there, and its character? Eleven miles. There is a little rise in two places, but it is of no moment.

3967. What are the grades? One in 60, but that could be very easily cut out.

3968. What are the railway rates from Goolwa to Port Victor? Greasy, 4s. 6d. per ton. It is the same for dumped or undumped.

3969. What sort of a port is Port Victor? A very good one indeed.

3970. Can boats of any tonnage go there? Yes.

3971. Therefore, if a large proportion of the trade of the Murray and the Murrumbidgee had to find an outlet to the outside world in the cheapest way, is that the route which would be chosen, provided that there were good boats at Port Victor? Undoubtedly, and if time were no object. There is one element which will be admitted by owners and shippers of wool—that is, to get to Goolwa they have to cross what we call the Lakes Alexandrina and Albert, and the cost of insurance is increased for crossing the lakes.

3972. Has the possibility ever been considered of cutting a canal from the Murray to Port Victor? It has never been practically considered; it could only be done at enormous cost. The thing may be possible. I do not know anything that is impossible if money and engineering talent come together; but for such a short distance I question whether it would not be cheaper to put down two or three lines of railway, and to provide expeditious machinery for discharging at Goolwa and loading at Port Victor. That would get over the difficulty far more economically.

3973. Have you looked at the matter with a view to suggesting a cheap and easy service to cross from Goolwa to Port Victor as likely to be worked in some day in connection with the whole river system? No; there is no necessity for that unless there is some decided move in the direction of allowing all the wool to find the best and cheapest way down the river. As long as there is competition for the trade as there is at present it will of course be the desire of the grower to reach his market as soon as he can, and it is our desire to get a fair amount of haulage on the railways. Therefore we do not wish to give special facilities for carrying wool to Goolwa, although it finds its level there if the growers choose.

3974. Are you increasing the wharfage accommodation at Port Pirie? Only at the Intercolonial Wharf, so as to make the approach direct instead of by means of turn-tables.

3975. We want to know what are the interests to the west of Broken Hill of all the companies raising ore at Broken Hill. For instance, what have their smelting-works cost them, approximately, and what have they expended at Port Pirie on works that would have to be abandoned if they sent all the ore to the east? I am sure that the Proprietary Company would be willing to give that information with regard to their expenditure at Port Pirie. I know it has been very considerable, but I do not wish to suggest a figure. There are also extensive works at Dry Creek.

3976. Are there any other works of the same kind? Yes. Block 14 Company have works at Port Adelaide, which have been going very successfully for eighteen months. The Junction Company have works at Port Adelaide, but they have been idle for some time. I am told that they are likely to start soon.

3977. Have you any knowledge of the cost incurred in establishing these works? No.

3978. Are the works which you have particularised doing work similar to that which is proposed to be done on the eastern seaboard? I do not think they have their roasters up yet. That is work which they have in hand now at Port Pirie. I think they are smelting only the carbonate ore which they have taken from Broken Hill, and they have also a refinery at work.

3979. Does that represent the same class of expenditure as if the ore were taken to Sydney? Yes.

3980. Therefore there is a tendency not to abandon their works, but to continue to use them? Yes, that is so.

3981. *Mr. Hassall.*] I presume if you reduced your grades you could reduce your rates? Yes; it is a line which is very cheaply worked. We have not to maintain an expensive staff. I regard Petersburg as being quite apart from the Cockburn line. It was there before that line was made, and it is required for the northern and western systems. Taking the line of 145 miles from Petersburg to Cockburn, there are only two stations with station-masters and clerks; there are no books kept at the other stations; the other employees are simply signalmen, so that we work the line at a minimum expense, and we are prepared to continue to do so.

3982. Are the works at Port Adelaide and Port Pirie of a permanent character? Yes; they will last for all time. It is only a question of maintenance. The lines of railway which we make through Crown lands are always unfenced. When the lands are taken up for agricultural purposes there is a clause which provides that the person who takes up the land must fence it, but if we run through agricultural country, to begin with, we fence our lines.

The following communication was subsequently received from Mr. Pendleton:—"When I met you yesterday you asked me if I could give you an approximate estimate of the cost necessary to alter our 3-ft. 6-in. gauge between Cockburn and Port Pirie to a 4-ft. 8½-in. line, and having looked into the matter as carefully as the short period allowed will permit, I have to say that roughly it would be £300,000."

Mr. Alexander B. Moncrieff, Engineer-in-Chief for Railway Construction, Department of Public Works, Adelaide, South Australia, sworn, and examined:—

3983. *Chairman.*] Are you Engineer-in-Chief for South Australia? Yes.

3984. What would be the minimum of metal or ballast which you would consider it justifiable to use in such country as that between Cockburn and Petersburg? With the trade which we are now carrying over that line the minimum depth of good ballast under the sleepers should be 6 inches.

3985. And then do you cover over the sleepers altogether with ballast? In this colony the sleepers have to be covered on account of the heat of the sun.

3986. Would that apply to a New South Wales line running west of Cockburn towards Menindie? Yes, I presume it would.

Mr. A. B.
Moncrieff.
5 Oct., 1896.

Mr. A. B.
Moucrieff.
5 Oct., 1896.

3987. Can you give us any information with regard to the present shipping accommodation at Port Pirie, the tonnage of the boats which go there, and what cost would be incurred in providing accommodation for boats up to 3,000 tons? I produce a plan of Port Pirie, showing the accommodation there. We are now dredging Port Pirie harbour to a uniform depth of 15 feet at low water. The tide rises about 11½ feet.

3988. So that a boat drawing 23 feet could approach it? In the approach to Port Pirie Harbour there is a minimum depth of 12 ft. 6 in. at low water; at the top of high water there is a depth of 23 ft. 6 in.

3989. Therefore, the maximum draught at Port Pirie at high water would be 20 feet. Yes, 20 or 21 feet.

3990. What is the nature of the bottom of Port Pirie and the approach to it? It is all soft, and there is no expensive dredging.

3991. Supposing you desired to provide accommodation for a boat drawing 28 feet of water at Port Pirie, would the cost be prohibitive? If orders were given to dredge out the whole of Port Pirie harbour so as to admit of a draught of 28 feet it would be a serious matter, but if it were simply a question of dredging out a berth at one of the wharfs there would be no difficulty about it.

3992. Would the dredging of the approach be a serious matter? It is a long approach; we should have to dredge a distance of, approximately, 3 miles in mud.

3993. Do you say that the cost of making Port Pirie available for boats of increased tonnage would not be great? It would not be great.

3994. What is the deepest draught boat which can use Port Pirie at present? Fifteen feet is the limit.

3995. What does that mean in tonnage? Later on I will let you have a schedule of the boats which come into Port Pirie. Dredging at Port Pirie in order to admit larger boats would not be expensive.

3996. What depth of water is available at Port Augusta? At the wharf at Port Augusta there is now a depth of 20 feet, and the approaches have all been dredged down to 18 feet at low water. The rise and fall of the tide is from 9 to 12 feet. A 20-foot boat could come there. There is a very fine wharf, and a direct railway approach. There is only a difference of 32 miles in the distance from Broken Hill to Port Augusta as compared with Broken Hill to Port Pirie.

3997. Could Port Augusta be readily deepened if necessary? Yes, it could be easily deepened. It is all sand. The frontage could be extended almost indefinitely.

3998. *Mr. Fegan.*] What is the frontage at present? Speaking from memory, I should say it is about 1,400 feet.

3999. *Chairman.*] Are both these harbours landlocked? Yes.

4000. Is there any "send" of the sea? No, they are very quiet.

4001. What is the nature of Port Victor? It is sheltered from the sea by an island and by a breakwater run out in a north-easterly direction. The breakwater is very strong.

4002. Is it a secure port? It is very safe when you get behind the breakwater.

4003. Is it safe to approach? It is very easily approached, but it is not so safe as Port Pirie or Port Augusta.

4004. Is it a good wholesome sea-port? Yes; once you are inside the breakwater you are quite safe.

4005. What is the depth of water there? The chart shows varying depths up to 27 or 28 feet. The anchorage varies from 19 to 27 feet. The chart shows behind the breakwater 6 fathoms, 5½ fathoms, 4½ fathoms, 3¾ fathoms, 3½ fathoms. We have an iron wharf inside the breakwater.

4006. What depth of water is there at the wharf? There appears to be 25 feet.

4007. Can we recognise Port Victor as being a good wholesome sea-port, and that a vessel, once it gets behind the breakwater, is safe, and also that a vessel drawing 25 feet can load there? Yes.

4008. *Mr. Trickett.*] Do large ships go to Port Victor? Not just at present; but very large ships do go there to load wheat chiefly, and to load wool.

4009. Is there any difficulty at all in navigation between Morgan and Goolwa? Not the slightest; it is a splendid river.

4010. What is the depth of water? There are no shallow places anywhere, and the depth runs to 60 feet.

4011. Can anything that goes to Morgan also go to Murray Bridge or Goolwa? Yes.

4012. From Goolwa to Port Victor we are informed that there is a railway, that the land is level, that there is no engineering difficulty;—has there ever been a project for constructing a canal there? Yes, there have been two projects. I produce a plan of a canal which was proposed to be made from Goolwa to Port Victor. The country was generally supposed to be very level. They commenced to plot a section, taking borings as they went, and as you will see from this section, when they got into 100 feet of solid granite they thought it was time to stop, and they never finished it. There was another suggestion which did receive some consideration—that was to cut across the sandhills for a distance of 2 miles from the river Murray, which would be practically making a new mouth to that river, which would discharge into the sea at Encounter Bay; but the "fetch" of the sea there comes all the way from the Antarctic Pole, and a tremendous sea rolls in sometimes, which would be rather dangerous.

4013. Then it resolves itself into this: That if the trade adjacent to the Murray and the Darling has to come down those rivers it has either to come through an artificial mouth of the Murray or by rail to Port Victor? Yes; or so develop the mouth of the river as at present to take out vessels.

4014. You dismiss the idea of carrying out the proposal you have just described? Yes; but steamers could get out of the present Murray mouth if it were properly developed, and so get over to Port Victor, but it is dangerous. I would summarise it in this way: No trade which could be carried on the Murray River would pay except at the cost of developing the mouth of the river, or of constructing a canal. That is the only way to carry on the trade successfully.

4015. Would it be expensive to make the Murray as far as your border such that the traffic would never be suspended? No; there would be no serious difficulty in developing the river from the mouth as far as Wentworth.

4016. *Mr. Fegan.*] Would it be difficult to make the river navigable all the year round? No. I know the river well from the mouth up to our boundary. I know the places which require to be improved, and it would not cost much; and that is also the case up to Wentworth.

4017. What is the distance from your boundary to Wentworth? I will furnish that information later on. We have been improving the river.

4018. *Mr. Hassall.*] Have you been doing any snagging? We have taken out all the snags, and have taken down all the overhanging trees. We have also adopted a method of deepening the river at shallow places.

places. We drive in a pile, leaving a narrow space between the left bank and the pile. On the right bank we stretch a wire rope, and hang on to that, by chains, pine-trees so that they float down the stream. The boughs are entangled in the sand, which forms a bank, and the water is forced into the channel, whereby a portion of the channel is made permanent. This proves very effective. We have entered upon rather larger operations in some places. Near Cragg's Creek we have put in a very extensive weir; it is not completed, but what we did last year was very successful. We have gone to a great deal of trouble about the river.

Mr. A. B.
Moncrieff.
5 Oct., 1896.

4019. *Chairman.*] Would you kindly repeat your description of the method adopted for deepening the shallow places in the river? Yes. When we come to a shallow place in the river we drive in a pile a proper distance from one bank so as to leave a wide enough channel for the navigation. To that we attach a wire rope, which is stretched to the opposite bank—from that wire rope we suspend pine-trees so that the branches will trail down stream. They become entangled in the sand, and in a short time form such an impediment to the water that, sweeping round to the end of the pile, it scours the channel. We find that is better than sheet-piling.

4020. I understand that Port Pirie lies up a creek;—is there a heavy sea there? No.

4021. What is to prevent you going to the side of Spencer Gulf, and getting there whatever depth of water you want? We are there already, and there is nothing to prevent us getting whatever depth of water we want.

4022. Is the enterprise in connection with the smelting of ore at Port Pirie, Dry Creek, and Port Augusta of magnitude? We have very fine works at Port Adelaide, Dry Creek, and Port Pirie. There is nothing at Port Augusta.

4023. Do those works deal with ore? Yes, not only from the Barrier field, but also from places in South Australia.

4024. Do those works represent the expenditure of considerable sums of money? Yes.

4025. As an engineer, would you condemn absolutely any attempt in such country as that between Terowie and Cockburn to lay a line of railway without ballast for carrying heavy traffic? If you have any heavy traffic over a line it must be ballasted;—that is to say, if it is to have any life. It will cost you more in the end if you do not ballast it.

4026. As an engineer, would you face the full cost at first? I would ballast the line. As a matter of history, when the Cockburn line was started it was intended to be only half-ballasted. That is to say, a mere trifle of 3 inches of ballast was intended to be placed under the sleepers, and to make it a surface line as far as practicable, and no bridges where possible. It was found out, however, before the line was completed that that style of construction would never carry a train, so the Government arranged with the contractors to make the line as it is now, increasing the ballast and generally improving the line. But if the line had been laid out as a proper line to begin with, there would have been a large saving of money, because, having laid out the line on the surface, when they came to strengthen the line it was found that deviations were required in all directions in order to make it economical. The Silverton tramway was laid out from the first as a fairly good line. That line was laid out by the late Engineer-in-Chief of South Australia. In connection with the improvement of our railways and wharfs in connection with the Port Pirie trade we have already spent over £1,000,000.

4027. What does that embrace? The railway and deepening improvements at Port Pirie and the wharfs.

4028. Does that also include the expenditure at Port Augusta? No.

4029. Do you think that both ports cannot be legitimately charged with that expenditure? I did not consider Port Augusta in making out that statement.

4030. *Mr. Trickett.*] What did the line to Cockburn cost per mile? I cannot give you those figures. The original Parliamentary provision for a line from Petersburg to Cockburn, half-ballasted and laid wherever possible as a surface line, was £3,200 a mile. Material was very dear at that time.

4031. Have you made a similar line lately? No.

NOTE.—The following communication was subsequently received from Mr. Moncrieff:—“(1.) The largest vessel trading to Port Pirie is the ‘Buluwayo,’ 2,796 tons register. (2.) The largest vessel trading to Port Augusta is the ‘Hubbuck,’ 2,000 tons. (3.) The largest vessel trading to Port Victor is the ‘Hubbuck,’ 2,000 tons. The draught of this vessel is 24 feet when loaded. The depth at low water at Port Pirie Government wharf is 22 feet; in the harbour, 15 feet; and in the channel, 12 feet 6 inches. At Port Augusta Government wharf, 22 feet; in the harbour, 20 feet; and in the channel, 17 feet 6 inches. At Port Victor, 24 feet at the buoys. There is no channel, but a roadstead protected by a breakwater.”

TUESDAY, 6 OCTOBER, 1896.

[The Sectional Committee met at “Flecker's Hotel,” Adelaide, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

THE HON. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. William Rendall Cave, merchant, Adelaide, South Australia, examined:—

4032. *Chairman.*] What is your occupation? I am a merchant carrying on business at Adelaide.

4033. Have you a full knowledge of the mining industry at the Barrier field and the South Australian interests which are identified with it? Yes.

4034. Can you give us a description of the smelting appliances in this Colony in connection with the Broken Hill mines? Of course, the Broken Hill Proprietary Company has a number of smelting works in this Colony, and the only one at Port Pirie now. I think they have acquired the rights of the British Company quite recently.

4035. Are the appliances and works in existence at Port Pirie in connection with Broken Hill of magnitude? They are certainly of very great magnitude.

4036. Are there works of magnitude at Dry Creek? Yes.

Mr.
W. R. Cave.
8 Oct., 1896.

4037.

Mr.
W. R. Cave.
6 Oct., 1896.

4037. Are there many others in South Australia? Yes; Block 14 Company has very large works at Port Adelaide, and they are extending those works. I think their works will be second to none if they carry out the extensions which they now contemplate at Port Adelaide. They have recently had under offer a piece of land twice the size of that they already occupy, and they are commencing to fill it up for the purpose of increasing their works.

4038. Are there very large interests at Dry Creek, Port Adelaide, and Port Pirie in connection with the Broken Hill mines? Yes.

4039. Do you desire to give us information particularly with regard to the facilities for loading at Port Pirie, and the freight charged? Yes. I understand it is contemplated now by the Proprietary Company to ship a very large quantity of their ore to Newcastle for treatment there. The cost of the conveyance of ore by sea from Port Pirie to Newcastle in the steamers now running would be somewhere about 5s. per ton—that is the ordinary rate. Not long ago we carried about 1,000 tons of lead for the company in one of our steamers to Sydney for transshipment, at 5s. per ton. That was by steamer from the wharf at Port Pirie by our labour, and it was delivered on board an ocean-going steamer in Sydney harbour.

4040. We have been informed by the Engineer-in-Chief that a boat drawing 15 feet of water can go into Port Pirie;—what is your opinion in regard to that? Vessels are loaded up there at present drawing 18 feet 6 inches; that is done constantly. I am a member of the Marine Board, and I know that the pilots will take up vessels at ordinary times of tide at Port Pirie drawing 18 feet 6 inches. Some of our vessels went out last year drawing 19 feet. They were laden with wheat.

4041. What is the tonnage of the largest vessel that could come in? I will furnish you later on with a return showing the tonnage of the large steamers that have gone in there. You can be assured that the large ocean-going steamers are now loading these concentrates at Port Pirie for Europe. There is one in particular, the "Omba." She met with a disaster and went into Freemantle. I think she had 3,000 tons of concentrates on board, which she loaded at Port Pirie.

4042. Could the capacity of that port be easily enlarged? Yes; it is only a question of deepening. With regard to the enlargement of the port, you have only to go down the river, and you can fill up as much as you like.

4043. If you could fix the depth of water, does not that control the whole business? Yes; but I should like to point out that a steamer of any draught, in my opinion, that comes into these waters can come into Port Augusta, which is a much better port for deep-sea vessels than Port Pirie. Vessels drawing 24 feet of water can load at Port Augusta.

4044. If Port Pirie is not deep enough, Port Augusta is? Yes. There was a motion in our Parliament to inquire into the question of leasing the wharf to the Sulphide Corporation. They selected Port Augusta in preference to Port Pirie, owing to the fact that there is no disability with regard to shallow water there, and Port Augusta has certainly more advantages in that respect than Port Pirie. The Government have spent a large sum of money in deepening Port Pirie, but even now it is not, and it will not be for years, so suitable a port for deep-draught steamers and for the large modern steamers which now come here. Large ocean-going steamers will always be able to come to a port like Port Augusta, and take five or six thousand tons of ore in one cargo, and perhaps more. The tendency now is to build steamers of very much larger capacity without increasing the draught in the same ratio. They are thus able to carry much larger cargoes with nearly the same draught of water. I assume the Sulphide Corporation had that fact in view when they selected Port Augusta, and, further, they arranged with the Government so that it would not cost them much more for railway carriage to take their ore to Port Augusta. I think there is only a difference of 25 miles, which would not be appreciable. The railway authorities recognised that fact, and they agreed to carry the ore at the same rate to Port Augusta as to Port Pirie.

4045. *Mr. Hassall.*] Is the line to Port Augusta a continuation of the Port Pirie line? It branches off at Petersburg, and goes northward. Port Augusta is at the head of the gulf. I think the Government entered into an arrangement with the Sulphide Corporation that the railway carriage from Cockburn to Port Augusta should be the same as from Cockburn to Port Pirie. They selected Port Augusta, and took up 1,000 feet of wharfage, with the idea that they would have the advantage of cheaper rates by sending their ore on board the new style of steamers. I know that they contemplate getting freight at 5s. per ton or less.

4046. Can you give us the draught of the deepest vessel that goes to Port Pirie and also Port Adelaide? Yes. I know that boats can always load down to 18 ft. 6 in. at Port Pirie. At different times I have loaded sailing vessels myself down to 19 feet. The pilots do not consider it is safe for a large vessel to load down to more than 18 ft. 6 in. At the same time, I know they frequently do that on a good tide, and they are taken out drawing a foot more than that.

4047. Do many passengers go from Port Pirie to Sydney? Very few. The boats that trade there are only cargo boats, and they do not carry passengers, as a rule. Howard Smith and Company's boats have sometimes come down *via* Adelaide, but comparatively few passengers travel by that route. The passengers, as a rule, come to Adelaide and then take the steamer. I should like to impress upon the Committee that if you do not build your railway, Port Augusta will eventually be the outlet for a much larger quantity of low-class ores than has been sent away in past years. Port Augusta has a great natural advantage in possessing 24 or 25½ feet of water. It would cost somewhere about £500,000 to obtain the same depth of water at Port Pirie. There is another fact that should be borne in mind. If it should become necessary to shorten the distance there is a kink in the present railway line which could be taken out, and that would counterbalance the difference in the distance from Cockburn to Port Augusta as compared with the distance from Cockburn to Port Pirie.

The following communication was afterwards received from Mr. Cave:—

FOLLOWING my remarks of this morning, I have refreshed my memory by reference as to the following:—

Draught of water at which it is safe for vessels to enter and depart from Port Pirie is 18 ft. 6 in. I have known ships to be taken down the river drawing (say) 19 feet and a few inches over, but in the case of a large ship the pilots always refuse to take them out drawing over 18 ft. 6 in. at high-water springs. There is a depth of about 18 feet dead low water at the Broken Hill and railway wharfs at Port Pirie.

At Port Augusta vessels having practically any ordinary draught can arrive and depart on ordinary good tides. A vessel drawing 26 feet or 27 feet can safely enter and leave Port Augusta. At the Government wharf there is 22 feet at dead low water.

The

MINUTES OF EVIDENCE—RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

The following vessels have recently loaded with concentrates and ores at Port Pirie, viz. :—

Vessel.	Tons Cargo	Tons Reg.	Vessel	Tons Cargo.	Tons Reg.
Buluwayo	3,000	4,412	Basuto	2,000	2,742
Port Stephens	2,000	3,554	Gulf of Mexico	1,573	3,172
Oscar II	2,000	1,266	Sikh	1,200	2,672
Omba	3,557	2,950	Pondo	2,053	2,741
Gulf of Venice	2,002	2,923	Hubbnck	1,607	2,749
Chemnitz		2,700	Manica	2,002	2,733

Mr.
W. R. Caro
6 Oct., 1896.

You will note that in most of these cases the ships have only carried away ballast quantities of cargo from Port Pirie, and then have proceeded to the other Colonies to load up with wool and other light cargo. The "Omba," a steamer which I named in my evidence this morning, is, I think, the only vessel that has cleared with a full cargo of concentrates and ore to Europe; the others have simply called and taken in their ordinary stiffening, as above shown.

With regard to the passenger traffic from Port Pirie to Sydney by sea, this really amounts to nothing. There are no passenger vessels trading direct, and the "Dawn," a very small coaster, is the only vessel that carries passengers to Port Adelaide. Appended are the fares charged, viz. :—

Railway Fares.

Broken Hill to Sydney, via Adelaide.

1st Single	£8 15s. 0d.	2nd Single	£5 15s. 6d.
1st Return	£13 2s. 6d.	2nd Return	£8 13s. 3d.

Broken Hill to Adelaide.

1st Single	£2 9s. 8d.	2nd Single	£1 11s. 1d.
1st Return	£3 14s. 6d.	2nd Return	£2 6s. 8d.

Broken Hill to Port Pirie.

Port Adelaide to Sydney.

1st Single	£3 4s. 0d.	2nd Single	£2 0s. 0d.
1st Return	£5 12s. 0d.	2nd Return	£4 0s. 0d.

By an arrangement with the Railway Department, I understand, these return tickets are interchangeable.

VICTORIA.

FRIDAY, 9 OCTOBER, 1896.

[The Sectional Committee met at the "Grand Hotel," Melbourne, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Henry C. Mais examined :—

4048. *Chairman.*] Were you formerly Engineer-in-Chief for South Australia? Yes, for twenty-one years.

4049. Did you construct the railway line from Petersburg to Cockburn? Yes; I constructed the whole of the South Australian railway lines, with the exception of 50 miles.

4050. What is the gauge of the railway to Cockburn? Three feet 6 inches.

4051. What did it cost? 144½ miles to Cockburn cost £540,000 up to the end of 1888, or £3,740 per mile. Since that date they have spent nearly £69,000 on additional railway works. They had sufficient rolling-stock when they opened the line to Broken Hill, but the traffic increased rapidly, and at the end of 1895 they had spent close on £69,000 on additional rolling-stock and other works.

4052. What is the cost per mile of the 3-ft. 6-in. gauge, such as that from Petersburg to Cockburn? About £3,000 per mile without equipment.

4053. Was that work carried out at a dear time? No doubt the work could be done for less now. I may say that the line originally was intended solely for pastoral purposes. After the contract was let, some diggings were discovered about 25 miles from Petersburg, and a large number of people went up there. It was then determined to make the line of a better class. Originally it was only a line laid with 4 inches of ballast, and the line was to be deviated where, under ordinary circumstances, a bridge would be necessary, and a bridge-crossing made, so that the line would go over any slight depression. A bank, for instance, would be made, and the line would be brought over the top of that, and be brought into the same position it would occupy if a bridge were built. That, however, was abandoned, and 4 inches of ballast, 1,700 yds. to a mile, were placed on the formation, and the sleepers put on top of that. The original intention was that 4 inches of ballast should fully ballast it. It was really an apology for ballast, and it would have almost been better without it. The work of putting down 4 inches of ballast, and subsequently ballasting the line, was done with the object of making a better line. The moment the line was opened additional ballast was put on by the Government.

4054. *Mr. Trickett.*] Was that the result of experience? It was considered inadvisable to work the line in that condition. Originally the railway was built merely to develop the country for pastoral purposes.

4055.

Mr.
H. C. Mais.
9 Oct., 1896.

Mr.
H. C. Mais.
9 Oct., 1896.

4055. *Chairman.*] In your opinion, would it have carried the traffic without the additional ballast? It would not have carried the diggings traffic. When that country is dry it is hard as the floor of this room, but after the smallest shower of rain it is as rotten as a bog. I have seen waggons loaded with goods going up to Broken Hill before the railway was built. There would perhaps be five tons in a waggon. They would camp at night on the road, and in the morning I have seen seventy of those waggons between Petersburg and Broken Hill, some of them sunk in the ground up to the bed of the waggon; others of them 1 foot or 2 feet down. That was simply because there was a slight fall of rain.

4056. *Mr. Trickott.*] What weight per truck did you estimate that this experimental line was to carry? The line was built with 41-lb. steel-rails. That was the lightest permissible rail; it was really lighter than Parliament sanctioned, but the Ministry would not have it heavier. Parliament prior to that passed a resolution that no narrow gauge railway should be built with rails less than 50 lb. weight. That resolution was set aside, and 41-lb. rails substituted. The rule that prevails in that matter usually is, that as one-twelfth of weight in lbs. of the rail is to the weight, you can put on a wheel. Dividing 41 by 12 you get $3\frac{1}{2}$ tons per wheel. Being steel, the rail would perhaps carry rather more than that weight, particularly if you had good sleepers under it. Many years ago when I first went to South Australia, there was a horse-line to be built from Gawler-town to Burra, where the copper-mines were. That line was 70 miles long. I reported on it to the Government, and the whole thing was altered. That line was laid with a 40-lb. iron-rail, and the sleepers were 21 inches centres. We ran our locomotives off the main line on to that line. The locomotives were of a lighter class then. The heaviest engine we put on would have six wheels, four coupled, and two in front, and it would weigh about 27 tons. They ran fairly well until they wore out the rails, and we had to renew them with 60 lb. steel-rails, with 20 inch centre sleepers. If you put the sleepers too close you cannot pack them, so there is a limit to that. Of course the proposition as it appears now is this—what is the probable traffic you are going to carry on the line you propose to build? Having ascertained that, you find out whether it is a daily regular traffic; then you know what power you want to pull that traffic over the railway, and you get an engine that can pull the load. Then you can ascertain whether you want it heavily or lightly ballasted, or whether you want to ballast it at all; but my experience in South Australia with reference to doing without ballast has not been satisfactory. We made a line by day labour for a distance of 100 miles, at Hergot Springs. That was done in a fair manner. It is a country extremely dry, but subject to occasional thunderstorms. After one of those storms I have seen the engine sink right down and bury the rails 2 feet in the mud. After we got the train out we left the rails there until the dry weather, when we pulled them out. That country borders on the lake, and there is gravel on it.

4057. *Chairman.*] What do you consider the 3 feet 6 inch gauge railway from Cockburn to Petersburg cost originally as ballasted to-day? £3,000 per mile.

4058. What do you think it would cost to-day? £2,500 per mile.

4059. What would that railway cost if it were built to a gauge of 4 feet 8½ inches? There is no rule by which such an estimate could be made.

4060. Can you give us any percentage? I can give you a statement of facts. If a 3 feet 6 inch gauge railway on level country cost £170 per mile less than the 5 feet 3 inch gauge, which was the standard gauge in South Australia at that time. In another part of the country, where it was most difficult to make a railway, the difference of cost was 50 per cent. The difference of cost between a 3 feet 6 inch gauge railway, and a 4 feet 8½ inch railway might be anything between £80 per mile and 30 per cent. It depends upon the grades and various other things.

4061. What would be the minimum amount of ballast which you could use between Cockburn and Petersburg, if you were carrying on heavy traffic? Nothing less than 6 inches under the sleepers.

4062. Do you think that a line 4 feet 8½ inches wide could be built to carry the trade between Cockburn and Petersburg for £2,600 a mile, exclusive of rolling stock? It is level country, but I do not think you could do it for much less than £3,000 per mile. That, however, is only an estimate, I have not gone into the question.

4063. Is there a limit to the use of additional sleepers? Yes, there is a limit. I am an advocate for having a line fully sleepered, instead of putting in as few as possible. You cannot have sleepers too close if you can pack them properly. The traffic on the line from Cockburn to Petersburg could never be conveyed on a surface line.

4064. *Mr. Fegan.*] Do you think it is possible for a railway 696 miles long to compete with a railway 252 miles long? That is out of the question; traffic will gravitate to the port which is nearest to it.

4065. Do you know if the rate of ½d. per mile per ton pays the South Australian Government? I cannot say now whether it does pay, but ½d. per ton per mile is very close shaving. It could not be done on difficult gradients. There the gradients are in favour of the traffic. From Broken Hill to Port Pirie it is practically a down hill grade. If that line had been laid with fair rails and good engines upon it, they could do the traffic well. When a line is made too light you have to run too many small trains.

4066. But a railway would not pay if laid down with heavier rails, and at an extravagant cost in the first instance? That has to be taken into consideration. Those rails will never be replaced with 40-lb. rails; they will be replaced with 50-lb. or 60-lb. rails.

4067. Will not that mean enormous cost added to the original cost? No, because that is not paid for out of capital. The difference in weight is charged to capital, but the cost of taking up the rails and putting them down is charged to revenue.

4068. Do you know what rights the Silverton Tramway Company possess which would prevent any other company from building a line alongside of theirs, or which would prevent the New South Wales Government from building such a line? I do not know that that company has any special rights. There was a rival line proposed years ago to run from Thackaringa in a straight line, but it never came to anything.

4069. What did the Silverton Tramway Company's line cost? Exactly the same as the South Australian railway to Cockburn. It was built by the same people. When the railway was brought to the border the same men went right through and finished it. The earthworks were done at the same price as the last 10 miles of the South Australian railway. The Cockburn line was taken in sections by the same contractor. There was an increased price given for earthworks the further the contractor went away from head-quarters.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Condobolin to Broken Hill.

SECTIONAL COMMITTEE.

APPENDIX.

A.

SWORN STATEMENTS BY MR. WILLIAM HAIGH, OF PORTLAND, AND MR. DAVID LAWSON.

WE, James Ryan and Louis Buckland Blackwell, journalist and civil engineer, respectively, of Lithgow, do solemnly and sincerely declare that on the 22nd day of September last we did obtain certain evidence from Mr. William Haigh, of Portland, herewith, marked "A," and from Mr. David Lawson, marked "B" herewith attached, and having reference to the proposed extension of the railway to Broken Hill; and we make this solemn declaration, conscientiously believing the same to be true, and in virtue of the provisions of an Act made and passed in the ninth year of the reign of Her present Majesty, intituled, "An Act for the more effectual abolition of oaths and affirmations taken and made in various Departments of the Government of New South Wales, and to substitute declarations in lieu thereof, and for the suppression of voluntary and extra-judicial oaths and Affidavits."

Made and signed before me at Lithgow,
this 1st day of October, 1896.

JAMES RYAN,
LOUIS B. BLACKWELL.

H. E. S. BRACEY, J.P.

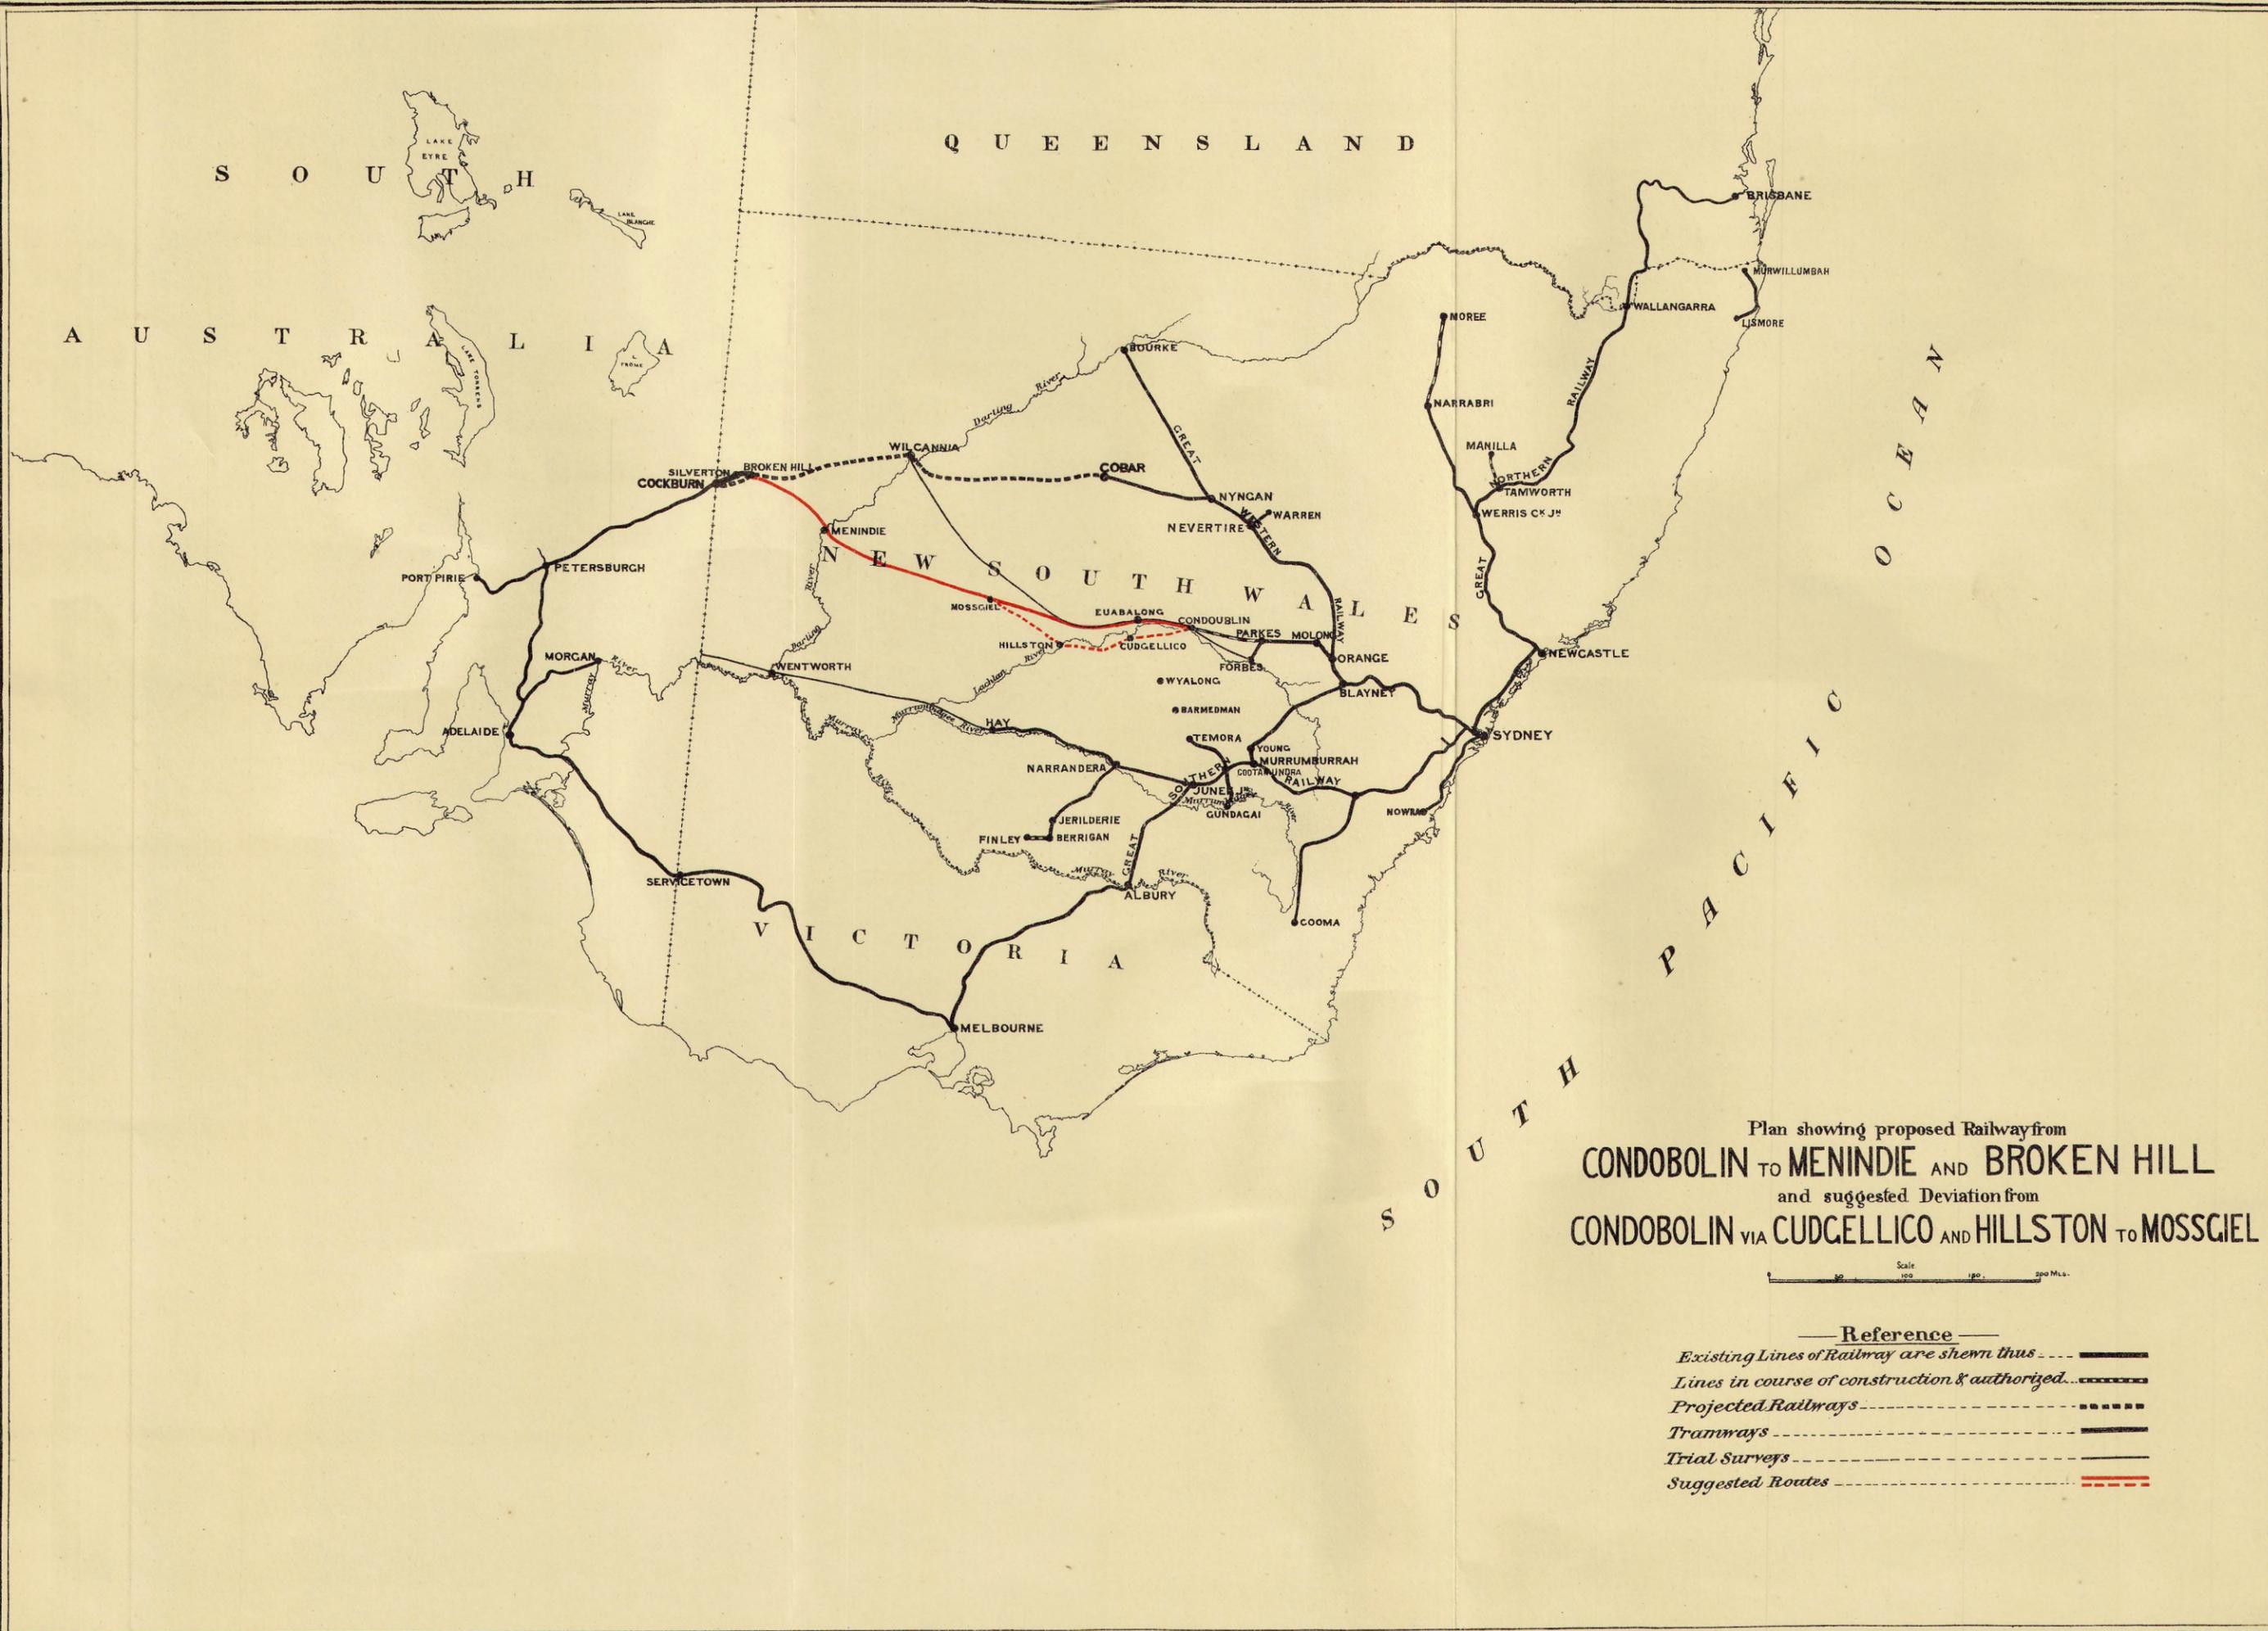

Mr. William Haigh was examined, and stated as follows:—

I have lived at Portland for nearly six years; was connected during that period with lime works.
I possess a thoroughly practical knowledge of the lime trade.
Have been supplying lime to Mr. Howell's smelting works at Dapto, and am now negotiating with him for the supply of limestone.
The property I am working consists of 15 acres, secured by a 14-years lease.
The present exposed face of limestone in my quarry amounts to 40 feet; do not know what depth it is, but must be considerable, as another quarry adjoining has been worked to a depth of 110 feet and not bottomed.
I cannot state the quantity of limestone in this neighbourhood, but think it is practically limitless.
The limestone deposit is exposed for half a mile in two directions.
The Cullen Bullen Lime and Cement Company have a quarry in operation close by.
I am prepared to supply lime delivered in trucks at Portland Siding at 15s. 6d. per ton, and limestone at the same siding at 4s. 6d. per ton, subject to further reductions for large quantities. I consider the stone from these quarries the best in the Colony.
On the 23rd instant I propose forwarding a sample of limestone to the Department of Mines for analysis.

Mr. David Lawson was examined, and stated as follows:—

For three years I was furnace manager to the Dundyvan Ironworks, near Glasgow; nine years in Muirkirk Ironworks, also in Scotland; four years with the Landore Siemens Steel Company, Swansea, in South Wales.
My experience in this country consists of eighteen months at Fitzroy, where I made 3,000 tons of pig iron, followed by about three months in Tasmania at Lampriere.
For the past thirteen or fourteen years I have lived in the neighbourhood of Piper's Flat Railway Station, and am well acquainted with the iron deposits on the Wallerawang Coal and Iron Company's estate. These consist of brown hematite, magnetite, and clay band ironstone. The brown hematite lode at a depth of 50 feet was proved 23 feet thick and 92 feet wide on the surface.
I consider there is from a half a million to three-quarters of a million tons of iron ore on this estate.
I believe all the country round here contains ironstone.
Sixpence per ton would be a fair royalty, to which must be added the cost of mining, amounting to 2s. 6d. a ton for brown hematite, and 1s. a ton for magnetite, also carting three miles to Piper's Flat Station.
This last item could be further reduced by constructing a tramway.

[Two maps and two plans.]

PLAN.

Sketch to accompany Report by the Sectional Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM THE ROCK TO GREEN'S GUNYAH.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from The Rock to Green's Gunyah," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

THE PROPOSED RAILWAY.

1. The proposed railway has been under consideration for some years. In 1891, in a report on proposed railways for Riverina by Mr. S. Alexander, then an Examiner of Public Works Proposals, a line was recommended from The Rock to Murray Hut, and this led to a deputation waiting upon the Minister for Public Works, and urging the construction of a line in the direction of Murray Hut, as far as Green's Gunyah, and to a Ministerial statement in the Legislative Assembly that a railway would be taken through that locality. It was explained by the deputation then, and subsequently, that the line would pass through good agricultural land, much of it Crown land, and open up the country towards Brookong and Urana, giving communication to existing settlers and encouraging further settlement. The following year a survey of a line from The Rock to Murray Hut was completed, a route being decided upon which touched the southern end of the Crown land in the Green's Gunyah district; and again the line to Green's Gunyah was urged by a deputation to the Minister, this time with a written undertaking on the part of residents of the district to pay, if the railway were constructed, a special tax to the extent of 1d. per acre on land within a distance of 5 miles of the line on each side, $\frac{1}{2}$ d. per acre on land within a distance of 10 miles, and $\frac{1}{4}$ d. per acre on land within a radius of 15 miles. Nothing definite, however, was done in the matter until 1895, when a Ministerial promise was given that the proposal should be taken into serious consideration; and this was followed by the Railway Commissioners reporting upon the line, and by the reference of the work to this Committee.

DESCRIPTION OF THE LINE.

2. The line, which is 25 miles 13 chains in length, commences as a branch of the Great Southern Railway at the Albury end of The Rock station, 327 miles 7 chains 11 links from Sydney, and proceeds westerly, with a trend to the south, along a reserved 3-chain road, as far as 345 miles from Sydney, where the watershed between the Murray and Murrumbidgee Rivers is crossed. At this point the line leaves the reserved road, and takes a north-westerly course to Green's Gunyah, where it ends at 352 miles 20 chains from Sydney on the travelling stock reserve which extends between Wagga and Urana. Except for a few miles at each end

end of the line, where the land is flat, the country passed through is undulating, and very little of it is private land. The ruling grade upon the line is 1 in 80, and the sharpest curve 20 chains radius.

ESTIMATED COST.

3. The estimated total cost of the line is £65,939, or £2,620 10s. 6d. per mile, exclusive of land and compensation, which, however, is so small that the estimate of £65,939 is not likely to be exceeded.

One of the largest items in the estimate is £11,928 for earthworks, which, in places, will be somewhat heavy. Culverts, timber bridges, and small timber openings are estimated at £3,512; permanent-way materials (60-lb. rails) at £15,697; laying, ballasting, and sleepers at £13,175; station works, including junctions and sidings, £2,832; station buildings at £4,045; and other items of expenditure cover freight, water supply, mileage and gradient posts, telegraph, engineering and contingencies, &c. Level crossings, cattle stops, and fencing are put down in the estimate at £982.

RAILWAY COMMISSIONERS' REPORT.

4. The report of the Railway Commissioners upon the line shows, in a comparison of the estimated annual cost with the estimated revenue, a loss per annum of £1,127. The annual cost, as estimated, amounts to £3,802, which is made up of interest on capital expenditure at $3\frac{1}{2}$ per cent., £2,177, and working expenses, £1,625. The estimated annual revenue is £2,675, comprising goods traffic, live stock, &c., £2,200; passengers and parcels, £175; and mails, £300.

Nearly the whole of the country through which the line would run, the Commissioners say in their report, is exceedingly good agricultural land, but, as grain and similar produce cannot bear high rates of carriage, there is very little prospect of that development taking place in farming, which should be the case, unless railway communication is afforded. But, while admitting this, they are of opinion that the proposed line, if constructed, will, for a long time to come, be a burden upon the existing railway system, unless there be entered into with the people of the district some arrangement such as they have expressed themselves willing to make, by which they will be required to pay a special tax as a guarantee fund levied for the support of the line. On that condition, and the understanding that a local scale of traffic rates will be charged on the railway in order to produce a reasonable revenue, they strongly recommend the construction of the line. On any other basis they would not recommend it. The time has arrived, they consider, when some special action of this character should be taken in regard to what they describe as "the continuous applications for railway extension."

At the date of their report—July, 1896—unprofitable lines forming part of the railway system of the Colony were being worked at a loss of £370,000 per annum, and this sum has to be provided by the users of other sections of the railways paying higher rates than otherwise would be the case. Such a departure from the practice hitherto followed, as specially taxing the people of the district through which a railway likely to be unprofitable is constructed, would, the Commissioners point out, "have the effect of checking applications for lines in districts where there is little prospect of their being of a payable character; whilst, on the other hand, it would be a strong incentive to those living within the area guaranteeing the line to put all possible traffic thereon; whereas now, in many cases, for a slight personal advantage, some of the lines are left to carry 80 or 90 per cent. of the traffic which returns but little net profit, while the small amount of traffic which gives a reasonable return is taken by road."

The guarantee, they consider, should cease as soon as lines of this character pay working expenses and 3 per cent. upon the capital outlay.

ESTIMATE OF TRAFFIC.

5. The Commissioners' traffic estimate is based on a report from the Railway Goods Superintendent, made to them in May 1896 and subsequently amended. In the first instance the yield per annum anticipated from the line was set down at £1,075; but, in consequence of the Commissioners, during their visit to the district, being informed that the residents were prepared to pay double the rates stated in
the

the Goods Superintendent's estimate, on all traffic except wool, and that all items of traffic, with the exception of wool, would be doubled in tonnage, the estimated return from the line was increased to £2,675, the details of which are as follows:—

Goods, 800 tons, at 10s. per ton	£400
Wool, 800 tons, at 10s. per ton	400
Grain, 4,000 tons, at 5s. per ton	1,000
Live stock, 400 trucks, £1 per truck	400
Passengers, 750 at 4s. (allowing one and a half journey per annum for residents of the district)	150
Parcels	25
Mails	300
Total	£2,675

The Sectional Committee appointed to inquire into the proposed work came to conclusions with regard to the traffic different from those of the Railway Goods Superintendent and the Commissioners, and consider that instead of the line showing a loss of £1,127 per annum it would, with a fair season, probably show a surplus soon after construction. They report that the Commissioners' stock estimate appears to be fair, and do not question the estimate regarding goods, passengers, parcels, and mails; but they are of opinion that the return from wool and wheat is under-estimated. A very reasonable forecast of the wool traffic, based on the information obtained by them, is £500 as compared with £400, the estimate of the Commissioners; and a very moderate yield, in a fair season, of wheat grown in the district will, they say, return to the railway £2,250, representing 9,000 tons of wheat, as compared with £1,000, the Commissioners' estimate, representing 4,000 tons. "Not only is the Railway Commissioners' estimate much under the return of last year's harvest," the Sectional Committee state in their Report, "but it has been given without a full consideration of the yearly increase in the area of land under crop," which increase is indicated by the progress apparent in clearing and preparations for cultivation in many parts of the district.

These conclusions of the Sectional Committee place the estimate of traffic £1,350 above the total amount shown in the Commissioners' estimate, and £223 in excess of the estimated annual cost. The details are as follows:—

Goods	£400
Wool	500
Grain	2,250
Live stock	400
Passengers	150
Parcels	25
Mails	300
Total	£4,025

PROBABLE TRAFFIC AREA.

6. The Sectional Committee limit the country, from which traffic will be obtained by the proposed railway, to an area extending for about 12 miles around Green's Gonyah, and to within 6 miles of The Rock.

Commencing at a point north-west of Galore, the boundaries of the area are as follows:—On the north-east by a line running south-east 24 miles and a little to the north of the road from Narrandera to Bullenbong, to a point about 2 miles beyond Bullenbong; on the south-east by a line bearing south-west about 24 miles, to a point within 3 miles of Urangeline Creek; on the south-west by a line bearing north-west about 24 miles, and following generally parallel with the Urangeline Creek for about 16 miles; and on the north-west by a line bearing north-east about 24 miles, to the point first mentioned.

Over the area described, the Sectional Committee found that the special rate proposed by the Railway Commissioners would attract produce to the line, this rate being considerably less than the present cost of conveyance by road.

The present road rate for the carriage of produce from Green's Gonyah to The Rock is from 9s. to 10s. per ton, which, taking the lower figure, is 4s. in excess of what it is proposed to charge by the railway. Within 12 miles of The Rock a 5s. rate, the Sectional Committee say, would probably prevent the proposed railway from being used except when the roads are bad, for at this distance road carriage and the special railway rate are, in amount, the same. But if a rate of, say, 2s. 6d. per ton were charged within this distance, remunerative traffic would possibly be obtained

obtained to within 6 miles of The Rock, from which point the traffic would be attracted to the Great Southern Railway. That railway would, no doubt, within this limit, attract a certain portion of the traffic by road, not only to The Rock station but to Yerong station, south of The Rock.

INFLUENCE OF EXISTING RAILWAYS ON THE TRAFFIC.

7. The proposed line is surrounded by existing railways which influence, more or less, the country in the southern parts of the Colony.

On the east, or at The Rock end of the proposed railway, there is the Great Southern trunk line; on the north the south-western line from Junece to Hay; on the west, the railway from Narrandera to Jerilderie; and on the south, the line from Culcairn to Corowa, as well as the Victorian railways beyond the Murray. Outside the 12 miles area around Green's Gonyah, much of the traffic will probably go, as at present, to Narrandera and Coonong; and the Great Southern Railway, for a certain distance north and south of The Rock station, is in a position to attract from the proposed line traffic which might be regarded as belonging to it.

SUGGESTED SPECIAL TAX AND LOCAL RATES.

8. The suggested special tax upon the residents of the district, and the imposition of special local rates, were matters which also came before the Sectional Committee in the course of their inquiry. They found that neither is viewed favourably by the residents. It is pointed out that, unless legislation be passed to render the special tax obligatory, it can only be levied with the consent of the land-owners, and that, in the absence of this legislation, many persons will refuse to pay.

A special rate for the carriage of produce is regarded as more equitable; but a charge of 5s. per ton for the conveyance of grain is twice the sum paid on the Berrigan railway, and that is considerably greater than the ordinary grain rate. This fact, in itself, makes the proposed special rate unpopular, and, in addition to this, it is contended that before the railway can be constructed the district will have developed sufficiently to place the line on a paying basis, and render a special tax unnecessary. On this point, the Sectional Committee are of opinion that the district around Green's Gonyah is quite as favourably situated for the production of cereals as that around Berrigan, and that settlement in the district will very shortly be as satisfactory as it was around Berrigan when the construction of the Berrigan railway was recommended by the Committee.

THE LAND IN THE DISTRICT.

9. Within 5 miles of each side of the proposed line, and a similar distance beyond its terminus at Green's Gonyah, the Committee learn, from official information supplied by the Department of Lands, there are 136,980 acres of alienated land, 26,840 acres of reserves, and 2,880 acres of Crown land. Between 5 and 10 miles there are 145,880 acres of alienated land, 28,640 acres of reserves, and 3,820 acres of Crown land. Within from 10 to 15 miles there are 163,160 acres of alienated land, 21,810 acres of reserves, and 4,830 acres of Crown land. These figures make a total of about 450,000 acres of alienated land, 75,000 acres of reserves, and 10,500 acres of Crown land.

As the construction of the railway must enhance the value of land in the district, an increase in the rentals charged by the State cannot be regarded as unjustifiable.

AGRICULTURAL PROSPECTS.

10. Within the 12-mile limit area, defined by the Sectional Committee, there are about 370,000 acres of land, 300,000 of which may be classed as suitable for the growth of cereals. The remainder is plain country, most of which will probably continue to be used for pastoral purposes. In the smaller area, from which traffic will be obtained at a lower rate than can be charged in the larger, there are about 46,000 acres, a considerable proportion of which is good agricultural land.

The agricultural prospects of the district are very satisfactory. Statistics supplied to the Sectional Committee represent the area at present under cultivation as 20,984 acres. Large areas of land held for pastoral purposes are being devoted to agriculture. On Brookong station 5,000 acres have been let this year, to be placed under

under wheat. Next year this quantity will be increased to 7,000 acres, and ultimately to 10,000, the reason given for the increase being that agriculture pays better than pastoral occupation. 30,000 acres at Brookong are about to revert to the Crown under the exchange system, and will shortly be thrown open for settlement. Most of this land is suitable for agriculture. Locally the net return from pastoral land is estimated at from 3s. to 4s. per acre, and that from wheat land at 15s.

In the vicinity of Green's Gunyah agriculture is rapidly extending, much of the land being well farmed.

The high price of wheat, which will probably not be permanently maintained, has had great effect in stimulating the growth of cereals. In this district, in some parts of which the rainfall is under 20 inches, bad seasons must be expected; still there can be little doubt of the suitability of the conditions around Green's Gunyah or of agriculture being upon a solid basis. To the Sectional Committee the possibilities of progress appeared so great, that they regard the figures from which traffic to the railway may at the present time be estimated, as not a true index of the amount of production probable from the increase of settlement certain to follow railway construction.

WOOL PRODUCTION.

11. A considerable quantity of wool is produced in the district, and at present goes to Melbourne by way of Corowa; although for several years it came to Sydney. Under the competitive system which prevails in connection with the railway systems of this and the adjoining southern colony, efforts to secure the wool for Victoria are not likely to be relaxed; but the extension of the railway system of New South Wales from The Rock to Green's Gunyah must place that system in a more advantageous position than at present.

THE COMMITTEE'S RECOMMENDATION.

12. For the reasons stated—(1) the suitability of the land in the district for agriculture; (2) the extent to which cultivation is now carried on, and will probably progress; and (3) the increased value that will be given by the line to Crown lands in the district—the Committee are of opinion that the proposed railway should be constructed.

The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings:—

“ Mr. C. J. Roberts moved—

‘That, in the opinion of the Committee, it is expedient the proposed Railway from The Rock to Green's Gunyah, as referred to the Committee by the Legislative Assembly, be carried out.’

“ The motion was seconded by Mr. Black, and passed on the following division:—

Ayes, 8.	Noes, 5.
Mr. Ewing,	Mr. Humphery,
Mr. Roberts,	Mr. Hoskins,
Mr. O'Connor,	Mr. Trickett,
Mr. Clarke,	Mr. Lee,
Mr. Hassall,	Mr. Fegan.
Mr. Black,	
Mr. Wright,	
Mr. Farnell.	

“ Mr. Lee moved—

‘That it be a condition that, prior to the railway being constructed, the landowners guarantee the amount per acre recommended by the Railway Commissioners.’ ”

“ The motion was seconded by Mr. Wright, and negatived on the following division:—

Ayes, 5.	Noes, 8.
Mr. Humphery,	Mr. Ewing,
Mr. Hoskins,	Mr. Roberts,
Mr. Trickett,	Mr. O'Connor,
Mr. Lee,	Mr. Clarke,
Mr. Wright.	Mr. Hassall,
	Mr. Fegan,
	Mr. Black,
	Mr. Farnell.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 25th November, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM THE ROCK TO GREEN'S GUNYAH.

THURSDAY, 16 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from The Rock to Green's Gunyah.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Mr. Lee.*] You appear here on behalf of the Under Secretary for Public Works? Yes, owing to the unavoidable absence of the Under Secretary. I have a statement prepared by him which I will read:—

H. Deane.
16 Sept., 1897.

PROPOSED RAILWAY LINE—THE ROCK TO GREEN'S GUNYAH.

Mr. Alexander, in his report on proposed railways for Riverina, dated 30th March, 1891, recommended a line from The Rock to Murray Hut, which would run about 8 or 9 miles south of Green's Gunyah.

Encouraged by this report, a deputation, introduced by Messrs. Cornly, Dibbs, Rae, and Lyne, M's.P., waited upon Mr. Secretary Young, and urged the construction of a line of railway from The Rock to Green's Gunyah. The Minister promised that as soon as surveyors could be spared he would have a survey made, and also continue it on to Murray Hut.

Soon after this Mr. Burge was engaged on an exploration of the route, and in November, 1891, the Minister stated in the House that the line would be taken through Green's Gunyah.

This prospect, however, was not realised, and persons interested urged the adoption of the route *via* Green's Gunyah, and that the line might be taken within a mile of Mount Galore.

Hereon Mr. Burge reported that the line recommended by Mr. Alexander ran 8 or 9 miles south of Green's Gunyah, but he (Mr. Burge) had deflected his line 6 or 7 miles north of Mr. Alexander's, so as to touch the southern end of the Crown lands forming the district known as Green's Gunyah. To go further north (to the Post Office) would add to the length of the line considerably, and increase the expense, and bring it within the area served by the Narrandera line; and would, moreover, involve a double crossing of Brookong Creek. To take the line, as proposed, within a mile of Mount Galore would increase and emphasise these objections.

On 11th August, 1892, Mr. Deane reported the completion of the survey from The Rock to Murray Hut—length, 99 miles. Estimated cost, £3,630 per mile = £359,370.

Deputations urging the construction of the line from The Rock to Green's Gunyah, waited upon Mr. Secretary Lyne, in September, 1892, and November, 1893, and on the latter date the Minister stated he had been in favour of the construction of the line for some time; and when the Betterment Bill, which he then had before the House, became law, he intended to urge before his colleagues the necessity for its construction. This, Mr. Lyne said, was one of the lines he desired to have made under the Public Works Act Amendment Bill, and if it was possible for him to induce the Government to construct it, the work would be carried out.

No further action of importance was taken till March, 1895, when Mr. Lyne introduced a deputation urging the submission of the line—The Rock to Murray Hut—to the Public Works Committee. Mr. Young, in reply, said he was fully aware of the highly productive character of this district, and promised to take the matter seriously into his consideration.

In April, 1896, the Minister issued instructions for a report to be obtained from the Railway Commissioners on the proposal from The Rock to Green's Gunyah. Mr. Deane estimated the line would cost £67,000, and would be about 25 miles long.

The Commissioners forwarded their report on the 7th July, 1896.

It should be pointed out that since the Commissioners' Report the estimated cost has been reduced by Mr. Deane from £67,000 to £65,933, or an average per mile of £2,620 10s.

ROBT. HICKSON,

Under Secretary for Public Works and Commissioner for Roads.

H. Deane. The Railway Commissioners' Report on the proposed line is as follows :—
16 Sept., 1897.

Office of the Railway Commissioners of New South Wales, Sydney, 7 July, 1896.

Proposed "Pioneer" line of Railway from The Rock to Green's Gonyah. Length, 25 miles.

In accordance with section 13 of the "Public Works Act of 1888," we beg to report as under :—

<i>Cost of construction—</i>	
The Engineer-in-Chief estimates cost of constructing the line (exclusive of land and compensation), at	£67,000
<i>Annual cost—</i>	
Interest on capital expenditure, at 3½ per cent.	£2,177
Working expenses (total cost)	1,625
Total annual cost	£3,802
<i>Estimated revenue—</i>	
Goods traffic, live stock, &c.	£2,200
Passengers and parcels	175
Mails	300
Total annual revenue	£2,675

Nearly the whole of the country through which the line would run is exceedingly good agricultural land; but as grain and similar produce cannot bear high rates of carriage, there is very little prospect of that development taking place in farming, which would be the case, unless railway communication is afforded.

The line, however, if constructed, would for a long time to come be a burden upon the existing systems; but as the people of the district, when applying for this railway in 1893, made the suggestion that the whole of the surrounding district should have a guarantee fund levied for the support of the line, to the extent of 1d. per acre within a distance of 5 miles on each side, ½d. per acre within a further distance of 10 miles, and ¼d. per acre within a radius of 15 miles, we would strongly recommend the construction of the line on these conditions; but the land for a distance of 5 miles from The Rock station on the main Junee-Albury line should be excluded, as the residents within that area are already served by the main line. The time has arrived when some special action of this character should be taken in regard to the continuous applications for railway extension.

At the present time, as stated in our Annual Report, unprofitable lines are worked, involving a loss of £370,000 per annum, and this sum has to be provided by the users of the other sections of the railways. This necessitates the charging of higher rates than would otherwise be the case. The productive territory of New South Wales is so far from the seaboard that the development and prosperity of the country to a large extent depends upon exceptionally low rates being charged for produce, and this great burden of unprofitable lines is a serious handicap upon our efforts to reduce rates.

The adoption of such a departure as the foregoing would have the effect of checking applications for lines in districts where there is little prospect of their being of a payable character; whilst, on the other hand, it would be a strong incentive to those living within the area guaranteeing the line to put all possible traffic thereon: whereas now, in many cases, for a slight personal advantage, some of the lines are left to carry 80 or 90 per cent. of the traffic which returns but little net profit, while the small amount of traffic which gives a reasonable return is taken by road.

In connection with this line, it may be mentioned that the owners of Brookong Station last year, and again this year, diverted the whole of their traffic to Melbourne, whereas had this branch been in existence, and the guaranteeing arrangement been in force, no doubt the whole wool clip would have been put upon the line to be forwarded to Sydney, the guarantee to cease so soon as the line pays working expenses, and 3 per cent. upon the capital outlay.

The residents of the district, during an interview with us, were informed that a local scale of rates would be charged for the traffic on this line, as, if this were not done, there would be no prospect of a reasonable revenue being derived.

The Common Seal of the Railway Commissioners
of New South Wales was hereunto affixed
this 7th day of July, 1896, in the presence of,—
H. MCLACHLAN, Secretary.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The following is a description of the railway :—

The Rock to Green's Gonyah (now Lockhart) Railway.

(Length, 25 miles 13 chains; estimated cost, £65,939, or £2,620 10s. 6d. per mile, exclusive of land and compensation.)

This line commences as a branch of the Great Southern Railway at the Albury end of The Rock station, at 327 miles 7 chains 11 links, and occupies partly a reserved 3-chain road, bearing westerly with a trend to the south as far as 345 miles, where the watershed between the Murray and Murrumbidgee Rivers is crossed.

Here the reserved road is left, and a north-westerly direction is taken to Green's Gonyah, where the line ends at 352 miles 20 chains on the travelling stock reserve, No. 991, which stretches between Wagga and Urana.

The country passed through is undulating, except for a few miles at each end, which are flat.

Very little private land is intersected.

2. Have you any plans to put in in connection with the proposed line? I have a compilation of the parish maps and a general outline of the route to a scale of 2 inches to the mile, a tracing of the line as proposed to a scale of 10 chains to the inch, and a section of the line to a horizontal scale of 10 chains to an inch, and vertical scale of 100 feet, and the Books of Reference.

3. *Mr. Hoskins.*] The Department required the residents to give some guarantee, did it not? Yes. I beg to hand in a printed report by Mr. Stanley Alexander on the proposed railways in the Riverina referred to in the statement.

4. Do you know whether the people are willing to give the land for the purposes of the railway free? Scarcely any private land will be required. The line goes through reserves nearly the whole distance. It is a 3-chain road most of the way. At the Green's Gonyah end it passes through some land belonging to the Brookong run, which is to be exchanged for some other land belonging to the Government.

5. *Mr. Lee.*] Will you describe to the Committee the nature of the line you propose to build? The line is of the usual character, but the earthworks in some places are heavier than those on other light lines which have been lately considered, and the cost comes out considerably higher. It is about £2,600 a mile.

6. Has there been some alteration in the survey or some other cause which led you to reduce the amount? That small reduction which is mentioned in Mr. Hickson's report is chiefly due to the adjustment of prices.

7. It does not refer to any alteration in the principle of the line? No.

8. Is it put before the Committee as a light line? Yes.

9. To be ballasted throughout? No; only to be partially ballasted.

10. What difficulty, if any, are you likely to meet with from watercourses? No difficulties. There is only one creek of any importance.

11. It is fairly flat country there, is it not? It is undulating country. It is very flat when you get within a few miles of Green's Gonyah. Then the country is flat right away west to Urana, Jerilderie, and Berrigan.

12. The nearer you get to Brookong you get more into level country? Yes.
13. And with rather a heavy rainfall what provision have you made on that portion of the line for carrying off surface water? I have included in the estimate an item of about £3,500 to cover the cost of culverts.
14. How would that be divided? There must be either one large water-course or a number of small ones? The country will be dealt with according to its requirements.
15. Have you made any special provision in that respect? I have made what I consider a necessary provision.
16. Do you anticipate any difficulty with the surface water there? No.
17. Are the conditions of that district such that it is not subject to heavy flushes of surface water? No, I do not think there will be any difficulty at all. There is only one creek of importance. Several openings will have to be made there to take the floods, but there is not a large water-course.
18. What was the cost per mile of the line from Narrandera to Jerilderie? I do not remember. That line has been made some years; and when it was made, the same attention was not paid to economy that there is now. It also includes a long bridge over the Murrumbidgee.
19. I presume the cost of material was much higher then? Yes; labour and everything. The line that is nearest to this in cost that the Public Works Committee have considered is the line from Tamworth to Manilla; but on the Green's Gunyah line the earthworks are heavier, but, of course, there is no large bridge as there is over the Peel River.
20. Taking works of that character what would be the general average cost of the remainder of the line, exclusive of such special items? If the earthworks and the drainage were reduced, that is to say, if the earthwork and the drainage were of the ordinary character of those of light lines, we should cut out about £500 per mile. That would bring it down to about £2,100 a mile, and that would be very close to what has been recently given as the estimated cost of lines.
21. Does the drainage differ from the ordinary works? It does, in this way: the earthworks are heavier. There are cuttings on this line that will probably have a depth of 15 or 16 ft. Instead of being a surface line it will be over a certain portion a cutting and bank line. If you look at the parish map on which the line is marked, you will see that about two-thirds along the length of the line from The Rock there is a series of curves; those curves are rendered necessary by the character of the country. There are several heavy cuttings about that part.
22. I presume that is intended to obtain a sufficiently easy grade? Yes; a sufficiently easy grade, with the minimum of earthwork.
23. What grade have you decided upon? One in 80.
24. Will that be sufficient to meet the requirements of such a line, which will be considered a grain line? Yes; when we come to the construction I may be able to flatten the grades a little. I am satisfied that a ruling grade of 1 in 80 can be obtained at that cost.
25. We should like to have it from you definitely that these curves and detours from the straight line have been adopted for the purpose of obtaining a good grade? Yes; the reason why the line follows this course down south-west, instead of going straight across to Green's Gunyah, is that it follows along a 3-chain road until it gets to about the 344½ miles, that is 17 miles from The Rock. For the length of 17 miles from The Rock it follows almost entirely that 3-chain road, and from that point it follows a general north-westerly direction to Green's Gunyah.
26. Then the portion along the road appears to follow a fairly straight line? Yes.
27. But after you leave the road, the line appears to make several rather large curves. Yes.
28. And your answer is that they have been adopted for the purposes of obtaining a sufficiently easy grade? Yes. The 3-chain road that is made there was laid down, I believe, after the first survey from The Rock to Murray Hut. It followed the course of the line for a certain distance, and towards the end of the 3-chain road, that is about 344½ miles from Sydney, the road itself is curved. That is because it follows the original trial line. The trial line had these curves on it in order to follow the contour of the country.
29. May I ask whether that 3-chain road is there in consequence of the policy of making reservations some years ago which was adopted in nearly every trial survey? No.
30. Is this 3-chain road land that was reserved some years ago for a possible railway extension? No, it is not of the same character. The reserves that used to be made for railway purposes were 2 miles in width, a mile on each side of the trial survey line. This road was made because I believe the necessity for opening up communication was recognised, and it was thought desirable to carry it along where eventually a line would probably be taken.
31. In consequence of the existence of that 3-chain road of which you have been able to avail yourself, the resumption of land for that distance, I presume, will be entirely avoided? Not altogether. Last week I went over the line, taking with me the parish map and a tracing of the plan, to a 10-chain scale and a section of the line as laid out. The result of my inspection of the line was to select a slightly different route in some cases in order to make the earth-works easier and to get the desired grade. This line, shown on the parish map in red, is the line submitted for investigation by the Committee; but the line which I decided in my own mind was the proper one to adopt, would differ from this line to the extent that for the greater part of the way instead of being on the left hand side of the road it would be on the right hand side of the road, and at two places it would enter on private property instead of remaining on the road. One of these places is at the bend, 329½ miles. That is the point where the spur of what is called The Rock runs out. I find that by keeping a little off the road and going on to private land a better line could be obtained.
32. Will that necessitate any alteration in the Book of Reference? No; the Book of Reference is complete. The other alterations I mentioned are to make the line diverge at 334 miles to the left, crossing the creek, and turning round to the left again, and coming on to the road at about 336 miles. When the Committee go over the line they will see that there is rather a stiff rise from the creek up for about half or three-quarters of a mile, and in order to obtain good gradients it is better to curve the line round in that direction. These are the two places where the line will touch private property. With regard to the line where it leaves the 3-chain road at about 344 miles, and apparently goes through private allotments, those allotments belonged to the freehold of the Brookong estate. They have been handed over to the Government in exchange for other land.

- H. Deane.
16 Sept., 1897.
33. Would you be good enough to give the numbers of the portions? The numbers are 40, 41, and 81.
 34. These sections were transferred to the Crown, and are now Crown land? Yes.
 35. Are the portions traversed by the deviation at 355 small or large holdings? Small holdings.
 36. But are they selections or pastoral holdings? The three portions belong to Edward Ashcroft and T. H. Cawood. It is land that has been selected, I think.
 37. Beyond taking the line through the land you take no improvements of very much value? No. I think that a portion of the land is under cultivation, but we need not take much of it.
 38. Your evidence is that there are no engineering difficulties to be contended with on this line? No.
 39. And there is every reason to suppose that for the amount of money indicated a substantial line can be made? Yes.
 40. Are you of opinion that a line of that character would meet the requirements of the district? Yes.
 41. You do not think it is necessary to construct a line at a higher rate? No.
 42. This line will afford all the convenience that is required by that district? Yes.
 43. You are satisfied in your own mind about that? Yes.
 44. Do you think there is any point of take off on the main line more suitable than The Rock? No. The Rock is the most suitable.
 45. In so short a distance the provision for stations is a very small item? The amount in my estimate for station work, including sidings and buildings, is £6,877.
 46. Have you a detailed estimate by you? Yes. It is as follows:—

THE ROCK TO GREEN'S GUNYAH (NOW LOCKHART).

REVISED estimated cost of a single line of railway, 25 miles 31 chains in length, with 60-lb. rails. Ruling grade, 1 in 80. Sharpest curve, 20 chains radius.

Description.	Estimated Cost.		Average per mile
	£	s. d.	
Earthwork	11,928	10 0	474
Culverts, timber bridges, and small timber openings	3,512	1 6	140
Level crossings, cattle stops, and fencing	982	10 0	39
Permanent-way materials	15,697	7 3	624
Freight	3,735	4 6	148
Laying at 1s., £2,169 4s.	13,175	2 0	524
Ballasting one-quarter at 4s., £2,169 4s.			
Sleepers at 3s., £9,110 14s.	2,832	0 0	112
Station works, including junctions and sidings			
Station buildings—Waiting-sheds, £400; platform, £200; goods-shed, £200; station-master's house, £200; 5-ton crane, £200; 20-ton weighbridge, £275; stock-yards, £370; engine-shed, £500; turn-tables, £1,100; coal stage, £150; carriage-shed, £200; grain-shed, £250.	4,045	0 0	161
Water supply	1,500	0 0	60
Mileage and gradient posts	377	8 9	15
Telegraph	377	8 9	15
Miscellaneous	450	0 0	18
Cost of works	58,612	12 9
Engineering and contingencies, 12½ per cent. nearly	7,326	7 3	291
Total cost	£65,939	0 0
Average cost per mile	£2,620	10 6

47. Under these rates of construction you are of opinion that the line will be sufficiently strong to carry a locomotive sufficiently heavy to draw the heavy trains which will be necessary, inasmuch as it will be a grain line? Yes.
 48. You think you have made ample provision for the cost? Yes.
 49. I suppose you do not care to express any opinion as to the policy of this expenditure? No; but I was very much struck with the fine character of the country.
 50. Could you tell us, with regard to that local levy, whether the people are still willing to carry out that levy? I am pretty sure that they are. When I was there, the residents were very anxious to get the line, and quite willing to fall in with such an arrangement.
 51. Are there any other points in connection with the line that you would like to lay before the Committee? I mentioned just now that some of these freehold lands had been handed back to the Government in exchange for other lands, so that the cutting up of this land and its sale by the Government will result in considerably more settlement than there is at present. Recently, the village of Green's Gunyah, now called Lockhart, was surveyed, and portions were put up for sale; and I am told that the prices fetched were considerably higher than the upset price, and that all the allotments put up were sold.
 52. *Chairman.*] Are there any buildings on them? There is an hotel, and a number of small buildings are going up. The district gave one the impression of being one of considerable energy.
 53. *Mr. Lee.*] Is agriculture there capable of extension? Yes, very largely. I should have mentioned that a large area of what was originally the Brookong run, about 9,000 acres, has been cut up and sold.
 54. How long ago? Quite recently.
 55. Was that done in anticipation of the extension of the railway or on account of the demand for land in that district? I think the Committee should get the information from the Lands Department.
 56. How many acres of alienated land would the line take? About 25 acres.
 57. The rest of the line goes either along the road or through land at present in the hands of the Crown? Yes.
 58. In that case, the small area of land that is required to be taken would not necessitate a demand on the part of the Government that the land should be given? No.
 59. We might fairly accept that as an explanation of the absence of any recommendation of that sort? Yes. I should like to suggest to the Committee that they obtain particulars as to the amount of Crown land which is available for selection. I should also like to add that I ascertained that on the Brookong estate

- estate there were 4,500 acres of land under cultivation on the share principle, not very far from Green's Gunyah, and I was informed that the total area under crop in the vicinity of Green's Gunyah was about 20,000 acres. To the north of Lockhart there are the districts of Galore, Osborne, and Goree Creek. With regard to the possible extension of the line in the future, I should like to point out that if the line were carried straight from the 3-chain road in a straight line across country it would cross the Brookong and Mahonga runs, and arrive eventually at the district of Clear Hills.
60. That is no great distance from Berrigan? Thirty miles.
61. Would not that be too close? I am not expressing any opinion as to the advisability of it. I was only mentioning that that is the direction which the line might follow. I should like to say that it is not necessary that the line should follow that straight course, which is the production of the 3-chain road, but if it went round by Green's Gunyah, then, by turning slightly to the left after passing Green's Gunyah, it could come on to the same route again.
62. I suppose the distance from The Rock to Coonong would be about 50 miles? No, 60 miles.
63. Your proposal is to go about 23 miles? About 25 miles.
64. From Green's Gunyah to Coonong would be about 15 miles. No, 36 miles.
65. It would not be over 30 miles? Thirty-four miles in a straight line.
66. The railway station at Coonong would influence the traffic 15 or 16 miles from that point? They look upon it that the road between Coonong siding and Urana is practically impassable. It would look as if the line ought to be kept well south so as to run parallel with the Jerilderie branch, and not interfere with it.
67. In consequence of the views I mentioned, it would be difficult for you to say how it would be possible for any extension of this line to be entertained? I would say this: that if there is any reason for extending the line from Green's Gunyah in a south-westerly direction it is this—that at present the whole of the produce of that district goes into Victoria. From Urana and Clear Hills, from Brookong and Mahonga, the wool and pretty well the whole of the produce from this district is taken into Victoria, and if a line were made there it would have the effect of intercepting it.
68. Regarding the traffic from that district which is said to go to Victoria, do you happen to know whether the conditions have changed in any respect since the completion of the line to Berrigan? No; because they would not go down to Berrigan and then go back again. Berrigan does not suit them.
69. You say that the country lying between Berrigan and the Murray necessarily yielded traffic to the Victorian railways before there was an extension from Jerilderie; but since that has been completed to Berrigan, does it not capture a certain amount of trade that used to go to Victoria? I think Mr. Harper could give you better information as to that.
70. *Mr. Trickett.*] I think you said that on your visit you determined that the line, instead of going along the 3-chain road in certain places, should go into the adjoining land? Yes.
71. Was that Crown land? No; private land.
72. Would that cause any claims for sovereignty? Not to a serious extent.
73. Did you inquire into that? Well, I saw the conditions.
74. You took that into consideration? Yes. It is the only way that I saw of getting the grade that is wanted—namely, a grade of 1 in 80—without incurring heavy expense in earthworks, and almost destroying the road.
75. Would it lengthen the line to any considerable extent? It lengthens the line by about half a mile.
76. Would you get all your material for the line on the route? Yes; we can get sleepers, and we should get ballast at The Rock.
77. Would you have to employ separate rolling-stock for that line, or would the ordinary engines be used on it? They are 60 lb. rails, and no doubt certain engines would be told off for the work.
78. Would it be a lighter class of engine than those used on the main line? Yes, lighter than the heavy engines which draw the main-line trains.
79. Would it be worked in the same way as the other light lines which have been recently carried out? Yes, exactly.
80. I suppose this line of railway may be considered on a par with the Nevertire to Warren railway? It is a heavier line than that.
81. Is it a very soft kind of country? No; it is undulating country. Some of it is very flat, and some rather hilly.
82. You said, in reply to Mr. Lee, that the local residents were prepared to submit to a kind of guarantee rate? Yes, but I did not go into any calculation.
83. Is it a line that would be likely to cost much for maintenance? No.
84. There are well-defined waterways to carry away the water to prevent anything like what occurred on the Narrabri to Moree railway? Yes, there are defined waterways. There is one point which struck me very forcibly when going over that line from Coolamon to Ariah, and that was the advisability of making an arrangement, if possible, such as was suggested by the Railway Commissioners when the Lismore to Tweed line was before the Committee—viz., that where a railway increased the value of the land, the increased value of the land should to some extent go towards paying the capital for the line. I think there is very little doubt that there are many districts in the Colony where the land which is worth (say) from 15s. to 20s. an acre is doubled in value as soon as a railway is made; and it would be only fair that the cost of the railway should be partly defrayed out of that increased value.
85. *Chairman.*] What you mean is virtually a railway betterment tax? Yes.
86. *Mr. Trickett.*] Will the owners of the land through which the railway is to run give the land required for the line? I did not make any inquiries on that point. The quantity required would be very small.
87. Do you propose to fence the line where it goes through private property? That might or might not be necessary. I have enough in the estimate, I think, to fence it if necessary; but I do not think it will be.
88. Is it a sheep grazing country? It is partly grazing, and one portion that we should go through is under cultivation.
89. And it would not be necessary to fence that? No; nor the other, because the lines that have been recently approved go through grazing country and they are not fenced.
90. Have you constructed any lines that run through unfenced grazing properties, and if so has there been any outcry on the part of proprietors of runs and any inconvenience or loss of sheep? I do not think there has been any serious outcry, though I think that occasionally stock are run over.

- H. Deane.
16 Sept., 1897.
91. But not to such an extent as to make that a ground for fencing? No; the traffic is worked entirely in the day time. It would be a matter for serious consideration if the trains had to be run at night.
92. Would a train be run every day on this line? I should not think so. They have a mail twice a week I think now at Green's Gunyah from The Rock.
93. I suppose that is only a small settlement? It is a village which has only recently been laid out.
94. Is there plenty of water at Green's Gunyah? Yes.
95. *Mr. Clarke.*] Seeing that this is a short line, is it intended to carry it further? There is no intention at present to carry the line any further. I explained a little while ago how it could be extended. I think the direction it would take if it were extended would be towards Clear Hills.
96. I think you indicated in what direction it should be carried down towards Berrigan? Yes; it was Clear Hills. That broken line on the map shows the position of the survey.
97. In answer to Mr. Trickett you could not give any idea whether the land would be given for the purposes of the railway by the owners? There is not much of it.
98. The line goes through good country? Yes; very fine country.
99. Fit for the growth of wheat and other cereals? Yes.
100. *Mr. Wright.*] Will you explain why that double bend is shown in the line; it bends first to the north and then to the south? The first bend is to avoid The Rock; then the line follows the 3-chain road.
101. Does it, by coming to the south, avoid the Bullongong Plains? Yes; they lie to the north-east of Green's Gunyah.
102. If a prolongation of that line takes place, can you tell the Committee why the nice little town of Urana is left out? It is pretty close to the Jerilderie line.
103. Is there any particular reason why Urana should be left out if the line is prolonged? It is too near the other line, and it would appear to be desirable to tap the country further south.
104. I suppose the town must be sacrificed for uninhabited country? No; there is a good deal of settlement at Clear Hills.
105. According to Mr. Alexander's report, the whole of the population of that district is 997 people, all the way from The Rock to Urana, leaving out Urana? That would have to be supplemented very considerably.
106. Do you think it would be quadrupled? I do not know.
107. If that is a proper estimate of the population six years ago, do you think it is likely to be more than quadrupled at the present time? I could not say, but I can say that there are numbers of Victorian farmers on the look-out for land; every bit of land that is thrown open for selection is snapped up. There are a great many more applicants for land than will be supplied for years to come.
108. The holdings are nearly a 1,000 acres each; therefore, would not a small population occupy a large area of country? Yes; but it means a great deal of cultivation. The selectors cultivate from a third to a half or two-thirds of their whole area.
109. Eventually they will? In many cases they do now.
110. I suppose that if their average holdings are a 1,000 acres they will not cultivate more than one-tenth? Yes, they will. When I was on the Coolamon to Arriah line there were men cultivating over a 1,000 acres each.
111. This line passes through the Tootool property? Yes.
112. What sort of country is it between the Rock and Bullongong? After you get about 7 miles out it is very good land all the way.
113. You are not in a position to give the Committee any information as to why Urana is left out, further than that it would be going too near the Jerilderie line? There is no actual proposal to extend the line at all, but an extension in the direction of Clear Hills has been talked of. Urana is only about 18 miles from Coonong siding. If they had a good road it would serve them, but as it is, they are badly cut off in wet weather.
114. A great deal of the country along this line is served by the Southern line is it not? Yes, but it will pick up traffic all along. Green's Gunyah will be the centre.
115. How far is it from Green's Gunyah to Urana? It is nearly 30 miles. It is about 10 miles to Brookong, and Urana is about 18 from there.
116. You think this route is the best to serve that part of the country? I do.
117. What about an extension from Wagga Wagga straight through? I think from The Rock is the better extension. An extension from Wagga Wagga would mean a longer line, and more construction to get clear of the influence of the main line.
118. *Mr. Hassall.*] The distance from The Rock to Green's Gunyah is only 26 miles? About 25 miles.
119. Is there a decent road between the two places? There is not a made road, but you can travel very well on it in fine weather.
120. I presume that something has been done to make the road fairly passable? No; nothing has been done.
121. Where do they take their produce to from Green's Gunyah? They make to The Rock.
122. They travel on the road in its natural state? Yes. The road to Wagga Wagga is also used.
123. What is the road like between Urana and Coonong? Very bad.
124. Is it much worse than the road from Green's Gunyah to The Rock? Yes. The road from Green's Gunyah to The Rock goes through fairly drained country. It is a very fair natural road, generally dry; but from Urana to Coonong siding they tell me is very bad. I went in the coach, and passed the Coonong homestead,—the coach driver has keys to the gates,—and there is a comparatively good road.
125. If you keep off the heavy traffic, but where the heavy traffic is it cuts up does it not? The road is closed in by fences, and gets cut up in a terrible manner.
126. Is the country between The Rock and Green's Gunyah fairly settled? Yes.
127. What description of settlement is there? There is a great deal of cultivation and wool growing. The settlers are principally farmers.
128. Do they send their produce to The Rock for shipment? Yes.
129. Has there been any great agitation on the part of the people of Green's Gunyah for the line? Yes; they are very anxious for it.
130. Do you think it will be a line that will pay? My opinion is that eventually it will pay very well. Of course it does not come within my province to inquire fully into that subject. 131.

H. Deane.

16 Sept., 1897.

131. There are no engineering difficulties? No.
132. Do you cross any watercourse between the two places? Yes; there is a small creek, but it will not not cause much expense.
133. What do you estimate to be the cost of the line? The total is nearly £66,000. It makes, on the modified route that I think ought to be adopted, £2,620 10s. 6d. a mile.
134. Is any of that country to the west of Green's Gunyah suitable for agriculture? Yes, nearly the whole of it. It is a level country—but most of it red soil.
135. What is it mostly used for? Pastoral purposes.
136. Is there a probability of the land being devoted to agriculture if the railway is extended? Yes. I think it is certain, if the railway were extended, there would be a much larger development. Land would be thrown open on the share principle.
137. Do you think there will be a sufficient number of applicants for it to develop the country pretty well? Yes; there are more applicants for land than can be accommodated.
138. Is there every probability that if the line be constructed it will open up the country and naturally bring traffic to the line? Yes; it seems to me to have very good prospects indeed.
139. *Mr. Roberts.*] Will your estimate of £2,600 a mile cover all the expenses of every kind, including land resumptions? There is so very little land required that I have not included it; but I have no doubt that it would cover it.
140. What percentage have you allowed for incidental and unforeseen expenses? For engineering and contingencies I put down 12½ per cent.
141. Is the country between The Rock and Green's Gunyah more hilly than the country between Jerilderie and Berrigan or Berrigan and Finley? Yes. The country between Jerilderie and Berrigan and Berrigan and Finley is quite flat, but here there are decided undulations.
142. Would that account for the increased estimate of cost;—I think the lines from Jerilderie to Berrigan and Berrigan to Finley were constructed at a lower rate? Yes, £2,000 a mile.
143. How is it that this line would cost £600 a mile more than those lines? It is through a different class of country.
144. Do you remember what was the cost of the line from Culcairn to Corowa;—was it a light line of railway? It was not as light a line as the railways that we make now. At that time there had been a considerable reduction; but it had not been made so low as this. I think the Culcairn to Corowa line cost about £3,000 a mile—perhaps £3,500 a mile.
145. Is the character of the country between Culcairn and Corowa similar to that between The Rock and Green's Gunyah? It is very similar.
146. Could you say whether, on the Culcairn to Corowa line, the traffic is increasing? No; I think it is a dead loss.
147. To a greater extent than was anticipated? I could not say without referring to the Commissioners' report.
148. Are you able to say whether any increased settlement took place between Culcairn and Corowa after the line was constructed? I am not.
149. *Mr. Humphery.*] Mr. Alexander reported to the Under Secretary for Public Works, on the 30th March, 1891, upon various proposed lines through the Riverina district, and referring to a proposed railway from Green's Gunyah, 26 miles, which I take to be identical with the line now proposed by you, from The Rock to Green's Gunyah, he says this:—
- Respecting the third line on this list, viz., the branch from Hanging Rock,—as before mentioned, it does not command sufficient extent of country to give promise of large revenue. Westward of its terminus the whole land to Urana is open plains, which will yield nothing. Southwards there is but an extent limited to a few miles in depth and width, from which traffic can reach the new line by a shorter road than to the existing line; but northwards the whole extent of country to Boree Creek will be under its influence. It will carry the wool from the Brookong shed and possibly from the Urangeline also. The district is one that will surely repay by expanding under the impulse of railway communication, but such confined areas cannot, for the space of a generation in time, carry the population and be subdivided to the extent necessary to provide the large production and consumption needed for support of a railway.
- You have been over that line? Yes.
150. Have you been beyond Green's Gunyah? Yes; I went right through Brookong to Urana.
151. Are you prepared to express any opinion on this paragraph in Mr. Alexander's report, which appears to be inconsistent with what you have stated to the Committee? There is a very large extent of red-soil land all over the district. Of course, in the neighbourhood of the creeks, the country would be liable to floods, or there would be water standing about, and the land would not be suitable for cultivation; but there must be hundreds of square miles suitable for cultivation.
152. Between The Rock and Green's Gunyah? I spoke of land to the north-west and south of Green's Gunyah. I mentioned just now that on the Brookong run, which lies to the west and south-west, they have 4,500 acres of land under cultivation, and that is sufficient corroboration, I think.
153. Are you prepared from your experience to express any opinion upon Mr. Alexander's statement? I do not think I quite understand it.
154. It means simply that this is not a branch line that can be recommended in the expectation that it will lead to production of settlement of a character that will eventually support the railway; do you agree with Mr. Alexander? No, I do not. That report was written in 1891, and during the last six years an expansion, quite unanticipated by Mr. Alexander, has taken place.
155. Do you think it would be possible to lessen the estimate you have given of the cost? I do not think so. I would rather, if there is any saving, spend it in improving the grade. One in 80 is a very good grade, but 1 in 100 would be better.
156. Is it contemplated to construct a railway from Coonong to Urana? No; it has been proposed.
157. Why is there a dotted red line on the map now before the Committee? That shows a trial survey that was made.
158. Has that line been recommended? I had instructions to get a trial survey made from Coonong to Hopfield, and that is part of it. It was never finished.
159. Is it your opinion, from personal observation, that Green's Gunyah should be the terminus of the proposed line? For the present. I think that eventually it should be continued.
160. Are you prepared to say in what direction? I think it should go towards Clear Hills if it is extended.

- H. Deane.
16 Sept., 1897.
161. Have you examined the country between Clear Hills and Green's Gunyah? I have not been over it, but we have reports upon it.
162. Does it not strike you that it would be an unnecessary line to Berrigan, having in view the fact that Berrigan is already connected with Jerilderie? I think it would be.
163. Then it is your view that it should stop at Clear Hills? I think that would be quite far enough for it to go.
164. The rest of the country being served by the existing line? Yes; I think that if a line was eventually made to Clear Hills, it would tap traffic which is now lost to the Colony.
165. By going further south? Yes.

FRIDAY, 17 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gunyah.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

- H.
McLachlan.
17 Sept., 1897.
166. *Chairman.*] You are Secretary to the Railway Commissioners? Yes.
167. *Mr. Trickett.*] Mr. Deane, on behalf of the Under Secretary for Public Works, handed in a statement connected with the proposed line of railway, and with it the Commissioner's minute, dated the 7th July, 1896;—I suppose that the facts and figures therein stated are correct? Practically correct.
168. Do you wish to add anything to that statement? No.
169. This line of railway is a short line of 25 miles, involving at the outside apparently a loss of £1,100 a year? Yes.
170. Would you tell the Committee what are the chief reasons that actuated the Commissioners in suggesting this line? I do not know that they suggested it. They were asked to report upon it, and they simply gave a report. I do not think they recommended it.
171. The suggestion did not come from the Commissioners in the first instance? I do not think so. They were asked by the Minister for Public Works to report.
172. The report of the Commissioners does not very much extol the line? No.
173. Are you personally acquainted with it? I have not been over the country.
174. In the first paragraph of the report of the Commissioners, it states that nearly the whole of the country through which the line would run is exceedingly good agricultural land? Yes.
175. In May, 1891, Mr. Alexander reported on a proposed line in that part of the country. He says, on page 19 of his report:—
- The evidence and inquiry failed to elicit any reasonable object for extending either of these lines to Urana. In a direct line from the nearest settlement in parish Hebdon, Urana is distant 20 miles. The whole of this space of country is plains land, which will probably be unproductive of revenue for generations of time.
- Is not that rather inconsistent with the statement in the Commissioner's report? The country in the neighbourhood of Brookong and Green's Gunyah is, I believe, suitable for agriculture. Of course you are a considerable distance from Urana at Green's Gunyah, and about Green's Gunyah there is a certain amount of cultivation going on.
176. It is clearly admitted that this line would be a non-paying line for many years to come according to the Commissioners' minute? Yes.
177. Seeing that at present the country is losing £370,000 a year on these unprofitable lines, do the Commissioners think it is desirable to increase this loss by making such a line as this? The Commissioners do not recommend the line.
178. Do they regard it merely as a line to be constructed from The Rock to Green's Gunyah, or a line to be extended further south towards Urana? They have no idea of any future extension.
179. I see one of the reasons given in favour of the construction of this line is that the people in the district are willing to pay some kind of a rate. The Commissioners say in their report:—
- The line, however, if constructed, would for a long time to come be a burden upon the existing systems; but as the people of the district, when applying for this railway in 1893, made the suggestion that the whole of the surrounding district should have a guarantee fund levied for the support of the line, to the extent of 1d. per acre within a distance of 5 miles on each side, ½d. per acre within a further distance of 10 miles, and ¼d. per acre within a radius of 15 miles. . . .
- Have the Commissioners gone into that to see what is likely to be realised? That matter arose in this way: The Commissioners were waited upon by a number of selectors and other people interested in the Green's Gunyah district, and in talking over the matter the Commissioners pointed out that the line would involve a loss, and the local people made that suggestion. From figures which the Commissioners have prepared, if that proposal were adopted it would mean a tax of about £1,500 per annum. Of course, it is only a suggestion, and an indefinite one at that. I think it is only right to say that the people who made the suggestion were not the biggest land-owners in the district.
180. You say it means a sum of £1,500 a year? Yes.
181. How do you make that out? Simply by taking the number of acres within the boundaries laid down and working it out.
182. Is that calculation based upon the land that is alienated or on Crown lands as well? I think it was made upon the whole area.
183. You do not know how much of that land is alienated? The calculation is based upon the whole area.
184. *Mr. Trickett.*] Would you be able to let us know? I will mention it to Mr. Harper, and turn up the figures.
- 185.

H.
McLachlan.
17 Sept., 1897.

185. I suppose that that £1,500 a year is not included in your estimate of revenue? No.
186. So that if this little idea did come off you would be so much to the good? Yes.
187. You have put down the goods and passenger traffic at £2,375;—is that at the ordinary or special rates? At very special rates; at what you might call exceptional local rates.
188. Are they heavier than any present rates? Yes; they are heavier than any local rates.
189. Are they on all produce? Yes.
190. Could you tell us what you propose to get for the carriage of wheat? Five shillings a ton.
191. How much is that rate heavier than any other? The Committee should know that the estimate of traffic is a most favourable one for the line. Five shillings was fixed, on the basis of what the people said they thought they would be willing to pay. It is a higher rate than we have ever attempted to charge anywhere else—double the rate we are charging from Jerilderie to Berrigan, and it is very much higher indeed than the rate from Corowa to Culcairn.
192. You have fixed these high rates in consequence of the representation of the residents as stated in the concluding portion of the Commissioners' report? Yes; I think personally it is to be accepted with a certain amount of caution.
193. Was that promise made recently? It was about May, 1896.
194. There may have been a considerable change in the population between now and that time? I do not think there has been much change in the population.
195. You state that the produce from Brookong station was diverted to Melbourne last year and this year, whereas, had the branch been in existence, it would have been brought to Sydney;—do you know that as a fact? I do not.
196. It is only a matter of conjecture? That is all.
197. The question of the destination of these woolclips is very often governed by the particular company that has a lien on the station? Yes; and the relative cost of transit.
198. I suppose you do not know what the road carriage is between The Rock and Green's Gunyah? I do not. A certain amount of grain comes in by road.
199. The Engineer-in-Chief pointed out yesterday that to get better gradients he was going to divert the line through some private property;—have you been informed of that? No; we do not as a rule deal with routes.
200. You do not appear to have put down anything for land resumption? No; the estimate is always furnished by the engineer.
201. As far as present experience has gone, these short lines of railway have not been a success? The Jerilderie to Berrigan line has not been doing badly. The Narrabri to Moree line is doing well, and the Parkees to Condobolin line, as far as it is opened, has been doing well.
202. I suppose the Commissioners, even in countenancing a line of this kind, are actuated by the possibility of future settlement? Yes; there is no business to-day to warrant a railway.
203. The agitation for this line appears to have extended back as far as 1891? It has been going on for many years. The original proposal was to make a railway from The Rock across to Jerilderie, and from there to Hay, I think.
204. Looking at the map, one would think that it is a line that if constructed at all should have a future extension in the direction of Urana, so as to serve that strip of country midway between Jerilderie and Culcairn? That has not been considered at all.
205. Have the Commissioners considered the question whether it would be better to bring a line from Wagga Wagga to Green's Gunyah? They have not gone into that at all. They simply reported on the line before them.
206. Do the Commissioners think that this line, which is chiefly for the purpose of carrying cereals, will become profitable to the railway system? As a general rule, an agricultural line is a good line, not so much on account of the carriage of cereals as of other articles that must be carried, because an agricultural country is pretty thickly populated as compared with a pastoral country.
207. The back trade is good? Yes.
208. Is not 5 miles rather a short distance to make a limit with regard to this special guarantee which is to be exacted from the people;—do you not think they would most likely cart their stuff at least 10 miles? That is a matter of detail. If we have a guarantee, the Commissioners look upon 5 miles as a reasonable limit.
209. If this idea is carried out, it should begin at 5 miles? That is their idea.
210. There was a suggestion offered to the Committee yesterday that if the construction of the railway was the means of selling Government land at a higher price than they would have got if there was no line of railway that should be taken as a credit in regard to the construction of the line;—do you approve of that? That is an old idea of the Commissioners. When the Lismore to Tweed line was before you they went into the matter elaborately, and strongly recommended that something should be done. If you could reduce your capital you have certainly so much less interest to pay.
211. Do they still adhere to the proposal? Yes; it is one that has been acted upon in Victoria and practically in some other countries.
212. But they have not been able to get a credit from the Government in regard to their lines in that way? Not from the Government; but we have had one instance in which we had capital written down—that of the Sans Souci tramway. Those who advocated it made a substantial gift in money towards the construction of the line and gave the land free.
213. But it has never been carried out by the Government in a book-keeping way? Only by giving the land free.
214. I suppose the ordinary rolling-stock would be run on a line of this kind? Yes.
215. I understand from this report and your evidence that, although the Commissioners do not oppose this line, they only countenance it as a line which may pay in the future? Yes. They would not say that they strongly recommend the construction of the line.
216. *Mr. Lee.*] There are two lines running into that country—you might call them parallel lines—one from Junee Junction towards Albury, and from Narandera to Berrigan? Yes.
217. That leaves a space between the two within which is the subject of the present recommendation? Yes.
218. Are there any special features of development either in the opening up of large estates, or the bringing of land under cultivation, or anything else that would justify the extension of the railway into that

H.
McLachlan.
17 Sept., 1897.

that district? The construction or extension of the railway would naturally induce a certain amount of development. It is understood that part of the Brookong estate would be cut up, and other big runs put under cultivation under certain conditions. It is purely a question whether it would be profitable to do it.

219. This Committee has had a large amount of evidence before it at various times that an ordinary district would be served by a railway within 20 miles? Yes.

220. You say that the whole of the district could be served by taking the produce through one or other of the lines I have mentioned, and the difficulty is to understand what justification there is for the recommendation of this railway extension under such circumstances? Of course you understand that the Commissioners do not recommend the line. They simply report upon the lines put before them.

221. I suppose it can be accepted as correct that there is a very fine agricultural area inside these two lines? Yes; the Commissioners think that there is a good deal of country along the route of the proposed line that would be suitable for agriculture.

222. And would be largely settled upon? Yes.

223. It would appear that the cost of the line placed before us is in excess of the trade that can be placed upon it to make it pay? Yes.

224. Have the Commissioners considered whether a narrower gauge of railway, and a cheaper one, would meet the case? They have considered that more than once, and they are very strongly of opinion that the existing gauge should be adhered to. That was the reason for recommending pioneer lines of railway. A break of gauge they think would be disastrous, and the only places where they would recommend it would be in broken country, or where there was not likely to be a connection with other lines.

225. You say that under no circumstances would they recommend a break of gauge? Not in this country, and where you have to connect with the main system of railways.

226. If the Commissioners do not recommend this extension, I suppose the report has been placed in the hands of the Committee as simply the report of the Commissioners necessary under the Public Works Act? Yes.

227. If this line were constructed, is the traffic of the Brookong station amongst the traffic that you would expect to get? Yes.

228. And if you gained that produce, as well as prospective produce, the line still shows a loss of £1,100 a year? Yes.

229. Does not the question arise whether it is advisable to extend the railway in that direction to secure that produce, which it would cost so much to get? Yes; the Commissioners have included the Brookong traffic in their estimate; but even including that traffic, if we got it, there would still be a loss.

230. As there is only 50 miles between the two lines, and the area dealt with is so small, the traffic outside that cannot be very large? No; I think not.

231. *Mr. Fegan.*] The rates mentioned in reference to this line have not been applied to any other portion of the Colony? No; they are the highest local rates that we have.

232. What is the reason that you propose these rates? The Commissioners pointed out that on the ordinary scale of charges the line would make a heavy loss. The people expressed themselves willing to pay a high local scale of charges.

233. Would it not be right to apply this to other lines, such as the Mudgee line? In the one case you have the line already built; in the other you have to consider the building of it.

234. The people in that district have to pay, in an indirect way, for the support of these other railways that do not pay? As a matter of fact, the railways on the whole are practically paying their way. There are sections which do not pay.

235. But these people have to pay the cost of lines which they do not use? There is no tax on them, as the railways are practically paying.

236. These rates seem rather excessive? Yes; but they are the rates which they said they would pay.

237. What guarantee have you that the people would pay them? None at all, except their own statement.

238. So that if you were to construct this line and the people refused to use it there would be no chance for it to pay? They could refuse to use the railway if it paid them better to cart their goods; but I do not think it would, even at the rates proposed.

239. Is it not a fact that in some cases waggon traffic is coming into competition with the railway traffic? Not for grain, principally as regards general goods.

240. So that even on these 26 miles there would be a better opportunity of competing successfully if there were good roads? We have no competition with the railway for the grain traffic, nor should we have at 5s. That is about 2½d. a mile.

241. The rate which they have agreed to pay would be much cheaper than what they are paying at present? I think so.

242. Do you know what they are paying at present? I do not.

243. *Mr. Hassall.*] I see by the estimate of the cost of construction and the probable traffic that there will be a loss on this line of about £1,200 a year? Yes.

244. Have you reason to believe that that estimate is correct? As I have explained, it is the most favourable estimate that could be made.

245. It is not in the most favourable light as regards the line? Yes.

246. You do not think it will pan out like the Moree line? No.

247. You propose to levy a special local rate? Yes.

248. Have you ascertained whether they are willing to pay that? The local rates are based upon what they have stated they are willing to pay, although they are very much higher than any other local rates that we have for both cattle and grain.

249. In the event of the traffic exceeding expectations, would that rate be lowered? I should think it would be.

250. You do not think there is much prospect of it? I do not.

251. This extension will not secure any traffic that you do not obtain at present, would it? We have lost the Brookong wool for the last two or three years, it having gone to Melbourne; but there is a prospect that we might get that wool and other wool from the district. As a matter of fact, the Brookong wool is included in the estimate, but there is a doubt as to whether we should get it.

252. Would it be worth while to make a line to secure the Brookong wool? It would not.

253. Or the wool in the vicinity? I do not think so.

254. Are there any other large clips round there that might be secured? There are the Mahonga and Urangeline, but it is doubtful whether we should secure them.
255. Have you any estimate of the probable clips? Yes; we know what the clips are. Mabonga is not included in the estimate.
256. It is sent on to the Murray? It is sent to Wahgunyah.
257. Is there a prospect of additional country being opened up by this line? That is one of the possibilities that the Commissioners hold out. It is good agricultural land, and the line might develop an agricultural settlement.
258. You turn the country from pastoral occupation into agricultural settlement? Yes.
259. And you increase the traffic? They have allowed for a certain development of traffic in the estimate.
260. There is very little prospect of the estimate being exceeded? Very little for a long time to come.
261. *Mr. Roberts.*] If the Railway Commissioners were really favourable to this line would they not make a recommendation? Yes; I think they would have specially mentioned it if they thought it was a line particularly worth taking up.
262. Do they not at times make special recommendations? It is very seldom that they do that. They might indicate to the Government where they thought an extension might be made, but as a rule it is in consequence of a request from the Government that they report upon railway construction.
263. But in the present case they specially avoid making any recommendation except under certain conditions? Yes.
264. That is with regard to certain guarantees? Yes.
265. If those guarantees were forthcoming, would the Commissioners really recommend the line? If the Commissioners could see that the line would be no loss on the main system of railways I think they would be prepared to recommend it. Of course, it is largely a matter for the Government and Parliament, the question of charging special rates as far as the land areas are concerned; it is a matter of policy.
266. Is there any precedent for a guarantee of this kind? No; I do not recollect any precedent. A Betterment Bill was introduced into Parliament in 1887 or 1888, but it was not passed.
267. What amount of revenue would the Brookong wool afford? I think the Brookong clip is about 5,000 bales.
268. That is a traffic worth looking after? Yes, it is a big clip. Of course, we should not get it at the ordinary rates, because they are too favourably situated with regard to Melbourne.
269. Does all the wool south from Brookong, between Brookong and the Murray, go to Melbourne? Along that line, inland, I daresay most of it does.
270. What has been the result of the construction of the line from Culcairn to Corowa? A loss of £7,000 to £8,000 a year.
271. Is the loss greater than was anticipated at the time of its construction? No; I think the loss is somewhere about what was anticipated at the time the Commissioners made their report.
272. Can you say whether any increased settlement took place after the construction of that railway? Not of my own knowledge.
273. Is it contemplated to extend the line from Berrigan in the direction of Clear Hills, or do you contemplate coming down towards Clear Hills with this line? The Commissioners have no knowledge of any such intention. They would not take the initiative in a matter of that kind.
274. Are you in a position to afford the Committee the advantage of any opinion that the Commissioners might hold with regard to any future extension? No; the Commissioners have not expressed any opinion in regard to it.
275. *Mr. Humphery.*] How much nearer would Brookong and Urangeline be to Melbourne than to Sydney? I think Brookong would be about 130 miles nearer to Melbourne.
276. Besides its being 100 miles near to Melbourne, the Victorian Railway Commissioners make great concessions to New South Wales pastoralists sending wool to Victoria? Yes. In speaking of that district, I am referring to the distance from Brookong to Gunyah, and from Gunyah onwards. If you had a railway *via* The Rock and Albury it would be about 80 miles closer.
277. It would not shorten the distance by much to Melbourne? No; it would be further to Melbourne than by a direct road.
278. What concessions are made to New South Wales pastoralists sending wool into Victoria? The concession varies according to the district from which the wool is sent. From that district they have been carrying it at half what they charge their own people—giving a rebate of nearly 50 per cent. on the wool.
279. That is to say, you have to compete against Victoria with regard to distance, and also with regard to concessions? Yes.
280. So that, probably, any wool you might obtain by the extension of the railway from The Rock to Green's Gunyah would be carried by you without profit? I would not say without profit, but certainly at much less than the ordinary rates.
281. Let us look at it from a business point of view: first you have to concede 100 miles in carriage? Yes, of course; but you must recollect that a good deal of that 100 miles is by road. We have the advantage of more railway communication.
282. How far would Green's Gunyah be from Urangeline Creek? Fifteen or 16 miles, I should think.
283. What would be the difference in cost of carriage by road between Urangeline and Wahgunyah? I believe that wool was carried from Brookong to Wahgunyah for 20s. to 25s. There may be 5s. difference between Brookong and Urangeline.
284. *Mr. Hoskins.*] Mr. Halliday, the late owner of Brookong, used to send his wool to Sydney? Yes. We have had it, and quoted special rates to get it.
285. *Mr. Humphery.*] You are aware that Urangeline station and Mahonga are owned in Victoria? I believe they are financially controlled in Melbourne.
286. At the present time, is not all the wool shipped to Victoria? Yes.
287. Has not that been the case for many years? Three or four years ago we had the Brookong clip.
288. Have you had the Mahonga and the Urangeline? We had the Mahonga one year.
289. Was the wool carried at a profit? Yes; none of the wool is carried at a loss. It is difficult to say what is loss and what is profit, because we do not take out the ton mileage. The difference between not carrying and carrying the wool at a low rate is a profit to us.
290. What distance by rail did you carry the wool from Mahonga? From The Rock.

- H. McLachlan.
17 Sept., 1897.
291. What is your charge for a similar distance on the northern and western systems? The ordinary rate from The Rock is £2 19s. 3d.
292. What is it on the northern and western systems? It depends upon local circumstances.
293. But you have not similar competition on those systems? No.
294. What is your rate? I should not like to quote from memory—the ordinary rate from The Rock is £2 19s. 3d.
295. Is it probable that the extension of the railway from The Rock to Green's Gonyah would not influence the rate of carriage to Sydney? If we had to cut for the wool, I do not think we should get much higher than we had.
296. You would not get more for carrying wool from Green's Gonyah than you do for carrying it from The Rock? Very little.
297. You have mentioned the difference in the distance of 100 miles, and the concessions made by Victoria;—would you not have to carry for less from Green's Gonyah than you carry it now from The Rock if you wanted to get the wool from Mahonga and Urangelinc? Yes.
298. Therefore, the line would be profitless as far as the wool-clip is concerned? You could not credit the local rate to it for that wool.
299. Will that line be profitless taking that view? Of course, if the line brought clips that we never had before there would be a certain amount of profit for the main line, but you could not allocate local rates to the local lines. You would have to charge a lower through rate from the new terminus than the ordinary rate from the present terminus.
300. But it is quite certain that in order to obtain that traffic you have to carry at a much lower rate than you are charging the producers over a similar distance? Yes.
301. *Chairman.*] How far is it from The Rock to Sydney? 328 miles.
302. How far is it from The Rock to Melbourne? About 257 miles.
303. That is 71 miles shorter to Melbourne? Yes.
304. What is the cost of transhipment? We charge 1s. as a rule.
305. How far on the railway will a shilling carry wheat? There is an extended rate for long distances. It would carry it more than 100 miles.
306. Bearing in mind the difference in the distances, and there is a break of gauge, would the wheat go more cheaply from The Rock to Melbourne or to Sydney? As a mere matter of railway carriage I should say to the former; but there are other considerations. I should say that but for the transhipment it would be cheaper to send the shorter distance.
307. It would be cheaper to send to Melbourne? I think so.
308. Suppose there was no transhipment? Then it would depend upon which railways have the more economical system.
309. So that if natural conditions were permitted to operate the produce from The Rock would go to Melbourne? Yes, if the conditions are the same in both directions.
310. If there were no interference with natural conditions? Yes.
311. Therefore, the produce from The Rock would go to Victoria? I think so under like circumstances.
312. I mean if there was no attempt by either Government to bring the traffic to its own railway? Yes.
313. But since Victoria offered a general reduction of 46 per cent. over the area you have to meet that by concessions that will enable you to hold at least a portion of the trade? Yes.
314. *Mr. Hoskins.*] But the longer the distance the lower the rate per mile? Yes; but if you have a short and a long length from a common starting point the short length will get the traffic. I have an article by Professor Seligman, of America, on the Interstate Commerce Act, in which he deals with the subject of the carriage of goods over long distances under competitive conditions very cleverly. He says:—
- The main point is the development of the traffic. The goods must not be charged so high rates as to render their transportation impossible or unprofitable. We must keep in mind the distinction between the fixed and the variable expenses. If the freight can be secured at rates which will more than cover the variable expenses—the actual hauling and a proportionate part of the station expenses—it will pay the road to take this freight, because an addition, however small, is thereby made to the fixed expenses. These would have to be met at all events, whether that particular freight was taken or not. A small contribution to fixed expenses is better than none at all. The choice is between freight at a rate slightly above mere cost of operation, and no freight. Yet to apply this low rate to all commodities would, of course, render it impossible to meet the fixed expenses or earn profits. In other words, it is profitable for a railway to transport certain classes of freight at rates which, if extended to all business, would run the company.
- Secondly, local discriminations may arise from competition in the centres of traffic, whether the competition be due to railways or waterways.
- The number of competitive centres in the United States is immense, the quantity of local discriminations is hence correspondingly large. A lower rate to the competitive centre is the sole condition of the retention of the competitive traffic. Increase of charges means a destruction of business.
- From the standpoint of the railway, therefore, the principle of differential rates is beneficial. It is due in the last instance to the distinction between fixed and variable expenses. Any rate on the through business above mere operating expenses is *pro tanto* profitable. The surplus goes to defray the fixed expenses. Rather than not get the traffic at all, the railway will take it at reduced rates; and yet these reduced rates, if applied to all business, would be ruinously unprofitable.
315. Your basis is made out of a local rate of 5s.? Yes, for grain.
316. We will take it for granted that the road rate is 9s. for the 25 miles;—the least you could offer to the people about Green's Gonyah would be 4s. a ton? Yes.
317. That 4s. a ton is not likely to have very much effect in inducing traffic to come to Sydney? Of course we get the traffic to Sydney now. The rate suggested is one that practically they fix themselves as that which they could afford to pay.

John Harper, Goods Superintendent, Department of Railways, sworn, and examined:—

- J. Harper.
17 Sept., 1897
318. *Chairman.*] What are you? Goods Superintendent, Department of Railways.
319. *Mr. Clarke.*] Have you any statement to make? Yes; I have here a report which I made to the Railway Commissioners. It is as follows:—

PROPOSED RAILWAY FROM THE ROCK TO BROOKONG.

Goods Superintendent's Office, Sydney, 30 May, 1896.

As directed by the Commissioners, I have traversed the district purposed to be served by the proposed railway from The Rock to Brookong.

The estimated distance is 33 miles, and the cost £36,186—£2,616 per mile.

Reference

MINUTES OF EVIDENCE—RAILWAY FROM THE ROCK TO GREEN'S GUNYAH.

Reference to the map attached will show that the proposed extension runs parallel with the existing line between Junee Junction and Narrandera, and almost at right angles to the main line to Albury and the line from Narrandera to Jerilderie.

J. Harper.
17 Sept., 1897.

The approximate distance of the line between the Narrandera and Jerilderie line and the line from Junee to The Rock is about 60 miles.

Between The Rock and within a trafficable area to the terminus of the proposed extension there are at the present time sixty selectors, holding between them an area of 40,000 acres, and having under cultivation about 7,000 acres. These farmers use The Rock station for the purpose of delivering their produce.

In addition to these selectors, who are in the immediate route of the proposed line, there are about twelve selectors whose holdings are about 12 miles south-west of the proposed terminus at Urangeline Creek, and who at the present time carry their produce to Yerong Creek. The aggregate production of wheat of these selectors last year represented about 60,000 bushels.

Station Properties.

The station properties which would be immediately served by this line are Tootool, Brookong, and Emu Plains.

The Urangeline and Mahonga shearing-shed is about 8 miles from Brookong, and might possibly, assuming that competitive rates were quoted, use the line for trucking purposes.

Population.

The population is a scanty one, but I understand it is the intention of the Lands Department to throw open reserves in the district, and no doubt the fact of this would be the introduction of a class of small selectors who will engage in agriculture.

There is no doubt the country is well suited for wheat production and general agricultural purposes. The soil consists, to a very great extent, of rich red and chocolate soils. The greater portion of it, however, is already taken up by the selectors referred to, or has been secured by Brookong and Mahonga pastoral holdings.

As far as the existing traffic of the district is concerned the two principal woolclips at the present time are carried by road to Wahgunyah and shipped to Melbourne. Practically it is only agricultural produce, a limited quantity of live stock traffic, and a small percentage of wool which finds its way to our railways. The supplies for stations are obtained from Melbourne, whilst the selectors deal chiefly in a retail way with Wagga Wagga.

I found on investigation that Mr. Day had carefully examined and analysed the produce of the district, but his estimate is probably rather sanguine, assuming, as he did, that the extension would secure to the Department the Brookong and Urangeline clips of wool. As far as this item of traffic is concerned it is needless to say that even assuming the railway were built to Brookong to-morrow, the question of securing the carriage of the wool would depend upon competitive rates lower than those on the main line being quoted.

Grain, &c.

With average seasons there is no doubt the output of grain would largely increase, but I do not think that under existing circumstances we could estimate a higher production than 2,000 tons, whilst the average rate would not exceed 2s. 6d. per ton.

Revenue.

My view is that the line would not produce more than £1,075 revenue per annum, made up as follows:—

Goods, 400 tons, at 10s.	£ 200
Wool, 800 tons, at 10s.	400
Grain, 2,000 tons, at 2s. 6d.	250
Live stock, 200 trucks, at 10s.	100
Passengers	100
Parcels	25
Total	£1,075

With £12 per mile added for mails, the total estimated revenue would amount to £1,471.

From personal observation, whilst making inquiries on the proposed line, I am of opinion that should it be considered desirable to build any extension from The Rock towards Brookong it would be wise to terminate it at a point on the travelling stock route in the neighbourhood of Green's Gunyah, from whence, should it ever be deemed necessary, it might be extended upon Crown lands to whatever westerly point might be desired.

It appeared to me that the proposed extension to Brookong would be a mistake, as the area available for settlement even on the station itself becomes reduced as the line takes a westerly course, and the terminus would practically be upon an open plain, entirely unsuited for settlement, whilst for 8 miles of its route it would pass through the freehold portion of Brookong, creating severance and unnecessary expense.

I may further add that I do not see any present necessity for the construction of this line, for whilst it may be urged that it passes through rich agricultural country it can scarcely be considered that the distance of its areas from the existing railway line is prohibitory.

Urana, the present station for which is Coonong, is on the south-western line, a distance of 335 miles from Darling Harbour, whilst by the route from Brookong the distance would be 361 miles, and it is questionable if the construction of this line would not tend to divert the Urana traffic from its existing railway point at Coonong.

The Secretary.

JNO. HARPER.

After the visit of the Commissioners I added this to my report:—

On the assumption that the statement made to the Commissioners by the residents of the district on the occasion of their visit was accepted, to the effect "That they were prepared to pay double the rates taken in my estimate on all traffic, except wool, and that all items of traffic with the exception of that article would be doubled in tonnage," the estimate would be increased as follows:—

Goods, 800 tons, at 10s. per ton	£ 400
Wool, 800 tons, at 10s. per ton	400
Grain, 4,000 tons, at 5s. per ton	1,000
Live-stock, 400 trucks, £1 per truck	400
Passengers, 750 at 4s. (allowing one and a half journey per annum for residents of the district)	150
Parcels	25
Mails	300
Total	£2,675

320. Do you think that report is accurate? Yes.

321. And that the traffic is not likely to increase? I would not say that it would not be likely to increase. Developments have taken place which may lead to very great increases. If the Government, as I have heard, have exchanged land unsuitable for agriculture for lands which are suitable, it ought to lead to far closer settlement.

322. The total annual revenue on this line would leave a loss of £1,100 a year? Yes; according to the Commissioners' report.

323. Do you think, in the event of this line being constructed, that loss may be ultimately reduced? I think it would be a long time.

324.

- J. Harper.
17 Sept., 1897.
324. It appears that the people are agreeable to pay local rates? Yes; so they stated to the Commissioners.
325. In what way can you compel these people, supposing they refused to pay local rates? Their only alternative is to refuse to use the line.
326. If the line is made, and they refuse to contribute to the local rates, there would clearly be a loss? Undoubtedly;—if they choose to use the road instead of the line.
327. What is the road-carriage from The Rock to Green's Gonyah? It is about 9s. a ton for wheat, and about £1 a ton for wool.
328. What is the rate from Urana to Coonong? There is no wheat taken from Urana to Coonong, and very little wool.
329. From about 5 miles from The Rock, between there and Green's Gonyah, will not the farmers bring their produce to The Rock by road? Undoubtedly, rather than pay such a rate as they speak of.
330. From fully half way? Yes; rather than pay that rate.
331. I understand that the Brookong wool, and that of some other stations, at present goes to Melbourne? Yes.
332. In the event of this line being made to Green's Gonyah, would it be an inducement to them to send their wool to Sydney instead of to Melbourne? I think we should probably get the Brookong wool, but I am doubtful about the Urangeline and the Mahonga wool.
333. Is it not to the interest of the firm or syndicate who have control of the Brookong Station to send the wool to Melbourne? I do not know. Circumstances have altered considerably. I think it is the Union Mortgage and Agency Company who have control. If so, it would not matter to them whether the wool came to Sydney or to Melbourne. The Urangeline and Mahonga interests are in Melbourne. I am afraid the Urangeline wool would not come in this direction. Their wool-shed is some 9 miles south of Brookong.
334. You think that the other clips, independent of Brookong, would possibly still go to Melbourne? I think so.
335. Is the country from The Rock to Green's Gonyah, in the immediate neighbourhood of the line, good agricultural land? Splendid, and some of the best has not been placed under agriculture yet. It is good agricultural country until you get west of Green's Gonyah. There is a ridge which is rather broken, but all the rest is good country.
336. Mr. Alexander in his report said this:—
The district is one that will surely repay by expanding under the impulse of railway communication, but such confined areas cannot, for the space of a generation in time, carry the population and be subdivided to the extent necessary to provide the large production and consumption needed for the support of a railway.
- Is that correct? That might have been quite true at that time, but the Berrigan line had not been built, and the district referred to by Mr. Alexander embraced a district which is now being served by the Berrigan line.
337. Would it alter the character of the country? It would alter the character and purposes of the railway. When that report was made, the Berrigan line had not been submitted to the Public Works Committee. Mr. Alexander's report embraced the whole country from The Rock to Finley. A line has been constructed which taps the country to the south-east and west of Berrigan, cutting off what is most undoubtedly the best portion of the district. I have no hesitation in saying that the district about Berrigan is better than about Brookong, and the rainfall is more certain.
338. Would not that be rather against the carrying out of the proposed line if the best land about Berrigan and Finley is cut off? You have my view of the traffic; I do not think I can go further than that.
339. Are you aware that the Railway Commissioners are in favour of the present line? I am not aware that they are in favour of it except on certain conditions. I have, of course, read their report before. I notice that it is surrounded by conditions, and I take it that they would not be in favour of a line if those conditions did not prevail.
340. You cannot say whether those conditions are likely to be carried out—they are only promised? If the Commissioners have taken them as *bona fide* I can scarcely express a doubt about them.
341. Under all the circumstances, do you think that this would be a good line to construct? I do not think that it would be a good line to build from a paying point of view.
342. Mr. Roberts.] Can you give the Committee information as to the result of the construction of the line from Culcairn to Corowa? The loss in the year ending December, 1895, after providing for working expenses and interest, was £7,925; in 1894 it was £8,023.
343. Does the Culcairn to Corowa line, in your opinion, rob the line from Albury to Culcairn? No; all the traffic which came in on the Culcairn and Corowa line at Culcairn now joins at Burrumbuttock and other points on the line.
344. Chairman.] What is the traffic? Scarcely anything but wheat.
345. Mr. Roberts.] I suppose all the wool goes to Melbourne? Yes; last year we had one clip, but this year it is going to Melbourne.
346. Chairman.] Where does the wheat go to? To Sydney; with the exception of last year, when, owing to unusual circumstances, a large amount was shipped to South Australia; but that is unusual.
347. Does any quantity of the wheat you are speaking of go down to Melbourne? No; not from Corowa.
348. Does it not go there in bond? No; I understand they do not allow it now.
349. Mr. Roberts.] How long has that law been in operation? The arrangement under which wheat was allowed to go to Melbourne in bond was withdrawn two years ago. There was a difficulty about identification.
350. Chairman.] What advantage would there be to the country if this line were constructed? It would give a very much increased value to the area exchanged at Brookong and any other Crown lands that exist in the neighbourhood. It would also tend to very extensive settlement, and it would bring traffic on to the main line—that is to say, instead of carrying a sheep to the acre, the wool of which goes to Melbourne, it would probably carry one-third or one-half of a ton of wheat which would find its way over our main line.
351. Mr. Hoskins.] At the rate you charge for wheat it does not pay? If we get enough of it it is alright. It is the quantity that pays.

352. *Mr. Roberts.*] I believe that the Victorian rebate system extends to Brookong;—how much further does it go? It extends indefinitely north to the Queensland border, and the further you go the worse it gets. It is as high as 66 per cent.
353. How far north towards Sydney does this rebate system successfully operate? Into the neighbourhood of Wagga Wagga.
354. And what would be the rebate rate at Brookong? 46 per cent.
355. Do you ever carry the Brookong wool to Sydney? We had it about three years ago.
356. Not since? No.
357. Was it carried at satisfactory rates? Yes; we should be glad to carry it again at the same rates.
358. Would that be on account of the large quantity of wool? Yes. Of course, we make a distinction—we have to in those competitive districts—between large clips and small ones.
359. Have you endeavoured to get the Brookong wool since? Yes.
360. But failed, on account of the more favourable inducements offered by Victoria? Yes.
361. How does the country between The Rock and Green's Gunyah compare with the country round Berrigan? I should say that, generally speaking, the country around Berrigan, taking the whole of it, is a little better, and the rainfall is better. There is very little to choose between them as regards the quality of the soil. I think the rainfall in the two places is about 18 inches against 20 inches. The Berrigan country is closer to the Murray, and it is well known that on the Murray they get a better rainfall than further north.
362. Has the value of the land around Berrigan increased since the railway was made? I think so.
363. Was it not quoted about £4 an acre? Yes, about £4 or £5 an acre.
364. What would you value the land at around Green's Gunyah? I think at about £2 10s. an acre.
365. Would the produce of wheat per acre be as large at Green's Gunyah as it is around Berrigan? It would scarcely be so good as Berrigan. The country improves as you come south-west to Clear Hills, in the direction of Berrigan, and approaching the Murray.
366. It improves as you go in a south-westerly direction? Yes.
367. How far is Clear Hills from Berrigan? I think about 35 miles. I think that Clear Hills, Berrigan, and Jerilderie, represent the three sides of an equilateral triangle.
368. Would you regard Clear Hills as being the terminal point in the event of its being determined to take the railway in a south-westerly direction from The Rock? I could not see much advantage in going any further, assuming that it was decided to go there, because when you pass Clear Hills you begin to interfere with the trafficable area of Berrigan.
369. Is 24 miles regarded as the trafficable area from the railway station? Twelve miles they say; but, as a matter of fact, 20 miles may be taken as being nearer.
370. As a rule, a wheat producer would not regard 20 miles as too far? It would not be absolutely prohibitive. There would practically be only 12 miles between Clear Hills and Berrigan.
371. I suppose that all the country about there is very similar in character, taking any line from The Rock to Coonong, from Coonong to Berrigan, Berrigan to Corowa, and Corowa to Culcairn? No; it is a very different class of country. To the north it is all open plains, and the rest is forest.
372. Is it not a fact that the further you go east from Jerilderie in the direction of The Rock the land becomes more hilly? Yes, in the direction of Clear Hills.
373. I mean towards The Rock? Yes.
374. The more easterly you go the more undulating the country becomes? Yes.
375. And instead of finding the remarkably level country that you find between Jerilderie and Berrigan and Berrigan and Finley, you find it more expensive for railway construction? Not necessarily. There is a great deal of flat country.
376. In the estimate for the construction of the line you will find the line from Jerilderie to Berrigan cost only £2,000 a mile, but the cost of the line from The Rock to Green's Gunyah will be £2,600;—is not that a very large increase in the cost of a pioneer line? Most of it arises from the difficulty in getting away from The Rock. I think you will find that some of the line in the vicinity of The Rock will cost over £3,000 a mile, whilst a great deal of the other will cost only the same amount per mile as the line to Berrigan.

TUESDAY, 21 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq., M.P.

The Committee further considered the proposed Railway from The Rock to Green's Gunyah.

John Harper, Goods Superintendent, Department of Railways, sworn, and further examined:—

377. *Mr. Hoskins.*] Do you think there is a prospect if the railway is made from the Rock to Green's Gunyah that within a reasonable time the receipts for it will be equal to the working expenses and interest on the expenditure? No; I cannot conceive that it will unless the people are content to pay the rates which they undertook to pay—that is to say, the rates which were given by me the other day.
378. Do you think there is a probability, judging from the character of the country, that the population in the district which will be served by the railway will largely increase? I think so; in view of the fact of a considerable area of land being thrown open for occupation, I think the population would be materially increased.
379. If the proposed railway be constructed, do you think it will act as a feeder to the Victorian railways? I do not think so under existing circumstances. It is hard to foretell what may happen in the future.

No

J. Harper.
17 Sept., 1897.

J. Harper.
21 Sept., 1897.

J. Harper. No doubt if Federation takes place, and there is a disposition to trade with the nearest port, the advantage would be distinctly in favour of Port Phillip, but I would add this: I think that under these circumstances the people who would use this line would not be content to pay the rates they said they would pay.

21 Sept., 1897.

380. You mean the extraordinary rates which they suggested amounting to a tax on the land? I am not speaking of the tax on the land, but of the high railway rates—5s. a ton for wheat carried 25 miles.

381. Is not that lower than the charge by road? Yes.

382. I notice that in the Railway Commissioners' report they state that if the line is constructed there is a probability of its carrying the wool from Brookong station;—is it not a fact that when Mr. Halliday was alive the Brookong wool did come to Sydney? Yes.

383. How is it you lost it? I am inclined to think that Mr. Halliday was more far-seeing than his successors, and that he thought that by utilising the New South Wales railways he would derive some indirect advantage.

384. He told me he had a special rate, and he could get freights here for wool cheaper than in Melbourne? Yes.

385. Do the residents in that district get their stores from Melbourne? Most of the stations get their stores from Melbourne, but the selectors buy principally in a retail way at Wagga Wagga.

386. How far will it be from this railway to the nearest station on the Culcairn-Corowa line? That line would be about 60 miles away, I think.

387. I thought that perhaps this line might be used to send produce to Melbourne by the Culcairn-Corowa line? As long as the matter remains in our hands we can always prevent that by imposing unfavourable rates in that direction.

388. And having to carry the goods 50 or 60 miles from the proposed line to the Culcairn-Corowa line would be a block also? It would be for wheat decidedly.

389. *Mr. Trickett.*] When Mr. McLachlan was being examined he was asked a question with regard to levying a special guarantee fund rate, which is to be 1d. an acre for 5 miles, $\frac{3}{4}$ d. an acre for the next 5 miles, and $\frac{1}{4}$ d. an acre for the next 5 miles, making altogether 15 miles;—was that calculation based upon the whole of the land, including the Government land? I fancy it was based upon the whole of the land in the district.

390. *Mr. Hoskins.*] You have no agreement of that kind in any part of the Colony in connection with the railways? No.

391. *Mr. Trickett.*] It is very important that we should know about this because it involves a revenue of £1,500 a year to the railway. But if a large amount of this £1,500 a year is to come from Crown lands it is hardly worth talking about? Of course, I can only speak with regard to conversations I have had with the Commissioners on the subject, but I think the calculation was based on the whole area within 15 miles of the line, which it was considered would very soon be occupied.

392. *Mr. Hoskins.*] Would it not involve the passing of a special Act of Parliament? That was the view of the Commissioners, but they thought that if the Crown sold or leased the land it should be subject to that charge within that radius. The Commissioners did not initiate the proposal.

393. *Mr. Trickett.*] The Commissioners say that it means £1,500 a year, and they must have gone on some basis? Yes, they calculated on the land within a 15-mile radius.

394. When land was alienated it was considered that it should carry this obligation? Yes; it was a very rough estimate. The idea was simply to lay the principle before the Government.

395. Were you consulted with regard to this memorandum of the Commissioners, dated 7th July, 1896? No.

396. Then you are not able to explain the second paragraph more than you have done? Perhaps I may have had some conversation which led up to it.

397. The Commissioners say:

The line, however, if constructed, would for a long time to come be a burden upon the existing systems; but as the people of the district, when applying for this railway in 1893, made the suggestion that the whole of the surrounding district should have a guarantee fund levied for the support of the line, to the extent of 1d. per acre within a distance of 5 miles on each side, $\frac{3}{4}$ d. per acre within a further distance of 10 miles, and $\frac{1}{4}$ d. per acre within a radius of 15 miles, we would strongly recommend the construction of the line on these conditions; but the land for a distance of 5 miles from The Rock station on the main Juree-Albury line should be excluded, as the residents within that area are already served by the main line. The time has arrived when some special action of this character should be taken in regard to the continuous applications for railway extension.

Were you a party to the drawing up of that? No; but I was present at the discussion, prior to its being drawn up.

398. It involves a large question of policy? I think the object of the Commissioners was to draw attention to the matter, and to put it before the proper tribunals—this Committee and Parliament,—as to whether it should be adopted. The Commissioners have previously suggested matters of policy, as far as the alienation of Crown lands is concerned, and the application of the proceeds towards the building of railways or the payment of interest on the cost of construction.

399. But you can see that this involves a big question? Decidedly. This matter having been brought before the Commissioners when they visited the district, they thought it their duty to bring before the Minister the possibility that under these conditions the line might be built.

400. With regard to residents already there, you could make a bargain of that kind, but when you come to people going to take up Crown land in that district you place them on quite a different footing from applicants for Crown lands in other parts of the country? The Commissioners appreciate the difficulty. They do not indicate how it should be done. I think their object—in fact I am sure of it—was that they desired to bring before a deliberative body of this character this proposal.

401. They seem to have arrived at a definite sum, and neither of the officers whom we have had before us seem able to say how that sum is going to be realised? The whole of the land was taken as becoming liable to that charge—Crown lands and all other lands in the district.

402. *Mr. Hoskins.*] The Commissioners felt that there ought to be a general system of assessing the land for the cost of the railways, where railways are constructed? Decidedly, but the whole position is this: the Commissioners have before laid before the Committee the idea that when Crown lands are alienated in the vicinity of a railway, a certain proportion of what is obtained from those Crown lands should go towards the capital cost of that line. This is an alternative. It is practically the betterment system. I think their desire was to lay before this Committee the suggestion made to them.

J. Harper.
21 Sept., 1897.

403. *Mr. Trickett.*] So far the Railway Commissioners have not been able to mature a scheme of betterment? Not the railway authorities—the Government.

404. You want to make up the loss? This calculation had been made long before the Commissioners visited the district. The rate per acre had been fixed before that and laid before the Minister. The Commissioners simply dealt with the paper that was in the hands of the Minister or the constructing authority, the matter having remained dormant until it was revived by the people in that district. The subject was not initiated on the occasion of the visit. I hope it is quite clear to the Committee that the Commissioners did not initiate this proposal—it had been initiated two or three years before.

405. I suppose that those residents who made this proposal were few in number? They were more representative of the selector class than any other. They did not represent the large estates, I must confess. They were chiefly selectors on the Brookong estate.

406. *Chairman.*] When Mr. Alexander reported on that country in 1891, he did not appear to have a very favourable opinion of it, as you will see from page 19 of his report, where he says:

The whole of this space of country is plains land, which will, probably, be unproductive of revenue for generations of time.

I can explain that. In order to describe the difference between the plains country, or inferior country, suitable only for pastoral purposes and agricultural country that I believe will be suitable for cereals, you start midway between Narrandera and Coonong, then go in a south-easterly direction to Brookong, coming southerly to the track between the Billabong and Urangeline Creeks, then take a westerly trend approximately midway between Jerilderie and Berrigan. On the west of that line there is inferior land unsuitable for the growth of cereals. To the east it is suitable for the growth of cereals. As Mr. Alexander says, westward in the direction of Urana you get on open plains.

407. *Mr. Trickett.*] In the vicinity of the proposed line the land is suitable for agriculture? It is along the whole route of the line. There is no possibility of any agricultural development in a westerly direction from the terminus at Green's Gunyah. There would be no extensive area of suitable land to the west for two reasons: because it is unsuitable for the growth of cereals, and such traffic as there is is intercepted by the proximity of the Jerilderie to Narrandera line.

408. That being so, it emphasises the suggestion that this is a line that is likely to remain at Green's Gunyah instead of being extended? I do not know. I fancy there are people who look upon its extension towards Clear Hills as a probability. It is good country in the neighbourhood of Clear Hills and Daysdale.

409. Are not those people pretty well served by the existing lines on the east and west? The people at Clear Hills are about the same distance from Jerilderie as the Berrigan people were. It is about 25 miles from Clear Hills to Jerilderie, and they are about 35 miles from Brookong.

410. Mr. McLachlan told us that this line was submitted on its own basis without any idea of extending it? The Commissioners have nothing before them with regard to a future extension.

411. With regard to the statement made by Mr. Alexander in 1891, is it not a fact that in connection with the growth of cereals New South Wales has taken a considerable jump during the last few years? Yes.

412. I suppose the Commissioners have that in view in regard to establishing this short line of railway? What the Commissioners had in view, I fancy, is this: That in building a line of that character their experience of the class of selectors who go into the district is that they will farm very intensely, and there will be a constantly increasing traffic.

413. All that district, Jerilderie, Berrigan, Finley, The Rock, and Green's Gunyah, has largely developed of late years as a wheat-growing centre? Yes.

414. With regard to those special rates to be paid there;—do you attach much importance to them? They are the rates which were submitted to the Commissioners, and which the people undertook to pay.

415. What do you think of these spasmodic efforts with regard to the payment of high rates? People are always agitating and offering to pay until they get the line.

416. Then they want a reduction? Yes; they see that their neighbours are not paying so much. I do not mean to say that they might not be compelled to pay it, by no lower rates being made; but they probably would not pay the high rate willingly.

417. *Mr. Lee.*] I am not very clear as to whence this proposal to levy special rates emanates? It was a proposal made to the Minister by the residents, or by a large number of them.

418. Do you clearly remember whether it was intended to cover a levy on all freehold land and upon Crown lands as well? Those who made the proposal dealt with their own land.

419. Was it freehold land? Freehold and selections.

420. It did not include Crown lands? No; they could not speak about Crown lands.

421. Did they say for what period they would pay the levy? Yes; until the line paid.

422. Do you think that the owners of land lying 15 miles north of Green's Gunyah will consent to pay a levy for railway purposes when they are already within 25 miles of a railway terminus? That is a matter which I think the Commissioners left for this Committee to consider or for Parliament to deal with. As I have said, the object of the Commissioners was simply to lay this proposal, which is certainly a unique one, before the Government.

423. What is the rate for grain on the Culcairn to Corowa line? The ordinary through rate for grain is in addition to the mileage rates to Culcairn.

424. What is the length of the line from Culcairn to Corowa? Forty-seven miles 39 chains.

425. Suppose you wanted to send stuff from Culcairn to Corowa, what would be the rate? The difference on the whole through rate would mean 3d. a ton; 13s. 1d. is the rate through from Culcairn, and 13s. 4d. from Corowa to Sydney.

426. Is that line used for conveying grain to Corowa or to the main line? Most of it is used for conveying grain to the main line stations.

427. Can grain be sent through Victoria in bond? I understand that it cannot.

428. *Chairman.*] Then what is the use of differential rates? They have no differential rates for wheat.

429. *Mr. Lee.*] One of the difficulties which the Department has placed before the Committee is this: You propose to make a line 26 miles long, and the grain rate is to be 5s. a ton, and there will be a loss of £1,200 a year, and you have so much length of line within a few miles of the Jerilderie to Berrigan line where the rate is 2s. 6d. If you show a loss on this proposed extension after imposing double the rate that you have imposed on the other line, what probability is there of that line ever paying working expenses? In my report I said that it never would pay.

- J. Harper. 430. *Mr. Wright.*] In view of the fact that we are likely to have Federation very shortly, what is your opinion of the policy of constructing a railway in that part of the country? My opinion is that we should be more likely to realise a higher rate than we do to-day if we had Federation. If the line be used to convey wheat to the local market we should probably get more from a line of that character than we get under existing circumstances.
- 21 Sept., 1897. 431. Are we not practically building lines which, after Federation has taken place, will divert the traffic to another colony? A railway of that character would have the effect of sending the traffic to Port Phillip.
432. Away from Sydney? Yes.
433. So that these railways in the neighbourhood of the Victorian border, in the event of Federation, will give our people better facilities for trading with the adjacent colony than with Sydney? Yes; but I do not know that these railways may not pay better being utilised that way than they do at present.
434. Whilst you think it would divert the trade from Sydney, looking at it from a purely railway point of view, it might increase the railway revenue? Yes.
435. I understood you to say that you saw no immediate prospect of this railway paying? No.
436. Do you think there is any great necessity for the line? I do not.
437. Do you think that Urana should be connected with the main line? I do not.
438. You do not think there is sufficient trade to justify it? No.
439. You will observe from the plan that the terminus of the railway at Green's Gonyah leaves Urana many miles away? There is absolutely nothing in the neighbourhood of Urana. The object of the line is to avoid the plains country, and to get into agricultural country.
440. *Mr. Hassall.*] Do you think there is any better point from which to take that railway across? I do not know of any. It is a great pity that the Committee had not the opportunity of investigating the thing before the Jerilderie line was made.
441. Then the proper route for that railway would have been from The Rock to Green's Gonyah, and from there to Berrigan? Yes.
442. Then the question arises, do you not think the extension already in existence from Narrandera *via* Coonong to Jerilderie and Berrigan will practically serve the intervening country between there and the southern line? I do not think it would develop it properly; but I cannot conceive of a paying railway that could be made there now.
443. What is the furthest point that any of these places would be from the railway? Clear Hills is about 28 miles from Jerilderie; Daysdale about 33; Clear Hills is about 22 miles from Berrigan; and Saveruake about 12 miles. The whole of the cultivation in the neighbourhood of Green's Gonyah is well within 20 miles of a railway.
444. The cost of land carriage is not an insuperable difficulty in taking produce to market? It is a heavy item; but I suppose there are compensating advantages.
445. Do you think the construction of the railway will bring any more traffic to the railway than you have at present? I think there will be more settlement and more production, and consequently more traffic will be brought on to the main line.
446. Practically, you would get what is now carried by road? We should get more, because there would be more production in the district if the railway was made; but I am not prepared to say that there would be enough, and that we should get enough profit to justify the making of the line.
447. You think that the interest on the cost of the construction and the working expenses would be considerably more than you could expect to realise from the carriage of traffic? Yes.
448. You do not look upon it as a profitable one? I do not look upon it as a line of such pressing importance that it should be made under existing conditions.
449. You think it would be advisable to give time for agricultural development? My opinion is that it would be as well to wait for Federation.
450. *Chairman.*] You told Mr. Lee that you were charging 3d. a bushel for the carriage of wheat from Corowa to Culcairn? Yes.
451. On the Jerilderie to Berrigan line you are charging 2s. 6d.? Yes.
452. On the Jerilderie to Berrigan line you are charging 2s. 6d. for half the distance, and on this line you propose to charge 5s.? Yes. On the Jerilderie to Berrigan line it was a distinct undertaking on the part of the people. Everyone expressed their willingness to pay that rate, and I believe they will be content to pay it.
453. Why is the carriage on the line from Culcairn to Corowa only one-tenth of the freight from Berrigan? On account of its proximity to the main line.
454. Is that the only reason? That is one of the chief reasons.
455. Has Victorian competition anything to do with it? Nothing whatever as regards wheat.
456. *Mr. Lee.*] How did the Berrigan line result last year? The year is scarcely complete yet. It looks well so far, but I want to emphasise the difference between this district and the Berrigan district. As I pointed out, west of this district you get into country absolutely incapable of agriculture. At Berrigan, no matter which way you go, north, south, east, or west, you are surrounded by a good agricultural area. One thing that makes me afraid of this line is there being no possible development in a western and south-western direction. With a thousand pounds as the estimate of the amount we should receive for the carriage of cereals at the rate of 5s., there would require to be 12,000 acres for which Green's Gonyah would be a dépôt.
457. *Mr. Humphery.*] In what locality is there 7,000 acres under cultivation? Cultivation extends along the whole length of the line.
458. But along 10 miles of the line you would not get any of it? No.
459. How many acres are there under crop in the last 15 miles? I should think not a quarter of the whole area.
460. Probably there are not 1,500 acres available to send produce to the line? I do not think so.
461. You are assuming that you would get 5s. a ton for long distances? Yes.
462. It would not pay anybody to pay 5s. to have their produce carried 10 miles? I should think not.
463. There appears likely to be a deficit of £1,200 a year on the working of the line? Yes.
464. If there were 24,000 acres under wheat which would come to the line at Green's Gonyah, would that pay? Yes; if they are content to pay these rates.

465. The line would pay if it could be proved that Green's Gunyah would be a depôt for the produce of 24,000 acres of wheat; if beyond doubt they would use Green's Gunyah as a depôt? Yes, and would pay 5s. a ton. J. Harper.
21 Sept., 1897.
466. You propose to levy 5s. a ton on freight between Green's Gunyah and The Rock? The people propose to pay 5s. a ton. Kindly put it that way.
467. *Chairman.*] Taking into consideration the freight suggested by the producers and approved by the Commissioners at 5s. a ton from Green's Gunyah to The Rock, where do you think the wheat traffic would split between The Rock and Green's Gunyah? That would depend to a large extent on purely local circumstances.
468. Taking a case where the producer was contiguous to the line? I should think that those who are either north or south of the line for any distance would be disposed to evade the payment of 5s. by carting their wheat to The Rock.
469. Would you say three-fourths of the line would be under the influence of The Rock, and the traffic along the rest of the line would go to Green's Gunyah? I should think so.
470. What is the distance to Melbourne from The Rock and also the distance to Sydney? The distance from Melbourne to Wodonga is 187 miles, and from Wodonga to The Rock 60 miles, making a total of 250 miles approximately. The distance from The Rock to Sydney is 327 miles, leaving a balance in favour of the Melbourne route of 77 miles.

Stanley Alexander, Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

471. *Chairman.*] What is your position? Supervising Engineer, Railway Construction Branch, Department of Public Works. S. Alexander.
21 Sept., 1897.
472. About the 26th May, 1891, you made a report on the country in which it is proposed to make this line of railway, embracing a large portion of the Riverina country between the Billabong and Murray? Yes.
473. At the end of your report you have a diagram, in which you show a line from Murray Hut to Berrigan, Savernake, Clear Hills, and towards Green's Gunyah? Yes.
474. Was that a line that you viewed with favour? Yes.
475. Notwithstanding the fact that the Jerilderie to Narrandera line was in existence at that time? Yes.
476. What reason had you for that? That is a line I recommended, from Murray Hut to Hanging Rock, as a main trunk line to suit the whole country.
477. Why did you locate it exactly in that position? It passed through much good country in order to reach the very good land between Clear Hills and Murray Hut.
478. Did you consider the line to Clear Hills, Berrigan, and on to Finley? Yes.
479. Is it good land? Yes, most of it is very good.
480. Since there is a line in existence from Jerilderie to Berrigan, and also a line to Finley to be built, would you still be of opinion that this line should be constructed? The existence of that line to Jerilderie modifies the question altogether. The construction of a line now from The Rock to Berrigan would make a circular railway. I should not think it was justifiable now.
481. Your evidence is that from Clear Hills, in a westerly direction, there is valuable country? From Clear Hills westerly is valuable country, and again from The Rock to Urangeline. There is an intervening space between Urangeline and Clear Hills which is of no value for agriculture.
482. No doubt it was a mistake to construct the line from Narrandera to Jerilderie? I think it is a pity that that line was ever made.
483. The construction of the Jerilderie to Berrigan line in continuation with the line existing from Narrandera to Jerilderie materially modifies your view with regard to the construction of that piece from Clear Hills to Brookong? Yes, certainly. That is not now the right way to reach the country about Clear Hills.
484. In clause 5, of your report of 1891, you say, westward of its terminus the whole land to Urana is open plains which will yield nothing? Yes, but that is not correct. As far as Brookong it is good land.
485. No large area of land is to be found on the west that would feed the terminus of the line at Green's Gunyah, because of the proximity of the Narrandera to Jerilderie line? There is a great extent of good country west and north-west of Green's Gunyah. Map No. 4 shows my idea of the profitable development of that part of the Riverina.
486. Is this your view that a through line as shown on map No. 4 from The Rock *via* Savernake, Clear Hills, Berrigan, and Finley would be a wise line to construct? Yes, on the date of that report.
487. But since the Jerilderie to Berrigan line has touched some of the best of the country you do not consider the through line to be necessary? That is right.
488. Will you state definitely your opinion with regard to this proposed line from The Rock to Green's Gunyah? I do not think it will pay. It is 25 miles long; it will take a scope of a country about 30 miles, and of that 10 or 15 already belongs to the main line. It is only when you get 10 or 15 miles away from that line that you begin to earn any new revenue.
489. Is there room for a third line between the existing lines? There is room for a long line such as I projected down to Murray Hut, but not for a short line 20 or 30 miles long.
490. Between the main line passing by The Rock and the Narrandera to Jerilderie line there is 60 miles? Yes.
491. A line midway between the two would take the traffic for 15 miles on either side, making 30 miles altogether, leaving the main line to serve 15 miles of country and the Jerilderie line 15 miles of country? Yes.
492. Do you regard that as over-supplying the wants of such a district at present? No, I should not think so, if the central line could be a reasonably long one, say, 100 miles in length. A line from The Rock to Murray Hut would be about 100 miles long.
493. Is there not suitable land round Green's Gunyah to justify the construction of a railway from The Rock to there? It is good land, but there is not enough of it, and there is no back country from which traffic might be drawn. West and south of Brookong there is an unfertile belt which is the limit of the area under the influence of such a line.
- 494.

- S. Alexander. 494. But there is not enough of it? No. They have good roads there or good roads can be made at moderate expense. The ground is suitable for road making, and there is plenty of material for making roads in that district.
- 21 Sept., 1897. 495. In your opinion Green's Gonyah is not one of the places to which a railway should be constructed at present? I think not.
496. Mr. Humphery.} What is the character of the land between Green's Gonyah and the Billabong Creek? Between Green's Gonyah and Urangeline Creek it is all good. As soon as you cross the creek you get into very swampy country, country that will never be settled.
497. For what distance? About 24 miles.
498. That is all inferior country? Yes.
499. Running on towards Clear Hills and Green's Gonyah the land is good? Yes. On crossing the Billabong Creek you come to Clear Hills and very good land indeed. That good land carries you right through from Clear Hills to the Murray Hut. It is also very good at Savernake and right down to the Murray.
500. Then there would be 24 miles of inferior land between Urangeline Creek and Billabong Creek? Yes.
501. From your recollection of the country near Urangeline and Clear Hills, do you think this 24 miles of railway would pass through country not likely to be placed under agriculture? I said just now that it was all worthless land, but I see that I said in the eighth paragraph of my report in 1891 that, "the land, though not altogether coming under the category of plains land nor yet of forest land, is still low, flat, and, in part, subject to flooding, being covered for the most part with a stiff, clayey soil, common on land in similar localities all over Riverina. There are, however, several settlers on this part. Very much of the land is again private property." I do not think that the land between Urangeline and Billabong Creeks will ever be thickly settled, but settlers there will be living in a struggling way, subject to floods and having stiff land to work.
502. Is it your opinion that, in consideration of any extension from Green's Gonyah to Clear Hills, 24 miles of line must be regarded as likely to be unprofitable. Yes.

WEDNESDAY, 22 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The HON. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The HON. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The HON. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The HON. WILLIAM JOSEPH TICKETT.	GEORGE BLACK, Esq.
The HON. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gonyah.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

- C. E. Rennie. 503. Chairman.] Do you produce a map showing the tenure of land on each side of the railway from The Rock to Green's Gonyah, and from there onward to Berrigan? I do.
- 22 Sept., 1897. 504. Will you describe the areas that you have taken? The total width of the land shown as being influenced by the railway under consideration from Green's Gonyah, is about 28 miles in average width.
505. How far north-west of the dotted line on the map have you taken? From about 12 to 15 miles.
506. And the reason why you have gone no further distance than 12 miles north-west is because the influence of the Narrandera to Jerilderie line extends that far? Yes.
507. And the same thing applies to the main Southern line on the other side? Yes; from 20 miles beyond Green's Gonyah to Berrigan the land is taken 10 miles to the north-west, and 15 miles to the south-east.
508. Even down as far as Clear Hills you come under the influence of the Narrandera and Jerilderie line? Yes.
509. And 15 miles towards the south-east? Yes. The blue tint on the map shows the alienated land, the green shows the reserves, and the brown colour the Crown land; the Crown land is only in scattered patches.
510. Will you describe the total area of alienated land or land in process of alienation? The total area of land from The Rock to Green's Gonyah is 549,030 acres; the area of reserved land, 96,850 acres; and the area of Crown lands, 11,740 acres. Then, from The Rock right through to Berrigan, the area is 1,155,840 acres; the area of the reserves is 178,430 acres; and the area of Crown land 33,340 acres.
511. I asked you a moment ago whether the alienated land was not only alienated land, but also land in the process of alienation? Yes; conditional purchases, conditional leases, homestead selections, and auction sales.
512. In the opinion of the Lands Department the land is gone? Yes; you may regard it as all alienated.
513. What local name is on the map 20 miles beyond Green's Gonyah? It is portion 40, parish of Faed.
514. In that area down to the point you mentioned, 20 miles beyond Green's Gonyah and to The Rock, the total area of Crown lands is 11,000 acres? About that.
515. Are you prepared to express an opinion with regard to the possibility of the alienation of any reserves? There are about 2,000 acres in process of subdivision, to be set apart for homestead selection. There are, at present, proposals being considered by the Department in connection with the Brookong exchange, by which reserve No. 2,443 is to be thrown open.
516. How many acres are there? Several thousand acres.*
517. What other reserves are there? The stock reserve, from Urana towards Wagga Wagga, is being cleared, and there may be some pieces of that available; we cannot tell the quantity.
518. You say that there is Crown land 20 miles beyond Green's Gonyah;—how does that happen to be Crown land? It is chiefly remnants left unalienated.

519.

* NOTE (on revision):—About 9,000 acres.

519. Do you consider that the remnants are as good as the adjoining land which has been taken? The probability is that they are less profitable areas; they are mostly small pieces. C. E. Rennie.
22 Sept., 1897.
520. When you find the country all taken except the reserves and small pieces, those pieces must be inferior? Yes, or too small to occupy. Some of them are very small.
521. Therefore, these remnants are either too small to occupy, or are inferior land? I think that may be assumed.*
522. You do not know the form of alienation? There are different forms. I could not specify them.
523. I suppose a great deal of it is by auction sale? Yes. There has been a patch taken up by homestead selection near Green's Gunyah.
524. What was that before? It was withdrawn from leasehold area. It went off very quickly.
525. Any land thrown open in that vicinity in suitable areas would be likely to be alienated? Yes; there is no doubt about that.
526. The operation in connection with reserves and leasehold areas, and the exchange and surrender, cannot cover more than a few thousand acres? I have hitherto only spoken about reserve 2,443.
527. What are the total operations possible there? The total operations are larger than that. The areas which the Crown is now negotiating for, to acquire by exchange, mount up to about 29,000 acres.
528. Where are those 29,000 acres? It is in different blocks. There is a large block in the parish of Clive.
529. What is the area? I could not tell the separate area.†
530. There is one area south from Green's Gunyah, a distance of about 12 miles? Yes, about that. There is another of several thousand acres about 6 miles south-east of Green's Gunyah, and there are two other areas comprising a couple of thousand acres half way between Green's Gunyah and The Rock, and another area of about 4,000 acres about 12 miles north-east of Green's Gunyah. These areas aggregate about 29,000 acres.
531. Therefore there would be about 29,000 acres of Crown land which would be to some extent benefited by the construction of this line? Yes—that is, if these exchanges go through. The Crown is negotiating to acquire the land by exchange.
532. The probability is that there will be 29,000 acres of Crown land affected by the line? Yes.
533. What is the area which the Crown allows one holder? It varies very much, but it is reckoned that about 480 acres of wheat-growing land is sufficient.
534. Presuming that there are 29,000 acres of wheat-growing land available, how many would that accommodate? About sixty families. That is only an approximation, because the areas vary a great deal. It is all good agricultural land which is proposed to be acquired.
535. Taking the northernmost portion that is likely to be affected by the exchanges, how far away is that from the main line to Sydney? About 16 miles.
536. Is that the shortest distance you can get? Yes.
537. Then the others suitable for wheat-growing—how far are they off? About 12 miles from The Rock; the next one is about 18 miles, and the others would be about 18 miles.
538. Therefore, the greatest distance of the most distant of these 29,000 acres of Crown land from the existing line is some 18 miles? Yes.
539. And the nearest appears to be about 12 miles? Yes.
540. If the exchanges to which you refer take place with regard to the larger area of lands due south from Green's Gunyah, and distant therefrom about 12 miles, even with a line constructed to Green's Gunyah the people would save about 6 miles of road carriage, since from that place to the nearest place on the Southern line is not more than 18 miles? It is about 18 miles. This largest area to which I refer, the centre block, appears to me to be about 11 miles from Green's Gunyah and about 18 miles from the main Southern line, somewhere in the vicinity of Henty.
541. Are you prepared to express an opinion as to whether the construction of a line from The Rock to Green's Gunyah would have any material effect upon the value of the Crown lands that you anticipate alienating? It would increase the facilities of railway communication.
542. You are not prepared to say whether it would have any material effect upon those lands? I hardly think so; because they are not very far distant from the line now, and the land would go in any case. I do not think it will go any faster for the prospects of having another line.
543. Are you aware whether the reserves which have been referred to are likely to be curtailed? I could not say. It is most likely that, sooner or later, they will be reduced in size.
544. Does that cover the whole case with regard to such land as would be incidentally affected by a line from The Rock to Green's Gunyah? Yes. No doubt having a line there will make the land better for settlement; but I think the land will be taken up just as fast whether there is a line or not.
545. Coming from The Rock, south-west from the land which you have described as 20 miles from Green's Gunyah, how much land is there there? About 21,600 acres of Crown land.
546. Can you inform us why it has not been sold? I could not say, because some of these large pieces may have been recently-cancelled reserves. A large area classified there will be thrown open to selection very shortly.
547. The Crown are endeavouring to deal with it? Yes.
548. But the whole amount comprises only an area of 21,600 acres? Yes.
549. There is a reserve shown a little north-west from the dotted line on the map;—how far is that from Berrigan? It is about 13 miles from Berrigan, north-east.
550. The other area is shown almost due east from Berrigan? That is about 24 miles. It is under a proposal for exchange for other land.
551. How far south from the dotted line on the map is it? About 12 miles.
552. Therefore, if the line were extended to Berrigan there are some 20,000 acres that might be affected by it? Yes.
553. Would that be materially affected by the line? I am not prepared to say.
554. What exchanges are there going on in the southern portion of the area shown? About 10,000 acres.
555. Only 10,000 acres? Yes—that is to say, within the limits of 10 miles north-west and 15 miles south-east.
556. You are not prepared to say whether there will be any operations with regard to the reserves? No; I could not say. 557.

* NOTE (on revision) :—Some remnants are in leasehold areas, and so not available.

† About 10,000 acres.

C. E. Rennie. 557. Have you brought any information which we have not got from you? I cannot tell the Committee any more except this, that the lands are in treaty for surrender. There is an area of about 24 miles north-east from Berrigan on the line itself that is in treaty for surrender—about 3,800 acres. There are about 4,700 acres, about 26 miles east from Berrigan, and another area about 24 miles off at Coreen comprising about 2,000 acres.

22 Sept., 1897.

558. There can be no material increase in the value of the areas of land which the Crown will have to sell by the curtailment of the reserves? No.

559. Therefore, as far as the public estate is concerned, the construction of the line from The Rock to Berrigan will not have any material effect? No.

560. A railway from The Rock to Green's Gunyah, or from The Rock to Berrigan, will not have any material effect in increasing the value of Crown land, and therefore in increasing the amount of money that you will receive? I do not think so.

561. The land will go off just as quickly without it? I think the demand for land is sufficient to insure it all being taken up. All the land which has been acquired is good agricultural land.

562. As far as the State property is concerned in that vicinity, it does not appear to you that a railway would materially affect it, the conditions being such that you can sell the land on the usual terms whether a railway is made or not? Yes; that is the case as far as I can judge. If the whole exchange area that we are now in treaty for were acquired, and we allowed 480 acres for each family, that would provide for seventy or eighty families.

563. As far as you are aware your total operations would appear to be limited to the settlement of about seventy families? Between seventy and eighty families on the land to be acquired by exchange.

Walter Alexander Smith, District Engineer, Department of Public Works, sworn, and examined:—

W. A. Smith. 564. *Chairman.*] You bring some information from your Department? Yes; in Mr. Scarr's absence I bring a statement which he was to have presented to the Committee. I am not myself acquainted with the Wagga Wagga district.

22 Sept., 1897.

565. The only information that you have is that furnished by the office? Yes; it is as follows:—

Department of Public Works, Account Branch, 20 September, 1897.

STATEMENT showing expenditure on certain roads affecting the question of the proposed Railway from The Rock to Green's Gunyah.

Item No.	Mile- age.	Roads.	Amount voted.						Amount expended.
			1892.	1893.	1894.	1895. (6 months)	1895-6.	1896-7.	
1,418	60	Wagga Wagga to Gillenbah	£ 600	£ 600	£ 520	£ 300	£ 520	£ 440	£ s. d.
1,423	22	Wagga Wagga to The Rock	220	180	100	180	150	2,599 1 4
1,425	18	Coonong Station to Urana	720	720	650	300	650	620	603 11 8

Nicholas Colston Lockyer, Collector of Customs, sworn, and examined:—

N. C. Lockyer. 566. *Mr. Fegan.*] Mr. Harper was here yesterday, and made a statement to the effect that wheat could not go in bond through Victoria;—has any alteration been made with regard to that to your knowledge? Not so far as I am aware. It is not at all likely that there has been any alteration.

22 Sept., 1897.

567. Then that statement is not correct? We received, in 1895, over 300,000 bushels of Riverina wheat in Newcastle and Sydney, sent through Victoria under bond.

568. Then Mr. Harper's statement is not correct? I do not think it is.

569. In your position, would you not receive an intimation of it if any change took place? I have not had time to make inquiries, but it seems very improbable that such a thing could have taken place. It is practically impossible.

570. It could not have taken place last year without your knowing it? No.

571. You would be advised if any change were intended? We should have heard about it without a doubt. I can make inquiries by to-morrow.

572. *Mr. Lee.*] It would not take place without your Department being informed? I think not. It would create a great deal of discussion.

FRIDAY, 24 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gunyah.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

573. *Chairman.*] Have you a statement to make in regard to the population of the area that is presumed to be affected by the proposed railway from The Rock to Green's Gunyah? I have made an estimate of the population within the two areas. I have taken the number of electors in the localities within the areas. W. McIntyre.
24 Sept., 1897.

574. The first area is from The Rock to Green's Gunyah? Yes.

575. How wide on the northern and southern sides of the railway? Fifteen miles on the southern side of the railway, but there is a direct line from The Rock to a point 15 miles from the railway south-easterly, and midway between the Narrandera to Jerilderie railway and this proposed railway. I estimate that there are 1,449 souls within the Green's Gunyah area—that is, the northern part.

576. That is the first total population? Yes.

577. You arrived at that by taking the number of electors and multiplying by what? By 4½. That is the official figure used by the Statistician. I think that is, if anything, a little under the actual population.

578. Is it dependent upon the last roll? Upon the roll in force.

579. Have you anything with regard to past years? No.

580. You have another area? Yes; the southern area, from a point 20 miles from Green's Gunyah, 10 miles on the northern side of the proposed railway line, and 15 miles on the southern side. I have estimated that there are 2,857 souls in that area; the total population in the whole area being 4,306.

581. What population is there within 10 miles of The Rock going west? I cannot give you that.

582. You have included The Rock? Yes; I have included The Rock, and I have included Berrigan. There are twenty-one electors at The Rock—that will be a population of eighty or ninety. At Berrigan there are 180 electors, representing a population of 750. At Bullenbong there are twenty-one electors, representing a population of about ninety. At Green's Gunyah there are twelve electors, representing a population of fifty or sixty. At Brookong there are fifty or sixty electors. At Urangeline Creek there are three electors within one division, and nineteen in another division. I have a list of all the localities, with the number of electors at each place.

583. Will you read it? Yes, it is as follows:—

PROPOSED Railway from The Rock to Green's Gunyah and Berrigan.

Electorate.	Division.	No. of Electors.	Estimated Population.
<i>North-eastern portion.</i>			
Wagga Wagga	Pt. of Jackson's Waterhole	26	117
The Hume	Pt. of Hanging Rock	195	877
The Murray	Pt. of Urana	101	455
		322	1,449
<i>South-eastern portion.</i>			
The Murray	Pt. of Urana (including Urana)	206	927
	Pt. of Tocumwal (including Berrigan)	277	1,246
	Pt. of Mulwala	81	365
	Pt. of Corowa	67	301
	Pt. of Jerilderie	4	18
		635	2,857
Total		957	4,306

WEDNESDAY,

WEDNESDAY, 29 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gonyah.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

H. C. Russell,
C.M.G.
29 Sept., 1897.

584. *Chairman.*] Have you the particulars of the rainfall in the district between The Rock and Green's Gonyah? Yes. We have not a station called Green's Gonyah, but we have one at Burrangong, almost in the same spot, and there the rainfall is 19.36 inches, the records being very satisfactory as to time, as they extend over twenty-one years. The rainfall at Mittagong is 22.98 inches; at Wagga Wagga, 23.27; at Yerong Creek, near Mangoplah, it is 24.11; at Urana, according to a twenty-two years' record, the average is 18.48. At Berrigan it is 17.86 inches, but this is from only one year's record—1895. At Bullabong, the rainfall is 21.21; at Jerilderie, 18.14.

585. The rainfall in the country affected by The Rock to Green's Gonyah line may be taken as approximately from something under 19 inches to something over 24 inches? Yes.

586. Taking a fair mean, we might say about 22 inches? Yes, I think so.

587. Does the rainfall come at a suitable time of the year? Yes; it comes in the latter half of the year, which is very favourable for wheat-growing.

588. Therefore, if the soil is suitable, it ought to be a good district for cereals? Yes. Speaking generally, the rainfall increases regularly from west to east, and when you get down below the Lachlan it increases towards Victoria going due south. The rainfall is rather better in the southern part of the districts concerned than that in the northern parts.

THURSDAY, 30 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gonyah.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

J. Clarke.
30 Sept., 1897.

589. *Mr. Lee.*] We should like some information in regard to the mail service between The Rock and Green's Gonyah? We have only one mail line to Green's Gonyah. It is on our line between The Rock, French Park, Ferrier's, and Urana, *via* Brookong, 52 miles, three times a week; a covered conveyance; cost, £249 a year. The distance to Green's Gonyah is 25 miles. It is somewhere near Ferrier's post office. I should say that it would cost about £100 for that part of the service if it had to be run separately from The Rock.

590. If the railway charge for the same distance would be £300, you would practically pay £200 more than you pay at present? Yes.

591. That is the only mail line that would have to be discontinued if this railway were made? Yes, I think so.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and further examined:—

C. E. Rennie.
30 Sept., 1897.

592. *Chairman.*] Have you any information with regard to the land on the route of the proposed line from The Rock to Green's Gonyah? Yes.

593. The Committee wish to know the areas of land within 5 miles of the line, between 5 and 10 miles, and between 10 and 15 miles of the line? Within 5 miles of each side of the line there are 136,980 acres of alienated land.

594. Does that extend 5 miles beyond Green's Gonyah? Yes; all round, but not to the east of The Rock. Between 5 and 10 miles from the line there are 145,880 acres of alienated land; then from 10 to 15 miles from the line there are 163,160 acres of alienated land. The reserves within 5 miles of the line are 26,840 acres; Crown lands, 2,880 acres; that is about 30,000 acres altogether. Between 5 and 10 miles of the line there are 28,640 acres of reserves, and 3,120 acres of Crown lands; altogether about 32,000 acres. Between 10 and 15 miles of the line there are 21,810 acres of reserves, and 4,630 acres of Crown lands; about 26,000 acres altogether.

595. *Mr. Wright.*] Can you give the total alienated land within those areas, and the total areas of Crown land? About 450,000 acres of alienated land, about 75,000 acres of reserves, and about 10,500 acres of Crown lands.

596. That is all that is really available in the entire district at the present time? That is within 15 miles of the line.

597. A little over 10,000 acres? Yes.

FRIDAY,

FRIDAY, 5 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	JOHN LIONEL FEGAN, Esq.
The Hon. JAMES HOSKINS.	THOMAS HENRY HASSALL, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
CHARLES ALFRED LEE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gunyah.

William Henry Patrick Cherry, Chief Compiler, Government Statistician's Department, sworn, and examined:—

598. *Chairman.*] The Committee desire information with regard to the Mark Lane prices of wheat for a term of years? I can give you information as to the prices obtained by both British and imported wheat; but the information in regard to imported wheat only goes back as far as 1891. The following figures are taken from the official statistics of the British Board of Agriculture, and identical with the figures published in the official gazette, and published also in the *Mark Lane Express*, which is issued every week.

W. H. P.
Cherry.
5 Nov., 1897.

Year.	Price per bushel.	
	British.	Imported.
1891.....	s. d. 4 7½	s. d. 4 9½
1892.....	3 9¼	4 1¼
1893.....	3 3½	3 5½
1894.....	2 10½	2 10½
1895.....	2 10¼	2 11½
1896.....	3 3¼	3 3¼

599. Therefore imported wheat brings about 1d. a bushel more than the British wheat? From ½d. to 1d. a bushel more. In 1893, when the British wheat was worth 3s. 3½d. per bushel, the quantity returned is given as 2,620,060 imperial quarters, being 8 bushels to the quarter. In 1894, the quantity returned was 1,956,824 imperial quarters; in 1895, the quantity returned was 1,928,383 imperial quarters; and in 1896, when the price went up, 2,111,021 imperial quarters. These figures apply only to British wheat.

FRIDAY, 12 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from The Rock to Green's Gunyah.

William Henry Patrick Cherry, Chief Compiler, Government Statistician's Department, sworn, and further examined:—

600. *Chairman.*] The Committee desired certain further information with regard to wheat; have you been able to get it? Yes, most of it. I should like first to add to the evidence I gave the other day about the prices of wheat in London. I gave the prices in London for ten years, and I should like to give the septennial average for 1896. The annual average ranged from 4s. 0½d. in 1887 to 2s. 10d. in 1894 and 1895, and then it rose again in 1896 to 3s. 3½d. The septennial average for the period ending 1896 was 3s. 6½d. The prices of wheat in Sydney in the months of February and March for the last ten years were as follows:—1887, 3s. 10d. in February and 3s. 11d. in March; 1888, 3s. 6d. and 3s. 6½d.; 1889, 4s. 9d. and 5s. 3d.; 1890, 3s. 6d. and 3s. 6d.; 1891, 3s. 7½d. and 3s. 10d.; 1892, 4s. 9d. and 4s. 9d.; 1893, 3s. 6½d. and 3s. 6d.; 1894, 3s. and 3s.; 1895, 2s. 5d. and 2s. 7d.; 1896, 4s. 4d. and 4s. 4d. For the present year the price in February was 4s. 8d. and in March 4s. 6d. I was asked for information as to the cost of freight and other charges from the Australasian provinces. The total cost from the farm in New South Wales to London would be 1s. 9d. per bushel.

W. H. P.
Cherry.
12 Nov., 1897.

601. How is that made up? It is made up by reckoning first of all the cost of carting the wheat from the farm to the railway station, and trucking it there at 3d. per bushel. That is the average rate for landing the wheat at the railway station, assuming that the farmer is about 20 miles from the railway station. That would be a little over 9s. per ton. Then the railway freight is estimated at about 4½d per bushel. The next item would be cartage from Darling Harbour to the ship, which might be put down at about 1d. per bushel. In regard to ocean freightage there has been very little wheat exported during the last few years, but the average was about 25s. a ton or at the rate of about 8d. per bushel. The insurance would be ½d. a bushel, and the selling and other dues in London would come to about 4d. a bushel. These items of cost make a total of 1s. 9d. per bushel.

602. That estimate is on the supposition that the wheat grown in New South Wales is carried over 20 miles to a railway station? Yes, about 20 miles.

W. H. P.
Cherry.

12 Nov., 1897.

603. The only item we could touch, therefore, would be 3d. for carting? Yes. In the case of a large wheat-growing farm close to a railway siding a man would save that, or nearly that.

604. As railway construction proceeds contiguous to the farm it would eliminate that 3d.? Yes, a good deal of it.

605. And if it were possible to put the wheat right into the ship's hold at Darling Harbour the item of 1d. per bushel would also be eliminated? Yes, that would be so, if it were possible to dispense with the cartage from Darling Harbour to the ship.

606. Then there is a possibility of eliminating a portion of the 3d., say 1½d., and there is a possibility of eliminating the 1d.? Yes. There is also another possibility. I have reckoned the ocean freightage to London at 8d. per bushel, or 25s. per ton, but if large quantities were exported it is possible that sailing vessels might carry wheat as low as 20s. or 21s. per ton, which would be about 6½d. per bushel. I gave 8d. as the average of the last three years.

607. The tendency with regard to oversea freight is towards a reduction? Yes.

608. The reduction in the ocean freightage from 8d. to 6½d., which you think possible, would mean another 1½d. off your total estimate? Yes.

609. So that there is 4d. a bushel which you might take off your estimate of 1s. 9d. without very much danger, which would bring it down to 1s. 5d. as the cost of transit from the average wheat-field in the Colony to London? It is possible that the cost of the selling and other dues in London, which I put down at 4d. a bushel, might run as high as 5d. The charges are pretty heavy.

610. How did you arrive at the 4d.? The city and market dues come to 5d. a ton. The landing and dock charges would vary from 3s. 6d. to 5s. a ton. Then there are other charges for sampling and superintending; then there is the *del credere* brokerage and the selling commission in London. All these charges might run up to 5d. a bushel.

611. What was the average price of wheat in London for the last seven years? Three shillings and sixpence farthing.

612. Therefore, if New South Wales had been exporting wheat under such conditions as you particularise, the average return per bushel for the last seven years, depending upon Mark Lane, would be about 2s. 1½d.—that would be the average price on the farm after deducting 1s. 5d. as the cost of transit to market? Yes.

613. What was the lowest price in London according to your figures? The lowest price was 2s. 10d.

614. That would leave the farmer 1s. 5d. in the worst year? Yes.

615. What was the highest price in London? Four shillings three farthings in 1887.

616. Deducting 1s. 5d. as the lowest possible price of transit to London, that would leave 2s. 7d.? Yes.

617. *Mr. Lee.*] What was the price of wheat in New South Wales in 1887? Three shillings and elevenpence.

618. *Chairman.*] Have you any estimate of what it costs to produce wheat? Yes. The cost of producing wheat varies very much according to the size of the farm and the appliances used. It does not appear that it would pay a man to grow wheat for export to London on such a small area as from 50 to 75 acres. A man could grow wheat for export on an area of from 150 to 200 acres; but he would not get much out of it. The cost of growing wheat is approximately:—15s. 6d. an acre on large farms; 20s. an acre on moderately sized farms; 27s. an acre on small farms. These figures are given in *Wealth and Progress*. I have examined them closely, and am sure they are pretty correct. On a farm of about 200 acres it costs a man from 1s. 6d. to 1s. 8d. a bushel to grow his wheat.

619. There would be no profit in that? No.

620. Did you include the man's labour? Yes.

621. How much of that 1s. 6d. or 1s. 8d. would be his labour? It is very difficult to say. With a farm of 450 or 500 acres, a man, according to my figures, could grow wheat at a cost of from 1s. to 1s. 3d. per bushel, according to the district. Taking 12 bushels to the acre, which is the average yield in New South Wales for the last thirty years, it costs a man from 13s. to 15s. an acre. I have proof of the correctness of these figures from the books and accounts of farmers themselves.

622. How do you make up that cost of from 13s. to 15s. per acre? I will take the case of a farm at Carcoar—an old farm, 450 acres in extent. The expenses for sowing and harvesting are £294 on the 450 acres,—which is an average of about 13s. an acre.

623. Would you give the details comprised in that total sum of £294, specifying the items of ploughing, cost of seed, and so on? I could scarcely give the items, but as furnished in a reliable return which I have, they make a total of about £294, which represents the cost of sowing and harvesting on this farm of 450 acres. The man is one of the best farmers in the district. In calculating their expenditure some farmers include charges which others do not seem even to think of. I think from 13s. to 15s. an acre is a good average for a farm like that. In the case of this farmer the cost of growing wheat is 1s. 1½d. per bushel.

624. What was the lowest price for wheat in Mark-lane which you gave us in your figures for septennial periods? The lowest price was 2s. 10½d., and the highest was 4s. 0½d., the septennial average being 3s. 6d.; so that, according to these figures, it would pay the farmer the amount I have just quoted. In the year to which those figures apply, the yield was only 7 bushels to the acre. It was a very bad year. The farmer gets an average of about 12 bushels to the acre. In a very bad year he would meet his expenses.

625. Taking off the freight charges, the highest year in the septennial period shows 2s. 7½d. a bushel, and the lowest year 1s. 5½d., the average being 2s. 1d.? Yes.

626. Therefore, a man cultivating 400 or 500 acres in New South Wales, since the cost of production, according to your figures, is 1s. 1d., would get in the highest year 1s. 6½d., and in the lowest year 4½d., or an average of 1s. a bushel? Yes.

627. Taking into consideration the surroundings of a farm, and considering what the farmer saves in the shape of house-rent, food that he produces on the farm, and other items, if he had £150 a year cash coming in, he would be able to live? Yes.

628. Therefore, it means this: that a man with an ordinary farm of 450 acres, such as you described, even if he had to send his wheat to London, would be able to make a living, generally speaking? Yes.

629. Looking at the whole state of the case, taking the last seven years as an example, as regards the prices in London, and the cost of wheat in the London market, in your opinion could wheat-farming be carried out so that the farmer in New South Wales could afford to live if he had to send his wheat to

Mark-

Mark-lane, provided reasonable opportunities were given to enable him to get his produce to the sea-board? Yes; I think a farmer ought to get more than a living; at any rate, if he could always rely upon those prices he could live.

W. H. P.
Cherry.

12 Nov., 1897.

630. Did you include rent in your calculations? In the case quoted, the rent was in the shape of interest on a conditional purchase. Of course, if a man rented land, this item would amount to very much more. It would come to from 6s. to 8s. an acre, which would add a great deal to the total cost of production. Under those circumstances it would not pay; but in the case of a conditional purchase it would pay.

631. As against that, in your calculation you paid the man for his labour? Yes.

632. That does not go to an outsider, it goes to the farmer himself; he is virtually selling his labour to himself? Yes.

633. That is an item you have not included in the calculation? Yes.

634. And that would, to a certain extent, meet the rent difficulty? Yes.

635. *Mr. Humphrey.*] In your estimate, did you take into consideration the initial cost of putting the land under crop? No; the farm had been under crop for years. If a man had to start on a farm, and buy everything, of course it would come a great deal more expensive.

636. You have not included the cost of clearing and stumping? No; in the case I gave all the clearing was done.

637. You supposed that at the time you began to make your estimate of cost the land was fit for the plough? Yes; if a man had to clear the land it would make all the difference in the world.

638. Have you any more information to give to the Committee? In regard to the cost of freight, that would be pretty much the same from all the Australasian provinces. I was asked for information in regard to the charges on wheat sent to London from Canada, the United States, Argentine, India and Russia. The charges from the United States and from Canada would be about the same. The railway freight from Chicago would be about 7½d. a bushel, and the freight from New York to Liverpool about 2½d. a bushel. That would mean a freightage of about 10d. from Chicago to London.

639. Can you give us any information as to the cost of production in America? No; but according to figures given in the published report of the United States Department of Agriculture, the price on the farm in 1892 was 2s. 7d.; in 1893, 2s. 3d.; in 1894, 2s.; in 1895, 2s. 1d.; and in 1896, 3s. These figures represent the average prices all over the States. The average crop in the United States is about 12 bushels, the same as in this country. In Canada it is a little more.

640. *Mr. Roberts.*] Have you any note as to the reason of the rise in price in 1896? No; it was a general rise. In regard to India, the freight from Bombay to London would be from 5d. to 6½d. a bushel, or from 15s. to 20s. a ton. In the case of Russia, the freight to London from Odessa would be from 7s. 6d. to 10s. a ton, or from 2½d. to 3½d. a bushel. I was also asked about the freight from Argentine. I can give a little information about Argentine, which, it appears to me, in regard to wheat production, is the only country we have to fear. Large quantities of wheat are imported into the United Kingdom from the United States and Russia; but they do not import much more wheat into London from either the United States, Russia, or India, than they did ten years ago. I suppose the reason is, in the case of the United States, that they find it takes all their time to keep pace with their own population. At any rate, as a matter of fact, the export of wheat from that country is not much greater than it was five or ten years ago, neither is the production very much greater. It does not appear, therefore, that we have much to fear from those countries. But the case of Argentine is different, and it will take us all our time to cope with that country.

641. *Mr. Hoskins.*] What is the average acreage production in Argentine? About the same as in this country.

642. *Chairman.*] As against India can we hold our own? Great Britain is not getting much more wheat from India now than she was five or ten years ago.

643. How does the cost of transit from Chicago to London compare with the average cost from New South Wales to London? The cost from Chicago to London would be about 10d. a bushel—7½d. on the rail, and 2½d. across the Atlantic.

644. *Mr. Wright.*] Would they send wheat from Chicago by rail or by canal? The greater portion goes by rail.

645. *Chairman.*] In the cost of 10d. a bushel from Chicago to London, have you included the various charges in the shape of selling dues, etc., which you added to the cost of transit from New South Wales? No; 5d. a bushel must be added.

646. Then the figures show a total cost of 1s. 3d. from Chicago to London, as against 1s. 5d. from New South Wales? Yes, they have a slight advantage over us.

647. Therefore, a wheat-grower in New South Wales, as regards access to London, would be pretty well on the same footing as a wheat-grower adjacent to Chicago? Yes; he would be slightly at a disadvantage—say to the extent of 1½d. or 2d. a bushel.

648. You have given the cost of production in the United States? Yes; I gave the prices on the farms during the years from 1892 to 1896. There is a note in the report of the Department of Agriculture in which one of the officers says: "Investigations made in the different districts on the great plains show that in some places, with an average of 15 bushels per acre at 40 cents., it might be profitable." As he took special places, it is probable that, instead of 1s. 8d., 1s. 10d. or 2s. would be more like an all round price that would be profitable.

649. What is the cost of conveying wheat from Argentine to England? In a consular report made to the Board of Trade, it is stated that they can land wheat at the port of Rosario for 35 cents., or 1s. 6d. a bushel. Then it has to go from the port of Rosario to Buenos Ayres by rail, a distance of nearly 200 miles, and the cost would probably be about 3d. a bushel. The ocean freight it is rather difficult to arrive at. Ships charge 35s. a ton for the round voyage from England, taking out coal and bringing back wheat. I am told that 15s. a ton would be a good average to estimate for coal, and 20s. for wheat, which would be 6½d. per bushel. The figures, therefore, would be 1s. 6d. per bushel landed at the port of Rosario, 3d. a bushel for the railway carriage—I cannot be positive as to this item—and 6½d. for the ocean freightage. If we add to this 5d. a bushel for other charges, the cost, landed in London, would be about 2s. 8½d. Probably the railway freight from Rosario to Buenos Ayres would not be as much as I have estimated.

650. The item of 1s. 6d. to Rosario includes the cost of production and everything up to that point? Yes.

651. There is only a difference of 2d. in the freight to London between the United States, Argentine, and Australia? There is not very much difference. I have given the freight at 6½d. from Argentine and 6½d. from Australia.

652.

W. H. P.
Cherry.

12 Nov., 1897.

652. Therefore, the profit in favour of Argentine is in respect of the 1s. 6d. a bushel, embracing the cost of production and expenses to Rosario? Yes.

653. How do they do it for 1s. 6d. :—have you any suggestion to offer on that point? I cannot give you the details, but I would point out the way they grow wheat in Argentine. Two or three capitalists form a syndicate, and they get from Spain and Italy men of the peasant class who, with their ancestors, have been growing wheat for generations, and consequently thoroughly understand it. They provide these men with all appliances and sufficient to live upon for about two years, and when the crop time comes round the principals step in and take a certain proportion of the returns. It is something like the halves system in New South Wales. In dealing with the cost of production we have not taken into account a system of that kind. We have not taken into account a case like that of Mr. Greene of landra. Mr. Greene cultivates a very large area, and it is done, I think, on the halves system. What the cost of production amounts to in such a case I do not know; but I certainly think that, given fair seasons, a man who engaged in wheat growing on a system of that kind would do much better than a man who cultivated 400 or 500 acres of his own, though not having gone into the question I am not prepared to say absolutely. Evidently the system in Argentine is somewhat like that carried on at landra. I can give figures comparing the exports from Argentine to London with those from Australasia, embracing the last ten years. It appears to me that the Argentine people are really our only rivals. In the year 1887, Argentine and Australasia, in their export of wheat to London, were equal; that is to say, Argentine exported just over 1,000,000 cwt., and Australia exported 1,300,000 cwt. The position of affairs was not much altered in 1891. Argentine in 1891 exported 2,500,000 cwt. to Great Britain, and Australasia exported just over 2,000,000 cwt. Since 1891, however, there has been a great change. Argentine exported to Great Britain in 1894 over 13,000,000 cwt., and in 1895 over 11,000,000 cwt. In other words, while the export from Argentine increased from 1887 to 1895 twelve times, the export from Australasia in the same period increased only three times. I have the figures here showing the wheat production in Argentine for ten years. I have already given the export to the United Kingdom. The production in 1887 was a little over 18,000,000 bushels; in 1888 it was a little over 12,000,000 bushels; in 1889 it was 24,000,000 bushels; in 1890, 32,000,000 bushels; in 1891, 36,000,000 bushels; in 1892, 59,000,000 bushels; in 1893, 83,000,000 bushels; in 1894, 60,000,000 bushels; in 1895, 46,000,000 bushels; and in 1896, 33,000,000 bushels. These figures are from a statement in the British official reports.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from The Rock to Green's Gonyah.

APPENDIX.

A.

[To Evidence of Stanley Alexander.]

REPORT ON PROPOSED RAILWAYS FOR RIVERINA.

Sir, Railway Construction Branch, Sydney, 22 September, 1897.
 With reference to my report on the proposed railway from Hanging Rock to Urana, dated 30 March, 1891, I beg permission to point to certain statements made in it regarding the country lying between Urana and Green's Gonyah. In paragraph 10, page 19, as to the bulk of the settlement lying under 25 miles from the main line of railway, I point out that three (3) parishes—Finley, Ross, and Urangeline, held but ten settlements between them, the latter parish only one.

On page 19, in paragraphs 11 and 5, I was incorrect in stating that the whole extent of country between Urana and Green's Gonyah will be unproductive of revenue. From Green's Gonyah, going westward as far as Brookong, the quality of the land is found to deteriorate, gradually merging into "plains" country, which is not suited for agriculture; but of this extent there is in the aggregate a large proportion of good land which will be cultivated.

As to the quality of the country generally, I would point to the closing sentences of paragraph 4, Part V, page 17, in which a very high opinion is expressed in its favour.

The Chairman, Parliamentary Standing Committee on Public Works.

I have, &c.,
STANLEY ALEXANDER.

B.

[To Evidence of Nicholas Colston Lockyer.]

CONVEYANCE OF NEW SOUTH WALES WHEAT THROUGH VICTORIA.

Dear Sir, Customs Department, 23 September, 1897.
 I send you herewith the reply of the Acting Secretary for Trade and Customs, Melbourne, to my inquiry respecting the importation under bond of Riverina wheat into Victoria for export. It will be seen that there has been no variation recently in the ordinary Customs practice in the matter referred to.

The Secretary, Public Works Committee.

Yours, &c.,
N. C. LOCKYER.*Victorian Customs practice with regard to Riverina wheat.*

TELEGRAM dated 22 September, 1897, from Collector of Customs, Sydney, to the Secretary for Trade and Customs, Melbourne.

"Evidence given yesterday before Public Works Committee, that you have discontinued the practice of permitting Riverina wheat to be conveyed under bond through your territory to port of shipment for export. Kindly advise me by wire if that is the case, or if any alteration has been made in the usual and recognised practice?"

REPLY dated 23 September, 1897, by the Acting Secretary for Trade and Customs, Melbourne.
 "Riverina wheat still allowed under bond for export. No alteration."

Customs Department, 23/9/97.

N. C. LOCKYER,
Collector of Customs.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM THE ROCK TO GREEN'S GUNYAH.

REPORT.

THE Sectional Committee, appointed on the 7th October, 1897, to inspect and take evidence and report on the proposed Railway from The Rock to Green's Gunyah, have the honor to report to the Parliamentary Standing Committee on Public Works:—

The Sectional Committee, consisting of T. T. Ewing Esq. (Chairman), the Hon. C. J. Roberts, C.M.G., M.L.C., and George Black, Esq., M.P., accompanied by Mr. Surveyor Jamieson, of the Railway Construction Branch, left Sydney at 9 p.m. on 8th inst., and, after taking evidence at Cootamundra on another proposal, arrived at The Rock on the 12th October; thence they proceeded to inspect the route of the proposed line. Arrived by coach at Milbrulong, about half way between the Rock and Green's Gunyah, they were there met by a large body of settlers, who intimated their desire to give evidence in favour of the project. The Committee arrived at Green's Gunyah about 6 o'clock p.m.

On the following day they examined a large number of witnesses, who strongly advocated the construction of the railway under consideration. A close inspection was made of the surrounding country, and on the 14th inst. a visit was paid to the Galore district. The Committee then drove to Brookong, where they took evidence from the manager and others. Arrived on the 15th inst. by coach at Urana, where a number of local residents gave evidence strongly in favour of the extension of the railway to that place. Thence the Sectional Committee proceeded to Coonong, and took the train to Coolamon on the following day.

LAND AFFECTED BY THE PROPOSED CONSTRUCTION OF A LINE OF RAILWAY FROM
THE ROCK TO GREEN'S GUNYAH.

The tract of country through which it is proposed to construct a railway line from The Rock to Green's Gunyah is influenced on the east by the Great Southern trunk line, on the north by the line from Junee to Hay (although in this direction the absence of means for crossing the Murrumbidgee and the distance from this railway minimises its influence), on the west by the line from Narrandera to Jerilderie, on the south by the line from Culcairn to Corowa, and by the Victorian system of railways beyond the Murray.

The boundaries of the area principally affected, commence at a point about 6 miles north of Galore, and is bounded on the north-east by a line running south-east 24 miles and a little to the north of the road from Narrandera to Bullenbong, to a point about 2 miles beyond Bullenbong; thence on the south-east by a line bearing south-west about 24 miles to a point within 3 miles of Urangeline Creek; and thence on the south-west by a line bearing north-west about 24 miles, and following generally parallel with the Urangeline Creek for some 16 miles; thence on the north-west by a line bearing north-east about 24 miles to the point first mentioned.

It was necessary to define the influence of the various possibilities of transit, in order that the proposed line between The Rock and Green's Gunyah should not be credited with trade which would not legitimately belong to it.

From the centre, at Green's Gunyah, this limit extends about 12 miles in all directions. Over this area, the special rate proposed by the Railway Commissioners would attract produce to the line, the proposed charge being a considerable reduction upon the present cost of road carriage.

To the east of the area already described, and extending to a point within 6 miles of The Rock, bearing north-west to Bullenbong and south-west to the south-eastern corner of the area of special influence, traffic will be obtained, but not at so high a rate.

The limits of the area of special influence, which embraces about 370,000 acres (of which about 300,000 may be classed as land suitable for the growth of cereals, 70,000 being plain country, most of which will probably continue to be used for pastoral purposes), is shown by red tint upon the tracing herewith—that incidentally affected is shown by red hatching, and embraces an area of about 46,000 acres.

DESCRIPTION OF THE COUNTRY.

The timbered country in this district is well adapted for the production of cereals—the plains and low-lying lands being locally regarded as purely pastoral areas.

The limits of the timbered lands may be located about 10 miles east from Coonong; thence in a northerly direction and turning west towards Cuddell and the line from Narrandera to Jerilderie; thence turning east along the road from Narrandera to Wagga Wagga to its intersection with the Bullenbong Road, and from this point following that road down somewhat north therefrom towards Bullenbong. The eastern, western, and northern limits of the affected area are almost wholly timbered lands. To the south-west and south lie those intrusions of plain country already referred to. On the sketch the edge of the timbered country is shown by yellow edging, and the limits of the plain country by firm blue lines.

PRODUCTION OF COUNTRY AND TREND OF TRAFFIC.

The products of the district are principally stock, wheat, and wool. Within the limits specified to the north, south, and west, much of the traffic now passes close to Green's Gunyah en route to The Rock. The road freight from Green's Gunyah may be stated at from 9s. to 10s. per ton. To the north-west a small portion of the traffic reaches Narrandera; on the north-east the trend of traffic is by the Bullenbong Road to The Rock. From the east by road direct to The Rock. From the south-east, a portion of the produce finds its way to Yerong railway station, paying about 6d. per ton per mile for the various distances of road carriage.

As the lowest road-carriage quoted from Green's Gunyah to The Rock is 9s. per ton, all produce from the described district, of which the former is the centre, attracted by a saving of 4s. per ton, will use this railway. Within 12 miles of The Rock a 5s. rate would probably prevent the use of the proposed railway, except when roads are bad, for at this point road carriage and the special railway rate are equal in amount; but if a rate of, say, 2s. 6d. per ton were thence charged, remunerative traffic possibly could be obtained to within 6 miles of The Rock.

The competition of the Yerong route might also be felt to the south-east; but the Sectional Committee are satisfied that within the limits laid down the traffic will be secured, unless in some special cases.

The Brookong wool can now reach Melbourne at a cost of £3 per ton; £2 of this amount is charged for road carriage, the Victorian Railways carrying from Wahgunyah, a distance of 17½ miles, for £1 per ton. Road carriage from Brookong to Green's Gunyah may be stated at 8s. per ton, and the special freight for wool from that place to The Rock is quoted at 10s. Now, The Rock is 59 miles from Albury; therefore, if the wool were going to Melbourne *via* The Rock, the cost would be 8s., plus 10s., plus railway freight over the New South Wales railways for 59 miles; whereas, road freight is £2 to Corowa. Obviously, if the New South Wales railway authorities were willing to carry this wool to the Victorian border, they need not fear road competition.

The

The Mahonga wool, which is all shorn at Urangeline Station, now pays about 35s. to reach the Victorian system, *via* Corowa; the road carriage to Green's Gunyah would be about 16s. per ton, and if the wool were taken thence to Melbourne the cost would be 16s., plus 10s., plus 59 miles of railway carriage. Therefore, the Railway Commissioners would be required to carry 59 miles to the border for 9s. to secure this wool, unless they chose to equalise the rate throughout by a reduction of the special rate on the proposed line; but, at the figures quoted, the wool might be carried to Albury, 83 miles, at a cost of 19s., equal, with road carriage added, to team charges from Urangeline to Corowa.

The cost from Wagunyah and Wodonga to Melbourne being estimated at similar rates, it appears certain that, if the wool from Brookong and Mahonga were despatched to Melbourne, the Railway Commissioners could afford to deliver it at Albury cheaper than it could be delivered at Corowa; it is also probable that a through rate could be quoted sufficiently low to cause Sydney to be the port of shipment.

BENEFIT OF CHEAP CARRIAGE TO AGRICULTURAL LANDS.

Taking Green's Gunyah as a centre, the saving of freight even at the high rate quoted would be 4s. to 5s. per ton. Three acres of wheat will give about a ton of freight; therefore, the saving by railway carriage is equal to a rental of 1s. 8d. per acre, or £52 10s. per annum, upon 600 acres of wheat.

The rental charged to the homestead lessees is about 4½d. per acre, and it is anticipated that some 30,000 acres of Crown land, within the specified area, will in the near future be thrown open for settlement. If those lands be benefited even 1s. per acre per annum by the construction of the railway, the State might rightfully charge it to those leasing these lands. The rental would still be regarded locally as far below a fair charge.

If the proposed railway be considered as a means of developing the country, and not merely as the carrier of the produce already available, although the State might not be prepared to permit the increased annual rental to augment the yearly return from the railway, or to capitalize it, and write down the cost of the line, still the benefit to Crown lands, and the effect this line will have in increasing the revenues of the Lands Department, must be regarded as an important item.

Large areas of land, held for pastoral purposes, are now being devoted to agriculture. The net return from pastoral land is estimated locally as from 3s. to 4s. per acre, and that from wheat lands at 15s., and there is little doubt that such stations as Brookong will put large portions of their holdings to the most profitable use. The manager of that station estimates that their area under wheat will be 10,000 acres in the near future.

Agriculture in the vicinity of Green's Gunyah is rapidly increasing. Much of the land is well farmed, and although its extent is being steadily extended, as in most other districts, the area under crop has been largely circumscribed by the recent drought.

The area affected by the railway has already been estimated at about 300,000 acres of agricultural land; the area under crop is now about 20,000 acres—that is, about 1 acre out of 15. The possibilities of increase are so great that the Committee have no doubt that the figures from which the now possible freight might be calculated furnish no true index of the volume of products probable on the increased settlement certain to follow railway construction.

Agricultural development is dependent on the availability of suitable men, and the Sectional Committee has no hesitation in stating that farmers equal to the cultivation of much greater areas of land are awaiting the opportunities here presented.

The high price of wheat has had a great effect in stimulating the growth of cereals. This price is not likely to be continuously maintained, and the wheat farmer, in a country with a rainfall of under 20 inches, is sure to have bad seasons; but there can be little doubt of the suitability of the conditions around Green's Gunyah, nor that the industry is on a solid basis.

Although

Although cost of freight is a vital matter to the agriculturist, still the question of expedition and certainty are also of great importance. With a railway the farmer can place his produce on the market when he sees fit, and within a definite period; long road carriage, by team, frequently loses him the benefits of a rising market, and otherwise places him at a disadvantage for satisfactory trading.

FINANCIAL ASPECT OF THE LINE.

The stock estimate of the Railway Commissioners appears to be fairly accurate.

The wool return has, in the opinion of the Sectional Committee, been underestimated. A very reasonable forecast of the traffic from that source is £500.

The estimate by the Railway Commissioners of the quantity of wheat traffic, at one ton to 3 acres, is 4,000 tons, and, therefore, 12,000 acres of cultivated land, or an area of somewhat less than $4\frac{1}{2}$ miles square, would furnish this amount. Not only is the Railway Commissioners' estimate much under the return of last year's harvest, but it has been given without a full consideration of the yearly increase in the area of land under crop.

In many parts of the district clearing and preparations for cultivation are being extended, and the year and a half which have elapsed since the visit of the officer of the Railway Commissioners may explain much of the discrepancy.

A very moderate yield in a fair season will be 9,000 tons, which will return to the railway £2,250. Therefore, the estimate furnished to the Commissioners is less than half of what we believe to be probable in the near future.

The line, therefore, instead of making a loss of £1,127 per annum, with a fair season, would probably show a surplus soon after construction. In addition, the enhanced value of Crown lands must be considered.

PROPOSAL TO LEVY A SPECIAL LAND TAX ON THE AREA BENEFITED BY THE RAILWAY.

It was proposed to divide the land proposed to be benefited by this railway into three parallel zones of 5 miles each; the first extending that distance on either side of the railway, the second from this limit to a distance of 10 miles, and the boundaries of the third zone terminating 15 miles from the railway.

Within the first zone it was proposed to levy a special tax of one penny per acre; within the second zone one half-penny per acre, and within the third zone one farthing per acre. It was proposed to devote this tax to the liquidation of the anticipated loss upon the line.

This proposal is not viewed favourably locally, on the ground, that it can only be levied with the consent of the landholders, unless special legislation be provided to deal with it. In the absence of this legislation, many will refuse to pay the tax, and it will be borne by a section only of the landholders, and thus will not be uniform. The residents regard a special rate for services rendered as being more equitable, since all those using the railway will contribute to the cost, and point out that the charge of 5s. will be twice that paid on the Berrigan line, which is much greater than the ordinary grain freight rate; the residents contend, that before the railway is completed, the district will have sufficiently developed to place the railway on a paying basis, and that the potentialities of the locality place the question of a sufficient volume of traffic to justify the construction of the railway beyond doubt. In general principles the Sectional Committee agree with these contentions.

COMPARISON WITH THE BERRIGAN DISTRICT.

It may not be out of place to institute a comparison with the Berrigan district. The Committee is of opinion that the district round Green's Gunyah is quite as favourably situated for the production of cereals as that around Berrigan, and that the settlement will very shortly be as satisfactory as was that at Berrigan when the line was recommended by the Committee. The cost and annual expenses, allowing for the

the extra length of the Green's Gunyah line, are approximately equal. Notwithstanding the fact that the failure of the South Australian crop diverted a great portion of the Berrigan wheat from the Berrigan-Jerilderie line, this railway will complete its first year with a very small loss. But for this diversion there would have been a surplus.

The Sectional Committee have little doubt, after fully comparing the two districts, that, if the Crown lands be thrown open, in its first year the Green's Gunyah to The Rock line will furnish a satisfactory result. The increase in the rentals from the Crown lands will more than compensate for temporary loss—if any.

The Sectional Committee, for the reasons above stated, recommend the construction of this line.

THOS. EWING,
Chairman.

26th October, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM THE ROCK TO GREEN'S GUNYAH.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

WEDNESDAY, 13 OCTOBER, 1897.

[The Sectional Committee met at the Hotel, Green's Gunyah, at 11 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from The Rock to Green's Gunyah.

Walter Day, farmer, Green's Gunyah, sworn, and examined:—

1. *Chairman.*] How long have you been resident in the district? Eighteen years.
2. Where is your present holding? Three miles from Green's Gunyah, in a north-westerly direction.
3. What area have you? 1,037 acres.
4. What statement have you to make? Statistics have been prepared for the information of the Public Works Committee, showing the number of landholders on the route, the areas of the holdings, the areas under cultivation, and the population within a radius of 15 miles of Green's Gunyah. The number of landholders is 124; the total area of the holdings is 300,644 acres; the area under cultivation is 20,984 acres; the population is 914; the area of Crown lands to be thrown open for settlement during the next few months adjacent to the proposed railway is about 29,000 acres. That is not all within the 15-mile radius; some of it is a little beyond it.
5. Where is the Crown land that is to be thrown open? In the parishes of Lockhart, Napier, and Clive, on the Brookong holding.
6. Lockhart being east from Green's Gunyah, Napier south-east, and Clive nearly south? Yes.
7. We will take the Lockhart holding first? What area of land which will presumably be available is there in the parish of Lockhart? I cannot state exactly what area there is, but in my opinion there will be 6,000 or 7,000 acres in the parish of Lockhart, some of the leasehold area given up by Brookong.
8. Is it the area shown in white etching on the map? Yes.
9. Situated 7 or 8 miles west of Green's Gunyah? It commences about 2 miles from here.
10. Is it in three separate blocks? It is unsurveyed. It adjoins a homestead selection taken up about fifteen months ago on the north. The total area is 6,000 or 7,000 acres.
11. What class of land is it? All of it is good. I would point out that some fifteen months ago 9,000 acres in the parish of Lockhart were thrown open for selection in areas of 480 acres each, and there were 680 applicants for the twenty blocks.
12. Do you believe that the same thing will happen with regard to these? Yes.
13. Do you know what rent the holders are paying for the land referred to? One and a half per cent. on the capital value, which was fixed at 30s. per acre. For the first five years I believe it is costing about 4½d. an acre to hold the land. After that the rent is to be doubled, but I will get the Committee more definite information with regard to it.
14. What areas are there in the parishes of Napier and Clive? I think there are 4,000 or 5,000 acres in the parish of Napier.
15. Is it good land? Yes.
16. How far is it from Green's Gunyah? Four or 5 miles.
17. Do the remarks you made with regard to the demand for land apply to that? Yes.
18. What about the parish of Clive? The same remark will apply to that. There are 6,000 or 7,000 acres there.
19. How far from Green's Gunyah? From 9 to 12 miles. Perhaps one or two portions are a little further away on the Urangeline Creek.
20. These areas make up the 29,000 acres to which you refer? No; there is other land on the Bullenbong Creek to be thrown open.
21. How far east of Green's Gunyah? About 14 miles.
22. What is the character of the country? It is good agricultural land.
23. Do your remarks with reference to the other areas apply to this? Yes.
24. Does that cover the whole of the 29,000 acres? Yes.
25. What is the freight for wheat from Green's Gunyah to The Rock? About 10s. a ton.
26. Three acres of land, approximately, will give a ton? Yes.
27. Therefore, the freight from Green's Gunyah to The Rock on wheat is, roughly, 3s. an acre? Yes.
28. Therefore, if a railway were built from The Rock to Green's Gunyah, and you were charged 5s. per ton for carriage, you would be saving 1s. 6d. an acre? Yes.

W. Day.
13 Oct., 1897.

- W. Day.
13 Oct., 1897.
29. Is it your opinion that a railway to Green's Gonyah would be worth 1s. 6d. an acre if 5s. were charged for all the produce that would come to Green's Gonyah as a centre? In my opinion it would be.
30. And the same also applies to all the produce. Is not that what it is worth to them? It is. I can speak for myself, and I should be quite prepared to pay that. I think that the majority would be.
31. The wheat from Green's Gonyah has to be got to the railway to be disposed of;—you cannot get to any railway for less than 10s. a ton at present. If you could get there for 5s. by rail, that shows exactly the value of the railway to you? Yes.
- 32-3. How far west from The Rock would a carrier be prepared to carry wheat for 5s. a ton? I do not think he would be prepared to cart it more than 10 or 12 miles. The loading is the point;—it is the same for 10 or 12 miles as it is for 30 miles.
34. You think, therefore, that half-way between Green's Gonyah and The Rock would be the limit within which the carriers would carry wheat at the 5s. rate? Yes.
35. And from Bullenhong and the land south-west from that point? Yes.
36. Now, direct your attention to the country north of Green's Gonyah to a point half-way to the Hay line;—what class of country is that? It is good agricultural land.
37. What class of country is it south-east from Green's Gonyah? First-class agricultural land.
38. What class of country is it going south? Very good agricultural land going in the direction of Brookong. For the first 10 miles it is forest land.
39. Is that good country? Yes.
40. And beyond that? Beyond that it is plains for a distance of about 12 miles. Between Brookong station and Urana there is a plain on the main stock route.
41. South from Brookong, what is the country like? Some of it is plain until you get across the Urangeline Creek.
42. What is the country like due west from Green's Gonyah? It is forest land for a distance of 7 or 8 miles.
43. Then you get into the plains? Yes; it is a narrow strip of plain.
44. From Colombo plain to Narrandera and the Jerilderie line, is that all plain country? On the west side of Colombo plain it continues on to the line. From 7 to 10 miles west from Green's Gonyah it is good land, and south-west from 9 to 10 miles it is good land, till you get to the Brookong plains; then the country becomes less suitable for agriculture. South from Green's Gonyah there is good land.
45. These are the boundaries of what you regard as first-class agricultural land? Yes.
46. Of which Green's Gonyah, you believe, will be the centre? Yes.
47. Have you any statistics with regard to cultivation? I collected the statistics for Mr. Stanley Alexander, about five years ago.
48. What was the amount of cultivation then? Within a 15-mile radius it was about 7,000 acres.
49. Did you collect any statistics subsequently? Three years afterwards I collected them, and I estimated the cultivation then, roughly, at about 14,000 acres.
50. Have you collected any statistics recently? Yes. The land under cultivation is, roughly, 21,000 acres now.
51. Five years ago it was 7,000 acres, three years ago 14,000 acres, and now it is, approximately, 21,000 acres, without a railway? Yes; I am sure the increase will go on proportionately.
52. What area of wheat land round Green's Gonyah, in your opinion, would be placed under cultivation (say) in three years, if you knew that a railway was going to be made? I think there would be at least 40,000 acres placed under cultivation—probably more.
53. Would all these Crown lands be under cultivation in five years? Yes, most of them; because it is probable that they would be thrown open in small areas, and men on small holdings must put their land under cultivation to make a living.
54. Is there any tendency amongst the pastoralists here to break up their holdings? That is being done. Brookong station at present has 4,500 acres held on the share system.
55. Are they prepared to extend that? I think so, and other landowners are letting land on the share system.
56. What are the other holdings? There are some on Emu Plains.
57. Will wheat pay them better than anything else? Yes.
58. Then your case is this: that the large landholders who have held their land for pastoral purposes will place it under the share system because it pays them best? Yes; it will not pay to keep such good land for running sheep on.
59. What can they make out of sheep per acre? About 5s. In some seasons more.
60. What would you make out of wheat under fair circumstances? During the last two seasons, at present prices, people have made as much as £3 net, in some cases more. I think you could make a net profit of £1 an acre after paying expenses.
61. You have taken as a basis wheat at 4s.? Yes; during the last two years we have had that price.
62. You might make a statement as to the cost of the production of grain, including clearing, ploughing, seed, and cost of carriage. You want to make it for the first year, and subsequent years; the heaviest work being in the first year? Of course it depends upon what amount of timber is on the land. This forest land at Brookong, which has been rung for a number of years, can be cleared and made fit for the plough at a cost of 7s. or 8s. an acre.
63. What does it cost for breaking up? I think about £1 an acre, altogether.
64. For £1 an acre, in ordinary ringbarked country, could you put in wheat? Yes.
65. *Mr. Black.*] Would you add the cost of clearing to the cost of production for the first year, or distribute it as a capital charge? I would distribute it; because if I clear land this year, that is done for all time.
66. When you said it would cost £1 an acre to put in wheat, did you include the 7s. an acre in that? Yes.
67. That cannot be correct? Seven shillings for clearing, and about 8s. for ploughing.
68. You admit that it is not fair to charge the whole of the expense of clearing to the first year, because you reap the benefit of that in after years? Quite so.
69. How many years do you think you can crop the land successively without letting it lie fallow? From three to five years. We could crop it four years in succession; then we have to fallow it for a time.
70. *Chairman.*] The cost is £1, but of that part belongs to subsequent years; say, 1s. per year? Yes.
71. What will the land return? With proper cultivation I think we could safely say 15 bushels to the acre.

72. Therefore, the profits are exactly what you get per bushel for the wheat, less the £1, plus the carriage? Yes.

73. With regard to other produce that would come to the railway, what wool would there be? I estimate that there would be about 1,000 tons. One station alone has 450 tons—that is, Brookong. Then I think there would be more than double that from the small holders in the district.

74. You believe that Brookong would furnish 3,000 bales, and the small holders in the district would furnish the same? Yes.

75. Then you have tallow and sheepskins? Yes; there would be tallow and sheepskins; and fat stock would be a large item on this line.

76. Where would the fat stock be going to? To Sydney.

77. But where does the fat stock go to now? To Sydney and Albury. They are trucked at The Rock.

78. Do they walk to The Rock? Yes.

79. What number of stock go to The Rock annually? I should say 30,000 sheep.

80. Any cattle? I do not think there would be many cattle.

81. Then as regards return freight, you have no special item to refer to except station supplies? Yes, and farm implements.

82. Is that your whole case, or do you desire to place anything else before us? I have made out a little statement, which is as follows:—

We have been advocating the construction of this line for about ten years. I have been secretary of the Railway League during that time, and have given the matter a deal of consideration.

The reasons for asking for the construction of the line are as follows:—

- 1st. That it will serve one of the finest tracts of agricultural land in the Colony, on which there is already settled a large farming population.
- 2nd. Within the next few months there will be over 20,000 acres of splendid agricultural land thrown open in small holdings which the proposed railway will pass through. Other Crown lands that will be served by this line will be opened for selection at a future period.
- 3rd. Within 15 miles of Green's Gunyah there is already over 20,000 acres under crop, which will be greatly increased if the line is built. It is reasonable to expect that on the opening of the line there would be fully 100,000 bags of wheat grown annually within 15 miles radius of Green's Gunyah; this would put over 10,000 tons on the railway. I estimate that there would be about 1,000 tons of wool carried on the line; about the same quantity of goods. There would also be a large traffic in fat stock, and with passenger traffic and mails the line ought to pay almost from the start. The people served by the line would no doubt be agreeable to pay a higher rate than on the main lines. A large percentage of the holdings in the district range from 320 to 640 acres. The people on these small holdings must cultivate their land to make a living. With proper cultivation the land here will yield an average of 14 to 16 bushels to the acre. The rainfall can be depended on and is sufficient for wheat-growing, averaging about 18 to 20 inches annually. There will be no difficulty about land resumption, as the line passes through Crown lands the whole way to Green's Gunyah. *Re* evidence given in Sydney, have made reports on official evidence given in Sydney in the daily press. One officer stated he did not think the line would pay; I would point out, that it is now four or five years since that officer visited the district. The areas placed under crop have been nearly trebled since then, and there has also been a large increase in the population. I trust, Mr. Chairman and gentlemen, that from the evidence that we will place before you, and the statistics of the district, and from your own observations of the district, that you will be convinced as to the necessity for constructing this railway.

83. *Mr. Roberts.*] Are you aware of any suggestion having been made by a resident of this district for the establishment of a guarantee fund to induce the Government to make this line? Yes; I was one who signed the guarantee some six years ago.

84. Was not the suggested charge 1d. an acre within a distance of 5 miles of each side of the line, ½d. an acre within a further distance of 5 miles, and ¼d. an acre within a radius of 15 miles? Yes; it was signed by landowners representing about 70,000 acres at that time. We thought then it might be necessary to guarantee that there should be no loss on the line on account of there not then being a large area under crop; but we do not think that that would be necessary now.

85. Can you recollect how many gentlemen signed that document? I do not remember. I think the area represented was about 70,000 acres, and they were mostly small holdings. The document was not signed by the large holders.

86. Did six people sign it? Yes, more.

87. More than a dozen? I think so.

88. Have you a copy of it? No.

89. Have any of those gentlemen withdrawn their names since they signed the document, or are they still willing to become guarantors for the line? I have heard that one who signed has withdrawn—Mr. Howard.

90. What area of land does he represent? About 2,000 acres.

91. Is the Committee to understand that the remaining landowners would be willing to make the guarantee to which I have referred? I am quite willing to abide by what I signed then, and I think the others will do the same.

92. Has not the question lately been discussed amongst the interested parties—those who sent the guarantee? Very little has been said about it.

93. You are unable to say more than that you yourself are still willing to stand by the guarantee? I can only speak for myself; but I am sure all the others would stand by it, but we do not consider that the guarantee is required now.

94. You wish to withdraw? No; I do not wish to withdraw from it.

95. Over what portion of the line did these landowners live;—did they represent the whole distance from The Rock to Green's Gunyah? No; I think most of them were living near to Green's Gunyah.

96. Is it true, that in addition to offering this guarantee with regard to the revenue of the line, the people of this district offered to pay double rates for the carriage of grain? That statement was made to the Railway Commissioners some time ago that they would be prepared to pay a special rate.

97. Are you aware what that special rate would be? I think it is about 5s. a ton.

98. Are you aware that for a similar distance—namely, from Jerilderie to Berrigan,—wheat is carried for 2s. 6d. a ton? I was aware that there was a special rate, but I did not know exactly what it was.

99. Are you and your neighbours still willing to pay this double rate of 5s. a ton if the railway is constructed? That statement was made by some of the residents in the route, but not by all. There was nothing signed, but I think the people would be quite willing to pay a special rate if the line were made, because they are paying 10s. a ton to get the wheat carted from here to The Rock. If they could save 5s. they would be satisfied.

- W. Day.
13 Oct., 1897.
100. Do you not think that you would approach the Railway Commissioners very soon after the line was constructed, and ask to be put on the same footing as other portions of the Colony;—would it not appear a hardship to you to pay 5s. a ton for 25 miles when the people around Berrigan are paying only 2s. 6d. for the same distance? It would; but if we could save so much per ton it would pay us to pay the special rate.
101. If you have to pay 5s. per ton, and provide a guarantee fund in addition, what better position would you be in than you are in at present;—can you not get grain carried from here to The Rock for 5s. a ton? No; I have paid 10s., 12s., and 13s. per ton. I have never had any carried for less than 10s. per ton.
102. Ten shillings you regard as the ruling rate? Yes.
103. How far distant, coming towards Green's Gonyah from The Rock, would the farmer use the railway for the carriage of wheat? If there was a station 10 miles from here they would go there.
104. Is it not a fair thing to assume that for a distance of 10 miles from The Rock all produce would go straight to The Rock by dray? Yes.
105. Therefore, there are only 15 miles of country which you can look to for revenue for the proposed railway? If there was a station at Bullengong Creek no doubt there would be a certain amount of produce put on there.
106. But it would not pay them to pay 5s. a ton? No, not so near The Rock.
107. But the Goods Superintendent reckons that 5s. a ton would be the charge for any grain put on the railway between here and The Rock? I could not say that people would pay it within a few miles of The Rock.
108. Close to this line they might pay it, because they could easily put their stuff on the railway, and it would not pay the teams to load it and cart it for 5s. a ton.
109. Would there be any land resumed at all between The Rock and Green's Gonyah? There is a 5-chain reserve for about 18 miles. Then you come on the exchange land, and there are Crown lands for 18 miles just into Green's Gonyah.
110. There would be no compensation for the resumptions required? Not that I am aware of.
111. I notice that Mr. Harper estimated that the quantity of grain would be 4,000 tons, but you estimate that it would be between 10,000 and 11,000 tons? Yes; I think that was about the estimate.
112. How have you located your wheat areas? I have located the whole of it from a point about half-way to The Rock. All east from that I have taken no credit whatever for. Within that area of 20,000 acres there ought to be a return of 8,000 tons of wheat.
113. You have no doubt about those figures? No; I collected them myself.
114. Does that estimate of the produce of the land half-way between here and The Rock include Mr. Breslin's property? No.
115. Is Mr. Breslin's place not exactly half-way? About half-way.
116. You gave an estimate of the amount of wheat that you think will be produced between Breslin's place and Green's Gonyah? Yes.
117. You think that about 8,000 tons of grain will be carried by the railway;—do you arrive at that conclusion from your knowledge of what the land is producing at present, or are you assuming a possible increase if the railway is made? I think that the 20,000 odd acres under cultivation at present will be increased by new settlement, and the larger holders letting land on the share system, and that, by the time the line is made, there will be a much larger area under cultivation.
118. Is there much demand for land in this district? Yes; there is a great demand for land for settlement.
119. And you think that the 29,000 acres which are to be thrown open for settlement within the next few months will be rapidly taken up? There will be a great rush for it. There will be at least fifty applicants for every block.
120. Where will they come from? From all parts of Victoria and the other colonies.
121. Do you often hear people express a desire to come into this district? Yes.
122. Could they get land here cheaper than in Victoria? Yes, much cheaper. In Victoria for good agricultural land they have to pay a higher rent than they pay here.
123. Would this 29,000 acres be taken up by small holders? Undoubtedly; there is such a great demand for land in this district, and it is such good land, that the District Surveyor has thought it desirable to cut it up into small areas.
124. Do you know the Berrigan district? I was through that district some years ago.
125. Can you point to any marked increase in the population since that Berrigan line was made? I cannot say.
126. How far is the Urangeline Creek from here? About 15 miles in a southerly direction.
127. Are they sending their produce from Urangeline Creek to Yerong Creek? Yes.
128. Have you included that in your estimate of traffic? Yes. We have landowners to the north of Urangeline Creek. It is about 30 miles from there to Yerong Creek. Their produce would be sure to come here if we had a railway.
129. Have you made any estimate of the number of trucks of live-stock that will be carried? I have stated that I think there would be about 30,000 fat sheep trucked on this line.
130. How many sheep are carried in a truck? About 100.
131. If the Government estimate is about 400 trucks of live-stock,—you think that would be a fair estimate? Yes.
132. Now we come to the matter of wool;—Mr. Harper's estimate is 800 tons, at 10s. a ton. You estimate that there will be 1,000 tons? Yes. Perhaps Mr. Harper has not included the wool from Boree Creek station, which would come here.
133. How far is Boree Creek from here? About 12 miles north-west. They are carting their wool to The Rock now, and that is over 30 miles.
134. What does it cost them to take it to The Rock at present? About 25s. a ton.
135. What would it cost to bring it to Green's Gonyah? Five or 7s. a ton.
136. Did you include that in your estimate? I did not include Boree Creek wool in my estimate.
137. Did you include the Brookong wool? Yes.
138. Does not the Brookong wool at present go to Victoria? Yes, it goes to Victoria, but you would hardly think they would cart wool 70 miles if they had a railway within 9 or 10 miles.

139. Are not special inducements held out to the Brookong people to send their wool to Melbourne? I think so. W. Day.
13 Oct., 1897.
140. Is it not likely that the rebate will, if necessary, be increased; and is it not almost impossible to make sure of getting the Brookong wool? It is possible.
141. Of course, the Brookong wool must be a large factor in your estimate? Yes. I have no written authority to say that the Brookong wool would come by this line; but if there is a railway within 10 miles you would hardly think that they would cart the wool 70 miles.
142. It would depend upon which would be the cheaper route? It costs more than £2 a ton to send wool by team to Corowa.
143. You have assumed that the railway would get the Brookong clip? Yes. Formerly it went to The Rock and *via* Sydney, and I think if we had this railway it is almost certain that it would again be sent that way.
144. Have you been told so on any reliable authority? Yes; I have a statement, but which was not given in writing. Mr. Nutting said we are not going to send our wool 70 miles if we had a railway within 10 miles.
145. No figures were gone into as to what it could be taken into Victoria for or down to Sydney? No.
146. You say that five years ago there were 7,000 acres under cultivation in this district, three years ago there were 14,000 acres, and at the present about 21,000 acres? Yes; about that.
147. To what do you attribute that rapid increase of the area under cultivation? To increased settlement, land being thrown open during the last five years, and to the Brookong people letting land on the share system.
148. Was there a difficulty in obtaining land until the last few years? It was known that the land would produce wheat some years ago, and the demand brought the people there.
149. As land was obtainable people were anxious to settle upon it? Yes; if there was ten times as much land available it would all be taken up.
150. And you think that if the proposed railway were made there would very soon be 40,000 acres of land here under cultivation? Yes.
151. Within what period? Say, within three years.
152. Are the people unanimously in favour of paying this 5s. a ton for carriage, or is there a large majority who are willing to pay this double rate? Some have expressed themselves willing, and others are not quite so favourable.
153. Was it put into writing before the Railway Commissioners? No; the Railway Commissioners only stayed an hour, and it was simply a statement made to them.
154. How many were present? About as many as are in this room to-day.
155. And they were unanimous? Some did not make any remark. The statement was made, and there was no contradiction.
156. *Mr. Black.*] When do you get your best rains? Just at the proper season of the year for wheat-growing—in March and April, the sowing-time, and in winter and in spring.
157. You have given figures with regard to population and area; have you any idea of the number of sheep on the land within the area that you have described? I should say there are about half a million sheep. At Brookong there are over 200,000 sheep; then there are the sheep of all the small holders.
158. How many acres does it take to keep a sheep? Improved land will carry a sheep to the acre in all seasons. The land of many of the small holders is carrying one and a quarter and one and a half sheep to the acre.
159. In seasons of heavy rain does the water lie on the land at all? Yes, in small patches; but nearly all the land is sufficiently dry for cultivation in all seasons.
160. You have no waterlogged, boggy land? A very small area.
161. Can you tell us at what price it pays the farmer in this district to grow wheat? It pays very well at 2s. 6d. per bushel—in fact, it can be produced for less than that; it can be produced for 2s. a bushel.
162. Are you sure that the cost of production, which you say is about 14s. an acre, is correct? That is my estimate.
163. Does it include reaping and carting? The ploughing includes the seed.
164. Does the cost of production which you gave the Chairman include reaping and carting? No.
165. If you got 14 bushels to the acre, and received 2s. 6d. a bushel, that is 35s., and the cost being 14s., you have a return of upwards of £1 an acre? I said I considered that there would be a net return of £1 an acre; the return has been much better than that at 4s. a bushel.
166. In ten years, how many years of complete failure will you be likely to have? I have never known a complete failure whilst I have been in the district.
167. How many partial failures would you have in ten years? One year we had a dry spring and the crop was a bit light. The last seasons have been dry, and the crops have been fairly good.
168. Then there is not much foundation for the complaints of those Members who go to Parliament and ask for donations of seed-wheat for the farmers? The people in this district will never ask for that.
169. Would it pay you to produce wheat at 2s. a bushel? Yes.
170. Are you aware that Mahonga and Brookong stations are owned by Melbourne people? I understood that Brookong was owned by a Scotch firm.
171. Did you put down the Mahonga wool in your estimate? No; but I put in the Brookong wool.
172. Mr. Roberts was asking about the guarantee;—would you prefer to enter into that guarantee or to pay special rates on the line? I should prefer to pay special rates.
173. Is it not usual where people have a railway constructed by the Government, and special rates are charged, to apply to the Government after a short time to get the rates reduced? I have heard of it.
174. Do you think the people in this district are different from people in other districts? I think that if they state that they will pay a special rate they are prepared to do so, and considering the increase in the production of grain we might expect within a year or two that we should not want the special rate long.
175. You think that the traffic will so increase that the railway will be self-supporting? Yes.
176. Do you think it is likely that large townships will spring up here? I think there will be a good sized town here, because this place is surrounded by good agricultural land.
177. What about the water question? That can easily be dealt with, because there is a creek here, and all they have to do is to make dams.
178. How often does it rain here? The last two seasons it has not rained much, but I have seen it raining for several years in succession.
- 179.

- W. Day.
13 Oct., 1897.
179. Where would you dam the water? The creek could be dammed at any part.
180. There would be no danger of backing the water up too far, and flooding valuable land? None whatever.
181. You think that that would be sufficient for the wants of the inhabitants for some time? Yes; a large dam would be sufficient.
182. If the railway were constructed it would be necessary to have other railway stations on the route besides the one at the terminus? Yes.
183. Where does your experience show that the stations should be? According to my experience there should be one station here and another 9 miles further eastward at Milbrulong, then there should be one about Bullengong Creek, 9 miles further on.
184. How far on The Rock side of Bullengong Creek will the people take their produce to Bullengong station between there and The Rock? I do not suppose they would cart it more than a couple of miles.
185. They would rather cart it 7 miles to save the freight than bring it 2 miles to Bullengong? They may prefer to bring the produce 3 miles; it depends upon circumstances. If the road is bad they would prefer to take the produce 13 miles to the Bullengong station.
186. What is the distance of the nearest part of that 29,000 acres from The Rock? About 13 miles; that is, what is on the Bullengong, but the nearest point of the great bulk of the land would be about 18 miles. It would average about 25 miles away.
187. Do you think those people are likely to use the proposed railway who are 12 miles from The Rock? Yes.
188. How far would they be from the proposed line? They would be about 1 mile more.
189. Then, if there is a station convenient, they will use the line? Yes.
190. *Chairman.*] Is there any road from the land proposed to be acquired in exchange in the parish of Clyde? Yes.
191. What sort of country is it to travel over? Very bad at times.
192. Is it low-lying country? Yes; some of it. The traffic from Clyde would be inclined to go to Yerong Creek.
193. If there was a railway station at Green's Gonyah, would the traffic come from that exchanged land to Green's Gonyah instead of going to the main line? The bulk of it would. That must be 25 miles from Yerong Creek, and this land would lie within 12 miles of Green's Gonyah.
194. Then the case from Green's Gonyah, it being the centre, is this: 12 miles of carriage pays 5s., with 3s. rate upon the railway, as against 25 miles' carriage on the main line? Yes.
195. Noting the fact that a 5s. rate may be charged in the first instance for wheat, will the produce of that land, which is likely to be obtained by the Crown in exchange, come to Green's Gonyah rather than to the Main Southern line? Most of it will.
196. You say that upon a full consideration of the facts? Yes.
197. *Mr. Roberts.*] Where do the supplies for the district come from? From Wagga Wagga and Sydney.
198. Is there much business done with Melbourne? A good deal of machinery comes from Melbourne, but most of the people deal with Wagga Wagga and Sydney.
199. If goods be landed cheaper at Green's Gonyah from Sydney than from Melbourne, from which place would they be obtained? I believe that carriage is much dearer from Albury to The Rock.
200. You are aware that it is 71 miles further to Sydney than to Melbourne? Yes. The people here principally get their supplies from Wagga Wagga; some get them from Sydney.
201. Then, of course, there is the cost of trans-shipment where the two lines join? Yes.
202. What is the cost of trans-shipment? I do not know.
203. You say that all the machinery comes from Melbourne? Not all of it, but some. There is more manufacturing carried on in Melbourne; people cannot get what they want in Sydney.
204. I believe that the plough manufactured in Victoria is more in favour than those sold by the Sydney merchants? Yes; and we get strippers from South Australia.

Patrick Breslin, farmer, French Park, sworn, and examined:—

- P. Breslin.
13 Oct., 1897.
205. *Mr. Black.*] How long have you been in the district? About thirty-five years.
206. How long have you occupied your present holding? Sixteen years.
207. How many acres have you there? About 2,600 acres.
208. Have you held that from the beginning? No.
209. You have added to it? Yes; my first selection was 1,100 acres.
210. How did you use your land when you first took it up? For grazing only.
211. When did you begin cultivating? Very shortly after I came there.
212. I suppose you came there soon after the opening of the railway? Yes.
213. How many acres have you under crop? About 225 this season.
214. Is that more or less than you had last season? It is about the same quantity. I was prevented by the dry season from putting in more.
215. How many more acres would you have had if the season had been favourable? 100 acres more.
216. Do you propose to put that under crop next year? Yes; and to add to it very much; I hope to be able to put in about 1,000 acres.
217. That is a big jump? I intend to do it on the share system.
218. How do you send your products to market? I send it by teams to The Rock.
219. When you employ carriers what does it cost you per week? I have paid 9s. a ton sometimes for it; I paid 8d. a bag this year.
220. How far are you from The Rock? Twelve and a half miles.
221. Eightpence a bag is 6s. a ton? Yes.
222. How do you get your wool away? I always cart my own wool.
223. What do you reckon that it costs you? I have paid as high as 12s. a ton.
224. I suppose it is worth 6s. a ton to you to do it, considering the labour and wear and tear? Yes.
225. If you could get your wheat and wool carried by rail from there from the two stations that a beneficent Providence is going to put down at your door you could afford to pay 3s. a ton? If the station is where it is proposed to be I could not use it—it will be too far away. 226.

226. You would prefer to cart 12½ miles instead of 3 miles? I could not cart that distance.*
227. When you have wool on the dray you would as soon take it 12 miles as 3 miles? No; I would not; I would go 3 miles towards The Rock, and put it on the railway there.†
228. If there is a station 3 miles from you, and 9 miles from The Rock, would you not use it? I would.‡
229. What have you been able to get off your land per acre? About 14 bushels.
230. Is that a fair estimate? It is a small estimate.
231. Some land gives a better return when it has been a year or two in use, does it not? It does.
232. How many crops do you think you can get without allowing the land to lie idle for a time? I am not a very good authority on agriculture. I have got a twelfth crop in the ground now.
233. Is that extra good or only fair average land? It is only fair average of the land that I have.
234. Some of your neighbours talk of going in for dairying; have you any designs in that direction? No.
235. Is it because you prefer wheat-growing? No. I have not the requisite facilities for dairying. I think that for dairying you ought to have a water-frontage or water supplied by artificial means.
236. Do you agree with Mr. Day's evidence with regard to the cost of production? Pretty fairly. I think he has under-estimated it in some cases.
237. And has he under-estimated your profits as well? I think he has. I keep an account of everything that I do. I pay men's wages, and pay for machinery, and after taking the cost of production, and allowing 15 per cent. off the machinery and horses, I realise not less than 36s. an acre.
238. What do you think the wear and tear of machinery and horses comes to per acre? I have not reckoned it.
239. Would it come to a 1s. an acre? I consider that it would.
240. You have found the rainfall so far satisfactory in regard to wheat-growing? Fairly satisfactory; we could do with a little more at times.
241. Have you any other information for the Committee? Nothing more than to show that there are Crown lands adjacent to my place which would be thrown open in the course of time. The Bullengong Estate adjoins mine.
242. Do you desire to corroborate Mr. Day's evidence? Not exactly. I think that he is in error in some respects. He has not as good a knowledge of the country as I have. This Bullengong land which is to be exchanged for other land is on my boundary. There are 3,000 or 4,000 acres of Crown lands that will be available in a very short time. First-class agricultural land a mile from the proposed railway line.
243. How many sheep have you? Generally about 3,000.
244. *Chairman.*] What is the return per acre from land devoted to agricultural purposes? I think that I can say without any doubt that it is 25s. an acre.
245. What would a pastoral area give? It will do well if it gives 4s. 6d. an acre.
246. Therefore, the difference is about £1? Yes.
247. What about the position for a station? Although I am not prepared to urge any special position for a railway station, still I may point out that there are Crown lands in the parish of Tootal, also some lands west of that adjoining the road to Hanging Rock. I do not desire to urge it strongly, but I believe that if the matter were looked into that would be found to be the right position to suit the people in that vicinity.‡
248. *Mr. Black.*] How about providing water;—is the ground good for holding water? Yes; it will hold water like a tin bucket.

P. Breslin.
13 Oct., 1897.

Charles August Lindner, farmer, Green's Gunyah, sworn, and examined:—

249. *Mr. Roberts.*] How long have you lived in this district? I have been here six months.
250. On what portion of the proposed line is your property? The station on the line for me would be Milbrulong.
251. How far is that from The Rock? Sixteen miles.
252. What is the area of your holding? 640 acres.
253. What portion of that is under cultivation? None of it. I got the land too late to put any wheat in. I am getting a quantity of land cleared ready to put in wheat for next year.
254. Do you confine your attention to grazing at present? Yes.
255. How many sheep have you? I have a little over 200 at present.
256. How many acres do you intend to sow for next year? I am getting 150 acres cleared, and I intend to put it all under wheat.
257. Will the construction of this line be of any great benefit to you? Yes.
258. What would be the usual rate of carriage from your holding to The Rock? I think 7s. 6d. a ton for wheat.
259. Did you hear the evidence of Mr. Day? Yes.
260. Do you endorse all he stated? Yes.
261. Have you been able to form an estimate as to the amount of wheat that would be carried on this railway? No; but I think the statistics under-estimate the quantity. I know that the crop has increased since the statistics were collected.
262. Is there much cultivation in the neighbourhood of your own property? Yes; there is a good deal. Most of the settlers only came there last year, and were unable to get much in on account of dry seasons. They all got in as much as they could, and most of them are clearing now in order to get more in for next year.
263. If you have only been here six months, what opportunity have you had of checking Mr. Day's figures? I went over to Mr. Day for the purpose. I have lived between 30 and 40 miles away from here for years.
264. You are tolerably well acquainted with all the settlers between here and The Rock? Yes; fairly well.

C. A. Lindner.
13 Oct., 1897.

265.

* *NOTE (on revision)*:—I could not use the stations as suggested—Milbrulong or Bullengong Creek—Milbrulong being 4 miles westerly, and Bullengong Creek 5 miles easterly from me; I would prefer to cart direct to The Rock.

† *NOTE (on revision)*:—If a station or platform were within 2 or 3 miles in the direction of The Rock I would use it.

‡ *NOTE (on revision)*:—There is a reserve for camping in the parish of Tootal, on portion 78 of 129 acres, and westerly from that about 70 acres of Crown Land, in addition to portion 78 adjoining the railway line. A station or platform on either of these portions would be of great advantage to a number of settlers situated about 11 miles westerly from The Rock.

C. A.
Lindner.
13 Oct., 1897.

265. And you have a fair knowledge of the amount of wheat that each individual takes off his land each year? No; I never went into that.
266. How could you endorse Mr. Day's figures unless you could check them by information obtained from the different landowners? I do not say that I endorse the whole of Mr. Day's statements. Some of them are under-estimates.
267. Are you aware that the estimates put in by Mr. Day are certainly double the amount of those prepared by the Goods Superintendent? Yes.
268. It would be an important point if you could impress upon the Committee that Mr. Day's estimates are correct, and that those of the Goods Superintendent are altogether under the mark? I think that matter can be explained. The statistics of the Goods Superintendent were collected prior to those prepared by Mr. Day.
269. Do you know of any landowner in the district who would be prepared to swear to Mr. Day's figures? No.
270. *Mr. Black.*] Do you know the land at Brookong that it is proposed to throw open for settlement? Yes; I have been over most of it.
271. We have it in evidence that there are 29,000 acres; have you heard that the area is greater than that? I heard some little time ago that a letter was received from the Under Secretary for Lands, stating that the area would be 32,000 acres; but that was prior to the recent sitting of the Land Board at Wagga Wagga, when the exchanges were dealt with.
272. Do you know under what system they propose to throw the land open? I think under homestead selection.
273. Have you formed any opinion as to the best method of taking up land? I think homestead selection is by far the best way.
274. Do you think it prevents land from being taken up for speculative purposes? Yes.
275. Can you tell by the improvements whether the land is wanted for settlement, or is taken up to sell? Yes. They are putting on the best of improvements that I have seen on any newly taken up area. They are erecting strong fences and good houses, and clearing the land well.
276. Then you think the extension of the homestead selection system to Brookong would offer the best guarantee that the railway would prove payable? I think so.
277. Is there much flooded country here? There is no flooded country about here.
278. Do you think the people in your neighbourhood would use the railway if they had one? I think so.
279. They would not continue to cart their produce to The Rock? I certainly would not; common sense would lead me to make use of the railway.
280. How far are you from The Rock? About 16 miles.
281. What can you afford to pay per ton from there to The Rock? I suppose I should pay what I must pay.
282. If they pay 5s. a ton from Green's Gunyah by railway, would it be fair to charge you 4s.? I daresay it would be.
283. *Chairman.*] You are one of the deputation from the body of men we saw yesterday? Yes.
284. How many men are there in that locality? The locality is a very large one. From where you saw the deputation yesterday there is an extent of good country going westerly, southerly, and northerly, towards Bullenbong Creek.
285. How many men were there where we saw you yesterday? The residents were not all represented.
286. Is there anything else you desire to mention? Yes. I was instructed specially to say that a railway station should be recommended at the crossing where you met us yesterday.
287. How many people would use that station? An enormous number. There are settlers alongside of each other on each side, both north and south.
288. Your statement is that at Milbrulong, where we met you yesterday, there is a considerable area of agricultural land; a number of settlers are cultivating it, and they would reach the railway at that point? Yes.

John Henry Mentz, farmer, Milbrulong, sworn, and examined:—

J. H. Mentz.
13 Oct., 1897.

289. *Chairman.*] How far are you from Green's Gunyah? 10 miles in the direction of The Rock.
290. Are you on the north or the south side of The Rock? On the north side.
291. You are in the district referred to by Mr. Lindner? Yes.
292. What area have you got? 320 acres of leasehold land.
293. How much are you cultivating? I have 150 acres under crop.
294. Do you send any wheat away? Last year I sent away the produce of 100 acres.
295. Where did you send it to? To The Rock.
296. What did it cost for carriage? 9s. a ton.
297. How far north are you from The Rock? The farm is about 18 miles from The Rock.
298. Are there many farmers there? Yes; a great number.
299. Is the land good to the north and south? It is splendid land.
300. Where were you before you came here? Albury.
301. You have no doubt of the success of cereals here? I am sure of that.
302. Are Mr. Day's statistics correct as far as you are concerned? I am convinced that they are correct.
303. Do you see any hope of getting your wheat carried by road cheaper than the rate quoted to us? Not unless there is a lot of competition between the carriers.
304. Therefore, whatever the railway does cheaper than 9s. a ton will be that much saving to you? Yes.
305. Do you want to say anything about the railway station site? I think the site suggested is the proper place for it. I refer to the spot mentioned by Mr. Lindner.
306. You agree with Mr. Lindner with regard to the position of the railway site close to the crossing of the route? Yes; and I desire to say that I have heard the evidence given to-day, and I agree with it in all important respects. I may state the reasons that brought me here. I have great faith in this place. I can see that it is a coming place. If the proposed railway did not pay at first, it is bound to pay within a couple of years. The quantity of land being taken up by the homestead selection clauses is a guarantee for the railway. There is no doubt that the land in the Brookong district is some of the best agricultural land in the Riverina country.

John

John Rawson, jun., farmer and grazier, sworn, and examined:—

307. *Mr. Black.*] Where do you reside? In the parish of Napier.
308. How many miles from The Rock? About 20 miles, but I do not go to The Rock railway station. I go to Yerong Creek, 16 miles from my place.
309. How far would you be from the proposed railway? About $4\frac{1}{2}$ miles.
310. You are south of the proposed line? Yes.
311. What is the size of your holding? 5,800 acres.
312. How much of that is under cultivation this year? 310 acres.
313. How much had you under cultivation last year? About 180 acres.
314. How much do you expect to have under cultivation next year? I have no idea at present of increasing the area, but I may increase it if we get a railway.
315. You cultivate your own land? Yes.
316. What do you pay for road carriage to Yerong Creek? 16s. a ton for wool. I have paid from 7s. 6d. to 9s. per ton for wheat. It depends on the competition amongst the carriers.
317. If the railway were constructed, would you cart your wheat 4 miles to the railway, instead of 16 miles to Yerong Creek? I should go to the railway.
318. What would be your nearest point to the railway? On the boundaries of Urana and Mitchell counties, where it intersects The Rock and Green's Gunyah Road at Milbrulong.
319. Are there many other farmers and graziers around you? Yes; according to Mr. Day's statistics the population is 193, cultivation 4,850 acres, and the acreage of the farmers holdings 37,000 acres.
320. Is all that south of the route? No; it is north and south.
321. How many miles south of the route would people use the railway? I think from 10 to 12 miles.
322. How far south have you collected your statistics? About 10 miles.
323. How far north? Some other collector went north—I suppose for about 10 miles.
324. Do you agree with the evidence given by Mr. Day? I do in a general way.
325. Are there any points on which you differ from him? Yes. I promised to pay 1d. an acre tax on all my land within 5 miles of the railway, but I should not like at the same time to pay a heavier rate for the carriage of goods. I should prefer only to pay an additional rate for carriage, and that would touch all who have not agreed to pay the additional penny an acre for land within 5 miles of the railway. Some landholders did not agree to pay that tax of 1d. an acre.
326. Suppose that the Brookong people do not use the railway, but wish to send their wool to Melbourne? Unless they pay the guarantee of 1d. an acre, that station will not pay its quota towards any loss on the railway. It is very valuable land at Brookong, and I do not think they would use it for grazing purposes if we had a railway. They would either dispose of it or let it on shares. Therefore it would come under wheat. I believe they have already let large quantities of land on the share system.
327. I suppose you look on agriculture as being better not only to the men who cultivate the land, but also for the whole country? Decidedly; cultivation brings population, and that causes traffic of other kinds which benefits a railway.
328. Do you consider that Milbrulong is a place that is entitled to have a station or siding? Yes; because all the principal roads of the district converge on that point. There is a large amount of settlement there, and there is a great deal of Crown lands.
329. Is there permanent water in the vicinity? No; all this country is waterless country unless it is made. There has been no effort made to get artesian water yet.
330. *Chairman.*] How far in this district can you carry wool or wheat for 5s. a ton? I think 10 or 11 miles. They generally charge a little more for wool than for wheat, because when they are carrying the wool the season is not so favourable. The wheat is carried in the summer time.
331. Have you had an opportunity of seeing the statistics which have been handed in by Mr. Day? Yes.
332. Are they correct? Yes.
333. Do you know the methods by which they were collected? Yes; I helped to collect them, and we collected them as honestly as possible, so as not to deceive you. There is one thing I wish to say, and that is that owing to the increased growth of wheat, if we fail to get a railway it will entail a large expenditure in the making of roads. The present roads will not carry the traffic.
334. About 1 acre in 50 is under cultivation, and what are the other acres like? They are all of the same quality.
335. You are prepared to say that three-fourths of that land is as good as that which is already under cultivation? Yes; four-fifths of it.

J. Rawson,
jun.
13 Oct., 1897.

John Hardie, farmer, The Rock, sworn, and examined:—

336. *Mr. Roberts.*] Where is your property situated? About $9\frac{1}{2}$ miles from The Rock, in a westerly direction, towards Green's Gunyah.
337. What area do you hold? 670 acres.
338. How much of that is under cultivation? 104 acres.
339. How long have you held the property? Portion of it about eight years—that is, 160 acres.
340. Then you increased it to 670 acres during the last four years? Yes.
341. Will you tell the Committee what area you put under crop during the past year? I commenced with 40 acres, and increased it up to the present area.
342. Do you intend to increase the area under cultivation in the future? Yes.
343. Do you live on the south side or the north side of the route? Upon the north side; half a mile or 1 mile from the main road.
344. Would this railway be of any use to you if constructed? Yes.
345. What do you pay for carriage now? I have paid 5s. on the average when the roads were in good order, but I have offered much more than that when the roads were not in good order.
346. In what way would a railway be of advantage to you? For getting wheat, chaff, and other products away.
347. At a lower price than you have been paying? Yes.
348. What would you regard as a fair railway rate, seeing that they will have to pay 5s. from Green's Gunyah? I should regard 2s. 6d. or 3s. a ton as a fair thing if the charge is 5s. from Green's Gunyah.

J. Hardie.
13 Oct., 1897.

- J. Hardie.
18 Oct., 1897.
349. Therefore, you would hail with satisfaction the construction of the line? Yes.
350. Had you anything to do with the collection of the statistics which were handed in by Mr. Day? I collected some in my own neighbourhood, within 6 miles of The Rock.
351. Are they included in those put in by Mr. Day? No.
352. For what purpose did you collect these statistics? In order to have evidence to bring before the Committee on this occasion.
353. What is the number of the settlers, and the aggregate of their holdings? There are thirteen settlers, and the largest holding is 2,460 acres, and the smallest 320 acres.
354. Have you the number of acres under cultivation? Exclusive of Mr. Birslens, there are 1,220 acres under cultivation.
355. What is the total number of acres? 6,042 acres.
356. Are you prepared to say positively that all the landowners whose names appear on the document you have handed in will make use of the railway? Yes.
357. Speaking roughly, what distance is the forest from the road on each side, north and south? The forest is only 1 mile. There are thirteen holdings, all within $\frac{1}{4}$ mile of the forest.
358. And all within 10 miles of The Rock? Yes.
359. If a rate of 2s. 6d. or 3s. a ton be charged, you are satisfied that they would make use of the railway? Yes.
360. How many sheep do you run on your land? From 500 to 1,000.
361. Do you send your wool to The Rock? Yes.
362. Do you pay the same rate of carriage for that as you do for wheat? More has to be paid for wool than for wheat. Most of the settlers cart their own wool. Some pay 10s. a ton for the carriage of the wheat.
363. What do you pay? I cart it myself.
364. Would you mind saying to what expense you are put in carting it? It will cost from 2s. 6d. to 3s. a ton at the very least.
365. It only cost you 2s. 6d. or 3s. a ton to cart your wool, but if you employed a teamster it would cost you 10s. a ton? Yes.
366. Are you sure that you have made full allowance for the amount of labour, time, wear and tear of your plant in carrying the wool, when you say that it would cost 2s. 6d. or 3s. a ton? I hardly think that I have. In the event of an accident it would never cover anything like it.
367. If the railway were constructed you would use it? Yes.
368. Did you hear the evidence given by Mr. Day this morning? Yes. I agree with his evidence.
369. From your knowledge of the district, do you think that Mr. Day over-estimated the wheat traffic when he said that there would be between 10,000 and 11,000 tons of wheat carried annually on this railway? I could not answer that question, because I have not inquired into the matter.
370. *Mr. Black.*] What was your reason for only collecting those names and areas within such a short distance of the proposed railway line as 1 mile? The other holdings that are outside that are either too close to Yerong Creek to come on to this line, or else they are too close to The Rock. On the Urana Road there are a couple that I felt doubtful about.

William Litchfield, farmer, sworn, and examined:—

- W.
Litchfield.
18 Oct., 1897.
371. *Chairman.*] Where do you live? In the parish of Clive.
372. How far are you from Green's Gunyah? About 12 miles, on the southern side of the proposed line.
373. What areas have you? About 6,000 acres.
374. How much of that have you under cultivation? I have two properties. The produce of one will come to Green's Gunyah. I can speak with regard to both Green's Gunyah and Milbrulong.
375. How far are you from Milbrulong? About 8 miles.
376. From which of your cultivated areas will the produce go to Milbrulong? I have 160 acres, the produce of which would go to Milbrulong this year if the line were made.
377. Did you ever send any produce from there to The Rock? No.
378. What do you think would be the cost of carriage to The Rock? I have sent the produce to Yerong Creek, and I pay 10s. a ton.
379. How far are you from Yerong Creek? Eighteen miles.
380. What will it cost to draw from your place to Milbrulong? That would be about half the distance—I should think the cost would be about 6s. a ton.
381. Do you regard Milbrulong as a good centre? Yes.
382. Would you extend your area under cultivation if there was a railway? Yes.
383. Where is your other property? In the parish of Hebden, about 9 miles south of Green's Gunyah.
384. From there would you draw direct to Green's Gunyah? Yes.
385. What would your road carriage from there to Green's Gunyah be? Five or 6 shillings a ton.
386. How far are you from the main line? About 25 miles.
387. What does it cost you if you send produce that way? Twelve shillings a ton. I have paid for both wheat and wool.
388. Do you know this district well? Yes.
389. You have heard the evidence given with regard to the suitability of the land for the growth of wheat—do you agree with that? Yes. The second property to which I am now referring has an area of 1,280 acres, of which 600 acres are under cultivation.
390. Are you prepared to increase that if the railway is extended to Green's Gunyah? I should do so.
391. What return do you usually get? About 12 bushels an acre.

Maurice Carroll, farmer and grazier, Boree Creek, sworn, and examined:—

- M. Carroll.
3 Oct., 1897.
392. *Mr. Black.*] What are you? Farmer and grazier, residing at Boree Creek, north from here.
393. How far off? Where I am residing is about 9 miles from here.
394. Where do you take your produce to? To The Rock principally.
395. If the proposed railway were made you would come here of course? Yes.
396. How many acres have you altogether? About 2,600 acres.
397. How many acres have you under cultivation? I have 220 under wheat.

398. How many sheep have you on the rest? About 4,000 this year.
399. What do you pay now for carriage to The Rock? I have usually paid 1s. a bag, or 9s. a ton.
400. If you have to cart to Green's Gunyah, what would the charge be? I expect it would be about 6d. a bag.
401. What would you be prepared to pay for railway carriage from Green's Gunyah to The Rock? I would pay 5s. a ton, and extend the area that I have under cultivation. I should not save much in carriage, but I could let my land instead of having 220 acres under cultivation. I would let about 2,000 acres.
402. You think that if the railway is made it is likely to largely increase the area under crop? Very much.
403. In your case it is likely to be multiplied by ten? It would.
404. Do you think that yours is a fairly representative case? I do.
405. What is the character of the land between here and Boree Creek? It is extra good.
406. Is it superior to the land about here? I believe it is as good—it is forest land.
407. How far are you from the plain country? I think it is about 1½ mile from where I am; there is a small plain close by which is good cultivation land.
408. Is there any flooded country about where you are? No; it is all good sound land for wheat.

M. Carroll.
13 Oct., 1897.

Thomas Bond, farmer and grazier, near Green's Gunyah, sworn, and examined:—

409. *Mr. Roberts.*] How long have you resided in the district? About sixteen years.
410. What is the size of your holding? My brother and I hold jointly about 5,700 acres.
411. How much of it is under cultivation? 210 acres.
412. Is that more than in previous years? No. We had 280 acres cleared, but it was so dry this year that we could not get the wheat in.
413. How many sheep do you run on your property? We shear about 6,000, and we sell a good few off in winter before shearing.
414. Where do you send your wool to? It is going to Melbourne this year.
415. Where is your property? About 7 miles south of Green's Gunyah, in the parish of Napier.
416. Has your wool hitherto gone to Sydney? It has gone both ways.
417. What advantage to you is it to send it to Melbourne? It has been more a matter of choice than of advantage.
418. Do you find it cheaper to send to Melbourne? I do not think there is much difference.
419. Is the difference in favour of Melbourne? No. I would rather send it to Sydney only on account of the firm. We sent to Melbourne because we would rather do business with them.
420. Would you mind saying what advantage it is to you to send your wool to Melbourne? I do not know that there is any advantage in it, but we promised to send it to Melbourne. We preferred to send it to Sydney, and last year we did send it to Sydney.
421. The prices are almost the same? Yes.
422. If this railway were made, would you make use of it? Certainly I would.
423. Is it not possible that you still might send the wool to Melbourne? I do not think so.
424. Have you taken any active part in the agitation for this railway? I have collected some of the statistics.
425. Did you collect any of the statistics that were laid before the Committee by Mr. Day? Yes; a portion of them.
426. Are you prepared to swear to the truth of those figures? Yes; to the truth of the figures as being the figures that were given to me.
427. To what area of country do they apply? I went about 14 miles south from Green's Gunyah.
428. Are you positive that all the persons whose names you put down on the list would make use of this railway? As far as I could gather from them, they would use it.
429. What do you pay for carriage to The Rock? From 9s. to 12s. for wheat, and from 15s. to 25s. for wool. During the last two years we have paid 15s. a ton for wool to Yerong Creek.
430. Why do you prefer to send it to Yerong Creek? We have always been able to get it carted there more easily than to The Rock.
431. Would you send it to Yerong Creek whether it is going to Melbourne or Sydney? Yes.
432. Are many of the people whose names you have put on the list as likely to use the proposed railway now sending their wool to Melbourne? Some of them send it to Melbourne and some to Sydney.
433. You have every reason to believe that they would make use of this railway? Yes; they would make use of it—most of them—from the station at Green's Gunyah.
434. But is it a fair thing to put this area into these statistics unless you feel satisfied beyond all doubt that either wool or wheat will go by this railway? That is what I do feel satisfied of. The farthest of them would be under 14 miles, and those who send to Yerong would have to cart over 30 miles.
435. Would the fact of their having to cart over 30 miles make it cheaper for them to send to Sydney than to Melbourne;—would they be able to land their wool cheaper in Sydney by this line? Yes; they should be able to do so.
436. What rebate do you get on wool going into Victoria? I do not know what the charges are.
437. Is it not quite possible that if this railway is made, a still more liberal rebate may be allowed by the Victorian railway authorities to get the traffic? That is more than I can say. We should be more inclined to send to Sydney, because it would be sending a considerable distance round to go to Melbourne.
438. Where do you get supplies from? From Wagga Wagga and Sydney.
439. Do you not obtain them from the other side of the Murray? No.
440. Would you be sending any live stock by way of The Rock to Sydney if the railway were constructed? Yes. We go in a great deal for fattening, and our sheep have gone to the top of the market for many years past. The sheep bought from us by a dealer this year took the first and second prizes at Albury as fat sheep. Others went to the top of the market in Sydney as fat sheep.
441. Can you say that there will be a large live-stock traffic from here? Yes. About two winters ago we went to the top of the Sydney market in three drafts out of four sent up. With reference to the wheat, there is a matter which I have not heard the witnesses mention: the millers give a certain price at the railway station, one price at The Rock, and one at Yerong Creek, and we should get the same price at Green's Gunyah if the line came there, and save the carriage.

T. Bond.
13 Oct., 1897.

- T. Bond. 442. If this railway should become an absolute fact, would you largely increase the area under cultivation? Yes; unless wheat went lower than I have ever seen it before.
 13 Oct., 1897. 443. What would you regard as the minimum? We made it pay at 2s. a bushel.
 444. Would you adopt the halves system? No; I prefer to do more myself.
 445. You think that if a railway was constructed here there would be a very great impetus given to wheat-growing in this district? There is not the least doubt of that. One of the first things which the farmers ask when they want land is, "How far is it from the railway station."
 446. Is there a large demand for land in this district? Yes.
 447. And there is no fear but what the 29,000 acres which are soon to be available will be eagerly sought after? Not the slightest doubt.
 448. *Chairman.*] Mr. Roberts has asked you, with regard to these statistics, if you believe them to be correct? Yes.
 449. You believe that there are 21,000 acres under cultivation now? Yes.
 450. You notice, also, that the area over which the statistics were collected comprises 300,000 acres? Yes.
 451. Therefore, 14 acres out of 15 acres are still under pastoral occupation? Yes.
 452. If a railway be constructed, what proportion of that 14 acres out of every 15 acres will be devoted to agricultural settlement? I believe that quite nine-tenths of it is fit for cultivation.
 453. How far will 5s. carry their wool or wheat at the ordinary rates? I have never had to make a bargain for that; but I should think about 9 or 10 miles.
 454. You see on the map an area of country, etched white, lying south of the parish of Napier? Yes.
 455. How far is that from Yerong Creek? About 23 miles.
 456. What rate would a person have to pay per ton for the carriage of wool or wheat from there? About 15s. for wool, and about 10s. for wheat.
 457. What would you have to pay to Green's Gonyah or Millbrulong? From the centre of it, about 5s. a ton for wheat.
 458. Would the produce from that country, when developed, come north or go east? It would come northward.
 459. Have you any doubt about it? Not the slightest.

Michael O'Connell, farmer, Green's Gonyah, sworn, and examined:—

- M. O'Connell. 460. *Chairman.*] You are a resident of the Green's Gonyah district? Yes.
 13 Oct., 1897. 461. You have heard the statement made by Mr. Day? Yes.
 462. Your knowledge of the district enables you to speak positively with regard to it? Yes.
 463. Do you consider Mr. Day's statement to be true? Yes; I agree with him.
 464. *Mr. Black.*] How long have you been in the district? About twenty years.
 465. How many acres have you? 640 acres, of which I cultivate about 60 acres.
 466. Do you intend to increase the area under cultivation? Yes.
 467. How many acres will you have under cultivation next year? Probably about 200 acres.

John Lloyd, farmer and grazier, sworn, and examined:—

- J. Lloyd. 468. *Chairman.*] Where do you live? In the parish of Clive, about 14 miles south-east from here. I am a farmer and grazier.
 13 Oct., 1897. 469. What area have you? 1,649 acres, including leasehold.
 470. What area have you under crop? 160 acres.
 471. Where have you taken your crop to previously? To Yerong Creek.
 472. What rate do you pay for carriage? Last year I paid 7s. 6d. a ton.
 473. What is a fair charge? Eight shillings or 9s. The charge last year was the lowest I ever paid.
 474. If this railway was made where would you send your produce? To Milbrulong.
 475. How far are you from there? About 8 miles.
 476. What would it cost you to send your produce to Milbrulong? About 4s. a ton. It is about half the distance to Yerong Creek.
 477. Do you agree that 5s. is a fair rate for carriage, 10 miles? Yes.
 478. Will you increase your area of cultivation if the railway is made? Yes, to 250 or 300 acres.
 479. You have heard the statement as to the vast proportion of the land in the district that is suitable for agriculture? Yes.
 480. Is that statement correct? Yes.
 481. Did you gather any of the statistics? Yes; I gathered them from the districts south, in the vicinity of my holding,—Clive, Napier, and Mundawandra.
 482. But that portion of the statistics is correct? Yes.

Thomas Wilson, farmer, Brookong North, sworn, and examined:—

- T. Wilson. 483. *Chairman.*] Where do you live? At Brookong North.
 13 Oct., 1897. 484. What is the area of your holding? About 1,100 acres.
 485. How much do you cultivate? About 120 acres.
 486. Do you send your produce to The Rock? Yes; I paid about 1s. 2d. for a bag last year.
 487. About 10s. 6d. a ton? Yes.
 488. What will be the cost of carriage from your place to Green's Gonyah? I do not know—the distance is 9 or 10 miles.
 489. Witnesses have sworn that 5s. is a fair rate;—do you expect to get your wheat carried for that? Yes.
 490. Will you increase your area under cultivation if a railway is made to Green's Gonyah? Yes.
 491. You have heard statements made as to the class of country embracing the area for which statistics were gathered and which have been handed in by Mr. Day—the land is described as being almost all suitable for agricultural settlement;—is that so? It is.
 492. You collected some of those statistics? I did.
 493. Are they correct? Yes.
 494. Do you know the method on which all these statistics were collected? No.
 495. Do you know that there is about 21,000 acres of land under cultivation in this area? I suppose there is.

Andrew Matthews, farmer, near Green's Gunyah, sworn, and examined:—

496. *Mr. Black.*] Where is your home? Three miles west of here.
 497. How long have you lived in the district? About eighteen years.
 498. What is the size of your holding? I own about 1,200 acres in three different holdings.
 499. How much have you under crop? My sons and I have 370 acres under crop.
 500. How much had you last year? About the same area.
 501. Do you intend to increase your cultivation area next season? We could double it if we had a railway.
 502. You have some sons who have set up for themselves? Yes, I have three.
 503. You have three sons with you, and three sons by themselves? Yes.
 504. The three sons with you are working their land conjointly? Yes, with me.
 505. Is that land included in the area of the 1,200 acres? No.
 506. How much are the others working? Very nearly 1,500 acres.
 507. Then you are working jointly an area of 2,700 acres? Yes.
 508. What are the names of the sons who are working on their own account? William Wesley 640 acres, Andrew 630 acres, Daniel 346 acres.
 509. How much have they under crop? About 280 acres.
 510. The three of them? Yes.
 511. Do they intend to increase their cultivation areas? I think so.
 512. Where do you send your crop to now? The stock has been bought by dealers on the land.
 513. But where do you send your crops to? Generally to The Rock, then to Wagga Wagga, or wherever we can get the best price.
 514. What have you been paying for carting? Ten shillings and 11s. and 12s. a ton. This year I have been offering 12s. a ton, and have not got carriers yet to take the crop that is going. I expect to pay higher. Many of the teams are dead.
 515. Do the carriers use bullocks? Yes.
 516. Would you use the railway if it came here? Yes, and I should be glad to get it.
 517. What do you think would be a fair thing to charge per ton on the railway? I should be satisfied to pay half what I am paying to the carriers.
 518. You have heard the evidence given by Mr. Day and others;—do you agree with that in the main? I agree in the main with what was said by Mr. Day; but he did not take into consideration the larger quantity of stock in the district.
 519. Is there anything that you would like to add to his evidence? I think he could have said a little more about the carriage. He has not taken into consideration what will have to be paid for cartage this year.
 520. Where do the carriers come from who carry the crops? Those who cart my stuff have been in the district many years; but many come from Victoria and go back. They camp in the district, and their bullocks destroy the district by eating out the grass. It would be a great benefit if we had not them at all. Those who are within 10 miles of the line could cart their produce with their own teams, and they could keep it in sheds till they are not busy. When we have fat sheep and lambs, it would be a great advantage where the paddocks are dirty to cut a crop for hay. I will go in for fattening and sending fat lambs to market. There is a district here 20 miles north, 20 miles west, 15 miles south, and 5 miles east, nine-tenths of the produce of which ought to come in here. There are the main roads from The Rock, Urana, Boree, and Galore, and this is the place for all the traffic.
 521. Do you mean that you would cut your wheat-crop for hay? After 4 or 5 years cropping we could make hay of it and send it to market.
 522. What price can you get for hay? Thirty shillings on the ground.
 523. Would it not cost £1 to get it to Sydney? I never sent any to Sydney; I could sell it for 30s. on the farm.
 524. Is there anything else that you wish to say? I have only to say this in regard to paying a rate of the description referred to, that it would be a great advantage. I should like to say a few words about the offer which we made a few years back. We made the offer which you have stated; but we were in the expectation that a railway would be commenced a short time afterwards. More than a year has elapsed now, and there are more people in the district than there were then. I will say for myself and my sons, that if you do not put an extra price upon the carriage of produce, I would put down the guarantee money in advance to get the railway. It would not be fair to expect two payments. There will be a great drainage of traffic in here. There are over half a million acres of which the produce will come here, and of that area over 400,000 acres are fit for the plough. People will not keep that for grazing sheep. If I ran sheep alone I would pay my rent and clothe my family; but if I grow wheat I can do more than that. We can make as much by the plough as we get for the wool and the fat sheep too.

John McDonell, farmer, sworn, and examined:—

525. *Mr. Roberts.*] What is the area of your holding? 1,716 acres, situated 12 miles north of Green's J. McDonell. Gunyah.
 526. Have you gone in for any cultivation? Yes, I have.
 527. How many acres have you had under cultivation? 700 acres this year; last year I had 600 acres.
 528. How many sheep do you keep? I have 1,500 at present. I generally have more; but the season has been a bad one.
 529. What would be the average number? I can run 2,000 sheep.
 530. Where do you send your wool and wheat to? I send the wool to The Rock; last year the wheat went to a mill at Narrandera.
 531. What do you pay to take the wool to The Rock? I carry it myself.
 532. Do you always send your wheat to Narrandera? I send it wherever I get the most money for it.
 533. How far is your estate from Narrandera? Twenty-five miles.
 534. Then Narrandera is the nearest railway station? The Rock is the same distance.
 535. Would the proposed railway be any advantage to you? It would be only 12 miles to the railway from my place if this railway was made.
 536. Would you be prepared to pay 5s. a ton for the carriage of wheat? Yes.

A. Matthews.

13 Oct., 1897.

J. McDonell.

13 Oct., 1897.

- J. McDonell. 537. You are aware that that is double the ordinary charge? I am aware of that.
 538. Would the people in this district be prepared to pay that rate? I hear them say that they would pay anything that is fair.
 13 Oct., 1897. 539. Were you present when Mr. Day gave his evidence this morning? I was.
 540. Do you endorse all that Mr. Day said? I do.
 541. Do you pay the same rate for carriage to The Rock that you paid to Narrandera? I never had anything carted to The Rock.
 542. What do you pay to Narrandera? I have paid 7s. 6d. a ton; that was a low price.
 543. Was that for wool or wheat? Wheat. The cost of the carriage of wool is about double.
 544. Would you have to pay 15s. a ton for the carriage of wool to Narrandera? Yes.
 545. What would you have to pay if a railway were constructed to Green's Gunyah for the 12 miles between your place and here? About 5s. a ton.
 546. Would that be for wool? No; it would be 9s. or 10s. for wool.
 547. Then you would have to pay another 10s. on the railway for wool, would you not, from here to The Rock? I suppose so.
 548. Then it would pay you better to take it to Narrandera? I should cart it myself; I can do it cheaper that way.
 549. Then you would use this railway? I certainly would, at every opportunity.
 550. Did you collect any of the information for Mr. Day in connection with the statistics that he produced this morning? I collected a few some time back and handed them to Mr. Day.
 551. Covering what area? Covering 2,650 acres of crops.
 552. How many holdings are there between Green's Gunyah and your property? There are thirteen holdings near to my house.
 553. Have you examined the figures that were produced by Mr. Day? No.
 554. Then you can only speak of those which you supplied to Mr. Day? That is all.
 555. Do you send any live stock to market? I do.
 556. Then you would send them by rail if the line was constructed? Yes, I would; I should only have to bring them 12 miles instead of 25.
 557. Would you get your supplies by railway too? Certainly.
 558. Where do you get them now? From Wagga Wagga and Sydney, by The Rock.
 559. What does it cost you to get your goods from The Rock? I generally cart them myself.
 560. Have you ever gone into a calculation as to what you ought to debit your accounts with for being your own carrier? It is about half what I should have to pay to carriers.
 561. Do you regard 10s. a ton for wool from Green's Gunyah to The Rock as a fair charge? Yes; I should not object to it.
 562. You are thoroughly favourable to the construction of the railway, and would be a good customer to it;—do you think that the people between here and your homestead would use the railway? They would. I always hear them speak favourably of it.
 563. *Chairman.*] Does the road after passing Bullengong Creek from The Rock go direct to Mount Galore? Yes; it is a direct mail route.
 564. Is it all forest country south from that road to Green's Gunyah? Yes; it is all forest country.
 565. Going from where it crosses Bullengong Creek to Mount Galore, 8 miles north, there is the Old-man Creek? Yes.
 566. What sort of land is it between those places? Plains.
 567. How wide is it from the road north to the edge of the forest country? About half a mile. The average width of the forest country on the northern side of the road from Bullengong to Galore will be about 2 miles; beyond that, going northerly, the plain country extends pretty well to Murrumbidgee.
 568. Will you describe the country going north from Galore to Narrandera? The road first goes in a north-westerly direction till it strikes the main road from Wagga Wagga to Narrandera; then it follows 10 or 12 miles along this road. North from this to the Murrumbidgee is flooded country and plain; to the south it is fairly good agricultural country.
 569. Will you describe the country south from the routes that we have been previously speaking of? The plain country keeps away from the line about 10 miles till you get pretty well west of Galore; from that point right to Galore it is all good agricultural land.
 570. Describe the country south-west from Galore? Going south-west from Galore towards Coonong it is fairly good agricultural land till you strike the plains about 10 or 15 miles from Coonong.

Thomas Alfred George, farmer and grazier, near Boree Creek, sworn, and examined:—

- T. A. George. 571. *Mr. Black.*] Where is your holding? About 10 miles north-west of this place, and about 3 miles from Boree Creek.
 13 Oct., 1897. 572. What is the size of your holding? 3,000 acres.
 573. Have you any of that land under cultivation? Yes; 160 acres.
 574. What property had you under crop last year? None; we had only been ten months in the district; there was about 115 acres under crop on the same property last year.
 575. What area will you have under crop next year? If we get a railway, about 400 acres.
 576. Is it good country in your direction? Yes.
 577. Where is your nearest railway? At The Rock, 31 miles away.
 578. And you are about 10 miles from Green's Gunyah? Yes.
 579. I suppose you will bring your produce here if a railway is made? Yes.

Thomas Henry Davis, farmer, Green's Gunyah, sworn, and examined:—

- T. H. Davis. 580. *Mr. Roberts.*] How long have you resided in the district? About four years.
 13 Oct., 1897. 581. What area of land do you hold? 605 acres, of which I have 210 acres under cultivation this year.
 582. What did you begin with, four years ago? I have only had two crops on the land; last year I had 210 acres under crop.
 583. Where does your property lie? About 1 mile north-west from here.
 584. Where do you send your produce to? To The Rock.

585. Do you come through Green's Gunyah? Yes.
586. What do you pay for carriage to The Rock? I have paid 12s. I cart most of the produce with my own teams.
587. Then you would have no objection to pay 5s. a ton for carriage by the railway? I should not.
588. Notwithstanding that it is double the rate charged in other districts for similar distances? No.
589. Do you get your supplies by way of The Rock? Yes; from Wagga Wagga.
590. Did you hear the evidence of Mr. Day? Yes.
591. Do you entirely agree with what he stated? Yes; it was correct, according to my experience.
592. Did you take any active part in preparing his statistics? No; I gave them my own statistics.
593. From what you know of the district, what do you think of the figures given by Mr. Day? I think they are correct.
594. Do you think this district has a great future before it as regards agriculture? I do. I came from Victoria to this part; I had three farms in Victoria, and I was paying a big rent for them—6s. an acre. I consider this land far superior to the land in Victoria, but the land there is selling at £7 and £8 an acre. In Victoria we had a railway near us, and we could cut chaff and send it to market; here we cannot do that. I consider that in chaff a man can grow a large bulk here, and make more than he can out of grain. Last year I made £7 an acre out of the stuff that I cut for hay. In summer you could cut it and send it away to Sydney, but in winter you could not do it; the roads are too bad.
595. If a railway came to Green's Gunyah would the land be largely increased in value? Yes.
596. Are you a homestead lessee? No; I have a special area. I took up the land at 35s. an acre. We can cut a lot of stuff and sell chaff. It takes 3 acres to produce 1 ton of wheat. Going in for hay, you can get 2½ tons per acre. If the land is dirty it is not good for wheat, but you can turn it into a hay crop, and it will make good chaff.
597. Do you run any stock? I have sheep, but my principal object is farm.
598. Do you intend in future to increase the area under wheat? Yes.
599. What area do you expect to have in next year? Above 300 acres. Had it not been a dry season I should have had that in this year.
600. The evidence which you are giving now is the evidence which would be given by those in your neighbourhood? Yes.
601. *Mr. Black.*] What part of Victoria did you come from? From the Goulburn Valley, near Shepparton.

T. H. Davis.
13 Oct., 1897.

Samuel Higgins, homestead lessee, sworn, and examined:—

602. *Chairman.*] What area have you? 480 acres.
603. What do you pay for it? The capital value of the land is 30s. an acre, and I pay 1¼ per cent. on that for the first five years. After that I am to be subject to reappraisal, which I believe will make it twice the amount which I am paying now.
604. Are your neighbours paying the same? Yes.

S. Higgins.
3 Oct., 1897.

William Herbert, farmer and grazier, near Green's Gunyah, sworn, and examined:—

605. *Mr. Black.*] Where do you reside? About 8 miles north-east from Green's Gunyah.
606. How many acres have you? About 4,900 acres.
607. How much of that is under crop? 420 acres. It is in two properties—one is about 8 miles from here, and the other about 18 miles.
608. On which property have you the crop? On the property nearest to Green's Gunyah.
609. What had you under crop in the previous year? About 200 acres.
610. Do you intend to make a further increase? I have 300 acres getting cleared now.
611. Where have you been sending the crop to? To The Rock.
612. How far are you from The Rock? Twenty-two miles.
613. What do you pay for the carriage of wheat? 1s. a bag.
614. Do you expect to get it done at the same rate this year? No; I think it will cost more this year. The teams are not in the district, and there will be far more to cart. I have offered 13s. 6d. a ton, and it has been refused.
615. Do you think that the charge will be as high this year considering the circumstances? It will be fully 1s., if not more.
616. Are there many farmers in your locality? A good few within a few miles of my place.
617. Is the land there equal in quality to what it is here? Yes, fully.
618. You have heard the evidence given to-day? Yes.
619. Do you desire to correct it in any particular? I might throw a little light on it. The evidence is fully reliable. If a railway were to come here, instead of 40,000 acres being under crop, there would be over 100,000 acres under crop within twelve months. If we were to put as much wheat in as we can we should not be able to get the teams to take it away.
620. You think the railway is likely to pay? I do not think it; I am sure of it. Mr. McDonell said there is a plain to the east. I might remark that on the east of Mr. McDonell's property, right to the Murrumbidgee, it is all good land, with the exception of about 700 acres of plains.
621. It is continuous forest timber? Yes. The produce of all the land on this side of the Murrumbidgee north from here must come to this place.

W. Herbert.
13 Oct., 1897.

William Douglas Drummond, farmer, Berrigan, sworn, and examined:—

622. *Chairman.*] You are a resident of Berrigan? Yes.
623. Have you a full knowledge of the Berrigan district? Yes.
624. Do you know the district around Green's Gunyah well? Yes.
625. What is your opinion with regard to the comparative merits of the two districts? I think there is a far larger area of land fit for agriculture here than there is in the Berrigan district.
626. And is the quality of the soil equal? Yes.

W. D. Drummond.
13 Oct., 1897.

- W. D. Drummond.
13 Oct., 1897.
627. Will any land thrown open by the Government be taken up readily? Yes; I have not the slightest doubt about it. There would be the largest ballot for the land that is to be thrown open that we have had yet.
628. Do you believe it will pay the pastoralists to devote their land to agriculture? Yes; I am certain that the owners of the large estates will do it, as they have done about Berrigan. They will find that wheat-growing pays the best.
629. You have made the statement that in your opinion Green's Gunyah is the centre of the district which will furnish a larger area of agricultural land than the Berrigan district;—will you explain why you hold that opinion? When advocating the line from Jerilderie to Berrigan, we took an area with Berrigan for the centre, running 6 miles north in the direction of Jerilderie, 12 miles west, and 12 miles east, then running south to the river about 20 miles.
630. And Green's Gunyah, in your opinion, is the centre of a larger district than that? Yes.
631. What has been the influence of the railway upon agricultural settlement in the Berrigan district? For the year 1887, when we came to New South Wales, there were about 2,000 under cultivation in the district; but within the same area to-day there must be fully 80,000 to 100,000 acres under cultivation.
632. What proportion of that will use the Berrigan to Jerilderie line? The greater portion of it will. Last year, South Australia, having a shortage, the buyers from South Australia came into the market at Yarrowonga, Tocumwal, and Corowa, and offered high prices, the consequence being that about 100,000 bags went across the river.
633. How many bags went by the railway? About 110,000 up to the present time.
634. Because of the shortage in South Australia, the Berrigan line, in your opinion, lost about half its wheat traffic? Yes.
635. About 11,000 tons were lost? Yes.
636. Therefore, at 2s. 6d. a ton, the railway lost between £1,300 and £1,400? Yes; about that.
637. You think that there can be no serious competition with the proposed line to Green's Gunyah? Yes.
638. How far from a railway do you think a man can afford to grow and cart wheat under ordinary circumstances? If a man has to cart more than 10 or 12 miles he then has to engage teams. At Berrigan, if they are within 10 miles of a railway, they do not put the cost of carting it down at all, because at the time of the year when the wheat is taken to market their horses are idle, and they cart it themselves.
639. And what is the state of things where they are more than 10 miles from a railway? They employ carriers. A man 18 miles out would have to pay 8s. a ton for the carriage of his wheat. I desire to state that not only would the railway be beneficial to an agricultural district because of the cheapness of the freight, but it is a great advantage in moving large bodies of grain. On the railway to Berrigan last year there was a special rate of 2s. 6d. a ton from Jerilderie to Berrigan, and the fact of so much wheat being at Berrigan brought more buyers into the market, and they gave the same price for wheat at Berrigan as they gave at Jerilderie, although it should have been 2s. 6d. a ton less. Nearly all the farmers sold their wheat right away at 4s. 4d. per bushel. They were able to guarantee delivery in a week's time if necessary. If they were 20 or 30 miles from a railway they could not guarantee delivery within a month. Many farmers, if they had not had the railway, would have lost the market. Before they could have got the wheat to Jerilderie it would have been down 4d. a bushel, and they would have had to pay 4d. cartage to Jerilderie. I consider that it is a clear saving to the farmers of Berrigan having the railway last year of from £10,000 to £15,000.
640. If the wheat from the Berrigan district were concentrated in Berrigan could they shift it from Berrigan to Jerilderie? No.
641. Would the same thing apply here? It would apply in any district where the roads are not formed. They get very bad, and the teams cannot travel on them.
642. Have you anything else to tell the Committee? In regard to the large holdings, which I know Parliament looks upon as being to a certain extent detrimental to the interests of the railways, I would point out what has been done in the Berrigan district on one or two of the larger estates. Since 1888 Messrs. McFarlane Bros., of Barooga, have sold from 23,000 to 25,000 acres to small holders, who have gone in for agriculture, and they have 10,000 acres for sale to-day. So it is evident that if farmers come into the district the large holders are not going to occupy the land if they can get a fair price for it. The owners of Momalong Station, on the east side of Berrigan, have sold 6,000 acres, and they placed 2,000 acres more on the market last week. Berrigan Station, on the north, sold 800 acres, and they have 5,000 acres more to sell. In regard to the clips of wool in the Berrigan district, the clips from Wunnamura and Berrigan went to Sydney this year. In previous years they went to Melbourne.
643. *Mr. Roberts.*] Which way does the Momalong wool go? It has gone to Sydney for the last two years. It previously went to Victoria. I consider 5s. a ton rather high as a special rate, but it may suit the farmers very well to pay it. I think 3s. a ton would be a very fair thing from The Rock to Green's Gunyah. If the Government make the rate as low as possible, it naturally increases the production, and if that were done, in a year or two the line would be one of the best-paying lines in the Colony. Notwithstanding the fact that Jerilderie is only 8 or 9 miles north from Mairiinary Siding, the farmers prefer to pay 2s. 6d. per ton for wheat to go by railway to taking it to Jerilderie by road. In the sale of land at Barooga 10,000 acres were publicly sold on the 25th instant.

Robert Alexander Warden, Acting Manager, Commercial Banking Company of Sydney, Limited,
Green's Gunyah, sworn, and examined:—

- R. A. Warden.
13 Oct., 1897.
644. *Mr. Roberts.*] Are you Manager of the branch of the Commercial Banking Company of Sydney (Limited) at Green's Gunyah? I am Acting Manager.
645. How long has this branch of the Commercial Bank been established here? Three weeks to-day.
646. Was it upon your recommendation that it was established here? Yes; on my recommendation to the Board of Directors.
647. Will you tell the Committee what prompted you to make that recommendation? I was in the Riverina district about six weeks ago, when I heard of the prospects of Green's Gunyah, and I came here myself, driving round from Berrigan through Urana by Emu Plains and Boree Creek, and I spent three days here. During those three days I saw as much of the country as I possibly could, and having seen the nature of the soil and obtained information from Mr. Day as to the number of selectors within a radius of 15 miles, and the area under cultivation, I had not the slightest hesitation in recommending that the Board should open a branch here at once. I look upon the soil of this district as being quite equal

equal to anything in the Berrigan district, and I have been all over that district. I think that the area of agricultural land is larger within the same radius of Green's Gunyah than it is in the Berrigan district. There is a great deal of land about Berrigan which I do not think equal to this—sandy land, and swamp, and plain country, not fit for agriculture.

R. A.
Warden.
13 Oct., 1897.

648. Up to the present time, has the amount of business done been up to your anticipations? It has been more than equal to my anticipations; but a banking business cannot be made in three weeks. I am more than satisfied with the prospects of business here.

649. In your official position, I suppose you travel about New South Wales a great deal? Yes; I travel all along the line from Sydney to Albury, and south of the line.

650. You have had sufficient experience to be able to judge of the soil, and its suitability for wheat-growing? Yes; I have had a great deal of experience.

651. You think that if a railway were constructed here, a great impetus would be given to wheat cultivation? I think so. I think it would induce a much larger area to be put under wheat cultivation.

THURSDAY, 14 OCTOBER, 1897.

[The Sectional Committee met at Brookong Station, at 7 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from The Rock to Green's Gunyah.

John Bligh Nutting, Inspector of Stations, Union Mortgage and Agency Company of Australia, Limited, sworn, and examined:—

652. *Chairman.*] Does the map before you show correctly the land you are obtaining in exchange for land that you are surrendering to the Government; and does it also show with tolerable accuracy the plain land which is not suitable for wheat-growing on the Brookong station? Yes, the land outside the mark shown on the map defining the plain country is, in my opinion, most of it suitable for agriculture. It is the best of wheat land. Those exchanges are practically settled.

J. B. Nutting.
14 Oct., 1897.

653. What is the total area of the estate? 130,000 acres of freehold, and about 30,000 acres of leasehold.

654. How long can you hold the leases? We are giving up the lease; it will be an annual license.

655. How many acres are you surrendering? Leasehold and freehold, about 30,000 acres.

656. How much land have you under wheat? This year we have let 5,000 acres; they have not got wheat in the whole of it on account of the dry season. We are going to increase the area next year to 7,000 acres.

657. Can you make any statement as to the probabilities of increasing the area beyond that? In all probability it will be increased to 10,000 acres.

658. Are you prepared to make any further statement with regard to the rest of the estate? I cannot say whether we are going to use it for sheep or wheat. It is impossible to say what the company will do.

659. In your opinion, is it probable that agricultural occupation will pay better than pastoral occupation? I know that it will.

660. Then we can estimate your own probabilities from that? Yes.

661. Would the produce of the holdings, as depicted on the map, go to Green's Gunyah, as a centre, if there is a railway there? Yes.

662. Do you think the produce of the properties in the parish of Clive will go to Green's Gunyah? I am sure of it.

663. If there is a railway station at Green's Gunyah would you send your wool there? It is all a matter of price.

664. You are at present paying for land carriage down to Corowa? Yes.

665. How far is that? 70 miles.

666. Then it is simply a question of land carriage to Corowa, or railway carriage to Green's Gunyah? It is simply a question of a through rate; and a through rate to Melbourne is 60s.

667. If the Government will carry produce from Green's Gunyah for 60s., will you use the railway? I think so, decidedly, deducting land carriage to Green's Gunyah.

668. Anything under that would make it certain? To put the thing in a straight way, we have never asked the railway authorities of Victoria or those of New South Wales to come down. They have always approached us. They have kept coming down and coming down. Then, of course, we are simply taking the lowest rate; that is all. Suppose the New South Wales railway authorities to-morrow said, "We will carry your wool for 60s. from Green's Gunyah to Sydney"; if the Victorian railway authorities came and offered to do it for 50s, we should send it to Victoria.

669. What is a fair rate of land carriage from here to Corowa? It is £2 from here to Corowa, and the Victorian railway carried the stuff then from the Murray to Melbourne for £1.

670. Do the Victorian railway people take the traffic from here, or have you to take it to the railway? M'Culloch's people do it for the Victorian railways. They have their arrangements with the railway authorities.

671. You enter into a contract for a through rate to Melbourne? Yes.

672. You see the area depicted on the map of which Green's Gunyah appears to be the centre;—what is your opinion of that area? It comprises the very best wheat land. I do not think you could get any better wheat land anywhere.

673. Have you a knowledge of Berrigan? Yes; I have a thorough knowledge of the country at Berrigan and Finley. There is a tendency on the part of the Berrigan people to come here—in fact they are coming; and, had we wished to do so, we could have leased 15,000 acres for agricultural settlement this year. The Railway Commissioners of New South Wales offered to carry our wool for £3 10s. 6d., and the road carriage from Brookong to The Rock is £1. The cartage from Brookong to Green's Gunyah would be 5s. a ton; therefore the expense of a railway from The Rock to Green's Gunyah would make a difference in carriage of approximately 15s. a ton. The cheapest road-carriage for everything is about

J. B. Nutting. 6d. per mile. The probability is that there will be a deal of wheat grown if the carriage goes down to 2s. 6d. per ton over the line. That pays very well.

14 Oct., 1897. 674. Where do you get your stores from? Our bookkeeper can talk to you on that point. The rate of carriage has a great deal to do with it.

675. Is it not a fact that if the wool goes to Sydney the stores will come from Sydney? Yes; it is a question of the prices of stores. In all probability the stores will follow the wool as long as the carriage is cheaper. Even if our wool did not go to Sydney, it appears to me that the cheapest way to get even to Melbourne from Brookong would be to pay the 5s. land carriage to Green's Gunyah and the railway rate from Green's Gunyah to Albury instead of 70 miles of land carriage to Corowa. In order to equalise the two land carriages to the north and to the south, there would be £1 15s. under the present arrangement available for a short run on the railways. Therefore the extension from The Rock to Green's Gunyah may get the Brookong wool. The question is, whether it will get the wool from The Rock to Sydney or from The Rock to Albury.

Walter Day, farmer, Green's Gunyah, sworn, and further examined:—

W. Day. 676. *Chairman.*] You wish to make a statement to the Committee? Yes. My attention has been directed to the discrepancy between the statistics furnished by me to the Committee and those furnished by the officer who collected them for the Railway Commissioners. I have no doubt about the accuracy of my statistics. I am prepared at any time, if an officer be sent for the purpose, to verify them. The discrepancy may possibly be explained by the development that has taken place since the statistics were obtained. The Committee have had an opportunity during the last few days of seeing that the area is being considerably extended. As an example I desire to emphasise this, that Brookong, which I put down at 4,500 acres under cultivation, has been under-estimated by 2,500 acres. My statistics did not include the Mahonga wool, which I think will probably reach the railway at Green's Gunyah. There is also 90 tons of wool from Boree Creek which I did not include, which, being only 12 miles from Green's Gunyah, it appears would certainly use the railway from that place.

William Charles Rolls, Manager, Brookong Station, sworn, and examined:—

W. C. Rolls. 677. *Chairman.*] How far is it from Green's Gunyah to Mabonga? The wool-shed is at Urangeline, and the distance is 18 miles from Green's Gunyah.

14 Oct., 1897. 678. What would be the rate of carriage from Green's Gunyah from there? 8s. or 9s. a ton.

679. What would the rate of carriage be from Urangeline to Corowa? About £2.

680. Is it the same distance to Brookong from Corowa? Urangeline is about 10 miles nearer. Their rate of carriage might be 35s. According to the ordinary rate paid, it is probable that their carriage to Corowa would be 5s. less. I should reckon the Mahonga clip to be somewhat larger than the Brookong clip. The Brookong clip varies from 2,000 to 3,000 bales, or from 450 to 475 tons. The Mahonga clip would probably be about 500 tons. The Urangeline country, in the vicinity of the woolshed, is suitable for wheat. If there was any cultivation at present about Urangeline, they would have to pay 15s. a ton freight to reach Yerong Creek, which is the nearest railway station.

FRIDAY, 15 OCTOBER, 1897.

[The Sectional Committee met at the Court-house, Urana, at 2 p.m.]

Present:—

THOMAS THOMSON EWING, Esq., CHAIRMAN.

The Hon. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed railway from The Rock to Green's Gunyah.

Charles Norman Culley, stock and station agent, Urana, sworn, and examined:—

C. N. Culley. 681. *Chairman.*] You are a resident of Urana? Yes; and I am a stock and station agent.

15 Oct., 1897. 682. You know the district thoroughly? Yes; I am honorary secretary of the local Progress Association. I have been in the district for the last twenty years. Urana is at present isolated, having no railway communication. We have on the north of us the Jerilderie to Narrandera line, which at the nearest point is 18 miles distant from here, and owing to the nature of the country it is practically of no benefit. There was a survey made, I think, about three years ago from the Rock, *via* Green's Gunyah, on to Clear Hills, south-east of Urana. The dotted line on the map shows approximately the situation of that line. If there were an alteration and the line started about 13 miles east of Urana, it would serve Urana and the settlement on the north-west. The route that I believe would be the most acceptable to the people of this neighbourhood and most beneficial to them, would be one coming direct from Green's Gunyah, down the travelling stock reserve to Urana, passing through Crown land all the way from a point 13 miles west of us. The line as surveyed by the Department of Railways would go through flooded country, which would mean a heavy expenditure in construction, and render it inaccessible. It would also pass through private property all the way. The Clear Hills people, situated about 15 miles south of Urana, are in accord with us. When I speak of Clear Hills, I mean a locality pretty well south of Urana, coming down as far south as old Clear Hills, and embracing a width of approximately 10 miles.

683. You are an exponent of the views of the people of Clear Hills, when you advocate the extension to Urana? Yes; from Urana to this settlement there are also Crown lands. The map in the possession shows the stock route and other reserves in that direction; then when you get from Urana south to Clear Hills you follow the travelling stock route first.

684. Then, having made sufficient southing to pick up the dotted line, do you approve of the rest of the line into Berrigan? I desire to limit my statement to the vicinity of Urana and Clear Hills. Daysdale

- is situated to the north of a parish named Coreen. The views I express are the views of the Daysdale people. C. N. Culley.
685. The line, if extended as far as Green's Gunyah, will be of no value to you at Urana? No.
686. Still you view with favour this portion of the line which will eventually be constructed to or near Urana? If the line came from The Rock straight down to Urana, it could at any time be continued to Clear Hills. My contention is that a line from The Rock forms a portion of the line for the eventual development of this district, and if it were brought to Urana, as I suggest, it could then turn in a southerly direction, and go through Clear Hills towards Daysdale. Within the last twelve months 15,000 acres have been settled on.
687. What are the people going to do with that land? It is nearly all good cropping land. Between the Nourawie Settlement and Urana there are also some 9,000 acres of Crown lands to be thrown open. If the line came to Urana, those people would have it, at the nearest point, within 5 miles. North-east of Urana, on the boundaries of Buthawa and Brookong holdings, there is a large forest reserve of very good land, which comes within 7 miles of Urana. No doubt in a short time that land will be settled on. There is a surveyor out now surveying some portion of it—about 3,000 acres. Should the line come from Green's Gunyah to Urana, down the travelling stock route, it would pass within 3 miles of that reserve.
688. What is the freight from Urana to Coonong? At the present time the freight from Urana to Coonong is about £1, or 25s. for ordinary merchandise.
689. Is there any wheat carriage? I have nothing to do with wheat; but I should think that the cost of the carriage of wheat would be about the same.
690. Would a running rate of 6d. a mile be the charge for wool, as a rule? I do not think so. With regard to the cost of road carriage, either from the New South Wales or Victorian railways, I have no knowledge in detail; but I am able to state that the road from Urana to Coonong, which is our shortest road carriage to the railway system of New South Wales, is unsuitable for the traffic, and we cannot use it. On looking at the map one would naturally think that the line which we should advocate would be one from Coonong to Urana; but knowing the better country and the number of people a line from The Rock *via* Green's Gunyah would serve, we are in favour of that route. It would pass through good agricultural land; but a line the other way would not.
691. How wide is the plain coming east from the Jerilderie-Narrandera line? With very little exception it is all plain.
692. Suppose you left the Narrandera to Jerilderie line, and were going east, how far would you travel on plains before you reached the timber country? I think the plains would extend about 10 miles.

Percy Rollo Brett, Inspector of Stock, Urana, sworn, and examined:—

693. *Chairman.*] Did you hear the evidence of the last witness? I did, and I agree with it.
694. Do you agree that that plain is about 10 miles wide? I quite agree with the last witness that it is about 10 miles. P. R. Brett.
695. Do you know the freight for merchandise, wool, and wheat, from Urana to Coonong? I know they have offered about 25s. for carriage to Coonong, this year, and could not get their stuff carried. I had wheat to send over, and they wanted 2s. 9d. a bag, which is about 25s. a ton. The other day I sent over 3 tons, when fourteen good horses got bogged. The road from Urana to Coonong has had, in places, very considerable sums of money expended upon it, but thus far with very little result. 15 Oct., 1897.
696. Is 25s. a ton a fair rate right through? It is too high.
697. Is it a fair index of what the people have to pay? £1 is the lowest that I have ever known it to be.
698. What is the rate from Urana to The Rock? I could not say.
699. Have you carried to Corowa? Yes; you can get a load from Corowa—back loading—for £1 a ton.
700. What is a fair rate for a squatter to pay to have his wool carried from Urana to Corowa? About £2 a ton.
701. Would wheat be as much? It would be quite as much.
702. Therefore the freight from Urana to Corowa is approximately about £2 a ton, and is likely to remain so? Yes; except in the wool season, when you can get return loading. It may be done in summer time, under favourable conditions, from 25s. to 30s. a ton.
703. What is the road like from Urana to Green's Gunyah? It is very good, except on the Brookong plains, and there it is very bad.
704. How far are we from Green's Gunyah? About 32 miles.
705. How far is it to Corowa? Fifty miles.
706. What do you consider would be a fair rate to Green's Gunyah for wool or wheat? The road carriage from Urana to Green's Gunyah would not be much less than that to Corowa, although the distance is nearly 20 miles less. In one or two places it is very bad road.
707. Have you any other information for us? I desire to give some information with regard to the land under cultivation, the development of settlement, and with regard to wool. If the line Mr. Culley advocates is made, it would bring us at the nearest point 4 miles from the Urangeline wool-shed. That wool goes to Corowa. It is a very large district, and the clip in fair seasons would average from 4,000 to 5,000 bales. The Buthowa wool also goes to Corowa. At Buthowa they shear about 30,000 sheep in a fair season. At Burrengong they shear from 25,000 to 30,000 sheep, and that wool goes to Corowa. That wool would come here if the line were made as suggested. At Urangeline Station they shear 14,000 or 16,000 sheep, and the wool from there would come here. That would account for the larger stations. There are a number of smaller stations as well. Six miles south of here the whole country is selected in blocks of from 260 acres to 320 acres. The selectors are living on the land and clearing it for cultivation. The land is settled from a mile for a distance of 7 or 8 miles. Some of the selectors have as much as 50 acres under cultivation. The land abuts the area that Mr. Culley said is now being surveyed on the Brookong holding. One of my sons and I have nearly 800 acres, and we intend to put the whole of it under wheat if we can get cheap carriage. I wish to emphasise the remark made by Mr. Culley in reference to the portion of line shown by dots on the map, coming from Green's Gunyah east of Urana. It will go through large pastoral estates and be contiguous only to a couple of portions of agricultural land. There are about three selectors who would be likely to go in for cultivation there. From where it approaches the Urangeline Creek to Uranagong Lake, it would require to be piled nearly the whole distance, which I estimate at 3 miles. It would require other works also in addition to that.

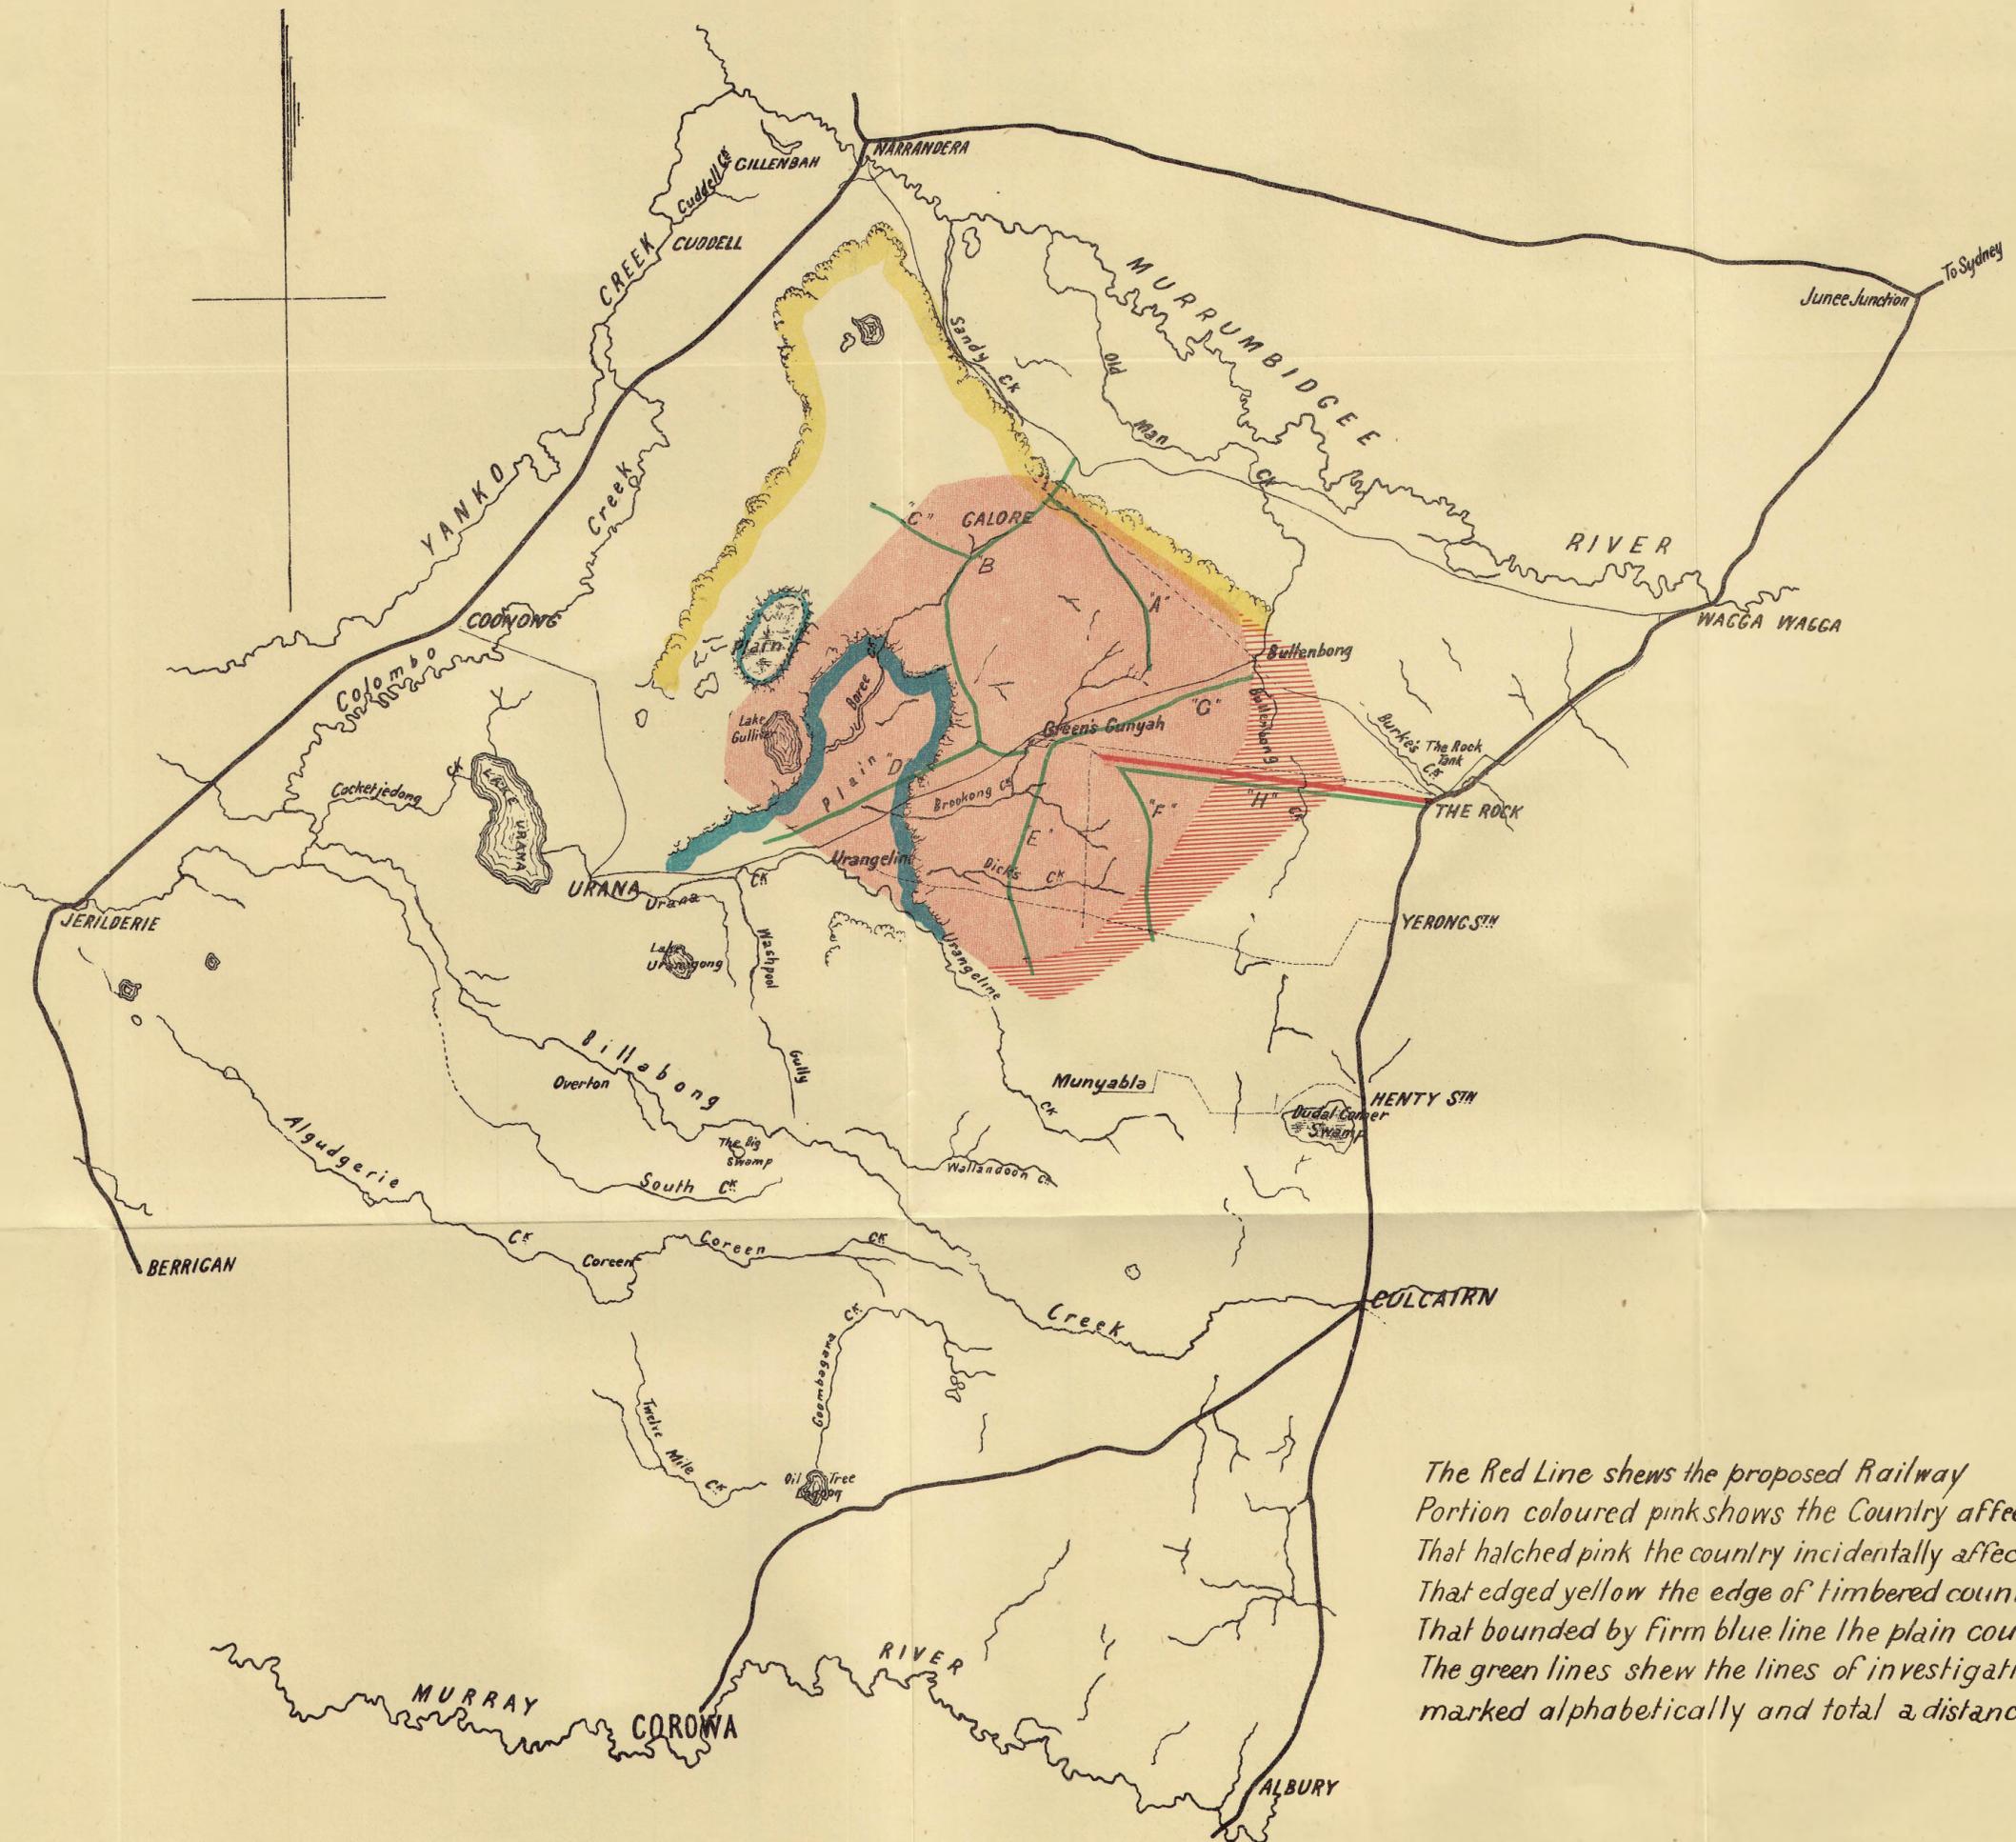

Herman Ambrose Hill, storekeeper, Urana, sworn, and examined:—

- H. A. Hill. 708. *Chairman.*] What is a fair charge for the carriage of goods from Urana to Coonong? In the winter months the rate of £1 a ton.
- 15 Oct., 1897. 709. Is that for everything? Yes; for all merchandise. There is great difficulty in getting the stuff carted, the roads are so bad.
710. What is it under favourable conditions? Fifteen shillings a ton.
711. Do you know the freight to Cowra? At present it is from 17s. to a £1 a ton, but that is on account of the return loading. The rate for wool is from 30s. to 35s. a ton. By making use of the return trips when the wool is carried we get stuff carried back sometimes as low as 17s. 6d. a ton.
712. The rate you mention to Corowa would cover wheat and wool, would it not? Yes.
713. Have you had experience of carrying from any other stations in the district? I have had goods brought to Urana from Morunda, which is 20 miles nearer Narrandera than Coonong, at the same rate as from Coonong. The distance from Morunda to Urana is 32 miles.
714. Why would they rather go there? Because the roads are more suitable for traffic.

[One plan.]

Sketch to accompany Report by the Sectional Committee

Scale 8 Miles to an Inch

*The Red Line shews the proposed Railway
 Portion coloured pink shews the Country affected by the Railway
 That halched pink the country incidentally affected
 That edged yellow the edge of timbered country
 That bounded by firm blue line the plain country
 The green lines shew the lines of investigation. They are
 marked alphabetically and total a distance of 114 miles.*

RELATING TO THE

PROPOSED RAILWAY

FROM

COOLAMON TO ARIAH.

Presented to Parliament in accordance with the provisions of the Public Works Act,
51 Vic. No. 37.

Printed under No. 25 Report from Printing Committee, 8 December, 1897.

SYDNEY: WILLIAM APPELEGATE GULLICK, GOVERNMENT PRINTER.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

The Honorable FREDERICK THOMAS HUMPHREY, Vice-Chairman.
 The Honorable JAMES HOSKINS.
 The Honorable CHARLES JAMES ROBERTS, C.M.G.
 The Honorable WILLIAM JOSEPH TRICKETT.
 The Honorable DANIEL O'CONNOR.

LEGISLATIVE ASSEMBLY.

THOMAS THOMSON EWING, Esquire, Chairman.
 HENRY CLARKE, Esquire.
 CHARLES ALFRED LEE, Esquire.
 JOHN LIONEL FEGAN, Esquire.
 THOMAS HENRY HASSALL, Esquire.
 GEORGE BLACK, Esquire.
 FRANCIS AUGUSTUS WRIGHT, Esquire.
 FRANK FARNELL, Esquire.

MEMBERS OF THE SECTIONAL COMMITTEE.

THOMAS THOMSON EWING, Esquire, Chairman.
 The Honorable CHARLES JAMES ROBERTS, C.M.G.
 GEORGE BLACK, Esquire.

GENERAL INDEX.

Report by the Committee.

LIST OF WITNESSES.

[Examined by the Committee.]

	PAGE
Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works	1-2
Henry Deane, Engineer in-Chief, Railway Construction Branch, Department of Public Works	2-6
Hugh McLachlan, Secretary to the Railway Commissioners	6-9, 20
John Harper, Goods Superintendent, Department of Railways	9-18
Henry Chamberlaine Russell, C.M.G., Government Astronomer	18-19
Percy Scarr, Principal Assistant Engineer, Roads Branch, Department of Public Works	19
Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department	20-21
Charles Edward Rennie, Chief Draftsman, Department of Lands	21
William McIntyre, Chief Electoral Officer, Chief Secretary's Department	21

[Examined by the Sectional Committee.]

John James Miller, auctioneer and stock and station agent, Cootamundra	1-3
William Miller, stock and station agent, Cootamundra	3-5
Frederick Pinkstone, journalist, Cootamundra	5-7
Arthur Sharp, District Surveyor, Forbes	7-9
George Thompson, stock and station agent, Cootamundra	9-10
William Falconer, builder and contractor, Cootamundra	10
Robert Hastie, farmer and grazier, Malongla, near Cootamundra	10
William Hall Matthews, storekeeper, Cootamundra	10-11

	PAGE.
William Gibbon Walker, District Surveyor, Hay	12-13
William Boyd, farmer, and secretary to the Coolamon to Ariah Railway League	13-16
Alexander Arbuthnot McKersa, farmer, Colirroobie.....	16-17
Henry Daniel Adams, Narrandera	17
Thomas Watson, farmer, Ganmain	17
Barnet Basil Bennett, Wagga Wagga	17
John Holloway, grazier, Moombooldool	18-19
Walter Hubert Neary, station-master, Coolamon	19
Jamieson Ashwood, storekeeper, Coolamon	19-20
John Barnes, commission agent, Coolamon	20-21
Frederick Hall, storekeeper, Coolamon.....	21
John O'Shaughnessy, farmer, Moombooldool	22-23
Sydney William Wellman, Manager, Ariah Station	23-24
James Fyfe, farmer, Mount Chrystal.....	24-25
Michael Mickelson, sawmill proprietor, Mount Chrystal	25
Alfred George Humby	25-26
John Kelson McKeown, farmer, near Warri	26-27
Edwin Charles Pope, Manager, South Yalgogrin Station	27
Donald Tait Wilson, grazier, North Bolero	28
Charles John Bear, grazier, North Berembed	28
William Keynes	29
Stephen Kehoe, farmer	29
John Clark, Cowabbie	29
Robert Alexander Gemmell, farmer, Warri	29
Basil Barnet Bennett, farmer and grazier, Wagga Wagga	29-30, 31
William Fisher, farmer, Mimosa West	30-31
William MacCauley, farmer, Mimosa West.....	31
John Cassidy, farmer, Tara	32
Thomas McCaig, farmer, Methul	32
John Mills, farmer, Big Mimosa East	32
William Hewett, farmer, Methul	32
Samuel Harrison, farmer, Broken Dam.....	33
Thomas Priest, farmer, Mimosa West	33
John Charlesworth, farmer	34
John Penfold, farmer.....	34-35
Thomas William McCaig, farmer, Methul	35
James Robertson, grazier, Mimosa.....	35-37

APPENDIX.

[To Evidence taken by the Committee.]

To evidence of H. Deane, Engineer-in-Chief for Railway Construction—Trial survey, Grong Grong to Ariah	A
--	---

PLAN.

Sketch plan to accompany Report of the Sectional Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM COOLAMON TO ARIAH.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Coolamon to Ariaiah," have, after due inquiry, resolved that it is not expedient that the proposed Railway be constructed; and, in accordance with the provision of sub-section (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

REASONS FOR THE PROPOSAL.

1. The first action in regard to the construction of a railway from Coolamon to Ariaiah was taken in April, 1895, when the Member for the district waited upon the Minister for Public Works, and urged the necessity for a line from Coolamon to Merool Creek. A petition presented on this occasion represented the district to be adapted to both agriculture and pastoral pursuits, where wheat-growing was carried on extensively, and through which a railway could be constructed cheaply, the country presenting no engineering difficulties. Such a line as that proposed, it was also stated, would open up a large area of Crown land for settlement, and, in the opinion of the petitioners, there was no doubt that it would be found to pay, as it would give a great impetus to wheat-growing and farming generally.

A promise was given by the Minister that an officer should be sent to report upon the matter, and, accordingly, an examination was made by a surveyor, who reported in terms similar to the statements in the petition with regard to the nature of the country along the route of the proposed line, but pointed out that the land was largely undeveloped, the greater portion being used principally for pastoral purposes. The cultivated land, it was found, was only $2\frac{1}{2}$ per cent. of the country that would be benefited by the railway.

In 1896 the route of a line from Coolamon to Ariaiah was surveyed, and, as a result of an examination then made of the country to the east and west, an alternative proposal was brought under the notice of the Minister by the Engineer-in-Chief for Railway Construction, who was of opinion that the shortest and cheapest route to Ariaiah would be from Grong Grong, a station on the South-western Railway, 25 miles from Coolamon towards Narrandera. A survey from Grong Grong proved this to be correct, as there was a saving in length of nearly $9\frac{1}{2}$ miles, and in cost of construction of £16,668, though the estimated cost per mile was somewhat higher. It was reported that the country through which the Grong Grong line would pass, though used generally for sheep, was well adapted for agriculture, and that there was a yearly increase of population, and an extension of the area under crop.

Subsequently

Subsequently other routes came under notice, and are mentioned in the evidence given in the present inquiry. One, advocated by the Methul Railway League, would leave the Coolamon-Ariah surveyed line at about 17 miles from Coolamon, near Cowabbie station, and proceed by a more direct route to Ariah. Another route suggested is from Ganmain (a railway station 10 miles west of Coolamon) to Ariah; a third is from Coolamon to Mandamah or Broken Dam; and a fourth from Temora to Ariah, *via* Mandamah.

It was decided by the Department of Public Works to submit the Coolamon to Ariah line to this Committee; but the Under-Secretary, in his evidence, expresses the opinion that, if any one of the lines be adopted, that from Grong Grong is the best, as it would serve the same purpose as the others at a lower cost.

DESCRIPTION OF THE PROPOSED RAILWAY.

2. In addition to what has just been stated, it should be mentioned that the surveyed line from Coolamon to Ariah passes along a travelling stock route for nearly the whole of the way. Commencing as a branch of the South-western Railway, at the Hay end of the Coolamon station, at 309 miles 40 chains from Sydney, it passes through the western portion of the town of Coolamon, in a north-westerly direction, to travelling stock reserve 1,914, and thence proceeds along the western boundaries of that reserve and travelling stock reserves 1,589 and 2,350, north-westerly, to 342 miles 40 chains. From that point it goes in a northerly direction, partly through the last-mentioned reserve, and through alienated land, to the travelling stock reserve 12,453, on which it continues north-easterly to Ariah homestead, where it terminates at 351 miles 24 chains 4 links; the total length of the line being 41 miles 63·28 chains. The ruling grade on the route is 1 in 100, and the sharpest curve 15 chains radius. The country passed through is generally flat, and for only about 5 miles is private land intersected.

ESTIMATED COST.

3. The estimated total cost of the line is £91,307, or £2,185 per mile. The details of the estimate show £10,317 for earth-works; £3,710 for timber bridges and small timber openings; £1,746 for level crossings, cattle stops, fencing, and road diversions; £26,072 for permanent-way material; £19,767 for plate-laying, ballasting, and sleepers; £7,356 for station works and station buildings; £4,500 for water supply; and other amounts, which, together with those preceding, make the total cost of the works £81,161 13s. 3d. The balance of the £91,307, which is £10,145 6s. 9d., is the estimate, calculated at 12½ per cent., for engineering and contingencies.

RAILWAY COMMISSIONERS' REPORT.

4. The Report of the Railway Commissioners is unfavourable to the line. The annual cost is given as £6,253, which comprises £2,753 interest at 3 per cent. on the capital expenditure, and £3,500, cost of maintaining permanent-way and traffic and locomotive expenses. The traffic estimate is £2,047, made up of £1,543, the total estimated revenue from all sources exclusive of mails, and £504 for mails. The estimated annual loss is, therefore, £4,206. The Commissioners recognise the fact that the land along the whole route of the railway is highly suited for agricultural purposes, but point out that settlement is exceedingly meagre. They also say that "the traffic that would be obtained on the line is now sent either to Narrandera, Grong Grong, Coolamon, or Temora, and it is only an increased development of the country that can be looked to for any additional traffic that will be placed upon the existing lines." Under present conditions, therefore, they do not see their way to recommend the construction of the proposed railway.

THE COMMITTEE'S INQUIRY.

5. In their inquiry, the Committee have examined official witnesses, from whom were obtained a description of the proposed line, and the reasons for the proposal, and also witnesses competent to give information with regard to the land likely to be affected by the railway, and to the rainfall and the population of the district. A Sectional Committee was then appointed to inspect the route of the railway and the country the line is intended to serve, and to examine witnesses in the district. Their report will be found printed with the evidence taken before them.

LAND

LAND IN THE COOLAMON-ARIAH DISTRICT.

6. The country through which the route of the proposed railway passes, and which the line would serve, is very suitable for agriculture. The population of the district consists of pastoralists, who combine agriculture with sheep-farming, and selectors, who also carry out a system of mixed farming.

At the present time there is a considerable area of land under cultivation, and the prospects of further enterprise in this direction are satisfactory. Whenever land is thrown open by the Government it is readily taken up. Farmers from the other colonies are constantly inspecting the southern parts of New South Wales, looking for land, and any area made available for selection attracts more applications than can be granted. This desire to settle in the southern districts of the Colony is due to the character of the land and the facility with which it may be cultivated.

The rainfall in the district through which the proposed line would pass is over 20 inches per annum, and the yield of wheat is stated to average about 16 bushels to the acre. Failure of crops, the Committee are informed, has taken place only when the conditions have been unfavourable throughout the Colony. "Within a radius of 100 miles of Narrandera, or perhaps more," the Government Astronomer says, in his evidence before the Committee, "the rain distribution is one of the best in the Colony. They have almost entirely satisfactory rains during the wheat-growing period. They have rain in the winter, when they sow the wheat, and an abundance of rain before December."

Taking the land within 20 miles on each side, and within a similar distance north, of the proposed railway—an area which may fairly be regarded as that which would be affected by the line—there are within that limit 483,360 acres of alienated land, 25,760 acres under settlement and improvement leases, 206,080 acres of reserves, and 293,540 acres of Crown land. The Crown land consists of 217,470 acres of leasehold land, which will be available between now and the year 1900, 55,750 acres of land held under occupation license, and 23,320 acres of untenanted land.

OBJECTIONS TO THE PROPOSED RAILWAY.

7. As a part of the Colony where settlement and production are satisfactorily progressing, the Coolamon-Ariah district has claims to consideration in the matter of railway communication; but the railway to Hay already serves a considerable portion of that district. To the statement of the Railway Commissioners that all the traffic which would be obtained by the line to Ariah is already sent to the existing railway system, either at Narrandera, Grong Grong, Coolamon, or Temora, may be added the opinion that, even if the proposed railway were constructed, some of this traffic would continue to go to one or other of those places. The new line would not attract it from localities to which the present railways, at one point or another, would still be equally convenient; and it is not contemplated to extend the line in the future northwards from Ariah, the intention being simply to construct it for the purpose of assisting the development of the Coolamon-Ariah district.

Another objection to the proposed railway is the direction in which it leaves the South-Western railway at Coolamon. Instead of branching off from the main line at a right angle, it leaves it at an acute angle, by which plan it remains, as the Sectional Committee point out, within the range of the influence of the Hay line for a longer distance than is desirable.

OTHER ROUTES.

8. At Warri, which is situated a few miles from Ariah, the line turns somewhat east of north, and, if it were desirable to only approach the country in the vicinity of Ariah, it would be sufficient for the present to construct the line to Warri. A suggested deviation *via* Methul has much to recommend it if it be determined to carry the produce southwards. A line from Grong Grong would, as far as Warri, be the most direct approach to the Hay line. But if a line from Coolamon, Grong Grong, or Ganmain, towards the north, be justifiable, other lines branching northward from other points on the South-Western railway will be required; and thus, in the course of time, there will be a number of short railways constructed to carry traffic, much of which is, and always will be, within the reach of the Hay line. Further, the produce of a territory lying west from Temora will be conducted south to be subsequently carried north along the main Southern line.

DESCRIPTION OF THE COUNTRY WEST FROM TEMORA.

9. The Sectional Committee, in their Report, which deals very fully with this question, describe the country through which a line traversing this part of the Colony in a westerly direction would go, as on the whole fairly suitable for agriculture. Portions of it are broken, and belts of mallee and ironbark are met with; but of the total area of land which would be within the influence of the suggested railway, a vast proportion may be regarded as good. The annual rainfall in these districts varies from 18 to 22 inches, and although the smaller quantity is not sufficient in itself to prevent the growth of cereals from being at times uncertain, the fall is generally at such periods of the year that 18 inches for the twelve months would not prevent agriculture from being fairly satisfactory to the settler, and preferable to pastoral occupation alone.

It will be found stated in the evidence before the Sectional Committee that a fair net return from pastoral land in this district is about 3s. per acre, and from agricultural occupation, 15s. per acre. The rent paid by Crown lessees is stated to be a few pence per acre per annum; but it is said that if these lands were available for agricultural settlement, and within 15 miles of a railway, a very much higher rent could be obtained. There are about 340,000 acres of Crown lands within a belt of country 25 miles wide, extending westerly from Temora to a point 15 miles beyond Warri. West from this the extent of Crown lands is still greater, and the increased value which would be given to these by railway communication is a matter of great importance.

A PREFERABLE SCHEME.

10. The question therefore arises whether the development of this part of the Colony cannot be brought about in a more advantageous manner.

In dealing with the matter of railway construction in any part of the Colony, it is as necessary to determine the extent to which areas outside the districts immediately affected by the proposal for a railway are concerned in the matter, as it is to decide upon the merits or otherwise of the proposal from evidence relating to the districts which the line is specially intended to serve. In other words, a railway proposal has a national as well as a local aspect, the former equally as important, if not more so, than the latter; and it therefore is advisable, in regard to any proposed railway extension, to consider, not only whether it will be beneficial to the district through which it will run, but whether it will advantageously form part of a scheme for the systematic development of the whole of the adjacent territory.

As will be found stated in the report of the Sectional Committee, there lies between the Lachlan and the Murrumbidgee Rivers a great area of undeveloped country requiring railway communication.

To the south of a line drawn through Wyalong towards Hillston, and between it and the existing railway to Hay, the Sectional Committee point out, a distance of nearly 70 miles intervenes, which distance is fairly well maintained to Hillston. This area of country is closely concerned in the proposed line, and should be benefited by any railway construction in that part of the Colony judiciously planned and carried out.

No survey of the country between Temora and Ariaah or Warri has been made; but it is known that there is no difficulty in the way of constructing a railway by this route. For about 5 miles west of Temora the land rises somewhat, but a good grade could be obtained, and, after crossing the range, the country presents no engineering difficulties. A direct line from Temora to Ariaah (or Warri) would be a little shorter than that from Coolamon to the same place, and the distance to Sydney would be less.

THE COMMITTEE'S RECOMMENDATION.

11. The Committee have agreed to the following resolution:—

“That, in the opinion of the Committee, it is not expedient the proposed Railway from Coolamon to Ariaah, as referred to the Committee by the Legislative Assembly, be carried out.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 18th November, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM COOLAMON TO ARIAH.

THURSDAY, 23 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Coolamon to Ariah.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make? Yes; it is as follows:—

COOLAMON TO ARIAH.

THE first action in regard to this proposal was taken in April, 1895, when Mr. Fitzpatrick, M.P., with Mr. Wm. Fisher, of Coolamon, waited upon Mr. Secretary Young, and urged the necessity for constructing the line.

Mr. Fisher presented a petition signed by a large number of farmers settled in the district interested, giving reasons why the line should be constructed, and asking that a trial survey be made.

The Minister promised that he would have an officer sent to report on the matter, and thereon Mr. Deane entrusted Mr. C. M. D. Stuart to make an examination of the proposed route.

Mr. Stuart's report, which was submitted to the Minister on the 27th June, 1895, showed that the line, which practically followed the travelling stock route, would pass over very flat country, and there would be no engineering difficulties. Also that the country passed through is good agricultural land, suitable for wheat-growing, and extends up to both sides of the range, which is low and narrow; it is greatly undeveloped, the larger portion being used for pastoral purposes principally. The cultivated land is about 2½ per cent. of the country that would be benefited by the proposed line.

The matter was not revived till April, 1896, when the Minister directed that this, amongst other proposals, should be prepared for submission to the Public Works Committee, and at the same time he authorised the survey to be carried out.

Mr. Barge, on 9th December, 1896, reported the completion of the survey by Mr. Mocatta, the length of line being 41 miles 63 chains 28 links, and the ruling grade 1 in 100. Estimated cost, £91,307, or £2,185 per mile, exclusive of land and compensation.

The Railway Commissioners, in response to the Minister's request, forwarded their report on the 11th December, 1896, which reads as follows:—

In accordance with the provisions of the 'Public Works Act of 1888,' section 13, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a light railway line (exclusive of land and compensation), at £91,770

Annual Cost—

Annual expenditure at 3 per cent. £2,753
Cost of maintaining permanent way, and traffic and locomotive expenses 3,500

Total annual cost £6,253

Traffic Estimate—

Total estimated revenue from all sources, exclusive of mails £1,543
Mails 504

Total estimated traffic £2,047

The land along the whole route of the railway is of a high character for agricultural purposes. The settlement, however, is exceedingly meagre, and it will be seen that the prospects of traffic are far below the annual cost that would be incurred in working the line, and leaving a considerable deficiency in the actual daily expenses to be made up, as well as the whole of the interest on the capital outlay.

The traffic that would be obtained on the line is now sent either to Narrandera, Grong Grong, Coolamon, or Temora, and it is only an increased development of the country that can be looked to for any additional traffic that will be placed upon the existing lines.

Under the existing conditions we cannot see our way to recommend the construction of the line.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this eleventh day of December, one thousand eight hundred and ninety-six, in the presence of,—
H. McLACHLAN,

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FERRON,
Commissioner.

R. R. P.
Hickson.
23 Sept., 1897.

When the survey from Coolamon to Ariah was being carried out, Mr. Deane, in a minute to the Under-Secretary, dated 24th June, 1896, pointed out that in order that the Minister might have full information as to possible alternative routes, he had directed the surveyor to examine the country both to the east and west. Mr. Deane was of opinion that the shortest and cheapest is undoubtedly that joining at Grong Grong, and as it is reported to go through equally good country and serve the residents as well, it would seem to be preferable to the travelling stock route. The Minister approved of the survey being made, and on the 7th January, 1897, Mr. Barge reported its completion by Mr. Wilkins, the length of the line being 32 miles 25 chains. Ruling grades 1 in 100 and 1 in 75, and sharpest curve 16 chains radius. The estimated cost being £74,639, or at the rate of £2,310 per mile.

The country this line would pass through is generally composed of boree and mulga flats, and is used generally for sheep, but is well adapted for agriculture, and there is a yearly increase of population, generally from Victoria, who are taking up land for wheat growing. The first 9½ miles is chiefly through Crown property, and this is also the case on the part common to the Coolamon trial line.

A petition from residents of Grong Grong, Narrandera, &c., was forwarded by Mr. Fitzpatrick, M.P., urging the adoption of this route, and recently the Grong Grong Railway League wrote urging its construction, when the Minister approved of their being informed that if the line from Coolamon to Ariah was referred to the Public Works Committee, it would be competent for them to urge their claims for a deviation before that body.

A route was also advocated by the Methul Railway League, which would leave the surveyed route along the travelling stock route at about 17 miles from Coolamon, near Cowabbie Station, traversing private property for the whole of the distance (about 22 miles) to Ariah. Mr. Deane, in a minute to the Minister, stated that in adopting this route there would be a small saving in distance, but this is counterbalanced by the inconvenience of leaving the main road, and the difficulty and expense of making roads of access to the line. The matter then dropped.

In his report, dated 28th February, 1893, on the proposal from Coolamon to Broken Dam, Mr. Barge referred to an alternative line, which would be almost identical with this proposal, Coolamon to Ariah, and Mr. Wilkins also explored a line from Narrandera to Barrellan, which would run parallel to the Coolamon to Ariah line, and serve almost the same district.

2. Which line does the Department suggest? The line submitted to the Works Committee is the Coolamon to Ariah line, but I think that if either line is to be adopted the Grong Grong line would be the best. It will serve the same purpose at a less cost.

3. Do you know what the Ariah to Temora line would be like? No.

4. Have you any knowledge of the matter? I have no knowledge of that country at all.

5. What is the difference between the expenditure and the income as estimated by the Department? The annual cost is estimated to be £6,253, the total income from traffic £2,047, leaving a difference of £4,206.

6. What would be the cost of a line from Ariah to Grong Grong? About £74,639.

7. *Mr. Hoskins.*] Would it not cost more to make? It would cost more per mile, but the distance being shorter the total cost would be less.

8. *Mr. Roberts.*] What would be the loss, reckoning working expenses only and disregarding interest upon outlay upon the projected line from Coolamon? £1,453.

9. *Chairman.*] What is the Departmental justification for this line? The Minister hopes that the making of the line will increase settlement, and so bring in a large revenue.

Henry Deane, Engineer-in Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

H. Deane.
23 Sept., 1897.

10. *Mr. Fegan.*] Have you got a statement? No; I had a statement prepared for the Under Secretary, and I do not know that I have anything else to say. I hand in the following detailed estimate of the cost of the proposed railway:—

11 November, 1896.

COOLAMON TO ARIAH.

ESTIMATED cost of a single line of railway 41 miles 63·28 chains in length with 60-lb rails. Ruling grade 1 in 100. Sharpest curve, 15 chains radius at junction.

Description.	Estimated cost.			Average per mile.
	£	s.	d.	
Earthworks	10,317	5	0	247
Timber bridges and small timber openings.....	3,710	2	6	89
Level crossings, cattle stops, fencing and road diversions	1,746	0	0	42
Permanent way materials	26,072	7	3	624
Freight, &c.	5,938	16	0	142
Platelaying, @ 1s. = £3,677 12s.	19,767	2	6	473
Ballasting (½) @ 3s. 6d. = £3,217 18s.				
Sleepers, @ 2s. 6d. = £12,277 12s. 6d.	3,266	0	0	78
Station works, including junction and sidings				
Station buildings: waiting-sheds, £315; platform, £200; loading-banks, £450; goods-shed, £300; station-master's house, £200; grain-sheds, £500; 20-ton weighbridge, £275; 5-ton crane, £200; engine-shed, £500; coal-stage, £200; carriage-shed, £200; turntable, £600; sheep yards, £150.....	4,090	0	0	98
Water supply	4,500	0	0	108
Telegraph	627	0	0	15
Gradient and mileage posts	627	0	0	15
Miscellaneous	500	0	0	12
Cost of works	81,161	13	3	243
Engineering and contingencies, 12½ per cent., nearly	10,145	6	9	
Total cost.....	91,307	0	0	
Average cost per mile	2,184	17	0	

11. What is the chief product that will be carried on the proposed line? It is intended to tap the wheat-growing district and to serve the free selectors.

12. Have you been over the line? Yes, a short time ago. I started from Coolamon and returned *via* Temora.

13. I suppose your chief object ultimately is to connect with Temora or Wyalong? I do not think so. There is no proposal to connect in any way with the existing lines at any other point.

14. I see that the cost will be £91,770, and the annual expense will be something like £6,253, whilst the traffic will only return about £2,047? That is the Railway Commissioners' report, I think.

15. That means a heavy loss from the beginning? It does.

16.

16. With no prospect of getting more than you have on your estimate? Of course it is not my business to advocate a line. I am here to represent the engineering and construction part of the question. When I went over the line a short time ago, I saw a good many of the residents at the Ariah end, and, of course, they are very much in want of a railway. But they are not particular whether it goes from Coolamon or any other point as long as they get a railway. They say that the area under cultivation is very largely increasing, and that there are large areas of Crown land that have been, and which will be cut up, affording room for a very large extra settlement. They also told me that they had heard what has been proposed with regard to the Green's Gonyah line, namely, that special rates should be charged, and that there should be a kind of tax levied on the land, and that they would be quite prepared to advocate the same for their district if thereby the construction of the line would be secured.

H. Deane.
23 Sept., 1897.

17. That is the residents adjacent to the proposed line? Yes.

18. Mr. Hickson's report says:—

Mr. Deane was of opinion that the shortest and cheapest route is undoubtedly that joining at Grong Grong, and as it is reported to go through equally good country, and serve the residents as well, it would seem to be preferable.

Is that so? Yes; I think that was some observation which I made when the question was raised some time ago.

19. It continues:—

The Minister approved of the survey being made on 7th January, 1897. Mr. Burge reported its completion by Mr. Wilkins, the length of the line being 32 miles 35 chains; ruling grades 1 in 100 and 1 in 75, and sharpest curve 16 chains radius, the estimated cost being £74,639, or at the rate of £2,310 per mile.

The difference in mileage would be 41 miles as compared with 32 miles? Yes.

20. How is it that this has been placed before the Committee instead of the other if the other is a shorter route? I believe the Minister preferred to have this line submitted, after considering the requirements of the people in the district. The opinion formed was that this line as submitted would suit the residents of the line along the route to a larger extent than any line more nearly at right angles to the south-western railways. There are a good many farmers in the neighbourhood of Cowabbie, to the right of the station.

21. Are they freeholders? They are conditional purchasers.

22. Then if the line were brought from Grong Grong it would not benefit them? No, they would be left out.

23. What population would the line from Grong Grong suit? That line would go in a direct line to Warri, where there is settlement. There are also some considerable Government reserves, which will probably be opened up for settlement.

24. I suppose there is not much engineering difficulty with regard to the construction of the line? No.

25. The two lines are about equal in that respect? Yes.

26. Would you have any difficulty in getting sleepers there? We should have to bring them by the railway, or they could be obtained from the range, which runs pretty nearly north and south about six miles to the west of Temora.

27. Then you have not any adjacent to the route of the line? None to speak of.

28. Is all that good agricultural country? It is magnificent country.

29. Very little of it is forest country? Very little, except pine forest. I was told that there were very large quantities of fine pine to the north-west of Warri, but that is not suitable for permanent way purposes, or bridges.

30. What is your estimated cost of getting sleepers? I put down sleepers at 2s. 6d.

31. Is not that rather a low price? Yes; but I think that they can be got for that.

32. In your estimate of the proposed line from Condobolin to Euabalong, you put down the sleepers at 4s. 3d.? Yes; there will be long carriage there. The ranges where iron-bark is found have only a very scanty and stunted growth of timber, and a great deal of it has already been worked out.

33. Have you any extra charge for bridges along the line, not shown on the plan? No; there is not very much. The estimated cost of waterways and culverts amounts to £89 per mile.

34. How many stations do you intend to have on the line? I think three or four, but the accommodation will be mostly in the way of short sidings without any buildings.

35. What would be the thickness of your ballast? I should do without ballast as much as possible. About a quarter of the line would be ballasted, as there are some places where the ground is rather wet.

36. Where do you intend to get your water supply from? We shall have to make artificial reservoirs; £4,500 is put down for that.

37. That will make, I suppose, about three reservoirs? Yes, possibly. There is a creek at the far end, but it has not been tested sufficiently. There is always water to be got there in the sand, but I am doubtful whether it would answer the purpose of a locomotive supply. I have reckoned upon having to make excavated tanks.

38. What would your earthworks chiefly consist of? Embankments; but at Coolamon there would be a few cuttings.

39. So there would be very little difficulty as regards the construction of this line? No difficulty.

40. Is there anything else but agricultural country there? There are a good many sheep. Cowabbie is a sheep run.

41. But the majority there are small settlers? On the eastern side of the run there are a good many small settlers, but the run itself is occupied by sheep.

42. Do you think there is any probability of this line paying in the near future? I would rather avoid giving an opinion on that. I should like to point out, as I did in the case of the Green's Gonyah line, that there are a number of Government reserves which have been cut up, and leaseholds which will soon fall in, and if the railway could be benefited to the extent of some part of the increased value, as recommended some years ago by the Railway Commissioners, it would reduce the cost of the line—that is to say, it would reduce the capital, and would enable it to pay at a much earlier date.

43. At the same time getting rid of the land. Whilst you are making the interest less you are giving away the State estate? Yes, it is quite a proper thing to do. The policy of the country is evidently to sell the public estate as fast as possible, and if the money were devoted to the railways it would be a very proper way of dealing with it.

44. I suppose you have no idea of the area of the reserves which you mentioned? I have asked the Under Secretary to write to the Lands Department to obtain it, but the information has not been received yet.

45. You prefer that we should ask the officers of the Railway Department whether they would recommend the construction of the line? Yes. Perhaps this would be a fitting time to say that when I was up there

- H. Deane.
23 Sept., 1897.
- there it was pointed out to me by the residents of Warri, which is where the line bends to the north, that that was far enough for the line to go; that if it went to the 315-mile peg, that was all that the settlement required—that is, 6 miles less than is proposed. The line goes on to Ariaiah. I had instructions to make it to that point. Ariaiah is a station in the possession of the Bank of New South Wales, and they are waiting to see what is likely to be done in the matter of railway construction. If the line is made the land will be thrown open on the share principle.
46. By reducing it by 6 miles you would save very little? The cost of that part of the line would be about £2,000 a mile; that would be £12,000.
47. *Mr. Roberts.*] What is the distance from Temora to Ariaiah? Thirty-nine miles.
48. As against 41 miles from Ariaiah to Coolamon? Yes.
49. Would the construction of a railway from Temora to Ariaiah be more difficult or more expensive than the making of a railway from Ariaiah to Coolamon? I do not think there would be very much difference. The first 6 miles out of Temora would be the most expensive part of the line. It would have to mount the low ridge shown on the map; but after you get on the top it is practically level right across.
50. Could you give us a rough guess as to what the cost per mile would be to make a railway from Temora to Ariaiah? I should think that, taking into consideration the smaller mileage, the total cost would be about the same.
51. Does it not appear to you that a line from Ariaiah to Temora would be of greater advantage to the people around Ariaiah, inasmuch as the distance to be traversed to Sydney would be much less;—can you give us the distances from Sydney to Coolamon, Temora, and Ariaiah, and the difference in the mileage? I can give it in this way: The distance from Temora to Ariaiah is 39 miles; the distance from Sydney to Ariaiah, *via* Temora, is 330 miles; by way of Coolamon, 351 miles; and by way of Grong Grong, 366 miles.
52. The distance from Ariaiah to Sydney would be much shorter, would it not, than the distance from Ariaiah to Melbourne, *via* Wagga Wagga? It would be about the same, I think, but I have not the figures here.
53. Is it true that you suggested the Grong Grong route to Ariaiah as being preferable to the Coolamon route? Yes; there is a minute to that effect.
54. That would be on the ground of economy? Yes.
55. In making that suggestion did you take into consideration the possibility of connecting Ariaiah with Temora? I did not.
56. On second thoughts, would it not appear to you to be a preferable route? Looking at it from a different point of view altogether,—yes. But if you want simply to connect Ariaiah or Warri with the existing railway, no doubt the best way is to come down on to the south-western line. If you are looking to the future development of the railways, having a proper system to serve the country—cutting it up into strips, as it were—then I think the other connection should receive consideration.
57. You recommend the route from Grong Grong to Ariaiah, in preference to that from Temora to Ariaiah, on account of its being cheaper? Yes, merely on account of its being cheaper.
58. In making that recommendation, have you taken into consideration the extra haulage of goods over the line? Referring to Mr. Hickson's statement, I see that the words put into my mouth are: "Mr. Deane was of opinion that the shortest and cheapest is undoubtedly that joining at Grong Grong, and as it is reported to go through equally good country and serve the residents as well, it would seem to be preferable to the travelling stock route."
59. Would the line go through private land all the way from Grong Grong to Warri, or to Ariaiah? I do not know. I will have the report looked up.
60. Are you able to say that if the line were recommended to go that way the owners of the land would be prepared to give what land is required for the construction of the railway? I think it should be made a stipulation. I find that it is stated in the report that the first 9½ miles is chiefly through Crown property.
61. As regards the resumption of private land, the cases would be similar, whether the line went by way of Coolamon or Grong Grong? The line by way of Coolamon goes by a travelling stock route nearly all the way.
62. In either case, you think there should be a stipulation? I think so.
63. Would the same rule apply with regard to the suggested line from Temora to Ariaiah? Yes; a great deal of it would be along the travelling stock route. There would be some properties to purchase at the Temora end. You could not expect residents there to give the land free.
64. I suppose the cost of resumptions would not be a formidable amount? No. I think the line could probably be laid out to cut into the properties very little, especially if it follows the travelling stock route.
65. Have you not heard that the country from Barmedman to Hillston—and that would probably take in the land from Ariaiah to Hillston—was very unsuitable for railway construction, as there are numerous ranges? It is ridgy, but there is no difficulty about getting a railway through it. You could not make a very cheap line.
66. I asked Mr. Harper, when he was here, about the country from Barmedman to Hillston, and I think he said he had been over it, and he did not look upon it with any favour as being suitable for railway construction compared with the line from Cudgellico? That would be so.
67. You have not been over the country between Barmedman to Hillston? I have not, but I have been round by Cudgellico.
68. Would not that country from Wyalong to Cudgellico, and Cudgellico to Hillston, give a favourable grade? Yes.
69. What would be the grade between Coolamon and Ariaiah? 1 in 100.
70. And the same from Grong Grong to Ariaiah? I think that could probably be obtained.
71. Would the grade from Temora to Ariaiah be a less favourable one? There are no surveys, but I do not think there would be very much difficulty.
72. The only difficulty would be getting over that range a few miles out of Temora? Yes.
73. I think you said that some of the people around Ariaiah had expressed their willingness to submit to a tax at so much per acre, with a view to getting a railway? What they said was that they would fall in with the same conditions that were proposed for the Green's Gunyah line.
74. When you say "they," how many people do you refer to—to all the principal landholders, or only one or two? I think all of them. I called at Mr. Boyd's place on the way to Ariaiah. Some of the residents had been on the lookout for me. I think there were ten of them at Mr. Boyd's, and they all represented

represented about 1,000 acres, or more, each of cultivated land, land actually under crop, and they were evidently a representative party. They assured me that the residents generally would be prepared to do it. There were several others who were not there, but who also had a considerable quantity of land under cultivation, but I understood they were all of the same view. H. Deane.
23 Sept., 1897.

75. Is the land from Coolamon to Ariah, Grong Grong to Ariah, and Temora to Ariah, all of the same class—equally well adapted for the production of wheat? Yes; it is all excellent land, all red soil; some of it a little more sandy, and some of it a little stiffer. There are in the neighbourhood of Warri and Ariah some low ridges, but they do not take up very much of the country.

76. Were you able to gather, in conversation with the residents of the district of Ariah, that any large settlement would take place if a railway were brought there;—was there any evidence of a demand for agricultural land? Yes, there was. A great many Victorian farmers are going about the southern parts of the Colony looking for land, and whenever land is thrown open by the Government, there are many more applications than can be granted.

77. Is that in view of the construction of a new railway? No; even without that. The value of the land would be very much affected by the construction of a railway, and the Government might expect to get largely increased values.

78. Can you tell us what area of land is under cultivation around Ariah? No; I have no statistics. But I pointed out to the residents there that no doubt in a few weeks a Sectional Committee would be passing through, and I strongly advised them to have all their facts ready.

79. Did you see much land under cultivation? Yes, a good deal. Even going along the road you see a good deal. There was one farmer named Fogarty, who seems to have fully 1,000 acres under cultivation in two blocks; then the Boyds, whose property adjoins the main road, have very large areas.

80. Do they send their wheat to Coolamon? Yes.

81. How would a line suit from Narrandera in the direction of Warri? There was an examination of a route from Narrandera to Barrellan. I think it is mentioned in Mr. Hickson's statement.

82. What is the length of it? Twenty-four and a half miles.

83. Would that be west of Warri? Yes.

84. Has the route from Narrandera to Barrellan been considered by the Minister? I should think there is no doubt about it. He had the report before him.

85. Would not such a line increase the length of the journey to Sydney? Yes, it would be longer than *via* Grong Grong.

86. What rails do you intend to use on the proposed line? Sixty pound rails.

87. Would the line be fenced? No, there is no necessity to fence it.

88. Have you found other unfenced lines to answer satisfactorily? There have been no serious objections raised.

89. There have been no serious collisions with stock? No; the traffic is always carried on in the daytime.

90. *Mr. Black.*] Do you know the country between Temora and Ariah? Yes; I have been through there.

91. Is it as good as that between Coolamon and Ariah? It is very much the same class of country, till you come to the range, within a few miles of Temora.

92. Then, possibly, it might not open up such a good wheat-growing area? I think it would; but there is very little settlement there. There is some settlement about Broken Dam, but there is not the same amount of cultivation that there is on the Coolamon to Ariah route.

93. *Mr. Lee.*] Does the route from Coolamon to Ariah pass along the travelling stock reserves? As soon as it gets out of the town boundaries it follows the travelling stock route all the way to Warri. It passes through some private land, which will be shown in the Book of Reference.

94. From Warri to Ariah is about 10 miles? No, 6 miles.

95. That line seems to take a short turn to the north? Yes.

96. And is also a rather irregular route? Yes.

97. Is that owing to the nature of the country? It has been laid out like that with the view of getting a surface line. The country rises and is rather ridgy to the right. It is slightly undulating.

98. From Grong Grong to Warri is about 31 miles? I think so.

99. As the dotted line is shown on the map from Grong Grong to Warri, between those points 10 miles would be saved? Yes; it is about 9½ miles, I think.

100. As a matter of fact, you can go from Grong Grong to Ariah in about 31 miles? The distance from Coolamon to Ariah is 41 miles 26 chains; from Grong Grong to Ariah is 32 miles.

101. That is 32 less 6, so that it is 26 miles from Grong Grong to Warri? Yes.

102. You say that the people said that if the line terminated at Warri it would meet all the requirements of the district? Yes, of present settlement.

103. Under these circumstances, would it not be the better way to let it go from Grong Grong to Warri? Yes; I put that before the Minister.

104. I presume there are no engineering difficulties? No, none.

105. None that would necessitate a more costly line? No. I think the country is slightly more undulating, but the construction would be cheap.

106. But if there were an increase in the cost, do you think it would be much? No.

107. The difference in cost would be more than saved by the reduction in distance? Yes. The residents of Warri appear to be very anxious that the line should join the south-western railway at Ganmain.

108. Why did they favour that in preference to the apparently closer connection at Grong Grong? It would effect a saving of distance, and therefore a reduction of cost over the Coolamon connection, and it would not be so far round as to Grong Grong. It appeared to me somewhat of a compromise between the two. It is stated, although I cannot verify it, because I have not had the country examined, that the country between Cowabbie and Ganmain is very flat, and that there would be less difficulties there than on any other route.

109. Of the three proposed starting-points—Coolamon, Ganmain, and Grong Grong—which do you think is the best? I should not like to say without having Ganmain examined as a junction.

110. We have the Coolamon project before us, and even at its initiation it is shown that we could have a better connection at Grong Grong. Therefore, we should like to know from you which would be the most desirable point to start from? As a matter of railway policy, I could scarcely give an opinion; but

H. Deane.
23 Sept., 1897.

as a matter of cost, I have no doubt that the Grong Grong route would be the cheapest. The Gaunmain route would probably be very little more than the Grong Grong, and the Coolamon route would be the most expensive.

111. *Mr. Wright.*] Can you give the Committee the distance that it would be from Ariah to Sydney *via* Coolamon, *via* Grong Grong, and *via* Temora? Yes; *via* Temora, 330 miles; from Coolamon, 351 miles; *via* Grong Grong, 366 miles.
112. That gives 21 miles in favour of Temora? Yes.
113. What kind of bridges do you propose to build? Timber bridges.
114. Have you provided for good openings for the heavy flow of water? Yes.
115. Do you cross the Cowabbie Creek? Yes.
116. That being a flat country, there is a vast accumulation of water after heavy rains;—are you satisfied that you have provided sufficient openings for the water to get away? Yes.
117. What provision have you made for conserving water on the route for traction purposes? I have put down £4,500 for water supply.
118. You will have practically to conserve all the water that you require? Yes.
119. What is your opinion of the holding quality of the country for tanks? I think that will be all right, even if we have to line the tanks.
120. Did you make inquiries? I discussed the matter.
121. £4,500 would build four tanks, at about £1,000 each? Yes.
122. How much a yard do you allow for excavations in that country? About 1s. 3d.
123. I think you said that the alternative route marked "*via* Grong Grong" on the map, went nearly all through purchased land? No.
124. As a matter of fact, is there any Crown land except the Grong Grong Plains? I think the first 9½ miles is Crown land. There is some leasehold and some pastoral land.
125. Grong Grong Plains is all purchased land? There is a good deal of purchased land; but I am pretty well certain that the report stated that there was 9½ miles of Crown land at the southern end.
126. You stated that you got ironbark sleepers for Temora? Yes; along the range.
127. Have you ever got good sleepers there? They are cutting them now, and carting them into Temora. The trees are not large, but a great many sleepers have been cut.
128. They are destroying the forests by cutting saplings down? I do not know.
129. Have we no wood that would supply the place of ironbark for railway sleepers? Not that will do so well.
130. Do you know anything about the quality of bloodwood? Yes; it is very durable, but it is almost impossible to get it without its being full of gum-veins. It breaks up.
131. Would not bloodwood last underground longer than ironbark? I do not think there have been any tests.
132. What about red gum? It is a very good timber.
133. You can get red gum more cheaply than ironbark? I do not know that you can. It depends upon the carriage.
134. In proposing to construct railways in the southern districts, we might raise the question whether other timbers could not be got more cheaply than ironbark? I should rather doubt whether you could get bloodwood for the same price, and I do not think it is a timber that splits very well.

FRIDAY, 24 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Coolamon to Ariah.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

H.
McLachlan.
24 Sept., 1897.

135. *Mr. Hassall.*] Have you a statement to make? No. I understand that the report of the Commissioners has been laid before the Committee by the Department of Public Works. That really gives the views of the Commissioners in regard to the matter.
136. Is the estimate submitted as to the cost of the railway, and the amount of probable traffic, as nearly correct as you can make it? Yes. I may say that the estimate of traffic was made by Mr. Harper, who feels more satisfied with this estimate than with any that he has made yet. He has taken every station and every holding.
137. The total cost of constructing this line is estimated at £91,770? Yes.
138. The working expenses and interest on capital amount to £6,253 per annum? Yes.
139. As against an estimated revenue from traffic from all sources of £2,047? Yes.
140. And that shows a total annual loss of £4,206, or a loss over and above working expenses alone of £1,453? Yes.
141. Have you formed any opinion as to whether this traffic would be increased by the construction of the line, or does Mr. Harper's estimate cover the probable increase in the traffic? It covers the traffic we may reasonably expect to get, but it does not provide for any development of business.
142. So there would be a prospect of increased traffic if the line were constructed and the land brought under cultivation? Yes.
143. Do you expect any large increase? Yes; the district is a very favourable one for agriculture. It is good land right through, and no doubt if a line were made there would be a certain increase in production.

144. Do you know whether Mr. Harper took into consideration in making his estimate the possibility of securing any traffic that now goes to Melbourne? There is no competitive traffic in this case. We practically get it all.

H.
McLachlan.
24 Sept., 1897.

145. So, if no railway were constructed, the traffic must come on to the line at some point? Practically there is no competitive business in it. The business belongs to Sydney at the present time.

146. So that you could not get any fresh business in that respect? No.

147. You do not know anything about that part of the country? I have not been over the route.

148. It is said that that country is good for agricultural pursuits? It is no doubt an excellent district, and very suitable for agriculture.

149. Any increase in the traffic could only be the result of a largely-increased area being put under cultivation? Yes.

150. What do the Railway Commissioners themselves think in reference to it? Their conclusion is summed up in the last words of the report, that they do not recommend the line, although they look on it as one capable of developing the country to a large extent without any competitor coming in to secure the business.

151. There is no necessity to construct the line to cut anyone else out? No.

152. It appears that under the most favourable circumstances the line must result in a pretty heavy annual loss? Yes.

153. Therefore, under these circumstances, the Commissioners cannot see their way to recommend it? No.

154. More particularly as no fresh traffic would be intercepted? No; except what would result from the development of the country by increased settlement.

155. That is the only direction in which you could look for increased business? That is it—from the development brought about by the construction of the railway.

156. Have you any idea whether the country is held in large or small holdings? The proposed line follows one of the stock routes. There is a good deal of settlement in the district; a good number of selectors, and there are one or two large holdings.

157. Have you any knowledge of the country between Temora and Ariah? The Commissioners have some knowledge of that tract, and it is one that they think might reasonably be considered. This line, with a number of others, enters into what you might call debatable country. It is a debatable question whether you should make the railway from Coolamon to Ariah, or from Temora. *Via* Temora it is about 30 miles nearer to Sydney, but the land on the Coolamon route is better agricultural country, and is more likely to lead to development. Temora is one of the points from which you might make a railway to Hillston. It is a debatable question as to the route which should be selected. The Commissioners do not look upon the extension to Ariah as likely to go beyond that place. They look upon it as a local line to develop that particular district.

158. They consider that it will stop at Ariah? Yes.

159. Taking the view that the line might be extended from Temora, they would look upon it as practically an extension in the direction of Hillston? Yes, that is the debatable point. The Commissioners do not look into the question of routes, but they see that that is fairly open to consideration.

160. Would they think it advisable for a Sectional Committee in visiting that locality to inquire into that proposal to also take into consideration the extension of the railway from Temora? They think that would be a reasonable thing for the Committee entrusted with the investigation of the matter, to do.

161. *Mr. Roberts.*] I see from the Railway Commissioners' report that the interest on the capital expenditure is charged at 3 per cent.? Yes.

162. How long have you charged 3 per cent.? About twelve months. I think that the case of the city railway was the first one in which it was done.

163. You regard that as a fair charge at the present time? Yes.

164. With regard to the proposal before the Committee, did not Mr. Deane recommend the construction of a line from Grong Grong to Ariah? That is a matter which would not come before the Commissioners, although I understand that a line has been surveyed from Grong Grong as well as from Coolamon. The question of the route is a matter which is not referred to the Commissioners. The line is referred to them, and they report upon the commercial aspect of it.

165. Mr. Deane's recommendation, then, would only go before the Minister? Yes.

166. The Minister would not obtain the opinion of the Railway Commissioners as to the route? Not as a rule.

167. When the Railway Commissioners say that they cannot recommend the construction of this line, do they take into consideration the possibility of increased settlement and consequently increased traffic on the railway if it could be constructed? No; they look at the question as to whether the line is likely to be a paying line in itself. The development of the country is, perhaps, a matter of policy. The Commissioners look at it in a commercial light, and it is apparent that this line will not pay.

168. They form their opinion upon the actual production at the time? That is so.

169. Not as to possibilities? No; it would be largely a matter of guesswork as to what is likely to follow after the construction of the railway. They prefer to base their figures on what they know exists.

170. Is there not a very sparse settlement in the part of the country through which this railway would pass? Yes; the population is very thin. There is no centre of population to touch. The total population of the district served by the railway will be about 600.

171. Are you able to tell the Committee of any case in which only a sparse population existed at the time it was thought desirable to construct a railway, and in which a marked increase of settlement took place after the railway had been made? No; I cannot from memory recall a case. Sometimes we have made sections of lines where there was no population, but it has been with the object of reaching centres of population.

172. Has it come under the notice of the Commissioners that a railway as far as Warri would answer all purposes without going as far as Ariah? No; the Commissioners were asked to report on a line to Ariah, and they do not go into alternative routes or sections as a rule.

173. How much nearer would a line from Ariah to Temora be to Sydney than a line from Coolamon to Ariah? About 30 miles.

174. Is it not a mistaken policy to have 30 miles of extra haulage to Sydney;—is it not imposing unnecessary expense upon the people of Ariah? It would appear so as far as Ariah is concerned, but the intermediate districts have to be considered.

H.
McLachlan.
24 Sept., 1897.

175-6. You have to consider whether you would develop more country and serve more people by a line from Coolamon than you would by a line from Temora,—is not the country between Ariah and Temora of a similar character to the country along this route? From what I can gather you would serve a better country between Ariah and Coolamon than between Ariah and Temora. It is an exceptionally good class of country from Ariah to Coolamon.

177. You say that there are six hundred people in that district;—is that the whole of the population between Coolamon and Ariah, and within a radius of 10 miles north of Ariah? That is in the district. I do not know exactly what the boundaries are.

178. How many miles is it from Grong Grong to Warri? I am not sure, but I think it would be about 24 miles.

179. Would you express any opinion as to the desirableness of the construction of a line from Grong Grong to Warri? No; the Commissioners have not had that before them.

180. Was there not a line surveyed out from Narrandera at a point west from Warri? I believe there was four or five years ago.

181. In dealing with branch lines, have the Commissioners ever considered the desirableness of adopting a narrow-gauge line of railway? Yes; and they have reported to this Committee upon it.

182. Can you tell the Committee what their ideas on the question are? The matter has been before the Commissioners on one or two occasions, and that is one reason why they went into the policy of pioneer lines. A pioneer line costs very little more than a narrow-gauge line; it saves all the trouble and expense of transhipment and separate rolling stock. The Commissioners think that it would be almost a misfortune if any branch lines connected with the main system were attempted to be made on a narrow gauge.

183. They are altogether opposed to it? Entirely.

184. Could you tell the Committee what would be the difference in the cost of construction between the narrow-gauge line and the ordinary lines of New South Wales? I should not like to say. It is an engineering question. I understand that it would not be above a couple of hundred pounds a mile in such country.

185. I think I am right in saying that in Victoria lines are put down at the rate of £1,750 per mile, and I have heard that lines are constructed in Queensland at £1,500 a mile? I do not think you will find that in Victoria any railways have been put down at that rate. In Queensland the average is pretty high. The cost of these pioneer lines is only about £2,000 a mile.

186. Does the question of the cost of construction come under the consideration of the Railway Commissioners? Yes; the Railway Commissioners recommended the pioneer system of construction, and in various ways they have tried to cheapen the cost of construction.

187. For the present, are the Commissioners satisfied that the country should pay £2,000 a mile for a railway? Yes, if the line is worth making at all.

188. Would they regard it as false economy to try to build a line for less than £2,000 a mile? Not if you could build a railway more cheaply at the same gauge, and make it equally suitable. The thing is to bring down the cost to as low a price as possible. The Commissioners think that it is down about as low as it can go at £2,000 a mile.

189. Could you tell what is the lowest price per mile at which railways have been constructed in Victoria? I could not.

190. I mean for pioneer lines? They have not built any lines yet similar to our pioneer lines. I think their Standing Committee has passed some narrow-gauge lines, but I do not think any of them have been contracted for yet. They have a 5 ft. 3 in. gauge.

191. What is the lowest price paid by the Victorian Government for the construction of lines on the 5 ft. 3 in. gauge? I am not aware.

192. Do you know the lowest price paid in Queensland? No.

193. *Mr. Trickett.*] How many trains a week do you think you will run on this line if it is constructed? I think a train every second day. That is about what they had in view.

194. Both ways? Yes, on alternate days, the same as on the other lines.

195. Would it go out one day and back the next? Not necessarily. The train might go out and back again in one day.

196. You will remember that when we were first considering these pioneer railways, the Commissioners pointed out that although a line might not pay the interest and the working expenses, still if it paid working expenses, and some contribution towards the interest, they were prepared to recommend it in view of the assistance it would be to the main line? Yes.

197. The Commissioners, having considered this line, do not even recommend it? No. As a matter of fact the line would fall very much short of paying the working expenses. Though the Commissioners made that general recommendation, they at the same time look at each line upon its merits.

198. Do you know whether these short lines of railway in Victoria have been rather a drag upon the system of railways there? The feeding lines have, and more than one of them has been closed.

199. Do they still say that they are a drag on the system? Yes, according to the last report that I have seen.

200. So that, in addition to the Commissioners' own views, the experience of the adjoining Colony is that the construction of a line of this character is rather a doubtful expedient? Yes.

201. *Mr. Hoskins.*] As regards the question about narrow-gauge railways, have you ever heard of their being made to any extent over country where there were engineering difficulties? Yes; it is where there are engineering difficulties that we hear of their being made. They make them in rocky and mountainous country. They are thinking of making one at Mount Zeehan in Tasmania.

202. If narrow-gauge lines were constructed, would there not be difficulties with regard to transhipment, and would it not be better to have the line constructed where it would not work in with the main line, so that there would be no difficulty with regard to the rolling stock? Whatever narrow gauge you adopted you would have to equip the line with a maximum of rolling stock, instead of working it in connection with the main system. And if you had a number of independent systems, it would take a large capital to equip each line with rolling stock. The traffic very often varies in different districts. Two years ago all our live stock traffic was coming south from the Riverina district. In that district they had a good season, but the west and north-western country had a bad season. Consequently on one line we had a heavy traffic and had to use additional rolling stock, and we could always, by an interchange of trucks, provide for the extra demand.

203. The Railway Commissioners have considered the question of having a narrow-gauge railway with the view, as some people think, of reducing the cost of construction, and are they favourable? They are entirely unfavourable. If the Committee are interested in that matter, I may mention that it was discussed at the International Railway Congress in London, in 1895, and the American representatives, who had to alter thousands of miles of railway to the standard gauge in their own country, were most emphatic in warning the colonies against breaking their gauge, unless under very exceptional circumstances.

204. *Mr. Black.*] You said, in reply to Mr. Roberts, that you knew of no instance of railway construction in this country resembling this proposed line. Do you not think that the Jerilderie to Berrigan and Berrigan to Finley lines resemble it? At Berrigan and Jerilderie there are townships and a certain population. The Finley line has not been made yet. Mr. Roberts was speaking of railways which had been made.

205. Are you aware that the mere fact that there is going to be a line from Berrigan to Finley has so stimulated the residents, that there is a growing township there? No.

206. *Mr. Trickett.*] Since I asked you about the Victorian railways, I have got a copy of the last report of the Victorian Railway Commissioners, and I see that there are no less than 58 of their branch railways non-paying, involving an annual loss of £340,224? Yes.

207. There is a special clause in the Commissioners' report, in which they say this: "How to deal with non-paying lines is a difficult question, as it must be borne in mind that under any conditions interest on capital expenditure must be met." I suppose the Commissioners here are alive to the importance of a state of things of that kind, and are therefore very guarded as to recommending lines of this character? Yes. Victoria is slightly different from us, because the traffic from their feeding-lines goes only a short distance on the main line. Their country is more concentrated than ours. The feeders there are not the same help to the main lines as some of our branches. At the same time it is no doubt a warning not to make too many non-paying lines.

208. You said that, with a view of capturing as much of this traffic as possible, routes would have to be considered by which the wheat traffic can be brought to Sydney? That, of course, is a question for the future. There is no fear of losing the business just now.

209. *Mr. Hoskins.*] Rates are lower here than in Victoria? Yes; and there is the break of gauge. We are drawing wheat from Berrigan, which is very close to Victoria.

210. It would cost less to bring grain from the proposed railway to Sydney than they would have to pay to send it to Melbourne? There is no fear of it going to Melbourne at present.

TUESDAY, 28 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Coolamon to Ariah.

John Harper, Goods Superintendent, Department of Railways, sworn, and examined:—

211. *Mr. Roberts.*] Have you had a large experience in making estimates as to the probable traffic on the projected railways in this Colony? I have had a good deal of experience.

212. Do the estimates forwarded by you, as a rule, come out approximately correct? I think so.

213. As a rule, have they been more than you estimated, or otherwise? In some cases more, in some cases less.

214. It is a fair thing for the Committee to assume that your estimates have at all times been approximately correct? Yes.

215. And they are accepted by the Commissioners? Yes.

216. Have you been over the route of the line now under consideration? Yes.

217. Have you prepared any statement as to the probable traffic on that line? Yes; it is as follows:—

Proposed Railway, Coolamon to Ariah.

7 December, 1896.

(Distance, 42 miles. Estimated cost, £2,185 per mile—£91,770.)

As directed by the Commissioners, I have made careful inquiry as to the probable traffic on this proposed extension.

The surveyed route traverses the travelling stock route nearly the whole distance, passing through splendid agricultural land.

The settlement consists of pastoralists, who combine a certain amount of farming with sheep; and selectors, who, almost without exception, carry out a system of mixed farming.

There is no centre of population, the residents being scattered generally along the line or beyond it. At present the wool and wheat of the district is sent to either Narrandera, Grong Grong, Coolamon, or Temora, the destination being decided by the location of the producers to the east or west of the stock route.

The area of Crown land available at the present time is very small, and the leasehold areas have a currency of from four to five years before they revert to the Crown.

The total population of the district which would be served by the proposed line is about 600; the number of sheep held, 380,000; and the area under cultivation about 18,000 acres, chiefly wheat.

The rainfall is a fair one, and failure of crops has only taken place when the conditions have been generally unfavourable throughout the Colony.

There is a considerable quantity of pine in the district, and a local saw-mill is at present at work cutting.

The current rates of carriage by road are—Wool, 6d. per ton per mile; and wheat, 9s. per ton for 25 miles and 12s. per ton up to 40 miles. The road is fairly good, and considerable expenditure has been incurred in the neighbourhood of Coolamon.

The following statement will indicate the manner in which the settlement, population, and production is distributed.

303—B

Distance

H.
McLachlan.
24 Sept., 1879.

J. Harper.
28 Sept., 1897.

J. Harper.
28 Sept., 1897.

Distance from Coolamon at which traffic would reach the line :—

Miles.	Wheat. Tons.	Wool. Tons.	Population.
10	850	25	96
20	1,400	250	160
30	1,700	180	97
42	1,200	600	260

An arbitrary rate of 1d. per ton per mile would no doubt be readily paid for wheat, but I do not think that wool would bear more than 2½d. per ton per mile, whilst stock would certainly not pay more than an extension of the through rate, in view of the splendid stock routes of the district.

My estimate therefore is :—

	£	s.	d.	£	s.	d.
Wheat.....	575	0	0			
Wool	373	0	0			
Timber.....				75	0	0
Goods				300	0	0
Live stock				100	0	0
Passengers				100	0	0
Parcels, &c.				20	0	0
Mails				504	0	0
Total.....	£2,047	0	0			

218. *Chairman.*] Do you take zones up to 10, 20, or 30 miles for wheat and wool? I can only take two zones for present road carriage. Up to 25 miles it costs 9s. per ton for wheat; up to 40 or 42 miles, 12s. per ton. I may state that I had a letter this morning from the Secretary of the Progress Association at Ariaah. This report of mine was made in December last year, and the letter which I have received is dated 25 September, 1897. The writer says :—

We have been collecting fresh statistics for the past few weeks, and as they show a considerable increase on the 1895 returns, I have been instructed by the League to forward them on to you. I will forward them in a few days.

I have not yet received those statistics.

219. *Mr. Roberts.*] Is your estimate based on the present traffic or the possible traffic of the future if the line should be made? My report is based on the actual traffic existing in December last.

220. Have you any reason to believe that any increase in the traffic has taken place since then? I have not been in the district since then. It is very likely that it has.

221. Where is the greatest amount of agriculture carried on;—is it at Ariaah? It is all along the line, both north-east and north-west, the whole distance from Coolamon. But I have only included in my estimate the total traffic 10 miles from Coolamon. I have estimated that up to 10 miles from Coolamon a certain amount of the traffic would come to that place.

222. It would go by road as at present? Yes.

223. You have taken it at a point 10 miles from Coolamon right out to Ariaah? Yes; and lying east and west.

224. Do you regard the country along the proposed line as admirably adapted for the production of wheat? Yes; I consider that it is splendid agricultural land.

225. Is it more than usually good land? Yes; it is exceptionally good land.

226. What would be the yield per acre? They have had as much as 24 bushels; but that is exceptional. The average is generally about 16 bushels per acre.

227. Could you point out to the Committee how far that good agricultural land extends;—does it extend out to that range west of Temora? Yes; a great deal of it. The best portion of it is south-east from Cowabbie. That is probably the best agricultural land in the district.

228. Would that range west of Temora form a sort of boundary to all the good agricultural land? No, there is good agricultural land both east and west of that range.

229. But I want to know how far west of that range, and how far north the good country goes? Practically the whole distance except for broken spurs.

230. How far north? To the neighbourhood of Broken Dam.

231. Then it comes down to the Narrandera and Juncce line? Yes.

232. The country you describe lies practically between Ariaah and Cowabbie? Yes.

233. Going from Ariaah towards Yalgogrin, what sort of country is there? It is very good; it will grow wheat.

234. Pushing on to where it cuts the southern dotted line on the map—Hillston to Barmedman;—is that country good? Yes, but I have not been over it.

235. Coming further south, is that good country? There is a good deal of rough country going from Yalgogrin to Wyalong. The good country extends north-east.

236. What is it west of Yalgogrin? I have heard that some of it is good.

237. Then this is your description of that country: south of the line from Ariaah and Mandamah towards Coolamon the country is specially good eastward of Cowabbie? Yes.

238. Going some distance north it is rough country, and there is a good deal of rough country between Yalgogrin and Wyalong? Yes.

239. From Ariaah to Yalgogrin is good country, and also the country west from Ariaah? Yes.

240. Most of the country of which Ariaah is the centre would grow wheat, except a stretch starting north of Ariaah and Mandamah, and going in a wedge shape in the direction of Yalgogrin and Barmedman? Yes.

241. Have you ever been over the country between Ariaah and Hillston? No.

242. How far in the direction of Hillston have you been from Ariaah? I have followed the dotted line on the map to a certain extent in the direction of Wyalong.

243. Beyond what we call the good agricultural country, does it get more rugged as you get nearer to Hillston? There is a good deal of rugged country between Wyalong and Cudgellico, and between Barmedman and Hillston.

244. You are not able, from personal observations, to compare the country between Wyalong and Cudgellico and Ariah and Hillston, are you? No; my mission was simply to report upon the suggested line from Coolamon to Ariah. J. Harper.
28 Sept., 1897.
245. Have you been over the route from Grong Grong to Warri? No.
246. You know enough of the country to say that it is pretty much the same as the country between Narrandera and Coolamon? No; I would not say that. Between Narrandera and Warri the country is a good deal more broken.
247. Have you been over the country between Ariah and Temora? No.
248. Are you aware of the distances to Sydney from Ariah by way of Temora and by way of Grong Grong or Narrandera? I do not know what the mileages are.
249. I think I am right in saying that from Ariah to Sydney by way of Temora is 30 miles nearer than by way of Coolamon? The difference in distance would be about 18 miles only.
250. Would not the district around Ariah be better served by a railway from Ariah to Temora than by a railway from Ariah to Coolamon? Yes; but this line does not deal only with Ariah, it deals with the whole of the intermediate country; and the settlement around it is indicated by the estimates of traffic which I have given as coming in at different points. At 20 miles there would be 1,400 tons of wheat and 250 tons of wool; at 30 miles, 1,700 tons of wheat and 180 tons of wool; at 42 miles, 1,200 tons of wheat and 600 tons of wool.
251. Would not the same traffic be developed if a line were made from Ariah to Temora? I do not know. It would if they went by Broken Dam, and they would have probably to go that way to get over the range. If so the people living out 30 miles would not go to Mandamah, they would come on to Coolamon.
252. You have described the country along the east of Cowabbie as being possibly the most valuable area in the district? Yes; it is recognised in the district that the Mimosa country is the best.
253. If a line were made direct from Temora to Ariah, it would not be far north of this valuable tract of country? It would be from a good portion of it.
254. Did you, when visiting Ariah, hear anything of a desire on the part of the inhabitants to submit to a sort of tax if they could get the railway? No; neither did I hear of any proposal to pay other than the rates I have given.
255. With regard to the rates, you said that the charge for carting wheat 20 miles along the road was 9s. a ton? Yes.
256. If that were carried by rail what would the charge be? One shilling and eightpence.
257. And for a distance of 10 miles, am I right in saying that the charge would be 10d. by the railway? Yes; and the charge for 30 miles on the railway would be 2s. 6d., and 12s. by the road.
258. For 1,200 tons carried by rail the charge would be 3s. 6d. as against 12s. by the road for wheat? Yes.
259. What is the charge by road for wool? For 20 miles, 4s. 2d. by rail, 10s. by road.
260. The charge for the carriage of 500 tons of timber by rail would be 3s. a ton;—how much would it be by road? I do not know.
261. Would it cost fully three times as much? Yes.
262. For 600 tons of wool carried by rail you would charge 10s. a ton? Yes.
263. What would be the cost by road? They would not get that carted under £1 at least.
264. Then with regard to live stock? That is really an extension of the through rate. It is 10s. for 200 trucks.
265. By road they would have to be driven? Yes. It would probably be a little over 1d. per sheep.
266. With regard to passengers, you estimate 400 at 5s.? Yes.
267. What is the present coach fare? The coach runs twice a week, but very few people use it. I think the fare is 15s.
268. You estimate the revenue at £504 per year from mails? Yes; that is the usual allowance of £12 per mile.
269. Looking at all these rates, it would be an advantage to the people of the district if they got a railway constructed between Coolamon and Ariah? Yes.
270. Have you formed any opinion as to what the increased settlement would be if a railway were constructed;—is there any demand for land? There would be a very extensive demand for land in the district if a railway were made. There is plenty of land available.
271. Plenty of Crown land? I think there is a fair portion of leasehold land, but it does not fall in for four or five years. Outside that, I do not think that there is anything that is not temporarily alienated, except the forest reserves.
272. Do you think increased settlement would take place when the land is thrown open, even without the railway? Yes; I think the people would be glad to get on the land on the same terms as people there have gone on the resumed areas.
273. Have you formed any opinion as to the desirableness of constructing this railway? Of course, I have formed no opinion outside the figures which I have given; but still, if the question of agricultural lines has to be dealt with, I think this is a very fair district in which to look at the whole matter.
274. But there would be a loss, according to your estimate, of about £1,400 in the working expenses alone? Yes.
275. You are making an arbitrary charge for wheat, and the line will be non-paying;—would it be possible to charge enough to make the line pay? I have no doubt that people would tell you that they are prepared to pay more; but for the purposes of my estimate I have not assumed it, any more than I did in the case of Green's Gunyah line.
276. Are these the largest rates that you hope to obtain? Yes; they are the largest that I should be prepared to say that we should get.
277. Your rates are based upon those charged on railways already constructed? Yes; they are the extreme rates charged for wheat on any railways that we have.
278. From your knowledge of human nature, you think that these people would not be prepared to pay more for the carriage of produce than the people in other parts of the country? I do not think they would.
279. I think you said the population was 600;—what area of country would that take in? That would be about 42 miles, and 10 miles north of Ariah would be included, and an area of about 10 miles on either side.

- J. Harper.
28 Sept., 1897.
280. Are you aware that Mr. Deane suggested that the district of Ariaah might be well served by a railway from Grong Grong to Warri? I do not know what evidence he has given.
281. That line would be only 26 miles long, but the proposed line from Coolamon to Ariaah is 41 miles long? I am sure that there is a lot of settlement east of the proposed line that would never go to a line from Grong Grong to Ariaah.
282. It would still go into Coolamon by road? Yes.
283. Would you like to express any opinion as to a line from Ariaah to Temora? I have no information on the subject.
284. Did I understand you to say in your report that the area of Crown land around Ariaah was small? Yes; the area available and the leasehold areas have four or five years to run before they revert to the Crown.
285. You are aware that a very large area of land will be available in four or five years' time? Yes, a considerable area of leasehold land.
286. When you say there are 18,000 acres of land under wheat, is that over the whole 41 miles, or further north? The greater part of the cultivation is east and west of the line. There is very little cultivation at Yalgogrin and north of the terminal point.
287. The further you go north the less cultivation there is? Yes.
288. Is there more around Ariaah than any other part? No; there is more in the intermediate districts, more about Cowabbie.
289. Is Cowabbie halfway between Coolamon and Ariaah? Approximately, it is.
290. What is the rainfall of the district? I think it is about 20 inches.
291. Can you give the Committee any information as to the failure of the crops in the district? In our experience they only fail in that district when they have failed in other parts of the Colony.
292. Would that be in times of excessive drought? Last year was not what might be considered a good year, except in the neighbourhood of Berrigan, and we had from that neighbourhood 80,000 bags of wheat.
293. From the Coolamon-Ariaah district? The wheat which came to Grong Grong, Coolamon, Temora, and Narrandera amounted to about 80,000 bags.
294. Have you got any statistics to show how often failures of the crop take place? No.
295. It only takes place in times of excessive drought? Yes, in times of excessive and general drought.
296. Could you tell the Committee at which point on the line between Narrandera and Junee the greatest quantity of wheat and wool comes in? It came in at Coolamon, between Junee and Narrandera last year, and generally it does.
297. Does this district obtain all its supplies from Sydney? Yes.
298. Would the whole of the trade between Coolamon and Ariaah and the surrounding districts be retained even if no railway were made;—is there any fear of it going to the neighbouring colony? There is no fear of it going into the neighbouring colony.
299. Is there much agriculture around Temora? Yes, a good deal.
300. Have you any figures to show the increase in settlement since the railway was opened from Cootamundra to Temora? No.
301. Do you think there is any probability of this loss of £1,453 on working expenses disappearing within the next five years if the railway is made? I am inclined to think that within a period of certainly less than ten years the line would more than pay working expenses.
302. Is your opinion based on the demand that there is for agricultural land in the district? Yes, and the character of the land.
303. And the anxiety of people to get on to the land? Yes.
304. And the fact that within four or five years a large area will be available for settlement? Yes. I fancy it will be to the interest of the large land owners, notably at Cowabbie, to throw their land open.
305. Take the Berrigan line. Has there been any increased settlement there since the railway was made? Yes.
306. Has there been a marked increase? Relatively. In a district where people farm about 600 acres you cannot get a very big increase of population, but you may get a large increase in carriage.
307. Is there a marked increase in the area under wheat? Yes.
308. Have you any figures to show how many acres were under cultivation within a certain radius of Berrigan? I have not that with me, but I can supply it.
309. There was a marked increase in the area under cultivation around Berrigan after the construction of the railway, and you regard it as fair to assume that the same thing would take place if a railway were made in such a district as Ariaah? Yes.
310. *Mr. Hoskins.*] To what port is the wool produced in this district sent? To Sydney.
311. And from the districts beyond Ariaah? The whole of the wool from the districts north of Ariaah is sent to Sydney.
312. Therefore the proposed line would attract the whole of the wool traffic from that district and the districts further north as well as the wheat? Yes; it would provide for its carriage over a greater distance of railway line.
313. We have been told by Mr. Deane that the land between Ariaah and Temora is very similar to that between Coolamon and Ariaah; if that be so, would it not be an advantage to the Railway Department, as well as to the Colony, if a railway could be constructed from Temora to Ariaah, which would make the route to the seaboard 30 miles shorter than the line now proposed? I do not know whether Mr. Deane examined the line with a view to its productiveness; I should say that he looked at it purely from an engineering point of view.
314. A communication has been received from the Progress Committee of Temora asking that, before a decision is come to in regard to this line to Ariaah, they may be heard as to the construction of a line from Temora to Ariaah;—do you not think that before a decision is come to a Sectional Committee should have an opportunity of inquiring as to which would be the shortest line, and what is the area of good country adapted for settlement between Coolamon and Ariaah? My position, and that of the Commissioners also, is that we were asked to report upon a proposed line from Coolamon to Ariaah. If the Commissioners had suggested any other line they would have laid themselves open to the remark that they were interfering with other people's business.

J. Harper.
28 Sept., 1897.

315. Do you not think that it would be an advantage to the community if a railway connecting that district with Sydney could be made 30 miles shorter than is now proposed? I should think so, but I do not know how that 30 miles comes about. The difference between the two routes is only 18 miles. The distance to Temora is 292 miles; the distance to Coolamon is 310 miles. From what I have heard the distance is practically the same from Temora to Ariah as it is from Coolamon to Ariah.
316. The population along this proposed line is very small? Yes; it generally is on an agricultural area until it is developed.
317. The prospect of the line paying working expenses is rather remote, is it not? Certainly. But railways carried into essentially agricultural districts may be relied upon in ordinary circumstances to carry settlement, and they are also pioneer lines.
318. You have told Mr. Roberts that there is very little land available for additional settlement along this line? At present, but in four or five years more Crown lands will be available.
319. *Mr. Humphery.*] Have you closely examined the land between Coolamon and Ariah, and beyond Ariah within the district that you have estimated would send traffic to this railway? Yes. I have been over it, and I have identified every farm in the district.
320. How did you arrive at the estimate as to the quantity of wheat that the line would carry? That is taken from the actual production of each farm.
321. You say there are 18,000 acres under cultivation at present the produce of which would reach the railway? Yes.
322. Will you describe on the map the area which would embrace the 18,000 acres which you refer to? The farthest point to the north-east would be in the direction of Mandamah, that is 14 miles from Ariah. To the north-west 12 miles, with the exception of South Yalgogrin, which is 18 miles. There is wheat grown within 7 and 8 miles west of Ariah, and a good deal of it too. To the west the extreme distance is 9 miles, south-west 9 miles, and to a point 10 miles from Coolamon.
323. Do you say that within that area at the present time there are not less than 18,000 acres under wheat? Yes.
324. Why do you come to within 10 miles of Coolamon? For the simple reason that I do not think that any of the traffic within 10 miles of Coolamon will go to the line; it will come into Coolamon, because a great deal of the cultivation lies to the east of the line, and the distance to Coolamon would not be much greater than the distance to the proposed line.
325. What distance is Cowabbie from Devlin Siding? About 12 miles.
326. I think you said that Cowabbie was about halfway? Yes.
327. Do you not think that you have slightly over-estimated the probable traffic, having regard to the fact that Cowabbie is only 12 miles from the existing railway? There is no practicable road between Cowabbie and Devlin's Siding, and in the neighbourhood of Cowabbie the greater part of the production is to the east.
328. Not to the south? To the south, but not so much to the west.
329. There is a siding at Ganmain? Yes.
330. Have you considered that 10 miles from Coolamon on the proposed line the agricultural land would not be more than 7 miles from an existing platform? I think it would be more.
331. On the west? On the west it might not be so much.
332. Have you taken that into consideration? I have only shown 850 tons of wheat at 10 miles. Mr. Robbins has 900 acres under wheat. That is 300 tons out of 850 tons.
333. That is east of the line? Six miles north-east of the proposed line.
334. Why have you estimated that that will go to the proposed line when it is only 10 miles from the existing railway? It is 16 miles. He could not get into Coolamon without coming on to the stock route.
335. How far would he have to carry his wheat to the proposed line by road? Six miles.
336. And to the existing line? Sixteen miles.
337. He would have to pay road carriage as well as railway carriage? Yes.
338. What would be the difference in going to the proposed line? He would carry the 6 miles by his own teams; but if he had to go 16 miles, he would not use his own teams.
339. Your argument is then that if he travelled the 6 miles only, he would carry the produce by his own teams to the station, and would thereby effect a saving? Yes.
340. Therefore, you think you have properly included that in the possible earnings? Yes.
341. Have you, after consideration, based all your estimates in the same way? Yes; I have taken every man's holding and the wheat produced on it, discarding all those that were within 10 miles of Coolamon.
342. All the holdings in the district that would be served by the railway, in large or small areas? Just as they are held.
343. Are they held in large areas? They are both large and small. For instance, there is Connell, of Stenhope; he is 35 miles from Coolamon, and 10 miles east of the line. He has 600 acres of wheat under cultivation, and 2,500 sheep; another one possesses a smaller number of sheep, which indicates that he has a smaller holding; another has 400 acres under cultivation and 5,000 sheep; another has 150 acres under cultivation and 500 sheep.
344. This is a paper furnished by the local committee, is it not? Yes.
345. Have you satisfied yourself of the correctness of it? Yes; I have struck out every portion of the statement which has not been supported by investigation made by myself.
346. Therefore the paper may be taken as having been verified by you? Yes.
347. *Mr. Hoskins.*] If the settlers hold such areas as you have described there never will be a large population in the district, will there? No, but it is quite possible that there may be a township formed; townships have sprung up in such cases. I do not profess to be more in favour of the line than my report indicates, but I think it is a line that should have careful consideration.
348. Suppose a line were made between Temora and Ariah, what portion of the district comprised in your return would be served by it? The whole of the district in the neighbourhood of Ariah.
349. Can you say, approximately, what area would be served by the proposed line? I may mention what I have given as coming in at Ariah. I have said that at 42 miles there would be 1,200 tons of wheat, 600 tons of wool, and a population of 250.
350. Assuming that the line were made from Temora to Ariah, then you would have 20 miles to serve instead of 10? No.

- J. Harper.
28 Sept., 1897.
351. Would you exclude the traffic at 30 miles? Yes, because it would come to Coolamon.
352. Why 30 miles to Coolamon against 10 miles to Ariah? I do not think there is the least probability of your being able to charge less than we charge from Ariah—3s. 6d. a ton; it would cost them 5s. or 6s. a ton to get it there.
353. The new line would have to bear a special rate, whether it was constructed from Temora or Coolamon? Yes.
354. Therefore, although the distance by Temora would be less than by Coolamon, there would be no difference to the people using the line? It would be cheaper to come to Coolamon. There is competition at Coolamon with Victoria, and the rate there is £32 10s. for a 6-ton truck; at Temora it is £32 10s.
355. *Mr. Humphery.*] You say that the rates between Temora and Sydney are higher than the rates between Coolamon and Sydney? Wheat is 3d. a ton cheaper from Temora than from Coolamon, and there is only 18 miles difference between the distances. If they had to pay to cart their produce into Ariah from any point between Coolamon and Ariah, and had to pay a special rate of 3s. 6d. a ton into Temora, it would more than compensate for the short distance.
356. Would it not give a better return by way of Temora than Coolamon if you got higher rates on that line? I suppose it would on the whole; 18 miles would not make very much difference.
357. *Mr. Trickett.*] Did you ascertain what distance it would pay the wheat-growers to cart their wheat to the railway station? They give different opinions in different districts. Most of them say that if they can get to the station and back in a day, without having to camp out, they can do it far more cheaply than having to pay carriage. In some cases they have to go 15 or 20 miles, but on heavier roads they could not do that distance.
358. The Railway Commissioners, in their report, go so far as to say that they cannot see their way to recommend the construction of the line? Yes, and I do not recommend the construction of the line. I simply lay before you the information which I have obtained.
359. *Mr. Lee.*] You are quite clear that the rates you name for wheat and wool would be the rates which the producers there would be able to pay? Yes.
360. That means, that if the rates were higher there would be a possibility of competition, and they strongly object to pay a higher rate? Yes.
361. It appears that the bulk of the wheat is produced somewhere between 20 and 30 miles? Yes.
362. And the larger quantity of wool beyond that point? Yes.
363. You have told us that there are about 18,000 acres under cultivation, chiefly wheat? Yes.
364. You estimate that the 18,000 acres of wheat will bring in £575? Yes.
365. The anticipated loss on the line is £4,000? Yes.
366. If that loss is to be arrested at any time, must it not be by the grain produce? If the land is more intensely cultivated it will carry more sheep.
367. As more land is brought under cultivation there will be fewer sheep? No; just the contrary. We have found that in such cases there are more sheep.
368. As the pastoral holdings become absorbed by agriculturists, then the number of sheep will decrease? Yes, on the runs.
369. Therefore it is not the wool that you have to look to to make up the deficiency? The wool will assist in bringing it up.
370. Would it not be a very small item? We think it will be an increasing item. At Naromine, before a number of selectors went on the land, we did not get one-third of the wool that we get to-day. A large area has gone into cultivation, and the district produces more wool than ever. The land carries more sheep to the acre now than it did formerly.
371. It is not so much to the wool that you look to for the increase in revenue as to the grain? The grain.
372. If this loss is to be made up in the future by the increase of agriculture, then it follows that there will have to be an additional 72,000 acres brought under cultivation? No, I do not admit that at all. In the first place, I do not admit that the 18,000 acres are carrying only wheat; I say that they are largely producing wool.
373. If you depend upon grain to make up the deficiency, the area under agriculture will have to be increased by 72,000 acres? If we depend upon wheat alone, and there are no sheep at all in the district.
374. If wool is grown it can only be grown by the farmers? Yes.
375. Then there must be about 112 square miles of additional agriculture, that is, four times your present amount? You would have to add very largely to your wool estimate. My contention is that if the country is properly occupied that estimate will be largely increased. I should think that it would require about 90 square miles.
376. That is near enough;—is there that area of agricultural land there? The line is 42 miles in length, and a depth of one mile on either side would give 84 miles.
377. The whole of it is not fit for agriculture? A large portion of it is.
378. I asked you what quantity of land there is, and you give me the length of the line;—but are you not aware that the land is almost all alienated from one end of the line to the other? Yes; but that does not indicate that it will not produce wheat.
379. I want to know whether there is an additional 72,000 acres that can be sold? The Crown Lands Office ought to be able to tell you that. On the Berrigan line there was scarcely an acre of Crown land when the line was made.
380. Do you think that along that line the land already alienated, but not cultivated, is capable of giving an additional 72,000 acres of cultivated land? Yes, I do.
381. I believe that Berrigan wheat is carried 20 miles at 2s. 6d. per ton? Yes.
382. At that rate it pays well, owing to the quantity? Yes.
383. But do you not carry about 16,000 tons of wheat on that line? Yes, something like that.
384. As compared with an estimate of 5,000 tons on this line? Yes; but if it increased in the proportion we are speaking of we should carry as much as on the Berrigan line.
385. That is a matter of conjecture? Yes.
386. No doubt it would increase to some extent? Decidedly.
387. And making a railway would cause it to increase rapidly;—but you are not prepared to say that there would be the large area I mentioned? No. My position is this: I do not wish the Committee to go through the district, and then afterwards tell me that I have understated its capacity.

J. Harper.
28 Sept., 1897.

388. If a large amount of additional settlement takes place it must extend to and be within the influence of railway stations on existing lines? It would extend more to the north than it does at present.
389. I find that you expect to get from wheat and from wool £948? Yes.
390. And the total revenue expected is £2,047? Yes.
391. Included in which is the item £504 for mails? Yes.
392. Which is equal to 25 per cent. of the estimated revenue? Yes.
393. I presume that it does not cost £504 to run the mails there at present? No.
394. That being a paper account, it is really not an earning to the State? I might say that with increased facilities and improvements in railway working, which are taking place every day, we might naturally expect the expenses to be reduced.
395. We assume that the traffic expenses are estimated on the lowest possible basis;—but supposing that the line were run for nothing, the traffic would not pay the interest on the expenditure? That brings me to another question—the question as to the cost of roads. As things go, there has been enough money spent on the roads to half build the railway lines.
396. Has not your experience been that the more railways we make the more roads we require;—that you must make roads as feeders to the railway? Decidedly.
397. You are of opinion that in the course of time the population will contribute sufficient traffic to pay the working expenses and the interest on the cost of the line? I say it might.
398. You think it would be some time before such a large development will take place? Yes.
399. *Chairman.*] It is perfectly clear that the Temora to Cootamundra line would be benefited by the traffic? Yes; but you want to take the Junee to Hay line. It could do with a little assistance.
400. The Cootamundra to Temora line is not working to its full capacity? No; neither is the other. There is this much to be said with regard to the other, that on a line like that, where you have a larger staff available, you can get more work done more cheaply.
401. How much is the road carriage for 15 miles? Nine shillings and 12s.
402. What rate do you propose to charge for 15 miles? One shilling and threepence.
403. A saving to the farmer of 7s. 9d. per ton;—how much is that per bushel? A little less than 3d.
404. You recognise that the line from Temora to Ariah would be practically parallel with the line from Junee to Narrandera, and they would not be much more than 30 miles apart? Not much more.
405. Therefore, any agriculturist occupying any portion of that country between a line drawn from Temora to Ariah, and a railway from Narrandera to Junee, would not be more than 15 miles away from a railway? No.
406. Not a very bad position for a farmer? No; but there are not roads to every square mile of country, nor a railway station at every mile. The farmer might have to go 25 miles before he could get to a railway station.

WEDNESDAY, 29 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKEET.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Coolamon to Ariah.

John Harper, Goods Superintendent, Department of Railways, sworn, and further examined:—

407. *Mr. Wright.*] Have you been through the country bounded by Junee, Temora, and Cowabbie? I have been from Cootamundra to Temora, from Junee and to the west of Coolamon along the main line, and through Cowabbie and Mimosa.
408. That is the best part of that country? Berry Jerry is the best.
409. What is the longest distance in which wheat is cultivated from the railway? The longest I know of where people claim to be satisfied is from Gunbar coming into Carrathool. There the people claim to be satisfied, but in the seasons to which I refer they were getting a good price for their wheat.
410. They can grow wheat and cart it to the railway? Yes; but they were getting 4s. a bushel for it at the time I speak of.
411. Are there any farms in a straight line to Cowabbie and Temora and Junee more than 20 miles from an existing railway station? Yes, at West Mimosa, which is more than 20 miles.
412. How far is the nearest station from Temora? About 25 miles.
413. If you scale the map you will find that there is not one portion of that country between Narrandera, Cowabbie, Temora, and Junee that is more than 20 miles from the existing railway? I am sure that there are plenty of farms that are more than that. I have not been between Temora and Mimosa.
414. Cowabbie is between 17 and 18 miles from the railway? It is certainly more than that.
415. If you take the belt of country through Cowabbie straight into Cootamundra you cross Mimosa? Yes.
416. Coming from Narrandera to Cowabbie, and across to Temora, there is no area of land that is more than 30 miles from the existing railway? That is as the crow flies.
417. Is there any difficulty in growing wheat in that area? People say they are growing wheat successfully in that district, but they are asking for a railway.
418. In your return you say that 80,000 bags of wheat were carried on the north-western line last year;—what proportion of that was grown to the north of the limits that I have given you? I could not say.
419. Do you think one-tenth of it? Yes, north of Cowabbie.
420. Do you think 8,000 bags were grown north of that? Yes. North of Ariah, speaking from memory, and north-west and north-east, between Broken Dam and Ariah, I think there were 1,200 bags. There were over 10,000 bags grown in the neighbourhood of Ariah.
421. What is grown west of Warri? There is a good deal of cultivation.

J. Harper.
29 Sept., 1897.

- J. Harper,
29 Sept., 1897.
422. Is there any cultivation at Mumbledoon? Yes.
423. That is 30 miles from Narrandera? Some where about that.
424. That is practically your western limit? The north-western limit.
425. According to your return 190,000 bushels of wheat would be likely to come on to that line? Yes.
426. And that would mean 15,879 acres at 12 bushels to the acre? Yes.
427. Do they average that? They average about 16; but the rail carries about 12.
428. In round figures that is 200,000 bushels that the line might be expected to take? Yes.
429. Where is the bulk of the 80,000 bags grown? Twenty miles out of Coolamon, extending over the whole distance.
430. Is there any grown south of the railway line? Yes, but not very much.
431. Do you think the land to the south of the line is inferior? The land to the south is not open to the same extent that it is to the north.
432. Is there any cultivation at Mara? Yes; the produce from there would come in at the Mara platform between Coolamon and Junee. I have some information which I promised to get as to the average areas under wheat in the various districts. I undertook to give the increased area under cultivation in the Berrigan district. Since the line was opened it has increased from 34,000 acres to 39,000 acres, giving an increase of 5,000 acres, or 12½ per cent., over last year. Some honorable Members spoke about Grong Grong. The increase in the Grong Grong district has been from 11,000 acres to 13,000 acres. The increase which comes into Coolamon I gave as the produce of 18,000 acres. It has increased from 24,000 acres to 26,000 acres; Old Junee, which I did not include in my estimate, from 25,000 to 27,000 acres; Gunbar from 7,000 to 7,500 acres.
433. The 80,000 bags of wheat, which you said had been received, represented the cultivation of about 21,300 acres at 12 bushels to the acre;—do you think that if this line is constructed there will be another 18,000 acres put under cultivation? Yes.
434. In what time? I do not know. I should think within a reasonable time. The cultivation at Temora has increased from 14,000 to 15,000 acres.
435. How far west and north-west of Ariaah have you been? I have been from Wyalong to Yalgogrin, and from there to Rankin's Springs and Hillston.
436. What was your impression of the country as you passed through from Ariaah to Broken Dam? In the direction of Broken Dam there is a lot of very good country at Merool Creek.
437. That is all good country? Yes.
438. Is not the best of that land between Warri, Ariaah, Broken Dam, and Cowabbie? I would not like to say that.
439. You do not think that is the best country? The country which impressed me most was West Mimosa.
440. What is the country like from Grong Grong going to the north? I do not know anything about it, except what I have heard. It is broken country.
441. Were you at Yalgogrin? Yes.
442. It is rough country there, is it not? Yes, broken ranges.
443. That country west and north-west is practically valueless for cereals? Not to the west, but to the north-west it is.
444. You can give the Committee no definite period of time within which, under ordinary conditions, this line would be self-supporting, as far as traffic is concerned? Yesterday I said I thought it would be within ten years.
445. Suppose that the country were largely cultivated for wheat, would that mean a large augmentation of the population? A comparatively larger augmentation of the population would take place. I fancy that the whole of that country would have to be cultivated in large areas, which would not mean a very large population.
446. Would not that mean the employment of first-class machinery, and the diminution of the demand for labour? It would mean the employment of more labour than is employed there at present.
447. You carry cereals remarkably cheap;—is there any probability of that country being so densely populated as to recoup a railway for what it loses on the wheat, by means of the return carriage in the shape of stores? It is not admitted that we lose anything on the carriage of wheat.
448. *Mr. Hoskins.*] You would have a number of empty trains running into the country to bring back wheat, and comparatively small quantities of goods to be carried into the district? If we studied the whole interior of the country as regards railway communication in that light, we should not develop it. We must look to the cheapening of carriage in the interior.
449. Several schemes for agricultural railways have been submitted to the Committee;—is there any immediate prospect of such an accession to our population as would enable those extensive areas to be cultivated? I think so. If the conditions for taking up land are favourable I think there would be no difficulty in getting population.
450. Could you have more favourable conditions than exist in this Colony for the taking up of land? As far as I read current events, there appear to be far more applicants for land than there is land to meet the demand.
451. Where do you suppose the population is to come from? They are coming from the other colonies at present.
452. How would it be if thousands of farmers in New South Wales are shifted from one district to another? Those who are applying for land now are not New South Wales farmers. Every one knows that the bulk of the farmers who are applying for land in New South Wales come from South Australia, Tasmania, and Victoria.
453. And they are generally supposed to be better farmers than our local people? That has been my experience of them.
454. They cultivate more intensely? Yes, and have a better knowledge of cultivation.
455. In the event of these railways being made, and the land is cultivated here as it is in Victoria growing cereals, say, for ten years, what effect will that have on the soil? It will make it better capable of carrying produce than it is to-day.
456. What would be the effect of having crops continually taken off the soil? I think in sufficiently large areas, it can be worked for a great many years without exhaustion. That, however, is a technical question

question which I cannot deal with. I think that if the areas are sufficiently large to enable them to farm in a proper way, alternating their crops, and spelling the land occasionally, it will last for many years.

457. You think that if farmers have reasonable areas, intense cultivation and rotation of crops will produce larger results in cereals and wool? Yes; that is my impression from what I have seen.

458. Are there not many districts in New South Wales, where there is cultivation, which are much worse situated as regards railway communication than this particular district? I do not know whether there are any places which are really worse situated in that respect. Some of those people in the neighbourhood of the area have to cart their produce 42 miles to get to the nearest railway station, and then they have to secure a distant market for their grain.

459. *Mr. Wright.*] But those who have to cart 42 miles are only a few? A good many have to cart about 40 miles. They cannot cut straight across the country; they have to follow such roads as they can get.

460. Have you ever been in the Rockley district? Yes.

461. That is an old farming district, and they are without railway communication? Yes; but the Rockley farmers do not cultivate in the same way that the people cultivate in the Ariah district. At Rockley they have comparatively good seasons, failures being few and far between. Most of the produce raised there has a market in Sydney; but the farmers in the Ariah district can only send to Sydney occasionally.

462. The road carriage is about the same? Yes; but Rockley is a small district compared with this.

463. With a larger population? Certainly. That goes to prove what I say: that with more intense cultivation the country is capable of carrying a bigger population.

464. Do you not think we might reasonably ask the people of this district to show by increased settlement and larger production that they are entitled to a railway? I should rather say that you should ask how much land they are going to bring under cultivation.

465. Did you go as far as Kildarie? No.

466. There is very little leased land in that country, is there not? I could not say from personal knowledge, but it is quite possible. Land may be ostensibly in the hands of the selectors, but really it may not be; but I think that when the Sectional Committee visits the district it will find that most of the selected land is in the hands of *bona fide* people.

467. It is quite possible for the land to be alienated in large blocks, and to be brought under cultivation? Yes; it is possible that the holders of the land will find it worth while to do what they are doing in the Riverina district.

468. The Commissioners do not recommend the construction of the line as a possibly paying line? No.

469. Nor do you? No; but it is one that deserves consideration from you gentlemen who can look into questions of policy, which I cannot do.

470. *Mr. Hoskins.*] I suppose you are aware that there is a large population located at Wyalong and Temora? Yes.

471. Would it not be better to make the railway from Temora to Ariah than *via* Coolamon? If the railway were made from Temora to Ariah the Wyalong people would not be a bit nearer to the market than they are now, and for all the traffic which we send to Temora in twelve months we should require to send trucks empty in the wheat seasons to bring away the wheat. You cannot balance either the wool or the wheat traffic.

472. The population at Temora is larger than the population at Coolamon? Yes.

473. Then, would there not be more loaded trains to Temora than there would be to Coolamon? Yes; but you have a large population at Temora engaged in producing ore. We are sending empty trucks to Temora to bring down ores to the smelting-works on the South Coast. If you are going to deal with a big traffic in a community like this, you will always have an exodus of empty trucks in one direction in any particular season. The day before yesterday it came under my notice that we had to send empty trucks from Sydney to bring ore from Temora, to be smelted at Lake Illawarra; and you will always find in a mining district, outside the ordinary requirements of the population, on the return journey the ores and other products will more than occupy your empty waggons.

474. At all events, a mining population uses a large quantity of merchandise? Decidedly.

475. Did it not occur to you, in making up the probable revenue and expenditure, it ought to be added to by goods being carried into the district, instead of empty waggons being sent to bring down the wheat, from which very little revenue is received? I have no doubt that in working out their calculations the Commissioners did deal with that phase of the question.

476. Do you know whether they have taken into consideration the fact that a large expense would be incurred in sending up the empty waggons to fetch the wheat? They have taken that into consideration in fixing the rates to Coolamon. If they are satisfied with a rate of 12s. 4d. to Coolamon, I have no hesitation in saying that 1d. per ton per mile over the rest of the journey will pay. They do not make rates without studying whether it will pay or not. A good load of wheat is not a badly paying thing. During the wheat season we never run with other than fully loaded trains.

477. You have fully loaded trains, but you charge a low rate, and you have to send long trains of empty trucks? Decidedly we have; but that is taken into consideration by the Commissioners.

478. Considering the large number of persons who are employed about Temora, do you not think that trains going *via* Temora to Ariah would be more likely to be loaded than trains sent to bring down wheat *via* Coolamon? No. Temora is a terminal point with a population of 1,600. To the south of Coolamon, and in the direction of Berrigan, Jerilderie, Hay, and Narrandera, you have twice the population that you have at Temora. The trucks which are utilised to convey the traffic to those people at Narrandera are equally available for bringing traffic from Coolamon with the waggons that take traffic to Temora.

479. Except that all the trucks would run much longer distances? That would not matter, because you would have that at Narrandera. If it would hold good at Temora it would hold good for all the mileage beyond that country.

480. You have included districts which would have no influence upon it? Traffic is sent to those districts, and the waggons have to find their way back.

481. *Chairman.*] In the Railway Commissioners' report with regard to the line from The Rock to Green's Gonyah, the distance is given as 25 miles, and the working expenses and total cost £1,625. In the case of the Coolamon to Ariah line the distance is 41 miles, and the cost of maintaining permanent way, traffic, and locomotive expenses is £3,500;—is it the same class of country? Yes, it is about the same class of country.

- J. Harper.
29 Sept., 1897.
482. *Mr. Lee.*] What is your opinion of the policy of taking a line as far as Warri only? I think that if it were taken to Warri it would meet the requirements of the district,—not quite so good as if it went to Ariah; but I think the people north and north-west would not have very much to complain of if they had railway communication at Warri.
483. Do you think it would be in the interests of that part of the country if the line started from Grong Grong? I would really rather not express an opinion.
484. What class of country would it pass through? The country from Grong Grong I do not know.
485. Is there as large an area suitable for agriculture as there is on the proposed route? That I could not say.
486. *Mr. Humphery.*] You expressed the opinion that there would be a great deal of traffic in ores from Temora to the South Coast? Yes.
487. Would that traffic be continuous throughout the year? The South Coast works have only recently started. It is more than probable that the traffic would be continuous throughout the year. But we have no idea what its volume is going to be, nor how long it is going to last.
488. Compared with the traffic on the proposed line, you would have your rolling stock occupied for about seven months of the year longer? That is in the carriage of ores back.
489. Yes? Decidedly, if the ore traffic continues.
490. On the one line you would have the wheat traffic for five months out of twelve;—on the other, you would have the ore traffic during the whole year? Probably. If the line to Ariah were constructed, ores would be brought down from Yalgogrin. To the west of the line there are mineral developments, 12 or 14 miles out of Grong Grong, and extending for some distance in the direction of Yalgogrin.
491. What rates do you get for the carriage of ore from Temora? A $\frac{1}{2}$ d. per ton per mile.
492. How does that compare with the carriage of cereals? I think the mileage would be about the same.
493. Therefore, if you could secure an equal tonnage from mineral traffic, it would be more profitable than the traffic on the proposed line, because you would have it for the whole twelve months as against only five months of the year? I am not prepared to say that. We might get too much of it, in which case we should be in the same position that we are with regard to grain—we may have to run empty waggons.
494. During the wheat and wool season you run empty trucks one way? Yes; but we might have to send trucks for ores. We have had to do it at Gundagai.
495. Is it not profitable to work your trains with traffic one way only? Not unless you are prepared for a big traffic. If you know you have to deal with a large traffic for three or four months, you have your rolling stock concentrated, and you can work it under more economical conditions than you can when you have an isolated rush of traffic.
496. Does that mean this: that, instead of having on the proposed line your estimated quantity of produce to carry, you have three times that quantity, and therefore there would be no profit, because you would have to run your trucks empty one way? No; the more you increase the volume of traffic the better. Your control expenses do not increase, and if you have an absolute load, from every point you start at you save a loss of mileage.
497. I do not quite see how on one line you must make a loss, and on the other line a profit, whilst on both lines similar conditions prevail? For the reason that in no instance should we have the ore coming in the same volume.
498. The answer is that in the one case you have a greater volume of traffic than in the other? No; it is not that. We may have 100 trucks of wheat going from Berrigan and Jerilderie. Those trucks are used in that local service. They have only the empty running between Jerilderie and Berrigan, and a portion of them will find their way down to Sydney with flour; some will go loaded to Murrumburrah and Wagga Wagga. We get through loading from that point, pick up loading there again and bring it to Sydney.
499. That is to say, you have to have a different class of trucks? No.
500. What would prevent you, when running mineral trucks, from picking up on the way grain and wool trucks? In the one case the ore has to come to Sydney for reduction; in the other case there are fourteen or fifteen country mills to which wheat is sent. A truck may make a dozen trips between stations before it comes to Sydney, but the ore truck comes straight back to Sydney.
501. Are we to understand that the mineral traffic would be less profitable than wool and grain traffic? Decidedly.
502. *Mr. Wright.*] Is there any place where there are half-a-dozen mills on the road? There are mills at Jerilderie, Narrandera, Wagga, Albury, Murrumburrah, Cootamundra, and Young.
503. The revenue from the line is estimated at £2,047 per annum, and of that £504 is for the conveyance of mails. Considering that the mails can be carried for £50, is not £450 of that a revenue that might be considered, to a certain extent, bogus? I have always put it openly before you, and you can form your own impression about it. In estimating the revenue from the carriage of postal matter, it is usual to allow the Railway Department from £12 to £15 per mile for the service.
504. That is irrespective of whether you run a train a day, or a train a week? Yes; it is so much a mile.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

- H. C. Russell,
C.M.G.
29 Sept., 1897.
505. *Chairman.*] You are the Government Astronomer? Yes. There was a little difficulty with regard to the questions put to me from the fact that there were no records at the places named. I have had to take the nearest stations having records extending over a sufficient number of years. Ten years is not enough to give an average, especially just now, because during the last ten years the rainfall has been something like 25 per cent. greater than it was during the previous ten years. I have been obliged to select stations where the records have been as extensive as possible, in order to get fair results.
506. Will you give the particulars of the rainfall on stations north of the Junee-Narrandera line? I will begin at Ariah. In that district the average rainfall is 20·83; then 30 miles west, at a station called Coonapara, the rainfall is 20·56; to the east of that, at Boligamy, it is 20·66; at Yalgogrin, to the south of Ariah, it is 20·38; at Barmedman, 21·07; at Bygoo, further south, the rainfall is 22·20; to the west of that, at Barrelog, it is 19·52; at Mandamah it is 21·41; at Murrill Creek, 20·25; at Kildary, the average

average rainfall is 18.87. The longest record that I have in that part of the country is one at Cowabbie extending over twenty years. The rainfall there is 18.72. Then going to the west again at Collinroobie the rainfall is 20.88; at Coolamon it is 22.97; at Junee, 22.18; at Narrandera, 19.27; at Gainmain, 22.10. 507. Therefore the rainfall over that area of country presumed to be affected by the construction of the line from Coolamon to Ariah varies from 19 to 22 inches, a little over 20 inches being a fair mean? Yes, it would be.

H. C. Russell,
C.M.G.
29 Sept., 1897.

508. What is your opinion of such a rainfall for the cultivation of cereals? Within a radius of 100 miles of Narrandera, or perhaps more, the rain distribution is one of the best in the Colony. They have almost entirely satisfactory rains during the wheat-growing period. They have rain in the winter, when they sow the wheat, and an abundance of rain before December. It has often occurred to me as remarkable that the wheat-growing industry had not developed earlier about Narrandera, the most favourable place for it.

509. Twenty inches of rain falling at the right times is sufficient for the cultivation of cereals? Yes.

510. Therefore, if the soil is suitable in the vicinity mentioned, agriculture should be a success? Yes; as far as I am able to judge I think it would be.

Percy Scarr, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

511. *Mr. Black.*] Have you prepared a statement in regard to the roads in the district that will be affected by this railway? Yes; it is as follows:—

P. Scarr.
29 Sept., 1897.

STATEMENT showing Schedule Roads affected by the construction of the proposed Railway from Coolamon to Ariah.

Schedule No.	Mileage.	Roads.	Amount Voted.						Amount Expended.
			1892.	1893.	1894.	1895.	1895-6.	1896-7.	
331	20	Coolamon to Cowabbie.....	£ 400	£ 400	£ 360	£ 270	£ 360	£ 330	£ s. d. 1,585 13 4
338	32	Narrandera to Collinroobie	95	110	184 12 3
341	41	Temora to Wyalong	825	1,950	2,050	3,533 18 1
343	22	Temora to Mandamah	220	260	195	260	260	844 7 6
335	28	Grong Grong to Warri.....	270	146 18 11
			£ 400	620	620	1,290	2,665	3,020	6,295 10 1
Total amount voted							£8,615 0 0		
" " expended							6,295 10 1		

512. Have you any reason to think that if a railway were constructed there would be any less expenditure on the roads? No. I think it would rather tend to increase the expenditure on the roads.

513. Your experience has been that the construction of railways instead of lessening the expenditure on the roads has tended to increase the demand? It rather tends in that direction, because it opens up country, and increases population, so that more roads are wanted.

514. Then the railways cannot be looked upon as taking the place of roads? Not in all cases.

515. Is there a road from Temora to Ariah? No. There is a road from Temora to Wyalong. There is a road as far as Mandamah from Temora.

516. *Mr. Hoskins.*] How much has been spent on that? £844.

517. *Mr. Lee.*] Which way is the trend of the traffic in that part of the country between Temora and Narrandera? The greater part of it comes from Cowabbie to Coolamon. That is the most important road in that direction. The traffic south from Mandamah goes to Temora; south and west of Ariah it goes to Coolamon.

518. You do not find it necessary to metal the roads there? Some of the money has been spent on metalling after the roads have been cleared. We have not sufficient money, and we have to do it by degrees. The principal traffic there is wheat, and it comes in in the early summer, when the roads are pretty good; otherwise there would be a great deal of trouble with the roads there.

519. According to your statement, the annual expenditure on roads there is very small? Yes; it is new country to us. The soil there carries the traffic very well.

520. I think it can be accepted that the nature of the country is such that a very large expenditure on the roads is not required? Not under present conditions, because the heaviest traffic comes in during the summer. But if there were a general traffic at all times of the year we should have a great deal of trouble with the roads, and there would have to be a very great expenditure upon them. The road from Temora to Wyalong has been in a bad state, because the traffic is on the road all the year.

521. That is bad country for a road, is it not? Yes.

THURSDAY, 30 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Coolamon to Ariah.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and further examined:—

H.
McLachlan.
30 Sept., 1897.

522. *Chairman.*] The Committee desire to know how it was that in one instance the cost of maintaining the permanent-way and locomotive expenses amounted to £85, and in another instance to £65, on two different routes, Coolamon to Ariah and The Rock to Green's Gunyah, although the country seems much the same on both routes? As I pointed out, each line is considered on its merits—that is, there is no averaging of one line as against another, and the circumstances are never the same in two cases. Take the case of the line to Green's Gunyah. We have a line, not a great distance from it—the Culcairn to Corowa line—and that line is only worked three days a week, so that we could shuffle the men backwards and forwards to work the line alternately, and therefore the Green's Gunyah line would not involve what you might call the whole cost of an independent service. In that way the cost per mile would be relatively less than the cost of the line on which you have to employ a separate set of men, and where you have to make separate arrangements entirely. You divide the cost of the fixed staff in regard to one or two items. That will account for the difference between the two estimates.

523. The running of trains three days a week on the Culcairn to Corowa line is a temporary thing;—we hope the time will come when you will run trains every day? It has been going on for about five years, so I do not think it can be considered temporary.

524. Then your reply is, that the contiguity of the Culcairn to Corowa line, enabling the two lines to be worked together with the same staff, explains why the cost of working one line will be so much less than the cost of working the other? Yes; that is the reason of the apparent difference in the cost per mile.

525. How often do you work the line from Narrandera to Jerilderie? I think that on that line there is a train a day.

526. *Mr. Hoskins.*] In estimating the working expenses of a line, do you take into consideration the fact that, owing to the small population in the district, you may have to run empty trucks to bring down the produce? Yes; but, as a matter of fact, the cost relatively would not be much altered, because one set of men would run the empty trains as well as the full trains. The Commissioners have only debited the branch line with the out-of-pocket expenses. The same drivers and firemen would take the empty as well as the full trucks, and the same traffic men and the same permanent-way men would be employed; so that our out-of-pocket expenses would be very much the same in both directions.

527. *Mr. Lee.*] Since you were here last we have had Mr. Harper before us giving details as to the traffic, and we learn that out of an estimated revenue of £2,047, 25 per cent. would be derived from the carriage of mails? Yes.

528. Mr. Harper has also told us that the area under cultivation is 18,000 acres, so it takes 18,000 acres to give a prospective freight of £575, and there is an estimated loss of £4,000 on the line; therefore, if the traffic in the future is to consist of grain, cultivation in the district will have to increase by an additional 72,000 acres? That would not altogether follow; because if you put an additional, say, 18,000 acres under grain, that necessarily would bring a certain revenue for return goods. I do not think you could work it out by the same rule.

529. My question was, if the increased traffic is to be derived from grain, it will take practically that amount of land? If grain were the only consideration, yes.

530. Very little increase can be expected from wool? I do not think there would be a great increase from wool.

531. Have you any data in the Department to show whether there is any probability of agriculture increasing so largely in that district? No, we have no figures.

532. You really have to be guided by the facts presented to you through your officers? Yes.

533. I presume, then, that by a careful analysis of these figures the Commissioners have been influenced in coming to the decision which they did not to recommend this line? Yes.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

J. Clarke.
30 Sept., 1897.

534. *Mr. Lee.*] The Committee would like to know what mail services there are from Coolamon towards Ariah, and from Ariah westward, also whether there are any mail services from Temora towards Mandemah, and from there to Ariah, names of the lines and the amount of the contracts? The first line is that between Coolamon and Ariah. The particulars of that contract are as follow:—From Coolamon to Shannan's, Ariah *via* Veetches, M'Kinnon's Public School and Junction Inn, 42 miles, twice a week by two-horse coach, £94 per annum. There is no other mail service connected at Ariah.

535. Is there a mail service from Grong Grong to Warri? No.

536. Is there a service in that direction? Yes; from Coolamon to Warri and Warri saw-mills, *via* Bull's Hole Corner, Cowabbie and Murray Creek, 40 miles, twice a week, a four-wheeled coach, two horses, £120.

537. Is there one from Temora to Mandemah? Yes. From Temora to Mirrool Creek, Broken Dam, Willandra, Yalgogrin, North Murray Station, Hungary, Mandemah, Kildary, White Gate, $\frac{1}{4}$ mile north of Kildary, $1\frac{1}{4}$ mile west of White Gate School and Goodigah, 85 miles, twice a week, sulky and one horse, £179.

538. Supposing there were a train running from Coolamon to Ariah, which of those lines, if any, would you be able to discontinue? The one to the left would still be run, I think, to serve roadside people from Coolamon to Warri. If they run out from Ariah the roadside people would probably require a mail, and between Temora and Broken Dam I suppose there would be a mail once a week.

539. Practically the only line that would be discontinued would be the one from Coolamon to Ariah? Yes.
540. That is £94 a year? Yes. If the distance is 42 miles we should have to pay £504 a year, instead of £94, as we are paying now.
541. I suppose that once a railway commences to run, you are compelled to use the train? No, we are not compelled.
542. In a case like this where the charge is so much increased, would your Department be likely to maintain its own service on the score of cheapness? That would be a matter of policy.
543. Are there any special features in connection with the service that make it desirable to pay this largely increased charge to the railway? I should not think so.
544. Do you derive any special advantage in connection with the parcels post? No. We get what we can out of that. I do not know whether it would be very large on this line or not.
545. At all events, you are quite clear as to the alterations that would be necessary in the mail service if a line were run to those points—it would only be necessary to discontinue one line? I think so.
546. *Mr. Humphery.*] You mentioned that the mailman called at the chief places between Coolamon and Ariah;—would the railway pass those points? I could not say.
547. It would not necessitate a service from the stations on the railway line to the places that you mentioned? I do not think so.
548. What is the time occupied on the journey between Coolamon and Ariah? Seven hours. They leave Coolamon at noon, and arrive at Ariah at 7 p.m. When they establish a line like that there are generally some small platforms on the line, and people receive their correspondence there.
549. *Mr. Trickett.*] Is the parcels post a paying branch of the Department? I think it is.
550. In places where railways have been extended, do you find a large increase in the parcels branch of the business? It has increased very much, I believe.

J. Clarke.
30 Sept., 1897.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

551. *Chairman.*] You have brought some maps I believe? Yes; I have brought a map showing the tenure of Crown land within 20 miles of each side of the proposed railway from Coolamon to Ariah, and also from Temora to Ariah. On the map the blue colour shows the alienated land under different tenures; the green colour shows the reserves; the brown tint shows the Crown land; and the blue shading shows the improvement and settlement leases. I have taken out the totals on the line from Coolamon to Ariah within the limits mentioned within about 20 miles north-east, north and west, and then a line running into Coolamon, midway between the Coolamon and Ariah line and Hay line. Within that area there are 483,360 acres of alienated land; 25,760 acres under settlement and improvement leases; 206,080 acres of reserves, and 298,540 acres of Crown lands.
552. Adding the two together there are 500,000 acres of Crown land? Yes, about 500,000 acres of reserves and Crown land. I will now give an analysis of the Crown lands in that area. Leasehold lands 217,470 acres which will become available between the present date and the year 1900; land held under occupation license, 55,750 acres; lands untenanted 23,320 acres.
553. To that you must add the reserves, which amount to some 200,000 acres? Yes.
554. The Crown still holds 500,000 acres? Yes. From Temora to Ariah the figures run as follows, within the area shown on the map by the red line:—Alienated land, 598,660 acres; settlement and improvement leases, 39,300 acres; reserves, 205,310 acres; Crown land, 306,820 acres. These Crown lands are made up as follows:—Leasehold area, 225,670 acres; occupation license, 32,330 acres; untenanted lands, 48,820 acres.
555. There is not any very great difference between that and the area you mentioned before? The difference is not very large.
556. Are there any exchanges? I have no information about exchanges. It would make very little difference, because if you get land by exchange you have to give up an equal quantity.
557. Have you the number of holdings and the average area of the holdings? No.
558. Is there any other land in that district unselected, not within reserves or leasehold areas? Yes; the land that I spoke of as being untenanted. There would be on the Coolamon to Ariah route about 75,000 acres of land open.

C. E. Rennie.
30 Sept., 1897.

William M'Intyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined.

559. *Chairman.* You have brought us some information with regard to population? Yes; I have made an estimate of the population within the area along the proposed railway from Coolamon to Ariah, via Cowabbie. The estimate is based upon the number of electors upon the Parliamentary Electoral Rolls now in force, from which I have as near as practicable ascertained the number resident at each locality situated within 15 miles on each side of the proposed railway, from a line 15 miles north of the existing line from Junee to Narrandera, to a radius of 15 miles northerly from Ariah. There are portions of two electorates within the area, and the total number of electors I estimate at 168, equal to a population of about 750 souls. The localities within, and the number of electors at each, according to the rolls, are as follows:—

W. M'Intyre.
30 Sept., 1897.

<i>Murrumbidgee Electorate.</i>					<i>Grenfell Electorate.</i>				
Ariah	18	Bolaro	7

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Coolamon to Ariah.

APPENDIX.

A.

[To Evidence of H. Deane, Engineer-in-Chief for Railway Construction.]

TRIAL SURVEY—GRONG GRONG TO ARIAH.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 1 October, 1897.

REFERRING to questions 59 and 60 of his evidence of the 23rd ultimo, I am directed by the Engineer-in-Chief to forward you the attached statement of Crown and alienated land traversed by the trial survey of the above line.

The Secretary, Public Works Committee.

E. HUNGERFORD.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 30 September, 1897.*Grong Grong to Ariah.*

I beg to inform you, in response to your verbal inquiries, that there are approximately 15 miles 40 chains of Crown land and 16 miles 65 chains of alienated land, traversed by the whole length of the trial survey of the above line, including the northern portion, which is also common to the Coolamon to Ariah survey.

The Engineer-in-Chief.

C. O. BURGE.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM COOLAMON TO ARIAH.

REPORT.

THE Sectional Committee appointed on the 7th October, 1897, to inspect, take evidence, and report upon the proposed railway from Coolamon to Ariah have the honor to report to the Parliamentary Standing Committee on Public Works:—

1. The Committee, consisting of Mr. T. T. Ewing, (Chairman), the Hon. C. J. Roberts, C.M.G., M.L.C., and Mr. George Black, left Sydney by train on the evening of the 15th October, and arrived on the following morning at Cootamundra, where they commenced taking evidence. At a meeting held in the Council Chambers a large number of witnesses, chiefly residents in the town and district, were examined, most of whom advocated the construction of a railway from Temora towards Wyalong, with Hillston as its objective point, instead of a line from Coolamon to Ariah. Some of the witnesses expressed the opinion that whether a line from Coolamon be constructed or not, a line from Temora, in the direction indicated, would be a matter of necessity.

On the following day the Sectional Committee proceeded to The Rock for the purpose of inquiring into the proposal to construct a railway from that place to Green's Gunyah. On the 16th the Sectional Committee arrived at Coolamon, where they resumed the inquiry respecting the proposed Coolamon-Ariah line. A considerable number of witnesses gave evidence in favour of the proposal, and on Wednesday proceeded to inspect the route of the line, which they traversed as far as Warri. A meeting was held at Uley, on the same day, when evidence was obtained bearing on the question of the route of the proposed line and the probable effect of railway construction upon the wool, wheat, and timber industries. At this place some of the witnesses advocated the construction of the line from Grong Grong instead of from Coolamon. From Uley, on the following day, the Sectional Committee proceeded to Methul, where they were met by a number of farmers, landowners, and others, most of whom strongly opposed the construction of the line, as proposed, from Warri to Ariah, and advocated a deviation to the east, which would carry it more directly towards Ariah and take it on the eastern side of the Cowabbie Range. After inspecting the country between Methul and Mimosa, evidence was taken from witnesses who also desired the line to be kept to the eastward of the Cowabbie Range, so as to meet the wants of the numerous settlers in the Methul district. From Mimosa the Sectional Committee proceeded to Temora, where they were met by the members of the Railway League and a number of townsmen, who informed them that they had not sufficient information with regard to the western country to enable them to give evidence which would be of any value.

2. Between the Lachlan and the Murrumbidgee lies a great area of undeveloped country, which will probably be intersected in the near future by a line extended west from Wyalong to Hillston. To the south of this line, and between it and the Hay line, taking Wyalong as an illustration, a distance of about 65 miles intervenes, which is fairly well maintained to Hillston, which lies, approximately, 60 miles direct north (by scale) from Carrathool.

The Committee thought it well to take into consideration the territory bounded on the north by the projected line to Hillston from Wyalong; on the east by part of the line from the Murrumburrah to Blayney line, and from Murrumburrah to Junee Junction; on the south by the line from Junee Junction to Hay, and extending west towards the Lachlan. This, practically, is the area now under consideration, into which the line from Cootamundra to Temora has already been

constructed

constructed in a westerly direction. The main inquiry is circumscribed by a line from Coolamon to Ariaah: thus an opportunity of expressing an opinion in detail upon the whole of this extent of country was not afforded the Sectional Committee. Still the investigations have been sufficiently extensive to enable definite views to be expressed with regard to it, and to enable suggestions to be made for its ultimate development. In laying down a railway in any tract of country it is necessary to decide what system will be adopted in dealing with the outlying area, and, therefore, consideration must be given not only with regard to the immediate requirements and present produce, but whether it will form part of a scheme for the systematic development of the whole of adjacent territory.

3. The class of country may be fairly well described as being suitable for agriculture from Coolamon to Temora. From Temora to Ariaah (except two narrow belts of country); from Ariaah as far west as Binya, and from thence down on to the Hay line, with the exception of such portions of the country as are too broken, and some of the plains adjacent to the Junee-Hay line, may be classed as suitable for the growth of cereals. North-east from Ariaah, towards Barmedman, although a considerable portion of the land is suitable for cultivation, it is not uniformly good, being broken in places, and interspersed with belts of mallee and ironbark. North-east from Ariaah, towards Wyalong, for a considerable distance there is cultivable land. Somewhat south from Buddigower there are belts of mallee and ironbark, but with good wheat-growing land intervening, which class of country extends fairly well to Wyalong. West from a line direct from Ariaah to Wyalong, good land extends to Mount Yalgogrin. The stock route, passing to the east of that Mount, lies in good country; but west from this, extending in a northerly, then in a westerly direction, passing north of the stock route above Currajong, and thence westerly to Sim's Gap, thence following south-easterly through Cocapaira, passing The Peak, and then to Moombooldool North, then bearing, in a north-easterly direction to Mount Yalgogrin, lies a great belt of country described as mallee scrub. East, west, and north of Sim's Gap, and from Binya going west and north, there is a considerable extent of broken country. The plain also from Carrathool and Hay extends a considerable distance to the north. To the north from this plain and west and north from Kooba lies a large tract of country which is described as suitable for the growth of cereals.

With regard to portions of this district far removed from Ariaah and Coolamon (in a vicinity which the Committee had no opportunity of inspecting), it will be understood that the descriptions are only approximately correct. Still they are sufficiently accurate for practical purposes. A full description in detail of so great an extent of country could only be obtained by a greater expenditure of time than the Sectional Committee felt justified at this stage in devoting to it.

4. The line from Coolamon to Ariaah submitted by Parliament is open to serious objections. First because it passes away from the Hay line at an acute angle and therefore remains on one side for a longer distance than is desirable within the influence of that line. At Warri it turns somewhat east of north. If it were desirable only to approach the country in the vicinity of Ariaah—Warri would be a sufficient distance to construct the line at present. It would be desirable also to obtain a more direct route to the Hay line. A deviation *via* Methul, some 8 miles distant from the present location in an easterly direction, was suggested, a strong point being made of the surrender to the Crown of some 30,000 acres of land in its vicinity; but although the district around Methul would furnish a considerable freight to the railway from the settlement already in existence, and there will probably be an immediate extensive increase, no extension towards the south is at present desirable, nor can such be made advantageously with a due regard to the ultimate extension of the railways of the Colony. The sketch accompanying this report lays down with tolerable accuracy the section of country for which railway communication is necessary south from the projected line *via* Wyalong to Hillston, and north of the present line from Junee to Hay. For 15 miles south of the extension to Wyalong, and 15 miles north from the Hay line, no produce will reach either of these systems at a less road carriage than 7s. 6d. per ton for wheat, and 12s. 6d. per ton for wool. If a railway be constructed from Temora, passing between Warri and Ariaah, thence by Moombooldool, Binya, and Kooba towards Gunbar, it would intersect about midway this tract of country, and thus divide equally the territory, lying outside a 7s. 6d. rate per ton for wheat, between the proposed
extension

extension *via* Wyalong and the Hay line. Before recommending the construction of a line in this position, it requires to be proved that the produce from this area would be sufficient to furnish freight for a railway, render accessible a considerable agricultural settlement, and increase the value of the Crown land sufficiently to justify the expenditure. The Committee have excluded from the estimates any lands within 15 or 20 miles of any existing or projected line.

5. The land within the influence of a line traversing this country in a westerly direction may be described as being fairly suitable on the whole for agricultural purposes. West from Temora some inferior lands would be passed through, also some ironbark country not far from Mimosa West. A rough range may require to be dealt with east from Warri. North from Binya there is some abrupt country which may require a deviation in the suggested route, but within the area affected by such a line the good land forms a great proportion of the total extent. North from Moombooldool lies a belt of mallee country (shown on the sketch). Opinions with regard to the value of this land during the early portion of the inquiry were adverse, but after as full consideration as the Sectional Committee felt entitled to make (with reference to a matter not absolutely before them), they came to the conclusion that the land should not be excised from the enquiry as being useless. The evidence of men who had cultivated mallee lands, and who had opportunities of comparing these with the the mallee districts of Victoria, was to the effect that they would offer a good field for settlement, and could readily be brought under cultivation if proper means of communication were provided. This is probable, and if it be so it much strengthens the case for the construction of a line such as the Committee deem it wise to suggest. The annual rainfall in this district varies from 18 to 22 inches, and although the lesser amount will render the growth of cereals precarious at times, it is not too small, falling as it does in this district, to prevent agricultural settlement from being fairly satisfactory to the occupant, and preferable to pastoral occupation alone. These descriptions are subject to modifications in detail where, for instance, intrusions such as the Cowabbie Range and tracts of ironbark and inferior country occur, which, however, do not seriously affect the general character of the country.

6. If a line from Coolamon or Grong Grong towards the north be justifiable, a very short time must elapse before lines going north from other portions of the Hay-June line will also be required. It therefore becomes a question whether these lands are to be developed by a number of short lines going north to various centres along this great belt of country, or intersected by a lengthy western line.

7. In order that the influence of the projected line should not be over-estimated, the limit of country has been curtailed to 25 miles—that is, $12\frac{1}{2}$ miles on either side of a fairly direct line from Temora to Gunbar. A fair net return from pastoral land in this district appears to be about 3s. per acre. There is a general consensus of opinion that, taking an average over a period of years, a net return of 15s. per acre is not an over-estimate for agricultural occupation. If, therefore, it be possible to substitute agricultural settlement for pastoral, the wealth of the district will be materially increased. The rent paid by the pastoral lessees is stated to be between 2d. and 3d. an acre per annum. If these lands were available for settlement, and were within 15 miles of a railway, in the opinion of residents well competent to judge, a rent of from 2s. to 4s. an acre could readily be obtained. The area of Crown lands lying in a belt of country which would be benefited by an extension due west from Temora to Warri, 25 miles in width, extending west to a point 15 miles from Warri, is approximately 340,000 acres—*i.e.*, about half the land is still in possession of the Crown; further west the Crown areas become greater. If such access as will permit this land to be occupied for cultivation be provided, it is obvious that the increased value given to the Crown lands alone must be much greater than the cost of the railway, or if the State be prepared to lease a fair proportion of the land, the increased rent obtainable would much exceed the interest on the initial cost and the estimated working expenses.

The cost of conveying the wheat produce of an acre of land a distance of 15 miles in this district by road is approximately 2s. 6d. The State could place this extra rental upon the lands if to this extent the cost of land carriage was lessened without placing the farmer in a worse position, for it is immaterial to the producer, generally speaking, whether he pays the extra charge in rent or in carriage.

8. Within 15 miles of Warri, as a centre, there are now 19,000 acres of wheat, which with the trade in timber, wool, and back freights, and the certainty of large developments in the near future, would fairly well justify the construction of a line to that place. The position of Warri to-day is typical of that of half-a-dozen centres which will certainly come into existence in the country north of the Hay line. Thus the development of the country—if it follow upon the same lines as the proposal before the Committee—will necessitate the construction of several short lines aggregating (say) 150 miles of railway, the first 15 miles of each of which will pass through country already fairly well provided for by the main line. On each of these separate lines there will be terminal charges, and a service inferior to that on a through line, and the produce will be conducted to the south, which is intended to reach the sea-board at the port of Sydney to the north-east. On each one of these feeders, produce from country lying but little north of west from Cootamundra will be brought a distance of 35 miles south, to be again conducted north along the main southern line.

9. The Sectional Committee is of opinion that the Coolamon-Ariah line should not be carried out; but suggest that a line be surveyed approximately in the position shown on the sketch herewith, and as close to a direct line from Temora towards Gunbar as engineering considerations will permit.

A brief epitome of the reasons already set forth will not be out of place:—

- (I) That there is a vast area of land, situated in a belt 25 miles wide, lying 20 to 45 miles north from the Hay line, suitable for the growth of cereals.
- (II) It is not desirable to carry to the south, traffic which is intended eventually to reach the main port of the Colony for shipment.
- (III) Within the specified area a special rate may be charged.
- (IV) There is already a great extent of genuine settlement in this portion of the district.
- (V) The increase in the value of Crown lands alone will justify the work.
- (VI) The agricultural produce of the Colony must be conducted as cheaply as possible to the seaboard.
- (VII) A large farming population will be immediately available if proper means of access be provided.

In our opinion, this work should be immediately taken in hand, not only in the interests of the present occupants, but in order that the Crown may obtain the increased value which a work of this description will give to the public estate. The Crown is leasing lands at 2d. to 4½d. per acre which will readily bring 2s. and 4s. per acre if suitable means of communication be provided. If the line were decided upon, say as far as Warri, and the lands designed in suitable areas, almost the whole of this country could be settled advantageously at once. The second section might be extended to Moomboodool, or this point could be made one section from Temora.

By the time the railway was completed, the traffic, with fair seasons, would probably justify its construction, and the State would be in receipt of the increased value of the lands. The demand for any suitable lands and the recent experience of Victoria in the ballots for the mallee country make it clear that the population is available to occupy the country if suitable access be given. If the land be alienated before the railway is constructed it is clear that the State will lose the special value which the expenditure will give these lands. The course proposed is exactly that which would be followed by any business man in dealing with his own estate.

At suitable distances along the route, station-sites should be chosen near the centres of the most productive tracts of country and where water can be readily stored. These would become business centres of the various districts. The lands should be graded in zones; the value being decided by the quality of the soil and the cost of road carriage. Railways should be located, unless there are very strong reasons to the contrary, where the public estate will reap the fullest benefit.

THOS. EWING,
Chairman.

26th October, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM COOLAMON TO ARIAH.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

SATURDAY, 9 OCTOBER, 1897.

[The Sectional Committee met at the Council Chambers, Cootamundra, at 10 a.m.]

Present:

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The HON. CHARLES JAMES ROBERTS, C.M.G. }

GEORGE BLACK, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Coolamon to Ariah.

John James Miller, auctioneer, and stock and station agent, Cootamundra, sworn, and examined:—

1. *Chairman.*] How long have you been resident in the district? Twenty-four years.
2. You have a full knowledge of the district? Yes, and of the district running west past Hillston, and out between the Lachlan and the Darling.
3. And of the country directly west of the line? Yes; I have been eleven years in the business as a stock and station agent and twenty-four years engaged in agricultural and grazing pursuits.
4. Do you desire to make a statement? I wish to give the Committee my knowledge of the district between here and Temora, Temora to Wyalong, Wyalong to Cudgellico, and from Cudgellico to Hillston, Mossgiel and Ivanhoe, and also to give my opinion as to the most desirable route for the railway, and the best in the interests of the country.
5. And also with regard to the extension from Temora due west by Broken Dam and Ariah? Yes. In the first place a committee took evidence some years ago in regard to the construction of a line from Cootamundra to the north-west, and the evidence given here then in favour of a line to Temora was based on the expectations that it would continue through from Temora. There was no Wyalong then at all. It was based upon the possibility of a line running right through to tap the South Australian border at Broken Hill. Although at that time there was no sign of the springing up of Wyalong, the Government made that line, and it was considered that that would be the first section of a line running towards the South Australian border. After the construction of that line to Temora, a large number of selectors went out to that district, and took up land a considerable distance beyond Wyalong, between Wyalong, Hillston, and Lake Cudgellico. They took up that land with the belief that this line to Temora would form the first section of a through line to Adelaide. Those settlers have had very great difficulty to contend with—drought, rabbits, and other things, and they have no railway communication to enable them to get their produce to a market. A line from Temora would be of great benefit to the people who went out there to make their living, and it would be the means of opening up a large extent of Crown lands which are now lying idle. The land, as far as my knowledge goes—and I have had considerable experience as a practical farmer—is very good, and I have no hesitation in saying that there is some of the very best wheat land lying between Temora and Hillston. No matter whether you take the road *via* Cudgellico or the other, you get a splendid area of agricultural land.
6. Your contention is limited to this: that the line should go from Wyalong into Temora and Cootamundra, and not across to Grenfell and Koorawatha? Yes. I should like to impress upon the Committee the desirability of a line from Wyalong into that country. I look at it, not from a local point of view, but as a national line which will open up country even beyond Wyalong, and right through to Menindie. I should like to say what I know about Lake Cudgellico and its probable future. Besides the vast extent of agricultural land there, we have a lake which, if the river is locked, could be kept full, and would provide for a very large settlement, and the settlers could go in for irrigation farms. Farms there can grow 10 acres of potatoes at 10 tons to the acre by irrigation from the lake. If that can be done on a small scale it can be done on a large scale by establishing good irrigation farms. My opinion is that a considerable extent of land could be irrigated at Lake Cudgellico. A considerable area of the land lies at a less elevation than the Lachlan in fresh, and there is a good market in the west. There is a weir at Willanthry, and already produce can be grown there. Between Hillston and Mossgiel there is some of the finest wheat land in the Colony. It is good chocolate soil and nearly all plain country. I think that the farmers there should make wheat-growing pay if they get 6 or 7 bushels to the acre. There is such a profusion of growth there in winter and spring that no doubt wheat can be grown well if they get it matured before the dry weather comes on. I have no doubt that millions of acres there, which some people say will not grow wheat, will grow wheat profitably in years to come. There is no stone of any kind there for miles. In wet weather I have travelled there; but travelling is a matter of very great difficulty, in consequence of there being no material available for road metal. It must, therefore, be as cheap to construct a light line of railway as it is to cart material for making macadamised roads. They have to bring stone a considerable distance to make streets there. It will be almost as cheap to construct a light line of railway as to make a good road. There are no engineering difficulties, except where floods come down the rivers. Outside of that there are no engineering difficulties whatever. I have been along

J. J. Miller.
9 Oct., 1897.

J. J. Miller. both the routes last surveyed—the line from Temora to Hillston and the line from Temora to Hillston *via* Cudgellico. I may say that I think Cudgellico is worthy of every consideration. The construction of a line through that locality would mean a detour of a few miles. I think it would be a matter of making the line 16 miles longer: but it is a matter for consideration as to whether we should leave an important place like Cudgellico without railway communication. There should be an extension of the railway west from Wyalong, not neglecting the importance of Cudgellico, touching the important centre of Hillston, and intercepting such trade as is likely to be obtained between the Lachlan and the Darling, and eventually getting to Broken Hill.

9 Oct., 1897.

7. That is your idea of future development? Yes.

8. Then there is the question as to whether the line is to come into Temora, and not to go across to Grenfell? It is all good agricultural land between Barmedman and Wyalong. If a railway line is to be taken from Wyalong across the Bland Creek, it would go through a very large extent of clay country, not suitable for wheat, although it is splendid fattening country. The clay comes very near the surface.

9. How wide is that area of country on the Bland? From 25 to 30 miles.

10. How far is it from Grenfell to Wyalong? About 70 miles.

11. Then 25 out of the 70 miles would not be suitable for agricultural settlement? No; not the same as the land between Temora and Barmedman. I know that about Grenfell there is some good agricultural land. I have no hesitation in saying that Grenfell is entitled to a railway on its own account. But a line from Temora to Wyalong would be the natural outlet for the traffic of that district. A great many stations there do all their financial business in Melbourne. The line is one which should be made in view of Federation coming about. It would be trying to make water go up hill to take the trade through Grenfell, and on to Koorawatha. Cootamundra is an established centre, midway between Melbourne and Sydney, and the people in the district through which this line would go have all established business connections with us, and a great many from Melbourne as well as from Sydney. It seems to me an unnatural outlet for that business, which has not been in touch with Grenfell or Koorawatha, to make a line to drag it that way, as it were. This is the natural outlet for that trade, and the first section of the intended extension has been made to Temora. The effect of that has been to build up a business connection between here and the country about Wyalong. I might here refer to the report of a Committee that took evidence in 1895, on the Temora line. One reason why they would not recommend the line from Temora to Wyalong was, that the population of Wyalong did not justify the expenditure. Wyalong has now established itself. There is a permanent township, and the mining carried on seems to be of a permanent character. There is a good area of agricultural land out there, settlement has gone on, and I think the fact has been fully established that the population of Wyalong is permanent, and will be increased if railway communication is given. With regard to the water supply of Wyalong, I do not know whether anything very considerable has been done. The report of the Committee of 1895 says that the population of Wyalong does not justify such an expenditure as the construction of a railway would necessitate; that the successful development of the field depends largely upon a permanent water supply, which was not then in existence; that the policy of the Government with regard to the leasehold areas in its vicinity has not yet been disclosed. Also that the Parkes-Condobolin line, having been approved by the Committee, an extension *via* Wyalong can no longer be regarded as a line to tap the western country. I beg to refute that. An extension *via* Wyalong is really the natural means of tapping that western country, especially now it is found, after investigation has been made, that a line from Condobolin to Euabalong is not likely to serve the interests of the country like a line from Wyalong. I have no hesitation in saying that the proper natural outlet of the traffic from Wyalong is *via* Temora to the main Southern line. It would be 15 or 16 miles longer *via* Cudgellico; but I think it would pay the country to make that detour.

12. You believe that Cootamundra has long been regarded as the trading centre for the district around Temora and Wyalong; and you say that the Government has lent itself to that idea by extending the line from Cootamundra to Temora? Yes.

13. You believe still further that the junction of an important town to the west should be on the main railway system of the Colony, not on a branch line? Certainly.

14. The suggestion you make is that, to bring the produce from Ariaiah on to the Hay line at Coolamon, would be a menace to the trading interests of Cootamundra? Yes; and besides that to the interests of the farmers themselves. Look at the heavier haulage there would be—to draw that produce out to Coolamon by rail, then down to Junce, and back to Cootamundra. That would be saved by bringing the railway direct to Cootamundra in the first instance.

15. The distance is, approximately, 36 miles greater? Yes.

16. With regard to the character of the country between Temora and Ariaiah, and Coolamon and Ariaiah, which, in your opinion, is the better country? There is a great deal more settlement between Coolamon and Ariaiah. But a line from Temora to Wyalong would not go through Ariaiah. Between Temora and Ariaiah it is ironbark country for a distance of 5 or 6 miles. But once you get over that part of it, the land is all good wheat land.

17. Thirty miles out of 36 is suitable for agricultural settlement? Yes.

18. You would urge that there should be a connection with the main line, rather than with a branch line? Even if the Ariaiah line is carried out to Coolamon. It will be on the branch line then, and it will be very inconvenient for travelling stock.

19. Is there anything else that you wish to say? I should like to tell the Committee my opinion—as one who has been in the stock business for a number of years—on this subject. I think that the future of store stock travelling on the line is very promising. Hitherto the Commissioners have relied upon fat stock, but I think that for the future most of the store stock will be carried by railway. At present we have stock routes. We have a large amount of country in the mountains which is of no use, except in the summer months. It is used for grazing at a time when the country out back is suffering from drought. Large numbers of stock have been removed in summer time to the hilly country. It cost 6d. a head to send them by road to the lully country, and it takes six weeks to bring them. In future years the Railway Commissioners will get all that business on a line running there in dry times.

20. That applies to any railway? Yes; stock owners will make use of the line to bring in the stock. It will be much quicker and cheaper. There is a prospect of a big business being done in store stock traffic in years to come. I desire to add with regard to the extension of the railway into the western country that for the carriage of stock, since the stock will be required to go direct to the mountains, there is a
direct

direct route to Cootamundra, Gundagai and Tumut, and the railway has been made to Gundagai. Ultimately that line will go on to Tumut, and into the mountainous country, and stock coming out of the level country to Wyalong through Cootamundra, will go direct to Gundagai to the mountainous country for summer grazing. If a railway were constructed to Wyalong it would take the sheep right away. It is a big thing to the grazing districts. It means a saving to the country of thousands of sheep, the development of the railway business, and the opening up of that mountainous country. Even in good seasons people would be able to utilise it, because they would get their stock backwards and forwards by the railway. If the ewes are sent away in lamb, they must lamb in the mountains before they can return, and it takes a month to get into the mountains by road, and according to the law they must stay four months before removal.

21. The mountain country lies between Gundagai and Cooma, and if a line from the western country goes to Grenfell, we have then to travel an extra length of railway from Koorawatha to Cootamundra; if the Ariah line goes to Coolamon, then you have to make unnecessary northing from Coolamon to Cootamundra? Yes, besides knocking the sheep about in travelling the extra distance. Cattle would suffer as well. I desire also to say that, if the line were extended from Temora to Ariah, it would intersect a wheat growing area, the traffic of which at present comes *via* Temora to a very large extent, and then to Cootamundra to get to the various markets. With reference to the Mimosa settlements, it does not appear that they will be specially benefited by a line from Coolamon to Ariah, since their present trade is with Temora, but another witness will be able to deal more in detail with the case.

William Miller, stock and station agent, Cootamundra, sworn, and examined:—

22. *Mr. Roberts.*] You heard the evidence of the last witness? Yes.

23. Do you endorse all that he stated with regard to the country west of Wyalong? Yes.

24. And as to the desirableness of getting to Hillston? Yes.

25. You are aware that this is an inquiry as to the desirableness of constructing a railway from Coolamon to Ariah? Yes.

26. Do you wish to show that in the interests of the country it would be a mistaken policy to construct the proposed line of railway from Coolamon to Ariah? Yes; but I should like to express my views shortly upon the policy of the proposed extension.

27. Do your views entirely coincide with those of the last witness with regard to the extension of the railway from Temora? Yes. I should like not only to endorse all that he said, but also to add a little to it.

28. If I understood the last witness correctly, what he wished to show was that the expenditure of money in the construction of the line from Temora to Wyalong would be far more satisfactory than a similar expenditure in the construction of a railway from Coolamon to Ariah, or from Temora to Ariah? That is so as regards a line from Temora to Ariah. I would not say from Coolamon to Ariah.

29. Do you think it would be more advantageous in the interests of the country to make a line from Temora to Wyalong than to make one from Temora to Ariah? Most decidedly.

30. Do you wish to make any further statement? I should like to express my opinion from my knowledge of all that country and apart from local interests altogether knowing all that country as I do from here to Hillston and Wyalong, from Wyalong to the Lachlan River, and from Coolamon to Ariah, and from Koorawatha to Wyalong, and I think my judgment will be pretty sound. I can speak from honest conviction as to what the wisest policy would be for pastoral and local interests. Apart from the interests of Cootamundra, which are not particularly great in regard to this extension, I may state that the stepping-stone to a great trunk system has been laid down from Cootamundra to Temora already. I call it a trunk system as distinguished from a branch railway, such as that would be from Coolamon to Ariah, a small branch to serve no ulterior end.

31. How many miles is it from Cootamundra to Temora by rail? Thirty-eight miles. At the inquiry of 1890 I gave some evidence. The understanding then was, when we gave our evidence in favour of a line from Cootamundra to Temora, that it was not merely to provide facilities for the traffic from Temora, but that the line was to form the first section of a great national work. Had we known that we were only working for a small branch railway, I do not think our enthusiasm would have been so great as it was. The interests of the country would not have been served so well by a small branch line as they would by a great trunk system. We were looking forward to the opening up of a great central area of the country by a trunk system of railways which would connect the central districts of the Colony, the great western districts, not only with the Sydney market but also with the main trunk line here at a point midway between the two capitals of New South Wales and Victoria. The whole of this line from Cootamundra to the Lachlan, *via* Wyalong, would open up a variety of country—pastoral country, mining country, large tracts of agricultural country, and country well stocked with timber. If you look at the map of the railway system of the Colony, you will notice that we have already the South-western line opening up the lower Riverina country, and one covering the country between the Southern and the Western lines. Between those two branches, and the western line and Parkes, there is a vast belt of good country that requires a railway. The point is that if we advocate a railway system it should be one that serves the country best, and we ought to go in more for a system than for supplying local wants. We must find a line to intersect that country, and leave the small branch lines to come later on. A railway from here to Wyalong, the first section of which has been made at a cost of £100,000, I understood was to be a great trunk line to intersect the interior of the Colony. If you compare that with the necessity of a line from Coolamon to Ariah, you will see that they are absolutely different—one is a small branch line to meet a few local wants, which in my opinion were hardly wants at all. When you get agricultural country within 25 miles of a railway, that country is well served. Taking 25 miles from 41, you are serving 16 miles of country. And I do not think there would be much enthusiasm in favour of that amongst people outside of the district directly interested. The object of advocating a line to Wyalong is, not so much to serve the interests of Wyalong, or of new country, as to intersect the wide area of country fairly stockable so as to serve all the country that lies between the railway systems of the west, and the southern system. Taking into consideration that all that is new country, which has been locked up for fifteen years by the Land Act of 1884, that the biggest proportion of agricultural land in that stretch of country is held by the Crown, and that a railway right through to the Lachlan would put 10s. an acre at least on the value of the Crown estate, I think anyone will see the desirability of constructing such a line. At present there are selections for sale—freehold land near the Lachlan River at 10s. or 15s. an acre, with improvements to the value of 10s.

J. J. Miller.

9 Oct., 1897.

W. Miller.

9 Oct., 1897.

- W. Miller. 10s. an acre upon it. If it were reached by a railway, that land would increase in value by 10s. an acre. When you are aware of the vast area of Crown land in that district, you can see that the cost of making a railway there would be greatly reduced by the augmented value which it would give to the Crown lands.
- 9 Oct., 1897. 32. *Chairman.*] Suppose a railway were made to Wyalong, could the Government readily dispose of the large areas of land adjacent to that line? They could dispose of it all at a freehold value of £1 an acre. I think the land closely situated to a railway platform will have an annual value of 1s. an acre, and from 5 to 10 miles away, 9d. an acre.
33. Such land as you would find in large quantities between Wyalong and Hillston, and between Temora and Ariah? Yes; land suitable for immediate agricultural improvement. From 10 to 20 miles distant the rental value would be 6d. an acre with a good tenure of twenty-eight years.
34. Without it what is the land worth? From 1d. to 2d. an acre.
35. Would farmers be found to settle on that country if the Government made a railway there? I am positive of it, from information which I had of a ballot which took place for land recently.
36. How many people, as a rule, will ballot for such land, keeping in view the country that we are speaking of? At Naromine there were 138 applicants for one settlement lease.
37. Can you give any instances in this district? Vacant land is scarce here.
38. Is there any wheat land leased here? Yes; on the large estates.
39. Can you give us any reason for the opinion which you have expressed? I know by the inquiries that are made for land.
40. Is there much inquiry for wheat-growing land in this district? Yes.
41. Are you aware of any wheat-growing land similar to the land under consideration, which is leased? Yes, similar country. The North Junee estate, and the Houlaghan's Creek country, is all leased on the half-share system, and partly on clearing leases.
42. What does it bring to the large estate holders, taking the half-system, or any other system? He gets all his land cleared and improved, that is one thing; and he gets one-third of the crop. It depends on the season what the return is.
43. If a man has similar land adjacent to a railway line, would he be prepared to accept 1s. an acre for it? No.
44. What would he expect to get? From 4s. to 5s. an acre.
45. Therefore, it is a reasonable inference that if the State changes the basis from pastoral to agricultural occupation by the construction of a railway, it ought to get 1s. an acre? Yes.
46. *Mr. Roberts.*] In advocating the extension of the line from Temora to Wyalong, your desire is to tap Hillston? To tap the Lachlan. I am not particular where, as long as it is a central trunk system.
47. Do you regard Hillston as the most favourable point? Not directly.
48. Which route do you favour? The route *via* Cudgellico. Going towards Wyalong, and striking straight out towards Hillston, the railway line hugs a barren chain of mountains; whereas if it were made *via* Cudgellico, it would intersect a stretch of agricultural country about 40 miles wide. I advocate the construction of a line to Wyalong *via* Cudgellico, because it would have about 25 miles of good agricultural land on either side of it; whereas if you go *via* Barmedman to Hillston, you would have the good land on only one side.
49. Do you consider it desirable to go to Cudgellico. Could not some mileage be saved by branching off to Hillston without going there? My advice is to keep as far to the north of that road as possible, then you intersect more good agricultural land.
50. Suppose the line went within 20 miles of Cudgellico? Yes, but the further you keep away from the chain of mountains from Wyalong to Hillston, the more good agricultural land you intersect. With regard to the Koorawatha project, I can say from my knowledge of the Grenfell district, having lived there two years, that the agricultural interest there deserves a light line of railway from some point, but it would be most unwise, in my opinion, to extend the railway in that direction when you have such a beautiful system from Cootamundra, a point from which to connect the mountains with the western country. The country from Grenfell to Wyalong, I might say, on the whole, is absolutely unfit for agriculture. I know every step of the country from Grenfell to Wyalong. Out from Grenfell there is a fair amount of good country, but when you get about 10 miles away you pass the Weddin Mountains, and you get on to country which is unfit for agriculture until you get to Wyalong.
51. Do you know the country between Koorawatha and Grenfell? I know the route, though I have not actually been over it. I have been within 15 miles east of Grenfell.
52. Suppose an extension from Temora to Wyalong were not carried out, would you think it a desirable thing to connect Ariah with Temora? I do not think it would matter much, as far as the Ariah people are concerned whether they go to Temora or to Coolamon.
53. Would it be an advantage to Cootamundra to have the Ariah trade coming through here? It might or it might not be; I could not say. My opinion with regard to the Coolamon-Ariah line is that it might serve local interests, and at best would give some additional convenience to a district already tolerably well served. From Temora, *via* Barmedman and Wyalong, on to the Lachlan, there is a belt of auriferous country, in which there are great possibilities.
54. *Chairman.*] What is the country like about Whitton? It is pastoral country.
55. How far north does it extend? About 20 miles.
56. Then what do you reach? Agricultural country and broken ranges.
57. How far does it extend? All the way to Lake Cudgellico, except where it is broken by the range.
58. You describe the country immediately north of Whitton as purely pastoral country for the first 20 miles? Yes.
59. Beyond that you reach broken country, which is intersected by valleys suitable for settlement? Yes.
60. Then, immediately east and embracing the holdings of Binya, Barollan, and Moombooldool, there is a large area of first-class agricultural land, extending right to Ariah. But before you reach Ariah you get the whole of the ranges that run in a westerly direction as shown on the map? Yes; I think the country has a north and south width of 40 or 50 miles; much of it is broken, but generally speaking it is country that will carry good settlement.
61. How far is the southern belt of the mallee country from Whitton? I should say about 40 miles, perhaps 50 miles. Speaking generally, south from the main belt of the mallee country which, for the present,

present, I regard as not likely to be settled, there extends for a distance of 25 miles, good agricultural country which brings you within 20 miles of the Hay line, that 20 miles being pastoral country.

62. *Mr. Roberts.*] What is the country like from Ariah to Cudgellico? It is all good, except where it is broken by a chain of ranges.

63. Would it be an expensive line to construct? No.

64. Would it be easy to construct the line from Wyalong to Cudgellico? The country from Wyalong to Cudgellico is almost level all the way.

65. At Ariah it would be more undulating country? Yes, you would have to cross ridges. Even if the railway were constructed from Coolamon to Ariah, I am of opinion that an extension from Temora would be a proper extension to develop the country lying west of Temora, viewing it from a national standpoint.

W. Miller:
9 Oct., 1897.

Frederick Pinkstone, journalist, Cootamundra, sworn, and examined:—

66. *Mr. Black.*] You have heard the evidence given by the preceding witnesses;—do you agree with it? Yes; I agree with it generally, except as to one matter, and that is the price which the farmers can afford to pay for wheat land. I think that it is impossible to make wheat pay in any part of the country if you put a higher price than from 20s. to 25s. per acre on the land. The cost of production will be so increased as to make it impossible for Australian wheat-growers to compete with American and others. That is the only matter in reference to which I differ from the other witnesses. To enable wheat-growers in the south-western districts of this Colony or of Australia to compete in a foreign market, you must not increase the capital value of land beyond 25s. per acre, and the rental value must be about 2½ per cent. upon that.

67. How do you reconcile that statement with the fact that in the southern parts of the Colony men are taking up land on the halves-system? Those men who take it up on the halves-system will find, when they have to pay the cost of production, that it will take about 12 bushels to the acre at 2s. 6d. to pay the producer and the owner. Hence, the wheat-growers cannot afford to pay more than 25s. an acre for land.

68. When the land is taken on the halves-system, the proceeds are divided between the two? Yes; but both have to pay the cost of production.

69. Six bushels to the producer and 6 to the owner;—is that what you mean? The cost of production in the United States ranges from 20s. to 30s., and we have to produce wheat below that cost to compete with the States. I do not think you could reckon on any of these lines on getting above 25s. an acre even for farms abutting on the railway.

70. Is that the only particular in which you wish to refer to the evidence? That is the only contradiction. I should like to give evidence as to the effect of the extension of the railway into this district. The railway tapped this district at the close of 1877. I suppose that at that time there was not a farmer in the whole of the district south of Yass cultivating more than 50 acres of wheat; now we have them cultivating as much as 1,000 acres. I have a comparative statement here showing the progress that has been made during the last four years in the cultivation of wheat. The growth of wheat in the Clarendon district increased from 50,000 acres in 1894 to 52,000 acres in 1897; in the Bland district from 28,000 acres to 36,000 acres. The total acreage in the three counties of Harden, Clarendon, and Bland increased from 133,000 acres to 145,000 acres. In addition to that, the pastoral industry has actually increased, and there has been a very large development in mining. The following are the comparative figures by counties for cultivation of wheat for grain and for hay:—

F. Pinkstone.
9 Oct., 1897.

Counties.	To 31st March.			
	1894.	1895.	1896.	1897.
	Acres.	Acres.	Acres.	Acres.
Harden	41,473	33,568	27,218	38,977
	4,885	5,286	7,811	4,888
Clarendon	50,744	49,454	36,126	52,101
	5,754	6,632	10,069	7,675
Bland	28,232	30,688	25,499	36,243
	2,869	3,717	7,578	5,848
Total acres	133,957	129,345	114,301	145,732

The township of Cootamundra is at the junction of these three counties; Gundagai is embraced within Clarendon, on the south of Cootamundra, and Temora within Bland, on the north.

71. Railway communication has encouraged cultivation? Yes. It is impossible to grow wheat and pay road carriage beyond 20 miles. If a man has to pay 1s. a bushel to reach the railway then he cannot grow wheat. He must devote his land to sheep or hay.

72. I suppose that in wet weather the roads are almost impassable? Yes.

73. You were going to speak of the development of the pastoral industry? Yes; I say that whilst the progress of agriculture has been promoted by railway extension, the pastoral industry has progressed side by side with it.

74. In what way? Fifty or 60 per cent. of the settlers are growers of wool as well as of wheat and of other agricultural products. A run close to this township, which never at any time in its history ran more than 12,000 sheep, now carries many selectors, each of whom is running a good many sheep. I suppose you would find twenty selectors subdividing the run, and rearing from 500 up to 3,000 sheep each.

75. Is that because of the easier communication with the market? Yes, more rapid and cheaper communication.

76. And the stock can be got away in time of drought? Yes.

77. I suppose there is not much cattle-dealing here? It is not so extensive as in the Cooma district. In the Gundagai district there is a good deal of large stock; if you turn to the official statistics you will find that the counties which will be affected by this railway—say between Koorawatha, Cootamundra, and Coolamon—are the largest wheat-growing counties in the southern division, and on the table-land, namely: Montegale, 37,550 acres; Harden, 38,970 acres; Clarendon, 53,101 acres; the Bland, 36,243 acres. These are

- F. Pinkstone. are the returns up to the 31st March, 1897. There is no other county on the table-land of the southern division approaching anything like that. The next highest will be 14,000 acres as compared with 50,000 acres. Making a comparison between Koorawatha and Cootamundra, I think that the large mining developments speak more favourably as to the extension *via* Cootamundra on to Temora, than by Koorawatha. A line from Koorawatha would pass too far north. The gold country lies south, south-east, and south-west of Wyalong, so that if you made a line from Koorawatha to Wyalong, the mining traffic would not travel by that line, but would have to come by Temora to Cootamundra. We have sent a good deal of ore to Dapto and Footscray, and they would have to send *via* Wyalong, Grenfell, Koorawatha, Harden, and Cootamundra. Even if you constructed a line of railway from Cootamundra to Ariah, and the mining traffic to Dapto went by that branch, it would still have to pass through Cootamundra, so that both for mining and pastoral purposes the whole of the traffic that is to be served by the railway extension between Temora and the Lachlan must pass Cootamundra by whatever branch it travels. You will find, if you consult the railway returns that, generally speaking, it is the short lines that do not pay, and are entailing a heavier cost upon the country; and you would be increasing the short lines by making a branch to Koorawatha on the one hand, or to Coolamon on the other.
78. Why should a deviation from Koorawatha be shorter than an extension from Temora? I do not think you would be likely to get a trunk line to the Lachlan from Koorawatha.
79. Would it not be as possible to carry a line from Koorawatha through to Hillston as from Temora? Yes; but you will miss a large amount of traffic. What I mean is that the line already constructed from Cootamundra to Temora would be left as a non-paying line. The loss on this line has been reduced since 1893 from £6,000 or £7,000 a year to £2,000 a year. By making a line to Koorawatha you would inflict a serious injury on the line from Cootamundra to Temora.
80. Do you think that it would injure the Temora line? It must; the service would have to be reduced, and the loss would be increased instead of being decreased.
81. Do you think it would divert traffic? Yes.
82. How great a distance is there between Temora and Wyalong? Forty miles. It is about 150 miles from here to the Lachlan, and Wyalong is just about half the distance. For stock purposes you would have to come through Cootamundra. The original idea of the railway extension to the southern line at Cootamundra was to connect the summer country of the Murrumbidgee and Tumut with the pastoral country of the Lachlan. Even by this short line—Gundagai to Temora—many stock have been saved. If the railway extension were made from Koorawatha the traffic would still have to come to Cootamundra.
83. You mean all stock travelling for feed;—you do not mean stock travelling to market? No. Another reason that the line should go from Temora out west is that we have one of the best milling plants established in Cootamundra, and that makes a good inland market for wheat producers between here and the Lachlan.
84. Are there not mills at Harden and at Murrumburrah? Not mills that can be so easily reached; there is a mill at Junee but none at Coolamon. There is a mill at Temora and a mill at Cootamundra. Then there is the expense of creating an unnecessary junction which ought to be considered. Each new junction must entail a comparative loss to the management of the railways, and if a line is made from Coolamon or Koorawatha it must create a new junction, whereas there is one established at Cootamundra between the two points.
85. Do you approve of that route which Mr. Miller outlined *via* Lake Cudgellico to Hillston? Yes; I have travelled by the Humbug Creek to Temora and Broken Dam and back from Wyalong. I think Mr. Miller is perfectly correct,—the further north you can keep the line between Temora and the Lachlan the better country you will travel. I should like to see the railway reach Cudgellico and then go down the river to Hillston. I admit that, if it is to be a trunk line to connect eventually with the South Australian system, a direct line to Hillston would be shorter than the other.
86. You were going to say something about the influence such an extension would have on Cootamundra? Prior to the extension of the railway to these districts, there was not a township in existence between Young and Yass on the north, and Gundagai and Wagga on the south, but since then towns have sprung up with populations of several hundreds, and populations altogether amounting to 7,000 or 8,000.
87. Do you think that the springing up of those new townships is any advantage to Cootamundra? Yes, they helped to establish Cootamundra as a central market.
88. Do they not become supplying centres themselves? My experience is that the more those townships increase to the west of Cootamundra the better. When the railway went west to Temora it injured this township, but we have been recovering our trade during the last four or five years and I think that the whole of the trade will come back to us. Before the extension of the railway this country was covered with a large quantity of pine scrub, now we find flourishing townships and enterprising municipalities. Large amounts of money have been spent by people in developing their land. In our own case we have already expended £22,000 in waterworks, providing a system of lighting and erecting council's buildings, and all these works are paying. We are so much encouraged by the result of our enterprise that we have undertaken further responsibilities to the amount of £7,000 or £8,000 to supplement the water scheme by gravitation. We should then have a responsibility amounting to about £30,000. The works are paying 6 or 7 per cent., and the principal is being repaid on the Government loan. Temora is a very thriving municipality. Even mining discoveries have been brought about by the extension of the railway. The railway was extended to Temora, and it brought selectors out there, and they discovered a field which has yielded about 120,000 ounces of gold. That is directly traceable to the railway extension which brought about selection which also resulted in the discovery of gold at Wyalong.
89. I should have thought that each new township would have become a new distributing centre? Looking at the matter superficially you would; but every township that has grown up since the establishment of Cootamundra has really helped Cootamundra, and the more the railway is extended the greater will be the production throughout the district.
90. *Chairman.*] You were in the district before the railway was extended from Cootamundra to Temora? Yes.
91. Would what followed incidentally upon the construction of that line in your opinion occur again if the line were continued further? I think so. As an illustration of the effect of the extension of the railway from Cootamundra to Temora, I may say that before the extension of the line there was not a single public school in that country, but now there are over 100. It has not only caused settlement and progress between those two points, but it has also encouraged people to go further out.

92. Suppose that a line were carried west or north-west from Temora, and the rent of land was 6d. or 7d. an acre are there men available to take up the land? I have no doubt about it. F. Pinkstone.
93. Where are the men to come from? The Victorians are very anxious to come to this country, and the land is not thrown open fast enough for them. As a rule the allotments between here and Temora are balloted for. 9 Oct., 1897.
94. In your opinion the state of things in Tasmania, Victoria, and South Australia with regard to wheat growing is such that New South Wales will be able to offer inducements to people to come and take up land? Yes. The rainfall is much lighter in Victoria and South Australia, and I am certain that the extension of the railway to the Lachlan would bring about a large settlement. I have sent out a good many selectors myself, and I have had repeated inquiries from Victorians for land, but the land is not made available. As showing the demand for land, I may mention that when land near to Temora was cut up, and a price as high as £3 an acre put upon it, there were crowds in front of the Land Office buildings here anxious to get it.
95. How many applicants were there for each piece? Seventeen or eighteen. There is a piece of land to be thrown open here in a week or two and I know about half a dozen people who are already waiting for it.
96. Is there anything special about that land? No; it is representative of the good wheat country lying between here and the Lachlan. The rainfall is very suitable; it ranges from 20 inches up to 26 inches, and the fall is very nice for wheat-growing purposes.
97. Have you had any experience in regard to balloting at Young and Wagga Wagga? Yes, as many as 300 people have come to get two or three pieces of land.
98. Is that land better than the country generally? No, the Bygalore country is supposed to be the best wheat-growing country in the district. I saw a crop of wheat there that was sown in July. In September it was above the fence and as thick as it could stick.

Arthur Sharp, District Surveyor, Forbes, sworn, and examined:—

99. *Chairman.*] Your district includes all the land west of the railway line from Young to Murrumburrah and Cootamundra, and then going northerly, partly westerly, through Temora; then coming southerly for a short distance below Mandamah, or Broken Dam; then by the Mirrool Creek; then northerly towards Condobolin; then turning westerly to a point south, between Cudgellico and Euabalong; and then north; embracing the whole of the country on the southern side of the Lachlan River? Yes; that is my district. A. Sharp.
9 Oct., 1897.
100. With regard to any country within those boundaries, you are prepared to give us information? Yes.
101. What is your opinion of the class of country between Temora, Barmedman, and Wyalong? It is timbered country and scrub, the soil being mostly good for agricultural purposes.
102. Would the work of clearing it be expensive? It would be comparatively difficult to clear that country. It differs from the country between Cootamundra and Wallendbeen, where if you ringbark the trees they die, comparatively little undergrowth appearing afterwards. On the other side of Temora, when you put an axe into the timber, suckers and seedlings spring up.
103. Is any of the country under wheat? Yes; a good deal of it is under wheat.
104. Will it pay to cultivate it, notwithstanding the suckers? Yes.
105. Although they materially affect the ease with which the crops can be raised? Yes.
106. It is fairly good country? Yes.
107. Country that is likely to be selected if there is a railway? A great part of it that is available is selected.
108. Is there any extent of Crown land adjacent to the line? Yes; as soon as you get into the Central Division there are leasehold areas.
109. How far from Temora? Twelve miles north-west, about half-way to Barmedman.
110. Will you describe the country from Temora *via* Broken Dam to Ariah? For a few miles it is similar to what it is between Temora and Barmedman. Then we cross a dividing ridge, and for 5 or 6 miles the country is very inferior. Then you get into good agricultural land all the way to Ariah. My estimate was that the whole of that country in the county of Bourke, exclusive of the strip along the dividing ridge—in fact, all the county of Bourke in my district—is suitable for agriculture up to about 75 per cent. of the area.
111. Are you prepared to describe the class of country west of Ariah? Only for a short distance—about 12 or 15 miles.
112. What kind of country is it? Similar to that already referred to; it generally gets more scrubby.
113. Is it suitable for agriculture? Yes.
114. Will you describe the country from Koorawatha *via* Grenfell to Wyalong? The country from Koorawatha to Grenfell, I consider as practically all suitable for agriculture. Mr. Wood has one block of country of 4,000 acres under cultivation, without a break, and 6,000 acres altogether. Mr. Greene has a similar area—indeed, two or three of them. He has 16,000 acres under cultivation. Leaving Grenfell and going west you pass 4 miles through an ironbark ridge; then it opens out again for about 6 miles of good country. You pass through a gap in the Dividing Range where the land is indifferent in quality; then from there on about 8 or 9 miles more it is good country. Then we get into clay country, and for a distance of between 25 and 30 miles it is splendid grazing country, but unsuitable for agriculture. It consists of borce and belar country. I do not consider it suitable for agriculture until you get within 5 or 6 miles of Wyalong. Then it is good agricultural soil again.
115. Is the land 6 miles west of Grenfell of an indifferent quality? I think I said 4 miles. Then there are about 5 or 6 miles of good, about 2 miles of bad, then 8 to 10 miles of good country.
116. Then the good land extends to within 5 miles of Wyalong? Yes.
117. Then north and west of Wyalong, embracing Hillston and Cudgellico, and bounded on the north by the Lachlan, what is that land like? Taking a line north from Wyalong, you would pass along the edge of pastoral country till you get to the Lachlan River.
118. That divides the country virtually into agricultural and pastoral areas? Yes, a line north from Wyalong.

A. Sharp.
9 Oct., 1897.

119. Would it run along the Bland country? Yes, just west of the line to the river. Along the river and any branches of the river it is chiefly grazing country with little patches very good for agriculture. It is mostly myall and belar country. A little over 20 miles from Condobolin there is a strip of grazing country. Then [between there and the boundary of my district, it is all similar country. It is good grazing country if properly improved, and I estimate that about two-thirds of the area is suitable for wheat-growing. The rainfall is uneven and uncertain, and that renders agricultural pursuits rather risky. You might lose one crop in three.
120. After you get back to the frontage of the Lachlan, except where the ranges intrude, most of the land is suitable for agricultural settlement? Yes, I believe about two-thirds of that large area.
121. Is there a considerable portion of Crown lands there? Yes; the greater part of it is Crown land.
122. After allowing for the fact that the rainfall is rather close to the amount required for agricultural purposes, the potentialities of the soil are such as to cause you to believe that the land is fit for agricultural settlement? I think so. I think agriculture could be carried on there. The crops would not be so heavy as they are further east, but you could rely on 10 bushels to the acre two seasons out of three.
123. Is the State getting any return for that land at present? Yes. There is not much abandoned country in it; it is getting pastoral rent.
124. What are the pastoral rents? They vary from ¾d. to 1½d. They average about a penny I should think.
125. Is any of that abandoned country in your district? Yes; I suppose 60,000 or 70,000 acres of it.
126. The larger portion of the residue is held at the rent of a penny an acre? Yes; but that does not include the conditional purchases and conditional leases.
127. I suppose there are plenty of pine scrub, dingoes, and rabbits? The pine is not the worst kind, it is easily got rid of; but there is budda, dogwood, wattle, &c.
128. Making the place a wilderness? Yes.
129. If a railway were constructed from Wyalong to Cudgellico and on to Hillston, in your opinion would the State be able to lease the land? I think it would be an inducement to lease it. I am doubtful about the mallee land.
130. A large portion would be leased? Yes.
131. At what rent? Not very high rents. I think from 2d. to 3d. Certainly not more than 3d.; more likely about 2d.
132. That is right through? Yes.
- 133-4. Is this land worth reclaiming? Yes.
135. Is there any way, except by putting a railway through it, and substituting agricultural for pastoral occupations? I do not think so. People will not look at it at present.
136. Unless the railway is put through it, it goes back to a state of nature? It is worse than in a state of nature after it has been ringbarked.
137. It remains a place for breeding vermin? Yes. People will take it on scrub leases in large areas at very low rents. One leasehold area was thrown up lately, and another very large area further south—85,000 acres—at Buddigower, with three years to run, was thrown up the other day.
138. You think the State should get 2d. an acre for the whole right through? Yes.
139. What would it take for a man to live on? I should say about three sections to enable him to carry on mixed farming.
140. Then this is about the position of affairs: that west from Wyalong, and north-west from Hillston, and west more northerly still towards Cudgellico, there is a great block of country, some of which has been abandoned and the residue of which is not bringing an average of more than a penny an acre? Yes.
141. In your opinion, if a railway were put through that land, it could be let at 2d. per acre? Yes.
142. And there is no other way of doing it? No; except by granting scrub leases on long tenures.
143. Do you believe that the whole of the land would be reclaimed? No; you would get no more settlement than there is now.
144. You would get no settlement and would not have so wholesome a development? No.
145. Can you say anything with regard to the land thrown open, somewhat south from Wyalong? Buddigower, 85,000 acres, has been abandoned.
146. The question of a line to the district west from Wyalong depends upon the settlement of the district? Yes.
147. You can only say that it is worth reclaiming? Yes.
148. You regard it as immaterial whether the railway comes from Koorawatha to Grenfell or from Young? No; except that going from Young it would be more direct as a future main line from Forbes to Dabbo, and on to Werris Creek.
149. You think that would be a better design to come by Young, Grenfell, Forbes, and Peak Hill? Yes.
150. And another reason, I suppose, is that it would assist more people? On the Koorawatha line there are large holders who are making the best use of their land—putting it under cultivation. But there are only four of them that would be benefited by it till you get close to Grenfell; whereas by Young the line would pass through a better settled district.
151. You believe that Grenfell is entitled to railway communication? Yes.
152. An extension from Grenfell to Wyalong is objectionable, partly because there is a wide stretch of country across the Bland, which is good pastoral land, but not good agricultural land? Yes; and it would pass through four big estates, which comprise amongst them 200,000 acres.
153. These are the reasons against an extension west from Grenfell? Yes.
154. Then your opinion with regard to the Temora-Cootamundra connection is, that the whole of the land is heavily timbered, and that the settlers will have difficulties to contend with; but still it is land that would be settled? Yes.
155. Have you a map for us? Yes. The blue on the map shows land suitable for agriculture; the red etching shows land suitable for either grazing or agriculture; the brown etching shows indifferent country—inferior grazing, or useless country.
156. Is that all you can tell us? There is a great deal of mallee country about Wyalong. A man started to clear some of it; and he told me that it cost 7s. an acre to clear it for the plough. When I saw his crops they looked very well.

MINUTES OF EVIDENCE—RAILWAY FROM COOLAMON TO ARIAH.

157. You think that the mallee country could be dealt with? Yes; I think scrub land can be dealt with.
 158. Have you anything further to tell us? To show that Wyalong is rather a prosperous place, I may mention that there was a suburban land sale there a week ago, and I think about fifty blocks were put up, varying from 1 acre to 5 acres, and they were all sold, and nearly all at an increase upon the upset price; and some at a very substantial increase. As regards the extension of the railway beyond Wyalong, it ought to be borne in mind that in three years' time, by virtue of the withdrawal of the land from leasehold, there will be a quantity of good land open for settlement. I am doubtful whether people will go on to that difficult country for perhaps still another three years, as there will be enough good land to keep them going. Perhaps it will be well not to take the line beyond Wyalong at all, until the good land becomes exhausted.

A. Sharp.

9 Oct., 1897.

George Thompson, stock and station agent, Cootamundra, sworn, and examined:—

159. *Mr. Roberts.*] Do you know the country between Coolamon and Ariah? Yes.
 160. Do you think it would be a desirable thing to have a railway to give Ariah connection with the railways of the Colony? My opinion is that there is no line that would open up the country or cause settlement better than an extension from Temora to Wyalong.
 161. Is that with the object of reaching Hillston? Yes.
 162. Do you come here to propose that that policy should be adopted in preference to the proposed line from Coolamon to Ariah? I do. I think it is far preferable to any other. In my opinion it would be ridiculous to advocate a line from Koorawatha or Young to Grenfell.
 163. Is not Grenfell good country? There are two large estates there, but they are within reasonable distance of a railway at present. I do not think there is a very large area to come under cultivation in that country.
 164. You heard the evidence of the previous witnesses, who stated that there was a large area under wheat around Grenfell? Yes. It is about four years since I was there. From what I hear, I think there are only two or three very large farms in the district.
 165. Did you hear the evidence of Mr. John Miller and that of his brother? Yes.
 166. Do you endorse all that Mr. Miller said on the subject of railway extension? Yes.
 167. Do you know the country between Temora and Ariah? Yes.
 168. Is there not a range about 6 miles west of Temora? Yes.
 169. When you get outside there towards Ariah, is all that country good for wheat cultivation? There is some very good country.
 170. Extending out to Coolamon? Yes.
 171. Is there a large area under wheat in the Ariah district? Just between Ariah and Temora, and towards Coolamon, there is.
 172. Is it not admirably adapted for the cultivation of wheat? Yes, excepting in patches.
 173. Do you think if Ariah were connected with the railway system of the Colony that a large amount of settlement would follow? I have no doubt that in all that country it would induce settlement. Recently I met a lot of farmers beyond Barmedman, and they said that if they had a railway there they could do well, because the land is equal to anything in New South Wales for agriculture.
 174. Are you speaking of land in the Ariah district? Ariah, Kildarey, and Mandamah.
 175. You desire to see Temora connected with Wyalong? Yes.
 176. With a view of its going out to the Lachlan? Yes. Had there been a railway to there, I have no doubt that it would have saved thousands of sheep and cattle, which could have been got away by rail. Some time ago 5,000 sheep started from Lake Cudgellico, but they had only 1,200 when they arrived at Stockinbingal trucking yards.
 177. We will confine ourselves to the railway connection with Ariah; which route would you prefer, in the interests of the country? A line from Temora to Ariah.
 178. Upon what ground? It would be more central and would involve less haulage.
 179. Did I not understand you to say that the land was equally good for agriculture from Ariah to Coolamon as it was from Ariah to Temora? Yes.
 180. But you say that you prefer the route by way of Temora? Yes.
 181. I ask upon what grounds? It would be a more direct line.
 182. Would there be less haulage on the railway, assuming that the produce was going to Sydney? Yes.
 183. Less haulage to take the produce of Ariah to Sydney by way of Cootamundra than by way of Coolamon? Yes; and it would be convenient for live stock during bad seasons. By coming in this direction they get right on to Gundagai. It is a direct route to the summer country, and the route usually traversed in bad seasons.
 184. Do you know Grong Grong? Yes.
 185. Could not a shorter connection be made from Ariah to Grong Grong than from Coolamon? I have not been across the country there.
 186. Is the country similar in character? I believe it is.
 187. Right on to Narrandera, I suppose? Yes.
 188. Do you know how many bushels of wheat to the acre you get between Ariah and Temora? No; I should think 8 to 10 bushels will be about a fair average in seasons like the present.
 189. Is there much cultivation at present between Temora and Ariah? Yes; about 3 to 9 miles from Temora there are a great many farms.
 190. I mean west of the ridgy country? Yes; there are a great many farms in that direction—that is, going towards Mimosa.
 191. Do you think a large amount of settlement would follow if Temora and Ariah were connected by railway? I do.
 192. Do you favour the construction of a line from Temora to Ariah? I do—north of Ariah.
 193. But you prefer going in the direction of Wyalong? Yes; you get splendid country right through.
 194. Has much settlement taken place around Temora since the railway was opened? Yes; there are a great number of settlers there 20 or 30 miles out.
 195. Has the traffic on the railway appreciably increased since the opening of the line between here and Temora? I think it has considerably.

G. Thompson.

9 Oct., 1897.

- G. Thompson. 196. Have you any figures to show the increase of the traffic? During the last two years I have bought a great quantity of wheat in the Temora district.
- 9 Oct., 1897. 197. Where does that wheat come from? From Broken Dam and Mimosa way, and Barmedman.
198. Do you get all the Wyalong traffic through Temora? Yes. If Wyalong were connected by railway with Grenfell and Young or Koorawatha, there would be a large decrease in the earnings of the railway line from Temora to Cootamundra.
199. Can you tell us whether the population of Wyalong has increased or decreased since 1895? It has increased during the last few years, since the mines were opened up there.

William Falconer, builder and contractor, Cootamundra, sworn, and examined:—

- W. Falconer. 200. *Chairman.*] What evidence do you desire to give? In the first place, in my opinion the most direct route from the main line to Hillston would be *via* Wyalong. It will open up splendid agricultural land all the way to Wyalong. It also opens up a large mining area—Reefton, Barmedman, and then Wyalong, which is one of the best mining centres in New South Wales. The construction of the line *via* Grenfell means an extra 30 miles of haulage, and will mean that the public will travel *via* Temora, then by coach; and, besides this, teams will be in competition with the railway, as they are at present in different parts of the colony. There will be a big loss on the line if constructed *via* Grenfell. Cootamundra has large business connections with Wyalong and that district, but a line to Grenfell would break up all those connections. There are large timber reserves of Murrumbidgee pine and ironbark, which would produce a large revenue for the railway in carriage; besides, the ironbark will cause a lot of employment in cutting sleepers for railway purposes. This is very much needed, as most of the ironbark along the present lines is getting very scarce. Cootamundra and Temora are deeply interested in both mines and business, and to get to Wyalong would mean going the present road by coach or other vehicle. If a line is constructed *via* Grenfell, then, when we have to transact business at Wyalong, we shall have to go to Murrumburrah by rail and round by Young to Koorawatha, which means a difference of about 55 miles in going from Cootamundra. If the railway is not made from Temora, the cheaper way will be to go by rail from here to Temora, then drive out to Wyalong. They are running coaches without railway competition at all, and you can go for about 7s. 6d. return. There are large belts of ironbark suitable for railway sleepers, and belts of Murrumbidgee pine, one of the most valuable timbers for building purposes. The white ant will not touch it, and the Government are using it all over the Colony. There is splendid ironbark after you pass Wyalong. These belts go right through from Grong Grong past Wyalong.

Robert Hastie, farmer and grazier, Malongla, near Cootamundra, sworn, and examined:—

- R. Hastie. 201. *Mr. Black.*] Do you live in this district? Yes, at Malongla.
- 9 Oct., 1897. 202. Have you a statement to make? I am growing wheat on my land between Wyalong and Lake Cudgellico.
203. What kind of country is it? It is good land.
204. Is it open country or forest country? It is both open and forest country.
205. What kind of soil is it? There is black soil, rich red soil, and brown soil. All the different sorts of timber grow there.
206. In what direction do you think the line ought to go? From Temora to Wyalong.
207. What is your opinion of the country for the purpose of wheat growing? It could not be better.
208. How much wheat do you grow? 200 acres.
209. For how many years have you grown wheat? It is seven years since the land was taken up. The railway going to Temora has opened up a large new centre. Railways are required for both stock and wheat. A great deal of land would be taken up, but people are waiting for the means of getting their produce to market.
210. How many years have you grown wheat? Seven years.
211. What has been your average return? We have been cutting it for hay, but we are growing wheat now.
212. How many years of failure have you had? There has been only one year, and that was 1888.
213. That was before you started? Yes, but I was here. I have been here thirty-eight years.
214. You have had no failure during that seven years? No.
215. At that rate it would be a very extraordinary year when you would have a failure? We have had partial failures.
216. Have you anything further to say? I have not heard the country described between Wyalong and Lake Cudgellico. It is all good land for cultivation along Humbug Creek and at Hungry station.

William Hall Mathews, storekeeper, Cootamundra, sworn, and examined:—

- W. H. Mathews. 217. What are you? I am a storekeeper, and have resided twenty-three years in this town.
- 9 Oct., 1897. 218. *Chairman.*] You are acquainted with the surrounding district for many miles? Yes.
219. We are inquiring as to a proposal to construct a railway from Coolamon to Aria;—are you acquainted with the Aria district? Yes.
220. Is there much settlement there? Yes; the holdings average from 640 to 2,560 acres.
221. Do you know what the yield per acre is around Aria? During the last five years we have not had a good crop; we have only had one average crop, and two failures. The average during the past five years has been from 6 to 12 bushels. Last year it was about 6½ bushels. Before that the average in that district was 14 bushels.
222. In what years were the failures? Last year, and the year before. They were not failures, but approaching failures.
223. Was that owing to an insufficient rainfall? Yes; we had not half of our average rainfall in 1895.
224. What is the average rainfall? For this district it is 26½ inches; out there about 23 inches. That is ample for wheat growing.
225. Do you think that if Aria were connected with the railways of the Colony, much increased settlement would take place? I consider that there would be a fair amount. The land is suitable for wheat growing, being similar to the land about Juneo.

226. Have you been over the country between Coolamon and Ariah? No.
227. Have you travelled between Temora and Ariah? Yes. All the land that can be taken, except the reserves, is settled. Ariah itself is a large station.
228. Have you heard of any demand for land around Ariah? I think the land is always taken up when there is any thrown open.
229. Which, in the interests of the country, do you think would be the better way to construct the line—from Coolamon to Ariah, or from Temora to Ariah? From Temora to Ariah most decidedly, because then there would be less actual railway carriage. You would avoid travelling on the main Southern line, which, in the future, will have to have as little extra traffic thrown on it as possible. Instead of coming to Junee, and travelling over heavy grades, you would reach the line at Cootamundra. Besides that, there would be a shorter distance for people to pay for carriage, and less wear and tear.
230. Do you regard Sydney as the market for the produce of that district? Yes, at present. When federation comes it will open up a very broad question as to equal markets for the colonies.
231. Ariah would be about equi-distant between Sydney and Melbourne? Very nearly.
232. Are we to understand that you favour the construction of a line from Temora to Ariah? Yes, and right on to Hillston. I favour it very strongly.
233. I am speaking now of the desirableness of not connecting Ariah? Yes; I would say decidedly, in the interests of all concerned, and of settlement generally, that an extension of the line from Temora would be the most beneficial. The distance between Ariah and Coolamon is about 40 miles, and the most distant point between these two lines would be only 20 miles.
234. What is the distance between Ariah and Temora? About 27 miles by road; it may be 30 miles.
235. Would there not be some ridgy country to go over? There is some ridgy country on the other side of Temora. When you get over that, there are no engineering difficulties whatever, and that is very slight.
236. Then you think it would be a wise policy to connect Temora with Ariah? Yes; it would increase the paying capabilities of the Temora line; it would give that part of the country the facilities required for settlement. Without a railway settlement will not take place, because it does not pay to cart produce very long distances.
237. Suppose a line were constructed from Temora to Ariah, would you suggest which way it should go then? You would tap a lot of country all round. I would suggest a short feeding line that would drain the country to the south-west and the west.
238. Whilst you favour the connection of Ariah with Temora, would you wish Temora to be connected with Wyalong? Most decidedly. There always has been an idea of a line right out west.
239. What prompted you to come and give evidence before the Committee;—was it to advocate the construction of any particular line? No; I only came out with regard to the general interests of the country.
240. You came merely to say that you favoured the connection of Ariah with Temora? That was one thing. I think that the railway which would be the most direct would be the most beneficial.
241. If a line were made from Temora to Ariah, would it be likely that another would be made from Ariah to Wyalong? At present Coolamon drains all the traffic lying to the south and the west of Ariah, but the traffic to the north-east goes into Temora.
242. Suppose that two lines were under consideration—one from Temora to Ariah, and one from Temora to Wyalong—which would you advocate? One from Temora to Wyalong, on a broad national view of the question.
243. That would be to get out to Hillston? Yes. The line suggested from Temora to Ariah would be a feeding line—a cheap light line.
244. What you mean is, that if we wish to open up that part of the country between Temora and Hillston, by all means spend the money in that direction instead of going to Ariah? Yes.
245. Is there a large traffic now between Cootamundra, Temora, and Wyalong? It is increasing yearly. Ten years ago the traffic was very slight indeed.
246. Do the Wyalong people deal with Cootamundra or Temora? With Temora.
247. If a line were constructed from Wyalong to Grenfell and Koorawatha, I suppose the traffic on the Cootamundra-Temora line would show a marked decrease? Yes, a very marked decrease indeed. It would tend to make the line not to pay; that probably the trains, instead of running every day, would be reduced to a bi-weekly service. When the line was opened three years ago they thought that a tri-weekly service would do all that was required. The railway, however, caused increased settlement, and that caused increased traffic, and the loss on the line is steadily diminishing. It is believed that within the next three or four years the line will be self-supporting; but should the back trade be cut off by another railway, the traffic would be greatly reduced.
248. Where does settlement take place? Wherever there is good land to be obtained anywhere round Temora.
249. Is Wyalong known to be a settled gold-field? The general impression has always been that Wyalong would be a good field, and the conviction is that it will be a very permanent one. The deeper they are going the better the reefs are, and good returns are being obtained.
250. Most of the supplies for Wyalong go from Sydney, I suppose? Yes.
251. But a large business is done in Cootamundra? Not a very large amount. Most of the business in Wyalong is done direct with Sydney. One great advantage of a line to Hillston *via* Temora would be that in dry seasons it would be useful for conveying stock. A case came to my knowledge which illustrates this: A man last summer on the Lachlan had 700 bullocks, but the grass ran out, and there was every chance of their starving. The owners therefore decided to remove them to the mountains. They started, and by the time they got to Temora they had only 400. When they got to Gundagai they had only 200, and by the time they got to the country to which they were destined they had only 40 left. Had there been a railway, those 700 bullocks, which would be worth about £12 a head at the present time, would have been saved. Had there been a railway there the bullocks could have been in Gundagai in twenty-four hours, where they would get plenty of grass, and 10 per cent. would have covered the whole loss. An advantage is that stock would never have to travel on the main line; they would cross the main line at Cootamundra.

MONDAY, 11 OCTOBER, 1897.

[The Sectional Committee met at the Council Chamber, Cootumundra, at 11 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The HON. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Coolamon to Ariah.

William Gibbon Walker, District Surveyor, Hay, sworn, and examined:—

W. G. Walker. 252. *Chairman.*] Are you the District Surveyor at Hay? Yes; I have worked in the Hay district from 1877 to 1885, and from December, 1893, to the present time as District Surveyor.

11 Oct. 1897. 253. You have a full knowledge of this district—of the settlement in it? Yes. I produce a map marked "DD" showing the land between Hillston and Cudgellico southerly to the boundary of my district. It embraces an area of 1,821,000 acres of Crown lands. Of this area 1,175,000 acres are now available for settlement, and this latter quantity also embraces 602,000 acres of abandoned country. Included in the area of 1,821,000 acres are 646,000 acres which are within pastoral leases, but will be available for settlement in about two years' time. At the present time the Crown is receiving no rent whatever for the 602,000 acres, but it is offered for settlement in improvement lease blocks at a nominal rent averaging about one-fifth of a penny per acre. The whole of this land is of a good agricultural character, with the exception of a very limited area hardly worth mentioning, embracing a few ranges of hills. I am of opinion that it is the want of a railway that is retarding settlement there; that if a railway were constructed the Crown could look for an average rent of 3d. per acre for the whole of that million acres, the difference in the value of land being decided by its suitability for agriculture and its contiguity to railways. The notes on the map show the different classes of settlement reserves and Crown land as held. I desire to direct attention to an area of country north of the Lachlan that may not be intimately connected with the subject of this inquiry, but which is worthy of consideration. It commences from the eastern boundary of my district on the Lachlan. There is a belt of country following the Lachlan, going up the Willandra, and then going in a fairly westerly direction towards Ivanhoe. This belt is about 8 miles in width, and it varies, and it is pine and timber country. North from this is what may be called a mallee belt, and, although heavily timbered, the soil will be suitable for agriculture. The rainfall is rather small; but I believe that there are possibilities in it in the future. It is well to remember this, though I am not quite sure whether it is pertinent to the inquiry, that that country is included within the counties of Blaxland and Mossgiel, and embraces 1,147,320 acres of abandoned country. In parts of the counties of Nicholson and Dowling, in the Land Board District of Hillston, there are 317,000 acres under pastoral lease which will expire during the next two or three years. There are 1,023,000 acres available for settlement, of which 488,000 acres is abandoned country.

254. What is the total area of abandoned country in the Hillston and Hay districts? There are 114,200 acres of abandoned country in the Hay district; in the Hillston district there are 1,635,530 acres.

255. That may be said to lie, approximately, west and south from Cudgellico, north-west from the Lachlan, and south-west and south from Hillston? Yes; of which 602,200 acres lie south from the Lachlan; and therefore, in two years' time, there will be about 1,819,000 acres available south from the Lachlan.

256. Therefore the estate that we are dealing with is practically west of a line coming south from Cudgellico, going as far down the Lachlan as Hillston, then embracing the country down to Gunbar, and coming down the boundary of your district on the east? Yes. With regard to the character of the country within my district, I produce a map, marked "CC," showing what may be regarded as agricultural country, taking out the portion I have already mentioned as being possibly a little too abrupt for cultivation purposes in the ranges. The agricultural country may be described as bounded on the east by the Land Board District of Hay, following down the Lachlan to below Hillston; then in a southerly line passing west from Gunbar; then coming south below Gunbar about 6 miles; then with a general easterly trend, intersecting the western boundary of the Hay Land Board District at Mirrool. To the south and west from that may be regarded, from the standpoint of to-day, as purely pastoral country. The map "BB," which I produce, shows untinted the Crown land in the Hay district, shows the reserves in green tint, and the leased land which will again become the property of the Crown is tinted sienna. The alienated land is tinted red or pink. This map makes it apparent at once where the alienated land is, and where the State is principally interested in the land. At present there is open for homestead selection, within a radius of 21 miles of Hillston, 52,000 acres. A small portion of this area was thrown open on the 7th instant, and seven blocks were taken up. In addition to this there will be available for homestead selection almost immediately, and adjoining the town, 5,251 acres, obtained from Cowl Cowl and South Merowie stations by way of exchange.

257. Do you know the country about Ariah? I know it fairly well, but it is out of my district.

258. We are informed that a line passing from Temora to Ariah, except some few miles of ridge, will pass through land suitable for agriculture until it intersects the ridge shown on the map coming south? Yes.

259. This, we are informed, extends north for some considerable distance as agricultural land—in fact, right from Temora, almost in a direct line to Gunbar; all that is said to be agricultural land with the exception of the ridges in question;—do you believe that to be a fact? Yes.

260. And the plan shows that there is a very considerable area of Crown land along that route? Yes.

261. The southern boundary of this agricultural area is described as extending to within about 25 to 35 miles of the Hay line, and following easterly, approximately, that distance from the line, the land to the south of that line being pastoral? That is correct.

262. Then it follows that, if that agricultural land is to be developed, it will be necessary either to run small feeders up from the Hay line, or to put a line directly west through it? Yes.

263. Are you prepared to express an opinion, if it becomes necessary to develop that land, as to what is the best thing to do? To make a direct line; that is preferable to having feeders.

264. With regard to the northern portion of the district, you know fairly well where the railway line is presumed to be located from Wyalong to the north-west? Yes.

265.

W. G. Walker.

11 Oct., 1897.

265. In your opinion, will it be to the interest of the State to make that line? Yes.
266. Do you believe that the public estate will get a return? Yes.
267. You have explained that there are over a million and a half acres of land from which you are getting nothing? Yes.
268. What will you get for it in the event of a line being constructed from Wyalong north-westerly? Three pence an acre, I anticipate.
269. What are you getting now? Nothing; the rent of the land that is at present let by the Crown is not bringing in more than 1½d.
270. And you think that the Crown might justifiably expect an increase of 2d.? Yes.
271. If all that land were reserved right through from the Lachlan to the Hay line, would it be possible for the state to get a large increase from it if a railway were made? Yes.
272. Are there hopes of reclaiming that country under pastoral occupation? Not much; we are trying to, as improvement leases.
273. We must change it from pastoral to agricultural occupation? Yes; and the best way would be to make a railway.
274. If the State held the land till the railway was constructed, there would certainly be an increase of 2d. an acre? Yes; virtually I think the Crown land may be regarded as likely to increase to 3d. an acre, the area leased being only a small portion.
275. With regard to the wheat-growing capabilities of the district, does not Gunbar lie practically south from Hillston? Yes, about half-way between Hay and Hillston.
276. Have you had any experience of Gunbar—of any agricultural occupation at all? Yes; I know a gentleman there whose services were obtained as an expert in land values in connection with the reappraisal of special areas, and in the evidence that he gave before the Hay Board, he stated that ever since the line was constructed to Hay, about 1883, he had been cultivating land at Gunbar, and that notwithstanding the various droughts, and the difficulties of carriage, he had never been on the wrong side of the ledger.
277. How far had he to carry his produce? Between 40 and 50 miles.
278. Do you consider that that is too far for an agriculturist to carry his produce? It is too far.
279. How far do you think is a fair distance for a man to draw his produce? Twenty miles would be the limit, in my opinion.
280. Is the area that you speak of at Gunbar a specially-favoured area? No, it is a fair average sample of the land which I have described.
281. If a line were made through that district, the inference is that if a man could live at Gunbar he could live contiguous to a railway? Yes.
282. If a northern line going from Wyalong north-west to Hillston would reclaim land within 20 miles on both sides, could we get an increased rent of 3d. an acre—would not a line going from Temora west have some effect on the southern portion of the district? Yes; but the southern portion is not Crown land. As far as my district is concerned, a line so projected west to Gunbar would pass on the southern side of a vast area of unoccupied land suitable for cultivation; but, in my opinion, the northern line would do more for the reclamation of the district, and it is immediately required; whereas the southern line could be constructed as the State saw fit. The northern line should undoubtedly be constructed first, as the Crown would reap the greatest benefit, and it would carry a larger number of settlers.
283. You believe that if the country were so developed it would be possible to get farmers to settle on the land? Yes.
284. You believe from your experience that there is no doubt about it? Yes.

MONDAY, 18 OCTOBER, 1897.

[The Sectional Committee met in the Oddfellows' Hall, Coolamon, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Coolamon to Ariah.

William Boyd, farmer, and secretary to the Coolamon to Ariah Railway League, sworn, and examined:—

285. *Chairman.*] Are you prepared to make a statement in reference to the proposed railway? The reason for asking for this line to be constructed is that it would be of great advantage to a great body of settlers. It would pass through rich agricultural country, on which a farming population would settle, and there would be a great demand for land if Crown lands were thrown open. There will be a large area thrown open in a very short time. The Lands Department are now resuming land for settlement. The land will be closely settled in a short time, and the railway would pay, we think, in about five years—perhaps sooner. In 1895 I collected some statistics, and handed them to the Minister for Works. I collected statistics again this year, but we did not get in all our returns. We sent out 106 forms to be filled in, and we got sixty-eight returns. Those sixty-eight show a large increase in the area under cultivation and the quantity of goods received. The acreage under cultivation in 1895 was 10,225 acres; in 1897, 14,258 acres, showing an increase, according to the sixty-eight returns, of about 4,053 acres, or 39½ per cent. The 14,250 acres to which I have referred do not cover the whole area under cultivation; in fact, the number of people who, I believe, were producers, was 106; but these returns only embrace the holdings of some sixty-eight producers; therefore, although I am not prepared to state definitely by how much the 14,000 acres should be increased, it is certain that it ought to be increased. Adding the returns for 1895 in place of those that did not come in, I have endeavoured to make the return complete. The area over which I collected the statistics is shown by a pencil-line on the map. The boundaries are going fairly north from Coolamon, somewhat west from Broken Dam, then northerly and westerly to between Whalundry and Bygoo, but nearer Bygoo, then west towards Sandy Creek through Yalgogrin south, then to Moombooldool north, and then from there with a south-westerly trend till it intercepts the Hay line west of Coolamon. In regard to the sixty-eight returns, I may state that the number of bags of wheat in 1895 was 31,825; in 1897,

W. Boyd.

18 Oct., 1897.

- W. Boyd. 1897, 57,103 bags—that is, the probable yield for this year—an increase of about 25,000 bags, or 79½ per cent. Wool shows a slight decrease. In 1895 it was 4,446 bales; in 1897, 4,155 bales, or a decrease of about 6½ per cent., caused by the severe drought. The quantity of goods received in 1895 was 536 tons; for 1897, 811 tons, showing an increase of 275 tons. The estimated probable increase in cultivation in 1895 was 18,836 acres; in 1897, 63,216 acres. The same individuals say that they will put this area under crop if the line of railway is made.
- 18 Oct., 1897.
286. Can you explain to the Committee whether, in your opinion, that estimate is a justifiable one? It is. I think that the whole of the cultivation will be put in if the line is carried out. The quantity of other produce is about 6,860 tons. This includes tallow, hides, skins, hay, chaff, grain, timber, and minerals. It does not include the whole of the timber, nor the whole of the minerals, because we could not get the whole of those items. The number of fat sheep for 1897 is 26,000. The number of acres under cultivation in 1895 was 17,661 acres; the area in 1897, 20,834 acres. Of this area, 14,000 is given in the returns, and 6,000 is based on the returns of 1895, because the whole of the returns for 1897 were not sent in.
287. Are we justified in believing, therefore, that 20,000 acres does not cover the whole area? Yes; there should be the same proportionate increase shown in the other returns had they been sent in, but only sixty-eight were sent in. The probable yield of wheat for 1897 is 79,277 bags; wool, 5,089 bales. The probable quantity of goods received is 1,122 tons in 1897; the probable increase in cultivation, 72,486 acres. The area of Crown lands, as far as we can estimate them, within 15 or 20 miles of this line, would be 225,000 acres, not including stock routes.
288. How is that Crown land now held? It is held on leasehold by pastoral lessees.
289. Therefore, it will probably be available in two or three years? Yes. These Crown lands are not within 15 miles of the town of Coolamon.
290. Have you included any reserves in the area? It is all under leasehold; not reserved lands.
291. Is this 225,000 acres land held by pastoralists which will be available within two or three years? Yes.
292. And it does not include reserves? I believe it does not. The figures are as follows:—Ariah, 10,000 acres; Warri, 8,600 acres; Marool Creek, 21,127 acres; Wallcroobie, 12,000 acres; Moombooldool, 43,000 acres; Yalgogrin, 60,000 acres; Bygoo, 14,720 acres; Mimosa West, 27,000 acres. At a meeting of the Railway League, held on the 25th September last, they agreed to sign a guarantee that, in the event of the line not paying for a few years at the start, they would be willing to submit to a special tax to cover the loss. They passed the following resolution:—"We, the undersigned members of the Coolamon Railway League, hereby agree to pay a land tax on land other than Crown lands, towards providing a fund to make up any loss in the event of a deficiency occurring in the working of the line when constructed—the rate to be 1d. per acre on lands situated within 5 miles, ½d. on land within 10 miles, and ¼d. on lands situated within 15 miles of the proposed line." This resolution was signed by seventeen members of the League.
293. What area do those seventeen persons represent? I have not made any calculation to find that out. We have letters from seven members who were not present, saying that they would be quite willing to pay the tax.
294. Twenty-four altogether? Yes.
295. Is the whole country north from the Narrandera-Hay line, taking Coolamon and Ganmain as two points, suitable for the growth of cereals? Yes; all except the Cowabbie Range.
296. To what extent does that range lessen the area suitable? I suppose it runs 12 or 15 miles, and is about half-a-mile wide.
297. Is the land adjacent to the Hay line better or worse than the land to the north? It is much the same class of land.
- 298-9. Therefore, the line from Coolamon to Ariah passes through the same kind of country all the way with the exception of the broken country? Yes.
300. Would the same apply to a line from Grong Grong? Yes.
301. Going north from Ariah towards Wyalong, and coming west 10 miles from Ariah, then going north, what is the nature of the country running north that would be influenced by a railway to Ariah? The land all round Ariah and Kildary is good agricultural land.
302. How far north from Ariah does good agricultural land extend? I have travelled 12 or 15 miles north of Ariah, and I found it all good land.
303. Have you gone north-west from Ariah? Yes; as far as Yalgogrin—about 18 miles.
304. Is that good land? It is.
305. What is the land like towards Broken Dam? That is good land.
306. And is it good land to the north-west of Broken Dam? Yes.
307. You spoke of 225,000 acres being thrown open for settlement in the future—would there be farmers take up that land? Yes; it would all be taken up.
308. What area would you allow a farmer in this district? From 640 to 1,000 acres, according to the class of land.
309. An average of about 800 acres? Yes, about that.
310. To settle the whole of that 225,000 acres, with an average of 800 acres each, would require nearly 300 farmers? Yes.
311. Would they be available? Large numbers are coming over from Victoria. At the land ballots there are sometimes fifty applicants.
312. You have no doubt, from your experience, that a sufficient number of farmers will be obtained? I have not the slightest doubt about it.
313. Can you mention any cases in which land has been balloted for? About a fortnight ago, 4 miles north-east from Grong Grong, there were three blocks thrown open, averaging 500 acres each, and there were twenty-five applicants for each of those blocks.
314. Was there anything special about those blocks? No; it was ordinary land.
315. What is the freight from Ariah to Coolamon by road? Wool is £1 a ton; it is higher than wheat.
316. Is that a fair charge? It is.
317. What is the rate for carrying wheat from Ariah? About 13s. a ton.
318. Is that the minimum? It is a fair average charge.

319. What is the charge for wool from Warri? About 17s. 6d. a ton.
320. And for wheat? About 12s. a ton.
321. Have you ever got carried at less than 12s. a ton? No; my wheat goes to Grong Grong at present. The charges which I have given are the charges to the Hay line. We pay 9s. a ton from Uley, to Grong Grong.
322. What would have to be paid for the carriage of wool going north from Ariah to reach the Hay line? The charge would be about 9d. a ton per mile.
323. Having got to Ariah as a depôt, what would you have to pay to get down to the railway? Nine-pence per ton per mile.
324. What is the lowest freight on the Hay line anywhere? About £1 a ton.
325. What would the charge be for the carriage of wool from Ariah to Temora? I do not know.
326. Would it be greater than the charge for carriage to the Hay line? I think so.
327. What would it cost to bring wheat from Ariah to the Hay line? About 13s. a ton.
328. Is that the cheapest way in which you can approach any portion of the New South Wales railway system? Yes.
329. From a point half-way between Ariah and Grong Grong, what would you pay per ton for wheat and wool? You would have to pay a little more than half rates. I put wheat down at 8s. for half-way, and wool at about 15s.
330. Where does the traffic go at present from Ariah? Principally to Coolamon.
331. Some may reach Grong Grong? Yes.
332. Does any reach Temora? Not from within 10 miles of Ariah.
333. As you go west from Ariah, would not the traffic make straight down on to the Hay line? Yes; it does. Some goes to Grong Grong, and some to Narrandera.
334. *Mr. Roberts.*] Where do you reside? At Uley.
335. How many miles is that from Coolamon? Thirty-two miles north-west.
336. What is the area of your holding? 3,972 acres.
337. What portion of that 3,972 acres is under cultivation? 130 acres.
338. What is the average yield per acre? About 16 bushels.
339. What are the maximum and minimum yields? The yield varies from 10 to 24 bushels to the acre.
340. Is the whole of the land between Coolamon and Ariah well adapted for agriculture? Yes; except at Cowabbi Range.
341. Do you favour a line from Coolamon to Ariah in preference to one from Grong Grong to Ariah, or from Ariah to Temora? I am not particular whether it comes from Coolamon to Ariah, or Grong Grong to Ariah. A railway from Temora would not suit us so well.
342. If a line were constructed from Temora to Ariah, would it not serve as many people? I do not think so.
343. Would you and your neighbours use a line from Ariah to Temora? Yes; I would use it if it came to Warri.
344. Do you know the country between Ariah and Temora? Yes; for about 12 miles east of Ariah.
345. Is the country there equally adapted for agriculture with the land between Coolamon and Ariah? Yes; for that distance.
346. Is there as much cultivation taking place between Temora and Ariah as there is between Coolamon and Ariah? No; not so much.
347. If a railway were constructed from Coolamon to Warri, do you think that would be a sufficiently long line for the present time? I think so.
348. You do not regard it as absolutely necessary to go beyond Warri till further settlement takes place? I think it would do at present. If there is any extension I think it ought to go in a north-westerly direction from there.
349. Instead of going north to Ariah it ought to go in a north-westerly direction? Yes.
350. What causes you to form that opinion? As it turns round to Ariah it approaches the Temora line, and would not get so much traffic as it would if it went the other way.
351. Is the land of a superior quality in a north-westerly direction? No; the character of the land is much about the same, but it would tap more Crown land, and have better prospect of development.
352. Is there a large area of Crown land in a north-westerly direction from Warri? Yes.
353. Within what period would those lands be available for settlement? I could not say; I should think in about three years. I think that most of the leasehold has only five years to run, under the Act.
354. How far is it from Coolamon to Grong Grong? Twenty-six miles.
355. So that if Grong Grong were the point on the south-west line to be tapped, there would be an extra haulage of 26 miles? It is further from Warri to Coolamon than it is from Warri to Grong Grong.
356. What is the difference? About 10 miles.
357. But then there will be 26 miles extra haulage between Grong Grong and Coolamon? Yes.
358. Does all your produce go to Sydney? Yes.
359. Where do the people in your neighbourhood obtain their supply? From Wagga Wagga, Coolamon, Narrandera, and Grong Grong.
360. Is the same rate charged from Grong Grong to Sydney as from Coolamon to Sydney? I could not say.
361. Does settlement seem to be increasing every year in the district? Yes; when any land is thrown open it is always selected.
362. The population is rather small at present, is it not? Yes.
363. If a railway were constructed, do you anticipate a great increase in the number of settlers? Yes; if the land is thrown open.
364. Are you in a position to say that there is a great demand for land that would be affected by the proposed railway? Some land was thrown open at Cowabbi last year, and there were about thirty applicants for it; therefore, I think there would be a large demand for land.
365. *Chairman.*] In what form was it thrown open? As homestead selection.
366. What was the rent? One and a quarter per cent. from first year.
367. What was the capital value of the land? I think about £1 an acre.
368. What do they think they are paying per acre? About 4d.

- W. Boyd. 369. *Mr. Roberts.*] I suppose that they combine grazing and farming all over this district? Yes.
 18 Oct., 1897. 370. How many sheep do you run? Close upon a sheep to the acre in average seasons.
 371. How many have you on your run at present? Only about 1,000, owing to losses from drought.
 372. What is the largest number you have had? 3,000
 373. I think you said you sent an estimate of traffic to Mr. Harper last month? Yes.
 374. Have you had any reply from him? Yes; he said he had given his evidence, and he had handed my papers to the Chairman of the Works Committee.
 375. Have you seen the estimate made by Mr. Harper as to the probable traffic on the proposed line? Yes; I have seen it in the Press.
 376. I see from some figures handed to me by the Chairman, that Mr. Harper estimates that within 10 miles of Coolamon there will be 850 tons of wheat and 25 tons of wool; can you show whether or not that is a fair estimate? I can try to compile it from our statistics.
 377. Does the proposed line go along the travelling stock route to Warri? Yes; except the small piece at Cowabbi and at Warri.
 378. Would there be any cost for land resumption or compensation? I do not think so.
 379. Do you think people would be prepared to give what land is required for the railway? Yes; I am quite prepared to give any of my land for the purpose.
 380. In making your estimate for the traffic, have you estimated anything within, say, 10 miles from Coolamon? There are a few farmers within 10 miles of Coolamon.
 381. At the meeting held on the 25th September last, when some twenty-four land owners offered to guarantee any loss should the railway be constructed, what area of land was represented? I will make a return showing it.
 382. Before resolving to offer this guarantee did you consider the desirableness of offering to pay a higher rate of carriage to the Railway Department? Yes; we understood that we should have to pay a special rate. Mr. Harper informed us of that.
 383. Have you considered whether it would not be better for you to pay a still higher rate to that mentioned by Mr. Harper instead of offering this guarantee? We should be quite willing to do that.
 384. If a higher rate were charged, does it not appear to you that everybody who used the line would contribute towards the revenue, whilst if there was a guarantee some owners of the land might not fall in with the arrangement? I daresay it would be a better plan to charge a higher rate, but if land is increased in value the owner should pay.
 385. *Mr. Black.*] Do you know the number of sheep in the district which has been referred to by you? According to the 1895 returns there were then 395,570 sheep.
 386. Has the number increased or decreased? It has decreased, owing to the drought.
 387. Do you know the average rainfall in the district? I think about 18 inches.
 388. Have you any figures as to the cost of the production of wheat? I have not.
 389. What price would it pay to produce wheat? About 2s. a bushel.
 390. You spoke of the goods received at Coolamon;—where did they come from? From Sydney and Wagga Wagga.
 391. Any portion of them from Melbourne? Not to my knowledge.
 392. Where do the storekeepers and the squatters in the district trade? In Sydney.
 393. Is there any coach communication between Ariaiah and Coolamon? Yes. A coach goes out from Coolamon to Ariaiah, *via* Methul, twice a week.
 394. Are the mails sent by it? The mails to Ariaiah are. There is another service from Coolamon to Warri along the proposed line.
 395. Does it go to Ariaiah? No; there is 5 miles between the terminus of the two mail routes.

Alexander Arbuthnot McKersa, farmer, Colinroobie, sworn, and examined:—

- A. A. McKersa. 396. *Mr. Roberts.*] In which direction is Colinroobie from Narrandera? Due north.
 18 Oct., 1897. 397. What distance? Twenty miles to my place, Colinroobie proper—that would be the settlement—would be about 24 miles.
 398. Are you acquainted with the country between Coolamon and Ariaiah? No.
 399. Do you wish to point out that the public interest will be better served by a line from Narrandera to Colinroobie than by one from Coolamon to Ariaiah, or do you regard them as two distinct lines, each deserving of consideration on its own merits? I prefer to deal with them as two distinct proposals, not as opposed to each other.
 400. Would you like to make a statement? Yes; but my statement will be very incomplete, because, not expecting to meet the Committee at present, I have not come prepared with sufficient data. Our secretary is not with us, and only half the deputation is here; two remained in Sydney; and I think it would be a matter still requiring future inquiry if we went on with our evidence now.
 401. The Committee will be glad to hear any statement that you would like to make? I can give you, roughly, the figures that have been prepared.
 402. Has any public meeting been held about the construction of a railway from Narrandera to Colinroobie? Yes; two meetings have been held, and a petition has been sent to the Minister for Public Works.
 403. And you have lately interviewed the Minister on the subject? Yes.
 404. Since you interviewed the Minister you and your friend have been appointed to interview this Committee, and to lay before us the views of those you represent? We simply received a telegram from the Mayor of Narrandera asking us to meet you here; but, as I said, we have not come prepared for a lengthy examination. With regard to the traffic, we have an annual output from the stations and selections along the line that we propose of 3,840 bales of wool. Then there is a back loading to the stations, of which I have the figures, but I have not the actual cartage to the selections. I estimate, however, that the cartage to the selections would amount to 1 ton per family. That would give about 313 tons of back loading. The number of fat sheep that it is estimated would be trucked on the line from Borella is about 35,000 tons. The number of farmers settled along the line is 113 within a radius of 12 miles. The area under crop is about 28,250 acres, and with an average yield the number of bags will be about 113,000. We have Crown land within a radius of 35 miles. According to the figures which I got from a surveyor, which he says is very much under the actual acreage, there are 500,000 acres of these lands. The chairman of the league has assured me that the area would amount to 700,000 acres.

MINUTES OF EVIDENCE—RAILWAY FROM COOLAMON TO ARIAH.

405. What area do you get these statistics from? For the wool and wheat statistics I have taken a radius of 12 miles from the proposed line, and for the Crown lands 35 miles. It only includes the land immediately on the right and left of the line, and extending north about 35 miles.

406. Will this land be thrown open within a few years? I think so; the lease expires in a couple of years.

407. Is it all suitable for wheat cultivation? The bulk of it would be available for wheat growing; but there are hills here and there.

408. Would some 5 per cent. of it be available? I should think three-fourths would be fit for wheat growing.

409. What do you pay for the carriage of wool from Colinroobie to Narrandera? About 15s. a ton.

410. And how much a ton for wheat? About 10d. a bag. In addition to the area of Crown lands which will be available in about two years, there are a number of reserves which I have not included, and there are also exchanges which will be made available for settlement. A number of landholders, both farmers and squatters along the line, are prepared to lease their land for wheat cultivation. Some of them are offering it now, and I believe they are getting tenants.

411. Would that be on the share system? Yes, in some cases, and in other cases on rental. There would be little or no expense in the resumption of land along the route of this line, as most of the railway would be run along the main road. There might be a little land to be resumed here and there where the road is narrow; but the landholders along the line would give the land free. The only portion that we are not sure about is for a distance of 4 miles through Midgen. The annual rainfall at Colinroobie is about 22 inches.

412. How many bushels of wheat do you get to the acre? The lowest yield which I have had was about 11 bushels.

413. What is the maximum? Six bags; but that is not the highest that I know of—I have seen eight and nine bags to the acre.

414. Is the country undulating between Narrandera and Colinroobie? Yes, the principal part of the country is undulating; but there are no difficulties in the way of constructing a railway—no engineering difficulties whatever. The proposed line will follow the Hay line for about 4 miles, then branch off in a northerly direction. The only difficulty that I know in the way is a hill just where it would take off from the Hay line; but the Government engineer who inspected the line said that the cutting would be a very light one, and that the expense would not be great, and that on the rest of the line there would be no cutting at all.

415. Has there been a survey made of the route? No.

416. Has the Minister promised that a survey shall be made? No.

Henry Daniel Adams, Narrandera, sworn, and examined:—

417. *Chairman.*] You are from Narrandera? Yes.

418. And you desire to place before the Committee the desirableness of connecting Colinroobie direct with the main line? Yes.

419. You have heard the evidence given by Mr. McKersa? Yes.

420. Do you agree with that absolutely? I do indeed.

421. It is correct in every detail? Yes; I think so.

422. Would you desire to add anything to it? The only thing I could add would be that the line asked for is to be a very light one. I think the people would almost be satisfied with a tramline as a feeder to the main trunk line. I wish also to state that the purchased land could be avoided; but I think it would be better, perhaps, to go through some purchased lands. By following the stock route the whole of the way the line would be made 4 miles longer than is necessary, and the cost of that extra 4 miles would exceed the value of the land that might be wanted to make the line more direct.

Thomas Watson, farmer, Ganmain, sworn, and examined:—

423. *Chairman.*] What statement have you to make? Some time ago we got up a petition to the Minister for Public Works asking for a trial survey to be made from Ganmain to Ariah. On the conditions on which we asked for it we reckoned that such a line would answer all the purposes for which a railway was asked for from Coolamon to Ariah; that it would practically make the line 6 miles shorter, and that there is ample facilities at Ganmain for providing water for railway purposes. The land that the survey would go through, with the exception of one or two small pieces, is all Crown land and forest reserve. We believe that if we had this trial survey the advantage of this line would be clearly seen, and it would be chosen in preference to coming into Coolamon. It would make a difference of 6 miles in the distance, and there are no engineering difficulties on the route.

Barnet Basil Bennett, Wagga Wagga, sworn, and examined:—

424. *Chairman.*] Where do you live? I live at Wagga Wagga, but I have land on this proposed line.

425. Do you wish to make a statement? I wish to speak as to the general features of the country. We have been advocating a railway from Coolamon northward for many years. No doubt a railway from Coolamon northward for 40 or 50 miles would open up an area of as fine agricultural country as there is in New South Wales. I know the whole of the country, and that is my opinion. A railway running from Coolamon by any route northwards would open up a large extent of first-class agricultural land. As regards my own land, within the last two months men from South Australia have offered to work the land for five years on terms, and I am told by them that they have sold their properties in South Australia and are now on their way to settle in this part of the country.

426. Your land lies about 8 miles south-east from Ariah? Yes; and my son has land 8 miles nearer Temora.

427. How far from Temora? About 20 miles. My place is about 30 miles from Temora. As regards our land, we have 700 odd acres cleared this year, and it is already let on terms. I am calling for tenders for 1,000 acres of clearing, and 500 acres of that is let, and I have applications for the other 500 acres. I believe that if I were in a position to get 5,000 acres of land cleared there this year I should let every acre.

A. A.
McKersa.
18 Oct., 1897.

H. D. Adams.
18 Oct., 1897.

T. Watson.
18 Oct., 1897.

B. B. Bennett.
18 Oct., 1897.

John Holloway, grazier, Moombooldool, sworn, and examined:—

- J. Holloway. 428. *Mr. Black.*] What are you? A grazier at Moombooldool; I am the owner of my holding.
 18 Oct., 1897. 429. How much land is there? The whole together comprises some 60,000 acres—43,000 is leasehold and 18,000 is secure.
 430. What area have you under cultivation? Only 70 acres at present. We simply grow what is necessary for the station.
 431. Have you any intention of increasing that area? Yes; I am making arrangements to cultivate 500 acres more—that would be 570 acres altogether. The object is to let the crop accumulate for feeding sheep in case of drought.
 432. If you had facilities for reaching the market, would you not be likely to go in for wheat production? Yes, very extensively. If I could I would put the whole of the secured land under wheat, because it would be more profitable. The land is well suited for wheat growing.
 433. Where would you send the wheat to? To Narrandera.
 434. How far is that? Thirty-five miles.
 435. How far are you from Coolamon by the proposed railway line? About 60 miles.
 436. How far would you be from the terminus of the proposed line? It is 15 miles from Warri to Moombooldool.
 437. If the line were constructed, would you use it in preference to going to Narrandera? Yes.
 438. What do you pay for road carriage to Narrandera? From 20s. to 25s. a ton; 30s. a ton for wool.
 439. If you had a railway station at Warri I suppose you could get your wool carried there for 6s. or 7s. a ton? Yes; we should cart it with our own teams; it would be only a day's journey.
 440. You would get back the same day? No; we should unload the same day.
 441. What would be a fair rate by rail for wool from your nearest point? I can hardly answer the question; I suppose about 10s. a ton.
 442. You would not object to a charge of 10s. a ton by the railway? No; that would suit the station very well.
 443. Where does your wool go to from Narrandera? To Sydney.
 444. How is the land held in your locality? It is leased from the Crown principally. The leases will fall in in the year 1900.
 445. Is the soil similar in quality to the soil in the neighbourhood of Coolamon? Yes, I think so, except in the valley of the Mirool Creek, which is subject to very high floods. It is more of a loam near the creek—very rich land. The country is covered with pine box and oak timber.
 446. Do you know the country towards Temora? Only as far as Broken Dam and Barmedman.
 447. Is that country equal for agricultural purposes to the land between here and Ariah? I do not think it is quite as good. It is more hilly, but I think it is good wheat country.
 448. Do you think that if this railway were made it would cause increased settlement? Undoubtedly.
 449. How would the settlers get their opportunity? By the Government throwing open land for settlement, and by people letting their land.
 450. Is there any quantity of Crown land that will be made available for settlement? There are travelling stock reserves, and a few small water reserves which are under lease. The land there is held under lease.
 451. How will it become available for selection? By the Government offering it for sale as homestead selections and farms.
 452. Do you know if there is any inquiry for land in that locality? I only know by seeing the rush there is at the land offices for land. There is no land available in our neighbourhood, and has not been for years.
 453. Where have the applicants come from? Mostly from Victoria, and many of them are young men growing up. Two men whom I have employed for years have saved money and selected lately. They were fortunate enough to get good farms.
 454. Have you formed any opinion as to whether this line is likely to pay within the near future? I think it would pay within five years. I think by the time the railway is likely to be made the leases will fall in; and by the time the railway is open there will be a very big population if the Government are smart in letting people get the land. That is the only difficulty.
 455. What is a fair freight for the carriage of wool for 30 miles? Ninence a ton per mile.
 456. What would be a fair rate for 15 miles for wool? It would not be very much less. I will say 7d.
 457. What would be a fair rate for the carriage of wheat 30 miles? I think it is 9d. a bag.
 458. What is your opinion as to a fair return per acre for agricultural land? Net profit, £1 an acre.
 459. And how much for pastoral land? About 4s. an acre, and it will be very good pastoral land to give that. You need to keep a sheep to the acre.
 460. A considerable area of land is being taken up on improvement leases in the districts of Ariah, Dowling, and Kilbergoo;—what is your opinion with regard to the future of that settlement—is it likely to be permanent without railway communication? I think not. The reason why I expressed the opinion that this improvement lease occupation is likely to be a failure is because of my own experience at Moombooldool North, where the land was taken up and abandoned, and again taken up and abandoned.
 461. Can you describe the land lying south from the road from Temora towards Wyalong, and then from the line west from Wyalong south to the Hay line? The land from Ariah to Coolamon, in my opinion, is good agricultural land. From Ariah to Temora, although passable, the land is not quite so good, it being broken by a ridge of hills. It is as good as far as Broken Dam. To the north I have been through to Barmedman, and the country from Ariah, in that direction, is good for agriculture. Going in a north-westerly direction the country is good to Bygoo and Buddigower; but west of this country, somewhat west from Bygoo, there is a big belt of mallee country which extended from about Yalgogrin westward to Moombooldool North; then runs north-westerly towards the Peak; then towards Conapaira. Towards the east there is a good belt of agricultural country. Here and there are breaks of hills, and some plains country about Whitton. As you approach Whitton the country becomes plain, and therefore in my statement I should have excluded the land immediately north of Whitton from the agricultural area. Of course there are various places within those boundaries which are hilly; but speaking of the country generally, the description is correct as far as my knowledge goes, which has extended over a great number of

MINUTES OF EVIDENCE—RAILWAY FROM COOLAMON TO ARIAH.

- of years. Further west I will not go, as my knowledge is not sufficient to enable me to give definite information. J. Holloway.
462. If a railway were put through, so that there would be access to the mallee land, would that be useful for cultivation? I do not think it would be for many years, because there is much better land; but eventually it will be. 18 Oct., 1897.
463. You are doubtful about its being used? Yes.
464. Can the mallee scrub be rolled down? Yes.
465. Have you ever heard any comparison made between it and the mallee land in Victoria? No.
466. Is this land as good as the Victorian mallee land? I should think it is better.
467. But still the advantages offered by other land in the vicinity, yet unoccupied, for agricultural settlement, are superior, and you believe that the mallee belt will wait till all the other good land is taken up? Yes, I do.

Walter Hubert Neary, station-master, Coolamon, sworn, and examined:—

468. *Mr. Roberts.*] How long have you been station-master here? A little over seven years. W. H. Neary.
469. Do you keep a return of all the traffic that passes through Coolamon? Yes. 18 Oct., 1897.
470. Have you any statement that you can lay before the Committee showing the traffic between Coolamon and Ariah or Warri? I have not.
471. You have merely the inward and outward traffic from Coolamon station? Yes.
472. For how many years? For the year ending 30th June, 1897, the wool traffic is 2,550 bales or 442 tons 8 cwt.; freight, £1,418 8s. 8d. Wheat traffic, 32,522 bales or 3,671 tons; that gives £1,919 0s. 6d. in freight. Then we have in stock of this year's crop about 7,000 bags.
473. You have not included that? No.
474. *Chairman.*] A full year gives you about 40,000 bags? Yes. I should like to say that last year was a light year. 97,000 bags was the most that we ever loaded in one year, and we did that six years ago.
475. Was the greater portion of it from the north? I think about 75 per cent would be. General goods, such as timber and merchandise, amounted to 1,367 tons outwards, and the freight on that is £752 8s. 10d. Inward goods, 1,554 tons; freight, £4,379 10s. We had 241 trucks of stock; passengers and parcels, £1,158 7s. 5d. Total freight, £8,469 8s. Total tonnage, 7,034.
476. Does the wool come here from Ariah? Yes.
477. Where does the general merchandise come from? From Wagga Wagga, Sydney, and Junee.
478. It is brought to Coolamon and distributed in the country between Coolamon and Ariah? Yes.
479. Does it appear that the traffic to that part of the country is increasing? Certainly it is increasing.
480. The traffic to Coolamon is increasing every year? Yes, except the wheat last year. The traffic in wheat was not so heavy last year, and that was owing to the want of rain.
481. Has the wool traffic kept up? Yes; it keeps up well.
482. Does the general merchandise show any increase or decrease? It shows a slight increase.
483. Is the passenger traffic increasing? That is about the same.
484. And what about the parcels traffic? The whole of that small traffic is about the same.
485. Has the market increased during the last twelve months? No.
486. Does much timber go from Coolamon? A good deal has gone from here.
487. Does that come from the country between Coolamon and Ariah? Yes.
488. Is that traffic on the increase? No; it is about the same.
489. Is there any increase in the live stock traffic? No; there was a decrease last year.
490. To what do you attribute the decrease? I suppose it is owing to the drought.
491. Is there any difference in the rate of carriage for wool, wheat, merchandise, or live stock, on any part of this line from Narrandera, Grong Grong, and Coolamon, to Sydney? No; it is all the same.
492. Can you give the Committee any information on this point, as to which is the largest distributing centre for wool, wheat, and general merchandise to that portion of the country north of the line from Coolamon to Narrandera? I should say Coolamon, certainly.
493. In preference to Grong Grong or Ganmain? Yes.
494. You regard Coolamon as the most central depôt for the distribution of the traffic? Yes.
495. Where did that 60,000 bags come from? From the surrounding district. The difference is that Marrar was included. It has been opened as a siding since. It is 8 miles from here, towards Junee.
496. Is Marrar still keeping up its reputation as a wheat-producing district? I should say it was.
497. Do you know anything of the country between Coolamon and Warri? No.
498. Are you in a position to say whether Coolamon is the most desirable point to reach the South-western railway, in the interests of the people round Warri? I should say that it was.
499. In what way would it be preferable to Grong Grong? Because there is more traffic that comes to Coolamon for and from Ariah.
500. Do you think that a line from Coolamon would suit more people than a line from Grong Grong? Yes.

Jamieson Ashwood, storckeeper, Coolamon, sworn, and examined:—

501. *Mr. Black.*] Do you get your goods from Sydney? Yes. J. Ashwood.
502. All of them? Yes. 18 Oct., 1897.
503. Do you trade with Sydney? Yes. My machinery comes from Melbourne and Adelaide, but everything else from Sydney.
504. Do you think that the prospects of this district entitle it to a railway? Yes.
505. On what data is your belief founded? The number of people who would be served by the railway, and the amount of land likely to be thrown open for settlement between here and Warri.
506. Do you think this will turn out to be an agricultural district? Yes.
507. How long have you been here? About sixteen years.
508. Have you been in the store business all the time? No; I have been nine years in the store.
509. Have you seen advance in the productions of the district, and increase of settlement? Yes.
510. Since when? Mainly the last six years.
511. Do you know the country between Ariah and Temora? No.

- J. Ashwood. 512. *Chairman.*] You believe that the district is good enough? I have got in between 18,000 and 20,000 bags of wheat, and there are others buying besides me. Most of our business is done out this way.
 18 Oct., 1897. 513. Do they in the north cultivate more land than in the south? Yes; and all on the north depend on Coolamon for their supplies.
 514. Was the station-master right in estimating that 75 per cent. of the wheat came from the north? I think he was.

John Barnes, commission agent, Coolamon, sworn, and examined:—

- J. Barnes. 515. *Chairman.*] How long have you been resident in this district? Between here and Ariaah, about thirty-eight years.
 18 Oct., 1897. 516. You have a full knowledge of the district? I have.
 517. How far does your knowledge extend? It extends from here to the Lachlan.
 518. You know the country right from the Murrumbidgee to the Lachlan? I do.
 519. Do you know the country to Gunbar? I have been there a few times.
 520. Have you been to Hillston and Cudgellico? Yes.
 521. Have you been to Forbes? Yes.
 522. Have you been through Wyalong and Barmedman? Yes; and to Temora.
 523. What proportion of the country you have described sends its traffic to Temora? The traffic from Buddigower goes to Temora, and Buddigower lies north-east-north from Kildarey. The wool from Mandamah sometimes comes to Coolamon, sometimes goes to Temora; the wool from Mimosa west comes to Coolamon, and the traffic south from Mimosa comes to Coolamon. With regard to the district under consideration, generally speaking the road carriage determines the place or railway station to which the wool is sent, but there is a tendency to give a preference to Coolamon because of its superior advantages in regard to grass and water. As we pass west from Ariaah the wool makes straight down to Narrandera, carrying out the statements I have already made that the road carriage to the nearest railway station dominates the question.
 524. Does the same thing apply to wheat? Yes; and also to the distribution of goods.
 525. You mentioned that wheat has to come to Coolamon in preference to other stations equi-distant in consequence of the better travelling routes? Yes.
 526. Does that apply to the travelling stock? Yes; in that country.
 527. In the area that you have described, the country is good to within 4 miles of Temora, where you get on to the main range? Yes.
 528. Going north from Coolamon to Ariaah, what is the country like? It is all good agricultural country.
 529. Coming due south from Mandamah, what is it like? All good agricultural country.
 530. And from Ariaah into Grong Grong, what is that like? It is all good.
 531. Is it similar into Ganmain? Yes.
 532. From Moombooldool what is it like? Some of it is a bit rough.
 533. Where is it rough? Coming from Moombooldool south from Narrandera the distance is about 33 miles, and of that I estimate that about 8 miles is rough country, the rest being good agricultural land.
 534. Going north-east from Mandamah into Barmedman, what is the country like? Some of it is very good and some of it is a bit rough.
 535. What proportion of it is rough? In places you come to belts of mallee and ironbark country.
 536. Can you tell us the proportion of good agricultural land? I could not.
 537. Is it one-half, travelling from Mandamah to Barmedman? I should say that two-thirds of the distance would be all good country.
 538. Going due north from Barmedman towards Wyalong, what kind of country is there? Similar country—two-thirds of it good.
 539. Is there a possibility of wheat growing to any great extent north-east from Mandamah towards Barmedman, and north from Mandamah towards Wyalong? Yes.
 540. Going north from Ariaah you come to Yalgogrin, what kind of country is it there? Some is very good country; in some places it is ironbark. Going north you pass through some belts of mallee country; but it is principally agricultural country.
 541. Between a line running north from Ariaah towards Yalgogrin, what kind of country is it? It is all fairly good country till you reach the dense mallee scrub. The mallee belt as shown on the map before me appears to be fairly correct, except that I think it might be extended somewhat west towards Simm's Gap.
 542. South from the mallee belt, how far does the good agricultural land run? Between the hills and the mallee belt there is good country. Generally speaking, the land south of the mallee belt is good grazing and agricultural land.
 543. Is a large proportion good for agriculture or for pastoral purposes? It is about half and half.
 544. Is there a possibility of good settlement there? There is.
 545. How far do you go towards the north before you get out of the plains? I could not say exactly how far; I know it is very good country. North of Whitton there is an extensive plain; but in my opinion it is only suitable at present for pastoral purposes.
 546. Is the land north of Warri good? From Warri to Taylor's Hill is good, but at Taylor's Hill it becomes broken, and that broken country extends about 4 miles to the west, then opens out into level country suitable for agriculture.
 547. How far does that go then? It then runs 25 miles west good agricultural country—in fact, the country is good until you strike the rough country upon the Conapaira Range; then there is a distance of broken country which extends until you get on to the agricultural land which extends to Gunbar. With regard to the land at Gunbar, I am not prepared to say that I regard it as first-class for agricultural purposes. The land about Ariaah, and from there towards Temora, also to the south, and some distance to the west, in my opinion, is more suitable for agricultural purposes than the land about Gunbar.
 548. What is the mallee scrub land like? There is scrub mallee and bull mallee.
 549. Have you had any experience of clearing mallee? No; I understand that they roll down the scrub mallee, but not the bull mallee.
 550. Is this mallee land the same kind of land that they farm in the Wimmera district in Victoria? I think this is a stronger mallee.
 551.

J. Barnes.

18 Oct., 1897.

551. Will it be worth clearing? Not at present.

552. Then we must regard it as country that is not likely to be seriously affected by railway communication? That is my opinion. With regard to the suitability of cultivation of the mallee belt I cannot express a definite opinion, as I have had no personal experience of the mallee country in Victoria where such work is carried on; but I have formed the opinion from what I have heard from men of experience, that the mallee in this country is not likely to be so readily dealt with as the land which is regarded as similar in Victoria. Were it cleared it appears to me that the soil is somewhat light for cultivation. I think, therefore, that it should be excluded for the time being from the land that may be presumed to be benefited by railway communication.

553. Have you seen any great alteration in the mode of occupation of the land near Ariah? I have.

554. Is the farming there general? Yes.

555. Is it steadily increasing? It is.

556. If the Crown determines to throw open for agricultural settlement other leasehold areas, will there be any difficulty in getting farmers to take it up? Not at all. They would take it up at once as homestead selections at the ordinary price; in fact, I think there will be a big rush for it.

Frederick Hall, storekeeper, Coolamon, sworn, and examined:—

557. *Mr. Roberts.*] How many years have you resided in Coolamon? A little over four years.

F. Hall.

558. Have you any knowledge of the district between Coolamon and Ariah? Yes; I have been once to Ariah.

18 Oct., 1897.

559. Can you tell the Committee anything as to the volume of traffic between Coolamon and Ariah? Yes, the volume of traffic is very considerable. A large part of my business is done with settlers in that district.

560. With what place do you do the most business? With the north, decidedly.

561. Where are your customers most numerous on the line between Coolamon and Ariah? They begin from the very start along both the Berryjerry Road and this main stock route, and all the country between.

562. What does it cost you to deliver goods at Warri? They send their own drays in; I do not pay for delivery. A very considerable quantity of wool and wheat comes from that district.

563. They bring wheat and wool, and take stores from you back again? Yes.

564. Would you regard Coolamon as the best site for a connecting point for the district round Ariah? I should.

565. Would you prefer Coolamon to Grong Grong or any other station between here and Narrandera? I have not gone over the line between Grong Grong and Ariah, but I fancy that the largest population is between Coolamon and Ariah rather than between Ariah and Grong Grong.

566. Do you prefer Coolamon to Ganmain as a distributing depôt? I should, decidedly. None of the settlers on that line go to Ganmain.

567. Do the settlers to the north of Coolamon get their merchandise from Coolamon? Yes; some get their merchandise from Wagga Wagga, but it is sent *via* Coolamon.

568. Where do you do business with? Sydney.

569. Do you supply the settlers with machinery? Yes; I sell great quantities of machinery. This year we are selling an extra quantity.

570. Do you get any from Victoria and South Australia? Yes, and a good deal from Sydney.

571. Can you explain to the Committee why it is necessary to get certain agricultural machinery from Victoria and South Australia;—is it not obtainable in Sydney? Not the same patents; but a great deal of machinery that comes from South Australia and Victoria comes by sea to Sydney and is then carried overland by railway; so the railway gets the benefit of it.

572. How do you account for the fact that this particular machinery is not obtainable in Sydney? I think because New South Wales has been until of late years behindhand in growing wheat. South Australia and Victoria have had the start, and the manufacture of these things was commenced there.

573. Have you made inquiries in Sydney as to whether such machinery as you describe is obtainable there? As a matter of fact, we get machinery from Victoria and South Australia through Sydney agents. We practically get it from Sydney, although it is manufactured in Victoria and South Australia.

574. As a business man, can you confidently recommend the construction of this line as being advantageous to the best interest of the country? I know that there is a very large amount of agricultural land that would be opened up, and from what I hear the line could be constructed at a small expense. There will be very few engineering difficulties.

575. Do you think that that would conduce to a marked increase of settlement? I think that most decidedly it would do that.

576. Are there men waiting to obtain land should it be thrown open? There is no doubt whatever about that. The great difficulty in the district has been that the land has not been thrown open sufficiently quickly. Hundreds of people are applying for land, and cannot get it.

577. Do you know that as a matter of fact? Yes; a gentleman the other day was telling me that he has been in the district for some years renting land, and he is most anxious to get land of his own, but is unable to do so.

578. The settlement at present is rather small, is it not? It is, in some parts of the district.

579. What point between here and Ariah would you regard as the most populous part of the district? I suppose about Methul.

580. How far is that from Coolamon? About 20 miles.

580½. Is there a fairly numerous settlement around Warri? Yes; there is a good deal of cultivation there.

TUESDAY, 19 OCTOBER, 1897.

[The Sectional Committee met at Mr. Boyd's residence, Uley, Warri, at 3 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Coolamon to Ariah.

John O'Shaughnessy, farmer, Moombooldool, sworn, and examined:—

J.
O'Shaughnessy.
19 Oct., 1897.

581. *Chairman.*] What area have you? 4,300 acres.
582. What do you grow? Wheat and wool.
583. Where do you take your wheat to? To Narrandera at present.
584. Do you go straight into Narrandera by road? Yes.
585. How far is it? 34 miles.
586. Is that your nearest point to a railway? Narrandera and Grong Grong are the same distance.
587. What do you pay for the carriage of your wheat? 16s. a ton.
588. What do you pay for the carriage of the wool? The lowest rate that I have paid has been £1 a ton, and the highest 32s. 6d.
589. Then the average would be about 27s. Yes; last year I paid 25s.
590. How far are you from Ariah? 14 miles.
591. Is the land suitable for the growth of wheat? Yes.
592. Twenty-five miles west of your place is the land suitable for agriculture? Yes.
593. Can you go further and still be on good country? Yes; it is as good 20 miles away as it is at my place.
594. Is it good land north of your place? We get into the mallee country there about 25 miles away.
595. What is the quality of the land to the north-west? For a distance of 50 miles it is as good as the land in this district for wheat growing.
596. What is it like going south towards Narrandera? It is all good land there.
597. You would like to see a line of railway into Ariah because it would save you about 16 miles of carriage? Yes, more than that. I could carry the wheat myself if it was a shorter distance. When you have long distances to go you have to send your wheat away as soon as you get it stripped, or else you cannot get it away at all.
598. How many acres do you cultivate? From 450 to 800 acres.
599. What is a fair crop? The highest was eight bags to the acre, and the lowest six bushels. My average for eleven years was 18 bushels.
600. Would you increase the area under cultivation if the distance of carriage was less? I would indeed.
601. What is the net return from pastoral land? If you run a sheep to the acre the profit from a sheep is about 3s.
602. What is a fair return from an acre of agricultural land? If you farm it properly, you should get four bags to the acre.
603. What would your net return be? It is according to the price. My highest price for wheat has been 6s. 3d., and the lowest 2s. 6d. In 1888 I got 6s. 3d.
604. Do you think the return of 15s. an acre from wheat is a reasonable estimate? No; I think it is too low.
605. Do you know anything about the cultivation of the mallee country? Yes, I know the mallee country.
606. Do you know the Victorian mallee? I do.
607. Is there any difference between the mallee here and the Victorian mallee? I cannot see that there is.
608. Is the soil here as good as the soil in the mallee country of Victoria? Yes, it is. Mr. Keogh has a patch of mallee country here and some other good land, and he told me that he gets the best crops off the mallee land. I believe it is similar to the Victorian mallee. The soil is as good as that in Victoria, but as to the practical results from it, I can say nothing. The Land Board has put 1s. 6d. an acre on an annual lease of 1,000 acres adjoining me. And I can show you 150,000 acres of land quite as good as that.
609. What could you buy land here at? There is none selling.
610. What do the Government think the unimproved value? They put £2 an acre on special areas round this place; but they have reduced it to 30s.
611. Therefore, in the opinion of the Government the land is worth 30s. an acre? Yes.
612. If the Government offered it at 30s. an acre would it be taken? It would if they gave a certain quantity. If they gave a fair quantity, every acre of that 150,000 acres would be selected.
613. In your opinion would the value of the Crown lands be materially increased by the construction of the proposed railway? It would.
614. What would it be worth if a railway were made? It would be worth from 15s. to £1 an acre more than it is now. The difference between land 30 miles from a railway and land contiguous to a railway ought to be fully £1.
615. If a railway were made, do you think that if you could get any Crown land it would be worth that? Yes.
616. Could men be found to take it up? Certainly.
617. What rent could be obtained for Crown land close to a railway? It would all depend upon what area they would give, and whether it was improved or not.
618. What would the rent be of ordinary improved land? From 1s. to 1s. 6d.
619. You have no doubt you could get 1s. 6d. an acre? Yes; and plenty would take it at that.
620. *Mr. Black.*] You said that the cost of the carriage of wool to Narrandera was from 20s. to 32s. 6d. a ton, whilst the rate for wheat was 16s. a ton? Yes; they carry wheat cheaper than they carry wool.

621.

621. I want to know why you gave a fixed rate in the one case, and not in the other? The carriers have a union, and they fix the charge. I should have to pay 16s. a ton this season for wheat, and I am paying 32s. 6d. for wool. J. O'Shaughnessy.
19 Oct., 1897.
622. *Mr. Roberts.*] Where do you get your goods from? From Sydney; sometimes Narrandera.
623. You have to pay carriage from Narrandera to your place? Yes.

Sydney William Wellman, Manager, Ariah station, sworn, and examined:—

624. *Mr. Black.*] What is the size of Ariah station? About 42,000 acres. S. W. Wellman.
19 Oct., 1897.
625. Is it all freehold? No, there are only about 2,760 acres of it freehold.
626. Is it all used for pastoral purposes? Yes, with the exception of about 200 acres of land that are cleared for cultivation. There are 2,760 acres of freehold, 11,496 conditional purchase, with the freehold, and the balance is leasehold area.
627. Is the soil suitable for agriculture? Most of it is.
628. Is two-thirds of it suitable for cultivation? I should say that there is not more than 2,000 acres out of the whole lot that would not be suitable for cultivation.
629. Nine out of every 10 acres is suitable for wheat-growing? Yes.
630. Do you find that growing wheat pays you? We have done very little of it at present, but I certainly think it would.
631. Is there any reason why you do not grow more wheat? We have not the power. The Bank does not care to go into it at present. But we are going to let the land on the halves system.
632. Is there a demand for land on the halves system? Yes.
633. How many applications have you had? We have had none, because we have never brought it before the public.
634. Have you had any inquiries? No; but several of my neighbours would take land.
635. You have reason to believe that some of your neighbours would be glad to take land from you on the halves system? Yes.
636. Where do you send your wool and wheat to? To Coolamon, which is about 42 miles distant.
637. What do you pay for road carriage? 30s. a ton.
638. Where do you get your station supplies from? From Coolamon chiefly at present.
639. What rates for carriage do you pay? For back-loading at shearing time £1 a ton.
640. What do you pay if it is not back-loading? About 25s. a ton.
641. Are you well acquainted with the character of the country in your vicinity? Yes; it is forest land really—the same class of country all through; some of it a little more loamy than the land here, and some having more clay in it.
642. Is it heavily timbered? Some of it is.
643. Is it pine country? Pine, bull-oak, and box.
644. Do you know the country between Ariah and Temora? Yes.
645. How does that compare with the country between Ariah and Coolamon? It is very similar until you get within about 6 miles of Temora; then there is a range of ironbark country.
646. How far is Ariah from Temora? About 40 miles.
647. Then you are equi-distant from Temora and Coolamon? Nearly.
648. But you send your produce to Coolamon? Yes.
649. What is the reason of that? It is because most of our business is done there. We have been connected with Wagga Wagga more than with any other town.
650. In what direction do you think a railway line should be constructed to tap this district? A line would be suitable from either Temora or Coolamon.
651. Which would serve the district best? That would depend upon where the terminus of the line would be.
652. Provided that a terminus were placed in the most suitable position? I think a line from Coolamon would be the best.
653. Which line would pay the best? It would be hard to say. At present there are more people on the route from Coolamon to Warri than on the other. The other line is not so closely settled.
654. Then a line from Coolamon to Ariah would serve more people than a line from Temora to Ariah. I think so.
655. Then, if in either case the line went no further than Ariah, a railway from Coolamon would be preferable? Yes.
656. What do you think would be a fair rate to charge for the carriage of wheat by a railway from Ariah to Coolamon? I could hardly say; I have had very little experience with wheat. I know it has cost the growers 1s. 6d. a bag to get it carried by road.
657. That would be 13s. 6d. a ton? Yes.
658. Could they afford to pay 7s. 6d. a ton or 1s. a bag? I should think so.
659. What would be a fair railway charge between Ariah and Coolamon for wool? I think about 15s. a ton.
660. Would you be prepared to pay that rate? I could not say, because I am not in a position to do it.
661. Would you recommend it? I certainly should.
662. *Mr. Roberts.*] How far north from Warri is the property you represent? About 5 miles.
663. If a railway were constructed from Coolamon to Warri, would you regard that as fairly meeting the requirements of the district for the present? Yes.
664. Were you present at the meeting on the 25th September of the present year, when a resolution was passed by some twenty-four gentlemen, representing a large area of country, offering to guarantee any deficiency in the revenue if the railway were made? I was not; but I had notice of it.
665. Are you able to tell the Committee whether the owners of the various stations would fall in with that resolution? No; I handed a letter to the secretary of the league, from the Bank of New South Wales, to say that they would not pledge themselves.
666. Is the rate of carriage from Ariah to Temora about equal to what it is from Coolamon to Ariah? No; I can get wool carried at £1 a ton.
667. But you have had to pay 30s.? We had, up to the last year or two; but now I can get wool carried from Ariah to Temora for £1 a ton.
- 668.

- S. W. Wellman.
19 Oct., 1897.
668. What would you have to pay to get it carried to Coolamon? £1 7s. 6d.
669. So there is really a difference of 7s. 6d. a ton? Yes.
670. Would more people be served by a railway from Coolamon to Warri than by a railway from Ariaiah to Temora? Certainly.
671. You have been over the country from Ariaiah to Temora? Yes; I know the country well. I have lived here for about eighteen years.
672. Have you travelled over the country from Grong Grong to Warri? Yes.
673. Which route do you think ought to be chosen for a railway—the one from Grong Grong to Warri, the one from Coolamon to Warri, or the one from Temora to Warri? I certainly should think the one from Coolamon to Warri would be the best.
674. Is there more land for cultivation on that route than on either of the other two? I think so.
675. With regard to the future, would there be a larger area of land thrown open on that route than on the others? I could not tell you exactly.
676. *Chairman.*] If a railway were constructed to Ariaiah from any direction, would it be possible to substitute agricultural for pastoral occupation on your conditional purchase and freehold land? Yes.
677. What is the rent that the Crown charges for the land about here? The rent of ours is 2½d.
678. Would a pastoral rate of from 2d. to 5d. throughout the district be fairly correct? Most decidedly it would.
679. Threepence-halfpenny may be regarded as a fair average? Yes; I think that is right.

James Fyfe, farmer, Mount Chrystal, sworn, and examined:—

- J. Fyfe.
19 Oct., 1897.
680. *Chairman.*] What are you? A farmer; I have been a sawmill proprietor.
681. *Mr. Roberts.*] Where do you reside? At Mount Chrystal, on the Narrandera and Moombooldool road, about 14 miles south-west from here.
682. Do you carry on farming and grazing? Yes.
683. How many acres have you? 2,200.
684. How much is under cultivation? At present we have 400 acres under wheat.
685. Where do you send your wheat at present? To Narrandera.
686. What rate of carriage do you pay? We have been paying 10s. for wheat.
687. How much for wool? I cart my own wool.
688. Do you fetch any goods from Narrandera? Yes; I generally bring the goods with my own team.
689. Is 10s. a ton a fair rate in all seasons? Not in winter. It is a fair rate in the wheat season.
690. Do you send any timber to Narrandera? I have sent thousands of tons, but I am out of the trade at present.
691. How many years have you been out of the trade? Two years.
692. What did you pay for the carriage of timber? I have paid from 12s. to 17s. a ton. There is a mill working my property now, and they are paying 12s. 6d. Before that we were paying 13s. a ton.
693. Would 12s. 6d. be a fair rate at present? I should say that it would.
694. What description of timber is it that you send away? It is all pine.
695. If a railway were constructed to Warri, would it be to your interest to use the railway? Not a railway from Coolamon.
696. Where should the line come from to suit you? From Grong Grong.
697. For what reason do you prefer Grong Grong? Because it would bring me within 8 miles of the railway.
698. Would a larger number of settlers be served by a railway from Grong Grong to Warri, than by a railway from Coolamon to Warri? I could not say; but I can say that the Colinroobie settlers would be served by a Grong Grong line.
699. How near would Colinroobie be to a line from Grong Grong? About 14 miles.
700. How far are they from Narrandera? From 25 to 30 miles.
701. What would you have to pay to carry your wheat 8 miles to get on to a railway from Grong Grong? I should think about 4s. a ton.
702. At what mile peg from Grong Grong would you put your produce on the line? I think about 22 miles.
703. Does it appear to you that there would be much saving if you had to pay 4s. a ton to bring the wheat to the railway? I should think there would be a great saving.
704. It would be principally wheat that would be brought to the railway? Wheat and timber. There is a mill working on my property delivering 1,500 or 2,000 tons a year regularly at Grong Grong. All that timber would be delivered on that line at the nearest point. We have been delivering 1,500 tons of pine during the winter.
705. What would it cost you to take it direct to Narrandera? It has been carted for 12s. 6d. a ton in favourable seasons, and as high as 17s. 6d. in winter.
706. Are you satisfied that the distances you have given are correct? After consideration, I think the distance that I gave with regard to the Grong Grong line cannot be correct. My friend, Mr. Holloway, says that I am in error in saying that the distance is 20 miles. To Grong Grong it would be only 12 miles.
707. Is there much pine in the neighbourhood where you live? A good deal.
708. Is there a good demand for pine all through the year? Yes.
709. Is there any special period of the year for cutting it? No.
710. Where does it all go to? It goes to Cootamundra, Albury, and Victoria.
711. Does any go to Sydney? Some has gone to Sydney, and some to Port Darwin.
712. It is what one may term anti-white ant? Yes; the white ants cannot live in it.
713. And there is always a good market for it? Yes; but being so far from the railway has crippled the industry, owing to the high rate of carriage and the bad roads.
714. How long have you resided on your present holding? I have been twenty-five years in the district, but I have been living eight years where I am now.
715. Why have you given up the timber business? Because the cost of carriage and the bad roads are against the trade.

MINUTES OF EVIDENCE—RAILWAY FROM COOLAMON TO ARIAH.

716. Did it not prove remunerative? Not at the last. After the Carrier's Union started I could not carry on.
717. *Chairman.*] You are paying about 2s. 3d. per 100 feet? Yes, about that.
718. *Mr. Roberts.*] What do you get for 100 feet of timber? I get 8s. at the mill; with carriage paid, that would be 10s. 6d.
719. Would that be rough or dressed timber? Rough timber. It would be 12s. for dressed timber.
720. What did it cost you to cut the timber down in the forest and put it on the dray? I could not say exactly.
721. Do you know what net profit you made out of every 100 feet of dressed timber that you sent away at 12s. 6d.? I should think about 3s.

J. Fyfe.
19 Oct., 1897.

Michael Mickelson, saw-mill proprietor, Mount Chrystal, sworn, and examined:—

722. *Chairman.*] Would a line from Grong Grong suit you? Yes.
723. Are you at present engaged in sawmilling? Yes.
724. What do you get per 100 feet dressed timber? Thirteen shillings, delivered at Grong Grong.
725. Suppose you could deliver twice as much timber, could you sell it? Yes; the demand is growing.
726. In your opinion, will a great amount of timber be taken from this country? Yes.
727. Is there a large pine forest adjacent to you? Yes.
728. There is work for how long ahead? We can see a couple or three years ahead without shifting.
729. What area will you work without making a shift? We draw logs 3 or 3½ miles.
730. A square of 6 miles would cover your operations? Yes.
731. What is the size of the pine forest? I could not say; but I know it would be very large.
732. You have heard the statement made by Mr. Fyfe? Yes.
733. You heard the rate of carriage that he gave? Yes; it was perfectly correct.
734. And you desire to corroborate his statement, that a line from Coolamon to Ariah would be of no value to the people in the timber trade at Mount Chrystal, and that the railway should go from Grong Grong? Yes.

M. Mickelson.
19 Oct., 1897.

Alfred George Humby, near Warri, sworn, and examined:—

735. *Mr. Black.*] Where do you live? About 8 miles in a north-westerly direction from Warri, just on the edge of the mallee.
736. How long have you been settled there? I have been on that particular land for six years. It is my own farm.
737. Where do you find a market for your timber? I send it all over the country by rail. It goes to Albury, and into Victoria, and large quantities go up to Corowa.
738. Which railway station do you truck at? Grong Grong.
739. How far are you from Grong Grong? Forty miles.
740. How do you convey your timber to the railway? By team.
741. What do you pay for carriage? Last month I paid 25s. a ton, or at the rate of 7½d. per mile. From the 1st October it will be 6d. There is a summer rate and a winter rate.
742. How much is that per 100 feet? It costs about 4s. per 100 feet.
743. You find it difficult to compete with others who are on a railway? Yes. When we were within 3 or 4 miles of a railway, our last year's trucking amounted to 2,000 tons. Now I cannot truck 500 tons. I have a statement here which I will read:—

As a proof of loss in freights through distance from railway, I take my own mill business as one instance. The first three months of 1890, I find that 201,500 feet, = 403 tons, were trucked at Devlin's siding, and this is not the busiest quarter. The corresponding quarter for 1897 I am only able to truck 25,155 feet, = 51 tons, being a decrease of 352 tons in this quarter. I could at once more than make up the deficiency if within reach of the railway. Other mills have closed up entirely, viz., Fyfe, Hardy & Co. My average for the year 1890 was 1,000,000 feet, = 2,000 tons. My estimate is, that with my decrease and the two mills before mentioned—Fyfe, Hardy & Co. average about the same—the decrease must have been 5,500 tons per annum. Should the question arise, "Do the Commissioners in reality lose these freights?" I answer "Yes, to a very large extent."

Should the same amount in measurement be carried from Sydney in imported timbers over these lines, on account of their lightness, double the quantity has to be carried for the same return as compared with our local timber. The timber carried from these parts means a direct gain to the Commissioners, on account of it being a permanent return freight, whilst timber carried from Sydney means, in most cases, empty return trucks.

Whilst discussing the advisability of constructing the proposed railway to Warri, a statement was made that whether the line be constructed or not the Commissioners will lose nothing in freights, as the produce of this district will be carted into Narrandera or Grong Grong railway station. This I most respectfully and emphatically beg to contradict by my before-mentioned figures, and by stating that, in addition to losing the freights that would be conveyed on this proposed line, on account of the timber having been all cut within carting distance of the present line to Junee, unless the proposed railway to Warri be constructed, the railway will lose by far the greater part of the timber traffic over the Junee to Narrandera line, the districts of Bolero, &c., and in reach of Warri, and right away to Hillston, being well known as the premier districts for timbers.

In these difficult times of dealing with the unemployed labour question, it seems a monstrous shame that hundreds of thousands of pounds should be sent out of this Colony annually for this one product alone, viz., timber, whilst a large amount might be retained and spent in wages, freights, &c., by our Government assisting to develop our own resources by constructing light lines, such as the proposed one to Warri, which district would prove itself one of vast resource for timber, in addition to an unlimited production of wheat.

Referring to my previous statement that I could greatly increase my quantities, shipping on the railways, and the probable returns for the first and succeeding years, I am prepared to prove that a large demand would be created in Sydney alone for these timbers if I could place them on the rails at a price to compete with imported timber; and such could be done if the heavy road cartage could be reduced before our produce reaches the railways.

744. I understand that you are now cutting one quarter of the timber you used to cut? Yes.
745. You cut all the timber near the railway, and the railway has not followed you? That is it.
746. You do not think there is a decreased demand for the timber? Decidedly not. I could truck a large quantity of timber direct to Sydney now. I could have an order for 200,000 feet of timber, and I am afraid to undertake it on account of the difficulty of carriage.

747.

- A. G. Humby. 747. Suppose you had a block extending from a common centre, say 3 miles in each direction, how quickly would you cut it out? In two or three years.
- 19 Oct., 1897. 748. Employing how many men? About twenty men.
749. Would those men be employed at the mill? They would be the men employed at the mill, and drawing logs. If you include the men felling the trees, there would be thirty hands employed.
750. What area of pine do you think is now available in this district for your purposes? There is a large quantity of timber at Warri, and large timber reserves at Bygoo, and Bolero station.
751. Will you locate on the map the pine country adjacent to Ariah? Commencing at Bygoo, on the map, and coming south towards Ariah, we pass over large quantities of land which carries a great quantity of good pine timber. Then, turning west to Moonbooldool, you have a considerable area also carrying large quantities of pine; also at Bolero and on the Warri run there is also a deal of pine. I think that the pine covers an area of about 20 miles square.
752. Do you know the site of the proposed railway station at Warri? I do.
753. How far is that from your mill? About 8 miles.
754. What would it cost per ton to carry timber there? For 8 miles, it would be about 4s. per ton.
755. What could you afford to pay by railway to Coolamon? I should be very well satisfied if I could land it at Grong Grong for 10s. per ton.
756. You will have a saving of 15s.? Yes.
757. Could you not afford to pay more? We have been obliged to give it up because it does not pay. I came up here and threw away £1,500 in twelve months, trying to compete in spite of the distance.
758. Would you be willing to pay 6s. per ton by rail to Grong Grong or Coolamon? Yes.
759. If you had railway communication, what quantity of timber would you be able to turn out? I would undertake to put 2,000 tons on the trucks in the first year.
760. Do you know anything about the mallee country? I do.
761. Is the soil there good? It is.
762. Do you know the mallee country in Victoria? I have seen photographs of it.
763. How does it compare with the mallee country here? I cannot see much difference in it.
764. Is there any difference in the strength and thickness of the scrub? The scrub here is lighter, and therefore more easily dealt with.
765. Could it be dealt with by the Victorian method of rolling it? Yes.
766. Is the Victorian mallee country well suited for wheat growing? Yes. Some Victorian mallee farmers applied to me six months ago for some of that land.
767. *Chairman.*] Have you grown any crops on the mallee ground? Yes.
768. Is it satisfactory? Yes.
769. What does it cost you per acre to put wheat into the mallee land? I think it can be cleared for 2s. 6d. per acre.
770. Then the other expenses would be the same as those on other land? Yes.
771. What does it cost to put forest land into the same state? I believe that it can be put in cheaper in the mallee land.
772. Would the return be as good? I think if properly farmed it would be pretty well equal.
773. You believe that if a railway came close to the mallee country the mallee land would be taken up? I do. I have as good a crop as you could wish to see growing in mallee country, and although the weather is dry it is looking as healthy and green as anything you could find. The land seems to hold moisture.
774. Do you believe that settlement on the mallee land north-west from here will be as profitable to the farmer as on the other country? Yes.
775. You do not regard it as waste land? No, I do not. If the land is let at a cheaper rate the farmers will do quite as well on it as those who are paying more for other lands which are supposed to be better.

John Kelson McKeown, farmer, near Warri, sworn, and examined:—

- J. K. 776. *Chairman.*] You are a farmer? I have started at it lately.
- McKeown. 777. *Mr. Roberts.*] Where do you live? Six miles north-west of Warri.
- 19 Oct., 1897. 778. What is the area of your holding? A little over 5,000 acres.
779. What do you devote your attention to? Grazing and wheat-growing.
780. Has your farming been successful? Yes, very good.
781. How many acres do you cultivate? I think about 200 acres.
782. How many sheep do you run? From 3,000 to 5,000.
783. Would the land run a sheep to the acre? No. It would but for rabbits and green timber.
784. Is there any mallee land on your holding? No.
785. Do you know anything at all about the mallee country? I have seen it, and some of my neighbours have cultivated a little of it.
786. Successfully? Yes.
787. How far are you from the mallee belt? About 3 miles.
788. Is there any large area of mallee country under crop? I do not think so.
789. You said your neighbours were cultivating it? Yes, on a small scale.
790. How many bushels of wheat do you get to the acre? A great deal depends upon the seasons. On an average, 15 or 18 bushels.
791. Where do you send it to? To Narrandera.
792. How many miles is your property from Narrandera station? I think about 40 miles.
793. What is the rate of carriage? It varies. It has gone as high as £1 per ton for wheat and down to 15s. It averages about 17s. 6d.
794. Do you send wool to Narrandera? Yes.
795. And is the rate of carriage the same for wool? I have paid 1s. a ton per mile; but latterly I have got it carted for less.
796. Have you got it carted for 6d. per ton per mile? I have had it carted for about 9d. a ton.
797. You pay from 17s. 6d. to £1 per ton for wheat and 25s. for wool? Yes.
798. How many miles are you from Warri? I think about 6 miles.
799. If a railway were constructed from Coolamon to Warri would you bring your wool and wheat down to Warri? Certainly. 800.

MINUTES OF EVIDENCE—RAILWAY FROM COOLAMON TO ARIAH.

800. What do you consider would be a fair rate of carriage on the railway for wool and wheat to Coolamon? I do not know.

J. K.
M'Keown.

801. What would it cost to bring it from your homestead down to Warri? I should think 3s. or 4s. per ton.

19 Oct., 1897.

802. You have always employed teamsters to carry your wool? Yes.

803. Would you regard 10s. per ton for wool as a fair price by rail from Warri to Coolamon? Yes. I think it would be a pretty stiff price; but it is less than I pay now.

804. If it costs you 4s. to bring it to Warri, then 10s. to go by rail to Coolamon, that would be 14s. as against 25s., the amount you are paying now? Yes.

805. Have you any choice of routes from Warri to the South-western line? No.

806. It would suit you equally well, whether your produce went to Grong Grong or Coolamon? Yes; but the distance is less to Grong Grong than from Coolamon to Warri.

807. But there would be 26 miles of extra haulage would there not, on the South-western line, if your wool went to Sydney *via* Grong Grong? There would be.

808. What is the difference from Grong Grong to Warri, and from Coolamon to Warri? I think there is a difference of about 2 miles between the two routes.

809. You think that the Grong Grong route would be 8 miles shorter; but against that there would be the extra haulage of 26 miles from Grong Grong to Coolamon? Yes.

810. Will you tell the Committee which route would serve the largest number of settlers? I think the line from Warri to Coolamon would at present. A great many people would come here if there was a line. I could let my land to any number of people if there were a railway here.

811. The want of railway communication is retarding the development of this part of the country? Yes, very much.

812. Do you know anything of the country towards Temora? Not any further than Ariah.

813. If a line were constructed from Warri to Temora, or from Ariah to Temora, how would that suit you? If it came to Warri it would suit me equally well.

814. Or even to Ariah? No; it would be too far away.

815. *Chairman.*] If there was a railway station at Warri, what, in your opinion, would be a fair rent per acre for your land? There are many farmers willing to give a bag per acre.

816. That is 4 bushels per acre? Yes.

817. Therefore, if wheat is 2s. per bushel, that is 8s. per acre? Yes.

818. Could you get 3s. per acre for your land right through if there was a railway? Yes. I think it is worth more than that for farming.

819. Could you get it? I think so.

820. You think tenants could be obtained at 3s. an acre? Yes, for good land, fit for cultivation; but people prefer to pay in the form of grain and to give you a bag per acre.

821. Then this year that would have paid over 16s. per acre? Yes.

Edwin Charles Pope, Manager, South Yalgogrin Station, sworn, and examined:—

822. *Chairman.*] What are you? Manager of South Yalgogrin station, for Messrs. Goldsbrough, Mort, & Co. The station is situated north of Bolero.

E. C. Pope.

823. What is the extent of the holding? 84,000 acres.

19 Oct., 1897.

824. What are the various kinds of tenure you have? There is about 25,000 acres of freehold and conditional purchase and conditional lease land (12,000 acres being freehold in that 25,000 acres), and the rest conditional purchase and conditional lease.

825. Therefore, there remain about 60,000 acres of Crown land on your holding? Yes.

826. When does the lease expire? In 1900.

827. Is there 60,000 acres suitable for cereals? Yes; the whole of it, except 2,000 acres.

828. Presuming that the State constructed a railway to Ariah, and was prepared to lease the land in suitable quantity, could farmers be found to pay 1s. per acre for it? I believe so.

829. Could farmers be found who would pay more than that? I should not like to say.

830. Would the land be settled on? I believe so.

831. Where do you send your produce to? To Narrandera.

832. How much do you pay? We pay 35s. each way for wool and merchandise.

833. What is the distance? Fifty-four miles.

834. What is the charge for wheat? We never had any wheat.

835. Do you regard the distance as prohibitive for wheat? Yes.

836. How far can a farmer afford to draw wheat by road. Twenty miles is the full distance.

837. What would be a fair charge for the carriage by road, 20 miles, of wool and wheat? For wool, about 14s. per ton; for wheat, the charge would be less. I believe that the company for which I manage here would be prepared at once to put 4,000 acres of land under wheat if we had a railway. We believe that tenants could readily be obtained on the share system. A good deal of the country has been so overrun with rabbits. It will not pay to destroy them, and devote the land to pastoral purposes; but with closer settlement they could readily be dealt with. I should have mentioned that some 22,000 acres of our holding is mallee country, which I believe is suitable for cultivation.

838. Do you believe it is suitable for cultivation? Yes; I have seen crops growing on it. Wheat was grown on some land formerly belonging to a settler for several years, and now there is a good crop of grass on it.

839. Do you believe that closer settlement will reclaim the mallee land? Yes.

840. You cannot reclaim the mallee land for pastoral purposes? No.

841. And you cannot banish rabbits except by closer settlement? No. There is 60,000 acres of mallee country formerly held in connection with the Yalgogrin station, now lying waste. It was thrown up because it did not pay us to fence it.

Donald

Donald Tait Wilson, grazier, North Bolero, sworn, and examined :—

- D. T. Wilson
19 Oct., 1897.
842. *Chairman.*] You are situated south of the station managed by the previous witness? South-east.
843. *Mr. Black.*] What area have you? 15,000 acres of Crown land and 640 acres of freehold and conditional purchases. I hold the Crown land under occupation license.
844. Have you any land under cultivation? Only about 12 acres for hay.
845. Is the land suitable for cultivation? A great deal of it is.
846. Is there any reason why you have not gone in for wheat-growing? I know nothing about it. I am not a practical farmer. I have been sheep-farming all my life.
847. I suppose you would have no objection to let a share of your land on the share system? I should be very glad to do so.
848. Where do you send your wool to? To Narrandera.
849. How far is it by road? Forty-eight miles.
850. What is the charge? Thirty-five shillings per ton. I have paid that rate for three or four years.
851. How far are you from the proposed station at Warri? My homestead is 13 miles from Warri homestead.
852. What would the road carriage be for that distance? Ninepence per ton per mile.
853. That will be about 9s. ? —
854. If the railway were constructed to Warri would you send your wool by rail? Certainly.
855. What rate could you afford to pay for the carriage by railway? Anything under 35s. would be a saving, of course.
856. If you think that would be an inducement? Certainly.
857. Did you hear the evidence of Mr. Pope? Yes; and I agree with it.

Charles John Bear, grazier, North Berembed, sworn, and examined :—

- C. J. Bear.
19 Oct., 1897.
858. *Chairman.*] Where do you live? At North Berembed.
859. Where is it situated? The home station is about 9½ miles from the Grong Grong railway station, almost north.
860. *Mr. Roberts.*] Would you like to show in your own way why, in your opinion, it would be preferable to construct a line from Grong Grong to Warri, instead of one from Coolamon to Warri? That is what I should like to do. I do not know the road to Coolamon, although I know the township of Coolamon; but the surveyors who surveyed the line from Grong Grong to Warri have told me that it was 8 miles shorter than the Coolamon route. That alone I consider is a great thing in its favour. Then, as far as I know about the district, the same number of people would be served by the Grong Grong route as would be served by Coolamon route. The same result, in my opinion, can be obtained with a less initial expenditure if the line is made from Grong Grong. Besides that, I should like to point out that nearly all the land between here and Grong Grong is fit for wheat growing. The property at North Berembed is eminently adapted for wheat growing, and we are now throwing large areas open on the share system. Within the last three months I have leased about 1,600 acres for a rent of one bag per acre. We have now 1,500 acres under offer, and if it is taken up, which there is every prospect of its being immediately, we intend to throw open the greater part of the estate, which consists of some 22,000 acres of secured land, for wheat growing. I would also point out that on the North Berembed run there are about 7,000 acres of Crown land, nearly all of which is well adapted for wheat-growing.
861. Is 22,000 acres the full extent of your holding;—there are about 22,000 acres of secured land, and about 7,000 acres of Crown land, situated within 10 miles of Grong Grong station? Yes.
862. Would it be worth while to use the railway for that distance? Some of the farmers have taken land even closer. I asked if they would put their produce on the proposed line, and they said most certainly they would.
863. Is any wheat at present being grown on your property? Yes; I suppose altogether something like 2,000 acres wheat has been grown by selectors for some years, although I have done very little myself.
864. What does it cost them to put it on the railway? I do not know.
865. How many sheep do you run to the acre? One sheep to the acre.
866. Are you troubled with rabbits? They have given great trouble there. It is largely for that reason that we are leasing the land on the share system, because closer settlement is the thing to keep the pest down.
867. Do you know the country between your homestead and Warri? Yes.
868–9. *Chairman.*] But what do you think of the land about here? Most of it is very suitable for wheat growing. Land valuers and farmers have told me that our property is equal, if not superior, to the famous Berrigan country for wheat growing.
870. Is the country you speak of as good as what you see in this district here? I should say it was better, because there is a great deal of this Boree land on our property.
871. You regard it as a fair thing to say that the country between Coolamon and Ariah and Grong Grong and Ariah are the same in character? Yes, on the average.
872. Your only reason for preferring a railway from Grong Grong to Warri instead of from Coolamon is that it would be 8 miles shorter? Yes; and a line from Grong Grong would serve about the same number of people.
873. You know the distance between Grong Grong and Coolamon by rail? Yes; I have heard that it is 26 miles.
874. I suppose that your wheat and wool go in the direction of Sydney? Yes.
875. Then would there not be 26 miles extra haulage on the main line as against the 8 miles that would be saved between Grong Grong and Warri? I suppose that would have to be considered.
876. Can you tell the Committee of any other areas under cultivation between your station and Warri? Yes; there is a property adjoining us, some 3,000 acres of which is let out on the share system.
877. Does that system appear to be working successfully? So far, it seems to be going on successfully. There is a boom in it—in fact, it is only beginning. Our experience is, that it is taking on wonderfully well, even in the face of bad seasons.
878. Do you represent any number of landowners around Grong Grong, or have you come to give your individual opinion? I simply speak for the firm of Bear Bros., being the senior partner.
879. You decidedly favour the Grong Grong route? Yes.

William

William Keynes, sworn, and examined:—

880. *Chairman.*] What is your opinion of the mallee country lying north-west from here? I come from Victoria. I was at Kenive, Nhill, and Dimboola. I was there seven or eight years. I was cultivating land, and hearing of the land at South Yalgogrin, I came to New South Wales to look at it. I also looked over North Belero and part of Bygoon. I compared the lands of the two colonies together, and I reckon that the land here was equally good for wheat growing, and just as easy to prepare for cultivation as the mallee lands in Victoria. The only drawback was that there is no railway here. I found that the land was some 40 to 70 miles from a railway. From my experience of the Victorian mallee, I believe that the mallee here could be rolled down for about the same cost, and I think the soil is every bit as good. If there was a railway nearer to it the land would be quickly utilised; it would all be leased out.
881. What area would you require? Less than 1,000 acres would be sufficient for me.
882. What rent would you pay? I would pay 4s. an acre rent for the first five years, because you have to give more than that for other land, and I consider that the mallee land is less expensive to cultivate, and you get bigger returns from it. The Colony being subject to droughts, the mallee land pays better in dry seasons.
883. What rent would you give for such land as there is about here? I think 4s. an acre would be enough for it.
884. Do you think the State could get 1s. 6d. per acre for the mallee land in this district if there was a railway? I do.
885. You think the Victorians would come and take it up? Yes; they would rush it and be glad to get it.
886. At 1s. 6d. per acre? Yes; you could double it.
887. You heard Mr. Bear's evidence? Yes.
888. Do you agree with him? Yes; I believe Mr. Bear's evidence to be correct in every detail.

W. Keynes.
19 Oct., 1897.

Stephen Kehoe, farmer, sworn, and examined:—

889. *Chairman.*] Do you want to tell us your experience with regard to the cultivation of the mallee land? Yes. I cleared a paddock of 120 acres at Moombooldool, and about 8 acres of it was mallee land. I cultivated it for three years, and I got from 2 to 3 bushels per acre more off the mallee land than I got off the other. It was more expensive to clear, of course.
890. Do you believe that the mallee land could be satisfactorily occupied by farmers? Yes, if we had a railway.
891. *Mr. Black.*] How much more per acre did it cost you to clear the mallee than the ordinary forest land? About 10s. an acre.
892. And you say you got a better return from it? Yes; I stripped it by itself for three years.
893. Then it would pay you to clear the mallee land for wheat growing rather than the other forest land? Yes. If a railway were made into this district I would increase my holding, and I believe that other people would do the same.

S. Kehoe.
19 Oct., 1897.

John Clark, farmer, Cowabbie, sworn, and examined:—

894. *Chairman.*] Where do you live? At Cowabbie, about 8 miles from here.
895. You have heard the evidence with regard to the agricultural and pastoral possibilities of the district? Yes.
896. Do you desire to add anything to them? What I heard is all correct.
897. Have you anything to tell us about the development of the auriferous country? Yes. The district where I am has been proved to be auriferous. There is a line of country, 5 or 6 miles square, which is gold-bearing; but the want of water has prevented its development. I believe that if a railway were made it might tend to develop the mining industry. The great drawback is want of water. There seems to be a fairly large amount of payable ore, but they have not enough water to treat it; it is a low-grade ore. If they had facilities to take it away by train it might possibly pay to work it. It would not pay to cart it.
898. What work has been done on it? One mine is working on it; a battery was started recently. They are down about 80 feet.
899. What does the ore carry? About 5 dwt. to the ton. In regard to road carriage, I may say that we pay 9s. 6d. per ton for the carriage of wheat to Grong Grong, a distance of 20 miles. I think that 7s. a ton would be a fair charge for 15 miles. For 6 miles they pay as high as 6d. a bag, and at that rate it would be 11s. 3d. per ton for 15 miles. They make a proportionate reduction for a longer distance.

J. Clark.
19 Oct., 1897.

Robert Alexander Gemmell, farmer, Warri, sworn, and examined:—

900. *Chairman.*] How far away do you live from here? About 4 miles.
901. Have you heard the evidence given here to-day? Yes; I can only corroborate what Mr. Clark has said.
902. Do you want to add anything? The union rate for the cartage of wheat is 6d. a ton per mile over 6 miles. Under 6 miles it is a matter of private agreement.

R. A.
Gemmell.

19 Oct., 1897.

WEDNESDAY, 20 OCTOBER, 1897.

[The Sectional Committee met at the "Junction Inn," Methul, at 3 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Coolamon to Ariah.

Basil Barnet Bennett, farmer and grazier, Wagga Wagga, sworn, and examined:—

903. *Chairman.*] You have a statement to make? Yes; I have written down my evidence, which I will read:—I reside at Wagga Wagga, and I am a landowner at Mimosa West. I am prepared to enter into a bond to pay 5 per cent. interest to the Crown on the increased value of my land for ten years, if a railway

B. B. Bennett.
20 Oct., 1897.

B. B. Bennett. railway siding or station is put down within 10 miles of my holding of 3,300 acres on Minioso West. A line of railway laid down from Coolamon to a point on Merool Creek, about 3 to 4 miles north-east of Ariaiah station, on the Merool Creek, by the following route:—Say Coolamon along travelling stock route 1914-8 miles to Devlin's Gate; thence 11 to 12 miles along T.S.R. 1951 to "Junction Inn"; thence by the nearest practicable and most direct route, to the aforesaid point on the Merool Creek, would be the best, for the following reasons: 1st. It would, with the exception of about 1 mile, pass through splendid agricultural land. 2nd. That at least 90 per cent. of the land for a distance of 20 miles on each side of the line is good wheat land. 3rd. That it would go through and alongside a large quantity of Crown lands that could be made available for settlement by the Crown in a short time, to wit Devlin's Dullah Paddock, T.S.R.'s 1914 and 1951. Mimosa West pastoral lease, Wallarooobia and Yarrenjerry pastoral leases, and the terminus would be on T.S.R. 1034, it having a frontage of some 20 miles to or in close proximity to Merool Creek. 4th. That the lands for 20 miles east, 10 to 15 miles north, and same distance west, of the proposed terminus are, as regards 90 per cent. of it, absolutely and undoubtedly of a quality superior to other parts of the proposed line. 5th. That it would go through and pass by within 10 to 15 miles of some of the largest farmers in the district. 6th. That any lands that have lately been thrown open on the proposed line, have been eagerly contested for, and that all available land on and near the proposed line would be taken up without delay. 7th. That there is splendid box-timber all along the T.S.R.'s. named, also pine in large quantities on the Yarrenjerry pastoral lease; also the terminus would be within a reasonable distance of good ironbark timber. 8th. That the proposed terminus on the Merool Creek would be not more than 25 to 30 miles from Wyalong, and almost in a direct line from Coolamon to Wyalong gold-fields—consequently would be the nearest railway station to Wyalong. 9th. That the proposed line and terminus takes, so to say, an equi-distant course between Temora and Grong Grong, as the terminus would be about 33 miles from Temora and 33 miles from Grong Grong, and 37 from Coolamon, thus avoiding the laying down a line approximately parallel with any other line. 10th. That although the country 20 to 30 miles north and west of north of the proposed terminus is largely intersected by mallee beds, and rough mountainous country, it is also intersected by large quantities of Crown lands known to be highly auriferous, and a fair percentage of good agricultural land. 11th. That the country through which the line will pass being practically level, that it should be laid down at a minimum cost, and no expensive stations would be required, as sidings attended by porters would be ample for the present requirements of the people. On the line, also, the position of the proposed terminus is such that it would eventually become the centre of a large agricultural community. 12th. That an increased value on the agricultural lands, say, 10 miles east and west of the line, from Devlin's Gate *via* Methul, would, approximately, if capitalised at 4 per cent., give a return of £1,920 per annum. This, I believe, would be willingly paid by private holders; and as there is a large quantity of Crown lands, on which the Crown could fix their own values, this amount would be far exceeded.

903. Although you are satisfied with Coolamon as a starting point, and also with Ariaiah as a terminus, you believe that the line should come east of the range, not west? Yes.

904. You object to the detour to the west? Yes; because the larger quantity of agricultural land is in the other direction.

905. *Mr. Black.*] Through what kind of country would the proposed line come? Leaving the other route, there are 64,000 acres of Crown lands which we believe are to be thrown open in a very short time; then the railway would come 11 miles along the travelling stock route.

906. Over how many miles of country will it travel where resumptions would be necessary? From the junction into the north-west. I think there need be hardly any resumptions.

907. How many miles is it from here to the proposed terminus at Ariaiah? Nineteen miles.

908. That line would run through land which must be either given or resumed? It would go through Crown land to a great extent. I do not think it would go through a great deal of purchased land.

909. *Mr. Roberts.*] How many extra miles of railway would have to be constructed if this alteration in the route should be adopted? One mile. One route is 37 miles and the other is 38. We are advocating a route *via* Methul to Merool Creek.

910. Your contention is that your route is shorter than the other? Yes.

911. You mentioned also a guarantee with regard to any deficiency in the revenue;—how many residents in the district do you speak for? I simply speak for myself. I am prepared to pay 5 per cent. for ten years on the increased value of my land if a station is erected within 10 miles of it.

William Fisher, farmer, Mimosa West, sworn, and examined:—

W. Fisher. 912. *Chairman.*] How far from where we are at present? Fourteen miles.

913. What do you pay for the carriage of wheat to the railway station? 1s. 3d. a bag, which means 11s. 3d. a ton.

914. Where do you send your wheat to? Coolamon.

915. What do you pay for the carriage of wool to the railway station? Much more than for wheat.

916. Your produce consists of wool and wheat? Yes.

917. Your district has been described as running from Ariaiah in a westerly direction, as suitable for wheat; also, in a northerly direction from Ariaiah towards Temora, as all cultivatable land, with the exception of 4 miles; and south down to the Hay line is also fit for wheat, except where there are hills? That is correct. I think we are all one as to the advisableness of the construction of the line from Coolamon to Ariaiah, the only difference being that some of us think that the line should not make a detour of 6 or 7 miles, unless that is necessitated by engineering difficulties; and we know that it is not. The people who live in this district see no reason why the line should go on the other side of the range, instead of coming this way. A more direct line would serve the same purpose, and would serve more people.

918. The railway should be located as closely as possible to where the wheat is grown? Yes.

919. Therefore, it is for us to ascertain where that position is? Yes.

920. *Mr. Black.*] You object to the detour;—unless that is made, would it not leave out a large agricultural district known as Cowabbie? No; certainly not. It would not leave out any portion of it. It might make the people on the west of the Cowabbie Range travel a little further, and it would be more accommodating to the people on the east side of the range. My contention is that it would benefit more people

people by coming to the east of that range than by going to the west. It is a positive fact. The settlement is proceeding from east to west, and by building the railway as proposed you will be getting away from settlement to where there is a lesser number of people requiring a railway. If a vote were taken of all the people of the district on the question, I have no hesitation in saying that three to one would vote in favour of the line coming this way. W. Fisher.
20 Oct., 1897.

921. Is there any danger of the line interfering with traffic which now goes to the Temora line? It is only fair to draw a line half-way between the two. The traffic from one side of that line would go to the Temora railway, and the traffic from the other side of the line would come to this railway. It would draw very little traffic away from the Temora railway.

922. Would the people of Ariah be as well served by a Temora connection? Better, I think.

923. *Mr. Roberts.*] What you would recommend to the consideration of the Committee is, that the line should be made east of the Cowabbie Range instead of on the west? Exactly so. I look upon a line from Aria to Temora as out of the question. A direct line from Coolamon to Ariah is the proper one—one which will receive the support of the people of the district; but I do not see why it should make that detour.

William MacCauley, farmer, Mimosa West, sworn, and examined:—

924. *Chairman.*] You have heard the evidence given by Mr. Fisher and Mr. Bennett;—do you agree with it? Yes, entirely. W.
MacCauley.
20 Oct., 1897.

925. Can you give us anything additional? No; I can only say that it would be advantageous to a lot more people if the line is made along the route suggested by them.

926. *Mr. Roberts.*] What is the area of your holding? Nearly 1,600 acres.

927. How much do you cultivate? 300 acres.

928. Where do you send your wheat? To Coolamon.

929. What do you pay for carriage? 11s. 3d. a ton.

Basil Barnet Bennett, farmer and grazier, Wagga Wagga, sworn, and further examined:—

930. *Mr. Roberts.*] How much wheat do you grow? Very little so far. We are badly situated for want of railway communication. B. B. Bennett.
20 Oct., 1897.

931. Do you send your wheat to Coolamon? To Coolamon and Temora. We are slightly nearer to Temora.

932. How far away? From 22 to 25 miles.

933. How far are you from Coolamon? From 28 to 30 miles.

934. Is there any difference in the rate of carriage between the two places? No; the men have their choice. Sometimes they go to one place and sometimes to the other.

935. How would a line from Ariah to Temora suit you? It would make no practical difference to me.

936. Are you in favour of a line from Temora to Warri? Personally it would not matter to me; but I have always advocated a line from Temora to Ariah. It is said that the line *via* Methul would be 8 miles closer to the Temora line than the Cowabbie line would be, but I should like to show how close the other one is to Grong Grong. The line we propose divided the country better than the other one. The Cowabbie line would be very close to Grong Grong. I do not know the exact distance, but it is not very far. A line from Temora to Ariah would open up the Ariah country, but it would place the people here at a very great disadvantage.

937. Do you know the country from Warri to Grong Grong? Yes.

938. Which line would serve the largest number of settlers—the Grong Grong to Warri line, the Coolamon to Warri line, or a Temora to Warri line? The present population is situated along the Methul Road.

939. Did you hear the statement put in by Mr. Bennett, senior? Yes.

940. Do you agree with that statement, except with regard to the Temora route? Yes.

941. Do you favour the guaranteeing of any sum of money to prevent the Government from suffering any loss in connection with the railway? I am prepared to make the same guarantee in connection with my property that my father proposes.

942. Have any meetings been held here with the view of approaching the Government on the subject of the guarantee? Not that I am aware of. Some time ago the statement went to Sydney from Broken Dam that the settlers would guarantee the line. I think it was not a money guarantee; but they guaranteed to grow a certain quantity of wheat.

943. Has there been any offer made to pay an extra rate of carriage until the line was remunerative? I do not think that any offer has been made. If the Government are willing to carry our wheat for 6d. or 9d. a bag, it would be a great saving to the people.

944. You feel sure that the people would willingly pay that rate? I feel confident they would.

945. *Chairman.*] What is a fair rate for the carriage of wheat and wool 15 miles by road? Wheat, from 10d. to 1s. a bag—that would be from 7s. 6d. to 10s. per ton; wool, 12s. 6d. to 15s. We do not grow much wheat at present, because we have not railway communication; but we are offering special inducements to cultivate our land for us, and by those inducements we are making it equal to being alongside a railway. The land still gives a return slightly better than we could get from sheep, and it improves the land. We are offering to put the wheat on the trucks at the railway station, so as to save the men who cultivate the land the expense of carriage. It does not pay, from a wheat point of view; but it gives a slightly better return than sheep would give.

946. What is a fair return to expect from an acre of land used for pastoral purposes in the district, towards Mimosa West? A great deal depends on whether the land is improved or unimproved.

947. Would the maximum obtainable from land used for pastoral purposes be 3s. an acre? Yes.

948. What, in your opinion, is a fair net return from land devoted to agriculture;—would a farmer expect to make £1 an acre? I should not.

949. Would he make 15s.? No, he would not.

950. What net return would a man make on his own property? About 12s. 6d. an acre.

John Cassidy, farmer, Tara, sworn, and examined:—

- J. Cassidy. 951. *Chairman.*] Where do you live? At Tara, 25 miles from Coolamon, on the east side of the travelling stock route.
 20 Oct., 1897. 952. How many miles are you north of Methul? About 5 miles.
 953. What do you pay for carriage to Coolamon? I cart to Temora, between 23 and 24 miles: I pay 1s. a bag, or 9s. a ton.
 954. What is the area of your holding? 400 acres.
 955. What is your ordinary yield? I have been here five years, and I have not had a good season yet. I do not think that my crops have averaged more than two bags to the acre. I am in favour of the route suggested by Mr. Bennett,—from Coolamon along the travelling route; then turning north to Methul; then north-west to Ariaiah. In my opinion that is the route that will suit the majority of the people. It will suit me personally because it is close to my place.

Thomas M'Caig, farmer, Methul, sworn, and examined:—

- T. M'Caig. 956. *Mr. Black.*] Where do you reside? At Methul, south of this place.
 20 Oct., 1897. 957. What is the size of your holding? 4,250 acres.
 958. How many acres have you under crop? I have had 1,200 acres under crop, but I have not so much under crop this year. I should like to get a railway and go in for more extensive cultivation.
 959. If you had a railway what would you do then? I should put in all that I possibly could. I should cultivate half the holding and use the other for grazing.
 960. Where do you send the produce to? To Coolamon.
 961. What do you pay? I have got it carried lately for 9d. a bag. I used to pay 1s.
 962. That is rather a low rate? It is pretty cheap. I would willingly pay the Government 6d. a bag from my place to Coolamon for all the wheat I could grow.
 963. Would you pay 6s. for the first five years and less afterwards? Certainly I would.
 964. What do you pay for wool? I cart the wool myself. If I had to hire it it would cost me about 12s. a ton—perhaps only 10s. I am not quite sure.
 965. How far are you from Coolamon? Seventeen miles.
 966. How far from the proposed line? The one which we are trying to get would go close past my place.
 967. So the cartage to it would not be an important item? No.
 968. How long have you been in the district? Fourteen years.
 969. Did you come from Victoria? Yes.
 970. Is this district equal to Victoria for wheat growing? I think this is as good a wheat growing country as the Goulburn Valley in Victoria, and I was there eighteen years.
 971. You think there is a large area of land suitable for wheat growing? I do.
 972. You have heard the evidence of Mr. Bennett and other gentlemen? Yes.
 973. Do you agree with that? I agree with everything that Mr. Bennett said in that paper that he read.
 974. *Chairman.*] Do you think that 7s. 6d. for wheat and 12s. 6d. for wool are fair rates for carriage 15 miles? It is a fair thing.

John Mills, farmer, Big Mimosa East, sworn, and examined:—

- J. Mills. 975. *Mr. Roberts.*] What area of wheat land do you cultivate? I have 100 acres in this year.
 20 Oct., 1897. 976. What is the largest area that you have had in? 140 acres.
 977. How many bushels do you get to the acre? Sometimes as low as 2, and sometimes as high as 18 bushels.
 978. Where do you send your wheat? Principally to Temora.
 979. Is Temora nearer than Coolamon? Yes. I am 21 or 22 miles from Temora, and 20 miles from Coolamon.
 980. What rate of carriage do you pay at Temora? One shilling a bag or 9s. a ton.
 981. Do you pay the same rate to Coolamon? No; about 3d. a bag more.
 982. Then I suppose you always send your produce to Temora? Yes.
 983. You have heard the different routes proposed for this railway. The route put forward by Mr. Bennett, the route from Coolamon to Ariaiah, and the route from Temora to Ariaiah. Which line do you think would be the best in the interests of the country? To serve the largest body of people, the route from Coolamon to Methul, as suggested by Mr. Bennett.
 984. Is that according to the present population, or taking into consideration the probability of a large area of land being available? I do not reckon that at all. I am only speaking as to the present population.
 985. You pay 9s. a ton for carriage by the road. What would you be prepared to pay for the carriage of wheat, if the railway were constructed? The same as my neighbours.
 986. Would you regard 6s. a ton as a fair rate till the line becomes remunerative? Yes; I would pay that.
 987. You have a good knowledge of the country where it is proposed to make the railway? Yes.
 988. Do you regard it as well adapted for the growth of wheat? Yes.
 989. Do you go in for grazing? Yes, a little.
 990. What do you pay for the carriage of wool? I have not grown wool lately.

William Hewett, farmer, Methul, sworn, and examined:—

- W. Hewett. 991. *Mr. Black.*] How many acres have you? One thousand six hundred acres of conditional purchase land.
 20 Oct., 1897. 992. Is any portion of it cultivated? Yes.
 993. How much have you under crop? A little over 400 acres.
 994. Is that the largest area that you have had under crop? Yes.
 995. Are you disposed to increase it? If we had a railway I should be.
 996. How do you send your produce to market? I send it by teams to Coolamon.
 997. How far are you from Coolamon? About 24 miles.
 998. What are you paying for carriage? One shilling a bag for wheat.
 999. How much for wool? I have always carried my own wool.
 1000. Which route for the railway do you favour? Coolamon *via* Methul to Ariaiah.
 1001. Did you hear the statement made by Mr. Bennett? Yes.
 1002. Do you agree with it? Yes.

Samuel Harrison, farmer, Broken Dam, sworn, and examined:—

1003. *Chairman.*] You come from Broken Dam? I do; I am a representative, as it happens. S. Harrison.
 1004. Will you explain your views with regard to the establishment of railway communication with Broken Dam? We have had a report made on a line from Temora. We started an agitation for a railway from Temora to Hillston *via* Broken Dam. 20 Oct., 1897.
 1005. Are you satisfied for the railway to stop somewhere about Ariaah? If it stops about Ariaah there is a lot of country—Kildary, Mandamah, and Buddiga. In the opinion of the people about Broken Dam, the right route for a railway to be constructed would be direct from Temora in a westerly direction towards Ariaah. We believe that that would be a shorter distance to Sydney. We believe that it will intersect the country better than any line coming from the south. The map before me shows the extent of reserved land, and also the extent of land held under pastoral lease which will eventually become settled. The number of people residing in the vicinity of Broken Dam I do not know; but the population there is considerable; about ninety within a radius of 18 miles.

THURSDAY, 21 OCTOBER, 1897.

[The Sectional Committee met at Mimosa Station, at 11 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Coolamon to Ariaah.

Thomas Priest, farmer, Mimosa West, sworn, and examined:—

1006. *Mr. Black.*] What are you? A farmer residing $4\frac{1}{2}$ miles west from here. T. Priest.
 1007. In what direction would that be from the junction? About 8 miles east from the junction. 21 Oct., 1897.
 1008. How long have you been there? Fifteen years.
 1009. How much land have you? 500 acres conditional purchase.
 1010. How much have you under cultivation? 200 acres.
 1011. Have you had a greater quantity than that under cultivation? I have; but this season the weather did not allow me to put more in. It was very dry in April and May, the ploughing-time.
 1012. Are there many other farmers in your locality? Yes, a good few.
 1013. Is the bulk of the country about where you are, conditionally purchased land? Yes; the selectors near me are all conditional purchasers.
 1014. Is the land similar to that which we passed through in coming here from the junction? Yes; it is all one class of land, more suitable for agriculture than anything else.
 1015. What are the average crops? From 12 to 15 bushels an acre.
 1016. How many years have you been cultivating? Fifteen years.
 1017. What has been the average price that you have received for wheat? I have got all prices, but I keep no account.
 1018. At what price does it pay you to produce wheat? You cannot make it pay at much less than 4s. a bushel situated as we are, having to cart it so far.
 1019. Does it cost 1s. 6d. a bushel to get it to market? We have to trust to wheat; we cannot grow chaff to send to market. It is not as if we could grow a lot of hay.
 1020. How far are you from a railway? Eighteen miles from Coolamon.
 1021. Do you usually go there with your wheat? Yes.
 1022. What cartage do you pay? Nine shillings a ton; but I generally do my own drawing.
 1023. Do you grow wool? No.
 1024. What do you do with the land that you do not cultivate? I run stock on it.
 1025. Do you run a few sheep? I have none at present.
 1026. You are 18 miles from the railway, and you say that you cannot grow wheat to pay at less than 4s. a bushel—are you sure of that? A man might do it if he were sure of 3s. 6d. from one year to another.
 1027. Are you in favour of the railway line marked red on the plan? Yes.
 1028. For any reason other than personal ones? No.
 1029. You are in favour of it because it would suit you best? Yes; I should be within 8 miles of that line.
 1030. Have you formed any opinion as to which route would serve the greatest number of producers, and be of the greatest benefit to the country? I could not say.
 1031. Suppose you had a railway at the junction, what would it cost you to cart your wheat there? About 6d. a bag.
 1032. What would you be able to afford for railway carriage if you paid 4s. 6d. a ton for road carriage? Another 4s. 6d., that would make 9s., what I am paying now.
 1033. Where would your gain come in then? I could get more loading away, and I could deal in chaff and other things.
 1034. You could vary your crops? Yes.
 1035. You see that black line marked on the map from Temora to Ariaah? Yes.
 1036. A line along that route would not be of much advantage to you? It would be of no advantage whatever; it would be the same distance as Coolamon from me.
 1037. *Chairman.*] You have heard it given in evidence that a fair freight for wheat on the road by a team for about 15 miles would be 7s. 6d. a ton;—do you agree with that? Yes.
 1038. And for wool 12s. 6d. a ton? Yes I think that is a fair rate.

John Charlesworth, farmer, sworn, and examined:—

- J. Charlesworth.
21 Oct., 1897.
1039. *Mr. Roberts.*] What are you? A farmer; I reside about 6 miles east from Methul.
1040. You are a holder of a conditional purchase? Yes, 336 acres.
1041. How much have you under cultivation? 208 acres.
1042. All wheat? Yes.
1043. Do you run any sheep on it? No.
1044. Is that 208 acres the largest area that you have had under cultivation? No; I have had 250 acres under cultivation.
1045. What is the reason for your not cultivating so much this year? The season was too dry; I could not get the wheat in.
1046. Do you regard the present as a good season? Very fair, so far.
1047. Will you increase your area under crop next year? I cannot increase it a great deal, because my holding is not large enough.
1048. You have about 100 acres to spare? Yes; but I have to run stock on that.
1049. Where do you take your wheat to? To Coolamon.
1050. What is the rate of carriage? 9s. a ton.
1051. How many miles is it from Methul to Coolamon? I always understood that it was 22 miles.
1052. How far is it from the nearest road that you travel when taking your produce to the railway? About 17½ miles.
1053. Do you favour the route east of the Cowabbie Range? Yes; the route past Methul.
1054. And if a railway were run along that route you would have to go 5 miles to get to the station? About 6 miles.
1055. What would be the cost of carriage over that 6 miles? About 3d. a bushel from my place.
1056. Have you formed any opinion as to what you would have to pay for carriage by the railway, and what saving there would be? There would be a good deal of saving, because I could go two trips to the junction in the time that it would take me to make one trip to Coolamon.
1057. What could you afford to pay for railway carriage to Coolamon? I could afford to pay about 9s. a ton.
1058. You would regard anything less than 9s. a ton as a great advantage? Yes.
1059. What is the greatest distance that you could afford to be from a railway? About 10 miles.
1060. Anything over 10 miles, you think, makes the railway of no value? You could not travel any distance over 10 miles in a day.
1061. Twelve miles would be a fair thing to go and return in one day? I could hardly do it in a day—it would be a big day.
1062. If a railway were constructed, would you be likely to increase the area under wheat? My land is adjoining a reserve, and if it is thrown open for selection I should stand a chance of getting more land.
1063. You think that if a railway were made through this district a larger area would be put under cultivation? I believe it would; because then, when the ground gets dirty, we could grow chaff and other things.
1064. Have you ever taken anything to the railway besides wheat? No.
1065. Would the cartage of chaff be higher than the cartage of wheat? It would be 11s. or 12s. a ton, as against 9s. for wheat.
1066. In your opinion, the carriage of chaff, on account of its bulkiness, would be 25 per cent. more than the rate for wheat? The chaff being more bulky it is more difficult to carry than wheat.
1067. You do not grow wool? No.
1068. Have you ever calculated what it costs to produce a bushel of wheat? No; I do it with my own labour.
1069. Do you not keep any accounts? No.
1070. Do you agree with the evidence of Mr. Priest? Yes.
1071. In your opinion, a railway line as advocated, by way of the junction and Methul, would serve a larger number of residents than a line from Coolamon to Warri, or a line from Temora to Ariah? I cannot say; I am not acquainted with those lines.
1072. Have you been to Broken Dam? Between Temora and Broken Dam it is all ironbark country; it would not do for cultivation at all. It is good land after you get across the ironbark country.
1073. Do you believe that this Methul route would serve a larger number of settlers than either of the other routes? From what I have heard it would.
1074. Your neighbours all favour the Methul route? Yes; we have been advocating a line there for a good few years.
1075. How many years has a railway by this Methul route been advocated for? It must be nine or ten years since it was started.
1076. Did that agitation take place after you heard of the request from the Warri people for railway communication? I think ours was the first.
1077. *Mr. Black.*] Did you come from Victoria? No, I came from Marulan.

John Penfold, farmer, sworn, and examined:—

- J. Penfold.
21 Oct., 1897.
1078. *Chairman.*] Where do you live? Five or 6 miles from here; between here and Methul.
1079. What is the total area of your land? In the parish of Trickett I have 1,760 acres, and I have 1,200 acres more to the north-west.
1080. What do you pay for carriage to Coolamon? I go to Temora, and I pay about 9d. a bag for wheat.
1081. Is 7s. a ton a fair rate? That would be it.
1082. Do you send any wool? A little bit, and I carry it with my own team.
1083. What would you have to pay to get to Coolamon? I have paid 1s. and 1s. 6d. a bag for wheat to Coolamon.
1084. We have been informed that 7s. 6d. a ton for wheat is a fair rate for 15 miles, and 12s. 6d. a ton for wool; do you agree with that? Yes; it is a fair thing.
1085. What would the land about here be worth to a farmer provided he got a lease from the owner? I think some of the better land might average about 3s. per acre. A man could not go much astray at that.
1086. Do you think people could be got to take this land at such a rent as that? I do not know; it is very hard to say.
1087.

1087. Is there a demand for land in the district? There has been a great demand; there have been a great deal too many applicants for the land to be got.
1088. So it appears that there are people who want land? Yes.
1089. Does closeness to a railway enable the farmer to engage in other occupations than growing wheat? Yes.
1090. Therefore, the saving of carriage, although important as regards wheat, is still more important as regards chaff? Yes; chaff is more awkward to carry about.
1091. Do you know the route from Coolamon to Warri? I saw it twenty years ago and several times since.
1092. Do you know the population and produce of the country from Coolamon by the route which will serve the greatest number of people? On the Methul route there are two to every one that you find on the other route.
1093. Have you any figures to prove it? No.
1094. Is there anything else that you would like to say? I should like to mention that I think the proposed line runs a little too much towards Grong Grong. By going to Warri, then turning back to Ariaah, I think it is going out of the road. There is a great bend in the line. I should like to say also that in my opinion settlement is much greater along the Methul route, and you get a bigger development of country by the construction of a shorter line. This agitation for a railway *via* Methul is no new thing; we started the agitation twelve years ago.

J. Penfold.
21 Oct., 1897.

Thomas William M'Caig, farmer, Methul, sworn, and examined:—

1095. *Mr. Black.*] Where do you reside? At Methul—south-west of the junction.
1096. What is the nature of your holding? I have 2,400 acres of good agricultural land.
1097. How much do you cultivate? I have about 900 acres under crop.
1098. Is that the largest area that you have ever had under crop? Yes; half of that is let to tenant farmers.
1099. How far would you be from the line which is now under consideration—the Warri route? Five or 6 miles, I should think.
1100. What is your objection to that line? Simply that the other would suit me better, and would suit a greater number of people.
1101. You do not want a railway nearer than 5 miles? I should be thankful to get it within that distance.
1102. Where do you send your produce to now? To Coolamon; a distance of about 17 miles.
1103. What do you pay for carriage? Ten pence a bag, equal to about 7s. 6d. a ton for wheat.
1104. If you had a railway within 5 miles, I suppose you would do your own carting? Most likely.
1105. What railway rate could you afford to pay? I could afford to pay 6d. per bag—that is, 1½d per bushel.
1106. Do you know the country adjoining both routes? Yes.
1107. And you will see on the map a third line from Temora to Ariaah? I am not well acquainted with that.
1108. Of the two other lines, that *via* Methul and the one *via* Warri, which goes through the best country? I think they are about equal, as regards the quality of the land.
1109. Then your reason for favouring the Methul route is, that it is the most thickly settled? Yes.
1110. It is not that the land is any better on the Methul route? No; as far as that is concerned, the two routes are about equal.
1111. Then there is nothing to prevent the other route from being as thickly populated as this is? Yes, in my opinion there is.
1112. What is the reason? There is more leasehold land on the route that we advocate, more Crown land. I might state that I am of opinion that the increased value which the railway would give to the Crown land would nearly pay the cost of the railway.
1113. You have heard the evidence already given—do you agree with it? Yes.
1114. *Chairman.*] If any Crown lands were thrown open within 12 miles of a railway, would it be readily taken up? It would.
1115. What would be a fair rent for a farmer to pay? For improved land I think he could afford to pay 1s. 3d. an acre, for unimproved land less.
1116. A considerable portion of this land has been improved? Yes.
1117. What would a farmer pay for that? The value of improved land within 15 miles of a railway is estimated at 4s. 6d. per acre per annum for cultivation. I have let some at 3s. an acre, but I will not renew the lease. I believe that if the State is prepared to throw open the large area of land it would be reasonable to expect an average of 2s. an acre rent.
1118. In your opinion, can men be got to take up the land? I have not the slightest doubt of it from the number who apply for land whenever it is available. There are thirty applications for five blocks which were thrown open in close proximity to the proposed line a few weeks ago.
1119. *Mr. Roberts.*] What is the value of freehold land round about Methul? I consider that it is worth £2 10s. per acre within 15 miles of a railway.
1120. That land originally cost £1 an acre? Yes.
1121. How much of the extra 30s. per acre has been spent on improvements? Probably 12s. or 14s. per acre has been sunk in improvements.
1122. And the balance would be the price that you put on it on account of the difficulty of obtaining land? Yes.
1123. Would the value of that land, in your opinion, be doubled if a railway were brought within 5 miles of it? It would be too much to say that it would be doubled.
1124. If it is worth £2 10s. an acre now what would it be worth if a railway came within 5 miles of it? £3 10s. an acre.

T. W. M'Caig.
21 Oct., 1897.

James Robertson, grazier, Mimosa, sworn, and examined:—

1125. *Chairman.*] Have you been long here? Twenty-five years.
1126. You have an intimate knowledge of the country? Yes.
1127. You see on the map a red line going *via* Methul, and a dotted line *via* Warri, terminating at Ariaah;—in your opinion, on which is the better route for a railway to serve the country? I think the Methul route

- J. Robertson. route is the better one. My reasons are that the line marked black on the plan is too close to an already existing line; in addition to that I desire to point out that the line *via* Methul has an advantage that is not shown on your map in this way,—that there is in contemplation, and in my opinion a transaction is certain to be completed, which will render the land shown on the blue portion of your map, again Crown land. The area to which I refer embraces approximately 25,000 acres, of which the portions immediately indicated would be affected by the Methul line. Commencing at the south-eastern corner, portion 26, parish Methul; thence northerly to north-eastern corner of portion 17, parish Tara; thence westerly to north-western corner of portion 15 of that parish; thence southerly to south-western corner of portion 41, Methul. The land surrounding this area is now held by farmers. A further area commencing at portion 12, Trickett, and going north to portion 51, embracing all the land between those portions and Penfold's holding; thence south-east, including all the land between that and forest reserve, No. 1,439, on to which it abuts. This is within the Methul radius. To eastward is a further area, including portion 1 (one) Trickett, on to 26, Ingleba. The other areas are in parishes Mimosa and Robertson and Lachlan. Making in all about 33,000 acres. I state the acreage approximately. The transaction to which I refer is this: there are pastoralists adjacent to the Narrandera-Jerilderie line who desire to consolidate their holdings. The land in that vicinity does not offer the same facilities for agricultural settlement that the land here does. The Government, in making an exchange, require an area of land to be surrendered equal to that which they give to the pastoralist. Since the transactions in connection with the consolidation could not be carried out on the run from the Narrandera-Jerilderie line, the Government have expressed their willingness to take land in this vicinity, provided that it is suitable for agricultural settlement, and to allow the pastoralists to consolidate their grazing areas. Therefore, the Government will receive acre per acre of agricultural land in exchange for what are in my opinion inferior lands for agriculture. I believe that this transaction is certain to be completed.
1128. *Mr. Black.*] What was the original area of the Mimosa holding? About 200,000 acres. That includes the runs Ironbark, Currajung, Pine Tree, and Mimosa East.
1129. What is it now? We now own about 43,000 acres of purchased land, and 46,000 acres of leased land, half of which is going to be resumed.
1130. At what date does that fall in? This half is now due; we have received notice that it will be dealt with shortly.
1131. How much do you hold under occupation license? 26,000 acres; it is forest reserve; we have not had stock on it for five years.
1132. You are going to sell 33,000 acres? Yes, of our freehold land.
1133. *Chairman.*] In your opinion, if the State does throw open large areas of land within 15 or 20 miles of a railway, can people be found to take it up? I have not the slightest doubt of that. This place is better known in Victoria than in Sydney, and it is from Victoria that the population is coming to take up the land. Our shearers come from Victoria, and I can hear more about Mimosa in Melbourne than I can anywhere else. I think that the first Thursday the land is thrown open, they will take every acre of it, at good prices too.
1134. What, in your opinion, is a fair amount for a pastoralist to expect to obtain for pastoral occupation? Not more than 2s. 6d. to 3s. an acre when he depends solely on the wool.
1135. What ought a man to make from agriculture? My experience of it is that it pays; we farm ourselves, and I have never had less than 12s. 6d. an acre from it, and I have had much more. You ought to get 15s. an acre out of it every year. I cultivate a piece of land which is not better than the average, and 12s. 6d. an acre is the lowest that I have made out of it. I have made as much as £3 an acre out of it; but that, probably, will not happen again. With regard to the country generally north-west from here, there is good agricultural land, then you get into ironbark ranges; after passing away from that it is good country as far as Temora. From Temora, coming west after you pass over the ironbark ranges, it is good land through Mimosa west towards Warri; but there is some poor country, but good country predominates. South from that, pretty well to Coolamon, is, in my opinion, land suitable for the growth of cereals.
1136. What would be the rate for the carriage of wheat and wool by road a distance of 15 miles? We are 17 miles from Temora here, and I have paid 1s. a bag for wheat. I think 9d. a bag is a fair rate. For the carriage of wool I pay £1 to the carriers, but I reckon that by my own teams it will be 15s. a ton.
1137. You have heard it stated that 7s. 6d. a ton and 12s. 6d. for wool are a little under what is a fair thing? Yes, I think so.
1138. Perhaps you could tell us your experience of farming industries over a period of years? Wheat is the only thing that we have been growing. The land gets sick of wheat growing; but when you cease to grow wheat it will come back to a proper state, and you can get good grass off it. I am satisfied that after it has been ploughed and cultivated the land will carry more stock than it does in its natural condition.
1139. Suppose you stocked it heavily after having cultivated it, would it again become good wheat land? Undoubtedly. Our experience is that wild oats are the greatest trouble. By the time you have grown five or six crops the wild oats have spread all over it, and you have to eat it down with sheep.
1140. Sheep running on it for a period of years destroy the wild oats? Yes; they get eaten out.
1141. How long have you had land under cultivation? I can show you a paddock which has been seventeen years under cultivation. We have a paddock which was the first piece of ploughed land in this district. We only took seven or eight crops out of it. It is a mistake to think that this land is going to waste. I have seen land in the western districts of Victoria become perfectly useless to grow anything but weeds. I have never seen land here that we have taken off nine or ten crops but what was in good sound heart. To farm properly we must have sheep, and the land will carry more sheep when it is farmed before.
1142. *Mr. Black.*] How many sheep are you shearing this year? About 50,000.
1143. That is below your usual quantity? Yes; we have shorn 65,000.
1144. How many stands are there in the shed? Thirty-six.
1145. Have you been keeping a record of the rainfall? Yes; for about seventeen years the average is 22 inches. We have had as low as 9 inches and as high as 33 inches down.
1146. How many acres have you under crop? 1,000 acres.
1147. Have you been cultivating long? It is only within the last few years that we have gone in for cultivating to any large extent; we used to farm 50 or 60 acres before.
- 1148.

1148. How many bushels per acre do you get? We have had 16 bushels, that would be 4 bags. Last year we had clean wheat for milling purposes, 2½ bags, or 10 bushels. That is the lowest yield I have ever known. I reckon that our average yield would be 16 bushels, or 4 bags. We had as much as 25 bushels to the acre. J. Robertson.
21 Oct., 1897.
1149. You heard the statement that was made with regard to chaff? Yes; I quite agree with that. I would rather carry wheat 20 miles than chaff 10 miles.
1150. *Mr. Roberts.*] Do you send your wheat to Sydney? We sell it at Temora on the trucks.
1151. You advocate the line by way of Methul in preference to the other route? Yes.
1152. Is that because it would serve a larger number of people? I think it would serve a larger number of people, and according to the quantity of land which is going to be available for settlement, it would serve a very much greater number of people in the near future. The State, in my opinion, will have no difficulty in obtaining 2s. 6d. an acre for any land surrendered in the district.
1153. Do you think that a line from Temora in the direction of Warri would be as good as a line by way of Methul? I think not. I think that a line from Coolamon *via* Methul would divide that country better than a line from Temora in the direction you indicate. I think that the Methul line has command of a greater area of good land than a line from Temora would have. If you go down to Mirrool there is a great deal of rough country; the range is wider where you would have to cross than at any other place.
1154. You do not look favourably on that line? I do not. I should be perfectly disinterested when this land is gone. I am speaking of its general use to the district.
1155. As far as you are concerned, Temora would suit you best? It would suit me just as well.
1156. If the Methul route were adopted you would still send your wool and wheat to Temora? Yes.
1157. Do you personally supervise the cultivation of your wheat, or do you let the land on the halves system? We do all the work entirely on our own account; we have no halves system.
1158. Is there much land cultivated on the halves system in this district? When you get south on to the Merulebele property, they have 10,000 acres let on the halves system, that is near to Junee. Rockview station is all let on the halves system.
1159. Have you had any applications from persons desirous of working your property on the halves system? Several.

PLAN.

Moree to Inverell Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM MOREE TO INVERELL.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Moree to Inverell," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed; and, in accordance with the provision of subsection (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

OFFICIAL DESCRIPTION.

1. The proposed railway is 96 miles 35 chains in length, and is estimated to cost £279,500, or £2,898 6s. per mile, exclusive of land and compensation. Details of this estimate will be found in the evidence of the Engineer-in-Chief. The route, as given in the official description, is as follows: Beginning by a junction with the Narrabri to Moree railway at about half a mile south of Moree Station, it proceeds eastward on the south side of the Gwydir River at a distance from it varying from a $\frac{1}{2}$ to 4 miles. At Ezzy's Crossing, about 2 miles below the confluence of the Warialda Creek, the river is spanned, and the creek is crossed about 4 miles south of the Warialda township. There the line begins to rise towards the table-land by Kelly's Gully valley, and at about 10 miles from Warialda it adjoins the main road from Warialda to Inverell, but leaves the road again about 10 miles further on. It then intersects the parish of Little Plain nearly at its centre, and crossing the dividing range between the Gwydir and Macintyre rivers, approaches the road at the south end of the parish of Byron, terminating at the west bank of the Macintyre River close to the town of Inverell. Communication between the town and the railway will be by a road bridge across the river. The works are generally of a light character between Moree and Warialda, and somewhat heavier from Warialda to Inverell. Ballast can be obtained very readily from the rivers, and sleepers from ironbark forests at Warialda and east of the Narrabri to Moree railway. The ruling gradient against the heavier loading proceeding from Inverell to Moree is 1 in 100, and that in the opposite direction 1 in 80. The sharpest curve is 10 chains radius.

When the question of constructing a railway from Moree to Inverell was first considered a route was surveyed north of the Gwydir River, because it was believed at the time that sooner or later an extension in the direction of Boggabilla would be made, but further investigation showed the route recommended in the present proposal to be the best.

Warialda is left out of the direct line of route because by passing about 4 miles to the south of the township a saving is effected in distance, and to the extent of £10,000 in cost.

RAILWAY

RAILWAY COMMISSIONERS' REPORT.

2. The Railway Commissioners report that the annual cost of the railway will be £16,183, and the traffic £13,422, leaving a debit balance of £2,761. The cost comprises interest upon capital expenditure, at 3½ per cent., £9,083; maintenance of permanent way, £4,225; traffic charges, £1,100; and locomotive expenses, £1,775. The traffic estimate is made up of goods, £8,810; coaching, £3,400; and mails, £1,212. These figures represent that while the line will show an annual loss of £2,761 it will return more than working expenses; and, in addition, there will be a considerable amount of traffic brought to the main line which will increase the main line's earnings.

Comparing the railway with one from Glen Innes to Inverell, they point out that while the former will make the distance from Newcastle to Inverell 34½ miles longer than it would be *via* Glen Innes, it offers the following advantages:—A comparatively level line from Werris Creek to Inverell, a distance of 255 miles, as against an exceedingly heavy road throughout by the Glen Innes route; less cost in construction, the estimate for the 96 miles 35 chains comprising the Moree to Inverell line being smaller than that for 53 miles 60 chains, which is the length of the route from Glen Innes to Inverell; country of a much superior description along the greater part of the route traversed by the railway; the existence of a large area of Crown land within a reasonable distance of the line; the presence of more settlement than is to be found along the Glen Innes route; and the prospect that the construction of the railway will lead to a fair additional development of the district.

In a letter to the Minister for Public Works, in March, 1896, the Commissioners say that a very important point in the consideration of this matter is the fact that the greater portion of the wool and produce calculated upon as forming the probable traffic for the Glen Innes to Inverell line comes from the districts to the west and north-west of Inverell, and therefore a railway from Moree to Inverell will give the settlers in the district a much improved means of conveyance.

THE QUESTION ONE OF DIFFICULTY.

3. The question whether this railway should be constructed is rendered more difficult than ordinary railway proposals by the unavoidable comparison it suggests with a line which would connect Inverell with Glen Innes, and to some extent by the consideration whether some place other than Moree or Glen Innes would not be more advantageous to Inverell and its district and to the railway system of the Colony generally.

Evidence was given in the inquiry in favour of the Glen Innes connection, and of a connection with Guyra; and witnesses were examined who were of opinion that the district might be better served if both these places, as well as Moree, were discarded, and a connection with Manilla adopted.

But the evidence generally will be found to deal mainly with a comparison of the advantages offered by Moree and Glen Innes, which, whatever may be said in favour of other places, are the most important as connecting points.

SITUATION ALTERED SINCE LAST INQUIRY.

4. When the proposal to construct a railway to Inverell from Glen Innes was before a previous Committee, in 1893, an extension of the North-western line from Narrabri to Moree had not been decided, and Glen Innes was practically the most convenient place with which, at that time, Inverell could be connected by railway. Recognising this, and finding, after due inquiry, that the proposal to construct a line from Glen Innes to Inverell was one that justifiably might be carried out, the Committee recommended it, and their recommendation was adopted by the Legislative Assembly. The Legislative Council, however, rejected the Bill which provided for the construction of the line, and, in 1895, Parliament sanctioned the extension of the railway from Narrabri to Moree. These proceedings, and an uncertainty now apparent as to railway connection between Inverell and the Great Northern railway eastwards, materially alter the situation.

The

The railway authorities see, in the altered circumstances, greater advantage in running a railway from Moree than in constructing one to Glen Innes. The residents of Inverell are divided in opinion as to whether the railway should go to Inverell *via* Glen Innes or *via* Moree.

HOW THE RAILWAY WILL SERVE INVERELL.

5. Inverell, with a population in the electorate of 8,124, is the centre of a district producing wheat, maize, and potatoes for home consumption and export, and it includes within its electoral boundaries pastoral properties depasturing about 586,000 sheep. At the present time its trade operates east and west—chiefly east—the nearest railway communication being in the direction of Glen Innes. With a railway at its doors, and carriage rates such as to bring desirable markets within reach as cheaply as may be done by way of Glen Innes, the bulk of the trade of Inverell, it is believed, will be carried on over the line *via* Moree. The districts about Moree and Narrabri are regarded as suitable markets, and what they cannot take of the surplus products of Inverell may be sent on to Maitland, Newcastle, and possibly Sydney. There are also places north and north-west of Inverell and Moree which it is considered Inverell may look upon as outlets for its trade, such as Collarendabri, Mungindi, Yetman, and Walgett. The best markets for Inverell produce for some time past are said to have been in the west.

Additional settlement and population in the districts served by the railway, which it is believed the construction of the line will bring about, will add to the purchasing power of the markets Inverell will find available, while at the same time it will, in several places, materially add to production, as a much larger area than at present will be put under crop.

EXPECTED TRAFFIC.

6. The Railway Commissioners expect a traffic on the line of £13,422, of which amount £4,723 is looked for from traffic to come in at Warialda, which it is said would not have been obtained by a railway from Inverell to Glen Innes, and £1,212 from the carriage of mails. Nothing that may come to the line from east of Inverell, or from Bingara, which would be 26 miles from the railway, is included in this estimate. The goods traffic anticipated at Inverell is set down at 3,000 tons, inwards and outwards, a quantity said to be considerably less than the present traffic by railway and teams, and likely to be exceeded. The rate is 10s. a ton. Wheat, hay, straw, chaff, &c., is estimated at 5,000 tons at 8s.; wool, 1,000 tons at 17s. 6d.; live-stock, 250 trucks at 25s.; and passengers, 5,600 at 10s.

The Warialda estimate comprises goods, 1,000 tons at 10s.; wool, 2,000 tons at 3d. per ton per mile, equal to 13s. 4d.; live-stock, 2,290 trucks at 20s.; and passengers, 2,400 at 5s. The passenger traffic, in regard to both Inverell and Warialda, is based on the existing population—one journey a year to each person resident in the district.

This total traffic estimate, the Railway Goods Superintendent informed the Committee, is a low one, and, in his opinion, the results from the construction of the line will show a considerable increase.

Traffic from east of Inverell, some of the evidence indicates, will come to the railway. Twelve miles is locally regarded as the reasonable distance which a farmer will travel with his produce to a railway in preference to finding a market in another direction by road; but the opinion has been expressed that the line will be used by people within half the distance between Inverell and Glen Innes, and the railway authorities anticipate securing a large portion of the road traffic now carried on between Inverell and Glen Innes.

PRODUCTION IN THE DISTRICTS SERVED BY THE RAILWAY.

7. According to statistics produced in evidence, the annual production of the Inverell electorate is, in round figures—wheat, 153,000 bushels; maize, 107,000 bushels; potatoes, 851 tons; oats, 5,000 tons; in addition to which there are

are live stock and wool. Of maize, it is estimated 50,000 bushels would be sent westward. Wool is not a large item, as of the 586,000 sheep in the district of Inverell, there are only 240,000 around Inverell, representing 3,600 bales.

At Warialda, or in its vicinity, there is little land under cultivation, the district being chiefly pastoral, and containing 1,481,873 sheep and 56,710 cattle.

PROBABLE INCREASE OF CULTIVATION AND SETTLEMENT.

8. A considerable increase in the area under cultivation in the districts benefited by the railway will probably follow the construction of the line. According to a return put in evidence before the Sectional Committee the acreage in holdings, freehold and conditional purchase, affected by the railway, amounts to 161,496 acres, the acreage under crop to 9,757 acres, and the probable increase in the latter 9,240 acres. The Crown Lands Agent at Warialda informed the Sectional Committee that it is proposed to throw open during the present year, between Inverell and Moree, 348,000 acres in settlement and improvement leases, the land intended for agricultural settlement leases being of very good quality, and the remainder not necessarily poor land but infested with prickly-pear. The revenue from land in the district, he stated, is increasing every month, and numerous inquiries concerning land are received, mainly from Victoria. These inquiries are said to be largely due to the possibility of the railway being constructed. People who have embarked in agricultural pursuits have taken up additional conditional purchases and leases for the purpose of increasing their holdings, and, as may be seen from the evidence of witnesses examined, the farmers generally are impressed with the belief that the railway will lead to a considerable increase in their production and trade.

Around Inverell, and from Inverell westwards to within a few miles of Warialda, the land is exceptionally good, consisting chiefly of black and chocolate volcanic soil, and south of the railway route there is a lot of very good country between Warialda and Moree.

Most of the existing settlement in the vicinity of the line is north and south of the route between Inverell and Warialda; but, with the facilities which the railway will afford, an increase in the number of settlers will probably take place north and south within the limits of distance affected by the railway, in which area there is a large quantity of unalienated Crown land.

According to a statement prepared for the Committee by the Chief Electoral Officer, the existing population that would be served by the railway is 16,890. This number is to be found within an area of 35 miles each side of the line, and in portions of the three electorates of Moree, Inverell, and Bingera.

REPORT OF THE SECTIONAL COMMITTEE.

9. The Sectional Committee, who visited the district and examined witnesses at Moree, Warialda, Inverell, and Glen Innes, arrived at the conclusion, by a majority, that the proposed railway should not be constructed, but "that the connection of Inverell with the railway system should be made with the main line at or about Glen Innes."

OBJECTIONS TO THE PROPOSED RAILWAY.

10. In the evidence of some of the witnesses examined will be found some strongly expressed objections to the proposed railway, and an equally strong expression of opinion that if Inverell be connected with the railway system of the Colony the point of connection should be at Glen Innes. Shortly stated, the objections put forward are:—

- (1) A doubt whether an adequate market will be found in the west for Inverell produce.
- (2) The necessity to travel or send produce $34\frac{1}{2}$ miles further between Inverell and Newcastle or Sydney, *via* Moree, than by way of Glen Innes.

(3)

- (3) The probability, if not the certainty, that if the proposed railway be constructed a large dray traffic will still be carried on between Inverell and Glen Innes.
- (4) That the railway from Narrabri to Moree will do the work expected of the proposed line as far as Warialda.

THE OBJECTIONS EXPLAINED.

11. With regard to markets, most of the people of Inverell are satisfied that they will find those they require by the proposed railway. What produce cannot be disposed of in the west can be sent on to Newcastle, and perhaps to Sydney, provided the rates of carriage offer sufficient inducement; and it is understood they will. It matters not, the Committee were informed, what route is adopted to get to the desired markets as long as the cost of getting there is sufficiently low to enable the people to send their produce profitably. The additional distance by way of Moree is of little importance, particularly as direct connection by railway with Glen Innes is now regarded as a matter in the far future. The Railway Commissioners do not favour such a connection, and have no intention of proposing it. Moreover, they intend to adopt a system of special rates, in order to obtain for the proposed railway the traffic which now passes between Glen Innes and Inverell by road, considering as business men that they are justified in competing for trade in order to make the railway pay; and the Railway Goods Superintendent is of opinion that they will secure the whole of this road traffic. This, however, appears to the Committee to be doubtful. By the published rates in connection with the railway from Narrabri to Moree, the charge for goods from Sydney to Moree is £6 Gs. 8d. per ton, which, with the 10s. rate between Moree and Inverell, would make the cost from Sydney to Inverell, *via* Moree, £6 16s. 8d. per ton per truck load; yet certain goods can be landed, but less expeditiously, in Inverell, *via* Glen Innes, at the present time, at £4 per ton, by steamer and team. A re-arrangement of rates to meet the case of Inverell would, of course, effect the Commissioners' object, and such a re-arrangement would appear from the evidence of the Secretary for Railways to be likely, as he explained to the Committee that if goods were landed at Inverell by the railway at the same price at which they are now landed by railway at Glen Innes, teamsters would be unable to compete by taking loading from Glen Innes to Inverell.

The estimated return from the carriage of mails is noticeable, from the fact that the Railway Commissioners propose to charge £1,212, and between Inverell and Glen Innes the charge would be £645; whereas the mails are now carried by coach between Glen Innes and Inverell for £379 per annum, and can be delivered in Inverell by way of Glen Innes earlier than they probably will be *via* Moree by train. The estimate is based upon the rate per mile at which the Commissioners debit the Postal Department for the carriage of mails by railway.

COST OF A RAILWAY FROM GLEN INNES TO INVERELL.

12. The lowest estimate of the cost of a railway from Glen Innes to Inverell is £313,800, or £6,000 per mile, the length of the line being about 53 miles. The estimate of traffic is £11,040, calculated upon rates the same as those proposed to be charged on the Moree to Inverell line, and £6,266 if based on rates proportionate to the mileage. Interest on the capital cost would amount to £10,199, and—though the Railway Commissioners find they can work branch lines now much more cheaply than in the past—working expenses to £6,613, or a total of £16,812. Compared with the smaller estimate of traffic these figures show a deficiency of £10,546. The estimated cost of maintenance of this line exceeds what, in the opinion of the Engineer-in-Chief for Railway Construction, would be necessary. The ruling grade on the line would be 1 in 60.

DECISION OF THE COMMITTEE.

13. Though, as already remarked, the question which the Committee had to consider is one of difficulty, they are of opinion that the proposed railway should be constructed. Inverell and its district are of sufficient importance to justify the extension

extension of the railway system to the town, and while there is much to be said in favour of a railway connection by the shortest route, it is clear from the evidence that, should the railway from Moree not be constructed, railway extension to Inverell may be postponed indefinitely.

RESOLUTION PASSED.

14. The resolution arrived at by the Committee was passed on Thursday, 8th April, and is shown in the following extract from the Minutes of Proceedings:—

“Mr. Roberts moved,—

‘That, in the opinion of the Committee, it is expedient the proposed railway from Moree to Inverell, as referred to the Committee by the Legislative Assembly, be carried out.’

“Mr. O'Connor seconded the motion.

“Mr. Wright moved,—

‘That the motion be amended by the insertion of the word “not” before the word “expedient.”’

“Mr. Lee seconded the amendment.

“On the question, ‘That the word “not” be inserted before the word “expedient,”’ the Committee divided as follows:—

Ayes, 6.

Mr. Ewing,
Mr. Trickett,
Mr. Clarke,
Mr. Lee,
Mr. Black,
Mr. Wright.

Noes, 7.

Mr. Humphery,
Mr. Hoskins,
Mr. Roberts,
Mr. O'Connor,
Mr. Fegan,
Mr. Hassall,
Mr. Farnell.

“The amendment was therefore negatived.

“The motion was passed on the following division:—

Ayes, 7.

Mr. Humphery,
Mr. Hoskins,
Mr. Roberts,
Mr. O'Connor,
Mr. Fegan,
Mr. Hassall,
Mr. Farnell.

Noes, 6.

Mr. Ewing,
Mr. Trickett,
Mr. Clarke,
Mr. Lee,
Mr. Black,
Mr. Wright.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 21 April, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM MOREE TO INVERELL.

TUESDAY, 1 SEPTEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the proposed Railway from Moree to Inverell.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make with regard to the proposal before the Committee? I have a short statement which I will read. It is as follows:—The question of connecting Inverell with the railway system of the Colony has been before the Department for several years. Originally, the routes proposed were for a connection with the Great Northern Line at one or other of the following points, viz.:—(1) Glen Innes; (2) Guyra; (3) Uralla; (4) Kentucky. Before the Great Northern Railway was constructed a line was also proposed *via* Tamworth, Manilla, and Barraba. After very careful consideration it was decided that the Glen Innes line offered the most advantages, and the proposal was submitted to the Public Works Committee in 1891, but the Committee, after inquiry, then reported adversely. The proposal was again submitted to the Committee in the following year, and after investigation it was then recommended that the work should be carried out. A Bill to sanction the construction of the line was laid before Parliament in January, 1894, and after passing the Lower House was eventually negatived by the Legislative Council in June, 1894. Since that time the railway has been extended from Narrabri to Moree, and a new point of connection with Inverell has thereby been presented, the outcome of which is the proposal now submitted. In September, 1894, the Minister gave instructions for an exploration of the country between Moree and Inverell to be made. This was done by Mr. Surveyor Stuart, and his report was forwarded to the Minister by Mr. Firth, then Acting Engineer-in-Chief, on 3rd October, 1894. Upon this the Minister gave instructions for a trial survey to be made, and four surveyors were accordingly despatched for the purpose. Various deviations have been proposed and investigated in the course of the survey, but it is stated that the route now proposed is the one which appears to best meet the general requirements of the district.

H. Deane,
Esq.
1 Sept., 1896.

Official Description.

The following is the official description of the line:—Length, 96 miles 35 chains. Estimated cost, £279,500, or £2,898 6s. per mile, exclusive of land and compensation. This proposed light line begins by a junction with the Narrabri to Moree railway now under construction at about half a mile south of Moree Station, at 314 miles 31 chains 58 links from Newcastle, and proceeds eastward on the south side of the Gwydir River at a distance from it varying from a $\frac{1}{4}$ to 4 miles. It spans this river at Ezzy's Crossing about 2 miles below the confluence of the Warialda Creek, and the latter is crossed about 4 miles south of the Warialda township. Here the line begins to rise towards the tableland by Kelly's Gully valley and adjoins the main road from Warialda to Inverell at about 10 miles from the former place and leaves the road about 10 miles further on. It then intersects nearly at its centre the parish of Little Plain, and crossing the dividing range between the Gwydir and Macintyre Rivers, approaches the road again at the south end of the parish of Byron and ends at the west bank of the latter river close to the town of Inverell. The works are generally of a light character between Moree and Warialda and somewhat heavier from Warialda to Inverell. The ruling gradient against the heavier loading proceeding from Inverell to Moree is 1 in 100, that in the opposite direction being 1 in 80. The sharpest curve is 10 chains radius.

H. Deane,
Esq.*Railway Commissioners' Report.*

The Railway Commissioners' report is as follows:—

1 Sept., 1896.

Office of the Railway Commissioners of New South Wales, Sydney, 18 August, 1896.

Proposed Line of Railway from Moree to Inverell—96 miles 35 chains.

IN accordance with the provisions of the Public Works Act of 1888, section 13, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a light railway line (exclusive of land and compensation) at £279,500

Annual Cost—

Annual expenditure at 3½ per cent.	£9,083
Cost of maintaining permanent-way, and traffic, and locomotive expenses	7,100
Total annual cost	£16,183

Traffic Estimate—

Goods	£8,810
Coaching	3,400
Mails	1,188
Total estimated traffic	£13,398

The distance from Newcastle to Inverell, *via* Moree would be 412 miles, about 34½ miles longer than the route by way of Glen Innes, but the following great advantages lie with the Moree route, namely—

- (1.) The comparatively level line from Werris Creek to Inverell, a distance of 255 miles, as against an exceedingly heavy road throughout by the Glen Innes route, the main Northern line passing over two mountain ranges, the highest point crossed on the Moonbi Range being 3,045 feet, and the New England Range, 4,514 feet, the total height the traffic has to be lifted in going from Werris Creek to Glen Innes being 6,609 feet.
- (2.) The cost of constructing the 96 miles 35 chains is less than the estimated cost of construction of the 53 miles 60 chains from Glen Innes to Inverell.
- (3.) The country lying between Moree and Inverell is of a very much superior character, for the greater part of the distance, to that lying between Inverell and Glen Innes.
- (4.) A much larger area of Crown lands also lies within reasonable distance of the line under consideration, whereas, on the other route, the major part of the land has been alienated from the Crown.
- (5.) The settlement is, also, more considerable along the Moree route than along the Glen Innes route.

There is no doubt that the construction of this line would lead to a fair additional development of the district.

The ruling grade on the new line will be, in the direction in which the lightest load will go, 1 in 80; against the heaviest load, 1 in 100.

The Common Seal of the Railway Commissioners
of New South Wales was hereunto affixed,
this 18th day of August, 1896, in the pre-
sence of—
H. McLACHLAN.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The line appears to be viewed with favour by the residents of the district. On the 11th October, 1895, an influential deputation, consisting of a number of Members of Parliament and others waited upon the Minister to urge that the proposal might be submitted to the Public Works Committee, and a Petition was then presented by Mr. Hassall, signed by about 1,100 inhabitants of the district interested, in support of this proposal. I hand in a Book of Reference, a compilation of Parish Maps, and a section of the line in four parts.

Estimated Cost of proposed Line.

The following is a detailed Estimate of Cost of the line, made out in five portions, to which is attached a summary of the whole:—

17 August, 1896.

MOREE TO INVERELL.

Part No. 1.

DEVIATION south-side of Gwyder River.

ESTIMATED cost of a single line of railway 23 miles 38·90 chains in length with 60-lb. rails.

Description.	Estimated cost.			Average per mile.
	£	s.	d.	
Earthworks	5,636	12	9	240
Timber bridges and small timber openings	3,053	3	6	130
Level crossings, cattle-stops and fencing	1,707	10	0	73
Permanent-way material	14,824	7	6	631
Freight, &c.	4,350	16	0	185
Platelaying at 1s.	£2,066	15	0	581
Ballasting (½) at 3s. 6d.	3,618	18	0

Length adopted by Engineer-in-Chief—96 miles 35 chains.

H. D.

2. Can you tell us what the Departmental reasons were for preferring this new route from Moree to the old route from Glen Innes to Inverell? I think that the new route has been proposed chiefly upon the representations of the Railway Commissioners.

3. They thought that it might be wiser to have a comparatively level, though longer, route than a shorter route with more engineering difficulties? Yes. The advantages of the proposed route are explained in the Commissioners' report, wherein they point out that in proceeding from Werris Creek to Inverell, *via* Moree, the grades will be easier and the total height to be surmounted will be less than in proceeding by way of Glen Innes.

4. *Mr. Trickett.*] This proposal is comparatively a new one? There was an old survey, but I have disregarded it, because it seems to have fallen altogether into abeyance.

5. Of late years the agitation has been for a railway to Inverell from Glen Innes, Guyra, Uralla, or Kentucky? Yes. The country through which the proposed line will pass is by no means flat, and, while we propose to construct a light line, the line will be by no means so light as the Narrabri to Moree line, the Condobolin line, or other lines that have recently been under the consideration of the Committee.

6. What would be the cost of a bridge over the Macintyre at Inverell? I have put it down at £7,953 15s.

7. *Mr. Wright.*] Will it be of wood or of iron? Of wood.

8. *Mr. Trickett.*] What would be the cost of the bridge crossing the Warialda Creek? £2,250.

9. What is the sharp curve shown in the fourth section of the line? That curve is necessary in order to get the grade. We have to follow round the ground.

10. The proposed line terminates at Inverell, on the western side of the river? Yes; but I have allowed for the construction of a road bridge to suit the convenience of traffic from Inverell to the railway. A bridge has recently been constructed on the south side of the town; but it will be of no use in affording access to the railway station. The station will be at the continuation of Byron-street.

11. Is that one of the main streets of Inverell? Yes.

12. The object of stopping short of the river is to avoid the expense of constructing a bridge over the river? The object of stopping at the river is to obtain a good station site. The best site is on the western side of the river. If you cross the river there is no suitable site immediately upon the other side, the ground there being low and partly subject to flood. The only place where you could get a suitable site would be between Grieve-street and Bennett-street, on the eastern side of the town.

13. I suppose that an extension of the railway to that point would mean great expense in resuming land? It would involve a mile and a half of extra construction at an additional cost of between £2,000 and £3,000, and there would also be the cost of resuming private property.

14.

14. Is the place where you propose to put the station sufficiently convenient to Inverell? Yes, the site is a very good one. It is as near the town as we can get, and when a road is made it will be found very suitable.

15. Is it as suitable as the other site you have mentioned would be? It is as near to the principal part of the town, though it is not in the town.

16. Is the site you propose to adopt Government property? It is private property, but improved.

17. It is not built upon? No.

18. It will not be very expensive to acquire? I think not.

19. Can you tell us why the last section of this line will be so expensive? Chiefly on account of the heavy earthworks and culverts.

20. I suppose the country is something like that which you meet after leaving Inverell to go to Guyra? Yes. Proceeding from Inverell towards Moree, there is a pretty stiff rise, and we have to wind about considerably in order to get the grade we want.

21. That will necessitate somewhat extensive embankments? Yes; they are shown on the section I have already handed in.

22. Is it the character of the excavation or the quantity that will make it costly? Only the quantity. The soil is soft on top; but harder down below.

23. Have you been over the line? Yes.

24. Therefore, you are in a position to state that these charges are approximately what the cost will be? Yes, the charges are fair ones. The character of the country at the Inverell end brings the cost of earthworks up to £661 per mile, and of culverts, bridges, and small openings to £609 per mile.

25. What was the average cost per mile of the line from Narrabri to Moree? £2,409.

26. *Mr. Wright.*] Including sleepers? Yes.

27. *Mr. Trickett.*] Then the cost of the first 20 miles of the proposed line will be about £200 per mile less than the cost of the Moree line? £127 per mile less. £2,282 per mile as against £2,409 per mile.

28. The difficulties gradually increase as you get to Inverell? As you will see from my estimate, the first section is the cheapest; then comes the fourth, then the third, then the second, and lastly the fifth.

29. Have you made as cheap an estimate as you think the work can be done for? I think so. I have gone into the matter very carefully.

30. In your report you say that the proposed route is apparently favoured by the residents of the district— which district do you mean? In Inverell there is, no doubt, some difference of opinion; but I know that a good many persons have stated that they would be satisfied if they got this line.

31. However, that is a matter into which you did not specially inquire? No.

32. Is not Warialda, a town of considerable importance? It is a small town.

33. Why does the line avoid that place? It saves a considerable amount to leave Warialda out.

34. Does it save in distance? There is a slight saving in distance, and a saving of about £10,000 in cost.

35. How far will Warialda be from the line? About 4 miles.

36. The country up towards Warialda becomes a little difficult? It is very difficult, leaving Warialda, and going eastward.

37. The proposed line would be constructed to carry the same class of traffic as will be taken by the line from Moree to Narrabri? Yes; and the grades are precisely the same.

38. Will it be possible to construct the railway quickly? Yes.

39. But not so quickly as the Moree line? No; because it is more costly, and longer.

40. Is there sufficient material along the line to make the embankments and so on? Yes.

41. Is there anything special in regard to the line which you would like to mention? There is nothing remarkable about it. We can get ballast very readily at the rivers, and there is an ironbark forest near Warialda. We can also get ironbark from the range to the east of the Narrabri to Moree line, and water will be easily procured at convenient places.

42. The line has everything in its favour? Yes.

43. I suppose you are acquainted with the route of the proposed line from Glen Innes to Inverell? Yes; I have been over it two or three times.

44. What was the lowest estimate for that line? £6,077 per mile—the total cost being £317,907.

45. How would that line compare, so far as engineering difficulties are concerned, with the line under consideration? It passes through much rougher country, and the earthworks would be more expensive, because a great deal of basalt would have to be excavated. Then, too, the ruling grade on the line from Glen Innes to Inverell would be 1 in 60.

46. Would the country through which it passes be as good? It is all very good country, though the country at the Moree end may be better than that on the Inverell to Glen Innes line, because it is lower and flatter, and there is more black soil there, while, too, the climate may be better.

47. Does the Government hold more land along the line of route than is held by private individuals? I have not got that information; but I can prepare you a statement in regard to the matter.

48. Is not the information given from the Book of Reference? Yes. The first part of the line passes very largely through Crown lands and reserves.

49. But in other parts it goes chiefly through private property? Further on it goes almost entirely through private property.

50. What about the Glen Innes to Inverell line? That goes very largely through private property.

51. If the proposed line were constructed it would cut Inverell off from any chance of connection with the Northern line and thence to Queensland, or with the North Coast by way of Glen Innes? Yes.

52. You are not prepared to express any opinion as to which is the better line from the point of view of traffic? No.

53. *Mr. Lee.*] It is stated in the Railway Commissioners' Report that it will cost less to construct a line from Moree to Inverell, which makes the distance from Inverell to Sydney $34\frac{1}{2}$ miles longer, than a line from Glen Innes to Inverell? The difference between the lengths to be constructed in either case is more. A line from Moree to Inverell would be about 96 miles in length, and a line from Glen Innes to Inverell about 52 miles, a difference of about 44 miles.

54. Yet the proposed line can be made more cheaply than a line from Glen Innes to Inverell? Yes.

55. When was the estimate of the latter line made? At the end of last year.

56.

H. Deane,
Esq.

1 Sept., 1896.

- H. Deane, Esq.
1 Sept., 1896.
56. That would be about the time when the estimate for the proposed line was made out? The estimate for the proposed line has only just been completed.
57. Were both lines estimated on the same class of construction—that is to say, with the same provision for ballast, sleepers, &c.? Yes.
58. Exactly the same? Yes; both estimates have been made under the same conditions, and provide for the same class of accommodation.
59. It is the same description of line in each case? Yes.
60. The lines are in every respect identical? Yes; they have been estimated upon exactly the same basis, except that the engineering contingencies in regard to the line from Glen Innes to Inverell have been put down at 15 per cent., and in connection with the proposed line at 12½ per cent.
61. Is there any other difference? No; that is all. Of course the earthworks on the Glen Innes to Inverell are heavier than those on the proposed line. You cannot make the cost of both lines the same, because the country between Glen Innes and Inverell is much heavier than the country between Inverell and Moree.
62. How much less will the proposed line cost than a line from Glen Innes to Inverell? The cost of the Glen Innes-Inverell line would be about £6,077 per mile as against £2,893 per mile for the proposed line.
63. The estimated cost of the Glen Innes to Inverell line in November, 1892, was £8,000 per mile? Yes that was a rough estimate.
64. In that estimate you allowed 6s. each for sleepers, while in the estimate now before the Committee you only allowed 2s. 9d. each for sleepers? In the revised estimate for the Glen Innes to Inverell line, I have allowed 3s. each for sleepers.
65. What about ballast? I have allowed for ballast at 3s. 6d. The chief reason for the reduction in the cost of the Glen Innes to Inverell line is the adoption of sharper curves. When the proposal was submitted in 1892, we had curves of 12 or 14 chains radius; but now we have substituted curves of 10 chains radius, with a view to cutting the estimate down to its lowest limit.
66. Does your estimate for the Moree to Inverell line provide for ballasting right through? No; I have taken it according to the country. On the flatter country near Moree I have allowed for half ballasting, and for other parts of the line I have allowed chiefly for one quarter ballasting.
67. What have you allowed on the Glen Innes line? I have allowed for the whole of that line at one quarter.
68. But is there not a large tract of country between Glen Innes and Inverell which is sufficiently sound to carry an ordinary line without ballast? That remains to be seen.
69. Is not the country, as a rule, much sounder than the country between Narrabri and Moree? Yes.
70. If ballast is not provided for on the Narrabri to Moree line, why should it be provided for on the Glen Innes to Inverell line? I have provided for two-thirds ballasting right through on the Narrabri to Moree line. I allowed about 1,200 cubic yards to the mile.
71. But on the Glen Innes to Inverell line is there not a large tract of solid hard country? Yes.
72. Particularly over the Waterloo Range and the country beyond? Yes.
73. Would it be necessary to ballast that part of the line? No; I should probably leave a great part of that line unballasted; but ballast would be necessary in crossing the flats, and in going up the valleys.
74. In all the soft places? Yes.
75. The Commissioners say in their report—
(1.) The comparatively level line from Werris Creek to Inverell, a distance of 255 miles, as against an exceedingly heavy road throughout by the Glen Innes route, the main northern line passing over two mountain ranges, the highest point crossed on the Moonbi Range being 3,045 feet, and the New England Range 4,514 feet, the total height the traffic has to be lifted in going from Werris Creek to Glen Innes being 6,609 feet.
- Is not 4,500 feet the highest point upon the northern line? Yes; the way in which that total has been obtained is by adding all the rises. I did not check that part of the Commissioners' statement, though I think it is approximately correct.
76. Is it a right way to make the calculation? I think so. These rises are all against the load.
77. Have you made a similar calculation in regard to the proposed line? No; I have not touched upon the question.

THURSDAY, 3 SEPTEMBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

- H. McLachlan, Esq.
3 Sept., 1896.
78. *Chairman.*] You are instructed by the Commissioners to represent them in this matter? Yes.
79. Are you prepared to make any statement to the Committee? No; I believe the Committee have already had the Commissioners' report of the 18th August.
80. Can you give us a statement as to the hauling power of an engine upon different grades? It is calculated that one of our ordinary goods engines—"205 class," not one of the extra heavy engines—can haul, at a speed of 10 miles an hour, 210 tons upon a grade of 1 in 40, 265 tons upon a grade of 1 in 50, 315 tons upon a grade of 1 in 60, 410 tons upon a grade of 1 in 80, and 500 tons upon a grade of 1 in 100.
81. Can you give us a similar statement showing the effect of grades upon speed? No; but I will ask an engineer to work out the information.
82. What is the ruling grade upon the suggested line from Glen Innes to Inverell? 1 in 60.
83. And upon the Great Northern line? 1 in 40.
84. *Mr. Clarke.*] Are you pretty well acquainted with the route of the proposed line? I have not been over it. I only know of it from the reports.
- 85.

MINUTES OF EVIDENCE—RAILWAY FROM MOREE TO INVERELL.

H.
McLachlan,
Esq.

3 Sept., 1896.

85. You are not aware if there is any settlement there? The reports indicate that there is a considerable settlement. The district is well settled, for a country district, and the land is good. Mr. Harper explored the whole country on behalf of the Commissioners, and he will be able to give you information in regard to every mile of it.

86. Is not the estimated cost of the line rather high? No, it is rather low, if compared with existing lines.

87. Would it pass through rough country? The country is pretty rough towards Inverell. Nowhere is it like the country between Narrabri and Moree, or about Berrigan, and consequently more expensive construction is required.

88. Is it intended to ultimately carry the line on from Inverell to Glen Innes? So far as the Commissioners are aware there is no such intention.

89. What is the distance from Moree to Sydney? *Via* Narrabri, 413 miles.

90. And from Moree to Newcastle? 313 miles.

91. Are you of opinion that the proposed line will serve the district better than a line from Glen Innes to Inverell? That is the opinion of the Commissioners.

92. What portion of the Queensland trade would the line get? It would influence that traffic. We are likely to get more of the Queensland trade if the line is constructed than we get under present conditions.

93. Will you not get part of the Queensland trade on the Narrabri to Moree line? We expect to do so.

94. The Queensland trade will go to Moree in preference to Inverell? Yes. We look upon the Narrabri to Moree line as an accomplished fact. The contractors are running over it now.

95. Then what good can result from the proposed extension, if the Narrabri to Moree line gets the Queensland traffic? The Commissioners, in their report upon the proposed line, do not refer to the Queensland traffic. They think that the local advantages are sufficient to warrant the construction of the line. Any traffic coming down to Warialda or Inverell would be carried on the proposed line.

96. What is the distance from Warialda to Moree? About 40 miles.

97. In the event of the Tamworth to Manilla line being constructed, would any of the Queensland trade come to Manilla? I do not think so.

98. Do you think it likely that that line, if constructed, would be carried on to Barraba or Bingara? There is no such intention at present. It would be a heavy line to make, and the grades would be severe. Mr. Harper was sent over all these routes to collect information in regard to them for the Commissioners, and Mr. Deane also sent an engineer to make a rough survey of the country.

99. What is the distance from Glen Innes to Sydney? 422 miles.

100. The Commissioners estimate that there will be a loss of about £2,000 a year on the proposed line;—is not that a heavy loss? It is not a heavy loss, considering the circumstances. The line would return a very good profit over working expenses, and it would develop country and throw additional traffic on to the main line.

101. I suppose Mr. Harper will be able to give us all information in regard to traffic? Yes.

102. *Mr. Lec.*] Will you explain the diagram which you have placed before the Committee? It is a diagram, having for its object a comparison of the grades between Werris Creek and Inverell, *via* Glen Innes, and Werris Creek and Inverell, *via* Moree.

103. What is the grade on the line to Inverell, *via* Glen Innes? The ruling grade on the Great Northern line between Werris Creek and Glen Innes is 1 in 40. Between Werris Creek and Moree there is a grade of 1 in 50, or 1 in 55. That grade could be cut out if the traffic warranted it, and the heaviest grade would then be about 1 in 70.

104. The heaviest grade upon the Great Northern line is at Ben Lomond? There are several places where there is a grade of 1 in 40.

105. If it were necessary, these grades could be cut out? The grade on the Werris Creek to Moree line to which I have referred could be cut out at a comparatively small cost; but to cut out the grades upon the Great Northern line would mean so enormous an expenditure that the Commissioners would not look at the proposal.

106. What has been done at Locksley? Those are small cases. The Commissioners have never carried out so expensive a work as the cutting out of the grades on the Great Northern line would be.

107. But if the traffic demanded it these grades could be taken out? No doubt it would be possible; but it would be commercially impracticable.

108. Is not everything practicable after what the Commissioners have done at Locksley? Of course everything is possible for money. For instance, you might make a straight line to Bathurst by tunnelling through the mountains.

109. What is the length and cost of the deviation at Locksley? About 4 miles. It cost £36,000.

110. Do you not think that it would be possible to make similar improvements upon the Great Northern line? Not for anything like the money.

111. On what data do you base these statements? Upon knowledge of the country. The matter has never been inquired into.

112. If the country had been examined as closely as the Western line in the neighbourhood of Locksley has been examined probably the grades there could be reduced at the same if not at a lower cost? Locksley is only one place. There are a great number of grades upon the Northern line, and the traffic would not warrant the expenditure necessary to reduce them.

113. When the Western line was made the traffic would not have warranted the cutting out of any grades;—is it not reasonable to suppose that when the traffic on the Great Northern line increases the grades there will have to be cut out? It would be unreasonable at present to try and cut them out.

114. But supposing the traffic warranted it? The traffic does not warrant it; you have to look at facts as they exist to-day.

115. If the traffic warranted the cutting out of the grades upon the main Northern line, could they not be cut out just as the grades upon the Great Western line have been cut out? The work could be done, of course, if you had the money to spend; but so many thousands of pounds would be required as to make it impracticable.

116. In view of the Great Northern line being one of our main trunk lines, I ask you whether it would not be possible to reduce the grades there, just as the grades on the Great Western line have been reduced? I do not think it would be impossible to reduce the grades there; but it would mean an enormous expenditure. You must look at facts as they exist to-day.

H.
McLachlan,
Esq.
3 Sept., 1896.

117. You are not in possession of any data which would warrant you in making a statement of an emphatic character, for the simple reason that the country has not been explored by railway engineers since the line was made? I am in possession of sufficient information to be able to say that it would require an enormous sum to reduce the grades upon the line to Glen Innes.

118. How many miles of 1 in 40 grade are there? I have not the details with me.

119. If these 1 in 40 grades are not continuous they could be flattened at a moderate cost? I think it would cost an enormous amount to reduce them. Besides these 1 in 40 grades there are grades of 1 in 50 and 1 in 48. Where you have bad grades over a long length of line it takes an enormous amount to improve them.

120. But precisely the same remarks would apply to the Western and Southern Lines, where you have spent an enormous amount of money in improving the grades? The Commissioners have spent a good deal in improving those grades.

121. There was a grade of 1 in 33 upon the main northern line, and that has been cut out? Yes.

122. Is it not reasonable to suppose that, with further exploration, means could be found for reducing these grades? They could be reduced if we had the money.

123. How have the Commissioners calculated the lift from Werris Creek to Glen Innes? They have shown the total lift. If you started from sea-level and rose to a point 1,000 feet high with continuous lifts, and then descended 500 feet, and rose again another 1,000 feet, your total height above sea-level would be 1,500 feet; but the total lift would be 2,000 feet.

124. Every up grade from Werris Creek to Glen Innes has been counted as part of the lift? Yes; the Commissioners have shown the aggregated lift.

125. Does it not appear strange that to get over a point 4,514 feet high—your highest point—you should have a lift of 6,609 feet? No; because the lift is not continuous. I suppose no line has a continuous lift.

126. Was the lift ever estimated upon this basis before? The Commissioners do not base any calculations upon their statement in regard to the lift. They simply place the information before the Committee.

127. What is the aggregated lift upon the Moree line? I have not got that information.

128. Will you tell the Committee why it has not been put before us? It would be very small alongside the other. I can, however, get the information. This is not a new discovery on the part of the Commissioners. It is a method of calculation which has been used before. I have seen it referred to in Sydney by people other than the Commissioners.

129. Then, if you had as many ups and downs as would amount to a lift 20,000 feet before you got over a height of 4,500 feet, you would consider the total lift 20,000 feet? Yes.

130. The Commissioners' report says that the grade for the light load on the proposed line will be 1 in 80? Yes. That is going to Inverell.

131. And that the grade for the heavy load will be 1 in 100—that is the return grade? Yes.

132. Therefore the heavy traffic will have the better grade? Yes.

133. If the height of Glen Innes station is 3,518 feet and the height of Ben Lomond station is 4,471 feet, there is a difference in elevation between the two places of over 900 feet, the distance being 22 miles? Yes.

134. From Ben Lomond to Werris Creek, is there not a continuous down grade? No; there is a number of up grades. Near Walcha Road and the Macdonald River there are two very sharp pinches.

135. Those grades must be very short? I think they are both fairly long. There is a number of other heavy grades coming this way.

136. From Ben Lomond to Werris Creek is about 146 miles? Yes.

137. Except at the two places you have mentioned, there is a continuous down grade? No; there is a number of other up grades. I will show the Committee a section of the Northern line showing the grades.

138. What is the height of Inverell? A little under 2,000 feet.

139. Do you consider a grade of 1 in 60 fairly good? If there were heavy traffic we should not consider it a fair grade. In England it would be considered a steep grade.

140. Can you inform the Committee what has dominated the recommendation of the Commissioners that the Inverell traffic should be brought to the metropolis by a route 34½ miles longer than is necessary? The Commissioners were asked to express their opinion upon the proposed line, and they reported that it would be cheaper to make the proposed line than a line from Glen Innes to Inverell. The actual cost of construction would be less, while more country, and better country, would be opened up. I believe that the Inverell people are in favour of having a western market, which the proposed line would give them.

141. But if this line be carried out they will be shut off from any connection with the main northern line above Werris Creek, and be prevented from trading with Queensland or with the north coast? Yes.

142. The Commissioners have decided that the proper way for the Inverell traffic to go is out west, and then round by way of Moree, instead of direct to the northern line, and so, if necessary, to the coast? Having taken all the circumstances into consideration, they have recommended what they think the better route.

143. What is the estimated annual loss upon the line from Tamworth to Wallangarra? Something like £60,000 from Armidale and £90,000 from Tamworth.

144. Will you explain to the Committee what prospect that line has of pulling up its arrears if its natural traffic is taken from it in the way proposed? I do not think it will pull up its arrears; but a connection from Glen Innes to Inverell would cost more than the proposed line, and would get less traffic. You could also work the proposed line more conveniently.

145. Does not the Commissioners' recommendation appear to determine for all time that the main northern line shall have no opportunity of earning interest upon its cost and working expenses? I do not know that it makes much difference to the northern line. The railway system as a whole gets the traffic in any case, and the proposed line would serve more people and a larger district at a lesser cost than a line from Glen Innes to Inverell. I do not know why we should consider the northern line particularly in this matter.

146. Do the Commissioners recommend the construction of the proposed line? Yes; and they have made their recommendation after a full consideration of all the circumstances.

147. I notice a very important omission in the Commissioners' report;—it has been usual for them to recommend that a line should be constructed only if the land required were given free of cost;—can you explain why that recommendation has not been made in this case? No.

148. Are you aware that the surveyed route passes through at least 210 different holdings? No.
 149. If it does pass through so many holdings the resumption must necessarily be very large? The land may not be very valuable, unless there are town lots. The proposal is to pass outside the town of Warialda altogether.

H.
 McLachlan,
 Esq.
 3 Sept., 1896.

150. But a large area of land would have to be resumed? Yes. I know, however, that there is a great deal of Crown land in that district. In the five counties through which the railway would serve there is a very large acreage of Crown land available for settlement.

151. Do you know whether the land-owners there have signified their intention of giving the land for the construction of the line? They have not done so, to my knowledge.

152. Then the question of land resumption and severance will be an important one in connection with this extension? The Commissioners' opinion is that where a new line is made it should be upon condition that the people owning the land through which it will pass, and benefiting by it, should give that land free. That is the general principle upon which they have gone, although they do not refer to it in all their reports. They made a special statement in regard to it when they first reported upon branch lines.

153. Where a proposed line shows a loss of nearly £2,000 a year, do you not think that the necessary land should be required to be given? It is the opinion of the Commissioners that on all these new lines the land should be given free.

154. Teamsters compete very seriously with the railway in the north? Yes.

155. Are not very large quantities of goods conveyed by team from Grafton through Glen Innes to Inverell? There is a fair team traffic that way.

156. That has been going on for years? Yes.

157. Have the Commissioners recommended the proposed line in order to fight that traffic? No; that is not one of the great objects which they had in view.

158. If the proposed line was constructed, would not the traffic that I speak of still continue? I do not think so. We shall have the advantage of the cost of cartage between Glen Innes and Inverell. We shall be in a better position to compete for the trade than we are now.

159. I cannot see how the extension of a line 40 miles west from Glen Innes is going to stop the traffic I speak of? If we can land goods at Inverell at the same price as we now land them at Glen Innes, teamsters will be unable to compete by taking loading from Glen Innes to Inverell.

160. The Commissioners have already endeavoured to prevent the leakage on the northern line by establishing differential rates? Yes. At the present time, traffic to Inverell from Glen Innes, starts upon equal terms, whether it comes from Grafton or is brought to Glen Innes by railway; but, if the proposed railway is made, we shall be able to take goods to Inverell as cheaply as we now take them to Glen Innes, and we shall thus have the advantage of the cost of carriage between Glen Innes and Inverell.

161. Can you say definitely whether the Commissioners make the recommendation that the lines should be carried out only upon the condition that the necessary land is given? No; they make no recommendation at all. Neither did they make such a recommendation when reporting upon the Glen Innes to Inverell line, though they laid down the general principle in 1889.

162. Are the Commissioners prepared to make that recommendation in the case of this line? I am not aware.

163. Are we to understand that the Commissioners are prepared to recommend the construction of the proposed line, even if the land required is not given? I am not aware, but I will make inquiries.

164. Have you any views with which to favour the Committee as to an ultimate connection with the North Coast? No.

165. Or upon the possibility of the adoption of a uniform gauge by Queensland? The question of a uniform gauge is a good deal in the future. The Commissioners hold the idea that there should be a uniform gauge between the Colonies, and especially on the lines connecting the capitals. I do not know, however, that the traffic between Inverell and Queensland makes the question of much importance.

166. There has never been any opportunity for cultivating the trade between Inverell and Queensland? No; but it cannot be said that there is likely to be any great traffic there.

167. At all events, the Commissioners are of opinion that the Glen Innes-Inverell traffic should be brought to Sydney by way of Moree? Having considered all the circumstances, the Commissioners are in favour of the proposed line.

168. *Mr. Wright.*] I understand from you that the Commissioners are under the impression that if the proposed line was constructed they would secure a large part of the Queensland trade? I was referring to the line from Narrabri to Moree when I spoke about the Queensland trade.

169. May I ask you whether the Commissioners have entered into a policy having for its object the deprivation of the adjacent Colonies of their legitimate trade? The Commissioners have not considered the proposed line in connection with the interception of the Queensland trade.

170. But is it part of their policy to construct railways to deprive the neighbouring Colonies of legitimate business? It is not part of their policy to construct railway lines at all.

171. I mean, to recommend the construction of lines? The Queensland trade has not been specially considered in connection with the recommendation of the proposed line.

172. Do you think that the Commissioners have adopted the policy of recommending lines to deprive the adjacent Colonies of trade to which they are legitimately entitled? The Commissioners have recommended lines which would obtain traffic from the other Colonies, and which traffic we have had previously. When they have been asked to report upon a line, they have considered all its probable sources of traffic.

173. You think that the Commissioners reasons for recommending the proposed line are—first, that it would be easier and cheaper to make and to work than a line from Glen Innes to Inverell; and, secondly, that it would be likely to secure a large amount of traffic? It would open up more country, and secure more business.

174. What grounds have you for asserting that it would secure more trade? Mr. Harper's reports.

175. Is not the country between Glen Innes and Moree already served by the existing lines? Unless the proposed line is made, a very valuable district will be deprived of the advantages of railway communication; and where railway communication can be given with practically no loss to the country, is it not well that it should be given.

H.
McLachlan,
Esq.
3 Sept., 1896.

176. But do you not think that the existing lines give that district all the facilities it has a right to demand, and secure the whole of the traffic? I think not. At the present time, the traffic from about Warialda drifts down to Tamworth and other stations.

177. The Commissioners' estimate of the traffic upon the proposed line is about £2,000 less than their estimate of the probable traffic on the Glen Innes to Inverell line four years ago? Mr. Harper's estimate of the traffic upon the Glen Innes to Inverell line was £8,000. He was furnished with certain figures by the local people, but he did not accept those figures. The Commissioners' estimate was £7,790.

178. Mr. Harper said in his evidence that the local traffic estimate was £15,000? Yes; but his estimate was about £8,000.

179. Will you explain how it is that, while the working expenses for the proposed line are estimated at £7,100 the working expenses upon the Glen Innes to Inverell line—which would be 3½ miles shorter—are estimated at a larger amount? I daresay that if the Commissioners were to go into the Glen Innes to Inverell estimate again they would reduce it, because experience has shown that these branch lines can be worked more cheaply than was thought six or seven years ago.

180. Would there not be a large difference in favour of the shorter line? Under similar conditions, the shorter line would be worked more cheaply. At the same time, the cost of maintenance on the Glen Innes to Inverell line would be higher than the cost of maintenance on the Moree to Inverell line.

181. The proposed line is described as a light line? Yes.

182. Would it be capable of carrying the heavier Beyer-Peacock and Baldwin engines? The Commissioners speak about using the lighter class of rolling-stock, not the new Beyer-Peacock engines or the Australian consolidated engines.

183. The traffic from the Inverell district would be of such a nature that it would require to be taken in big loads to make it pay. Do you think you could run a train load of 400 tons net over a light line? I am inclined to think that, if required, with the "205-class" goods engines you could take a train load of 500 tons gross upon the line in the direction in which the grade was 1 in 100, and 410 tons in the direction in which the grade is 1 in 80.

184. What would be the tare with a train of 410 tons? About 140 tons. You may take it at 2 to 1.

185. Do you think that the proposed line would be sufficiently stable to carry traffic of this description? I should think so, if required; but I would prefer to allow the question to be answered by an engineer. The Commissioners have no intention of running their heaviest engines upon these light lines.

186. Though they are aware that the traffic will be of the heaviest description? There will be, of course, a considerable amount of grain traffic, but a few trains of 410 tons can move a lot of stuff in a day. It would not take many trains to move the present production.

187. The prospects of the line cannot depend upon the present state of the country? Well, under existing circumstances, the line will pretty well pay for itself. Any development will return a profit.

188. That is if the Commissioners' estimate is correct? We know that it is pretty correct from our experience of other lines. Take the Cobar line, for example.

189. What are the working expenses of that line? The traffic amounts to nearly £13,000, and the working expenses to £5,400 for the past year. It is higher for 1896, but the traffic increased.

190. How do you expect to increase the traffic upon the proposed line? By the development of the district. The line will open up the market for Inverell towards Moree and Narrabri. Only a few weeks ago we had a letter from Tamworth, asking us to quote a cheap rate from Tamworth to Moree, as they found that the Inverell people were beginning to cut them out of the western trade.

191. You think that the proposed line will encourage agriculture about Inverell for the supply of the western district? Yes, and supply part of Queensland.

192. Notwithstanding the fact that Moree is open to the operations of other parts of the Colony, and of the adjacent colonies? Yes.

193. What are the rates for a truck from Sydney to Glen Innes? £30 for general goods.

194. Are you aware that goods have been delivered at Glen Innes from Grafton at a lower rate? There is a considerable traffic that way.

195. I suppose that the rate to Inverell *via* Moree will not be less than the Glen Innes rate? That has not yet been fixed; but the rate would probably be the same in each case. It would be a through rate.

196. If goods could be delivered at Inverell from Sydney at a lower rate than they could be taken there by the railway, the line is not likely to have a very large traffic? I am not aware that goods could be delivered at Inverell for less than the railway charges in the off seasons of the year.

197. I am informed that goods could be and are delivered there for less than £5 a ton? We should be in a better position to get the trade if we could deliver it in Inverell for the same price as we now deliver in Glen Innes, to the extent of the cost of road carriage between the two places. It is well known that where the traffic is competed for competitive rates apply. We charge nothing for the extra distance north from Glen Innes, and the same rule may apply in the case of Inverell.

198. Upon what was the Commissioners' estimate of traffic based? I would sooner you got that information from Mr. Harper.

199. If the estimate was based upon the existing rates for truck loads, and you carry the traffic for lower rates, the returns will be affected? The estimate is based upon a through rate, but I would sooner you got the information in regard to it first-hand from Mr. Harper.

TUESDAY, 8 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHREY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

200. *Mr. Wright*] Can you tell me whether, in reporting on a line like this, the Railway Commissioners consider their general railway policy? They deal with the line under all circumstances. Of course they would naturally consider the matter as it would affect other railways, as well as from a local point of view.

H.
 McLachlan,
 Esq.
 8 Sept., 1896.

201. They would naturally consider the future of a line like this in connection with their railway policy? They would consider all the circumstances.

202. Do you know whether any possible connection with the coast was taken into consideration in the recommendation of this line? Not in any particular way. Of course they had that question before them. What I mean is, that they would make their recommendation, considering all the surrounding circumstances at the time.

203. I think it will be admitted that one of the surrounding circumstances is an ultimate connection between the coast and the table land? Yes.

204. Do you know whether that was considered in dealing with this line? I think they had that in their minds when they recommended this line.

205. Then, in recommending this line, they recommend a line altogether dissociated from the Great Northern line? Yes.

206. Do you know whether they have any intention to continue the line to the main northern line? They have no present intention of the extension.

207. Then in dealing with the proposed line, they must have ignored any possible connection between the coast and the table-lands of New England? Yes.

208. Are you aware that there has been an agitation for a connection between the coast and the table-lands? Yes.

209. A line has been suggested from Guyra and Glen Innes? Yes.

210. And the Commissioners have ignored the possibility of coastal extension in dealing with this matter? As I have explained, they have had the whole of the surrounding circumstances before them. They have looked at future possible developments, and in view of everything, they have recommended the line.

211. Then, according to that view, everything that is to be carried to the north, or north-western portion of the Colony, must of necessity have been considered? At the present time the line would not have a connection with the coast. There is no idea of connecting with the coast.

212. Then everything in connection with the great north-western country must come to Newcastle? Yes.

213. The rights of the people in the western country and the coast land, in connection with direct communication, are absolutely ignored? At the present time, they would have no connection.

214. You say you do not think there is any future idea of connecting the Great Northern line with the coast line? I do not see anything in the immediate future. Of course, it is a long time to say "all time;" but for present and immediate future requirements, there is no intention of connecting Inverell with the coast.

215. As far as you know, there is no intention to sanction any coastal extension at all? Not as far as the Commissioners are aware.

216. Do you, as an official of the Department of considerable experience, consider it is a wise policy to bring everything to Sydney or Newcastle from the far north-western portion of the Colony? As a matter of fact, it is purely a matter of route. The traffic with Grafton, which is spoken of as the connecting point with the table land, really comes to Sydney, and they already have a connection. The immediate object to be gained is to give Inverell some connection with the coast—with the big markets of Newcastle and Sydney. They either get it this way, or by way of Glen Innes and Grafton; but the goods ultimately comes to Sydney or to Newcastle; and looking at the whole of the circumstances, the Commissioners think that what they have recommended is the best. At the same time they did not directly have before them any proposal to extend the line to the coast.

217. You are aware that the Inverell district is wheat producing? Yes.

218. And its population is a sparse one? Comparatively so.

219. You are also aware that on the northern coast land there is a large population which requires cereals in the shape of wheat, and which cannot grow them? Yes—about Glen Innes.

220. Notwithstanding that fact, you think the proper market of Inverell is in Sydney? It is not a question, I think, of a proper market. It is a question of what is best to be done, and, taking all the circumstances into consideration, the Commissioners recommend this extension. As a matter of fact, so far as wheat is concerned, it does not make a great deal of difference if the northern people get it from Tamworth. There is plenty of wheat about Tamworth.

221. You say that as far as Inverell is concerned, the railway would increase population, and give facilities in regard to the produce of the district? Yes.

222. And if the produce of that district points to another direction than that of Sydney, do you think it is the duty of the Department to give them a route which they do not want? But we understand that the people of Inverell do want this route—that they who know their own business are in favour of it.

223. I believe a section of them do, of course? Yes. The Commissioners are advised, and they themselves think, that the route they recommend is the best. Of course, it makes a market for the west as well as for Sydney and Newcastle.

H.
McLachlan,
Esq.
8 Sept., 1896.

224. But it gives no market in the direction where there is a market available—where there can be little competition? But after all the market at Glen Innes is a very limited one for a big district.
225. I am not speaking of Glen Innes. There is a market further north and east? But you would have to make the railway further east, which would cost a large sum of money.
226. Not necessarily? All previous experience has shown that to be the case.
227. We have it in evidence that the wheat-producing portion of the table-land will supply the coastal districts with wheat, even without railway communication? Yes.
228. At all events you recollect that the question of a coastal line did not at all enter into the calculations of the Railway Commissioners? As I say they recommended it in view of all circumstances, and they think the route recommended is the best one.
229. Am I right in this assumption:—that recognising the claims of Inverell to railway communication, the Commissioners thought it their duty to recommend the construction of a line by the cheapest and easiest worked route? And which they think gives the maximum of accommodation and benefit. It gives a market east as against west. Of course you must recollect that people on the coast already have excellent communication by sea—people to the west have absolutely no communication.
230. But if a farmer at Inverell wants to supply wheat to a farmer of the Clarence or Richmond River, would this route be of any use to him? No; he could not do it unless he sent it by Sydney.
231. If he wanted to supply the bulk of the wheat for the Queensland market, is this a practicable route? No, I do not think it is. The question is whether Queensland will not grow its own wheat. As a matter of fact, no wheat is now sent by the northern line into Queensland.
232. No, there is none grown? There is some grown about Tamworth. I think there is more wheat grown at the present time about Tamworth than there is about Inverell, and the difference of landing a ton of wheat in Brisbane from Tamworth and Inverell, if the railway were made, would not, I think, be more than 2s.; and 2s. would not create any wonderful development.
233. You refer to the difference in haulage? Yes.
234. If you had a railway from Glen Innes to Inverell, as against one from Moree to Inverell, what would be the difference in haulage? What I mean is this: If you had a railway from Inverell *via* Glen Innes to Brisbane, as against a railway from Tamworth, I do not think the difference would amount to more than 2s., and that is what you have to look at. You spoke about giving the people of Inverell a market. I say there is a market there, and no one takes advantage of it. We do not send a ton of wheat to Queensland by the northern line.
235. But you send a large quantity of produce into the northern districts—to the Clarence—where there is a large population? Yes.
236. And you think this would be a considerable handicap to the Inverell people, if they desired to supply the northern farmers? If there were a market to the northern farmers it would, so far as Inverell is concerned.
237. You say that the Railway Commissioners took every circumstance into consideration, and that the possible northern coastal extension was not taken into consideration? They took every circumstance into consideration when they recommended the line.
238. Having everything before them—including the possible coastal connection with the table-lands—they still recommend the Inverell farmer to send his produce to Newcastle or Sydney? They recommend the line as proposed.
239. Will you explain to the Committee what the plan represents? It is a diagram section showing the line by way of the old connection—Glen Innes—and the proposed line from Glen Innes to Inverell, and the one *via* Narrabri to Moree, with an extension from Moree to Inverell.
240. Which is the Moree line? The black one.
241. May I ask why one is in such a small compass as compared with the other? To show the alternative heights. They are drawn to scale.
242. What distance does the pink colouring represent? One is 35 miles more than the other. The black is 35 miles longer than the pink.
243. What does the pink represent? 377 miles; they both start at Werris Creek.
244. Is it 377 miles from Werris Creek to Inverell? No, that is the Sydney distance, but both start at a common point at Werris Creek.
245. Is it not a very extraordinary way to represent a chart—to aggregate all the grades in one lump? That shows the actual grades and the actual height. It does not show the lift.
246. Why was it necessary to present a diagram in this extraordinary form? That is the usual form in which diagrams are presented by railway engineers.
247. Is it customary to heap five or six grades on the top of each other? You must do that in preparing a diagram on a small scale to cover a large area of country.
248. Can you give an instance in which a similar thing has been presented to the Committee or to the public? It is not often a similar circumstance happens.
249. Within your knowledge has any plan like this been presented to this Committee or to any public body? We have not had any similar circumstance to my knowledge, but it is certainly usual to present diagram sections. It shows the two lines placed on the one set and in juxtaposition.
250. It shows the aggregate grades of the two lines? It really shows the two lines. It shows the altitudes they reach, and the grades on each.
251. But it does not show the grade on that diagram? Yes, it shows the grade in each case.
252. You misunderstand me. In the pink diagram you show the aggregate grades on an elevation of 4,000 feet? Yes.
253. Look at the left-hand section and see the hump there at an angle of 45 degrees; surely that is not a railway grade? No; because the run-up shows 20 miles of railway in a couple of inches. You rise perhaps 500 feet there in 10 miles, therefore you must naturally exaggerate your grade.
254. Then that is an exaggerated elevation of the grade? You must exaggerate your grades. You could not possibly do anything else, unless you show a plan 370 miles long. It is purely a matter of size. If you extend the plan the grades perhaps would not look so severe.
255. I think you, on a former occasion, told Mr. Lec what elevation you had? I think it was 4,514 feet.
256. That is at Ben Lomond? Yes.
257. And what is your ruling grade on that line? 1 in 40.

H.
McLachlan,
Esq.
8 Sept., 1896.

258. What length is there with a grade of 1 in 40? There are a number of grades of 1 in 40 on the section, and that controls the load. If there were only one grade, you might, with a push-up engine, get over the bad spot, but there is a number of continuous grades both ways over that section which causes the ruling grade to be 1 in 40.
259. What is the steepest grade on the Moree line? 1 in 80, and 1 in 100.
260. The cost of the line between Inverell and Moree, although the distance is greater, is less than the cost of the line between Glen Innes and Inverell? Yes.
261. Has Mr. Harper been called upon to make any further calculations as to the traffic over the Inverell to Glen Innes line? I think not—not recently.
262. Has there been any revision made of the estimate of working expenses? No.
263. You have pointed out that the working expenses on the 96 miles will be less than on the 53 miles? Yes. Of course they are a little higher in the bulk.
264. I take it that the Commissioners have been largely guided, as far as the traffic is concerned, by Mr. Harper's estimate? Yes.
265. Who made out the estimate for locomotive and other expenses? That is the Commissioners' estimate.
266. Does it not strike you as being singular that the working expenses upon ninety-six miles of railway should be absolutely less than upon fifty-three miles? They are not absolutely less. The estimate given for the old Glen Innes-Inverell line was £6,296, I think.
267. I think it was over £7,000? They made two estimates. I am not quite sure about the second one.
268. The coaching and other expenses were estimated at £6,296 per mile? Yes; that is the last report they made.
269. That is for a distance of fifty-three miles? Yes.
270. The estimate for ninety-six miles is £7,100? Yes.
271. Does it not strike you as remarkable that there should be such a wide margin of difference between the two estimates—the one line being little more than half the other in length? It might strike you as being strange, but, of course, proportionately the expenses would not be increased; because, in the first instance your locomotive expenses would probably be somewhere about the same. You would have to maintain a set of men and engines for both lines; and your traffic expenses would probably be the same, because you would have the same terminal station in each case.
272. You would have more road accommodation on a line of ninety-six miles than on a line of fifty-three miles? Perhaps not much more.
273. There would be five or six extra stations? There would not be many stations. We do not make stations on new lines like this. There would be platforms and sidings.
274. Would you not have a station to accommodate Warialda? You would have one there, but the expenses would not be increased proportionately.
275. Is there any reduced cost in the shape of material and wages? I think the Commissioners might reduce the permanent way expenses if they revised that estimate. The Glen Innes line would be a heavier line to maintain than the Inverell line, because of the nature of the country; but since that estimate was made the Commissioners have found that they have been able to reduce the working cost; and they probably would be able to slightly reduce the estimate made in 1890, if they were making it to-day.
276. Then in effect, they have found that the estimate for the Glen Innes line was an over-estimate, so far as the expenses are concerned? I would not say that altogether; but if they were making the estimate to-day they might slightly reduce it, because by different methods they find that those lines can be worked more cheaply than they originally estimated.
277. In view of the estimate for the Moree line, would they not be able to largely reduce it? I would not say that, because the traffic and locomotive expenses might not be much reduced.
278. Are you aware of the fact that Mr. Harper has stated that the construction of a line from Moree to Inverell would not take more than 6,000 bales of wool per annum away from the Tamworth to Manilla line? It is not within my knowledge.
279. I suppose I am right in presuming that the estimate is based on existing rates? It would be a truck rate to Inverell—a through rate.
280. A mileage rate for wool and cereals? To some extent it is; but the details of the estimate were not made up by me. I think it was based on what you call a through rate rather than a local rate. There is a through rate from Narrabri to Moree at the present time.
281. That is as far as Sydney and Newcastle are concerned? Yes. Naturally local traffic would bear local rates.
282. Is there any desire to make a special rate on this route? I think not.
283. You consider the line will pay without? Yes. For instance, if there were a western market it would be a local rate which would be charged, because you would start the first mile from Inverell. The distance would be short, and naturally a local rate would be charged.
284. That is for goods going out beyond Moree? Yes.
285. Would you charge a local rate there? That would naturally be a local rate, because you would start with 1 mile.
286. You would not ask for a special rate for the western traffic from Inverell? I think not.
287. You would conform to the general rates? Yes.
288. And traffic inwards to Inverell—that is, outwards from Sydney—would be at the through rate? Yes.
289. And what about a special rate? It would be to some extent based on existing rates. Of course a great deal depends on circumstances which might arise, and which would necessitate certain action being taken.
290. Is it a non-competitive line, comparatively;—would there be any necessity, for instance, to have a specially low rate? I daresay you would want a truck rate to Inverell for general goods.
291. What will be the truck rate to Inverell based on existing rates? £30 a truck.
292. Are you aware that they are landing goods now at Inverell for a little over £1 a ton, *via* Grafton? No; I am not aware of the local incidents.
293. In the event of that rate obtaining, how could you hope to compete against it? As I have said before, if a large quantity of the goods now go from Glen Innes, and have a handicap of road cartage between

H.
McLachlan,
Esq.
8 Sept., 1896.

between Glen Innes and Inverell, we must be in a far better position to compete for the Inverell and western trade than we are to-day. Most of the goods going to Inverell are for west of Inverell. If you cut into that western country you naturally must secure the trade.

294. If you can save 30s. a ton by getting your goods by sea to Grafton, and thence by road, would not the same danger exist with regard to the local supply to Inverell? Naturally, if a business man got his goods 20s. a ton cheaper he would get them by road, but I do not think that condition would exist if the railway were made.

295. You think the extra distance between Inverell and Glen Innes would prevent active competition with the road traffic? Yes; the extra cost of road cartage between Inverell and Glen Innes must be a great advantage in our favour when we could land by rail on the spot. Of course we must secure the trade west of Inverell, which, no doubt, many of those goods would apply to.

296. What will be the rate per ton for wool from Inverell to Sydney or Newcastle if the railway is constructed? I do not think that has been absolutely fixed.

297. You are aware of the rate from Glen Innes at the present time? Yes. Glen Innes to Newcastle £2 17s. 6d., to Sydney £3 15s.

298. That is for greasy wool? Yes.

299. Are you aware that at the present time wool is being delivered 20 miles west of Inverell into Sydney, *via* Grafton, for £2 10s. a ton? I am not aware.

300. Could you compete with a rate like that? That is a matter which the Commissioners would have to decide when the line was opened. It is rather premature to talk of actual rates at the present time. The Commissioners have had to meet competition before, and they will be able to meet it again.

301. I am only instancing that as the low price at which produce can be delivered from this district into Sydney by what is considered by the people as the natural outlet to the eastern seaboard? Of course that shows one of the advantages in making a connection. At present all that wool is of no benefit at all to the Commissioners. We do not get the carriage of that wool over the main line. If we make the line to Inverell we are in a position to compete for the traffic, and get it over the main line, so that, in addition to the £13,600 earnings which we should obtain locally, we should gain a lot of new business over the main line.

302. Is that amount the estimate of the local traffic? Yes; that is the value of the traffic over the local line. It does not include the through rate to Sydney.

303. Of course that obtains in connection with every extension? Yes.

304. Whatever traffic you get over the local line you get to a large extent over the main line? Yes. The Commissioners, recommending or reporting on a new line, draw attention to the fact not only that the new line is valuable in itself, but that it also helps to develop traffic on the existing lines.

305. Is it the opinion of the Commissioners that this extension will gain any traffic which they do not gain at the present time? You have shown that we are likely to gain a lot of traffic which now goes by road to Grafton.

306. I do not think you will gain that? We shall get some of it.

307. I suppose one of the objects of the Commissioners in recommending the extension from Moree to Inverell is that the line will traverse a large area of country? It will open up a large area of country. It will give the Inverell people a western market, and it is a fair line to make. For the same amount of money we can give so much better advantages to the country generally.

308. I do not think we have had a recent estimate of the Glen Innes line? I think it must come to more than £279,000. Mr. Deane's original estimate for the Inverell line was, I think, a little under £400,000, and of course it is an expensive line to work.

309. The distance is 31½ miles further to Werris Creek *via* Moree than *via* Glen Innes? Yes.

310. And do the Commissioners think this distance will be more than compensated for by the comparatively easy grades and the consequently less expensive maintenance? There are other advantages. There is the easier country, for instance. You open up a greater area of country, and the money to be spent in the first instance is considerably less. You also give other advantages—you give the Inverell people a western market, and you open up a very large area of Crown lands. There are large areas in the country, lying immediately west of Inverell, open for settlement.

311. How is the east of Inverell situated, so far as Crown lands are concerned? In the county of Arawaita there are 803,846 acres; in the county of Murchison, 318,810 acres; in the county of Courallie, 107,516 acres, which this line will cut into. In the county of Staphylton there are 316,250 acres, and in the county of Burnett there are 318,172 acres.

312. What is available east of Inverell? I know there is not so much, because it is taken up.

313. Do you know why it is intended to leave out the town of Warialda, which was included in Mr. Deane's survey? I understand the reason was that the line to the south would go into a better class of country. Immediately around Warialda the land, I believe, is not particularly good. To the south of Warialda it is good land.

314. That is only one reason why Warialda is being left out? That is one reason; and it also gives a more direct route.

315. What would be the increased distance if the line went to Warialda? I am not sure.

316. *Mr. Roberts.*] Has there not been a desire on the part of the Government for many years past to give Inverell the advantage of railway communication? Yes.

317. What are the various routes which have received consideration at the hands of the Commissioners? Only two at the hands of the Commissioners—Inverell to Glen Innes, and Inverell to Moree; but I know of my own knowledge that the Guyra route has been talked of.

318. Did the Commissioners ever report on any line except the Glen Innes to Inverell line? I think not.

319. Can you tell the Committee whether the Commissioners view with favour the line from Guyra to Inverell? I do not think they do. As I say, they never reported upon it; they think this line is the best to serve the purposes of Inverell.

320. Have the Commissioners been over the proposed line from Moree to Inverell? Yes.

321. What is the distance from Glen Innes to Inverell? It depends upon the survey you take. By the road, I think it is only 44 miles; but the survey makes it between 50 and 60 miles. Mr. Deane's last survey, I think, made it 53½ miles.

H.
McLachlan,
Esq.
8 Sept., 1896.

322. What is the lowest estimate per mile for the construction of a railway from Glen Innes to Inverell? Mr. Deane's estimate, I understand, was £8,000 per mile.
323. And the estimate of the line from Moree to Inverell is £2,898? Yes. That is £2,898, as against £8,000. Mr. Deane, if I recollect aright, reduced that estimate by extending the line.
324. *Mr. Wright.*] The other day Mr. Deane said it would be £6,000 per mile? I know he extended the length to get a cheaper line.
325. *Mr. Roberts.*] What would be the difference in the expenditure between making a line from Moree to Inverell and a line from Inverell to Glen Innes, on the basis of £6,000 per mile from Glen Innes? The difference in favour of Inverell would be, roughly speaking, £40,000 for the longer line. Although the Inverell line is longer by 43 miles, it will be cheaper by £40,000 to make.
326. Under the most favourable circumstances the line from Moree to Inverell would cost £40,000 less than the line from Inverell to Glen Innes? Yes.
327. Would the annual working expenses on a line from Moree to Inverell be less than they would be on a line from Inverell to Glen Innes? No. The working expenses on the longer line would be greater. At the same time you would deal with a much larger traffic, because you would deal with a much larger local business. The whole result would be very much in favour of the Inverell-Moree line. Naturally, to some extent the working expenses would depend upon the amount of business to be done.
328. Then the annual expenditure would be more on the Inverell to Moree line? I think it would be a little more.
329. But would you get a larger quantity of freight? Yes, much larger.
330. Am I to understand that the actual return would show a much larger profit by the proposed route than by way of Glen Innes? Yes.
331. What is the estimated loss per annum if the line is constructed? About £2,800.
332. Can you tell me how long a period will have to elapse before the line will become a paying one? I could not say that. Indirectly it may pay almost from the first, because it will bring additional traffic to the main line, and will help to make it better paying; so that indirectly it may pay expenses from the start.
333. I suppose the estimated loss of £2,800 is a low one? It is a fair statement of traffic; and the Commissioners have taken no credit for the value of the traffic on the main line. It refers purely to local business. If we gain £3,000 or £4,000 of traffic on the main line we take no credit for it in connection with the proposed line.
334. Did not the Commissioners, a few years ago, favour the construction of the line from Glen Innes to Inverell? I do not think so.
335. Did they ever report in favour of it? No; they made no recommendation. They simply pointed out that there would be a considerable loss if the line were made.
336. Should this line be constructed, would the Commissioners favour connecting Inverell and Glen Innes? I do not think so. There is certainly no intention at present of making the connection.
337. Do you know whether they have given the matter any consideration? They would naturally consider it. They recommended this route as against the other, and showed their reasons for doing so.
338. I suppose the fact of Narrabri and Moree being connected by railway has opened up that part of the country, and suggested the present proposal? Yes. If the railway had stopped at Narrabri, I do not think the Commissioners would have recommended this extension.
339. Have the Commissioners considered the desirableness of taking the line 4 miles out of Warialda—past Warialda? I think they have.
340. Do not they consider Warialda of sufficient importance to connect it with the railway system of the Colony? Not in view of the disadvantages which that would entail. You are dealing with a line having for its object a through traffic, and also opening up country; and both these objects are better served by a direct line which goes a little distance out of Warialda.
341. But is not Warialda a settled and prosperous town likely to give a large amount of traffic to the railway? The township, in itself, would not give a great amount of traffic; the district would. It does not matter much to the settlers and squatters about there whether they have to go 2 or 3 miles extra.
342. But would not the Commissioners consider that, in view of the possibility of Warialda increasing in importance, it would be well, if the line were constructed, to have a station at Warialda? They would oppose the township; but not to run into the town. It would cost a large sum of money, and would also lengthen the journey.
343. What would be the extra cost if it went to Warialda? I do not think that has been worked out. It would, of course, depend a good deal upon the country you had to go through. According to the average cost, it would cost about £12,000.
344. Is it not a fact that in the past, where towns have been passed by, as it is proposed to pass by Warialda, ultimately either a branch line or a tramway has had to be constructed in order to connect the town with the railway system. Take, for instance, Yass. Many years ago, although Yass was a very old and prosperous town, the railway was taken past its doors, and ultimately a large expenditure of money was incurred by the construction of a tramway to connect the town with the railway station? Yass is the only place I can think of where that has been done. Yass, of course, is a much bigger place than Warialda.
345. Having that in view, would it not be well for the Commissioners to consider the advisableness of giving Warialda railway communication? So far as the actual route of the line is concerned, that is a matter for the Department of Public Works; but I think the opinion of the Railway Commissioners is that it is better to take the direct route as shown.
346. What is the population of Inverell? 2,534 according to the last census.
347. Is that for the town of Inverell alone? For the town and immediate surroundings.
348. And the soil all round the district is remarkable for its fertility? Yes; it is a fertile district.
349. Is the line from Werris Creek to Inverell level all the way? You will see by the plan that in one place there is what you would call a severe grade of 1 in 50 and 1 in 55; but that, at a small expense, could be cut out, and you would practically have a level line throughout.
350. Do the grades increase as you approach Inverell? No; they are very favourable. I may mention that Mr. Lee asked me on a former occasion what was the lift on the old line from Werris Creek-Moree-Inverell.

II.
McLachlan,
Esq.
8 Sept., 1896.

Inverell. The lift spoken of—6,600 feet—was at the termination, where you start for Inverell. Taking a similar point to Moree it would be 1,297 feet. To Inverell you rise about 2,400 feet.

351. What is the total lift between Werris Creek and Inverell? 3,700 feet. The 6,600 feet lift is only to Glen Innes. From Glen Innes to Inverell would be 563 feet. The ruling grade from Inverell to Glen Innes is 1 in 60—coming this way.

352. Between Glen Innes and Inverell the greater part of the country is alienated? So I believe.

353. Do you know what is the feeling of the people of Inverell with regard to the proposal under consideration? I understand the majority of the people of Inverell prefer a connection by way of Moree.

354. You say the Commissioners recommended this route in preference to any other? Yes.

355. *Mr. Black.*] With regard to the Glen Innes-Inverell line, are you aware that in 1884, the estimate of the construction of that line was £12,844 per mile? I know it was very heavy. That was when Mr. Wright was Minister for Public Works.

356. Now the amount is reduced to a little over £6,000 per mile? Yes; it must be borne in mind that although the estimate per mile is reduced, the line has been lengthened about 10 miles.

357. In estimating the amount of traffic which would be gathered in by the railway, was it reckoned that any would come from the Barraba-Bingara direction? There might be a little from Bingara; but Mr. Harper went through the district obtaining evidence, and he will give evidence.

358. The Commissioners do not apparently think that the construction of a railway from Manilla would tap any part of the country which otherwise would be served by the Inverell-Moree line? Not to interfere with the construction of that line. Of course, at the present time some of the Warialda traffic does come to Manilla and Tamworth; but the estimate they give is a fair one, considering all the circumstances.

359. They have no idea whether one line will materially interfere with the other? Not in view of the distance they are apart.

360. It appears to me that one of the main reasons for the construction of the line is, according to the Commissioners, the encouragement of settlement? Yes, and at the same time the line is a profitable one to make.

361. If it fails to encourage settlement, will it then be profitable? Practically yes—on the present traffic, population, and resources.

362. Is it not rather a long stretch of country between the two towns without any intermediate service? Yes, but at the same time it is good country between the two towns, and it is likely to be productive.

363. That being so, one of the primary objects must be the encouragement of settlement? The Commissioners say there is no doubt the construction of the line will lead to a fair additional settlement of the district, but even on our present experience the line will practically pay for itself and interest as well. There is settlement there, and nearly the whole trade of the district will be served by the railway.

364. Is it proposed to fence the line? I think not. That is a matter with which the engineer will deal.

365. In the Railway Commissioners' report the annual expenditure is estimated at 3½ per cent.? Yes.

366. Is not that rather high? If anything it is high, according to the present value of money, but perhaps it is a wise thing to have it rather over than under. I believe that at the present time any of the Colonies can borrow at 3 per cent.

367. Were you asked any question as to why the Commissioners have made no qualification with regard to the compensation for land? Yes, Mr. Lee asked the question. The Commissioners have laid it down as a general rule, in dealing with new lines, that the land required should be given or acquired free, where it is reasonable to do so; and in two cases—the Berrigan-Finley line and the Tamworth-Manilla line—they thought it should be a condition that the people should combine, so that the land should cost the Government nothing. With regard to this line, as with a number of others, they would not make it an absolute condition that the land should be given free. At the same time they think that the Government should, as far as possible, obtain the land required for the construction of the line free; but they would not make that an absolute condition so far as their recommendation was concerned.

368. Do you know any reason why they make a distinction in these cases? There is a number of circumstances to be taken into consideration. The line is a favourable one in itself, and they do not think it should be altogether shut out if a small sum has to be spent in land compensation.

369. But do you not think, where a railway line is carried through small holdings, the bulk of which are agricultural holdings and through good town lots, that the damage done to the small holdings is of a greater character than it would be where the line—as in the Moree-Inverell district—runs over large pastoral areas, and where the return to the squatter is infinitely in advance of the damage done to his territory? That is so.

370. Do you not think, under these circumstances, it is a most peculiar and unparalleled circumstance that there should be no recommendation in this case;—it appears to me that in this case, more than in most others, there should be a recommendation? In regard to the Manilla line the Commissioners say that it could not be expected that the small holders would give their land free. They specially exempted them.

371. They did not do that with regard to the Berrigan railway? In that connection they said that they did not expect a man who had a small holding to give his land absolutely free. They thought that where the line was to be of benefit to the district, and it was not so profitable to the State as this line will be, the people should combine. It was thought that where a man had £20 worth of damage done to him for a small benefit, the people who derived large benefits should assist to pay him.

372. In this instance the station-holders will be largely benefited; first, from the fact that they will be able to truck their stock in times of drought; and, in addition to that, you anticipate that there will be such an influx of settlement, due to the construction of the line, that they will be able to rent out their land for agricultural purposes at 5s., 6s., 7s., or even 10s. per acre;—why should not these men, who will benefit so largely, compensate those landholders out of the funds they themselves create for any damage or severance which may be incurred by the construction of the railway. It appears to me a most peculiar circumstance? But the Commissioners have all through laid it down that they think the land should be given free, but they are not prepared to make an absolute condition in their recommendation that if all the land is not given free the line should be abandoned.

373. The Commissioners should be absolutely fair in these matters. In cases where the balance is so much in favour of the people through whose property the railway will run, the statement should be even stronger

stronger than in connection with any of the cases you have mentioned? The statement is the same in this case as in any of the others which have been mentioned. They have always thought that in connection with new lines the land should be given free. In every report they have made, with one or two exceptions, they have not referred to the land question. If you read nine out of ten of their reports you will see that they do not refer to the land. They have laid it down as a general principle, that the Government should arrange as far as possible for the land to be given free. They have no power themselves to deal with land. They can simply recommend to the Government that in their opinion land for new railways should be given free.

H.
McLachlan,
Esq.
8 Sept., 1896.

374. Are we to understand that they do not make a recommendation of that character in this instance, because they think it is understood by the Committee that that is their opinion? Yes, I think so; but they would not go so far in this instance as to say that it should be an absolute condition that the line should be abandoned unless all the land is given free.

375. In the event of the line being constructed, do you think it will be used by the storekeepers of Inverell, and the station-holders, for the conveyance of goods to the Sydney and Newcastle markets? Yes.

376. You think they would pay for the $3\frac{1}{2}$ miles of increased railway rate, and incur the further delay of bringing their goods round by Narrabri to Moree? I think they are likely to get the traffic.

377. *Mr. O'Connor.*] What is the distance between Inverell and Moree? Ninety-six miles.

378. And between Glen Innes and Inverell? About 53 miles. Of course Moree to Werris Creek is slightly shorter than Werris Creek to Glen Innes.

379. *Mr. Black.*] You think, then, so far as the general traffic towards Inverell is concerned, the Commissioners can compete with carriage *via* Grafton, and thence by team to Inverell? Yes; the Commissioners will be in a much better position to compete than they are to-day.

380. Can you give us any idea as to what will be the cost per truck? I do not think that has been absolutely determined.

381. Do you think goods could be carried for £4 a ton? I would not like to say without further consideration.

382. What is the highest grade from Inverell to Moree? One in 100 coming to Sydney, and 1 in 80 the other way. The heavy traffic—grain, live stock, and wheat, would be working this way. The easiest grade is with the traffic.

383. And the heaviest grade between Glen Innes and Inverell is 1 in 60? Yes. I have already furnished the Committee with the haulage power of an engine on the different grades.

384. *Vice-Chairman.*] Is it intended to make Inverell the terminus of the line? For the present.

385. Is there any intention of making it branch north from any point on the line between Moree and Inverell? Not that I know of.

386. Has any consideration been given to the probability of a line in the future, from any point between Moree and Inverell? There has been from Moree; but I do not think from points between.

387. In the estimate of the cost of the construction of this line you have not estimated for rolling stock, and in the estimate for the line between Condobolin and Broken Hill you have provided £100,000 for rolling stock—is that so? Yes.

388. As this proposal will necessitate haulage over nearly 100 miles of railway, will additional rolling stock be required? There may be a small amount of additional rolling stock required, but in connection with branch lines, the Commissioners look upon the main line rolling stock as being able to work it. If we had to spend £10,000 in additional rolling stock, it would only mean £300 a year. It would not be a large item.

389. Why the distinction between the two lines? It is such an exceptional line—360 miles as against all the branch lines being under 100 miles—that the Commissioners have not provided for additional rolling stock, and they have intended to work them so as not to embarrass the branch lines with the main line rolling stock.

390. Therefore you have made your estimate for the Inverell line under rather favourable conditions? Yes. At the outside it would not add more than a few hundreds a year to it.

391. You would not place it in the category of unprofitable lines? It would not pay working expenses and interest, according to the estimate, to start with. Unprofitable lines are those which do not return interest and working expenses.

392. Do you regard a line unprofitable which returns a substantial portion of the interest? They have been shown in the list of unprofitable lines, but this line, in particular, would give you a large additional traffic on the main line.

393. Are the possibilities of the proposed line encouraging? Yes, the Commissioners think so. The large traffic now going by team would most likely be taken over the main railways.

394. So that in the course of a very few years the line would be taken out of the list of unprofitable lines? I should think so.

395. Some of the branch lines have already been removed from that list—the Junee to Hay line for instance? Yes; the last return in regard to that line just about cleared itself.

396. With regard to the cost of haulage—I observe you are carrying grain at something less than one-third of 1d. per ton for a distance of 500 miles? Yes.

397. Is there any margin of profit? No; not for that distance.

398. Would you place hay and grain under the same tariff? Yes—that is, of course, flour produced in the district coming towards the sea port.

399. Do you carry both at a loss? There is certainly no profit in it. There is no profit in the carriage of the article itself, but it has always been looked upon as giving a profit in return traffic.

400. Then from what particular class of produce do you expect to derive a profit? General goods, and machinery.

401. That would be the down traffic? Yes. Of course wool pays a good rate too.

402. You have made an estimate of about £13,000 earnings by the line? Yes.

403. Are we to understand there will be no profit on the up traffic? Of course, a good deal of traffic would be wool, which pays a good rate.

404. There would be very little profit on any other traffic with the exception of wool? You might say traffic other than farm produce.

405. What other produce do you refer to? Hides, tallow, skins, and live stock.

- H. McLauchlan, Esq.
8 Sept., 1896.
406. Are you not carrying at a low rate for those articles? At a much higher rate than for grain.
407. As a matter of fact I believe that, charging the average rate of interest on the total cost of the railways, it would come out at $3\frac{3}{4}$ per cent? I think that that would be somewhere about the last return—I have not the exact figures with me.
408. And the total earnings have been nearly $3\frac{1}{2}$ per cent? Yes; £3 8s. 10d.
409. Would that be after making provision for nearly £400,000 of annual loss on what you call unprofitable lines? Yes; that is speaking of the railways as a whole.
410. Then, had it not been for the loss of traffic directly attributable to the drought, instead of there being a loss there would have been a profit, inasmuch as the earnings would have exceeded $3\frac{1}{2}$ per cent? Yes.
411. The report is up to June last? Yes.
412. Since then you have had two months' experience? Yes.
413. Are you able to say whether, up to this time, there is the prospect of a more favourable year than the one through which we have passed? Yes; the prospect is more favourable.
414. So that it is quite probable that $3\frac{3}{4}$ per cent. may be earned? I can say that the prospects are much more favourable now than they were this time last year.
415. Then you think the Commissioners are disposed to take a little risk in recommending the line? They look upon brighter times being ahead.
416. If you can carry grain at a cost of one-third of a penny per mile over a distance of 500 miles, how is it you are unable to convey ore from Broken Hill to Sydney, a distance of 700 miles, for less than $\frac{1}{2}$ d.? The Commissioners, of course, do not carry grain at a profit over that distance, but they look upon getting a return traffic which makes the rate a profitable one. Of course, there are many things in connection with railway traffic which make the rates seem anomalous. For instance, one of the English companies charged a different rate for walking-sticks to that for umbrella handles, although they are practically the same, on account of the return traffic.
417. You make a distinction between bags of sugar and bags of flour on the Mlawarra line? Yes, the charge for sugar is higher than for flour.
418. But the weight is the same? Yes; of course, rates are fixed to some extent on an *ad valorem* basis. There are several considerations. You charge what you think the traffic can bear.
419. In connection with the Condobolin to Broken Hill proposal, it was stated that it would not be possible to carry ore from Broken Hill for less than $\frac{1}{2}$ d. per ton? Yes.
420. Without explanation it would appear to be contradictory to say that you can carry grain at one-third of a penny? Yes; if you had nothing else to carry the other way, there would be no profit.
421. Then all your profit would come practically from the back loading? Yes.
422. A comparison has been made between the proposals to construct a line between Glen Innes and Inverell, and Moree and Inverell? Yes.
423. The Moree-Inverell line will have an advantage over the other proposal, inasmuch as you would serve nearly 100 miles of country, as against less than 50 miles between Inverell and Glen Innes? Yes.
424. Would that mean largely increased traffic? I think it would; and the Commissioners, of course, estimate that also.
425. What have you estimated for the traffic between Glen Innes and Inverell? Between £7,000 and £8,000, as against £13,000 for the line between Moree and Inverell.
426. So that besides the question of lower cost, you have taken into consideration the additional earnings which will result from the longer extension? Yes.
427. Will the cost of working the line between Werris Creek and Inverell be less, by comparison, owing to the better grade? Naturally that must occur.
428. What have you estimated as the probable cost of working between Inverell and Werris Creek, *via* Moree, and *via* Glen Innes to Werris Creek? No detailed estimate has been made, except, of course, that you know you can haul bigger loads one way as against the other.
429. Do you think that would equalise the difference in length—34 miles? I would not say that altogether, because there are so many circumstances you have to take into consideration. That is only one factor of a number giving an advantage in favour of the longer line.
430. Are you not every year conducting the traffic at a reduced cost per mile? That is so.
431. What was the saving last year, compared with the previous year? The proportion was about the same. There was not much difference between 1895 and 1896. The percentage of working expenses to revenue was about the same—55, as against 54 $\frac{1}{2}$. There was a slight increase in 1896. That was due to the reduced traffic.
432. What was the difference between the net profit per train mile in the years 1895 and 1896? The advantage was in favour of 1895; but if you compare 1895 with some of the previous years, you will find there is a difference of one shilling in favour of the present time.
433. What was the net profit in 1895? 3s. 5 $\frac{1}{2}$ d.
434. And in 1896? 3s. 3 $\frac{1}{2}$ d.
435. So that the year 1895 was better than the year 1896 by 2d.? Yes. That of course had been due to the reduced traffic. We had to keep up the same establishment to a large extent.
436. Was not the reduced traffic in a large measure attributable to the drought? Yes.
437. Have you any estimate showing the rate per mile of the whole of the tonnage for the year 1896? Yes, 1.44 or 1 $\frac{1}{2}$ d. practically.
438. Looking at the figures in the Railway Commissioners' general report, are you prepared to say that the estimate of the cost and earnings of the proposed railway to Inverell has been fairly based upon the experience of 1895 and 1896? Yes.
439. And having regard to the rates which prevailed during those years? Yes. Of course the Commissioners have the experience of other branch lines to guide them. They know what expense they are going to be put to. They can estimate them very clearly.
440. Is it proposed to charge ordinary or special local rates between Moree and Inverell? Between Moree and Inverell it is, of course, in itself a local rate, but for through traffic we shall, I think, charge a through rate.

441. In connection with several proposals recently considered by the Committee, it was understood that a local rate would be charged? Yes; on some of the branch lines a local rate is charged, and also a through rate. It all depends on circumstances.

H. McLachlan, Esq.
8 Sept., 1896.

442. I wish to know whether you have taken into consideration in your estimate the probability of local rates being charged? Local experience is the result of the working of other branch lines. The Commissioners know, by working a somewhat similar line, so far as length and other things are concerned—the Cobar line—what the working expenses will come to. With regard to rates, they can estimate pretty well what tonnage of traffic they will get. As a matter of fact, we are now charging through rates from Moree to Sydney. We do not charge a local rate there, and most likely we shall have a through rate on to Inverell. In fact I think it will be absolutely necessary.

443. Is your evidence this—that the annual cost has not been under-estimated, and that the anticipated earnings have not been over-stated? Yes; the Commissioners think it is a fair statement of the case.

444. So that in dealing with the proposal the Committee may regard the probable loss for a time only as being under £3,000 a year? Yes.

445. That is exclusive of the interest on additional rolling stock? Yes, which would be a small sum.

446. *Mr. Lee.*] The height of Ben Lomond station is 4,471 feet. From there to Llangothlin we have a down grade? Yes.

447. From Llangothlin to Guyra, a distance of 7 miles, there is a rise of 119 feet? Yes.

448. From Guyra to Armidale there is a fall? Yes.

449. From Armidale to Kelly's Plains—5 miles—there is a rise of 156 feet? Yes.

450. From Kelly's Plains to Uralla there is a down grade. From Uralla to Wallan—15 miles—a rise of 118 feet, and from Wallan to Tamworth there is a continuous down grade? Yes.

451. Having all these points, it is difficult to find where there is any stiff grade between any of the two points indicated? The best answer I can give is, that I will show for the inspection of the Committee the actual grades existing between Ben Lomond and Werris Creek. Although a line may show 200 feet between two stations, there may be some awkward grades to work in between these two stations.

452. The station at the Hawkesbury River is 9 feet above sea level, and the next station—Borowra—a distance of 8 miles—is 667 feet high. Is not that the ruling grade of the Great Northern line from the border to Sydney? It is a 1 in 40 grade from there.

453. Is there nothing stiffer than that? No, we have nothing stiffer than 1 in 40. I daresay that Mr. Ewing asked me questions the other day with regard to the power of an engine on different grades. I spoke of an engine on a 1 in 40 grade at 10 miles an hour hauling 210 tons. On a 1 in 80 grade the same load could be hauled at 20 miles an hour, and on a 1 in 100 grade at 23 miles an hour. That is to say, the speed can be doubled with the same load on a 1 in 80 grade as against a 1 in 40 grade.

WEDNESDAY, 9 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.
THE HON. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

454. *Mr. Roberts.*] Have you made a report to the Railway Commissioners as to the probable traffic on the proposed line? Yes, it is as follows:—

J. Harper, Esq.
7 August, 1896.
9 Sept., 1896.

Proposed Railway to Inverell.

When the Commissioners reported on 1st December, 1890, on this proposed line the estimated cost of construction from Glen Innes was given as £492,400, and the mileage as 44 miles 37 chains. The annual cost was shown as follows:—

Capital cost at 3½ per cent.	£17,734
Whilst the working expenses were estimated as under:—	
Traffic Branch	£1,756
Locomotive Branch	1,500
Permanent-way Branch	3,040
	6,296
Total annual cost	£23,530

The estimated revenue was as follows:—

Coaching	£3,000
Mails	500
Goods	4,290
	£7,790

In April, 1891, a further revision had been made by the Construction Branch, reducing the cost of construction to £427,400, the length being 54 miles 34 chains. On this estimate the Commissioners revised the cost of working expenses, making them £7,128.

The revenue was shown as:—

Coaching	£3,200
Mails	500
Goods	4,500
	£8,200

From a return furnished by the Construction Branch after 22nd January, 1896, a further revision was made, giving the total length of line between Glen Innes and Inverell as 52½ miles, and the estimated cost, £317,908.

The

J. Harper,
Esq.
9 Sept., 1896.

The Commissioners' first estimate of the traffic on the proposed line between Glen Innes and Inverell, is based upon the following figures, through rates being adopted for the purpose:—

870 tons, A & B traffic, at 3s. 6d.	£152 5 0
1,161 tons, 1st and 2nd class, at 10s.	580 10 0
1,452 tons, 3rd class, at 15s. 9d.	1,143 9 0
	£1,876 4 0
Outwards Traffic—	
Wool, 2,200 tons, at 3s. 9d.	£412 10 0
Sheep, 400 trucks, at 12s. 4d.	263 6 8
Cattle, 400 trucks, at 15s.	300 0 0
Wheat, maize and potatoes, 3,500 tons, at 1s. 6d.	262 10 0
Hay, 1,000 tons, at 1s. 10d.	95 13 4
B class, 250 tons, at 4s. 6d.	56 5 0
Tin ore, 1,000 tons, at 4s. 6d.	225 0 0
Coaching—	
Passengers, 3,000 at 10s.	1,500 0 0
Do 3,250 at 8s.	1,300 0 0
Parcels	200 0 0
	£4,615 5 0
Mails.....	£6,491 9 0
	500 0 0
	£6,991 9 0
New estimate, 101 miles.	
Goods, 3,000 tons, at 10s.	£1,500 0 0
Wheat, hay, straw, chaff, &c., 5,000 tons at 8s. (special).....	2,000 0 0
Wool, 1,000 tons, at 17s. 6d.	875 0 0
Live stock, 270 trucks, at 25s.	312 0 0
Passengers, 5,600 at 10s.	2,800 0 0
	£7,487 0 0
The Warialda estimate, at which point a large volume of traffic will come in which would not have reached Inverell even assuming the line had been extended from Glen Innes to that point, is as follows—	
Goods, 1,000 tons, at 10s.	500 0 0
Wool, 2,000 tons, at 3d. per ton per mile equal to 13s. 4d.	1,333 0 0
Live stock 2,200 trucks, at 20s.	2,200 0 0
Passengers, 2,400 at 5s.	600 0 0
	£4,723 0 0
Mails, 101 miles, at £12 per mile.....	1,212 0 0
	£13,422 0 0

The estimate of the mails in view of the reduced length of the line by taking the southern route would be £24.

At the present time the wool in the Warialda district finds its way to either Tamworth, Gunnedah or Narrabri.

It will be seen in the Warialda sheep district alone there is equal to 1,481,873 sheep and 56,710 cattle, but in addition to this there are certain pastoral areas in the Moree stock district which would also use the projected line. In view of the fact that we carry about 8,000 bales of wool annually from Glen Innes the estimate of 1,000 tons from that point, equal to about 5,500 bales cannot be regarded as excessive.

I have endeavoured to obtain information from the Lands Office as to the total area of Crown lands available in the counties which would be served by this line, but it is represented that this would be the work of some days, and the only information I have been able to obtain has been as to the lands which are immediately available for settlement.

455. Your total estimated traffic amounts to £13,422? Yes. I think that differs from the Commissioners' report, because since they had the altered distance they have dealt with the mails.

456. That estimate would show an annual loss of about £3,000? Yes.

457. Notwithstanding that the figures show a loss of about £3,000 per annum, do you think the construction of the line would be justified? I think if a line to Inverell is to be built it is desirable to carry it that way.

458. I presume you have been over the country between Moree and Inverell? Yes.

459. Is there much settlement along there now? There is a good deal on the south bank of the river, away back from Warialda, and between Warialda and Inverell there is considerable settlement.

460. In making your calculations, have you speculated at all as to any increased traffic. Upon what basis have you compiled the figures? I have worked them out upon the number of sheep within a trafficable area of Warialda. As far as Inverell is concerned, that is necessarily more or less speculative.

461. Have you every reason to believe that the estimate of traffic will be well within the mark? Yes, I have no reason to expect it will be less than that.

462. You have had a good many years experience in preparing estimates? Yes.

463. As a rule have your figures been found to be correct? As a rule, they have.

464. Do you think the construction of the line will lead to greater settlement in that part of the country between Moree and Inverell? I think so.

465. Is the land about Inverell very fertile? It is exceptionally good. From a point 4 miles beyond Warialda to Inverell it is splendid land.

466. A fine wheat-growing country? Yes, it will grow anything.

467. Looking at the map, you will see that the proposed line from Moree to Inverell leaves Warialda about 4 miles distant from it? Yes.

468. Do you not think it desirable that Warialda should be tapped by the railway? Warialda is only a comparatively small town with a population of 600; and I think it would materially add to the cost of the line to take it there. Another idea in connection with the line being taken further south is, that, no doubt it will be used to a certain extent by the people of Bingara.

469. How far is Bingara away? Twenty-six miles, I think.

470. Would much traffic come from Bingara? Very little. I think the low grade traffic on which low rates are charged for long distances would probably come that way. I do not attach much importance to the Bingara traffic in connection with this line.

471. In submitting your figures to the Railway Commissioners did you include the Bingara traffic? No.
472. How far towards Glen Innes would your estimate include? Nothing towards Glen Innes at all—not beyond Inverell.
473. Nothing east of Inverell? No.
474. In your opinion, would there be a larger amount of traffic on the proposed line, than there would be on the line constructed from Glen Innes to Inverell? I think so; in fact, I am sure of it, because it will pick up traffic at Warialda which would never have gone to Inverell.
475. Is the country equally as good between Glen Innes and Inverell, as between Inverell and Moree? I think most of the country between Warialda and Inverell is better than that between Glen Innes and Inverell. There is a lot of very good country between Moree and Warialda, on the south of the proposed line.
476. I suppose it is all similar in character? No; it is chiefly black and chocolate volcanic soil between Warialda and Inverell; and between Warialda and Moree it is ordinary red soil.
477. Is the soil similar in character down to Werris Creek? Excepting that the country is more plain country.
478. East of Warialda the soil increases in richness? Yes.
479. And on that ground you think a large amount of settlement will probably take place if the line is constructed? Yes. As a matter of fact most of the existing settlement about Inverell lies to the north and south of the proposed line between Warialda and Inverell.
480. I understand that the country all the way from Werris Creek to Inverell, can be described as comparatively level? It is, as compared with the main northern line.
481. Referring to the country between Inverell and Glen Innes—is that nearly all alienated from the Crown? Yes; I understand it is.
482. Is there plenty of land available for settlement between Moree and Inverell? Yes; there is a good deal to the south of the proposed line, and north also.
483. If the line were constructed, would we get any traffic which does not now go over the New South Wales railways? Yes. No doubt it would have the effect of drawing traffic which at present goes from Inverell to the coast, by road.
484. How far is it from Inverell to Glen Innes by road? Forty-four miles.
485. How far is it from Glen Innes to Grafton? 111 miles.
486. You say that a large amount of traffic goes from Inverell to Grafton? Yes.
487. In forming your estimate, have you included the probability of our getting a fair amount of that traffic? I have estimated for Inverell considerably less than the railway and the teams carry there. I have only given 3,000 tons of goods altogether, as being the whole of the consumption both in and out of Inverell. I think probably that would be exceeded.
488. I suppose you could scarcely tell me how much is carried by teams from Inverell to Grafton at the present time? I can only give an approximate amount. I think something like 1,400 or 1,500 tons, and *vice versa*.
489. What is the rate of carriage between Inverell and Grafton? It varies very much. The rates for wool, from Inverell to Glen Innes, are about 30s. a ton, and from Glen Innes to Grafton, about 60s. a ton. That is about £4 10s. altogether.
490. Does the 1,400 or 1,500 tons represent wool and wheat? No, it does not include wheat. The *Glen Innes Examiner* has published a statement which indicates that there were 701 hides, twenty-one bales of skins; but no wheat or produce of that kind carried.
491. Any wool? Yes; from Inverell there were 1,429 bales of wool.
492. Then wool would be the principal item to make up the 1,400 or 1,500 tons? Yes; but in addition to that there were 1,433 tons of merchandise which came to Inverell. Then, of course, there are goods which come to Glen Innes, and which are subsequently sent on from Inverell to Glen Innes, but which are not shown in this return.
493. Do the people of Inverell get their general merchandise from Sydney by way of Grafton and Glen Innes? No; as a matter of fact, there was more carried by rail than by the coast—necessarily; but still there is a good deal carried by the coast.
494. Out of the 1,500 tons sent from Inverell, how much do you estimate would come to the railway, if constructed, by way of Moree? I think if the line were built from Inverell to Moree it would all come.
495. There would not be any going by Grafton? No.
496. *Mr. Black.*] Did you say that 1,500 tons of produce were sent from Inverell? That represents everything in and out—to and from Inverell.
497. *Mr. Lee.*] I thought you said 1,500 tons each way? No; I did not mean that—I meant produce in all directions.
498. What is the actual traffic? The actual traffic is 1,400 tons, or 1,500 tons, in and out.
499. That is both ways? Yes.
500. *Mr. Roberts.*] Can you divide it, and tell us how much there is inwards, and how much there is outwards? I am afraid I could not.
501. You think that if the line is constructed the whole of the traffic will be carried by it? Yes; I think there is a reasonable prospect of it.
502. Would it be carried at a cheaper rate? No doubt a differential rate would have to be made—the same as exists to-day at Glen Innes.
503. What would be the rate as compared with £4 10s.? That I could not say. It would have to be adjusted if the line were built.
504. What is your estimate of the passenger traffic? From Inverell 5,600 passengers at 10s., or £2,800; from Warialda 2,400 passengers at 5s., or £600.
505. In making that estimate have you assumed that there would be a large influx of population to the district? No; that is based on the existing population. That practically gives one journey a year to each person resident in the district.
506. Do you generally find that that works out correctly? Yes. I am inclined to think that it will be exceeded, because I think, if a connection were made with the western country, probably during the summer months, a good many people would travel there for the purpose of a change, and of taking advantage of the Inverell climate.

J. Harper,
Esq.
9 Sept., 1896.

- J. Harper,
Esq.
9 Sept., 1896.
507. Is the climate of Inverell exceptionally healthy? Yes.
508. What is the population of Inverell and district—I mean within the population area? 5,600.
509. Is it a settled population? Yes.
510. Has it been increasing during the last few years, or does it show a decrease? I do not think it has been increasing.
511. But you think, if the line were constructed, there would be a large amount of settlement, and, therefore, increased population between Warialda and Inverell? Yes.
512. Do you know the feeling of the people of Inverell with regard to the line? It is strongly in favour of it.
513. Would it not strike one that they would prefer the Glen Innes route, as being nearer to the metropolis, and not occupying so much time in getting down to Sydney and Newcastle? It is a question whether it would. The difference is only 34 or 38 miles, according to the varying distances given by the Construction Branch, and there would be easier grades on the proposed line.
514. The difference would be 34 miles each way? Yes.
515. So that a man living at Inverell would travel 68 miles locally by way of Moree, than by way of Glen Innes? Yes; but he would probably travel under faster conditions owing to the more favourable grade. What I found the people urging most strongly was the fact that it would open up a market in the west for their produce.
516. What is the population of Warialda? In the town 600, and in the district 2,400.
517. You do not think Warialda is of sufficient importance to warrant the line going through it, or nearer to it? I do not think it would be justified. The country around Warialda is very rough.
518. I suppose that is the reason the line has been surveyed as we see it on the map? Yes; when the survey was made on the north bank of the Gwydir, it also missed Warialda through the same cause.
519. Would not the people of Warialda be likely to want a tramway if the line were built 4 miles out of the town, in the same way as the Yass people have done? No doubt they would want one; but I do not know whether they would get one. It would not cost very much to shift the whole of Warialda.
520. Does the tramway from the town of Yass to the railway station pay? No.
521. Is it run at a loss? Yes.
522. *Mr. Wright.*] Would it ever pay? I think I can unhesitatingly say "no."
523. *Mr. Roberts.*] At what radius from the centre of the town of Warialda would the population of 2,400 be found? Forty or fifty miles, I think, north. The Bingara population area extends nearly to Warialda.
524. Then you do not think the importance of Warialda justifies the line being taken right to the town? No.
525. In the event of the line from Tamworth to Manilla being constructed, do you think it would be a preferable way of connecting Inverell with the railway system of the Colony by having a line from Manilla to Barraba and on to Bingara, and thence to Inverell? I do not think so. The cost would be very heavy indeed. It is very heavy country.
526. It would be very much nearer would it not? Yes; the distance to be travelled would be much less, but it would be more expensive, and I do not know that it would not open up the same extent of country.
527. Of the two you prefer the present proposal? Yes.
528. Do you know the line from Guyra to Inverell? I have been over it.
529. What sort of country is it? It is not as good as that between Inverell and Glen Innes.
530. Would you prefer the line from Inverell to Glen Innes to the line from Inverell to Guyra? Yes.
531. But you prefer the line from Moree to Inverell to either of them? Yes.
532. *Mr. O'Connor.*] I suppose you were specially selected and specially trusted by the Railway Commissioners to make an inquiry and to give a report? Yes.
533. And your report is based upon your own personal observation? Yes.
534. I suppose that in any report you give you are only influenced by what you see, and by what your sense of justice dictates? Yes.
535. You would not be influenced in any way to say anything in your report which was not warranted by your personal observation, and by your industrious inquiries? I would not.
536. However, much you may desire to be in harmony with the head of your Department, your reports are based on your own inquiry as you go through the country? Yes.
537. *Mr. Black.*] In reply to a question asked by Mr. Roberts with regard to the Inverell people not caring to travel some 68 miles of extra distance, entailed by going *via* Moree, you said that that would be made up because they would travel under faster conditions? I said it was possible they would on a better grade.
538. Do you want the Committee to understand that the pace travelled on the 53 miles between Glen Innes and Inverell, would be so much slower than on the 96 miles between Inverell and Moree? No; but the whole distance was taken, assuming that it would be through to Sydney.
539. But in what way could they travel faster through to Sydney, seeing that you do not pick up the line to Werris Creek going by Moree, and seeing that going *via* Glen Innes you pick up the fastest railway travelling we have in the Colony at Glen Innes. Do you not think you have made a mistake? I do not think it is the fastest railway travelling we have in the Colony.
540. It is the fastest on that line? Yes.
541. If you travel 422 miles at the fastest possible rate on that line from Glen Innes, and you only travel somewhere about 200 miles at the fastest possible rate through Werris Creek, and then branch off to a line where the travelling is not so fast, how can it be possible that a man going from Inverell, *via* Moree, would travel under faster conditions than if he went to Sydney, *via* Glen Innes? It is quite possible in view of the altered circumstances of traffic on the Narrabri line.
542. Are they likely to prevail? Increased traffic would warrant the running of faster trains on that line. As far as that matter is concerned, I am quite willing to admit that that at present could not be realised.
543. You seem to think that the climate of Inverell will prove attractive to summer residents? That is to people in the Moree district and out on the north-west. I am not going to say that people would go from Sydney, but I think they would be inclined to go from Narrabri.
544. Have you been at Inverell a whole season? No, but I have been there during the summer time.

545. Would you be surprised to know that the temperature at Inverell during the summer months is very little less than that of Tamworth? I do not know what the relative heights are;—probably Tamworth is as high as that.

546. Do you think the Railway Commissioners by this circuitous route could land goods in Sydney or Newcastle, from Inverell, or carry them as cheaply from Sydney to Inverell, as they can now be taken by team to Grafton and thence by steamer to Sydney? Yes, I think they could. As I say a differential rate would have to be made, but the object of course would be to save the traffic which is going that way.

547. Are you aware that during the twelve months ending 30th June, 1896, there were 973 tons 3 qrs., and 26 lb. of merchandise landed at South Grafton from Glen Innes for export to Sydney? Yes, that is quite probable.

548. Do you know that during the same period there were only 433 tons 16 cwt. 3 qrs. and 22 lb. carried from Inverell to South Grafton for export to Sydney? That may be right.

549. If the people at Glen Innes who are now in fairly direct communication with the metropolis, find it expedient to send a very large proportion of their produce to Sydney by Grafton, how can the people of Inverell who, by the proposed line will be furnished with a very much more circuitous route to the metropolis than have the people of Glen Innes be expected to send the bulk of their produce by railway, if the people of Glen Innes do not find it advisable to do so? I can quite conceive it would be possible to carry over the indicated line from Moree to Inverell more cheaply than you can carry from Glen Innes to Sydney at the present time.

550. You can carry over the proposed line more cheaply than from Glen Innes to Sydney? At the present time.

551. Is that because of the nature of the country? Yes.

552. The cost of haulage will be less? Yes.

553. I believe the distance from Inverell to Sydney, *via* Moree, is about 510 miles? Yes.

554. And from Inverell to Newcastle *via* Moree it is about 411 miles? Yes.

555. You think then that on the Inverell-Moree-Sydney line, which is 510 miles, you could carry goods more cheaply in proportion to distance than from Glen Innes to Sydney, which is only 422 miles? Yes.

556. That is to say the 69 miles of extra haulage both ways will be compensated for by the reduced lifts? Yes; I would point out that as far as the Inverell business is concerned both the produce and population outside Inverell lie in a southerly direction.

557. What about Elsmore and Tingha? The people of Tingha would be met equally as well by a line from Moree to Inverell as by a line from Glen Innes to Inverell. Tingha lies away to the south-east.

558. *Mr. O'Connor.*] That is your opinion? Yes.

559. And you have spent some time in investigating the matter in the interests of the State? Yes.

560. *Mr. Black.*] At what rate do you propose to carry cereals from Inverell to Sydney? A special rate of 8s. per ton is proposed over the whole section of the line—that is between Inverell and Moree.

561. *Mr. Wright.*] Is that a local rate? Yes.

562. You propose a local rate for that section? Yes; that would make it 21s. through to Sydney.

563. What will be the rate of carriage of wool? From Inverell to Moree 17s. 6d. a ton.

564. What will be the through rate? I cannot tell, because the 17s. 6d. would be absorbed in the other rate.

565. What will be the carriage of ore per ton from Inverell? I have really included that in the 3,000 tons of goods. I did not make an allowance for ore at all. I took 3,000 tons as being the gross amount of traffic at 10s. a ton.

566. What will be the rate for the carriage of flour? Eight shillings per ton for wheat, straw, chaff, hay and flour.

567. And for general goods? Ten shillings between Inverell and Moree.

568. And iron? That will be included in the 10s.

569. And sugar? The same.

570. And live stock? 250 trucks, at 25s. a truck, or £312.

571. Now, with regard to the carriage of goods the other way? They are all included. The 3,000 tons represent all the goods with the exception of cereals, wool, live stock, and flour.

572. The carriage of general goods from Moree to Inverell would be 10s. per ton? Yes.

573. That will be the proportion? Yes.

574. Have you any idea what will be the rate from Sydney to Moree? I have not, because the probabilities are that when we get to Moree, we shall have to adopt a differential rate for the purpose of competing with Queensland.

575. Then, if goods can be landed in Sydney *via* Grafton by team and steamer at £3 per ton, do you think the Railway Commissioners could successfully compete with that rate? I should not think they could if it could be done continuously.

576. If storekeepers have contracts for the landing of goods, and can land goods at £3 a ton all the year round, what then? I have not heard of any contracts as low as that. They may be at Glen Innes, but not at Inverell. I could not find a single merchant at Inverell who could tell me that.

577. What are the McLean Brothers' rates? When I was there the rate I got them was £4 a ton.

578. *Mr. O'Connor.*] Do you mean £4 a ton to Sydney? Yes. I can understand, of course, that contracts may have been made just now with a certain motive.

579. *Mr. Black.*] You anticipate a considerable amount of intermediate traffic between Inverell, Warialda, and Moree? Yes.

580. What products do you think will be carried from Inverell towards Moree? Wheat, hay, straw, chaff, and flour are being carried at the present time under abnormal conditions.

581. And fruit? Yes.

582. Do you not think that within a very short space of time, the Moree district, as far as wheat is concerned, will be self-supplying? I doubt it. I do not think the character of the soil about Moree is suitable.

583. Do you think it is too heavy? Yes; I do not think that wheat can be cultivated there with success, in view of the present rainfall.

584. I understand it is lighter soil nearer the border? No, it is heavier, if anything. The soil which will grow wheat is on the south bank of the river. No doubt wheat will be grown there if they have the means of transit.

- J. Harper, Esq.
9 Sept., 1896.
585. In the event of the railway being constructed to Inverell, have you taken into consideration the advisableness of carrying fruit at special rates? I have not included fruit in my estimates at all.
586. Are you aware that fruit is one of the finest products of the Inverell district? Undoubtedly.
587. Do you know that the apples, figs, pears, apricots, peaches, cherries, and strawberries are equal to anything grown in Tasmania? Yes. As a matter of fact Moree is supplied at the present time by hawkers along the road.
588. Do you not think it would be advisable to encourage the industry for the benefit of the people of Sydney by making special rates? There is no doubt the rates would be made through to Sydney if the fruit produce of the district warranted it. I met ten hawkers on the road from Inverell to Moree.
589. *Mr. Wright.*] How long is it since you were in the district between Inverell and Moree? About four months.
590. Were you in Warialda? Yes, I stopped there twice.
591. Did you travel along the direct road? By both the north and south banks of the river.
592. Is the country fairly well taken up between Moree and Inverell? Yes.
593. If that is the case, how is it that the Secretary for Railways is able to tell us that there are immense areas of unalienated Crown lands on the route? So there are relatively. There are large areas to the north of Warialda and to the south which have not been thrown open.
594. But I am speaking of the route of the railway? I would not say that they are on the immediate route of the railway?
595. But within 10 miles? Within that distance there is a considerable area.
596. You say it is largely taken up, and another witness says it is nearly all open for selection? It is not nearly all open for selection, but large areas are.
597. You are under the impression that there is a large amount of Crown land available for occupation? Yes.
598. And you think it will be taken up? I do.
599. Some years ago you reported on the railway from Glen Innes to Inverell? Yes.
600. Was your report on that line a favourable or unfavourable one? My idea then was that Inverell should have a railway. That was the effect of my evidence.
601. In answer to Mr. Roberts you stated that the land between Moree and Inverell was very good? Between Warialda and Inverell chiefly; and that it was also good land between Warialda and Moree?
602. The whole way? Not all the way—not in the neighbourhood of Warialda.
603. How much bad land will there be? I should think there is about 15 miles of poor and worthless soil east and west of Warialda.
604. You say the land between Glen Innes and Inverell is inferior? No. I said it was no better than the land between Inverell and Warialda.
605. You have stated that the people of Inverell are in favour of the route to Moree? Yes.
606. Do you mean the people of Little Plains and Big Plains and that part of the country? I mean the representative men of the town.
607. Some years ago they were in favour of another route, were they not? I do not know whether this route was under consideration at that time.
608. Is it not a fact that the people of Inverell have been so long disappointed in getting a railway that they are prepared to accept any scheme of railway communication? I think there is a good deal in that. At the same time, they appear to think the western scheme will suit them better, and that they will find a market for their produce.
609. Do you know Mr. Sinclair, of Inverell? Yes.
610. Is he in favour of this route? No; he is in favour of the Glen Innes extension.
611. Is Mr. Granger, the manager of the Bank of New South Wales, in favour of this route? No.
612. But Mr. Eddie of Little Plain is in favour of it? Yes.
613. And the local flour-mill people at Inverell? Yes.
614. What is your idea about the benefits to be conferred on Inverell from the western extension? I think there is no doubt that a good deal of the produce grown about Inverell will find its way to the west as they anticipate. Then, as far as Inverell is concerned, I think the interests of Warialda deserve almost as much consideration in one direction as the interests of Inverell. I think, as a matter of fact, there will be more heavy loading put on at Warialda than at Inverell, except in the shape of produce.
615. Beyond Warialda it is very fine country? Yes.
616. Capable of producing anything which can be produced in that climate? North of Warialda it is more fitted for sheep and cattle than anything else.
617. Speaking about the markets for the Inverell people;—is not the population west very limited? I suppose there must be considerable population—10,000 or 12,000. Then, of course, there is the consumption of fodder.
618. But it is sparsely populated on the whole? Yes.
619. And it is a district likely to be confined for many years to pastoral occupation? Yes.
620. You say you do not think Moree is likely to be an active competitor with Inverell in the production of cereals? No.
621. You think that district will remain pastoral for a considerable time? Yes.
622. And, therefore, will have a sparse population? Yes.
623. That being the case, where is the market to be obtained for the enormous wheat production of which the Inverell district is capable? It will have to find its way, I suppose, to the seaboard.
624. Then the effect of this railway will block the Inverell people for all time from supplying wheat to the northern rivers or to any portion of Queensland which may require it? That opens up another question. My own impression is that if they had a railway to Glen Innes it is an open question whether they would supply the northern rivers. I do not think they would, because I think they can carry it cheaper by steamer from Newcastle and Sydney than from Inverell.
625. But you must recollect that they have, first, 400 miles to carry it by rail to Sydney? Yes. Of course, one thing fixes a selling rate. As far as that is concerned, directly we begin to export London values would rule.
626. If I wanted to supply Mr. Humphery with wheat, would I go the whole way round this table to do it? The probability is Mr. Humphery would not want to buy from you, that is, he could buy cheaper from some one else.

627. The man at Moree can buy his wheat from the Adelaide grower, and land it almost as cheaply as the man in Inverell could? He would not land it quite so cheaply, and that would make the difference to the Inverell man.

J. Harper,
Esq.

9 Sept., 1896.

628. I notice that you estimate the goods at £8,810 per annum;—I am referring to the Moree extension? That is from Inverell.

629. Coaching, £4,300 per annum; mails, £1,188 per annum? Yes.

630. The Railway Commissioners charge £12 per mile for carrying mails on the main lines? No; more than that. They get as much as £20.

631. Is this a fair estimate for carrying mails on a branch line? Yes.

632. Do you know that the mails between Inverell and Glen Innes are now carried for £48 per annum by coach? That is quite probable.

633. And yet you propose to charge £1,100 for the same services. By that means are not you building up an estimate unfairly. You are charging ten times more than for carrying the mails than is charged by coach? That is a matter of policy which does not affect me. It is not my estimate at all.

634. But does it not seem to you to be an unfair way of obtaining an estimate? Will you pardon me for not answering that question.

635. Answer it with any explanation you like? The only explanation I can offer is that it is what the Railway Commissioners are credited with. There are services rendered—I do not mean to say they would be worth the extra money—which are not rendered by the coach.

636. At all events, you based that estimate on a recognised Departmental plan? Yes.

637. And if it is an over-estimate, it has nothing to do with you? No.

638. It strikes me that the estimate of traffic, amounting to £13,398, over this long distance is very small considering that some years ago you estimated the traffic between Inverell and Glen Innes at £15,000? No; I did not.

639. Listen to Question 529 in connection with your evidence on the proposal to construct a railway from Glen Innes to Inverell in 1892:

My recollection of the evidence taken before the former Committee is that the people stated that they would be prepared to pay 10s. a ton for carriage between Inverell and Glen Innes? Yes; but we give them more than that. Our estimate is £15,326.

? But you ought to read the context. A set of figures was handed to us by the Inverell people for criticism, and if you read the rest of my evidence you will see that all through.

640. You say that the figures handed to you showed £23,000 per annum? Yes; but this was my application of an estimate for their figures, and I distinctly said they were not my figures. You will see that I did not accept their figures.

641. Where will I see that? Question 513, as follows:—

Mr. Barling, on being examined before the Committee the other day, stated that a fresh lot of statistics had been submitted to the Department showing the total receipts from traffic as £21,805. Have you gone over those statistics? I have analysed them as a matter of figures, not as a matter of fact.

That is to say, I applied our local rates to their estimates.

642. But you knocked them down to £6,000 afterwards? Yes, by applying their tonnage to our rates. I may state the following questions were asked me:—

When were your statistics obtained? In 1889.

These, I suppose, were supplied in 1892? In 1892.

Have you any reason to doubt their correctness? I am sorry to say that I have every reason to doubt their correctness. With regard to the quantity of sheep estimated to be carried, we have not carried so many on the northern line between Tamworth and Jennings during the period mentioned.

All through I discredited the figures.

643. But these estimates were estimates four years after you had taken yours, and you say here you have no new estimates;—Is it not possible that the traffic during that time had considerably increased? No.

644. Owing to increase of population? We should have had an indication of it at our railway stations to-day. As a matter of fact, they have diminished. I think you will find that, further on, I said:—

Can you tell us whether the trade to and from Glen Innes station has increased since 1889? It has increased.

Much? Not to a very large extent. I may explain that during a portion of 1889 the differential rates were not in operation and our business had fallen off. They were brought into operation during the latter part of 1889, and our receipts have since increased by reason of our increased business.

645. There is the fact to which you cannot shut your eyes, that in 1889 you made a certain estimate, and that estimate you now make out to be £8,200 per annum? Yes.

646. Four years after that the local people submitted another traffic scale to you, and you say you altered that according to the figures obtained four years before? No, I did not alter their tonnage at all.

647. But you discredited it? I discredited their tonnage; but applied our local rates to it.

648. If their tonnage is correct, and you have no evidence to show it is not, the revenue will be £15,000 per annum? Yes.

649. You stated in answer to Mr. Black that you thought the traffic between Grafton and Glen Innes in and out would be 1,400 tons per annum? Yes.

650. I have a statement showing that to the end of June, the traffic outwards from Grafton was 1,783 tons, and the traffic inwards in the corresponding period of twelve months 627 tons? I am not dealing with Glen Innes, but with Inverell.

651. Of that traffic I find 460 tons came from Inverell into Grafton, and 463 tons were sent from Grafton to Inverell? Yes.

652. That is a traffic of 923 tons between the two places? Yes.

653. The total traffic in and out of Grafton and Glen Innes is 2,400 tons in the year? I have the same statement somewhere; I expect it does amount to that.

654. The actual return from the agents at South Grafton is 783 tons outwards; 463 tons were sent to Inverell, and 627 tons inwards, of which 226 tons came to Inverell? Yes.

655. In the event of this line being constructed, truck rates, I presume, will be applied? Yes.

656. What will be the truck rates to Inverell per ton? I should think it would be low enough to secure traffic. I could not say what it would be. I have only dealt with that section of the line in my estimate.

J. Harper,
Esq.

9 Sept., 1896.

657. It will not be less than it is to Glen Innes at the present time? Not less than that.
658. Considering that at the present time goods can be carried from Sydney to Inverell at £4 10s. a ton, are you likely to get the traffic when you bear in mind the fact that the local business man always has a prejudice in favour of the teamster? If that rate were not low enough, probably the Commissioners would make a lower one.
659. The Commissioners state in their returns that the loss on the line between Tamworth and the border is about £100,000 per annum. Have they considered the effect of their action in proposing the construction of a line which will rob the northern line of nearly half its traffic? I do not know about robbing the northern line of half its traffic, because if it secured the portion going to the coast now there would probably be as much profit in it.
660. You must be aware that the construction of this line will take 11,000 bales per annum out of the 13,000 bales of wool coming to Inverell and Guyra? I do not estimate that of the Inverell traffic more than 6,000 bales will go by this line. I think there is a certain portion lying between Inverell and Glen Innes, and to the north and south of those points, which will still continue to go in as now.
661. Notwithstanding the complaints of the Railway Commissioners that the northern line is a drag upon them by reason of its annual loss, they are now proposing a competing line which will deprive it of a considerable amount of traffic? It will deprive it of a certain amount of traffic, but it will gain other traffic which it has not got now.
662. It will make the loss on the northern line still heavier, whilst the line they propose to construct will not be a supporting one? It is rather an open question whether, if there were a line from Inverell to Glen Innes to-morrow, the Commissioners would get the traffic on the main line.
663. You have a line running from Armidale to the Queensland border, which is not paying? That is so.
664. And you propose the construction of another line, with necessarily increased expenditure, because it means a duplication of staff to a certain extent, with absolutely no substantial gain to the traffic? Of course that is a question which, I suppose, the Commissioners have considered.
665. Without the possibility of getting additional traffic—because you cannot get the Queensland traffic by reason of their border fees—you propose to construct another line which will increase the loss on the main northern line, and which will not be self-supporting? Yes.
666. Supposing the Commissioners were prepared to recommend the construction of a line to Inverell, and leave it to the inhabitants to select which line they would have—a line from Inverell to Glen Innes, or a line from Moree to Inverell;—taking the whole of the people immediately surrounding Inverell into consideration, which line do you think they would prefer? I should think, in view of my recent experience, they would prefer the Moree line.
667. The line proposed to be constructed to Inverell *via* Moree leads to a very hot country? Yes.
668. Do you think it would be a favourite route for passengers to travel in the summer-time? It is not, as a rule, a favourite route through hot country.
669. Do you think it is possible that with a good line of coaches, and a passenger rate of 5s. per head, the passengers would still go from Inverell to Glen Innes? There is a possibility that people of weak health would go there.
670. There is the danger that passengers would not patronise the Moree line, but would cross by coach to the main line? There is that possibility.
671. And that, to some extent, will weaken the possibility of a revenue being obtained from the coaching traffic? Yes; I purposely gave a very low estimate.
672. You gave a low estimate, recognising the fact I have spoken of? Yes. I know that the road is good.
673. And the climate is better? Yes.
674. Has the question of a coast extension ever engaged your personal attention? No.
675. Have you an idea that, at some future time, there may be a connection between the coast-lands of the Richmond and the Clarence River and some portion of the tablelands of New England? I could not say that. It may be a matter of policy.
676. Is it, in your opinion, a possibility that sooner or later that connection will take place? Even that I could not say, but I know that it is constantly before the public.
677. You do not care to commit yourself to any expression of policy? No.
678. The construction of the proposed line from Inverell to Moree means, at all events, the impossibility of connecting the northern portion of the Colony with the coast? I do not see the impossibility of that.
679. Unless by the extension to Glen Innes? Yes.
680. Is there, in your opinion, any possibility of that? That is again a matter of possibility, but I do not say it is impossible.
681. At all events, it is plain that the Commissioners have no intention of connecting the coast with the tableland? I do not know their intentions. I only know these lines when I go over them.
682. Can you tell me if it is likely there will be any further extension of this line towards the northern borders of the Colony? I have not heard of any.
683. From your knowledge of the country and the traffic requirements of the country, do you think it is likely that any suggestion of that kind will be made in the future? I could not say. I prefer not to answer that, but I have my own opinion about it.
684. Do you think that by the construction of the proposed line we shall obtain any traffic which we have not at present over our railways? I think as far as the Queensland traffic is concerned the Moree extension will tap the best portion of it—all that can be got.
685. And you think the construction of the line will not facilitate the capture of any of our neighbours' goods? I do not think so.
686. You say that Warialda is a small town? Yes; I think there are 100 houses and 600 inhabitants.
687. You have described the country near Warialda as rough? Yes.
688. Is it not plain undulating country? It is very indifferent country and sandy. There are some very stiff hills.
689. There are no mountains? They are not mountains, but it is rough country.
690. There is nothing that a man could not ride a bicycle over? On the good roads about Warialda they could do that.
691. I suppose the reason the railway will not be taken to Warialda is because it will be a little too expensive? Yes.

692. But there would be no engineering difficulties in carrying it to Warialda? No; but it would mean an expensive addition of 7 or 8 miles.

693. Are you inclined to express an opinion as to whether the line should go to Warialda? Personally, I do not think it should go to Warialda.

694. Why? Warialda is one of those accidental roadside towns. There is absolutely nothing about it.

695. But it is the town and depôt for a valuable district? Yes.

696. If my memory serves me correctly, the district north and north-west of Warialda is quite as good as that about Inverell? It is not as good soil for agricultural purposes, but it is a splendid pastoral country.

697. At any rate you think that, owing to the expense, it is not wise to go into Warialda? I think so.

698. You think that if the line is 4 miles away it will serve the people of Warialda? Yes, in view of the small population of the township. I do not think the distance of 4 miles will be an insuperable difficulty.

699. All the traffic which would come to the station at the point would come through the town of Warialda? Yes, nearly all.

700. Do you not think that in a few years we shall have a repetition of the Nevertire-Warren business? I do not think so. The circumstances are different. Of course, it was known to everyone that between Nevertire and Warren there was an almost absolutely impracticable road.

701. It has been travelled for fifty years with fairly good success? Yes.

702. Do you not think that in a short time the Warialda people will point out that the whole of the traffic converges into their town, and that they have a right to communication, and that they will get it? I do not know what representations may be yielded to; but I am quite sure that the Warialda people are not situated as the Warren people are.

703. But there is a possibility, and almost a certainty that an agitation of this kind would at once spring up? I am quite sure there would be an agitation.

704. In paragraph 3 of their report the Commissioners say:—

The country lying between Moree and Inverell is of a very much superior character, for the greater part of the distance, to that lying between Inverell and Glen Innes.

In answer to my question a short time ago, you said you thought the country between Glen Innes and Inverell was quite equal to that between Moree and Inverell? Yes; of course, there are patches on both sides which are bad.

705. You have been over the road between Inverell and Glen Innes? Yes.

706. And with the exception of three little spurs of ridges, is it not a positive fact that every inch of that land is of the richest description? Yes.

707. Paragraph 4 of the Commissioners' report says:—

A much larger area of Crown lands also lies within reasonable distance of the line under consideration, whereas on the other route, the major part of the land has been alienated from the Crown.

Of course, it is quite easy to understand that there is a much larger area of valuable land on 96 miles than on 45 miles. I suppose you are aware that between Inverell and Glen Innes there is a considerable amount of reserves not yet open for selection, which might be opened in the event of a railway being constructed? Yes; but I went carefully through a map at the Lands Office, and without being able to point out the exact areas, I could see there was a proportion of 20 to 1 of land on this route as compared with the other.

708. And yet we are told it is largely occupied by selectors? The alienated portions are occupied by selectors to a large extent, particularly in the neighbourhood of Warialda.

709. The population extends out pretty thickly from Inverell to Little and Big Plains? Yes.

710. Beyond that, what have you? On Myall Creek and Reedy Creek there is population.

711. But there is not much population? They are farmers principally.

712. What population is there about Kelly's Gully? I could not tell you.

713. That is the deviation you come up to avoid going into Warialda? There may be one or two farmers about there.

714. Is there much small settlement immediately contiguous to Moree? No, not along the route. There are a lot of reserves on Binagui and Mukabundi and adjoining stations.

715. I suppose you consider that from 10 to 15 miles of the present route is already served by the Moree extension? The first station, Mukabundi, would be served by it. As a matter of fact, I have not included that in my estimate. Then there is very good land at Binagui. The survey passed through that close to the woolshed. Then there is some good land at Gravesend.

716. Will you explain what is to be gained by the State by the construction of this railway? Giving greater facilities to the people north of Warialda.

717. But what is the State to gain by the construction of the line? From the figures obtained by the Railway Commissioners, there will be at first a loss.

718. The State will suffer a loss by the construction of the line, and a still heavier loss by the deprivation of the existing northern line of a certain amount of traffic? That might be compensated for by the increased value of the public lands available in the neighbourhood.

719. But you yourself feel confident that the line is one which ought to be constructed? Yes; of the two, this is the one I should prefer.

720. Notwithstanding the fact that you see no chance of getting the passenger traffic? I do not say that we are not going to get any passenger traffic. I am quite sure that during the winter months the opposite will occur to what will occur during the summer months.

721. Notwithstanding the fact that we have to suffer a certain loss of passenger traffic, and notwithstanding the fact that to enable you to get the traffic you are likely to have to carry goods at an unremunerative price of less than £5 per ton, you think the country is justified in spending £300,000 to construct the line to get nothing? Yes, as against the one from Glen Innes.

722. Putting that on one side, is the country justified in spending £300,000 for the benefit of a few settlers between Inverell and Moree, and to suffer an annual loss also? That is a question of policy. I have tried to lay all the facts with which I am acquainted before you.

723. Have you considered how long it will take the line, by the increase of settlement and traffic, to be a self-paying one? I cannot answer that. Of course I have answered a similar question in the case of densely-populated country like the Berrigan country. There you can look ahead; but it would be impossible to do it where there is unalienated Crown land.

J. Harper,
Esq.
9 Sept., 1896.

- J. Harper, Esq.
9 Sept., 1896.
724. Is there a possibility that, by a set of circumstances, unknown at present, your estimate may be an unknown estimate? I am not prepared to concede that, because I think I have kept well below it. So far as Inverell is concerned, I think the estimate is a small one for the whole traffic in and out of that district, including the possibility of ore and everything else.
725. I notice that the locomotive and working expenses of the proposed line from Moree to Inverell—96 miles—are estimated at £100 per annum less than the same service between Inverell and Glen Innes? I think since the Commissioners have prepared the other estimate circumstances have altered, and the cost and working expenses have been much decreased.
726. If another estimate were submitted in regard to Glen Innes and Inverell, the decrease in the working expenses would be considerable? I think if the Commissioners were to estimate to-morrow for that line it would be reduced.

THURSDAY, 10 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHRY (VICE-CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.
THE HON. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn; and further examined:—

- H. Deane, Esq.
10 Sept., 1896.
727. *Mr. Lee.*] When you were here on a former occasion, I asked you if you had any calculations as to the lifts from Werris Creek to Inverell, and your reply was that you had not up to then touched upon the question. Have you since that time prepared any plan of the rises in the aggregate? Yes. In the first place, as requested by the Committee, I have checked the total height which, it is stated in the Railway Commissioners' report, traffic would have to be lifted going from Werris Creek to Glen Innes. I find that, taking all the little rises into consideration, it is 6,869 feet—that is, 260 feet more than the Railway Commissioners' estimate; but if I were making a return for the same purpose as the Railway Commissioners wanted those figures, I should bring it to about the same. I make it a little over 6,600 feet in the same way as the Railway Commissioners, so that I think those figures may be taken as quite correct. Taking the other line, we have a total rise of 3,546 feet; but cutting out the smaller and shorter rises, which can be surmounted without any special effort, I bring the total of the rises to 3,400 feet—that is to say, to a little more than one-half. In actual elevation, it is just about one-half, and if you add all the rises together the totals are larger than in the other case; but it also comes to about one-half.
728. At all events that is a correct estimate? Yes.
729. Could you more fully explain the nature of these rises, as to where and how they occur? I think the diagram section will be the easiest to understand.
730. Your detail survey, as shown on the parish maps, shows an extraordinarily crooked line—the diagram provides almost for a straight line? Yes; it is on too small a scale to show all the turns.
731. From your detailed survey, it would appear that there is an enormous number of small rises? Not necessarily. For instance, take a particular point from the crossing of the Warialda Creek up Kelly's Gully, and it will be seen that towards the top end of Kelly's Gully there is a big bend, but that is all in one rise. These sharp bends do not mean rises and falls. They are put in for the sake of avoiding rises and falls.
732. Are you able, from the map, to show where and how the rises occur? Starting from Werris Creek, on the northern line, the first rise is up to Terrible Vale and Duri.
733. I want you, in a sketchy sort of way, to show where the important rises are—where they are a block to traffic? The first rise shown on the plan is a rise of about 309 feet—the main rise between 156 miles 7 chains and 159 miles 78 chains. That is the most important rise at that end of the line. After that the most important rise, of course, is that long rise after you leave Moonbi, coming up the Moonbi Ranges. The ruling grade is 1 in 40, and there is a good deal of it.
734. That rise extends as far as Walcha Road? A little beyond Walcha Road, that is 220 miles 4 chains from Newcastle. After that there is another little rise. Then the next big rise is beyond Armidale, from Dumaresq up to a point between Black Mountain and Guyra.
735. What is the grade between the two points? 1 in 50 is the ruling grade. Between Llangothlin and Ben Lomond there is a rise. There is a piece of 1 in 50, but there is not much of it.
736. Those are the rises going north to Glen Innes? Yes.
737. How many miles are there of 1 in 40 between Werris Creek and Glen Innes;—are there many miles of it continuously, or is it only a series of small rises? They are in conjunction with other rather steep grades. The rise from Werris Creek to Terrible Vale is not such a continuous one. There is one piece of 1 in 40, which is about a quarter of a mile in length. I am taking only the rises towards the tableland. There is a length of 1 in 40 near the Macdonald River, about 2½ miles in length, and there is another length just beyond the Macdonald River of about 1½ mile. The first one I mentioned—that below the Macdonald River—is the worst, because it is part of that long ascent from Moonbi, and is in conjunction with grades of 1 in 52, 1 in 48, and 1 in 50.
738. But would not that be between the Macdonald River and Walcha Road? No, between the Moonbi and Macdonald River.
739. What about the length of that? It is about 2½ miles.
740. With the exception of that piece what is the grade from Moonbi to Macdonald River? There is a good length of 1 in 48—about 3¼ miles of it, and there is a stretch of about 1½ mile of 1 in 50.
741. The next grade of 1 in 40 appears to be in the neighbourhood of Ben Lomond—between Black Mountain and Ben Lomond? There is only a grade of 1 in 40 descending there.
742. Then there is no 1 in 40 after you pass Walcha Road, between that and Glen Innes, going north? No.
- 743.

743. Now come back again and start at Glen Innes. Where do you pick up the first 1 in 40? Going up to Ben Lomond. H. Deane,
Esq.
744. Is that extensive? Yes, about 3 miles.
745. And the next point? There is a little one at Armidale which is 1 in 41, close into Armidale. That is less than one-quarter of a mile in length going towards Sydney. 10 Sept., 1896.
746. On the Sydney side? No; on the Glen Innes side of Armidale. It is a very short run.
747. Then it would appear that when you surmount the 1 in 40 at Ben Lomond, coming south, the grade from there down is a moderately easy one? Yes.
748. Still coming south, are there any formidable grades about Walcha Road, or Macdonald River, or Wallan, which would impede the carrying of large loads? There is a grade of 1 in 44 before you get to Walcha Road for about $1\frac{1}{4}$ mile, and there is one of 1 in 50 just after you pass Macdonald River.
749. Coming south, are there any engineering obstacles on the Great Northern line which would prohibit the use of full trains? There are the grades I have mentioned.
750. But are they serious impediments to full traffic? If you have one of a mile and a quarter it is a serious impediment.
751. Are not full loads brought over them at the present time? I cannot give you the details of the traffic.
752. As a matter of fact, whatever there is to be brought down by the usual train loads is brought down by that line? Yes.
753. Consequently the down grades cannot be so formidable, otherwise they would make the running of those trains doubly expensive? Yes.
754. What is the ruling grade from the top of Ben Lomond—that is, the highest point—to Werris Creek? The ruling grade is 1 in 40 near to Werris Creek—between Duri and Currabubula.
755. What is the length of that? About half a mile. It is at Currabubula.
756. Can you tell us what is the steepest grade on the rise coming out of the Hawkesbury to the top of the hill? 1 in 40.
757. Then, as a matter of fact, the ruling grade on the main northern line is 1 in 40, and that ruling grade will be found within a few miles of Sydney as well as in the distant part of the New England tablelands? Yes; but of course that is worked in a different section.
758. That is the grade coming south, is it not? Yes.
759. Consequently your grade from Glen Innes over the Ben Lomond Mountains would never be stiffer than 1 in 40? No.
760. And you meet with that grade close to Sydney? Yes; within 35 miles of Sydney.
761. If the grade on the tableland were 1 in 100, the ruling grade would still be 1 in 40 near the Hawkesbury? Yes.
762. Is not the grade a dominating principle with you in laying out your railway lines? Yes.
763. You are justified at times even in extending the length of a line in order to get a better grade? Yes.
764. Has that principle been observed in the survey of the line from Moree to Inverell? Yes.
765. And does that account for the apparently extremely crooked nature of the line? It accounts for a good deal of it. It is partly due to the desire to save earthworks.
766. Many of the semi-circles in that line have been made with a view of escaping the heavy grade? Yes.
767. And by doing that you have been able to get a ruling grade of what? Of 1 in 100 towards Sydney, and 1 in 80 outwards.
768. It has been the means of considerably lengthening the line, has it not? It has probably lengthened it for a few miles.
769. How many miles? I could not tell you exactly. I should think, possibly, 4 or 5 miles.
770. Looking at the sketch map, does it not appear that if a more direct line could be obtained its length could be considerably shortened? You cannot get it.
771. The country is such that you cannot get a straight line? No.
772. So desirous were the Department of obtaining a low grade that they worked round ridges and in and out of various places? In laying out a line you are bound by the features of the country in any case whatever grades you have. If you adopted very much steeper grades than that you would have to adopt very nearly that general direction.
773. But if you had wanted to get a 1 in 50 or 1 in 60 grade, could you not have omitted a large number of the curves? Some of them.
774. The main object has been to obtain a line of good grades? Yes.
775. That being the case, the distance being sacrificed to grade, it must follow that the grade coming out fairly good would make the grade on the Great Northern line appear, by contrast, very bad? Yes.
776. If you were to observe the same conditions in the survey of the proposed extension, would not the line in places be almost as bad as that across the tableland? I could easily get 1 in 40 grades if I wanted them. Some country is better adapted to good grades than others.
777. But, notwithstanding all the trouble the Engineering Department have taken to obtain such an easy grade, the fact still remains that they are confronted by a 1 in 40 grade at the Hawkesbury? There is no doubt about that grade.
778. I suppose you are not prepared to give any evidence as to whether it would be more desirable to take the line another way—coastwise or otherwise? No.
779. You simply desire to give evidence as to the proposal before us? I can only say that that line is, in my opinion, the best way of connecting Moree with Inverell.
780. Is it proposed to fence the line? No.
781. Not any parts of it? Some parts of it will be fenced, but, generally speaking, fences will be dispensed with. They are not included in the estimate.
782. And, of course, it will be a single line with the necessary sidings? Yes.
783. Do you know if any information has reached your office as to the dealing with the freehold land through which the survey passes? No; I am not aware of any.
784. You are not aware whether there has been any arrangement made for the proprietors to give the land free? No.
785. Was the survey made with the view of that being done, or irrespective of it? The survey was made, so as to get the best line.

- H. Deane, Esq.
10 Sept., 1896.
786. Irrespective of freehold or Crown lands? I would not go so far as to say it has been made irrespective of boundaries. Where it is possible to go through Crown lands in preference to private lands, it is always done.
787. So far as you are aware, the proposed line is located where the engineers thought it was best, leaving the question of land to be determined by the authorities more immediately connected with it? Yes.
788. Your Department has nothing to do with the matter? No. I do not see how the line can be shifted very much laterally to avoid properties—to get through more Crown lands in preference.
789. Do you think you would be able to find a better ruling grade? No; I believe that is the best line which can be found. I have been into the matter very carefully myself, and I have examined the line.
790. Have you been over the route? Yes.
791. Will there be any bridges involved in the construction of the line? The most important bridge will be that over the Gwydir, near Ezzy's Crossing. The next to that, probably, will be that over Warialda Creek.
792. The line immediately approaching Inverell appears to be about the most costly portion of it? Yes.
793. How do you account for that? Because of the features of the country.
794. The cuttings, I suppose, are much heavier? The country is sharply undulating.
795. The cuttings would be necessarily heavy to keep down the ruling grade? Yes.
796. If the line were constructed, and it was determined at any future time to extend it, the question of a bridge over the Macintyre River would have to be considered? Yes.
797. That would be costly, would it not? Not very.
798. Would it not run into many thousands of pounds? It is a small crossing, as rivers go. About £4,000 or £5,000 would do it.
799. Has there not been an ordinary traffic bridge recently erected there? Yes.
800. That cost more than £4,000 or £5,000? It did—I forget the amount; but the crossing which we should have in the production of the present line will be a better one than where the road bridge goes, besides which it is always cheaper to make a railway bridge than a road bridge. It is a narrower bridge, and there is not so much decking required. Although it has to carry heavier weights still it is cheaper.
801. Are there any surveys from Inverell or in the immediate vicinity of Inverell going north to any given point? No explorations have been made.
802. By way of Emmaville and Decpwater, for instance? I think it is twenty years ago since there was an exploration beyond Inverell towards the north, but I do not know how far it went.
803. If it were considered advisable in the future to extend the line, would there be any possibility of extending it except by taking it direct east? I could not give you any reliable information as to that.
804. The estimated cost of the line, I presume, is based on the fact that if it is constructed it will be sufficient to carry the present traffic? Yes.
805. You are not providing for a line to carry the maximum amount of traffic which could be carried over it? If the line is constructed, as I propose, of course if the traffic largely increases, it can be improved.
806. You are not providing for an enormously solid traffic? No.
807. The line will be sufficient to carry the present traffic, and it can be built up if required as traffic increases? Yes.
808. *Mr Roberts.*] I notice that the cost per mile of the line from Narrabri to Moree was £2,409? Yes.
809. And the estimated cost of the line from Moree to Inverell is £2,898, showing an excess in cost of £489 per mile;—will you explain the reason of that increase in the cost? The country is not so level as it is between Narrabri and Moree.
810. How many bridges are there between Narrabri and Moree? There are two bridges at the Namoi River and Narrabri Creek, and a number of other bridges of smaller size.
811. I think there are three bridges on the proposed line from Moree to Inverell? Two large bridges; but in rougher country such as that, if there are not many bridges there will be a great many culverts and small openings, which add very considerably to the cost.
812. Is it the bridges which have to be constructed on the proposed line from Moree to Inverell which account for the increase in the cost of the line? Not altogether, but it is a different class of country.
813. Is that the principal item? No, not necessarily. Where you have heavier earthworks you will almost invariably have a heavier amount for waterways as well, so that on this line, where the earthworks on most of the sections are heavier than from Narrabri to Moree, you get waterways also heavier.
814. The Narrabri to Moree line goes through more level country than the line now under consideration? Yes.
815. Will you describe the grades between Narrabri and Moree? There are two short pieces of 1 in 76, which are calculated to be the same as 1 in 80 on an extended section. The ruling grade towards Sydney is 1 in 100, but it will be seen from the diagram that the country is nearly a level one between Narrabri and Moree, but after you pass Moree and go towards Inverell you begin to get in the hilly country. After you get out about 20 or 30 miles the country becomes more undulating.
816. How many stations do you propose having between Moree and Inverell? They are not absolutely fixed yet, but perhaps I can give you an idea of what is included in the estimates.
817. Will there be any stations between Moree and Warialda? Yes, there will very likely be two stations.
818. And the third station at Warialda? Yes.
819. How far will that station be from the town of Warialda? Four miles.
820. What amount of money do you save by keeping the line 4 miles out of Warialda? About £10,000.
821. What is your principal reason for not taking the line into the town of Warialda? The saving in expense.
822. What is the character of the country;—is it rough country? It is very rough after you leave Warialda. You will see that if you travel on the road from Warialda towards Inverell. There are some very rough ridges to cross.
823. Do you not think it would be wise for the line to go through the town of Warialda;—would you have to make a curve in getting to the town? You could easily get into the town; the question is one of getting out of it. It would be most costly. The difference in cost would be about £10,000. I submitted the matter to the Minister, and it was decided to adopt the proposed route.
824. Is that owing to the extra distance which would have to be travelled? Yes, it makes a little difference in distance—I think about 2 miles—and there is the difference in the cost of about £10,000.
825. Have the Railway Commissioners approved of the line going in the way proposed, viz, via Warialda? Yes.
- 826.

- H. Deane,
Esq.
10 Sept., 1896.
826. Do you not think that the fact of the line being 4 miles out of the town will lead to a great deal of dissatisfaction on the part of the residents of Warialda? I do not think so; but that is a matter I have had no instructions to inquire into. I have had both lines surveyed, and submitted the two, and the one now submitted to the Committee is the one which is approved of.
827. Is that the one selected by the Minister for Public Works? The Minister and the Railway Commissioners.
828. You have mentioned three stations—Warialda being the third? Yes.
829. How many stations will there be between Warialda and Inverell? I have allowed for three intermediate stations between Warialda and Inverell.
830. Will the fourth be at the terminus? Yes.
831. According to your estimate, the cost of sleepers is 2s. 9d. each? Yes.
832. Is that what you paid for the Narrabri to Moree sleepers? No; it is about what half of the Narrabri sleepers cost. We paid 2s. 6d. for half the sleepers on the Narrabri to Moree line. We required the extra 3d. for adzing and putting on the road.
833. Where are they to be brought from? From the neighbourhood of the Narrabri-Moree line and from the Warialda district.
834. I notice in your estimate, part No. 1, you put down the station-master's house at £200; in part No. 3, Kelly's Gully line, you put down the station-master's house at £350;—why should the one cost more than the other? The more expensive one is at the Warialda station which will be a more important one than the other.
835. Will the station buildings be constructed of wood? Yes.
836. In answer to Mr. Lee, you said that the line would not be fenced? It is not proposed to fence it.
837. You have already constructed several lines of railway where the fencing has been dispensed with—for instance, the Nyngan to Cobar line? Yes; that is not fenced.
838. What other lines are unfenced? There are none open.
839. Have any difficulties arisen from the fact of the Nyngan to Cobar line not being fenced? No.
840. Has it been found to answer? Yes; it has been found to answer there.
841. The proposed line from Moree to Inverell stops on the western side of the Macintyre River? Yes.
842. Do you consider that the best site for the terminus? Yes; the line cannot be taken right into the town, not into the centre of the town—but it can be taken to the other side but still within the township. That would cost about £2,500 more.
843. Would that be irrespective of the cost of the bridge over the river? That is the net cost, but the actual cost of carrying it to the further site would be about £7,500; but if you deduct the cost of the bridge and approaches, which would be necessary if you stop on the west side of the river, it would leave about £2,500.
844. Would it not be a greater convenience to the townspeople if it were taken to the eastern side, which you have just mentioned? It would be a greater convenience to those on the eastern side of the town, but for those living in the centre it would be about the same.
845. Where do the majority of the people live? In the centre.
846. Would the £2,500 be exclusive of land resumption? Yes.
847. Did you form an estimate of the cost of the site which you think would be suitable for the station buildings at the eastern end of Inverell? Do you mean as regards resumption.
848. Yes? No, I have not.
849. Could you give a rough guess as to what it would cost? No.
850. Would the road-bridge which is already there be suitable for taking the line across the river? No, it is in the wrong place for the railway.
851. You would have to construct a new bridge? Yes.
852. What would be the cost of that? About £5,000.
853. With the £2,500 that comes to £7,500, and then there would be the cost of the land to add to it? Yes, there is the cost of the bridge in any case. The bridge has to be made. You either have to make a road-bridge or a railway-bridge.
854. I understood the road-bridge was there already? It is not in the right place for the railway station. A new bridge will be necessary at a cost of about £5,000—that is the bridge and approaches.
855. Then the extra cost of a line would be £2,500? Yes.
856. Would that go through private property which would have to be resumed? Yes.
857. And then there would be the additional expense of a large block of land for a terminal station? I think if the Inverell people wish to have it there, instead of on the other site, they should provide the land. It is equally convenient for the Department to stop on the western side of the Macintyre River.
858. You think it affords all reasonable accommodation for the people of Inverell? Yes.
859. *Mr. Wright.*] Your estimated cost of the proposed line is £2,898 per mile? Yes.
860. Will you state what position your surveys are in now? The trial survey is complete.
861. Has the line been permanently staked? No.
862. Have quantities been taken out? Yes.
863. Accurately? Yes.
864. Is it possible, in staking this line, deviations will take place? Small deviations.
865. Is it not possible that there may be a considerable discrepancy between your estimated works and what will be found necessary when the line is permanently staked? No.
866. I suppose you mean it is not probable? It is quite possible to be led into more expense through circumstances which are not foreseen at the present moment.
867. Supposing one of your officers reports that by a deviation of half a mile he can secure a better route, would not that affect your quantities? It would reduce them.
868. It might not necessarily do so? Then it would not be a better route.
869. You are satisfied about your estimates, and your quantities have been carefully taken out? Yes.
870. Is it not customary, before you can say definitely that such is the case, that, where you have to make cuttings, you have trial holes sunk to ascertain the nature of the country you have to go through? It is a very common thing to do.
871. Would not a contractor, if he had a cutting 10 feet deep, expect to find a trial hole to show him what the nature of the country was? In letting contracts it is advisable to have trial holes. We are much more likely to get lower prices than if we do not, because a contractor otherwise takes a good deal of risk upon himself.
872. The survey, I suppose, is not in a condition now which would enable you to call for tenders? No.
873. The line will have to be permanently staked? Yes. 874.

H. Deane,
Esq.
10 Sept., 1896.

874. And quantities carefully taken out? Yes.
875. And where there may be a doubt about the nature of the country, trial holes will have to be sunk? Yes; and the land will have to be surveyed, which is an important thing. There is a certain amount of land survey which has been carried out, but the survey for the purpose of resumption of course would be in more detail.
876. Have any cross-sections been taken out? Yes.
877. All along the line? Yes; but not so closely as on the permanent staking. On the permanent staking it is usual to take the cross-sections, where the ground is at all uneven, every chain, or perhaps closer than that; but here there have been cross-sections taken at intervals—perhaps every 5 chains.
878. And you do not think the permanent staking of this line and the completion of the surveys, is likely to very seriously affect your quantities? I do not think so.
879. What do you reckon for earthworks per yard on the line? About 1s. 9d. per cutting, and 1s. for side cutting.
880. I suppose there will not be much rock to contend with? Not very much.
881. In looking over your estimates it struck me that some things were very low;—take No. 1, for instance—“timber bridge and small timber openings”—that is the first bridge;—what is the length of that bridge? There are a number of them.
882. There is a bridge out of Moree—No. 1 section? No; we are on the south side of the river.
883. What are the lengths of the different bridges, or the structures you might call bridges? Anything from 10 feet up to 100 feet. The only large bridges we have are the bridge over the Gwydir River, and another over Warialda Creek.
884. Is it not customary, in modern railway construction, to substitute iron or steel for wood in all railway bridges? No; it is a very common thing when you first make a line—it is so in America and in new countries—to build them of timber, and afterwards improve. In our own case we are exceptionally well situated for timber bridges, inasmuch as we have ironbark of good quality which will stand for twenty or thirty years before requiring renewal.
885. Have you any railway timber bridge which has stood for thirty years? There is railway bridge timber which has stood for thirty years?
886. I am speaking of a railway bridge? I do not think that any of the older bridges have been made of ironbark entirely.
887. How long did the ironbark viaduct between North Wagga and Wagga stand? I cannot tell you about the ironbark in that structure; but there was a great deal of timber in there which was not ironbark.
888. Do you know that, within five years of the erection of that timber work, the bulk of it was condemned by the bridge commission? I know there was a great deal of timber there which was not ironbark.
889. The question I asked is whether a great deal of that structure, five years after its erection, was condemned by the Royal Commission inquiring into bridges? I know the difficulties we experienced with the bridge. You have asked me a question to which I cannot say “yes” or “no.” I have read a great deal of the report of the Royal Commission, and I have also been to Wagga, and I have seen the viaduct running out between Wagga and the iron bridge. It was in a bad condition. A lot of it had been renewed when I was there, but I know, as a fact, that a great deal of the timber that had been taken out was not ironbark.
890. *Mr. Black.*] Was it paid for as ironbark? I do not think so.
891. *Mr. Wright.*] I think it was? I do not think so.
892. That structure has only been erected fifteen years? Yes.
893. And yet many years ago it was condemned? That does not alter my contention.
894. It has only had a life up to the present time of fifteen years, and yet of your own knowledge a good portion of it has been condemned and removed? Yes.
895. You have stated that a wooden bridge will last twenty-five to thirty years, and I want you to give me an instance in which a wooden railway bridge has, in Australia, stood for thirty years? I do not know that I can give you any instance where the timber has been exclusively ironbark. When the Wagga viaduct was erected, I know that the specifications did not provide for ironbark for everything, nor did they provide for timber which was absolutely durable.
896. I did not confine it to any class of timber;—can you give an instance where a wooden railway bridge has stood for twenty years in Australasia? If you wish to have any information, I can make inquiries. I may say there have been few large timber openings made.
897. The bulk of our railway bridges on lines hitherto constructed have been of iron? Yes.
898. And this departure in regard to wood is comparatively a new one in the construction of cheaper lines of railway? Yes; I think I may say it is. There have, however, been timber bridges built. There is the Singleton bridge for instance, and some laminated arched timber bridges at Queanbeyan and Molonglo, on the Cooma line. There are also truss bridges beyond there on the same line between Queanbeyan and Cooma. Also between Glen Innes and Tentorfield there are three or four truss bridges. Possibly the reason some of them have been made has been on account of the difficulty of getting the iron-work in time.
899. You have said that the bulk of the bridges in America, in connection with the early construction of railways, were of wood, which might be afterwards replaced? Yes.
900. As a matter of fact, have they not, in America, gone in to a large extent for viaducts of iron on iron trestles? Yes, over gorges.
901. But over elevated areas? In a large country like America you will find differences of practice.
902. I suppose that in Europe the bridges are universally of iron or steel? Yes, or brick or masonry.
903. Has any scientific man yet discovered the life of an iron or steel structure? No, I do not think so. Steel has not been in use long enough. Steel is in the same position as ironbark.
904. Do you not think, from an engineering standpoint, it is a mistake to substitute wood for iron or steel, in view of the cheap rate at which these articles can be obtained now? No; I do not think so. I would certainly use steel where I wanted very long spans; but if I could design a span long enough in ironbark, I should think it perfectly safe to use it, and in doing so there would be a considerable saving.
905. You prefer timber to iron? I do not say I should prefer it; but if it were a matter of economy, I should use it.
906. Which do you think the cheaper, in view of the life of the structure? I think it is cheaper to use

use timber at the present day. Of course money is cheaper than it was. A few years ago it would have paid all the better to use timber, but now you have to borrow less money to build a wooden bridge than if you had to build a steel bridge. Money will be cheaper by-and-bye. Probably in thirty years time you will be able to borrow money at 2 per cent. instead of 4 per cent.

907. You construct a wooden bridge at a cost of £3,000, which would last twenty years; at the end of that time you have to borrow additional money to construct an iron or steel bridge to replace it;—by that process you add a capital sum to the cost of your line? Yes.

908. Is that a wise policy? It has all been gone into. I cannot give you any calculations off-hand, but I shall be happy to give you them later on. I can now tell you only that the question of the advisableness of using timber and steel has been carefully gone into. Truss bridges were put in over the Narrabri Creek and Namoi River for the sake of cutting down expense.

909. Has the Department yet discovered a perfect specific for dry-rot and white ants? I do not think they have.

910. I suppose you will admit that our best timbers are liable to both these difficulties? Yes; but if they are looked after they do not suffer.

911. You think that for temporary purposes and cheap construction durable timber is a good substitute for iron? Yes.

912. You think it is even better to use timber with the view of ultimately substituting iron for it? Yes. As a rule, for all the smaller bridges, we are in the habit of using timber, and there is no doubt it is the best thing to use.

913. The sleepers, you say, will be 2s. 9d. on the proposed line as against 2s. 6d. on the Narrabri line;—why is there this difference? The 2s. 9d. is put down from actual experience. I expect to get the sleepers for about 2s. 6d. delivered, and then it will cost 3d. to adze them and put them in the road.

914. Were they not adzed on the Moree line? Not when first delivered; the contractor for the line had to adze them.

915. The contractor adzed them? Yes. There is a timber forest near Warialda, but I think for all that the sleepers will necessarily be a little more costly than on the Moree line.

916. Then the timber is actually closer to this line than it was to the Moree line? No, it was closer to the Moree line; was more convenient, I should say.

917. I see you estimate £200 for a station-master's house;—what sort of cottage can you build for that? It will only be a small place—about four rooms; it is what has been done lately.

918. I suppose I am right in taking it for granted that your object has been to cheapen the cost of the work as much as possible, having due regard to its efficiency and the necessary accommodation for the working staff? Yes.

919. You found, in effect, that under the old regime unnecessary expenditure had taken place in providing accommodation for the men? Yes.

920. You assure me positively that you have very little doubt that the line will be constructed within your estimate? Yes.

921. And nothing can take place in connection with the permanent survey which is likely to increase the estimate? No.

922. I think Mr. Lee obtained from you the fact that a stiff grade exists near the Hawkesbury? Yes.

923. I find from the railway time-table that Hawkesbury is given as 9 feet above high-water mark, and Berowra as 667 feet, and the distance between the two is 8 miles? Yes.

924. That is a stiff pull the whole way is it not? Yes.

925. It is a stiff grade the whole way? No, I do not think it is exactly that; but I will send for the section of the line.

926. Going further north I find there is a rise of 937 feet between Aberdeen and Murrurundi? Yes; there is a grade of 1 in 40 going up from Murrurundi to The Gap.

927. From Murrurundi to Ardglen, a distance of 6 miles, there is a rise of 524 feet? Yes.

928. Must not these grades on the main northern line between Newcastle and the dip beyond Liverpool Range, and between Sydney and Newcastle, govern the whole of the traffic on the northern line? With regard to that matter, I think it would be better to ask some of the traffic people how they manage the trains.

929. I ask you if that grade must not govern the whole of the traffic on the northern line? I do not think it necessarily would, because where you have grades concentrated you can make special arrangements.

930. But you have not got them concentrated; it is 266 miles to Werris Creek? But you have grades concentrated at Murrurundi.

931. You have the same concentration of grades from Glen Innes to Black Mountain, so that if it holds good between Newcastle and Werris Creek the same remark holds good between Werris Creek and Glen Innes? You can scarcely call it a concentration of grades when you have several bad grades scattered about.

932. Will you describe the features of the line from the Hawkesbury to Berowra Station, on the up journey, a distance of 8 miles? The summit is about 28½ miles, which is a little higher than Berowra Station, which is 705·9 feet. The lowest point at the Hawkesbury is 6·8 feet or, say, 7 feet; so that the rise is 699 feet in 8 miles.

933. Is there not a grade of 1 in 33 on that 8 miles? No, 1 in 40.

934. *Mr. Lee.*] There used to be? No; the grades have not been altered. There is a little over 3 miles of 1 in 40.

935. *Mr. Wright.*] A continuous pull? Yes. Then there is about three-quarters of a mile of 1 in 55, and then about 1 mile and 10 chains of 1 in 50. There is also a grade just before you get to the summit of 1 in 60.

936. What length is that? About three-quarters of a mile. The rest of the grades, making up the length, are comparatively easy—1 in 75, 1 in 100, 1 in 120, and so on.

937. At all events you have mentioned the stiffest? Yes.

938. Now will you take the other section from Strathfield to the highest point near Berowra? The grades are all easy, until you pass the Parramatta River. You have a 1 in 60 ascent to Ryde Station, but beyond there you have grades of 1 in 40. There is nearly a mile of 1 in 40. Beyond Eastwood up to

H. Deane,
Esq.
10 Sept., 1896.

Carlingford there is nearly half a mile of 1 in 41. From the crossing of Devlin's Creek, at 15 miles, there is nearly a mile of 1 in 40, and another length of nearly a mile of 1 in 50. Further on there are about 30 chains of 1 in 44. That brings you up to Pennant Hills.

939. Then there is a considerable rise between there and Berowra? Not a very great one. At any rate it is split up very much. The highest point at Pennant Hills is 529 feet, just beyond the old bridge. Then there are lengths of 1 in 40, and other grades about half a mile or so at a stretch. There is a grade of 1 in 40—about 50 chains—as you get up to South Colah.

940. Are there any stiff grades between Newcastle and Aberdeen? They have all been cut out, I think.

941. Would it be an impossible thing to cut out some of the grades on the line further north of these points—the Murrurundi grade, for instance? I do not think that would be possible.

942. What effect would the deviation of the grade at Knapsack Gully produce? That is a different case. It did not cut out the 1 in 30 grade going up from Emu Plains.

943. You still have the grade through the tunnel? Yes; of 1 in 33.

944. Is that the same grade as you had in the Zigzag? Yes.

945. Some very severe grades have been cut out on the Blue Mountains? The improvements on the Blue Mountains have been more in the cutting out of the curves than the grades. You cannot do much in improving the grades on the Blue Mountains, except near Clarence Tunnel, where there is a bit of 1 in 33 cut out.

946. What radius are the mountain curves? Where the 8-chain curves have been cut out, 12 chains are the sharpest, and most of them are 14 chains.

947. I understand that on the proposed line you purpose putting in 10-chain curves? Yes.

948. Can you explain why it is considered necessary to take out 8- and 10-chain curves on existing lines, and substitute 14 and 15 chains, whilst we still construct 10-chain curves on new lines? That is for the rapid running of heavy trains.

949. You think that will only apply to the main arteries? Yes; it is quite a different thing on the branches.

950. Have you seen in other parts of the world trains travelling on curves very much less than 10 chains? Yes.

951. Of what radius? In America I have travelled over curves of 6 and 7 chains.

952. And at a high rate of speed? Yes; a pretty high rate of speed, but not upon express trains.

953. Thirty miles an hour? Yes, I think so.

954. With heavy traffic? Yes.

955. So that you have found in other countries that it is possible to do what the Railway Commissioners say it is impossible to do here—to take with speed heavy traffic along 6- and 8-chain curves? You must remember that the American rolling stock is different from ours. The central buffers make a great deal of difference, as well as the use of the bogie stock.

956. The bogie governs the whole question? And the central buffers. I think the central buffers are quite as important as the bogie.

957. Do you think you can run a loaded train with big carriages and double buffers round a 5-chain curve? It would go round, but I do not think it is a desirable thing to try. I should not like to travel round it at any speed.

958. Do you see any objection to a railway having curves of 8 and 10 chains radius? I do not think there is any objection to 10-chain curves on lines of this character.

959. Would it be possible to conduct a heavy and speedy traffic over lines of 10 chains radius? Yes, at a fair rate of speed; anything short of express speeds.

960. Do you think a 1 in 40 or 1 in 50 grade is an impracticable one for ordinary traffic? No; it is only a question of engine power.

961. Do you think it is a grade which will seriously impair the usefulness of a line? Yes; it means more engine power, of course.

962. What grades are there in America? On the Southern Pacific Railway there are grades of 1 in 30 and 1 in 40.

963. And they find no difficulty in working the traffic? They work it right enough.

964. And carry the goods cheaply? I do not know what are the rates on the Southern Pacific line, but they carry pretty cheaply.

965. If we are told that a heavy traffic cannot be successfully carried on a line with 1 in 50 and 1 in 60 grades, do you think it is incorrect? I would rather not say anything to criticise. I have not gone into the question or made any calculations.

966. Do you think heavy and speedy traffic can be successfully carried on at remunerative prices on lines with grades of 1 in 50 and 1 in 60? I think that is too general a question to ask.

967. If you were authorised to construct a line from point A to point B, to accommodate the general merchandise traffic of the country, and you found it difficult to get grades of less than 1 in 40 or 1 in 50, would you think it necessary to go to very much greater expense to flatten out the grades? It is a matter for calculation as to how far one should go in flattening out the grade. There is no doubt that in some cases it would be desirable to adopt heavier grades, and if the rates you charge are sufficient, and the quantity of traffic is sufficient, you can have a paying load over the steep grades.

968. Supposing you were asked to construct a line that would hardly ever, under any circumstances, be required to carry a greater weight than a load from 150 to 200 tons, would you think it necessary, in that case, to have grades of less than 1 in 50? No; not unless you were looking to the future.

969. You say the grade between Hawkesbury and the top of the hill to Berowra, and between Ryde and Berowra, on the down journey, would not govern the traffic of the northern line, that being the ruling grade for a distance of 25 miles? No; you would have a long stretch between there and Murrurundi which you could work otherwise. You could take long trains on that length.

970. Would not that remark apply to any other portion of the line? Yes; if the grades were sufficiently concentrated it would apply.

971. Would it not apply very strongly to that portion of the line going up from Moonbi to the top of the Moonbi Ranges, a distance of 12 or 14 miles? Yes, but there would be the extra hauling power which you would have to pay for. If you can avoid the steep grades it is so much to your advantage.

972. But are not the grades on the ascent to the tableland of New England, both from the southern side upward,

upward, and the northern side upward, sufficiently concentrated to enable you to employ additional engine power if the traffic justified it? Yes.

973. I understood you to say that you thought the proposal before the Committee was the best way of getting a railway from Moree to Inverell? Yes; my instructions were to get a railway between Moree and Inverell. The problem of getting the best railway from Sydney to Inverell was not put before me.

974. The question of getting the best communication from Inverell to Sydney has not been dealt with by you? No.

975. Your calculation for the construction of a line from Inverell to Glen Innes was originally about £8,000 per mile? Yes.

976. That line is permanently staked now? Yes.

977. Will you state what you think it can now be constructed for at the lowest estimate? £6,077 per mile.

978. Is that the cheapest rate at which it can be constructed? I think it might turn out a little cheaper, but I should not like to say it could. In looking over my estimate I find that I have "engineering and contingencies" 15 per cent. instead of 12½ per cent. I can knock off the 2½ per cent. I do not think the contingencies would be any greater on that line than on the proposed line.

979. Would that effect a reduction in the cost? It brings it down to about £6,000 per mile.

H. Deane,
Esq.

10 Sept., 1896.

FRIDAY, 11 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.

THE HON. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

980. *Mr. Black.*] In reply, I think to Mr. Lee, you said the bridge over the Macintyre River, in proximity to the proposed site of the railway station, would be comparatively inexpensive? I think I gave the sum for the bridge and approaches as £5,000. The actual amount in the estimates was £4,380. But to that has to be added percentages which make it nearly £5,000.

981. The river bed there is not very wide;—would it not be necessary to construct a viaduct on one side? The flood waters come over the bank a little, but not very much.

982. Is not the bank on one side very much lower than on the other? The flood waters come over the bank on the eastern side. The bank itself is high, but there are openings. There is a creek which enters the Macintyre River and the water flows over on to the land, but that would not be a serious matter.

983. Mr. Wright asked you if it was not contrary to the practice of the world to construct railway bridges of wood instead of iron; I should like to ask you whether that is not largely because timber of a similar character to ours is not available? Yes, it is. I pointed out that with ironbark you can make a very satisfactory and durable bridge. I can give you a little information about that.

984. What is the tensile strength of ironbark per square inch? I am afraid to give you that from memory.

985. How would it compare with steel? The tensile strength of steel is from 28 to 30 tons to the square inch. In using timber in tension you can never utilise the full section. You cannot clip or rivet it in the same way that you can iron or steel. It is always under that disadvantage.

986. Is it not a fact that there are some wooden bridges in this country which have been in existence for over thirty-six years? I have not any particulars with me, but I am quite sure that there are bridges that have lasted more than twenty-five years.

987. The life of a steel bridge is practically infinite? It is not known at present. It is generally assumed to be almost unlimited. I think that is putting too high a value on its life.

988. I suppose that a steel bridge of the character necessary would cost 150 per cent. more than a wooden one? It would cost twice as much.

989. What is the maintenance of an iron bridge as compared with a wooden bridge? For a railway it would be about the same. It is a question of the renewal of the painting. A wooden bridge has more surface.

990. There is a good deal of timber used in connection with an iron bridge? Yes.

991. Taking into consideration the cost of maintenance and the interest on the outlay, the amount of money spent yearly on a wooden bridge would be less than that spent on an iron bridge? Yes. A railway bridge stands in a very different position from a road bridge inasmuch as in considering the maintenance of a road bridge you have to consider the maintenance of timber decking, which would be always wearing out. In the case of a railway bridge one part would last just as long as the other. In fact the beams and transoms in platforms of some of the railway bridges have lasted a very long time, quite as long as the time that I gave for the life of an ironbark bridge—twenty-five years.

992. I suppose that in a road bridge the planking would require renewing every ten years? It depends upon the traffic.

993. You said that you had got a statement? Yes. With reference to the comparative cost and life of timber and steel bridges that came into my evidence yesterday, I want to explain a little more clearly what I meant. Supposing that a timber bridge cost £10,000 to build, and a steel bridge, to carry the same traffic, and of equal strength, cost £20,000. By building the bridge of timber, £10,000 would be immediately saved, and if this sum is put out at compound interest for twenty-five years at 3 per cent. the saving will amount to nearly £21,000 at the end of the twenty-five years, showing that the building of a steel bridge can be economically deferred until that period has elapsed.

H. Deane,
Esq.

11 Sept., 1896.

- H. Deane, Esq.
11 Sept., 1896.
994. *Vice-Chairman.*] In other words you spend £10,000 on a timber bridge, and if it should require renewal at the end of twenty-five years you have £21,000 available? Yes.
995. So you could build another for £10,000, and start again with £11,000 to your credit? Yes; it shows that it is not always wise to go to the larger expense in building the more durable structure.
996. Have you taken into consideration Mr. Black's question as to the cost of maintenance—that a timber bridge may cost considerably more to paint than an iron bridge, owing to the larger quantity of material? There will be a little more in painting. I have not any comparative statement to make with regard to the painting, but painting is not a very serious item. I have only taken the interest at 3 per cent., but the Government are not borrowing money at 3 per cent. yet.
997. You think the cost of painting, and the expenditure on repairs during the twenty-five years, would not appreciably affect the saving? No; you get the saving in spite of it. I desire to mention this, because the propriety of building a timber bridge instead of a steel bridge was challenged, and I think I am right in showing that, if it is desirable to build a timber bridge, it can be done so economically.
998. *Mr. Lee.*] Supposing a steel bridge cost £30,000? I am taking the comparative value. I have reckoned it out that a steel bridge, under similar circumstances, will cost double the amount of a wooden bridge. When you come to very large spans it is much more convenient to use steel. Timber tends to become then an impracticable material, consequently you have very little option.
999. *Vice-Chairman.*] There is no reason why you should not use timber bridges between Moree and Inverell? No. Then with regard to the borrowing of money, the tendency is for rates of interest to decrease. At the end of the twenty-five years, when you want to renew, you will probably be able to borrow the money on more favourable terms.
1000. You may? That is the tendency.
1001. Is there anything that you desire to add to your evidence? I stated that various deviations had been made and investigated. I think I used the word "examined;" it would be more correct to say "investigated." This compilation of parish maps does not show the deviations; but if a Sectional Committee is going over the line possibly they would like to have them shown. There is the deviation at Warialda. The line submitted is, undoubtedly the best line; but the first survey that was made proceeded from Moree northwards and across the two rivers, and went through Paramellowa, keeping on the north side of the river, then passing through Warialda. It crosses Mosquito Creek at the bend where the latter bears to the right; it then turns back again towards the river. That bend is necessary to get the grade. It then follows up the Warialda Creek into Warialda.
1002. That line was considered? It was actually surveyed. It is more costly than the other, and longer as well.
1003. It would be a little longer between Moree and Warialda? Yes.
1004. What would be the difference in length? The length of that line is 101 miles 28 chains, and the length of the line submitted is 96 miles 35 chains, so there is a saving of 5 miles.
1005. *Mr. Black.*] What difference is it between Inverell and Moree as the crow flies? 79½ miles.
1006. *Vice-Chairman.*] What is your estimate of the cost of the line *via* Paramellowa? £315,000.
1007. Against £279,500? Yes.
1008. Would that line traverse better country? No; the lower line is in the better country. The reason why it is taken up in that way was that it was proposed to run a line on the north-east towards Boggabilla. Such a line would have a portion common to the two.
1009. How many miles of the extension in the direction of Boggabilla would have been available for the branch line to Inverell? I should say about 8 miles.
1010. And what would be the cost of construction of those 8 miles? About £35,000.
1011. Do you think that would be a better service than the proposed line because you touch Paramellowa and Warialda? On either line you can go through Warialda, or pass up Kelly's Gully. The grade is the same.
1012. Then if it should be the policy of Parliament to extend the line in the direction of Boggabilla, you will have to build 8 miles of road at a cost of £35,000, notwithstanding the expenditure on the proposed line? Yes.
1013. Deducting £35,000 from the £315,000 the cost, of both lines would be very nearly the same? Yes.
1014. Assuming the cost to be equal, is it your opinion that the proposal submitted to the Committee is the better one? Yes, I think it is.
1015. A better one for all purposes? Yes.
1016. Likely to be more profitable in its running? Yes; it is better country on the south side.
1017. Would it not make a considerable difference in the expenditure by the Postal Department if a line were constructed on the northern side of the river instead of on the south, so that the mails could be delivered direct to Paramellowa and Warialda, instead of branch postal services being necessary from these points? That I have not considered. The position at Warialda would be exactly the same. One would have the option of either going through Warialda or Kelly's Gully in both cases.
1018. So the difference in cost to the Postal Department would be very slight? Yes.
1019. The cost of these two surveyed routes is almost similar? The cost in the case of the northern route would be £35,000 more.
1020. That would be absorbed in extending the Moree line in the direction of Boggabilla? Yes.
1021. Why did you select this line? It was the recommendation of the Railway Commissioners.
1022. The first proposal was to make a line on the northern side? That was the line that was approved for survey. Then, at the beginning of this year, the Railway Commissioners asked that the line should be taken south of the Gwydir, so that survey has been made.
1023. Did the Railway Commissioners give reasons for the present proposal? Yes; they made a report on the subject.
1024. Why did you, in the first instance, survey the line north of the Gwydir instead of the present route? Because it was believed at that time that an extension in the direction of Boggabilla would sooner or later be made, and then the double crossing of the Gwydir River would be saved.
1025. Has the intention to extend the line in the direction of Boggabilla been abandoned? It has at present.
1026. So that the line is now being surveyed between Moree and Inverell upon the assumption that Moree will be the terminus for some time to come? Yes.

H. Doane,
Esq.
11 Sept., 1896.

1027. Assuming that the line in the direction of Boggabilla was still in contemplation would you start your line to Inverell from Moree, or from the eight-mile point north of the river? Knowing what the relative costs are, I should think it better to start as is now proposed. Better country would be served.

1028. Even if the line to Boggabilla had been in contemplation, you would still have started from Moree in preference to starting north of the Gwydir? I would now, but at that time it was thought that the saving would be worthy of consideration.

1029. Now, you cross the river four times, do you not? There would be one crossing on the present line, and there would be two crossings on the extension north.

1030. Then we may look upon the present line as additional in cost? Yes, in one way it would be additional cost; but the general cost of construction is less on the southern side of the river.

1031. The cost of crossing the Gwydir would be about £8,000, which might be dispensed with if the line started north of Moree? No; I think it would come to very much the same thing.

1032. I see that you provide £7,953 on page 3? Yes, for the bridge over the Gwydir River.

1033. Then that would be the only saving effected by starting the line 8 miles north of Moree? Yes; but against that you would have the extra cost of earthworks on the northern side; they are heavier.

1034-5. So that everything considered, it is better for the line to start from Moree? Yes.

1036. Will you read the Commissioners' report? Yes. I should like to say that this report was made whilst I was away inspecting this line. If it had been left for a few days, part of it would have been rendered unnecessary. The report is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 10 March, 1896.

The Hon. J. H. Young, M.P., Minister for Public Works,—

Railway Communication to Inverell.

In accordance with the promise of the Chief Commissioner, the whole of the various routes which have been considered in connection with the question of giving railway communication to Inverell have received further consideration and inquiry, and we are strongly of opinion that Inverell should be approached from the terminus of the Narrabri-Moree railway.

Further inquiry would, however, indicate the wisdom of making a new survey, somewhat to the south of Warialda, as it is found that in the neighbourhood of Warialda itself the land is of a poor quality, whereas to the south it is of a much richer quality, and the line being carried in a southerly direction would, it is thought, materially affect the cost of bridges in connection with the crossing of the Gwydir and Mehi streams.

We understand from Mr. Harper, our Goods Superintendent, who has thoroughly investigated the country for us, that 4 miles to the south of Warialda, and thence to Inverell the line would pass through some of the richest country in the Inverell district. It would also traverse the most thickly-populated and highly-farmed land in the vicinity of Inverell itself. The line on Little Plain, Gum Flat, and Greedy Creek, lying from 12 to 20 miles to the west and south-west of Inverell, is exceedingly productive, and carries considerable settlement. It is stated that in these vicinities also there is far more agricultural production than in the whole route between Inverell to Glen Innes.

Mr. Harper also informs us that the country on the southern bank of the river presents advantages for future agricultural settlement which do not exist on the pastoral lands lying to the north. Warialda itself is a settlement of small importance, and it is considered that carrying the line to the south thereof has so many advantages as to far outweigh the small amount of inconvenience that would be suffered by avoiding the township.

Mr. Harper found that the chief business people of both Inverell and Moree were strongly in favour of the suggested line. A very important point in connection with the consideration of the matter is the fact that the greater portion of the wool and produce which was calculated upon as forming the probable traffic for the Glen Innes to Inverell line comes from the districts to the west and north-west of Inverell, and therefore the route now under consideration to Moree, would give the settlers in the district a much improved mode of conveyance.

The rough estimates which have been prepared for the line, show, that although the distance will be about double that as between Inverell and Glen Innes, yet all the additional mileage could be constructed for the same money as it was considered the Glen Innes-Inverell line would cost; therefore the State would secure the great advantage of opening up double the amount of land, and, generally, of a much better character than the land lying between Glen Innes and Inverell; in addition to which the grades upon the lines would be of a much more favourable character, and it would be much cheaper to work; and again, the line would have the effect of securing to the railways, traffic, that if taken to Glen Innes, in all probability would be taken to the sea-coast.

For these reasons, we strongly recommend that the Moree-Inverell line be adopted, instead of the Glen Innes-Inverell route.

E. M. G. EDDY.
CHARLES OLIVER.
W. M. FEHON.

I afterwards wrote this memorandum:—

Railway Construction Branch, Engineer-in-Chief's Office, Sydney, 27 March, 1896.

Railway Communication with Inverell.

WITH reference to the accompanying communication from the Railway Commissioners I have the honor to report as follows:—

I carefully examined the possible routes myself during my recent visit through the district.

A line from Moree, on the south side of the Gwydir River via Izzy's Crossing to Warialda, would be much shorter and cheaper than any on the north side of the river. I beg the Minister, however, will understand that no mistake was made in selecting the route on the north side of the river, because it was done deliberately, and on the supposition that the first few miles would serve as a portion of the line to Boggabilla, which the Railway Commissioners then advocated. If the Boggabilla proposal is abandoned there is no necessity for running along the north side of the Gwydir to Warialda.

As regards the central portion of the line, that passing through or near Warialda, it would be impracticable to carry the line further south than Kelly's Gully, where a survey has been made, the advantages of which route I pointed out to the Minister some time ago; the Kelly's Gully route is the only practicable one south of Warialda. Any attempt to bring the line further south than this would involve the encountering of a mass of high ridges and gullies the cost of traversing which would be prohibitive.

As to the third and last section of the line, the proposal to serve the residents of Little Plain and Gum Flat, better, by bringing the line through those localities and entering Inverell through a more southerly gap, is, I am afraid, not practicable. I had, last year, the passes of the range west of Inverell carefully examined, and arrived at the conclusion that the only route by which a fairly cheap line could be constructed was the one adopted. The surveyor who made that examination, Mr. N. Chalmers, is now in Western Australia, but Mr. Stuart has also explored the country, and he is of opinion that such a line as now suggested would be very costly. I have, however, instructed Mr. Edwards to test the proposed route by a survey, after which I will make a further communication on the subject.

A minor deviation to bring the line nearer to Little Plain and retain the present route where it passes through the gap in the range, can be made, but it will probably be somewhat more costly than the present line.

With regard to the line as marked out between the head of Kelly's Gully and Inverell, I have little hesitation in saying, that, from an engineering point of view, it is the best that can be found. The earth-works are as light as can be expected in the class of country, and the necessary provision for water-ways slight, as the line follows the water-shed.

At an interview I had with the Chief Commissioner for Railways, I explained the above to him.

H. DEANE,
Engineer-in-Chief.

The Little Plain deviation which Mr. Harper suggested, and the Railway Commissioners mention in their report, was examined by Mr. Edwards, surveyor, and was found not to be desirable. The consequence being

H. Deane, Esq.
11 Sept., 1896.

being that it was decided that with the exception of the deviation on the southern side of the river, between Moree and Warialda Creek, the line should stand as already surveyed—that is, up Kelly's Gully, and from there on to Inverell.*

J. Clarke, Esq.
11 Sept., 1896.

Joseph Clarke, Esq., Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined :—
1037. *Vice-Chairman.*] What are you? Inland Mail Clerk, Postal and Electric Telegraph Department.
1038. Have you a statement to make to the Committee? I have a statement here which I will read :—
REFERRING to the request of the Secretary to the Parliamentary Standing Committee on Public Works for information respecting the cost of the conveyance of mails between Glen Innes and Inverell, Moree and Inverell, Tamworth and Bingara, I have the honor, by direction of the Deputy Postmaster-General, to give particulars of the existing mail contract services along the lines mentioned, namely :—

Glen Innes, Inverell, Warialda, and Moree.

Contractors'		Postal Lines.	Dis- tance in Miles	Frequency of Communi- cation.	Mode of Conveyance.	Annual Amount payable to Contractors.	Date of Termination of Contracts.
Names.	Addresses.						
255 William Byron ...	Glen Innes ...	Glen Innes, Reddestone, Wellingrove, Nullamanna, and Inverell, <i>via</i> Glendon, Wellingrove Station, King's Plains, Appletree Gully, Vever's Sheep Station, A. M'Leod's and Brown's.	66	Two ...	Horseback	£ s. d. 95 0 0	31 Dec., 1897
256 Richard Alcock ...	Glen Innes (direct line)	Glen Innes, Swan Vale, Beaufort, Matheson, and Inverell; and Inverell, Rob Roy, Little Plain, Reedy Creek, and Warialda, <i>via</i> the Main Road.	42	Six.....	} Coach, 2 or 4 horses.	479 0 0	31 Dec., 1898
180 Chas. R. Wilson	Moree	Moree, Paramellowa, and Warialda, <i>via</i> Boolooroo, and up the north bank of the Big River, past Tareelari, crossing it at Boolooroo.	39	Three			
			60	Two ...	4-wheeled coach, 4 horses.	117 0 0	31 Dec., 1897
Total cost per annum						£691 0 0	
or adding the cost of two small services connecting at Warialda—							
217 James Ryan	Warialda	Warialda and Yagobie, <i>via</i> Highland Plain, East Lynne, Glendon, Gravesend, and Oatenmildi.	27	One ...	Horseback	28 10 0	31 Dec., 1898
218 Mark Lavings ...	Warialda ...	Warialda and <i>Gragin Station</i> ; Warialda and <i>Gragin Station</i> , <i>via</i> Robert's and Myalla.	14 15½	Two One	} Horseback	38 19 0	31 Dec., 1898
The total amount per annum is							

Contractor, W. O. Coggan, of Inverell; Line, Bingara, Little Plain, Gum Flat, and Inverell: 53 miles; tri-weekly; 2-horse coach; £120 per annum; to 31st December, 1897. This mail runs from Inverell, *via* Gum Flat, towards Little Plain, thence to Bingara.

Tamworth and Bingara.

Contractor.		Postal Line.	Dis- tance in Miles	Frequency of Communi- cation.	Mode of Conveyance.	Annual Amount payable to Contractor.	Date of Termination of Contract.
Name.	Address.						
200 Geo. Wilkinson, sen.	Tamworth ...	Tamworth, Attunga, Manilla, Upper Manilla, Barraba, Cobbadah, Dinoga, Bingara, Oakey Creek, and Warialda, <i>via</i> Barker's, North Bingara, and Moorefield (Hall's Creek)	125	Six.....	Coach, 2 or more horses.	£ s. d. 1,199 0 0	31 Dec., 1897

The mail contract service, it will be seen, is Tamworth, Bingara, and Warialda; the distance between Bingara and Warialda is 28 miles, and deducting the mileage rate for that portion of the line, the cost of carriage of mails over the Tamworth-Bingara section, 97 miles, six times a week, is £930 8s. 6d. per annum.

If mails were conveyed by railway between Moree and Inverell, the charge under the existing arrangement would be :—

If the weight of mails does not exceed an average of 2 cwt. per day, £12 per mile per annum.

If the weight of mails exceeds an average of 2 cwt. per day, £20 per mile per annum.

Number of mails exchanged on the lines, including parcels.

Glen Innes and Inverell, <i>via</i> Wellingrove, twice a week service.....	24 bags per week.
Glen Innes and Inverell, <i>via</i> Matheson, six times a week service	22 bags per day.
Inverell and Warialda, three times a week service	24 bags per week.
Moree and Warialda, twice a week service	12 bags per week.
Narrabri and Moree, six times a week service	10 bags per day.
Tamworth and Warialda, six times a week service	44 bags per day.

STATEMENT

* NOTE (on revision) :—

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,
Sydney, 19th September, 1896.

Sir,—As requested by the Chairman I have the honor to give the following information in reference to the ownership of land on the Moree to Inverell line :—Crown land 47 miles 20 chains, of which 24 miles are held under homestead, conditional, and scrub leases; pastoral lessees occupy the remainder (23 M) Alienated land 49 miles, 15 chains.

I have, &c.,

H. DEANE,

Engineer-in-Chief for Railway Construction.

The Secretary, Parliamentary Standing Committee on Public Works,

MINUTES OF EVIDENCE—RAILWAY FROM MOREE TO INVERELL.

39

STATEMENT showing the number of letters posted at, and the Revenue derived from, the Post Offices on the Glen Innes and Inverell, Inverell and Warialda, Moree and Warialda, and Tamworth and Bingara Mail Services, during the Year 1895.

J. Clarke,
Esq.

11 Sept., 1896.

Manilla	43,360	435	99	22	536
Upper Manilla	11,200	94	9	103
Barraba	69,210	489	135	36	660
Cobbadah!	9,780	80	80
Bingara	92,500	561	249	47	857

1039. *Mr. Clarke.*] Can you give us exactly the cost of the conveyance of mails by coach from Moree to Inverell on the proposed line of railway, 96 miles? Moree to Warialda is one part. We have these in different contracts. I estimate the cost from Inverell to Warialda three times a week at about £100 a year, then the next one Warialda to Moree twice a week, £117.

1040. That would be about £217? Yes.

1041. I see by an estimate here made by the Railway Commissioners the cost by the railway if it is constructed will be £1,188, that is from Moree to Inverell? Very close to it.

1042. So that the difference between the two systems would be £971? Yes.

1043. Is that the ordinary rate on the railway throughout the Colony? Yes.

1044. Is it not an enormous amount compared to the ordinary charge for carrying mails? It is, but I suppose it is considered to be much better.

1045. Do you think it is a fair arrangement in the public interest? I believe it is thought to be a very high rate.

1046. What would be the cost of a daily service between Moree and Inverell? About £500 a year.

1047. *Mr. Lee.*] That compares very favourably with the line from Glen Innes to Warialda, which is very nearly the same distance? That is 81 miles, it is somewhere about the same. There is another consideration which comes in in regard to that line, and it is as to whether there would be sufficient inducement for a man to put a coach on to run at that rate. If it were in a country like this—Glen Innes to Inverell, where there is a good traffic, the cost would be about £450.

1048. *Mr. Clarke.*] Even so, the cost is more than double what it is by the ordinary coaches? Yes.

1049. Is that the case all over the Colony? Wherever there is an extension of the railway and we have to pay railway rates it costs us a great deal more for conveyance of mails than it did by coach.

1050. I suppose that the railway authorities like to make as high charges as they can? It has been in operation for many years. I do not know how soon it will come to an end; some new arrangement has been mooted.

1051. Do not you think this particular rate is very high? It appears to be. On private lines we get it done cheaper.

1052. What is the difference in time between the ordinary carriage and the railways? The railways average about 20 miles an hour including stoppages.

1053. How long would it take to carry the mails from Moree to Inverell? It is a sort of bush track, and it is rather slow. We will say it would take a couple of days.

1054. That is in comparison with three or four hours by rail? We will say six hours.

1055. *Mr. Roberts.*] Have you a daily mail between Glen Innes and Inverell? Yes, the distance is 42 miles; the mail goes six times a week.

1056. And what is the annual cost of that? The cost of that, including one to Warialda three times a week, it being a combined service, will be £100 less.

1057. And the contract from Glen Innes to Inverell? Glen Innes to Inverell six times a week, and Inverell to Warialda three times a week, £479, taking off the £100 makes it £379.

1058. Is it a fact that wherever a railway is made the cost of carrying the mails is increased to the Postal Department by 100 per cent.? Yes, sometimes more.

1059. Is there any agreement existing between your Department and the Railway Department for the carriage of mails? Yes.

1060. On what basis do they arrive at their estimates? I cannot tell you. Up to a certain year we pay a lump sum of £45,000 a year. On lines opened since then, minor lines, they pay £12 per mile per annum if the mails are under 2 cwt. per day, over 2 cwt. per day they pay £20 per mile per annum; and where we employ a travelling post office, as we do between Sydney and Albury, it is £36 per mile per annum. Of course, some of these lines are included in the lump sum of £45,000 a year. If we wanted to put on a travelling post office, we should have to pay £36 a mile per annum.

1061. An estimate has been laid before the Committee by the Railway Department making the amount for the carriage of mails £1,188. That would be at the rate, approximately, of £12 a mile for 99 miles? Yes.

1062. If similar work were done by coach, it would only cost, approximately, about half that sum? About half.

1063.

J. Clarke,
Esq.
11 Sept., 1896.

1063. What are the advantages in the way of early delivery, accruing from railway communication in a case like this? It would all depend upon your time-table. If you want to get to Inverell, running through from Sydney as they do now, the 6.15 train arrives at Narrabri next morning at 9 o'clock. It gets to Moree at about half-past 2 o'clock. I think with improved advantages there might be $1\frac{1}{2}$ hour saved, and you could reach Inverell by, say, 6 p.m. Going north to Glen Innes, we get through at 5 now; in a short time we shall get through at half-past 4 in the afternoon.
1064. Having these facts before you, supposing this railway were constructed, would your Department send the mails by way of Moree? I do not think we could send the Inverell mails.
1065. I understood you to say that it would be quicker by way of Glen Innes by coach? I think it would be, as far as Inverell is concerned.
1066. Consequently, if the railway were constructed, it would give no advantage from a postal point of view? Not to Inverell; no doubt to all the other points it would.
1067. And you would send whichever way you could reach the addressee quickest? Whichever way would be most expeditious.
1068. Does that £12 a mile for mail-matter include newspapers and parcels? The carriage of parcels is quite a new thing—it began in 1893. There has been an extra allowance for that of £3,500 a year.
1069. Then that is in addition to the £12 per mile? Yes; it is a new thing altogether.
1070. Can you tell us whether this apparently high charge is likely to continue? I know that there are some steps being taken to reconsider it.
1071. Do you think that if this line is constructed, and you send your mail-matter all the way by rail to Warialda, that the revenue of the Department will correspondingly increase with the extra cost of carriage by rail? I do not think so. I do not think there is any increase to the revenue in consequence of the carrying of mails by railway instead of by coach.
1072. Persons are enabled to communicate with one another oftener when the mails are carried more rapidly;—might not that induce a man to write two letters where otherwise he might write one? I do not think it will.
1073. You do not think that the advantage is such as would cause an increase of revenue? Certainly not.
1074. If this line were constructed would the mails from Bingara come by rail *via* Moree to Sydney instead of going down to Tamworth? Of course that would depend upon the point. It is 97 miles to Bingara.
1075. Instead of sending mails all the way from Bingara to Tamworth, would they not come by Warialda? It looks as if it would suit to send to Moree by train.
1076. Would it not enable the Department to make a saving in the cost of sending mails from Bingara to Sydney? They might reduce that communication up there.
1077. It need only go as far as Bingara, consequently there would not be much knocked off? There would be something on to Warialda. There are a lot of intermediate interests there. I do not think they would take anything off.
1078. Are you able to say that if this line were constructed the cost of any existing contract would be lessened from the fact of your being able to use the railway? It might do away with some contracts; the opening of a railway generally means extra services—branches like feeders. We never gain anything by a railway line being opened. The people want greater facilities. They want the mails taken from the railway to them.
1079. If it renders one contract unnecessary it creates the necessity for another? Yes, very often. Also along the line there are sometimes mail lines, because they cannot be served by the railway people.
1080. You have had a large experience in that Department;—how long have you been in your present position? I have been connected with all kinds of work in the Inland Mail Branch since September, 1869.
1081. You have had a large experience with regard to mail contracts? Yes.
1082. *Mr. Lee.*] Which of these mail services will you be able to discontinue if the line is constructed? I do not know whether these mail lines run parallel to the proposed railway or not. The existing lines would be cut up in some way.
1083. From Glen Innes, *via* Wellingrove, to Inverell, 66 miles—that will have to be continued? Yes, it is twice a week.
1084. Then the next one is from Glen Innes to Inverell—a coach mail daily, 42 miles? I believe that will stand whether the railway is built or not.
1085. The connection will have to be kept up between the two places? Yes.
1086. In other words, the Wellingrove service is the road-side service on the southern side of the mail-track and the mail-track service on the northern intermediate side—is not that the case? I think so.
1087. There is no prospect of either of those two lines being removed? No.
1088. If the line is constructed to Inverell by Moree, the Sydney mails will be sent by that way? They might, if we gain time by sending them by Moree; if, on the other hand, they could be delivered quicker from Glen Innes to Inverell, they would go that way.
1089. You do not bind yourselves to the railway service if it is not a quicker service? No; but the railway is generally quicker.
1090. Strange to say, not always in carrying mail-matter? No.
1091. That being the case, would there be any necessity to continue the present daily service from Glen Innes to Inverell? I think there would be.
1092. Or, in other words, the people having had it established for so many years, would they be likely to suffer a reduction of that? As far as I can see, I think that a daily post would be of much more service if they had railway communication than it is now, because if they had a railway it would create a greater traffic.
1093. With reference to the line of mails from Tamworth to Bingara, and Warialda and Tamworth *via* Manilla, is not the charge of £1,199 rather heavy? That is the present charge; it is a heavy one.
1094. It would follow from this, of course, that very heavy mails are carried that way? There is just about twice the amount of mail-matter carried by that line that is now carried by the Glen Innes line.
1095. Would the construction of a Moree line help that service? It would only affect the top end, if it affected any part of it.
1096. Within a few miles of Warialda? Warialda would come into the railway, and perhaps as far as Bingara; it all depends upon the table; if we could fit things to go right through and catch a train, that would suit.

J. Clarke,
Esq.

11 Sept., 1896

1097. It would be near enough if you were to say that you agree that that portion of the service might be discontinued but not the whole of it? They might alter the former contract for a number of the people on the line.
1098. But the distance would be the same? I fancy so.
1099. Then Warialda to Moree, you would be able to do without that? Well, there would be bound to be some people there to be served by some sort of service.
1100. That may cost £117 a year now? Yes.
1101. You will have to keep up a portion of it for station use and small settlers? Yes.
1102. The mail from Warialda to Moree will be carried by train? Yes.
1103. Therefore, a £117 service may dwindle down to about £60? Yes.
1104. Therefore, out of all these lines, if the Moree line is constructed the only saving that you say would be made would be a possible reduction of the Warialda to Moree service to £60? Something of that sort.
1105. The saving would then be about £57. About that.
1106. It costs you at present £479, less £100, to convey the mails from Glen Innes to Inverell? Yes; £379.
1107. If you sent those mails by way of Moree you would be paying for 34½ miles extra to start with,—that is to say, it is 34½ miles longer by way of Moree than by Glen Innes? It is a long way round.
1108. That is 34½ miles at what cost? £12 per mile.
1109. You will have to carry a distance of 96 miles from Moree to Inverell as against 42 miles that you are carrying now? That will be so.
1110. It will cost you £1,116 to get your mails from Moree to Inverell which you are now getting through for £379? Yes.
1111. That is calculating that you pay £12 per mile? Yes, of course; but we should not pay for the Inverell mail alone, it will be for all the mail matter.
1112. Is not that the exact position? Yes, in regard to the Inverell mails. We should start, perhaps, from Werris Creek, and from there go to Inverell, and thence by coach. They would carry it 42 miles at so much a year. Then if you built a railway from Moree that mail would go from Werris Creek to Moree, and from Moree to Inverell, 93 miles, if it suited us. You would have to take the difference between Werris Creek and Glen Innes, and Werris Creek to Moree.
1113. If you had your line constructed to the north of Glen Innes that would bring you within 42 miles of Inverell;—you have your line constructed to Moree? Yes.
1114. You have to send that way 66 miles in addition? Yes.
1115. And you must deduct what it costs by coach? Yes; it will not be as good a service as *via* Glen Innes.
1116. So, as a matter of saving to the Postal Department, it does not appear that there is any at all? No; neither in money nor in time.
1117. Did you say that the present charge by the Railway Department for a travelling post office is £36 per mile? Yes; but a good deal of that charge is wrapt up in that £45,000 a year.
1118. Would you make a comparison as regards the distance from Sydney to Jennings? We have a travelling post office on that line.
1119. What do you call a mile;—does it include the return journey? It includes to and from, and we can send as many times as we like. We can use any trains they have. On the Southern line we have the express and the southern mail and all that sort of thing.
1120. It is £36 per mile per annum? Yes.
1121. As a matter of fact, you pay both ways then? I think not. We pay on the length of the line. It is over 400 miles to Jennings, and if any part is not included in the lump sum we have to pay £36 per mile for the extension.
1122. As a matter of fact, you calculate it per day, and according to your statement the charge per day would be a charge for the year? The charge is per mile per annum.
1123. It is 491 miles from Sydney to Jennings; that, at £36 per mile, amounts to £17,676, and that would be for the year? Yes. Between here and Newcastle we have any number of trains, and also between Newcastle and Maitland.
1124. From Sydney to Jennings the cost will be £17,676 a year? Yes; but there must be a large portion of it in the £45,000.
1125. You are very clear that the charge per mile on branch lines is £12? Yes.
1126. And if the weight is increased beyond 2 cwt. the charge is £20 per mile? Yes.
1127. What is the total amount that you pay? We pay to the Railway Department about £70,000 a year for the carriage of mail matter.
1128. *Vice-Chairman.*] What are you paying between Narrabri and Moree for the mails carried by rail? £489 12s.
1129. For the total service? Yes. That is the price paid now, and will be up to the end of the present year.
1130. And what will it be after that? It will depend upon circumstances. If the contractors are in charge of the railway, I do not know exactly what we shall have to pay.
1131. Assuming that the line passes into the hands of the Commissioners? It depends upon the weight.
1132. What would be the total sum for 63 miles? I suppose about £756.
1133. The opening of a railway to Moree would entail an additional charge on the Postal Department of how much? £267. Besides that there is extra business going off at different points.
1134. Will that be the actual difference in the cost to the Department or will you have additional charges in connection with branch lines from the intermediate points? There would be some additional charges. For instance, when a railway opens we have to arrange for mails six or twelve times a week between the Post-office and the station.
1135. Give the figures approximately? Between Narrabri and the Railway Station it would be, I suppose, £30 a year. Between Millie and Girley it would be about £25 a year extra, and between Moree Post-office and Moree station another £25 a year. These would be certainties.
1136. The sums you have just mentioned are included in the present charges of £489? Yes.
1137. So they would be additional to the £267? Yes.
1138. What do you gain in time? We may say that we gain a day.

- J. Clarke, Esq.
11 Sept., 1896.
1139. Between Moree and Narrabri? Yes. We should start from Narrabri at 9 in the morning, get to Moree at half-past 12 or 1 o'clock. By coach we did not get there until late at night, and the delivery was next morning.
1140. Do you consider the difference in cost to the Department is excessive? Having regard to the advantages gained by that extension I should not, because there is a very large extent of country beyond there which also gains in point of time in the delivery of their correspondence. I think that is a very great advantage.
1141. Therefore, you regard £12 per mile between Narrabri and Moree as a fair charge for the gain to the Department? Yes; it is a great gain. Of course, this £489 is a very low price in comparison with what we have paid for that line. At one time we paid over a £1,000 for it. I think we have paid up to £1,300 a year for the Narrabri and Moree line.
1142. *Mr. Lee.*] When you reckon mail matter at £12 per mile, do you include the parcels post? Yes; that covers everything.
1143. In a district of that kind it is not likely that the mail matter would be under 2 cwt. per day to Inverell, including the parcels post? No. If you sent the Inverell mails that way it would be £20 a mile to a certainty.
1144. It would be safer to say £20 per mile than £12 per mile? Yes.

TUESDAY, 15 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John McFarlane, Esq., M.P., sworn, and examined:—

- J. McFarlane, Esq., M.P.
15 Sept., 1896.
1145. *Vice-Chairman.*] What constituency do you represent? The Clarence.
1146. *Mr. Lee.*] Have you examined the route of the proposed line? I have.
1147. And are you aware that a proposal has been submitted, and supported by the Railway Commissioners, for the construction of a line from Moree to Inverell, thence to Sydney? Yes.
1148. As a line which, in their opinion, is a proper method of taking the whole of the western traffic north of the line at Glen Innes, and in the vicinity of Inverell, to the metropolitan markets? I understand that is the case.
1149. Distinctly averring that that is, in their opinion, the route by which the New England traffic should find its way to the metropolis, and not by way of the coast to any point? I understand that is their opinion.
1150. The Committee would be glad to have your opinion in regard to the matter? I certainly disapprove of the scheme for the reason that I think that it will divert the trade from its natural channel. Of course I would approve of connecting Inverell with Moree, if there were a connection between Glen Innes or Guyra with the Northern line.
1151. You believe, in the best interests of the residents of the northern, north-western, and north-eastern parts of the Colony, that it is highly desirable the western traffic should be brought to the main northern line at some point? At either of the points I have mentioned.
1152. With the ultimate view of having an extension to the coast by which that traffic will go direct? Exactly. Of course the argument in support of that is, the short distance between Inverell and the sea-board, or between Moree and the sea-board, as compared with the long distance from Moree or Inverell by the proposed route to Sydney or Newcastle.
1153. Are you prepared to give us the exact distances? The distance from Inverell to Sydney is about 513 miles by the proposed route; whereas, by having railway communication between Inverell and say, the port of Grafton, the distance is only about 152 miles.
1154. That would be 513 miles from Inverell to Sydney? Yes.
1155. And 152 miles from Inverell to the coast at Grafton? Yes; and 340 or 350 miles from the Clarence to Sydney. Really the distance between the Clarence and Sydney may be reckoned a secondary consideration only, in view of the extensive harbour improvements which are made on the Clarence, and which now admit of large shipping. At the present moment, ships drawing 15 and 16 feet of water can enter with perfect safety; and when the proposed harbour improvements, which are estimated to cost £100,000, are carried out, there is no doubt whatever that a far greater improvement can be made, with the result that much larger ships can enter with perfect safety.
1156. Then from a local point of view, you, as a representative of the Clarence district, are, of course, desirous that the traffic at New England should be brought to the coast at that point? Yes; that is the strong argument in favour of my contention.
1157. And you support it by saying that it could be done at a considerably reduced rate compared with that over the proposed route? At a much reduced rate.
1158. That being the case, the assumption will be that the producers or the table-land at New England would be enabled to reach their metropolitan markets by way of the Clarence, at a considerably lesser rate than they can do so by rail? Yes.
1159. And at such rates as must admit of the sending of their produce to the metropolis? Yes.
1160. Which is now prohibited? Yes. With regard to the natural resources of the coast district, and also of the table-land, of course the climates are vastly different, and what can be produced on the coast cannot be produced in the interior, and *vice versa*. For instance, potatoes, which can be grown very profitably on the table-land, are sent in hundreds of tons to the Clarence River from Sydney; and if a railway were constructed, even in that article alone, there would be a considerable amount of traffic. Hundreds of tons per year would be sent to the Clarence River, and to the Richmond River. They could come from the table-land at a cheaper rate than they can be sent from here.

1161.

J. McFarlane,
Esq., M.P.
15 Sept., 1896.

1161. Therefore there is an extreme probability that there will be such a large interchange of products between the two districts that there will be a considerable amount of railway traffic? There will be considerable traffic. There is flour, for instance, which is a very important matter, which can be profitably produced on the table-lands, and which cannot be produced at all on the coast. Again, sugar can be grown on the coast, and it cannot be grown very profitably on the table-land.

1162. The articles you mention—potatoes, wheat, flour, and so on—are articles of low value? Yes.

1163. And consequently they are at present not sent to the coast, because they could not stand the land carriage? No, that is one of the arguments against conveying the produce to the Sydney market. With the prices ruling in Sydney at the present time, it would not matter how flourishing or how good a harvest there was, if it had to stand a carriage of 500 miles, the producers could not profitably send to the Sydney market.

1164. Consequently the traffic which is going on between the table-land and the coast at the present time, which I believe is considerable, is confined to station products chiefly the one way, and to the supply of stores the other way? Principally so.

1165. Therefore the agricultural productions you mention do not form a portion of the trade at present going on between the table-land and Grafton? If any at all, a very small portion.

1166. Therefore the large traffic which is already carried on by drays between those two points will be largely augmented if the agricultural products can be offered to it? Undoubtedly.

1167. We will take, for instance, the district of the Clarence, which produces similar articles? I believe that that district largely produces sugar? Yes.

1168. I presume that at the present time the bulk of the sugar which is supplied to the New England country has really to be sent to Sydney, thence by rail? Principally so.

1169. Involving considerable addition in the shape of freight? Yes, more than 100 per cent. additional freight.

1170. That one item alone, which in this Colony runs into many hundreds of tons per annum, would offer a considerable amount of carriage to the railway in the course of a year? Yes.

1171. But at the present time, owing to the high rates which have to be paid, it is impossible to send the land carriage that way? Yes.

1172. But the upland districts have to get sugar? They have to get their supplies.

1173. Consequently it has to be sent by way of Sydney, and thence by train? Yes.

1174. And the consumer has to pay the additional cost? No doubt he has.

1175. You have taken an active part in the agitation for coast connection? Yes.

1176. And I believe you have never swerved in your opinion that the proper development of the north-coast and the table-land connection is a necessity? I have never held two opinions about it.

1177. The time has now arrived when the matter has to be looked at from its immediate point of view;—do you think—placing your own opinions on one side for a moment—that if the line should be extended from Inverell to Moree it would have the effect of taking off the drays which at present trade between Grafton and Glen Innes? I do not think so.

1178. Therefore the construction of that line would not, as a matter of course, capture the trade now being lost by the Great Northern railway? I do not see how it could.

1179. Why does that dray traffic go on between the coast and Inverell at the present time? Simply because they can get their goods cheaper that way.

1180. And if there were a more direct communication at the cheaper rate they would get the whole of those things? Yes, certainly.

1181. And a considerable addition? Very likely.

1182. Therefore, do you see in the proposal before the Committee the proper or future development of that portion of the Colony—I am now speaking of the north and north-east? I do not see how this will assist it much. It may assist it a little.

1183. The northern and north-eastern portions of the Colony are very remote from the metropolis? Yes.

1184. And it is almost an impossibility to expect the Great Northern railway to drag that produce to the metropolitan market? Yes; my idea is to have the shortest possible route to the seaboard—the same as they have in Queensland, which seems to answer admirably.

1185. As the railway is intended for all time, I must now ask you a question a few years ahead;—you know the situation of the table-land, so far as the port of Brisbane is concerned? Yes.

1186. You know it lies very much closer geographically to Brisbane than to the port of Sydney;—if in the event of a complete system of federation we have no border duties, and this proposal is carried out, do you not think there is a great danger of the New England traffic finding its way through Queensland *via* Brisbane? Of course, it is generally sent by the cheapest route to the market. You cannot form an opinion outside that. The natural tendency is in that direction.

1187. In the event of the Inverell connection being made, and no coastal line being added, and in the future we have federation, there is an extreme danger of the New England traffic proceeding through Queensland *via* Brisbane to the port of Sydney, instead of coming by the Great Northern line? There is no doubt about that whatever.

1188. For the reason that the freights would be cheaper? Yes, it would be a shorter route. Apart from the coast line, Brisbane would be the nearest port by a large number of miles, and they would naturally send there, unless there were a shorter route to the coast. There is no doubt whatever that that would be the effect.

1189. Therefore, without coastal connection, and without connecting the west with the Great Northern line, the residents in that part of the country will have very little choice; they would be compelled, as it were, to make use of the shortest and cheapest route? Certainly.

1190. You are aware that there is an enormous area of country, including very much good land lying at the heads of the Clarence and the Richmond? Yes.

1191. Which, as you are aware, extends far up to and along the Queensland border for a great many miles? Yes, and also to the south.

1192. It is a part of the country about which very little appears to be known? Yes.

1193. That unless some attention is given to the coast it will also require communication? It will not be settled upon until there is communication.

1194. Coming down to the south, and still on the eastern coast, and taking the country lying between
Glen

J. McFarlane, Esq., M.P.
15 Sept., 1896.

Glen Innes, and within approachable distance of Armidale—that is a part of the country which can never be served by the Great Northern line; is there not a large area of country lying on those two slopes, or on the fall towards the coast, which can never be served by the Great Northern line? Not by the Great Northern line.

1195. And certainly could not be served by the proposed extension? Certainly not.

1196. For the proper development of that part of the country, do you think the wiser course would be to have a connection from Inverell to the main northern line, at the next best point, and thence a connection which would give the coast people the chance of getting either intermediate markets between Glen Innes and Newcastle, and going to the coast direct, or going by way of Brisbane? Certainly; I am decidedly of that opinion.

1197. But would you recommend that as against any other proposal? So far as I am aware.

1198. I have in view now a connection with the Great Northern line? I understand.

1199. Because if there is no connection with the Great Northern line, of necessity all the traffic on the west of that line must be lost? Yes.

1200. What the Committee wish to arrive at is as to what is the best thing to do with this proposal;—is it a wise proposal to recommend, because it cuts off coastal connection? That is the objection I have to it. It does not connect with the northern line at a convenient part, with a view to further extension to the coast where the interior would be more greatly benefited.

1201. Supposing there were to be no coastal connection whatever from the Great Northern line, do you think that the construction of that main coast line would meet the objections you have at the present time? No; certainly it could not.

1202. Why? Because there is no connection between the northern line and the coast line. The coast line would have the effect of opening up a large amount of valuable country along the coast; but it could not be of much benefit to those living 40 or 50 miles in the interior, unless there were a connection between the northern line and the coast line.

1203. Would the coastal line be of the slightest value to the settlers in New England? I cannot see how it would be a particle of benefit.

1204. Their object would be to get to the coast as quickly and as cheaply as possible? The shortest possible route to a safe port.

1205. *Mr. Clarke.*] Judging from the evidence we have already, it is not intended to carry the proposed line, if constructed, further than Inverell? That is the objection I have to it.

1206. Your objection is that it will leave a blank between Glen Innes and Inverell? Yes. It would have to go from Inverell in the direction of Glen Innes or Guyra, to meet the coast line, before it could have any connection with it.

1207. You think that if the line stops at Inverell, it will prevent any line going to the coast from the main line? I understand it will have that effect.

1208. We have evidence from the Secretary to the Railway Commissioners, that it is not intended at present to extend the line further than Inverell? I think the distance between Inverell and Sydney *via* Morce, compared with the distance in a direct line from Inverell to the coast, ought to settle that question very easily on account of the difference in distances.

1209. I suppose you are aware that a great deal of the country along the proposed line is adapted to the growth of cereals? I believe it is.

1210. Do you think a portion of the flour made from the wheat would, if a line were built to Glen Innes, go to the coast? A considerable portion of it would, because they cannot grow wheat on the coast.

1211. In that case it would be of benefit to the general public to get wheat and flour, grown on the proposed line of railway, to the coast, and to receive in return sugar and other products? It would be of great advantage to those residing in the coast districts, and also to those on the table-lands and in the interior.

1212. What is the rate of carriage from Grafton to Glen Innes? It varies. Sometimes it is as low as 6s. per cwt. to Inverell.

1213. By teams? Yes; it is less than that in many cases.

1214. We have evidence that it has been carried as low as £4 10s. per ton to Inverell? That is so.

1215. Have you any idea of the probable cost of making a railway from Glen Innes to Grafton, or from Guyra to Grafton? There have been several estimates, and I believe recent surveys have reduced them very much.

1216. Do you think it would be possible to construct a line to the coast much cheaper than was once anticipated? Surveys are about to be commenced, and I venture to say they will be considerably under the lowest estimate which has yet been made.

1217. Could a line from Guyra to the coast be made more cheaply than one direct from Glen Innes to Grafton? I understand it could.

1218. Is not some of the country which would be gone through from Guyra to the coast well adapted for settlement—such country, for instance, as that about Don Dorrigo? Some of the richest land in the Colony is at Don Dorrigo.

1219. I suppose the people on the coast would be satisfied to get a railway from the main line either *via* Glen Innes or Guyra? I do not think the residents have any strong opinion about it so long as they can get the best available centres connected.

1220. There appears to be some intention to have a coast line commencing at Glen Innes and going along the coast, heading all the northern rivers? Yes; there has been a surveyed line for some time.

1221. That, I suppose, would be a very expensive line? It would cost a good deal of money, principally in bridging the rivers.

1222. But it would be of great benefit to the people living on the Macleay, the Nambucca, the Manning, and the Bellinger, and all along the coast? I think it would be the best paying line in the Colony. It would do away with the necessity of making a number of breakwaters.

1223. I suppose you are aware that, with the exception of the Clarence and the Richmond, all the harbours on the north coast, from Port Stephens down to the borders of Queensland, are difficult to get out of? Yes, shipping is uncertain. Vessels are often barbound.

1224. And there is difficulty in getting produce to market? Yes.

1225. *Mr. Wright.*] Does that apply to all the northern rivers? Nearly all.

1226. *Mr. Clarke.*] I suppose when the harbour works at the Clarence are completed vessels drawing up to 20 feet of water will be able to get into the river? I have not the slightest doubt about it. Sir John Coode stated that when his scheme was carried out it would admit of vessels drawing that amount of water. His scheme has only been partly carried out. It was proposed to make a north training-wall to confine the channel, and when that was completed to make a north and south breakwater; but even now when the one training-wall only has been made there is a wonderful improvement in the depth. The channel is straight, and carried from 17 to 20 feet of water. It is not an infrequent occurrence for steamers to go in at night. A large sailing ship entered the other night drawing about 16 feet of water.
1227. *Mr. Lee.*] There is a permanent depth of water of 17 feet? It is rarely less.
1228. *Mr. Clarke.*] In that case vessels of considerable size drawing 20 feet of water would be able to leave the Clarence, and would have not only the advantage of the Sydney market, but of markets in any part of the world? I have not the slightest doubt that when the harbour works are completed some of the largest intercolonial boats will enter the Clarence with safety.
1229. Do you think it would be advisable in the general public interest to have a railway from the table-land to the coast? Most certainly.
1230. Even if it costs a large amount of money? Yes; I think the circumstances thoroughly warrant it.
1231. *Mr. Roberts.*] Seeing that the present terminus of the north-western railway is at Moree, would you not favour a connection between that town and Inverell? No; I think it is beginning at the wrong end. I would be in favour of it if Inverell and Glen Innes were connected.
1232. Seeing that the line is already at Moree, and the proposed line is only 60 miles long, and goes through fairly level country, do you not think it would be a wise expenditure on the part of Parliament to sanction the connection between Moree and Inverell? Not with the view of carrying the traffic to Sydney, on account of the great distance.
1233. Do you give that opinion with a feeling of apprehension that if the line is constructed there will be less probability of any coast connection taking place? There is no doubt it would delay the coast connection, because when the Inverell people applied for a railway to connect them with Glen Innes, they would be told by the Government that they were already connected with the railway system of the Colony.
1234. Have you considered the estimated cost of the line from Moree to Inverell? £2,800 per mile. It is a very low cost.
1235. Having that in view, do you not think it is a line worthy of favourable consideration? There is no doubt it is worth considering; but knowing the district so well, and knowing the requirements, I certainly think the requirements of the whole of that part of the Colony would be better served in the way I have indicated by having a shorter route to bring them to the seaboard.
1236. Your contention is, that if the line were taken from Inverell to Glen Innes, and thence to Grafton, it would only have to travel about 150 miles, whereas by the other way it would have to travel 513 miles? Yes.
1237. Against that, have you given consideration to the question as to what the expenditure would be? I have; but at the present moment we have not a very correct estimate of what the cost would be between Glen Innes and Grafton. In view of the reduced cost at which railways have been constructed during the past few years, I feel sure it will be found that the estimate of the trial survey which is about to be made will be very much lower than any estimate previously given.
1238. The country between Glen Innes and Grafton is rugged in the extreme? Some of it is bad country.
1239. And would render railway construction difficult and expensive? There is no doubt it is an expensive line; but the country is not so bad as many have pictured it. It is not a howling wilderness, as many have stated. I admit there are portions of the country which are very bad.
1240. If such a line were constructed, there would be no produce to carry along the route except what you would bring from Grafton on the one hand and Inverell on the other? To places there would be. For instance, after you leave Grafton there is a considerable stretch of very good country, the producers upon which have long distances to convey their stuff to market. Of course this would be all picked up by the railway.
1241. At first sight I admit it seems strange that produce and passengers should be carried over 500 miles when they can get to the seaboard in 150 miles, but that is owing, I suppose, to the almost impassable state of the country;—if the line had been less difficult, I suppose that line would have been made years ago? I think it should have been made years ago. There are mail coaches now plying for passenger traffic between Glen Innes and Grafton.
1242. Is there a large passenger traffic on the route? There is not what may be termed a large traffic.
1243. Is there a daily mail? I think there are five coaches a week.
1244. And there is a large amount of general merchandise carried from Sydney to Grafton and Grafton to Glen Innes, and thence on to Inverell? Yes, a lot is sent by team.
1245. Do you favour any particular route from Inverell to the coast? The most direct route is from Inverell to Glen Innes, and then to Grafton.
1246. Do you prefer that to any other? Yes, on account of its directness. Of course when the railway is made, even though it be only a few miles longer, it is there for all time, and I take it that even if there is an additional cost, it is best to have it in the most direct manner possible—that is, provided there are not too many other contingencies which might outweigh that consideration, which I do not see in this case.
1247. Have you heard of any less estimate for a line from Grafton to Glen Innes than £19,600 per mile? I think that is the highest. It is an old estimate.
1248. Made in the year 1890? Yes; I think it is considerably less than that now.
1249. You say another survey is now taking place? Instructions have been given to make one.
1250. Can you give the Committee an approximate idea of what the cost of construction per mile would be under the new survey? I would be very much surprised if the estimate exceeds £1,000,000—that is, the total cost of a line from Grafton to Glen Innes.
1251. You think it can be built for something under £10,000 per mile? I think so.

Charles Edward Rennie, Esq., Chief Draftsman, Department of Lands, sworn, and examined.—

C. E. Rennie,
Esq.
15 Sept., 1896

1252. *Vice-Chairman.*] Do you produce a plan of the district, showing the route of the proposed railway, the land alienated along the route, and the land occupied? Yes; the red colouring is intended to show the alienated, conditionally purchased and conditionally leased land between Moree and about 20 miles to the east of Inverell, and 30 miles on each side of the line north and south. The green tint shows the reserved land of all classes within the same limits. The brown tint shows the leasehold areas and improvement leases within the same limit. The white patches show the vacant land unoccupied except as occupation licenses. The line runs almost due east from Moree to Inverell. The whole of the land is either occupied in selections, occupation licenses, leases, or reserves.

1253. Tracing the course of the proposed railway, will you point out any available land which is not alienated? Starting from Moree there are some patches on the south about 20 miles distant.

1254. Is that a large or comparatively small area? Comparatively small.

1255. Leaving that, and travelling eastward towards Glen Innes, at what point do you come to the next patch of unalienated land? There is a much larger patch on the northern side of the line. It extends northward about 20 miles. At about 40 miles from Moree there are some very small patches of vacant land—some vacant patches of a few thousand acres. For a distance of about 30 miles the whole of the land is alienated or reserved within several miles of the line.

1256. Are you able to state the nature of the holdings? Only as regards the classes of holdings. It was either sold at auction or is held as conditional purchase or conditional lease.

1257. Is that all you know about the district? Some of the leasehold areas will become available for settlement next year.

1258. Can you state how many acres, and within what distance of the proposed line? Within the 30 miles limit on either side next year there will be, roughly speaking, about 90,000 acres available for settlement.

1259. *Mr. O'Connor.*] What is the character of the country? I think it is mostly grazing country.

1260. *Vice-Chairman.*] You are speaking now of pastoral leases? Yes. In 1898 there will be a further area of about 35,000 acres available. It is situated within the same limit, and is also pastoral lease. All the other pastoral leases within the same limit will run on to the year 1900.

1261. What will be the total area of leaseholds which will fall in between the present day and the year 1900? 575,000 acres approximately.

1262. Will it be available for selection? I cannot say. Some parts of it will be reserved; but roughly speaking there will be 575,000 acres now held as leasehold which will then be set free from lease by the expiry of the pastoral leases. The total approximate area of alienated land, and in process of alienation, is about 1,635,000 acres; lands now held under pastoral lease about 575,000 acres; improvement leases, 74,500 acres; reserves, about 671,000 acres; lands now available for settlement, 755,000 acres; but that is broken up into fragments, and a large part of it I know is inferior country.

Charles McDonnell Stuart, Esq., Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

C. Mc.D.
Stuart, Esq.
15 Sept., 1896

1263. *Mr. Clarke.*] Do you know the nature of the country between Moree and Inverell? Yes.

1264. What kind of country is it? Fairly good.

1265. Is it adapted for the growth of cereals? Yes; the greater part of it is, particularly between Warialda and Inverell.

1266. I notice it is not intended to take the line to Warialda? No, it leaves it about 3½ miles away.

1267. Why is that? Because it is a much easier run of country up Kelly's Gully, and that is where the line goes.

1268. We have had examples of railways being made within a few miles of the town, for instance, at Yass, and afterwards a tramway being made at considerable expense to connect the town with the line; would there be any probability of that occurring at Warialda? I should not think so. Warialda is a small place, and I think it will ultimately work its way down to the railway. The town is situated in a gully.

1269. Is not the proposed line an expensive one? No, it is a cheap line per mile.

1270. Are you aware that it will entail an annual loss of £2,785? That is a matter which I cannot enter into.

1271. Do you not think it will be a disadvantage to the public if the line is not carried on as far as Glen Innes? I do not think so. I do not see the advantage of going to Glen Innes, unless Glen Innes is connected with the sea.

1272. Is that not one reason why it would block the construction of a line from Inverell to Glen Innes? My opinion is, that it is best to go from Moree to Inverell to open up the country.

1273. Is the land between Glen Innes and Inverell equally as good as that between Moree and Inverell? No.

1274. Would it be more expensive to build a line from Inverell to Glen Innes? It would be, per mile.

1275. Are you aware that the proposed line goes mostly through alienated land and that there is very little Crown land? Yes.

1276. Can you give any reason why the Commissioners have departed from their usual custom which is, that railway lines are not to be made unless the land is given free? No.

1277. If the line stops at Inverell and is not carried to Glen Innes, or Guyra, or the main line, will that prevent the line going to some part of the coast? I do not think so.

1278. How would the people in the neighbourhood of Inverell get to the coast without a railway? If you made a line from the table-land to the coast, you would probably, ultimately connect with Inverell, but I think it is time enough to do that when you connect with the coast.

1279. But the present proposal leaves a blank between Inverell and Glen Innes, whereas if the line went all the way from Glen Innes, or even from Inverell to Glen Innes, would it not be more in the public interest? I do not think so. I think that the back country about Moree is as good a market for Inverell as any other place.

1280. But the back country around Moree and north of Moree would naturally come down to Narrabri? It would.

C. McD.
Stuart, Esq.
15 Sept., 1896.

1281. Whence then the necessity of a new line? It is to give the Inverell people connection with some railway; and, of course, I believe in giving them the cheapest communication possible and I think the Moree line is the cheapest one.

1282. I have mentioned that there would be a good deal to pay in compensation by going through the alienated land? Yes; but I think there is more Crown land on the proposed line, in proportion, than there is on the line between Inverell and Glen Innes. There I think it is nearly all alienated.

1283. If you had to pay compensation it would make an additional cost to the line? Yes.

1284. You think, on the whole, that the line from Moree to Inverell would be to the public benefit? Yes.

1285. Notwithstanding that it will entail an annual loss? I believe it will ultimately pay.

1286. Can you give an idea as to when that will be? No.

1287. *Mr. Roberts.*] I understand you surveyed the route between Inverell and Glen Innes? Yes, on two occasions.

1288. Would it be more difficult and expensive to construct the line between Inverell and Glen Innes than it would if carried through country such as we have between Inverell and Moree? Yes; the country is a good deal rougher, and you have a greater elevation to rise.

1289. Do you know the country between Glen Innes and Grafton? Yes; I have been over it. It is very rough. I was on the survey between Glen Innes and Grafton up the Mann River.

1290. Would there be any great engineering difficulties in making a line from Glen Innes to the coast? It would be a very expensive course, but there are no difficulties which could not be overcome.

1291. Is there not good country between Glen Innes and Grafton? With the exception of a bit about Grafton and Glen Innes, the intermediate country is not worth much.

1292. And it would cost a very large sum to construct a railway? Yes.

1293. Have you surveyed the proposed line from Moree to Inverell. No; but I was over the country previous to the survey.

1294. And it is very favourable for railway construction? It is a very good line. Looking at the country it is surprising how good a line has been got. You would not think you could get one so good in going through it.

1295. Do you know the feeling of the people of Inverell with regard to railway communication? It is divided. There are two parties—one for Moree and the other for Glen Innes.

1296. Have you formed any opinion upon the question yourself? Yes; I formed the opinion before the survey was commenced that it would be a very good idea to run a line from Moree to Inverell, because you go through the flatter country.

1297. And notwithstanding the fact that you would have to travel over 500 miles to reach Sydney? Yes, but there is only 35 miles difference going by way of Moree and going by way of Glen Innes.

1298. Although the distance is greater by way of Moree and Inverell the cost would be smaller? The cost itself would not be smaller, but if you take the distance it is smaller. The distance between Glen Innes and Inverell is a little more than half the distance between Inverell and Moree, and yet the cost is almost the same.

1299. Is there much settlement between Inverell, Warialda, and Moree? There is a fair amount of settlement, particularly about Inverell?

1300. Will there be a large amount of land available there for settlement if the line is constructed? I think so.

1301. Do you think it would be gradually taken up? I cannot say, because there is such an immense area of country in New South Wales, that you cannot expect it to be taken up very quickly.

1302. Having been in the district, I thought you might have formed an opinion as to whether there was a great demand for land? I could not say that. Of course you want strangers to go there. The local people have nearly all got land. I have no doubt that if the line is constructed a great deal more land will be put under cultivation, because there will be a market for the produce.

1303. And the fact that the line being already made to Moree causes you to come to the conclusion that it would be better to connect Inverell with Moree than to come to Sydney by way of Glen Innes? Yes; I think it would do the greatest good to the greatest number.

1304. *Mr. Black.*] You have not a very favourable opinion of the country between Glen Innes and Grafton? No; the greater part of it is poor country.

1305. It consists mainly of stony ridges and mountain ranges? Yes.

1306. The only available ground is the narrow valleys which follow the creeks. They run sharply down towards the valley flats, which are limited in extent? Yes; in some places the ranges run right down into the river.

1307. Is there any truth in the rumour about a better route situated some distance to the north of the proposed line—are there any means of carrying a line through better country? I do not think that any line which they can survey there will be much better than the one they have got.

1308. You think the reports as to there being a better route available have not much foundation? There are sanguine people who think they have better routes, but when they are surveyed they will not find much difference.

1309. Have you any idea as to what would be the cost of carrying a railway between Inverell and Glen Innes by a route presenting the lowest possible grades? I think £6,000 per mile is what this Committee once said they would pass the line at.

1310. Do you think it could be done for less? I think it might be done now, because things have cheapened since then.

1311. Do you think that if a railway of a similar character to that proposed to be constructed were constructed between Glen Innes and Inverell it could be done at a lesser cost than £6,000 per mile? A very little less.

1312. As one who knows the district, do you think it is possible to carry goods by that circuitous route, to Newcastle and Sydney, as cheaply as they could be carried *via* Grafton, and thence by team to Inverell. My reason for asking you the question is that the railway can, in the case of Glen Innes, where the route is more direct to the metropolis, compete with the steamers to Grafton, and thence by the team method of carriage;—how will the railway, in the case of Inverell, where the route is more roundabout, be able to compete? But they will be connected direct with the railway at Inverell, going round by Moree, and with the carriage the opposite way, they will take the goods the whole of the distance by waggon from Inverell to Glen Innes, and then on to Grafton. 1313.

- C. McD. Stuart, Esq.
15 Sept., 1896.
1313. My question is, "If the Railway Commissioners cannot compete so successfully with the Grafton route as to do the bulk of the carrying trade with Glen Innes, how can they do it in the case of Inverell, where the railway route is less direct?" I think they ought to be able to compete very satisfactorily.
1314. *Mr. O'Connor.*] I understand that the country between Moree and Inverell is principally occupied by pastoral tenants? Yes.
1315. In the near future it will become Crown land again? Yes.
1316. Is a large portion of the country between Moree and Inverell fit for agriculture? Yes; particularly between Inverell and Warialda.
1317. Do you know the country extending for 10 or 15 miles north of the proposed railway? I have been right up, nearly to Boggabilla, and from Inverell to Yallaroi. About Yallaroi especially there is some of the finest country in New South Wales. About Tullooona Station there is some splendid country as well.
1318. *Mr. Lee.*] Did you survey any portion of the line from Moree to Inverell? No; I simply went over the route first for an exploration.
1319. As you made no survey, and had no concern in fixing the position of the line, you are not prepared, I suppose, to explain why it is surveyed in such a peculiar way? I think I can answer questions of that character, as I went over the country.
1320. Are you prepared to give any official reasons why a survey of the character which has been made has been permitted? Yes; they have taken the easiest country they could get.
1321. How do you know? Because I have been over it. If I were to survey the line myself, I would take it over the same country.
1322. Who surveyed the line? Mr. Chalmers, Mr. Powell, Mr. Cumming, and Mr. Marshall.
1323. *Vice-Chairman.*] Was there a line previously surveyed starting about 8 miles to the north of Moree? Yes.
1324. Do you know anything of that survey? Yes, I explored both lines.
1325. *Mr. Lee.*] Can you tell me the distance by road between Moree and Inverell? Ninety-eight miles.
1326. Can you tell me why it was necessary to survey a huge line like a huge serpent from point to point the whole of the distance? Going out of Inverell you have to get up to the top of the dividing ridge between the waters of Myall Creek and Reedy Creek, and to do that you have to work up with a grade of 1 in 100, and to use curves of sufficient length to get 1 in 100. Once you get on top you run comparative straight until you hit the top of Kelly's Gully.
1327. You say that when you get to the top you run comparatively straight? Fairly so.
1328. Have you not told the Committee that it is comparatively flat country from end to end, and that the line is easy of construction;—the survey does not show it to be so? It is flat if you follow the survey. The country itself is not flat. I said a short time ago that if you were to drive over the country you would be surprised at getting such a good line.
1329. The survey, then, is not consistent with our ideas of a flat and easy country? Of course, it is not plain country; it is broken country.
1330. As a matter of fact, then, to obtain a straight line from point to point would involve some excessive cuttings, and much heavier grades than the adopted ruling grades? 1 in 100 and 1 in 80.
1331. *Mr. Black.*] Can you tell me how far it is from Moree to Inverell as the crow flies? No; but the road is as straight a line as you can get, and the proposed railway is not much longer than the road. The only flat country is after you pass the river, from Gravesend to Moree; the other is hilly country.
1332. And that accounts for the serpentine character of the survey which has been worked over this ridgy country, and around ridges for the purpose of obtaining an easy grade? Exactly.
1333. Therefore, the length of the line has been sacrificed to obtain an easy grade? Yes.

WEDNESDAY, 16 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.

THE HON. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John McFarlane, Esq., M.P., sworn, and further examined:—

- J. McFarlane, Esq., M.P.
16 Sept., 1896.
1334. *Mr. O'Connor.*] Do you know the country between Moree and Inverell? Not very well.
1335. Have you been over it? I have been through it.
1336. Is there any good agricultural country there? Generally speaking, it is fairly good country.
1337. *Mr. Wright.*] I take it that you disapprove of the proposed extension, because it will not facilitate the construction of a railway between the table-land and the coast? That is the principal objection.
1338. Do you think any system of railway in the western country will be incomplete in itself unless provision is made for connection with the coast? Not in my opinion.
1339. In the event of the north coast railway being constructed, would you still think connection between the table-lands and the coast necessary? Certainly it would be necessary.
1340. Do you think the climatic conditions of the coast and the table-land, and the variety of products grown in both places, necessitate an interchange of commodities by the most direct routes? Yes.
1341. And you think further that the people in the north-western portions of the Colony should have the right of sending their produce to the nearest possible seaboard? Yes.
1342. Have you been over the country between Glen Innes and Grafton? Yes.
1343. I believe a portion of that is fairly good land? Yes; there are considerable portions of fairly good land.
1344. Do you know if there are any minerals in the mountains? Yes; it is rich in minerals, and in timber.

1345. I understand there are considerable cedar forests and pine forests in the intervening country? Yes. J. McFarlane, Esq., M.P.
1346. I suppose you are aware that the same objection raised against connection between the table-land and the north coast was raised originally against the construction of the line over the Blue Mountains? There are always objections against any expensive route—in fact, some people object to any route. 16 Sept., 1896.
1347. I suppose you are aware that it was stated that the Blue Mountains were barren, and that a railway there would never pay? Yes. My idea is not so much that the line should benefit the intervening country, but the rich country beyond the table-land, and on the table-land.
1348. Still, in your opinion, is there a possibility that even the intervening country may produce considerable wealth? Certainly.
1349. In the shape of undiscovered minerals and the timber which grows there? Yes.
1350. Is it not a fact that a great many of the mountain slopes would be suitable for the growth of certain fruits? I think they would be admirably adapted for fruit-growing.
1351. Therefore population might concentrate if the railway were built? No doubt.
1352. I suppose the northern part of the coast of New South Wales does not produce wheat? The coast land is not adapted for wheat.
1353. So that the whole population will have to be supplied with breadstuffs from some other part of the Colony, or from outside the Colony? Yes.
1354. Can you say what the population of the northern rivers is—from the Manning to the Tweed? From the Manning to the Queensland border it is about 100,000.
1355. And those people have to be supplied with breadstuffs from outside their own districts? Yes, entirely so.
1356. If a railway connecting the table-lands and the coast were constructed, would not the whole of the produce be supplied by the fertile wheat-growing land around Inverell and district? Yes; at a much less cost than the present transit.
1357. The probability is that it would be so? Yes.
1358. And that the northern districts would take from the rich lands of the coast their best products? Yes, naturally so.
1359. So that there is every prospect of a considerable trade being developed from the commencement? There is no doubt there must be a large trade.
1360. In addition to the trade incidental to the interchange of commodities between the two districts, would there not be a large commercial trade springing up in supplying the back country with goods from Sydney *via* Grafton? No doubt there would be an increased trade.
1361. Do you know that the bulk of the goods now consumed in Glen Innes—that is, goods of the second or third class, which pay a higher railway freight—are conveyed *via* Grafton to Glen Innes? Yes; in considerable quantities.
1362. And also, considerable quantities in Inverell? Yes. Goods also come down from there—wool, for instance.
1363. I noticed by a return the other day, that for the last twelve months 1,800 tons of goods had been sent from South Grafton to the table-land, and 600 or 700 tons of return loading? Yes.
1364. So that, in your opinion, everything points to the necessity for a railway line between the coast and the table-land? Yes.
1365. And to its value to the community, if constructed? Yes.
1366. Do you know the land about Inverell? No; I have not an intimate knowledge of it.
1367. I suppose you know, by repute, that it is wheat-growing? I know by repute that it is fertile, and specially adapted for wheat-growing.
1368. Have you every reason to believe that in the course of a few years Grafton will be a port equal in facilities to Newcastle? Yes; I have every reason to believe it will.
1369. That is, there will be sufficient depth of water to admit of large vessels going in at all times? Yes. It has improved materially with the amount of money spent in carrying out the south training-wall, which is about completed. When the other proposed improvements are carried out there is no doubt it will have a corresponding effect.
1370. The Government are still spending a large sum of money to perfect the harbour? Yes; I believe it is their intention to carry it out.
1371. If the Government have the intention to make Grafton a first-class seaport, one would naturally think of their looking some little distance inwards from Grafton? One would think so.
1372. I suppose the port, as it has existed for many years past, has always been capable of doing the whole of the trade of the Clarence River? Yes; there has always been a fairly good entrance.
1373. And so long as the port of Grafton consisted of a coastal trade with comparatively small steamers between Sydney and Grafton, the harbour as it was ten years ago was good enough for its purposes? It answered the purpose.
1374. And if large and expensive works are undertaken now one naturally concludes there is some ulterior object in bringing produce to the harbour from the interior? Yes; that is one of the reasons for justifying the expenditure.
1375. And no system of north coast railway would meet the requirements of that district, because there would still be no connection between the western lands and the sea coast? It could not positively benefit it, being so far distant, unless there were a connection.
1376. Are you familiar with the practice pursued in connection with the railway policy of any of the adjoining colonies? Yes. In Queensland, for instance, they generally connect the interior with the nearest seaport, and I think their railway system answers admirably for opening up the country.
1377. Wherever they have a port in Queensland they have given the people behind it the opportunity of connection? Yes.
1378. Does the same remark apply to Victoria? It does.
1379. And South Australia? It seems to apply to all the other colonies where there is railway construction of any extent.
1380. So that, as a matter of fact, New South Wales is the only colony which drags its produce to one port? I believe it is.
1381. In your opinion, is that a system prejudicial to the best interests of the country? It is. The carriage will always kill any industry which is remote from Sydney when there is so much expense incurred in carrying it 400 or 500 miles to Sydney.

J. McFarlane, Esq., M.P.
16 Sept., 1896.

1382. If the Government of New South Wales are continually throwing open the lands in the western part of the Colony—both in the central part and the northern and southern parts—and inviting people to settle, do you not think they should give those people the utmost facilities for sending their produce to market by the nearest route? That is my opinion.

1383. Do you think, if facilities were given to the north-western portion of the Colony to get produce to the seaboard, large settlement would ensue? I have not the slightest doubt about it. With the railway carriage and the low prices ruling in the Sydney market at the present time, it would not pay to raise produce. For instance, lucerne hay, which I understand can be profitably grown on the table-land, and in many parts of the country now under review, is only bringing 25s. to 30s. a ton in Sydney. The whole of that would be absorbed in carriage. So that in that particular line there would be no inducement at all. The same with maize, which is only bringing 1s. 11d. to 2s. a bushel. It would not pay to convey it 400 or 500 miles by rail to market. The same remark holds good with regard to other produce.

1384. Do you believe the construction of a line between the coast and the table-land would encourage a large traffic, and the land would still be taken up? It would encourage a large traffic and open up a large area of land for settlement.

1385. And with every prospect of the line paying within a reasonable time? Yes.

1386. *Vice-Chairman.*] You have referred to the cost of carriage of maize;—are you aware of the special rate which obtains for the carriage of all kinds of produce? I am aware there are differential rates.

1387. Are you aware that for distances between 400 or 500 miles the rate per ton is one-third of a penny? I am aware of that.

1388. Would it not pay to grow maize and despatch it by rail at that rate? No; not at present prices. I will cite the case at Tumut, which is not nearly as far as Moree. At the present price it will not pay to send to this market. It would have to be 9d. or 1s. more a bushel here before it would pay them to send. It would have to be 6d. per bushel at all events before it would offer any inducement whatever to send to the Sydney market.

1389. Could sugar be purchased at the present time at the Clarence and delivered at Glen Innes at a lower rate than it could be bought in Sydney and sent to Glen Innes? Under ordinary circumstances it could.

1390. Are you speaking from your own knowledge? No; but I look at it from this point of view: The sugar has to be manufactured there and conveyed to Sydney first, and then it has to be transmitted there afterwards.

1391. If a line were constructed between Glen Innes and Grafton, it would be necessary, in order to make it a profitable line, to charge special rates owing to the cost of construction;—do you think, in view of the low cost of carriage between Grafton and Glen Innes, special rates could be charged? It is impossible to say what the special rates would be. Everything would depend upon the carriage rates.

1392. You understand that the cost of the railway would be very large in proportion to the average cost of lines of the character of railway now under consideration? Certainly it would be considerably more.

1393. And the only way of meeting the interest upon the outlay would be by making a special charge? Under any circumstance the railway charges could not approach the charges for conveying by team.

1394. You think that if the Commissioners were to charge even the present team rates there would be a profit? Certainly.

1395. Would that profit, as far as you can judge from your knowledge of the commerce of the district, be an appreciable amount, having regard to the very large expenditure? It would be like other railways—it would not pay for the first few years, until the trade was properly developed. I suppose none of the railways which have been constructed have paid for the first few years. As a rule, trade follows the construction of a railway. Even from unlooked-for sources the railways always bring trade.

1396. In reply to a question by Mr. Wright, you referred to the trade which would be opened up between Grafton and the table-land; did you refer to a local or oversea trade? I was speaking of both—with regard to the local trade, and the trade likely to accrue from opening up the intervening countries. I said it would contribute towards the traffic, and also open up the country in the interior, and would add very materially to the traffic.

1397. Do you think large ocean-going ships would find their way direct to Grafton? Already we have had a sailing ship direct from London conveying goods to Grafton.

1398. What description of ship was it? If I remember rightly, it was a barque.

1399. What was the description of the cargo? Cases of drapery and general merchandise.

1400. Was the whole of her cargo delivered in Grafton? I could not say; but I know she came direct.

1401. You can understand that the facilities afforded for the distribution of merchandise arriving in Port Jackson are so much greater than would be afforded for the distribution of cargoes arriving at Grafton;—does it therefore appear probable that for many years to come Grafton will become an important distributing port? I take it that it would always be increasing in the same way as Newcastle. Of course Newcastle would not offer the facilities which Sydney would offer, with regard to distributing goods coming direct from London. At the same time they call there, and discharge whatever goods are consigned to that port, or for the interior, and I take it that the same would hold good with regard to Grafton.

1402. In giving that answer, have you in mind the fact that Newcastle is a large coal-producing district? Yes, I am aware of that.

1403. And that there is a direct advantage to ocean vessels in going to Newcastle by reason of the return cargo? Many of them, of course, have to go there for coal under any circumstances. I admit that; but there are numbers of ships which are not steamers which do not convey much coal, but which trade there.

1404. Then, speaking in a general way, it is your opinion that Grafton is likely to become in time a port of equal importance to Newcastle? The coal, of course, will always be of importance to Newcastle, and coal as yet has not been developed in the Clarence district.

1405. Apart from the coal trade, would the advantages afforded to ocean vessels for profitable commerce be equal? I think it would be much about the same. Of course everything will depend upon the amount of country which will be opened in the interior, and the resources of the country in the interior.

1406. Do you not think the conditions of Newcastle are more favourable than those which exist at Grafton? Most certainly; they are far more favourable now.

1407. What produce would you have for export from Grafton assuming there were a connection between Glen Innes and Grafton? For export to where?

1408. For export from the Colony? There is the butter industry, for instance.
1409. I am referring to exports by ocean-going vessels? Dairying is assuming large proportions in the whole of the northern district, and it would be a large item. Sugar would also be a considerable item, and there would be a cattle and wool trade as well.
1410. Would not the whole of the products you have mentioned be available quite irrespective of the table-land;—are they not coastal products? Not the wool and a good part of the dairying.
1411. Is the Richmond River being largely occupied at the present time for dairying purposes? Yes, and so is the Clarence.
1412. Would those districts be affected by the construction of a railway between Grafton and Glen Innes? It would not affect them for export.
1413. If there were railway connection between Glen Innes and Grafton, how would the export trade at Grafton be improved;—what additional exports would you have? Only an increase on what we have at the present time.
1414. *Mr. Wright.*] You produce no wool on the coast at the present time? No.
1415. *Vice-Chairman.*] Would wool be an addition? No doubt the butter industry would grow in the north-western portion of the Colony, and this would be a market for it.
1416. Do you think there would be a large production of butter on the table-land? I feel satisfied there would. There is also tallow, hides, and produce of that character, and minerals and timber.
1417. So that irrespective of the productions of the coast in proximity to Grafton there would be large additional produce on the table-land which would find its way to Grafton for export? There is no doubt whatever about it.
1418. I take it that you have no objection to the connection between Moree and Inverell, but what you are anxious for is connection between Glen Innes and Grafton? And Glen Innes to Inverell, and also from Inverell to Moree; but let the connection be made in the correct place first.
1419. If there had been proposals under consideration to construct railways between Grafton and Glen Innes, and Glen Innes and Inverell, would you have favoured the extension from Inverell to Moree? Afterwards.
1420. You think we are beginning at the wrong end? I do, most certainly.
1421. In any case, you are of opinion that a railway between Inverell and Moree should be constructed? Yes. I have no objection whatever to the connection, but my opinion is that it should be constructed with a view of having the railway extended to the coast.
1422. Inasmuch as the proposal now before the Committee is the construction of a railway between Moree and Inverell, which you think ought to follow and not precede the construction of a railway between Grafton and Inverell, why object to that proposal? I do not think it is a satisfactory proposal, seeing that it is commenced at the wrong time and place.
1423. But you recognise that the Committee are now dealing with a proposal to construct a line between Moree and Inverell, and not from Glen Innes to the coast? It is premature at the present time. They should have railway connection at the place I have mentioned first, and this should follow.
1424. Is it your opinion that this proposal should be rejected, because it is premature? I think so, on the grounds I have stated.
1425. Apart from the ground that you have stated, namely, that you think the other railway should be first constructed, do you recognise advantages that will be conferred by the construction of the proposed railway—to the occupiers of land, and to people who are settled, and may be expected to settle—at various points between Inverell and Moree? I do not exactly catch the drift of the question.
1426. Your objection, of course, we thoroughly understand, but there is, as you are aware, now under consideration a proposal for the construction of a line between Moree and Inverell; between those two points nearly the whole of the land has been alienated, and the evidence is to the effect that there is a large area of excellent quality;—having regard to the great advantages which would be enjoyed by the occupiers of the land and producers along the route, are you disposed to press your objection, and to deprive them of a railway, because, in your opinion, this proposal should follow, instead of precede, the Glen Innes to Grafton line? My opinion is that that is quite a new question.
1427. I want your views about it? Of course that is looking at the question from a different aspect altogether from the grounds upon which I have given my objections to it. Of course, if there is sufficient traffic between the two places, the Committee would be right enough in recommending the line. Anyone who is asked his opinion about it would naturally say “if the trade between the two places justifies it, it is right that the line should be constructed.” My objection is that it is not a suitable route for the Inverell or Moree people to convey their produce to the Sydney market, or to trade with the Sydney market. I set against that the route I have indicated to the seaboard as being the correct one.
1428. Your sole objection appears to be that the Glen Innes to Grafton line ought to be made first. Putting that aspect aside, do you see any objection to a railway from Moree to Inverell being constructed immediately? If the intervening trade is sufficient to warrant the connection between the two places it would be right to construct it, but not as a national line to answer the purpose of connecting the table-land with the Sydney market as against the coast.
1429. You recognise that the rejection of the proposal would not necessarily lead to the construction of the Glen Innes to Grafton line? I do not suppose it would.
1430. That being so, are you of opinion, with your knowledge of the probable advantages which will follow the construction of the line, that it should be rejected? It might have the effect of delaying the construction of the other lines—that is the objection I see in it. The moment the Inverell people petition for connection with Glen Innes they would be told that they already had a means of conveying their produce to Sydney.
1431. Your fear is that if the proposal be carried out the coastal connection may be indefinitely postponed? It may. My opinion is that it would.
1432. Otherwise you have no objection to it? I would have no objection to connecting any particular places, providing the circumstances warranted it.
1433. *Mr. Roberts.*] Are you acquainted with the rates of carriage by rail from Sydney to Glen Innes;—can you tell the Committee what is the rate per ton? No, I cannot.
1434. Nor what is the rate per ton if goods go by sea to Grafton and thence to Glen Innes? By sending by sea to Glen Innes it would cost about £4 a ton.
1435. You are not aware what it would cost by rail? No.

J. McFarlane,
Esq., M.P.
16 Sept., 1896.

J. McFarlane, Esq., M.P. 1436. I understand it has been stated the cost is exactly the same? I suppose there would not be much difference.

16 Sept., 1896. 1437. When the Secretary to the Railway Commissioners was under examination he made the following statement:—

At the present time traffic to Inverell from Glen Innes starts upon equal terms whether it comes to Crafton or is brought to Glen Innes by railway; but if the proposed railway is made we shall be able to take goods to Inverell as cheaply as we now take them to Glen Innes, and we will thus have the advantage of the cost of carriage between Glen Innes and Inverell.

Having heard that statement, would you like to make any reply to it? The distance from Sydney to Glen Innes is 422 miles, and the distance from Sydney to Inverell by the proposed route 513 or 514 miles. I cannot understand how the carriage to Inverell can be the same as to Glen Innes.

1438. *Vice-Chairman.*] The distance being about 86 miles in favour of Glen Innes? It is over 90 miles. I fail to see how goods can be carried as cheaply over 513 miles as over 422 miles. I do not know how they may regulate the matter with the differential rates.

1439. *Mr. Wright.*] Do you think it is likely, in the event of the coast being connected with the railway, and a railway being constructed between Glen Innes and Inverell, any trade will spring up between the south-western portion of Queensland and the Inverell district? That all depends on the border duties.

1440. But supposing the border duties were removed? If the border duties were removed, there is no doubt trade would spring up.

1441. Which do you think is the more natural market for the table-land about Inverell and west of Inverell? To come to Sydney, or go to the northern coast lands and certain portions of Queensland. The nearest market is always the best.

1442. Then you think the natural market would be north and east? Yes.

Charles McDonnell Stuart, Esq., Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

C. McD. Stuart, Esq. 1443. *Mr. Lee.*] Do you know whether any special attention has been directed to the survey of this particular line, more than is usually directed to any other line, with the object of obtaining an easy grade? I do not think so—not more than what has been done upon railway surveys lately. They have been very careful lately in getting the easiest grade possible.

1444. Judging by the contour of the country, as shown on the parish map, it would appear that the country is rough and undulating from point to point? It is from Inverell to Gravesend.

1445. And to obtain these easy grades the line would have to be run round the points and spurs rather than go over them? Yes.

1446. That must of necessity have lengthened the line considerably? Of course.

1447. Can you give us any idea as to the direct distance from Inverell to Moree? As the crow flies, a little over 80 miles. Of course there is no straight road in that direction. The road is almost as long as the railway.

1448. You could not get a straight road for the same reason that you could not get a straight railway? Yes.

1449. If the same principle had been adopted in the survey from Inverell to Glen Innes, is it not reasonable to suppose easier grades would be obtained? No; the same principle was adopted.

1450. Would it not lengthen the line to ease the grades on the Glen Innes to Inverell route? The line has been lengthened 12 miles over the length of the road. The route as surveyed is 53 miles long, and the road is only 41 miles. The route was lengthened in order to get a better grade. The same thing has been carried out on that survey as upon the proposed line.

1451. What is the ruling grade between Glen Innes and Inverell? One in 60 as against 1 in 100 on the proposed line from Moree to Inverell.

1452. Would it be possible to straighten the proposed line without increasing the cost? I do not think it would.

1453. Whilst exploring the country, did you take into consideration the large area of freehold land about there? No; my sole object was to locate the line.

1454. Therefore, you do not feel yourself competent to give evidence with regard to the land? No.

1455. Which do you consider the difficult parts of the line? Between Inverell and Little Plain is the heaviest part.

1456. Is that owing to the difficulty in getting a grade? Yes; in getting a grade of 1 in 100 against the load.

1457. Are the cuttings particularly heavy there? No; you can judge of that by the cost of the line.

1458. But they are heavier in some parts than in others? Yes, that part of the line is heavier than other parts, and is more expensive.

1459. Is there any difficulty in getting out of Kelly's Gully to the top of the ridge? No; you can get out almost with a surface line.

1460. Are there heavy cuttings there? No; the heaviest cuttings are at the Inverell end, from the top of the Dividing Range down into Inverell.

1461. What provision, if any, did you make for the extension of the line into the town of Inverell? It is surveyed right into Inverell, and connection could be made with the Inverell to Glen Innes survey.

1462. By means of a bridge? Yes.

1463. It would be rather expensive? It would not be very expensive.

1464. Were you brought into contact with many landowners there? I met a few of them.

1465. Was there any disposition on their part to give the land required for the construction of the line? I could not say. I do not think the question was ever raised.

1466. Does it pass through many large holdings? Not many.

1467. Does the line pass through many selectors' properties? Not many, except immediately leaving Inverell.

1468. Consequently the freeholds on the pastoral properties are surveyed in sections a mile square? I suppose so.

1469. And in some cases the line must pass through those sections to a considerable extent? Yes.

C. McD.
Stuart, Esq.
16 Sept., 1896.

1470. Would it not be possible to get a line without passing through so much freehold? Not to get as easy a line.
1471. What is the ruling grade between Moree and Narrabri? The ruling grade against the load, 1 in 100, and with the load, 1 in 76.
1472. *Mr. Wright.*] Did you survey the line? No.
1473. Have you been over it since it was surveyed? No. I was over it before it was surveyed. I was practically over the exact route. I went over the country, and the route is the direction I chose.
1474. Has there been any further exploration than yours? There have been local explorations by the surveyors in order to make small deviations.
1475. When an officer is sent out, and a route is given to him, is it not almost his duty to stick to that particular route? No; he has a free hand. The route I lay out is simply a recommendation, and the officer who is sent out is supposed to improve it as much as he can.
1476. And if they think a little deviation is wise the Department will not grumble at it? No.
1477. Can you tell us anything about getting in and out of Warialda;—did you go over that country? Yes.
1478. What is the country like around Warialda? Warialda is situated in the valley of Reedy Creek, and the difficulty is in getting into it from the Inverell side.
1479. I suppose the country is not rough? It is fairly rough. You cannot get a grade of 1 in 100.
1480. You would not call it mountainous? It is not much worse than the other. It is not impossible to get a line through Warialda.
1481. The reason that it is left out is that the other is an easier one? Yes.
1482. Would it be possible to go into Warialda without sacrificing the grade? It would.
1483. The expense, however, would be great? Yes.
1484. It would make the line about three miles longer? Yes.
1485. Can you give any idea as to what would be the cost of those three miles? Approximately about £11,000. I am not, however, in a position to deal with the question of cost.
1486. But you know of your own knowledge that a line could be taken to Warialda without sacrificing the grade? Yes; but it would not be so nice a line. It would increase the curvature.
1487. What radius would be required to take it in and out of Warialda? You would have to use 10-chain curves.
1488. Is that at all impracticable in railway construction? No; it is the limiting curve we have used on that line and others.
1489. It would not increase the sharpness of the curves? No; but it would increase the number.
1490. Is the whole of the country along the route you have travelled over good country? Fairly good.
1491. For what purpose? Between Warialda and Inverell for agricultural purposes.
1492. All of it? Yes; and between Warialda and Moree they have used it for years for pastoral purposes, but it could be used for wheat-growing.
1493. As a matter of fact, the Moree district is entirely pastoral? Yes.
1494. And is likely to be so? I suppose so.
1495. Do you think the advent of the railway would cause many million acres of wheat to be grown in the district? I could not say.
1496. Is the country west from Warialda suitable for the growth of cereals of any kind? The further west you get the worse it is, because you get into drier country.
1497. The country around Moree is principally black soil? Yes.
1498. It cakes very much in wet and dry weather? Yes, it is the usual black soil country; it is very fine country.
1499. Do you consider it fine country for growing cereals? I would not go so far as that, because there is so much country in New South Wales which is probably better for it.
1500. As a matter of fact, the red soil is considered better than the black soil for the growth of wheat? Yes.
1501. You say that the approach to Inverell is rather a difficult one? Yes.
1502. Does it involve very much extension of the line to secure a grade there? Yes; a good deal of extension, and a lot of curvature.
1503. It would cost something, I suppose, to bridge the Macintyre River, in order to take the line to Inverell itself? Yes; but not a great deal.
1504. What width is the river from abutment to abutment? About 3 chains wide.
1505. Where the road bridge is built now, we have the most suitable place on the river for a bridge? Yes; there is a good high bank on both sides.
1506. And if you went south of it you would have a wider river to cross? We should have flatter banks. The river would be a little wider, but not much.
1507. The banks would be lower, and the approaches more expensive? Yes; but on the whole I would not call it an expensive bridge.
1508. Would it cost £40,000 for an iron bridge? I do not think so. I think a wooden bridge would be constructed.
1509. Do you think wood is the best for bridges of this kind? I think so, if you take into consideration the difference in the first cost. Of course wooden bridges are not as long-lived.
1510. On the whole, considering the cheap cost of construction, you think wooden bridges are the best in the first instance? I think so. Before the bridge required renewing it would more than pay the difference.
1511. You think, in effect, that they are the more economical of the two? I do.
1512. Is there any flooded country to pass over on the proposed line? No, they have avoided the flooded country. Between Moree and Warialda there is some flooded country, but the line goes outside it.
1513. Are the waterways on the proposed line sufficient? Yes, I think so.
1514. Did you notice any lands on the route you passed over except a little wheat under cultivation? Immediately on leaving Inverell there is a good deal of cultivation. Between Little and Big Plain there is land under cultivation on the northern side of the road.
1515. Is there any cultivation west of Big Plain? Not much—hardly any.
1516. Did the land appear to be held in large areas? Yes; once you get away from the Big Plain you get into the Gragin Run, which has a large area. I presume all the runs will be thrown open for selection.

- C. McD.
Stuart, Esq.
16 Sept., 1896.
1517. At any rate, after passing Little Plain, and until you get into the immediate neighbourhood of Moree, there is no cultivation? Very little.
1518. Is there much cultivation around Warialda? Not much.
1519. I believe that is the poorest land on the route? I should say it is.
1520. It is fitter for grazing than for agriculture? Yes.
1521. *Vice-Chairman.*] You say that the route under the consideration of the Committee was recommended by you? Yes.
1522. Did you previously recommend any other route? No.
1523. Did you explore between a point about 8 miles north of Moree and Inverell? Yes.
1524. Did you recommend that route? I did, but I look upon that as part and parcel of the same line.
1525. I am speaking of two different routes;—did you not previously recommend that route? I did. In my report I recommended the northern route first, but there is a reason for it.
1526. What reason? Because it was understood at the time I made the exploration that there was a proposal to carry a line from Moree to Boggabilla or Mungundi. The line from Moree to Boggabilla or Mungundi would have run over that 8 miles, and one bridge across the river would have done the two lines. That is the reason I recommended it.
1527. Were you instructed to explore a line from the point you have mentioned, 8 miles to the north, or were you left with discretionary power? I had discretionary power.
1528. I want to know your reasons for going 8 miles north of Moree in the first instance, instead of starting from Moree? It was in order to make use of a portion of the line which would be common to the line towards Mungundi or Boggabilla.
1529. Were you instructed to find the best route? I was.
1530. You say a wide discretion was granted you? Yes.
1531. Why did you not first survey from Moree? Because the Government first proposed to carry a line from Moree to Boggabilla or between Moree and Mungundi.
1532. Did you recommend that the line should be extended from Moree to Boggabilla? No, but I was asked to make an exploration to see what the country was like. If either of those lines were going to be made I should have recommended the line to Inverell to have started at the 8 miles from Moree on the northern side of the river.
1533. Is that your opinion still? It would be if they were going to make a line to Mungundi or Boggabilla.
1534. Assuming the line to Boggabilla, would the connection between the 8 miles north point be a better route than the one under consideration? Only on condition that you made the other line—not otherwise.
1535. I am supposing a line to be projected between Moree and Boggabilla, would the northern route be better than the one under consideration? Yes; in the sense that it would be a little cheaper.
1536. What would be the advantages as regards soil and settlement? It would not be as good as the southern line. The best land is on the southern side of the river.
1537. Having surveyed the northern route, did you give attention to any other possible point of connection between Moree and Inverell? Yes; in the same report I recommended the proposed line as an alternative, and the Government had their choice. The northern line altogether depended on whether they intended to make a branch to Boggabilla.
1538. Then at the time you made your recommendation of the northern route conditionally upon the railway being extended to Boggabilla; you also recommended the line as now surveyed as an alternative one? Yes.
1539. From your knowledge of the country, are you of opinion that this will not only be a cheaper line under existing circumstances, but that it will also be a better connection between Moree and Inverell? Yes, for that connection only. It is the best and cheapest line.
1540. Why do you say that connection only? If you go to Boggabilla afterwards, you will have to make that 8 miles of line and put another bridge across the river.
1541. What is the character of the country between Moree and Boggabilla? Very good. The Tullooona station is very good country indeed.
1542. Is it similar to or better country than that traversed by the proposed line? It is considerably better country. It is not better than the country around Inverell, but better for pastoral purposes. It is better country.
1543. It is not fit for agricultural purposes? Not quite so good.
1544. Would you regard an extension beyond Moree in the direction of Boggabilla as serving pastoral interests only? Yes.
1545. Did you explore any other routes than the two you have mentioned? No, not leaving Moree. There is no other route you can take. There are only the two I have mentioned.
1546. Then I suppose you had no hesitation in selecting the route under consideration? Certainly not. For directly connecting Inverell I would take the route under consideration.
1547. *Mr. O'Connor.*] Do you know the country between Inverell and Glen Innes? Yes.
1548. What kind of country is it? It is good pastoral country, but it is not as open as the other. You get into a certain valley, and have to follow it down, and there is a range of hills between that and any other country at the back of it.
1549. For purposes of settlement, it is not so well adapted as the land between Inverell and Moree? I do not think it is.
1550. Still I suppose there is some good land between Glen Innes and Inverell? Fair land.
1551. I suppose you have travelled over the country a good deal at different times? Yes.
1552. Would you say that the land between Glen Innes and Moree is as good as any land in other parts of the Colony where railways are constructed? Yes; taking it all round, I suppose it is.
1553. Are there any great engineering difficulties along the route? No.
1554. In some places the land is pretty good, and in other places very good? Yes.
1555. *Mr. Black.*] What is the prevailing grade on the Inverell to Glen Innes route, on the last surveyed line? It is 1 in 60, as against the load.
1556. How does that compare with the grade on the Narrabri to Moree line? It is 1 in 60, as against 1 in 100.
1557. And Narrabri to Werris Creek? Upon that you have 1 in 55.

1558. Is that 1 in 55 over a long distance? I do not know. It is on a line which has been constructed for years. The grade is at Boggabri.
1559. Will not that tell against the traffic on the line through from Werris Creek to Inverell? Of course it will. But look at the section where it would have to go if it went to Glen Innes.
1560. You mean on the main line? Yes.
1561. Would the northern survey, 8 miles from Moree, go through Paramellowa? Yes.
1562. Is Paramellowa a place of any importance, or likely to become so? I do not think so. It is only a surveyed town. It is certainly not as good land as on the south side of the river.
1563. If the line had gone through Paramellowa would it have gone through the town of Warialda? Not necessarily, because both surveys join before you get to Warialda.
1564. At what distance west of Warialda would they meet? A few miles—8 miles from Warialda and 43 from Moree.
1565. Having in view the abandonment of the project to go to Boggabilla, you think the southern line is far preferable? Yes; if you look upon it as an independent line it is the best.

C. McD.
Stuart, Esq.
16 Sept., 1896.

Percy Scarr, Esq., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and examined:—

1566. *Mr. Roberts.*] Have you a knowledge of the proposed line to connect Moree with Inverell? I have been over part of the country. I have been from Inverell to Warialda, and down to Goondiwindi, but not to Moree.
1567. What is the character of the country between Inverell and Warialda? It is 20 years since I was there, and I would not like to say much about it.
1568. Were you ever called upon to report upon the best way of connecting Inverell with the railway system of the Colony? Yes; Mr. Price and myself made an extensive report on the subject in 1890.
1569. What was the exact nature of the report you were asked to furnish;—was it in regard to connecting Inverell with the Great Northern Railway? Our instructions are shown in the following extract from the report:—

P. Scarr, Esq.
16 Sept., 1896.

Department of Public Works, Sydney, 31 May, 1890.

MINUTE PAPER.—RAILWAY EXTENSION—NORTHERN DISTRICT.

THE MINISTER desires Messrs. Scarr and Price to at once proceed to undertake the following inquiry in connection with Railway Extension in the northern districts of this Colony.

The first matter for determination is the best way of connecting Inverell with the Great Northern Railway, for which the following points of junction have been proposed, viz:—

- (1) Glen Innes.
- (2) Guyra.
- (3) Uralla.
- (4) Kentucky.

It will be necessary to give these routes the most careful investigation, with the view of determining which of them presents the promise of securing the most favourable results in the general public interest.

The second branch of the inquiry will embrace the consideration of the question as to the best means of connecting the Great Northern Railway with the proposed coast line. For this purpose the following routes have been suggested, viz:—

Tenterfield to Casino,
Glen Innes to Grafton, and
Guyra, *via* the Don Dorrigo Scrub, to Grafton.

The third matter for attention is the connection between Guyra and the Coast about Coff's Harbour.

The merits of the proposed line from Tamworth *via* Manilla towards Inverell should also be inquired into.

1570. What was the result of the investigation made by yourself and Mr. Price; did you recommend the route from Glen Innes to Inverell? We did not make any definite recommendations, but summed up the whole matter, and then gave our conclusions.
1571. You gave your views on the different routes you went over, and left the Minister to decide? Yes. We were not called upon to give definite opinions upon the routes, but to collect material with regard to them.
1572. When you were called upon to make this report along with Mr. Price, where was the terminus of the north-western line? It was at Narrabri then.
1573. It had not then been determined that the Narrabri-Moree line should be constructed? No.
1574. Now that the terminus of the north-western line is at Moree, do you think that will be the best way of connecting Inverell with the railway system of the Colony? I do not know that I would be justified in giving a definite opinion on that point for the simple reason that I have not gone closely into the matter. I have not made inquiry into the country, and I do not know the country about there very well.
1575. Do you know the country between Inverell and Glen Innes? Yes.
1576. Would that be an expensive line to make? It would. There is some very heavy work upon it.
1577. If a line were made from Inverell to Glen Innes, would there be likely to be much settlement upon it, or is it a fact that the whole of the land is in the hands of a few persons? The land at that time was in the hands of about four persons, speaking generally. There were four large estates which extended nearly the whole length of the line. What subdivision or breaking up of the land there has been since I could not say.
1578. Did you gain any information as to the likelihood of the land being sold, leased, or thrown open for settlement? We heard statements to the effect that it would be broken up, sold, leased, and so on, if the railway were made; but we considered that they should be taken with a grain of salt, as the experience up to that time had not been that the large estates in different parts of the country would be broken up under similar conditions.
1579. You had no positive evidence on the point? No.
1580. It was merely rumour? Yes.
1581. Was the land well suited for agriculture? There is a great deal of very good land indeed.
1582. Was more than one route traversed by you between Glen Innes and Inverell? Yes, there were two routes surveyed.
1583. Which did you prefer, *via* Swanbrook or *via* Wollingrove? The Wollingrove route.

1584.

P. Scarr, Esq. 1584. Upon what grounds did you recommend that route? I cannot recollect very clearly, but they are all stated in the report. It was chiefly, I think, because the land was better, and not that it was better from an engineering point of view.

1585. I think you travelled from Guyra to Inverell? Yes.

1586. Is there some fairly good land on that route? Yes; but not nearly so much as there is on the Glen Innes line. It is more patchy, and does not extend for such a great length along the line.

1587. What about the engineering difficulties? That was the easier line of the two as far as the engineering question was concerned.

1588. As compared with the Glen Innes route? Yes.

1589. But the Glen Innes land was preferable for agricultural purposes? Yes. There were other considerations as well. It struck the Northern line further north than the Guyra line, which we considered of some importance, and it did not require to get up to such an elevation on the Glen Innes connection as on the Guyra connection.

1590. All things considered, you preferred the Glen Innes to Inverell route? Yes, in preference to the Guyra line.

THURSDAY, 17 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY, (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.,

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John See, Esq., M.P., sworn, and examined:—

J. Sec, Esq., M.P. 1591. *Vice-Chairman.*] You represent the electorate of Grafton in the Legislative Assembly? Yes.

1592. *Mr. Wright.*] You know the proposed railway under consideration? I have a knowledge of the proposal.

1593. To construct a line of railway from Moree to Inverell? Yes.

1594. Have you any personal knowledge of that particular tract of country? No, I have not been between Moree and Inverell. I know the country about Inverell very well.

1595. Will you give the Committee your opinion respecting the proposed line as far as it will serve Inverell and the surrounding district? I do not think the proposed railway will serve the interests of the people of Inverell.

1596. Why? I think the best connection for Inverell would be by running a line from that town to Glen Innes. I take it that this is not only a local, but to a very large extent a national undertaking. The Inverell people are entitled to railway communication, and in my judgment the best way to serve their interests would be by taking the railway from Inverell to Glen Innes with the ultimate intention of carrying it to the coast.

1597. It has been stated in evidence that the Railway Commissioners, in considering the policy of serving Inverell, have not taken into consideration the general policy of a proposed connection with the coast to serve the north-western portions of the Colony? Well, I think this is not only a local but a national work. Any railway of this description should be so constructed so as to give the people the best possible access to their nearest market. I should like to point out that, from Sydney to Glen Innes, by way of the Northern line, the distance is 422 miles. From Glen Innes to Inverell, over the projected railway—the one authorised by the Public Works Committee some years ago—the distance would be 53 miles, making a total of 475 miles; of course I am only speaking approximately. From Sydney to Narrabri the distance is 350 miles; from Narrabri to Moree 65 miles; from Moree to Inverell it is, I understand, 96 miles; a total of 511 miles or 36 miles further than the line from Sydney to Inverell by Glen Innes. The distance from Inverell to Glen Innes is 53 miles; from Glen Innes to the coast it is, approximately, 100 miles, and from Grafton to Sydney by water, it is 340 miles. That makes the whole distance from Inverell, *via* Glen Innes and Grafton, to Sydney, 493 miles, or 18 miles shorter than the proposal from Sydney to Moree and Inverell. I have given these figures for the purpose of emphasising the difference in the distances. I think it will be easily shown that, some day—and I hope that day is not very far distant—the best and easiest method of enabling the Inverell people to reach their market will be by way of Grafton or some depot on the coast.

1598. Then you consider that any proposal to provide the north-western portion of the Colony with railway communication, should embrace a scheme for connection with the coast? I do. I think the proposed railway, if carried out, will compel the people of Inverell to travel from Inverell a distance of 515 miles—taking them away from their market—and they will have to send their produce, willing or not, for 515 miles by railway, as against their natural outlet which would be the best port on the coast, north of Newcastle, distant from Inverell about 150 miles.

1599. You have a knowledge of the town of Inverell and the products of the district? Yes.

1600. What, in your opinion, is the natural market for Inverell? There can be no doubt that the north-coast and Sydney will form a market for Inverell products, and any form of railway communication which might be devised should be such as to afford facilities to the producers on the Richmond, the Clarence, and all that magnificent country down to the Bellinger. My friend, Mr. Lee, and others who have been there, know that to some extent it embraces the Don Dorrigo scrub, which is one of the richest portions of New South Wales, and which at the same time is almost inaccessible on account of the want of proper facilities. First of all there is the Bellinger, the Nambucca, and the Macleay, and I will not even except Port Macquarie.

1601. Can you give the Committee any idea of the population of the northern rivers, from the Macleay to the Tweed? Quite 80,000.

1602. The whole of that population has to be fed with imported breadstuffs? They do not grow a bag of wheat there. With regard to the population—including the Manning and the people north of Port Stephens—I put it down as 100,000 on the north coast.

J. See, Esq.,
M.P.
17 Sept., 1896.

1603. And those people have to be fed with breadstuffs grown outside that district? Yes; I think I am speaking correctly when I say that there is not any wheat grown.

1604. And your contention is that if a railway be made between the table-land of New England and the seaboard, the whole of that population can be fed by the produce of Inverell and district? Yes. There is not only Inverell, but there is Armidale, and all the country beyond, because if this suggestion were carried out, as I say it ought to be, it would really mean the beginning of another line to the coast.

1605. Is there any possibility, if a coastal line be constructed, of the wants of Queensland being met by the wheat-producing lands of that portion of New South Wales? Yes. I do not know of any part of the country which offers such facilities for population as the north coast districts, and the table-land on the west—that is the table-land from Glen Innes on to Inverell, and on to the Queensland border. I do not know of any portion of the country so well adapted for settlement as that. There is no doubt in my mind that, with proper, cheap, natural facilities—not artificial facilities, such as the project before the Committee will afford—there will be an enormous settlement if the people can get their produce to market at a reasonable and fair rate.

1606. On the other hand, it is contended by certain residents of Inverell, that their market is west of Inverell—that is towards Moree and west of Moree. Have you any idea what population there is to consume the produce of those districts? A very poor one, and I do not suppose it will ever be a big one. I do not think the country is adapted for settlement—it is a grazing country.

1607. You believe it to be a pastoral country? I think so.

1608. And one not likely to carry a large population? I should think there are more people on the Richmond now than there ever will be in that country during the next 100 years.

1609. You are firm in your belief that if Inverell is to be a large grain-producing district, it must look for a market away from the western parts of the Colony? There is no doubt about it. Anyone who has travelled in the northern and north-western districts, and who knows the drift of trade from the early settlement of the country, will be guided in coming to the conclusion that that is the nearest and best way of getting to the table-land. It is true that the system of centralisation has induced trade to go to Sydney and Newcastle, simply because the railway has been made; but I say again that, to secure that trade, a very unequal and unfair system has had to be adopted in regard to the railways, by the introduction of the differential rates. If the rates charged on the northern line, between Armidale and Tenterfield, were consistent with the rates charged between Armidale and Newcastle, then nearly all the trade which is done between Glen Innes, or between Armidale and Tenterfield, along the northern line, and beyond Inverell, would be done by bullock team from Grafton, and from Lawrence to Tenterfield, where a very considerable trade is already done, despite the differential rates, which have been introduced for the purpose of securing the trade by the northern line.

1610. You are aware that there is a large annual loss on the northern line, from Tamworth to the border? Yes.

1611. Do you think the construction of the proposed railway will increase that loss to the northern line by taking the traffic from it? I think it is self-evident that it will. Supposing they secure the whole of the Inverell trade—that is on the line—they will have disabilities to contend with even then, in the shape of competition by teams. The distance to the coast will always be a formidable competitor as against a railway. Therefore, to secure the whole of the trade by way of Moree they will have to adopt comparatively low rates.

1612. And that will have the effect of further augmenting the present loss on the northern line? It is 254 miles from Sydney to Werris Creek, and 422 miles from Sydney to Glen Innes, so that there are 168 miles of the northern line which will lose the traffic which it formerly had in connection with the Inverell trade. In other words, the Inverell trade, which was done by rail, was done from Glen Innes, and of course came to Werris Creek, and on in the ordinary way. By this proposal of the Government, necessitating all the goods coming to Glen Innes, and towards Werris Creek, on the northern line, the whole volume of the Inverell trade will go over the other line, and will, most naturally, decrease the volume of trade, and the earnings of the northern line.

1613. And if it is shown by the railway authorities that the proposed line between Moree and Inverell will be run at an annual loss, it will naturally increase the loss on the northern line? Unquestionably. It is indicated that the loss on the proposed line will be £2,700 a year; but I suppose that it will be more than that. I assume that in the provision which has been made for the cost of the line, they do not take into account the cost of the resumptions and stations. The estimate which has been given refers merely to the cost of making a railway.

1614. It includes everything as far as the railway itself is concerned—stations and everything? But it does not include the land, which might come to another £50,000. I understand that the line goes mostly through alienated country.

1615. What I want to emphasise is this: That not only do they show a loss on the proposed line, but that the loss on the northern line will be augmented? There is no question about it.

1616. To the loss of £2,700 per annum upon the proposed line, they should add the loss of revenue which will be sustained in connection with the northern line? Yes. They will lose the whole of the trade they had hitherto on the northern line from Werris Creek to Glen Innes, which will be diverted over the other line, to the loss of the Glen Innes line.

1617. And it should be added to the annual loss on the proposed line? Yes. One of two things should be done. It should either be charged to the proposed line, or debited to the other. It seems to me, whichever way you take it, that it is a competing line against the northern line. Instead of making Inverell a feeder to the northern line, they propose to divert the trade from Inverell to Moree, which will take the northern trade from the northern line.

1618. Then the line, instead of being a feeder to, will be a sucker from, the northern line? Unquestionably.

1619. You are quite clear that the trade of Inverell should gravitate to the east, and possibly to the north? In spite of the differential rates, which I have already mentioned, there is still a very considerable trade between Inverell and Grafton by team. I am perfectly convinced, from my knowledge of the country, and from my association with it—and I have made it a study for years—that on every ground, national and otherwise, the line ought to connect with the northern line at Glen Innes.

1620. You are aware that the climate of Moree is pretty hot? I suppose it is.

J. See, Esq.,
M.P.
17 Sept., 1896.

1621. Do you think the passengers who wish to reach Sydney are likely to face that climate and travel in the train? I am pretty sure they would not. A man can drive from Inverell to Glen Innes on a good road and through a good country in four or five hours.

1622. If passengers can be conveyed by first-class coaches to Glen Innes for 10s., and if they can reach Sydney by that route with little personal inconvenience, do you think they are likely to go to Moree? I should say that they would go to Glen Innes. In the first place they have the mail train, which is a great consideration.

1623. We have it in evidence from the postal authorities that they can land their mails in Inverell by means of train to Glen Innes, and then on by coach, in less time than they can take them by train *via* Moree, and for less expense, therefore, I suppose the passengers could be carried at less expense? I do not know how they do that. It is a matter of calculation as to how long it takes the train to go from Sydney to Glen Innes, and we know that from Glen Innes to Inverell it is down hill all the way. Consequently, coming back it is up hill. I think there is a descent from Glen Innes to Inverell of from 1,500 to 1,700 feet.

1624. You say there is a trade between Grafton and Inverell? Yes.

1625. There is a considerable trade. I believe, from South Grafton to Glen Innes and Inverell? Yes.

1626. Can you give us any idea of the present rates of carriage—that is inclusive of the rates from Sydney to Glen Innes and to Inverell? I would not like to mention rates, but I know that the method they have adopted of sending a considerable amount of produce from Inverell to Grafton, and then on to Sydney, is cheaper than sending by rail.

1627. You mean that certain classes of goods are carried more cheaply—including insurance—from Sydney to Inverell *via* Grafton? Yes; and I even include the delay which, of course, to a business man is something. It might take three weeks to send goods to Sydney from Inverell *via* Grafton, and it would probably only take a week to get them from Sydney to Inverell. A business man would enter into a calculation of the amount of interest; and in spite of all disabilities he would get his goods landed more cheaply by way of Grafton and Glen Innes than he would by rail.

1628. That is a fact which applies to Glen Innes? An absolute fact.

1629. And the natural inference is that it will also apply to Inverell, if it is connected by railway? I do not think there is any doubt about it. I think if they make a railway to Inverell, they will not get rid of the competition. Therefore to ensure trade, differential rates will have to be adopted which means that the work on the railroad will be done at a loss to the general taxpayer. It means that in order to secure the trade, you have to carry goods at an abnormal rate, and the deficiency arising from that abnormal trade has to be made good by the taxpayer.

1630. There is now, in effect, competition between the steam-boat proprietors and the Railway Commissioners for the Inverell trade? No, it comes without any special effort so far as the steamer companies are concerned.

1631. But you say the Railway Commissioners have made special rates which entail an annual loss on the railway? There is a differential rate on the northern line, between Armidale and Tenterfield, for the purpose of inducing trade from Inverell, Emmaville, Tingha, and that outlying country to go upon the northern line. But for the differential rates along that portion of the railway, the goods would be taken more cheaply under ordinary circumstances from Inverell to Glen Innes, and Grafton by road.

1632. Notwithstanding the existence of that differential or cheap rate, a large quantity of goods is taken *via* Grafton? I can give you the figures.

1633. Can you give us an estimate of what has been carried for any specific period over that road? I have a list which has been prepared by a gentleman whose every day experience enables him to give reliable information. I refer to Mr. J. T. McKittrick, of South Grafton, who has a large forwarding business, and who does probably the chief trade in loading teams. He sends a considerable quantity of sugar, and produce of that description from the Clarence. The Clarence and the Richmond, as you know, are sugar-producing districts, and I know that in the season a large quantity is sent from Grafton to Glen Innes and Inverell, that is in addition to the ordinary merchandise which is sent by way of Grafton from Sydney. Then a great quantity of goods is sent from Inverell and Glen Innes in the shape of wool, hides, potatoes, bran, and products of that description.

1634. Have you the information you refer to for any particular period? Yes; I have the tonnage of produce received at South Grafton for the twelve months ending 30th June, 1895, and it is as follows:—

From Dalmorton.....	5 tons
Glen Innes.....	284 „
Inverell.....	260 „
Emmaville.....	41 „
Armidale.....	25 „
Deepwater.....	12 „

That makes a total of 627 tons received at South Grafton from the table-land. That comes along the road despite the difficulties which have to be contended with. The tonnage of merchandise forwarded from South Grafton for the twelve months ending June, 1896, is as follows:—

	Tons	cwts.	qrs.	lbs.
To Glen Innes ..	973	0	3	26
Inverell	433	16	3	22
Tingha.....	30	6	2	2
Armidale	145	7	1	10
Hillgrove	39	7	0	16
Emmaville	62	13	2	26
Deepwater	26	0	2	20
Dalmorton	72	18	3	22
Total.....	1,783	12	1	4

The following is the description of the produce received at South Grafton for the twelve months ending 30th June, 1896, from the under-mentioned places:—

J. See, Esq.,
M.P.
17 Sept., 1896.

Produce.	Dalmerton.	Glen Innes.	Inverell.	Armidale.	Deepwater.	Emmaville.	Total.
Wool, bales	3	1,044	1,429	84	73	246	2,879
Hides	114	547	701	189	1,551
Horns, bags	15	14	29
Ores, bags	633	633
Tallow, casks	1	5	6
Hair, bags	1	11	1	4	17
Skins, bales	10	7	21	29	67
Chaff, bags	711	711
Bran, bags	150	150
Oats, bags	50	50
Potatoes, bags	80	80
Beeswax, boxes	4	4
Sand, bags	27	27
Sundries, packages	9	5	43	57
Total packages, bales, or bags...	137	3,281	2,214	310	73	246	6,261

1635. What is the total tonnage inwards and outwards? 2,400 tons.

1636. The whole of that traffic, except a small portion sent from Dalmorton, has been lost to the railway revenue? Of course if it had gone over the railway they would have had more carriage; but in order to get what they did get they have to carry it more than 100 miles on the northern line for nothing. In many instances, goods which are intended for Armidale are, under the present system of carriage, sent on as far as Guyra, and in some cases as far as Glen Innes.

1637. Your contention is that as this amount of goods has been carried under difficulties by horse and bullock teams, if a railway were constructed from the coast to the table-lands of New England, not only would they have had that traffic, but the whole of the traffic in those districts over the main northern line? Yes. I was going to point out that the traffic I have enumerated from Glen Innes, Inverell and the other places consists of wool, hides, horns, ore, skins, chaff, bran, some oats, potatoes, and sundries.

1638. Principally wool? Yes; 2,879 bales of wool, and 1,551 hides, and 633 bags of ore. This is the remnant of what was once a very large trade. There used to be thousands of tons of goods sent up before the days of differential rates obtained, and, of course, before the railway opened from Armidale.

1639. Notwithstanding the cheap rates offered by the Commissioners, this volume of trade still obtains at Grafton? Yes.

1640. You believe that if a railway were constructed from the coast to Inverell, not only would all this traffic be secured, but the whole of the traffic which now traverses the northern line up to this point would be carried? Yes; that is the natural inference; but I think the enormous development of trade which would ensue from proper communication with the coast would increase the earnings of the northern line rather than decrease them.

1641. You are aware that it has been said that a line between the table-lands of New England and Grafton would necessarily be an expensive one to construct, and that the country is bad;—do you know the intervening country between the table-land and the port of Grafton? I know it fairly well; I do not know any better road than the one between Grafton and Glen Innes. Parts of it are a little steep. I drove a pair of ponies over the whole distance quite comfortably in two days, and I only drove eight hours each day.

1642. What is the character of the country;—is any portion of it suitable for agriculture? Some of it. Of course, I do not know what its future may be, but I should think that it abounds in minerals. It is the most magnificent timber country I have ever seen, and what its possibilities may be in regard to fruit-growing, and as a sanatorium, I do not know. We have only the Blue Mountains as a guide, and certainly, in my opinion, it is much better than the Blue Mountains.

1643. Some portions, I understand, are good soil? Unquestionably.

1644. And along the whole of the route there is an abundance of timber and a possibility of minerals being developed? Yes, and it is splendidly watered. I suppose there is no better-watered country in the world.

1645. Do you think the mountain slopes are adapted for the cultivation of fruits and vines? I am sure of it. Some people may affect to despise them because they know nothing about them, but anyone who has a knowledge of other countries, and who has travelled through Italy, France, and Germany, and seen the wretched hillside slopes upon which people exist, and compares them with our magnificent hill country here, must be able to realise that. Perhaps not in our time, but certainly before very long, those hills will be occupied by tens of thousands of people.

1646. Then your opinion is that if that railway were constructed there would soon be a considerable population and traffic? I do not think there is any doubt about it.

1647. And the whole of the traffic in the north-western part of the Colony would pass over there? My impression is that that is the course which nature intended it to take.

1648. I suppose that irrespective of where the railway should tap the main northern line, you look upon its natural outlet as the Clarence River? Natural and necessary outlet. That is the best point, but in any case, even supposing it were not, there still ought to be a connection between the north coast and the table-land for the convenience of people on the north coast and those in the north-west.

1649. Irrespective of the terminal point on the coast, you think the Government should make some effort to connect these two important districts? There is no doubt of it. Supposing the people on the north coast had a railway from Newcastle or the Hunter—which would be a continuation of the present northern line—if they wanted to send sugar from the Richmond or the Clarence to Inverell they would have to send it to Newcastle, and then upon the northern line again. If the country develops, as I believe it will, you must give facilities for reaching the market. The greatest drawback to the proposal before the Committee is that it fixes for all time a carriage by rail of 515 miles as against the natural road.

1650.

- J. See, Esq.,
M.P.
17 Sept., 1896.
1650. You think then that the great defect of the proposal is that the question of a port for the northern portion of the colony is altogether ignored? I think it is carrying out the old system which has done so much harm to the country, and that is the system of centralisation. If you had a market on the north coast, the time would not be far distant when you would be sending cargoes of wool, preserved meat, and so on, away.
1651. You think that if the people had railway communication between the table-land and the north coast, an independent trade would spring up between Grafton and some other important point? No doubt.
1652. For instance, a good deal of the wool is at the present time exported direct? Yes.
1653. Would there be a possibility of shipping cargoes of wool from the northern portion of the colony? Yes. They have a magnificent bar on the Clarence now; in fact, it has almost ceased to be a bar. It may almost be looked upon as a port, if not equal to, at any rate, nearly as good as Newcastle.
1654. I believe there has been some attempt made recently to secure direct vessels between London and the Clarence? They have been talking about it.
1655. Has anything definite been done? I think Mr. Utz negotiated with some agents at home to get a small vessel out, but the disabilities will be considerable. The smaller the ship the more you have to pay. It is not because there is a want of facilities for shipping, but because of the disabilities of the trade in consequence of competition, which prevents one getting freight enough.
1656. You think that if a large trade can be secured, Grafton is of sufficient importance to admit of the entry of large vessels to it? Yes, if the north-west trade went along to its natural port, there would be no difficulty in connection with the matter.
1657. Independent of the question of direct trade between the outer world and the north coast, would not the construction of a railway from the north coast to the table-land enable all the producers in the north-western portions of the colony to land their produce in Sydney, and to get their supplies back at a lesser rate than they could under existing railway arrangements? Undoubtedly.
1658. So that all that portion of the colony would benefit in regard to the cost of freight? Yes; besides the interchange of trade between the northern districts and the north-western districts.
1659. Independent of that trade, growers in the western district would have the advantage of cheaper transit both ways? Yes.
1660. You say that the population of the north coast from the Manning to the Tweed is about 100,000? That is what I estimate it.
1661. Have you any idea of the population of the table-lands, say from Guyra to Tenterfield, and west of that? No; I should think about 30,000, including Tenterfield. There may be more.
1662. We will take it as 30,000. You would have, then, this advantage if your contention were maintained, that the people of the north-west would get their supplies, which they cannot produce themselves, such as wheat, from the west; and the people west would get their supplies of sugar and other things from the seaboard? Yes.
1663. In addition to that the people west would have every facility for getting their supplies to and from Sydney at lesser rates than they now pay? You would have one-tenth of the population of the colony at once brought into close communion in regard to an interchange of products—that is when the general scheme of railways, which is contemplated, is carried out.
1664. What effect would that have upon the northern line? I think it would help it.
1665. Do you not think it would draw traffic from it? I do not think so.
1666. For instance, if you had a railway from the coast, junctioning with any place on the northern line, it would necessarily distribute the stuff on that line for a certain distance? Yes; and you would get a natural route for it, instead of a competing route.
1667. We will say that the junction is at Tenterfield. Supplies will go to Glen Innes and so on? I can understand a competing or differential system against another colony such as Victoria, for instance, which has attacked us for the purpose of inducing trade. The anomaly there is that they would charge 8s. for carrying a bale of Victorian grown wool from Echuca to Melbourne, but they will carry a bale of wool grown in Riverina, New South Wales, for half that amount.
1668. Do you think that whilst it is fair for the Railway Commissioners to meet warfare with warfare, it is also fair to meet our own people with the same weapons? I do not think it is, and it will deprive a number of people of a trade which naturally belongs to them. No one, of course, can compete against the state, because the state has the whole of the people at its back as well as the consolidated revenue. Therefore if the state makes up its mind to run any travelling interest it can do it. But the question is whether it is desirable for the state to undertake to destroy an industry, because it has the power to do it. It is using the might of the people as against the individual, and the individual may have done as much for the country in the early days of pioneering as the railways are doing now.
1669. Another aspect of the question is this: that the people who pay the reduced rates get the benefit of them? I admit that the individual does, but the public have to pay him. It is, after all, the giving of a subsidy by the people to the individual—it is a bounty.
1670. It is taxing the consolidated revenue for the benefit of a small district? Exactly so, or it is taking from the earnings of the railway, which belong to the people.
1671. Which is the same thing inasmuch as that forms a portion of the consolidated revenue? Yes.
1672. Looking at the matter quite apart from your position as a representative of a northern electorate, do you believe that coastal communication should be given to the table-land? I have no hesitation in saying that it should. If I sat for any other electorate in the Colony I should have the same opinion as I have now in regard to the advisableness of carrying the railway from Inverell to Glen Innes and then on to the coast.
1673. Having an extensive knowledge of the district, and of its trade requirements, can you give the Committee any idea as to whether a railway from Inverell to Glen Innes and then on to the coast would pay or nearly pay? I have no doubt it would pay very shortly. The original estimate—which is only a rough one—for the line from Inverell to Glen Innes—£2,000,000—was about double what it should be.
1674. That is about £20,000 a mile? I remember that when they first projected the railway between Glen Innes and Inverell they said it would cost £700,000, and I see they have reduced the cost to £137,000.
1675. You are aware that the first estimate for a railway from Inverell to Glen Innes, and from Grafton to

to Glen Innes, was only guess-work ;—there were no perfect surveys made? It was a sort of rule-of-thumb business, I think. At one time they seemed to aim at taking all the railways to the tops of the mountains.

J. See, Esq.,
M.P.
17 Sept., 1896.

1676. Under the old trial surveys, on each of the routes projected as possible routes to connect the tablelands with the coast, there was a large mileage with grades of 1 in 30 and 1 in 33? I know they were steep, but I have not paid much attention to the technicalities of the matter.

1677. You are aware that recent surveys have reduced the grades of the three routes to connect the tablelands to 1 in 60? I know they have been reduced considerably.

1678. That is between Grafton and Glen Innes, Tenterfield and Grafton and Byron Bay, and Guyra and Coff's Harbour? Yes.

1679. The possibility is that as the grades are being reduced, and modern engineering skill in the construction of railways is cheaper than it was formerly, if a proposal of this kind be submitted now the estimate will be less than it was originally? I should think half. The Glen Innes and Inverell estimate has been reduced by more than one-half—£719,000 to £317,000. The lowest estimate before that was £421,000. I notice that according to the new data, which the Minister for Works introduced to Parliament in connection with the old scheme of connecting Inverell and Glen Innes, it was estimated that the income and the expenditure would be about £22,000. It was afterwards stated in a report, which I saw, that whilst the expenditure would remain at £22,000 the income would be reduced to £15,326. But there appeared to be no account taken of the reduced estimate of £100,000 in the construction. The interest itself upon that would be £3,000 a year; therefore that must come off. I take it that the Committee desire to have the fullest and most accurate information in reference to this direct proposal, and also in reference to any other proposal which might serve the interests of the people better. I do not think it is a fair thing to disparage another line for the purpose of making the one which it is proposed to construct appear to be so much better. There ought to be just as much information obtained from the people in regard to a railway between Inverell and Glen Innes as in regard to a railway from Moree to Inverell. Although I understand the question of constructing a line between Glen Innes and Inverell is not under consideration, it is to all intents and purposes a rival route. And if it can be shown that it is a better route than the one proposed by the Government it ought to be adopted. I regard this as a national undertaking, and if the construction of a line from Moree to Inverell means that Inverell is to be the terminal point of the railway, then the north coast people would be deprived for a considerable time to come of their natural and just rights. Although Tenterfield, Richmond, and Grafton are remote from this particular proposal, nevertheless they are involved in it, and there are very large interests in which they are directly concerned.

1680. Your contention is that the whole question should be dealt with as one question? I think so. The man who lives at Lismore, Wollombi, or Kempsey is interested in the matter as much as the man who lives at Inverell.

1681. It is a question which affects the seaboard and the northern and north-western portions of the Colony, and should be dealt with in a comprehensive manner? It is a new departure altogether to recommend this proposal. For a long time there has been a contention as to whether a railway should go from some point on the northern line to Inverell. It has always been understood by anyone who has given the matter consideration that the connection should be from Inverell to a point on the northern line, whether it be Kentucky, the Mother of Ducks, Glen Innes, or any other point. This proposal, however, opens up an entirely different aspect of the question, and whilst it may give Inverell railway communication, it will not serve them nearly so well as the other line, and at the same time it will deprive other portions of the Colony of railway communication to which they are entitled.

1682. We are told by the Secretary for Railways that the Railway Commissioners have dealt with this proposal as one for providing accommodation for Inverell alone. They say that owing to the steep grades on the northern line, and the low grades on the Narrabri to Moree line, and the proposed Moree-Inverell line, they can carry produce to Sydney *via* Moree as cheaply as they could *via* Glen Innes, and at less expense, so far as hauling and wear and tear are concerned. Therefore they recommend the proposed line to serve Inverell alone, without reference to any future extension. The Secretary for Railways was asked whether the Railway Commissioners had taken into consideration the expediency of connecting the north coast with the railway system of the Colony, and his answer was that he did not think so; do you think that that is unwise? I do not think there is any doubt about it. The Railway Commissioners may be doing what in their judgment is right, but I would not yield my knowledge of the country to them on what I call national grounds; and I am not looking at the present, but at the future. If you go from Lawrence to Tenterfield you will find teams hauling goods to Tenterfield in spite of all difficulties. You will also find teams on the Glen Innes Road, and also between Grafton and Armidale. These are all strong evidences that, despite the differential rates, there is still a trade going on.

1683. And as a representative man, and as a man taking a deep interest in the country, you consider that no system of railway extension to the north-western country will be satisfactory unless it includes connection with the north coast? No. I could understand the railway going from Glen Innes to Inverell, and then on to Warialda, or some other place which they thought most convenient; but no one ever thought when the railway was made from Narrabri to Moree that it was ever contemplated to carry goods from that way to Inverell. There may be a good deal to be said in favour of connection between Glen Innes and Inverell, and some other portion, but to stop the line in a desert, as it were, is absurd. Again, the national question, which is a bigger question than the local one, of getting to the coast in the best way, and of enabling the people to enjoy, at a fair rate, the outlet which is best for them, has to be considered.

1684. The people in the north have a right to communication with the other parts of the Colony by the most direct and cheapest route, to convey their produce to market? Yes. In South Australia they recognise that wherever they have a good port the point of departure of the line to a particular district should start from that point. Take, for instance, Port Pirie and Port Augusta,

1685. I believe the same remark applies to the whole of the Australasian Colonies? Yes.

1686. In Queensland railways are constructed from the different seaports into the western country? Yes, trunk-lines of railway.

1687. There is one at Brisbane, one at Rockhampton, and one at Townsville? Yes; and it is the same in little Tasmania. They have made a port at Devonport. Instead of taking the goods to Launceston, as they could have done at about the same cost, they have made a port at Devonport, and trade is developing there. It is the same in New England.

1688.

- J. See, Esq.,
M.P.
17 Sept., 1896.
1688. Has not a considerable mining field recently developed west of Grafton? Yes, there has been a fairly good field discovered at a place called Bucca Creek which is south of Grafton 30 or 40 miles. Then there is a place called Yugilbar near Solferino which may be a good field. There is a good field at the Mann River, and also about Dalmorton. I think all that mountain country is auriferous.
1689. And all the gullies of that range are rich in soil and timber? Splendid pine and magnificent cedar. Some of the finest pine I ever saw grows in those gullies. As you travel along the Glen Innes Road you see a distinct forest of pine, and a distinct forest of hardwood running almost in parallel lines up the mountains.
1690. I believe it is magnificent hardwood? Yes, as good as any in the world.
1691. Would not the forests alone be very valuable? It is almost impossible to compute the value of the hardwood in the table-land. Beyond the rise of the table-land, where it begins, you may put it down as being worth millions of pounds.
1692. I suppose the construction of a railway would mean the employment of a large number of timber-getters, and employment to the railways in bringing the timber to market? Yes.
1693. And a possible further development of the mineral resources of the mountains, and the possible occupation of the country by a successful class of fruit-growers and orchardists? Yes, by all the trades that follow settlement.
1694. I believe this country is much superior to that of the Blue Mountains? Much superior.
1695. And all that obtains on the Blue Mountains in regard to residential sites might obtain there? There is no doubt that it would become a sanatorium for the people of the north. Instead of going to Sydney and the Blue Mountains, as they do now, they would be able to get to the table-land from Grafton within three or four hours.
1696. So that whichever way you look at the possible coast connection, you see something like a good future before it? It is almost impossible to conjecture what is the future of these districts.
1697. *Mr. Black*] With regard to the line between Grafton and Glen Innes, do you think there is any possibility of there being any intermediate trade? I think there will be considerable intermediate trade.
1698. I mean trade picked up at points between the two termini? Yes. I think, in the first place, it is a wonderfully rich auriferous country, and I think there will be a considerable amount of settlement follow the railway—farming, and timber-getting more particularly. There is no question about the vast forests of timber—pine, and cedar; in fact in a great many places it is almost unexplored.
1699. Do you attach much importance to the farming prospects of the country? I do a great deal.
1700. Is there any particular portion of the route where you think there are facilities for farming? People tell me there are considerable portions of the mountains, and the sides of the hills, which are fit for it. I am told there are very large tracts of magnificent fertile chocolate soil at the back of the mountains.
1701. You attach most importance to the timber-getting, and the development of the mines? Yes; to the intermediate trade, and to the use of the place as a sanatorium. I may state, that there is not much intermediate trade between the Zig-zag and Penrith, excepting that kind of intermediate trade which is occasioned by people who go there for change of air, and who take to growing raspberries and gooseberries.
1702. With regard to the ascent of the big hill, I understand that there is some means of evading the steepest grades? There have been explorations recently made, more particularly with regard to what they call the Buccarumbi Range. Mr. Lloyd went out and discovered what he considers to be a better route than the old one over the range, which they regard as worse than the Big Hill. The route to Glen Innes avoids the Big Hill altogether. It is known more particularly as the Big Hill, because of its length. Although you have to go a little further round, they expect to get better grades, and possibly better country. There is a gentleman up there now, Mr. Powell, who has been sent to survey the explored portion of Mr. Lloyd's country.
1703. Buccarumbi is about 40 miles out of Grafton? Yes, I suppose it is.
1704. You begin to ascend it after leaving Mrs. Mulligan's? It is before you get down to the river.
1705. Anyhow it is between the O.B.X. Creek and the river? Yes. Mr. Lloyd thinks that he has discovered a route which will almost miss the Buccarumbi Range which was looked upon as one of the most formidable undertakings in connection with the construction of the Grafton and Glen Innes line.
1706. The soil, as far as Mulligan's is concerned, is very fair? It is very good grazing country. They take the milk into South Grafton from O.B.X. Creek—that is a distance of 18 miles. Of course it is the haulage which prevents the people doing any good in farming. When they have to draw stuff 30 or 40 miles by team it takes the gilt off the gingerbread, and there is no back loading.
1707. You think then that the apparent difficulties of the route between Grafton and Glen Innes can be overcome by judgment and engineering skill? Yes. Mr. Statham, who is an old public officer, and who was at Grafton for many years, had and still has an idea that a better route than the one proposed could be found. He obtained a lot of parish maps, in fact, the whole of the parish maps of the country between Glen Innes and Grafton, and marked out a route which he thought would obviate many of the difficulties with which they had to contend previously. I express no opinion about the railway route, because I have not been over it.
1708. If the estimated cost of the Glen Innes to Inverell railway has been reduced from over £12,000 per mile to £6.077 per mile, and the estimated cost of the Grafton-Glen Innes line has been reduced from £20,000 to £10,000 per mile, and if the Railway Commissioners do not think it advisable to construct a line between Glen Innes and Inverell, do you think it is likely they would be enamoured of a proposal to construct a railway between Grafton and Glen Innes when the cost per mile would very much exceed that of a line between Glen Innes and Inverell? Probably not; but I should not go to the Railway Commissioners for a railway policy. That is a matter for the public themselves to determine. The Railway Commissioners are simply asked to give a report, but Parliament is the institution which undertakes the construction of railways. If Parliament considers it a good thing to make a railway, it is really no business of the Commissioners. I take it that the people of the country know better what they want than probably do the Railway Commissioners. I am prepared to give the Railway Commissioners the fullest praise for their capacity to manage the railways; but I would not yield my knowledge to theirs in regard to what I think to be the best route for railways which are to develop trade.
1709. You think that if a railway could be constructed between Glen Innes and Inverell at a cost of £5,000 or £6,000 per mile, the money would not be ill spent? No. I am perfectly certain that if it would cost £317,000 to construct a line from Inverell to Glen Innes, as against £279,000 to construct a line from Moree to Inverell, it would be far better for the country that it should connect with the northern line

line from Inverell, than that it should divert the trade from the northern line to Werris Creek. There are 168 miles of northern line from Glen Innes to Werris Creek which will lose the Inverell traffic. It is a case of robbing Peter to pay Paul. On the other hand, the differential rate will still be kept up; but it is hardly likely, unless they carry goods from Inverell at a very low rate, that they will get rid of the teams altogether.

J. Sec, Esq.,
M.P.
17 Sept., 1896.

1710. It appears to me doubtful whether they will be able to compete with the teams at all? Notwithstanding that they propose to make a railway from Inverell to Moree, they would still have teams to Glen Innes to compete against.

1711. If the people of Glen Innes, having direct communication with Sydney, prefer in most instances to bring their goods *via* Grafton, and thence by team, to bringing them by the railway, are not the people of Inverell, having a more roundabout way of communication by way of Moree, still less likely to use the railway? Without question.

1712. If that be so, railway communication from Inverell with Sydney would not be of much use for the conveyance of goods from Sydney to Inverell, however much it may be used for the disposition of the produce in places contiguous to the line between Inverell, and perhaps Narrabri? Not further than that, because they have the valley of the Hunter there.

1713. You think the chief outlet for the Inverell trade, in the event of the railway being constructed, would terminate at Narrabri? I do not think there is a doubt about it. I should not think there is a big trade; it is an intermittent kind of trade, and depends sometimes on the seasons. When they have abundance of grass they do not want chaff and corn; but when they have a dry season, of course they want it more or less. When the goods had to be hauled from Narrabri to Moree there was a much larger demand, because there were more horses. As you extend the railways into the country you extend the volume of traffic by team, and decrease the value of their stock.

1714. *Mr. O'Connor.*] I believe your knowledge of the northern country is very extensive? I have been connected with the trade of the northern district for twenty years.

1715. I think you said a short time ago that the Glen Innes to Inverell Railway would, from a national standpoint, be beneficial to those places, and also to places on the coast? Yes; the whole of the north coast from the Manning to the Queensland border would benefit by a connection between the coast and the table-land; in other words they would be connected with the railway system of the Colony.

1716. Your contention is that the line should begin at Glen Innes? The proposal is to begin it at the wrong end. It is putting the cart before the horse. I understand that it is contemplated that Inverell should be the terminal point. If that be so, it will be fatal to the interests of the northern people. The line ought to begin at Glen Innes, and go on to Inverell, and then it can be extended in any direction from there as it suits the country best.

1717. Your contention is that before a railway goes from Inverell to Moree, one should be constructed from some point on the northern coast? Undoubtedly; if there were a railway from Glen Innes to the coast, and a railway between Glen Innes and Inverell, and then on to Moree, it would be much better for the Moree people themselves. They would be nearer the coast under my suggestion.

1718. The Moree people would be nearer Sydney by going to Glen Innes, and then to the coast to Grafton, than by travelling round the other way? Yes.

1719. I think they have made it pretty clear that Sydney will be nearer, and that the rates charged will be less? The cost of carriage is always a great factor in the matter of production. The man who has a garden at Botany can carry his goods to market at a small cost, and he is better situated than the man who has to pay freight. Of course, the freight must come off the value of the goods; therefore, the nearer you bring people to a market the better. It means cheapness combined with promptness of transit. If you have to haul goods 515 miles over the railways and to compete against the natural interests of the people, you must either charge the people more than they ought to pay, or not charge them as much as they ought to pay, and you ask the taxpayer of the country to make up the difference. There, as I say, is the evil of our differential rates.

1720. You know the country between Glen Innes and Inverell? Yes.

1721. If a line were constructed there, would there be anything which would be antagonistic to its being carried further on? I do not think so. I hold, however, that a line from Inverell and Glen Innes is part and parcel of a line to connect with the coast. The absence of it means that there is a determination not to connect with the coast. I suppose you agree that if there were better railway communication in that part of the country, population and wealth would increase. I am perfectly sure that if the people of Inverell and the rich country around there could get their produce to market at a fair and reasonable rate, there would be a great deal more of it. In addition to that there would be the interchange of trade which belongs to the people who occupy the north coast, and those who occupy the north-western portion of the country, and which, as has been pointed out, represents one-tenth of the whole of the population of the country.

1722. I understand that in connecting with the coast by rail you would not only benefit the people at Glen Innes, and on the projected line, but also the people now at Tenterfield? Yes.

1722½. You said that it would even benefit the people at Armidale? Exactly, because a connection with the coast from the northern line would enable the people on the north coast to reach Tenterfield. Wherever the connection on the coast is you give the man at Richmond an opportunity of getting his goods to Tenterfield by having a connection with the table-land north of Newcastle. If you want to send Richmond River sugar to Armidale by rail, you have first to send it by water to Sydney or Newcastle, then it has to go back again on the northern line 400 or 500 miles as against 100 miles as the crow flies.

1723. Is the water at the port of Grafton sufficiently deep to allow of a fair sized ship entering? There are 20 feet of water on the bar. I should think that ships of 1,500 tons now get up to Grafton. There is water enough for all requirements. It is marvellous what the recent improvements, suggested by the Public Works Committee, and which have been carried out lately in the shape of training-walls, have done. The depth inside has been increased from 12 or 14 feet to 20 feet.

1724. *Mr. Lec.*] The predictions of Sir John Coode have been fulfilled? Absolutely, and when the training-wall on the north side is finished, I should think the depth of water will be equal to anything on the coast excepting Sydney.

1725. *Vice-Chairman.*] Better than Newcastle? I think so.

1726. *Mr. O'Connor.*] I understand that you have no hostility personally to the railway between Moree and Inverell, but you think that from a national standpoint, it would be more advantageous first to connect Glen Innes with Inverell? Yes.

FRIDAY, 18 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John See, Esq., M.P., sworn, and further examined:—

- J. See, Esq.,
M.P.
18 Sept., 1896.
1727. *Mr. Lee.*] Referring to your advocacy of a connection between the coast and the table-land on national grounds, you do not wish to convey the idea that your view includes one route only? No.
1728. You use the term "national" in a comprehensive sense? Yes.
1729. Your opinion is that the most desirable route from the table-land would be to Grafton? Unquestionably.
1730. Supposing it were found desirable, in the interests of the country, to connect the coast with any other part of the table-land, your argument would still hold good that there ought to be a connection with the coast? Unquestionably.
1731. Therefore the present proposal if it is intended to be in lieu of any future connection with the coast is one of which you cannot approve? Quite so. I look upon that as the beginning of a line to the coast.
1732. Whether the route to the coast be from Don Dorrigo, Deepwater, Tentersfield, or any other point which may be determined, it in no way affects the position you take up that without coastal connection there can be no connection to convey the northern trade by the western route *via* Moree to Sydney? None whatever. That must, in my opinion, be the beginning of a route to the coast.
1733. This proposal involves the whole question of coastal connection; and you hold the opinion on national grounds that any proposal to divert the trade west of the railway line by Moree to Sydney is a wrong one? I do most undoubtedly.
1734. There is a railway on the north-east coast from Murwillumbah to Lismore? Yes.
1735. And the Queensland railway system has reached as far as Southport? Yes.
1736. The entrance to the Tweed River is very indifferent? It is a bad entrance.
1737. It would take an enormous sum to make a decent entrance to that river? I think it would. Generally speaking, a river with a bold north head is more difficult to provide with a good entrance than is a river with a bold south head.
1738. Is it ever likely to become a port for ocean shipments? Not for large ships—that is, for ships of 400 or 500 tons.
1739. I mean ships capable of carrying the produce of the district twenty years hence? I do not think so.
1740. If the Tweed port is never likely to carry oversea traffic, and there should be a connection made between the Queensland railway system and our border, there would be a great danger of the produce of the Richmond, and a portion of the Clarence district, being conveyed by the existing railway into Brisbane? Of course it is much nearer to Brisbane than it is to any other port.
1741. Would there not be a danger of that taking place? No doubt there would. Unless some extended system is adopted in connection with the north coast line it would appear to be a line made to help Queensland.
1742. The North Coast line when made will be a very costly one, and it will take many years to construct? Yes.
1743. We have a railway on the north-east coast, and it will be comparatively easy for the Queensland Government to connect cheaply with our border? Yes, it would not cost very much.
1744. Therefore, there would be an extreme danger of their tapping our trade on that side? Yes.
1745. Do you not think that that is an additional argument for having a table-land connection by which the people could have two routes? Undoubtedly.
1746. Sugar is very largely produced in the North Coast district? 25,000 tons a year.
1747. It is not all manufactured into a consumable article on the river? No, but it could be; it is mostly raw sugar.
1748. The consumption of sugar in the north and north-west districts must necessarily be very large, on account of the large population? I reckon that a tenth of the people are interested in this railway, and that would mean at least 5,000 or 6,000 tons a year.
1749. That of itself must show two things—first, a large freighting of sugar for the train to convey; and, secondly, a large amount of profitable trade to be done direct with the producer? I should consider it a very great trade.
1750. At the present time the bulk of that sugar has to be sent by water to Sydney, and thence by rail? Some of it goes by team.
1751. Are you aware that it costs more to send goods by train from Armidale to Sydney than it does to send goods from Grafton by dray and rail to Armidale? I know it has gone to Armidale by road from Grafton, and a very considerable quantity goes to Glen Innes and Inverell by road from Grafton.
1752. Consequently the articles of interchange are there? Yes. A few weeks ago, when I was going up to Glen Innes, the teams were coming down from Glen Innes and Inverell with potatoes, oats, chaff, and bran, in considerable quantities.
1753. You found very little wheat or flour coming down? None.
1754. Why? Because it is too expensive to get it down.
1755. These commodities will not stand dray carriage for a long distance, but the districts are capable of producing a very large quantity of them? Yes; a very considerable quantity.
1756. If they were conveyed that distance by rail at the same rates as they are conveyed on any other line, it would be possible to send these articles of produce to Grafton, and from Grafton by ship to other places? Undoubtedly. It would enable them to supply the requirements of the northern districts.
1757. If there is no coastal connection, can that take place? No.

1758.

J. See, Esq.,
M.P.
18 Sept., 1896.

1758. What is to become of the wheat which is raised on the table-land? It will have to be brought down under the differential rate system, which is a tax on the whole community, or it will not be produced.
1759. Are you aware that these rates, being extremely low, are very little availed of by settlers about Armidale, Glen Innes, or Tenterfield? I do not know to what extent they are availed of.
1760. Do you know the reason why they are availed of so very little? No.
1761. Are you aware that it is owing to other causes the wheat cannot be sent down even at these low rates? I suppose one strong reason would be the high rate from Armidale. Although the rate between Tenterfield and Armidale may be low—practically nil—yet the rates from Armidale on to Newcastle or Sydney would be excessive.
1762. The grain rate is a low one there? Yes; but it is a long distance from Sydney—it is 420 miles.
1763. It is nearly 500 miles from the border? Yes.
1764. Is it not owing to the fact that wheat is so largely produced in the southern and western districts at a much cheaper rate than it can be produced in the northern district? That is one big factor.
1765. If the growers in the north are put on the same footing as the growers in the south and the west who have the fullest advantage of railway communication;—if the northern growers are given cheap communication with the coast, and a cheap freight thence to Sydney, do you not think that there is a possibility of their competing on even terms with the others? Undoubtedly.
1766. Will they be able to do it if they have to send 500 miles by one route as against 300 miles by the other? No, good as the land is; and I think it is better in the north-west than it is in any other part of the Colony.
1767. Is not the rainfall certain and ample? It is an excellent rainfall.
1768. It will guarantee cultivation almost as a certainty? I think so.
1769. Has it ever occurred to you why these differential rates were made to or from the country? They were made to divert the trade from going to Grafton and to the Richmond.
1770. Why? Because if they did not impose the rates the stuff would go there in spite of the railway.
1771. Because it could be conveyed more cheaply? Undoubtedly.
1772. The fact remains that notwithstanding these low rates the distance from the metropolis to the table-land *via* the coast is so much shorter that the traffic could be carried out more cheaply by dray? Yes; if the same *pro rata* charge was made between Armidale and Tenterfield as from Armidale to Sydney. Very little stuff would go by rail to Glen Innes or Inverell.
1773. You are very largely interested in the shipping business of the northern districts, and you have had a long experience in that business? Twenty years' experience.
1774. Long before the railway was opened to Glen Innes? Yes.
1775. Before the railway was opened to Glen Innes a great many of the Armidale goods used to go by way of Grafton? The late Mr. Moore and a number of the large traders in Armidale used to get immense quantities of goods up from Grafton.
1776. All along the line? From Armidale right out to Moree, embracing that belt of country right on to the Queensland border from the coast and including Tenterfield. Long before the railway was ever contemplated to Armidale the dray road to the north-east district was through the Clarence.
1777. The population of the Clarence and the Richmond is now very large? I think it is over 50,000.
1778. Is it not a fact that the land on the Richmond and the upper part of the Clarence is held in large areas by settlers and selectors? Yes; a good deal of it.
1779. The bulk of the land they do not cultivate? No; it is held mostly for grazing.
1780. A very much larger area is available for cultivation than is cultivated? Yes.
1781. Do you think the population will largely increase there during the next fifty years? Not in proportion to what it would if they could get their stuff to market.
1782. Speaking in general terms, do you think it will? I think it will on the coast; but I do not think it will in the west. The population will not increase in anything like the same proportion to what it will in places where expeditious means of transit are afforded.
1783. If the railway is carried right through their district, do you think the population will increase? Yes.
1784. Is there land there to carry the population profitably? Yes.
1785. Do you think the population could treble itself? More. It is almost impossible to conjecture what the capacity of that country is. In other words, the limit of these districts has not been reached. I think they are only skimming the fringe of it.
1786. Under recent legislation, has it not become the policy of the country to settle people cheaply on the second and third class lands back from the rivers, such as the hilly country which lies on the eastern slopes? Yes.
1787. Is it not likely that the whole of that country will be taken up as homestead settlements and settlement leases? I think it is.
1788. Are you aware that there has been a considerable amount of selection in that form? Yes.
1789. Therefore, the tendency is for the population on the eastern seaboard to increase considerably? It is looked upon as capital breeding country. There is any amount of water, and there is always a fair amount of grass, if not of the best fattening description. Some of it is unequalled for fattening purposes.
1790. Whatever may be the capacity of these rich districts now no one can say what the limit will be? No.
1791. Consequently there is a large prospective traffic for the railway in future? I think a very large one.
1792. You are conversant with the reason which led to Sir John Coode reporting on the northern rivers? Yes.
1793. You know that he was engaged specially for that purpose? Yes.
1794. I think you gave evidence when the Public Works Committee were inquiring into that question? Yes; I think I was instrumental in getting Sir John Coode to come here.
1795. Was it not urged both by yourself and by the witnesses at Grafton and on the Clarence that one reason, and a strong reason, why these extensive improvements to the Clarence should be carried out was in view of the ultimate and certain connection of the district with the table-land? That was a very strong reason.
1796. It was one of the strongest reasons? Undoubtedly.
1797. Because it is the geographical outlet for that portion of the northern and north-western part of the Colony? Yes.

- J. See, Esq.,
M.P.
18 Sept., 1896.
1798. Were all these works approved of? Yes.
1799. And are now being carried out? Yes. The Clarence, with its tributaries, drains about 8,000 square miles of country; it runs right up to the Macpherson Range in Queensland.
1800. Have you ever been right up to the head of the Clarence and the Richmond, towards the Queensland border? No; I have not been beyond Yugalbar.
1801. Are you aware that there are some hundreds and thousands of acres of magnificent soil in that part of the country? I am sure of it.
1802. It contains the finest forest reserves that can be found in the Colony? I know that an immense quantity of cedar comes down from the ranges.
1803. These forests are very numerous on the eastern side of the country? I know that from the shipping experience I have had.
1804. That must become an important factor in railway freights in years to come? It is difficult to conjecture what our timber reserves are worth.
1805. You know that the extension of the railway in other parts of the Colony has very largely developed the timber traffic? Undoubtedly it has.
1806. Are you aware that it has brought the cyprus and the knotted pine of the north-west very largely into use? No.
1807. Are you not aware that the carriage of timber on these lines is a very large item? I should think it is.
1808. What has happened in one case may happen in another? It is sure to open up a large traffic where there is an abundance of timber.
1809. Do you think that in laying down the railway policy of this Colony it would be wise in the public interests to bring as much of the western traffic as possible to some suitable point on the Great Northern line, with an ultimate connection being made with the coast, so as to embrace all the centres of population on the north-east coast? Yes; it ought to be done.
1810. You think that is a proper policy to adopt? Undoubtedly; if it is not done it will be a very serious loss to the country.
1811. No extension with the coast, or extension down on the coast, will be complete unless it embraces the whole of the Richmond and Clarence districts? No.
1812. Is it a wise thing, as a matter of railway policy, to bring the western traffic to the Great Northern line and ultimately to take it to its geographical port on the coast? In my judgment, no railway ought to be made which will have the effect of delaying the construction of a connection between the northern line and the coast, and this line evidently will delay it, if it will not entirely destroy it. I do not think it will serve the people of Inverell as well as a line from Glen Innes would.
1813. That is not a question of delaying connection with the coast? No.
1814. If you were sure that this proposal is made with a view to drag for all time the trade west of the Great Northern line to Sydney by way of Moree in lieu of a coastal connection, would you favour it? No.
1815. You think it would be an unwise policy to adopt? I think it would be a suicidal policy to adopt.
1816. And whatever may be urged in reference to the cost and route or routes to the coast at the present time are matters which should not be taken into consideration in determining this particular part of railway policy to take the western traffic by way of Moree? No. I do not think it ought to be.
1817. *Mr. Clarke.*] I understand from your evidence that you do not object to Inverell having a railway? No.
1818. In the event of a line being carried from Inverell to Glen Innes, which is not contemplated by the Commissioners, you would be satisfied that that line should be constructed if it goes to Glen Innes? Yes. For over twenty years I have advocated the construction of a line from Glen Innes to Inverell.
1819. Your objection is to leaving that break between Inverell and Glen Innes, which is likely to retard communication with some part of the northern coast? That is one of the reasons, but the strongest reason is that, in my judgment, a line from Moree to Inverell will not serve the people of that district so well as the other line would do, and give them the chance of using the northern line or the alternative of a line which must go to the coast from some point on the northern line.
1820. Would Byron Bay be a good port on the coast to connect with? I do not think so.
1821. You told Mr. Lee that the Queensland railway is very close to our border, and the possibility is that except a railway is made from the table-land to some point on our coast a good deal of our trade will go towards Queensland? That is very possible. The Tweed Heads are 20 miles from Southport, and Nerang Creek—the terminus of the Queensland railway—is only 30 miles from Murwillumbah, the terminus of our North Coast line. If the Queensland Government were to push on their railway to our border it would offer a nearer market to the people on the Richmond River and the Tweed River than they have.
1822. But considering our present fiscal policy, would there be any probability of any produce going from this Colony to Queensland? I think I should have to consult Mr. Reid about that matter.
1823. According to our present fiscal policy, is there any probability of any portion of our trade going to Queensland by that coast line? I think so. I think the Richmond and the Tweed are capable of producing many things for which there would be as good a market, or a better market, in Brisbane than there is in Sydney or Newcastle.
1824. What things do you refer to? A great quantity of products.
1825. Not sugar? Perhaps not sugar.
1826. Maize or timber? Any quantity of timber, cheese, bacon, butter, and numerous other things.
1827. Do you think that much produce would go to Queensland from the coast under present circumstances until we get federation? Geographically, Brisbane is a nearer port to the Richmond than any other port we have as a consuming port, and if all things were equal, there is no doubt that the trade of the Richmond and the Clarence, from their geographical position, would trend in the direction of Brisbane. There was an agitation some years ago that the Clarence and Richmond districts should be annexed to Queensland, because of their geographical position.
1828. I suppose it is only natural to suppose that a portion of our trade would go to Queensland under federation? Not with a port like the Clarence, which in some respects is almost equal to Brisbane—at any rate, it is capable of being made a port equal to all the requirements of the trade.
1829. Do you remember that in the early days of that Colony nearly all trade from Brisbane came to Sydney? Yes.

1830. In consequence of the expansion of their trade, and the increase of population, and the improvements of the Brisbane River, they are now doing an importing and exporting trade in connection with nearly all parts of the world? Yes.

1831. Do you think, in the event of a railway being made from the table-land to Grafton the same result would follow? I think so.

1832. You think that vessels of a large tonnage would come into the Clarence, and if there were a trade, or a trade to be formed, they would go into other parts of the world independent of Sydney, Melbourne, or any other colony? I think so. I think the Macleay, the Manning, and the Hastings Rivers will be gradually improved until they become navigable by vessels of considerable tonnage. Sir John Coode demonstrated that fact that wherever you get loose sand which is influenced by the ebb and the flow of the tide if you concentrate a scour it will remove the sand obstruction. I believe that as the requirements of the settlers increase the Government will carry out the necessary improvements.

1833. Do you think that such rivers as the Macleay, the Manning, Port Macquarie, the Nambucca, and many other rivers could be improved so as to be available for vessels of a moderate tonnage? No. I think the Clarence is the finest river of all. In fact, I believe it is the finest river in Australia.

1834. Some years ago it was proposed to make a railway from Glen Innes to Grafton? Yes; Parliament carried the vote.

1835. What was the estimated cost of the line at that time? Two millions.

1836. What is the probable cost at the present time, taking into consideration the lower rates at which railways are now made? No estimate has been made since, I understand, except in a desultory sort of way. I compute that if the cost of the Glen Innes-Inverell railway has been reduced from £700,000 to a little over £300,000, by the same rule the cost of making the Glen Innes-Grafton railway line should be reduced by about one-half.

1837. Do you think, in the public interest, it is desirable to have a railway to the coast at a cost of £1,000,000? Yes. I do not think the northern line, or the proposed line to Moree, can ever serve the interests of the people in the north-west. It will only be diverting the natural trade from its proper trend by artificial means.

1838. You think that a large trade from the coast to the table-land, and a large trade from the table-land to the coast, would ensue if a railway was constructed? Yes; a considerable trade.

1839. What kind of produce would go from the table-land to the coast? They produce wool, wheat, oats, chaff, hay, potatoes, and various kinds of produce. I suppose they would send down their hides and station products.

1840. What would be the traffic from the coast to the table-land? The ordinary merchandise, sugar, and, I suppose, occasionally maize. I should think sugar would be one of the principal articles. It is very difficult to say exactly what the interchange of products would be. The very fact of establishing communication between two towns always creates a trade which could scarcely be anticipated.

1841. Do you think that if a railway were made from the table-land to Grafton, or to any other part of the coast, goods could be carried by water to Sydney more cheaply than they could be carried by railway from Inverell to Sydney, *via* Narrabri? Yes. I should think it could be done for one-half. Water-carriage is recognised as being very much cheaper than land-carriage.

1842. Have you taken into consideration the proposal to have a railway from (say) Raymond Terrace along the coast as far as Grafton? Yes.

1843. Would that be as advantageous to the public as a line from the table-land to Grafton? They would want both. If they had the coast line they would want to connect with the table-land. I think that would be inevitable.

1844. You mean, I suppose, that from the Macleay and the other northern river districts which have shallow bar harbours a good deal of produce which goes by sea to Sydney would go down to Grafton, being a better port? That is one reason; but there are stronger reasons than that. I think there is an abundance of land unoccupied. I believe that the Don Dorrigo Scrub and a lot of land at the head of the rivers which is now unprofitable would be opened up by railway communication. Hundreds of thousands of acres of rich alluvial scrub land cannot be cultivated now because of the difficulty of getting the produce to market. It costs more to cart the produce from the bush than it is worth. If there were proper means of getting the produce to market the land is there for occupation.

1845. I think you said that on the north coast, between Raymond Terrace and the Queensland border, there is a population of about 100,000 persons? Yes.

1846. Are you of opinion that the best possible means of communication should be given to them? Yes. I think the North Coast railway is sure to be made.

1847. *M^r. Roberts.*] On account of the importance of the town of Inverell, the settled character of the population, and the well-known fertility of soil in the district, you admit at once that that town ought to be connected with the railway system of the Colony? Yes.

1848. You know that more than one proposal has been made to connect Inverell with Glen Innes? I think two proposals were submitted to Parliament. On each occasion the proposal passed the Lower House, but was stranded in another place.

1849. At that time Narrabri was the terminus of the north-west line? I think it was when each proposal was made.

1850. The construction of a line from Narrabri to Moree had not then been suggested to Parliament? No; but I think it was generally understood that an extension to Moree would be made, but whether from Inverell or from Narrabri I am not in a position to say.

1851. You will admit that the position of things is somewhat changed now. Now that a line is constructed from Narrabri to Moree, would you not favour the construction of a line from Moree to Inverell in preference to a line from Glen Innes to Inverell? Certainly not; in my judgment it has not altered the position of affairs one degree.

1852. It has not altered your opinion on that point? It has rather strengthened my opinion than otherwise.

1853. Do you still adhere to your opinion that the cost of a line from Glen Innes to Inverell would exceed the cost of a line from Moree to Inverell by £40,000? Undoubtedly I do.

1854. The fact of making a saving of £40,000 would not cause you to alter your opinion? No; not if it was a saving of £140,000. I do not reckon the initial cost as the only thing to be considered; that is only

J. See, Esq.,
M.P.
18 Sept., 1896.

J. See, Esq.,
M.P.
18 Sept., 1896.

only an item. When the initial cost means a direct saving, but an ultimate annual loss and great inconvenience, then I consider the initial cost does not count. In other words, if you can get an article to suit you for £500, as against an article for £250 which will not suit you, the former is the cheaper bargain. To my mind, the route of the railway is one of the biggest factors we have to consider, and the purpose which the railway is intended to serve is another.

1855. Do you come to that conclusion owing to your anxiety to see a connection between the table-land and the coast? It is not a personal anxiety with me

1856. I mean owing to your anxiety to promote the interests of the people of this Colony? I do, unmistakably.

1857. Putting on one side for the present the possibility of a line from Glen Innes to Grafton, if a saving of £40,000 could be made by connecting Inverell and Moree, would you still favour the connection of Inverell with Glen Innes? I would, unmistakably, because it is about half the distance, and there is only half the railway haulage. While you are helping the Moree-Werris Creek line by connecting Moree with Inverell you are depriving the northern line of the trade it has now from Inverell. I was not satisfied with the figures which were submitted. You must take into consideration the earnings on the Moree-Inverell line

1858. I presume you have considered the extra distance which has to be travelled? That must be a factor in considering the question. Passengers would have to travel 96 miles as against 52 miles.

1859. People from Inverell wishing to go to other parts of New England, instead of going down by rail to Werris Creek, and thence along the northern line, would find it more convenient to go across to Glen Innes? I think so.

1860. I understand that an agitation has been going on amongst the people on the table-land for over twenty years, and that they have asked various Governments to connect the table-land with the coast? Yes.

1861. Have the people on the table-land decided amongst themselves as to which route would be the most desirable one? There was never anything else in their minds at one time than that Inverell should be connected with the northern line until this new proposal was made.

1862. I mean between the table-land and the coast? There is a variety of opinion as to which route should be followed. The Armidale people want the line to go from Armidale.

1863. Was any decision ever arrived at by a majority or by a conference? No. The only decision arrived at was when the Glen Innes-Grafton railway was submitted by the Government to Parliament.

1864. You think that a connection between Glen Innes and Grafton would satisfy the majority of the people residing in New England? I do.

1865. What is the population of Grafton? There is a population of 20,000 on the Clarence. In the Grafton electorate there are 10,000 or 11,000, and there is the same number in the Clarence electorate.

1866. What is the depth of water on the bar? It varies from 16 to 20 feet.

1867. Vessels of considerable tonnage can enter the Clarence? Yes, at all times of tide, and in almost all weathers. I do not think the steamers have been bar-bound once in twelve months, which we regard as a good test.

1868. North of Newcastle does the Clarence River afford the greatest depth of water at the entrance? Yes.

1869. You would regard a line from Glen Innes to Grafton as a national line? Yes; just as much as the northern, western, or southern lines.

1870. When you say a national railway, do you mean that it is one which ought to be constructed irrespective of cost? I do. If there ever was a justification for constructing the Cooma or the Mudgee line, or even the southern line, to my mind this has superabundant claims.

1871. You think the commercial aspect of the case should not be paramount? Yes; I consider that very shortly the line would pay.

1872. *Vice-Chairman.*] Have you seen an estimate of the cost of the North Coast railway between the Hunter and Lismore? I have heard £6,000,000 talked about.

1873. Is that a railway which would serve the population of 100,000 persons you spoke of? That is one of the railways.

1874. An estimate of £6,000,000 you consider to be extravagant? I should regard £6,000,000 as a mere random guess at the cost.

1875. How many miles of railway would be necessary to connect the Hunter with Lismore? I should think it would be nearly 400 miles from the Hunter to the border. It is 300 miles to the Clarence by water from Sydney.

1876. The estimate is about £15,000 per mile;—that, in your opinion, would be wildly exaggerated? I think so. I should think it would cost about £3,000,000.

1877. The railway to the coast from Glen Innes I suppose you would put down at about half the original estimate, basing your figures on the present estimate for the Glen Innes-Inverell line? Yes.

1878. The national view you take would involve a cost to the country of not more than £4,000,000, instead of the former estimate, which was double that amount? I should think so. I am pretty well sure that any railway could be made at about half the rate that a railway was made for ten years ago.

1879. What would it cost per bag to send grain by water from Grafton? It would depend entirely on the size of the ship you took it in. The present freight is 9d. per bag, or 7s. 6d. per ton. If you send a thousand-ton ship to Grafton of course the more stuff you carry the cheaper you carry it.

1880. I conjecture that you do not regard 6d. per bushel from Glen Innes to Sydney, a distance of between 400 and 500 miles, as an excessive charge for railway haulage? No; but you can get goods carried by water 500 miles for 2d.

1881. Do you think that rate would prevent the production of grain in ordinary seasons? I do. The differential rate was imposed in that district for the purpose of diverting trade to the northern line. Instead of its being a feeder it is a sucker, as the Moree line will be.

1882. The Committee may regard your evidence as given from a national point of view rather than from a commercial point of view? Commercially, it does not matter a straw to me. I am not speaking from a personal standpoint. I am speaking as the representative of a district of some importance, and with knowledge acquired by an intimate association with the northern districts. I have studied this question on national grounds as a public man. I have endeavoured at all times to give my voice and vote in the direction of serving the people and not myself. My presence here is purely in the interests of the people living

living in the north-west and north-east districts. I think their interests are inseparably connected, or ought to be. Any one who has travelled up these districts must have formed the impression that Providence has pointed the way in which the trade ought to go. We ought to endeavour to follow the example of Providence. If we try to divert the trade by unnatural means it does not seem to me that it will serve the interests of the people.

J. See, Esq.,
M.P.
18 Sept., 1896.

1883. You understand that this is a question of expenditure of £300,000 as opposed to the view which you take which would involve an expenditure of £4,000,000? I do not think that. I say that the initial part of a line to connect with the coast is from Inverell to Glen Innes, or to some other point on the northern line. A line from the northern line to the coast seems to me inevitable, but that is altogether apart from the North Coast line. The North Coast line will, I think, be made even if the Moree extension is made. A connection ought to be made between the North Coast line and the northern line.

1884. Even assuming that the Moree-Inverell line be constructed, and an expenditure of £3,000,000 for a coast line, as well as an expenditure of £1,000,000 to connect Glen Innes with Grafton, would not that involve the additional expenditure of joining Glen Innes with Inverell? It might. I understand that this proposal is made to take the trade of Inverell to Moree, and thence to Sydney, in preference to bringing it to Glen Innes, and then along the northern line to Sydney. I also understand that the Commissioners have indicated that, in their opinion, the terminus of the line ought to be at Inverell. If that be so, it would be a national calamity, and I am strongly opposed to any such proposition.

1885. Would the fact that a line had been constructed as far as Inverell, *via* Moree, prevent the successful advocacy of the view you have expressed of connecting Glen Innes with the coast, and then the whole of the coast by a railway from Lismore to the Hunter? The intervening country between Inverell and Glen Innes is only a small item. The bogey of the cost of making a line from the table-land to the coast would be of stronger significance than it is now. This proposal will really divert a considerable amount of traffic on to this line, which was originally intended to serve Moree. It seems to me to have entered into the minds of the Railway Construction Branch that it is easier to connect Moree and Inverell than to connect Glen Innes and Inverell, meaning that you divert the trade on to this north-west spur. The whole contention lies in this fact—that you are committing the people of Inverell, certainly within their lifetime, to sending their goods *volens volens* 500 miles by rail, or taking the alternative of sending their goods by dray, which some of them will do, to Glen Innes, and it will then find its way down to the Clarence River.

1886. I understand your view to be that, irrespective of Inverell, there should be an expenditure of £4,000,000 for a coast railway and for a connection between Glen Innes and Grafton? Whether the Moree line is or is not made, I think there will be a North Coast railway. I do not think that the North Coast railway should be bracketed with the Inverell-Glen Innes railway line any more than the Moree-Inverell line should be bracketed with it.

1887. In speaking of the North Coast railway, you mean a railway from the Hunter to Lismore? Yes.

1888. Is it not part of your view that the distribution of the produce from the table-land must take place from a point on the coast by means of the proposed North Coast railway, so as to serve the population of 100,000 persons referred to? Yes.

1889. In view of the possible indefinite postponement of railway communication between Moree and Inverell, whilst waiting for the construction of a line between Grafton and Glen Innes, do you not think that we should limit our attention at present to the question of whether the connection should be *via* Glen Innes or Moree? Unquestionably.

1890. Is there anything else which you would like to state to the Committee? I do not think so.

Stephen Belcher Burge, Esq., sworn, and examined:—

1891. *Mr. Black.*] You have been a resident of Inverell for some considerable time? For about seven years. I have been a storekeeper in the Colony in a general way of business for about twenty years.

1892. In Inverell? No; in the Colony.

1893. How long is it since you left Inverell? About three weeks.

1894. You are pretty well acquainted with the feelings of the people in the town and district on this question? Yes.

1895. What route are the people of Inverell generally in favour of? The Moree to Inverell.

1896. Do you know the reasons on which they base their desire or opinions? For the simple reason that all our trade as storekeepers is done with the west. Nineteen-twentieths of our trade is done with the Queensland border—Moree and all towards the west.

1897. What trade do you mean? General produce, corn, chaff, and flour.

1898. You mean that you find your market there? Exactly.

1899. Do you think that that market would be increased by the construction of a line from Moree to Inverell? I do. I am certain that it would be a great convenience to the people wanting a railway. The people between Inverell and Moree are really those who are wanting a railway. The people between Glen Innes and Inverell, I take it, already have a railway. Between Glen Innes and the Half-way House I do not know the name of a farmer. I take it that if a railway were made from Moree to Inverell the farmers between Glen Innes and Inverell would be better served than any farming community in New South Wales, because they would have two railways to work on.

1900. You are not now in business in Inverell? I have a very large stake in the district. Three of my sons are in business there.

1901. Supposing a railway is constructed from Moree to Inverell, how would the storekeepers of Inverell get their goods? I take it that as it would be a light railway over level country the Commissioners would be able to carry goods a great deal cheaper than they could over the mountains.

1902. Do you think they could compete successfully with the steamer to Grafton and thence by team to Inverell? If they did not the storekeepers would, of course, get their goods *via* Grafton; but I take it that the Commissioners can carry their goods cheaper on a flat line than on the mountains.

1903. I suppose you can give the Committee no definite idea of what quantity of Inverell produce is disposed of in the direction of Moree? I should think nineteen-twentieths of it goes west—all along the Queensland border. There is very little that goes to Glen Innes. It never has gone to Glen Innes while I was in Inverell, except in one year, when the storekeepers got a great quantity of wheat.

1904.

S. B. Burge,
Esq.
18 Sept., 1896.

- S. B. Burge, Esq.
18 Sept., 1896.
1904. Do you think the construction of a railway would assist the conveyance of produce towards the Queensland border? Certainly; the people who are starving between Inverell and Moree for the want of a railway are small selectors and squatters.
1905. You do not call Moree "towards the Queensland border"? I do, certainly. Mungindi and Bogabilla are not far from Moree. One is 60 miles, and the other is 70 miles. We sell to people around Mungindi. The statistics which have been made for the Inverell-Glen Innes line are all blown to the winds since they have made a line from Narrabri to Moree, because Moree will get all the station wool which used to come to Inverell from up round about Warialda. We will lose all that trade from Inverell. We are being cut off our market, and Tamworth steps in.
1906. Do you not think the Mungindi market is more likely to be supplied with produce coming from the Hunter River *via* Moree than from Inverell? No; it never has been to my knowledge; it has always been supplied with Inverell stuff.
1907. You think the western and northern markets will be sufficient to absorb the surplus products of Inverell in the event of a railway being constructed? I do, for a great many years to come. There is no doubt that there will be a coast line some day. It has never been decided whether it is to go from Tenterfield, Glen Innes, or Guyra. It will be a funny thing to construct a line from Glen Innes to Inverell if they intend to go down to the coast from Guyra. If our mails were run from Guyra to Inverell we would not know that there was such a place as Glen Innes. Our mails are taken 30 miles over the mountains to bring them $7\frac{1}{4}$ miles nearer home.
1908. You object to a roundabout route being taken to Glen Innes? I do.
1909. Do you not think a line from Inverell to Moree is a roundabout way of getting to Sydney? I do. If a line were made from Glen Innes to Inverell to-morrow it would not pay for the greasing of the wheels, and an agitation would be started to extend it down to the west in order to make it pay.
1910. If that is so, how is it that the people of Inverell hold such contradictory opinions on the matter? A line has been agitated for for twenty years by the people; most of these people have bought land very largely round about where the railway is supposed to go. I think it would be a suicidal thing to build a railway from Glen Innes to Inverell, at any rate at present.
1911. *Mr. Lee.*] Do you know the country much west of Inverell? Yes.
1912. Towards Moree and about Warialda and down to Bogabilla? Yes.
1913. Where does the settlement lie between Inverell and Moree? I should think there are more people 15 miles on the other side of Inverell than at any other place.
1914. About Little Plain? Yes. There are a great many selectors about Warialda, and from Little Plain right down to Warialda.
1915. What is the nature of settlement at Warialda—agricultural? No; grazing.
1916. Is that because the land is not suitable for agriculture? No; because the rainfall is not sufficient. They cannot rely on the rainfall.
1917. What is the nature of the country immediately approaching Warialda? It is a little sandy.
1918. Is it steep? No.
1919. Do you think, if a line be constructed between these two points, Warialda should be touched? No; I do not think it is important enough to be connected. I am led to understand that it would increase the cost a very great deal.
1920. But it is the only centre of population between the two points? That is so.
1921. Is it likely to grow into more importance? I do not know that it is an older town than Inverell, and it has not grown very much, compared with what it was thirty years ago.
1922. Your only reason for thinking it should not be connected is its present unimportance? Yes.
1923. Is that the only reason you have? That, and the extra expense it would entail. Warialda is a very sandy and bad soil, and the railway, I understand, is running through good country.
1924. After you get a few miles from Inverell, it is all more or less ridgy country? Yes.
1925. There is very little flat country? It is mostly flat country after you get past Little Plain.
1926. Does the sketch before us indicate that the country is flat? Not at all; I should not have thought that there were these deviations in the country.
1927. In order to get a fair ruling grade between Inverell and Moree they have had to adopt the course of running round the ridges? It is quite clear to me now that the country is not at all flat.
1928. Is there much trade going on west from Inverell? Yes; that is where I have principally done my trade in flour, corn, chaff, and potatoes.
1929. Where is the market for the bulk of the produce grown in Inverell? The bulk of the market is in Moree.
1930. The population of Moree is comparatively small? The Moree storekeepers send it down to the Queensland border.
1931. Is not the population of Moree less than the population of Inverell? Considerably.
1932. Does not Inverell produce a very large quantity of produce? Certainly.
1933. How can Moree consume all that Inverell can produce? We have to provide for ourselves, of course, but the bulk of the stuff we send out west. It also goes down towards Narrabri. We look to Narrabri as well as Gunnedah for a market.
1934. Has not that been only recently, whilst the construction of the line from Narrabri to Moree was proceeding? That is so.
1935. That is what has caused the demand for the produce? Yes, lately.
1936. Prior to that event a certain quantity, but not the bulk, was sent down? I should say almost the bulk of it was sent to Warialda, Moree, Bogabilla, and along the Queensland border.
1937. Are all these points reached by dray? Yes.
1938. Will they be reached by dray even if a railway be made from Moree to Inverell? Bogabilla would be, I suppose.
1939. If you want to trade with Bogabilla it would be as short for you to send direct by dray to Inverell as it would be to send from Moree to Bogabilla? Yes.
1940. Consequently you save 90 miles carriage? Yes.
1941. The railway does not affect that? No.
1942. The other portion of the traffic would be in the direction of Moree and Narrabri? Yes.
1943. You have also done from Inverell a certain amount of trade with Glen Innes, Armidale, and other towns on the northern line? Very little.
- 1944.

1944. You always supply large quantities of wheat to the millers? In only one year while I was there did we do any business with Glen Innes worth speaking about. S. B. Burge, Esq.
1945. There are no mills at Moree and Narrabri? No. 18 Sept., 1896.
1946. The flour-mills are in the Inverell and Bingara districts? Yes; there are two mills in Bingara.
1947. You are already within as close touch of Bingara as you would be with a railway? Exactly.
1948. Therefore, if you are going to depend on the west for your trade, as far as wheat is concerned, the wheat can only be exported in the shape of flour? Exactly.
1949. If you had a connection with the northern line, would you not have an opportunity to export wheat or flour, or both? Yes.
1950. If a connection were made between Glen Innes and Inverell, would it not afford a very much easier mode of getting on to the main northern line, and taking advantage of the markets on the north and on the south, and at the intermediate towns and Sydney, than by sending it 34 miles farther round to get to the Sydney markets? Yes; if the Railway Commissioners would carry it at such a price that it would pay.
1951. Taking it at the ordinary rates, would it? It would.
1952. Without a connection between Inverell and Glen Innes all communication between Inverell and west of Inverell is entirely cut off from the north-east country right down as far as Werris Creek? Yes.
1953. Supposing that you, as a resident of Inverell, wanted to go to Armidale, would you be likely to take the train from Inverell *via* Moree to Werris Creek, and thence to Armidale? No.
1954. You would drive across from Inverell to Glen Innes—a distance of 40 miles—and take the train for Armidale? Yes.
1955. The proposed connection must mean, without any doubt, the entire severance of New England from Inverell? No more than we are severed from it now. If it paid us to take it there by team we would.
1956. If it were taken by team, would it not be an argument that the construction of this line would not obtain the traffic which already goes by team? No; it all depends on circumstances. We know that sometimes an article like corn or wheat is high in one place and low at another. We could often do well by sending corn to Sydney, but we could not get it down there. There were no teams to take it down.
1957. Supposing you wanted to get your produce to Sydney, would it not be cheaper for you to go by way of Inverell, which would be 34 miles shorter than the other route? Yes, it would.
1958. Which market do you think will eventually be the market for the surplus products of Inverell? I should think on the coast, certainly.
1959. Are you not aware that this line is proposed as the proper method of conveying all the trade from Inverell and that western country to Sydney, in lieu of any connection with the coast in the future? And quite right, too, for the next fifty years.
1960. If you look to the coast as the proper market for your surplus products, how are you to get to the coast? We will not require it for fifty years to come.
1961. Why? Because we can use the railway to Newcastle, which is our port.
1962. If Newcastle is your port, would it not be 34 miles shorter for you to go by train from Inverell *via* Glen Innes than to go *via* Moree? No; we would rather go to Guyra, which would bring us 30 miles nearer.
1963. But Guyra would be better still? Yes.
1964. Both routes would be shorter than the Moree route? Considerably shorter.

TUESDAY, 22 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	CHARLES ALFRED LEE, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.	

The Committee further considered the proposed Railway from Moree to Inverell.

Stephen Belcher Burge, Esq., sworn, and further examined:—

1965. *Mr. Lee.*] You stated on a former occasion that you thought Newcastle and Sydney would be the markets for the Inverell produce? Newcastle is the market at the present time for any surplus. S. B. Burge, Esq.
1966. Then would it not be desirable to get the produce there by as short a route as possible—by the Glen Innes route, which is 30 odd miles less than the Moree route? Yes. 22 Sept., 1896.
1967. You are in business at Inverell? Yes.
1968. Do you get a large quantity of goods at Inverell from the coast? Yes.
1969. If a line were constructed from Inverell to Moree, would not the same dray traffic go on *via* Glen Innes to the coast? Not so much as if the railway were made from Inverell to Glen Innes.
1970. Are you aware that goods can be landed by steamer and dray at Inverell at from £2 10s. a ton less than they can be carried by train? Yes.
1971. If such were the fact, do you not think that the goods would go the cheapest way? Certainly. You asked me a question the other day with reference to the country between Moree and Inverell, and I answered that it was practically flat. What I meant by that was that it was flat so far as railway construction would be concerned. The railway will be practically level right through.
1972. It is undulating and ridgy? Yes; I have travelled over it and have never had to use the brake.
1973. Are you interested in Moree? My sons are. They have taken up land there within the last six months.
1974. But your business connections are at Inverell? Yes.
1975. *Mr. Clarke.*] Are you acquainted with the nature of the country between Moree and Inverell? Yes.
1976. Is there much settlement on the proposed line? Yes; it is pretty well settled. It is pretty well settled about Little Plain, and all the way to Warialda and Warialda itself, and there are settlers between there and Moree.
1977. Can you give any idea as to what is the population? No. 1978.

- S. B. Burge, Esq.
22 Sept., 1896.
1978. Is the country between Moree and Inverell suitable for the growth of cereals, such as wheat, barley, and oats? I should take the country within 8 or 9 miles from Warialda to be one of the best wheat-growing portions in the Colony.
1979. Where is your present market for these cereals? Down west—out towards Moree, and towards the Queensland border.
1980. That is west and north-west? Yes.
1981. Why do you consider the proposed line would be more beneficial in the public interest than a line from Inverell to Glen Innes? We are advised that we are not likely to get the other one; in fact, we are positively assured that we cannot get it; and if we do not get it Inverell will practically fall back into a sheep walk, unless something is very soon done. I say that because we got on right enough until the Government made the line from Narrabri to Moree, which cuts away the only market we have.
1982. The distance from Inverell to Sydney is 500 miles. You consider the proposed line would be more beneficial to the public than a line constructed from Inverell to the main northern line at Glen Innes? I should think it would be better. It would not cost half as much, and would go practically through flat country. It would be run very much cheaper.
1983. Assuming that a line from Moree to Inverell is constructed, would not there be a break from Inverell to Glen Innes, as it is not, I believe, intended to carry the line to Glen Innes,—would not that be an injustice to the people of Inverell and Glen Innes? No; they would be better provided with railways than any part of the Colony. They would have two markets to work on—they would have the Glen Innes railway and the west as well. Besides, the farmers between Glen Innes and the Half-way House have already got their railway. It is only the farmers west of Inverell who are really starving, as one might say, for a railway; between Inverell and Glen Innes they are all right—it is only a distance of 42 miles.
1984. In what way are they all right? They have a railway. I can say, as a storekeeper of long experience, that any farmer who is within 20 miles of a railway has practically the markets of the world before him.
1985. You say they are all right, and at the same time they are 42 miles distant from Inverell? The farmers all live about half-way, excepting those about Brodie's Plains, who are 8 or 10 miles from Inverell, or 32 miles from Glen Innes.
1986. Do you think wheat or other cereals grown in the neighbourhood of the line would go to Sydney? Newcastle is our harbour at the present.
1987. Would not a good deal of the cereals grown be for local requirements? Yes.
1988. In that case there would not be much advantage, so far as the railway is concerned, in taking produce to Newcastle or Sydney? Of course, directly the railway is constructed, twice the quantity will be grown. That always has been the case all over the world.
1989. Do you consider the proposed line, when completed, would prevent a line being made to the coast? Certainly not; the Moree people and the Inverell people would some day agitate together for it to go to the coast.
1990. How would they get to the coast? That is what we want to find out. Directly we hear when it is going to the coast, we shall be decided as to which route it shall take. It would have to go to Guyra, Glen Innes, or Tenterfield.
1991. Then you think it is necessary a line should be made to the coast from Guyra, Glen Innes, or Tenterfield? Yes; I think all the inhabitants of the district are agreed about that.
1992. Which would be the most suitable place on the line to start from—Glen Innes, Tenterfield, or Guyra? No one seems to know that. If they knew where the line would start from the trunk line, they would be decided as to which way it would go. As things are now, half the people are for Guyra and the other half for Glen Innes.
1993. *Mr. Roberts.*] Do you prefer the Inverell-Moree route to any other route which has been suggested? Certainly.
1994. I suppose you know that various propositions have been made to construct a line by a different route, such as Glen Innes, Guyra, Uralla, and Kentucky? Yes.
1995. On what grounds do you prefer the proposed route;—in coming to Newcastle or Sydney would you not have to travel a great many more miles than by the other route? Yes; I prefer going over flat country to going over mountainous country. I prefer going the extra distance of 30 miles over flat country.
1996. Do you not regard the loss of time which would necessarily take place in travelling that long distance as a drawback of the proposed route? No; I think they would be able to do it as quickly as they would the shorter route over mountainous country.
1997. Have you ever been to Tingha? Yes.
1998. Is not that an important mining centre? It was, but it has gone back very much during the last four or five years. The output of tin has decreased very considerably.
1999. *Mr. Wright.*] Do you know what quantity of wheat is grown in Inverell? No.
2000. Is all the wheat grown in the Inverell district milled in Inverell in a fair season? For three years out of five it would be.
2001. I am speaking of an average fair season—are the milling appliances good enough to mill the wheat grown in the district in a fair average season? Yes.
2002. What do you do with the surplus wheat? Send it to Glen Innes.
2003. Where it is consumed? They send it from Glen Innes to other places.
2004. Have you any idea as to the quantity of the flour produced in Inverell? No.
2005. There are two small mills there? Two pretty large ones.
2006. Do you know their capacity? No.
2007. Can you tell me what is the population which you claim as your market from Inverell—east, west, and north-west? I cannot. It is not only the population which takes our produce, but the stock consumes a great deal of it. It is a pastoral district, and corn and chaff are consumed by the stock.
2008. But they do not feed sheep with corn? There are bran and pollard and stuff like that. The sheep consume large quantities of bran.
2009. Can you state the tonnage of produce which Inverell sends per annum to the west? As I have said before about nineteen-twentieths of the produce goes west. I do not refer to the wool which naturally goes to the nearest railway station.

2010. You are not prepared to submit any figures? No.

2010½. And you can give no approximate estimate as to what the tonnage is? No.

2011. Neither can you give any approximate estimation of the population which you claim Inverell serves? No.

2012. Will not the construction of the railway to Moree under any circumstances cut off your market to a very large extent? No; that is the very market we want to get at. Instead of sending by teams, we want to make use of the railway.

2013. Do you expect, as a storekeeper of Inverell, to get goods from Sydney to Inverell, and send them back by rail to Moree? I do not know what the Railway Commissioners will do. As I say, it is an easy line to construct.

2014. But if you get your goods by railway, they will have to pass Moree to come to your place? Yes.

2015. And it is 96 miles from Moree to Inverell? Yes.

2016. Do you think you are smart enough to get your goods at Inverell, *via* Moree, and then to send them back to compete with the storekeepers at Moree? It is not the store goods, so much as the produce of the district.

2017. But there are other things besides produce, such as groceries and so on. You do not expect to retain the whole of the market for that class of goods if the line is constructed. Can you send them as cheaply to Boggabilla from Inverell as Mr. M'Intosh can send them from Moree? Not under the same conditions.

2018. Then so far as the storekeeper's business is concerned, the railway will not strengthen your hands at all? Not in that respect.

2019. But you contend that it will give an outlet for the products of the district? Yes.

2120. What surplus wheat did Inverell produce last year? It did not produce any surplus at all.

2021. Did it produce enough to feed yourselves? Yes; and more. What was over was sent to the west.

2022. But you say there was no surplus? I mean no surplus after serving the west.

2023. If Inverell and district was polled, and the votes fairly ascertained in favour of a connection with the northern line, either by way of Glen Innes or Guyra as against the Moree line, which do you think would carry the day? At the present time, I think it would be in favour of Moree.

2024. I suppose you are calculating upon the strength of the Little Plain farmers? No; there are the squatters about the district, and every man from the Little Plain and the Big Plain.

2025. How would the people at Brodie's Plains vote? They would vote against it.

2026. I suppose that more than one-half of the people of Inverell proper would vote against it? I do not think so. I consider the Brodie's Plains people already in the railway.

2027. Do you consider the western market as the market for Inverell? I do.

2028. You are a great believer in the fertility of the soil of Inverell? Yes.

2029. And you think it could produce an immense quantity of wheat? Yes.

2030. Do you know if the whole of the population west of Inverell is about 8,000? I know it is not a great deal.

2031. Are they going to consume all the wheat which can be grown in this immense district? No.

2032. What are you going to do with the surplus? We will get a railway on to Glen Innes or somewhere else, but it is of no use talking about a thing which we know we cannot get at the present time. If we have to wait until such time as the Government make a railway to the coast, Inverell, as I say, will go back into the position of a sheep-walk.

Henry Copeland, Esq., M.P., sworn, and examined:—

2033. *Vice-Chairman.*] You are a Member of the Legislative Assembly representing the Phillip Division, of Sydney? Yes; formerly I represented the northern goldfields, then New England, and then Armidale. I should like to make a statement to the Committee in the first instance. I may say that I appear here as representing the public generally, and to some extent from old associations with the people of New England, including the people of Tingha and Bundarra, whom I consider are vitally interested in this question. If Inverell were going to construct this railway out of her own money, I take it that she need only be considered in the question, but inasmuch as the railway is to be constructed out of the general funds belonging to the people of the Colony as a whole, the people of New England and the people to the east have as much interest in this question as the people of Inverell themselves. It is just as necessary to provide a market for the New England people to dispose of their produce in Inverell, as it is to provide a market for the Inverell people. I take it that the towns on the New England railway, and going still further, the eastern coast, say Grafton and other places, and the railway towns down to Sydney and Newcastle, Maitland, Murrurundi, and other places which include a population in round numbers of 500,000, are also strongly interested in this question. I may say that Tingha is also very strongly interested in it, and I shall show that Tingha has a population equal to the population of Inverell itself. Tingha will be left out of it absolutely if the railway is taken *via* Moree, also Bundarra with a population of about 500, which could connect if the railway were carried to Guyra at about 14 or 16 miles between Tingha and Guyra. I think the majority of the people of Inverell and district cannot possibly be in favour of placing their towns 72½ miles further from Sydney. I heard the last witness estimate the longer distance to be travelled as 34½ miles further from Sydney. I shall show clearly that it is 72½ miles further to get to Werris Creek by the Moree route than it is to get to Werris Creek by the Guyra route, and it is about 37½ miles further to get to Werris Creek than by the Glen Innes route. The Glen Innes route, it must be understood, has to be flattened out so as to avoid the grades, and whereas it used to be estimated at 44 miles, it is now 53½ miles. The distance from Inverell to Guyra *via* Tingha is 55 miles. From Guyra to Werris Creek it is 131 miles. Therefore from Inverell to Werris Creek, *via* Guyra, it is 186 miles, with the advantage of trading with a dissimilar climate, each district producing what the other cannot produce. For instance, the table-lands produce potatoes, oats, oaten hay, barley, and other products which Inverell does not produce. Therefore it is an advantage for two districts with a dissimilar climate to trade, because the one exchanges with the other. Again, we all know that whenever a time of drought comes on, the people of the west desire to send their stock to the table-lands of New England, which district seldom, if ever, suffers from drought. Grass is generally to be found in New England, not quite as good as could be found out west, but still good in times of drought. The population

H. Copeland, of Tingha in 1891 was 2,988, that included 733 Chinese. I shall show that the Chinese are decreasing in numbers whilst the Europeans are increasing. The population of Armidale in 1891 was 3,826; Uralla, 819; Tamworth, 4,502. It must, of course, be remembered that if a line is built to Moree, Tamworth will be cut out of the Inverell market, whereas if the line is taken to Glen Innes or Guyra, Tamworth will be in the range. The total population of Tingha, Uralla, Armidale, and Tamworth is 12,235 persons. Then we have the East and West Hillgrove, 16 miles from Armidale (say) with a population of 3,000. Lower down we have Walcha, with a population of 864, where the people do not grow much wheat for themselves, and where there is a different climate altogether from that of Inverell. These people would be likely to consume Inverell wheat if they had a connection. That brings the population up to 16,099. Then there is the population at Grafton to be added at some future time, namely, 4,445, making the total population of those few towns 20,544. If the railway goes to Moree, it will be a distance of 96 miles 35 chains. From Moree to Werris Creek it is 162 miles 31 chains, making the distance from Inverell to Werris Creek, *via* Moree, 258 miles 66 chains; as against Inverell to Werris Creek, *via* Guyra, 186 miles. That shows an extra mileage for the Inverell people for each single journey of $72\frac{3}{4}$ miles. From Inverell to Sydney, *via* Moree, it would be 512 miles 66 chains; *via* Guyra, 410 miles; showing a difference again of $72\frac{3}{4}$ miles additional, and that railway would travel through a similar climate. The climate of Moree is similar to that of Inverell, and would produce similar articles, and therefore there would be no exchange; whereas if the line were taken eastward to Glen Innes or Guyra, Inverell and the western people would be enabled to purchase the very best potatoes in the world grown about Glen Innes and Guyra, as well as oats, barley, hay, and chaff of the best quality. I believe the population of Warialda, when the last census was taken, was 500.

2034. *Mr. Wright.*] The railway authorities say it is 600? Warialda is not given in the census, and I estimate the population at 500 in 1891; Moree, 1,143; Narrabri, 1,977; Gunnedah, 1,362. That gives a population between Inverell and Werris Creek—that is, *via* Moree—of 4,982; whereas the population between Inverell and Werris Creek, *via* Guyra, and the same of course, *via* Glen Innes, is 20,500, including Tamworth.

2035. *Vice-Chairman.*] Would you include the Tingha population? No; I have left Tingha to be dealt with separately. It will be seen that the whole population on the Moree route is only 380 more than the population of Tamworth alone, and, of course, if the Moree route is adopted, Tamworth will be cut off from all connection with Inverell. As far as Tamworth is concerned, the distance from Inverell to Tamworth, *via* Moree, would be 285 $\frac{1}{4}$ miles, whereas from Inverell to Tamworth, *via* Guyra, the distance would only be 159 miles, so that so far as the market of Tamworth is concerned, with a population of between 4,500 and 5,000, the distance would be 126 $\frac{3}{4}$ miles more *via* Moree than *via* Guyra. Take the rate of travelling to be the same as from Werris Creek to Narrabri, 20 miles per hour. Each single journey from Werris Creek or from Sydney, *via* Moree, to Inverell, would be three hours thirty-eight minutes longer than *via* Guyra. Passenger fares, the same as to Narrabri—first-class, 2 $\frac{1}{2}$ d. per mile, = 12s. 10d. extra cost each way; second-class, 1 $\frac{1}{2}$ d. per mile, = 8s. 5d. each way. Thus, in addition to lengthening the journey by three hours thirty-eight minutes, the people would have to pay these extra passenger railway rates. Then there would be the additional freight on produce and return goods over 72 $\frac{3}{4}$ miles each way. As I have already stated, the population of Tingha in 1891 was 2,255 Europeans and 733 Chinese, making a total of 2,988; whilst the population of Inverell at the same time was 2,534, showing a majority of 454 for Tingha. I will read an extract from the evidence of Mr. James Rank, senior constable at Tingha, which was taken when the Sectional Committee was on its travels on the 7th May, 1891:—

2905. *Chairman.*] What position do you hold in Tingha? I am a senior constable, in charge of the Tingha district.

2906. How far does your district extend? About 25 miles north from here, 24 miles towards Guyra, and 16 miles out west.

2907. Does that embrace Bundarra? No, I do not go to Bundarra.

2908. How long have you been in the district? I have been stationed here since May, 1886.

2909. Has the European population of Tingha increased or decreased during that time? In my district the European population in 1888 was 1,960, and the Chinese population 1,150. In 1889 the Europeans numbered 1,950, and the Chinese 1,000; in 1890 there were 2,120 Europeans and 1,100 Chinese, and in 1891, there were 2,255 Europeans and 730 Chinese, showing an increase in the European population, and a great decrease in the Chinese.

What will be the position of Tingha if the line is constructed? For all time to come Tingha will have to cart its tin, or whatever else it produces, 15 miles in order to get to the railway. That is the distance it will have to cart its stores from the railway. If the line is taken to Moree, it will have to cart a distance of 15 miles to Inverell, then from Inverell to Sydney, *via* Moree, a distance of 512 miles, making the distance of Tingha from Sydney 527 miles. Now, with regard to the other route. If the railway is constructed to Guyra, the distance from Guyra to Tingha by rail will be 40 miles. The distance from Guyra to Sydney is 385 miles, making a total distance from Tingha to Sydney, *via* Guyra, of 425 miles as against 527 miles *via* Moree. Thus Tingha will be placed 102 miles further from Sydney by the Moree route than by the Guyra route. It would be better for the Tingha people to cart their tin and stores 40 miles to and from Guyra with 385 miles trainage to Sydney, than to cart 15 miles to Inverell and then have a trainage of 512 $\frac{3}{4}$ miles—a difference of 127 $\frac{3}{4}$ miles. I would like to point out that in forming the estimate of the traffic formerly with respect to Inverell, Tingha was generally considered; but now in forming an estimate of the traffic, Tingha must be left out altogether; because I think most people will agree with me that if you have to go to the trouble of loading and unloading, the carriage of a few extra miles is not so much to be considered. Therefore, I think, there can be little doubt that if the railway is constructed *via* Moree, Tingha would continue to send its goods to Guyra or Glen Innes, and to obtain its stores from there. The traffic would not go *via* Moree. The people would be hardly likely to pay 127 miles of extra passenger fare and freight for their goods. Now, with regard to the railway fares. From Tingha to Werris Creek first class—that is at the Guyra rates, 2 $\frac{1}{2}$ d. for 175 miles—the fare would be £1 9s. 11d. The Tingha people, if they went by the other route—to Moree—would first have to pay the coach fare to Inverell—say 5s. It is a distance of 15 miles, and I am putting it at 4d. per mile. From Inverell to Werris Creek, a distance of 258 $\frac{3}{4}$ miles, at the Narrabri rate of 2 $\frac{1}{2}$ d. per mile, the fare would be £2 5s. 9d., making the fare from Tingha to Werris Creek £2 10s. 9d. *via* Moree, as against £1 9s. 11d. *via* Guyra, showing a difference of £1 0s. 10d. on the railway fare for each trip made. Besides that there is the additional railway journey of 87 $\frac{3}{4}$ miles, and 15 miles of coach travelling. The difference in the second-class fare between travelling *via* Moree and travelling *via* Guyra would be 15s. 3d. each way; besides 15 miles of coach travelling—say 2 $\frac{1}{2}$ hours at the rate of 6 miles an hour; and an extra 87 $\frac{3}{4}$ miles

miles of railway journey—say, nearly $4\frac{1}{2}$ hours. Thus the journey would be lengthened to the Tingha people by 7 hours. It would take the people of Tingha 7 hours longer to get to Sydney, *via* Moree, than it would take them to get there *via* Guyra. I am reckoning $2\frac{1}{2}$ hours for the coach to go from Tingha to Inverell, a distance of 15 miles. With changing, and so on, they do not as a rule do more than 6 miles an hour. From Inverell to Werris Creek is $259\frac{1}{4}$ miles, and from Guyra to Werris Creek 171 miles. That makes a difference of $87\frac{3}{4}$ miles. The tin ore sent from Tingha in 1889 or in 1890 was 1,200 tons; value, £62,000. I may say I have no information as to the quantity of tin being obtained at the present time, but I know from personal knowledge that there is a great possibility in the future for Tingha when they set to work on the tin-lodes. Hitherto they have only been working the alluvial tin, but the tin-lodes have yet to be developed, and there is a possibility also, I think, of diamonds being discovered. I think it is a diamond-bearing country. The population can be gathered from this fact, that in 1889 there were 505 children on the school roll between Inverell and Guyra, representing 110 families, as against 263 children, representing seventy-three families, on the Glen Innes line, excluding the terminals. I now wish to refer to Bundarra. The population of Bundarra is about 500. If the Inverell-Guyra line were constructed, Bundarra would be brought within 14 to 16 miles of it, instead of the people having to travel over 70 miles to Tamworth, or 52 miles to Uralla; and it must be borne in mind that the proposal will affect the Bundarra and Tingha people for all time to come, and, therefore, it is a matter of very serious importance to them. Now look at the question from the traffic standpoint. If we assume that there will be one mixed train each way per day, it means that there will be wear and tear on 873 extra train miles per week. That means an extra trainage of 45,396 miles per annum. The trains running between Werris Creek and Inverell on the Moree route would travel 45,396 more miles in a year than they would between Werris Creek and Inverell, *via* Guyra, and that is to be continued for all time. The working expenses per train mile last year were $48\frac{1}{4}$ d. That would give the additional working expenses on this particular line at £9,125 per annum. Of course the Commissioners would be recouped by passenger fares, and so on, but I take it that it should be the policy of the country to carry the people and their goods backwards and forwards, not by the longest routes, and at the highest railway fares, so as to create railway revenue, but over the shortest distance, and at the lowest possible fares. To accomplish the extra 45,396 miles it would take one train to run 2,269 hours continuously, or ninety-four and a half days' continuous travelling day and night at 20 miles per hour each year for all time. Now take the length to be constructed. From Inverell to Moree it is 96 miles 35 chains. From Inverell to Guyra it is 55 miles. That means a saving of $41\frac{1}{2}$ miles of maintenance in favour of the Guyra route. I do not know whether it is proposed to construct any bridges over the Macintyre River or not.

2036. *Mr. Lee.*] Not in connection with this survey? Then they will stop on the south side of the river. I notice that the line is described as a light line, but I wish to point out that the line from Inverell to Guyra has never had justice done to it at all. We know very little as to what that line is, and judging from the fact that in later years, since the Government have gone about surveying and resurveying the Glen Innes line, the figures have been altered from $43\frac{1}{2}$ miles between Inverell and Glen Innes, with an estimated cost of £192,000, to $53\frac{1}{4}$ miles, at an estimated cost of £317,000. What I desire is to see the same supervision extended to the Guyra line. At present the Guyra line is stated to be 55 miles, and the estimated cost £403,000. But I venture to predict that with the same discrimination and examination of the Guyra line, the cost of constructing it will be reduced in the same way as is the cost of constructing the Glen Innes line reduced from £492,000 to £317,000. Messrs. Scarr and Price, referring to the Guyra line, say:—

There appeared to be no engineering difficulties to contend with on this route, much of it being a surface line. The curves and grades are easy, except through the New Valley Range, and at a few other points.

What I desire is that this line should be permanently surveyed and re-estimated before the Committee give any decision as to what line they will recommend. It seems to be the maddest proposal that ever emanated from any Government, to say that they will take a line $72\frac{1}{2}$ miles further than there is any necessity to take it. I should like to know what the Sydney people would think if they had to travel a mile or 2 miles further, and be detained an extra 5 or 10 minutes on the journey. What must these people suffer when they have to be detained for three and a half hours on each separate journey.

2037. *Mr. Wright.*] They seem to like it? I do not know whether they like it or not; but I can easily understand that they are very desirous of getting a railway, and I suppose they think that if they get a line to Moree the country will not remain in such a state of madness as to continue to refuse them a railway to the east—to the coast, or the main trunk line. The argument used to be urged in favour of the Glen Innes line that it would enable Inverell to deal with Queensland. I think, however, that in constructing this railway, we must look only to our railway towns, and to our own population for a market. The Queensland market is cut off from everything Inverell can produce by the duties which are placed on imports. At the present time their duties are:—Bacon, 3d. per lb.; beef or mutton, 25 per cent. *ad valorem*; butter or cheese, 3d. per lb.; hay and chaff, 15s. per ton; eggs, 25 per cent. *ad valorem*; hops, 8d. per lb.; onions, 20s. per ton; wheat, 4d. per bushel; flour, 20s. per 2,000 lb.; maize, 8d. per bushel; potatoes, 15s. per ton; tallow, $1\frac{1}{2}$ d. per lb.; wool, 25 per cent. Therefore, it is perfectly clear Inverell need not think of doing much trade with Queensland. Hence they must look to doing their trade with the 500,000 people, including Sydney and the railway towns. In order to do trade with that 500,000 people, it should be their policy to do it at the cheapest possible rate, and that they should not be saddled with $72\frac{1}{2}$ miles of extra haulage and extra passenger fares.

2038. Have you included the people of the North Coast district in the estimate? I have only included Grafton. With regard to that estimate, I may say I have not gone into the figures of the intervening towns. The population of Sydney is 415,000. Then there is the population of Newcastle. Beyond that there are Maitland, Scone, and other places with about 20,000. I venture to think, from the correspondence I have had in regard to this question, that a great many of the Inverell people have become hopeless in regard to railway construction. They are not stirring themselves in the matter; but if they had the choice they would undoubtedly prefer to go by Glen Innes or Guyra. That undoubtedly is their legitimate route. I notice that the estimate for the goods traffic is £8,810 per annum, whilst the coaching is £3,400. I do not profess to be a railway man. At the same time I am inclined to think they are over-estimating the traffic, for the simple reason I have given, namely, that the Tingha people will not travel that way. It will be to their interests to discard the railway altogether, and to continue as they do now—to travel to Glen Innes or Guyra. I should like to say a few words with reference to Guyra. I feel

H. Copeland,
Esq., M.P.
22 Sept., 1896.

H. Copeland,
Esq., M.P.
22 Sept., 1896.

feel some interest in seeing that railway constructed, not as a representative of that district—because I do not represent it at the present time, but simply because I think it is a railway which should be constructed in the interests of the general public. Unless the Members of the Committee have read Messrs. Scarr and Price's report, I think it would be well to include this part of their statement in the report of the Committee. In reporting on the Guyra to Inverell line in 1890 they say:—

Statements much at variance with facts have been persistently made by some of the opponents of this route as to the quality of the land over which it passes, it being freely described as "worthless," "thoroughly rotten," &c.

On the contrary, though a considerable portion of the country traversed by the line is of very inferior character for agricultural purposes, the wholesale condemnation of the country is certainly not justified.

From Guyra, for a distance of 8 miles, the soil is of a rich red volcanic nature, capable of producing heavy crops of cereals, &c., suitable to the climate.

Thence to Wade's selection, 3 miles west of Tenterden, and about 23 miles from Guyra, the land consists of black alluvial flats and volcanic ridges.

This class of country extends for some miles on either side of the line. On the northern side merging into the Ben Lomond Range, and on the south into the high granite country bordering on the Bundarra River.

From the point last named (23 miles from Guyra) the line passes over poor stony land of porphyry and granite formation, to a point about 1 mile beyond Moree Creek, whence to New Valley Range the country is fair pastoral land, but unfit for cultivation.

I should like to point out that this poor stony land, although unproductive from an agricultural point of view, is productive from a mining point of view, and in all probability will be productive for many years to come. I have no doubt, when capital is directed to the tin lodes of Tingha, the field will become a permanent one:—

From New Valley to Tingha (40 miles from Guyra) the soil is decomposed granite of the worst quality, poor grazing land, and quite unfit for agriculture.

This character prevails for some 4 or 5 miles beyond Tingha, when volcanic ridges of red soil are met, which extend at intervals, alternating with granite slopes to the Gilgai, 5 miles from Inverell and 50 from Guyra.

Thence to Inverell the soil is generally rich and good, with the exception of some rocky ridges.

On the whole the land along this line may be said to consist for 30 out of the total length of 55 miles of soil, good above the average.

Surely that is a fair proportion. There are very few railways, I think, upon which that proportion will be exceeded:—

The other 25 miles being unfit for agricultural, and of only second rate quality for pastoral purposes.

A considerable portion is held in freehold by Tenterden and Ollera Stations.

There is, however, not nearly so large a proportion of land held in this way by the stations on this line as on the Glen Innes to Inverell route.

In the summary of their report, Messrs. Scarr and Price say:—

As a connection with the Great Northern Railway, the Guyra to Inverell line has the following advantages:—

1st. It is the least expensive, the estimated cost being £403,861.

2nd. It is, as to grades and curves, the better line.

3rd. It passes through a fair quantity of good land, much of which is unalienated.

4th. It offers the more direct connection with Sydney.

5th. It would also be the more direct connection between Inverell and the proposed Guyra to Grafton line.

6th. It passes through the mining district and town of Tingha; though, as pointed out previously, the permanence of this tin-field remains to be proved.

7th. It would get the Bundarra traffic, which would hardly come to the Glen Innes line.

It is a proper thing to ask what is to become of the line from Moree to Inverell. The Government cannot possibly think of stopping it at Inverell; they must extend it to the coast or to the main trunk line, and there can be no doubt whatever that the proper route is to Guyra, and thence to South Grafton, through the finest country in Australia.

2039. *Mr. Lee.*] This line is now proposed as the proper method of taking all the traffic west of the northern line, and in lieu of any coastal connection? The proposal to me is an utter absurdity.

2040. But that is the definite proposal? By that proposal not only Inverell, but the whole of the people west and north-west of Inverell will be cut off from the advantages of trade and traffic with New England, as well as the people of the coast districts. They limit themselves, of course, to sending everything they produce to Sydney by rail. Having once got to Moree they must go to Sydney by rail, whereas if they were to adopt the eastern route there are several courses open to them—either to go to Tenterfield and Byron Bay, or whichever is made the seaport for the line, or to go from Guyra to Grafton, or to Coff's Harbour, and get cheaper coastal carriage. If, however, they take the Moree route they are committed for all time to pay enormous freightage on everything they produce and require, and they are limited in their market to Sydney or Newcastle. Of course, it is a good market, but they must pay railway freight for all time instead of having the opportunity of getting a cheaper freight by sea, and they are, necessarily, cut off from the sugar of the north coast, or whatever they want from the table-land. They will have to pay a heavy rate for cartage for everything they send away in that direction, or everything they wish to obtain for domestic purposes; to me it seems to be entirely out of the question. What I want to urge is that other people have as much voice in the matter as the Inverell people;—the Armidale people, or the Tenterfield people, or the Tamworth people, have as much say in this question as have the Inverell people. If the Inverell people were finding the money for the construction of the line, of course they could take it any route they pleased, but as it is I think that in the interests of the whole of the public the line should be rejected. The Committee should have the opportunity of travelling over the other route, and before doing so the Department should set to work and see whether it cannot produce a line either *via* Guyra or Tenterfield. I have been told several times that a good route could be found to Tenterfield direct, although I should not advocate it; I would far rather advocate the Glen Innes route than the route to Moree. In my opinion, however, the route which should be adopted is a route to Guyra, *via* Tingha, because the Tingha people and the Bundarra people put together are of quite as much importance as the Inverell people themselves. By adopting the Moree route the people of Tingha and Bundarra are absolutely cut off. There is some good land at Bundarra, but they cannot carry 70 miles to Tamworth, or 50 miles to Uralla; therefore, the place is absolutely stagnant.

2041. *Vice-Chairman.*] In your estimate of the population of Tingha you left out the year 1892? In the evidence given before the Committee on the 29th November, 1891, Senior-constable Rank stated the European population to be 2,120, and the Chinese at 1,100. In the year 1892 he gives the figures as 2,090 Europeans, and 450 Chinese, or a total of 2,550. That is the latest information available. I may be permitted to explain why it is that the Inverell-Glen Innes route has always been looked upon

with

with more favour by many people than the Guyra route. The reason is that the Railway Commissioners for many years made differential rates for their tonnage. I have a document with me showing what was being done on the 20th April, 1892, by the Railway Commissioners. This shows that they charged £6 per ton on aerated waters, ale and beer, and goods of the third-class carried from Darling Harbour to Glen Innes, a distance of 423 miles. For the same articles they charged £6 4s. 6d. per ton from Darling Harbour to Guyra, which is 37 miles shorter, thus forcing the whole of the trade to Glen Innes. On the third-class, or general goods, they charged only £7 per ton from Darling Harbour to Glen Innes, whilst they charged £8 13s. 4d. per ton from Darling Harbour to Guyra, which, as I have already stated, is 37 miles shorter. The truck rates were as follows:—From Sydney to stations between Glen Innes and Wallangarra, inclusive, for sugar, rice, unwrought and galvanised iron, wire netting and fencing wire, in a four-wheeled truck, loads of 6 tons, £24; and £30 for first, second, and third-class goods, whilst they charge £40 per truck for similar goods to Guyra, which, as I have already explained, is 37 miles nearer. There is a reduction of £16 per truck for taking these goods 37 miles further. The result has been that that has forced all the traffic to Glen Innes, and between Glen Innes and Inverell. That being the case, the road authorities have also spent more money on the road between Glen Innes and Inverell. I have a return which shows that for the five years, 1887, 1888, 1889, 1890, 1891, the road authorities expended £29,756 on 53 miles 34 chains between Glen Innes and Inverell, whilst for the same period they only expended £12,250 on the 55 miles 10 chains between Guyra and Inverell. They actually spent more than double the amount on the Inverell to Glen Innes route than on the Guyra road, the result being that the traffic was naturally diverted in that particular direction. I venture to think there is no gainsaying the fact that Guyra is the natural route for the railway. It is the shorter route, and the one which ought to be taken, so as to give the Inverell people their proper and legitimate means of exchange with the people on the table-land and the people on the coast. It is the proper route to enable the people in Sydney and on the table-land and on the coast to exchange and communicate with the people of Inverell.

2042. *Mr. Clarke.*] In view of what you have stated, I take it that you are in favour of the route from Inverell to Guyra? Yes; a thousand times rather Inverell to Glen Innes than the Moree route, but still I prefer the Inverell to Guyra route.

2043. And in the event of that not being carried out? Then the railway from Inverell to Glen Innes.

2044. That, I presume, would enable the railway to be continued to the coast? Yes; either by way of Guyra, through the Don Dorrigo country and on to South Grafton, or from Grafton to Glen Innes or Inverell to Lismore.

2045. Or some part of the coast? I am afraid you will never get a railway from Grafton to Glen Innes, until you get flying railways. It is the only way a railway can get from Glen Innes to Grafton.

2046. But are you aware that the estimate for constructing a railway from Glen Innes to Grafton is only half what was estimated some few years ago. At that time it was considered that it would cost about £2,000,000 to construct, but it has since been stated that it can be constructed for half that amount? £2,000,000 was voted for that railway.

2047. It can now be done for half that amount? £2,000,000 was voted for that railway.

2048. And now the estimate is considerably less? I have not seen that estimate, and I do not know whom the authority is.

2049. *Mr. Sec* gave that evidence? It is evidently unofficial.

2050. At all events, you do not approve of the proposed railway from Moree to Inverell? I certainly do not, and how any one else can approve of subjecting the people for all time to come to travelling 72½ miles more than is necessary, I cannot imagine. I think the distance of 512 miles between Inverell and Sydney would absolutely preclude Inverell from sending anything to Sydney. I do not think they could afford to send such things as hay or chaff over that mileage, unless the Railway Commissioners recast their rates, and adopted the zone system.

2051. You do not think much wheat, hay, or chaff, or produce of that kind would go to Queensland? It cannot go there, on account of the duties.

2052. It must come to Sydney or be consumed locally? It must come to Sydney, and if the price in Sydney is not more than about 2s. 6d. per bushel, as in all probability it will not be, I do not see how they are to pay freight over 512 miles. It is essential that they should keep the distance down as low as possible, because in any case Inverell is far enough from Sydney, and why they should make it 72½ miles further, I cannot imagine.

2053. We have it in evidence that the Railway Commissioners in some cases propose to carry grain 500 miles at about one-third of a penny per ton per mile. That is a very low rate? It is—it is lower than the mineral rate.

2054. Does it not seem to be a very low charge? Yes; still it will not be too low for the people who grow produce.

2055. No doubt they would derive an advantage from it? It is possible that by making a low rate, you would encourage greater production. At the same time that would not justify the construction of a line 72½ miles further than is necessary.

2056. The Railway Commissioners think that by making a line from Moree to Inverell, a distance of 96 miles, the cost will only be as much as making a line from Inverell to Glen Innes, which is half the distance? I should like to point out that, judging from my previous experience, the Railway Commissioners are rather inclined to build railways so as to produce revenue. By taking this route they will undoubtedly create revenue, seeing that they would charge for 72½ miles more than they would charge by the other route. It will bring more revenue to the Railway Commissioners, but I take it that that should not be the object of State-owned and State-constructed railways. The object should be to give the people the greatest amount of convenience for the smallest cost. Although they get more revenue on the one hand, they will pay more working expenses on the other. In any case, both the revenue and working expenses have to come out of the pockets of the people, and I do not see why the pockets of the people should be depleted simply to carry out a proposal to construct a railway 72½ miles longer than is necessary.

2057. *Mr. Roberts.*] In view of the fact that there is a difference in the estimate of the cost between the two lines—that is, one from Glen Innes to Inverell, and another from Inverell to Moree—of £40,000, would you not think that it would be a wiser policy to construct the line now under consideration? I do not think so. The interest on £40,000 at 3½ per cent. would only be £1,400 per year. As I have pointed

out

H. Copeland,
Esq., M.P.
22 Sept., 1896.

out in my evidence, the working expenses come to something like £9,700 a year. That is the average estimate at 48½d., which was the average for the last year's working of the railway per train mile. When you reckon that over 72½ miles, you find that the extra working expenses per annum will be £9,126, and that has to come out of somebody's pocket. Of course, it would have to come out of the pockets of the people who used the line.

2058. Would you recommend the Inverell-Glen Innes route without taking into consideration the cost of connection? No; undoubtedly I should recommend the Inverell-Guyra route. There is no doubt there is a little more good land between Inverell and Glen Innes than there is between Inverell and Guyra, but a great deal of it is very stony. A great deal of the land between Inverell and Glen Innes is very rocky, although the soil is good. There are, however, other questions to be considered. To a great extent the land between Inverell and Glen Innes is held in large blocks, and that is not the case in regard to the land between Inverell and Guyra. The land there is more selected.

2059. Assuming that your recommendation to construct a line from Inverell to Guyra is adopted, would that be with a view of recommending a line to Grafton through the Don Dorrigo scrub? Not necessarily with that idea. I would strongly urge the construction of a railway from Inverell to Guyra, so as to give the people of Inverell and Tingha, and the people west and north-west of Inverell, the readiest and the cheapest means of communication with all the northern railway towns, and with Newcastle and Sydney, which I consider their legitimate market. Then, whenever we can construct a railway, I would undoubtedly urge the construction to the coast. I think we have made a great mistake in constructing our railways so far into the interior, instead of making use of a harbour wherever we have one. I think railways should go from the coast into the interior. For instance, I would advocate a railway from the Richmond or Byron Bay, and one from the Clarence or Coff's Harbour. I would also advocate one from Eden to Bombala, in the Monaro country. That is the policy adopted in Queensland and New Zealand. It has kept their ports open, and has prevented centralisation.

2060. Is it not a fact that the figures put forward by the Railway Commissioners, and from which you quoted, show that the proposed railway is more likely to prove remunerative than any other line which has been suggested? I should like to say that I attach very little importance to official estimates. Before the railway from Glen Innes to Grafton was passed by Parliament, at a cost of £2,000,000, it was reported upon several times, and was afterwards abandoned. Then we have this fact—that the Inverell to Glen Innes line is extended to 53½ miles, and the cost is cut down. That convinces me that official estimates cannot be too much relied upon, and that common sense is as safe a guide as the official estimates. You can get official estimates in the same way as you can get statistics—to support any theory you like to propound.

2061. We all know why the line from Glen Innes to Inverell was lengthened—it was to reduce the grade, and thereby reduce the cost per mile? I do not know what the grade is estimated to be now, but I should think they ought to get a grade of 1 in 60 at the present estimated cost. I have no doubt they could get a better grade still between Inverell and Guyra, if they would resurvey it.

2062. Are you aware that the grade between Inverell and Moree is 1 in 100 for the up traffic, and 1 in 80 for the down traffic? Yes; which of course is a very great advantage.

2063. Does not that compensate to a large extent for the greater mileage which you would have to travel? The grade is a very easy one from Werris Creek to Narrabri, but I notice they only travel 20 miles an hour.

2064. Do you not think that is a fair speed? I think it is quite sufficient, and I am calculating that they will travel at the same rate from Narrabri to Moree, and Moree to Inverell. I should like to point out that this is only an estimate of which we have had no experience. I have generally found in connection with railway construction that the actual expenditure is a good deal more than the estimated expenditure.

2065. I think you will find that of late years a great improvement has taken place in that respect? Yes. If the Government are prepared to build a railway on a cheap system, undoubtedly it can be done, and, I think, should be done. I do not see why they should not build a railway from Inverell to Glen Innes or Guyra at a far cheaper rate than the present proposal. The traffic would not necessitate a very rapid speed of travelling, and of course it is the pace the train travels at which necessitates to a great extent the heavy expenditure. A slow train can travel on a cheap line, no matter where it is going.

2066. Would it be possible to get the same grades between Inverell and Glen Innes, or between Inverell and Guyra, which you could get between Inverell and Moree? I do not think it would. I think you could get a better grade between Inverell and Moree than between Inverell and Glen Innes, because there is the Waterloo Range to cross, and there is no such high range between Inverell and Guyra. I think you could get a much better grade than is known at the present time. The Department, however, has not examined the line, and has not spent any money in examining it. They went over it and made a flying survey, and said they could get a ruling grade of 1 in 40. At that time 1 in 40 was a fashionable grade. The Public Works Committee had not come into existence then, and it is only since it has come into existence that the country has become dissatisfied with the 1 in 40 grade, originating from the Committee itself. That line has not been examined since that time, and I have no hesitation whatever, having travelled over the route several times, in saying that you could get a much better grade than 1 in 40. Messrs. Scarr and Price's report shows that for a great distance it is a surface line.

2067. You have noticed that the estimate for the Inverell to Moree line is £2,898 per mile, as against £6,000 on the Glen Innes route? Yes.

2068. Notwithstanding that fact you would prefer the route by way of Glen Innes, if you do not see a way of getting the Guyra line? Undoubtedly. At the same time I should prefer the Guyra route. Why I prefer a shorter route is because time is valuable. It is all very well to look merely at the first cost of a railway. We must, however, take a statesman's view, and look at the value of the time of all the people who will travel by the train, and are detained for three and a half hours on the journey for all time to come.

2069. A man coming to Sydney from Inverell and back would have to travel 140 miles more than he would by way of Glen Innes? Yes, 145 miles more by way of Guyra, but only 75 miles more by way of Glen Innes; and then there is the extra fare he would have to pay. I forgot to mention in giving my evidence that the Railway Commissioners have reduced the differential rates; in other words, they have extended the favoured districts further south from Glen Innes to Walcha Road Station.

2070. *Mr. Wright.*] That has been in existence for the last two years? Yes.

2071. Are you aware that since the whole of the northern portion of the Colony has been put on the same footing with regard to railway carriage the trade to Glen Innes has increased, whilst the trade to Guyra has decreased? I think it is little to be surprised at, for the reasons I have pointed out—that the

Department

Department of Public Works expended £29,000 on the road between Glen Innes and Inverell during the same period that they only expended £12,000 between Guyra and Inverell.

H. Copeland,
Esq., M.P.

2072. As a matter of fact, do you know that nearly all the Tingha tin is now brought into Glen Innes? I think a great deal of it is, for the reason that it is 2 miles shorter, and a better road.

22 Sept., 1896.

2073. There is also another reason—that there is a larger back carriage from Glen Innes than from Tingha? Yes; of course in the season Guyra sends a good deal of potatoes, oaten hay, and so on out west.

2074. But nothing like the proportion of goods which goes to Glen Innes? I cannot say that.

2075. Have you any personal knowledge of Tingha of late years? I have not been there for four years.

2076. Is it within your knowledge that the population has largely decreased of late years? No, it is not; and I doubt it very much.

2077. If it is asserted by people who ought to know, would you be prepared to dispute it? It depends upon whom they are.

2078. If Mr. Moore, the Member for Bingara, says the population has largely decreased, would you place credence on the statement? I should think the statement ought to carry some weight.

2079. You know the country between Tingha and Guyra personally? Yes.

2080. And the country between Glen Innes and Inverell? Yes.

2081. Have you been off the road much on either track? No; but I have made a point of looking about and inquiring when I have been travelling backwards and forwards. In addition to that, having been Minister for Lands for four years, I have had the special advantage of having hundreds of reports before me as to the character of the soil. I know it is rocky in many places.

2082. Will you explain how, if the land between Tingha and Guyra is good, there is still such a large quantity of it available for occupation, and not taken up? The only land available for occupation and not taken up is that in the vicinity of Tingha, where it is not agricultural land at all. It is simply mining land.

2083. Bad for everything except mining? Yes; it is passable grazing country. It is poor grazing country for some few miles. Of course mining country is not, as a rule, very good for agriculture.

2084. You spoke once or twice about the possibility, if a line be constructed between Guyra and Inverell, of securing the Bundarra traffic? Yes.

2085. Have you been over to Bundarra by that route? Yes.

2086. You know there is a precipitous range to come up? I do not remember any, and I have driven over it.

2087. If you read the report of Messrs. Scarr and Price you will find that they say it is an impracticable road? I have not so read it, but I have with me a letter from the owner of Clerkness, Bundarra, Mr. R. A. Wiseman, who used to be the manager of the A. A. Estate. He says:—

Dear Mr. Copeland,

Clerkness, Bundarra, 5 May, 1892.

Please allow me, as one of your constituents, as well as one of the public, to thank you for the stand you took re the Glen Innes-Inverell railway, and your success in getting that line withdrawn. I trust the Guyra line will now be submitted. Guyra is the line for Bundarra (knowing there is no chance of Kentucky). Tingha is under 17 miles from here, with a good road for 14 miles (only 3 bad).

I remain, &c.,

R. A. WISEMAN.

The Honorable H. Copeland, Esq., M.L.A., Sydney.

2088. You are aware the Committee have recently approved of the construction of a line of railway to connect Tamworth with Manilla? Yes.

2089. That will be 27 miles from Tamworth towards Bundarra? Yes.

2090. Would not the most direct and expeditious way of coming to Sydney be by that railway? That would still leave them a long distance to travel. It would leave them 50 miles of road carriage.

2091. But they get nearer to Sydney? That is so. I think, undoubtedly, that if the Moree line is constructed, Bundarra will adopt the Manilla route.

2092. Under any circumstances I think it would? No; it would not if the line were constructed to Guyra.

2093. Are you aware that we have had evidence from the postal authorities to the effect that they can land the postal matter at Inverell, *via* Glen Innes, as they do at the present time, at a very much cheaper rate, and in three hours less time, than by the proposed railway to Moree? I am not surprised at that. It only shows the absurdity of the proposition. I do not know about the three hours less. I cannot see how they could do it in three hours less. They could do it in three hours less if they constructed the line from Glen Innes to Inverell.

2094. But with the mail service as it is now—by train from Glen Innes and coach to Inverell—the mails will be delivered in Inverell three hours before they are delivered in Glen Innes by the proposed extension, and with less cost to the State? It shows the absurdity of the proposal, if it is so.

2095. Your view is that the connection with Inverell should be to the east? Undoubtedly.

2096. You think Guyra is the best route? Yes.

2097. And failing Guyra, you think the railway should be constructed to Glen Innes? Yes.

2098. *Mr. Black.*] You have expressed your disbelief in the efficacy of official statistics;—does that remark apply to the population statistics you gave us? I would not swear to them. I give them for what they are worth. It is the best information I can get.

2099. Would you be surprised to know that at the last general election only 140 votes were polled at Tingha? I should be very much surprised.

2100. And ninety in Bundarra and fifty-five in Guyra? It was not for want of population, I am sure. 150 votes would not represent more than 800 or 900 of a population, and I am quite sure it is very much larger than that. Of course, the people may not have voted, because they were not "sweet" on either candidate.

2101. You seem to imagine that there is no trade between New England and Queensland;—are you not aware that there are large quantities of chaff and potatoes which go from New England to Brisbane? It is very little. They have to jump that barrier of 15s. a ton duty.

2102. If that be so, and they can supply Brisbane, is it not likely that New England will also supply that part of the Queensland border which is in her vicinity, and within easy team distance? I should like to point out that the climate of New England is essentially qualified to grow the best potatoes—far better than the district of Inverell or Queensland.

WEDNESDAY,

WEDNESDAY, 23 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

David Kirkcaldie, Esq., Chief Traffic Manager, Department of Railways, sworn, and examined:—

D. Kirkcaldie,
Esq.
23 Sept., 1896.

2103. *Mr. Roberts.*] Do you know anything of the traffic between Glen Innes and Inverell? I know there is considerable team traffic. I could not tell you exactly what volume of traffic there is to Inverell, but I know we lose several thousands of pounds yearly in consequence of the team traffic between Grafton, Glen Innes, and Inverell.

2104. If the proposed railway is constructed from Moree to Inverell, do you anticipate getting the whole, or nearly the whole of that traffic? That will entirely depend on the rates we charge. Of course, if we intend to get the traffic we should have to fix our rates accordingly.

2105. Is the cost of carriage of goods from Sydney to Glen Innes, by way of Grafton, the same as it is direct from Sydney to Glen Innes by rail? I think not. So far as my information goes, the rate of carriage of goods from Sydney to Grafton is something like 15s. a ton, and from Grafton to Inverell the cartage runs to about £4 10s. per ton.

2106. What is the cost for goods taken the whole way to Glen Innes by rail? In truck loads of not less than 6 tons, we charge £5 a ton from Sydney to Glen Innes.

2107. Then there is a margin in favour of the sea route, and thence by team? I am speaking now of Glen Innes. I said the cost was 15s. a ton from Sydney to Grafton, and about £4 10s. per ton from Grafton to Inverell—that is £5 5s. for landing the goods in Inverell.

2108. What can goods be landed in Glen Innes for? About £3 15s. to £4 a ton, including the sea carriage.

2109. What will be the cost all the way by rail? £5 per ton, in truck loads. That is the general goods rate. Of course, some of our rates are less than that. There is one class of traffic for which we charge 30s. 10d. to Glen Innes; another class 53s. 7d.; another class 112s. 8d.; another class 120s.; and another class 140s.; but when we come to truck loads, in order to secure the traffic, so far as we possibly can, the rate from Sydney to Glen Innes is £30, which is equal to £5 a ton.

2110. *Mr. McLachlan*, the Secretary to the Railway Commissioners, stated in evidence:—

At the present time traffic to Inverell from Glen Innes starts upon equal terms whether it comes from Grafton or is brought to Glen Innes by railway; but if the proposed railway is made we shall be able to take goods to Inverell as cheaply as we now take them to Glen Innes, and we will thus have the advantage of the cost of carriage between Glen Innes and Inverell.

? I think there must be some misapprehension there, because a large quantity of the general goods which go to Glen Innes now are conveyed by sea and road. Although we have quoted £30 a truck, which is a low rate for such a distance, we have not been able to secure all the traffic, or anything like it. A great deal of it goes by sea and team. The lower classes we get altogether.

2111. Do you have special rates with the view of counteracting the traffic by road? Yes.

2112. And notwithstanding that fact you are unable to compete? A great deal goes by sea and road, in spite of our low rates.

2113. Do you think it will continue to go by sea and road if the proposed railway is constructed? It depends entirely upon what rates we charge. Of course we could fix the rates at such an amount as to secure the traffic. The question is whether it would pay us; whether we would not lose more by doing so than we would gain, because we might have to reduce rates to Armidale and other points as well.

2114. People who were not affected by the low rates would be dissatisfied? Yes.

2115. Are you familiar with the grade between Moree and Inverell? Yes.

2116. For the down traffic the grade is 1 in 80, and for the up traffic 1 in 100? Yes.

2117. Would the fact of having such an easy grade cause the traffic to be taken at a lower rate? No, I think not; we do not take grades into consideration in fixing our rates.

2118. Which line do you think it would be better to construct in the interests of the country—the Moree-Inverell line, or the suggested line from Inverell to Glen Innes? If we are to get the traffic by railway at all, the line from Moree to Inverell is the one which seems best calculated to get it. If we construct a line from Inverell to Glen Innes, it will simply mean feeding all that district from the coast. Instead of the goods going from Sydney or Newcastle to Inverell, they will probably go by sea, and then by road to Glen Innes. They will then very likely be trucked to Inverell, although when once they get goods on a team, a few miles extra travelling does not matter very much.

2119. *Mr. Black.*] The same reason why you construct a railway from Moree to Inverell will not in any way divert the traffic now going from Grafton to Inverell? I do not say it will. I only point out that of the two the line *via* Moree to Inverell is more likely to bring traffic to the railway than the line from Glen Innes to Inverell.

2120. If by constructing a line from Glen Innes to Inverell you do not divert traffic which now goes by way of Grafton to Inverell, how are you going, by constructing a railway from Moree to Inverell, which carries goods to and from Sydney and Newcastle by a more circuitous and, despite the route being more level, by a more expensive route—if you are not able to compete now, and if the Glen Innes to Inverell railway leads to the sea route, how is the Moree to Inverell line to carry it? I only say that of the two the Moree route is more likely to get us the traffic than the Glen Innes route.

2121. You use, as an argument against the construction of a line from Glen Innes to Inverell, the statement that it will not secure goods now carried by way of Grafton; I wish to point out that your argument tells equally against the Moree-Inverell railway? I do not think so. Of the two, my feeling is that the Moree route will give us the Inverell traffic, but I am not going to say that either route will give us the whole of the traffic.

2122.

D. Kirkcaldie,
Esq.
23 Sept., 1896.

2122. Your argument can only have point if there is any intermediate traffic—that is, at points between Inverell and Werris Creek;—if the line creates intermediate traffic, it may pay working expenses? There might be intermediate traffic, but I am talking now about the Inverell traffic.

2123. If you prove that your position is strong;—it appears, however, that your argument tells against the Moree-Inverell Railway as against the Glen Innes-Inverell Railway? Of course I cannot say we are going to secure the traffic by either route. I am not going to say—unless we adjust our rates to meet competition by teams—we can secure the traffic by either route.

2124. *Mr. Roberts.*] You refer to adjusting your rates;—would those rates be what may be termed payable rates, or would you carry goods at a loss? We would not carry them at a loss, but we might have to carry them at a small amount of profit.

2125. And run the risk of creating dissatisfaction among people to the south? Yes.

2126. Is there likely to be a large amount of traffic between Glen Innes and Inverell, or would it all come from the terminus in the event of the line being constructed? The construction of the railway would certainly lead to the development of the district as far as agricultural produce is concerned. Possibly it might also lead to the opening up of some of the mines there.

2127. Then your argument is that the traffic would probably go by rail from Inverell to Glen Innes, and from Glen Innes to Grafton by road? I do not think it would ever do that. Once they put the traffic on the railway, they would not unload to take it by road to Grafton. General goods going to Inverell might continue to go by sea to Grafton, and be carried from there to Inverell in the same way as they are carried to Glen Innes now. Although for a number of years we have given specially low rates in order to catch the Inverell traffic, without doing injustice to other localities, we have not succeeded in securing all that traffic or anything like it. A great deal still goes by sea and team.

2128. And you think it will continue to do so no matter which railway is constructed? I think so.

2129. I am afraid you did not make it quite clear to me as to the mistake which might be made in constructing a railway from Inverell to Glen Innes;—you said you would not gain so much traffic from such a line as from the line from Inverell to Moree? I think the general goods coming from Grafton—and it is upon general goods that we make the most of our payable revenue—would still continue to go by sea to Grafton, and by team to Glen Innes. I understand they can land goods in Glen Innes for about £3 15s. or £4 a ton. Seeing that our rate to Glen Innes is £5 a ton, it almost follows that the traffic will continue to go the route it goes now. If we cannot secure it now, I do not see how we can hope to from Glen Innes to Inverell.

2130. The teams having been loaded at Grafton are not likely to unload at Glen Innes, so that goods can be carried by rail to Inverell? I do not think it is likely. When once they get goods on the teams they prefer to go right through with them and deliver.

2131. And that is one of your principal reasons for recommending the Inverell to Moree route? Yes.

2132. If the Inverell to Moree route were adopted, would not there be a lot of traffic between Glen Innes and Werris Creek which is on the main line;—would not the main line be robbed of that traffic? To a certain extent, it would.

2133. Then, in making an estimate ought not that to be added to the probable loss in running a line? Yes; but, of course, in the estimate which is before the Committee, I cannot tell whether that has been taken into consideration. It may have been.

2134. Would the wear and tear on rolling stock be of less cost to the Department for traffic going to Inverell by way of Moree than on the main line? Practically the same.

2135. I am in error, then, in supposing that the cost of the traffic on the main line would be larger than on the north-western line—that is, from Werris Creek to Inverell? I think so. I think there is very little in it. Of course, the train loads on the one line would be very much greater than on the other. If there is a large traffic, of course, the more level you get your line the better. For example, from Moree to Inverell, with a ruling grade of 1 in 80, we would haul thirty-eight trucks loaded with goods. If you multiply thirty-eight trucks by 9 tons it gives you 342 tons, about half of that would be a paying load. From Glen Innes to Inverell, with a ruling grade of 1 in 60, and the same class of engine, you could only haul twenty-one trucks. That is twenty-one as against thirty-eight.

2136. Then there would be a saving in the working of lines on a more favourable grade? If there were a large traffic.

2137. But you look upon the traffic as being so small that the matter is not worthy of consideration? It is one of those things in regard to which one has to look to the future. If this line were going to develop a large traffic within the next twenty years, grade would be everything; but for the present it is not of such serious importance to us.

2138. But, of course, we are building our railways for all time? Then the route which gives the best grades, all other things being equal, is the one which should be adopted.

2139. You look upon Grafton really as the natural seaport for Inverell, and that is proved by the fact of the teams carrying the goods that way? Yes; of course, when one talks about the port for Inverell, I mean that all the traffic to that part of the country either comes from or goes to Sydney or Newcastle. Therefore, it is purely a question of competition—railway *versus* sea and team. Grafton in itself is of no importance except as a port for forwarding produce.

2140. Do you know the country between Glen Innes and Grafton? No.

2141. I suppose you have heard that it is of a mountainous character? Yes.

2142. And likely to delay for the present the construction of a line between Glen Innes and Grafton? Yes.

2143. Assuming that one held the view that, for the present at any rate, it is impracticable to make a railway from Glen Innes and Grafton, except at an enormous expenditure, you think that the line now under the consideration of the Committee is the one which should be adopted? I think so. If the railway is to be constructed at all, I think that is the better one.

2144. You undoubtedly prefer it to the Glen Innes route? I do.

2145. With regard to the route *via* Guyra to Inverell—that would bring Inverell very much nearer to Sydney than the proposed route? Yes; of course one has to look at the physical features of the country, and the productiveness of the country.

2146. Could you form any idea as to what grade would be obtainable on a line such as that? I have not the slightest idea.

D. Kirkcaldie, Esq.
23 Sept., 1896.

2147. *Mr. O'Connor.*] I take it that you are favourable to the construction of a line from Moree to Inverell? Yes; that is to say, if a line is to be constructed at all, it seems to me that that is the better one to construct. Still I offer no opinion with regard to the line from Guyra to Inverell, because I know nothing about it.

2148. Are there any reasons in your mind, why we should not have a line from Glen Innes to Inverell? No; excepting that, when you get to Glen Innes, you are within 110 miles of Grafton. Our experiences is that, notwithstanding our best efforts, the best paying of the Glen Innes traffic goes by sea to Grafton, and by road to Glen Innes. We get the traffic which we carry, at very low rates. But when we come to the higher class traffic—general stores, sugar, tea, and drapery—we find the bulk of it going by sea and road. Then there is another point which you have to consider—that if we were to give Glen Innes a much lower rate than Armidale,—for example, there is an intermediate point between those places in regard to which there would be great contention about doing the business—whether Glen Innes should do it, or Armidale. If we give Glen Innes much lower rates than Armidale, Glen Innes can do the business, and Armidale is shut out.

2149. As far as I can see, those who are best capable of giving an opinion are not opposed to the construction of the line between Inverell and Moree; but it seems to me strange why Inverell should be cut off from Glen Innes. Is there anything in your mind inconsistent with the idea of constructing a line from Inverell to Moree, which would not comprehend the extension to Glen Innes? No. As far as I can understand it, you go through somewhat better country in going from Moree to Inverell.

2150. You have not been over the country yourself? No.

2151. But you have read the best reports regarding it? Yes.

2152. Then, after making the most serious and careful inquiry, you are not opposed to the line from Moree to Inverell? No; if a railway is to be made at all.

2153. *Mr. Lee.*] The question of dealing with the Inverell traffic has always been a complex one? Yes.

2154. Is not that owing to the fact that the coast line is so close to Glen Innes? Yes.

2155. So far as you are concerned, you simply look at the matter from a revenue point of view? Yes, and from the point of view of opening up of good country.

2156. What is the distance from Sydney to Jennings? 491 miles.

2157. From Sydney to Albury? 386 miles.

2158. From Sydney to Cooma? 265 miles.

2159. From Sydney to Hay? 454 miles.

2160. From Sydney to Bourke? 503 miles.

2161. From Sydney to Inverell by way of Moree? 509 miles.

2162. Therefore, the proposed construction to Inverell will make the longest line in the Colony? Yes, from Sydney.

2163. From Sydney to Inverell by way of Moree, the line will be 509 miles, and will be the longest line in the Colony? Yes.

2164. You have already justly admitted that the Railway Department has been unable to attract a portion of the Glen Innes, and nearly the whole of the Inverell traffic, to the railway. If the Department has been unable to control that traffic on a line 422 miles long, will you show the Committee how it is going to get it, if it has to carry it 509 miles? As I say, it is purely a question of rates. If the railway is constructed, we will do the best we can to get the business.

2165. Do you admit that you will be unable to do that unless differential rates are made to secure it? We could not do it without differential rates.

2166. What would be the rate of carriage for general goods from Inverell by way of Moree to Sydney, or from Sydney to that point? Do you mean the ordinary rate.

2167. Yes, for ordinary goods—the goods which you say you make most revenue out of? The through rate from Sydney to Inverell by way of Moree—from what we call the miscellaneous class—would run to 23s. 4d. per ton—that is for coal and heavy traffic of that kind.

2168. But I am speaking of general goods? The ordinary rates for 509 miles run from 129s. 11d., for first-class traffic, to 225s. 4d., for third-class traffic; but then of course we introduce the truck rate. What that truck rate would be would depend entirely upon the competition.

2169. Could you give us a fair average of the cost per ton per truck? If we charge the ordinary scale, without having regard to any competition, it will be at an average of £8 7s. per ton.

2170. Of course there would be no necessity to adopt differential rates there, as you are supposed to be away from the influence of the coast traffic? Yes, but if they can land goods in Inverell for £5 a ton or a little over, it seems to me we should require differential rates.

2171. You are aware that we already have it in evidence that the object of starting the line to Inverell is to compete with the coast traffic? Yes.

2172. Therefore the Committee are anxious to know how this long length of line is going to compete with the coast? If it is a fact that they can land goods in Inverell for a little over £5 a ton, it does not seem to me that we can compete except by means of differential rates.

2173. Have you heard recently that they are delivering goods, by way of the coast, at Inverell, at £3 10s. a ton? No. Does that include the sea freight.

2174. Yes; from Sydney to the coast, and on to Inverell. Are you also aware that they are sending tin ore from Grafton at £1 per ton? Yes; I believe they have been doing that to a small extent. I do not think there has been much traffic of that kind. I think there were some small consignments sent with the teams which were going back empty in order to bring back general goods.

2175. As it would appear that nothing but a differential rate would enable the Commissioners to obtain a revenue from the line, will this differential rate seriously interfere with the calculations which have been placed before us? That I could not tell you, because I have not gone into those calculations.

2176. I presume the estimate of revenue supplied by Mr. Harper would be based on existing rates? I presume so. I have not talked the matter over with him because he is not in town.

2177. Supposing the scheme is adopted, or supposing that differential rates can be made considerably lower than the fixed rates owing to the close proximity of the coast, is it not extremely probable that you will always have great competition with the teams? I think so. Of course there is one thing to consider, and that is that the railways would land traffic in Inverell in less than 48 hours, whereas if you go by sea it will take at least 10 days or a fortnight.

2178. That, of course, will be a great consideration in getting up a class of goods for immediate use? *D. Kirkcaldie, Esq.*
- Yes—general stores.
2179. Of course, in general business, there is a large amount of stuff for which there is no immediate hurry? That is so. *23 Sept., 1896.*
2180. Do you think the railway would secure all the traffic to the north which it ought to do if, instead of taking the traffic round that long distance by the west, we were to make a connection by the coast at some suitable point? Such a point as Grafton, for example.
2181. Either Grafton or the Richmond? It would mean this—that we would lose an enormous amount of revenue.
2182. In what way? Because the goods, instead of going from Sydney or Newcastle to the various points along the line, would go by sea to Grafton, and from Grafton they would be distributed all over the table-lands of New England. If you tap any of the rivers with a railway, then I think we must look at it that we are not to get that traffic to carry from Sydney or Newcastle. Therefore, we will lose the whole of the revenue as between Sydney or Newcastle and Glen Innes. We will take it that you bring a railway from Glen Innes to Grafton, that is 110 miles. You have coastal boats from Sydney to Grafton, so that instead of hauling your traffic 422 miles between Sydney and Glen Innes, or 352 miles between Newcastle and Glen Innes, you would haul it 110 miles between Grafton and Glen Innes.
2183. But would not you be hauling a quantity of traffic then which you are not hauling now, and which is now carried by the drays? No doubt you would. If we tap Grafton by railway we should lose more revenue between Sydney and Glen Innes than we would get between Glen Innes and Grafton. Between Grafton, Glen Innes, and Inverell the competition by sea and team is equal to about one-third of the team competition with the railways all over the Colony—that is to say, if we lose a total of £15,000 in freight by competition with teams, we reckon that £5,000 of it occurs between Glen Innes, Inverell, and Grafton.
2184. You reckon then that you would lose £5,000 a year which you ought to get on the northern line? Very much more than that.
2185. If a line were constructed from the main northern line to the coast, would you not gain that £5,000 a year, and would you not haul the whole traffic, no matter what it may be, over some portion of your line? You would not get the £5,000 a year, because that is the freight either from Newcastle or Sydney. From Sydney to Glen Innes there are 422 miles of haulage, and between Newcastle and Glen Innes only 324. Between Grafton and Glen Innes there are 111, so that we would lose from 213 to 311 miles of railway haulage.
2186. *Mr. Black.*] With regard to what you have said as to the impossibility of competition with seaborne traffic to Grafton, or some of the northern ports, is not that a condemnation of the present railway policy of centralisation, which endeavours to drag all the products of the country to the metropolis, no matter from how great a distance? I do not think that is a fair way of putting it. It is not a question of centralisation. Whether the business goes to Grafton or not, it simply gravitates to Newcastle or Sydney. It is not as if you were shipping direct to England, Europe, or America from Grafton. It is purely a question of whether you will bring the traffic from Glen Innes to Sydney by rail, or from Glen Innes to Grafton by road or rail, and on to Sydney by sea. Therefore, it is not a question of centralisation at all.
2187. Of course, that is open to argument. You might argue further, in this way: that although, with your policy of railway centralisation, you have made Sydney a port for the Colony, under other conditions, where there was a system of coast railways, taking products from the interior to various parts along the coast, it might be possible to use other ports only inferior to that of Sydney, which would be distributing centres, and which would have direct communication with different parts of the world? Of course, if you had harbours like Sydney or Newcastle at various points along the coast there would be a good deal in that contention. Practically, however, the traffic gravitates either to or from Sydney and Newcastle. I do not think there is much in the centralisation question.
2188. *Mr. Lee.*] I suppose the figures you quoted—£5,000—are supposititious figures? Yes.
2189. Have you any idea what freight you lose in consequence of that coastal traffic? Speaking broadly, we lost between £6,000 and £7,000 last year.
2190. Therefore, your argument is that it will be better to continue to lose that £6,000 or £7,000 a year than to construct a line to the coast, which may rob the main northern line probably of £4,000 or £5,000 a year? I think so. You have all the new capital upon which to pay interest besides the working expenses.
2191. Does it not mean that it would be better to let that traffic go. In other words, you do not get it now, and if you built a line to the coast to get that £6,000 of freight a year it would involve a further loss to the northern line. In your opinion it would be better to let that traffic go? I think so. Of course, last year was an exceptional year. For some reason or other the team traffic developed largely between Grafton and Inverell last year. According to the figures I have before me, it was more than double what it was in 1894.
2192. At the same time, the teams have been competing with your line ever since it was opened? Yes, more or less.
2193. So that, as a matter of fact, the traffic there is an established one? Yes.
2194. What is the object of starting the line from Inverell? That I do not know. I have no knowledge as to the object of the construction of the line.
2195. Your evidence tends to show that it would be impossible for you to compete unless you reduced the rates considerably? Unless we got differential rates.
2196. The traffic will still go by dray to the coast. Where, then, does the justification come in of starting the line from Inverell, when, by your own showing, you cannot secure the traffic? That is a question of policy with which I have nothing to do.
2197. I believe that large quantities of grain are being moved at low rates from all parts of the country districts? Yes.
2198. And it is your low rates which have induced the grain to move? Largely.
2199. Do you not think that if there were a cheaper means of communication for the farmers of the table-land and Inverell you would do a larger amount of business in grain than you are doing at the present time? From the northern line, no doubt.
2200. You admit that the distance from Sydney is very great? Yes.
2201. And although the rates are low at places, the growers at long distances are at a disadvantage? Yes but the rates for long distances are very low as the distance extends.
- 2202.

- D. Kirkcaldie, Esq.
23 Sept., 1896.
2202. Does not that point to the fact that, with the proper development of the table-land and the western slopes, some more direct communication will be required to develop that country, and put it on equal terms with the south-west? There you open up a big question. If you are going to develop that country and make it as productive as the country about Jerilderie and Berrigan, the easier you can make your grades the better. The rates are so low that you cannot afford to carry the grain unless you get large train loads.
2203. Is the Berrigan line open yet? No, it is to be opened on the first of next month.
2204. Are the predictions of the Public Works Committee and of the Department of Railways likely to be verified in regard to it? It seems so.
2205. Do you think the area has so largely increased that the earnings will be in excess of what was estimated? I should not like to say that; but the next harvest will be a very fine one.
2206. It is one of those lines upon which you charge an exceptionally low rate, and are likely to carry very heavy loads? Yes.
2207. *Mr. Black.*] You are of opinion that there will be a considerable amount of traffic at the points intermediate between Inverell and, say, Werris Creek? Yes. We have the railway now as far as Narrabri, and we shall soon have it to Moree.
2208. If there were no great quantity of intermediate traffic to be obtained, do you think it would be advisable to construct the railway from Moree to Inverell? That is a matter of Government policy upon which I would not like to express an opinion.
2209. I infer from your remarks, that in constructing the railway there are other considerations beyond those of merely carrying goods at payable rates? Yes, I think so.
2210. If, as you say, the carrying of goods a few miles, when they are once placed on the dray, is not a very great consideration, and if the railway authorities at present find it impossible to compete on equal monetary terms, as far as Glen Innes is concerned, with the steamer to Grafton, and thence by the team method of carriage, and if the Glen Innes to Sydney railway route brings you more directly into communication with the metropolis than the Moree-Inverell extension could do—if it is impossible for you to compete in the case of Glen Innes with the Grafton route, how do you think you can successfully compete on equal monetary terms with a new line when it is completed? As I said before, we can only compete by a system of differential rates, or what you would call competitive rates.
2211. Would you so differentiate the rates that you can land produce or goods from Sydney or Newcastle more cheaply in Inverell than you can now land them in Glen Innes? No, I do not think so; you could not well do that.
2212. Would you land them as cheaply? You might do that on the same principle that we are landing goods as cheaply in Hay as in Narrandera.
2213. And if the railway from Inverell to Moree be completed, and you undertake to land goods in Inverell as cheaply by rail as you do now in Glen Innes, do you think you could compete with the Grafton route on fair terms? As far as Inverell is concerned?
2214. Yes? I think we might.
2215. Do you know the distance between Grafton and Inverell? A little over 150 miles.
2216. Have you any idea what the teamsters charge per ton between Glen Innes and Inverell? About 30s. per ton. I believe it has been as low as £1; but I know that when I made inquiries a few months ago, it was as low as 30s. That was for wool in the month of April.
2217. I am inclined to think £1 is a fair estimate? It may be. Perhaps you are adding that £1 to the rate from Grafton.
2218. No; I will add it for the purpose of this argument; but I am not saying that a load brought from Grafton to Glen Innes, and then sent on without being unloaded, would cost £1 extra. I do not think it would. If there were a load on, I think they would carry it for 15s. per ton. I am desirous of finding out what is your idea as to the current rate between Glen Innes and Inverell? The rate I have given is from Glen Innes to Inverell, and *vice versa*. In April last it was given to me as 30s. a ton. It is quite possible it may be less.
2219. Do you know the rate the teamsters charge from Grafton right through to Inverell? I believe it has been done for as little as £3 10s. up to £4 10s.; £4 10s. is a fair price.
2220. If you delivered goods by rail in Inverell as cheaply as they are now landed in Glen Innes—carriers taking the goods, as they do, from Grafton to Inverell, for £3, £3 10s., and £4 a ton, and adding the water carriage on to that—you would still be liable to be undersold by the steamers to Grafton, and thence by the dray route? Yes, there is always that risk. There is this to be looked at: The steamer freight costs about 15s. We will assume that the road carriage is £4. That brings the amount to £4 15s. Our rate to Glen Innes is £5. We would be able to land the goods in Inverell in forty-eight hours, whereas, by sea, it takes them ten days.
2221. Your own idea is that they would save 10s. a ton by sending them by Grafton? Yes.
2222. The question is whether that would counterbalance the delay? Possibly, in many cases of traffic it would not. If you were in a hurry the goods would go by rail; otherwise they might go by sea and team.
2223. You do not, apparently, see much force in the objection to the construction of the proposed railway that it would interfere with the traffic returns on the northern line? Yes, I dare say there is something in that, but I have not gone into it. Mr. Harper has done all that.
2224. But you do not apprehend that this is a strong objection? Yes, I do. Unless you intend to develop a new traffic on this line, it means that the traffic we shall get will be diverted from some other line, although we may get a few extra miles of carriage.
2225. Then your opinion is that the Railway Commissioners, in recommending this railway, have done it with the idea that it is likely to create new trade and open up settlement? Yes.
2226. And you think that if that belief should be discovered to be fallacious, one of the chief reasons for recommending the construction of the line, will have vanished? Yes, but I cannot understand the Commissioners making such a recommendation unless they have the strongest grounds for it.
2227. Do you think that, with the construction of the proposed railway, there will be an increased trade at intermediate points to the Queensland border? I do not think so.
2228. Do you think the Queensland wants are already as great as they are likely to be? I think so. I do not see how it is going to affect the Queensland traffic at all.

2229. But if a line were constructed from Brisbane to some point on the Queensland border, approximately between Moree and Inverell, would that prejudicially interfere with the returns of the Moree-Inverell railway? If they did that it would very likely have the effect of diverting some of our main northern traffic to the Queensland railways, but I scarcely think they will do that. It is not worth their while to bring a railway down to the border, although it has been talked about.

D. Kirkcaldie,
Esq.
23 Sept., 1896.

2230. I understood the Queensland Government were going in for a policy of railway extension? They are going to construct a line to Cunnamulla.

2231. Of course a railway to Cunnamulla, even if brought to Barringun, would not interfere with the Moree-Inverell railway? No, a railway to Mungundi would tap our country.

2232. I suppose you have weighed all the pros. and cons. of the question? No; I have not gone very deeply into it, because Mr. Harper obtains all the statistics in connection with a new line.

2233. At all events, the Railway Commissioners are more disposed to feed the north-western line than the main northern line? I scarcely think they have any desire to feed the north-western line. Their desire is to secure the greatest amount of traffic, and they think they will do that by taking a line from Narrabri to Moree, and then from Moree to Inverell; besides, as I understand it, opening up some better country than there is between Glen Innes and Inverell.

2234. *Mr. Clarke.*] Are you personally acquainted with the country along the proposed line? No; but I understand that it is very fine wheat-growing country.

2235. Do you think that wool from some portions of Queensland, and wheat from the immediate neighbourhood of the line from Moree to Inverell, will come down by the proposed line from Sydney? The wheat must come. But as far as the wool from Queensland is concerned, I do not see any hope of getting it. First of all, Moree is a long distance from the border, and then there is a duty of £2 10s. a ton on wool coming from Queensland into New South Wales.

2236. You do not think you would get much of the Queensland trade? I do not think we should get any from Inverell, but I daresay we shall get some from Moree.

2237. Do you think you would get the wool and other produce grown in New South Wales? Yes; our rates are so low for wheat and traffic of that kind that we must get it.

2238. Do you think the line from Narrabri to Moree, when completed, will take the greater portion of that trade without any extension from Moree to Inverell? Yes. Of course it will not touch the Inverell trade. The trade of the Inverell district will still continue to go by Glen Innes to the coast unless we can secure it by the construction of a line.

2239. Would the greater portion of the trade on the southern side go to Inverell or Moree—I mean from Bingara, Barraba, and down towards Manilla? The Barraba and Manilla traffic will largely go to Tamworth.

2240. For a short distance north of Barraba the trade would go to Tamworth instead of Moree? Yes.

2241. We have evidence to the effect that it is not intended to carry the proposed line further than Inverell. It will stop there and will not go to Glen Innes? Yes.

2242. That would leave a considerable break between the terminus and the main northern line? Yes. If you take it to Glen Innes, as I said before, you go into keener competition with the coast again.

2243. Do you not think that the coast people are entitled to railway communication if it is not so expensive? But the coast people already have communication by sea. If Grafton were a large seaport, from which you could send ships to all parts of the world, there might be a good deal in what has been said about centralisation or decentralisation, but seeing that it is merely a question of route to and from Sydney or Newcastle, the matter of centralisation does not seem to me to come into consideration at all. All the traffic drifts either to or from Newcastle or Sydney. It is simply a question of whether it should come or go direct by rail or by team to the coast and then by sea to Sydney. It all focuses around Sydney or Newcastle.

2244. You have already stated that goods can be taken by sea from Sydney to Grafton, and then by drays from Glen Innes to Inverell at a lower rate than what the railway authorities can charge? As I said before a large proportion of the best paying goods by railway, which go to Glen Innes from Sydney, are sent by sea to Grafton and carted across.

2245. But if the proposed line is continued to Glen Innes, do you not think the large population on the coast—80,000—are entitled to railway facilities in the same way as other parts of the Colony? As I say it is simply a matter of Government policy. You will load the railway capital with 110 more miles of railway in addition to the working expenses, and you will take away the bulk of the revenue, say from 422 or 324 miles, to put it on to 110 miles. In other words we shall simply take the traffic to the steamers to let it run to Sydney. Consequently a line between Grafton and Glen Innes could not fail to be a formidable competitor with the main northern line between Sydney, Newcastle, and the table-lands of New England.

2246. I suppose you know it is the policy of all the Colonies—including Victoria, South Australia, and Queensland, to have railway communication from their table-land to all the available ports on the coast? Yes, but I do not think that there is a great deal of it in either of those Colonies.

2247. Particularly in Queensland? With Queensland the circumstances are different. They have a number of disconnected railways, and cannot help themselves.

2248. You have stated that if there were a large port on the northern coast where shipments could be sent by Australian vessels to any other parts of the world there might be some reason for taking the railway to the coast? I do not think I put it in that way. I said that if there were large ports like Sydney or Newcastle along the coast, there might be some reason for constructing the railway to the coast, not necessarily to Grafton or any particular point, so as to ship traffic direct to England or elsewhere instead of bringing it all the way down to Sydney.

2249. Are you aware that at the present time there are about 17 feet of water on the bar at the Clarence? I am not aware.

2250. And that when the breakwater is completed there will probably be 20 feet? Yes.

2251. If that is so would you consider it a good port? Yes.

2252. *Vice-Chairman.*] Do I gather from your evidence that, either from Glen Innes, or from Moree, the construction of a railway to Inverell must be attended by a loss? That of course it is impossible to say. It will depend entirely upon the rates we will be able to charge. If the present team carriage is to continue, we shall have to make competitive rates in order to secure the business.

2253. What is the present truck rate to Moree? When the line is opened it will be £6 14s. 8d. per ton—say, £6 15s. a ton for general goods.

2254. Then how will it be possible for you to carry 100 miles further than Moree, in competition with the sea-board, with goods delivered as you say at Inverell, *via* Grafton, at £4 15s. per ton? I do not see how we can do it unless we cut down the rates.

2255.

- D. Kirkcaldie, 2255. Can you venture to cut down the rates to Inverell below the truck rate from Sydney to Moree?
 Esq. We have not been doing that kind of thing of late years; but once we used to do it.
2256. Do you think it probable that the Railway Commissioners would carry to Inverell *via* Moree for less than £5 a ton? I do not.
2257. I suppose there would be an immediate agitation if you were to carry to Inverell for £5, and still charge £7 to Moree? Yes.
2258. That being the case, where is the revenue to come from? It is impossible for me to say; I have not been able to go through Mr. Harper's figures, and I have had no opportunity of talking the matter over with him. I am only speaking from general deductions. According to the present scheme of rates, as between Sydney and Grafton, and Grafton and Glen Innes and Inverell, I do not see how we are going to secure the traffic unless we quote exceptionally low rates.
2259. And is it your opinion that you could not venture to quote even minimum rates which could compete against the existing rates between Inverell and Sydney *via* Grafton? I do not think we could.
2260. Then excepting that Inverell, in your opinion, should have connection with the existing railways, there can be no reason urged from a commercial point of view for constructing the line? Not from anything which has been before me.
2261. I take it that you have such a general knowledge of the working of the railways that you are capable of expressing an opinion for the guidance of the Committee? Yes. If I express an opinion, I say we must quote very low rates; otherwise we will not get the business from Sydney or Newcastle.
2262. Then, in arriving at a conclusion, the Committee must regard the expenditure upon the proposed railway as likely to prove unprofitable for a considerable time—in fact, so long as the present low rates between Inverell and the coast continue? I think so, unless, of course, there is a great future before the district in the shape of developing intermediate traffic. That I am not in a position to express an opinion upon.
2263. All you say is that if Inverell is to be connected with the existing system of railways it will be better to connect it by way of Moree than by way of Glen Innes, because the present loss would only be increased by connecting with Glen Innes? That is so.
2264. *Mr. Wright.*] You say there is no chance of your competing with the Sydney-Grafton traffic by the Moree-Inverell extension, unless at specially low rates? Yes, for general goods.
2265. Those specially low rates would, I presume, seriously affect Mr. Harper's estimate of the revenue to be derived from the line? Unless he has taken all these things into consideration; and I have had no opportunity of talking the matter over with him.
2266. Is it not more likely that Mr. Harper has based his estimate upon existing rates than otherwise? I think it is very likely.
2267. Would he be justified in basing his traffic returns on some imaginary rate to which he might think the Commissioners would come down? I think not.
2268. Therefore we are right in assuming that the estimates placed before us by Mr. Harper are based upon the traffic which he thinks is likely to ensue over the line under existing rates? I should think so.
2269. Then, if the Railway Commissioners have to obtain the traffic at a specially low rate, it will reduce Mr. Harper's estimate of revenue? Yes.
2270. Do you think the old system can ever be revised;—do you think it will ever be in the power of the Railway Commissioners to pass Moree in the long extension from Narrabri to Moree, and carry goods more cheaply to Inverell than to Moree? The public have had to submit to it before; but the object of the Commissioners has been to get rid of these anomalies.
2271. Would it not lead to considerable agitation, and antagonism to the Commissioners' proposal? No doubt it would.
2272. I believe the result of the opposition to the system previously adopted was that the Commissioners abandoned it and gave a through rate over the whole line? Yes.
2273. Have you considered what effect on the northern line the construction of the Moree-Inverell line will have? No.
2274. I suppose you are aware that it will rob the northern line of a great deal of the traffic it now has? It will to an extent.
2275. Therefore, am I right in saying that the proposal to construct 96 miles of railway, which the Department says will not be self-supporting, will rob the existing northern line of a good deal of traffic, and we shall have to spend £2,000 or £3,000 a year to obtain that traffic;—in other words, you will have the same traffic on the two lines as you now have on the one, and you will have to spend a considerable sum of money to obtain it? I do not know that it will rob the main line of a great deal of traffic, because at the present time the best-paying traffic is to and from the coast, and we do not get it.
2276. Still it will rob the main northern line of a large quantity of wool traffic which it now receives? No doubt it will rob it of some.
2277. What is the distance from Deepwater to Werris Creek? 191 miles.
2278. And all the traffic diverted from the northern line to this line will be taken off the main northern road for a distance of 191 miles? There will be a certain amount, but I do not think it will tap the line so far down as Werris Creek.
2279. You will find all the traffic 25 miles west of the northern line will be diverted to the Moree-Inverell extension if carried out? No doubt.
2280. Therefore the existing northern line will be robbed of that traffic? To a certain extent it will.
2281. The Government propose to construct a line of railway 96 miles in length, to cost the country a few thousand pounds more per annum to run than it will pay, and whilst doing that they rob an already impoverished and poor-paying line—the northern line—of a good deal of its traffic. Not only have we this £2,000 to pay, but a portion of the traffic on the main line will be lost? That is a matter of policy.
2282. Are we not justified in adding to the annual loss on the Moree-Inverell line the additional loss which will be incurred on the northern line? There will be a certain amount of loss to the northern line.
2283. It is quite possible for the Commissioners, if the line is constructed, to at any moment issue a regulation to the effect that goods carried 507 miles or over are to be carried at a certain rate? Yes.
2284. But you do not think that plan will be adopted? I do not think so; it is against the Commissioners' policy.
2285. And unless they reverse their present policy the proposed line will be worked at a loss per annum? Yes, I think so.

2286. And they will be increasing and accentuating the loss already incurred on the northern line? Yes, D. Kirkcaldie, Esq.
2287. Do you, as an old railway expert, think that if a man puts his wool on a truck at Inverell he will take it off at Glen Innes, and convey it by team to Grafton? No. 23 Sept., 1896.
2288. Therefore the chances are if the line is constructed between Glen Innes and Inverell nearly all the traffic will come through to Sydney? I would not say that, because a large quantity of goods go from Grafton to Glen Innes and Inverell. The teams which carry those goods take back wool. They take the wool from Inverell to Grafton at very low rates. As a matter of fact I am told they carry it at about £2 10s. per ton.

THURSDAY, 24 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Charles Edward Rennie, Esq., Chief Draftsman, Department of Lands, sworn, and further examined:—

2289. *Vice-Chairman.*] I understand you have prepared a map showing all the information you were asked to furnish to the Committee when you were here last? Yes; it is on a larger scale than the one I had here last week. It shows the whole of the land comprised within 15 miles north and south of the proposed railway, instead of 30 miles as shown by the previous map. C. E. Rennie, Esq. 24 Sept., 1896.
2290. *Mr. Wright.*] What is the number of conditional purchases and other areas on the proposed route? The conditional purchase holdings number 1,297, with a total area of 336,600 acres.
2291. What is the number of leases and the area? Conditional lease holdings 225; area 138,450 acres. That, of course, is within a limit of 15 miles on either side of the proposed line. The area held under pastoral lease (that includes scrub and improvement leases) is 220,500 acres. The land at present available for settlement is 270,800 acres.
2292. Does that include reserves? No.
2293. Can you give us the area of reserves? 359,000 acres.
2294. *Mr. Lee.*] What is the nature of the statement you have in your hand? It is a statement of the area of each portion severed by the proposed line as per book of reference.
2295. Will you state in giving that evidence the dates of the alienations—that is under conditional purchase? I could not give you that.
2296. You are aware that under the Railways Act there is power to resume land within so many years at a stated price, after it has been alienated? Yes.
2297. Have you any data which will enable us to obtain that information? The dates of the conditional purchases, of course, can be got.
2298. *Vice-Chairman.*] Have you prepared a statement which you can put in as portion of your evidence? Yes; it might require some explanatory note to make it intelligible.
2299. *Mr. Lee.*] Your detailed return shows the alienations under conditional purchases, homestead selections, and absolute alienations? The return shows the lands severed by the line.
2300. But they are alienated under different conditions; some under conditional purchase, some homestead selections, and some by purchase at auction? Yes, they are all specified.
2301. All these areas are severed by the railway survey? Yes, the total length of line which traverses each holding is given approximately.
2302. The length of line through conditional purchases will be 34½ miles? Yes. Conditional leases, 5 miles; homestead selections, 1½ mile; settlement leases, nil; land under pastoral lease, 10½ miles; reserves, 19½ miles; alienated land, 19 miles; land available for settlement, 6 miles; total, 96 miles.
2303. Have you any knowledge as to whether there are applications pending for settlement or homestead leases in the vicinity of the proposed line? Yes; an area about 22 miles from Moree, and extending from the railway survey back a distance of 15 miles, is now being measured into blocks for homestead selections, settlement leases, and improvement leases.
2304. Is there a probability of the country being settled upon in the near future? It is expected so.
2305. And under that form of settlement, residence is compulsory? Not on improvement leases. It is on homestead selections and settlement leases.
2306. Do you contemplate having many improvement leases? I could not say—I have not the details. All I can say is that this area is now being subdivided for that purpose.
2307. Then the only available Crown lands along the railway survey appear to be within the vicinity of Moree? No. There are about 70,000 acres, the centre being about 30 miles from Moree.
2308. How far from the railway survey? It stretches from within a mile of the railway survey back to about 15 miles.
2309. And that is looked upon as waste or third-class land? Inferior land. It is thickly timbered and scrubbed.
2310. Under any circumstances it cannot carry a large population? No, it is not anticipated that it will.
2311. What is the character of the land to which you have already referred as being near to Moree;—is it suitable for agriculture? I have not the description here, but the fact of its being designed for homestead selection and settlement lease shows that it must be regarded as fairly good land for settlement.
2312. With those two exceptions, is not the whole of the rest of the land alienated? Close to Warialda there are several blocks of about 5,000 acres each.
2313. Is that inferior land? That I could not say. I have not been over the country.
2314. Is there any available Crown land between Warialda and Inverell? Within the 15 miles limit there are two large areas.
2315. That would be almost in a line with Warialda? Yes; almost due south of Warialda there is an area of about 12,000 acres.

- C. E. Rennie, Esq. 2316. But that would be no nearer Inverell? No.
2317. You might call it within the radius of the Warialda traffic? I should think so.
- 24 Sept., 1896. 2318. Going east from Warialda, what available land is there between that point and Inverell? There is a block of 16,000 acres about 25 miles from Inverell, and about 7 miles from the railway survey in a straight line to cross.
2319. Would it be fair to assume that any Crown lands unreserved at the present time in the vicinity of Inverell must necessarily be inferior land? I should think so. It is highly probable that it is so.
2320. Looking at the map, and seeing where the land has been alienated in the vicinity of Inverell, would it not appear that any unreserved land must be very inferior indeed, if it is vacant? That is extremely probable. There are a few small blocks not vacant. There is one of nearly 2,400 acres.
2321. I suppose the future settlement must be more towards the Moree end than that of Inverell? Yes, there is more land near Moree than Inverell. That is at present.
2322. Moree, and intermediate about Warialda? Yes; the bulk of the vacant land is from Moree to Warialda at present.
2323. There appears to be a large area reserved in the radius you have given;—is it necessary to perpetuate those reserves? That would depend upon investigation and report. The probabilities are that they could be reduced to some extent after inspection.
2324. I should like to direct your attention to the reserves south-east of Inverell? That is a large gold-field reserve.
2325. Covering a very large area of country? Yes.
2326. Has any action been taken to examine those reserves with a view to their readjustment? I only know, generally speaking, that efforts have been made from time to time throughout the Colony to reduce reserves as much as possible, but I could not say if any definite action has been taken lately about this one.
2327. Is not the present practice to let those reserves on annual lease? Yes, to some extent.
2328. Is it not held by many authorities that these very large gold-field reserves are not required? I could hardly answer that.
2329. Has any application been made to your office to have them geologically examined with a view to their reduction and readjustment? There have been applications from time to time of that nature.
2330. Is not correspondence going on between the Department of Lands and your office at the present time? I could not say.
2331. What area is included in that gold-field reserve? I should think there must be between 80,000 and 90,000 acres.
2332. I suppose the smaller reserves going west and north-west are camping, timber, and water reserves, other than stock routes? Yes; they are mostly travelling stock reserves. There is one forest reserve close to Warialda.
2333. Is Warialda, Bingara, and that country within a gold-field reserve? Bingara does not come within the scope of the map.
2334. Is that country included in a mineral reserve? I could not say without consulting a map showing Bingara.
2335. West of Warialda you are outside the mineral belt? Yes.
2336. *Mr. O'Connor.*] You say there are 270,000 acres now available for settlement? Yes.
2337. I understand that towards the end of this year, and probably early next year, there will also be a considerable quantity available for settlement? Yes; I was going to mention that within the leasehold areas in 1897, there will be about 52,000 acres available for settlement through the expiry of the pastoral leases.
2338. *Mr. Lee.*] What position is that in? I have not located it. Then in the year 1900 there will be 145,000 acres more within the same belt. I find I have the dates of expiry on the map. The lease of the pastoral holding No. 681 expires in 1897; leasehold area No. 30 expires in 1897; No. 576 expires in 1897—that is close to Moree.
2339. *Mr. Wright.*] Is there any man with a longer tenure than 1897? Yes; some of the leases are up to 1900.
2340. *Vice-Chairman.*] Will you mention the number of acres available in each period? 52,000 acres in 1897; 149,000 acres in 1900. That makes 201,000 acres in all. Of course that is within the 15 miles limit.
2341. *Mr. O'Connor.*] Is that nearer to Inverell or Moree? It is pretty well divided. There is a large leasehold No. 706, Myall Creek, which expires in 1900, and it is pretty near to Inverell. There is another leasehold, No. 140, close to Warialda; and number 395 immediately south of that.
2342. Between now and the end of four years there will be about 470,000 acres available? Yes.

Percy Scarr, Esq., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and further examined:—

- P. Scarr, Esq. 2343. *Mr. Roberts.*] On a former occasion I questioned you as to the merits of the two lines, namely, from Guyra to Inverell, and Glen Innes to Inverell? Yes.
- 24 Sept., 1896. 2344. I think you said that, all things considered, you were inclined to favour a line from Glen Innes to Inverell? Yes.
2345. Are you impressed with the necessity of Inverell being connected with the railway system of the Colony? With the railway system somewhere, undoubtedly.
2346. You think, owing to its settled population and the fertility of the soil, and its undoubted suitability for wheat production, it ought to be connected with the railway system of the Colony? Yes; in some direction.
2347. Have you formed any opinion as to the connection of Inverell with Moree? No; only from my general knowledge of the country. It appears to me to be a very good scheme.
2348. Do you think it preferable to the Glen Innes-Inverell route? Yes, for this reason: First of all, it seems to be a very much cheaper line, and can be got through more quickly; besides that it will give the Inverell people access to a market which they have got to the westward, and which they have always had.

had. I should like to say that a great deal of what they produce in Inverell could be got rid of out in the west. For that reason it would be a good line to build. P. Scarr, Esq.

2349. Which is the most fertile part of the country about Inverell—to the east, west, or north? To the west and north—that is, out towards Warialda, and then out to the north-west towards Boggabilla. 24 Sept., 1896.

2350. How would the market to the west extend? I take it that there is an unlimited market as far as distance goes, but as to quantity I could not say. Their products could be taken right out to the far interior if they could make it profitable to take them there.

2351. Right out to the Queensland border? Yes.

2352. Do you not think the traffic from Inverell, or I should say the greater part of the traffic, whether Inverell is connected with Moree or Glen Innes, would be most likely to go by road to Grafton, and thence by sea to Sydney;—do you think if a railway to Inverell is constructed, or even if a railway is constructed to Glen Innes, the traffic will be drawn away from the road; I think you will admit that a large amount of traffic now goes by teams from Grafton and thence to Sydney and *vice versa*? I understand there is a good deal of traffic there, but what proportion of the whole it is, I could not say. Some information came before me a short time ago, which led me to think that there was not so much traffic on the Grafton-Glen Innes route as has been reported. I had that information casually some time ago from one of our officers, but I cannot call to mind the figures, nor the occasion on which it arose, but I think I could find it if I had a little time. It left the impression on my mind that there was not such a large proportion going from Grafton to Glen Innes as has been reported to us.

2353. How far back does it refer to? Three or four months, I think.

2354. You gave some consideration to the Uralla and Kentucky lines? Yes.

2355. But your inquiries did not lead you to prefer either of those routes to any of those I have mentioned? No; we could hardly see anything in favour of those lines at all, and put them out of consideration very soon.

2356. Would not a line from Guyra to Inverell be very much nearer to Sydney than a line from Glen Innes to Inverell? No doubt.

2357. And the line could be constructed at less cost? Considerably less cost.

2358. But, notwithstanding that fact, you prefer the Glen Innes route? Yes, for the reasons stated in our report.

2359. On account of the land being superior? Yes; but one very strong point which weighed with me was, that we considered the Casino and Tenterfield line would have to be constructed before many years were over, and assuming that it was constructed, and that there was much traffic to take to Inverell from that direction, that traffic would have to be taken to a height of 4,500 feet above the sea, instead of something like 3,000 feet at Glen Innes and Tenterfield. It would have to be taken to the top of Ben Lomond, then down again to Glen Innes, and it would be very many miles out of the way.

2360. Having been over the New England district, are you firm in your belief that a connection should be made with the coast—between the coast and the table-land of New England? Some day. I do not think it is a very urgent matter at the present date.

2361. What are your views with regard to the proposal to connect Glen Innes and Grafton by railway? I should like to speak with all respect to those who advocate that line, but I think it is simply a piece of madness, for the reasons which were given very plainly in our report.

2362. I suppose you think it is impracticable? Commercially impracticable.

2363. That is owing to the rugged and mountainous character of the country? Yes; and there would be no produce to be carried on the line between Grafton and Glen Innes.

2364. It would, I suppose, be entirely dependent for its traffic on the products of the country west of Glen Innes? That piece of line, 53 miles from Glen Innes to Inverell, would have to earn the whole of the money on the 150 miles.

2365. Do you favour the proposal to connect with the coast from Guyra *via* Don Dorrigo;—I suppose you favour it under the assumption that it is considered absolutely necessary to get to the coast? Yes. Our instructions included the following:—

The second branch of the inquiry will embrace the consideration of the question as to the best means of connecting the Great Northern railway with the proposed coast line.

Our instructions were not that we were to say which we considered was the best line, and which connection with the coast should be first made, but the best means of connecting the Great Northern line with the proposed coast line, taking it for granted that the coast line was to be constructed.

2366. Is that the line from the Hunter to Grafton? Yes.

2367. Assuming that that were to be constructed, you would recommend it to go from Guyra, by way of Don Dorrigo? In the first instance.

2368. During your visit to New England you went as far as Tenterfield? Yes.

2369. And thence to Casino? Yes.

2370. Do you think a line should be made from Tenterfield to Casino, and that it should join the line at Lismore? Some day no doubt—as soon as they can find the money for it.

2371. That would be rather a big order? I think it would. It is put down at £1,000,000.

2372. If that north coast line should not be carried out, do you think the line from Tenterfield to Casino is one which might be favourably considered? Yes, I think so.

2373. If a coastal connection were deemed necessary at the present time, what route would you be inclined to suggest? The Casino and Tenterfield line.

2374. How many miles would that be? I think it is 86 miles from Tenterfield to Casino, and 17 miles from there to Lismore.

2375. What would be the nearest shipping port? Lismore is the head of the navigation on the Richmond. The ocean-going boats come up to Lismore.

2376. What draught of water is there at the entrance to the river? I suppose there will be 12 or 13 feet. The Tomki goes up there regularly.

2377. I suppose a steamer of 500 tons could go up there? I should think so.

2378. Would not Byron Bay be a better shipping place than Lismore? If they make the harbour which was talked about. I understand vessels of all sizes can go there if a harbour is made.

2379. And if a line from Tenterfield to Casino were made, it would be necessary to make a harbour at Byron Bay? I do not see that that follows. I do not see the necessity for a harbour at Byron Bay.

P. Scarr, Esq.
24 Sept., 1896.

2380. You think the Richmond would afford all the depth of water necessary? I do not say that. What I mean to say is this: assuming a harbour is not to be made at Byron Bay, it need not block the Casino and Tenterfield line.

2381-2. But if the line were constructed, you would want the Byron Bay harbour? There is no doubt it would be a strong argument in favour of the harbour, because it would be a fine shipping port for all that western country.

2383. How far would Inverell be from the shipping port then? I think the new distance on the Inverell and Glen Innes line is 53 miles. The distance from Glen Innes to Tenterfield is 60 miles. If that be so, that would be 53 plus 86 plus 17 plus 60, in all 216 miles.

2384. Seeing that Inverell by way of Moree is 509 miles from Sydney, and the coast could be reached by way of Glen Innes and Tenterfield in 216 miles, would it be fair to assume that that route would be largely availed of by the Inverell people? It is only fair to assume that.

2385. *Mr. Black.*] I suppose there is no likelihood of the proposed line being carried beyond Inverell? That I could not say.

2386. Have you any idea of any direction it might afterwards be thought advisable to carry it? No; not unless it is carried on to Glen Innes.

2387. I suppose you think that that is a very remote contingency? I should think so, if the Moree-Inverell line is carried out. That, of course, is only my own idea.

2388. *Mr. Lee.*] Independent of your special visit to the district in 1890, to report upon the various railway routes, you had a prior knowledge of the country? Yes.

2389. And you are well acquainted with the whole of it? I am.

2390. I suppose your long connection with the Roads Branch of the Department of Public Works gives you a complete and detailed idea of the district? Yes. Apart from my personal knowledge of the district, I also obtain a good deal of information in going through the papers, and so on, in connection with the business of the Department.

2391. You have been able to watch the progress and traffic of those districts for many years? Yes; it has been my business to do that.

2392. We have it in evidence that the proposal to construct a line from Moree to Inverell has been made for the purpose of directing the traffic west of the Great Northern line to the metropolis, in lieu of any prospective coastal connection. That is to say, the proper way to take the traffic is by the west *via* Moree, and not to the coast;—does your general knowledge of the district lead you to the conclusion that that is the proper way to take the traffic? It seems to me to be a question first of all as to the initial expense of getting the traffic, and secondly whether the traffic could be worked at a cheaper rate on the steeper grades on the descent from the table-land to the coast.

2393. There would also have to be taken into consideration the reduced cost of carriage to the producers? Yes.

2394. The proposed line to Inverell *via* Moree will make Inverell 500 miles from Sydney, and the truck rates, which include all classes of trade, are £8 7s. per ton. If the drays from the Clarence can deliver goods from there at Inverell at from £3 10s. to £4 per ton, do you think it would be possible for the railway to compete with them? That is a question I hardly know how to answer. It seems plain that they could not do it.

2395. If the railway could not compete with that traffic, would it lead you to believe that that is the proper way to take it? Looking at it from that point of view only, I should say not;—that is speaking of the goods carried from Sydney to Inverell or *vice versa*. Then the question would come in whether there would not be so much traffic on the way apart from the through traffic as to justify the construction of the line.

2396. You know that Glen Innes is 427 miles from Sydney? Yes.

2397. And you know that since the railway was opened the drays from the Clarence to Glen Innes and Inverell have taken a large amount of traffic which should have gone along the Great Northern line? Exactly.

2398. To the extent of £6,000 or £7,000 worth of freight per annum? Yes.

2399. If it is found impossible to control that coastal traffic at Glen Innes—a distance of 427 miles—how is it to be controlled if it has to be carried 509 miles? They might be able to carry that 509 miles at a cheaper rate than they can work the 427 miles.

2400. But what if the rate is £8 7s. a ton? They might be able to take it at a cheaper rate than that. They might be able to land a ton of goods or a truck load of goods at Inverell *via* Moree at a cheaper rate than they could land it at Glen Innes *via* the Great Northern line.

2401. Why? Because of the extra working expenses on the steep grades going up there.

2402. It is held by the Department that grades are not considered in working the traffic—that there is a certain amount set apart per mile for working traffic irrespective of what the grade may be? I am not a railway expert, and am not intimate with these matters.

2403. Did your visit to those districts lead you to the conclusion that there should be some connection between the table-land of New England and the coast? Yes; but I do not think that it is an urgent matter.

2404. Did you form the conclusion that it would be a desirable thing? Yes.

2405. If the proposed line were carried out, and if the north coast line were carried down the coast with no coastal connection, the residents of New England would be no nearer to a port than they are at the present time? Certainly not.

2406. And that would mean that for all time they would have to carry their produce either from the extreme north, 491 miles, by the Great Northern line, or from Inverell, 509 miles? Yes.

2407. Whereas in a direct line to the coast they could go by one route by way of Tenterfield from Glen Innes, 216 miles, and by way of Guyra and Don Dorrigo, about 150 miles? No; it is 150 miles from Guyra to Grafton *via* Don Dorrigo.

2408. That is so; and it is 55 miles from Guyra to Inverell, making 205 miles? Yes.

2409. In any case, no matter which way it goes to Inverell, the people would be less than half the distance from the port? Yes.

2410. And Inverell is only one portion of New England? Yes.

2411. The people of the main range of New England, such as Armidale, Glen Innes, and Tenterfield, are as much, or even more interested in getting to the coast than the people of Inverell? Yes. There is one point

point I should like to mention. You speak of the distance from Inverell to Sydney as 509 miles. Sydney, however, is not the nearest port. You pass through Newcastle which is 100 miles, so that you would have 409 instead of 509 miles. P. Scarr, Esq.
24 Sept., 1896.

2412. But to all intents and purposes, Sydney is the port for the station produce of the country, such as wool, tallow, hides, &c. It is the saleroom and the port? I presume so.

2413. If it can be shown from the figures placed before you that the cost of getting to the Inverell country is so much in excess of what it would be by going by the Great Northern line as at present, or by the coast by dray, in what respect could you approve of the extension of a line from Inverell by way of Moree to Sydney? I still think it is an open question, so far as my knowledge goes as to what rate the Railway Commissioners could afford to carry the stuff. Besides that, when you have the stuff landed on the northern coast you have to add to it the freight to Sydney whatever it may be.

2414. Can it not be accepted as a fact that if the carriage by rail to Inverell is 33 per cent. more than stuff can be conveyed from the coast for, it is more likely to go by way of the coast than by rail? I presume so, if there is so much difference as that.

2415. I presume when you were in those districts you did not go north of Tenterfield? I went as far as Wallangarra on the railway line.

2416. Have you ever been in that portion of the Tenterfield district known as Woodenbong, Killarney, Acacia Creek, and Tulloom? No.

2417. Are you aware that there is some of the richest land in New South Wales there? I understand there is some good land there.

2417½. Carrying large forests of valuable timber? So I understand.

2418. And are you aware that a grade could be obtained from Tabulam *via* Woodenbong to Tenterfield, and entirely miss the Richmond Range? I have no information on the subject.

2419. Since you made your report, the cost of construction has been greatly reduced? I believe so.

2420. And the construction of branch lines has, to a certain extent, materially altered the railway policy—was the line from Murwillumbah to Lismore constructed at the time you made your report? It was being constructed when we were up there.

2421. Had you in view the importance of connecting that piece of railway with the main railway system of the Colony? Yes.

2422. Were you of opinion that, as a separate railway, it could not be run with any prospect of paying? That was our opinion, and I think it must have been patent to everybody.

2423. Therefore, it would only be justifiable if ultimately made a portion of the railway system? Yes.

2424. As a separate railway it was a mistake? It seemed so. I may say that at the time I had very little knowledge of it.

2425. Therefore it became a necessity to make a connection? Looking at it from that point of view, and desiring to make the Lismore and Tweed line pay, it would have a better prospect of paying if it were connected with the table-land. Of course that is a matter of policy.

2426. If, as you assume, a connection will have to be made some day between the north-east coast railway and the railway system of the Colony, then it would naturally point to the fact that the connection should be made somewhere in the direction of Tenterfield,—I do not say at Tenterfield, but somewhere in that direction? Yes.

2427. That would be the nearest point, and the most accessible? I should say that, apart from the proposed north-coast railway, the Tenterfield to Casino line is a proper connection to make, for these reasons:—that it connects with a very rich and fertile piece of country, and it would afford, by connecting with the Brisbane line at Southport, an unbroken gauge from Brisbane to Albury, if the Brisbane people would alter their gauge from Brisbane to Southport, a distance of 50 miles, and then about 17 or 20 miles from Southport to the border.

2428. But if a connection were made between the Great Northern line and the coast line at Lismore, you do not hold that it would follow, as a matter of course, that a harbour would have to be constructed at Byron Bay? No.

2429. That would be a matter for subsequent consideration, when the trade sufficiently developed to admit of direct ocean traffic? Yes.

2430. Apart from that, the facilities offered to steamers running to the Richmond River would be sufficient to meet the ordinary traffic? At present.

2431. And, if necessary, in order to embrace the whole of the north-east districts, Grafton could be connected by a branch line to Casino? Yes.

2432. You do not wish to convey the idea that if the connection is made, Byron Bay harbour will have to be made? No. The railway having been made, it will be an argument in favour of the Byron Bay harbour being constructed.

2433. You express the opinion that if the trade is brought in from Inverell to Glen Innes it will have to be lifted over the highest point, 4,500 feet, that is Ben Lomond? On the way to Sydney.

2434. Are you aware that it would not have to be lifted 4,500 feet? No.

2435. It would have to be lifted scarcely 1,000 feet? I think it is more than that, something like 2,000 feet.

2436. Ben Lomond is 4,500 feet, and Glen Innes is 3,500, so that the lift really would be 1,000 feet? From Glen Innes; but from Inverell it would be more than that. Inverell is 2,000 feet, or thereabouts.

2437. The steepest grade in that lift would be 1 in 40? So I understand. That is the existing grade on the northern line.

2438. You attach much value to these lifts? As I have said before, I am not a railway expert. But the railway people seem to attach considerable importance to them.

2439. I suppose it would matter very little whether you lifted your traffic at Ben Lomond or the Hawkesbury? I do not know of any place about there which is anywhere near the height of Ben Lomond.

2440. The lift from the Hawkesbury to the top of the hill—7 or 8 miles—is between 600 or 700 feet, and the grade is 1 in 40? Yes, that is the grade.

2441. And you have the same grade there as on Ben Lomond? Yes, the same grade, but not the same height to lift. Six or 7 miles of grade would not be so bad as 20, 30, or 40 miles of grade.

2442. You do not find 20 or 40 miles of grade together? I take it that it amounts to the same thing. You burn the same coal, and have the same wear and tear.

P. Scarr, Esq. 2443. Have you seen anything since you made your report which would induce you to alter your opinion? I should like you to keep in mind the instructions we received. We were to report on a connection with the proposed north coast line—not as to the best means of getting to the coast. That tied our hands very materially.

21 Sept. 1896.

2444. You see no reason to alter your report at the present time? No. We recommended the Don Dorrigo connection as the best one under those instructions. Had we not been tied down, as far as I am concerned it might have been different.

2445. That must be observed in your examination, because it is so clear what your instructions were, and no one could read them without coming to the conclusion that you were tied down? Yes.

2446. *Mr. O'Connor.*] Do you know the district between Moree and Inverell? Not the whole of it. I know Inverell fairly well, and I have been out as far as Goondiwindi, but not to Moree.

2447. Do you know anything of the country from Guyra to Inverell? Yes; there is some very good land on the road.

2448. What is the distance? Fifty-six miles.

2449. Is it occupied at the present time? Yes, but only sparsely. There is a good deal of farming as you get towards Guyra, where the land is good.

2450. Are the people there pretty well off? It did not strike me that they were. They all seemed to be struggling, and I understand they are not very prosperous at the present time.

2451. Do you know the country between Inverell and Glen Innes? Yes; there is some very fine land there.

2452. It is fit not only for pastoral but for agricultural purposes? Yes.

2453. We have had some evidence to the effect that if the line is constructed from Moree to Inverell it should be extended to Glen Innes;—have you formed any opinion with respect to that extension? I cannot say that I have. But it seems, looking at the matter in a broad way, that that connection would have to be made. I think it would be a benefit to have that connection, but then the question of expense comes in, whether the game is worth the candle, so to speak.

2454. I suppose you know the country well from Glen Innes to Tenterfield? Yes.

2455. Do you know the country from Tenterfield to Lismore? Yes.

2456. What kind of country is it? There is some fine country below the ranges—from Tabulam to Lismore. Of course it would be very natural to consider whether the table-lands of New England should be connected with the sea as soon as possible.

2457. I think you have expressed the opinion that the construction of a line between Glen Innes and Grafton is to be regarded at present as a wild-cat scheme, on account of the nature of the country? Yes; and on account of the enormous expense of constructing the line.

2458. What is your opinion with regard to the construction of a line between Tenterfield and Lismore to the sea coast? I am altogether in favour of a line from Tenterfield to the coast, and have been from the first day I saw the country.

2459. I believe that nature has largely endowed that portion of the Colony, and has made it available for settlement, and it is already thickly populated? Yes.

2460. And it is a very prosperous district? Yes.

2461. And the seaport of Lismore is a very fair one? There is a good navigable river. The Tomki seems to have no difficulty in going up there regularly.

2462. *Mr. Clarke.*] In the report which you and Mr. Price made in 1890, you expressed a decided opinion as to the impracticability of a line from Glen Innes to Grafton? Yes.

2463. Do you still adhere to that opinion? Yes; very strongly.

2464. For what reason? First of all, because of the enormous expense of constructing the line. If you made it, there would be nothing to carry upon it, so far as the intermediate country is concerned.

2465. Are you aware that a very large quantity of goods is carried by team from Grafton to Glen Innes and Inverell? I think the expression "a large quantity" is a comparative term. I do not know what the total quantity would be; but I feel pretty certain it would not be sufficient to make a railway pay even working expenses.

2466. I believe at the time you reported in 1890 the estimated cost was about £2,000,000? It was £19,000 a mile.

2467. I believe it has been found since then that a railway could be made for half that amount? I am not aware.

2468. At the conclusion of your report you stated:

Being, therefore, convinced that soon after the completion of the Guyra to Grafton line the Tenterfield to Casino railway must also be constructed, we are of opinion that the general interest of the whole country would be better served by the line from Glen Innes to Inverell than by the line from Guyra to Inverell, for the reason that Glen Innes is between the two points of connection with the coast.

Finally you say:

And on these grounds we found our disposition to favour—

1st. The construction of the Glen Innes to Inverell line.

2nd. The construction of the Guyra, *via* Don Dorrigo, to Grafton line.

And at a later date that from Tenterfield to Casino.

Do you still adhere to that opinion? As I informed Mr. Lee a short time ago, it is necessary to bear in mind the instructions we receive. The connection was with the proposed north coast railway line, and not with the coast; that makes all the difference. Our recommendation was that that was the best way to connect with the proposed north coast railway. We were not asked to say which was the best way of connecting with the coast.

2469. You still believe in the construction of a line from Inverell to Glen Innes? As the best way of connecting the northern line.

2470. And do you approve of the proposal to construct a line from Moree to Inverell? I must speak with a good deal of reservation, because I am not acquainted with the country and do not know much of the circumstances.

2471. You have stated that you are not acquainted with the whole of the land in the immediate neighbourhood of the proposed line? Yes; I was never at Moree.

2472. Do you think the Moree-Inverell line, if constructed, would be of benefit in getting a portion of the Queensland trade? It would intercept a large traffic from the northern border. A very large traffic

traffic now comes down by team through Bingara on to Tamworth, and it would intercept the whole of P. Scarr, Esq. that traffic.

2473. Will not the Moree line, now almost completed, intercept a good deal of that traffic? A good deal of it. 24 Sept., 1896.

2474. The proposed line would, no doubt, obtain the traffic in wool as far as the Queensland border? I should say so.

2475. Can you give us any idea as to the nature of the country from Moree to Inverell? Only as far as Warialda.

2476. What is it adapted for growing? The district as far as Warialda will grow anything. I may mention that I saw in an orchard at Inverell apples, grapes, and the olive; these, of course, grow over a wide range of climate.

2477. Would much of the wheat find its way to Sydney over such a long distance? I should say it would depend very much on the rate of carriage.

2478. From a commercial point of view, would we be justified in spending so much money on a line which will entail a loss of £2,800 per annum? As far as the carriage of wheat is concerned, I may point out that the distance from Sydney to Berrigan, where they are now constructing a line almost entirely for the carriage of wheat, is nearly the same as from here to Inverell.

2479. Can you say whether much of the wheat grown there would be required for local consumption? At the time we were at Inverell the farmers complained that they had a surplus which they could not get rid of. They also pointed out that if they had means of getting to the west they would get rid of it and grow a great deal more.

2480. I notice in part of your report that you refer to an extension to Bingara? Yes.

2481. This Bingara extension would run through one of the most fertile parts of the Inverell district. Are you aware that the Public Works Committee have recommended an extension of the railway from Tamworth to Manilla? Yes.

2482. Are you aware that at present it is not intended to carry the line further than Manilla? Yes; but at that time we did not assume that the Manilla line would be carried out at all. We were asked to report on the Manilla line which we did to a very slight extent, and our opinion was against the construction of it.

2483. You have stated that if a line is to be constructed to the coast you prefer the line from Tenterfield to Lismore? Yes; as a means of getting to the coast.

2484. I believe the navigation of the Richmond River has been very much improved of late? Yes.

2485. As well as the navigation of the Clarence? Yes.

2486. And the probabilities are that ultimately some portion of the produce of those districts, if the railway is completed either to Grafton by the direct route or by Guyra, and then through the Don Dorrigo country, will go direct from these rivers to any part of the world without coming to Sydney? Provided the rivers will admit ocean-going ships.

2487. On the whole, from what you know of the district, you think the proposal to build a railway from Inverell to Moree should be carried out? I do not care to express a decided opinion upon it, but it seems to me a good project as a means of assisting the Inverell district.

2488. Still if it should be carried out it would be the means of blocking the line to Glen Innes? I presume it would have that effect.

2489. And that would be contrary to what you recommended some few years ago? I do not say that, because the circumstances have altered.

2490. *Mr. Wright.*] Do you not think the north should have communication with the west and the interior? I think it should, but whether the time has arrived for it is another matter.

2491. In view of your belief that ultimately there must be a coastal connection, is there any opinion in your report which you would like to alter? No; I am still of the opinion which is expressed there, but the Moree and Inverell project is entirely new, and was never spoken of at the time we were there.

2492. You say you do not desire to alter any portion of our report, that you believe that, sooner or later, there must be a coastal connection, and that you adhere to the recommendation you made? As to connecting with the north-coast line, I think the shortest way to put it would be this. If I were asked which was the best connection to make with the coast, I should say the Tenterfield to Lismore line.

2493. Whilst believing that the northern districts should have coastal connection, you also believe that a railway should be constructed from Glen Innes to Inverell? Yes; the Glen Innes line is the proper one to make to connect with the north coast and the northern line.

2494. I notice from your report on the Glen Innes and Grafton line that you went over the country, but did not get much off the road? It is not easy to get off it.

2495. You did not follow the railway route at all? No one could follow it when we were there.

2496. Have you heard that considerable deviations have been made, and that the grade has been reduced from 1 to 33 to 1 in 60? I have heard that the grade has been very much reduced.

2497. If new routes have been discovered, and the grades reduced to 1 in 60, it should modify your hostile opinion? Not at all. Our opinion was formed in consequence of the nature of the country we passed through, and the hopelessness of getting any produce on the way to carry on the line.

2498. You did not follow the route? No; but we knew what it was.

2499. Would it be news to you that for 30 miles out of Grafton the railway passes through splendid country? It depends upon what you mean by splendid country. I saw none.

2500. Were you on the river? Yes.

2501. Is not that good country? Yes, along the banks of the river; but directly you get away from the Clarence you get into very poor country. I do not know where the deviations referred to have been made, but I understand that they are in the upper part of the line.

2502. I am told that the upper part is very good country, but I am speaking of the lower part? Unless we can get away from the valley of the Mann River, I do not see how they can improve the country. We climbed to the top of a very high mountain—2,500 feet high—and could see nothing but mountains.

2503. If a new route has been discovered, avoiding the bad belt of the Mann River, and considerably altering the grades, would not your opinion necessarily alter? I should have to see it again first. All I wish to adhere to is that, in my opinion, it is not possible to get through good country there. The good country is not there to get through.

- 94
P. Scarr, Esq. 2504. What is the country like from Tenterfield to Tabulum? It is hilly almost throughout.
2505. Do you consider it first-class agricultural country? No.
24 Sept., 1896. 2506. What is the country like from Tabulum to Casino? There is a good deal of good country from there. For almost the whole of the distance there is good land.
2507. What is it like from Casino to Lismore? There is good country there.
2508. Do you consider it first-class country? There is a good deal of hilly country between the two.
2509. Are there not considerable hills? Yes.
2510. And is not nearly the whole of the rest of the country a swamp? Hardly that; but even swamps are valuable.
2511. You do not consider it good agricultural land? I think a good deal of the swamp country could be made good agricultural land by drainage.
2512. Would you consider the country from Casino to Lismore good country? There is a great deal of good land between the two; but there is also a considerable proportion of hills.
2513. Do you consider the flat land good for agriculture? A good deal of that land is fit for agriculture.
2514. I suppose you have a general knowledge of the country between Casino and Grafton? I have always understood it was poor country.
2515. Did you go to Byron Bay? Yes.
2516. I suppose it is all good country from Lismore to Byron Bay, except a little nearer the coast? Yes, nearly the whole of it.
2517. And you think eventually there will very likely be not one but two connections with the coast? I should say so eventually.
2518. Do you think a connection with the coast *via* Tenterfield will be of material assistance to the New England district? It would in enabling the people to get rid of their produce.
2519. Would it be as good as the Guyra route *via* Don Dorrigo? That would only enable them to get to Grafton.
2520. But it would tap the railway at a very central point at Llangothlin? Yes.
2521. That is nearly half the way on the New England plateau, and divides the district with the Queensland border on the one side and the top of the Moonbi Ranges on the other? About half way, I should say.
2522. Looking at it from that point of view, it would be a better distributing centre than Glen Innes or Tenterfield? No; I hardly think that.
2523. If there is a considerable traffic springing up between the western portion of the Colony and the coast, would not a place in the centre on the northern line be better as a depôt for this particular trade than one at the extreme end? It would in one sense. I think it would tap the coast more centrally, but I do not think it would be likely for many years to tap the population. There would always be larger population on the Richmond and the Tweed than on the rivers further down.
2524. It would tap the coast centrally, and would be the best place for the western trade to converge to. It would bring the western country nearer to the railway than any other junction? I suppose it would.
2525. You have been on the proposed line as far as Warialda? Yes.
2526. Is it fairly good country? It is some years since I was there; but as far as my recollection goes, there is some good country.

FRIDAY, 25 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.

THE HON. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Percy Scarr, Esq., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and further examined:—

- P. Scarr, Esq. 2527. *Mr. Wright.*] You have stated that the country around Warialda is not first-class country? My
25 Sept., 1896. recollection is that immediately around Warialda it is not very good.
2528. Have you been north of Warialda? Yes; I went from Inverell to Goondiwindi. There is a lot of good country down there.
2529. I suppose you consider the land all the way from Inverell to Warialda, with the exception of a few miles, is fairly good? Yes.
2530. What is the nature of the land east of Inverell—about King's Plains? A large proportion of that is very good land.
2531. The whole of the land between Glen Innes and Inverell is good? Yes.
2532. What is the nature of the country between Tingha and Ollera? Almost worthless.
2533. And from Ollera to Guyra? There is good land there almost the whole way.
2534. With the exception of that piece of land, is there any good land between Guyra until you get to the Plains? There is one fine estate—Stratten—where there is some excellent land. That is to the south of Ollera.
2535. You stated in answer to Mr. Lee that nearly all the land on the surveyed route from Guyra to the coast is good? It is good land right down to Guy Fawkes. With the exception of 3 or 4 miles approaching Guy Fawkes, and then there is good land through Guy Fawkes, through the Don Dorrigo Scrub.
2536. What is the altitude of Guy Fawkes? About 4,400 feet; and Coghlan's Plain, in the Don Dorrigo, is 2,200 feet.
2537. Guy Fawkes is about the same altitude as the railway line at Ben Lomond? About.
2538. And the proposed survey is over Guy Fawkes? Yes.

2539. What is the distance from Guy Fawkes to South Grafton or Coff's Harbour? It is about 70 miles from Guyra to Guy Fawkes, and we estimated the distance from Guyra to South Grafton at 145 miles. I understand, however, when it came to be measured it was found to be a little more. P. Scarr, Esq.
25 Sept., 1896.
2540. Then you have to get down over 2,000 feet in a short distance of line? It is not a short distance. It is 25 miles from Guy Fawkes to the centre of Don Dorrigo.
2541. The difference in height between the two places you have mentioned is over 2,000 feet? Yes.
2542. And the distance is only short? Yes.
2543. Would that involve steep grades? As the distance is 25 miles, the grades should not be very steep.
2544. Have you any idea what is the length of the survey from the top of the hill at Guy Fawkes to the foot of the range into the Don Dorrigo Scrub? Twenty-five to 30 miles, and it is a uniform descent.
2545. You mean to say there is a steady descent from the top of the hill to Coghlan's Plains? Yes; and then you have a pretty uniform descent to Glen Ray.
2546. Whichever route is adopted, it is patent that you have to get something like 4,000 feet above mean water-level? Yes.
2547. Then the only difference in regard to the route is the question of a gradual descent in place of an abrupt one? Yes.
2548. You think the route from Guyra to the coast offers the best natural grade? I should hardly like to say that, because I do not know the various grades on the line very well; but I know there is a uniform descent from Guy Fawkes towards the coast.
2549. At the time you made this report had Mr. Simpson's survey been made? He had been through the country, but had not made a survey. I understand the survey has never been completed.
2550. Is it not a fact that from the top of Guy Fawkes through the Don Dorrigo Scrub the survey has never been made—only an exploration? When we were there the survey had not been carried through the Don Dorrigo. There was a surveyor working on the ranges above the Orara, and one near Guy Fawkes.
2551. Were they working from east to west in order to form a junction? Yes.
2552. It is quite evident that you consider this route with rather a favourable eye, and you think a survey should be made? I think it would be well worth the expenditure.
2553. I notice that you give it the preference over the other two routes? As a means of connecting with a coast railway, not otherwise. I might explain why I think so. If you have the coast railway right up to Grafton and then on to join the Lismore line you bring stuff down from the table-land, and the Guyra line would form the best point of junction, because you could then distribute north and south; but if the coast line were not carried far north, it would not be the best connection. Assuming that the coast line was carried as far as Coff's Harbour, it would only be a partial connection. You would only be able to send stuff from the table-land to the southward.
2554. That applies almost to any of the coast lines; you cannot get a distributing centre from the coast unless you have a coast railway? That is so.
2555. So that in the event of the line going from Tenterfield to Casino, and thence to Lismore, it will supply the Richmond and Tweed Rivers, but will not be useful for the Clarence and Macleay unless the coast railway is constructed? Exactly.
2556. Have you been to Coff's Harbour? Yes.
2557. What are your views as to the possibility of making that a good harbour? I have been told by men who know something about it that it is not a good place for a harbour.
2558. Was Captain Howard there when you were there? Yes; he was surveying.
2559. The country from Tenterfield to the coast is partially good and partially bad? Yes.
2560. How would a railway from Casino to Tenterfield suit the New England district as a means of getting produce away? The people would have a good market in the northern rivers district—the Richmond and the Tweed.
2561. Do you think it is desirable in the interests of the producers on the table-lands and the coast-lands that a railway should be constructed from the northern table-lands to the sea-board? I do not think it is an urgent matter at the present time.
2562. Do you think it is a policy the country will eventually have to adopt in order to give facilities to the people to interchange their commodities with the northern settlers and *vice versa*? I should say so, especially when we get the northern line connected with the interior.

Edmund Lonsdale, Esq., M.P., sworn, and examined:—

2563. *Vice-Chairman.*] What electorate do you represent? Armidale.
2564. *Mr. Black.*] What form of railway communication do you favour? If you intend taking any evidence as to the coast connection, I, of course, favour the Guyra-Inverell connection, and a continuation from Inverell to Moree as one continuous line. The continuation, of course, could go from Glen Innes all the same. I hold that for the interior of the country we want a railway on the eastern sea-board. The trouble is the want of a harbour. Having decided upon a port of outlet, we could go for that port; but from my local knowledge, I would favour the Coff's Harbour scheme.
2565. Then it is of no use deciding on a coastal railway until a port has been decided on? No.
2566. You know the country? I know the country on the Guyra route to some extent.
2567. Have you ever been through from Guyra to Grafton? I have been from Armidale to Grafton and from Guyra to Armidale.
2568. Is there a good road from Armidale to Grafton? A very fair road.
2569. Where does it connect with the Glen Innes to Grafton Road? They never connect. They come in at Grafton. There is a cross-road from Nymboida to the Newton Boyd Road junctioning somewhere near Buccarumbi.
2570. How do you get across the rivers? You punt across the Nymboida.
2571. You do not cross the Orara Bridge? No.
2572. Does the Guyra Road run into the Armidale Road? The road goes direct from Grafton, and the Guyra Road comes down to Armidale. If you went direct from Guyra you would junction somewhere by Guy Fawkes to the main road.
2573. If that is so, is it fair to suppose the Guyra people go to Grafton through Armidale because that is the best road? They are the made roads. You descend into Armidale, and then have to rise on the road; but by keeping from Llangothlin you keep on the range and run down by Guy Fawkes.

2574.

E. Lonsdale,
Esq., M.P.
25 Sept., 1896.

- E. Lonsdale,
Esq., M.P.
25 Sept., 1896.
2574. How is it you do not favour a railway from Armidale to Grafton? Because the difficulties in getting from Armidale to Grafton are, in my opinion, greater. A survey was made from Armidale by which they got some hundreds of feet higher, 40 or 50 miles out, than they were when they started.
2575. It would appear, looking at the natural contour of the country, that the Armidale people in going to Grafton should go through Guyra? No, because there is a much longer distance to go round.
2576. Do you know the Inverell country? No; but I know the country between Inverell and Glen Innes.
2577. Do you think the wants of Inverell, and the fertility of the soil between Inverell and Glen Innes, in spite of the heavy grade, warrant the construction of a railway line? I do not favour the construction of that line.
2578. A line being constructed between Guyra and Grafton, how would you connect Inverell with the coast? You would connect Inverell by a line from that place.
2579. Would not the grades between Inverell and Guyra be almost as great as the grades between Inverell and Glen Innes? About the same.
2580. Is the soil any better between Inverell and Guyra than between Inverell and Glen Innes? No.
2581. Is it as good? Not continuously.
2582. Is one half of it as good? I should say about half of it.
2583. The surveyed distance between Inverell and Glen Innes being 53 miles, and the surveyed distance between Inverell and Guyra being 55 miles, and there being, as is computed, between Inverell and Glen Innes 40 miles of excellent country, and there being, according to the statements of the surveyors, on the 55 miles between Guyra and Inverell, only about 25 miles of good country, and you having admitted the grades in each case are about equal,—can you give the Committee any reason why you prefer the Guyra to Inverell route to the Inverell to Glen Innes route? The junction at Glen Innes would mean coming over Ben Lomond, where there are heavy grades. The junction at Guyra avoids that altogether. If we junction at Guyra the distance from Inverell to that junction would be further.
2584. You mean that the extra distance to be travelled on the main line by the Inverell and Glen Innes route would counterbalance any other advantages to be gained? Yes. Besides you have the extra grade over Ben Lomond which you avoid the other way.
2585. Have you formed any opinion as to the advisableness of constructing a railway between Moree and Inverell? I think it should be constructed. If you take the Glen Innes route there is a difference of 36 miles to Sydney, but the traction from Inverell to Sydney, so far as I can ascertain, will be very much lighter by the Inverell-Moree line than by way of Glen Innes. The cost of the line would be less, and there would be less interest to pay. The Commissioners would make more profit by taking goods to Sydney by the Moree-Inverell line than by the Inverell-Glen Innes line. I think the western country is, to some extent, the market for Inverell. It would be the market for the potato country about Guyra. I am told the Moree country will scarcely ever be a country for cultivation, because it has no subsoil. Consequently there will always be a market for Inverell produce in that direction. I cannot see how it will affect the Inverell or Guyra line being made from Inverell, because if a line were made to either place it would, in the interests of the country, have to be continued. It appears to me that whilst this battle of lines is being fought, with the knowledge that the line ought eventually to be made, it is not a wise thing to keep that community out of railway communication with the centres of population and with their own natural market. The Inverell-Moree line is not in any way an antagonistic line to the two lines mentioned.
2586. Do you think the railway being constructed from Moree to Inverell, which would have the effect of increasing the amount of traffic over the main line to Sydney, it is at all likely that means of communication will be given to the coast, which, a suitable harbour having been discovered, would eventually, without doubt, have the effect of lessening the amount of traffic over the main line? The Commissioners might probably raise an objection to a line going that way, but in my opinion the Railway Commissioners do not control the railway policy of the country.
2587. I suppose you are inclined to agree with me that if you connect Inverell with Moree, and afterwards connect Inverell with the coast, the traffic will be diverted from its basin, which is now Sydney, and will run in a contrary direction towards the nearest coastal port? Yes; the people will send produce to the places which suit them best. If it suits them best to send it to the coastal port they will send it.
2588. I suppose you agree with me that the construction of the proposed line will not afterwards prove prejudicial to coastal connection? I think it will not. It will, no doubt, be used as an argument; but if we use our common sense, I do not think it will affect us. You will have a stronger force behind you for a coastal line than you have to-day. Personally, however, I see no reason why the line should go to Grafton. I take up this position: This must be a great exporting country, and to handle your stuff over and over again is ridiculous. You must get a port somewhere which will take you out to the deep sea so that your stuff can go straight to the markets.
2589. The railway has been a national asset, and the people of the country being necessarily interested, pecuniarily and otherwise, with the construction of every line, do you not think that the construction of any line of railway, no matter how successful it may be, or how good its prospects, which would inevitably entail a lessening of the amount of traffic on some already-constructed line, and therefore a loss to the country—do you not think that in such a connection a fact of that character must always be a strong argument, not only with Members of Parliament but with the people outside, against the construction of such a railway? Your question is this: that if one line is successful and you build another line to take the traffic away from it, would not that be an argument against that line. Of course it would. But the question is, "Is the argument one which should have any weight." It all depends on what the new line may be. The argument will be used, but it all depends on whom you address it to. I cannot say whether it would have any weight or not, but it would not have any weight with me. I should consider the whole question. The running of the railway to Moree and bringing the goods to Sydney will, of course, create traffic. The making of the coast line will reduce the traffic on that line and put it on the coast line. But before that is done you will have developed a much larger traffic on the other line which will take its place.
2590. At the same time you decrease the general volume of traffic over the main line, and carrying the stuff a lesser distance over a line constructed to the coast, you do not create a counterbalancing volume of traffic? If the argument is worth anything, it is against making a line to the coast at all, as we could come to Sydney or Newcastle for all time. Any line you make to a new port must take traffic from the main line.

2591. But you do not consider that the argument is now being used in connection with a line which is not yet made. The argument now is with reference to the construction of a railway from Moree to Inverell. If you do not construct a railway from Moree to Inverell, and you connect Inverell with the coast, you do not lose the traffic of the trunk lines of the Colony and the traffic to Sydney very much; but if, having connected Inverell directly with Sydney, you then connected Inverell with the coast, you would lose to the railway that amount of traffic being carried from Inverell to Sydney, and you would also tap the country—Moree and Narrabri—and divert all that traffic to the coast? The traffic from Moree to Inverell runs down the trunk lines to-day. If the coast line were made up to Inverell first, and you then extended it, you must stop the proposed line at Inverell for good. The moment you extend it beyond that you take the traffic off the trunk line. The moment you take the line from Inverell to the coast you take the traffic off the main trunk line to Sydney. If you started from Byron Bay or Grafton with a railway to Inverell, it would at once reduce the traffic on the main trunk line. Then if the argument is worth anything it is against building a line to the coast.

E. Lonsdale,
Esq., M.P.
25 Sept., 1896.

2592. But is it not an argument against building a line from Inverell to Moree? No; because that traffic comes upon the main trunk line.

2593. Yes, but if it does that it is not at the expense of the people constructing a railway there; it comes there in spite of the fact that there is no railway communication; it is taken by teams, and does not entail the cost of railway construction and maintenance? Under our present system, instead of the dray carrying it the train will carry it, and you will get paid for it.

2594. But if you construct two lines, one taking the stuff direct to Sydney by train, and all the money for the carriage going into the pockets of the people of the country, and if you then construct another line which takes it direct to the coast, and the goods are not carried perhaps for more than one-third of the distance that they would be carried if they went direct to Sydney there is a loss entailed, first in the matter of railway construction, and then from the fact that revenue is lessened over the trunk line;—if you are going to construct a railway to the coast would it not be better not to construct the Moree-Inverell railway at all, but to ask the Inverell people to wait until the line from Inverell to Guyra and thence to Coff's Harbour is constructed? No.

2595. *Mr. O'Connor.*] What is the character of the country between Inverell and Guyra? About one-half of it is good country.

2596. What is it fitted for? The good land is fitted for agriculture, and the other for grazing. Some of it is mining country.

2597. Have you formed any opinion as to the desirableness of a railway between Guyra and Inverell? I think it should come that way. If you can get a good port, which means that it should go by Glen Innes, it should go that way. With my present knowledge and information I think the line should go from Inverell to Guyra and from there to Coff's Harbour.

2598. Do you know of any harbour on the coast from which you could send ships to the outside world? I have read the report of Captain Howard on Coff's Harbour. He states that you can get a harbour of 174 acres at a cost of £280,000, with a depth of water of from 30 to 54 feet, an entrance to it of 800 yards, with a depth of water going in of from 5 to 9 fathoms. It appears to me that if you can get a harbour of that kind that is the place to go for.

2599. Do you know the country between Inverell and Glen Innes? Not very well, but I believe it is good country.

2600. If the line is constructed from Moree to Inverell, would you see any objection in it being continued to Glen Innes? Some people talk of Byron Bay as a port. If you can get the best deep sea harbour there—and all other things being equal—it seems to me that the line should go to Glen Innes. If, however, as I believe, Coff's Harbour should be selected, the line should go to Guyra.

2601. Do you know the country to Grafton? I know part of it—it is very rough.

2602. *Mr. Lee.*] How long have you resided in the New England district? Thirty years.

2603. And you are acquainted with the continuous agitation which has been going on for railway connection with the coast? Yes.

2604. Are you of opinion that for the better development of the New England country it is desirable that traffic should be taken west of the Great Northern line to Sydney, or should communication be given to some port on the coast? If you could get a good port on the eastern seaboard by which you could get out to the open sea it should go to that port.

2605. Are you of opinion it would be in the interests of the country to decide the question of a port first before the question of coastal connection is entertained? Yes.

2606. In other words you think that ought to be the base of operation for connection with the coast? Yes.

2607. I suppose you are of opinion that an effort should be made to get a port? Yes.

2608. You offer no definite opinion as to where that port is likely to be, although personally you appear to favour Coff's Harbour? That is so.

2609. You say the country should determine on a port of shipment, and base its place of shipment accordingly? Yes.

2610. Whilst that matter is being considered, and in view of the proposal now before the Committee to extend the railway from Moree to Inverell, do you think it would be wise—holding the views you do—that that extension should be made? Yes.

2611. You are aware, of course, that it ought to take the Inverell trade? It will, I suppose, so far as it can.

2612. You know the distance from Sydney will be 509 miles? Yes.

2613. Do you not think that in view of the existence of the Great Northern line upon which there is such a great loss every year, an endeavour should be made to bring that traffic upon the existing line instead of taking it away from it? Not with the idea of going to the coast. If you selected Coff's Harbour the line could not go to Glen Innes. Until you select your port it appears to me you cannot govern the line. If you made a line to Guyra, and then decided that Byron Bay should be the port, it would be ridiculous.

2614. Glen Innes is 422 miles from Sydney. Ever since that line was constructed the traffic by way of the coast has competed with it as far as Inverell. The estimated loss of freight to the railway is between £6,000 and £7,000 a year. If the railway authorities cannot control the traffic with a railway 422 miles long, how can they control it with a railway 509 miles long? Because the traction on that line is easier than on the 422 miles.

- E. Lonsdale,
Esq., M.P.
25 Sept., 1896.
2615. But the distance is long, and a rate per mile is to be charged? That is a matter for the Railway Commissioners. The traction being easier, they might afford to run goods on that line for less money.
2616. But if we are assured that the rates will be truck rates—and that is a reduction on tonnage rates—and that the estimated cost of landing goods at Inverell *via* Moree from Sydney will be 8s. 7d. a ton, how are they to secure that traffic which is now going to the coast, and which they would depend upon as traffic for this railway? I believe the extra speed will obtain a portion of it.
2617. If the Inverell people can land their goods at Inverell from Sydney at £5 a ton, and can send wool as back loading, do you think they are likely to pay £8 7s. a ton? No, unless there is an advantage in speed.
2618. If we are not likely to secure the trade of Inverell, what is the justification for constructing the railway? I believe the trade which Inverell sends out west will go on the line.
2619. But there is no population out west to offer a market for what Inverell produces? That will be their market as far as they can use it, and the surplus produce will go south.
2620. Last year there were 75,000 bushels of wheat produced at Inverell, consequently there can be no market out west to consume the whole of that; having such a long distance to travel, how is it possible the Inverell people will be able to use the line? They are bound to use it to some extent.
2621. There are other parts of the Colony, on the south and the south-west, where the wheat-growing lands are from 180 to 250 miles from the seaboard; the country under consideration will lie 509 miles to seaboard, therefore the line cannot offer much attraction in the shape of drawing wheat to the metropolis? No.
2622. If it were the policy to bring the traffic west of the Great Northern line to that line, it would, of course, be logical to bring it to the nearest point, consequently Guyra would be the nearest point to Sydney; as a matter of fact, Guyra would be 71 miles closer to Sydney than by the Moree line? Yes.
2623. So far as the development of the New England country is concerned, it would be a most desirable thing to do? So far as getting the stuff to Sydney is concerned, it would be best to come by Guyra.
2624. Do you not think that if Inverell were cut off altogether from the main northern line it would lose its intermediate market, such as Glen Innes and Armidale? There is very little market at Armidale at the present.
2625. Armidale is the capital of New England, and although it produces a little it purchases a good deal, and it is the largest freightage depôt north of Tamworth? There is a larger market about Armidale and that district for the products of Inverell than there is Glen Innes way.
2626. With regard to the probable passenger traffic, the passenger traffic for any portion of New England, or to within an easy approach of Werris Creek, could not possibly use the Inverell line? No one would use that.
2627. If people wanted to go from Inverell to Armidale, would they go round by Moree to get there? No.
2628. Therefore, there is that passenger traffic which the trains would not get? Yes.
2629. Supposing it costs from £1,200 to £1,300 a year more to deliver the mails at Inverell by train than it costs now to deliver them, and supposing they can be delivered three hours quicker, what then? If your supposition is good, I presume they would send them around by Glen Innes.
2630. Does not that point to the conclusion that the Moree line will not grapple with the whole of the traffic? No line will, I do not care where you put it. The western country between Inverell and Moree should have some means of communication.
2631. The population of Inverell is small? Yes; but the stations are large.
2632. Between Inverell and Moree, there are 210 different holdings; but the population is very small, notwithstanding that the land is alienated? I know that the population is not large; but the want of means of carriage has, to a large extent, caused that.
2633. Under all the circumstances, do you think it would be wise in the interests of the country to proceed with the extension from Moree to Inverell, or to allow it to remain until the question of a coastal port has been determined? We have been years in settling the question of the coastal line, and we have not settled it yet. Meanwhile, these people are waiting for communication.
2634. It appears pretty probable now that the point of possible connection with the coast will be Tenterfield, Glen Innes, or Guyra? I think so.
2635. If a line came to Glen Innes from Inverell it would be about midway between Tenterfield and Guyra? Yes.
2636. Therefore, if a line were made from Inverell to Glen Innes, it would be part of a possible future coastal connection? It would have to be then. Of course, if you built the line to Glen Innes it would be midway; but if the line went from Guyra to Coff's Harbour it would be a mistake to put it there. You would not, however, tear it up again, and you would send your inland traffic over the Ben Lomond line, a further distance, to get to the connection.
2637. The only difference it would make would be 37 miles? Yes.
2638. Therefore, it would be as near as possible midway—but, if anything, nearer to Guyra. If it is desirable to bring the western trade in to the coast, and the coastal connection is in the dim future, do you not think it would be wiser to bring that portion of the western traffic at once to the main northern line from Inverell to Glen Innes, and thereby feed the main northern line, instead of taking trade from it? If you make the line from Inverell to Moree it does not affect the northern line at all; it takes the dray traffic.
2639. *Mr. Clarke.*] You appear to be in favour of the line to the coast from Inverell to Guyra? Yes.
2640. What is the nature of the country between Inverell and Guyra? There are mining lands which are not very good. Near Ollera and Tenterden some of the land is agricultural and some grazing. Closer to Guyra it is good land. It is a mixture of good, passable, and indifferent land.
2641. Is the population from Inverell to Guyra large? I think there is a larger population that way than the other.
2642. I think it is admitted that the entrance to the Clarence is the best on the coast north of Port Stephens? It may be. I know Mr. See told me they have now 18 feet on the bar, which I suppose is the best that can be done for Grafton; and if they can only get that it does not seem to me to be a port to which to take produce from the western country. I discard it altogether for that purpose.
2643. But when the improvements are completed, according to Sir John Coode, the depth would be 20 feet? Even that depth will not do for ocean-going vessels. 2644.

E. Lonsdale,
Esq., M.P.

25 Sept., 1896.

2644. You are aware that the country of the table-land is only fit for growing cereals—wheat, oats, and in some cases maize—and that it will be an advantage to the growers to get to a port on the coast, whether it be Coff's Harbour, Grafton, or the Richmond? Yes.
2645. And it will also be an advantage to the people on the coast to get their goods to the table-land in exchange? I do not think there will be much exchange in that way.
2646. What is your objection to the railway going from Glen Innes to Grafton? As I have already said I discard Grafton because of its port, and I believe the country between Glen Innes and Grafton is very inferior. I have travelled from Glen Innes to Glen Elgin about 30 miles, and it is very poor country.
2647. *Mr. Roberts.*] Do you think the work of connecting the table-land of New England with the coast should be undertaken without delay? It seems to me to be a large amount of money to spend for the advantage to be derived. But there is no doubt that if you can get a port and a line to it you will develop production to a large extent. There is a large amount of settlement taking place towards Guyra. A quantity of land is being cut up there for homestead lease. The land down to the Don Dorrigo Scrub is magnificent land for cultivation. I would not urge haste in connection with the matter. The people there told me that the largest amount of land upon which a man can live there is 300 acres, and they are cutting it up into 320-acre blocks. I am satisfied that if the line is made that way there will be a large amount of settlement.
2648. If the line were made by way of Don Dorrigo, would it not lead to the expenditure of a very large sum of money? Yes, over £1,000,000.
2649. Holding that opinion as to the cost, would you feel justified in recommending the construction of such a line at the present? I would not go very strongly for it just now. I think it might be done in sections. The point of the whole question is whether you can get a good harbour.
2650. Have you formed any opinion as to which would be the best harbour to connect with the table-land? I am not a professional man, but my opinion is that Coff's Harbour is the best.
2651. Was not a survey made some years ago from Armidale to Trial Bay? They surveyed from both ends, but by some means the man who surveyed at one end got higher than the place he left, and the survey was discontinued. I have been told, however, that a route could be discovered to Trial Bay.
2652. You are aware that several routes have been surveyed, namely, Inverell to Glen Innes, Guyra, Uralla, and Kentucky, and moreover the proposal which is now before us. Of those five routes which do you think in the interests of the country should be adopted, that is putting aside the coastal connection altogether? I think the Moree line would be the best. It would give Inverell a western market, and of course I prefer the Guyra line in the event of a coastal connection.
2653. You are aware that the cost per mile of a line between Inverell and Guyra would be considerably more than that between Inverell and Moree? Yes, the capital cost of going to Moree would be less and the cost of traction would be less.
2654. You know as a matter of fact that there would be a large market to the west of Inverell for Inverell produce? Yes.
2655. Do you think the construction of a line from Inverell to Moree would lead to any large amount of settlement? From what I have seen there is a good deal of Government land about there, and I think it would.
2656. You certainly prefer it to the line by way of Glen Innes? Certainly. I do not think there are two questions about it.
2657. Are you aware that merchandise can be taken from Sydney to Inverell by way of Grafton and Glen Innes, first by sea and then by team, at a lower rate than it can be taken from Sydney to Inverell by rail? Yes, and *vice versa*.
2658. Having that in view, do you think that it is likely that the line will be made to pay? I think so. I think it will develop traffic.
2659. *Vice-Chairman.*] Is it your opinion that Inverell will be fully served for all practical purposes by the construction of the line under consideration? I think so.
2660. Are you able to say whether it would assist the movement of stock? I should think it would; but I cannot speak from personal knowledge.
2661. You are unable to say whether that would be a source of revenue to the railway? If it assisted the movement of stock I suppose it would be.
2662. Assuming the line was constructed, would Inverell be served 25 miles east or midway between Glen Innes and Inverell? Yes; the construction of the line would practically bring the people between Glen Innes and Inverell and between Glen Innes and Guyra, the one within 20 miles of railway communication and the other within 27 miles of railway communication.
2663. It would bring them within touch of railway communication? Yes.
2664. I suppose, in expressing your opinions, you have borne in mind the estimated cost of the two proposals—between Inverell and Moree less than £3,000 a mile, and between Inverell and Glen Innes £6,000 a mile? Yes; I have taken that into consideration.
2665. But in expressing your views you have not been wholly influenced by the cost of the railway? No. I may say that when giving evidence on the Guyra and Glen Innes lines at different times I have done so in the direction that I thought that the market of Inverell was out west.
2666. When the proposed railway was not in contemplation you expressed views similar to those you have expressed to-day? Yes.

TUESDAY, 29 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John Robert Smith, Esq., Tucka Tucka Station, Warialda, sworn, and examined:—

- J. R. Smith, Esq.
 29 Sept., 1896.
2667. *Vice-Chairman.*] Do you know the district through which the proposed railway line passes? Yes. I have been living in it for about 20 years.
2668. Where is Tucka Tucka? It is south of Bengalla, and adjoins it.
2669. What is the character of the country between Moree and Inverell? It is all grazing country from Moree until you get near to Inverell.
2670. Is the country between Moree and Inverell adapted for purposes other than pastoral? No. You might get little pockets along the rivers and the creeks upon which you might get a crop; but you cannot depend on the crops. The proof of that is that we get the whole of our produce from Inverell.
2671. Have you any statement to make with regard to the proposal? Before the Moree extension was constructed our wool went to Glen Innes, and we got back corn, potatoes, and things of that kind. Now the wool goes to Moree, and the teams come back empty.
2672. Do you know the country between Inverell and Glen Innes. Only by travelling over the road.
2673. Have you any knowledge of the nature of the country? It is grazing and agricultural country.
2674. Which country do you think is the best for agricultural purposes—the country between Moree and Inverell, or the country between Inverell and Glen Innes? There is no doubt that the best agricultural land is between Inverell and Glen Innes.
2675. Do you think the railway should be constructed between Inverell and Moree? Most decidedly.
2676. Why? If you made a railway from Glen Innes to Inverell, you would not have a truck of produce going from Inverell to Glen Innes in 12 months, simply because the Glen Innes market is always a lower market than that of Inverell. The Inverell market is to the west. Everything grown in Inverell goes west by team. They are not likely to send their produce to Glen Innes if they can get 2s. per bushel for their corn in Inverell. The price in Glen Innes is generally 1s. 6d. That is the difference in carriage between the two places,—about 1s. per cwt. If you load in Inverell it makes a difference in Glen Innes of 1s. per cwt. for the stuff coming down.
2677. Supposing there are squatters or selectors at Warialda, is their only market Moree or Inverell, or do they go further towards Sydney? They send their wool to Sydney, but they cannot send their produce to Sydney. The carriage would kill it. Very little produce is grown about Warialda. What produce there is there comes from Inverell.
2678. How does the wool go? From Warialda to Tamworth by team.
2679. They would not send wool to Glen Innes? No, it never went from Warialda to Glen Innes. It goes by the road to Tamworth.
2680. The meaning of that, I suppose, is that the carriers are more moderate in their demands for carriage than are the Railway Commissioners? I do not know that. The road between Warialda and Tamworth is, to a large extent, macadamised. The carriers live along the road, and go to Tamworth and get the back loading from the storekeepers.
2681. It pays them because of the back carriage? Yes, they get loading both ways. Yallaroi station, 40 miles from Warialda, always sends its wool to Tamworth.
2682. Do you think, when the line from Narrabri to Moree is opened, the people will send their wool to Tamworth by road? No, they will send it to Moree then. Between Moree and Narrabri there is heavy black soil country, and if it rains, you do not know when the teams will get to the end of their journey. The railway will get all that wool.
2683. Supposing a railway is constructed between Inverell and Glen Innes, do you think the wool would be sent to Glen Innes? No; decidedly not. It is not likely to be sent all round the country.
2684. Then when the Moree line is opened, the people will continue to send wool by road to Tamworth? The line is practically open now. The contractors are running it, and they are sending wool and everything else by it.
2685. Supposing a railway is constructed between Inverell and Glen Innes, do you think the selectors or pastoralists about Inverell or Warialda will send by the road to Tamworth, as distinguished from sending by rail to Glen Innes? I do.
2686. Where is your station? On the Macintyre.
2687. How many miles from Warialda? About 66 miles, towards Boggabilla and Goondiwindi.
2688. Are you of opinion that the construction of the proposed line will be a good thing in the interests of the country? I am certain of it. If you had a railway from Inverell to Moree you would get rid of a large amount of stock, whereas if you had a line from Inverell to Glen Innes, you would get no stock at all. The proof of that is in the fact that they cannot fatten enough stock up there for themselves, except at the latter end of the year and the beginning of winter. The butchers come down our way, buy the stock, and distribute it about New England.
2689. Do you know whether there is any desire on the part of pastoralists in the district to slaughter the meat, freeze it, and export it for the home market? I do not know. There are freezing-works at Narrabri, and I suppose if they find the venture pay, the works will be extended.
2690. Is there a sufficient number of pastoralists in your district to be able to erect freezing-works, export the meat to Europe, and make the railway pay? No.
2691. Supposing you had an opening to the coast—no matter where—do you think the erection of freezing works for the purposes of exportation would be undertaken amongst the pastoralists? No.
2692. *Mr. Lee.*] What are the adjoining stations to Tucka Tucka? Yetman, Benall, Myall Downs, and Bengalla. I reckon that after you get below Benall it will be just as easy to hit the railway at Moree as at Warialda.
- 2693.

J. R. Smith,
Esq.

29 Sept., 1896.

2693. Is there a track across there? Yes.

2694. Your nearest point, then, would be Warialda? Yes.

2695. Then you would have 66 miles to start with to Warialda? Yes, instead of 120 to Moree. I may say you would get a lot of trucking about Warialda. There are fattening stations about there. If a man has 2,000 head of bullocks, perhaps only 200 or 300 would be fit to travel by road, whereas at least half of them would be fit to be trucked, and they would land in better condition than the stock which travels by road.

2696. How far is Tucka Tucka from Inverell? Ninety-four miles.

2697. And it is a greater distance from your station to Inverell than it is to Moree? No; it is more from my place to Moree; but still, by going into Moree, I get out of going into that bleak country about New England.

2698. Which way do you go with your stuff to Tamworth? By way of Manilla.

2699. Supposing a line were constructed, what prospect of freight would there be other than wool and live stock? You would get the whole of the farmers' produce from Inverell, and you would give the Inverell people a market west. The Mungundi and St. George people get some of their produce from Warwick; and some from Inverell. It depends on the teams which are running.

2700. How far is it from Goondiwindi to Warwick? About 150 miles.

2701. How far is it from Goondiwindi to Inverell? 120 miles.

2702. So far as your district is concerned, rich as it is for pasture, there is not much prospect of agriculture? No; the land is good enough, but the seasons are too uncertain.

2703. Is there any tendency for pastoral properties to go out of wool? I think they are more likely to go into wool.

2704. As you know, wool is the great freight for a railway, and the Committee would like to know what is the general tendency in that part of the country? All the stations are going in for sheep.

2705. What is the prospect of future settlement down there.—is there any valuable land? I think it is pretty well taken up. There are some reserves which, I think, are going to be cut open.

2706. You are in the Central Division? Yes.

2707. And the land is very largely secured there? Yes.

2708. And there is not much room for future small settlement? No, all the best land is gone.

2709. Therefore, what that part of the country is to-day it is likely to be in twenty years' time, so far as settlement is concerned; but so far as the getting of your produce to market, and the taking advantage of Sydney and other markets is concerned, you think the extension of the line from Inverell to Moree would assist you? Yes, far better than by going the other way.

2710. Because you would have to travel a long distance the other way? It would not matter if it were a shorter distance, because the country the other way is sour.

2711. You are aware that Inverell produces a large quantity of wheat and hay? Yes; and I am also aware that they supply all the country about my way with flour. It all comes from Inverell. The season before last the people were supplied with Newcastle flour, but that was owing to the failure of the season.

2712. But, in a general way, the produce of Inverell is considerably larger than can possibly be consumed in the immediate district? Yes, a long way.

2713. I suppose you look upon Inverell as the best agricultural district in New England? Decidedly.

2714. And there are great possibilities there? Yes, if they had good farmers.

2715. After supplying the western market, how would they get their surplus produce to market? They would not have any; the west and the north-west would consume it all, because they would come into Narrabri.

2716. Would they not then be brought into direct opposition with Tamworth? Tamworth could not compete with them. It is not as good a district as the Inverell district. Then there is the railway carriage from Tamworth to Narrabri. They have to fetch the stuff to Werris Creek, and then go up the other line.

2717. Supposing the Inverell people wished to get their produce to the Sydney market, would they not be prohibited by the length of the line? No doubt that would handicap them.

2718. You will be aware that, if the line is constructed, it will be the longest in the Colony; consequently, if the Inverell people wish to get their surplus stuff to Sydney, they will have an extremely long distance to travel? But they could never bring their stuff to Sydney to compete with the stuff which is grown on the Clarence, the Richmond, and other places. They could send it from Warwick to Brisbane and knock them out of the Sydney market, because Warwick beats them by 10 to 1.

2719. In the growth of wheat and maize? Yes.

2720. I believe they can produce maize cheaper in Warwick than any other part of the Colony? I have bought tip-top maize from the storekeepers in Warwick for 6d. a bushel.

2721. *Mr. O'Connor.*] When was that? Three years ago. As a rule, it is seldom over 10d. or 1s. At the end of the summer you can get it for nothing. They will give you a bonus to take it away.

2722. *Mr. Lee.*] Do you know Warialda? Yes.

2723. What is your opinion as to the advisableness of carrying the line into Warialda? I would not think of such a thing unless it were the cheapest and best way to run it. Warialda is a little place, and it is "Coogee Bay country" all round the town.

2724. Have you any opinion to offer as to the route which has been surveyed between Inverell and Moree? No, although I was talking to the Chairman of the Land Board about it the other day. My idea would have been to have brought the line out north across the Gil Gil, then to have shot up and gone through Tulloona and Blue Nobby. The Chairman of the Land Board, however, said that that would increase the length of the line by 27 miles.

2725. What is the distance from Moree to the Gil Gil? Twenty-five miles. I proposed to continue the Moree line 25 miles north-east, and from that point to go through Tulloona.

2726. By taking that route you would avoid Warialda altogether? Yes; you would leave it about 35 miles to the south.

2727. But you would go through the very heart of the producing country? You would go through the heart of the best country. Another thing is this: from Moree the Mungundi Road comes into the road about 25 miles north of Moree, so that there would be a junction there. Instead of coming to Moree, they would touch the main Moree-Inverell line.

2728.

- J. R. Smith, Esq.
29 Sept., 1896.
2728. That is to say, they would touch the present survey, and thence go on to Moree? Yes.
2729. Is the country of such a nature that a direct route could be obtained? I do not know.
2730. What is the country like along the line you are describing? It would traverse the parishes of Bulloeroo, King, Ardgowan, Paramellowa, Yackobe, Eales, and Hadleigh.
2731. Then it would hit the original survey at 361 miles? Yes.
2732. Or as near as possible half-way? Yes.
2733. But it would be considerably south of Warialda? Yes.
2734. Supposing a more direct route than the present survey cannot be obtained, do you think it would be advisable, in the interests of the country, to adopt the one proposed rather than none at all? I should think so.
2735. *Mr. Clarke.*] I suppose you are aware of the nature of the country between Moree and Inverell? Yes.
2736. What traffic would be likely to use the proposed line in order to bring produce to Sydney, with the exception of wool and cattle? Sheep and wool. I do not think there would be any produce coming that way. I should think the produce at Inverell would stop at Moree.
2737. Is there a market at Moree, and north-west of Moree, for the produce likely to be grown there? Yes, I am certain there is.
2738. In that case there would not be much freight for the railway, except between Inverell and Moree? Not so far as produce is concerned. Some of it might, in dry seasons, come to Narrabri.
2739. Hitherto the wool north of the proposed line has come to Tamworth *via* Bingara, Barraba, and Manilla? Yes.
2740. Are you aware that the Committee have sanctioned the construction of a railway from Tamworth to Manilla? No, although I saw something about it in the newspapers.
2741. In the event of that line being constructed, will some of the wool between the proposed line and Warialda go down to Manilla or to Moree? I think it will go to Moree, because it is the shortest route.
2742. And the produce of the country, north and north-west, as far as the Queensland border, would still come to Moree? Yes, and from over the border too.
2743. You do not approve of the construction of a railway from Inverell to Glen Innes? No.
2744. Why? Because I am certain it will never pay for grease.
2745. Is there no good land along that route? There is fair land along it; but what are they going to do with their stuff when they grow it? It will not pay the people to send their stuff upon the line to Glen Innes, because the Glen Innes market is always a cheaper market than that of Inverell. All the produce grown there goes west.
2746. In the event, at some future time, of a railway being constructed to the coast, either by way of Guyra, Grafton, or Tenterfield, would it be fair to shut out the people who wish to go from Inverell and Glen Innes to the coast with produce? I know they get a lot of goods at Glen Innes from Sydney, by team, cheaper than by rail. Salt and iron, for instance, are transhipped at Grafton.
2747. Will they continue to do that if the proposed line is constructed;—will they be able to carry their produce cheaper from Grafton and Inverell by team, even if the railway is constructed from Moree to Inverell? Of course. The railway from Inverell will make no difference to that part of the country at all. The things they get at Glen Innes, such as iron, salt, and wire, are sent by steamer to Grafton, and are carried cheaper by team to Glen Innes than they would be carried by rail to Glen Innes from Sydney.
2748. In view of the fact that the proposed line to Inverell will be the longest in the Colony from Sydney, do you think there will be much traffic upon it, with the exception of wool and stock? No; it would not pay to send produce to town. They can get a price for it up there, and they could not compete with the stuff which is grown on the rivers.
2749. Is it not necessary in the public interest that there should be an interchange of products between the table-land and the coast, and *vice versa*? That depends on what the produce can be carried for. People will always get it where it is best and cheapest.
2750. *Mr. Roberts.*] What is the extent of your holding? 65,000 acres.
2751. Is it all leasehold? No, most of it is freehold.
2752. What proportion is freehold? About one-half.
2753. Do you confine yourself to the breeding of cattle? No; I buy stores and fatten them, and I also breed racehorses.
2754. If the proposed railway were constructed, would you be a large customer to it? If I could sell locally I would go to New England. We generally get the same price there as at Sydney at this time of the year; but after Christmas we have no sale in New England. Then we should send to the Sydney market. I dare say I could enter into a contract to take 150 trucks a year, if the rates were favourable, and if the Department of Railways would allow me 10 per cent. discount.
2755. What would you send? Cattle.
2756. To whom do you send your cattle now? At this time of the year I send nearly all to New England; afterwards I send to Sydney. There are two buyers—Messrs. Onus and Baker—who have the whole of the trade in their hands, and the cattle go to them, and they distribute them. They buy 600 and 1,000 at a time, and take them up in lots of 200. We generally give them three weeks or a month in which to lift 200 head. They take them up and distribute them among the butchers about Emmaville, Glen Innes, Inverell, and the little towns.
2757. You sell in large lots, and the buyers supply the small butchers? Yes.
2758. Will the proposed line go through any part of your property? No; it will not go within 60 miles of it.
2759. I suppose Warialda would be your nearest railway station? Yes.
2760. Would large quantities of stock be sent from Warialda to Sydney? It all depends on the price stock are fetching in Sydney; but I should say that 600 or 700 trucks a year would be a small estimate. You can fatten a lot of cattle which would never stand the trip by road, but they would be plenty good enough to put into trucks.
2761. I suppose that at the present time the stock go to Tamworth? As a rule, we travel them right in; it is very seldom we truck. Otherwise Breeza or Quirindi would be the place to truck them.
2762. But how about other graziers who have large flocks of sheep? They would truck at Breeza or Quirindi.

Quirindi. About Warialda there is Gragin, which is a fattening run, Reedy Creek, Coolati, and Gundi-windi. Yallaroi would send to Moree under any circumstances. Blue Nobby, Yetman, Tucka Tucka, and Benall would use the Warialda station for trucking. Of course, if the line is not made in that direction, they will go to Moree. J. R. Smith, Esq. 29 Sept., 1896.

2763. Have you any land under cultivation? I have about 35 acres, which I use for home consumption.

2764. Is the land out there suitable for the production of cereals? In good seasons black soil will grow anything; but you cannot depend on the seasons. In the river bends you can always depend on a crop.

2765. Do you favour the construction of the proposed line? I favour it, because it will give the Inverell people a chance of getting their produce to Moree, and it will give the people west of Moree a chance of getting produce at Moree. Formerly, when the wool went to Glen Innes from Inverell, we could get our produce and corn as back loading; but now the wool will not go that way. If you want corn from Inverell you have to get teams, which have to return empty.

2766. Is there a large market for Inverell produce to the west? Yes, they do not grow anything out there at all—it is not agricultural land. Of course, in good seasons, out our way they feed nothing; but in bad seasons they have to feed their working and team-horses.

2767. If the line is constructed, do you think it will lead to increased settlement along it? I do not know that it will lead to much increased settlement, because the country up there is pretty well settled.

2768. Have you any knowledge of the holders of the land between Moree and Inverell? Yes.

2769. Have you ever heard the question of giving the land required for railway purposes discussed? No.

2770. Do you know whether the people would be likely to give the land? I could not tell you.

2771. *Mr. Wright.*] Are you a wool grower? No.

2772. As a rule, cattle raisers are not great patronisers of railways? Excepting for the purpose of sending fat cattle to market.

2773. They do not consume anything like the amount of stores which sheep producers consume? No.

2774. I think you stated that wool from Yallaroi and Yetman's which formerly went to Tamworth would still go to Tamworth, if a line were constructed from Inverell to Glen Innes? Yes.

2775. Do you know the rate of road-carriage between Yallaroi and Tamworth? About 4s. 3d. per cwt.

2776. What is the rate for wool between Tamworth and Sydney? I could not tell you.

2777. Do you think they would pay £4 5s. a ton for the carriage of wool to Tamworth if the railway were constructed? You forget that you have to get your wool from Yallaroi, in order to get it on the railway, and they would charge just as much to take it from Yallaroi to Inverell as from Yallaroi to Tamworth.

2778. How far is Gragin from Inverell? About 30 miles.

2779. And it is about 40 miles from Inverell to Glen Innes? Yes.

2780. Do you know that wool is carried from Gragin to Inverell at the present time for 30s. a ton? It is pretty cheap if it is. I never heard of it being done for that price.

2781. Do you know that Pindarry wool—Pindarry being 40 miles from Inverell—is taken from the station to Grafton for £2 10s. a ton? No railway can compete against those prices.

2782. If a railway is constructed between Inverell and Glen Innes, will it not secure all the wool from Myall Creek, Reedy Creek, Yallaroi, Yetman, and all that country? I do not think so.

2783. To where would they send it? Moree.

2784. Why? Because it is a shorter distance. I know they are cutting a road now at their own expense from Yallaroi to Moree.

2785. What is the distance? Forty-one miles.

2786. And how far is it from Yallaroi to Inverell? About 70 or 75 miles.

2787. Would that apply to Myall Creek and Reedy Creek? No. Reedy Creek is near Inverell.

2788. And where is Gragin? It is between Warialda and Inverell.

2789. And nearly the whole of these stations would send their wool to Inverell? I daresay you would get the Reedy Creek and Gragin produce there.

2790. And the Myall Creek produce? No, it would be better for them to send to Moree.

2791. How far is it from Moree to Myall Creek? About 60 miles.

2792. And how far to Inverell? A little shorter, I think.

2793. What does it cost you a ton to get stores from Sydney to the station? I can tell you what it costs to get them from Glen Innes to the station—about 4s. a cwt.

2794. Is not that a high rate? Sometimes it is cheaper—3s. 6d., but never under.

2795. What distance is your place from Warialda? About 64 miles.

2796. So that if the line is constructed, you will, at any rate, be within 70 miles of a railway station? Yes.

2797. And what would it cost you to get your produce over that 70 miles? About 2s. per cwt., I expect. If you could get it by a man who was bringing wool back, it would be cheaper.

2798. I think you have stated that a good deal of goods are brought in from Glen Innes and on to Inverell, *via* Grafton, in opposition to the railway? No; I said there was a good deal of heavy stuff.

2799. You are wrong in your assumption. Iron and salt go by rail. Groceries, oilmen's stores, draperies and hardware, go *via* Grafton. The people in Glen Innes and Inverell give the Railway Commissioners the benefit of carrying the cheap stuff; but the other stuff is taken by way of Grafton? I know that I wrote to Mr. Utz two months ago about some iron and salt, and he told me he could supply me with it cheaper than I could get it by railway, because he got it up by the coast.

2800. I think he got one consignment of salt and iron very cheaply; but as a rule salt and iron are more cheaply carried by rail than are grocers' and oilmen's stores, and hardware. I suppose you know that a great deal of goods are conveyed from Grafton to Glen Innes and Inverell? I have always been under that impression.

2801. The distance between Glen Innes and Sydney, by rail, is 420 miles? Yes.

2802. The distance from Sydney to Inverell by the proposed line will be 509 miles? Yes.
