With regard to the complaint that was made as to the width of the black band, I would point out that the Government plan of the Hyde Park terminus at Park-street showed a strip 132 feet wide back to Goulburn-street. The report of the Royal-Commission recently presented to Parliament, paragraph 12, states that the resumption for six lines of railway could not reasonably be estimated at less than 100 feet wide. The evidence of the railway officers shows that six lines into Redfern terminus are utterly inadequate, although it has been increased from two lines comparatively recently. Therefore, it was thought that provision should be made for carrying twelve lines, occupying a breadth of 3 chains right from the Eveleigh depot into the new terminus, just as can be done if the Redfern site is remodelled; and the more so as it is not proposed to charge the railways for the land required. As a matter of fact, instead of the black line or band on the plan being 3 chains wide the actual width is only 2 chains—132 feet, just the same as the Commissioners' Park-street station showed the line to Goulburn-street.

776. Do you regard the station on the Rocks, shown with white edging, as central? Certainly not. I regard Wynyard-street station as central, and the Rocks station as a terminus.

777. What do you regard as the centre of the city? I should say the centre of the business part of the city is about York-street, between Wynyard-square and Market-street. That is the centre of the principal warehouses and business houses.

778. Will you concede this: If there is to be a central station, the best situated position will be between Market-street and Wynyard-square? If you are to have one instead of two: if it is not possible to get both sites, I should say between those two stations. If they are too close, one station somewhere between the two would be the most central site to suit the greatest number of suburban passengers.

779. Approximately north of your second stopping place? Approximately, King-street and York-street.

780. *Mr. Humphery.*] You gave the Committee an estimate of the value of the 10 acres proposed to be taken in connection with the Hyde Park scheme;—how did you arrive at your estimate of its value? I took Mr. Perdriau's valuation.

781. How many feet of available frontage would there be in the 10-acre block? Laying out the same block of ground on Hyde Park, you would get six frontages instead of four. Taking Elizabeth-street to Castlereagh-street, and Liverpool-street to Market-street, there was a value put upon that block which has four frontages. I find that this was taken up by the station and the strip. You can practically lay out six frontages, but I only took four. I put it down at the same price.

782. Are you dealing with the north-western corner of Hyde Park? I am dealing with the block and a portion of the southern end.

783. At present, will you confine your attention to the block of 10 acres in the north-western corner of the Park, and tell me how you arrived at your valuation? I arrived at it by supposing that a street was made down it. There would be one frontage to Elizabeth-street, two frontages to an avenue made through it, and the outside frontage to the Park in the same relative position as Elizabeth-street frontage is now.

784. How many feet of available frontage would you then have, taking the four frontages? It would be four times the length of the Park—that is 4,400 feet.

785. How much a foot do you consider that frontage of 4,400 feet would be worth? That I did not go into. I took an expert's opinion.

786. You have estimated that the available frontage would be from 4,500 feet to 5,000 feet? I have not estimated it by frontage, but by acreage, in the same way as other blocks are estimated. I find that throughout the inquiry land is put down at so much per acre, that 20 acres will come to so much at so much per acre.

787. How much a foot do you consider would be the selling value of the north-western corner of Hyde Park, assuming that you have an available frontage of from 4,500 feet to 5,000 feet? That would all depend upon the time it was sold. I am not an expert in land values. It might vary anything from £100 to £200, or £300 a foot. It all depends upon what the prospects are. I valued this block simply on the acreage basis on which a Government official valued a neighbouring property.

788. Is it your opinion that that land may be estimated at from £100 to £300 a foot? I think if a large avenue, the same as the Shaftesbury Avenue I referred to, were made from Redfern to Hyde Park—and believing that in a very little time there will be an improvement in the prospects of Sydney,—I think that would be snapped up by speculators very eagerly, because it would give Sydney what it does not possess—a main broad thoroughfare. I am assuming that it will be a chain and a half wide.

789. Do you agree with the valuation which has been submitted to this Committee of £60 a foot for the frontage to Elizabeth-street, and £90 a foot for the frontage to the Central Avenue? I know nothing of that. I know that it was valued at £74,000 per acre.

790. I am asking your opinion of its value, because you present a scheme in which you estimate the value of the land you propose to take, and compare that with the value of Hyde Park? I have compared the value on the basis on which I find from a report of the late Commission other land in the neighbourhood was valued.

791. What other land do you refer to? The land required to be taken for the western route.

792. Will you specify the land you refer to? The greater part of the land has only sheds and buildings of very little value on it.

793. Cannot you specify the particular block you refer to when you made the comparison between the value of that block and the value of the north-western corner of Hyde Park? In the paper I read to the Committee the

N. Selfe,

N. Selfe,
M.I.C.E.,
M.I.M.E.

22 July, 1897.

the other day, I took the block for the station at the back of the Town Hall at the full value of £74,000 per acre, which was put down by Mr. Perdriau. I arrived at that estimate from the valuations which are given in the report of the Commission.

794. What was the area of that block? 2 acres.

795. Are there any buildings on it? Yes.

796. Did Mr. Perdriau's valuation include buildings? I do not think they did.

797. You think he valued the land only? I expect so. Of course, in all these cases something has to be allowed for the value of the interest. If this plan is worth considering at all, there will, I suppose, be some thousands of pounds spent on the working out of these details.

798. You assume that Mr. Perdriau's valuation was for the land alone, not for the buildings? I do.

799. Therefore, if his valuation included the land, the comparison would scarcely be a fair one? It would be a fair one. If I only take it for the land, it is a fair one. I endeavoured to get the best information available; and I thought that if I took the data obtained in the recent inquiry it would be better than going abroad.

800. Will you give me your own opinion in regard to the value of the north-western corner of Hyde Park;—do you think, from your knowledge of Sydney, the land in that block could be sold within the next five years at prices varying from £100 to £300 a foot? I do not know that it could be sold for what is its real value, because at present it has three values. Hyde Park at present has, first, an unimproved value; secondly, an accrued value, from the labour which has been spent on it for forty years; and thirdly, the work which Nature has done on it for forty years. So that, when a proposal is made to give another park in exchange for that part of Hyde Park, it is only a misuse of words. Man can give the land, but Nature must make the park. It has taken forty years to make that park. If it is worth anything, that should be taken into account. Therefore, I am unable to say whether it would sell for a price which is equivalent to its present value as a park.

801. You are speaking, then, not of its commercial value, but of its value in your opinion as portion of a park? I am speaking of what it has cost to produce a park on a given site. It has cost forty years of labour, at an expenditure of thousands of pounds, and Nature's work. Of course, that was done, presumably, because a park was wanted. The man who buys the land for building purposes will have no sentimental feelings about that value, and therefore I have all through avoided going into the sentimental aspect of the question.

802. Avoiding still the sentimental aspect of the question, and confining yourself to the commercial aspect, what is your opinion of the value per foot of that land for commercial purposes, or for residential sites? If we get a return of good times, and an avenue is made right through from Hyde Park to Devonshire-street, and there is a large railway there, I feel not the slightest doubt that from £100 to £250 a foot will be easily obtained; and the site occupied by the burial-ground, and so on—as a frontage of about 10,000 feet could be laid out there—would amount to from £1,000,000 to £2,500,000.

803. What land are you referring to when you refer to a frontage of 10,000 feet? The 10,000 feet is included in that block alone which the proposed viaduct runs through, bounded by Devonshire-street, Pitt-street, Belmore Gardens and Elizabeth-street.

804. You are speaking now of the land near the railway station? Yes.

805. Is this what we are to understand: That if a railway station were placed at Devonshire-street, and if the 20 acres of land comprised in the Benevolent Asylum site and the Cemetery site were resumed and realised, and a great avenue were formed between Devonshire-street station and Hyde Park, the land round the railway station would be worth from £1,000,000 to £2,000,000;—is it upon that basis you have arrived at the figures you have submitted to the Committee;—I have arrived at it on the ground that, as this large site has a prospective value of from £1,000,000 to £2,000,000, it should not lightly be given over to even the purpose of a railway, without that railway being debited with such value, or what might be found when it was examined into to be a fair value. But, as I understand, during the whole of this inquiry, since 1891, when Sir Henry Parkes appointed a Royal Commission, it has always been assumed that the land at the Cemetery and Hyde Park was worth nothing.

806. I think you are under a misapprehension as to that; the assumption has been that the lands referred to and also the railways belong to the people, and if the people think fit to use the land about the Benevolent Asylum and at Hyde Park for railway purposes, there will be no loss to them;—it will simply be a transfer entry in the public accounts, will it not? Yes; but there will be this very great difficulty: That the Commissioners will increase their business to the extent that they propose, of £34,000 a year, without paying ground rent for the area on which they transact that business. If you are going to carry that out to its logical conclusion, why not let the Mines Department supply them with minerals, let the Forestry Department supply them with timber, and let the Government steamers fetch their coal. If the railways are to be carried out on commercial principles it is not following commercial principles to give the Commissioners £1,000,000 worth of property and not charge them with it, because they will make the £32,000 a year extra on a fictitious basis. If the land will realise only £10,000 by being sold to speculators that should be debited against the railways if they take the land.

807. In answer to the Chairman at the beginning of your examination you quoted from Mr. Eddy's evidence before the Royal Commission? Yes.

808. Did you overlook this reply by Mr. Eddy to a question which was asked by Mr. Hoskins—

Although an alternative scheme was put forward towards the end of the sitting of that Commission, it was simply put forward because it was stated that there was a strong feeling against taking so much of the Park. But we cannot depart from the opinion which was so clearly emphasised at that last inquiry, that Hyde Park is the right and proper position for a general station of the dimensions which you have had placed before you in plans.

? Certainly not. Mr. Eddy, when he thought that he could not get Hyde Park, was content to take St. James' schoolroom, but when he thought a chance came up for him to take the Park, then he was glad to say that Hyde Park was the best site. I think you will find further down in his evidence that he still reiterates that that being public property the railways should not be debited with it.

809. I am not speaking of what is to be charged to the railways, but I inferred from your evidence just now that Mr. Eddy was more favourable to the Castlereagh-street scheme than the Hyde Park scheme? No; he was always more favourable to Hyde Park as a terminus if he could extend the terminus north from the present site. In his evidence before the Royal Commission he said that for a main metropolitan station the St. James' school-room site was perfectly satisfactory; but that was not a terminal station. He distinctly said the long-distance trains would still stop at Redfern.

N. Selfe,
M.I.C.E.,
M.I.M.E.

22 July, 1897.

810. You recognise that Mr. Eddy, from first to last, was of opinion that it would be better to have the long-distance and suburban passenger traffic brought to Hyde Park, and that, failing to get that, he was prepared to take an alternative scheme, though not in his opinion a satisfactory one? Yes, perfectly satisfactory for the purpose. Mr. Eddy was most consistent. His consistency principally was shown in the endeavour to get a site without his railway accounts being debited with it, and the larger the site the better.

811. In your scheme, what alterations do you propose to make at Redfern station? I propose to build a terminus—the terminus which has been pronounced to be sufficient for many years to come, of which you have these large plans on the walls—at Redfern, where it will cover about a third of the site, but to make it accessible from Eveleigh with twelve lines instead of six lines as at present.

812. Your proposal would involve a large expenditure at Redfern? A large expenditure. Of course we have the evidence of the Railway authorities that the Redfern yard must be remodelled. I think the public and this Committee are all of opinion that Redfern yard is a disgrace to the Colony. It has been left so long, in the hope of something being done, that something is absolutely necessary in the immediate future. My opinion is that this terminus, which appears to be approved of all round, can be placed on the Redfern site, and a large area made in front by so widening Devonshire-street that it shall have a very fine open space, and every provision for extension, by having this very wide approach of twelve lines from Eveleigh. You need not necessarily make all the twelve lines at once, but at any rate you should resume ground from Redfern, where it is comparatively cheap, so that the twelve lines can be made, if necessary.

813. You have described generally what you think will be necessary at Redfern;—would your scheme involve the resumption of any privately-owned land? It would involve the resumption of a small piece nearly in a line with St. Paul's Church, on the opposite side of the railway, in order to allow Regent-street to be diverted, to make this wide strip from the retaining-wall of the parsonage. It would practically mean resuming a block and running this line diagonally.

814. Your scheme would involve the resumption of land up to Cleveland-street and Regent-street? The resumption of a small block at the corner of those two streets.

815. What is the area of the block? About 1½ acre.

816. Are there any buildings on the land? Yes; a lot of shops which all want coming down. There is one good building—an hotel I think—at the corner.

817. Starting from there, where would your next resumption be necessary? There is no other particular resumption necessary, except among the small cottages at Chippendale on the other side of the railway. These are all very small properties—little cottages and narrow lanes.

818. What will be the area of land required there? I have only gone into the question of resumptions within the city.

819. Would not the area of those properties be a little over an acre? I think it would be 1½ acre.

820. Would there be any more resumptions in the proximity of Redfern station? I think in the future, perhaps in ten or twenty years time, the kink in Regent-street, between the tunnel and the Bank of New South Wales, should be taken out. I think that Regent-street from its junction with George-street should be continued in a straight line to form a continuation of Regent-street at the tunnel.

821. How many acres would that be in round figures? I should think it would be at least 8 acres.

822. That would close the street between Regent-street and the railway? It would close Terminus-street.

823. That would involve the resumption of Carey's buildings and the Bank of New South Wales? Yes, and of the shops in Regent-street. It would make a much improved Regent-street. That is one of the advantages, one of the possibilities, of this plan in the future.

824. That is looking forward to an enlargement of the main terminal station at Redfern? Yes; the terminus I have shown here on the site is of exactly the same size as the terminus it is proposed to build in Hyde Park. There is then all this ground lying on the Elizabeth-street side, and if at any future time more ground were wanted on the western side you could remodel Regent-street.

825. Proceeding southward, where would your scheme require further resumptions? It would only require a strip from the present boundaries of the railway property to a small street called Eveleigh-street, which runs right up to the back of Eveleigh station.

826. Would that be an important resumption? These lands are only covered by very small workmen's cottages.

827. About what area is it? I could not tell you without a larger map going right back to Eveleigh station. I thought that was unimportant, being in Chippendale. I did not take any account of the resumptions to the south of the bridge.

828. That will be the only other resumption? Yes.

829. Does that mean remodelling the bridge at Redfern station? The tunnel is a great nuisance; it obstructs the sight of the signals, and it is a general complaint that it is so very long. I would do away with the tunnel and make an ordinary bridge. The tunnel is now on the skew with the streets; but by the resumption of the land at the corner of Cleveland-street and Regent-street we are able to get an ordinary bridge, which might be only 60 or 80 feet wide, but square with the lines, and it might extend perhaps in three spans. It would be just an ordinary bridge, which would be very much less costly than a tunnel, and very much less obstruction to seeing the signals.

830. You would build a bridge on the present site of the tunnel, but you would have a much wider space? Yes; the tunnel might be utilised for six lines, but it would have to be extended to carry six more lines if required.

831. Your idea is to bring twelve lines where at present six lines are brought through the tunnel? My idea is, while the improvements are going on, to provide ground for twelve lines. Mr. Parry has given evidence, which I have read in the Press, that it is absolutely dangerous at present. Every traveller must be aware of the enormous difficulty they have with Redfern yard, owing to that narrow space there. Instead of making one more arch, I say at once take up a strip to make six lines. It is a very small matter, owing to the fact that land, so I am led to understand, can be got comparatively cheap there.

832. *Mr. Black.*] Will it be possible, seeing that the streets are running at right angles, to substitute a bridge for a tunnel? If you carry your bridge as a continuation of Cleveland-street only, how will your Botany-street traffic get away.

833. You require a bridge, too, over Regent-street? No; it is one bridge—you join the two corners.

N. Selfe,
M.I.C.E.,
M.I.M.E.
22 July, 1897.

834. You will have a wide entrance to the bridge? I have provided 2 chains, and a retaining-wall in the middle to ease the ascent up to the bridge. I went into the question of making a tunnel and carrying the road in tunnel under the railway. It would be a very great improvement if you could sweep Redfern tunnel away, so that there would be a clear view from Redfern; but owing to the ground being so very high in front of St. Paul's Church, it would make a great drop in the road. By making a drop in the road, as it is proposed to do at Devonshire-street in the other scheme, you could carry Cleveland-street under the line, and do away with the tunnel; but that would be much more expensive, and perhaps properties might be affected. I found that the cheapest way was to make a bit of resumption at the corner sufficient to widen the lines, and then put up this bridge.

835. *Mr. Humphery.*] Leaving Redfern, and going northward, where would your first resumption be? A large plan was made for the Railway Commissioners by Mr. Foxlee, and the whole thing was gone into very carefully. I saw the plan in this room some time ago; I think it was brought over from the Existing Lines Office.

836. Do you want the plan to refer to? I do not think so. The Railway Department could give a great deal more information about that than I can, for they worked out my scheme, and have every inch of resumption shown on that plan.

837. Will you, for the information of the Committee, briefly explain the resumptions as you go in towards the city? The goods and passenger lines would turn off at Eveleigh and practically go under the proposed new station at Redfern. Leaving Redfern station and passing under George-street by a new bridge, double the width of the present bridge, and making provision for four more lines, two for North Shore and two for the circular railway, the line goes for a very short distance parallel and close to the Darling Harbour line, and it then turns to the north.

838. You have designed a new route for the Darling Harbour line from Eveleigh? No. There is a good deal of difficulty sometimes in getting loads up from Darling Harbour owing to the steepness of the grades. By dropping that line and easing the grades from Eveleigh it will be low enough to cover it over, and place a station on the top of it. From my experience in a great many countries in the world, it is not considered the correct thing for a suburban line to leave the terminus; it should turn off the main line before coming to the terminus, so that the terminus should not be both a terminus and a wayside station. Acting on that principle, this suburban passenger line turns off at Eveleigh, and when it gets to the western side of George-street at the site of the present bridge, it goes over the ground now occupied by calf-pens, market-grounds and sundry yards—very valueless buildings—till it comes to Engine-street.

839. Would the whole of the land required have to be resumed from private owners or does any portion of it belong to the Crown? I do not think there is any land there at present which belongs to the Crown.

840. It would go through privately-owned land all the way down to Engine-street? Through private land and streets, but the streets are so thickly together that the proportion of private land is extremely small. It crosses thirteen streets after leaving the tunnel.

841. How would you cross the streets? By an iron viaduct.

842. Leaving what headway? It shows rather high; it is 25 feet in some places, because it proposes to go from the point at George-street to the entrance to the tunnel nearly straight, and it will go right over the top of Hoskins'.

843. At what point would it enter the tunnel? Near King-street.

844. If it enters the tunnel near King-street, how do you provide for a station at Engine-street? It has two stations before it gets to King-street; the station opposite Christ Church is on the level.

845. Would the station be on the level at Engine-street? Practically.

846. Where do you propose to start your iron viaducts? We start from about half-way between Goulburn-street and Liverpool-street.

847. Do I understand that at Engine-street you have a surface station? Yes, there is provision for one there.

848. What land would you have to resume near Engine-street to provide that surface station? You would want about an acre.

849. That would be merely a platform? Yes, simply a wayside platform.

850. Between Redfern station and Engine-street, how many streets do you cross? Three.

851. Do you go under the surface? These are all streets which abut on the Darling Harbour line with dead-ends, so that by a very small modification there you could arrange a new route to get into the properties.

852. There would be no obstruction to traffic? No.

853. And the compensation would not be very great? I think not, from the uses to which these properties are put.

854. Are there any buildings on the land required for the Engine-street site? As the site has not been laid out distinctly for this Committee, I am unable to say, but I know there are no buildings on the land of more than a shed character.

855. From Engine-street how far do you proceed northward till you arrive at the next proposed station? Thirty-six chains.

856. How do you propose to get from Engine-street to that station? From Engine-street the line would cross Liverpool-street, Kent-street, and Druitt-street. These streets, possibly, may have to be modified in their grade, as they require to go under or over the railway. The station site provided by Market, Druitt, Kent, and Clarence streets is just 2 acres in extent, and is large enough to give a station of the same size as was approved of for a main metropolitan station on St. James' school site.

857. Are there any buildings of value on that site? A good many it would be a good job to pull down; but there are some good buildings on that site.

858. From that station to your next station, how far would it be? From that station it would be about 12 chains to the tunnel, which is entered to the south of King-street, and from thence it would be about 12 chains in tunnel to the Wynyard-square station.

859. Is the station at the back of the Town Hall to be a surface station? Yes, all open on the ground. It is so very much higher on the Clarence-street side than it is on the Kent-street side that it is possible that you would have to go upstairs to the level of the rails from the lower side, and down steps from the higher side.

860. How do you carry your railway from the back of the Town Hall to your next station? I carry it over Market-street by a viaduct and go under King-street.

861. You enter the tunnel to the south of King-street? Yes.

862. Then you have a tunnel of 6 chains, which brings you out into Wynyard-square? Yes. I arrive at a sunken station at Wynyard-square, the rails and platforms of which will be approximately level with George-street, so that an entrance can be made in George-street so as to walk straight into the station on the level.

863. What will be the depth of your station? I believe at its deepest part it is 20 feet below the surface.

864. Wynyard-square station will be 20 feet below York-street level? At York-street and Wynyard-street it would be from 18 to 20 feet in the highest part.

865. You take the whole of Wynyard-square? It is not quite necessary to take the whole of the square, but I think it would be better to take the lot.

866. Your proposed station between Wynyard-square and Engine-street is to be placed at the west of the new market buildings? That is my suggestion.

867. Do you go through all privately-owned property between that proposed station and Wynyard-square? Yes, except where the line runs under York-street.

868. Would it be necessary to resume the whole distance between Engine-street and Wynyard-square, of course with the exception of the tunnel? All of it, except where it runs in tunnel under York-street. It would be so near the surface that where it runs under buildings, it would be necessary to purchase them, and perhaps they could be let. There appears to be some uncertainty here about the right to tunnel under a property. It has been done we know in the Colony without paying for it, but then it has been done at a certain depth. Here you would be so close to the surface as to disturb the buildings. I am assuming that you will have to pay for all the properties you go under, except the streets and the parks.

869. Leaving Wynyard-square, where would your next station be;—would it be the terminal station? You go north 6 chains in a short tunnel, and then you come to daylight in the old St. Phillip reserve. It is a question in my mind whether it would not disturb Dr. Lang's old church: you would be so close to the foundations that probably it would have to come down. That is really the only building of any historic interest that it interferes with.

870. After passing what is known as Dr. Lang's Church, do you arrive at your terminal station? You have to go several chains more before you come to daylight in St. Phillip's reserve and Charlotte-place, which is now very steep up to the Three Crowns, and level at the top by the Grosvenor Hotel. I would lower the top hump, and let the railway go over Charlotte-place on bridges—you could not go under it. From this point you have to make a rise to 150 feet to get over the water, and you have to get down to Circular Quay. Two lines part company at Charlotte-place—one rises for North Shore, and the other descends in a grade of about 1 in 117 to the station at the Quay.

871. From Charlotte-place, what you intend eventually to be your northern line would be on one level, and the continuation for the purpose of the eastern line would be at a lower level? Yes, from Charlotte Place the eastern suburbs line would go on a descending grade to the Quay, while if the North Shore line is ever built it would commence ascending from the same point.

872. *Mr. Black.*] Would you emerge on St. Phillip's reserve on a level or on a rising grade? One line would be climbing and the other would be going down.

873. What would be the grade of the line which would be climbing? One in 50. I quite object to a bridge which would require any special arrangements. From Wynyard-square you can get a bridge 150 feet high on a 1 in 50 grade; and this has been set out with the idea of getting a 1 in 50 line at a height of 150 feet over the water.

874. *Mr. Humphery.*] Where would your proposed eastern line terminate? The eastern line goes across George-street, that is if there is a new George-street made, old George-street and a place called Change Alley at the bottom of Pitt-street coming across Circular Quay about 20 feet above the level of the road on an ornamental steel viaduct. There is room for a station in the neighbourhood of the Water Police Court, and from that point it will be in tunnel into the Domain.

875. You propose to have a station on Circular Quay? On the circular line practically that station, and all the rest of the route is a Government scheme. It was brought out in the time of Sir Henry Parkes, and the Engineer-in-chief worked it all out.

876. Will you explain where the Circular Quay station will be? It will be near the Water Police Court.

877. What land will be required there for that station? A site for the station would require to be resumed, but I take it that the line across Circular Quay would cause no resumptions, as it would be something of the nature of the overhead railway in New York, being merely steel girders and steel supports.

878. How would you get your trains away from Circular Quay before the extension eastward should be decided upon? Until this eastern extension is built the traffic to Circular Quay would go into the station on the Rocks, which we have the authority of Mr. Eddy for saying would accommodate eighty trains per hour.

879. For the present, the station between Argyle-street and Globe-street will be your terminal station? Until the eastern suburbs line is determined upon that will be the terminal station for the western extension.

880. Dealing with the terminal station at present, what resumption there would be necessary? I propose to resume 30 acres, devote 10 or 11 acres for the purpose of a railway, lay out the remainder in wide streets in place of the narrow ones, and sell the land for sufficient money to give the site to the railways for nothing. I am of opinion—I may be wrong—that if that property is worth on the authority of the Government valuer £30 a foot—you can practically shake hands across many of the streets now—and it is laid out in wide streets and levelled at a cost of £120,000, which was Mr. Foxlee's estimate for levelling it, these new streets will offer such extraordinarily valuable sites for merchants' purposes and businesses connected with shipping as to increase the price to £60 a foot. If it sells for £60 a foot it recoups you for the purchase money at £30 a foot.

881. And it is upon that basis that you made the estimate submitted in your statement? It is. I was led to see that this, the oldest part of the city, calls for some improvement. To take it in hand, apart from the railway, would be a very serious affair; but if it could go hand in hand with the extension of the railway, it would remove what is really a blot in the most prominent part of the city to anyone coming up the harbour. Our visitors land at Circular Quay with all these slums right in their faces. It would be not only a great improvement of the city, but also a commercial success.

882. Do you propose to cut down the whole of the 30 acres to the level of George-street at the Queen's Wharf? No; it would be some feet above the level of old George-street. It would be cut down to about

N. Selfe,
M.I.C.E.,
M.I.M.E.
22 July, 1897.

about the level of George-street at Bridge-street, and instead of descending as old George-street now does to Queen's Wharf, the new George-street would be practically level until it went through Ives' Bond in Argyle-street and came out up by the Harbour View Hotel at the terminus of Cumberland-street.

883. You propose to raise George-street? No; I propose to make a new George-street. I do not propose to disturb any frontage to the present street.

884. You leave George-street as it is, but you provide a new street which you call New George-street, running parallel with Old George-street? Old George-street is very crooked there.

885. But on a different level? On a higher level.

886. What would be the difference in level between the new street and the old street? I have plans showing that all complete. I should think, beginning at the same level at the junction of Essex-street, the new street would probably be 10 feet higher than the old one at Argyle Cut.

887. At what distance from Old George-street? The New George-street runs right over the site of the present Harrington-street and Cambridge-street.

888. They would disappear? Yes; Harrington-street, Cambridge-street, Cumberland-street, Gloucester-street, and all the cross lanes—Tom Cribb's-lane and all the others—would be wiped out, and you would have a clear block to lay out the railway, perhaps much more conveniently and to better advantage than I have shown, and the residue could be laid out in this new George-street, which would give you an unbroken thoroughfare on a level, leaving, of course, the old George-street for its present purposes. The only buildings which would be destroyed in George-street would be the buildings at the corner of Essex-street where you turn off at an angle.

889. Would you be obliged to destroy St. Patrick's Chapel? No; I propose to give it a little more land. St. Patrick's Chapel now is very close to the street, but that street being destroyed, and this small piece of land being of no use, I should propose to leave the white space shown there to the west of the church, in order to keep the railway as far off the church as possible. It would not destroy the church.

890. What is your estimate of the cost of construction from Eveleigh to the terminal station shown on the plan and round Circular Quay? I have never gone into that; I have been quite prepared to take the estimate prepared by the Railway Commissioners.

891. You have not made any estimate of the cost? No; I would not do that, because I considered that I should be putting myself in conflict with the railway authorities. I submit this scheme for what it is worth, and if the Committee think it has anything in it all, then I think it ought to be put into the hands of Mr. Deane to see whether it is a workable scheme or not. Mr. Deane, as representing the Government, has worked out schemes very much like this one; what is called the "L" scheme goes over to the Circular Quay from the western side.* I want the Committee to distinctly understand that I do not pledge myself to this modified route one yard one way or the other, because I have only put this line in from Liverpool-street to Wynyard-square as an alternative to one going through the markets. The line going through the markets I had surveyed, and I made complete plans at very great cost. They were practicable, and they were fairly reported upon before the Commission, except that the cost was unfairly brought out. If this deviation I indicate is worked out we will see whether it is a practicable plan, and, in view of the reduced values of city property, whether it could be done at a price which would justify its being recommended.

892. You have not made any estimate of the cost of the work, or, I suppose, of the cost of the resumptions, except upon the basis obtained from the evidence of Mr. Perdriau? No. In the evidence I gave as to the cost of this scheme, as compared with the cost of the other scheme, my estimate was £14,000 per chain, on the basis of Mr. Foxlee and of the Government Valuer.

893. Do you mean including resumptions? Including everything. After the Commissioners' officers and the Engineer-in-Chief reported on my scheme, their figures brought it out at that price; but what I complained of was that I was charged for the whole 30 acres at the Rocks, and with £120,000 for levelling it, and was not given one penny credit for the resale of 4,000 feet of frontage, which I consider was not putting the scheme on a basis which would enable a fair comparison to be made.

894. Do you think the scheme before the Committee with a terminal station at Hyde Park would cope with the suburban and long-distance passenger traffic? I think it is the grandest part of the city for a terminus, but I honestly do not think it will serve the great bulk of the business people who come in.

895. You are speaking of the St. James'-road scheme? Yes. I think all persons occupied on the west side of George-street will be able to come in by the electric tram from Redfern at a cost of 2d. a day. Mr. Eddy said that he expected to receive a revenue of £34,000 from the extension to St. James'-road. I cannot see why the people are going to walk to the top of King-street from these populous business quarters when they can take a tram or 'bus along George-street to go to Redfern, but if the railway runs along the western side of Sydney with a station every quarter of a mile, then there is not the slightest doubt that the necessity for the electric tram, which is authorised, largely disappears.

896. While in many respects, you regard the St. James'-road scheme as the grandest scheme yet offered, you are of opinion that your scheme will serve the western portion of the city, and provide for traffic that will not be provided for in the other scheme? Practically. If the main terminus of the Colony is to be extended northerly, I think we had better agree to give up all Hyde Park at once, and there, no doubt, you could get a grand terminus; but if the present Redfern site is quite far enough north for long-distance trains, as seems to be the opinion of nine out of every ten I converse with —

897. Is it your opinion? I have travelled in twenty different places and countries, and it is my opinion absolutely, from giving the most dispassionate look at it, that the Redfern station is nearer by one-half to the centre of the city than in most of them. Take Euston station, King's Cross station, and St. Pancras station, London—these stations are all out of town, and people who want to go to London get out at a station behind these large termini, and they pop into a local railway which brings them down into the centre of the city, just the same as at Eveleigh, you would change and get into a train which would take you to Paddington.

898. *Mr. Hoskins*] Do you not know that there is a station on the underground railway in London, which is close to Euston station? Yes.

899. *Mr. Humphery*] We are told that of the total traffic nine-tenths will be suburban traffic and one-tenth long-distance traffic;—would not the initial cost be less for a terminal station to provide for the whole traffic, and also the annual maintenance be less than it would if you divided up the traffic as you propose to do? I do not think so. I think this terminus, perhaps, is a great deal too grand and large

for

* NOTE (on revision):—(Question 399, Report of Royal Commission on City Railways, 1891, shows that the Government then proposed to cross the Circular Quay on a viaduct, with a station at the Water Police Court site, and to utilise Wynyard-square.

for the suburban traffic. It is on the scale of the large termini for long-distance trains, instead of something more akin to a suburban railway station. An ordinary by or through station is quite good enough for the every-day suburban passenger who comes in and wants to be deposited as close to his place of business as possible. I think there will be a tremendous congestion at the top of King-street, unless it is widened, with the proposed new terminus there. While approving of St. James'-road as having advantages for a terminal station, I think King-street should be widened right down to George-street on one side, if the terminus is carried to St. James'-road.* I have endeavoured in all these things not to look for to-day, but to look to the extension of the colony. During the forty odd years I have been here I have gained a little knowledge of public requirements, and taking into view all these things, if we are to have Hyde Park taken for the terminus, then, I say, consider the possibility of taking a great deal more than is now proposed. But it will not convenience the great bulk of the suburban passengers to put them out there. I do not believe one-half of them will go there when it is built if they can get to Redfern by tram or omnibus.

N. Selfe,
M.I.C.E.,
M.I.M.E.
22 July, 1897.

900. *Mr. Trickett.*] Are you aware that a considerable opposition to the Hyde Park scheme has been made on the ground that it will interfere with Hyde Park as a recreation ground for the people? I am.

901. By your scheme you propose to take the whole of the recreation reserve at Wynyard-square, surrounded entirely by buildings;—how do you think that proposal will meet with the popular feeling? It is a small loss against a big one. It is a pity to take Wynyard-square; but it is a very small evil compared to the other one. The flagstaff reserve is a very short distance away. Wynyard-square allows for connection to the eastern suburbs and North Shore overhead without tunnel; the Hyde Park site does not do so.

902. Of course, you have not gauged the feeling of the public in that respect? I have. It is wonderful the scores of people who give me their opinions on the matter, who ask me how the thing is getting on, and tell me what they think about it. But I have never heard one objection to taking Wynyard-square.

903. Are you aware that at the time Barrack-square was sold Wynyard-square was specially reserved for the use of the public and surrounding properties, and on the understanding that it should not be sold or interfered with? No; but if that is the case, it puts us on all fours with Hyde Park.

904. No; because there appears to be a special right of property reserved in the case of Wynyard-square? I suppose there was a deed of partition made up in such a way that the square was secured to the freeholders all round; and if such is the case, they will have some legal right to the use of the square, and it will make it a little more difficult.

905. Where do you think most people would get out of the train on your scheme—to the west of Market-street or at Wynyard-square station? It is very hard to say. The railway omnibuses begin to drop passengers about Market-street, and from Market-street to Bridge-street they fill up; having been a railway passenger for a number of years I see not only the great number of people who arrive by omnibus, but the number of people who walk and who would possibly come on further if kept in the train.

906. You think that the great mass of people would alight at Wynyard-square station? Yes.

907. Are you aware that engineering experts give it as an objection to a passenger station where there is a large traffic, that it should be underground and approached by a number of steps? I am not aware of that, because we have Mr. Eddy's authority to the contrary. The station on St. James' School site was 24 feet down, I think.

908. But Mr. Eddy also gave evidence in favour of the Hyde Park site, that its great recommendation was that it was entirely on a level? No doubt; but the station now proposed is sixteen feet below Park-street.

909. You admit that to go down a number of steps with a traffic amounting to tens of thousands a day must be somewhat inconvenient? If it was inevitable; but, as a matter of fact, you can make an approach or connection from Clarence-street on one side and from George-street on the other side on the level, so that there will be no steps to go down. I think I explained to the Committee that the level of the platforms in Wynyard-square would be very nearly about the levels of George-street, between Wynyard-street and Margaret-street. Suppose an entrance were made opposite the Equitable office, or anywhere in that neighbourhood, you would be able to walk into the station on a level from George-street.

910. In regard to your statement about Mr. Eddy's evidence, he said before the Commission:—

In other parts of the world where stations have been made above the level of the streets, and in some instances below the level, there has been the greatest possible amount of difficulty experienced; and every effort has been made later on to get rid of the difficult levels.

? He is quite right.

911. Therefore, comparing the two sites from that point of view, there is no doubt that Hyde Park is better than Wynyard-square? The proposed station at Hyde Park is sunk considerably. At the Park-street end the rails come right in under Park-street, and there is a tremendous ascent to get up at that end of the station.

912. According to the plans that is all regulated, so that everything can be dealt with on the level? You can regulate it better in Wynyard-square, because you can get an entrance on the level from George-street on the eastern side, and an entrance on the level from Kent-street or Clarence-street on the western side; this quite gets over the difficulty of a stairs, which you cannot avoid on the eastern side of Hyde Park.

913. In the statement you read to the Committee on Tuesday you said it was universally acknowledged that Redfern is near enough to the city for a present terminus;—do you adhere to that statement? I do. That is the great consensus of opinion. I have heard people say, "bring it into Hyde Park"; but I must say that twenty-nine people out of thirty seem to think that for terminal purposes Redfern station is quite sufficiently north. Of course I may not meet with the particular people who want otherwise. I can only give you my own experience.

914. Do you not know that for the last twenty years there has been an agitation amongst a great many people to bring the railway into the city? There has been a parrot-like cry for bringing the railway to the deep-waters of Port Jackson, but if you asked people what they meant by it they could not tell you.

915. Even the people of the western suburbs for many years have desired to be brought further into the city? Yes; but they would far sooner be brought to the Town Hall or Wynyard-square than to the top of King-street.

916. You are getting away from your former statement that it is universally acknowledged that Redfern is near enough to the city for a permanent terminus? The permanent terminus is at Redfern, and all these

*NOTE (on revision):—If the terminus platforms are on the level at the Elizabeth-street side, the eastern side will be down in an excavated area. Nothing short of removing the whole crown of King-street and St. James'-road down to the station or terminus level will do justice to the costly and haughty elevation that has been designed for the proposed new building.

N. Selfe,
M.I.C.E.,
M.I.M.E.

22 July, 1897.

these are wayside stations on a circular railway. I feel certain that there must be a circular railway before twenty years, embracing the eastern suburbs and going right round to Alexandria.

917. Whether you call it a permanent terminus or not, I suppose you will admit that many thousands of people object to being landed every morning at Redfern station, and having to go away during the day from Redfern station, and want the railway to be brought nearer the city? Yes; but there is no demand to be brought to a terminus.

918. On Tuesday you suggested that long-distance passengers should be deposited at Strathfield, and make other arrangements to get into the city;—do I understand you to mean that a passenger from Victoria or Queensland, or from Bourke or any other remote part of this Colony, possibly arriving at Strathfield at 5 or 6 a.m., is to be satisfied with being landed at Strathfield with his goods and chattels, and then have to make other arrangements to go to his friends in Sydney or to an hotel? No.

919. You admit that you stated that? I do not admit that that at all represents what I said. What I said was that long-distance passengers who had no impedimenta with them, and who simply wanted to go at once to small local stations, could, when their tickets were collected, change into a suburban train, which of course would be arranged to follow after the mail-train. But if they came with a lot of luggage, and were ordinary long-distance passengers, they would go into the terminus at Redfern in the ordinary way where the cabs stand and everything else would be prepared for them.

920. That is what you mean and not the bald statement you made the other day, that they could get out at Strathfield, and make other arrangements? No; if you put it in that way that entirely misrepresents what I intended to convey. What I meant to say is what I have said now.

921. Your *modus operandi* applies to long-distance travellers who come in without any impedimenta, and can make an arrangement of that kind without any inconvenience;—it does not apply to the great mass of long-distance travellers who generally have a good deal of luggage? These people always take a cab, and they could take their cab from Redfern, where proper arrangements would be made for cabs, and there would be no necessity to have a cab-stand at all the wayside stations down the city, any more than there would be at a tramway stopping-place. This railway down the western side of the city would be analogous to a local railway or tramway.

922. Then I understand you to mean that you treat the long-distance passengers differently from the suburban passengers with regard to their being brought into the city? I do. I treat this city railway extension as portion of a circular local line having direct connection with a main line, for those who choose to use it, but being primarily established for the benefit of suburban passengers.

923. In the proposed railway shown on your plan by "the terrible black trail," it is suggested by the Government to branch off with a line at St. James's-road going somewhere under the Mint, and coming out in a curved line at Cowper wharf, and thence on to the eastern suburbs? Yes.

924. That is a comparatively short distance? Yes.

925. On your line, I take it, a person wanting to go to the eastern suburbs would have to travel from Eveleigh station as far as Charlotte-place, thence round Circular Quay to the Water Police Court, and thence by a tunnel through the Governor's Domain and the ordinary Domain before he got to Cowper Wharf on his way to the eastern suburbs? That is correct, and that is what I—

926. Wait a minute. Is not that a very round-about way for anyone wanting to approach the eastern suburbs from the western suburbs as compared with the route suggested by the Railway Commissioners at the present time? It is a little longer, but it has far more compensating advantages, because a person from the eastern suburbs who wanted to go by a harbour steamer would have to go into Hyde Park, and then get into another train, and go down in a tunnel to Circular Quay, whereas in my scheme I bring the eastern suburbs, the western suburbs, the main line, and the Circular Quay travellers all on to one circle, and from any part you can go to any other part. If a person from Waverley or Randwick wants to go to Manly Beach, under the Government scheme, he will have to get out at Hyde Park and walk to the Circular Quay, or take a tram, whereas in my scheme he can get out at the Water Police Court station, or go round the western side to the Rocks station. The passengers can go either way, and the ticket will enable them to travel both ways on the circle. Suppose a man at Randwick wants to go to the Town Hall station, there are trains on both circles, and he will probably take the first train which comes in. The little extra distance of going to the Quay and up again will be nothing when you come to take it in the 5 miles circuit. I do not think the extra travelling is worth a minute's consideration compared to the immense advantage of bringing in all the people in these thickly-populated suburbs who want to see their friends at Manly Beach or Hunter's Hill to the steamers, because our marine suburbs deserve as much consideration as other suburbs. Circular Quay is devoted now to harbour traffic, and any scheme which does not bring the eastern and western suburbs in direct touch with the harbour traffic, I think, falls short in a very essential point. It is in the endeavour to combine these things, for better or worse, that I have done this.

927. You seem to forget that in their evidence Mr. Eddy and Mr. Deane both coincided in the opinion that the Hyde Park scheme is so designed that it can be extended, directly Parliament authorises its extension, to Circular Quay, being partly in tunnel and partly in open cutting, without, as you say, changing trains, because the evidence given in this inquiry by Mr. Deane is that the line would not have to be sunk to go right away down to Circular Quay? But as the line from the eastern suburbs comes into the Hyde Park station by a southerly turn, it is very certain that it could not go on to Circular Quay unless it were shunted.*

928. Mr. Parry the other day gave some very clear evidence explaining the mode of shunting and altering the engine from one end of a train to the other, which appears to get over the difficulty you suggest? I have no doubt that when the traffic warranted it the Commissioners would make every provision to take people wherever they wanted to go.†

929. There is an extra distance, but you think the extra distance nothing as compared to the complete circuit you propose to make? Yes; because Mr. Eddy laid such very great stress on the importance of a station at the Circular Quay.

930. In your possible connection with North Shore, I presume you propose to go by way of a bridge over the harbour? Yes; I have devoted immense attention to all the pros and cons of a bridge as compared with

*NOTE (on revision):—The Government extension from Hyde Park to the Circular Quay has twice as much tunnel as the whole western route proposed, including the length under York-street, for which no compensation would have to be paid.

†NOTE (on revision):—Mr. Parry's evidence in this connection may be applied to the questions put to me—Q. 440— which I preferred not to answer in detail.

with a tunnel, and as I understand that there are no less than four high-level bridges now being built in the world at a height of 150 feet, I have come to the conclusion that all the ships above that height should lower their top-gallant masts, as the interest on the cost of making a bridge higher than 150 feet would be more per day than the cost of lowering ships top-gallant masts would be per year, and the expense of running trains over a higher grade than 1 in 50 would be a great deal increased—because that is the ruling grade on the North Shore line, and should not be disturbed. And as a grade of 1 in 50 can be got with a bridge 150 feet high, I think the harbour traffic should be contented with a bridge of that height.

931. In your evidence the other day, you described the proposal of the Government, and indicated it on your plan as a "terrible black trail":—I suppose we can infer from that that you are prejudiced against that scheme? No. I might have said it, but I am not prejudiced at all. I want all the schemes considered on the same footing. I have explained why that patch was made so wide. It looks worse on the map, I suppose than it would look, looking out of a balloon on to the city.

932. On your plan you show a black line from Redfern station up to the new terminus at St. James'-road; do you think it is quite fair to indicate that route by, as you call it, a "terrible black trail," when you must know that from Goulburn-street to Park-street very much of the line is in tunnel? Yes, but the line runs there.

933. In your own plan, you do not show your tunnel in that way? I have only seen this plan to-day. Had I seen this Government plan, I should have chopped out this place and left the green in the Park as it is shown on the plan between the openings.

934. You candidly admit, I suppose, that the diagram you have produced is hardly a fair way to make a comparison? If I thought that the Members of this Committee were likely to be affected by a sentimental thing like that, I should say that it was unfair. But I had no thought that showing the thing in that way would be construed into anything of that kind, and, as I explained, I took the width as the actual width shown in the other plan, and it was pinned on as you see.

935. You have not shown your own line on the same scale? Because I do not know where it is going.

936. You know possibly about what width it is to be? Yes.

937. If your line was shown on the same scale as the Government line, I suppose it would show up very much more prominently than it does? It would look like another trail.

938. Will you, for the purpose of a fair comparison, prepare a plan showing your scheme on the same scale as the other? Yes. I have already explained that the black line was made 32 feet wide, exactly the width of the resumption shown on the Commissioners' plan, from Liverpool-street to Goulburn-street, as an approach to a large terminus. The red line was for four pairs of rails only.

FRIDAY, 23 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL PEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Edmund Compton Batt sworn, and examined:—

939. *Chairman.*] You are a member of the firm of Batt, Rodd, and Purves (Limited), and you are engaged in auctioneering, valuing, and all that class of business in connection with the city, of which you are an old resident? I am.

940. *Mr. Trickett.*] Do you remember being examined on the 30th March, 1897, before the Royal Commission on 'City Railway Extension'? I do.

941. On that occasion, in answer to Question 1838, you said—

I do not think that it is necessary to have a terminal station there at all. What I would suggest is a circular railway to serve both the eastern and the western parts of the city. The trams would then run in opposite directions round the city, and they would pass through Redfern as they now pass through any of the suburban stations. This would relieve the congestion of traffic at Redfern, which is caused mainly by the suburban traffic. If the greater part of that traffic were taken away from Redfern, there would be plenty of room there for a terminal station. People going long distances to Melbourne, or back into the country—could as easily get a cab and drive to Redfern then as they do now.

Do you still advocate those views? I hold precisely the same views. If anything, my views have been rather strengthened by the evidence. I have taken the trouble, since I gave my evidence, to read all the evidence which was given before the last Royal Commission and the earlier one.

942. Do you wish to add to the evidence you then gave, and in what direction? I do not know that I can materially add to it. I explained at the time that it was not my province to be a surveyor or civil engineer. I spoke as one knowing Sydney well, and being accustomed to the wants of its people in the way of travelling, and also with regard to the value of land. I do not think I can say much more, except that my own views are stronger than ever as to the undesirableness of taking the railway, and having a terminal station at Hyde Park.

943. You still think that long-distance travellers should be deposited at Redfern? At Redfern if it is treated as a terminal station, and the shunting can be got rid of by the plan I suggested—by a circular route, to give about a three-minute service in alternate directions,—I think they have room enough for I am afraid to say how many years.

944. You have not gone into the possible or probable expense of the scheme you advocate? Only indirectly. Not being a surveyor, I have had to simply map out a suggested route which I thought was available. But I have studied very closely the levels and plans of Mr. Greenwood, who gave evidence here the other day. He was a perfect stranger to me, and he rather surprised me that such an available route was so easily obtainable.

N. Selfe,
M.I.C.E.,
M.I.M.E.
22 July, 1897.

E. C. Batt.
23 July, 1897.

44

E. C. Batt.
23 July, 1897.

945. Do you remember what he said would be the cost of his route? About £375,000.

946. Have you any objection to part of Hyde Park being taken for railway purposes? To passing through it with a train I have no objection whatever. I think a park or a church should give way to the public good, but I should think that to take away one of the best lungs of the city (13 or 14 acres) for a terminal station where it is not required would be a very great mistake, and I do not wonder that the people object to it.

947. There is the view of the Railway Commissioners and the Engineer-in-Chief that it is *par excellence* the best site in Sydney for a railway;—you have considered that position, coming from men of their experience and knowledge? I bow, certainly, to the ability of the late Mr. Eddy as an administrator of the Department of Railways. I think he was far too broad-minded a man, if he found a better route suggested, or if he were given an opportunity to judge of one, to think that he was the best judge of Sydney, and what its requirements were for the travelling public. As regards his administration of the railways, I join most sincerely in saying that I think his death is a great loss to the Colony. But I cannot understand that he could be a better judge than those who have been in Sydney much longer than himself as to where is the best station for a railway.

948. In connection with your circular scheme, have you considered that North Sydney and the eastern suburbs have for a long time been crying out for railway communication, and have you provided for working in your scheme with those suburbs? For North Sydney, yes, but for the eastern suburbs I have really given it very little thought. I do not profess to say much about the eastern suburbs. I think they are pretty well served as it is now. The electric tram is being built.

949. Is there any fresh information which you desire to give to the Committee? I do not think I have much more to say. My thoughts since I gave my evidence have been directed into trying to see what the merits or demerits were with the scheme which was proposed, and the more I have looked into it the more I have seen that it would not serve the people of Sydney. The bulk of the daily travelling public from the suburbs, I think beyond dispute lies west of George-street. I cannot see how a station at Hyde Park would materially benefit any of the daily travellers whose occupations oblige them to go west of George-street. I think that is where by far the largest proportion of the traffic goes. Therefore the proposed scheme does not meet the long-made promise to the citizens of Sydney that suburban travellers should have a railway into the city. It seems to me absolutely a one-sided scheme. By what has been given in evidence since I was examined, it is admitted that in twenty years' time the probability is that new arrangements would have to be made. I cannot see, in dealing with this important question, that it is wise to do anything less than face the question for all time.

950. You seem to lay great stress upon the advantages your route would give to the people on the western side of George-street;—do you not think that the bulk of the passengers from the western suburbs proceed to between, say, Elizabeth-street and George-street, rather than to the west of George-street;—would you not think that a far larger quantity of them were taken up there to offices and shops and warehouses rather than to the west of George-street? No; I do not think so. I cannot speak accurately on the point, but I should imagine, at all events, the much larger business-settled portion of the community lies west of George-street rather than eastward.

951. Have you any figures to give? No.

952. It is merely a matter of opinion? It is a matter of opinion only.

953. *Mr. Roberts.*] When you state that the Department has room enough at Redfern for many years, did you arrive at that conclusion after a personal inspection of the difficulties surrounding the yards at Redfern? I did, after many inspections.

954. Do you suggest any alterations in the arrangements for working the traffic? I maintain that if the entrance through that neck of land to Redfern station has been enough for the whole of the suburban traffic in connection with the shunting, if you move the suburban traffic it ought to be enough to accommodate ten or fifteen times the present quantity of main-line traffic. The trouble, so far as I know anything about Redfern station, has been the continual shunting of the suburban passenger trains. I walked carefully round Redfern yard the other day. I found that there are heaps of room available, but which are now used for storing sleepers, iron chairs, rails, and things of that sort, and on the left-hand side, particularly for goods traffic; and as I know it is the opinion of the Commissioners that goods traffic and passenger traffic should not be in the same place, with the area of land in Redfern yard I maintain that they want nothing better for a central yard for many years to come than the present terminus.

955. *Chairman.*] It is not a question of area at Redfern, but a question of the shape of the station? I have already said that the shape of Redfern is most undesirable; but if it has been large enough to accommodate the whole of the suburban and main-line traffic—and, in fact, the whole of the goods as well—remove the great danger of the shunting of suburban trains, and it ought to be large enough for many years to serve ten times the traffic.

956. *Mr. Roberts.*] When you were examining the Redfern yard were you accompanied by any Railway official to explain the *modus operandi*? No; I went alone.

957. I mean by any officer dealing with the arrival and departure of trains? No; I know the station well; I did not want anyone to show me round Redfern station.

958. Does it not occur to you that it may require some information from a man well up in the working of railways to enable you to form a conclusion such as you seem to have done? I think not; because as I have already said in evidence, I have known this station for twenty years, and I know the traffic which passes through it, its mixed nature, and how it has been utilised for the shunting of every suburban train. I say remove that evil, and you have enough room at Redfern for the next 100 years.

959. Are you prepared to show how that evil can be removed? I do not know that there is any evil particularly to be removed.

960. Are you not aware of one dangerous point there to the carrying on of the traffic? I only know of the danger arising from the necessary shunting arrangements interfering with the entrance of incoming trains through the tunnel. Given a free access, and no shunting to be done in Redfern station, I cannot see why you want any more land than is available in the present yard. If there is, the cheaper land should be taken on the other side of that neck of land, and not across at the Benevolent Asylum site. In one case you get ordinary, cheap land, but in the other, you are going more and more into the city, which around Redfern is getting every day more valuable.

961. What you mean is that you would prefer an extension of Redfern yard in a southerly direction to taking the railway on to the Benevolent Asylum ground, with a view to establishing a station there? That is exactly what I mean. Any extension for a railway yard purely should, I think, be taken southward, and not northward.

E. C. Batt.
23 July, 1897.

962. Does it not appear to you that a great deal of inconvenience would be experienced, and I may say dissatisfaction expressed by long-distance travellers, if you asked them to be dropped at Eveleigh or Redfern, instead of being carried on to the heart of the business portion of the city? A small section of the travellers—long-distance travellers—would undoubtedly very much prefer, I daresay, to be landed at the door of the Australia Hotel, or their club, or whatever place they were going to stop at. But even if landed at King-street, and they had luggage, they would have to drive to the place where they were staying. With the exception of a daily long-distance traveller, who carries no luggage, I do not see any reason why the long-distance trains should not run round the loop-line I suggest, and back to Redfern, without obliging anyone to change—it could land him wherever he liked. I do not propose for a moment to have a station at these points, but only a platform, for you cannot expect to keep an army of porters except at the terminal station.

963. To drop the long-distance passengers at Redfern or Eveleigh, and then have a loop-line for what I may term the suburban traffic, does that to your mind satisfactorily deal with the question of extending the railway into the city;—does it not appear to you to be only half doing the work? No; I think it fully satisfies the requirements of the travelling public.

964. Are you a frequent long-distance traveller? I travel 22 miles a day each way, and I am very frequently away from the city.

965. Your professional duties take you to far distant parts of the Colony, and you arrive frequently at Redfern station from those points? Yes. It would be quite as easy for me to drive to my house by cab from Redfern as from Park-street. I do not see that it would make an atom of difference in the amount of the cab fare.

966. Do you not think that if the terminal station for long-distance travellers were retained at Redfern an agitation would immediately be got up to get the Government to extend the line into the heart of the business portion of the city? I do not. I take it that those most to be considered are the majority of daily travellers and not long-distance people, who are only occasional travellers. It is really to meet a daily want that the extension into the city is so much required. People who have to pay 2d. a day each way on the tram—and to whom a city extension has been promised for many years—should be landed nearer the centre of the city.

967. Would not a long-distance traveller feel that he had some grievance when he came to Sydney? I do not think so. I do not know any town where the long-distance traveller is brought into the centre of the city.

968. Are the Committee to understand that you prefer to drop the long-distance travellers at Redfern and to have a series of platforms between Redfern and Circular Quay to accommodate the suburban traffic, instead of having all the traffic terminating at St. James' road? I do not consider that this extension into the city for both suburban and long-distance travellers is meeting the wants of the place. I consider that any extension into the city should take place on each side of George-street, and the central station be kept where it is. I think it would be the cheaper, the better, and the more lasting plan—suitable for all time.

969. You are in favour of building a loop line? Certainly. We have to be thankful for small mercies. I am not one of those who oppose a line into the city because I cannot get all I want, but I say it is a momentous question, and because it happens to be a Departmental scheme just showing one route only it does not necessarily follow that it is the best. Mine was a suggestion originally made to Mr. Eddy. I never posed as an engineer, but I do profess to know Sydney, and I say that to serve the wants of the public, we want to serve them both east and west.

970. Of the routes which have been submitted to the Committee, may I ask whose route you prefer—Mr. Selfe's or Mr. Greenwood's? I paid more attention to Mr. Greenwood's; I took the trouble to go through his plans carefully with him, but I prefer to stand on the ground that I do not ask any one to accept my view of any particular route. I am not advocating any particular route, whether it is suggested by the Commissioners or some one else. Mine is rather a general opinion as to the most desirable form of a railway, rather than as to its actual location.

971. In speaking of the Hyde Park scheme, you said that in twenty years probably a new arrangement would have to be made;—does it not strike you that whatever route may be adopted by Parliament in twenty years time, having in view the growth of the city and its suburbs, that the same arguments may apply? No, not if a circular railway were made as an inner circle. I think it is very possible that within twenty or twenty-five years you may want to make an outer circle as well. If you make Redfern your terminal station, I think every one will allow that year by year it is getting more and more the centre of the city. You may want to make other lines, but you will not interfere with the existing ones. It is like the Metropolitan and District railways at home. You may keep on multiplying the circles, but you will not want to disturb these lines. I think by that means you can get a three-minute service in each direction all round the city within the inner circle.

972. That is, to still land long-distance travellers at Redfern? There is ample accommodation for them there for many years.

973. A large number of mail bags arrives from Victoria, South Australia, West Australia, and Europe, but according to your scheme if long-distance trains were kept at Redfern, great delay would take place in the transferring and checking of the mails and baggage? Not necessarily.

974. Would it not cause a much longer delay than if the terminus were located at Hyde Park? I should say it would make a difference of about three or four minutes at the outside.

975. It would make a difference of an hour? It does not take 10 minutes to come from the station. Every night the mail-cart and my cab run alongside each other to the station to catch the mail-train, and I do not take more than seven minutes sometimes.

976. *Mr. Wright.*] Have you any idea what route your circular railway would take? I have my own idea. I do not feel competent to go into that question, because I am not sufficiently acquainted with the levels. I should be only wasting your time if I did.

977. The route would have to be between Elizabeth-street and George-street on one side? Not necessarily between Elizabeth-street and George-street. I have no compunction about going through the Park with a line of rails.

978. It would be between Hyde Park and George-street on one side, and between George-street and Sussex-street on the other;—do you know the width from Hyde Park to the waters of Darling Harbour? I do not think it exceeds half a mile.

- E. C. Batt. 979. Do you know any city in the world where two lines of railway run parallel within half a mile of each other? I know where they are running a great deal closer. I have run into Gloucester, where two separate competing lines run alongside each other.
23 July, 1897.
980. But it is not a railway to supply the wants of a city? It is not done for the benefit of Gloucester. Those I propose are not competing lines. I do not consider that a loop-line is a competing line.
981. Looking at the peculiar configuration of Sydney, and the fact that it is built on a peninsula half a mile wide, do you think it is necessary for people to have two distinct lines running alternate ways in that small area;—is it not possible to supply the whole of that peninsula by one line passing through the city? I do not. What is wanted for the requirements of the daily travelling public is to be served in both ways. I think both sides of George-street want to be served.
982. You think that a man on the west side of George-street wants a line between himself and Sussex-street, and that a man on the east side of George-street wants a line between himself and the Park? I mean to say that it would be very much nearer for him.
983. You have had some experience as a railway passenger;—do you think two lines of railway on a circular route will supply one half the requirements of the city at the present time? I think it would do five or six times the traffic. On a circular line you could run a three-minute service.
984. You are aware that it may be necessary in some parts of the day to bring in trains at an interval of four or five minutes, and to detain them for a time;—what are you going to do with the trains on the line during that time? The trains on my line would never stop there.
985. Do you mean to say that it is a constant procession of trains going round the circle? I do not mean to say it is a constant procession, but so far as the traffic warrants it to the suburbs, there will be a continuous service of trains on this circle running past Redfern station.
986. If it is a continuous procession of trains, a train starting from A must come round and go back to B, to allow the other train to follow? No; my suburban trains would only come round fast enough to supply the wants of the suburban travellers. You might have your long-distance trains going through and coming out of the circle at Redfern. I want to take the people from the suburbs to the city.
987. You think that a circular line will do for the next century? It is a rather long time; I have seen the London and North-Western yards grow at home.
988. Do you think it is possible to conceive what the Railway service here will be in fifty years' time? You have always land to the south, which must of necessity be cheaper than land to the north. If it is large enough for the next twenty-five years, it will be just as cheap to take the Benevolent Asylum ground in twenty-five years' time as it is to-day.
989. Do you know that any extension to Sydney will mean the destruction of all the buildings at Redfern yard? I should not think that would be a vital question—like the resumption of heavy-priced city land.
990. Do you know that owing to the peculiar configuration of the ground you cannot extend in any direction in the present yard? I would take land on one side or the other of the neck of the bottle; I would go right out to Regent-street.
991. Would you take Regent-street away? If necessary. It would be cheaper than taking land to the north.
992. Under any scheme of city extension Redfern must be adapted for the storage of spare stock? That is my idea in urging the necessity for a loop-line. You do not require any storage. You make up your suburban trains which are always going to their natural destination.
993. At certain hours of the day trains run much more frequently than they do at other hours, and during these idle hours the trains have to be stabled somewhere? They find the yard enough for the present with all the difficulty of shunting. If you want more room why not move the engine-sheds. What do you want with goods-trucks going down to load stuff. There is plenty of room in Redfern yard if properly used.
994. Do you consider Mr. Eddy or yourself to be the better judge of that? I think it would be invidious for me to say. I might think I was, and he, if alive, might say that he was. I do not think we are bound to accept the statements of these people.
995. Do you think a gentleman who has spent his life in the Railway service is not a better judge than you or I can possibly be of what is wanted for the Railway service here? That is a difficult question to answer. I do not want to say that a man who is an expert does not know better than one who is not.
996. Do you not think Mr. Kirkcaldie should be able to form a better judgment of what accommodation is required for a certain amount of traffic than either you or myself? I must fence that question. I do not want to say exactly what I think. May I say that any scheme emanating from the chief of a department naturally finds its support and followers from those who are under him. It does not necessarily follow that it is the right scheme. It follows as a matter of *esprit de corps* that a man should support his chief in what he says.
997. I suppose you are prepared to admit that, when the head of a great department states that he requires to conduct certain traffic in a certain space, and that he cannot conduct that traffic without that space is given to him, very great importance should be attached to his evidence? Most certainly; but he makes that statement with respect to suburban as well as main-line traffic. Remove the difficulty of the suburban traffic, and it alters the whole case.
998. It is the view of the gentleman at the head of the Railway Department that, no matter what is done, there will have to be considerable removals at Redfern, and considerably increased accommodation provided; are we to place reliance on his evidence or not? I need not look round to appeal to gentlemen to attach what importance they like to that evidence. I reserve my own opinion still.
999. *Mr. Black.*] What is your opinion of the value of that land in Hyde Park;—is it not high-class land? You are trenching on rather delicate ground. When I give that information I am generally paid for it. I am not a philanthropist. I do not want to go into values. I spent twenty-three years in serving my time, and I generally get paid for my opinion on land values. Give me a route, and tell me what you want, and I think I will be able to give you as good an opinion as anyone else. So that I should not be accused of advocating the resumption of anybody's land, or the adoption of anybody's scheme, I come before this Committee absolutely free, not advocating any particular route, but simply trying to advocate a plan which I think is a good one for a city railway.
1000. I did not ask you to state the value of the land per foot, I only asked you if you do not think that by reason of its position, and its surroundings it is not high-class land? Certainly.
1001. And as valuable, probably, as most blocks of similar dimensions in the City of Sydney? I could not quite say that, but Hyde Park land, no doubt, is valuable land. It is in a very central part of the city,

city, and as compared with the western line, the land through which the line would pass would compare favourably in price. J. C. Batt.

1002. Are you a believer in a connection with North Shore, eventually, by bridge or tunnel? Yes; but I do not say at present. 23 July, 1897.

1003. Do you think if we had a central station at Hyde Park, it would be an easy matter to have a railway connection with North Shore in the event of communication being established by bridge or tunnel? From the evidence I have read, I think the only possible available way from Hyde Park is by tunnel.

1004. Well, if the communication to North Shore be by way of a bridge, railway connection between Hyde Park and North Shore would be almost impossible? Almost an impossibility.

1005. In the case of city land of very high value, is it not a fact that the erections thereon in most cases go a little way towards determining the value? I do not know that I quite gather your meaning.

1006. If you have a very valuable block of city land, unless the buildings thereon be new and expensive, the value of the buildings, as a rule, has little effect in determining the value of the land? I should say, certainly.

1007. Where land runs into £1,000 a foot the ordinary cheap class of building is not a factor in increasing the value of the land? But very slightly, because we would view it as an unsuitable building for the site. In valuing land of that sort, if the building is of such an insignificant nature, that the land is of so much more relative value than the land and building, we pretty well ignore the building altogether.

Simeon Frankel, Secretary, Great Synagogue, sworn, and examined:—

1008. *Chairman.*] You are Secretary to the Great Synagogue situated in Elizabeth-street? I am. S. Frankel.

1009. Have you a statement to make? I have a statement to make on behalf of the executive of the Great Synagogue. I do not appear here either to support or to oppose any particular route into the city, but merely to explain the effect which any extension of the railway through Hyde Park would have upon the building known as the Great Synagogue in Elizabeth-street. 23 July, 1897.

1010. You are now stating not your own views, but the views of the executive? Yes.

1011. Will you now proceed to make your statement? First we desire to point out that about twenty-eight years ago, when the land was purchased, the site was selected on account of its being in such a quiet neighbourhood, right away from the principal city traffic, and also on account of there not being any likelihood of any buildings being erected on the opposite side of the street which could in any way interfere with the holding of our services with due solemnity. We have expended about £28,000 on the building. Subsequently, much to our annoyance, the tram-line was built to pass the Synagogue, and although during service on every Sabbath, which lasts from 9 o'clock to 12 o'clock, and on the Day of Atonement from 7 a.m. to 7 p.m., the Commissioners have always stationed a man in front of the Synagogue, with instructions to make the motors be taken past at slackened speed; and we give them every credit for doing all they possibly can to minimise the noise; nevertheless we find great inconvenience at times; in fact, it is hardly possible to hear the minister speaking. Should the contemplated extension of the railway through Hyde Park be carried out, the constant running of trains and the noise attached thereto would, we feel, so seriously interfere with services being held as to render the Synagogue almost useless for the purpose for which it was erected, as it would be impossible for the same precautions to be taken in the case of the trains as are now taken in the case of the trams, by slackening the speed and stopping the whistles.

1012. Are you aware how far the tram-line is from the front of the Synagogue? Not many feet.

1013. The distance is 28 feet;—are you aware how far the nearest line of railway in Hyde Park will be from the Synagogue? No.

1014. The nearest line—what they call the long passenger line, which will not be used during those hours—is 175 feet from the Synagogue;—is your executive aware that the trains will be absolutely covered in with a roof? I have no idea.

1015. A great building covers the whole of that space, including the area in front of your Synagogue, where you expect to have the annoyance? We have not been supplied with any information.

1016. Are you aware that the intention of the Department is to widen Elizabeth-street by 40 feet? No.

1017. Are you aware how many trams pass between 9 a.m. and midday within 28 feet of your Synagogue? No.

1018. Between those hours 252 trams pass the Synagogue, of which forty-eight railway trams will be taken off; and the number of trains which would come into the station at Hyde Park, based on the Redfern traffic at present, during those three hours will be fifty-four; therefore you will have fifty-four trains in all probability going into and out of Hyde Park station, and the nearest train will pass within 175 feet of the Synagogue, and under cover; whereas at present you have passing within 28 feet of your Synagogue forty-eight railway trams, which will cease to run when the railway is extended;—there is some compensation in getting rid of so much tram traffic so close to your place of worship? On the other hand you must remember, sir, that they slacken speed on the trams.

1019. It is, after all, a question of disturbance? Yes; that is the principal reason why the executive asked for an interview. Not to oppose the matter in any way, but only to express our views in case there should be anything objectionable in connection with the proposal.

Alderman Charles Edward Jeanneret, sworn, and examined:—

1020. *Chairman.*] You are an Alderman of the City Council, and an old resident of the city? Yes. Alderman C. E. Jeanneret.

1021. *Mr. Clarke.*] You were examined before the Royal Commission on City Railway Extension on the 29th April last? I was. 23 July, 1897.

1022. Do you adhere to the statements you made in your evidence on that occasion? Yes.

1023. You disapprove of any extension of the railway to the city? No.

1024. What is it you have to state now? I come here to-day under rather peculiar circumstances. I originated this agitation in the Press and in the City Council against the proposal of the Government and of the Commissioners to establish a terminus at Hyde Park. I had a long conversation with Mr. Eddy, who sent for me on this and other subjects. He gave me all his reasons for making the proposal, but he failed to alter my opinion. I told him that, out of respect for him and his extended knowledge, I would take no public action in opposing his wishes in the matter, but that it did not alter my opinion in any way. Since then I have not taken any part in public or in the City Council in agitating the matter, but now I am required by my constituents and the City Council to support the statements I made before, and to give

Alderman
C. E.
Jeanneret.

23 July, 1897.

give other reasons against the adoption of this proposal. In this I am not agitating. I am prepared to give my reasons more strongly than before for opposing this proposal.

1025. In your evidence before the Royal Commission you said, "My opinion is that the railway should not at present be extended into the city further than it is now. The existing site is the most central, and the centre will gradually extend towards the south-west, so that ultimately Newtown or Stanmore will become the central point of Sydney instead of Redfern," and then you went on to say that Prince Alfred Park might be taken, if necessary, for an extension of the railway at Redfern station? Yes.

1026. Are you aware that, without going to great expense, Prince Alfred Park from its position would be useless for an extension of the railway? Except for cleaning sheds, it is not of very much use, but the land near the tunnel can be very easily resumed. Quite enough land may be easily acquired there at much less expense than you could by going into Sydney.

1027. Would not the land on either side of Regent-street cost very much more money? I do not think so.

1028. The City Council, it appears, are strongly opposed to taking any portion of Hyde Park? The City Council protested to the Government a year ago, before this project was submitted to the Commission, and they protest strongly now. They are almost unanimous in a strong protest against any portion of the Park being taken; in fact, against any extension, as far as I understand it, of the railway into the city for passenger purposes, beyond the neighbourhood of the present terminus.

1029. In your former evidence before the Commission you stated, I think, that the Benevolent Asylum grounds might be taken;—do you approve of the terminus being located on the Asylum grounds and a portion of the Cemetery? Since I gave my evidence I have carefully looked over the plans submitted by the Railway Department. I think the station is most admirably designed for the purpose intended, and is most convenient in every way; but it should not be built, I think, in any portion of Hyde Park, or any portion of the city nearer than Cartor's Barracks or the Benevolent Asylum, or in the neighbourhood of Redfern station. If it is necessary to extend the lines for the shunting of passenger trains, it should be done either on the south or on the north of the present discharging point.

1030. Are you aware that to extend the railway through the Benevolent Asylum grounds to Belmore Park would cost £400,000? I do not consider that the cost is a matter of great moment. I consider the rights and conveniences of the citizens are a matter of more consideration than an expenditure of £100,000 or so. As regards cost, if proper value is given for the land taken out of Hyde Park to the persons who are entitled to it—that is, to the citizens of Sydney—then, I say, this scheme will be infinitely more costly than the other, and, besides, it will be less convenient.

1031. Can you give an idea of the value of that portion of Hyde Park? In my opinion, land without buildings has no value, and land with buildings on it has very little value; and, therefore, I would not like to value that land just now.

1032. You might give the Committee an idea of its approximate value? I do not oppose the resumption of the land on the ground of its value, but on the ground of its public convenience.

1033. *Mr. Wright.*] On broad national grounds? On national grounds, if you like; but on grounds of convenience to the persons who seek to be inconvenienced. I am quite certain that those who think they will be inconvenienced by being brought into Hyde Park will make a very great mistake indeed. I have some knowledge how traffic is conducted in Sydney, and in a great many other cities. Although I know it would be a great convenience for the public to be able to get at the Commissioners and all their staff on that most beautiful site, yet that fact cannot influence me in my clear conviction that the central station should be in the immediate vicinity of Redfern.

1034. The cost of the station would be considerable, and no revenue would be derived unless the line were extended further? Very little revenue will be derived if it is brought to Hyde Park—certainly nothing in comparison with what has been estimated by the Commissioners.

1035. But we have the evidence of the Railway Commissioners and Government officials to the contrary? I think I know something of traffic. As far as traffic goes, I may be able to form as good an opinion on that point as some of the officers of the Department. I am quite certain that if the Commissioners have based their estimate on the revenue they expect to derive from bringing the present passengers they discharge at Redfern into Hyde Park they will not get a tenth of the traffic.

1036. Perhaps you will make a statement of your views to the Committee? My first objection to this proposal is that St. James'-road is by no means the centre of the area which should be served by the extension of the railway. I grant that it will serve a number of influential people. It will serve a number of persons who are engaged in various large businesses in this part of the city, but it will not serve the majority of the people who alight at Redfern to go to the manufacturing and industrial centres, who can purchase their goods at cheaper rates in Belmore Park and round about there than in the city, and who, I might almost say, by ten to one will prefer to be put out there than to be brought by railway to St. James'-road and have to go back to their place of business.

1037. They can get out at Redfern still, and take the tram? So can those who want to go to Redfern get out here and take the tram.

1038. *Mr. Clarke.*] You had better go on with your statement? I know no city with a configuration like Sydney has, where it has ever been thought desirable to bring the passenger traffic into the heart of the city by a direct railway. I know of no city where the plan of putting the central station on almost the highest part of the city has been adopted. We know very well that the greater part of the traffic of this city will be conducted round to the shores of the harbour, and a very few feet above the level of the harbour. The harbour, to a large extent, regulates the column of trade about the city, and the business places are on the lowest levels of the city. Mercantile places are mostly on the lowest levels of the city. This station is on a high level, and necessarily any persons wanting to go east or west will have to go up hill at a slow pace, and in coming from that place they will have to descend the hill with some danger. The top of a hill or a high elevation is not the place for a central railway station. I venture to say that in no place in the world will you find a central station on the top of a hill. Again if we only had our tramways completed as they will be in a year or two, these passengers who advocate an extension of the railway would not require it. The principal objections to the present system of travelling are the inconvenience, the delay, and the expense caused by the changing at Redfern station. The expense, the delay, and the inconvenience are altogether unnecessary. Again, the suburban traffic is rapidly being extended by trams and otherwise in all directions, and the competition between the tramway and the railway from St. James'-road to Redfern and other places will be so great that very little traffic will be left to the railway. I do not care so much about whether it pays or not, but I say the convenience will not be great, and the injustice to the citizens of being deprived of the recreation ground they have in Hyde Park will be very great indeed.

1039.

Alderman
C. E.
Jeannotet.

23 July, 1897.

1039. I suppose you are aware that a very large number of people come in from suburbs as far out as Parramatta, and that there is a large inland traffic? Yes.
1040. Do you not think that the large number of passengers who come in from the various suburbs and from all parts of the Colony are entitled to some consideration? True.
1041. It would be more convenient for them to come to St. James'-road than to land at Redfern, and to tranship into the trams? I do not think so. I think with the trams approaching the railway-station at a reasonable distance and properly regulated, Redfern would be quite as convenient, in fact more convenient to the great bulk of the passengers than a station at St. James'-road. When the George-street tram is constructed, it will not be so convenient to be landed at St. James'-road by any means as it will be to be landed at Redfern.
1042. You object to any portion of Hyde Park being taken away from the public? I do.
1043. Do you not think that the Domain, Moore Park, Centennial Park, Prince Alfred Park, and the rest of Hyde Park would be sufficient for the public? I daresay they would, if they had not already the whole of Hyde Park, which is more largely availed of than any other park. I do not see why the citizens should be deprived of it, for the sake of conveniencing the very limited number of people who want to be brought from Strathfield or other stations to St. James'-road. In fact, I know public opinion is very strongly against this proposal, and I am voicing, I believe, the opinions of nine-tenths of the inhabitants of this city. The advocates of this extension nothing like approach the number of people you meet against it.
1044. That is only a matter of opinion? It can easily be tested.
1045. In your former evidence you said you would like to see a railway run on the eastern side of Darling Harbour through Sussex-street, and then go down to Circular Quay in tunnel under Flagstaff Hill? On that point, after conversation with Mr. Eddy, I modified my opinion. I am not quite sure that the time has come when a goods line could be profitably constructed around the harbour. I am rather of opinion now that on the proposed tramway wool will be conveyed to the wool ships without the necessity of the railway, which I thought, when I gave my former evidence, would be very desirable. I know very few cities with a water frontage such as Sydney has where the railway does not go round by the shipping. It will come by-and-by here, but it might be postponed for the present.
1046. Do you consider that the facilities on the west side of Darling Harbour and the proposed extension to Darling Island will be quite sufficient for the goods-traffic for many years? I do not think so—it is possible they might be. I think that a great improvement, and a profitable improvement, too, could be made on the western side of Sussex-street, by the resumption of all the wharfs, and the making of a street.
1047. Are you aware that the greater portion of the goods coming into Sydney by train has to be taken by road to the stores of the various auctioneers and salesmen? Yes.
1048. And that very little—according to the evidence, not more than 5 per cent.—goes direct by rail to the shipping in the harbour? Just so, but these stores and sale-places are along Darling Harbour.
1049. *Mr. Lee.*] Your contention is that Redfern terminus if moved at all should not be moved further north than the vicinity of Devonshire-street, and that the travelling public are sufficiently well served by being put down there? Yes; and electric tramway transit is infinitely cheaper than railway transit.
1050. There is a tramway system in connection with the railway, and, therefore, it cannot be so intensely convenient to the people to be put out at Redfern, because it necessitates an extra service to get to the Quay? I do not think so.
1051. If there were no tramway service from Redfern station, how would they get into the city? I suppose there would be an omnibus service.
1052. The railway tram service has its first stopping place at Liverpool-street? Yes.
1053. Does not that prove conclusively that the desire of the people is to get to the city as speedily as possible, and that the subsidiary traffic between the station and Liverpool-street is not of sufficient importance to necessitate the stopping of the railway tram before it reached that point? The delay at the station before the tram starts often amounts to five or ten minutes, and people do not wait for that tram, or if they do they are greatly inconvenienced, and thoroughly disgusted at the way the service is carried on. The tram either starts before the train arrives, or waits five minutes after it arrives. It is very rarely you can get a railway tram, and you have to go to George-street to get a tram.
1054. Suppose you lived at a western suburb, and you came to Sydney by train every day, which would you sooner do—ride in the tram to King-street for 1½d., or continue in your train to King-street for 1d.? Unquestionably I would rather take a tram of the modern and improved style which you will have here presently. There is no comparison whatever between the comfort and convenience of riding in an electric tram and being landed in close proximity to your destination, and being landed at King-street from a train.
1055. Would you sooner alight from a train at Redfern and take a tram to King-street at a cost of 1½d. than continue your ride to King-street for 1d.? I would much rather take the electric tram.
1056. Any tram? Certainly not. I would not ride in these trams, to have my teeth knocked out, and be delayed and inconvenienced. It is these beastly things which prejudice the people against using the trams.
1057. Are you not aware that for a great many years the suburban people have demanded an extension of the railway into the city? I am aware that the suburban people to a limited number have been demanding an extension, and that mercantile people have been demanding an extension too, but the mercantile people have always thought that the extension would be to the westward.
1058. Are not a majority of the suburban people business people of this city? They are most influential wealthy people.
1059. But numerically? Numerically they are nowhere in the matter of traffic.
1060. Is it not a fair inference that the majority of those who are agitating for this extension have their occupations and businesses in the City of Sydney? Yes.
1061. That being the case, on what ground do the City Council oppose the bringing of the railway into the city? Because, in their opinion, the majority of their constituents are opposed to its extension, and those persons who seek to be brought to this particular spot, they reckon, constitute but a small portion of the travelling public. No doubt they are a most important and influential section, but numerically in the opinion of the City Council, they are very small.
1062. The population in the western suburbs at all events is very considerable, and is largely increasing? Yes.

Alderman
C. E.
Jeanneret.
23 July, 1897.

1063. Inasmuch as these persons have as much interest in the city as the City Councillors themselves, upon what ground do the City Council wish to debar them from getting proper conveniences? I take it that their interest is of quite a different sort. They are residents of places outside the city. They are not citizens. The greater part of them are not ratepayers.
1064. Is the Mayor of Sydney a citizen? Yes.
1065. Do you live in the city? No; but I am a ratepayer.
1066. Are not suburban people who have a business in the city citizens? They reside outside the city. They have their parks and can enjoy beautiful air without the trouble of leaving their own homes. They are not in the parks in the day or at night—they are at their businesses or their suburban homes. These parks are for the benefit of the residents of the city and persons who cannot take their recreation in the suburbs.
1067. Why should the City Council wish to debar so many of its own residents, you might say, from getting into the city by a railway? Because their superior knowledge tells them that there is a much better way of doing it than that proposed by the Railway Commissioners, and that is to have an electric tram up every other street. The system should be adopted in this city which has been adopted in every progressive city. In these cities they do not seek to bring the railways into the city, but they provide a service of electric trams, of whose economy and advantage the people in this city have no conception. As soon as that electric tramway is made in George-street there will be a change of feeling on that point.
1068. Suppose it were to be decided that the railway must be extended to the city, are you prepared to suggest which route it should take? I am not.
1069. Suppose it has been satisfactorily demonstrated, and that it can be satisfactorily demonstrated to you that the extension of the railway from Redfern station in the interests of the public is absolutely necessary, would you not think that the objections which have been alleged by yourself and the City Council against its extension to the city might be waived? It was demonstrated to me by Mr. Eddy that the arrangements at Redfern must be greatly altered, but he never said it would have to be removed from Redfern. I did not understand that it was held to be necessary that the station should be removed from Redfern, but that great alterations would be necessary there.
1070. Suppose the evidence before the Committee from the Department and from Mr. Eddy himself is that it is absolutely necessary to remove the railway system in the interest of the safety of the travelling public? My common sense tells me, as it should tell any man, that it could be made equally as safe at Redfern as at St. James'-road, provided you have the land to do it.
1071. Provided the land is not there, what then? It is there. It is only a question of resumption, which is a question of expense.
1072. After you have made the resumption at very great cost, and still have an inconvenient yard, are you not aware that not one penny of additional revenue would be obtained? I have seen the plans, and I say there is much more land to be got cheaply there.
1073. Can you not see, no matter what expenditure takes place, or how cheaply the land is resumed, no additional revenue will be derived? No additional revenue will be obtained by bringing it to Hyde Park, because the electric tramway can carry the people more cheaply than the railway, and more conveniently to the exact place where they want to go. The proposed terminus of the railway at Hyde Park is not central; it is not convenient to the people who want to go on the western side of Pitt-street.
1074. But if the tram fare is 1½d, and the railway fare is 1d., surely the railway is the cheaper of the two? By no means; the tramway is. For instance, between Minneapolis and St. Paul, two cities, when the electric tramway was built the electric railway ceased to run except for through traffic.
1075. *Mr. Roberts.*] Have any petitions been presented to the City Council from the citizens of Sydney, asking the Council to use their influence in their behalf in opposition to this proposal? Not written petitions. The Council is only giving its own opinion.
1076. How do you arrive at the conclusion in the City Council that it is the wish of the citizens that the proposed extension should not be carried out? Because each alderman is in touch with the ratepayers, and from conversation with the ratepayers, I think we are all able to judge what the opinion of the ratepayers is.
1077. *Mr. Trickett.*] A gentleman has suggested another route by which the whole of Wynyard-square is proposed to be taken for a railway station; would you, as an alderman, favour that proposal? No.
1078. Do you think the public would? I think not.

TUESDAY, 27 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Norman Selfe, M.I.C.E., M.J.M.E., sworn, and further examined:—

N. Selfe, M.I.C.E., M.J.M.E.
27 July, 1897.

1079. *Chairman*] You desire to make an explanation to the Committee with regard to the approach to the yard, and the population which you could provide for by a resumption between Eveleigh yard and Redfern, and also an extension on the western side of the station giving you a better approach to Darling Harbour? Yes. I desire to give the information which I was asked for the other day, but which I was then unable to give.

1080. *Mr. Hoskins.*] Will you be good enough first to explain the purpose of the map you exhibit on the easel? This is the official 40 feet to the inch map extending from Eveleigh yard to Devonshire-street. It shows in the extreme bottom the Eveleigh station, Well-street bridge, the tunnel, and Redfern yard, about which so much complaint has been made as to the difficulty of managing the traffic. It shows how, by moving Regent-street back to the west—by resuming property between Bank-street and Cleveland-street,—the railway could be made wide enough for twelve lines, the tunnel being removed altogether, and the bridge put across to connect Cleveland-street and Regent-street.

1081. What would the yellow tint represent? It shows the proposed resumption. The brown line shows the new bridge, which it will be seen is about only a third of the length of the present tunnel.

1082. What do the hatched portions tinted brown show? That is where Regent-street goes now. You could not extend the line from St. Paul's Church grounds, westerly, without going over Regent-street.

1083. *Chairman.*] Will you be good enough now to make the statement you desire to make? It is as follows:—

RESUMPTIONS NECESSARY TO GIVE TWELVE LINES OF APPROACH TO REDFERN TERMINUS.

The Committee on the 22nd instant asked the value of the land included under the proposal submitted, and requested me to supply further information. A larger map, 40 feet to the inch, since prepared, now shows the whole of the railway premises from Devonshire-street to the Eveleigh yard, and the details of the properties that would be required for twelve lines. The first thing to note in this plan is that by throwing about 2 acres of the railway premises into George and Devonshire streets—Redfern yard is so exceedingly large that it could easily spare 2 acres—a magnificent frontage and grand open space for a terminus is secured. The second point is, that a new terminus as proposed for Hyde Park, with a roof 740 feet by 380 feet does not take up much more than one-third of the whole Redfern site. If it is commenced on the present waste ground, new platforms can be erected, and trains brought in without disturbing the present main platforms. The third is, that by resuming the ground tinted blue, and straightening Regent-street, several acres can be added to the station in the future, if required by the expansion of the Colony.

That station shown with a frontage extending from Carey's shops to the Railway steps is exactly the same size as proposed by the Government for Hyde Park, a station which is now said to be equal to the requirements of the Colony for twenty years to come. But suppose it is required to be doubled in the future, you can take out more ground and straighten Regent-street, still having the improvement of the city going hand in hand with the extension of the railway. All that ground tinted blue can be had; but that will be a comparatively costly resumption compared to what I propose now for working twelve lines into the terminus.

I find that the rent of shops in Regent-street, with 17 ft. 6 in. frontage, is 25s. per week, and that the rents in Eveleigh-street, for frontages averaging 12 feet, run from 6s. 6d. to 11s. 6d. per week, as marked on the plan.

From this I deduce a value, allowing for forced resumption, of £70 per foot in Regent-street, and £40 per foot in Eveleigh, Chippen, and Woodburn streets.

The following frontages are taken in the plan before you:—

Regent-street, 400 feet, at £70		£28,000
Chippen-street	85 feet,	
Woodburn-street	390 "	
Eveleigh-street	985 "	

Total

1,460 feet, at £40	58,400
--------------------------	--------

£86,400

I would particularly ask this Committee—

1. To go on to the foot-bridge, crossing to Terminus-street, and look at the immense area now wasted; that can be utilised for the improvement of the terminus at Redfern.
2. To inspect the shams and cheap property proposed to be taken for a western city route from George-street bridge to Hay-street.
3. To examine leading officers of the Railway, representing the traffic, &c., as to the schemes submitted by the author.
4. To insist that the improvement of the city, and not the destruction of historic sites, should accompany any scheme for a city railway; and that by a Betterment Bill, all private properties improved should pay towards the cost.

1084. Your proposal carries with it the resumption of that area of land lying between the present line and Eveleigh-street, and going as far north as the corner of Banks-street and Regent-street, where there will be a further resumption in order to locate the present street? Yes.

1085. And recognising that it is objectionable to bring your goods traffic through Redfern yard, you propose to take the tunnel from near Eveleigh yard down to Darling Harbour? Yes. There will be no more tunnelling than is necessary to get the grade out into daylight.

1086. It means the laying down of two more lines there? Six more lines altogether—two for goods to Darling Harbour, and four for extension into the city as part of a circular railway and extension to North Shore.

1087. Are you going to have six lines to Darling Harbour? The two lines from Darling Harbour, which at present run into the others, I propose to carry further back towards Eveleigh.

1088. It means laying out a new line to approach Darling Harbour? Yes.

1089. Your second expense is the resumption of land? Yes.

1090. Your third expense is the erection of such station buildings as may be regarded to be necessary to give practically the same station as is proposed at Hyde Park? Yes.

1091. Your scheme is beset with some difficulty in carrying on traffic while altering the line, which, however, you explain that by utilising for the present the old station buildings, you, to a considerable extent, obviate? I get over the difficulty of disorganising the traffic, and running a risk of accident by making a station practically equal to the present one on what is now waste ground—that is, by utilising the surface from Terminus-street over the top of Darling Harbour branch to what is now about No. 11 platform.

1092. You do not propose to take the mail trains into the city? It would be presumptuous on my part to give an opinion as to that matter, but, personally, I do not think it is necessary to carry the long-distance trains any further than Redfern.

1093. *Mr. Hoskins.*] Your proposal involves the passing of a Betterment Bill, but Parliament is very much opposed to passing a Betterment Bill? There is not the slightest doubt that the railway as shown on the Hyde Park extension plan, running through the burial-grounds, will very much deteriorate the value of the ground extending from Hay-street to Devonshire-street, because it runs on a viaduct right across the land. If one portion that is deteriorated is to suffer, the part which is benefited ought to contribute.

1094. *Mr. Black.*] Do you propose to do anything with Railway-place, which runs at the back of Regent-street? That lane is now known as Terminus-street. At present under the scheme, so far as it is shown, there is only a woodyard taken, which I have not included in my valuations.

1095. *Mr. Hoskins.*] Some people who are not friendly to the proposal to take the railway into Hyde Park argue that 10 acres is not a sufficient area, and that the Railway Department have more land at Redfern than 10 acres;—are you aware that it is not intended that any of the dead stock or empty carriages

N. Selfe,
M.I.C.E.,
M.I.M.E.
27 July, 1887.

N. Selve,
M.I.C.E.,
M.I.M.E.
27 July, 1897.

carriages should be kept at the present terminus, but that Redfern yard should be made a depôt for rolling-stock? I understand that; and one weak point in the Hyde Park scheme, and a strong point in the Redfern scheme, is that, instead of running the long-distance trains from St. James'-road right back to Eveleigh yard—

1096. To Redfern yard? It is less distance from Redfern yard to Eveleigh, where there is an immense area of ground, than it is from Hyde Park to Redfern.

1097. *Mr. Black.*] From the tenor of your evidence it appears to me that the difficulty in properly utilising the space available at Redfern or making use of the resumption on the western side, is due to the fact that the Darling Harbour line runs through the main station? That is the principal difficulty, I believe.

1098. Then the diversion of that line for the goods traffic simplifies these matters of alteration? It would add several acres that are at present waste ground to the area in the Redfern site. Although there are only two lines going to Darling Harbour, it is in a cutting, and it is very wide at the top.

1099. *Chairman.*] Can you tell the Committee whether your line to carry the goods traffic to Darling Harbour would pass to the west of the broad red line shown as the western boundary of the station? The Darling Harbour branch might be kept anywhere until it came out to daylight.

1100. Where would you come out to daylight? I have not worked out the levels. Having the full width to work on the engineers would naturally keep the Darling Harbour line right over to the left-hand side.

1101. *Mr. Black.*] It would probably come out at the back of Inglis' saleyards? It would come out at George-street, where it does now. The Darling Harbour branch is very steep, and this will give them an opportunity to improve the grade.

1102. *Chairman.*] Either you will have a tunnel from where you propose to take off near Eveleigh yard to beyond the area shown by the plan, or you will have to have an immediate resumption beyond that shown on your plan? In one instance it means more resumption than you show, and in the other instance it means a very long tunnel? We will assume that there are twelve lines going along to the south of Cleveland-street, and when you get to Cleveland-street six of them begin to descend and go down into a tunnel. They will then be underground in all this part, and portion of this wide strip which is over the top of that tunnel will be available for sidings. They would not make any difference to the south of the tunnel, because you have the six main lines, and in addition to those you would have four lines for the city railway, and two lines for Darling Harbour; but when you once dropped the Darling Harbour line below the surface, you would then have the ground overhead available for additional standing room in Redfern yard.

1103. Will you point out to the Committee approximately your approach if your scheme were carried out to Darling Harbour, as far as the map will permit you to show it? The tunnel would begin about Cleveland-street and terminate at George-street.

1104. Either you would have a tunnel, which would go from Cleveland-street to George-street, or you would have to resume immediately some of the land tinted blue on your plan? No; the tunnel would run underneath the roads in the station.

1105. It will be a tunnel? To a short tunnel like that I can see no particular objection. To save further resumptions, I say put it into a tunnel. If you ran it out towards Regent-street, and resumed more land, it would be in the way of any future extension of the railway; it would mean shifting it again in the future.

1106. *Mr. Black.*] You do not propose a new course? No.

1107. *Chairman.*] A new course from Cleveland-street for a portion of it? I have no doubt it would. So as to allow the tunnel to be built before the present Darling Harbour line was disturbed, it might be put a little bit nearer to Terminus-street, where there is room—under where the coal and tar sheds are now. That is a matter of detail for the railway engineers to work out. I do not propose that the new tunnel for Darling Harbour should go outside the railway boundaries.

1108. It means the construction of two new lines to Darling Harbour? Yes; but from Cleveland-street to George-street.

1109. Or it might be from beyond Cleveland-street? It would depend on circumstances. I propose that it should begin to burrow approximately at the present tunnel, so that when it gets into the railway yard it is underground.

1110. If it started nearer to Eveleigh it would be in resumed land? If you resume the wide strip from the present yard right back to Eveleigh, it does not matter where you go down into tunnel.

1111. *Mr. Roberts.*] Are you prepared to submit to the Committee any scheme to carry not only the suburban traffic but the long-distance traffic—that is, to have a terminal station in what I call a central business portion of the city, as near the General Post Office as possible. It appears to me that the weak portion of your scheme is the fact that long-distance passengers will either have to change at Redfern station, or take cabs to reach their destination. Any scheme, to my mind, will be incomplete unless it brings the whole of the traffic down to the business centre of the city? I quite appreciate your points. I have considered them thoroughly, but I have arrived at just the opposite conclusion, namely, that the present terminus is near enough for all time as a permanent terminus. I have been in seventy of the principal cities of the world, and judging by them—and that is really the key-note on which my scheme is based—I think the present site is sufficiently near for a long-distance terminus, because Sydney is extending southerly so fast, and if anyone comes from a long distance, and has to take a cab to go to Randwick, he may just as well go from the present site as from Hyde Park. If anyone arrives with no luggage or impedimenta, it is nothing for him when the tickets are collected to change, as I change every day. At the present time the northern passengers have all to change, except for a few trains, at Strathfield, and it is only carrying out the system, which exists everywhere, where local lines intersect main lines.

1112. *Mr. Black.*] You mean that every traveller by train cannot expect to have a railway to the door of his hotel? That is so; and I mean to say further, that the city extension is essentially a local extension, more in the nature of a tramway, and more with the object of linking up, as it should do, the whole of the suburbs—eastern, western, and marine, and that it should, if possible, be able to bring people from the eastern suburbs and people from the western suburbs into connection, not only with one another, but with the steamboats which run to the harbour suburbs. And, therefore, a local line of that kind should not be mixed up with the long-distance traffic, where a totally different class of coaches runs on the lines, and a totally different class of passengers travels.

1113.

1113. Do you think that your position will be weakened, and the case for a Hyde Park extension made stronger, if the Railway Commissioners, in addition to building a station in Hyde Park, build a large hotel also in connection with the station? I do not see why they should not. If the Railway Commissioners built a large hotel they would be only doing what great railway companies of the old world do. But speaking from a public point of view, I think it would be undesirable for the Railway Commissioners to interfere with business in that way; they do to an extent with their refreshment-rooms. It is a matter which I have not thought out, and I would rather not give a decided opinion upon it.

N. Selve,
M.I.C.E.,
M.I.M.E.
27 July, 1897.

1114. Do you think if the railway were carried to Hyde Park it would be an easy matter, in the event of an extension by bridge or tunnel to North Shore, to form a connection between Hyde Park station and North Shore? It can only be done by tunnel, without making a most costly detour. You would have to make an "S" curve; that is shown by the Engineer-in-Chief's plans. It is in evidence by railway officials over and over again that you cannot get from Hyde Park to North Shore by a bridge. I favour a bridge for the Government as against a tunnel. I would let as many people make tunnels as they liked, but I should have only one bridge.

1115. *Chairman.*] Is there any other statement you desire to make? No; except that I hope the Committee will consider that my valuations are only those of an amateur. I was never in Eveleigh-street before this morning. Every lady I met there, however, was most polite, and told me the rent she paid for her house, which enabled me to supply you with the value of the resumptions proposed.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

1116. *Chairman.*] Have you had an opportunity of seeing the scheme which has been proposed to the Committee by Mr. Greenwood? Yes; he showed me the plans of the scheme himself.

H. Deane.
27 July, 1897.

1117. You understand exactly what he intends to do? I think so.

1118. Can you tell the Committee your opinion in regard to his scheme? It is essentially a tunnel scheme.

1119. *Mr. Hoskins.*] He proposes to have about a mile of open cutting? Yes; but there is a good deal that is underground too, and that, I think, is objectionable.

1120. *Chairman.*] What is your next objection to his proposal? I think it is also objectionable, because it separates the traffic too much. There is no provision for bringing the long-distance trains into Sydney. The Railway Commissioners have expressed a very decided opinion as to the desirableness of bringing both to a central terminus for the sake of economy of working, and also because there is a large class of long-distance traffic, of a semi-suburban type, which ought to be brought into town as much as the suburban trains. There is no possibility of dealing with that class of traffic on Mr. Greenwood's scheme, in my opinion.

1121. *Mr. Hoskins.*] He proposes to have a terminus at the Custom House, about 15 feet underground? I do not like that. I dare say it is quite possible to carry out, in a way, everything which Mr. Greenwood has put before the Committee; but I think it would be an exceedingly troublesome thing, and the station, being so much below the level of the harbour water, would give continual trouble, I am sure.

1122. *Mr. Lee.*] Would it be possible to carry on goods traffic as well as passenger traffic on that line? Mr. Greenwood proposes to use his line for goods traffic, but I think it is pretty well recognised that passenger traffic and goods traffic ought to be separated. Mr. Greenwood says he can do this, and carry on the two, and he can carry out other arrangements. But it appears to me that where his opinions stand in opposition to our chief traffic authorities in this country, they should be taken with considerable caution.

1123. *Chairman.*] You have explained that you view the station as being a number of feet under high-water, and necessitating very extensive terminal arrangements;—will you now tell us what you think of the shunting appliances? I pointed out to Mr. Greenwood when he saw me that Circular Quay was practically the terminus of his city extension, and that he had not shunting accommodation sufficient for the purpose, but he said he did not propose that that should be a terminal station; that he would carry his line on to the eastern suburbs; and that the waiting-place for the trains would be at Paddington, or somewhere out in the eastern suburbs. That, of course, is unworkable. Even if some of the trains went right through to the eastern suburbs, all of them would not do so. The traffic on the two lines, it is not likely, would be equally balanced; there would be a majority of trains on one line or the other. No doubt that would be on the existing suburban line. Consequently you would have to shunt some trains at Circular Quay, and you would require accommodation for that purpose. But, even supposing that there were the same number of trains, I pointed out to Mr. Greenwood that, if he worked to a time-table, he must have some place where the trains would stop, so as to enable them to wait for time, but I did not succeed in making him see that. It is a principle which is well understood by the traffic authorities. It is quite clear that a train coming in from the western suburbs, if it got in a little late, and went on to the eastern suburbs, would be late on that line as well. It would throw the whole trains on the system, and that is an undesirable thing. You would have to arrange a time-table so that the trains would have to stop at what is practically the terminal station—that is, for the two kinds of traffic to be dealt with under Mr. Greenwood's scheme. There is not, in my opinion, sufficient accommodation provided at Circular Quay for the purpose.

1124. *Mr. Hoskins.*] Suppose that on a busy day, for instance on Eight-hour Day or on a holiday, the trains came in quickly to the proposed terminus at Circular Quay, the trains would very soon have to return for more passengers;—but suppose that an engine or a carriage might be broken down and have to be detached from a train, how could it be done with only two lines of rails at the terminus 13 ft. 6 in. underground? No; it would be exceedingly difficult to manage.

1125. Mr. Greenwood proposed to have an open cutting from Campbell-street up to the corner of Bathurst-street and George-street, to cross under George-street and York-street, providing, I think, a surface station at Wynyard-square, and to have another open cutting from Margaret-street to Circular Quay;—from your experience of railways, are long open cuttings in the business part of the town customary? No; it would be a very unusual thing, although on the Metropolitan line between King's Cross and Moorgate-street, London, there are considerable lengths of open cutting.

1126. But they are short lengths, are they not—only a few chains? There are some considerable lengths more than a few chains, but they are mostly situated in property which is not very valuable.

1127.

H. Deane.
27 July, 1897.

1127. *Mr. Wright.*] Having examined Mr. Greenwood's plan, do you think his scheme is practicable in any sense of the word—that it meets the requirements of railway extension into the city? I do not think it would meet the requirements.

1128. In fact, you think it is not a practical scheme? I should not like to use the term "impracticable," but it is not a desirable scheme.

1129. You do not think it will meet the wants of the railway authorities or the traffic? No; I do not think it will.

1130. *Chairman.*] You have already explained, somewhere in the evidence, that the same line could not form a portion of the line to serve the wharfs, and part of a connection to North Shore, since, if it proceeds to North Shore by bridge, it must be 150 or 180 feet above the water, and if it proceeds by tunnel it will require to be 50 feet under the water—in one instance, the rise must be started a considerable distance back from the foreshore, and in the other instance the fall would require to be started a considerable distance back from the foreshore;—is that correct? I think that is what I stated.

1131. You have explained that the line before the Committee could be extended from the eastern suburbs and to Circular Quay? Yes.

1132. Presuming it is desired to bring North Shore in touch with the central station at Hyde Park as proposed, what, in your opinion, would be the best way to effect that object? I think it was explained before that if the line were extended across Circular Quay, it could be brought up on the other side, and so carried across to North Shore—that would necessitate a back shunt. But it would be equally possible, and I think it would be a more desirable thing to make a connection with North Shore to run back to Liverpool-street, and put a loop round to the western side of the city. There is no difficulty whatever about it. It is just as easy to make a connection with the proposed line by means of a semi-circular line there as to make a connection with the Benevolent Asylum grounds or the present station by a viaduct over Pitt-street and George-street.

1133. If, eventually, a bridge be built across to North Shore, it is as easy, as you have explained, by adopting some route as far south as Liverpool-street, to approach from North Shore a station fronting St. James'-road as it is the present station at Redfern? Yes.

1134. *Mr. Black.*] How would you proceed from Liverpool-street? You would pass round and over George-street, and get on that orange-coloured line on Mr. Selfe's plan. When the Royal Commission was sitting in 1891, I submitted a line on the western side of the city. I showed how a line was practicable passing somewhere in that direction, and passing into Wynyard-square, or you might also go under York-street as Mr. Greenwood suggests. There are other ways of doing it. The only point is that you get on to the western side of George-street, and from there you can work up over a bridge. The connection I showed was with the Benevolent Asylum grounds. This, instead of connecting with the Benevolent Asylum grounds, connects with the proposed line to St. James'-road at Liverpool-street.

1135. *Chairman.*] You have already explained that if it be intended to proceed to North Shore by tunnel, you are able to continue the line coming from Redfern to St. James'-road in the direction of Fort Macquarie, and pass by tunnel to North Shore, coming out somewhere near the head of Lavender Bay? Yes; I should like to state that Mr. Greenwood pointed out an objection he had—that you could not do without a steep grade. I wish to say that by lengthening the line of course you can get almost any practicable grade that you want. I do not advocate a tunnel. I do not advocate any of these extensions which involve tunnels, as the Committee are fully aware. I only speak of their practicability if you get rid of the difficulty of ventilation.

1136. From an engineering standpoint, is the extension to North Shore by way of a bridge from a station in Hyde Park a simple matter? It is no more difficult than any of the other schemes; for giving a headway of 180 feet over the harbour, they all involve a gradient of 1 in 30, I think.

1137. By any scheme? By any scheme.

1138. That is taking off somewhere about Wynyard-square? That is having an underground station just below the level of Wynyard-square, and then rising to go over the bridge.

1139. Since you gave evidence before the Royal Commission of 1891, a tramway has been authorised to be constructed down George-street;—does that alter your view in regard to an extension on the western side of the city at all? It has altered my views very considerably. I think the George-street tramway affords communication for the business people on the western side, which they had not before.

1140. *Mr. Fegan.*] Only for a comparatively few on the western side, is it not? I only mean that it does alter the conditions, that they are to a great extent served, and very efficiently served by the George-street tramway.

1141. People who are going to the western portion of the city will have to change when they come to Redfern? They will have to change or walk across from St. James'-road.

1142. That will not be much benefit to the western people? It is not like having trains running right through, certainly.

1143. Some time ago, after a visit to America and other countries, you wrote a report for the Government on the subject of connecting North Shore with Sydney? Yes.

1144. I believe then you were in favour of a tunnel? That was for the tramway.

1145. Would not the same thing be applicable to a railway? If the time comes when electricity is used as a motive-power, I should recommend a tunnel. Where you can apply electric motors to each car, it makes it possible to use very much steeper grades, so that it makes the whole question a very much simpler one.

1146. A bridge to North Shore would be rather an expensive thing? Yes.

1147. The proposal to branch off at Liverpool-street in the direction you point out has reference to a bridge, but would not the same thing be applicable to a tunnel? If I were going to tunnel to North Shore I should go by way of Fort Macquarie.

1148. *Mr. Black.*] In this proposed deviation at Liverpool-street to connect with North Shore, would you have a station at Liverpool-street? It could be arranged if necessary.

1149. Suppose the Northern mail from Hyde Park station were to turn off at Liverpool-street, would passengers be obliged to go down to Hyde Park to take the train, and then turn back on their tracks, as it were? Yes; to get to the mail-train they would have to go to the terminal station. There would be no stopping at Liverpool-street.

1150. The man who wanted to go by train to North Shore, if he could not get a ticket and get into the train

train at Liverpool-street, would have to go to St. James'-road, and take the train there? It would depend upon where he would be coming from. If he were coming to the city he could take the train over at Hyde Park, or there would be no doubt a location for a station at Wynyard-square, or some other place on the other side. I do not think there would be any difficulty about arranging for a station at Liverpool-street if it was required.

H. Deane.
27 July, 1897

1151. *Mr. Trickett.*] For many years you have been inquiring into the pros and cons. of extending the railway system into Sydney, have you not? Yes.

1152. To the western side of the city, to the centre of the city, and now on the eastern side of the city? Yes.

1153. Having reference to all these inquiries you have made, is it your deliberate opinion that the scheme which is now submitted for the consideration of this Committee is the safest, the best, and the one that should be adopted? Yes, I am quite satisfied as to that.

1154. *Mr. Black.*] Do you consider it the most economical as well? I consider it the most economical.

Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and further examined:—

1155. *Chairman.*] You were asked by the Committee to furnish an estimate of the value of that portion of Hyde Park which it is proposed to take for railway purposes? Yes.

S.E. Perdriau.
27 July, 1897.

1156. Will you describe the area? The area is 10½ acres. It would be necessary to leave a chain road along the central avenue; Elizabeth-street would be widened by 40 feet from St. James'-road to Park-street, and I allow for the extension of Market-street, 1 chain wide, across the area to the central avenue.

1157. Does that seem to you the most suitable design, or a suitable design? It is a suitable design. Instead of extending Market-street, a street might be located a little further south; it might suit better for the subdivision.

1158. How much could be got for the land if it were cut up and sold? With an area of 10½ acres you would have two rows of allotments about 140 feet deep, with a lane between them 30 feet wide.

1159. *Mr. Black.*] That is a great depth for a city allotment? Of course, the Government generally provides a decent depth in their subdivisions; they do not follow the rule laid down by private people.

1160. Can you give an instance where the Government has given a depth of 140 feet in the city? I do not know that we have made any subdivisions in the city of late which would afford a good guide in this respect. From George-street to the Tank Stream, between Hunter-street and King-street, the depth of allotments is 200 feet.

1161. *Chairman.*] Does the design you are speaking of appear to you to be about what the Government would do if the land were subdivided, as far as you are able to say? I think so.

1162. Do you propose to put a street parallel to Elizabeth-street between the avenue and Elizabeth-street? Yes.

1163. *Mr. Humphery.*] What available land would you have between Elizabeth-street and the central avenue? At the present time the width would be 380 feet.

1164. *Chairman.*] Will you make a statement of the value of the land on the basis you have got? By this subdivision there would be 1,065 selling feet frontage to Elizabeth-street, and that at £90 a foot would come to £95,850. There would be 1,190 feet of selling feet frontage to the new street, on the eastern side of the central avenue, and that at £60 a foot would bring £71,400, making a total of £167,250.

1165. That, on the basis you have explained, is the approximate selling value of Hyde Park if designed in that way? Yes; I showed the design and the figures to Richardson and Wrench, and they said that if they were given this subdivision for sale it would take them from 3 to 5 years to sell the land at these prices.

1166. Did they regard the estimate as fair? Yes; above the present price.

1167. Suppose you designed the block so as to give shorter depths, would it make any vital difference? I daresay you could get more out of the block: I have not gone into that question.

1168. *Mr. Black.*] Would there be no frontages at the two extremities? I know the prices I have given are full, and so I have not made any difference of that kind for the corners.

1169. Suppose you sell a square block, do you mean to tell me that you build houses only on the southern and northern sides, and not on the eastern and western sides? You can only get payment for the one frontage. You cannot get paid for the two frontages. You might get a higher price for one frontage.

1170. Suppose you take the block bounded by King, George, Pitt, and Market streets, does it not appear a most singular thing if houses are built only on George-street and Pitt-street? No; they build on all the frontages.

1171. Why do you only value the two frontages in this case? You cannot estimate the value of a block of land on two frontages. A corner block you can only estimate on one frontage. Of course, the end allotments would bring more than the other; but I think the price per foot which I put on the land covers that fully.

1172. Suppose you divide that block by putting in another street, how would that effect your calculations? You might get more out of it that way.

1173. Do you not think it is likely that any vendor who wanted to make money out of a piece of city land would cut it up in that fashion? I daresay a private person would. I do not think a Minister of the Crown would.

1174. We are not submitting a scheme to the Government to realise money by the sale of Hyde Park land for building purposes; we are endeavouring to find out what will be the value of Hyde Park land if put on the market under similar conditions to other land elsewhere, so that there can be no reason or sense in your preparing any scheme, founded upon a consideration of what the Government would or would not do if it were going to cut up the land for building purposes? I was instructed by the Chairman to make an estimate of the value of land supposing the Government cut it up and put it into the market.

1175. *Chairman.*] It is a question of having one allotment twice 75 feet, or two allotments 75 feet deep? You would not get that much out of it.

1176. *Mr. Black.*] In taking your measurements from the central avenue to Elizabeth-street, did you take off the piece which you propose to add to Elizabeth-street? Yes, 40 feet.

1177.

S. E.
Perdriau.
27 July, 1897.

1177. Is that another part of your instructions from the Chairman? I was instructed to estimate the area that has to be taken for railway purposes.
1178. Did he not also ask you to widen the central avenue by 40 feet? No; I am taking the area which is proposed to be taken for railway purposes.
1179. It is a question of how much 10 acres or 12 acres of Hyde Park land is worth as compared with 10 acres of land elsewhere which might be taken for railway purposes, and therefore it should not have been part of your instructions that you were to widen the streets or have only two frontages, because the Government is more liberal in its dealings with people than are private individuals. If you have made your calculations on this basis you have been misinformed, and in order that the Committee may be properly directed you will have to do it all over again? I shall be very glad to do so.

WEDNESDAY, 28 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Albert Christopher Brownen, Licensed Victualler, sworn, and examined:—

A. C.
Brownen.
28 July, 1897.

1180. *Chairman.*] What occupation do you follow? I am a licensed victualler.
1181. *Mr. Lee.*] You have given some consideration to the question of extending the railway into the city? Yes.
1182. Will you be good enough to explain your views on that question to the Committee? My views are to build a grand terminal station on the Benevolent Asylum grounds—at some spot to be chosen by the Railway authorities—and to make all the tram traffic and that sort of thing go in tunnel under Devonshire-street.
1183. In that case you would have to cross Devonshire-street? Certainly. You could build your station on the top of Devonshire-street and tunnel underneath the street. My opinion is that the Redfern station would meet all the requirements of the country traffic—that, is the mail-trains and the express trains. Thousands of people who live in the western suburbs would have to go to the terminal station I suppose; but it would be no advantage to them to go to St. James'-road. On the other hand, if people from Randwick, Paddington, and all that thickly populated part of the metropolis were going a long-distance journey it would be quite as convenient for them to go to Redfern as to St. James'-road, or nearly so. For the long-distance traffic I think Redfern is the proper place, especially in the course of a few years, for everyone acknowledges now that it is almost the centre of the city. What I am going to deal with, principally, in my statement is the suburban traffic into and out of the city. If a grand station were built at Redfern on every improved principle the trams could run to the side of the platforms, and all the passengers would have to do would be to leave the train and get into the tram. I propose to make a circular line of trams round the city. You could have three separate tram-lines to Circular Quay, which I should imagine must always be the terminus. Your eastern line could go through Castlereagh-street into Bligh-street, by the Hotel Metropole—it has a sharp turn there, but the small hotel on the other side, I suppose, the Government would purchase—straight across the Educational Department, round there into Bridge-street, and down to the Custom House. You could have three separate lines, or a circular line. If you had a circle of the trams, and you did not require all the trams to run round the circle during the slack portion of the day, you could run each line to Circular Quay.
1184. Will you explain which portions of the city you would confine your tramway circle to? From Circular Quay round to Miller's Point, and from Miller's Point straight through Kent-street into Liverpool-street, and then you turn round into George-street. All the way round the streets are wide and the traffic is not so very great.
1185. I understand that once you turned into George-street the tramway would proceed straight down the street? Yes; it can run over the electric tram-line which is going to be constructed if it can be done, and straight into the railway station. Of course, all the trams which are required for the railway could run straight into the railway station, and the other trams could follow on into Harris-street.
1186. Where would be the eastern side of your circle? I would go through Belmore Park, and instead of turning into Elizabeth-street I would turn into Castlereagh-street. You would have three lines of tramway running out from the railway station to take your passengers to the doors of their business places, to all the warehouses on the western side of the city, and to the Law Courts and other places on the eastern side. You could run the people out like shelling peas, and bring all the people abreast of the General Post Office—on the three lines—in, I should think, five minutes. If you bring people to St. James'-road by train, all the thousands of people who are engaged in the warehouses on the western side would have to walk across George-street, and while they are walking across George-street and other places they could ride by tram and reach their business houses. The time which is wasted in changing at Redfern could be made up, because people would be brought direct to the places where they wanted to go. It would save time, and would be more convenient. Then, thousands of people living in other suburbs want to be considered quite as much as people living in railway suburbs. The people living in Leichhardt, Redfern, Botany, Newtown, and all these thickly-populated places, want to be dropped in the city by tram just the same as railway passengers do.
1187. Newtown is already served by tram and train? Certainly, a portion of it is.
1188. Is not Leichhardt also served by tram? Yes.

1189.

A. C.
Brownen.

28 July, 1897.

1189. And on the Stanmore side by train? Yes; but under present arrangements it only brings them to one side of the city, whereas under my scheme, a tram, for instance, could leave Leichhardt at 8 a.m. for the western side of the city, and another tram could follow a few minutes later for the eastern side of the city, and if necessary could run down George-street. It would place the people, no matter whether they came from railway suburbs or tramway suburbs, in any part of the city.

1190. Your contention is that Redfern station should be moved across Devonshire-street to the site of the Benevolent Asylum? If it is necessary to do so. I am only suggesting these things. I do not mean to say that the railway engineers and traffic managers ought not to know best about that. I see by the report of what Mr. Norman Selve said yesterday that he advocates a scheme to purchase some of the lands on the western side from Eveleigh to Redfern. Perhaps by adding that land you would make the front of the station, if it is possible to do so, from Regent-street opposite Harris-street to Devonshire-street.

1191. Are you aware that the condition of affairs at Redfern station is not only highly unsatisfactory, but also rather dangerous, and that is a necessity either to make some extensive alterations at considerable cost or to remove the station? Yes; it is owing to the points running out of the station.

1192. Your contention is either that Redfern station should be made sufficiently large and commodious by resuming land there or that it be removed if necessary to the Cemetery site? Most decidedly.

1193. You think the terminus should stop at Redfern, and should not be moved into the city at all? Yes.

1194. And that the city should be served by a system of tramways? Certainly.

1195. To whatever parts may be found necessary from time to time? Yes. Circular Quay would always be the terminus of this line, whether you had a circular line or three separate lines. All the eastern suburban tramways could go straight down Liverpool-street, and turn into Castlereagh-street, or go on and turn into George-street, or go across George-street and turn into Kent-street. From Paddington and all those places in the eastern suburbs you could bring in your trams to all sides of the city.

1196. Would not Paddington and the suburbs on its eastern side be better served by a railway extension? I think not, simply because you cannot very well put a railway close to where the population is. In the Old Country, in London suburbs especially, thousands of people have to walk almost as much as a quarter of a mile to the station to go into the city by train. The horse-trams there bring in hundreds of thousands of people every day from points which the railway does not touch, and take them out again in the evening, and the people are highly satisfied.

1197. Do I understand that you are also of opinion that there is no necessity for a railway extension to the eastern suburbs, but that more suitable tram accommodation should be given, and that it will be the most suitable system for the people? Yes; I think trams are very little short of railways. You could not travel much faster by rail from Redfern to St. James'-road than you could by tram.

1198. You are aware that your scheme, if carried out, would involve the expenditure of a large sum to improve the station, either at Redfern or at the Benevolent Asylum site, and that after that large expenditure had been incurred the railway revenue would not be increased? The new railway station at Redfern is supposed to cost £500,000, and the new line to St. James'-road £200,000 or £250,000. I do not care whether the railway goes to the eastern or to the western side of the city, it will not serve the people; and my idea is that the money it would cost to bring the line to St. James'-road would go a long way to lay this circular tramway. I believe by this circular tramway half the omnibus traffic would be knocked out of the streets. It would give your tram traffic a greater margin and less congestion, and the extra thousands who would ride in the trams—because they would touch where people would want to go—would make up for all the loss. Suppose the station would cost £500,000, and the trams would cost £300,000; I think the larger number of people riding in the trams would show a handsome return on the outlay.

1199. On the outlay for the trams, but not on the outlay for the station? I suppose the station would be all dead money; but the trams, I think, would pay a handsome return, even supposing that they cost £300,000 to lay down.

1200. In view of the narrowness of the streets of this city, if so many of them were occupied by tramways as you suggest, would it not offer very great obstruction to other traffic? No. The omnibuses and other vehicles convey people now to the stations and to the different suburbs simply because the trams do not meet the requirements of those people. All the people who are going to or from the western side of George-street, or to or from Circular Quay, use the omnibuses; but if these tram-lines which I suggest were laid these persons would get into the trams and ride, and the omnibuses would not be wanted.

1201. Omnibus companies are competing with the existing tram-lines from almost every suburb? Yes.

1202. If the tramways are extended a little more to other suburbs, for what reason would you suppose that the omnibus traffic would be decreased? Simply because the tramways would run, and supply the wants of the people. I do not mean to say that it would entirely do away with the omnibuses. I mean to say that it would greatly diminish the number of the omnibuses. We all know that the omnibus traffic has become quite a nuisance in the city.

1203. Inasmuch as the extension of the tramways to the suburbs has not diminished the number of omnibuses, will a further extension of the tramway system decrease the number? Yes, by being able to place the people in the city where they want to be placed. If people living at Leichhardt could go down Kent-street or George-street by tram, they would not get into an omnibus. They get into an omnibus now because they do not want to be brought to Hyde Park by tram and then have to walk across the city.

1204. Are there any omnibuses plying on precisely the same route as the tramway along Elizabeth-street? Yes, nearly all the passengers who go down Elizabeth-street prefer to use the omnibus, because they do not want to walk across the city from the trams, and from Circular Quay to the trams. The tram only goes to Bent-street, and these people have to climb up that hill, especially on Sundays, holidays, and Saturdays, when there is a great harbour traffic. The trams I suggest would take any person to the boat, and when you returned all you would do would be to jump into a tram, and go wherever you wanted to go—to Balmain, or anywhere else.

1205. Have you been induced to form this opinion by the operation of the tramway system in Melbourne? Yes; I have been in Melbourne.

1206. You are aware that since the tramway system was introduced there the omnibuses have disappeared? Yes, you do not see hardly an omnibus in the streets.

A. C.
Brownen.
28 July, 1897.

1207. Are you aware that the omnibuses belonged to the same company as the tramways? Just so. Melbourne is a differently situated city to Sydney. There is no doubt that travelling on a tram, or anything you like to mention, above ground, is better than riding through a tunnel—which you would have to do if you put a railway round this city. The greater part of the city is almost an island. It would involve an enormous expense to put a railway-line round the city. Unless you put a circular railway round the city it would never serve the people.

1208. Is there anything else you would wish to say? I want to speak as to the paying part of the scheme—even suppose it cost £300,000 to build the tram-lines. I contend that with the large increase of traffic which will be given to the tramways if this scheme is carried out, you ought to carry the people to and from the railway station for 1d. You would get such a large increase of people travelling to the railway station, and also from the different suburbs, that you could make a reduction of tram fares, I believe, in a short time, throughout the whole system. I am sure you could run the people to the railway for 1d. You would get thousands of people to ride in the trams if you did. I notice that only a day or two ago, there were not forty passengers in a tram which was going to the railway at 4 o'clock in the afternoon.

1209. Suppose the line could be extended into Hyde Park for about the same amount as it would cost to extend it to Devonshire-street, and that Hyde Park were made the base of operations for the tramway system, would not that be equally as convenient to the people? No; I do not see it. By bringing the railway to St. James'-road you leave all that part of the city behind which would be served by my trams—that is, to the west of the Town Hall, and to the south of the Town Hall too.

1210. Suppose the lines were put down Market-street and Elizabeth-street, would not that meet the convenience of the people equally as well? It might meet the railway traffic.

1211. I am speaking of the convenience of the people on the western side of the city? It could be done; but I think Redfern would be the place to operate from.

1212. *Mr. Trickett.*] You have instanced London as a city where the people travel so largely by other means than a railway;—do you know anything about Melbourne? Yes.

1213. What is your experience in regard to the traffic on the railways which run from the suburbs of Melbourne into the city, notwithstanding that a splendid tram system is provided for the people? The railways seem to do a pretty large traffic.

1214. Especially in the morning and evening? I should say so. It is some years since I was in Melbourne, and they have made great improvements there, but the tramways seemed to work splendidly, and to be well patronised, and to put everyone down where they wanted to go. That is one great feature in taking the enormous omnibus traffic off the streets of the city.

1215. Are you not aware that in Melbourne the suburban trains, notwithstanding the existence of these tramways, in the busy parts of the day, both morning and evening, bring in a very large number of people from the suburbs? Yes.

1216. Is it not natural to think that if people could be whisked into town in the space of a few minutes by train, in preference to taking half an hour in a tram, they would sooner travel by train? Most decidedly; but I contend that when the trains get to Redfern there will be no time saved whether the people go by train to St. James'-road or by tram.

1217. I am speaking not so particularly in regard to Redfern as in regard to the eastern suburbs;—You seem to think that a tramway service would answer all the purposes of the people living in those suburbs? I think so.

1218. You think people would sooner take half an hour to go by tram than be brought in by train in the space of five or six minutes? You must understand that you cannot place a railway at the people's doors as you can a tramway. Therefore in the time you would waste to reach your suburban station to catch your train you would be half-way into Sydney by tram.

1219. You must know that there are centres in the suburbs where large numbers of people board the trams every morning, such as Bondi Junction, Waverley Junction, and Queen-street;—if a railway could be brought within reasonable proximity of any one of those places does it not follow that large numbers of people would not mind walking a few hundred yards to the station to go in by train? Yes; if it could be done.

1220. Is not that the general experience? Yes; but, on the other hand, I think it is years before the time for a suburban railway into Sydney. You must put it round a pretty large area, and the population would be very small, and to make a suburban line round Sydney, as everyone knows, would cost an enormous sum, whatever way it was taken. As regards the goods traffic, Mr. Eddy was always of opinion that the passenger traffic should be kept separate from the goods traffic. My opinion is that if at any time it was wanted to bring a railway for the goods traffic along the western side of the city to Market-street or to Circular Quay, we should simply run a tunnel; but for passengers, I think a system of tramways would meet all requirements, and be convenient to everybody.

1221. *Mr. Roberts.*] Does it not appear to you that it would be an immense advantage, and a convenience to thousands of people, to be brought to St. James'-road instead of having to change from train to tram at Redfern? It would be a convenience to a certain number of people, but I do not think it would serve the people on both sides of the city.

1222. Not necessarily to St. James'-road, but to somewhere equally in the heart of the business centre of the city? If it could be done. If you bring a railway anywhere into the city, except to St. James'-road—to the west of the city, or to anywhere near the centre of the city, I would not like to be answerable for the cost of the extension—it would be something tremendous. I think if we put a railway round the city, that is anything like this circular tramway, it would cost £2,000,000 or £3,000,000, and even then it would not serve the people like the tramways would.

1223. Are you aware that the Government is about to put a tramway down George-street from Redfern station to Circular Quay? Yes.

1224. Would not that afford travelling accommodation in the way pointed out by you, to a very large extent? Most decidedly. But, on the other hand, a railway to St. James'-road would be simply useless.

1225. Are you aware that if the railway is extended to St. James'-road it is intended to carry only passengers? Just so.

1226. And that the goods traffic would still turn off at Redfern and go to Darling Harbour? Yes. By this circular line you could run the trams separately—not round the circle, but to and from Circular Quay

on both the eastern line and the western line. In time you would find out on which side of the city the tram traffic was the heavier, and if it was found to be heavier in George-street, you would run extra trams, and shunt them at Circular Quay, where there is a large amount of land which could be converted into a great shunting-ground. All the lines could be worked separately or round the circle.

1227. Have you considered that if the terminus should be removed to Hyde Park it would be open to passengers to alight at Redfern if it suited them better, and that probably a station would be provided at Liverpool-street? Yes.

1228. Do you not think that your views of the extension of the tramway system could be adapted with greater convenience to thousands of people than they could if everyone had to change at Redfern? I cannot see it. Take the thousands of people who go down the harbour on holidays and Sundays. It is much better for them to change at once at Redfern, and be brought straight through to Circular Quay, than to get out at St. James'-road, from which they would have to walk, or ride by trams. The most objectionable part of the business now is the drag up to Bent-street from Circular Quay.

1229. *Mr. Wright.*] I take it that you hold this view: That a system of tramways to the business streets of the city, radiating from all the populous parts of the suburbs, would be better than any railway extension to the city? Most decidedly.

1230. You think you would get all the Hargrave-street traffic and the Paddington traffic? You could lay a branch line down Hargrave-street, and take all the omnibus traffic, and bring it into the eastern and western sides of the city.

1231. Are you aware that in all the principal streets of Melbourne there is a tramway which penetrates to all the outlying suburbs? Yes, and for much longer distances than our trams do.

1232. Do you think that they would meet the requirements of the travelling public better than any other system? It suits the public admirably there.

1233. How do you propose to deal with the through traffic from the country? I think Redfern is quite near enough to Sydney for the through traffic. My proposal is to take up the Elizabeth-street tram-line from Bridge-street to the railway station. That road would be left open to cabs and carriages taking the people to the terminus from all parts, especially from the eastern suburbs—such as people from the Australia Hotel, Roberts' Hotel, or whatever place they were stopping at. All they would have to do would be to get into their cab, and have a clean run to the station.

1234. You are possibly aware that there are considerable complaints on the part of long-distance travellers who arrive with a lot of luggage that they have to change from the train to a tram or cab? Certainly, it might be objectionable to them; but if they are brought to St. James'-road they would have to employ a cab, and the fare from Redfern, once the cab was started, would be just about the same.

1235. Do you travel much by the trams? I do. I never get into omnibuses because I do not like them.

1236. Does not the great bulk of the tram traffic discharge itself at King-street? Simply because the people have not got the option of getting out anywhere else.

1237. Have they not got the option of getting out at Market-street, Park-street, and Liverpool-street? King-street or Market-street takes them straight into the populated business centres on the western side of the city, such as Sussex-street, York-street, and all the warehouses.

1238. The fact that the bulk of the passengers get out at King-street pretty clear demonstrates that King-street is about the central point for the traffic? There is no doubt about that.

1239. *Chairman.*] Is there anything else which you would like to add? No, except that my scheme would obviate the necessity of using Elizabeth-street for the purpose of trams, and the railway passengers would, as now, be accommodated by special trams leaving the station by the eastern, western, and George-street routes.

Jose Guillermo Hay, Land Agent, sworn, and examined:—

1240. *Chairman.*] What are you? I am a freeholder. I am a resident of the City of Sydney now.

J. G. Hay.

1241. What is your occupation? I am a land agent.

1242. *Mr. Wright.*] You desire to make a statement with reference to the dedication of Hyde Park? I do.

28 July, 1897.

1243. Will you please read your statement to the Committee? It is as follows:—

STATEMENT by Mr. J. G. Hay concerning the Domain, of which Hyde Park formed a part, with a map of the City of Sydney showing the original boundaries of the town of Sydney in 1792; also, the existing boundaries of the Domain alluded to on the 6th of June, 1829; the boundaries of that portion walled and fenced in by Governor Macquarie, and the existing parks and recreation grounds within the city boundaries, 1897.

It has been stated, and constantly repeated, that Governor Macquarie issued a proclamation dedicating Hyde Park for ever for the recreation of the people of the town of Sydney. Herein are contained two serious perversions of the truth, as, firstly, Governor Macquarie never issued a proclamation on the subject at all, and, secondly, he did not dedicate the land as stated.

What he did was to issue a Government and general order of considerable extent, on the 6th of October, 1810, principally giving definite names to a large number of streets and spaces in the town of Sydney, among which he included that portion of the Government Domain which had gone under the various names of "The Common," "Exercising Ground," "Cricket Ground," and "Raccourse," and which he ordered was in future to be called "Hyde Park." After mentioning the boundaries of the land, the order went on to say, "being intended in future for the recreation and amusement of the inhabitants of the town, and as a field of exercise for the troops, the Governor has thought proper to name the ground thus described 'Hyde Park,' by which name it is henceforth to be called and denominated." This, and nothing more, no mention of a grant of the land for ever to the people; in fact, a grant of any portion of the Domain would have been against the original order of Governor Phillip and the intentions of the British Government, although some small portions of this large Domain were subsequently alienated to private individuals.

As the history of the tract of land (which, for convenience sake, I christened the "Phillip Domain") is not otherwise known, I will briefly state it.

The British Government gave Governor Phillip instructions to mark out an area of land within which no leases or grants of land for building were to be given, and to which area the term of the "Government Domain" came to be given.

When I was entrusted over nineteen years ago by Mr. Farnell (then Premier) with threshing out the history of Hyde Park, I discovered a very old map of Sydney showing by a green edging the boundary of this Domain, within which was noted the following order of Governor Phillip:—"It is the orders of Government that no ground within the boundary-line is granted or let on lease, and all houses built within that boundary-line are, and are to remain, the property of the Crown.—A. PHILLIP. Sydney, 2nd December, 1792."

On the first map of Sydney (1792) is shown the eastern boundary-line with the following written by Phillip:—"The boundary-line of Sydney Common (within which all the ground is retained for the use of the Crown and as Common land for the inhabitants of Sydney), no land can be granted"; and in another place within the same area: "All buildings which

J. G. Hay. which have been built for officers are public buildings, and etc. as well as the stores and houses erected for the convicts the property of the Crown."

28 July, 1897.

Again, on another portion of the map, is the following written by Phillip:—"N. B.—This line, which is the boundary-line, is intended to run from the head of the cove, which is to the westward of Sydney Cove, to the head of Garden Cove. Garden Cove is the second cove to the eastward of Sydney Cove, Farm Cove being between the two. Of this the Lieut.-Governor was informed before I left the country, and the boundary-line was traced by the surveyor when this map was made.—A. PHILLIP. Sydney, 2nd December, 1792."

The boundary-line herein referred to was the boundary of the town, and may be described as the line of Hay-street from the head of Darling Harbour (before the head portion was reclaimed) to the corner of Hay and Elizabeth streets, where the tram-line now emerges from Belmore Park, and from thence in a straight line in a north-easterly direction to the waters of Woolloomooloo Bay, at that time called Garden Cove.

It must not be confounded with the boundary-line of Phillip's Government Domain, although the eastern boundary of the Domain was also part of the eastern boundary of the town. Thus will be seen by a reference to Phillip's despatch to the home Government, 9th July, 1788, in which he encloses the intended plan for the town, and says:—"The principal streets are placed so as to admit a free circulation of air, and are 200 feet wide. The ground marked for Government House is intended to include the main-guard, civil and criminal courts; and as the ground that runs to the southward is nearly level, and a very good situation for buildings, streets will be laid out in such a manner as to afford a free air; and when the houses are to be built, if it meets with your Lordship's approbation, the land will be granted with a clause that will ever prevent more than one house being built on the allotment, which will be 60 feet in front and 150 feet in depth; thus will preserve uniformity in the buildings, prevent narrow streets, and the many inconveniences which the increase of inhabitants would otherwise occasion hereafter."

On the map of 1792, three of these allotments are marked with the names of Captain Paterson, Quartermaster Laycock, and Lieutenant Macarthur, and are outside the Government Domain, fronting about the line of Pitt-street now, on the western side between the then bridge and about the position of Hunter-street.

In 1807, in consequence of some houses having been erected on the Government Domain notwithstanding Governor Phillip's order, Governor Bligh issued the following general order on the subject:—

"Whereas His Excellency Governor Phillip did, by instructions from His Majesty's Ministers, draw two lines of demarcation in the vicinity of Sydney, within which no leases or grants of land for building were to be given, the said land being the property of the Crown

And whereas, a number of houses adjacent to Government House, to its great annoyance, now occupied by David Dickinson Mann, Abraham Ramsden, John Apsey, William Kimber, John Shea, Ferdinand Meurant, and others, within the said limits, have been built on land particularly marked out as making part of the Domain of the Governor's residence; the Governor is pleased to extend the notice already given to the first day of November next; at which time they, the present occupiers, are required and directed to quit possession of the said houses, taking away or disposing of their materials, the said ground being wanted for Government purposes.

His Excellency the Governor is ready on application to that effect, to grant permission to the said persons to build on such other ground, unoccupied, in the town of Sydney, as may not interfere with his arrangements on that head.

By Command of His Excellency,
EDMUND GRIFFIN,
Secretary."

Government House, Sydney, July 23, 1807.

When Governor Macquarie succeeded to the administration, he enclosed the greater portion of the Government Domain with wall and fence, and this portion now extending from St. Mary's Cathedral to Mrs. Macquarie's Chair, and including the present Government House and Garden Palace Grounds, and Botanic Gardens, came to be called by him the "Government Domain" but it did not cancel the remaining portion.

Among the innumerable improvements that Macquarie effected, he found it necessary to lay out the town effectively, and towards this purpose he issued the following Government and general order, principally giving definite names to streets and places of the town:—

Government House, Sydney, Saturday, 6th October, 1810.

"His Excellency the Governor being extremely desirous to do everything in his power that can in the least degree contribute to the ornament and regularity of the town of Sydney, as well as to the convenience, accommodation, and safety of the inhabitants thereof, has already in prosecution of these views divided the town into five separate districts, and has given directions for the erection immediately of a proper watch-house in each district for the protection of the inhabitants from night robberies, and for the more effectually securing the peace and tranquility of the town, and apprehending all disorderly and ill-disposed persons committing nightly depredations. In further prosecution to these views, His Excellency also intends to establish a well-regulated and strict system of police in the town, as soon as the watch-houses are completely finished.

As a necessary preparatory step to the proposed arrangements, His Excellency deems it expedient to give regular and permanent names to all the streets and ways leading through the town, and to order posts and finger-boards, with the names of the streets painted on them, to be erected in conspicuous parts of the different streets where they cross each other, as well as their respective terminations. These posts and finger-boards are accordingly to be immediately put up, and the streets are henceforth to be known and called only by the new names now given them. The principal street in the town, and leading through the middle of it from Dawos Point to the place near the Brickfields, where it is intended to erect the first toll-bar, being upwards of a mile in length, and hitherto known alternately by the name of High-street, Spring Row, and Sergeant-Major's Row is now named George-street in honour of our revered and gracious Sovereign.

The open space of ground or area whereon the Church of St. Phillip now stands, and which is hereafter intended to be formed into a handsome square (the street hitherto known by the name of Church-street forming the west side thereof), has been named Charlotte-square, in honour of Her Majesty, by which name only it is henceforth to be denominated.

It being intended to remove all those old buildings and enclosures now on that space of ground which is bounded by the Government Domain on the east, by the Judge Advocate's, Secretary's, Chaplain's, and Commissary's houses on the south, by the spring of water and stream on the west, and by the houses of Mr. Lord, Mr. Thompson, and Mr. Reibey on the north, and to throw the same into an open area, the said area, or space of ground, has been named 'Macquarie-place,' and it is henceforth to be so denominated.

The present Market-place being very badly and inconveniently situated, it is His Excellency's intention to remove the market very soon to a more commodious and central position for the inhabitants of the town in general. The place thus intended to remove the market to is that piece of open ground (part of which was lately used by Messrs. Blaxland as a stockyard, &c.) bounded by George-street on the west, Market-street on the north, and the burying-ground on the south; and it is henceforth to be called Market-square.

For the further accommodation and convenience of the inhabitants in general, and particularly of those persons bringing corn or other grain, goods, or other merchandise in vessels or boats from the Hawkesbury, &c., to the market, it is intended to erect a wharf immediately at Cockle Bay, contiguous to the new Market-place, and from thence there will be a good road or street made to communicate directly with the said Market-square, and which, when completed, is to be called Market Wharf.

The whole of the open ground yet unoccupied in the vicinity of the town of Sydney, hitherto known and alternately called by the names of 'The Common,' 'Exercising Ground,' 'Cricket Ground,' and 'Racecourse,' bounded by the Government Domain on the north, the town of Sydney on the west, the Brickfields on the south, and Mr. Palmer's premises on the east, being intended in future for the recreation and amusement of the inhabitants of the town, and as a field of exercise for the troops, the Governor has thought proper to name the ground thus described 'Hyde Park,' by which name it is henceforth to be called and denominated.

The Governor being desirous to prevent any encroachments from being made on the Park by brickmakers, and the Acting Surveyor having been directed to mark out for this purpose a boundary line dividing Hyde Park from the Brickfields, and which line of demarcation runs from the rear of Mr. Wilshire's lease across to Mr. Palmer's premises, His Excellency commands and directs that none of those persons who have obtained permission to

to make bricks shall in future on any pretence whatever, presume to cut up any ground for that purpose beyond the line fixed upon as the boundary for the Brickfields. Any person transgressing this order will be deprived of the indulgence of making bricks in future, and be prosecuted besides, according to law, for such trespass.

In further view to the accommodation and convenience of the inhabitants of the town of Sydney, particularly of those who have horses or other cattle that they may wish to have grazing for within a short distance, it is His Excellency's intention to have a large Common marked out immediately, within as short a distance of the town as circumstances will admit, and which will be publicly notified as soon as the ground is measured and marked out.

The following plan containing the names and descriptions of the new streets of the town of Sydney, is now published for general information.

LACHLAN MACQUARIE.
By Command of His Excellency,
J. T. Campbell,
Secretary.

[Plan.]

Of the new and old names of streets, &c., in the town of Sydney, with explanations and reference :-

1. George-street (old names, High-street, Spring Row or Sergeant-Major's Row), extends from Dawes Point in a southerly direction through the middle of the town to the extremity thereof, and to where the toll-bar is intended to be erected near the Brickfields.
- 2.—Prince-street (old name, Windmill Row), extending from Charlotte-square and the Government stone windmill in a northerly direction towards Dawes Point.
- 3.—York-street (old name, Barrack-street), extends from the barracks in a southerly direction to the burying-ground, parallel with George-street.
- 4.—Clarence-street (old name, Middle Soldiers' Row), next street west of York-street, and running parallel with it north and south.
- 5.—King-street (old name, Back Soldiers' Row), westernmost street of the military district, next to and running parallel with Clarence-street.
- 6.—Cumberland-street, extends from Charlotte-square in a northerly direction towards Dawes Point, next to and running parallel with Prince-street on the east.
- 7.—Sussex-street, a new street to be formed immediately next to Kent-street on the west, and running parallel with it north and south.
- 8.—Cambridge-street, extending from Charlotte-square in a northerly direction towards Dawes Point, next to and running parallel with Cumberland-street on the east.
- 9.—Pitt-street (old name, Pitt's Row), extends from Hunter-street in a southerly direction to Hyde Park, parallel with and next to George-street on the east.
- 10.—Castlereagh-street (old name, Chapel Row), extends from Hunter-street southerly to Hyde Park, parallel with and next to Pitt-street on the east.
- 11.—Phillip-street (old name, Back Row East), extending from the Government Domain southerly to Hyde Park, parallel with and next to Castlereagh-street on the east.
- 12.—Hunter-street (old name, Bell-street), extending from George-street in an easterly direction across the Spring and Tanks to Hyde Park.
- 13.—King-street, extending from George-street in an easterly direction, by Atkin's lease, through Pitt-street, &c., to Hyde Park.
- 14.—Bligh-street (old name, Bell Row), extending from the north end of Castlereagh-street in a northerly direction towards the Government Domain.
- 15.—Macquarie-street, the easternmost street in the town, and extending in a southerly direction from the Government Domain to Hyde Park.
- 16.—O'Connell-street (old name South-street), extending from the north end of Pitt-street in a northerly direction towards the Government Domain.
- 17.—Bent-street, extending from Spring Row in an easterly direction to the Fountain, and thence to the north end of Phillip-street.
- 18.—Market-street, extending from Cockle Bay in an easterly direction by Market Square and through George-street, &c., &c., to Hyde Park.
- 19.—Park-street, extending from George-street, in an easterly direction to Hyde Park by the south end of Pitt-street.
- 20.—Bridge-street, extending in a westerly direction from Macquarie-place across the Spring to George-street.
- 21.—Spring Row, extending from the Tanks and Hunter-street, on the east side of the Spring to Macquarie-place.

LACHLAN MACQUARIE.
By Command of His Excellency,
J. T. Campbell,
Secretary.

I feel certain that Macquarie never intended to make a grant of the land that he ordered should be called Hyde Park. A year later (5th October, 1811), in reference to a thousand acres for a Sydney Common, he did announce his intention in that instance to make a regular Crown grant in the following specific words:—"His Excellency thus communicates to the public, that he will make a regular grant of said common lands to the Judge Advocate and Magistrates of Sydney for the time being, in trust for the benefit of the present, and of all succeeding inhabitants of Sydney."

In reference to Hyde Park, no such language was used, and considering the dual character of the use that Hyde Park was to be put to, it would be impracticable to make any such grant.

It is to be seen that such a statement that goes about now, that Governor Macquarie by proclamation made a grant of Hyde Park as a recreation ground for the people of Sydney for ever, is a perversion of the facts that are disclosed in his Government and general order; and that it was not his intention to go so far, may be inferred from a comparison of the terms he used in his Government public notice of the 5th of October, 1811, when he assigned a large common to take the place of the hitherto used portion of the Government Domain for commonage purposes. On the 8th of June, 1829, a descriptive list of reserves in the town of Sydney was gazetted, and in that list the Government Domain is described as starting from the position of the mouth of the Tank Stream, thence by Macquarie-place and Bent-street, along that street to King-street East, thence to Elizabeth-street, thence by that street to Liverpool-street to the commencement of Oxford-street, and thence by a line in a north-easterly direction to the waters of Woolloomooloo Bay leaving John Palmer's grant of Woolloomooloo, lying outside it to the east, but excluding out of the said reserve two allotments which had been granted to J. Buckley and J. M. O'Connell, which are the present sites of the Domain and Richmond Terraces. This reserve, I hold, is practically the same as the Government Domain of Governor Phillip, and up to 1829 had (with the exception of the allotments granted to Buckley and O'Connell) been used for the purposes intended—for Government buildings and for such public purposes as education, religion, &c.

As late as 1851, when the Act was passed to close Macquarie-street running through Hyde Park, the said Act provided that it "should be enclosed with and form part of the domain or reserve for public health and recreation known as Hyde Park," and in the Survey Office old maps it had always been recognised as part of the Domain up to its official dedication for public recreation on the 3rd of May, 1878.

In the city of Sydney, in 1892, there were 748 acres of land used for parks and recreation grounds, or 26 per cent. of the total area of the city: and this is without the Centennial Park, or the old Rifle Range—which is now again vacant Crown land at the disposal of the Government.

In 1892, the area within the suburban municipalities dedicated to, or purchased for the people by the Government, including the Centennial Park, amounted to 2,730 acres, or 3.1 per cent. of their aggregate area.

In addition to these reserves, the Government dedicated to the people, in December, 1879, a large area of land situated within easy distance of the metropolis.

This estate, known as the National Park, with the additions subsequently made in 1880 and 1883, contains a total area of 36,320 acres. The amount of public funds expended on the National Park up to end of 1892 was £30,625.

On

J. G. Hay.
28 July, 1897.

J. G. Hay. On the Centennial Park up to end of 1892 was expended no less a sum than £201,455. On the Botanic Gardens, between January, 1880, and December, 1892, a sum of £75,843; for the same periods on the Government Domains, £32,676; on the Garden Palace Grounds, £14,182; and all other reserves within the metropolitan area, £284,941; or a grand total of £645,622.

These statistics that I have quoted are taken from Coghlan's "Wealth and Progress of New South Wales, 1893."

Since 1892, also, the Kuring-gai Chase, a large area of 35,300 acres, has been added to the national parks; but, excluding the two largest national parks, there is a total area of reserves, &c., according to Coghlan's Statistical Register for 1895, of 5,387 acres, and I know he has left out several reserves and does not take in further than Burwood on the main suburban line. When Governor Macquarie ruled, the bulk of the population of the Colony was in or about the town of Sydney. Its inhabitants have had to seek habitations outside the narrow limits of the town of Sydney, which was hedged in a couple of generations ago; and the successive Governments of this Colony have provided in a most lavish and unstinted manner for the recreation, health, and enjoyment of the citizens convenient parks and recreation-grounds contiguous to their homes.

1244. Was it by research that you obtained the information which is given in your statement? Yes.

1245. You stated that you were engaged by the late Mr. James Squire Farnell to make inquiries as to the dedication or otherwise of Hyde Park? Yes. At that time there was a trouble connected with Hyde Park. Pastor Allen was holding forth on Sundays, and it was a question of the Hyde Park Improvement Board dealing with the riotous proceedings there. It was found that it was doubtful if they had power to interfere, and the question then arose whether this land had ever been dedicated or not. Mr. Farnell said Hay was to be given this matter, and that he was to find out if it had ever been dedicated or not. I was in that branch which specifically dealt with the recreation-grounds, including Hyde Park. When I tackled this work I found that it was an exceedingly difficult one, more difficult than I expected, and I traced it back then to the oldest map of the town I could find in the survey office. On that map I found a copy of Governor Phillip's order of 1792. The outcome of the work I did was a suggestion that Hyde Park should be dedicated. As it had never been specifically appropriated, or put in such a manner as to be quite a satisfactory dedication, I suggested that it should be dedicated under the Crown Lands Alienation Act of 1861. Mr. Farnell approved of that suggestion, and some time after, finding that no one else had moved in the matter, I suggested that certain trustees be appointed and under the "Public Parks Act of 1854," which was done, in order that they should have absolute power short of alienation. They could do what they liked with Hyde Park, except to alienate it.

1246. It is not dedicated as a temporary common, and the trustees are permanent? No; Phillip, when the land was not actually required for some time, allowed the ground to be used as commonage, and Macquarie, finding that it was a nuisance, said he would grant a common outside the town, and do away with the commonage use of Hyde Park, and he granted what is now known as Moore Park—1,000 acres.

1247. In the proclamations of Phillip and Macquarie the land in Hyde Park is, to all intents and purposes, looked upon as Crown land? Yes. My contention is that Phillip, according to the instructions of the British Government, set this large tract of land apart for Government purposes, not only as the property of the Crown, but always to remain the property of the Crown.

1248. Reserving it permanently for Crown purposes? Yes.

1249. The only inroad on that was when the Government conveyed a portion of it to permanent trustees? No; in 1829 there had been two allotments granted to J. Buckley and J. M. O'Connell. Up to that year no portion of the land had ever been alienated to anyone, except to Buckley and O'Connell, who got the land where Domain and Richmond terraces are now. Since that period some portions have been alienated to private individuals, but the great bulk of that land still remains.

1250. Will you now describe the boundary of the town? Going back to 1792, Phillip had not named the piece of water which is now Darling Harbour, not even Cockle Bay; but he said the boundary of the town of Sydney was from the head of the cove, lying to the west of Sydney Cove, and now known as Darling Harbour, to the head of Garden Cove, now known as Woolloomooloo Bay. It does not strike a straight line from Darling Harbour.

1251. Will you describe the boundary of the town at the time by the streets of to-day? Phillip's boundary of the town of Sydney when he was Governor was the line of Hay-street to its intersection with Elizabeth-street, thence north-east in a straight line to Woolloomooloo Bay. Within that town boundary he had orders from the British Government to lay out a large tract for Government purposes, which he did. He has left no record of the boundary of it; but I have not the slightest doubt that the description in 1829 is near enough for our purpose.

1252. That is the description which you quoted in your statement? It was more than that. I think it was General Darling's order in 1829; he ordered a list of the then existing reserves in the town of Sydney to be gazetted, and this reserve is described starting from the mouth of the Tank Stream—that is, Sydney Cove—running along Mr. Reibey's allotment, which was where Mr. Norman Selfe used to live for years at Circular Quay, near John Williams' cooperage; thence along Macquarie-place, which was a little bigger then than it is now; thence along Bent-street up to Macquarie-street; thence along Macquarie-street to King-street East; thence southerly along the line of Elizabeth-street to Liverpool-street; thence easterly along Liverpool-street to what will be the commencement of Oxford-street now; and thence in a north-easterly direction to the waters of Woolloomooloo Bay. You will see that that portion of land coincides with the boundary of Sydney in 1792. Well, all that land in that area was set aside as a Government domain. I christened it the Phillip Domain to distinguish it. Macquarie enclosed with a stone wall and fence the area which is comprised in both the Domains, the Botanic Gardens, and the Garden Palace ground. He called that area the Government Domain, but he did not cancel the rest of it. Phillip's order was relative to the whole area. It is the orders of Government that no ground within a boundary-line is to be granted or let on lease, and all houses built within that boundary-line are, and are to remain, the property of the Crown. The boundary Phillip referred to as the boundary of the Government Domain, because he granted some allotments immediately outside that boundary-line to Captain Paterson, Lieutenant Macarthur, and Quartermaster Laycock. He did not mean within the boundary of Sydney, which would be absurd; he meant within the boundary of this Government Domain, and he intended by instructions from the British Government that that domain should always remain the property of the Crown, and should not pass out of the hands of the Government. Bligh, when he came here, referring to Governor Phillip's order and the instructions of the British Government, told half a dozen gentlemen whom he specified by name, and some others who had built very inconveniently to his residence, to clear out, to do what they liked with the materials of the property, and if they applied to him he would grant them allotments outside in the town. Bligh corroborated Phillip's order, and Macquarie never did anything to the contrary, unless

J. G. Hay.
28 July, 1897.

unless perhaps he might have given his subaltern, O'Connell, the allotment up by Parliament House, and the allotment to Buckley. He never did anything unless it was granting those two allotments to destroy the integrity of that domain. From the start of Oxford-street along College-street there was a small area of land alienated there after Macquarie's time. The ground was used for a garden by Judge Forbes. Francis-street is named after Sir Francis Forbes. Just about there a small portion has been alienated, but the Grammar School, or the Museum, I call a public purpose. I call the purposes of education and religion public purposes. St. Mary's and St. James' I consider a public purpose.

1253. Your contention is that the land now known as Hyde Park is virtually Crown land? Yes.

1254. That it has never been alienated to anyone or dedicated? It was dedicated at my suggestion in 1878, in order to gazette trustees, to frame regulations, and to deal with it in the public interest, to keep order; but up to that time it had never been granted.

1255. Is not that dedication in perpetuity to the trustees? When a dedication is made under the 5th section of the Crown Lands Alienation Act of 1861 it is intended to be permanent; but, of course, a Resumption Bill can destroy that dedication.

1256. Since 1878 Hyde Park has been dedicated in trustees for the use of the citizens of Sydney? Not specifically for the citizens of Sydney. It is dedicated for public recreation, health, and enjoyment—but there are no individuals named.

1257. For the people of Sydney? It is not mentioned in that way. You want to refer to a form of Crown grant. It is not dedicated for any specific class.

1258. For the general public? It is assumed for the people at large, not the people of Sydney.

1259. Therefore, if the citizens of Sydney set up a specific claim to Hyde Park, you do not agree with their contention? They have no claim at all; as a matter of fact, a deed has not been issued.

1260. The dedication has taken place by proclamation? No; the act of dedication was the announcement in the *Government Gazette* after certain formalities had taken place in accordance with the Crown Lands Alienation Act of 1861.

1261. Can you explain what power, if any, the Crown has over Hyde Park at the present time? The Crown *per se*, as Government, has no direct power over Hyde Park; it is left in the hands of trustees.

1262. There is no power to revoke that dedication? No, except by Act of Parliament. Up to 1878 there was that power in the hands of the Government.

1263. In your statement you alluded to other parks;—I wish now to refer to other recreation-grounds? Coghlan in his statistics, which he gets from other Departments, has left out a number of recreation-grounds, and consequently the area which he publishes is short of the true area. For instance, he has not included Dawes Point, which is used as a recreation-ground.

1264. *Chairman.*] That is only in course of transmission to the Colonial authorities? It was conveyed to the Colonial authorities at the time Garden Island was conveyed to the British Government. Garden Island was given to the British Government in exchange for all the ordnance lands—that was, Victoria Barracks, Dawes Battery, land at Bathurst, and a lot of other places.

1265. Do you wish to give some evidence about the extension of the railway into the city? I do, because I lived on the Blue Mountains for seventeen years.

1266. Will you give the Committee your idea as to whether or not the railway should be extended to the city, and if so, will you state what you think of the proposal to make a big passenger station in Hyde Park fronting St. James'-road? I certainly think the railway should be extended to the city—I do not think there is a second question as to that. But my own opinion is that no site in the business portion of the city for this extension would be practically as convenient as this St. James'-road site. It would be more convenient for extending the railway to Circular Quay afterwards.

1267. Remember that this proposed extension is intended only for passengers, not for goods? Exactly. The goods traffic might be taken to Darling Harbour or Darling Island.

1268. You have travelled a good deal, I suppose, by the railways? Yes; I travelled from the Mountains every day for some years, and the complaints for many years past have been very numerous that long-distance passengers are landed outside the city. It means that a large number of clerks and city warehousemen are debarred from using the Mountains from Saturday to Monday in consequence of not being able to get into their warehouses or offices by 9 o'clock on Monday morning, unless they get up at an unearthly hour and travel by the mail-train. If the terminus were located at St. James'-road they could get to their offices or warehouses at five minutes past 9 o'clock, and they would use the Mountains much more than they do. The same thing applies to all business men, but more particularly to the employees of merchants and others.

1269. Not merely the employees of mercantile houses? A large number of employees in Sydney would be very glad to go to the Mountains for a change from Saturday to Monday, but at present they cannot go.

1270. Why? They get to Redfern at 9 o'clock, then they have to change into a tram, and they do not arrive at the warehouse until twenty minutes past 9 o'clock, sometimes later.

1271. You think that the proposed extension of the railway to Hyde Park would enable this additional number of travellers to use the railway? Decidedly.

1272. They would save twenty minutes in transit? They would.

1273. Is that the only reason why you think the railway should be extended? No. It should be extended for several other reasons. My experience on the Blue Mountains in keeping a sanatorium showed the want of an extension of the railway to provide what they otherwise would have been very glad to have availed themselves of.

1274. If it is contended by witnesses, as has been done, that the electric tram in George-street will supply all the wants of railway passengers, in your opinion will that meet the case? Decidedly not.

1275. There will still be a break and great delay? There will be delay, and, further than that, those who have a portmanteau or anything of that sort would far sooner go straight down to the terminus, and leave it there if they do not want to take it away.

1276. *Mr. Lee.*] As one who has travelled for many years on that line, you think it would be in the interests of the public for long-distance passengers, such as passengers from the Mountains and places to the west of the Mountains, to be landed at Redfern station, while suburban passengers are brought into the heart of the city? I think it would be a great advantage or convenience if the long-distance passengers were also taken to St. James'-road.

1277. As a business man, do you think that any portion of the people of this Colony would submit to long-distance

- J. G. Hay, long-distance passengers being put down at Redfern, on the outskirts of the city, and suburban passengers being brought into the heart of the city? If they could avoid it, certainly not.
- 28 July, 1897. 1278. If an arrangement of that sort were carried out in the first instance, do you not think it is extremely probable that the country people would agitate for and obtain an extension of the long-distance traffic into the city within a short time afterwards? Certainly they would.
1279. Do you think it would be just to the community to put one portion of them at such a great disadvantage? Certainly not; they are all taxpayers.
1280. And as the railways are owned by the State, and centre in the city of Sydney, does it not, in your opinion, become a necessity that there should be one central depôt for the whole of the traffic? Certainly.
1281. *Mr. O'Connor.* The gift of Governor Phillip, although intended fully, had no real validity until the Government of Mr. Farnell, in 1878, made it a valid document? No; Phillip never made a gift at all. He said that that Government Domain should be the property of the Crown for ever.
1282. Who gave Hyde Park? No one gave Hyde Park; but Macquarie said that that piece of land known by four different names should hereafter be known as Hyde Park "being intended," as he said, "in future for the recreation and amusement of the inhabitants of the town, and as a field of exercise for the troops."
1283. *Mr. Wright.* He never made any grant? No. I proved logically that he never intended to make a grant by the case of the grant he spoke of to the Sydney Common, which he ordered to be conveyed to the Judge Advocate and magistrates of the town of Sydney a year afterwards.
1284. *Mr. O'Connor.* Legally that land was as much Crown land unalienated up to 1878 as any lands of the Crown to-day? It was in this position: It was legally Crown land, but used for recreation. Dawes Point is Crown land, but used for recreation. It was about in the same position in 1878, before action was taken at my suggestion to specifically dedicate it, as Dawes Point is at the present moment dedicated.
1285. The action of Mr. Farnell's Government in 1878 cures any defect which might have occurred? Yes. In 1878 there was a valid dedication of the land for the purpose of public recreation.
1286. It is as much dedicated now as if it had been in the days of Governor Phillip? It is properly dedicated now. Up to 1878 it could be dealt with by the Crown, but now it cannot be dealt with by the Crown, as it is out of their hands, except by a Bill of Resumption.

THURSDAY, 29 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the railway system of the Colony from the present terminus at Redfern into the city, including the erection of a large Central Station in the north-western division of the Park, fronting St. James' road.

The Honorable James Norton, LL.D., M.L.C., sworn, and examined:—

The Hon.
J. Norton,
LL.D., M.L.C.
29 July, 1897.

1287. *Chairman.* You are a Member of the Legislative Council and the President of the Board of Trustees of Hyde Park? Yes.
1288. *Mr. Fegan.* Have you a statement which you wish to place before the Committee? As what I want to say to the Committee is more in the nature of a protest than evidence, I have taken care to put it in writing. I have been compelled to do it very hastily, because you gave me such short notice to attend to-day.
1289. Would you rather have a longer notice? I have done it now, so that it does not matter. I would rather have had a longer notice.
1290. Will you be good enough to read your statement? It is as follows:—

I appear before the Committee for the purpose of protesting against the appropriation of any portion of Hyde Park for the extension of the railway system for the following reasons:—

The proposed works, including, as I understand, the widening of streets, the possible formation of others, and the laying down of rails in such portion of the Park as is not intended to be appropriated for yards or buildings will probably destroy nearly one half of the Park, and although the late Mr. Eddy disclaimed the idea of ever asking for any more there is almost a certainty that the residue being undoubtedly an excellent site for further works, will ultimately be appropriated if the present appropriation be allowed, and I notice that Mr. Eddy himself contemplated the probability of further land being sooner or later required, and could not guarantee that the present proposed extension would be sufficient for more than twenty years. It is impossible to deny that if an extension is admitted to be necessary or desirable the proposed site is unexceptionable, but the question then remains to be considered, whether the increased accommodation is worth the sacrifice required to obtain it. Sydney is well provided with parks, but the admirable position of Hyde Park makes it of much greater importance than all the rest, for it may be considered to be in the very heart of the city, and the necessary result of this is that a vast number of people amounting, I believe, to 40,000 daily pass backwards and forwards through it to their work, and thus enjoy its beauty and its unpolluted air, without the effort and loss of time which would result from a visit to the Botanic Gardens or other park elsewhere, whereas if it were appropriated for railway purposes they would not only lose this great advantage, but the length of their journey would be increased. The beauty of our beautiful city would be very seriously interfered with if utilitarian buildings, iron-rails, and railway trains, with all their bustle and confusion, steam, dust, noise, and excitement were substituted for trees, grass, and flowers, and there can be little doubt that the houses now surrounding the Park, would change their character and be very seriously interfered with, and that the Registrar-General's Office, the Supreme Court, and St. James' Church would have sooner or later to be removed, thus adding seriously to the cost of the proposed extension. It becomes necessary now to consider who will be benefited, and these may be divided into two classes, viz., the long-distance passengers, and the short-distance or suburban passengers, consisting principally of persons who live at such distances from Sydney that they are able to go backwards and forwards to their homes every day. With respect to the former, who are generally burdened with heavy luggage, it is a matter of very little moment whether they have to hire a cab from Redfern or from St. James' Church, but it cannot be denied that the proposed alteration would be of sensible benefit to the latter, principally in the saving of time, but it must not be forgotten that such benefit would be enjoyed by only a small section, who reside or have offices situated within a short distance from the terminus (say, for instance, not exceeding at the outside half-a-mile), and that.

that passengers who reside at Miller's Point, Darlinghurst, Darling Harbour, and other such places would not receive the slightest benefit, for it is impossible to carry the railway to everyone's door. Having cursorily examined the plans of the principal cities of Great Britain and of the Continent, I have not found that their railways, as a general rule, run to the centres of business, and if these great cities, with their large numbers of inhabitants, are content with railways terminating in their suburbs, Sydney, which is small compared with most of them, cannot have much reason to complain.

The Hon.
J. Norton,
LL.D., M.L.C.
29 July, 1897.

Having visited Brisbane, Melbourne, Adelaide, Auckland, Wellington, Christchurch, and Dunedin, I know that their railway stations are not in the centre of business, although they certainly are nearer to it in each of these cases than in the case of Sydney. I find that what may be considered the constitution of Hyde Park was granted by His Excellency Lachlan Macquarie, by notice published in the *Sydney Gazette* of 6th October, 1810, which dedicated the Park to the recreation and amusement of the inhabitants of the Town of Sydney. It therefore follows that the citizens cannot fairly be deprived of any portion of the Park without their consent, even if that consent be withheld in a dog-in-the-manger spirit, which, however, can hardly be imputed to them, because, as far as the permanent inhabitants, consisting mainly of the poor and labouring classes, are concerned, the parks are their only gardens and recreation-grounds, while the suburban residents, for whose convenience the Park is proposed to be taken, have plenty of open spaces and fresh, wholesome air, and in almost all cases private gardens of their own.

When, a few years back, an attempt was made to appropriate a portion of the Park for railway purposes, a large open-air meeting, over which I presided, was held in the Park, a resolution protesting against the proposition was carried unanimously, and the project was abandoned. At the late meeting held in the Town Hall under the presidency of the Mayor, an immense number of citizens attended and unanimously passed resolutions condemnatory of the proposed appropriation. I contend, therefore, that unless a much larger number of citizens than that which attended the late meeting (say, not less than two or three times the number) shall give their consent, the will of so large a minority, if it should be a minority, must be respected, even though there may be no other way of bringing the railway into the business portions of the city. As to the sentimental aspect of the question, I consider that that is entitled to due consideration, for a great part of the pleasures of life are made up of sentiment, and if that is to be excluded we may almost as well drop down to the position of Chinamen or blackfellows. On the other hand, the sentimentalists are entitled to say that the attempt to resume the Park instead of adopting some more expensive scheme, is a mere commercial matter, and a question of pounds, shillings, and pence, which ought not to prevail where the health, happiness, and enjoyment of the people are concerned.

1291. Has any one of the cities you visited as many parks or recreation grounds as Sydney has? They seem to me to be plentifully supplied, quite sufficient in proportion to the number of inhabitants.

1292. I suppose in Hyde Park you have an area of about 48 acres dedicated as a park? Yes.

1293. Out of that area it is proposed to take 10 acres for railway buildings and sidings:—do you think that the taking of that land will very much inconvenience the people in getting to their recreation-ground, or utilising the Park as much as they do at present? Not so much as if they took the whole of it, but then the fear is that, when that part is once taken, another piece will be wanted, and then another piece, and having given up a part, the whole will sooner or later be sacrificed.

1294. Your great objection, as President of the Trust, to the taking of this Park is that, in the near future, you will be called upon to part with some more of the Park? That is the greatest objection.

1295. If you got a guarantee that they would not use any more of the Park, your objection would not be as strong as it is? We cannot get such a guarantee.

1296. If the Commissioners were willing to say that for any further extension they would go down to Circular Quay, would not that get over a good deal of your objections? No; because I do not see that they can pledge themselves, or their successors in any way. The remaining portion of Hyde Park is so convenient that the great fear is that it will be taken, and no pledge can be sufficient to protect it.

1297. That is the danger in conceding this portion of 10 acres? That is the greatest danger.

1298. How many years is it since the meeting you presided over was held? It was held three or four years ago. It was held when a proposal was made to do the same thing which is now attempted to be done.

1299. How long have you been a trustee of the Park, and the President of the Trust? I have been a trustee since 1879, and President of the Trust since the death of Sir Alfred Stephen two or three years ago.

1300. You are one of the first trustees who were appointed? Yes.

1301. There were no trustees to look after that Park till 1878 or 1879? I do not know how it was managed, but the present Trust was not in existence till then.

1302. Really that land was not properly dedicated for a reserve or park till 1878? It was dedicated in 1810, as I mentioned in my statement.

1303. For other purposes, but not for a recreation ground or park? Well, I will read to you the words of the proclamation:—

Saturday, 6th October, 1810.

His Excellency the Governor, being extremely desirous to do everything in his power that can in the least contribute to the ornament and regularity of the town of Sydney, as well as to the convenience, accommodation, and safety of the inhabitants thereof, has already, in the prosecution of these views, divided the town into five separate districts, and given directions for the erection immediately of a proper watchhouse in each district for the protection of the inhabitants from night robberies

The whole of the open ground yet unoccupied in the vicinity of the town of Sydney, hitherto known and alternately called by the names of the common, exercising ground, cricket ground, and racecourse, bounded by the Government Domain in the north, the town of Sydney on the west, the Brickfields on the south, and Mr. Palmer's premises on the east, being intended in future for the recreation and amusement of the inhabitants of the town, and as a field of exercise for the troops, the Governor has thought proper to name the ground thus described Hyde Park, by which name it is henceforth to be called and denominated.

LACHLAN MACQUARIE.

By command of His Excellency,

J. T. CAMPBELL, Secretary.

1304. You would be here to object to the giving over of any portion of the Park, even if you were not on the Trust? I might not feel myself so much bound to appear as I do now; but I should have the same objection to it as I have now.

1305. You are aware of the proposal of the Commissioners to meet the claims of those who wish for a recreation ground? I think so.

1306. An area of 16 acres is proposed to be given by resuming land at the Benevolent Asylum ground and the old Cemetery:—do you not think that that will be more convenient for a larger number of people than is the north-western portion of Hyde Park? It will be more convenient for the people who reside in the neighbourhood of it, but not so convenient for the people who now use Hyde Park.

1307. It will be more convenient for a larger number of people than Hyde Park is at present? I do not think for a larger number, but certainly it will be convenient for some.

1308. It is simply the convenience of a population of 30,000 persons in the vicinity of the proposed Park as against the convenience of a population of 15,000 persons in the vicinity of this portion of Hyde

The Hon.
J. Norton,
LL.D., M.L.C.
29 July, 1897.

Park? I say the Park is used, not only by the people immediately fronting it, but by people from Surry Hills, Woolloomooloo and other places; and if you count them in, I think you will find that they comprise a larger number of people than the number who will be inconvenienced by the proposed new park.

1309. *Mr. Black.*] Do you not think that Hyde Park is used by people from all parts of the Colony and all parts of the world? Certainly.

1310. *Mr. Fegan.*] Would not the other ground, if resumed and beautified as proposed, be taken advantage of by people who come into the city? No; because it is too far off.

1311. Too far off the city? Too far off the main parts of the city.

1312. Does not that prove that it is time then that greater convenience was given to those large numbers in the city, and who come to the city? I do not know. I do not think that the argument tells in that way at all.

1313. If the larger number will visit Hyde Park, and the proposed park is too far for them, does not that show that some greater facilities should be given to that large travelling public who frequent Hyde Park and the Domain? I do not think it follows. They have a good many conveniences as it is—they have omnibuses and trams, and are likely to have more trams.

1314. You know that some steps were taken to resume that part of Hyde Park for railway purposes many years since? I do not know what steps were taken, but they eventuated in nothing.

1315. At that time circumstances were a little different from what they are now? At that time a large number of business people lived at their business places in the city, but since then they have gone to live in the suburbs, and they come in every morning to their business? I think some more have gone than were here at that time.

1316. Considering that the largest portion of our business people live out of town, do you not think it will be a great benefit to the community to have a railway into the city? It would be a great benefit to them, but I look more to the injury done to the poorer classes who cannot have these suburban residences, who live in Sydney, and must continue to live in Sydney on account of saving expenses.

1317. You do not take all the Park from them, for they will still have 30 acres in Hyde Park? You do not take all from them, but the main objection is the fear that that Park will be ultimately entirely sacrificed.

1318. I understand that is your greatest fear, but if it were possible to give you a guarantee that no further encroachment on the Park would be made, your opposition would be comparatively small in this case? It would be weakened a good deal.

1319. *Mr. Hassall.*] Do you think it is necessary to extend the railway system into the city? I think it is a very open question. I have not at all made up my mind that there is any actual necessity for it. It would certainly be a very great convenience to a certain section, and it would be a great convenience to me personally, but I am not prepared to say that the sacrifice to bring the railway there is equal to the benefit we would gain by its extension.

1320. Speaking individually, you think it would be a benefit to bring the railway to the city? To me, personally, it would.

1321. Your opinion, I suppose, is shared by thousands of others who would be similarly benefited? It is shared by a good many—by all within reach of the benefit.

1322. Those who habitually use the railway as a means of access to the city would be benefited by the proposed extension? I do not say all, but certainly a good many would be benefited.

1323. If it is admitted that it is desirable to extend the railway to the city, can you point out to the Committee any more convenient site than the site at St. James'-road? I cannot point out any site which I consider more suitable.

1324. You admit in your statement that the site is unexceptionable, being in the heart of the city? That is my opinion.

1325. And, therefore, the city, or any portion of the city practically would be easily accessible from that point? Well, it would facilitate access to a very large part of the city.

1326. Do you not think that in the event of the railway being extended to the city, they might run across lines of tramway to strike the railway at convenient points? Quite possible.

1327. But I think you say, granted all the convenience which might accrue from the station it would not be worth the sacrifice of a portion of Hyde Park? A portion, and I am afraid ultimately the whole.

1328. *Mr. Fegan* said that if you had a guarantee that no other part of the Park was required, there would not be so much objection to the extension of the railway in this way as there would be if it were proposed that the whole of the Park might be required? No doubt, if such a guarantee were given, and if we could see that the guarantee was worth anything. I cannot conceive it is possible to give any guarantee which will bind the future.

1329. I can only judge from the evidence brought forward by the Railway Department on this subject? I have read *Mr. Eddy's* evidence. He was perfectly sincere in saying that he did not want to take any more; but I cannot think that that will bind his successors. The spot being so convenient I think may ultimately be appropriated, in spite of *Mr. Eddy's* ideas.

1330. Does it not strike you that in the event of any further accommodation being required that accommodation will be in the direction of proceeding further north, towards Circular Quay, which might result in the construction of a circular line of railway? I think that is very likely indeed.

1331. From the proposed terminus round by Circular Quay and back again on that line of railway, and also providing a starting point for an extension to the eastern suburbs? Yes; but I notice that *Mr. Eddy* said that there is no necessity for providing for goods traffic at present.

1332. I am alluding only to the passenger traffic? I do not see that the passengers want to get so far. You would take them away from the centre of the city if you took them down there.

1333. Judging by the fact that no other traffic than the passenger traffic will immediately be provided for, it is not probable that any larger area of Hyde Park may be required when it is distinctly stated by the Railway Commissioners and the constructing authorities that the portion which is now asked for will be ample for all requirements for many years to come? I cannot quite see that. As to this idea about carrying goods, people's ideas may alter, and future Commissioners may say that it is quite necessary that we should take these goods down to the wharfs, and have a railway along the wharfs, so that we can deliver them on board ship. *Mr. Eddy* combated that idea, and said that it would be of very little advantage. If he had remained as Chief Commissioner, I would have had no difficulty on that score; but he is gone, and his ideas sooner or later will disappear too.

1334.

The Hon.
J. Norton,
LL.D., M.L.C.
29 July, 1897.

1334. You state that thousands of people use the north-western portion of Hyde Park in passing to and from the city. Considering that you have St. James'-road on one side, and Park-street on the other, it would not be necessary to make any very great detour to arrive at any portion of the city, which would be practically accessible from the portion of the Park which is required for railway purposes? The detour would not be a very large one, but there would be a sensible difference in it, and we find in the Park itself that if a person wants to go from one point to another point, and he has to go round a little corner, he will invariably go straight, and destroy the grass.
1335. If he can. That shows the desire of people to go straight to their business, and if it were not for the necessity of going through the Park, they would not go through that Park for the purpose of seeing it? They simply go there, because they are compelled to go there on the way to their business, and being so compelled, they get the benefit of the Park.
1336. It is proposed to take not the whole of the northern portion of the Park, but practically a fourth of the Park? Yes.
1337. On one side you will have Park-street as a means of access to the city; on the other side you will have St. James'-road, and if anyone wishes to get to the vicinity of Market-street, he will be able, by an overhead passage, running practically through the centre of the railway station, to pass from the central avenue in Elizabeth-street? Of course, that eases the matter to a certain extent; but you compel the people who now pass through the Park to use dusty roads instead of a verdant park.
1338. You do not mean to say that you would have a dusty road from the centre of that Park, or a dusty road either in Park-street or in St. James'-road? You cannot help it.
1339. I have yet to learn that asphalt is dusty? There is a good deal of dust in Sydney on some occasions, even in asphalted streets. Leaving out the question of dust, there is a hard road to walk over, instead of a nice smooth turf.
1340. Do you allow the people to walk across the turf as they like. You cannot stop it.
1341. Although you put notices to keep off the grass as much as possible? And they will not.
1342. With regard to the statement that you prefer trees, grass, and flowers against steam engines, railway cars, and all the concomitant noises of railway traffic, do you think it would be preferable to keep the trees, grass, and flowers as compared to the great advantages which will be conferred, not only on the suburban traffic, but also on people visiting Sydney from every colony in the group? It is a difficult thing for me to say. I am a believer in trees, plants, and flowers. I have been a gardener all my life, and therefore I have a great affection for them. I cannot very well get rid of that. I know dozens of people who would rather have trees, flowers, and grass than steam, smoke, and dust.
1343. If that idea had been carried out we should have had no city of Sydney to-day? No doubt, if you followed it out absolutely.
1344. Again, you state that no advantage would accrue to the western portion of the city—that is, along the foreshores of Darling Harbour—because it would be too far for the people to walk to reach their places of business? Very little benefit would accrue to them by the extension of the railway.
1345. Is it not a fact that people who use that portion of the city for their business operations generally choose some suburban residence which is easily accessible—they would practically use the water as a means of transit between their residence and their place of business, I do not say in all cases, but to a great extent? I do not know. I daresay a great many of them would live at Balmain, for instance—some, but not all.
1346. You, if carrying on a business in Sussex-street, would say, "I would choose as a place of residence some suburb which is easily accessible for my place of business"? Certainly. I have done it myself in my own case.
1347. Therefore, to a great extent, the objection to this proposal on that score would be done away with, because people then would not go and reside in a suburb which was not so easily accessible as another? That is perfectly true, to a large extent.
1348. People generally adapt themselves to their surroundings? Yes.
1349. Governor Macquarie's proclamation was that this land, describing the boundaries as he did, should be available for the recreation and amusement of the inhabitants of the town of Sydney? Yes.
1350. At that time the town of Sydney was only a very small town? Very small.
1351. It was not the city of Sydney, but the town of Sydney? The town of Sydney; and the Park, as appears by that proclamation appears to be outside the boundaries of the town.
1352. But the city has extended in so many directions that the circumstances of the present day are altogether different from the circumstances at that time? Very different.
1353. You will admit, I believe, that many of the people who carry on business operations in the city do not reside within its boundaries? A great many people do not; if they have any sense, they will reside outside the city.
1354. Suburbs have been founded practically year by year? Yes.
1355. And provision has been made for the residents of the various suburbs in the shape of parks and recreation grounds irrespective of Hyde Park? That is so.
1356. So that practically, viewing it in this light, what was suitable for the requirements of the people in the days of Governor Macquarie is not altogether suitable for the requirements of the people at the present day? No; but I cannot apply that to the Park. I think the Park is more suitable now than it was even then, because the places outside are covered with houses. There is all Woolloomooloo monopolised. That was practically a common when I was a boy; there was much more room to move about. But now, all that accommodation having gone, the Park becomes so much more useful.
1357. Looking at it from this point of view: that you propose to take a certain area in a particular locality, and it is admitted, in fact, proved beyond all shadow of doubt by the evidence, that the population to be served by that area as a park is only 15,000; that within a short distance you have another area—a suburban area I may term it—where a park would be very beneficial to 30,000 persons, and that you propose to give in exchange for the portion of the land to be taken almost double the area, in the more thickly-populated locality;—do you not think that that would be an advantage to the public generally? An advantage to the public generally as a mass; a disadvantage to the persons who now use Hyde Park, but a greater advantage to those who front the new park. You are robbing Peter to pay Paul, as it were.
1358. If you rob Peter to pay two Pauls, it does not matter? Peter would not like to be robbed in any way.

The Hon.
J. Norton.
LL.D., M.L.C.
29 July, 1897.

1359. You stated that if you do away with the sentimental aspect of the question you bring us down nearly to the level of blackfellows or Chinamen? Not the sentimental aspect of the railway extension only, but sentiment generally.
1360. Did the question of sentiment enter into the proceedings taken to acquire this country from the original inhabitants—the blackfellows? I am afraid there was not the slightest sentiment in it.
1361. If a question of sentiment were to enter very materially into this project, we might revert to the olden days when the blackfellows were the possessors of this country, and sentiment was not allowed to stand in the way of taking their country from them, and let them do the best they possibly could? We are more civilised now. I have been looking through Cook's Voyages lately, and I see that he hoisted the British flag wherever he landed, whether it was populated or not.
1362. If we are to take any notice of one meeting held in the Town Hall on the resumption of the north-western corner of Hyde Park, we might suspend our judgment until the other meeting is held to-morrow night, to ascertain what the feelings of those people may be? That is only fair.
1363. *Mr. Fegan.*] And over that meeting the Mayor is also to preside? The Mayor can have no feeling in the matter. I believe he is in favour of the extension; but he is quite right in holding two meetings.
1364. *Mr. Hassall.*] I take it that you appear here as the representative of the trustees of the Park, and that you practically object to any portion of the Park being taken for railway purposes? I do; and I may say that the trustees are quite unanimous.
1365. That is, unanimous on the subject? Of course they are to some extent biassed, but still they are quite unanimous.
1366. Yet, admitting that it may be desirable to extend the railway into the city, you cannot point out a more convenient site than that one? There is no site equal to it; that is quite clear.
1367. *Mr. Roberts.*] How many gentlemen constitute the Hyde Park Trust? Mr. Alderman Chapman (formerly Mayor of Sydney), Mr. Alex. Dean, Mr. W. W. Stephen (who succeeded Sir Alfred Stephen), Mr. Charles Moore (lately of the Botanic Gardens), Dr. E. P. Ramsay, of the Australian Museum, and myself are the only ones who attend, and I do not think there are any more.
1368. Are the Committee to understand that the trustees generally concur in your protest? Every one except Dr. Ramsay, who has not been present lately at any of the meetings, as he has been ill.
1369. Do you know the view which he holds on the question;—do you regard him as an opponent of the view held by yourself and other members of the trust? No; I think he would agree with us, but I cannot say that with certainty. I have not asked him.
1370. Are Cook Park and Phillip Park under the control of your trust? They are.
1371. In the event of this scheme being carried out, do you not think that Cook Park and Phillip Park might be made more attractive to the citizens of Sydney, and thus make up to some extent for the deprivation of portion of Hyde Park? Undoubtedly, that must follow.
1372. Will not the area that will probably be more extensively used be equal to the area in the north-western section of Hyde Park? I do not think it would be used any more extensively than Hyde Park is at present. I do not think it would make any difference in that respect.
1373. Phillip Park is not very attractive at present? No.
1374. *Chairman.*] It could be made so? It could if we had sufficient funds.
1375. *Mr. Roberts.*] Has the improvement of Phillip Park received the consideration of the trustees? No. We have not had the means to improve Phillip Park, and therefore it was of no use to consider the question. We are quite willing to improve it if we only get the means.
1376. Have the trustees applied to the Government for money, with a view to improve Phillip Park? Constantly; that is to say, they have often applied for more money than has been allowed them, so as to enable them to improve, not only Hyde Park, but Phillip and Cook Parks also. But on the whole the allowance made them has not been illiberal, though it has not been sufficient to enable them to improve Cook and Phillip Parks, except to a very small extent.
1377. Unsuccessfully? Yes.
1378. *Mr. Hoskins.*] You get an annual grant of £1,000? They give us £1,000 a year, and sometimes they give us a little more for certain things which we point out are necessary to be done.
1379. *Mr. Roberts.*] Is £1,000 a year the maximum sum allowed for Hyde Park, Phillip Park, and Cook Park? No; sometimes they have allowed a little more for certain objects, or various purposes which have been pointed out to them. But these allowances have always been made rather grudgingly, so that we cannot calculate on getting any great increase.
1380. Is this annual grant of £1,000 to cover the three parks? That is all we have.
1381. The trustees use their own discretion as to the way in which it shall be expended? Just so.
1382. Do the trustees have to pay for the lighting of Hyde Park? The Government pays for that.
1383. In addition to giving the endowment? Yes.
1384. Has any record been kept by your trust as to the number of people who pass through Hyde Park? When the former proposal to resume part of Hyde Park was made, Sir Alfred Stephen took a great deal of pains, and had people there posted to count the number of people who used the Park. I believe the number was 30,000 or 40,000 daily.
1385. Have you any figures to show the Park is enjoyed by a greater number of people now than it was five years ago? No.
1386. Is the number you give the aggregate number of persons who passed through Hyde Park, or only the number of those who passed through the north-western section of the Park? I assume that it represents the number of persons who entered the Park, and departed from the Park. You must halve that number if you want to get at the number of people who used the Park on that occasion.
1387. *Chairman.*] That is 20,000 persons over all the Park, not over this section of the Park? I think that is it.
1388. The inference will be that a fourth of the 40,000 people used this fourth of the Park? Not so, because there is a much greater traffic in the part which it is proposed to take than in the other parts.
1389. Was it 40,000 persons a day or a week? A day.
1390. *Mr. Roberts.*] It is almost an impossibility to find out the number of people who go there at any time to get fresh air? No; the whole thing is only an approximation, but a pretty near one.
1391. Is it not a fair thing to assume that the majority of these 40,000 persons were only using Hyde Park

Park as a short cut to the city;—they did not go there for any purpose of remaining there for any time? Not many of them. Of course if you go there now, you will see loafers lying about in dozens and remaining all day.

The Hon.
J. Norton,
LL.D., M.L.C.

1392. If the north-western portion of the Park be taken for railway purposes, and you still receive £1,000 a year from the Government, you will be able to improve the remainder of the Park to a much greater extent than you can at present? Provided that we have not to spend any of that money on the new portion proposed to be given to us. If we have to spend money at the burial ground it will take a great deal of money.

29 July, 1897.

1393. It is difficult to say whether the new parks would be under the control of the trustees of Hyde Park, being so far away? It is impossible to tell yet. If we have £1,000 to spend on the residue of the Park we can make more improvements there than we can now.

1394. In the event of this project being carried out, would not the Domain be more largely availed of than it is? Not more at all, I think.

1395. How do you arrive at that conclusion;—do you regard the Domain as being too far from the centre of the city? Yes; the charm of the Park is that people are compelled to pass through it on the way to their business, and get the benefits of it without going there specially. If they have to go for these benefits specially to the Domain, they will waste a good deal of time, and they will not do it; but this Park benefits them in spite of themselves, as you may say.

1396. You would class the Domain, I suppose, with the Centennial Park, which requires a special visit to enjoy it? Not so much; but something in that category.

1397. Are you aware that if this project is carried out arrangements will be made to completely and attractively cut off the station from the central avenue, and neither the station nor the shunting or passing of trains will be likely to be objectionable in any sense? I am aware that is proposed to do that; but I cannot tell whether it will be done. It may be done, or it may not. The present idea, no doubt, is to do it.

1398. The Committee are assured that it will be done, and that the station buildings themselves ought to be an ornament to the city? No doubt they ought; and, I think, if Mr. Eddy were alive, and the present Commissioners were to deal with the matter, they would carry out what they propose; but we do not know who will be the Commissioners by-and-bye. So that, unless the work is done instantly, there may be a change of idea.

1399. I think you mentioned that the character of the houses round the Park would be altered;—suppose Elizabeth-street were to become a business street instead of a residential street such as it is, do you see any objection to that? You cannot tell; any change may be detrimental. It may be found beneficial; but I think it is more likely to be detrimental. These houses will be used for an inferior purpose, and the houses themselves become inferior.

1400. Are you not of opinion that the street will be altogether altered in its character—that it will become a business street, somewhat similar to Pitt-street, perhaps to George-street? It might.

1401. And the north-western part being cut off in the way I have mentioned, are you not inclined to think that it would not be unpleasant in any way to the frequenters of the eastern portion of the Park? Do what you will, I think it would be unpleasant to them; but it is a matter of opinion. It is very hard to change the centres of business. You will have to do a great deal to take the business away from Pitt-street and George-street and bring it up to Elizabeth-street or any other place.

1402. I am not saying that such will be the case; I am only saying that, owing to the large traffic which will be brought into Elizabeth-street, that street will become a business street in addition to Pitt-street and George-street? It is quite possible that it might.

1403. As a trustee of Hyde Park, and more particularly as the President of the Trust, and being fully seized of the great responsibility of representing the citizens of Sydney, you are altogether opposed, I suppose, to even an inch of Hyde Park being taken? I am. I may say that I and the rest of the trustees have always opposed attempted encroachments on the Park. There have been several attempts to get bits for one thing and another.

1404. Is it not a fact that a short time ago the trustees refused enough space for a cabmen's shelter? It is perfectly true.

1405. Only on the ground on which you feel called upon to oppose this proposal—that is, not to allow an inch of Hyde Park to go? Not solely on that ground in that case. We thought it would become a very offensive nuisance; otherwise we might have given way possibly to that.

1406. If it were possible to give you a pledge that no further encroachment should take place, would you view with any favour the proposed extension of the railway to Hyde Park? In the first place I could not get such a pledge as would satisfy me. In the second place I do not know that my difficulty would be at all removed; there would be some mitigation, no doubt, which would be considered. I look at the thing, and I consider it as a matter which will affect not only one portion, but ultimately the whole of the Park.

1407. What leads you to suppose that in the near future the whole of the Park will be absorbed for railway purposes? Because Sydney has grown very fast, and is growing still, and will grow to a very large city sooner or later, and the requirements of a larger city than the Sydney of to-day will bring about a necessity for a larger railway station.

1408. But does it not appear to you that in the event of a future extension of the railway other areas in the city might be utilised to give the required accommodation, instead of having all the work carried out at Hyde Park? There is only one direction in which you could go. You could go down to Government House and take that land, and I do not look with very much favour on that.

1409. *Chairman.*] Will it not make a better park eventually than Hyde Park,—round by the water? It will make a very nice park indeed; but you have not the advantage of having the people going there perforce as you have here, and that is why I say Hyde Park is the park of all parks.

1410. *Mr. Roberts.*] You would not regard with favour, owing to your love of trees, grass, and flowers, the utilisation of any of the Governor's or Inner Domain, to the smallest extent for railway purposes? It might have to be done; but I should consent to it with the very greatest reluctance—I do not say that I would refuse.

1411. *Mr. Black.*] You have been asked some questions relative to the value of the Cemetery at Devonshire-street and the value of Hyde Park to the people of Sydney;—I suppose you look on this matter of Hyde Park, not merely as a local question, not as a question which will benefit or prejudice the people

The Hon.
J. Norton,
LL.D., M.L.C.
29 July, 1897.

in its immediate neighbourhood, but as a question which will have an effect, either for good or evil, in its alteration on the people of the whole country? I cannot say that I have looked at it in that light. I look upon it more as a local question.

1412. Do you mean to say that you look on the matter of the diversion of Hyde Park from its present use as merely a local question—as one of mere value to the people who front Hyde Park? Mainly for the people who front it and use it.

1413. It seems to me a very extraordinary view to take? There is another aspect—if you destroy Hyde Park, you destroy one of the beauties of Sydney.

1414. That, it appears to me, is not a local question? That is not local, I admit.

1415. Going further with this matter of local view, do you not think the value of Hyde Park as a place of resort will be depreciated not only by the portion taken, but also by the use the portion taken is to be put to? I think it will depreciate the remaining portion of the Park.

1416. Because of the noise? The noise, dust, smoke, and steam.

1417. That will be not only because of the presence of the station, but because the line will pass through the south-western section of the Park, and will, in certain portions there, be open for the purpose of ventilation? Yes.

1418. Do you not think that that south-western section of the Park will be in less favour as a place of resort if the line is constructed through it? Certainly, much less.

1419. Do you not think that the atmosphere will be so laden with smoke and soot that the growth of plants, flowers, and trees will be interfered with? I think so.

1420. And their beauty destroyed? Partially.

1421. Do you not think that in addition to the value of the land proposed to be resumed in Hyde Park for railway purposes there should be added an estimate of the destroyed value of that portion which fronts the land resumed? Certainly; considering the advantage and disadvantage of the whole transaction, that should be added.

1422. Do you know exactly what is the area it is proposed to resume? I see it is stated that it is about 10 acres.

1423. Would you be surprised to learn, on official information, that the station-site and the portion proposed to be added to Elizabeth-street will be 12 acres 1 rood? No; I am not at all surprised.

1424. And that the portion covered by the line in transit through the south-western section of the Park will be 1 acre 20 perches? I should have thought that it would be rather more, because I understand that six lines are to be taken to St. James'-road.

1425. If the construction of the railway will depreciate the value of the Park as a place of resort, will it not, in your opinion, also interfere with the usefulness and the pleasure the people feel in some of the fine buildings which surround it? Certainly.

1426. Do you not think that the Supreme Court, the Museum, the Grammar School, St. James' Church, St. Mary's Cathedral, and the Synagogue will all suffer from this extension? They will all suffer some detriment.

1427. That will not apply to the College, or the Museum, or St. Mary's, at present? Not much, because they will be some distance removed; but it will interfere a great deal with the Supreme Court, St. James' Church, and the Registrar General's Office.

1428. One of the pathways from the city to the Museum will be blocked and closed, and people going to the Museum will be compelled to make a detour? Certainly.

1429. In ways, direct and indirect, these buildings will all be interfered with? —

1430. Hyde Park being on a ridge has a fall on each side? Yes.

1431. On that account it has facilities for being laid out as a place of beauty that are not possessed by all portions of land to an equal extent; it has gentle slopes, and views may be obtained from it? Yes; land that is very irregular sometimes can be laid out with more beauty than land almost level, but at greater expense. The view we get from Hyde Park is, of course, accidental, but there it is, and nothing you can do to the land will lose you that view.

1432. If this land is of such solid value, and its value as a park cannot add to any value it may possess for railway purposes, would it not be better that some inferior land elsewhere should be used for the inferior purpose of a railway, and that this beautifully-situated land, of almost unsurpassed situation, and with fine natural surroundings, should be taken away from the purpose to which Nature and the forethought of our fathers have devoted it? Certainly; there can be no question about that. It would be very much better to use inferior land for what you are pleased to term the inferior purpose, which may be, in some respects, very superior. Of course, then comes the question of getting such land. That I am not prepared to deal with. It is more an engineering matter than anything else.

1433. Do you not think, apart from any saving in cost which may arise in the matter of resumption by using Hyde Park land for the purpose of a railway, the construction of a railway station at St. James' road will, of necessity, involve the resumption of valuable city land in order that the approaches to the station, by way of city streets, may be wide? I think it is very probable. It is proposed by this scheme to widen Elizabeth-street, for instance, and Park-street, I think; and it may be thought necessary to widen other streets also.

1434. Park-street will have to be raised to admit of a tunnel being carried under it? Yes.

1435. You were asked just now if you did not think it would be some advantage that the area of Hyde Park should be reduced in order that your grant, being spent over a smaller area, would be more beneficial to the remainder? If it is an advantage, I do not think it is an advantage worth considering in comparison with the loss of the symmetry of the Park. By taking away the finest part you leave, as it were, the scrag ends.

1436. Do you not think it would be a useless expenditure of money to improve Hyde Park, when it is within the bounds of probability that in fifteen or twenty years' time you may be asked to concede an additional portion for railway purposes? Certainly.

1437. *Mr. Hoskins.* Are you aware that steam and smoke are belched from railway engines through airshafts in the Temple Gardens in London, where there is a much denser and damper atmosphere than there is here, and that no complaint has ever been made of any injury being caused to trees and shrubs in the gardens? I know nothing about the Temple Gardens, but I do know that these things do damage trees, and I know that in Park-street some of the trees have been absolutely destroyed by the dust from the roads.

1438.

1438. Has any representation ever been made to you, as President of Hyde Park Trust, that persons, especially females, are deterred from crossing through Hyde Park from Market-street to Boomerang-street in consequence of the rude and, in some instances, indecent remarks passed by men lying on the grass close to the walks? No representations have ever been made to me as President, but I know as a fact that such things have happened.

The Hon.
J. Norton,
LL.D., M.L.C.
29 July, 1897.

1439. Do you not think that the number of persons who traverse that walk, judging from what you have heard on the subject, would be likely to be considerably more than otherwise if such insults were not offered to people? I think people are deterred from travelling through the Park on that account, especially timid women.

1440. Then if that portion of Hyde Park is enclosed for the railway, do you not think it will have a tendency to prevent such abuse as you have heard of from taking place, and as I know has taken place there? I do not think there will be any tendency to reduce the difficulty, but it would transfer it to some other portion of the Park.

1441. Are you aware that the necessity, or the alleged necessity, for extending the railway from Redfern to Sydney arises not only from the wish of many people to have it extended to the city, but also because Redfern station is reported by the officers of the Department to be almost unsuitable owing to the cramped-up room for shunting the trains and carrying on the operations of the railways? I believe there is a very great necessity for increased space. I have read Mr. Eddy's evidence, and I quite agree with Mr. Eddy that there is a very great necessity for extension in some shape. I do not appear here as an opponent of railway extension into the city, but simply as an opponent of railway extension into Hyde Park.

1442. *Mr. Lee.*] If you are opposed to the railway going to Hyde Park, and you are firmly impressed with the fact that there must be a removal from Redfern, would you suggest a way out of the difficulty? That is an engineering matter I cannot deal with. I do not see there need be any removal from Redfern, because it is possible that arrangements may be made there which will give the required space. I am not capable of judging of that.

1443. Accepting for the time being that there is an absolute necessity for its removal, and arriving at that absolute conclusion upon the evidence of experts whose evidence cannot be ignored on a matter of this kind, must the movement to extend the railway from Redfern cease because the people would reluctantly part with a portion of Hyde Park? I will not go so far as to say that no extension shall be made if it necessitates the resumption of part of Hyde Park; but I say that every effort should be made to find some other site if possible. Perhaps it is possible—perhaps it is not. Mr. Eddy was more capable of dealing with that question than I am.

1444. In view of the evidence of the men who alone are considered capable of giving reliable evidence on this question, such evidence cannot be ignored by you or myself, and having come to the conclusion on the evidence of the experts that there must be an extension from Redfern station, the question arises shall Redfern site be retained, with all its dangers and inconveniences, because it is not advisable to give up a portion of this beautiful Park? I do not go quite as far as that, but I do say that every attempt ought to be made to get further accommodation at Redfern rather than take the Park. If the accommodation cannot be got there, perhaps the Commissioners may be driven to take the Park.

1445. The reason why I asked that pointed question was because Mr. Eddy said before the Royal Commission, "I would point out that it would be unwise to spend a very large sum of money in connection with the present site at Redfern, or any site closely adjoining, because you could not charge any additional fare to recoup the interest on the large expenditure?" I believe he said that.

1446. That opinion is corroborated by all the experts on the matter, and private engineers have now had an opportunity for many years to perfect schemes other than that of Hyde Park; and the various Commissions, having had the advantage of having all the various schemes laid before them, and the recent Commission, having had an opportunity to judge of them, inevitably came to the conclusion that Hyde Park is the best scheme;—do you not think that in face of evidence of that character there is a substantial reason given why the extension should be made to Hyde Park? I do not think it should, because it is a mere matter of pounds, shillings, and pence. The Commissioners say that they cannot get any other kind of extension which will produce a revenue. Give up that, and there may be a dozen sites equally fit.

1447. Are you of opinion, then, that the railway should be extended to Devonshire-street, and a central station made there, notwithstanding the fact that no additional revenue will be obtained? It will be an improvement to extend the railway to Belmore Park.

1448. Are you of opinion that it would be better to remove the station over Devonshire-street than to take a portion of Hyde Park? I cannot say.

1449. The difficulty which presents itself to the Committee is this: That the Park is State property, that the railway is State property, and that in the interests of the public, and the public alone, it is desirable to extend the railway for public convenience to Hyde Park;—in view of that fact, and in view of the large portion which will be left for recreation purposes in the Park, do you think the State will be doing wrong in absorbing that small portion;—do you not think that out of consideration for the public convenience the trustees would be justified in withdrawing their opposition to the State absorbing a small portion of the Park? In the first place, I do not consider that the Park is State property. I think it is the property of the people of Sydney.

1450. Sydney only? Sydney only. That is stated in the proclamation, and it has been used in that way for the benefit of the people of Sydney all along from 1810.

1451. Surely the trustees would not, at this stage, raise such a point as that? I think we are bound to raise the point.

1452. If it was solely for the benefit of the people of Sydney, then they have the power to prohibit country people from going into the Park? I do not think the trustees would set up that position.

1453. Notwithstanding the dedication itself, you are aware that the Government have power at any time to revoke it? I do not think they are likely to exercise that power, except for purposes of this character.

1454. Except for purposes of absolute necessity? Yes.

1455. I am only putting the case before you as one of real necessity, that is in view of every other route being exhausted, and no other route found to be so suitable and so economical as this route—would not the trustees be justified in withdrawing their opposition to the resumption of this portion of Hyde Park? But I am not convinced of the absolute necessity to bring the railway into Sydney at all; it is arguable.

1456.

- The Hon. J. Norton, LL.D., M.L.C.
29 July, 1897.
1456. If you are not convinced of that, you must admit that the next best thing is to bring it to Devonshire-street, and let it remain there? I dare say that would be a very good thing.*
1457. There is no alternative? It would satisfy a good many people.
1458. It would involve an enormous expenditure, and bring in no additional revenue? I do not know why you should not put a penny on if you go over Devonshire-street, to where it was originally proposed to start the railway, and where a wall stood for many years as the commencement of it. It would be some appreciable benefit to bring it down to Belmore Park.
1459. Would the Committee be correct in inferring from your evidence that whether the railway is extended or not, or whether it can be profitably extended or not, no portion of Hyde Park should be taken for railway purposes? I am in a difficulty in answering that question. Of course I admit that under certain circumstances it may be absolutely necessary to come in and take Hyde Park.
1460. The difficulty which presents itself to this Committee is that it seems to be a matter of necessity to take a portion of the Park now? I am not quite prepared to admit that yet.
1461. *Mr. Black.*] With regard to these men who make comments on passers-by in the Park, do you not think they could be more expeditiously and less expensively moved by a policeman than by a railway train? Yes; I think the railway train might move them, or make them permanent fixtures.
1462. Do you not think the removal of these men in any direction does not obliterate them, but simply alters the base of their operations? I think so.
1463. You do not think, I infer from your evidence, that there is no alternative but Hyde Park? I do not say that. There may be or there may not be; I do not go into that question.
1464. *Chairman.*] With regard to the people passing through the Park, you do not know how the number was taken? The number was taken by men stationed at the entrances.
1465. The same people may enter one portion of the Park, walk into Sydney, come out to their luncheon, go in again, and return in the evening; it is quite possible that you have four times the real number? It is just possible.
1466. You do not know really how it was taken? It was taken by stationing men at the principal entrances.

David Kirkcaldie, Chief Traffic Manager, Department of Railways, sworn, and examined:—

- D. Kirkcaldie.
29 July, 1897.
1467. *Chairman.*] You are the Chief Traffic Manager in the Department of Railways? Yes.
1468. Have you had an opportunity to see the evidence which was given in connection with the late Royal Commission on City Railway Extension? I have.
1469. You have seen the evidence which was given by the late Chief Commissioner, Mr. Parry, and others? Yes, and the evidence of Mr. McLachlan and Mr. Harper.
1470. Did you agree with the evidence they gave? I did.
1471. Do you believe it is correct in all the main principles? I do.
1472. With regard to the difficulty and danger to work the Redfern station, are you in agreement with them? I would not say it is absolutely dangerous in working the station, because you can work any station without danger, but it has never been so congested as it is, and the risk is considerably greater than it was a few years ago. In 1877 we had not more than eighty trains out of and into Redfern in twenty-four hours. At the beginning of 1888, when the locomotive establishments had been removed to Macdonaldtown, and all light engines had to come from there to begin a day's work, and go back after they had finished, the number of trains and engines passing through Redfern yard on the main line, taking three ordinary days in 1888, had increased from 80 or 90 in 1877 to 340, 363, and 355. And in 1897, taking three days in January, the numbers had increased to 555, 547, and 561. If we come to exceptional days—on last Eight-hour Day, the 5th October, we passed through the yard 701 independent trains and engines in twenty-four hours independently of the shunting operations in the yard.
1473. *Mr. Regan.*] And 90 per cent. of that traffic would be done within limited hours? Yes. On the 22nd June last we had 681 trains and engines in twenty-four hours; from 4 o'clock in the afternoon of June 22 to 1 o'clock in the morning of June 23 we passed 324 trains and engines through Redfern yard, independent of shunting operations. That gives an average of thirty-six trains an hour for nine hours. To look at it in another way: When I joined these railways, a little over twenty years ago, the only two platforms in the station were what are now called No. 5 and No. 6 platforms. Of course there were the two docks, No. 3 and No. 4, but no one ever thought of starting trains from there any more than we do now. At the present time we have eleven platforms, and still we find, at certain hours of the day, that these platforms are altogether inadequate to meet the rush of traffic. As a matter of fact, the northern mail train is so long that we find a difficulty in getting a proper platform to start it from without projecting beyond the platform, as it has to do now frequently. Therefore I take it that the time has come when relief will have to be found somewhere.
1474. *Chairman.*] Is that imperative? It is imperative. It will give you a fair indication of the amount of work which goes on in the yard when I tell you that on an ordinary day the movements of the signals and point-levers in the signal-box, at the end of the platform, number fully 8,000; on a holiday, such as Easter Monday, it is fully 11,000.
1475. All these operations must increase in the future? Yes.
1476. It is imperative, therefore, that Redfern yard must be dealt with? It is absolutely imperative that something must be done.
1477. What can be done with Redfern yard;—would the extension of the railway to St. James'-road, approved of by the Royal Commission, by turning Redfern station to some extent into a passing station, obviate any danger or serious difficulty there? Entirely.
1478. So that is a radical cure for the state of the yard? Yes.
1479. Would any extension into Prince Alfred Park be an improvement? I think it would be a most difficult matter to improve Redfern yard.
1480. First, looking at an extension on the eastern side towards Prince Alfred Park, and going, as it were, round the corner from the tunnel, do you view with satisfaction any extension of that kind? I do not. I think it is simply putting off the day which must come, when we must have an extension to the city.
1481. You have had an opportunity of seeing Mr. Norman Selve's map on the wall? Yes. 1482

* NOTE (on revision):—In giving my answers to Questions 1456, 1457, and 1458, I was mistaken in thinking that they related to Hay-street.

1482. You see the proposal in hatching, and the yellow lines of the resumption, and you see also the location of the station building;—will you state your views in regard to his proposal? Briefly, I should say that you were going to spend an immense amount of money to get over the danger which, to a certain extent, obtains at Redfern station, but it is going to be of no utility as far as the public are concerned, and we are not going to derive another shilling of revenue out of the traffic. I have no idea of what the estimate of this work is, but it certainly will cost a very large sum, and it will be of no public utility.
1483. It embraces the resumptions, as shown on the plan, of which the Committee have not yet an estimate, the readjustment of Redfern yard, the erection of new buildings, and the construction of the new approach to Darling Harbour? Yes.
1484. Each of these four items enumerated will be considerable? They will be very considerable.
1485. It might eventuate, perhaps, in as large a cost as the city railway? It might. I think the expenditure of any large sum in that way is to be deprecated if it is possible to get the railway into the city. The great thing is to give the public all the advantages which can possibly be given to them. In carrying the railway into the city you do that, and at the same time you carry out a work which is going to pay for itself from the start, and you are going to give a large population living in Sydney a chance to go to the suburbs, for they will not take a tram to the station, and then take a train.
1486. The proposal before us means the expenditure of a large sum virtually to render Redfern yard safe? Yes.
1487. Having no connection with the extension of the railway to the city? None whatever.
1488. If the railway be extended further north than Redfern these works are unnecessary? Yes.
1489. Have you had an opportunity to see the scheme proposed by the Railway Commissioners, dealing with the traffic at St. James' road? I have.
1490. In your opinion, will it be sufficient for the traffic? Yes; there might be little matters of detail which could be altered with advantage, but taken generally the scheme is one which commends itself to me.
1491. It has been feared by some people that it means eventually the absorption of the whole of the Park? I do not think so at all.
1492. Why? Because I think we will be able to conduct an enormous traffic there by some little modifications, such as might be pointed out, without absorbing any more of the Park.
1493. I think the Chief Commissioner explained that you would have relief by an extension to Circular Quay, and to the eastern suburbs for the passenger traffic? But I think apart from that we can find plenty of relief up at Redfern station by having these six lines right up to Redfern station. All you can want down here will be platform accommodation. You can get plenty of storage at Redfern.
1494. Will the Hyde Park station, in your opinion, do all the trade which will ever require to be done from the area which legitimately should be served from that centre? I think so decidedly, until the time comes when you want railways right round the suburbs of Sydney.
1495. Then you will seek for new centres? Yes.
1496. Not by the extension of this? No.
1497. *Mr. Lee.*] Since the railway depôt has been established at Redfern, have the smoke and steam and other outputs from the engines been the means of blackening and destroying the property in the locality? I have never heard of it.
1498. Has it destroyed any property on the western side in George-street? I have not heard of it.
1499. Or in Devonshire-street? I have not heard of it.
1500. Or in Prince Alfred Park, or anywhere in the vicinity? I have never heard of it.
1501. Do you anticipate, if the railway is brought into Hyde Park, these offensive matters will be destructive to property in the vicinity? I do not think so.
1502. Do you think it will interfere with St. Mary's Cathedral? I do not.
1503. Or with the Synagogue? I do not think so; and my opinion is based on the fact that the railway runs through the Princes-street Gardens in Edinburgh for, I daresay, a mile, parallel with Princes-street, which, I suppose, is one of the finest streets in the world. It is a beautiful park, and no inconvenience is caused there by the railway.
1504. *Mr. Black.*] Is it not a fact that the people of Edinburgh very much regretted that that park was ever devoted to railway purposes? No.
1505. They used to do so about thirty years ago? I never knew of it, and I was then connected with the company which has its lines of railway running through the gardens.
1506. *Mr. Lee.*] Suppose the line were brought round to Circular Quay—I would not say in what way, but in some way—and that at Circular Quay the terminus was 13 ft. 6 in. below the surface of the roadway, would you be able to conduct the goods traffic under these conditions? I think you must discard the idea of working the goods traffic in connection with a city railway.
1507. I do not want you to dwell on that point, but to state whether on the bald fact, if you had to deal with the goods traffic on a line 13 ft. 6 in. below the surface of the roadway, you would be able to do it economically or efficiently? Certainly not.
1508. *Mr. Fegan.*] You mentioned the progress which the traffic, both goods and passenger, has made during the last twenty years:—are you expecting the proportion to increase in the future as much as it has done in the past twenty years? I see no reason why it should not. If you carry the railway into the city, I see no reason why the traffic should not continue to increase in the same proportion as it has done in the past; and even if it increased by one-half the amount it has done during the last twenty years, we will not be able to conduct it where we are.
1509. In your opinion it will increase? I see no reason to think otherwise.
1510. Therefore, it is only a matter of a very short time when, if things are allowed to remain as they are at Redfern, you must make a move somewhere? Yes; otherwise the traffic must be carried on in a way which will neither be creditable to us nor satisfactory to the public. We will have the same difficulty as we had years ago before we had the quadruplication of the suburban lines—the difficulty of getting trains along.
1511. Is it not a fact that the Chief Commissioner looked upon the tunnel at Redfern as a very dangerous point in the working of the trains? It is a very undesirable thing to have a tunnel near a railway yard. The signalman, who is exactly over the tunnel, cannot see what is going on underneath, and, therefore, we have to keep a man on the ground to indicate to him whether there is anything standing in the tunnel, which, perhaps, for a moment he may have forgotten.

- D. Kirkcaldie. 1512. Do you remember the accident which took place a few months ago, and in which some persons were not killed but slightly injured? I do.
- 29 July, 1897. 1513. Did not Mr. Eddy then point out that whilst the traffic was so congested at that point it was impossible to have things as you would like there? I think he did.
1514. Therefore, that points out that he was dubious of carrying a much greater traffic with any safety? I know he told me that a good many times.
1515. Can you state from memory what that railway accident cost you when several persons were killed two or three years ago? I really could not tell you.
1516. Will you be good enough to get the information for the Committee? I will try to get the information before I come back. [*Vide Appendix.*]
1517. It was owing to a mistake that that accident took place? Yes, both accidents happened in that manner.
1518. Are all your lines interlocked there, or only a portion of them? All the main lines are interlocked, and everything leading to the main lines.
1519. A portion is worked by a flag? No.
1520. *Chairman.*] On a heavy day it is worked by a flag to the east? Yes, but that is supplementary to the fixed signals.

FRIDAY, 30 JULY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANCIS AUGUSTUS WRIGHT, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

The Honorable Charles Gilbert Heydon, Q.C., M.L.C. sworn, and examined:—

- The Hon. C. G. Heydon, Q.C., M.L.C. 1521. *Chairman.*] You are a Member of the Legislative Council of New South Wales, and an old resident of Sydney? Yes.
- 30 July, 1897. 1522. *Mr. Hassall.*] You attend, I understand, to make a statement as to the effect on the business of the law courts if the railway is extended to St. James'-road? I was asked to come strictly to state what the result of extending the railway to the north-western corner of Hyde Park would be in the conduct of business in the Supreme Court. Assuming that a large number of trains come in, and that no special precautions were taken to prevent the sound reaching the Supreme Court, my opinion is that it would simply prevent the doing of business altogether. I do not think the courts could carry on business owing to the noise, but whether the plans include any special provisions to prevent the noise, and whether they are sufficient I do not know, and I am incompetent to judge.
1523. Have you seen the plans of the proposed station? No.
1524. From the map here you will notice that a considerable space is left between the station building and the Supreme Court? I see by the plan that there is to be a large space between the end of the railway and the block of buildings which includes the Supreme Court. There is no doubt that that station building would deaden the sound to an extent which would vary with the thickness of the walls and the height of the building.
1525. The whole of the station will be covered in nearly up to Park-street? I do not know the thickness of the walls, but presumably they would be thick, and walls on both sides. I am not competent to say whether they would so completely deaden the sound as to prevent the trains being a nuisance; but judging from the effect of the trams in Elizabeth-street and King-street on the business of the courts, then I would say certainly, unless the sound were very completely deadened; indeed, it would be almost impossible to carry on the business of the court. The court fronting Elizabeth-street is almost useless, and in the court which is near King-street, although there is an intervening room, the conduct of business is made very difficult indeed, in consequence of the King-street trams. New courts have been erected behind these and nearer to the Park, and unless the noise of the trains was completely deadened, I do not think the business could be done conveniently in those courts.
1526. The evidence of the Commissioners and the railway authorities goes to show that there will be no whistling either in entering or in leaving the station, and also that the trains will arrive and depart at such a slow rate of speed that they cannot be compared to the trams running alongside the Supreme Court, either in King-street or in Elizabeth-street.
1527. The rooms which are affected by the noise of the trams abut right on to the street? The Elizabeth-street one does, and there are a couple of windows through which the sound comes. The other court has a large room between it and King-street, so that it does not immediately adjoin King-street, but even in that court the noise is found to be a very great drawback, and makes business troublesome to everybody.
1528. Even here in this very room, with the trams running constantly backwards and forwards, it is not possible for us to hear the evidence as plainly as we otherwise would do? No.
1529. But considering that there will be a considerable space between the Law Courts and the station buildings, and that you have the whole of that building between the Law Courts and the trains, do you not think that they, to a certain extent, will deaden the sound altogether? The intervening building will deaden the sound to a certain extent.
1530. You will have not only one thickness of wall, but several thicknesses of wall through which the sound would have to penetrate in order to be a source of annoyance to the occupants of the Law Courts?

Walls

Walls all have openings, and if you have a wall without an opening there has to be an open roof. You cannot have a wall so that the sound is entirely shut out. The rate at which the trains would go, and the diminution in noise in consequence of their going slowly are matters experts can speak about very much better than I can. I can only say that one of the courts is practically useless in consequence of the Elizabeth-street tram, and in the other court, work is made very difficult, annoying, and troublesome in consequence of the King-street trams; and it strikes me, with deference, of course, to anything which the experts may say, that the annoyance of the railways on the other side can hardly be less than that of the trams. I think that is all I have to say.

The Hon.
C. G. Heydon,
Q.C., M.L.C.

30 July, 1897.

1531. If there was no possibility of any noise arising to militate against business being carried on satisfactorily in the courts, I presume you, as a representative of the higher branch of the profession, would have no objection to the extension of the railway to St. James'-road? As a barrister I should have no objection, but as a citizen I might. I was not asked to come to speak of that aspect of the question.

1532. Having had an opportunity to see the plan of the station building, and remembering that it is proposed to erect a very large substantial building at the end of the railway station, do you think any great inconvenience would be caused if the project were carried out? I cannot speak positively about it, because I have not an expert knowledge of these matters, but I cannot help thinking in my own mind, that there would be an annoyance occasioned to the business of the Supreme Court even with that building, and with all the yards being covered over.

1533. If that had the effect of deadening all sound no inconvenience would be caused? If there were no noise there would be no inconvenience.

1534. *Mr. Roberts.*] From what trams do you experience the most inconvenience? The steam trams cause the greatest inconvenience, but that may be because the Court, which has a frontage to Elizabeth-street has no intervening room, and no double thickness of walls.

1535. Do you know that it is contemplated to substitute electric traction for steam traction in Elizabeth-street? No.

1536. A sum of £100,000 has been voted by Parliament for that purpose;—do you regard the position of the Supreme Court as suitable under any circumstances, and that that will be the permanent location for the Court? No.

1537. It has been generally understood that the Supreme Court should be removed to somewhere at the top of King-street? That has been generally understood for such a great many years that I am afraid that it will be generally understood for a great many more years; but I think that if the railway comes to Hyde Park that will be an additional reason for moving the Supreme Court.

1538. *Chairman.*] It should be moved? I think it will be moved.

1539. *Mr. Roberts.*] Would you like to suggest a site which would be suitable for the Court? No; I have given no thought to that. I do not think you find in any other part of the world a Law Court with a tram to the north, a tram to the west, and an immense railway station to the south.

1540. But, in view of the substitution of electric traction for steam traction, is it not a fair thing to assume that the noise would not be magnified, even if a railway station were built in the north-western corner of Hyde Park, especially as St. James'-road would divide the Supreme Court from the station building, which would be of a substantial character? I do not think that is a fair way to look at it. I do not think you should say, "Well, we are going to create an annoyance certainly on this side, but then we will diminish the annoyance which exists on that side, and that will make matters square." It seems to me that that is not a reasonable way to look at it.

1541. If the business of the Court can be carried on now, perhaps not as quietly as could be desired, the noise would be no worse than it is now, even supposing that the trains came down to St. James'-road? I am speaking a good deal in the dark as to the additional noise which the extension of the railway would create. I am speaking with deference to the opinion of experts, and to a great extent in ignorance of the thickness of the walls of the new structure, so that I can only say as to that in a general way. I believe it will be an annoyance, but whether it will be a greater annoyance than removing the present steam trams would compensate for, I am not able to say.

1542. The steam trams, I understand, will be done away with, because electric trams are more up to date and can be worked more economically? I do not think they would be anything like as noisy.

1543. *Mr. Hoskins.*] Are you aware that it is not intended that the station at St. James'-road shall be a depôt for a large number of unused carriages and trucks, which would necessitate a great deal of shunting. The trains will be brought up to the station and taken away; and the engines will not be kept there, but will be taken to Eveleigh? How many trains, may I ask, will come in and go out in a working day.

1543½. The trains will simply discharge the passengers at the station, but no trucks and carriages will be left there to be shunted about, and which has caused so much noise at Redfern? I do not understand that a train which is being shunted makes any more noise than a train which is coming in or going out.

1544. The forming of trains causes the noise? It will make a more continuous noise, I suppose; but it will not make any greater noise.

1545. *Chairman.*] It is stated by the railway authorities that the number of long-distance and suburban passenger trains in and out of Redfern during an ordinary day is 324, and of this number thirty-eight would be during the busiest hour of the day? I gather from the figures which have just been mentioned to me that there will be a train arriving and departing in less than every two minutes.

1546. Make it every five minutes? That train would take some little time to come in and go out, so that there would practically be a continuous noise.

1547. *Mr. Hoskins.*] Do you really think there will be as much noise as there is now, with 220 trams a day running along Elizabeth-street? I cannot say whether it will make as much noise as the trams, which, certainly, are very noisy.

1548. In Devonshire-street do you hear much noise from the station;—does the moving of trains about Redfern yard cause disturbance or noise there? When I have been in Devonshire-street I have been in the street. You always hear a great deal of noise in a street; but you do not notice it. If you go into a room to conduct business which requires quiet, you will very soon find out whether it is noisy or not.

1549. *Mr. Trickett.*] In judging of the amount of noise which the trains will make, have you considered that their own impetus will bring them in against a dead platform, and that when they are leaving the station the engine would be about 500 feet distant from the platform at which they arrived;—it is not as if it were a passing traffic;—have you thought of that matter? No; I have not made any special investigation into that. If one were to make a scientific inquiry, one could stand at certain distances and

notice

The Hon.
C. G. Heydon,
Q.C., M.L.C.
30 July, 1897.

notice the speed and the noise I only spoke in a more general way, in which any one could speak of it. Trains always make a noise, it seems to me, however slowly they are coming; and it is a noise which travels a long way.

1550. *Mr. Clarke.*] Mr. Eddy, when he was before the Royal Commission, made this statement in reply to a question I asked:—

2710. Might it not cause those who attend the Supreme Court, St. James' Church, and St. Mary's Cathedral—the latter of which is not likely to be removed—annoyance? I think not. We will take care not to run the trains during service time. We do not do so now.

? Will the Commissioners take care not to run the trains during Court time, because that is the time I came here to speak about. Mr. Eddy seems to admit here that it will be necessary to diminish the number of trains on Sundays during service time. Now, St. James' Church is no nearer the railway than the Supreme Court; as a matter of fact it is not so near, and St. Mary's Cathedral is nothing like as near, yet Mr. Eddy recognises that there will be an annoyance from the trains, because he says, "We will take care not to run the trains during service time." It would be quite impossible for him to take that precaution during Court time, so that I take it that if it would be an annoyance to the church it would be an annoyance to the Court. His evidence seems to confirm my view.

1551. Mr. Eddy was also asked this question—

2708. *Mr. Clarke.*] In the event of the main station being formed at St. James' road, might not objection be taken to it by those who attend the Supreme Court, St. James' Church, and St. Mary's Cathedral, as an eyesore and an annoyance, because of the smoke? I do not think the station would be an eyesore. I think it would be an ornament, and there would not be enough smoke to cause annoyance. The Supreme Court is recognised by everyone as being rather too noisy at the present moment, and the sooner it is removed from its present position the better.

? I consider that answer absolutely confirms the opinion I formed before I came here. Mr. Eddy, when he is asked whether the railway will be an annoyance to those who attend the Supreme Court says, first of all, "I do not think the station would be an eyesore"—I am not saying that it would—and then he says, "and there would not be enough smoke to cause annoyance." I do not say that there would be enough smoke to cause annoyance. As to all the rest of it he says, the sooner the Supreme Court is taken away the better. He does not say that there will be no annoyance to the Supreme Court. He says, "The Court had better go and let the railway come."

1552. The Supreme Court will have to go at some time? That is another matter. If it is removed to another part of the town there will be no annoyance from the railway, but if it is where it is, I think there will be an annoyance from the railway.

1553. *Mr. Wright.*] Fronting St. James' road there will be a station building two or three storeys high, 380 feet long by 60 feet deep, with a colonnade in the front for foot passengers, and outside the colonnade a covered way 25 feet wide for cabs, with a clear space of 60 feet between the kerb and the Registrar-General's Office, and Elizabeth-street will be widened by 30 feet, and the whole of the lines within the area will be covered in. I will now refer you to a question which Mr. Hoskins put to Mr. Deane, the Engineer-in-Chief, on the question of the probable noise in the station:

Mr. Hoskins.] Do you not think if that view of yours were carried out, and the Registrar-General's Office were resumed for railway purposes, it would lead to the Judges of the Supreme Court and the lawyers finding fault with the noise at the termini, and the whistling of the trains, and finally to the resumption of the court buildings? I do not think they would hear a sound, because it would be all covered in. The buildings at the front of the station would be a break to any sound or whistling, and the platforms and lines would be covered by a large roof. I do not think that any inconvenience would be experienced from the whistling of the trains.

That is the evidence of the highest expert we have on this matter, and I think you will admit that very great importance must be attached to his evidence? I do not say it should not.

1554. With a distance of 145 feet between the terminus of the railway and the Supreme Court, the station building, three storeys high and 60 feet deep, must effectually prevent any sound from reaching the Court. In answer to another question Mr. Deane says, "positively you would not hear the trains at all; you would not be aware of their existence";—do you not think that the Committee are justified in attaching considerable importance to this evidence coming from the man it does? I do not say that because my opinion is what it is, the opinion of other people is not entitled to weight.

1555. Possibly that evidence might modify your own opinion? I attach a good deal of weight to his opinion, but what I came here to give was my own opinion.

1556. What I am trying to point out to you is that by the best witnesses at our command we are assured that no annoyance will be occasioned to the Supreme Court; in fact, that people in the vicinity of the Court will not be conscious that there is a railway station near there? I hope they are right.

1557. The great noise caused by steam traction is owing to the use of heavy motors, which weigh 14 or 15 tons, but with the introduction of electric traction you will have only the noise of the rolling of the carriages, which will be smaller in size than the present cars? You would be surprised at the noise occasioned by the rumbling of the cable trams.

1558. The electric traction is the least noisy of all systems? So much the better.

1559. I suppose but for these matters you have mentioned there would not be the smallest doubt in your mind about the effect of the trains coming into the station? I suppose everybody will admit that precautions must be taken, but whether those precautions are sufficient I am not expert enough to say.

1560. *Mr. Fegan.*] Your chief objection is to the inconvenience and the annoyance which will be occasioned by the engines to persons in the Supreme Court? Noise generally, which necessarily arises in and about a large railway station.

1561. I think you said that sooner or later you will have to remove from that site, that the buildings are not suitable for the Court's business? I did not say that; I was not asked to form any opinion about the necessity for removing the Court. As a matter of fact we have five court-rooms there in which the business could be done very well, if it were a quiet place. They are very good court-rooms, and are not well adapted for anything else. Unless there was some good reason for it, I should think it would be a pity to go to the expense of putting up another building.

1562. They can be utilised for many years to come under present circumstances? I think so, for a long time to come.

1563. The Committee, as well as the Royal Commission, are assured that the traffic has become so congested in the yard at Redfern that the officers cannot deal with it with that safety they would like to do;—and a proposal is made that a certain route shall be taken to ensure greater safety, and also to return the cost of the construction;—under these circumstances, do you think that the inconvenience caused by the noise

The Hon.
C. G. Heydon,
Q. C., M.L.C.

30 July, 1897.

noise should stand in the way? That is a matter I am not able to say a word about as a question of fact. That must be taken on the word of the railway experts of the country, but when it is put to me that Redfern station is unsafe, and that, therefore, you must come to Hyde Park, I say that is a *non sequitur*. I say you can enlarge your yard without coming to Hyde Park.

1564. If this extension is constructed it will bring in a revenue, and pay at once for itself? You mean that by taking the place which costs nothing, you are able to pay the interest on the cost of construction.

1565. No;—in other words, there has been an agitation for a considerable time to get the railway into the heart of the city. It is pointed out that in Edinburgh and in other large cities in Great Britain the stations are built right in the heart of the city. Liverpool, for instance, has three stations—the Lancashire and Yorkshire, the London and North-western, and the Midland—in the heart of the city. Considering the enormous expense of resuming the necessary land to widen the tunnel at Redfern, and considering the increase of traffic during the last ten years, the managers of our railways say that the best site they can recommend for a terminus is the Hyde Park site;—under these conditions, is it not fair to give the managers of our railways the credit of knowing the requirements of the traffic better than others? I do not understand that they say that is the best site merely as a site. What they say is, that it is the cheapest site. The Railway Commissioners do not want to have to be burdened with the interest on a larger expenditure than they can possibly help, and they are very keen about it. I do not understand that they say that if Sydney were a vacant piece of ground, with no houses on it, that corner of Hyde Park is the best possible site they can get for a station. What they say is, that it is the best site, considering that they can get it for nothing, and will have to pay no interest on the cost of it.

1566. Has it not come under your notice that the Commissioners are willing to put aside £100,000 to resume the Cemetery opposite Redfern station, and to set apart £1,000 out of the earnings of the year to beautify that park and keep it in good order? I understand that they have made some offer of that kind, and of course it is a very important matter to consider. If you will pardon me, I would point out that you are leading me into a general discussion of the whole merits of the scheme. What I was asked to come here about was the Supreme Court. I am not able to discuss the whole scheme.

1567. You would not care to give an opinion on the scheme? No. I was not asked to come here to give evidence against the railway coming to Hyde Park, but to give my opinion of the result of the railway extension on the conduct of the business of the Supreme Court. It might very well be that, although it would make the business of the Supreme Court very inconvenient, or even impossible, still, it would be a proper thing to do. I do not say anything at all about that. But as the Committee has to consider the thing on all sides, there was that one aspect of the matter I knew a little about.

1568. You do not wish to go into other matters? No; I would rather not give an opinion as to whether I approve of the scheme or not. I have not made up my mind about that.

1569. Do you think you will have as much noise from the trains, which will be covered over, as you have from the steam-trams? As well as I can judge, I should think we should. I have never known any railway station that had not a great noise—a deal of noise about it.

1570. I suppose you know that it is not intended to take the goods traffic as far as St. James' road? No, only passengers.

1571. *Chairman.*] Has there been in existence for a considerable period an agitation to remove the Supreme Court buildings? No; not what I should call an agitation. It has been spoken of occasionally, and I know that the Courts for a considerable time were considered to be too few, and not to give sufficient accommodation, but now there are two extra Courts, and very convenient ones.

1572. Do you consider that the building, as it is to-day, is suitable for carrying on the business which is done? Fairly suitable.

1573. The question of noise, or the question of disturbance, after all, is a matter of fact? It is a question of fact.

1574. You have explained that, taking into consideration the distance that the trains will be from the Court, and the amount of intervening matter, you are not quite clear in your own mind whether there will be any disturbance, but you think it is worth considering? I think there will be some disturbance.

1575. But whether it will be a material one you are not prepared definitely to say? I cannot say that it will be enough to prevent the business from being carried on.

1576. Mr. Deane and Mr. Eddy are two gentlemen whose opinions are entitled to very great weight? Yes.

1577. With a full knowledge of the distance separating the trains from the Court, and also a knowledge of the buildings which will be between the station and the Court, it may be almost a matter of fact that there may not be much interference with the Court? From Mr. Eddy's answers, it seems to me that it would be just the opposite. He admits that they will have to diminish the number of trains during service time.

1578. Show me an answer from which you can infer that he believes there will be a noise? The answer to question 2710 is quite clearly directed to St. James' Church and St. Mary's Cathedral. There is no answer in regard to the Supreme Court at all.

1579. Do you think the answer "I think not" does not cover the whole question? It is perfectly clear to my mind that it does not cover the whole question, and the matter is rendered still clearer by the answer to Question 2708.

1580. You cannot find any answer where he would lead you to believe that there is to be any annoyance at all? I have not read Mr. Eddy's evidence, but he certainly nowhere there—there may be other answers—commits himself to anything in the remotest degree approaching a statement that the main station being in Hyde Park will cause no additional annoyance to the Supreme Court, and I should certainly infer the contrary from what he says.

1581. He is asked a question in regard to three buildings, and his reply in regard to those three buildings is, "I think not"? Why is not he going to run trains in service time, if the trains will make no noise.

1582. You recognise that it is a matter of fact that the disturbance depends on two things—the distance and the intervening matter? It will be a matter of fact when the station is constructed. At present it is a matter of opinion.

William Edward Hargrave Hammond, Builder, sworn, and examined:—

1583. *Chairman.*] What are you? A builder.

1584. *Mr. Roberts.*] Have you prepared a statement on this subject? Yes; a rough statement

W. E. H.
Hammond.

1585.

30 July, 1897.

W. E. H. Hammond. 1585. Will you read your statement? It is as follows:—

RE THE CITY RAILWAY.

30 July, 1897. I propose to fill in Darling Harbour to the Pymont Bridge, and to obtain the material from Glebe Island. I may mention that it would be necessary to have that part of Darling Harbour that would not be used for the lines for goods-sheds.

Description of the line.—I would start from the present railway line at about midway between Fig and Quarry streets, as shown by line; thence crossing Darling Harbour to a point 100 feet west of Market-street, and 150 feet from the high-water mark on the present water side; thence to King-street at 150 feet from high-water mark, on the present water side; at King-street I would have the central station. I would resume land on the northern side of King-street; then continue on to Erskine-street, at 150 feet from high-water mark, on the present water side; thence to Margaret-street, as shown by line; thence over as near to the 150 feet as possible to high-water mark; thence on just beyond the A.S.G. Company's, at about 300 feet from Little Argyle-street, and above high-water mark. I would start to tunnel and continue as shown by line under the Observatory Park, and thence crossing George-street, reaching the waters of Sydney Cove; then keeping 150 feet from high-water, on the present water side. I would here make provision for No. 2 station; thence continue to a point near to the Water Police Court; thence taking the hill by tunnel under the Inner Domain, as shown by line, to Woolloomooloo Bay; then filling in Woolloomooloo Bay to make the terminus station. I propose to fill in all water by building retaining-wall and utilising the material from the tunnel to fill in. I propose not to interfere with the shipping only where the bay would be filled in. I propose to fill in Woolloomooloo Bay for the terminus. I would not interfere with the ferry-steamer traffic. I would make provision for it. I propose to make provision for four sets of lines—two for goods and two for passengers. I have also considered Paddington, Woollahra, Pymont, Balmain, &c., but as the time is so short I only wish by the present sketch to convey to you a rough sketch and description of a city railway.

1586. What acreage in Woolloomooloo Bay do you propose to fill in? Sufficient for the terminus—I should think about 20 or 30 acres.

1587. From that point you propose to extend the railway to the eastern suburbs? Yes.

1588. Do you propose to make a loop to join Redfern station or to join any portion of the existing lines of railway? That would be an after consideration—from Randwick.

1589. For the present you would stay at Woolloomooloo Bay? Yes.

1590. Have you prepared an estimate of the cost of the work or the cost of the land resumption? There would be very little land resumption, but I have not gone into any estimate of the cost at present.

1591. Do you view with favour the proposal to extend the railway to St. James'-road? No.

1592. On what grounds do you object to the proposal? Because it is not a suitable place.

1593. Do you object to the Park being taken from the people, or do you regard the site as being not sufficiently central? My objection to the Hyde Park extension is that it will not serve the whole of the people. For instance, there is no goods station. It does not serve the wharfs and the shipping, and I think all railways should serve the shipping.

1594. Are you not aware that the goods traffic will continue to go to Darling Harbour, and that the station at Hyde Park will merely be for the convenience of passengers? Suppose I am coming down from Parramatta to go to Manly, I have to get out of the train at St. James'-road and to walk down to the boat.

1595. Not necessarily, for you can get a tram? I can do the same at Redfern at present. It would cost me no more probably than to take a tram from Hyde Park.

1596. Would it not be more convenient to go by that route than to go by the route you suggest? In my opinion, to reach Circular Quay *via* Darling Harbour is very little longer than to go *via* Hyde Park.

1597. Would not your scheme involve a large amount of land resumption in going round the eastern shores of Darling Harbour? It is simply resuming water and filling in, and giving the people the same wharfage accommodation on the new frontage.

Myles McRae, Produce Agent, sworn, and examined:—

M. McRae. 1598. *Chairman.*] What are you? A produce agent.

30 July, 1897. 1599. *Mr. Black.*] Do you confirm the evidence which you gave on the 13th April last before the Royal Commission on City Railway Extension? Yes.

1600. And you desire to make an additional statement? I wish to mention that in Melbourne fully 10,000 artisans, mechanics, workmen, and tradesmen go home to luncheon every day, travelling as far as Malvern, Camberwell, Essendon, Port Melbourne, Brighton, St. Kilda, Footscray, Williamstown, and other suburbs, but here it is impossible for people to go home to luncheon on account of the time they would lose in going to and from the station at Redfern, as well as extra expense. Calculating the loss in time to each individual going to and from Redfern daily at half an hour, and calculating their earnings at £124 16s. each, per year, on the basis of eight hours a day, the 40,000 passengers who land at Redfern daily lose in time during the year no less a sum than £312,000, which is a big item. According to the reduced scale of charges which the late Chief Commissioner proposed to charge for the extra distance to St. James'-road, the passengers will save something like £3 5s. per head per annum, which is a big amount to the working classes. I am confident that there is no other route to compare to Mr. Eddy's route. There are a few genuine oppositionists, but otherwise you have only to ask the people where they live, and that will explain everything. The Redfernites, the Haymarketites, the Paddingtonites, and the property-holders along the Darling Harbour eastern frontages are opposed to Mr. Eddy's scheme, but not one of them, so far, has dared to question its directness or utility. Some of the residents of the eastern suburbs are afraid if the residents along the suburban railways are landed at King-street as they are by tram, and placed on an equal footing with them, they will lose in prestige; while the Haymarket and people in the immediate vicinity of Redfern are opposed to the railway passengers being brought beyond Redfern; they say that it is the proper place to dump them down. On the other hand, persons who own, and purchased properties in boom times along the eastern water-frontages are determined that not an inch or blade of grass of Hyde Park shall be touched—the proper thing to do is to resume, regardless of cost, the eastern water-frontages. Any disinterested citizen who will honestly examine Mr. Eddy's scheme in all its bearings will be struck at once with the master-mind that propounded it, proving beyond dispute the only axe he had to grind was in the public interest.

1601. Excuse me, I hardly think that that is evidence; it is a statement of opinion? I am opposed to a route which would pull down the warehouses and the wharfs which cost so much money, and will not suit the passenger traffic, and therefore I am in favour of Mr. Eddy's route, because it is reproductive. When

I was in Melbourne I discovered that the Harbour Trust charged 3s. and 4s. a ton wharfage on produce. In straightening the Yarra they did not have to resume a single foot of land on either side; it belonged to the Government; the dredging was similar to that of Cook's River, and I think the amount they expended was £2,500,000. They do not allow any hay to remain on the wharf on Sunday. If not removed it is carted by them to the Queen's warehouse; the owners have to pay double cartage, storage, receiving, and delivery.

M. McRae.

30 July, 1897.

1602. *Mr. Wright.*] Where is the relevancy of this evidence? What I wish to explain to the Committee is that if we expend £5,000,000 or £6,000,000 in constructing a railway round the eastern wharf frontages, the wharfage would be of such an exorbitant character that it would absorb half the value of the produce when it is selling cheap. It would wipe out the agriculturist of the northern rivers in one act. The land tax, although severely felt, would be a fleabite to it, in comparison. I speak from practical experience. I oppose that route because it would be unproductive. I consider it would be suicidal on the part of the Government to attempt to pull down what wise men built up—sufficient accommodation for the next fifty years. I had an expression of opinion from the country and metropolis four years ago in favour of Mr. Eddy's route, and got replies from eighty or ninety municipalities. I notice that Mr. Cropley has recently got eighty or ninety replies, so that the country is in favour of the route. I am at Redfern daily, and because I am in favour of Mr. Eddy's route some of the interested parties are ready to jump down my throat. Their chief argument is that the railway must not be extended, and the Park must not be touched. I reply: "In lieu of the 10 acres utilised, you get 25 acres of lung-room where it is most needed." They say, "We do not want it"; their real opposition is against the crowd being brought beyond Redfern, believing they would lose in business; this feeling extends to the Haymarket.

1603. *Mr. Humphery.*] Will you give reasons for or against the proposed extension instead of making an argumentative statement? I am in favour of this route, because it does not close a single street, because it does not interfere with the business relations of the city, and because it is reproductive.

1604. *Mr. Hoskins.*] And because it is the least expensive way of getting into the city? Yes. I consider the creation of a larger area for lung-room is a compensation for the 10 acres taken from Hyde Park.

1605. *Mr. Black.*] You stated that the people who opposed this proposal do so because they live in certain places? Yes.

1606. May it not be as fair to say that those who support the proposal do so because they live in other localities? I know that I suffer in time and money through the railway not being extended to the city, and I represent thousands of ratepayers, and they are all unanimously in favour of this railway extension.

1607. Your motives are no more disinterested than are those of others who you say oppose this proposal? I do not say that at all.

1608. It appears to me so from your evidence? They take a "dog in the manger" view of the matter.

1609. They do not see why they should do anything to benefit you at their expense, when something else might be done which would be benefiting them? It would not cost them a farthing, because it shows a surplus after providing for interest and working expenses. The railway must be extended.

1610. You have told the Committee that 10,000 working men go home to luncheon by train in Melbourne;—how far do they have to travel to reach the railway station? The greater number of them are fronting and near the railway stations—Spencer-street, Flinders-street, and Prince's Bridge railway stations; nearly all the principal streets terminate in Flinders-street, almost abreast of the two last-named stations. It takes from five to twenty minutes, according to the distance, to get to and from the railway stations from their business premises where they work; where it takes fifteen or twenty minutes they only live a few miles out of the city. Hence, they have sufficient time.

1611. Suppose you construct a railway to Hyde Park, from what distance from that station would workmen come in order to go home to luncheon? It is according to the time they have to spare,—say a quarter or half a mile. It would serve a very large area; but now, on account of the distance to Redfern, it is impossible for men to go home to luncheon. I am certain there are ten luncheon-houses in Sydney for each one existing in Melbourne on that account. 100,000 people travel by train in Melbourne to our 40,000 in Sydney.

1612. *Mr. Clarke.*] I suppose if another site could be found it would involve the resumption of a large quantity of land on which houses are built? Yes; it would close streets, it would be expensive, and I do not think the country is in a position to stand the expense.

1613. Is it not a fact that the working classes, as a rule, bring their luncheon with them? Some of them do, because they cannot go home by train; a great number lunch in town.

1614. Do not a good many of the working people live out of town in the suburbs? The extra expense and the loss of time are prohibitive. I know numbers who once lived 8, 9, and 10 miles out of town, but had to return to the city. Some of them had to come in at 5, or half-past 5, or 6 o'clock, and then had to walk in from Redfern. They found that they had to live in the city.

1615. In former times a great many of the working people resided in Kent-street and Sussex-street and at Miller's Point, and a good many of these people have removed to the suburbs? Yes, the eastern suburbs.

1616. Do you think it is likely that they will come back to the city? I know a tremendous lot of working men, and they say they cannot live in the suburbs on account of the loss of time and the extra expense.

1617. The extension of the railway to St. James'-road would benefit not only the working classes, but all classes in the suburbs, as well as country people who wish to be brought as near as possible to the business part of the city? Yes; and it will cause a big development in the western and Illawarra suburbs. I believe it will result eventually in a reduction in the fares—the same as in Melbourne, where they charge 22 or 23 per cent. less than we do, because they carry 100,000 passengers a day, as against our 40,000 passengers a day; passengers pay better than any other traffic.

1618. Do you not think the construction of the electric tramway in George-street will be sufficient accommodation to give without extending the railway to the city? No; because there is a breakage in the journey at Redfern. That tramway will be suitable for local traffic, but it will not suit suburban railway passengers. I consider the station at Redfern is positively dangerous.

1619. *Mr. Wright.*] Is your opinion purely disinterested? Yes.

TUESDAY, 3 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Thomas Brown, Esq., M.P., sworn, and examined:—

T. Brown,
Esq., M.P.
3 Aug., 1897.

1620-1. *Chairman*] I understand you have a statement to make with reference to the proposed extension of the railway into Sydney? Yes; and I have also here a small plan, upon which I have pencilled in blue the route by which I should like to see the railway extended.

1622. Will you read your statement? Yes; the scheme to which I wish to draw the attention of the Committee is almost identical with that which I outlined to the Royal Commission. The statement which I have prepared it as follows:—

In the construction of a city line, I take it that the main considerations which will weigh in favour of such an extension are:—

1. How best to meet the requirements of city traffic, as a farther extension of present railway arrangements.
2. How to meet these arrangements at a minimum of cost to the State and inconvenience or loss to the public by way of resumptions, interference with vehicular or pedestrian traffic, and withdrawals of areas set apart or required as public parks, &c.
3. An extension which will best adapt itself to existing tramway arrangements, and can be made readily to harmonise with the best suggested methods of connecting with the North Shore railway and tramway systems when such a connection is determined upon.

Any railway extension into the city must be by one of the following methods, or some combination of them, viz.:—

1. Level or open cut.
2. Overhead or viaduct, and
3. Underground or tunnel.

Each of these methods, when applied to city traffic, is beset with many difficulties, so much so that in large cities the level or open-cut is practically out of the question.

The overhead has also its serious disadvantages, and the underground is not without its drawbacks. The disadvantages peculiar to the underground system are namely, access, motive-power, ventilation, and light; but recent discoveries have very considerably minimised these disadvantages—so much so that, in recent years, the advance in all large cities (European and American) has been in the direction of replacing all other systems by the underground. In this connection it is to be noted that Sydney possesses peculiar and special advantages in the direction of underground railway construction by reason of its sandstone formation and ridge elevations.

Bearing in mind these several requirements and advantages, the scheme which suggests itself to me as best calculated to meet same is briefly set out as follows, and embraces an extension by viaduct or level from Redfern termini to Pier-street Bridge, Darling Harbour, and thence by tunnel from vicinity of Trades and Labour Hall, Dixon-street, to intersection of Liverpool and George streets; thence under George, York, and Harrington streets to vicinity of Essex-street; and thence to the Old Commissariat Stores, Circular Quay, as outlined on accompanying tracing.

The details of this scheme are as follows:—

1. BY VIADUCT.—Starting from a convenient point in Redfern yard, near Cleveland-street tunnel; thence by easy grade, passing over George-street West, at a sufficient elevation to clear street traffic; thence over existing goods line to the higher level of Pier-street bridge, where a semi-terminal station would be erected: or
2. BY LEVEL.—Starting from Redfern yard the passenger line could be carried on same level as existing goods line, and parallel with it, but wholly on eastern side of this line so as not to interfere with it, to the lower level of Pier-street bridge, where the aforesaid semi-terminal station could be erected.

Of the alternative methods of reaching the desired point of Darling Harbour suggested, I am disposed to favour the viaduct; for, although a little more costly at outset, the increased facilities and advantages offered would more than compensate for same. There would be ample room; the goods traffic lines would not be interfered with, and there would be easy access to Pier-street station for Ultimo and Pyrmont passenger traffic. The apparent objections to a level line along the route are a heavy grade at George-street tunnel, limitation of space in view of future expansions, and inconvenience of access to lower-level station, also interference with Harbour-street traffic in extending city-wards.

Now, taking up the question of extension city-wards. The line would be carried from the higher or lower level of the Pier-street station, whichever may be determined upon, to a point in the face of the abrupt rise to the left of the Trades and Labour Hall, where the ridge formation leading down towards Dawes Point begins. At this point (near Trades' Hall) the line would enter a tunnel, and so continue until it emerged at Circular Quay. The line of tunnel-route would be to corner of Liverpool and George streets; thence along George-street to the Town Hall; thence by curve between Town Hall and Victoria Markets into York-street; thence by way of Wynyard-square, Church Hill into Harrington-street, continuing along Harrington-street to a point about 1 chain beyond Essex-street; and thence by a direct line passing under George-street and emerging at the old Commissariat Stores, Circular Quay, where a terminal station would be erected.

From the entrance to Commissariat Stores to Flood's Wool-pressing Stores in direction of Dawes Point, a distance of 24 chains, is a 66 feet roadway abutting on to wharf frontages, which could be utilised for shunting purposes in connection with Circular Quay terminus, and thereby the difficulties inseparable from a dead-end terminus would be obviated. Further accommodation of a like character is also obtainable when required over the lands lying between the roadway and George-street North, and also by extending on to Dawes Point.

An extended service and increased working facilities could be obtained by carrying the underground service from the Church Hill station along Kent-street to north-west corner of Observatory grounds, and thence by a 12-chain curve to the old Commissariat Stores; thus affording railway facilities for Miller's Point, and increasing working facilities; but this is more a question of future development rather than of present requirement, or at least it presents itself to me in that light.

The question of supplying the connecting link between the North Shore tram and railway systems and the Sydney systems is one of increasing importance, and must be dealt with at no very distant date. One of the primary objects of a city extension should be to readily accommodate itself to such a connecting link. It seems to me that this line most readily adapts itself to such a connecting link with Milson's Point, either by a sub-harbour connection or by a bridge. The sub-harbour connection could be made by extending from Circular Quay station by way of Dawes Point, and thence across to Milson's Point. A bridge communication could also be carried across from Milson's Point to Dawes Point, and find ready railway communication under this system in the direction of Church Hill.

The distances covered by this proposal are by viaduct or level from Redfern tunnel to Pier-street Bridge, Darling Harbour, about 72 chains; Pier-street to tunnel entrance, Dixon-street, 21 chains; tunnel entrance to George-street, 10 chains; George-street from Liverpool-street intersection to Essex-street, 84 chains; Essex-street to Commissariat Stores, 7 chains; Commissariat Stores to Dawes Point, 24 chains; or a total line length of 218 chains, not including the Milson's Point link or the Miller's Point circle indicated.

An

An alteration of motive-power would be required in order to work the tunnel system, and that alteration had better be made at the Pier-street station. This station would give much needed railway facilities to Ultimo, Pyrmont, and Darling Harbour, including the Technical College. Station facilities could also be provided at corner of Liverpool and George streets, which would serve Brickfield Hill, also at Wynyard-square, opposite the General Post Office, and at Church Hill, near Charlotte-street, with a terminal station on site of Commissariat Stores, Circular Quay. Of course the allocation of intermediate station sites is a matter of detail.

T. Brown,
Esq., M.P.

Aug., 1897.

The motive-power for tunnel-working could be either by electricity or compressed air. Recent improvements have rendered both methods adaptable to underground working, but, for purposes of ventilation and advantages in working lifts, the compressed air may be worthy of special consideration, particularly in view of the recent alleged improvements in the Hardy motor.

To show how far this scheme is capable of meeting the conditions and requirements indicated at the outset, I would point out:—

1. That the line of extension from Liverpool-street follows the main artery of city traffic, and with stations at the points indicated, best serves the traffic for which a city extension is required.
2. By carrying the line down to the proposed Pier-street station the populous centres of that part of Ultimo, Pyrmont, and Darling Harbour, including the Technical College, will be served.
3. This line will require the minimum of resumptions, and such resumptions will be of full value to the State for all time.
4. This proposal leaves the public parks, together with the Devonshire-street Cemetery, untouched.
5. Street traffic is in no wise interfered with, and there are no level crossings.
6. The existing tramway service is not impaired, there being no competition therewith, and no alterations are necessary.
7. The total cost of construction, and public inconvenience occasioned thereby, will, I think, compare most favourably with the other proposals submitted, and the earning will be very much greater.
8. The scheme affords a means of a direct connection with the North Shore rail and tram systems, in conformity with proposals which seem to command the weight of expert opinion.

1623. You have no estimate of cost? No; but I am of opinion that the probable resumptions, because of surface disturbance, would not exceed an area of 17 chains. About 10 chains would have to be resumed at the Dixon-street entrance to the tunnel, and about 7 chains more would have to be taken where the line comes from Essex-street across George-street. But after the railway had been completed, the track would be covered over, and the whole, or nearly the whole of this land could then be put to use again.

1624. You do not propose to pay for the surface disturbance where you propose to tunnel? Only for a distance of about 17 chains. The line would pass under streets for most of the way, and I do not consider that there would be any disturbance there.

1625. Do you consider that the streets are wide enough for a tunnel such as you propose, to prevent interference with the buildings on each side? I think so.

1626. Of course, the disturbance would depend a good deal upon the character of the material tunnelled through? Yes; but I believe that the sandstone would prove satisfactory material.

1627. How many lines do you propose to bring down to the Circular Quay? I have not entered into details, but I think that a double line would be sufficient for present requirements. I regard the scheme purely as an extension for city traffic.

1628. Do you contemplate bringing the long-distance traffic into the city? That traffic could be brought into the city, but I do not propose to bring it in, because I think it can be fairly well served at Redfern.

1629. You think there is no need to bring it into Sydney? Yes.

1630. From what distance would you bring trains down to the Circular Quay? I would bring all the suburban traffic into the city.

1631. And nothing besides the suburban traffic? Well, that would be a matter for future consideration, but I do not think it would be necessary to bring anything but suburban traffic into the city.

1632. If you propose to make your arrangements simply for city and suburban traffic, your scheme is not so large as that which we have before us? Well, it could very easily be made to carry all the traffic coming to Redfern by laying down an additional double line of rails, though that, of course, would increase the expense. What is required most urgently just now is accommodation for suburban and city traffic. If it should be found necessary to bring the long-distance traffic to any of the points I have mentioned, the scheme might be made to answer that requirement by the laying down of another double line of rails; then ample accommodation would be given.

1633. You recognise that in a climate such as ours steam traffic through tunnels would be objectionable, and, therefore, you suggest that somewhere immediately south of Darling Harbour another kind of motive power—electricity or compressed air—should be applied? Yes; so far as my reading goes, it is impossible to have satisfactory steam-traction through tunnels, and it is also objectionable to have steam traffic in populous centres. My reading goes to show that, particularly in America, the tendency is to replace steam power by other power. I consider that it would be wise to change from steam to either electricity or compressed air at Pier-street.

1634. You recognise that that would involve some little delay? Possibly there might be some delay; but I cannot find that there has been any obstacle to a change of this kind in America. Of course, I am not an authority upon these subjects; I have to depend upon my reading. I find that on the New York and New Haven line of railway, between Berlin and North Berlin, there is a system of the kind I suggest at work. That line is about 12 miles long, and electric power has taken the place of steam there, with the result that the fares have been reduced from 25 cents to 10 cents. So far as I can ascertain, the change answers all requirements. I got my information from the *American Engineer* of June last.

1635. On the line you mention the trains are run by electricity right through; they do not stop and supplement another traction power by electricity? Well, in my reading, I came across a case where they unhitched steam motors, and hitched on other motors while the trains were moving. I do not see that there will be any great difficulty in making a change here, because at the Pier-street station you can have V-shaped points, and immediately the train pulled up, and while the passengers were being got rid of, the steam-engine could unhitch and run off, and its place be taken by the electric or compressed air motor without loss of time.

1636. Your idea is not impracticable, but it is regarded by the authorities as economically unwise. It would involve a delay of, perhaps, two or three minutes, and would mean the employment of an extra staff of men, while there are other difficulties connected with it? I have admitted that I am not an authority upon these matters. I am only going by what I have read in the scientific journals.

T. Brown,
Esq., M.P.

3 Aug., 1897.

1637. You would be approximately something like 10 feet above the water-level at your terminal point at Circular Quay? I think hardly so much; but I have not looked into that matter.*

1638. Well, we will take the height as approximately between 10 and 15 feet. You propose from there to connect with North Shore; but do you know the depth of water between McMahon's Point and Dawes Point? No; I have not gone into that part of the scheme minutely. I was guided more particularly by a scheme submitted to the Royal Commission by Mr. McMaster.

1639. I think that Mr. McMaster proposed to take the line across from Fort Macquarie. The depth between Dawes Point and McMahon's Point is very considerable. I believe it is something like 80 or 100 feet. In order to tunnel under the harbour with a reasonable grade, it would be necessary to commence to descend at a considerable distance back from the foreshore. On the other hand, if you proposed to cross by a bridge, which would have to be about 180 feet above the water-level, you would have to commence to ascend from a long way back from the commencement of the bridge. In the one case you would have to start from about Hunter-street, and in the other from about Wynyard-square? Yes; I contemplated crossing to Milson's Point by an underground tunnel, but I found that to get anything like a reasonable level I should have to go back a considerable distance—to Church Hill, if not further. But in reading the schemes submitted to the Commission, I saw a proposal to carry the line under the water by means of a large cylinder, and it suggested itself to me that the difficulty in the way of getting an easy grade for a tunnel would be overcome by the adoption of this idea.

1640. But in any case the top of the tunnel would have to be 40 feet below the level of the water, and that would make it necessary to commence with the ascent of the line a long way back from the foreshore. Turning, however, to another aspect of the case, I would point out that at the terminus of any railway you must either have a loop line or you must have a considerable area upon which to shunt the trains. You suggest that the land immediately south from Dawes Point, taking part of Dawes Point if necessary, will be sufficient for that purpose? Yes, and as traffic grows you can make a circular line, branching off at the top of Church Hill, and going round Kent-street to the Observatory and back to the Commissariat Stores, with a curve of 12 chains radius.

1641. That loop would be practically all tunnel? Yes; I think that for the present traffic you would get an outlet by carrying the terminus further along towards Dawes Point, so as not to have a "dead end" at the Circular Quay station.

1642. Have you any idea of the width required for a terminal station;—I think that we have it in evidence that there would not be sufficient width immediately west from the old A.S.N. wharf? Well, the station I contemplated would commence at the corner of the wharf, on the site of the old stores. I did not measure the land there; but there seemed to me to be a fairly good width between the Quay and George-street North. The width there is quite as great as the width of the present Redfern station.

1643. Of course, the traffic at the Circular Quay would be much less than that at Redfern, because there would be no long-distance traffic? Yes: I can ascertain for you exactly what the width is.

1644. Another point which has been suggested is this: That in any tunnel scheme there is sure to be vibration, which may entail large claims for compensation? Yes; but I think the depth of the tunnel would minimise the vibration sufficiently, except over the 17 chains which I have referred to.

1645. If your scheme is worked out, and found to be more expensive than that referred to us, will you still be prepared to maintain it? Well, if another scheme can be brought forward, which will serve the traffic better or equally well, and at a less cost, I shall not be prepared to maintain my scheme.

1646. How do you view the resumption of the Park? My objection to the resumption of the Park is that I do not think it is a good principle to take land dedicated for a park for other purposes. I can see that while the park lands of the city may not be fully required at the present time, a time will come when they will be required; and it would be very difficult to get the Government to resume land for a park later on.

1647. Do you not think it possible that under a certain set of circumstances a railway may ameliorate the conditions of the people more than a particular area of park land? Railways contribute to the amelioration of the conditions of the people; but you may have a large population which cannot avail itself of the railway.

1648. Can you imagine a set of circumstances in which a community would either have to give up part of a park for a railway or go without a railway and keep its park intact;—would not the former arrangement be the more comfortable one? Yes; but I do not think the people of Sydney are called upon to give up part of the Park for a railway, or the railway for a park.

1649. Do you know the area of park land around Sydney? I do not know the exact area, but I know that the area is fairly large. Still, in view of possibilities, I do not think that it is too large.

1650. Have you paid any attention to the question of giving approach to the city from the eastern suburbs? I have considered that matter, but not very minutely.

1651. *Mr. Trickett.*] Do you contemplate working in connection with the eastern suburbs in the scheme which you have suggested? I think that such a connection could be worked in.

1652. Where would the eastern suburbs line join your proposed line? Well, you could carry it round the Quay and under the Domain. I have seen a proposal to that end.

1653. *Mr. Hoskins.*] Suppose nearly 200 acres of park land are still left after the north-western corner of Hyde Park is taken away, do you not think that we shall have more park land than is given to most cities? Yes; but most other large cities are now trying to get park land.

1654. *Mr. Humphery.*] Has your attention been directed to the suggestion that another park should be provided near the Benevolent Asylum by taking a piece of land larger than that which it is proposed to resume for the railway for that purpose? Yes.

1655. Would not the gain of a park near Devonshire-street neutralise the loss of 10 acres of Hyde Park? Hardly. I hardly think you can replace Hyde Park by a park near Devonshire-street, though I admit that a park there is very necessary. Another aspect of the case is this: We have been fifty years or more in bringing Hyde Park to its present stage of perfection, and if we destroy it, and attempt to replace it by constructing another park at Devonshire-street, I suppose it will take the same length of time to bring the new park to a similar stage of perfection.

1656. *Mr. Hoskins.*] If £1,000 a year is expended upon it? Yes. With regard to the expenditure upon the proposed park, I do not think that it makes much difference whether it comes out of railway earnings or from the Consolidated Revenue. The people must pay it all the same. 1657.

* NOTE (on revision):—On further consideration I find that it will be desirable to have the Circular Quay station on a level with high-water level, so as to ensure a sufficient tunnel headway under George-street West. This would still be an open station, and no material inconvenience would be entailed upon passenger traffic thereby.

1657. *Chairman.*] That is your great objection to heavy resumptions? Yes.

1658. Did you read the late Mr. Eddy's evidence? I did.

1659. Perhaps you may remember that he had the strongest objection to tunnelling. He told us that it had been found very disadvantageous in other parts of the world where the temperature was not nearly so high, and he was sure that it would be found most unpopular in Sydney. He was asked if his objection to tunnelling would be removed by the adoption of electric traction, and to that he replied, "I do not think that we can deal with a state of things which does not exist." He was asked, "If we had electricity would a good deal of the objection be removed?" and his reply was, "Undoubtedly; but we have not arrived at that state of things yet." I suggested that the Commission might inquire into what is known as Hardy's method of using compressed air.

1660. *Mr. Wright.*] Has that method been practically applied anywhere? Yes, it has been applied in America. It was reported upon for a large syndicate in Liverpool, and the report was a most favourable one. I find from the scientific papers that the inventor of the Hardy motor has improved it, and I have an extract from the *Sydney Daily Telegraph* of the 21st July last, giving the results of experiments in connection with this improvement. I should have preferred to make an extract from scientific papers, but I have not yet been able to obtain the information in that way:—

If compressed air is to do half that is claimed for it, it should prove a dangerous rival to electricity as a motive power. According to the *London Echo*, an engine of this kind has been exhaustively tested on the Manhattan railroad of New York, hauling trains of ten heavily-loaded cars over 8-mile trips, and has stood the trial. In appearance it is but little like the traditional steam-engine. Its motor consists of thirty-five Mannesmann rolled steel tubes, 9 inches in diameter, and varying in length from 15 feet to 21 feet. These cylinders contain air stored at a pressure of 2,000 lb. per square inch. The air goes from these at a reduced pressure of 150 lb. to a vertical re-heater in the car. This re-heater resembles an ordinary boiler, and is charged with water at a temperature of about 350 degrees, and can be maintained at that temperature by a small fire. Through this water the air passes to be heated to the proper temperature; it then goes directly to the working cylinders. In New York the State Railroad Commissioners have recently recommended compressed air as safer and more desirable than any other power. Its advocates claim that in actual working it costs 1½d. a mile less than electricity; it also costs far less to instal. In Washington it was recently found that a compressed-air tramway can be laid down at a little over a fifth of the lowest estimate for laying an electric line with an underground trolley.

1661. *Chairman.*] Perhaps you know that the resident population within a radius of half-a-mile from Hyde Park is 15,000, while the population within the same distance from the Benevolent Asylum is 32,000, and that the area proposed to be taken for a park at Devonshire-street is considerably larger and quite as high as the portion of Hyde Park proposed to be resumed for railway purposes? Yes. I would point out, however, that the land in Devonshire-street to which you refer lies between Belmore Park and Prince Alfred Park. The residential population surrounding Hyde Park is not, however, the main factor which determines the use of the Park. Hyde Park is a rendezvous for a large number of people who come to Sydney to do their business, which would not hold good at Devonshire-street, because it is not close to a large business and manufacturing centre. Then, again, upon holidays and Sundays the people from the suburbs crowd into Hyde Park more than they do into any of the other parks. Upon those days there are ten times more people in Hyde Park and the adjacent parks than in any part of the city.

1662. I think your statement in this respect is debatable. The largest number of people will always be found in the Botanic Gardens? Yes, in the Gardens and in the Domain; but most of the people who frequent the Gardens and the Domain pass through Hyde Park.

William Henry Flavelle, sworn, and examined:—

1663. *Chairman.*] You are in business in Sydney? I am.

1664. *Mr. Hoskins.*] In what part of Sydney are you in business? In George-street.

1665. I understand that you are prepared to make a statement embodying your views upon the proposed extension of the railway into Sydney? Yes. So far as the general public are concerned, the chief reason for advocating a scheme which takes away a portion of Hyde Park is based upon what I consider to be a misstatement—namely, that the Redfern yard is not large enough for the terminal traffic. As I know all the termini in both London and Paris, having lived some years in each of those cities, I maintain that the area of the Redfern yard, if properly utilised, would be ample for all purely terminal traffic, as distinguished from suburban traffic. To show how much that space has been misused, I would instance the large sprawling areas which have been cut out of it for other than railway purposes. For instance, in the front you have the cab-stand, the omnibus-stand, and the terminus tramway. Then there is the over-large accommodation which is provided for the mortuary station, and the waste space in front of the goods terminus, and where the Railway Institute has, in my opinion unwisely, been built. If the Redfern yard had been properly laid out, as the St. Pancras station in London is, for example, it would be ample for all the legitimate requirements of the railway, providing that you took out the cab-stand and the omnibus-stand and put them into Devonshire-street. You could take a strip of land three times as wide as Devonshire-street out of the Cemetery and the Benevolent Asylum grounds, and by moving the Botany tram-line on to that strip you would have plenty of room for the cabs and omnibuses, while within the station area proper you would have ample room for all railway requirements. I maintain that 27 acres of land are ample for a purely terminal traffic, and, of course, I take out the suburban traffic. We have in London and in Paris—one with a population of 5,000,000 people, and the other with a population of 2,300,000—two large cities which afford us very useful examples of what has been done, and what can be done in the way of dealing with railway traffic in large centres of population. In London they have not attempted, to any large extent, to bring any but suburban traffic into the city. The one exception is the Great Eastern railway, which takes all its traffic to Liverpool-street. The Great Northern Railway Company, however, do not come further into London than King's Cross for their general terminus. Of course, they recognise that the suburban traffic must be taken into the city, and they take it in on two lines of railway to Farringdon-street, very wisely retaining King's Cross, which is well out of the city, as the terminus for long distance traffic. If you except Cannon-street and Charing Cross stations, you will find that the creation of a large railway terminus in any particular locality is attended by a decrease in the value of the property in that locality. If you take King's Cross, or the London Bridge station, for example, you will find a common class of buildings round those stations, while the establishment of termini in those places, so far from attracting a good class of trade, has driven it away. Neither in Paris, nor in London, will you find a valuable class of trade centred round a terminal station, with the two exceptions which I have already made—Charing Cross and Cannon-street. It seems that the class of person who hangs round terminal stations has an injurious effect upon property. At any rate it is the universal

T. Brown,
Esq., M.P.

W. H.
Flavelle.

3 Aug., 1897.

W. H.
Flavelle.
3 Aug., 1897

universal experience in Paris that terminal stations do not improve property. In Paris there is not a single good property immediately surrounding a railway station, and I speak from an experience of some years. That in itself constitutes an objection to bringing the terminus of a railway into the good part of the town. As regards the needs of suburban traffic—because I take it that long-distance traffic should not come into the good part of the city—I do not see why, if we are going to spend money to provide for suburban traffic, we should provide exclusively for the traffic from the Illawarra and western suburbs. Any satisfactory scheme must also make provision for two other groups of suburbs—the North Shore suburbs and the eastern suburbs. I complain that the Hyde Park scheme is not so comprehensive a scheme as we should have, inasmuch as it only provides for the western and Illawarra suburbs, and makes no provision for the other suburbs. I, therefore, suggest a scheme which I think will make the necessary provision. Before I go on to that matter, however, I would point out that if you are going to provide for suburban traffic in the city you must try and split that traffic. The weak point of the scheme referred to the Committee is that the whole of the traffic is concentrated at one station, and it will probably be found that the streets of Sydney are too narrow to provide proper outlets for traffic from such a station. A wise scheme would so split the traffic that people would be able to get out where they wanted to get out, and you would have the traffic distributed from various points. I am not an engineer; I am a jeweller. I simply come here as one who has an interest in the city, and who wishes to see it properly developed; I do not pretend to any engineering knowledge whatever. What I would point out is, that you have already got the railway as far as Sussex-street, and you could bring it underground from Sussex-street to Wynyard-square, putting your first station at Wynyard-square, and taking in Wynyard-square and Church Hill if necessary. You would then take a line with rising gradients to the old Fort-street Public School, and there you would be at a sufficient elevation to be able to pass on by means of a bridge to North Shore. Such an arrangement would bring the North Shore people to that part of the town where they want to go. People coming from North Shore do not want to go to Hyde Park; most of them want to get more into the heart of the town. The second part of my scheme is to take the line with a dropping gradient from Wynyard-square down Church Hill to the Circular Quay and Dawes Point. I do not consider that you will want any large amount of room for such a line, because I do not think that you will have very much traffic beyond Wynyard-square. Your main traffic would be through Wynyard-square, so far as North Shore was concerned. All that would be necessary for the extension to the Quay would be sufficient ground for two pairs of rails. The eastern suburbs would be provided for by a raised line going round the Circular Quay, on the principle adopted in the case of the Liverpool elevated railway, and through a tunnel to Woolloomooloo Bay, utilising the large area already resumed there, and eventually going on by another tunnel to Rushcutter's Bay, and so to the eastern suburbs. The two lines would meet at Dawes Point. The bulk of the traffic, however, would not run down to Dawes Point, but on the line crossing from North Shore. With regard to the capacity of two pairs of rails, I may state that the Metropolitan railway, which I saw when it was building—and I know the whole run of it from the start—carries on two pairs of rails twenty trains an hour during the busy part of the day, and runs passenger traffic for twenty hours of the day, using the remaining four hours for goods traffic on certain days, and for repairing on other days. From that it will be seen that it is possible to run 400 trains a day over one pair of rails, where you have no shunting, and can run the trains right through. Under my proposed scheme you would be able to run this train right through Wynyard-square to North Shore, and shunt it there. You could run trains from Homebush to Hornsby and back again. With regard to a matter which was mentioned here to-day, the difficulties of underground railway construction, when the Metropolitan railway was made—and that is the railway which everyone takes his cue from, Mr. Eddy like everyone else—it was combined with a street-resumption scheme, and the stuffiest and worst part of that line was the part between the Edgeware-road and Gower-street. When they made that part of the line they did not fully understand the necessity of ventilation, and what amount of ventilation was required, and consequently they did not put in enough ventilating-holes. Afterwards they found it a very difficult thing to improve the ventilation, because a road had been made over the railway, the crown of the tunnel coming within 3 feet of the surface of the road. In the same way, when they made the line from Charing Cross to the Temple, they made a road over the railway, which consequently rendered ventilation difficult. But by going diagonally from Sussex-street to Wynyard-square, as I suggest, you will have no roadway above the railway, and you will be able to make your ventilation perfect. I have been through the St. Gothard tunnel twice, and in each case I have travelled outside on the platform. A remarkable feature about that tunnel is that the smoke disappears, and no one understands how. You can ride from one end to the other of it—a distance of several miles—without getting any smuts upon you, and you can breathe comfortably all the way through. So that if, on the one hand, the Metropolitan underground railway, which was constructed when they did not understand tunnel work, is quoted, on the other hand you have the St. Gothard tunnel, which is the greatest development of tunnel construction. It would be worth your while, I think, to inquire why the St. Gothard is so well ventilated. With regard to the vibration caused by an underground railway, I may say that I have lived in a house over an underground railway. For the first six weeks or so we could not sleep; but afterwards we got so accustomed to our surroundings that we hardly knew when a train was passing, and the house has always remained in perfect order. London is particularly badly situated for tunnel construction, because it is built upon very treacherous clay. Here, however, we have sandstone, which is much better for tunnel construction. In London they have to “shore up” in many cases, and you are continually coming across quicksands and springs in the clay. My objection to the removal of the terminus into the city is that there is ample room at Redfern. In Paris, instead of bringing the railways into the city, they have what they call the *ceinture* railway. With regard to the depreciation of the value of property caused by an open railway cutting, I would instance the low value of property beyond Farringdon-street. Clerkenwell and that locality has been seriously injured by the open cut made for the Metropolitan railway there. At Hatton Gardens land is at a high price; but as soon as you get past the open cut you find a serious depreciation in values, caused mainly by the isolation consequent upon the open cutting. That is an argument in favour of a tunnel in place of cutting a huge gash through the city. The scheme before the Committee has been recommended upon the ground of cheapness. I take it that no one really wants to have any part of the Park resumed unless there is some insuperable objection to all other schemes. Let us follow out the argument of cheapness which has been advanced in favour of this scheme, from a ratepayer's point of view. It is proposed to bring the whole of the

W. H.
Flavelle.

3 Aug., 1897

the traffic of a country as large as the German Empire and Italy put together on to 10 acres of Hyde Park, and it must be remembered that we have to provide, not only for the present, but for future traffic. All the traffic from the Hyde Park station will be thrown on to King-street, which is a very narrow street, and through which there is a cable tramway running crossed by a steam tramway in Elizabeth-street. The result will be that later on we shall have to widen King-street. But it is worth while to remember what land in King-street is worth per foot. The cost of resumption there will be as large as any resumption you might make for railway purposes on the western side of the city, because land in King-street is at present worth anything from £500 to £800 a foot. Market-street is a very narrow street, and it does not bring you down into the heart of the business part of the city. Nearly all the traffic from the railway station will therefore have to come down King-street; but, notwithstanding all the disadvantages of that route, the widening of King-street might cost anything from £500,000 to £800,000, and that is an amount which cannot be fairly thrown upon the ratepayers. But, on the other hand, it would not be fair to cause a block of the traffic there just to save the money of the general public. This is a point which has struck me most forcibly in regard to this scheme. As to the question of the amenity of the town, I will instance two towns in the Midlands. I was living in Paris when Haussemann was making the Avenue de l'Opera and most of the boulevards. He started with the idea that the beauty of a town contributed enormously to its welfare and to its richness, inasmuch as it brought a good class of people to it. He maintained that if you built an ugly sordid-looking town, you drove people away. Therefore, when he made a large street he took care to have a fine building at the end of it. He would not have a railway station in the middle of the town, and I have the same views that he held with regard to the meanness and sordidness of terminal stations. He carried his ideas so far when he was building the boulevards that he made it a condition that the houses there were not to be constructed on any other than one plan, and at the present time you cannot put a pot of climbing flowers or a creeper into a window there. In Paris they will not tolerate anything ugly or nasty in connection with their buildings. Here, however, you are proposing to put a terminal station in the middle of the town.

1666. But we do not propose to build a mean-looking station? Well, you will create mean surroundings. That is proved by the experience of other towns. To go back to the Midlands, you have there the two towns of Birmingham and Wolverhampton. The Birmingham people are particularly public-spirited men. I am sorry to say that the Wolverhampton people are rather the reverse. In Birmingham the man who takes a public interest in the welfare of his town is the man who does the best business, because he is considered to be a man who is trying to do his duty to his fellow citizens, and he is not carped at because he takes an interest in public affairs. There they have covered up their railway termini very carefully, and everything has been done to improve the town, with the result that while business people establish their rough-looking workshops at Wolverhampton they put their business offices in Birmingham, and the proprietors of these various factories invariably live in Birmingham. The people of Wolverhampton simply went in for having a sordid, utilitarian, dirty manufacturing town, and they have their reward, inasmuch that all the workshops are at Wolverhampton; but the fashionable city is Birmingham, and the people of Birmingham reap a pecuniary advantage from having preserved the amenity of the town.

1667. *Chairman.*] Do you want to keep Hyde Park for the fashionable people? Fashionable people spend more money than other people, and if you can make a town nice without any additional cost, you may as well do it.

1668. *Mr. Hoskins.*] You deprecate having large terminal stations in the middle of a town, because you allege that their existence tends to depreciate the value of property in their vicinity, and causes small mean houses to be erected in their neighbourhood. On this point you referred to Paris. Now are the houses near the St. Lazare station mean and sordid? In my opinion they are. I was living in Paris in 1867, and I was there again last year.

1669. Are the houses fronting that terminus mean buildings? The business in the neighbourhood is poor, and the buildings themselves are nothing like so good as the buildings a bit further away.

1670. Are not the buildings in the vicinity of that station as good as those within a quarter of a mile of the Avenue de l'Opera? No; they are not, and the trade there is poor. I admit frankly that the houses there have been constructed in accordance with the provisions of the Building Act, because in Paris you must put up the regulation five or six storeys; but so far as the retail and general business of the neighbourhood is concerned, it is inferior to the business done a quarter of a mile off, while the residential sites in the neighbourhood are not as good as residential sites elsewhere.

1671. I stayed in a hotel within 100 yards of that railway station, and that hotel was always full of English people? Of course there are always hotels near railway stations.

1672. What about the Gare du Nord;—are there not good houses near there? There are good houses near there; but the business done there is inferior to the business done further away.

1673. But you admit that the houses themselves are not inferior? Where they have pulled down old houses they have put up better buildings; but in the majority of cases the buildings and the residential sites are inferior to buildings in positions elsewhere.

1674. What about the buildings near Charing Cross? I made an exception of the Charing Cross railway station.

1675. What about Shoreditch? That is an exceedingly poor place.

1676. Are not the buildings about there as good as the houses 500 yards from the railway station? No. In my statement I excepted Cannon-street and Charing Cross stations.

1677. You say that the area of land available at Redfern is ample for all railway requirements? Yes, if it is properly utilised.

1678. Will you not admit that the opinions of our late Chief Commissioner, who held very important positions in connection with the London and North Western Railway, and who for a long time was manager of the Caledonian Railway, are of value? They ought to be.

1679. His evidence was that the area of land at Redfern was not sufficient for the requirements of the traffic, and that they wanted a great deal more;—did he mean after taking out the suburban traffic? That is the point. It may be true that the area is not sufficient if you leave the suburban traffic to be dealt with there; but the point is, is not the area large enough for a purely terminal station after the suburban traffic has been eliminated.

1680. He stated that the area of land there was too small for railway requirements? Yes; but did he state specifically that if you provided a scheme for removing the suburban traffic the area at Redfern would not be large enough.

1681.

W. H.
Flavelle.

3 Aug., 1897.

1681. According to Mr. Eddy, that was not the point. I suppose you admit that he was competent to give an opinion? Well, he did not state that the Redfern yard was not large enough for purely terminal work.

1682. Mr. Eddy distinctly stated that the area of land embraced in the Redfern yard was not sufficient for the purposes of a station, and that they required a great deal more room. He further stated that the railway management would be better and more economical where there was a large central station instead of several small stations? Very likely. But he did not state that if you split the traffic up as it is split up in London, the Redfern yard would not be large enough.

1683. He said that the proper way to deal with the traffic was to have a large central passenger station. You told us that the upshot of making a large terminal station was to have a hideous building. The plan before the Committee does not show the proposed station building to be hideous? Well, I have never seen a handsome railway station. Railway station architecture is, to my idea, the apotheosis of hideousness.

1684. Unfortunately, your statements involve a considerable amount of argument, and you do not stick to your opinions;—you said that if we had a terminal station at the north-western corner of Hyde Park it would necessitate the widening of King-street and the resumption of a large amount of land there by the Government? Yes, unless the Government throw it on to the ratepayers.

1685. Do you know that it is proposed that an approach should be made to the railway-station through the present High School ground? Yes; but how about King-street beyond Castlereagh-street?

1686. The approach to the station would be up Market-street, along Castlereagh-street, and across the High School ground; and there would be another approach up King-street? The traffic from the railway-station would want to go further north than Market-street. You might make your beautiful approach, but the traffic would go down King-street.

1687. But the approach I speak of provides against the overcrowding of King-street, which you fear? No; it only partially provides against it.

1688. It takes away half the traffic in King-street? It provides for part of it; but it does not provide against the blocking of King-street between Castlereagh-street and George-street. The bulk of the people coming from a railway station will want to go to parts north of King-street, and King-street is barely wide enough for its present traffic.

1689. How will the traffic become more congested if you have another approach? But you will not have another approach. All you will have will be a sort of square in front of the railway station. Nothing is proposed to relieve the traffic in King-street, between Castlereagh-street and George-street.

1690. But people will have no need to go down King-street? They will go down the street which suits them best.

1691. You were speaking about there being no great objection to tunnels, and you said that the underground railway in London was the first tunnel that was made, and that the people who made it did not know how to provide ventilation;—is it a fact that the Metropolitan railway tunnel was the first large tunnel made in England? No, it was not the first large tunnel made in England; but it is the first large tunnel made under a town. Of course we had the Box tunnel made by Brunell. It is a most curious thing that some of these tunnels are well ventilated, while others are not.

1692. Did you ever go through the Thames tunnel? Yes.

1693. Is it badly ventilated? I have not been through it since the East London Railway went through it.

1694. Do you know the number of air-shafts along the Metropolitan railway is very great? Yes, you can see the steam coming up from them; but apparently they are not numerous enough.

1695. We have tunnels in this Colony—upon the Illawarra and Western lines—which have been constructed of recent years; but the atmosphere in those tunnels is very disagreeable? Well, you may take the St. Gothard tunnel as an example to the contrary; there the ventilation is perfect.

1696. But do you know that there is only about one train a day through that tunnel, and that a special description of coal is prepared for use there? The same description of coal might be used here.

1697. Are you not aware that the working of tunnels under towns is attended with much more danger and expense than the working of trains elsewhere? I do not think that the danger is greater. I do not think that the Metropolitan railway shows as large a percentage of accidents as other railways per 1,000,000 passengers carried.

1698. You spoke about all the traffic on the Metropolitan line being worked upon two sets of rails? Yes.

1699. Do you know that that is a circular railway, and that therefore large termini are not required? Yes; but I remember when there was not a circular railway, and large termini were not required then.

1700. Do you propose to have a circular line? No. I propose to run right over to North Shore. You can get as much shunting room as you wish for at Hornsby, and at the other end you could shunt at Parramatta or Homebush.

1701. Do you think it would be convenient to shunt and re-form trains at Hornsby? You would not re-form them if they were only running to Homebush and back.

1702. Suppose the load taken by a train was much less than was anticipated, would you not take off some of the carriages? I would keep the same trains running from Hornsby through to Homebush and back again. That is what I would call the area of the maximum suburban traffic. In London they run the trains right round the circle, though the traffic in the outer district is only one-third of that in the city.

1703. Would you not have an unnecessary amount of running at times when there were few passengers? No, because you would soon have the northern suburbs as closely peopled as the western suburbs are now. Those suburbs would probably be more closely peopled in time than are the western suburbs now.

1704. Do you know that the proposed terminus at Hyde Park is to be a terminus for the Illawarra, the Southern, the Western, and the Northern lines? Yes; and a nice congestion you will have there.

1705. How do you propose to take the railway from Sussex-street to Wynyard-square, and thence to Circular Quay? Chiefly by tunnel.

1706. Where have we the railway in Sussex-street? There is a goods station in Sussex-street now, at the end of Sussex-street. You would begin with an open cutting, and then you would have to tunnel. The line would be part tunnel and part open cutting.

1707. You would have to tunnel all the way from Darling Harbour? Yes, but you could have plenty of air-shafts. You could have air-shafts probably every 20 or 30 yards.

1708. Have you any idea of the probable cost of this tunnelling? No.

1709.

W. H.
Flavelle.
3 Aug., 1897.

1709. Your objection to the scheme now before the Committee is, I take it, that it is an inexpensive scheme, and that you think that money should not be a consideration? No; I do not say that. I consider that the scheme before the Committee is only nominally a cheap scheme, because if it is carried out, it will be necessary to widen King-street. Even if you only give up a piece of land in front of Hyde Park, it is worth money, and must be paid for, or has been paid for. I maintain that by the time you have done with the widening of streets, and have made your extensions—because you must have extensions to deal with the eastern suburbs and North Shore traffic—your scheme will be just as expensive as mine, and will give no better service.

1710. You say that the Redfern yard is quite large enough for all requirements, and at the same time you say that a strip of the Cemetery and the Benevolent Asylum ground should be reserved? Yes. I will take the omnibuses and cabs and tramway out of the Redfern yard, and I would have the station practically level with Devonshire-street. Then, by widening Devonshire-street, you would have plenty of room in it for all the cab, omnibus, and tram traffic.

1711. Is it not a fact that in London, as well as in other large towns, the cabs are allowed to go into the railway-yards? Yes; and I would make Devonshire-street practically the station yard. I would treble its width. Besides, it must be remembered that I propose to take the suburban traffic away from Redfern, and two-thirds of the present traffic must be suburban traffic.

1712. Would it not be very expensive to bring the suburban traffic to Wynyard-square in the way you suggest? Yes; but when the Metropolitan railway was first made it cost £1,000,000 a mile, and yet, when I was in England, it was paving 5 per cent. I left England in 1879, and the stock then stood over par. That railway cost £1,000,000 a mile, and I believe that the extension into the city cost more than that; yet it paid.

1713. Do you know that for years the Metropolitan railway did not pay 2 per cent.? The Metropolitan District Railway did not, but the Metropolitan railway was paying 5 per cent. when I left London.

1714. Do you think that this Colony, with a population of 1,300,000, would be justified in tunnelling right through Sydney through sandstone formation, to improve the railway accommodation of suburban residents? Decidedly. I think that the extension would be one of the best-paying assets the Colony would have.

1715. But you have no estimate of cost? No; but I know that the underground railway in London has paid, and I believe that this extension will pay.

1716. London is a city of 5,000,000 inhabitants—we have a population of only 400,000? That is all at the present time. I do not think that my scheme would mean more than a mile of tunnelling.

1717. I suppose you consider that the persons responsible for the management of the railways of this Colony ought to disregard financial considerations, providing they carry out your views? I am not going to answer a leading question like that. It is absurd. I never made such a statement. I did not say that they were to disregard all financial considerations.

1718. Do you think that the Government would be justified in going to the expense of tunnelling right through the city, as you propose, to make a railway to carry suburban passengers only? The Government will not carry out this scheme until it gets expert evidence as to the cost. I presume that the Committee will get expert evidence upon the cost of all these schemes. To put a series of leading questions to me is not, to my mind, calculated to bring out direct evidence.

1719. We have had evidence from other people who propose tunnels, but they have all been appalled at the cost? You will have to get at the cost.

1720. We know pretty well what the cost will be? If you know pretty well what the cost will be will you state it. I am afraid you are rather taking up the position of an advocate.

1721. *Mr. Humphrey.*] You propose to bring the suburban traffic along the Darling Harbour goods line? Yes.

1722. Do you think that that line would carry all the suburban traffic, which is nine-tenths of the whole of our traffic? The statement that the suburban traffic is nine-tenths of the whole of the traffic disposes of the idea that the Redfern yard will not be large enough for a terminal station after the elimination of that traffic.

1723. Do you think that the suburban traffic could be brought over the present goods line? It could be brought along the route of that line, though not on the rails that are now being used. I presume that fast-passenger traffic is always carried upon heavier rails than the rails which are thought good enough for slow goods traffic. The line will have to be ballasted and relaid.

1724. But do you propose to use the existing track, or to put down three or four more lines of rails? I propose to use the track of the present line, but not the identical rails now in use.

1725. Are you not aware that the grade down at Darling Harbour is a very steep one? I know that it is. I have watched the heavy goods trains coming up it.

1726. Experts have assured us that that line would be quite unsuitable for passenger traffic? The grade is very steep, because they try to bring the trains up close to the Redfern railway station. If they came up near to the tunnel, they would get a better grade.

1727. Do you not think that it would be very undesirable to work the goods and passenger traffic on the same lines? No; but there have been other schemes for bringing the goods traffic into town. It has been suggested that it might be brought down to Glebe Island and through Camperdown.

1728. Is it your view that the goods traffic should be provided for elsewhere? Yes, if it could not be carried on in four or six hours of the day. On the Metropolitan line they run goods trains between 12 and 4 a.m. Here, if we do not begin running passenger trains until 5 or 6 a.m., and leave off at 12, we will have five or six hours in which to run goods trains. On the Metropolitan line they deal with an enormous goods traffic in four hours.

1729. Do you suggest that the goods traffic here should be carried over the line in four or five hours of the day and the suburban passenger traffic at other times? Yes.

1730. You would make the Darling Harbour line do the whole of the work? Yes, on two pairs of rails.

1731. Have you been through Liverpool? I have been through Liverpool on my way to New York; but I do not know the town well.

1732. Have you been to Glasgow? Yes.

1733. Do you remember the principal railway station there? I do.

- W. H. Flavelle.
3 Aug., 1897.
1734. Do you remember its being removed from the south to the north side? No. I only know Glasgow from a visit of two or three weeks which I once made there.
1735. You are not prepared to speak as to the position of that station? No.
1736. Do you know anything of the Lancashire and Yorkshire Railway? I know that it runs into Liverpool.
1737. Right into the city? Yes.
1738. You do not know the area of that station? No.
1739. We have been told that it is $9\frac{1}{4}$ acres;—do you know Birmingham? I have been there twice.
1740. Do you know the New Street station? Yes; and on one side the houses are particularly mean and sordid.
1741. Is that a central terminus? Fairly so.
1742. Do you know the area of it? I do not. It is a through station. It is not a terminus, strictly speaking. There are very poor buildings alongside the railway there—particularly mean buildings. There is a railway terminus near Regent Park, which is a good residential suburb, with a very large number of really good houses in it. I own property there myself; but the resumption of land for this terminus has lowered the value of property round about. I think the terminus I speak of is the terminus of the Manchester and Liverpool Railway. The effect of making that terminal station was to convince the public that their property was being depreciated, and they opposed the scheme.
1743. When you were speaking of the Metropolitan railway, in estimating its cost were you estimating the average cost of the whole line, or the particular cost of 1 mile? When I remember the Metropolitan railway it only went as far as Moorgate-street, and there was very little room for shunting, though they shunted trains every three minutes. It was the portion between Moorgate-street and the Edgeware-road that cost £1,000,000 a mile.
1744. What was the distance? I cannot say. The extension into the city cost a great deal more.
1745. When did the company pay 5 per cent.? It was paying 5 per cent. when I left England about 1879.
1746. Are you aware that at the present time the dividend is only $2\frac{1}{2}$ per cent.? I do not know what it is now.
1747. The total length of that line is 67 miles, and its total cost £12,000,000? Yes; but that line runs up to Harrow, which I remember as a village. I was speaking of that part of it which goes through a thickly-populated district—from Edgeware-road towards the city. You cannot lump the cost of extending the line to Harrow to get an idea of the cost if taken into the city.
1748. *Mr. Hoskins.*] The trains to Harrow load up very well? Yes.
1749. *Mr. Humphery.*] All that you meant to say was that a small part of that line cost £1,000,000 a mile? I think 4 or 5 miles of it, if not more, cost that. I do not call that a small part for a metropolitan railway.
1750. Has that part of the line been profitable? Well, it looks like it. When only that part was in existence the line paid 5 per cent., and now, I understand, it only pays $2\frac{1}{2}$ per cent. That looks as if the extension were the unprofitable part.
1751. Is it your opinion that the extension into the city from Redfern will be profitable? I think it will be; I think the tendency is for every extension into the city to pay well. I remember when the Great Eastern Railway Company's shares were down £48 or £50, and less; but they extended their line from Shoreditch to Liverpool-street, at an enormous cost per mile, and that extension has made the railway very profitable, so that, I understand, the shares are now above par.
1752. So that, while you object to the taking of a portion of Hyde Park, you are of opinion that an extension into the city will be very profitable? If you only bring in the suburban traffic.
1753. Even if the cost of extension be very high? Yes.
1754. Have you lived in the railway suburbs for many years? No; but I am perfectly aware that the suburban people ought to have a railway into town.
1755. You are quite of opinion that the railway should be extended into the city? Yes; for the convenience of suburban passengers.

WEDNESDAY, 4 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Varney Parkes, Esq., M.P., sworn, and examined:—

- V. Parkes, Esq., M.P.
4 Aug., 1897.
1756. *Mr. Humphery.*] Do you desire to give evidence touching the proposal to extend the railway into the city? That is the object of my coming.
1757. Have you seen the plan of the proposed route exhibited here, and the report of the Royal Commission which inquired into the whole subject? I have not seen the plan, but I know the purport of the Commission's report. I came here to give general evidence, as a man who, being in a constructional occupation, and having a great acquaintance with the city, has formed certain ideas which I should like to lay before the Committee—ideas with regard to the effect which I consider the adoption of the Commission's report would have upon the future progress and development of the city.
1758. You desire to make a general statement? I would like to make a short statement. For something like eighteen years I have very vigorously followed the occupation of an architect, and during that time

V. Parkes,
Esq., M.P.
4 Aug., 1897.

I have put up extensive buildings in different parts of the city, and have naturally become thoroughly acquainted with all the localities round about it. Of course any man who uses his reason in the pursuit of a professional occupation will always look to the future progress of a great town like this. My object in coming here was simply to state that I consider that the day for carrying surface railways into great cities has entirely gone by. We in this Colony have no possibility of watching the course of progress in great European countries, except by reading; but any man who is enthusiastic in his profession will read very much upon the subject of new developments. The system of railway communication in use in all the great cities of the world is fast becoming an exclusively underground system. Not only do surface railways require a lot of space, but they hamper all sorts of trades by the smoke and noise which they cause. In Sydney, where we have narrow streets and small allotments, which you generally notice, because of the incongruous designs of the buildings, it is necessary for professional men to consider the future development of the city. I fear that the railway, if extended in the manner recommended by the Royal Commission, will be a mistake. It must be admitted that the most direct route from Redfern to the Circular Quay is the most proper route for an extension of the line. Therefore, no doubt, it is the wisest way to come through Hyde Park. But it would be a very poor improvement upon present arrangements if the railway stopped at St. James'-road. The essential thing is to extend the railway so far into the city that country people can transfer direct from it into the ships lying at the wharfs, and can get direct access to the means of communication which we have across the harbour. Then, too, the question of connecting with North Shore is one that cannot be overlooked, and I say emphatically that all the evidence goes to show that a bridge cannot be constructed from North Shore to Sydney, and that any communication must be beneath the water. I would draw the attention of the Committee to the fact that already 47 miles of electric railways have been constructed under the city of London, and there are schemes and company promotions for hundreds of miles of electric railways under various great cities. These in the course of a few years will all be in working order. Within the last five years electricity has developed in an astonishing way, and within at least the first ten years of next century, we shall have done away altogether with the wretched, noisy, and dirty system of tram locomotion. There cannot be the slightest doubt that the traction within the first ten years of next century will be by electricity, and the traffic will not only be clean, but noiseless, because it will be conducted entirely upon indiarubber tyres. There will, too, be greater speed. These matters, I think, the Committee are bound to take into consideration. Would it not, therefore, be a better plan, instead of having what is practically a surface line, to take the railway along the proposed route, but underground. I might point out that the only thing that is preventing the extension of the railway into the city is the proposal to take a part of Hyde Park. Why not remove that objection to the scheme by having an underground railway. It is mere sentiment to say that tunnels are smoky and dirty. The proposed extension, if carried underground, would not require a tunnel so confined or so lengthy as that on the Northern line, near Woy Woy. Tunnels are constructed at the present day by means of a steel shield, followed by a steel tube cased in concrete, and the proposed tunnel need not be circular—it may be oval, to accommodate four or five lines of rails, and can be well ventilated and made in all respects superior to what is termed an open cutting. When you come to King-street there is no reason why an area of 300 or 400 feet should not be excavated, and at the bottom of that excavation the necessary buildings and platforms might be made. You would then have an open-air railway-station. That would be what might be termed a calling station, and the railway could be carried from there on towards the Circular Quay to the Government House grounds. There is an excellent dip of land there, which allows for the construction of the best class of wharfage and station accommodation. This arrangement at once overcomes the objections to the present scheme on the part of those who desire to see the Darling Harbour railway extended round to the Circular Quay. My object in coming here this afternoon is—first, to remove the sentimental feeling against underground railways. If in the future it is decided to take the railway on to North Shore, the extension can be by means of a tunnel. The highest point on the Sydney side of the city above sea-level is Flagstaff Hill, which is only 90 feet high, and any bridge across the harbour must, according to the evidence of the experts who have given evidence upon various schemes having for their object the ascertaining of the best means of crossing the harbour, be at least 180 feet high. The deck of such a bridge would be 90 feet above the highest point of land on the Sydney side, and it would be enormously difficult to get an approach to it; therefore, any harbour connection must be by tunnel, and such a connection could be made without any difficulty at all by tunnelling from Fort Macquarie to Milson's Point. I see a very great objection to a surface line stopping at St. James'-road. In the future the railway must be extended;—never mind what the Committee recommend, or what Parliament sanctions; the situation of the city will force an extension. Works of the kind we are considering can only be carried out in conformity with the physical features of the country, and the situation of Sydney in that respect will necessitate the bringing of the line down to Circular Quay, and the making of connections from there round the margin of the water. But if you bring the line to St. James'-road, as proposed, and then extend it, you will have to entirely destroy the splendid site for public buildings which is given by the ridge on the eastern side of Macquarie-street. The Hospital buildings, the proposed new Parliamentary buildings, the site for buildings in the Inner Domain, and the Law Courts will all be interfered with. Of course, an alternative would be to run round by way of St. Mary's.

1759. But have you observed that any extension from St. James'-road would be underground? Well; if one part of the railway is underground, why should not the other part be underground, so as to keep the line on a level.

1760. You have not read the report of the Royal Commission? No; but I understand the nature of the Commission's recommendation, and I know the levels of the city.

1761. I thought you were probably unaware that the rails to the eastern suburbs, and for an extension to the Circular Quay would run below the level of Macquarie-street? That would be in an open cut. I think that the line should be 100 or 120 feet below the level of Macquarie-street.

1762. To have them 18 or 20 feet below the surface would not be sufficient? No; they should be in a tunnel. Of course the construction of a tunnel gives an opportunity for the adoption of electricity when it is desired to try it in the future.

1763. How would you arrange a passenger station 100 feet below the street level? That would be very easy. With the magnificent hydraulic pressure which you have in Sydney, it would be nothing to hoist up lifts 40 or 50 feet square.

V. Parkes,
Esq., M.P.
4 Aug., 1897.

1764. *Mr. Wright.*] Why do you want to be 100 feet underground? Because that would prevent interference with any future basement construction, which is a thing you must make provision for. You must not in any way hamper the building of the city, if you can help it. Then, again, you would get a fairer gauge of the level for inlet and exit.

1765. *Mr. Humphreys.*] At that depth you would be down to the level at which you would tunnel to Milson's Point? Yes; the grades in no case, so far as I can see, would be more than 1 in 100. The Macquarie-street ridge is a place destined for the construction of public buildings. Nature made it for that purpose, just as artifice could have made it. It is a magnificent ridge, commanding all points of view. As to the objection to the taking of the Park, that is merely a sentimental objection. The Park should be left for the construction of great public buildings. There is no doubt that the city must have these places, and it is not necessary to cramp our great buildings. In my opinion, Hyde Park would be the proper place to have the Houses of Parliament. Anyone designing the city would never dream of putting great public buildings into a crowded space. Besides you can never tell what the contingencies of a nation may be, and wherever Parliament meets the Parliament buildings should have an enormous space around them, not only to give room for public ceremonies, but also that in times of strife they may be capable of defence and isolation. In every country in the world the Parliamentary buildings are so placed that troops can be thrown round them at a moment's notice, and so that room is provided for any great public ceremony. In all probability, when we come to have greater wisdom in these things, Hyde Park is where our Parliamentary buildings will be erected.

1766. Are you not aware that a site has already been selected? Yes; and so long as it remains only a site very little harm is done. What one Parliament does another Parliament may alter; but where you can, without any difficulty, take a railway underground, why should you destroy valuable surface and disfigure the appearance of the city. As a public and as a professional man, I look forward to the magnificent development of this city as the most picturesque, the cleanest, and the least inconvenient in the world, and it will be so if we carefully guard these things. To bring the railway into the city by a surface line would be quite unjustifiable. With regard to the line running round to the other side of the city, there is no doubt that the only extension that can be made is an extension for goods traffic. So far as my judgment goes, I do not think that any sort of line on the other side would be serviceable unless it skirted the water's edge, and then it should join this passenger extension. It will be just as inconvenient for people to take a cab to the wharfs or to their hotels from St. James' road as from Redfern. Again, if the proposed scheme were carried out, St. James' Church would be ultimately destroyed. I think it would be a wise thing to take the station to the site of the present Girls' High School. I think that that would give ample accommodation for a call station, provided that the main station was constructed somewhere down near Government House. Those are briefly the opinions which I hold upon the question of railway extension into the city. The Commission were, no doubt, perfectly right in recommending the most direct route. The only objection I have to their proposal is that they recommend a surface line.

1767. You propose not to go through the Park to Macquarie-street, but to go through the Park as far as the site of the Girls' High School? I would come through the Park to about Market-street, and then take a curve on to the site of the Girls' High School.

1768. That is where you would have a daylight station? Yes.

1769. Have you considered all the objections which have been urged against the tunnel scheme? Yes; I have read them through very carefully.

1770. Would you approve of the adoption of a tunnel scheme if steam traction is to be continued to be used? Yes; I do not see the slightest objection to it. We have a double line of railway running through a tunnel $1\frac{1}{2}$ mile long, near the Hawkesbury, and there is no inconvenience caused by that arrangement. That tunnel you cannot ventilate, because it is something like 150 below the surface, but there is nothing to prevent your having a good system of ventilation in the tunnels I propose.

1771. But have you considered the large number of trains which would have to pass through the tunnel you propose? It would not matter if the trains ran every five or ten minutes.

1772. With regard to the North Shore connection, you are quite clear that it should be by tunnel and not by bridge? Yes, and I have studied the matter very carefully. If we had close to the water's edge high points from which you could carry a suspension bridge it would be different. Not having those high points, we should have to build towers to carry the bridge, and the grades approaching the bridge would be very strong. The alternative would be to put piers in the harbour, but any one who has studied the effect of the ebb and flow of tidal waters, where there is no river to create a scour, must know that a pier 100 or 200 feet wide would be a block to the traffic. If there was such a rock in the harbour the Government would blow it out to give easier navigation. I consider that a bridge connection is simply impossible.

1773. Apparently the only difference between your views and the recommendation of the Commission is that you would extend the railway into the city through a tunnel instead of on the surface? Yes, and I would continue it on to near Government House.

1774. I suppose you recognise that the advantages of substituting electricity for steam could be applied to either scheme, and the nuisance created by steam would be minimised? The adoption of electricity as a motive-power would do away with all nuisance if the line were carried on the surface; but my objection to the destruction of the surface would still remain. An open cutting—and you must have roads on each side of it—destroys the uniformity of the city, prevents the proper regulation of the traffic, and is always the source of a certain amount of danger, if it is not well guarded. Why break the surface of the ground and destroy the city if you can carry the railway underground.

1775. Of course it is a matter of argument? I do not think it admits of argument.

1776. Touching the present terminal arrangements at Redfern, have you given them any consideration? I know that they are most ill-arranged and jumbled together.

1777. You quite agree with the evidence tendered to the Royal Commission that some immediate change must take place at the Redfern station? No sane man could say otherwise; we must have a change. To have the railway yard congested as it is is certainly a source of danger.

1778. From your knowledge of the passenger traffic, do you think that there should be an extension for both long distance and short distance passenger traffic? I do not think it would be worth while to relieve the traffic at one congested point to congest it again at Hyde Park. That would be absurd. The real thing to be done is to carry the line right through to the Government House grounds, where you will have plenty of room to deal with both long-distance and suburban passenger traffic.

1779.

1779. I suppose you have given some consideration to the inconvenience experienced by suburban passengers at the present time? Yes.

1780. Will you briefly state whether, in your opinion, there is a loss of time in transferring from the trains to the trams and other means of conveyance into the city, and whether the tram system is sufficient to meet all requirements, keeping in view the proposed electric tramway in George-street? Yes; I hold very distinct opinions upon this point. Although I was only a young man at the time, just commencing my professional career, I thought, when they were first putting down our tramways, that a great waste of money was being entered upon. Where you have a tramway in the streets over which vehicular traffic is passing it must always require repairing. Our tramways must, up to date, have cost nearly twice as much as the railways would have cost. The inconvenience of transferring from train to tram is most aggravating to travellers. Ever since I was a schoolboy I have travelled backwards and forwards from the city to Liverpool, and I know that this transfer is a source of great annoyance and inconvenience to passengers. I think, too, that it was a blunder on the part of the Government to enter upon the construction of an electric tramway in George-street to relieve the Elizabeth-street tramway. I think that the George-street tramway ought never to have been built, or it ought to have been built, not as a line to take the railway traffic, but perhaps to take the Glebe Point traffic. It should, too, have been underground, like an electric railway. The trams never have been an assistance to the suburban and country passenger traffic, and it is absolutely essential, if things are to be done properly, for the railway to be extended into the city to the furthest point.

1781. *Mr. Black.*] Do you think the space available at the site of the Girls' High School is large enough for a station such as you propose? I think so. On the eastern side you are not surrounded by buildings there, and the site is quite capable of extension. For a calling-station, I think it is large enough.

1782. I suppose you are familiar with that part of Hyde Park upon which it is proposed to erect a railway station? Yes.

1783. Have you noticed that there is a considerable slope from the centre walk to Elizabeth-street? Yes; there is a good slope.

1784. Would you be surprised to learn that there is a drop of nearly 15 feet? I daresay there would be a drop of 10 or 15 feet.

1785. Then, to get a level surface, a good deal of cutting-away would have to be done? Yes.

1786. Would not such a cutting destroy the appearance of the locality? Yes; if you take a quarter or one-half of Hyde Park for railway construction you may as well take the whole of it. Not only will you have to make provision for the railway, but you will also have to make provision for trams, omnibuses, vans, and all sorts of vehicular traffic. The whole area of Hyde Park would not be too much for a central station; and, in all probability, the whole of that area would have to be cut down from 15 to 20 feet.

1787. In the scheme which you advocate I suppose you propose to carry off the smoke by means of numerous ventilating shafts? Yes; you can get a terrific ventilation in a tunnel by hydraulic apparatus. As a matter of fact, in the electric tunnels, where the trains practically just fit the tunnels, the rush of air made by the moving trains is so great as almost to blow a person out of the mouth of the tunnel. By the introduction of hydraulic force you could make an enormous draught in these tunnels.

1788. Then, too, it is the tendency of smoke to ascend? Yes; you could make an artificial draught most easily, and without great cost.

1789. Your scheme, as I understand it, would not so much have the effect of lessening the difficulty of marshalling the trains at Redfern, as it would operate to bring people into and through the city? Yes; that is its object.

1790. Have you considered that portion of Mr. Selfe's scheme which proposes to widen the railway yard from Redfern to Eveleigh by the resumption of a large portion of land on the western side? Yes; but I cannot see any object in that. If you are going to centre the railway at Redfern you must resume more land; but I take it that every sensible man in the country has come to the conclusion that it is a most improper thing to keep the railway right out of the city, and that the traffic should be concentrated at the water's edge.

1791. But where at the water's edge are you going to find room for marshalling trains, storing engines, and so on? If you will compare the area available at Fort Macquarie with that available at Hyde Park, you will see that it will be quite sufficient.

1792. Notwithstanding your desire to preserve the beauty of the city at Hyde Park, will you not interfere with its beauty by constructing a central station on the Government House grounds? Yes; but in travelling through the world you must have noticed that the water's edge close to the cities is where all the ships and cranes and lorries work. The water's edge in a great city is always the centre of traffic; but this traffic is low down where it is not seen. You will never prevent the splendid deep water of our harbour from being the very acme of vigorous commercial traffic. What does it matter if you have cranes, and steamboats, and wharfs where I suggest. They will not affect the beauty of the city. Our great public buildings must be put upon elevated positions. You do not think of beautifying the water's edge where the wharfs must be.

1793. I suppose you have heard that the Royal Commission recommended as compensation for the loss of Hyde Park the dedication of the old Cemetery in Devonshire-street as a reserve? Yes.

1794. Have you any idea what it would cost to remove the bodies from that Cemetery and re-inter them somewhere else? I doubt whether it would be necessary to remove them. If you remove them, the cost would be enormous, as you would practically have to excavate the whole area to a depth of 7 feet, because I believe the coffins lie close together, almost touching each other.

1795. Under such circumstances, reinterment would be impossible? If you attempted to remove the bodies, you would have almost to move the entire soil.

1796. You think that a large portion of the soil there is simply disintegrated human flesh? Yes; it must be.

1797. Under such circumstances, removal and reinterment is difficult, if not impossible? Yes; I do not think anybody could think of it. The Town Hall is built upon the site of a cemetery; but they never thought of removing the bodies there. On one occasion when I had to report upon the foundations of the Town Hall, we got a good collection of old coffins and bones.

1798. Do you not think that the relatives of those who are buried at Devonshire-street would object to the use of the place as a park unless the bodies were first removed? The great objection to the proposed arrangement

V. Parkes,
Esq., M.P.

V. Parkes,
Esq., M.P.

4 Aug., 1897.

arrangement is that Hyde Park is the very pick site of the city for public buildings. There is no relation of value between the two.

1799. You mean to say that for public purposes there can be no comparison between the two sites? No.

1800. You think that Hyde Park is of unsurpassed situation and of beautiful surroundings? No doubt about it. It was a wise thing to dedicate it in the first place.

1801. Do you not think that the excavation of a large area of ground with a heavy embankment on one side, and the erection upon the site thus prepared of buildings with the roof architecture which is inseparable from all forms of station construction would interfere with the beauty of the surroundings, and with the value of public buildings in the neighbourhood? If you sank the station at a great level, you would have a very ornamental approach to it; you would have a very ornamental wall round it; and the buildings themselves, if nicely constructed, would not be objectionable as you looked down upon them.

1802. But I am speaking of the scheme recommended by the Commission? No doubt if you come near the surface there will be an objection. The design before the Committee is, however, a very pretty one.

1803. But it does not show the whole of the station-yard? I do not think any great objection could be taken to a station building as designed. The exception I take is to the impossibility of future extension, and also to the annoyance caused by a surface line.

1804. You do not think it would be possible to get to the Circular Quay from St. James'-road if the proposed scheme were carried out? Not without a terrific destruction of property and of sites for public buildings.

1805. I suppose it would be almost impossible to tunnel from an above-ground station at Hyde Park? The grade would be preposterous.

1806. Then you could only get to North Shore by means of a bridge? Yes.

1807. That would necessitate the overhead crossing of George and Pitt streets? Yes, which would be most costly and unsightly. Such an extension would never pay interest upon its cost. A bridge from Hyde Park to North Sydney would be an enormous undertaking.

1808. It is proposed, in the case of an extension to North Shore to go, not from Hyde Park, but by detour from Liverpool-street? Overhead.

1809. Partially? How far would you go overhead.

1810. I do not think we have any particulars? I should say that that scheme was impossible financially.

1811. Are you aware that the proposed scheme involves the raising of Park-street? Yes.

1812. That would very much increase the difficulty of traction for all real traffic coming from Woolloomooloo? Yes; and there would be very strong complaints against it. The grade from William-street now is almost too great. You see what a difficulty there is with these severe grades, directly we come to wood-block them.

1813. Would not the tendency of such an arrangement be to turn traffic from Park-street and send it round by King-street or Liverpool-street? Yes; the traffic would make a detour.

1814. That would increase the difficulties which now arise from the narrowness of King-street? Yes.

1815. Do you not think that the construction of a central station at Hyde Park, and the consequent concentration of traffic there would make it necessary to widen some of the streets which give an approach to that place? Yes; as I explained before, a central station would have to provide, not only for the railway traffic, but for a vehicular traffic connected with the railway service. As much room would have to be left for foot passengers and vehicular traffic as for purely railway purposes. If I understand your question, you mean would there be sufficient space for the traffic which would be accumulated round the great central railway station in these thoroughfares. I say that there would not. All these streets are very narrow.

1816. If it became necessary to widen them, would not the resumptions cost a tremendous amount of public money? No doubt about it. I am not prepared to say that resumptions would be necessary, though it appears to me that they would.

1817. Do you not think that the construction of a railway station at St. James'-road would seriously interfere with foot passengers going from the city to Woolloomooloo and in that direction? Yes; unless the railway were underground.

1818. I suppose you are aware that one of the arguments advanced in favour of the proposed extension is that it will pay from the beginning—that, in addition to those who now use the trams to get to Redfern, you will get those who take the omnibuses or who come to town in other ways? Judging from my knowledge of human nature, as every public man will judge, I know that the moment this railway is constructed the people will require a cheapening of railway fares. The public are always clamouring for the best accommodation at the most economical rates. The construction of this railway must not be looked upon as a means of bringing revenue to the country, because it is not. The extension is necessary simply for the completion of our great railway system, and it is one of those public duties which the people owe to themselves to see that it is carried out whether it pays or not.

1819. In any case one of the reasons why the people of the suburbs are clamouring for this extension is that they want to be carried for a half-penny over a distance for which they are charged 1½d. at present? It is not only the people of the suburbs, but the people of the country generally who clamour for this extension. The extension must be made; but it cannot be treated as a paying concern, because it will never add anything to the revenue.

1820. Should there be any return from the extension it will be because of the increased distance the public are carried, not because you change the site of the central railway station? No.

1821. If that be so, you may gain revenue without moving the central railway station? I do not think that is a fair conclusion to draw, and it is a very difficult question to answer, because it demands such an amount of argument. If you leave Redfern station just as it is to-day, as the suburban traffic becomes greater, and the country traffic more vigorous, the public will ask the Commissioners to lessen the rates.

1822. It has been stated by the late Mr. Eddy and by Mr. Parry that even if you construct a new railway station at St. James'-road, within twenty-five years other central stations, which they call suburban stations, will also be required. Do you view that as an admission that there are other places in the city available for the construction of railway stations? In the opinion of engineers there are plenty of places available for the construction of railway termini. The great point I make, and the point which I would like to impress upon the Committee, is that we must provide for the adoption of electric traction. So many great minds have been brought to bear upon the development of electrical science that within the

first

first ten years of next century you will not only have all electric traction, but you will have traction upon absolutely noiseless principles.

1823. Your argument is that in extending the line we should adopt some scheme which, while equal to present requirements will have due regard to all the possibilities of the future? Yes; and which will save the surface of the city.

1824. It follows, then, that, even if there should be some temporary unpleasantness, as some people have argued there would be in connection with a tunnel scheme, it would not be of a permanent character, and it would be set off by the maintenance of Hyde Park as a possession of the people? I consider the objections to tunnelling as merely sentimental, because, as I have pointed out, it is quite possible to ventilate tunnels perfectly. In my opinion the proper thing is always to take city railways underground. There is no real tangible objection to this course on the ground of discomfort.

1825. Have you considered that, inasmuch as your scheme provides for a connection with North Shore, and there is a return from North Shore by way of Hornsby, it would not be necessary to have so many lines of rail through the city as if there was a dead end before we reached Port Jackson? Yes; that will diminish the necessity of having so many lines of rails. The northern suburbs people, instead of coming in by train in the way they do now, would come through North Shore.

1826. But as we are considering the interests of suburban residents, should we not consider the interests of residents of the northern suburbs? Undoubtedly.

1827. So far it would appear that they have not been considered in this matter? Undoubtedly they ought to be considered.

1828. Are you familiar with the suburbs along the Milson's Point railway? Yes.

1829. Do you consider that with railway connection with the city there will be a great increase of population there? The increase during the last five years has been astonishing.

1830. But if they had direct connection by railway it would be much greater? Nothing could be more satisfactory in the development of a place than the increase of population upon the North Shore. The greater part of it is city now.

1831. It has been said by witnesses that the emission of smoke and soot from railway engines will not be detrimental to the foliage of the trees, nor likely to interfere with the purity of the atmosphere;—do you agree with that statement? It would certainly affect the appearance of buildings. You can see an illustration of the effect of the smoke from tramway motors in the building opposite. When smoke and steam are constantly being wafted on to a building they must affect it; though I do not know whether they affect the foliage of trees. The noise caused by the motors is objectionable, as well as the smoke.

1832. Do you think the noise of the trains would be likely to interfere with the comfort of people residing near Hyde Park? Yes; I think so, if they run on the surface.

1833. Do you think it would interfere with the proceedings of the Supreme Court? If at the present moment the Judges will send out to stop hammering, I do not know what they will do when the trains begin whistling and bustling about. I know that when I was doing some alterations to St. James' Church I was stopped for whole days at the command of the Chief Justice. He would not even allow a pick to be put into a piece of stone.

1834. You are aware that, having regard to the religious sensibilities of those who attend St. James' Church and St. Mary's Cathedral, it is proposed to suspend the traffic during church-time? Yes, that might be done; but I look upon all these objections as petty. The really great thing is the building up of this magnificent city. No doubt there are hundreds of little things in connection with the scheme which might be objected to.

1835. There are various grounds of objection held by different people, and it is through these various forms of objection that antagonism to a scheme such as this is built up;—if you will understand the weight of public antagonism you must inquire into all its causes? Yes; I do not think that the interference with the service at St. James' Church would be a matter worth taking cognisance of.

1836. If the religious sensibilities of those who worship in Protestant and in Catholic churches are to be considered by the railway authorities, should not the religious sensibilities of those who worship in the Jewish Synagogue also be considered? No doubt.

1837. That would involve the suspension of traffic upon Saturdays? Yes.

1838. *Mr. Wright.*] Did I understand you to say that Flagstaff Hill is only 90 feet above high-water mark? It is 89 feet above high-water mark.

1839. Is it higher than the top of King-street? No; I think that the ridge at the top of King-street is a few feet higher.

1840. The scheme submitted by myself as a member of the Stuart Government, in 1884, was to tunnel under Hyde Park, with a station at Liverpool-street, and an underground station at King-street. From there the line would have gone across Macquarie-street, behind the Mint and public buildings, with a partially open station at Bridge-street, and then on to Fort Macquarie with a loop-line to Circular Quay? If that was the scheme put forward, it suggested what is no doubt the correct solution of the difficulty.

1841. There was great public clamour against that scheme? Very likely.

1842. You suggest a tunnel 100 feet deep? When I say 100 feet, I do not give that as the exact depth. What I mean is to tunnel sufficiently deep to meet the case—the depth might be 75 or 80 feet.

1843. If the tunnel is at a depth of 80 feet, what sort of excavation would you have at your railway station;—would not the debris nearly fill up Darling Harbour? There are plenty of places where it could easily be used.

1844. The original proposal was to have a tunnel 50 feet deep? Perhaps that would be enough. The matter of depth does not affect the scheme.

1845. You mentioned 100 feet merely as a rough approximation? Yes.

1846. You think that any extension would be incomplete, unless it went as far as the water's edge? I do not think it would be worth while to bring the railway from Redfern to Hyde Park to have it at Hyde Park.

1847. I understood you to say that you considered the Macquarie-street route as eminently adapted for public buildings? As you come into the harbour, the first thing you see is that ridge. It is like the backbone of a city. You see it from every point of view, and it is there that your fine buildings should be situated.

V. Parkes,
Esq., M.P.

4 Aug., 1897.

- V. Parkes,
Esq., M.P.
4 Aug., 1897.
1848. Yet you say that you think Hyde Park should be preserved as a site for public buildings? Yes; I am of opinion that Hyde Park is where Parliament House should be.
1849. Do you not think that the piece of ground on the ridge you speak of, between Bridge-street and St. Mary's, is sufficiently large to accommodate all the public buildings Sydney is likely to require for centuries to come? That is all very well, if you are going to crowd these buildings together, separating them only by walls. Public buildings should have open spaces around them. It would be a great mistake to crush them against one another.
1850. You think that the beauty-spots of the city should be preserved to furnish sites for good buildings? Yes.
1851. Have you read the evidence given by the late Chief Commissioner of Railways before the Royal Commission? No.
1852. You are possibly not aware that he thought an extension to the Circular Quay was not warranted by the probable traffic? While I have not read that evidence, I have seen it in the newspapers, and I know exactly what the opinions of the late Mr. Eddy were. I know he said that it was not necessary to carry the railway to Circular Quay.
1853. Are you aware that one of the primary reasons why he supported this scheme was that he could get a large revenue from it without taxing the people more than they are taxed at the present time? That is, if the line is taken to Hyde Park.
1854. Yes? I expect he did say so, but I do not think that is a point worth considering. In my opinion, we ought to look at this question from the point of view of public men.
1855. Do you not consider the late Mr. Eddy an authority? No doubt he was, but even very great men are not infallible. A master architect may make a most beautiful and clever design on one occasion, and may fail on another. So Mr. Eddy might have been at fault in this instance. I think he was.
1856. You think additional revenue would not be obtained by this extension? I doubt it very much.
1857. You adhere to the view that any extension should go underground, and will eventually be worked by electricity? Yes.
1858. Have you been to Europe? No; but I am well acquainted with what transpires there, because I take care to be well posted up in all recent developments.
1859. You are aware that the temperature of London is lower than that of Sydney? Yes.
1860. Are you aware that the tunnels there are insufferably hot? Yes; but you cannot make a comparison between the old underground railway and present-day construction. They have put down 47 miles of electric railway in London, and the ventilation is so great that, as a matter of fact, they are making inventions to provide against draughts.
1861. If we do not alter our railway system from steam to electricity, would you still think that the line should be underground? We should make provision for the alteration. We may not be alive some years hence; but we must not leave things in such a state that people who come after us will say that our ideas were ignominious. It is useless to expend a large sum of money upon work which may be undone twenty years hence.
1862. Your contention is that we should advance with the times, and have underground railways driven by electricity? Yes; but at the present we might be content with steam traction.
1863. If the late Chief Commissioner has pointed out that any application of electricity would not be advantageous, what about underground lines then? Of course, his is only the opinion of one man. I do not think that it should overrule that of every other mortal creature.
1864. But that is also the opinion of several other scientific men? They may be in error.
1865. We must be guided by the opinions expressed by the witnesses who come before us;—notwithstanding the evidence which was placed before the Commission, do you think that any extension into the city should be so planned as not to interfere with public reserves or private property—that the line should go underground? Yes. Wherever you construct a railway in the city you should prevent any interference with the surface.
1866. *Mr. Fegan.*] I understood you to say that the taking away of the Park was a mere matter of sentiment—that sooner or later it must be used for public purposes? It should be left available for public purposes.
1867. You suggest that it should be a site for Parliament House, the Law Courts, and so forth;—the main objection to the scheme we are considering is that it prevents the use of the Park for recreation? The great objection, I believe, is to taking away a valuable piece of land from the citizens which has been dedicated to their use. I do not think there is only one reason for this objection, because I have heard about a dozen.
1868. But that is the chief objection? I consider the chief objection to be that a fine site like Hyde Park should not be used for railway purposes, but should be kept for a better purpose.
1869. You believe that it would be better to reserve it as a site for public buildings, such as new Houses of Parliament? Yes.
1870. If you are to tunnel to a depth of 100 feet, where do you propose to commence to descend? I should tunnel at whatever depth might be necessary to keep the line on a level without incommencing basements.
1871. Would you go under Belmore Park? You could not go under Belmore Park. The tunnel would commence somewhere about Liverpool-street. There is not much difference between the level of Belmore Park and that of Government House grounds. Belmore Park is very low. The tank stream used to run through there.
1872. How would you get over Belmore Park? You would have to run over the surface, I presume.
1873. How would you get over Devonshire-street and into Belmore Park? You would have to go through a cutting across the burial-ground. Then you would be practically on the level of Belmore Park. At the first opportunity, which would be about Liverpool-street, you would commence to tunnel, and you would be able to run a tunnel straight through almost right to the water's edge.
1874. Your first station would be where the Girls' High School now stands? Yes. So far as I can see that would be the only call station required.
1875. You would be some distance underground there? Yes; perhaps 75 feet.
1876. How do you propose to make that station? I think the wisest plan would be to excavate a site for it.

1877. And how would you get to it? That difficulty could easily be got over by using hydraulic lifts.
1878. How would you go from the High School to Government House grounds? I would take as direct a route as possible. I would go right under Macquarie-street, and almost straight down to the water.
1879. What would be the cost of the scheme you propose? So far as the excavation was concerned, if you were to allow a little time for it, you would find that all the stuff would be removed for nothing. The city of Sydney is built upon magnificent sandstone rock, and if you were to allow fifteen months for this excavation, there is not the slightest doubt that you would get back every penny of its cost. I have excavated for building-sites in the city of Sydney, and I have always made money by the excavations, unless I had to remove shale or poor stuff. Wherever we have had rock to remove I have always been able to dispose of it.
1880. I think you will admit that the probable cost of this scheme is an important point? I think that the cost of a tunnel scheme would not be greater than that of a surface scheme. It would take longer to construct, but it would not cost more.
1881. Would you remove Government House? Yes.
1882. What could you build another Government House for? So far as that is concerned, a new Government House will have to be built within the next ten years. I have been told by tradesmen who have been working there that the present building is perished. Under any circumstances it will have to be pulled down shortly.
1883. But the cost of rebuilding it must be taken into consideration as part and parcel of this scheme? I think not, because the building is not worth considering. It is not worth £500 in the argument.
1884. I would like to buy it for that? If you were to give £500 for the material, you would lose money upon the bargain.
1885. Do you not think that the site of Government House is as valuable as, if not more valuable than, Hyde Park? If you come to discuss relative costs there is more land to be resumed under the present proposal than with a tunnel scheme. If you extend the railway from St. James'-road enormous resumptions will be necessary, and in the end, I think, you would find that the cost of the present scheme, if completed, would be a third greater than that of the tunnel scheme.
1886. But how would you compare the two sites I have named? Hyde Park is undoubtedly the more valuable.
1887. From a recreative point of view, is it superior to Government House grounds? Yes, no doubt.
1888. Could not the Government House grounds be taken under the proposed scheme to provide land for recreation purposes? Yes; but water-frontage right in the heart of a big city should never be used for recreation purposes.
1889. Have you made any estimate of the cost of your call station? I have made no estimate. You will find that all estimates given in evidence like this are problematical. Looking at the matter on broad grounds, I have not the slightest doubt that an underground railway would be the cheaper of the two.
1890. You admit, however, that the removal of the railway from Redfern into the city should be carried out without the least delay? No doubt.
1891. Is it not a fact that from time to time the residents of the suburbs have approached the Commissioners to have the fares cut down? Yes.
1892. And time after time their requests have been refused? Time after time they have been granted.
1893. Is it not a fact that two years ago an agitation was got up for the reduction of suburban fares, and that the Chief Commissioner refused to make any reduction, because he said that the railways must be made to pay? Very likely, but I do not recollect it. I have been with deputations asking for reductions in the cost of season-tickets, and they have succeeded. Seven years ago we used to pay £25 a year to travel from Liverpool, now we only pay £18 a year.
1894. I think you will admit that the people of Sydney are in a different position from the people of London or Liverpool, where they have several competing lines of railways, and where, if one railway will not reduce its rates another will? I think that a State railway management is more likely to reduce fares than are the directors of a private company.
1895. That, of course, is upon the condition that the line is paying? Yes; but it has become a well-founded principle that national railways do not pay.
1896. Do not our railways pay? The reports say that they pay, but the same reports say that upon a certain number of lines we are losing £300,000 a year.
1897. According to the evidence of the late Commissioner, a small extra charge would not increase what the people have to pay now, but it would bring in much more revenue to the railway? That might be so until the line had been open twelve months, and then people would bring unanswerable arguments in favour of a reduction, and a reduction would be made. You cannot reckon upon this extension as a payable affair. Railway fares have to be reduced and reduced, and I do not believe we will gain a penny in railway revenue by this extension.
1898. What is the whole length of your tunnels? There would be one a little over half-a-mile in length, and another a little over three-quarters of a mile.
1899. Where does your first tunnel come out? At the site of the Girls' High School. The other tunnel would end just about opposite Government House gates.
1900. What would be the probable cost of the tunnelling? I can only give you a general reply to that question. In tunnelling now-a-days, they work behind a shield, and they do not take out an atom more than they absolutely require to move. The work is done expeditiously, by means of machinery, whereas for open cuttings you must employ hand labour. The excavation of the tunnel must cost less than the excavation of an open cutting.
1901. What would your open cuts from Devonshire-street to Belmore Park cost? Not very much.
1902. Would there be any buildings to remove? Only some old Government buildings.
1903. *Mr. Roberts.*] Is it not probable that, owing to the thickness of the walls of the proposed station building at St. James'-road, the noise of the trains will be kept in, and there will be no interference whatever with the business of the Supreme Court? I might point out that the proposed station building will stand by itself, and that the trains will not run into it. They will be out in the open. Therefore that building will only be a slight check upon the noise.
1904. But the platforms are to be covered over? If they are covered over completely that will not keep in the constant shrieking of whistles, the noise caused by the bumping of buffers, and the hissing of steam from the safety-valves.

V. Parkes,
Esq., M.P.

4 Aug., 1897.

V. Parkes,
Esq., M.P.
4 Aug., 1897.

1905. Are you bearing in mind that St. James'-road will divide the stations from the Supreme Court;—will not the trains be a reasonable distance away, so that the inconvenience would be at least very slight? I think there would be considerable noise and hubbub. If you have ever been to a performance in the old Exhibition Building you would know what disturbance is caused by the noise of the trains in the Redfern yard, which is much further away from the Exhibition Building than the proposed station will be from the Supreme Court.

1906. Then if this scheme is adopted the Supreme Court will have to be removed? Yes, I am sure of it. If this scheme is to be adopted it will be better to take the whole block where the Supreme Court and St. James' Church stand, and shut up St. James'-road.

1907. In estimating the cost of the work, do you think that the removal of those buildings and the erection of a new Court elsewhere should be put upon the debit side? Yes; though it would not be many years before the construction of a new Supreme Court would be inevitable.

1908. You recommend the removal of the Supreme Court and St. James' Church? Yes.

1909. But do you think that the noise from the trains will be greater than the noise now created by the trams? A railway station there would be a most intolerable nuisance. The Hospital patients would complain of it immensely. I believe that we made a great error in putting a hospital there; but there it is, the biggest hospital in the Southern Hemisphere. The patients would be terribly disturbed by the noise of the trains.

1910. And you think that the railway would be an inconvenience to the various places of worship round the Park? Yes.

1911. Would there not be the same inconvenience if your scheme were adopted? No; because sound waves do not rise upwards. If a man is working in a quarry you cannot hear him until you get right to the edge. If you go up St. James' spire you can hardly hear the noise of the traffic below, though you would hear it a mile away if you were down on the surface of the ground. The reason is that sound waves travel horizontally.

1912. Is it not a fact that tunnels are only used in railway construction when it is impracticable to get from one place to another in any other way? And where railways are taken through great cities.

1913. Would not a daylight line give much more comfort to the passengers? I do not think so. I think you would completely spoil the city by running a surface line through it.

1914. In recommending the continuation of the line to Government House have you considered whether there would be sufficient passenger traffic to make it pay? Undoubtedly the traffic to the Circular Quay would be enormous. As to the question of the line paying, I do not believe it would.

1915. Do you think the time has arrived when this work should be carried out? Certainly, and the line should be taken right down to the Circular Quay.

1916. In the event of a line being taken across to North Sydney, where would it join the Milson's Point line? It would go across from Fort Macquarie to Milson's Point; but I do not know exactly where it would join the other line.

THURSDAY, 5 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

John Cash Neild, Esq., M.P., sworn, and examined:—

J. C. Neild,
Esq., M.P.
5 Aug., 1897.

1917. *Mr. Trickett.*] You remember being examined before the Royal Commission which inquired into the proposed extension of the railway into Sydney on the 20th April last, when you read a statement giving the particulars of a scheme which you thought it would be desirable to adopt, and gave evidence upon the subject generally? Yes.

1918. That evidence has been verified by our Secretary, and now forms part of the evidence which is under consideration by the Committee;—I would ask you, therefore, whether you wish to alter or to correct it any particular? No, I do not wish to do that; but I have seen a statement in the Press to the effect that Mr. Deane has stated that the proposal to locate a railway station on Cook and Phillip Parks was an impossible one, because of the difference in levels between the highest and lowest points of those parks. (I think the difference was said to be 59 feet.) I cannot credit that Mr. Deane did make that statement; but if the statement was made, I should like to say a word or two with reference to it.

1919. Before you do that, would it not be better to make any general statement which you may have to make in connection with the proposal before us; afterwards I will direct your attention particularly to the evidence given by Mr. Deane on the subject to which you refer? It would be more convenient, perhaps, and would result in a saving of time, if I were furnished with a copy of Mr. Deane's evidence before I prepared any reply that I had to make.

1920. In that case we should be glad to hear any other statement which you may have to make? The first matter to which I should like to refer is this: I share with Mr. Chanter, M.P., the responsibility of the chairmanship of what is known as the Hyde Park Defence Committee, and I wish to place in evidence one or two facts connected with a large public meeting which was held at the Town Hall, Sydney, under the auspices or through the efforts of the committee. That meeting was presided over by His Worship the Mayor, who, on behalf of the City Council, expressed his full sympathy with its object. The

first

first resolution was moved and supported by the Honorable Sir Arthur Renwick, M.L.C., the Honorable Dr. Norton, M.L.C., the Honorable W. R. Campbell, M.L.C., the Honorable John MacIntosh, M.L.C., and the Mayor of Paddington. The second resolution was proposed and spoken to by Mr. W. J. Lyne, M.L.A., Mr. John See, M.L.A., and myself. Other resolutions were spoken to by Mr. Whiddon, M.L.A., Mr. Chanter, M.P., Mr. Chapman, M.P., Dr. Kesteven, and other gentlemen, whose names I do not at this moment remember. The hall, with the exception of the eastern gallery which was closed, was crowded throughout, and the resolutions were carried by overwhelming majorities. The total number of hands held up in opposition did not, so far as I was able to count them, exceed 100. Indeed, I should be quite prepared to say that the number was materially less than 100. With regard to a second meeting which was held at the same place in favour of the scheme, I wish to place it upon record on oath that the Hyde Park Defence Committee had no part or lot in any shape or form with any opposition to the objects of the meeting. So far as I am aware, none of us attended the meeting. Any disturbance that took place was spontaneous on the part of the meeting, and had no kind of origin in the efforts or action of the Hyde Park Defence Committee. As statements have appeared in the Press to the effect that opposition was organised by us, and as the morning newspapers have refused to print short letters denying this charge, I thought I should be justified in placing the facts definitely before you in my responsible character as a member of the committee. The committee had not met for a fortnight, nor the executive for ten days, prior to the meeting to which I refer, and we had nothing to do with the proceedings at it.

1921. Seeing that you have placed your views as to the right route for the proposed extension before the Commission, I should like you to add anything you wish to add to that evidence? I have prepared with a good deal of care two statements from figures given by Mr. Coghlan. One shows the population of the railway suburbs in 1891, and the population of what I may call the non-railway suburbs at the same date, when the census was taken, and the other the assumed populations in 1895, these being the latest figures available. Among the railway suburbs I include Ashfield, Burwood, Canterbury, Concord, Darlington, Drummoyne—which is perhaps not a railway suburb at all—Enfield, Five Dock—this is scarcely a railway suburb—Hurstville, Kogarah, Macdonaldtown, Marrickville, Newtown, Petersham, Rockdale, Ryde, St. Peters, and Strathfield. The population of these suburbs in 1891 was, according to the census returns, 98,010. The non-railway suburbs comprise Alexandria, Balmain, Botany, Botany North, Camperdown, Globe, Hunter's Hill, Manly, North Sydney, Paddington, Randwick, Redfern, Waterloo, Waverley, Willoughby, Woollahra, and Leichhardt, and in 1891 had a population of 177,139. 1922. *Mr. Wright.* Redfern is a railway suburb;—it has a railway station, Eveleigh, in the middle of it? I think that the railway fringes one side of Redfern, but I doubt if Redfern can fairly be called a railway suburb. However, I must leave the figures as they stand. The Redfern Council has carried a resolution in opposition to the Hyde Park railway scheme. In 1895 the population of the railway suburbs was 115,592, and that of the non-railway suburbs 198,523, showing that the suburbs connected with the city by rail are by no means the most populous. The lesson I propose to draw from these figures is that any scheme of railway extension should provide conveniences for the people of suburbs which do not now possess the advantages of railway communication. It is evident that the majority of our suburban populations do not possess the advantages of railway communication, and I submit very respectfully but very firmly that any scheme of railway extension should consider the convenience of this population. If the proposed scheme were carried out, to get to the eastern suburbs would involve a journey to Park-street to reach the railway platform. From Park-street the line goes in tunnel in a northerly direction under Macquarie-street, and enters the Garden Palace grounds. Then, taking a south-east curve, it appears to terminate in the Domain, at the back of the Art Gallery, on the shores of Woolloomooloo Bay. The total length to that point—and I have scaled it very carefully upon the official plan—is about three-quarters of a mile, and the tunnel, being elbow-shaped, would be almost incapable of effective ventilation, to say nothing of the danger which would be created by running trains in such a tunnel. I do not think there is a railway in the world which has a tunnel with so extraordinary an elbow. I submit that it would be unreasonable to expect the inhabitants of the eastern suburbs, who number some 50,000 souls, to say nothing of the inhabitants of Waterloo, Alexandria, and other places, who would be accommodated by a circular line, such as has been proposed, to use such a line. While they were going to Park-street to get to the station, and were being dragged through a tunnel three-quarters of a mile long, back over ground which they had already travelled, they would have time to get two-thirds of their way home by tram. By the time they actually commenced their homeward journey, they would have time to get to the top of Barrack Hill. The proposal recommended by the Commission is eminently unsuited to the interests of the eastern and southern suburbs. Perhaps it would not be improper for me to mention that between ten and twelve years ago I moved a resolution in the Legislative Assembly in favour of the construction of the City and Suburban Railway. I should like to be permitted to add a copy of that resolution, and a statement as to its fate, to my evidence. With respect to the scheme before the Committee, I would like to say that, taking the top of Queen-street, Woollahra, which is practically the boundary of three municipalities—Paddington, Woollahra, and Randwick—as a fairly central point in the eastern suburbs, the distance from there to Park-street by the ordinary vehicular route is $1\frac{1}{2}$ mile, which is exactly the distance to Redfern railway station. The exit from the proposed railway station will really be nearer Market than King-street.

1923. There will be no exit at Market-street? Well, the people would leave the trains at a point nearer Market-street than King-street. I submit that the majority of the inhabitants of the eastern suburbs would, if the proposed extension were made, be no nearer the railway than they are now. The distance by road from Darlinghurst Court-house to Park-street is three-quarters of a mile, which is practically the distance from Darlinghurst to the present Redfern railway station. I do not think these facts have been brought out before; but I hope that they will be useful to the Committee in coming to a conclusion. There are other objections in regard to the scheme before the Committee which have struck me very forcibly. The area of Hyde Park which it is proposed to resume has been stated as only 10 acres; but Mr. Deane, in his evidence before the Royal Commission, stated it as 13 acres 2 roods 38 perches. Other evidence goes to show that $2\frac{1}{4}$ acres would be required for a running-track through the south-western quarter of the Park, which makes the whole area to be resumed within 2 perches of 16 acres. As the whole area of the Park is only 40 acres, this is nearly one-half. We must also take into consideration the inconvenience of the severance which would be caused by these running-tracks. Other very strong and important objections against the proposal have occurred to me. Assuming for the sake of argument that

J. C. Neild, Esq., M.P.
5 Aug., 1897.

that a portion of this 15½ acres is to be thrown into Elizabeth-street, and that only 10 acres are to be used for a station, that makes the matter much worse, because if there is a congestion of traffic at Redfern in a yard of 25 or 30 acres, what must the congestion be in a yard of 10 acres. If the railway authorities cannot conduct their present business in a yard of 25 or 30 acres, how will they be able to conduct it in a yard of 10 acres, especially when we remember that a smaller yard, while it will admit of lengthy platforms, rigidly limits the number of those platforms. Redfern, however, is a fan-shaped piece of ground, affording an opportunity for the construction of an immense number of platforms. I should like also to support the evidence of the Hon. John Macintosh as to the immense litter of buildings at the Redfern station. If these were removed, a vast increase in the area available for platform purposes would be gained. Another objection to the Hyde Park scheme is this. It is proposed to bring the railway from its present level of 3½ feet above sea-level to a height of nearly 100 feet above sea-level, and to leave it there. You bring it to the top of a hill, and leave it in a position almost impossible of sensible connection with the eastern suburbs, and a good connection with the Circular Quay by tunnel; because the length from St. James'-road to the Circular Quay is only about half or three-quarters of a mile, and in that length you have to secure a fall amounting to 60 or certainly 50 feet. So that any future extension from the Hyde Park station will involve awkwardly steep grades. Nothing can be worse than to have steep grades in the middle of a city and in a tunnel. If there is any part of a line where you should have good grades, it is in tunnels.

1924. *Chairman.*] The height of Redfern railway station is 5½ feet, not 3½ feet? Well, that would reduce the grades, of course. I have had to depend upon the newspaper reports for my information in regard to these matters.

1925. The level of Hyde Park, too, is, I think, only 83 feet? Well, what I was saying about the inconvenience of the Hyde Park site is not affected by the height of Redfern. Assuming that Hyde Park is only about 80 feet above sea-level, my remarks still apply with great force. To extend the line from the Hyde Park site to the Circular Quay, a distance of three-quarters of a mile, would necessitate a tunnel with a steep grade, and the plan submitted by Mr. Deane shows that in order to climb down from the top of the hill at St. James'-road to any point in Woolloomooloo from which a start could be made to an eastern suburbs line would involve a tortuous and dangerous tunnel. As regards the question how the vegetation in the parks would be effected, I have some considerable experience as an amateur horticulturist, and I have not been an unsuccessful one, so far as public competitions are concerned. From my knowledge of plants and trees, I have no hesitation in saying that the close proximity of a railway station to which hundreds of trains are coming throughout the day would materially injure the vegetation in the remaining portions of Hyde Park. I do not think the Members of the Committee will require much evidence upon this point, because they cannot have failed to have noticed the condition of vegetation in the neighbourhood of other railway stations all over the world, with the possible exception of a few in tropical countries, such as that at Colombo, where the number of trains per day is very few, and the rainfall is so frequent, and of such volume, as to give the vegetation a cleansing which it could not get under less favourable conditions. There is one other matter in respect to Hyde Park about which I should like to say a little, though I do not wish to labour this part of my evidence. I have obtained a copy of the *Gazette* notice issued by Governor Lachlan Macquarie on the 13th October, 1810, in which he sets aside this Park as a reserve for public recreation. This proclamation was absolutely municipal in its character. It was a proclamation giving their names to George-street, Charlottc-place, and other parts of the city, and Hyde Park was from first to last dedicated to "the inhabitants of the town of Sydney." I have introduced this matter to draw attention to the proviso in the 58th section of the Constitution Act, which, after vesting, or providing for the vesting, of the entire management and control of the waste lands of the Colony in the Legislature, proceeds in these words:—

Provided that nothing herein contained shall affect or be construed to affect any contract, or to prevent the fulfilment of any promise or engagement made by or on behalf of His Majesty with respect to any lands situate within the said Colony in cases where such contracts, promises, or engagements shall have been lawfully made before the time at which this Act shall take effect within this Colony.

I submit that the dedication of Hyde Park was an engagement or a promise made by the Governor in the name of His Majesty to "the inhabitants of the town of Sydney," and that that land is so eminently the property of the inhabitants of Sydney that it cannot be taken from them without an alteration of the Constitution Act. I desire now to give evidence with reference to a plan which I have here, showing a proposal for a circular route. I propose that the line should travel from Redfern to Darling Harbour by the present route, which might have to be widened—but this is an engineering detail. It might be found desirable to proceed on the eastern side of the head of Darling Harbour; but I suggest that, as the Crown apparently attaches very little value to the waterway at the extreme head of Darling Harbour, judging from the proposals which have been made to fill it up, the line might go for some distance on the western side, and cross from the iron wharf either on an embankment or upon a bridge. This would allow the upper waters of Darling Harbour to continue to be used for barge purposes. The railway might be taken across to near the head of Bathurst-street, and a station might be made on the water side of Sussex-street, close to Market-street. The foot of Market-street is the same distance from George-street as the upper end of Market-street. George-street exactly divides Market-street. From there the line would go in a tunnel 30 chains long to a sunken station at the site of the present High School, Castlereagh-street. To what depth it might be desirable to sink that station I do not know, because I have not the levels. If it were argued that there would not be sufficient length there for extensive platforms, I would point out that if two-thirds of the length of the station were open to the air, a little extension underground at each end would be of no consequence. If you had only the extreme ends of the station in the tunnel, and the centre portion of it open, the lighting would be abundantly good. From there the line would pass under King-street by another tunnel about 30 chains long, and would come out in the Domain, near Woolloomooloo. You could have a station about the site of the Government Architect's old premises; or, at any rate, you could have abundant ventilation there if you did not want a station. The line would be carried across Woolloomooloo upon a viaduct, and it would enter the cliffs at Darlinghurst upon the west side of Dowling-street, and go through to Rushcutters' Bay by another tunnel, which would be about 30 chains long. You could have a station at Rushcutters' Bay, which would be a very convenient position for one. From there the line would follow up the creek in a southerly direction, and you could have another station in the valley, near Marshall's Brewery. Following that route you would have very little

to

to pay for resumption, and you would convenience a vast number of people. From the point I have mentioned, another tunnel about 30 chains long would pass under the crown of the ridge in Surry Hills, and would come out on the west side of Riley-street. From there you would go by viaduct or on the level, as it might suit the engineers, to Redfern station, across the corner of the old burial-ground back to the Redfern station. A circular route such as that would serve an immense number of people, and it would not be necessary to have more than two lines of rails, which is all they have in the underground railways in London. I submit this scheme as being exceedingly inexpensive in the matter of resumptions, as having only four tunnels, none of them over 30 chains in length, and as giving the maximum of convenience, not only to the western suburbs, but to the people of the city, to the people of Woolloomooloo, Potts' Point, Darlinghurst, part of Paddington, and to parts of Surry Hills and Strawberry Hills. On the plan which I have exhibited to the Committee the route is only sketched roughly, because I had not the conveniences at hand for better preparation; but I will do myself the honor of sending to the Committee a map upon which the proposed route of the proposed line will be shown in a more workmanlike manner. I submit that this is a scheme which is worthy of a great deal of consideration by the Committee, and the obtaining of expert evidence with reference to its possibility. Might I also point out that my proposed station at Sussex-street might be made the starting-point for either an outer circular line, which would take in the Circular Quay, Woolloomooloo, and the eastern suburbs, returning through Redfern; or it might be made the starting point for a line on a rising grade to connect with any bridge that might hereafter be built to the North Shore. The eastern suburbs outer circle might also start either from Woolloomooloo or from the station which I have suggested at Rushcutter's Bay. This scheme, I imagine, is quite novel; but I think that gentlemen who are acquainted with the extensive system of underground railways which obtains in London will see the advantage of it, and the line will be above ground to a much greater extent than is the London Metropolitan line. I have also prepared information with reference to the size of the railway stations upon the north side of the Thames. There are something over a dozen of them, and I have in my possession scaled plans of London, from which I have carefully calculated the sizes of these stations. I am surprised to find how small they are. Charing Cross station is as nearly as possible in the centre of London. It is only a few yards from the statue of King Charles, which is recognised for traffic purposes as the central point in the city. To reach any of the London railway stations by cab from this point—of course, I except Charing Cross—costs 1s, which means that the distance is between 1 and 2 miles. The only stations which you can reach by cab for 1s. are the Ludgate station, which has an area of half an acre; Cannon-street station, which is a dead-end station, having an area of about 2½ acres; Holburn Viaduct, which is about 1 acre; and Euston. By paying a fare of 1s. 6d., which means that the distance is over 2 and under 3 miles, you can reach Fenchurch-street station, Liverpool-street station, Broad-street station, Bishopsgate-street station, Farringdon-street station, King's Cross, St. Pancras, Paddington, and Victoria. So that almost every station in London, with the exception of Charing Cross, is more than 2 miles from the traffic centre of the metropolis.

J. C. Neild,
Esq., M.P.
5 Aug., 1897.

1926. *Mr. Roberts.*] But all these stations are tapped by the underground railway? A good many of them are, but not all. Where they are tapped by the underground railway there are, at any rate, some few yards to walk between the underground railway station and the big railway station. For example, there is no station on the underground railway which is near the Cannon-street station, though there are not many yards between the underground railway station and Ludgate station; but you have to cross over the embankment and walk some few yards besides.

1927. The underground railway stations are generally within easy walking distance of big stations? Certainly. That is only an argument in favour of having a central underground system to connect with the larger outside railway systems. I do not know whether the Committee would care to have any information as to the area of the different London stations. Charing Cross station, for instance, which is entered, not by six lines of rails, but by four, is, according to the scaled plans, 7½ chains long by 2½ chains wide, and has an area of less than 2 acres. That station is a thoroughly representative station, and the immense traffic that is carried on there is remarkable, considering the small area available. The largest station of all is probably Euston station, but St. Pancras and Liverpool street stations are also very large. At the station they have platforms one over the other, and the trains come in at different levels.

1928. *Mr. Trickett.*] I was careful to ask you, in the first instance, if you wished to correct or to alter the evidence which you gave before the Royal Commission in April last? Yes.

1929. I now want to ask you if you propose to substitute this new scheme for the scheme which you then advocated? I am inclined to think that it would give a larger amount of convenience.

1930. You are prepared now to abandon your former proposal? I am not prepared to abandon it; but I suggest this as an alternative scheme. The scheme which I submitted to the Commission is essentially a city scheme. The scheme which I submit to-day involves a large area of what may be regarded as suburban district.

1931. Have you looked up the proclamation dedicating Cook and Phillip Parks to the public? No; I have not.

1932. You will remember that in your former scheme you proposed to take Cook and Phillip Parks, and to close up Boomerang-street? Yes.

1933. Do you not think that that would be an interference with public recreation grounds? I do not know the terms under which these parks were dedicated.

1934. The great objection to taking Hyde Park is that it is a breathing-ground for the city, which it would be a shame to interfere with? I do not think that anyone, except the members of the Bowling Club, makes any use of Cook and Phillip Parks.

1935. Therefore, you do not see any objection to their being taken for railway purposes? No; subject to the terms of the dedication.

1936. I suppose you have no idea what number of people come into town daily by way of Boomerang-street, who would have to go up William-street if your scheme were carried out? I suppose the bulk of the people who use Boomerang-street also use Hyde Park.

1937. I fancy that the largest current of traffic is up Boomerang-street and across King-street? I think there is a very considerable traffic down to Market-street; but King-street is undoubtedly one of the principal points aimed at.

1938. The closing of Boomerang-street would create some inconvenience? I think the inconvenience would be about the same whether you closed up Boomerang-street or closed up the Park. 1939.

J. C. Neild,
Esq., M.P.
5 Aug., 1897.

1939. The 13 acres 2 roods 38 perches mentioned by Mr. Deane includes that portion of the south-west quarter of the Park which would be required to give access to the station? Then I must have been misled by the statements made by the Minister in the House, and by the evidence published in the newspapers.

1940. If Mr. Deane has stated that the area of Hyde Park required to be resumed for the purposes of the proposed scheme is only 13 acres 1 rood 19 perches,—I suppose you will accept his figures? Certainly; but I suppose Mr. Deane has not altered his evidence as to the total area of the Park, namely 40 acres. If that be so, it is proposed to take one-third of the Park, instead of nearly one-half as I stated.

1941. I suppose you are aware that the approach from Nithsdale-street to Park-street will not be all tunnel—it will be partly what they call cut and cover? Yes.

1942. That will not seriously interfere with crossings? No; not so far as the footways are concerned.

1943. The line will be designed so as to avoid interference with traffic as much as possible? I did not imagine anything else.

1944. You propose in your new scheme to go from the foot of Market-street to the site of the Girls' High School; I am told that that distance is about 1,584 feet, and that the rise would be about 60 feet;—does not that suggest itself to you as a rather steep grade? Yes; but I think that I said that the station at the High School site would be a sunken station.

1945. Mr. Deane's evidence was that a sunken station would have to be 18 to 19 feet below the surface of the roadway, though he acknowledged that a sunken station would be very undesirable;—that would leave a pretty steep grade? Apparently. On the subject of sunken stations, I would point out that the Adelaide station is practically a sunken station, and so is the Flinders-street station in Melbourne; so that we have at our own doors examples of sunken stations, which are not made the subject of public difficulties.

1946. Does the Adelaide station suggest itself to you as a peculiarly convenient one? No.

1947. With regard to getting to the eastern suburbs, I suppose we are all pretty well agreed that we must start from somewhere about Cowper Wharf or the lower part of the Domain? Yes.

1948. Do I understand from the figures which you have quoted as to the distance of the London stations from the centre of the city, that you are opposed to the introduction of the railway into the city? No.

1949. Then, with what object did you quote those figures, showing the peculiar inconvenience to which the London people have to submit? My object was rather to show that no attempt had been made to bring the great railway systems of the country into the city, and, as was suggested by Mr. Roberts, the underground railway is worked more or less in conjunction with the other railways. It might be inconvenient, and perhaps impossible, to conduct long-distance traffic over what, for convenience sake, I will call my circular scheme, just as it is impossible to take a train from St. Pancras round the London underground line. If you are going to bring into the city the whole of the railway tracks of the Colony, you will require a great number of tracks, and the extension will be an exceedingly costly affair. I think there could be a convenient arrangement of platforms, so that long-distance passengers could change into the circular railway without much trouble.

1950. You are in favour of separating the long-distance traffic from the suburban traffic? Yes; if the suburban traffic can be given more extended convenience. If you are going to have a dead-end station at Hyde Park, let all the traffic come there, and have done with it.

1951. It is hardly fair to say that you will have a dead-end station at Hyde Park, because, if you study the evidence taken by the Royal Commission, you will find that the proposed scheme was designed so as to work in with a future extension to the Circular Quay and to the eastern suburbs? According to Mr. Eddy's evidence that would be at the end of twenty years.

1952. This is Mr. Eddy's evidence:—

Then the Hyde Park scheme, as far as St. James' road, would admit of the extension of the line northward, or to include the eastern suburbs? That is so.

Your opinion is that it should be so carried out? Yes; Mr. Deane has promised to arrange the foundations so that that could be done.

—? I admit the accuracy of your quotation; but will you allow me to draw your attention to question 2707:—

If, at the end of twenty years, it was found that the 10 acres were inadequate, what course would you suggest? The extension of some of the lines through the station to the eastern suburbs; and when that was found insufficient, the construction of a local line either alongside or on the western side of the city, or wherever it was found then largely-increased business required the new accommodation.

1953. I understand Mr. Eddy there to be referring to the contingency of a great increase in the traffic;—he does not say that there should be no extension to the eastern suburbs for twenty years? That seems to me the strong implication. The evidence to which I refer was given subsequently to that quoted by you.

1954. *Mr. Wright.*] Will you look at question 2655—

And without taking any more of the Park it would be possible to provide for additional accommodation for the expansion of the traffic? As I have previously said, I would not contemplate taking any more of the Park for railway purposes than is now suggested. When the time came for increasing the accommodation it would have to be increased by adopting some other scheme.

—? I have not suggested in any part of my evidence that there was any proposal to take any more of Hyde Park, or any likelihood of more being taken.

1955. *Mr. Trickett.*] I would like to read to you this portion of Mr. Deane's evidence (Questions 15 and 16, Committee evidence)—

If it is required at any time to extend two of the lines to Circular Quay, or to the eastern suburbs, it can be done without any lowering whatever. The two lines on the eastern side of the station will just be brought together and carried through the end of the building. The level of the top of King-street would be sufficiently high to enable this to be done without interfering with the surface.

You regard that as very important—the ease with which the eastern suburbs and Circular Quay can be approached from the station without any alteration of the level of the stations? I think it is a very important point. I did not notice it before.

—? That statement does not seem to me to involve anything more than the point that the station arrangements at Hyde Park would be more convenient than was originally contemplated. It does not seem to me to affect the question of connections with the eastern suburbs in the slightest; in fact, it makes things rather worse, because the starting-point would be at a higher level than would have been the case under the original proposal.

1956. *Mr. Black.*] Mr. Deane has pointed out that an extension to the North Shore would best be commenced from Liverpool-street? I think that a line passing through the western part of the city, and going over to North Shore, would accommodate more people than a line on the eastern side of the city. The bulk of the business of the city is done on the western side of Pitt-street.

J. C. Neild,
Esq., M.P.
5 Aug., 1897.

1957. *Mr. Trickett.*] I have put these questions to you to show that we have not lost sight of the question of future extension? I understood that the question had received consideration at the hands of the Commission; but it does not occur to me that the evidence given by the railway authorities, with reference to an eastern suburbs connection, is at all of a satisfactory character. Mr. Deane's replies on the subject seemed to me to have been essentially vague.

1958. I suppose you are aware that two of the eastern suburbs municipal councils—Woollahra and Waverley—have passed resolutions in favour of this scheme? I think that the Woollahra Council passed a resolution of that kind by a majority of one vote.

1959. Paddington passed an adverse resolution; I forget what Randwick did? I have received no intimation, except through the newspapers, as to what has been done.

1960. There has been no public meeting on the subject in Paddington? No.

1961. Seeing that the Engineer-in-Chief for Railways and the late Mr. Eddy put it as almost a *sine qua non* that we must either bring the railway to Hyde Park, or leave it at Redfern, which would you be prepared to vote for? Will you allow me to say that I am not aware that either the late Mr. Eddy or Mr. Deane had given evidence of so absolutely positive a character as your question would imply.

1962. Mr. Eddy's evidence was very much to this effect: that if he could not get the railway carried through to Hyde Park, he would make the best arrangements he could at Redfern, until the people became educated up to giving up Hyde Park? If he did say that, I am not prepared to accept his statement without question. May I refer you to the very positive statements made by him and his colleagues with regard to the absolute necessity for the construction of wharfs and so on at Darling Island, which induced the Government to pay £135,000 for that property. This Committee, however—and I was a member of it at the time—thought that there was no necessity for these works, and the Secretary to the Railways Commissioners afterwards stated here on oath that the necessity previously alleged to exist did not exist. That appears to me to show that it is possible for a gentleman, even so highly placed, and so eminently able as the Chief Commissioner, to be under a misapprehension. If he was under a misapprehension in one case, I submit that he might have been under a misapprehension in another.

1963. Do you think that the Commissioner may have erred upon this matter? There is no scheme so absolutely perfect that a compensating scheme cannot be found.

1964. As a preliminary to an extension of the railway to the eastern suburbs, do you recognise the necessity for bringing the railway further into Sydney? You could not usefully connect with the eastern suburbs without bringing the railway further into the city.

1965. You do not know that any public meeting has been held in the eastern suburbs to protest against the scheme into which we are inquiring? No; neither do I know that any public meeting has been held in any of the railway suburbs in favour of the scheme.

1966. I do not quite see the bearing of your statement in regard to the distance of Queen-street, Woollahra, from Park-street and from Redfern? While the Hyde Park scheme may admit of future extension to the eastern suburbs, that extension is not now proposed, and we must look to the advantage, if any, the proposed extension to the Park will give to the eastern suburbs.

1967. Mr. Parry, the Railway Traffic Superintendent, who, I believe, is recognised as a very able administrator, stated to us that the shape of Redfern yard increased the difficulties of dealing with traffic there, and that those difficulties would be obviated if they had long straight platforms for the accommodation of the trains? That would involve having a separate line for each platform.

1968. No; there would be six lines with platforms on each side of them? Of course, that would be an engineering detail. The improvement of the Redfern yard would involve the widening of the tunnel there. At Charing Cross there are only four lines of rails entering the station; but there must be a great many more than four platforms. I noticed that Mr. Parry made a great deal more of the dangers of the Redfern yard than the late Mr. Eddy did.

1969. But you do not compare Charing Cross, which is purely a passenger station, with a station like Redfern, which is also a goods and produce station? I do not think that the goods traffic should be taken to Redfern. It is neither a useful nor a convenient arrangement. In submitting examples of London stations, I do not submit them as absolute comparisons. I only submit them for what they are worth in the way of comparison. There are so many thousand points of difference that no one would allege that the conditions were equal.

1970. Will you look at question 203 of the Committee's evidence:—

In the event of the railway being extended from St. James'-road, what route would you adopt for an extension to the eastern suburbs? The map which is attached to the report of the Royal Commission was made at its request, in order to show what lines were possible. It is not to be understood that I recommend that all these lines should be carried out; nor should I, if I had to consider any one particular line, necessarily follow the location of the lines put down there to a few feet, or even to a chain or two. With regard to an extension to the eastern suburbs, the line which is shown there roughly indicates the way the extension would curve off to the right. It is very likely that it would be shortened, and might have a location further south, but there is no difficulty about getting away under the District Court, or the Hospital, or the Houses of Parliament, or wherever we may like to go. You only have to continue the lines on the eastern side of the station without altering their levels, and you get under King and Macquarie streets with plenty of depth.

That would very much shorten the route to the eastern suburbs? Yes; but it would seriously increase the grades.

1971. *Chairman.*] If you did not go right down to Woolloomooloo Bay you would not require so steep a grade? No; but against that is the fact that the further you get from the water's edge the more costly the resumptions.

1972. *Mr. Trickett.*] Since you were before the Royal Commission, have you made an estimate of the probable cost of the scheme which you then advocated? No; that is too expensive a thing for a private individual to undertake.

1973. Have you made any estimate of the probable cost of your present scheme? No; that is purely an engineering matter. It would be a very costly thing to make such an estimate.

1974. Which of your two schemes, in your opinion, is the better solution of the difficulty? For passenger purposes, I should give the preference to my circular scheme.

J. C. Neild,
Esq., M.P.
5 Aug., 1897.

1975. Will you briefly summarise your objections to the scheme referred to us by Parliament—the St. James'-road scheme? I think that, in the first place, it involves a serious and improper interference with a very valuable park, which, in my view, is the property of the citizens of Sydney. Secondly, while it admits of extensions, it is objectionable because it will provide a dead-end station. I admit that something else may follow; but we have no proposed extension before us now. I am dealing with the scheme before the Committee *per se*. I object to it on account of the dead-end station which it will provide. Then, too, it will not convenience the western side of the city at all, and it does not appear to me that it will be convenient for a future extension to the eastern suburbs. Another objection to it is that it does not permit of an extension from Hyde Park to any proposed North Shore bridge, except by passing over the heart of the city at an undue elevation. The only way in which you could connect with North Shore by a bridge would be by taking a line through the western portion of the city, and such a line would convenience more people than the proposed line. The present proposal may also be objected to inasmuch as the running of the trains will interfere with the vegetation in that part of Hyde Park which will be left, and will interfere with places of worship and public buildings adjoining the Park. Another point which might fairly be considered is this: It is the invariable fate of railway station centres to become also the centres of small business tenements. To have a collection of small places of business, eating shops, provision shops, and places like that, right in the heart of a big city like this, would be a detriment for all time. Looking at the matter from the standpoint of the stateliness of the city, I think that the construction of a big station in Hyde Park would be a deplorable thing.

FRIDAY, 6 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

John Horbury Hunt, Architect, sworn, and examined:—

J. H. Hunt.
6 Aug., 1897.

1976. *Mr. Clarke.*] You were examined before the Royal Commission upon the 23rd April, 1897, with reference to the proposal to bring the railway from Redfern to Hyde Park;—do you adhere to the evidence which you gave on that occasion? I desire to repeat what I then said, so far as the end of the third paragraph from the bottom of page 117.

1977. *Chairman.*] What do you propose to do with regard to the remainder of the statement you then made? I think it might be omitted from the present evidence, but is to stand in the former.

1978. *Mr. Clarke.*] You propose now to begin *de novo*? No; I have fresh matter to lay before the Committee.

1979. Will you proceed with your statement? I will. It is as follows:—

The planning of the proposed station is, in my opinion, an unskilful piece of work, unworthy of a great terminal station for a great city such as Sydney will become. There is much in the architectural treatment of the exterior that is very pleasing.

It is a bit strange how the spirit of economy balances itself in the matter of trying to save money in an endeavour to secure park lands, and then spending money without stint in these station buildings. Pray what is the tower for.

The general planning is as bad as bad planning could be put to paper. May it never get beyond the paper stage of its existence. It is evident that the planning is the work of one brain, while the architectural treatment of the exterior is the work of one other (may I say) higher brain intellect. Spaciousness is absent in the planning, whereas it should be a prominent and ruling feature of the whole scheme, while egress and ingress should be of such ample character as to prevent the remotest feeling of want of freedom of action under the most trying circumstances, even to the demands of a double Eight-hour Day. It is, however, evident that the plan before us will not provide for the pressure of half an Eight-hour Day demonstration.

What is to be expected from this want of provision for ingress and egress, coupled with want of spaciousness. Why, curses upon curses, attended by confusion in all its glory.

I have no fear of competent contradiction of this very severe statement. I should feel myself untrue to my profession and wanting in my duty as a citizen should I hold my peace with such a faulty work as is this now before us.

I will deal with a few details. We have here marked on the plan entrance hall, and figured 54 feet x 36 feet. Now the term entrance hall belongs more properly to domestic architecture, while the above-named dimensions are such as to be found in any fair-sized private house. Many private residences that I have built have entrance halls of larger size than this so-called entrance hall to the proposed great terminal station of the New South Wales railways—a fabric to cost over £200,000.

While its chief entrance is planned at 54 feet x 36 feet, it is made of much less practical working value by having but one opening thereto of the great span of 20 feet for the means of ingress and egress. Make no mistake about it, gentlemen, the whole of the inward and outward foot traffic to this station will have to squeeze through this 20-foot hole. And then when the crush of outward traffic has cleared the outer 20-foot hole it is even then not clear of the walls of the station, but is met by a screen-wall of the covered way, along which you have to travel more than 100 feet to the right or the left before you are free of the station, and this among vehicular traffic in a confined space. To criticise such bad planning is enough to make a fellow use the strongest unparliamentary language.

I repeat that the whole of the traffic will have to pass through this 20-foot hole, except, of course, those who go by cab or carriage to the Elizabeth-street side of the station. There are, I must in fairness admit, two other small side entrances far away from this main one, but they are about the comparative size of a back entrance to the yard of a small villa.

Next defect, and a cardinal one, is that the station is placed in a cramped corner. There is not, and cannot be made, a proper street outlet for the going and coming traffic, not even for the present-day service, to say nothing of that of the morrow. The Elizabeth-street side of the station is of no practical use to the general public, except those going to the station by cab or carriage. Here again, in this very simple matter of providing for a cab approach, the want of knowledge in the art of good planning is evident. Why the cab approach to the old station is far and away before this proposed new one. Coming around to the main front, we find fully one-half of its length jammed into an embankment, and retaining-walls 20 feet high or deep. This is the very worst feature about the whole scheme, and is inevitable to the site. Here, again, there is no proper or sufficient get-away for traffic to and from this the main entrance; and further, let it be clearly put

put before the public, the undisputed fact that there is but this one side entrance to this station, namely, Elizabeth-street—the Park side is all buried against Park ground at a depth of from 20 to 25 feet above platform levels, therefore no public entrance can be had on this side—another inevitable bad feature of this site.

To grade the surface of St. James'-road from the Queen's Statue to the level of the main entrance (a fall of about 19 feet) cannot be properly and efficiently done, even by removing the Registrar-General's offices; in any case this block of public buildings must come down, or there will be no approach whatever to the station. Here is another obstinate feature of this jammed-up site.

Stronger evidence is before us of how cramped this site is—notwithstanding it carries a high-sounding title of roominess, namely, "Twelve acres of Hyde Park;" nevertheless it is not the site for a big terminal station, because you have not the required distance from St. James'-road to Park-street to get under that street without raising up some 9 feet, which will not be permitted, depend on that. The Sydney Corporation have from time to time been cutting away at this particular part of Park-street so as to ease its grade as much as possible; to lift that street up above its original level will not be tolerated, for this is one of the main approaches to the city from the eastern side. It is just a bit too much liberty for the Railway Construction Branch to take with this principal street.

To get under Park-street at its present level then, the station will have to be what is termed an underground station, which we all know has been condemned by the late Chief Commissioner, and to support his condemnation he told us that the Lancashire and Yorkshire Company spent close to £1,000,000 to bring their station to street-level by only a few feet. This Park scheme has these two difficulties confronting its promoters, namely, Park-street levels, and the below-street level for the platforms of the station.

Here is one other objectionable feature, and one which will seriously affect the pedestrian traffic from the eastern suburbs via Boomerang-street across the Park to Market-street—a traffic not to be thoughtlessly ignored by the Department; a traffic increasing year by year, which is now to be cut off by the station buildings, and slot along an overhead bridge 400 feet long, and of the capacious width of 15 feet. Double this width and you will be near the proper dimension. Are we not to utter a grumbling word as to the smoke we are to be enveloped in while crossing this overhead bridge with dozens of engines passing and repassing under our feet,—for there will be no turning to the right or to the left to avoid such a nuisance—ladies and gentlemen coming to business, wearing bright, clean, linen, will not be very presentable after walking 400 feet through smoke and moist steam. The unthinking public are having, permit me to say, dust cast into their eyes by the advocates of this scheme, while they are being misled by the arguments advanced by the Department; and not until the scheme is completed will they be able to see that they have been misled, and a big mistake made in a big national work.

One other prominent feature of defective planning is to be found in the main colonnade to the St. James'-road end of station, which is shown by figures to be 15 feet wide. Twice that width would not be too large for so important a feature. Better wipe the colonnade clean out of the plan unless it be of a proper width, and thereby save its cost. Step by step we find evidence that there is no real conception of the requirements of a big terminal station.

The evidence that has been given by the Department in the matter of protecting the rails in the deep cutting through the other section of the Park is as amusing as it is impracticable. They speak of them as "openings"—this is a deceiving word. The rails passing along this deep cutting must be well and securely protected, or we will have to record year by year many serious accidents and loss of life. An accident in a deep cutting is more serious than in the open. To erect great high walls, as has been proposed, will never be tolerated, because it will give this part of the Park the appearance of gaol grounds. All this is on a par with the many other bad features of the scheme.

Mr. President,—I have no hesitation in making these very unfavourable and strongly-expressed statements. They are, I think, fully warranted by the great public importance attached to the scheme.

I have no quarrel, and never have had with any of the departments. I am acting in this matter in the frankest and freest manner with all good-will towards those with whom I am compelled to differ.

I have had a long term of practice in the profession of architecture; therefore the knowledge thereby gained as to the fitness of these things enables me to judge correctly of what is here before us.

The evidence given by the late respected Chief Commissioner would lead one to believe that he considered Hyde Park an exceptionally fine site. I happen to know different to this.

Mr. Eddy, being a neighbour, I had the advantage of many talks on this subject while on our way home or coming into town of a morning. More than once he has told me he had no desire to go to Hyde Park, except on the score of saving money. During one of these conversations about the later part of his first term, he said "If the Government vote me the money required I will make at Redfern, in conjunction with the Asylum site, one of the finest stations in the world."

The plan on the screen has been prepared by me, in skeleton outline only, to show what can be worked out by the Department if they are so disposed.

I propose to add to the Redfern grounds all the land bounded by Pitt, Devonshire, Elizabeth, and Hay streets, and thereon place the terminal station, or, in other, and more correct words, the great central station of the Colony, and of a dimension to last longer than twenty-five years—a period not much longer than required to wear off its newness. It appears but yesterday that I was at Redfern with Mr. Young while he had the present station buildings in hand. What then is the span of twenty-five years in the life of a nation, when to man it appears but a day or two.

The plan I am placing before you requires a little explanation, being only in skeleton outline. The proposed new station is to start from the northern end of the Redfern station, which is to be retained and connected therewith if thought advisable. The new station to be moved a little to the east or west to fit the old station. The new station to be 1,200 feet long by 725 feet wide; the main or central portion is 1,200 ft. x 450 feet, exceeding the proposed Park station from St. James'-road to Park-street in length by 42 feet and 66 feet in width. The suburban railway line is indicated on plan by red lines, to be carried into the city as a circular railway for the city traffic only, with no other provision.

Route through the city shown on this other plan of the city by red lines.

The whole length of this city line from the central station will be about 256 chains. 160 chains of this will be in tunnel, divided by four daylight stations. Of this 256 chains, only 24 will be by tunnel under private property, with but 20 chains of resumption for the whole line, and this through the poorest part of the city, namely, Wexford-street.

The inward traffic will first stop at the new markets; next at Wynyard-square. Here I would take the whole of the square and as much of the side-streets as may be thought necessary, so as to make this the chief stopping-place. I would resume 50 feet or more frontage in George-street right through to the square, as indicated on the plan, making a direct entrance from the level of George-street to the Wynyard-square platforms. On this site, from George-street to Wynyard-street, could be built the offices for the Commissioners, a much more convenient site for the general business public than at the out-of-town site Hyde Park.

The next stopping-place would be at Mort's Statue, as shown on plan. The Department may say this spot is at too low a level. My reply is that true engineers do not know of, nor do they admit, the existence of insuperable engineering difficulties.

The last stop is at Phillip Park, thence on to the central station.

I contend that this is the least expensive scheme yet proposed. It is strictly a city circular railway. The whole length of the line passes under public property, except the aforementioned 20 and 24 chains.

On the authority of the Engineer-in-Chief (questions 180-181) two sets of rails are here proposed, which will make all secure as to foundations of buildings to those streets under which we tunnel.

When the trains arrive at the chief station they are to be taken on to the city by electric motive power, as referred to by the Engineer-in-Chief (question 1159). There being so many daylight stations (four), there will be no difficulty in ventilating these short tunnels.

Next to the railway comes the tram service. The George-street tram will be a great feeder to the railway if properly handled. I have shown the tram-lines per black broken lines, the George-street line coming into the main station—in the basement looping around and joining George-street as shown. The platform of the tram will be but 10 feet below the station floor. The Elizabeth-street tram, indicated as before, comes into the basement, also stops there for the return journey, as at present at Redfern.

Cab and carriage roads for the inward and outward traffic are placed on the right and left hand of the station, and do pass through it. They are shown to be 60 feet wide, which is too great a width and may be reduced. These roads are distinct from each other for their whole length, also for their approach towards or going from the stations. This is an important feature. The pedestrian traffic is in like manner provided for by paths 60 and 40 feet wide.

Devonshire-street to be made 80 feet wide, and lowered as proposed by the Department. There need be no difficulty in grading this street into George and Pitt streets, and made fit for all ordinary traffic.

Pitt, Hay, and Elizabeth-streets here shown to be made 100 feet wide.

J. H. Hunt.

6 Aug., 1897.

J. H. Hunt.

6 Aug., 1897.

All the portion of the city, tinted yellow, known as Flagstaff Hill, will some day be resumed and levelled down. Then on this portion of the city, as here indicated, the true site for a city station will be found to be connected with the present proposed line, as shown on plan per blue lines.

The connection with North Shore should be by a high-level bridge from Ball's Head, as here shown. The Northern railway traffic will some day have to be brought into Sydney *via* North Shore, and by the route here indicated. I submit to you no estimates. That would be too big a gratuitous work. I do not believe in approximate estimates. They only lead to trouble.

I am, however, of opinion, that the re-sale of a portion of the land set apart by my scheme for new station, and not required for same, will more than pay for the resumption of the whole of the Asylum site properties, also for compensation and resumptions in connection with the extension of the suburban line into the city. The four city stations will all be inexpensive structures.

The George-street portion of the Wynyard-square station can be so designed as to bring in a rent that will fully pay the interest on the outlay for building the Railway Commissioners' offices on that site. By this scheme the Central Station will be relieved of all these expensively-designed offices attached to the Park scheme—and become little more than an area roofed over—the money thus saved in those proposed offices of the Hyde Park scheme will pay for the extra foundation work and all the retaining-walls belonging to the proposed central station, thus my scheme can be made to embrace only the cost of line construction with ordinary provisions for stations.

I am of opinion, and have proof to support that opinion, that all rival schemes to those of the Department are loaded down with big figures; take for instance the valuation of the properties on the Asylum site, which is excessive to a degree, and what is to be expected from an officer who admits that he had but a few hours given him for the work. To make matters still worse he puts down twice as much as would be required to provide accommodation elsewhere. All this tends to make the public believe that the Hyde Park scheme is in comparison the least-costly to the State, which is not so.

I have not marked on this skeleton-plan any grades; they have, however, been studied, and considered in all places to be practicable. It cannot be fairly expected of a man in private practice to go in this gratuitous manner into all these minute details pertaining to so important a work after the manner shown by these elaborate drawings prepared by the Department. I submit that this scheme of mine, while not in every respect my own (it is the result of studying other schemes), is worthy of being developed by many drawings, and in a fair and honest manner by the skill of the Department—or myself to be commissioned by the Government for the purpose—so that it may be brought into fair competition with the Hyde Park scheme.

How are you, Gentlemen, or the Members of Parliament, to correctly judge of this question if some opposing plan to that of Hyde Park is not developed in the same elaborate manner as has been done for the Departmental scheme.

There is one fallacy about this Hyde Park scheme which should at once be exploded, and that is as to the additional revenue to be gained by its adoption. It is well-known that the suburban residents are discontented as to the rate of fares at present existing, and they will not be satisfied until a reduction is made, then away goes this great public lever used at present in lifting this Hyde Park scheme into favour.

In concluding these somewhat severe remarks, I must beg of you, gentlemen, to clearly understand that I am not prompted to this position by any antipathy to any Government officer. Few men have, during the past thirty or more years, been more courteously treated than I have by the officers of the Service; I am no enemy of theirs.

In order to enable the Members of the Committee to judge for themselves of the defective planning of the Hyde Park railway station, I will point out that the passenger traffic to and from the station must pass through an archway only 20 feet wide. The entrance hall is described as 54 ft. by 36 ft.; but it is narrowed down by an opening of 20 feet, through which the passenger traffic must enter or leave the station. The covered approach marked upon the plan is for the use of vehicles. When first I looked at the sketch of the proposed building, I thought that I was wrong; but I now find that what would appear at first sight to be an opening beyond this covered approach, is blocked by a screen-wall.

1980. Does the plan give sufficient room to enable passengers to get to and from the station with comfort? No; it would cause the greatest discomfort. The colonnade is figured 15 feet, but drawn to 11 feet. If it had been drawn to 15 feet, it would be narrowed down by the thickness of the walls, which you cannot put at less than 3 feet thick. That makes the colonnade really only 12 feet wide, a width which will not give decent elbow room. It is monstrous to think of a crowd passing through such a colonnade. When the public pass out into the covered way, they are amongst the cabs and carriages. Why not give a direct opening in the front of the building, and make it twice or three times 20 feet. Let us see what entrances there are. To the east, there is a little rubbishy entrance where the passengers have to pass by the urinals, with their stink and unpleasant surroundings. You have an idea of what the approach to this main entrance will be like when you compare it with the street and the flight of steps leading down in front of Mort's warehouse, remembering that you have here about twice the height to contend with. On the western side there will be two more small rubbishy entrances. As regards the cab road, could anything be worse than a circular approach such as is shown on the plan.

1981. Do you consider that there is sufficient room for the public, after you get away from the station? Not to my way of thinking.

1982. Are you aware that it is proposed to open the street between Elizabeth-street and Castlereagh-street across the High School grounds? I have read so. That would empty the traffic into another street, where it would be jammed up again.

1983. But would it not to some extent get rid of the difficulty of dealing with it in St. James'-road? It is not enough. I had the opening you speak of in my mind when I was writing the statement which I have just read. The front main platform is figured as 60 feet; but it is narrowed down to 43 feet;—what is 43 feet of width for a crowd. The offices could not have been put in a worse place than they are. I could put before you—but I would not like to do so, because it would not be acting according to professional etiquette—prize plans of railway stations designed by pupils of the Home or American Architectural Societies, which would put this plan to shame, infinitely more commodious and better arranged than the plan before the Committee. The Department has the same opportunity of knowing these things as I have.

1984. You stated that Park-street would have to be raised 9 feet; but Mr. Hickson says that it would only have to be raised 3 ft. 6 in. That is the evidence he gave before this Committee on the 13th July? Well even that will not be allowed. 9 feet may be too high a figure; I am, however, certain 3 ft. 6 in. is just as too tight. The approach to Park-street is quite steep enough now, without your making a camel's back of it.

1985. In your scheme you propose to have the main station at Redfern on the Benevolent Asylum grounds? Yes.

1986. With a stopping-place at the back of the markets? Yes.

1987. From there you would go to Wynyard-square? Yes. I would have a stopping-place at Wynyard-square.

1988. Are you aware that Wynyard-square could not be taken for a railway station? I am not in sympathy with the constitutional opinions which I heard expressed yesterday.

1989. Wynyard-square is in a different position from Hyde Park;—when the Barrack-square was sold, in 1849 or 1850, I was present at the sale, and I clearly remember that it was stipulated that Wynyard-square was to be reserved as a park for the benefit of the purchasers of the adjoining lands? I know that is a very common stipulation;—does it not also apply to Macquarie-street property. J. H. Hunt.
6 Aug., 1897.

1990. No. The old Barrack-square was sold upon the stipulation that Wynyard-square should not be taken from the people without their consent? Well, I know that when the Exhibition was built the property-owners in Macquarie-street raised the objection that it could not be allowed to remain there, because they had purchased their properties upon the understanding that that site should be kept open. I do not propose to build anything on Wynyard-square above street level or in any way which would depreciate the value of the surrounding property. My proposal would rather add to the value of the surrounding property.

1991. The people would not consent to the resumption of the Park unless they received heavy compensation? Very good; if the Government could not get the land without paying compensation, they could afford to pay for it. I say, however, that all the properties round there will be very much improved, and the owners of them should pay tribute to, rather than receive compensation from the Government.

1992. You propose to have another station at Mort's Statue? Yes, passing under the street into the Education Department's grounds.

1993. Have you taken into consideration the cost of the necessary resumptions? No. If you give me a commission I will go into matters of cost.

1994. Have you taken into consideration the cost of the construction of the line? I do not believe in giving approximate estimates. To obtain an estimate of any value more elaborate drawings than I have put before the Committee would have to be prepared.

1995. You are entirely against the proposal referred to the Committee? Yes, as to the Park scheme.

1996. It is unfortunate that you cannot give us an approximate idea of the cost of your scheme—we have an estimate of the approximate cost of the scheme submitted by the Commissioners? I repeat that is asking too much from a private person. In my private work I have always avoided giving approximate estimates, because it is a most dangerous proceeding; it always gets you into trouble. But, as you know so much more than I do about the evidence given before the Committee, I am with you in trying to make out an approximate estimate. It must, however, be a partnership estimate, and you must bear the larger share of the blame for errors. Your officer, Mr. Deane, on page 9 of the evidence given before the Royal Commission, puts down for resumption of land £100,000. In regard to that item, I say that with my scheme there will be a sufficient amount obtained from the proposed re-sale of property at Redfern to pay for all the other resumptions, so that we can wipe out the cost of resumption altogether. With regard to the construction of the line, Mr. Deane puts down, in round figures, £300,000 for six sets of rails. I propose to have two sets of rails, which would cost about one-third of that amount. But, inasmuch as my line would be three times the length of the proposed line, the total cost of construction might be put down at £300,000. Then it must be remembered that it is much more expensive to cut tunnels than to bring the line by what you term a "cut and cover." You might put down another £100,000 for the tunnel work in my proposal, which would make the total cost £400,000.

1997. You stated that you thought the officials who had brought out these plans had not taken sufficient time? No. I referred to the valuation given by the Government Architect on page 68 of the Commission's evidence, where he says, "In accordance with the request of the Chairman handed to me yesterday." It is the words "handed to me yesterday" that I wish to direct your attention. I take exception to the whole of the valuations which follow, especially since it is stated further on that all the buildings there are dilapidated. I think that the figures are exorbitant.

1998. I suppose you understand that the estimate of £48,900 does not include the value of the land? I understand that.

1999. *Mr. Black.*] I think you could put up new buildings for that amount? I would like to be commissioned to rebuild all the buildings there for the £80,000 that is put down. In these bad times, I should think myself very lucky to have such a contract.

2000. *Mr. Lee.*] Regarding the alleged defect in the architectural planning of the proposed station buildings at Hyde Park, could not a defect of that character be overcome? I would overcome it by putting a sponge over the whole design and wiping it out, commencing *de novo*.

2001. But if this were the only difficulty in the way of the acceptance of the proposal it could be overcome? You have not room to get sufficient accommodation on that site, and to get away under Park-street.

2002. But you contend that there is not sufficient room allowed in the proposed design for the ingress and egress of passengers? Yes; and if you make sufficient provision you must take away so much from the length allowed for railway working. To get more accommodation you must go back on to the railway lines.

2003. That would not affect the opening you spoke of? No; but the whole plan is jammed up. Their starting-point was Park-street, but they found that they tied themselves up so much that they had to curtail their plan, and also set to work to put on figures to make up for their defective planning.

2004. Your suggestion is practically the same as that which you laid before the Royal Commission. You would bring the suburban traffic right down to Flagstaff Hill, cutting down Flagstaff Hill for that purpose? I do not propose to cut down Flagstaff Hill just at present. We could not afford to do it; but I want that to be looked to as a future development.

2005. The Committee would be quite unable to recommend your scheme without an estimate of cost. Any recommendation they may make to Parliament must be accompanied by a recommendation of cost? Let me call your attention to Mr. Deane's evidence:—

Have you any scheme prepared yourself? No; I do not propose to submit any scheme. I merely propose to take any instructions from the Commission to look into matters.

I suppose you are prepared to criticise any scheme which may be submitted? From an engineering point of view.

I want him to criticise this scheme, and you to give him instructions as to estimating the cost.

2006. You suggest that an estimate of the cost of your proposal should be prepared by the Departmental engineers? Yes. I should think that the Department, with the materials which they should have at hand, would be able to give you an approximate estimate in a few days.

2007. That is the course you suggest should be adopted? I think it is the proper course. It is the most reliable course, and their evidence would carry the most weight.

- J. H. Hunt. 2003. With regard to the land to be resumed, on what basis should it be valued;—would you accept the municipal valuations, or the valuations of the Commissioners of Taxation? That is a matter for your officers to decide.
- 6 Aug., 1897. 2009. I thought you took objection to Mr. Perdriau's valuation? No; I only spoke of the Government Architect's valuation. Being an architect, I am in a better position to criticise that valuation than I would be to criticise a land valuator's work.
2010. But, as an architect, you have for a long time been engaged in valuing land? No; that work is now taken away from us. Our profession now is reduced to one dealing with bricks and mortar only. We cannot give evidence in the Law Courts in regard to land valuation.
2011. You suggest that the land should be valued on the most approved modern plan? It should be valued by the land valuers of the Department.
2012. The land which will be resumed under the Departmental scheme lies between Liverpool-street and Gipps-street? That resumption will also apply to my scheme. Then I take a portion from Campbell-street diagonally across to George-street, at its junction with Goulburn-street, where the buildings are all occupied by Chinamen. You will also have to pay compensation to get under the little piece of property between Margaret-street and George-street.
2013. Would any resumption be necessary for your proposed station at the markets? No.
2014. All your city stations, although daylight stations, would be underground? Yes.
2015. *Mr. Fegan.*] You said that the construction of a station at Wynyard-square would increase the value of the surrounding property;—would it surprise you to hear that several witnesses have stated that wherever large railway stations have been constructed the surrounding property has very considerably depreciated? I know that. Such evidence bears upon stations like the station we have at Redfern, where you have steam-engines at work. On my proposed line I would adopt the American system of using electricity, with its quietness and cleanness, and all its other advantages.
2016. Where would you change motors? At Redfern.
2017. That would mean a delay of a minute or two? There would always be time required by people getting out at Redfern, and the change could be made while they were leaving the train. I look upon the Wynyard-square station, with the opening through to George-street, as the most popular that could be devised. I have mentioned it to two or three George-street people, and they all approve of it. You could erect a building of several storeys, using the greater part of it for offices for the Railway Commissioners, and you could let the two lower storeys.
2018. Then an increase of revenue would result from your scheme? I think so.
2019. Why should there not also be an increase of revenue as the result of the Hyde Park scheme? Because when people are in Hyde Park they are not in the heart of the city. The line I propose would take them right through the business parts of the city, and they would get out at the various stations I have provided for.
2020. Would not your line interfere with the George-street electric tram? No; the tram will always pick up street traffic. It will accommodate people travelling short distances in the streets.
2021. You believe that the route you suggest is better than the Hyde Park scheme, and would give more convenience to the people? I am sure of it.
2022. *Mr. Trickett.*] Do you still adhere to your proposal to cut down Flagstaff Hill, and to take the railway there? I want it to be clearly understood that whatever we do in the matter of railway extension now, something else will be required within the next twenty-five years; and it will be a pity not to show a little forethought and foresight in regard to these requirements. The levelling of Flagstaff Hill has nothing to do with the present scheme; but I look upon it as a development of that scheme.
2023. You are as vigorous an opponent of the Hyde Park scheme as ever? Yes; I want Hyde Park to be a city square, and a site for our great buildings. It is not a place for loafers or a breathing-space; it is a place which must become a great city square, surrounded by public buildings. Seeing that the city was originally laid out in so barbarous a manner, it seems almost an act of Providence, intended to benefit architects, that this magnificent park should have been reserved for a city square.

Alexander Wilson sworn, and examined:—

- A. Wilson. 2024. *Chairman.*] You are a resident of the City of Sydney? Yes.
- 6 Aug., 1897. 2025. *Mr. Lee.*] You desire to give some evidence with respect to the proposed extension of the railway into the city? Yes. I wish to give evidence in support of the scheme referred to the Committee. Recognising the very strong sentiment which exists for the preservation of Hyde Park, and sympathising with it to a great extent, I have endeavoured to make a suggestion which will get over the difficulty which the proposal to take part of Hyde Park for a central railway station has created. My scheme is shown on the map I now hand in to the Committee.
2026. Will you briefly outline your proposal? I propose that the Government should resume the whole of the blocks enclosed by Liverpool-street, Elizabeth-street as far as Gipps-street, Macquarie-street South, and a line which is a parish boundary, and is almost conterminous with the main part of Foster-street. I also suggest the resumption of the little block upon the ridge between Randall and Devonshire streets. I believe that the Royal Commission recommended the extension of the Elizabeth-street tram to Devonshire-street; but I am not sure by what route. I propose that the tram-lines should be taken straight along Elizabeth-street to Prince Alfred Park, though the hill at the end of Elizabeth-street would have to be cut down, and, in order not to disturb the levels of some of the other streets there, resumptions would have to be made. I suggest the resumption of the whole corner. One feature which has not been noticed, I think, in this connection is the congestion of traffic in Oxford-street, especially upon race-days. I find, however, that from Hyde Park corner—that is, the Liverpool-street corner—to Randwick by the present tram route is only 20 chains shorter than by the route going straight up Elizabeth-street. The Elizabeth-street route would have the advantage that there would be no grades to speak of. Thus you would save the Oxford-street hill, and you would not mix the Randwick traffic up with any other tram traffic, except the Botany traffic. I feel sure that the trams could run the extra 20 chains in the same time as, if not in five minutes less than they take to make the journey to Randwick now. This is a matter which I think must force itself upon the attention of the authorities every day. My proposal would also relieve the tram traffic in the upper end of Pitt-street, and would avoid a certain amount of the danger which occurs in shunting trams from one line to another near the Redfern terminus. Even if it took two or three minutes longer than it takes at present to reach Randwick by the route I propose, there would be a gain in the lessening of traffic in Oxford-street.

2027. Do you think that is a matter connected with this inquiry? I think that any scheme for the opening up of new roads should have the general improvement of the city traffic in view. The narrow ridge along which Oxford-street goes is the only way out of the city to the east and south-east, and all the traffic you can divert from that road the better. Upon race-days it is specially important that Oxford-street should be relieved.

2028. I notice that you propose the resumption of properties above Wexford-street? That is included in the resumptions necessary for the line. There are several churches and a public school on that block, but I do not see any reason for removing them. I do not set up as an expert upon the subject of land values, but I have consulted, though merely in a friendly way, a gentleman who is one of the recognised authorities upon this subject in the city. As to the value of the buildings, neither of us could go into that. The block which I propose to resume will practically be gutted by the present proposal, and I contend that to have an approach to and an exit from the city through park land for the first $1\frac{1}{2}$ mile, instead of through slums, with views of back yards, is worth paying something for. My scheme would also provide park land where it is more valuable to the resident population than is that part of Hyde Park which it is proposed to take for the railway station. There is a dense population immediately to the east and south-east of these areas, and a great number of people walk through that part of the city every day.

2029. Your scheme would very much disturb the properties near Wexford-street;—that might not be a very serious evil? Yes. The people whose residences would be destroyed might probably be able to find more desirable residences out towards Waterloo, or in other suburbs where they could get more fresh air.

2030. You provide for a continuous line of park from Prince Alfred Park right down to Mrs. Macquarie's Chair? Yes; something like what they have in Adelaide.

2031. Such a park would scarcely be surpassed in any part of the world? I think not, and the resumptions could be made without disturbing any business premises. All that would be taken would be an occasional butcher's or baker's shop.

2032. The properties that you propose to resume are not very high-class, so that the cost should not be very much? I think that the cost should not be large. The country should not feel the expenditure of £100,000 upon a matter like this.

2033. You contend that if this scheme were adopted it would meet with the objections of many good-meaning people to the resumption of any part of Hyde Park? I think so. I wish to defer to their objections to the taking of park land, though it must be remembered that park land is public land, and is to be used, if need be, for any public purpose. A man may have an acre of land surrounding his house, all of it in gardens, but he may later on feel it necessary to keep a horse and trap, and thereupon take some part of the garden to provide for the building of a stable. He says to himself, "We shall have less ground at home, but we shall have an opportunity to go a little further abroad for fresh air." I think that is an analogous case. At the same time, however, I recognise the weightiness of the sentiment against the taking of any park land.

2034. You wish to show that if proper provision is made for increasing the area of park land elsewhere there should be no reason for cavilling at the resumption of part of Hyde Park? I think that my scheme would answer the objections of a large number of people who object to the resumption of Hyde Park, and it will better distribute the breathing-spaces of the city. With regard to the extension of the railway, I have no scheme of my own, but I have formed an opinion in regard to the other schemes which have been submitted. I would like to recall an occasion about sixteen years ago when some members of the Committee and myself were all Members of the Assembly, and there was a discussion upon a motion for the construction of the Public Library, or the Law Courts—I think the Law Courts—at the top of King-street. I remember that the Hon. Mr. Pilcher, who was then a Member of the Assembly, made a speech upon that occasion, in which he asked, "Where did the population ebb and flow, where did the trams bring the people to?" Someone said something about Bridge-street. "Well," he answered, "I grant you that the Commissioner runs the trams down to Bridge-street; but the population flows to King-street," and he argued that King-street was not where the Law Courts should be placed. His remark, however, in regard to the ebbing and flowing of population struck me as very expressive. If the ebb and flow was to and from King-street then, it is three times as much so now.

2035. What do you consider the centre of the city? The corner of Pitt and King streets. I have seen a good many of the big cities of the world, and I have been in New York, which has been referred to in connection with this matter. New York struck me as being very similar to Sydney in its geographical situation and business arrangements. Any scheme for sweeping all round by Darling Harbour with a tunnel here and a tunnel there would not take the traffic away from the proposed extension to St. James'-road. If you had a line going round on the west side of the city to Circular Quay—and you will have some day—the bulk of the people who bring revenue to the railway would still travel to St. James'-road.

2036. Are you of opinion that in the course of a few years the centre of the city will be moved up more to about where the Redfern railway station is? Certainly not. Sydney will grow upwards, but the busiest part of Sydney for all time will be down from Redfern to Dawes Point. The business will become more and more concentrated there.

2037. You have no reason to suppose that the business centre of the city will be transferred to some place further south than Redfern? No. Fifty times the business that is now done can be done within the present business area. If you will look at the map of New York you will see how small the business area is there. There are 2,000 acres of park land within the city of New York. All that land is practically contained in Central Park, which is 5 miles from the post office. The reason why none of the principal railway lines come into the city of New York is that New York is built on an island, to which there is practically only one way of getting, if you except the Brooklyn Bridge. I have read statements in regard to a North Shore connection. When the city has a population of 1,000,000 it will be quite time enough to consider some scheme for coming out of the top of a chimney somewhere about Cumberland-street and crossing to North Sydney. When that time arrives the country will probably be able to pay the cost of the connection. In New York they recognise now that they built the Brooklyn Bridge before they were ready.

2038. In every city larger than our own have you not noticed that no one line serves the entire population, and that it has been necessary to bring in several lines at different points;—will not that be the case here? Yes. The time will come when the Circular Quay scheme will be necessary; but the St. James'-road scheme will meet present requirements. I may add that I have never owned a foot of land in the city or suburbs, and that I do not live in a railway suburb, but as a citizen of New South Wales, when a matter of this importance comes to be discussed, I desire to give my views upon it.

A. Wilson.
6 Aug., 1897.

TUESDAY, 10 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the city, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

John Musson, Civil Engineer, sworn, and examined:—

J. Musson. 2039. *Chairman.*] You are a resident of Sydney and an engineer? Yes.

10 Aug., 1897. 2040. *Mr. Fegan.*] Have you a statement to make? With regard to the project before the Committee, I would point out that some five years ago I submitted the same project to a Royal Commission, as the plan which I have here (*produced*) will show. While I would bring the line into Hyde Park, I would take no portion of the surface of Hyde Park. I would go along the western side of Hyde Park close to Elizabeth-street, and at St. James'-road would go round by a curve of 8 chains to the Domain, or under Macquarie-street. My object was to get a station without taking any portion of the surface of the Park, and in that I succeeded very well. I have provided a very nice roomy station 500 feet long.

2041. How far underground would that station be? The platforms would be about 14 feet underground. There would be just enough room for the carriages to pass. Under Macquarie-street the line might be 30 or 40 feet below the surface, and no sound would be heard in Parliament House or any of the other buildings there. The scheme now before you is practically the same as that which I then suggested, and I think that the least that might be done was to acknowledge it. Before the Royal Commission it was known as my scheme. Mr. Eddy came in, and thought well of it, and adopted it, and now it is called the Commissioner's scheme. The station which I propose will be at the end of the Park; but the line itself could go on to the site of the old Colonial Architect's department. There is not room enough to make a circle there. I gave evidence on this subject before the Royal Commission on the 6th June, 1890, and I also competed when the merchants of the city called for competitive designs. I was the only one who received no prize in that competition; but somehow or other the authorities are adopting my scheme now.

2042. There is no difference between the scheme you propounded before the Royal Commission and that which has been referred to the Committee? There are certain differences in detail, but the principle is the same. I would go through the Park below the surface of the ground, with occasional openings for ventilation purposes.

2043. Are you against taking any portion of the surface of Hyde Park for railway purposes? I should very much regret the resumption of any part of Hyde Park. That place is a picture, and if you put buildings upon it you would destroy the picture.

2044. Except that it takes part of the Park, you believe that the scheme now referred to is the best scheme for extending the railway into the city? If you have to go to Hyde Park. I am, however, decidedly opposed to the Departmental scheme; the cost would be enormous; it would come to £1,000,000, and if you estimate the number making use of the railway each day at 15,000, you can see what each of those passengers would have to pay to enable the Commissioners to meet the interest, in addition to the working expenses. Besides £1,000,000 would build a good many miles of railway elsewhere, and I, as an engineer, say that there is not the slightest necessity for going to Hyde Park. For that matter, you do not want a railway proper into the city at all. I have another scheme for meeting the difficulty which I would like to lay before the Committee.

2045. An entirely new scheme, or a variation of your original scheme? An entirely new scheme. I propose to run the railway traffic through the city direct. Why should not passengers be able to go direct to Burwood from the city as they can to Balmain or to Paddington.

2046. I suppose you know that the prime reason given for the proposed removal of the Central Station into the city is the congestion of traffic at Redfern? That is so.

2047. Where would you bring your suburban traffic from? I would bring it right through Redfern into the city.

2048. By what route? By the ordinary lines.

2049. Do you mean on the tram lines? Yes, or perhaps through Castlereagh-street. I would run passengers right through in the same carriages. There is no engineering difficulty connected with this proposal.

2050. What is the heaviest traffic at Redfern in the busiest hour of the day? About 5,000, and you have ten platforms to work it on. On my principle, you must have a circular line, so as to keep the trains continually moving. The suburban railway traffic in comparison with the long-distance traffic is about 10 to 1. I would run the trams into the railway station, and then along on the railway-line. It is a new idea; but I have the opinion of a very great authority in its favour—the late Mr. Goodchap. The expense of working would be at least one-half the expense of working a railway. That is a matter of importance, because the present fares are enormously high. In New York their great station is 4 miles from the bottom of the city, and the other day—Grant's day they call it—the traffic on two of the lines was 400,000. I think they have five overhead railways in New York. The fare is 2½d., and the distance is close upon 11 miles.

2051. Your previous scheme was an overhead scheme? On a former occasion I proposed an overhead system. I am still in favour of that system; but I do not propose it now. I propose to go right on to the Circular Quay, with the loop as shown on the plan before the Committee. It was always intended to take the line that way.

2052. *Mr. Roberts.*] Would that be a daylight line? Yes. From the junction of Hunter and Elizabeth streets I would go right through to Bligh-street, and then through the "Creswick Club Hotel" along Young-street to the Circular Quay, having a loop round by way of Pitt-street, Macquarie-place, and Loftus-street, with connections as shown in pink on the plan. I have a letter here, written by the late Mr. Goodchap, which I should like to read to the Committee. He and I were upon very friendly terms, and before his death were discussing this point.

J. Musson,
10 Aug., 1897.

Dear Mr. Musson,

8 June, 1896.

I am sure that your proposal to bring the suburban trains to the Circular Quay by the tram-line, though good in theory, would not answer in practice. I thought it well out when in office. Some of the business trains are formed of nine carriages. The motor could not haul them—three of those carriages, if so many—and it would involve too much delay to break a suburban train into three or more divisions.

Then, again, there is the difficulty of getting to the Quay by any steam-line without tunnelling.

With electricity, I understand, grade is not an insuperable difficulty. You have only to increase the volt to meet the contingency.

Let me suggest to you how to meet the requirements of the case.

Use steam as at present between the suburban stations and Redfern. When the trains reach Redfern (even nine carriages) slip your engine, and, with the usual armature, attach carriages (instantaneous action; indeed, it may be done before the carriages have ceased moving) to an overhead electric wire, which should be erected along the present tram-line to Bridge-street, and thence by an extended line to Circular Quay, returning by a loop or circle either south or north of Bridge-street.

The whole of the suburban passengers can be brought in this way to Circular Quay without changing carriages, or they can be dropped at their destinations *en route*.

The railway into Sydney is required chiefly by the residents of the railway suburbs.

We are told that the whole system of tramways is to be worked by electricity in the immediate future. Commence with the present line from Redfern to the Quay, and carry your suburban trains upon it. In eight months it could be done.

I am sure I should have attempted it in my time had the power and possibilities of electricity been in the advanced stage they are now.

I have marked my letter private, because I wish you to have the benefit—if there be any in it—of a slight addition to your central and substantive plan of bringing the suburban trains into Sydney by use of the tram-line.

C. A. GOODCHAP.

I have also written out a few notes in regard to this project I would like to read to the Committee. The main principle of my scheme is the taking of the tram traffic right on to the railway line:—

It is stated that the difficulty at Redfern is the want of room to work the traffic. There are, I believe, ten platforms, and the long-distance traffic in comparison to suburban is about 1 in 10; the area of the station in comparison with usual city railway stations is large. The difficulty arises solely from the distribution to their proper platforms and carriages of passengers arriving by tram that have traversed the city: the same confusion arises from the arriving trains, and the journey from them to the street trams and omnibuses.

Departmental figures show that between—

a.m.	No. of Trains arrived.	No. departure.	Total.	Passengers—Total.
7 to 8	12	15	27	1,002
8 to 9	22	9	31	3,921
9 to 10	9	9	18	5,601
p.m.				
4 to 5	6	12	18	2,361
5 to 6	13	25	38	1,227
6 to 7	14	16	30	4,629

The above are busy hours, and 5,000 passengers an hour does not appear a large number for the accommodation and space, and the number of porters employed to expedite traffic.

The number of railway trams arriving and departing, as given on time-tables, are 188 arriving and departing, without the slightest confusion or help other than the conductor. The time occupied in the stoppages is about ten seconds.

In addition to the 188 trams passing over Elizabeth-street to Liverpool-street during the same period are 1,216; that is more than seven times as many as the railway has, and the total number of passengers thus carried by the street trams may be estimated at 150,000, deduct therefrom (say) 28,000 railway suburban passengers, would leave 125,000, who were collected and discharged without help or platform. Compare the small expense with that attending the same duties to the railway suburban passengers, and the large amount of capital that has been expended in station buildings and an army of porters, and which has to be borne by the travellers.

The whole of the difficulty and the trouble and expense of changing carriages at Redfern may be overcome by having the cars or carriages pass through the city and Redfern to the railway suburbs without change of carriages; that the system should be the circle or loop; that the service should be at short intervals, with small handy trains with suitable carriages; in fact, that the railway suburbs should be served as other suburbs now are, except that the stopping-places should be much increased.

Thus Redfern could be passed with passengers collected *en route* through the city to their destination in the suburbs without change of carriages, and the same routine from their homes to the city. There would be no more bother or confusion than there would be in stopping at any of the city tram stopping-places.

In the city there would at convenient places be two or three tram-station buildings, with accommodation for rest and refreshments, and other conveniences, the want of which to the present time is a disgrace to that Department and any civilised community.

It may be suggested that the vicinity of the High School, at Elizabeth-street, would be one good position, and another at Circular Quay.

The question of traction is an engineering and an important one. I have already addressed your Committee on that subject. As it is decided to adopt electricity for our street railways, motor-cars could be used on the railway, and on arrival at Redfern, where the trolley system would be installed, the engine would slip the tram, and instantaneous connection with the overhead wire.

Possibly our railway suburban train may be worked by the three-rail system.

However, the above will take time; but the system of through communication between city and suburbs, and the circle system, may be adopted at once, and it may be experimentally on probation, and that at a very small cost indeed, and that is by working the motors on the railway, using the present track, the station turning to the right.

I think such a system would satisfy the railway passengers, and save the additional cost that they would have to pay. The interest on a million of money would entail a tax on passengers of about 2d. per day, apart from that of working expenses.

The economies would effect a very large saving in working expenses that would allow of a gradual reduction up to half the cost now charged. This is a very important consideration in these times, and it would draw a larger population from the city and induce settlement on suburban lands.

I may mention a city elevated railway—that of New York city. It is 33 miles long. It has about five branches in the city. It charges one fare, 2½d., for distances up to 10 or 11 miles. Its funded capital is about £7,000,000 sterling. During a recent commemoration—Grant's—on two of its lines 406,000 passengers were carried in twelve hours. Between nine to eleven, 101,000 were carried.

I most strongly suggest that the tram line should go to Circular Quay. It could easily and quickly be done at a very small cost. This is necessary to adopt the lock or circle system. My plan shows a line easy of gradient and direct, which would remove the dangerous block at Park-street, and the no less dangerous block and gravitation shunting system at Bridge-street, by which already a valuable life has been sacrificed.

That and that would be set free and leased premises capitalised in value would far exceed the cost of my proposed line.

2052.

- J. Musson. 2053. *Chairman.*] You do not desire to maintain the overhead proposal which you laid before the Royal Commission in 1890? I am not doing so, though I shall be quite prepared to do so at any time.
2054. Of the two schemes put before us to-day, you prefer the second? Yes. I might mention incidentally that an elevated railroad with a double track costs about £50,000 a mile.
2055. Your evidence, given in 1890, contains your views in regard to an overhead railway? Yes. If you required a special line for railway traffic you could bring it along Castlereagh-street, which is admirably adapted for the purpose, being a quiet street, and with a slight curve you could get right down to the Circular Quay. The system of taking the tram traffic right on to the railway could be immediately adopted, and could be worked very cheaply.
2056. You have stated the salient points of your proposal? Yes; and in the future I shall be glad to give any further evidence that the Committee may require. The late Mr. Goodehap drew the best men of the Colony around him, and there was no higher authority upon railway matters than he was, and he favoured this scheme. I fancy that even the present authorities would fancy it if it were brought before them. It would effect an enormous saving, and half of Redfern would be to let.

Leighton Kesteven, M.R.C.S., sworn, and examined:—

- L. Kesteven, M.R.C.S. 2057. *Chairman.*] You are a medical man, and secretary to the Hyde Park Defence Committee? I am not appearing here as the secretary to the Hyde Park Defence Committee, but as a citizen, and as a medical man.
- 10 Aug., 1897. 2058. *Mr. Wright.*] Do you desire to make a statement to the Committee? Yes; the ground I take in protesting against the resumption of any portion of Hyde Park is this: that Hyde Park is the one park which is in the centre of the city, and it would be injurious to the health of the inhabitants of that part of the city which surrounds it to resume any portion of it. Of course there are plenty of other open spaces, you may tell me; but I would point out that there are not other open spaces available to the residents of that part of the city immediately around Hyde Park. I live in Hyde Park, and my house overlooks that portion which it is proposed to take. I can assure the Committee that the Park is not, as it has been reported to be, a dumping ground for loafers. It is the exception to see them there, though you will see plenty of them in the Domain. The Park is used by respectable citizens. Upon fine afternoons you will see the Park crowded with respectable women and children enjoying themselves there and breathing God's air, which they could not do if the Park were taken away from them. It is an understood axiom, I believe, that the great thing in modern cities is to keep the air as pure as may be, and, for this reason, in every great city of the world you have the combustion of smoke insisted upon. In Sydney, however, it is proposed to bring 200 smoking furnaces into the heart of the city every day. Not only is it proposed to take away some of the free breathing spaces that we have now; it is also intended to vitiate the atmosphere of the city still more than at present. If it were proposed to bring the railway under Hyde Park, I would fail to see what objections there could be to it. You could get entrance at the corner of Park-street and at St. James'-road. I do not believe that any of the trustees of the Park, or any member of the Park Defence Committee, or any of those who object to the present scheme would object to the making of entrances from the Park similar to those in use on the Metropolitan Railway in London. You could put broad stair-ways at the corner of Park and Elizabeth streets, and at St. James'-road, which would permit people to go down and come up without the slightest difficulty. At the present time you have ample space for making a terminal station in the neighbourhood of Redfern by resuming part of Devonshire-street and the cemetery.
2059. You would take the Benevolent Asylum's grounds and the cemetery for railway purposes? Yes; and a portion of Devonshire-street. I would bring the Redfern yard further north. This would give you more space than you would know what to do with. You never see terminal railway stations in the heart of a city in any part of the world. You would have ample space for dealing with all your country traffic at Redfern, and for your city traffic you might have an underground railway. I cannot understand why it is proposed to take the surface of the most central park for a railway. If you run the line along in an open cutting, as proposed, every house near it will become uninhabitable as a private residence. It is bad enough in Hyde Park now, with the roar and rattle of the trams. If we keep our windows open we cannot make ourselves heard in our front rooms. If there were a railway there not a single house would be habitable, nor could the fronts of them be used at all, because of the smoke and the dirt and noise; besides, the rest of the Park would be worth nothing. Notwithstanding the proposal of the Commissioners to take only 10 acres, or only 13½ acres, we know that no assurance that no more will be taken can be of any value. That is proved by the fact that many years ago the whole of the Park was given to the public for their use for ever; and now it is proposed to take part of it from them. The present promise to take no more of the Park would not be worth any more than the first promise to take none of it. Besides, no one believes for a moment that only 13 acres will be taken. I am sure that I do not. The argument that there is plenty of open space over the harbour, which is in close proximity, falls to the ground. There is plenty of open space above the roofs of the houses; but it is not available to the people. This Park is the park in the city which should not be touched. It is all very well to say that it is a matter of economy to take it. It is always a matter of economy to concede anything. If you pay for Hyde Park, as the City Council had to pay for the market-square, it would cost you about £800,000. Yet you say that the whole scheme will only cost £625,000. If you steal my watch, it is very economical; but the watch is still of value. It is proposed to steal our park, and when we grumble at the Park being stolen, you offer us the Redfern cemetery. It is like offering us one of our own boots in exchange for our watch. It would take fifty years to make the cemetery anything like what Hyde Park is now. Further than that, the placing of an enormous station in Hyde Park will prevent us ever getting a complete railway system. When you make your get-away to the Circular Quay and to North Shore, this scheme will be found to be ten times more costly than any other which has been proposed. Of course, I am now trenching upon an engineering matter; but I am speaking from the reports which I have read. As a medical man, I take the stand that Hyde Park is the only park in the centre of the city which is available as a health resort.
2060. You speak as a citizen and as a scientist upon sanitary matters? As a citizen and as a medical man.
2061. Do you think that the taking of the Park would interfere very seriously with the health of the citizens and with the residential sites around the Park? Yes.
- 2062.

L. Kesteven,
M.B.C.S.
10 Aug., 1897

2062. Do you believe that the railway should be extended into the city? Most certainly.
2063. Are you in a position to recommend an alternative route? As a citizen, I may have opinions upon the subject; but it would be a piece of presumption on my part to recommend any route. To my mind, any of the schemes proposed would be better than that which has been referred to the Committee.
2064. You are of opinion that if the Devonshire-street Cemetery and a portion of Devonshire-street were taken we should have sufficient room there for a central station? Yes.
2065. The Department say that they have been urged to bring the railway further into the city, and that they have, therefore, put forward this scheme? Well, I object to their taking the central park of the city.
2066. But you are not antagonistic to the extension of the railway into the city? I believe that the majority of the residents of the city are strongly in favour of bringing the railway into the city, and that they believe that any of the schemes which have been submitted are better than that which is now before you.
2067. Do you think that in a warm climate like this an underground system of railways would be convenient? When I was a medical student I travelled upon the London underground railways for four or five years. If you can travel underground in London, where they have so foul an atmosphere, *a fortiori* you can do it with ten times more ease here, where the atmosphere is clearer, and where you can have much better ventilation.
2068. The average temperature of London is about 50 or 60 degrees? I am not speaking of the temperature, but of the foul air. The temperature below ground is less than the temperature above ground. In a tunnel you are not exposed to the sun.
2069. But you are exposed to the contamination of the atmosphere by escaped smoke and steam? Yes; but there could be proper ventilating-shafts.
2070. Have you travelled over any of our country lines? I have been from here to Queensland by railway, and I have travelled on the Parramatta line.
2071. Did you notice the extreme heat of the tunnels upon the northern line? Although I have been along that line several times I do not remember it at all.
2072. The best authorities upon railway matters here point out that any lengthy tunnel in Sydney would be practically useless—that the heat in it would be so great that people would not use it? That is pure supposition.
2073. It is the opinion of scientific men? Well, I speak with the experience of a traveller. The air in a tunnel is always colder than the air outside.
2074. In a tunnel half a mile long, through which trains were continuously passing, the temperature would be very much increased, notwithstanding any ventilation that might be given? You could have shafts all along to ventilate the tunnel. The Hawkesbury tunnel is different from these tunnels, because it is a long way underground, and you can only ventilate it at the ends. In the city you could have enough air-shafts to give sufficient ventilation without spoiling the Park at all.
2075. The expert evidence given before the late Royal Commission spoke against tunnels? That evidence was given mainly on the side of the Railway Commissioners. Mr. Varney Parkes told you the other day that you could have the tunnels perfectly ventilated.
2076. So far as we have been able to ascertain from experts, and from reports in scientific journals, an underground railway in Sydney would produce an atmosphere which would be unbearable? Well, my experience is that there is not the slightest objection to underground railways.
2077. Are you aware that it would be impossible to have a railway station anywhere in the city without closing up certain streets? I say that a city terminal station is not necessary. You could get openings for an underground line without closing any of the streets.
2078. You believe that the central station should remain where it is, and that the city should be served by an underground circular railway without any large stations? Yes.
2079. Do you think that the citizens would be better served by that system than by the proposal to put the central railway station into the heart of the city? I would not have a central station at Hyde Park. I consider that that is not a good business position.
2080. To have a large central station in any other part of Sydney than Hyde Park is physically impossible, because of the closing up of streets which it would entail? I do not consider that it is necessary to have a large terminal station in the city. You could get ample accommodation at Redfern.
2081. With more accommodation at Redfern, and with a circular city railway, all the requirements of traffic would be met? Yes, amply.
2082. *Mr. Fegan.*] I suppose you are aware that a larger air-space is being offered to the people of Sydney than that proposed to be taken from them? Offered by whom?
2083. By the Railway Commissioners? The Railway Commissioners have no ground to offer. The Devonshire-street Cemetery does not belong to them.
2084. They propose to set apart from their earnings an annual sum to provide for the resumption of that ground? That is getting rid of the question altogether. They have no right to do that.
2085. Are you aware that such a thing is contemplated? I am not aware that it is possible. The Commissioners cannot offer ground which does not belong to them. The Devonshire-street Cemetery belongs to us already quite as much as Hyde Park does.
2086. Do you think that the taking of 13 acres of Hyde Park would spoil the remaining 27 acres? Entirely. Besides, I know that the rest of the Park would go directly. I do not for a second believe that only 13½ acres will be taken. That is one of the strongest objections we have to the proposal. At the same time, if no more than 13 acres were ever taken, it would absolutely ruin the Park. The trains would fill the Park with smoke and dirt, so that no one could go into it.
2087. That would not kill the vegetation there? I am sure that it would.
2088. Has the smoke killed the vegetation in other parts of the world where they have large central stations? There is not much vegetation round the London stations. If you go into any of the London squares you find very little vegetation, because of the London smoke. If you are going to run a minimum of 200 furnaces into Hyde Park every day you can guess how much vegetation will continue to exist.
2089. Do you think that it is necessary to bring the line into the city? Yes.
2090. You would not like to give an opinion as to which is the best route? I think that any of the others would be better than this.
2091. You would prefer any of the other routes? Yes; because the proposal before the Committee would rob the citizens of Hyde Park.
- 2092.

- L. Kesteren,
M.R.C.S.
10 Aug., 1897.
2092. It is admitted that in other centres of population strenuous efforts are being made to get as much air-space as possible, but very few cities have as much air-space as we have in Sydney? Hyde Park is the only air-space that we have in the city of Sydney.
2093. Would you not say that the Domain was in Sydney? No.
2094. You would not call Belmore Park or Cook and Phillip Parks city parks? Cook and Phillip Parks are in the city, but Belmore Park is not much better than Wynyard-square. They are equally valueless. Hyde Park is the one park in the centre of the city.
2095. The Railway Commissioners are willing to resume the Devonshire-street Cemetery to convert it into a park, and to spend £1,000 a year in beautifying it and in keeping it in order? I think it is a piece of "cheek" for them to make such a proposition. Devonshire Cemetery is not theirs to resume.
2096. Of what use is that cemetery now? None at all. It ought to be used for railway purposes.
2097. You cannot say that it is either a place of beauty or a health resort at the present time? No; quite the contrary. The sooner it is done away the better.
2098. If it were made a park it would be improved? In a cemetery it is no nuisance, because the bodies have been buried too long to poison the air.
2099. There is no possibility of disease resulting from the exhumation of the bodies there? Not unless cholera patients have been buried there. The other day, when excavating in Rome, they got some malaria germs, which, they seem to think, might have been buried 1,200 years ago. Devonshire-street Cemetery as it now stands is an unhealthy place, because of the dirt and dead dogs, and the lantana growing there.
2100. If it were put to any other purpose it would be of more use than it is at present? Yes; but it would be useless as a park. It would be best to use it for railway purposes.
2101. *Mr. Roberts.*] Are the Committee to understand that you propose that the long-distance railway traffic should stop at Redfern? I do not see why it should not. If a man comes by train from Newcastle or from Brisbane he has at least a portmanteau and a black bag, and has to take a cab from the station to go to any part of the city. That being so, he would be no better off if brought to King-street than if left at Redfern, and the difference in time would not be more than three minutes.
2102. Would it not lessen his expense if he were carried to King-street? As a matter of fact, the legal cab fare from either place to any point in Sydney is 1s.
2103. Would there not be a great loss of time in driving from Redfern? Only three or four minutes at the most. That would not be very important in a journey of twenty-four hours.
2104. With that arrangement, if a long-distance traveller wanted to come right into the city by train, he would have to transfer at Redfern;—what would you call a long-distance traveller—one who came from Melbourne, one who came from Campbelltown, or one who came from Strathfield? The Strathfield man would be a suburban traveller. The trains from all stations this side of Strathfield, or even of Parramatta, would come on into the city. The line would be continued underground from Redfern.
2105. Do you advocate an underground railway? Most decidedly. I cannot see the objection to it. I have travelled in a great many, and I never saw any objection to them. Besides, here the passengers would only be underground for a few minutes. It would not take three minutes to get from Redfern to King-street. They would only have the smoke of their own train, and there could be thorough ventilation. Besides, there are always improvements being made in smoke-consuming apparatus. Better still, the steam locomotives could be disconnected at Redfern, and the trains taken on by electric motors.
2106. Does it not strike you that a surface line would be more comfortable? I do not think it would be as comfortable. I believe that an underground railway would be far cooler than a surface railway. Where do you keep your wines?—in your cellar, because it is cooler underground. If the tunnel were properly ventilated to take away bad air, an underground railway should not be uncomfortable.
2107. Can you point to the existence of underground railways in any hot climate in the world? No; but I am not an engineer.
2108. Does it not occur to you that an underground railway in Sydney can hardly be compared with an underground line in London, because of the difference in climate? But, inasmuch as it is cooler underground in London than above ground, it would be so in Sydney.
2109. Have you not heard people complain of the suffocating effects of the smoke in the London underground railway;—have you not heard them say that nothing would induce them to travel underground if it were not that they wanted to save time? As a medical student I travelled in the underground railways at Home for more than four years, and I never heard of any complaint, except about the stink of sulphur coming through the window, just as we get out here, and as I get now through my window from the trams.
2110. If there is this discomfort in London, would it not be intensified in a climate such as we have here in the middle of summer? I do not see any force in that argument. Here the temperature underground will be less than the temperature on the surface.
2111. But there would be the smoke? There must be smoke, but I never heard many complaints made about it. Some people will complain about anything. At the present time they are going to make a railway below the underground railway.
2112. *Mr. Farnell.*] That is to be an electric railway? Well, it would be well to use electricity here. You could run the carriages through the tunnel with an electric motor.
2113. *Mr. Roberts.*] Would there not be a great waste of time in transferring the passengers from one train to another? You would not want to transfer the passengers at all. The same passengers would go on. I am led to understand that at Redfern they could be connected with an electric system and run through the tunnel.
2114. Will not your views be carried out when the George-street electric tramway comes into operation? I am sure that I cannot see why the present trams should not run close up to the platforms. I am not advocating that arrangement now, because I believe in the extension of the city railway, but it would be a very simple thing to run the trams close up to the platforms, as they do at Kogarah. You could then take the passengers on with the same ticket.
2115. In view of the proposed construction of the George-street electric tram, are you prepared to allow things to remain as they are? No; I do not say that.
2116. Does it not occur to you that one of the best reasons put forward for the construction of the city railway is the saving of time which it would effect in a journey from the suburbs? I am certainly of opinion that a city railway is decidedly desirable upon that ground; but I do not think people want to be carried

carried to the top of King-street. I think Hyde Park is a poor site for a city railway. If you are going to have central city station at all, it ought to be where the new markets are. Hyde Park is not the centre of the city, and with a railway station at King-street, business men would have to take a cab or walk a long way to get to the station. I do not think that a poorer scheme than that before the Committee could have been proposed.

L. Kesteven,
M.R.C.S.
10 Aug., 1897.

2117. *Mr. Black.*] I want to ask you some questions with regard to the smoke-evaporating tendencies of atmosphere. It must be admitted that to draw a parallel between Sydney and London in this matter is very difficult. It appears to me that the conditions of the two places are altogether different. As I suppose you have given some attention to the effects of climate and atmosphere upon smoke and vapour, I want to ask you a few questions bearing upon this matter. Is it a fact that air can only absorb a certain quantity of carbon, and that the more moisture there is in the air the more slowly carbonaceous vapours will be dissipated? That is so.

2118. Therefore, when the air is heavily moisture-laden, and surcharged with continually emitted clouds of vapour laden with partially-combusted carbon, the tendency will be for each volume of smoke emitted not to immediately dissipate, but to hang in suspense in the atmosphere? It would hang in suspense in the atmosphere, because of its weight.

2119. Where the air is drier, and where there are not such large volumes of smoke being continually emitted, smoke is more readily dissipated, and less likely to affect the atmosphere prejudicially? If it is possible to ventilate tunnels in the old country, it is much more easy to ventilate them here.

2120. Because of the lightness of the atmosphere and its additional purity? Of course.

2121. I think that this is a point which ought to be made clear? It is the point when tunnel construction is under consideration. The heat of the atmosphere has nothing whatever to do with it, though a heated atmosphere would tend to carry away bad vapours more quickly than a cold atmosphere. They would be much more likely to hang about in a cold, damp atmosphere, like that of London, than in the hot, dry atmosphere of Sydney.

2122. Particularly as in London there is a pall of smoke always hanging over the city which holds down the volumes of smoke? Yes; it is like a net, and catches it.

2123. *Mr. Roberts.*] You spoke of the dry, hot atmosphere of Sydney;—has not Sydney a damp atmosphere? Our atmosphere is much drier than that of London. I will correct myself by saying the drier, hotter atmosphere of Sydney.

2124. *Mr. Bidck.*] Have you had any experience in connection the removal and reinterment of bodies? No.

2125. If the relatives of those who are buried in the Devonshire-street Cemetery were to demand the removal and reinterment of the bodies elsewhere, it might possibly be a very expensive business? I could not say.

2126. You are aware that the station at St. James'-road would be in a large cutting, because the level of the central avenue of the Park is about 18 feet above the level of Elizabeth-street? I have heard so.

2127. Under these circumstances do you not think that an excavation of this character would be a great detriment to the remaining portion of the Park? It would spoil the rest of the Park.

2128. The roofs of the station buildings would be but little above the level of the higher part of the Park? Yes.

2129. And it is probable that the smoke would drift very little over the heads of people in that part of the Park? It would not drift over their heads at all. The smoke from the trams comes into my first-floor windows now, and if the station were sunk below the level of the Park the smoke from the engines would drift into the faces of people in the Park.

2130. And necessarily would be destructive of the beauty of the trees there, if it did not kill them? I believe that it would entirely ruin them. I was speaking to Mr. Moore, the late director of the Botanical Gardens, on this subject, and he was of opinion that it would kill them. He is too ill to leave his bed, or I would have sent his name in as a witness.

2131. The construction of a station at St. James'-road would mean the concentration of traffic around that place? Yes.

2132. Do you not think that Market-street and King-street are somewhat overcharged with traffic now? If the proposed station were constructed there would be no get-away for the traffic.

2133. If the station were constructed, the traffic in those streets would almost certainly be doubled, and possibly quadrupled? Of course.

2134. Under these circumstances, do you not think that the widening of these thoroughfares would be necessary? The cost would be too much.

2135. If it were imperative it would have to be done;—therefore, in estimating the cost of the St. James' Park scheme, would it not be fair to include the cost of any resummptions necessary for street-widening? I cannot conceive that it would be possible to widen the streets. The cost would be colossal.

2136. Do you not think that such a contingency should be taken into consideration in connection with this scheme? Yes.

2137. Are you of opinion that the returns from new traffic would recoup the Government the proposed expenditure upon this scheme? I think that is almost outside the scope of my knowledge.

2138. Do you think the extension of the line would create new traffic? I do not think the Government would make more from the railway than they make now from the trams.

2139. Do you think that the people who now use the trams between Redfern and King-street would use the railway? Some of them undoubtedly would, but I do not think a great many of them would.

2140. Have you viewed this question in connection with a probable extension to the North Shore? Most undoubtedly I have. One of the crucial objections to the proposed scheme is that it provides no "get-away" to North Shore, except at enormous expense.

2141. Are you of opinion that in considering the question of city railway extension we should bear in mind the possibilities of electric traction? Certainly. I think that with an underground railway it would be better to have electric traction.

2142. *Mr. Humphery.*] When you say that there would be no "get-away" from St. James'-road to the North Shore, are you aware that the proposal before the Committee provides for an extension to North Shore if necessary by means of a tunnel? At what cost?

2143. The estimate has not been given to us? I am aware; but I said that it could not be done except at enormous cost. However, I am not qualified to speak upon engineering points.

- L. Kesteren,
M.R.C.S.
10 Aug., 1897.
2144. Your principal objection to the proposal before the Committee is that it contemplates an interference with the surface of Hyde Park? Yes.
2145. If the line could be taken by a tunnel from Redfern underneath Hyde Park, you would have no objection to it? I believe that is the universal opinion of the citizens of Sydney.
2146. Has it occurred to you that there would be some difficulty in obtaining a terminal station at any place except Hyde Park? I have pointed out that there is ample room for a terminal station at Redfern. Country residents would be as well served if they remained at Redfern as if they were taken on to King-street.
2147. Are you aware that the suburban traffic is nine-tenths of the whole traffic? The suburban traffic would be served by the underground line, and for that traffic I think a central station is unnecessary. It is not customary in any part of the world to have a central station in the heart of the city.
2148. When you say that the railway should be extended into the city, your view is that there should be no terminal station in the city, and that the passenger traffic should be carried through the city by means of an underground loop-line? Yes; speaking as a citizen, and voicing the opinions of thousands of other citizens, I cannot see why we want to put a spade into the surface of Hyde Park. If you were a resident of Burwood, and we said, "We are going to put the railway station on Burwood Park," you would object to the proposal. If you have an underground railway at Hyde Park we will not grudge you openings to it. If you propose to take the Park, we say, "That is our property, and you shall not steal it from us."
2149. *Mr. Frickett.*] I understand that you object to the taking of the Park because it will affect the health of the citizens? Yes.
2150. The railway goes pretty close to some of the houses about Redfern? Yes; but what class of houses are they, and what rents do they produce? Besides there are not many houses close to the railway there.
2151. Not near the Redfern tunnel? I cannot call to mind many houses which are close to the railway there—not as close as the houses would be if the proposed line were made.
2152. How close do you think the line would be to any house in Elizabeth-street? I could not tell you—I have not measured the exact distance.
2153. On the score of health, what would be too near a distance? A railway anywhere in the Park would destroy the habitability of the houses around the parks.
2154. What is the objection to the trams? I live in Elizabeth-street, and we cannot keep our windows on the first floor open because of the noise and the dirt.
2155. And the smoke? The smoke means dirt. It leaves a greasy dirt which there is no clearing away.
2156. Could you point to one empty house from Oxford-street right down to King-street? No; because it is Pillbox-row, and we have to put up with it. We do not like it any the more.
2157. You said that if the railway came, not a single person would live there? I said there would not be a house habitable. I do not believe that anyone would live there.
2158. What is the meaning of habitable? Comfortable to live in. I do not believe that the houses would any longer be comfortable as residences. All those houses would soon be empty of doctors. We should have to let them for what we could get, using the back rooms for consulting rooms. We should not be able to keep our families there.
2159. If that would happen when there was a railway 175 feet away from the nearest house in Elizabeth-street, why is it that there is not a single house uninhabited now that there are hundreds of trams running around the Park day and night? The trams are nothing compared with the trains. A tram is bad enough; but a train is ten times worse. How much coal do you burn in a railway engine, and how much in a tram motor?
2160. It is proposed to roof in the line right on to St. James'-road? That would not put a stop to the noise, nor the smoke. If you have been to Charing Cross you must know how the noise is echoed by a tin-roofed station.
2161. Are you voicing the opinions of the medical profession generally when you say that the construction of the proposed line would detrimentally affect the health of the people of the city? I have not consulted any medical man but one upon the subject. I am not speaking *ex cathedra*; I am speaking as a citizen and as a medical man.
2162. Have you heard of any movement among the medical men of Sydney, seeing that so many of them are located close to the proposed route of the railway, against the line, either because it would be a menace to health, or because it would compel them to clear out? I have heard a good deal of conversation upon the subject, and all I have spoken to are of the same opinion as myself.
2163. What doctor have you spoken to? I am not prepared to relate private conversations. I have not the slightest doubt that I could have gone round Hyde Park, and got most of the leading doctors, at any rate, to protest against the proposed scheme. I have asked Dr. Renwick to give evidence here; but I have not gone further than that.
2164. There has been no meeting on the subject? No; no meeting has been called or asked for.
2165. You spoke about thousands frequenting the Park;—do you mean at the southern end, where you live? I do not think I used the word "thousands." I said that any number of women and children used the Park every afternoon. Sir Alfred Stephen computed that over 20,000 passed through the Park daily. Of course, it is absolutely impossible to ascertain exactly how many people use the parks.
2166. Did your remarks apply to the southern end of the Park? No; to all portions of it. I am walking through the Park constantly.
2167. Where the station is to be? Yes.
2168. Notwithstanding that the approach to the station is to be through a tunnel starting at Goulburn-street and coming out at Nithsdale-street, and then by what is called a "cut and cover" to Park-street, you think that that arrangement would be quite as objectionable as an open railway? I think it would be just as bad.
2169. The paths connecting Park-street with Oxford-street are to be as little interfered with as possible;—you still think it would be very objectionable? I do.
2170. *Chairman.*] You referred to the value of the Park as £800,000;—where did you get that estimate? I based it upon Mr. Norman Selfe's estimate. Taking the value per acre of the land which the City Corporation bought for their new markets, I applied it to the Park, and divided it by four.
2171. Are you aware that an extension to the eastern suburbs could be made from the proposed surface-station at St. James'-road? No; I am not.
- 2172.

2172. From the north-eastern end? Without taking any more of the Park?

2173. Yes? No; I am not.

2174. Are you aware that the line could be extended to the Circular Quay without taking any more of the Park? I heard that there was a plan for taking it by tunnel to the Circular Quay; but that there would be an awkward elbow in the tunnel.

2175. The plan before the Committee will show that the route is fairly direct;—are you aware that it would be possible to make such an extension whenever tunnel construction in this climate became possible or wise? If I were to say, "Yes," I should be granting your premise that tunnels are not possible now. I say that they are perfectly possible.

2176. There are two objections to railway tunnels—their smokiness, and their inaccessibility? Where is the inaccessibility? Your station at St. James'-road would be 18 feet below the surface.

2177. The approaches to that station would be on the level;—if it be unwise to use steam in tunnels, and the time for using electricity is not yet come, one must decide between taking an open space of ground and paying full value for it, and taking a piece of ground upon which there are buildings, which would cost more? If you get a valuer to value city property, he does not value the buildings upon the ground. Unless the buildings are very large, he only has regard to the value of the land. The value of land in Elizabeth-street is the same on one side as on the other.

2178. Notwithstanding that, if you purchase land on one side of the road, you would come into the possession of good rents at once, while if you purchased land on the other side of the road, you would have to spend some thousands of pounds before you got any rents at all? Are you going to give nothing for the years spent in cultivating and improving Hyde Park?

L. Kesteven,
M.R.C.S.

10 Aug., 1897.

WEDNESDAY, 11 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LYONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the railway system of the Colony from the present terminus at Redfern into the city, including the erection of a large central station in the north-western division of the Park, fronting St. James'-road.

John Yelverton Mills, sworn, and examined:—

2179. *Chairman.*] You are in business in the city? I am.

2180. *Mr. Roberts.*] Are you conversant with the scheme submitted for the consideration of the Committee? In a general way.

2181. Perhaps you would like to make a statement before I put any questions to you? Perhaps that might be the better way. In October, 1884, I was employed by the Government to make an estimate of the value of land between Elizabeth-street and Liverpool-street, along the route of what was then called Mr. Wright's line. I might, perhaps, be permitted to read a press copy of the letter which I sent to the Honorable the Secretary for Public Works at the time:—

Since my report to you, which I had the honor to make last Thursday, upon the probable cost of resuming a strip of land for city railway extension, running through from Elizabeth-street, opposite Belmore Park, to Liverpool-street, so as to come out to the west of the central avenue in Hyde Park, I have again gone over the property on the line indicated to me by your verbal instructions, and I am quite satisfied from the revaluation that the sum of £55,000 is a just and liberal estimate of what this will cost.

2182. Does the plan on the wall, showing the route of the line we are now considering, fairly indicate the route of the line to which you refer? Yes; I believe that it shows approximately the same route.

2183. What was the width of the strip of land which you valued? About a chain.

2184. Was it all private property? The line went through private property and across some streets. I made my first valuation upon a Thursday, and in the following week I was asked to review it, and I went over the same ground again.

2185. Does £55,000 represent the value of the land, the values of the buildings upon it, and the probable compensation required for interfering with leases, severance, and disturbance of business? That was the value of the properties passed through by the line.

2186. Are you in a position to say from memory whether that amount would have to be largely increased to meet compensation for disturbance of business? I do not think it would have to be very much increased. The land is chiefly occupied by private houses, and those houses are of a very poor character.

2187. But there are some business premises there, too? Yes.

2188. Where people in business were doing fairly well, and their leases have some years to run, they would, no doubt, require some compensation for disturbance? Quite so; they would be entitled to it.

2188. That is a question which did not receive your consideration? No. The question was, what would these properties cost to resume.

2190. Have you any detailed information with regard to your valuations? No. In 1884 property was worth more than it is worth to-day.

2191. What would you think that property was worth to-day? Property there has gone down at least 33 per cent.

2192. Would £40,000 be a fair value to place upon it at the present time? Comparatively fair.

2193. If a chain and a half were required there, what would its value be at the present time? I cannot say. I should want to see what was on the extra half-chain before making any estimate. That might make all the difference.

J. Y. Mills.

11 Aug., 1897.

- J. Y. Mills. 2194. Would you say £80,000 for the chain and a half? That ought to amply cover it. I would point out, however, that in places a strip a chain and a half wide would include only half the property, and we might be compelled to take the whole property.
- 11 Aug., 1897. 2195. If an extra half-chain were required, it is possible that it might cost as much as 1 chain would cost? Quite possible. I think that the extra half-chain would cost as much as a chain.
2196. If the land proposed to be resumed for the construction of the proposed railway is valued at £100,000, you would consider the estimate a fair one? I should consider it ample.
2197. I understand that you have had large experience in valuing properties in and around Sydney? I have had hundreds of resumption cases to do.
2198. For what period were you employed by the Government as a valuer of land? I think I took the Darling Harbour cases in 1881. They lasted, perhaps, a year or so. After that I was appointed consulting valuator for all the metropolitan work, because Mr. James Burns, who was Government Valuator then, said that the work required some one who was constantly rubbing shoulders with the market, which no Government-officer could do. They used to refer all the metropolitan work to me, and I was at hand whenever they wanted me; in fact, I am still doing that work.
2199. And you have been engaged in business in the city, which has given you large experience in the valuing of property? For the last twenty-seven years without a break. As a citizen, I think that Hyde Park is the proper place to bring the railway to.
2200. You are in favour of having a terminal station at St. James'-road? Yes; there is room to spare there. On the eastern side of the Park, near Boomerang-street, you never see anybody. I passed there every day for years when I was living at Darling Point. That land is there for use if the people are crowded out of the other part of the Park.
2201. Are you aware that it is intended to take the north-western quarter of the Park, and a small portion of the south-western quarter? Yes. I consider that there is Park to spare.
2202. Having in view of the future development of the city and suburbs, but remembering the proximity of the Domain, and of Cook and Phillip Parks, do you think there will be enough land available for recreation purposes if the proposed scheme is carried out? Yes; there are very few people living round that portion of the Park, which it is proposed to take. The people who live a little further away are for the most part pretty well-to-do, and can afford to go out of town from the Friday to the Monday. The traffic across the Park is traffic caused by people going to and coming from the suburbs. They come across the Park as a short cut to the city. I understand that it is proposed to dedicate 16 acres at the other end of the city for park purposes. A park is far more necessary there. That end of the city is a congested human hive. There are 125 people to the acre living there. It is full of crooked narrow streets, and worse lanes, and before "Reid's Act" came into force, even the lanes were built upon. They want a park there very badly. Their present grounds—Belmore Gardens—is comparatively low. If a portion of the Devonshire-street Cemetery were converted into park land, they would have a recreation-ground in an elevated position, and would be able to obtain plenty of fresh air. It would make you heart-sick to go to parts of Surry Hills and Chippendale, and see the dense crowds of people that are huddled up there, and chained to their residences. They have not the means to go away from the city.
2203. You regard with great favour the project to convert the Devonshire-street Cemetery and the Benevolent Asylums' ground into a park? I do. A park there is urgently wanted, whereas at Hyde Park we have room to spare. This is a case of the rich crying out and forgetting the poor.
2204. Do you think that Hyde Park is as much required for recreation purposes at the present day as it was twenty or thirty years ago, when people engaged in business in the city lived over their places of business, and there were not the same facilities for getting out to the suburbs? I think that every year this Park is becoming less required, because of the tendency of people to live away from Sydney.
2205. I presume you recollect the time when Hyde Park was a resort for the families of the business men living in the immediate vicinity? It was. It used to be the great cricket-ground of the city.
2206. As a place of recreation, it is not so much in demand now? No; I reckon that in taking Hyde Park, and in making a park at Redfern, you are taking £162,000 worth of land, and giving £80,000 worth.
2207. What do you value the Hyde Park land at? I estimate that it would bring on the average £50 a foot. The present value of land on the opposite side of Elizabeth-street is from £50 to £75 a foot. Averaging the value of the park-land at £50 a foot, that makes the value of 13 acres £162,500. I allow 150 selling feet to the acre.
2208. Do you allow for the widening of Elizabeth-street? No; I am estimating what you would get for the ground if you sold it.
2209. What would that portion of the Park which it is proposed to resume bring if it were cut up by a keen commercial man, whose object was to get the greatest price for it? By a pounds, shillings, and pence subdivision, with the ordinary run of allotments, you would get 250 selling feet to the acre. That, at £50 a foot, makes the value of 13 acres £162,500, or £12,500 an acre.
2210. How do you arrive at the value of the Redfern land? I put it down at £20 a foot. That, allowing 250 selling feet to the acre, comes to about £5,000 an acre.
2211. You regard £162,000 as the maximum amount it would be possible to get for the land in Hyde Park, which it is proposed to resume? No; I say that that is a fair approximation of its value, taking the present values of property in the locality for a basis of valuation.
2212. What is the total area of the Devonshire-street Cemetery? I have allowed for the resumption of 16 acres there. That would cost £80,000.
2213. But it is proposed to take 24 acres? The same valuation would apply. I would put it down as £5,000 an acre, and the creation of a park there would give fresh air to people who are crying out for it. Another point I would direct attention to is the fact that the cost of tram travelling has done the western suburbs a great deal of harm. People are not so well off now as they used to be, and they find themselves obliged to come nearer to Sydney.
2214. Is there a very large population around the Devonshire-street Cemetery? That is one of the most congested and most ill-laid-out portions of the city.
2215. A park there would probably be a source of great gratification to the residents in the neighbourhood? It would be used by people who cannot afford to leave their houses from year's end to year's end.
2216. To get to Hyde Park would be too much of a journey for them? They would never see Hyde Park.

J. Y. Mills,
11 Aug., 1897.

2217. Supposing it were contemplated to take 13 acres out of the block bounded by King-street, George-street, Liverpool-street, and Elizabeth-street, what amount of compensation would have to be paid for the land for disturbance of business and so on? The cost of resumption there would be enormous. You have business premises to deal with almost entirely, and some of the land goes up to a very high value.

2218. Would you regard it as out of the question to resume land there for railway purposes? I do not think the traffic would ever justify its resumption.

2219. If from 10 to 13 acres were required there, you would regard the value as too great to allow of the resumption? Yes, for a commercial enterprise. The expense would be beyond all justification.

2220. Is that one of the reasons why you favour the scheme now under the consideration of the Committee? Yes; it will give public convenience with the least personal disturbance.

2221. Have you ever resided in the western suburbs? Yes; I resided at Parramatta for a great many years.

2222. But more recently you have lived in the eastern suburbs? Yes. I was also at Ryde for a time.

2223. When you resided at Parramatta were you impressed with the necessity for an extension of the line into Sydney? Well, you would often come into Redfern with your heart in your mouth.

2224. You were aware of the difficulties connected with the management of the traffic in the Redfern yard? Yes. One always felt nervous when the train approached the tunnel and came in towards the station.

2225. Did it strike you, as a business man, that there is a great waste of time in getting from Redfern to an office in the city? Yes; there is a great waste of time. If you walk you must lose an hour a day; if you take the tram it costs you £5 4s. a year, and you can get a yearly ticket to Ashfield for £5 17s. That shows how expensive the transit is. Besides, if you have a family travelling, you get no reduction upon the tram, but on the railway you get a reduction of one-half for all ladies living in your household.

2226. Have you, for any long period, been favourable to the extension of the railway into the city? Always. It costs you half as much as the cost of your yearly ticket to Parramatta simply to pay your tram fares.

2227. Are you aware that it is contemplated by the Railway Commissioners to charge an extra penny per passenger for bringing the traffic from Redfern to St. James'-road? Yes; but I think that double the number of people who travel it now by tram would travel that distance by train.

2228. Do you think that the people would view such an arrangement with feelings of satisfaction? They would willingly pay the extra fare.

2229. Have you given any consideration to a proposal to have the terminal station at Redfern, or just a little to the north of it, and the extension of a line into the city for the use of suburban passengers only? I think it would be better to bring all the passengers into the city.

2230. Do you think that if the line were constructed there would be plenty of traffic on it, and also for the proposed electric trams in George-street? Yes.

2231. In your opinion the traffic picked up along George-street would make the electric trams remunerative, and there would be sufficient other traffic for the railway? I think that the George-street traffic, and the traffic from Harris-street would be sufficient for the electric tram, altogether irrespective of the railway traffic.

2232. Do you regard St. James'-road as a fairly central place for a station? Yes; it is only a short distance from George-street. Not only that, but you have very good access to it from the Post Office, which is the centre of the city by going up Moore-street to Castlereagh-street. There will be an immense traffic to the railway from the northern end of the city, and that traffic will go along Martin-place and Moore-street into Castlereagh-street. This will relieve King-street.

2233. Would you prefer the scheme under consideration to a line running to the west of George-street, and terminating somewhere about Wynyard-square, but going underground for the greater portion of the way? Yes. We are likely to get the one, but we are never likely to get the other. I know that tunnels are considered dangerous for persons with a weak heart or in bad health. When my wife was in London the doctor prohibited her from riding in the underground railway. He said that people of weak health should not attempt to use it.

2234. In your opinion would property in the vicinity of the proposed terminal station be depreciated, or would what are now private residences become important business premises? I know that people are now looking forward to an increase in the value of property in this locality in anticipation of the construction of the line.

2235. Do you think that the existing streets will provide sufficient means of approach to the proposed station? I do.

2236. Do you regard Moore-street as likely to relieve King-street? I think that the whole of the traffic from the northern end of the city will come up Moore-street.

2237. Would it be desirable to make a new street from St. James'-road into Castlereagh-street, across the site of the High School;—would that relieve the traffic to any appreciable extent? I think you would be able to find room enough at present.

2238. But a new street such as that would relieve the traffic? It would be an advantageous addition to the number of streets.

2239. Would you advocate the opening of such a street? I think it would be well to open up a street there.

2240. Having in view the fact that the land required is already the property of the Government? Yes. It would be an improvement to have a street there.

2241. Do you think that it will be necessary to remove the Supreme Court, the Registrar-General's Office, and St. James' Church, to increase the accommodation required for railway travellers? I do not think so. If the approach to the station is on a rise, there will be very little smoke or disturbance caused by trains leaving the station. All that will be necessary will be to release the brakes, and the trains will glide away without any puffing or snorting.

2242. The noise of the traffic would not be likely to disturb the business of the Supreme Court, or to interfere with the worshippers in the various churches surrounding the Park? I think not, and I do not think that the smoke will injure the trees in the Park, judging by the appearance of the foliage and herbage in close proximity to the existing line.

2243. Do you think that it will be necessary to extend the railway to the eastern suburbs within the near future, or do you think that the tram accommodation is likely to meet all requirements for some time to come? I fancy that the tram will give sufficient accommodation for some time to come.

2244.

- J. Y. Mills. 2244-5. Are you aware that provision is to be made at St. James'-road for an extension to the eastern suburbs when required? I understand that that has been anticipated.
- 11 Aug., 1897. 2246. And that similar provision is to be made for a possible extension to the waters of the harbour? Yes.
2247. From your knowledge of the great progress of North Sydney during the last few years, do you think that the time has arrived when the Milson's Point railway should be connected with the line on the south side of the harbour? I think that the people there have a good service at the present time. A connection might be advisable hereafter.
2248. You do not regard it as absolutely necessary at the present time to bring passengers right down to the Circular Quay? No.
2249. Do you think that, for the present, a terminus at St. James'-road would meet all requirements? I do.
2250. You are thoroughly in accord with the proposal before the Committee? Yes.
2251. *Mr. Black.*] Do you think £12,500 per acre a fair valuation for land in Hyde Park? I based my valuation upon the values of Elizabeth-street properties to-day, taking the latest sale.
2252. Would you be surprised to learn that Mr. Perdriau values property in Castlereagh and Elizabeth streets at £70 or £80 a foot, or £90,000 an acre? No. I am giving you the value of vacant land.
2253. Do you think that the value of buildings on an acre of land in that locality would amount to £70,000? It would depend entirely upon what class of buildings they were.
2254. Suppose we take buildings such as those on the block of land upon which the High School stands you could put up a number of buildings of that kind for very little money? Yes.
2255. Do you not think that there is a remarkable difference between your valuations and Mr. Perdriau's? I cannot tell what basis he worked on. I go upon the basis of actual sales.
2256. Have you any idea as to what has been the fall in the value of land in that locality since 1880? The fall has been very great.
2257. Does it equal 30 per cent.? Yes; and in some cases 75 per cent.
2258. Are you aware that the High School site—1 acre 1 rood—was bought for £88,914? I do not know that I have heard the figures before; but when it was bought land was much dearer than it is now. £45,000 was given for a small piece of land down near the Circular Quay.
2259. The value of the buildings on that land is said to be £7,500; that would make the value of the land itself £80,000 at the time it was bought. Allowing for a fall of two-thirds, there would still be a considerable difference between its present value and the value you place upon the Hyde Park land? The last sale in the locality took place last week, when Nos. 141 and 143 Elizabeth-street, between Market and Park streets—44 feet—were sold for £4,500. The purchaser understands building thoroughly, and he told me that he would have put up the buildings upon it for £1,500. That would make the land worth about £70 a foot. He will get about 6½ per cent. upon the purchase.
2260. Which do you think is the more valuable land—the Benevolent Asylums ground or the Hyde Park land? I should think the Hyde Park land.
2261. Would you be surprised to know that Mr. Perdriau values the Benevolent Asylum site at £20,000 an acre? No.
2262. How do you account for the difference between his valuation and yours? I would not attempt to account for it.
2263. Then it is just possible that in the opinion of some other experts your valuation of Hyde Park may be considered an under valuation? It may be considered so by others.
2264. You know the land which is bounded by Elizabeth-street, Park-street, Pitt-street, and Liverpool-street? Yes; there are two blocks there.
2265. Is that very valuable land? Yes.
2266. Is it more valuable than the Hyde Park land? Yes.
2267. How much more valuable is it? A good deal more valuable.
2268. Is it twice as valuable? Yes.
2269. Three times as valuable? It is a great deal more valuable.
2270. For what reason? You would get a much higher price for it if you sold it.
2271. Is that because of its usefulness for business purposes? Yes, in a great measure. You would get a much higher price for it.
2272. Do you not think that if Hyde Park were subdivided, and business premises put upon it, land there would be just as valuable? No. I think that if Hyde Park were built upon, it would be used more for the accommodation of private houses. I do not think you could drag business up there.
2273. Are the buildings upon the blocks to which I have just referred very valuable? There are some very good buildings there, and some rubbishy buildings.
2274. Would it be an over-estimate to say that that land is worth £74,000 an acre or thereabouts? Is that including buildings?
2275. I presume so;—it is the municipal assessment? It may be worth that amount. There are a great number of buildings there.
2276. That valuation is based upon a twenty year's purchase? Yes; with a 5 per cent. return. You could not buy it at that, and get a 5 per cent. return.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 2277. *Chairman.*] Are you prepared to deal with the various points submitted to you by the Committee? Yes.
- 11 Aug., 1897. 2278. First of all, there is Mr. Selfe's scheme? I have looked into his scheme, and I have read his evidence. I have also dealt with Mr. Greenwood's scheme, and this morning I was going through Mr. Neild's evidence.
2279. Will you take Mr. Selfe's scheme first? I suppose I can do so just in general terms?
2280. Yes? The plan before the Committee shows Mr. Selfe's ideas for the alteration of Redfern yard. The rectangle edged with carmine is the site of his proposed new station. That is where he thinks the station might be located. Having got rid of the Darling Harbour branch, he would start to make a new station by putting down platforms upon the western side of this site, and gradually work the whole of the station buildings on to it. To do that, he would have to build the station piece-meal, which, of course, would

H. Deane.
11 Aug., 1897.

would be very inconvenient, because it would mean continual alterations, extending over a very long time. The sheds that are marked "locomotive shops" upon the plan, are now being used as carriage-sheds. Some of the other sheds shown there have been cleared away and sidings have been put in their place. In order to carry out Mr. Selfe's plan, you would have to do away with nearly all the existing arrangements at Redfern. All the sidings would have to be removed, together with the accommodation now provided for the storage of carriages and engines.

2281. *Mr. Wright.*] Why would that be necessary? Well, the area edged carmine runs right across them. You could not complete Mr. Selfe's station without removing them. Mr. Selfe has marked his station 740 feet by 380 feet. On the plan which shows the Departmental scheme, I have marked the distance from the outside of the building at St. James'-road, not including the covered way, right to the end of the platforms, as 840 feet. From that point to the outside switches at the entrance to the station yard is a distance of 1,120 feet. A similar distance upon Mr. Selfe's plan takes you to the other side of Cleveland-street, beyond the tunnel. It is that point which must be regarded as the beginning of the station yard. In the Hyde Park scheme there are no junctions to interfere with the management of trains inside the outer switches.

2282. But does not Mr. Selfe propose to make provision for a good entrance by resuming land between Eveleigh and Redfern? I believe that he proposes to do that in the future.

2283. *Chairman.*] But his approach would be on a curve? I do not think that that matters very much.

2284. *Mr. Hoskins.*] Would not Mr. Selfe's scheme do away with the Mortuary station? I believe that it would.

2285. *Mr. Black.*] Is it not a fact that from the front of the proposed colonnade, fronting St. James'-road to Park-street, is only 1,150 feet? Yes; but the outside "points" are much further out from the station than that.

2286. What is the distance from Devonshire-street to the tunnel? About 1,900 feet.

2287. There would be a tunnel at Park-street? An over-bridge.

2288. And a narrowing of the lines there? Yes; but there would be no branches to interfere with the management of the trains in the station yard. All the lines there are free for the management of station traffic.

2289. Did you not tell us that you wanted 1,800 feet more at Redfern than you have now for the marshalling of trains? Not 1,800 feet more than we have now. I probably said that we wanted a total length of 1,800 feet, and that agrees with what I am saying now. 1,960 feet on the St. James'-road plan includes the length of the building and the platforms at the end of the "roads" into the station. It would be about 1,800 feet from the end of the "roads" into the station to the first "points."

2290. If it is only 1,150 feet from St. James'-road to Park-street, and you deduct 170 feet for your platforms, you have a very small space for the marshalling of trains? The process is commenced before you get so far into the station yard as that.

2291. Would not such an arrangement interfere with the running of the trains in and out? No; that is the proper arrangement for the traffic. The clear length given upon Mr. Selfe's plan is entirely inadequate for the purpose, even supposing that the "roads" can be brought round on to the clear space shown on the plan in buff. You have not the clear run into the station there that you have at Hyde Park. I have pointed out the difficulty of rearranging the Redfern yard. Of course you have the expense of building the terminal station common to both Mr. Selfe's scheme and the St. James'-road scheme; but with Mr. Selfe's scheme you have the additional expense of perhaps two or three alterations before everything is got into the right place. That would mean an undue interference with the traffic. Then you have the cost of altering the Darling Harbour Branch, and of finding new locations for the sheds which you take out of Redfern yard. Another objection to Mr. Selfe's scheme is that it leaves the long-distance traffic at Redfern, whereas it has been shown by the Commissioners that it would be absolutely necessary to bring at any rate some of the long-distance traffic into the city. If you do not bring all the traffic to the same point, you have the expense of a double staff of station hands, and increased cost in working.

2292. *Chairman.*] Might I suggest another item of expense—the cost of resumptions towards Eveleigh? I have not taken that into consideration. That would be extra.

2293. *Mr. Lee.*] Is Mr. Selfe's a feasible scheme, supposing that the resumptions are to be made? I do not think it is. I think it would be almost impossible to alter the arrangements as he proposes.

2294. *Chairman.*] Do you feel justified in expressing an opinion as to the cost of the alterations suggested by Mr. Selfe, in comparison with the cost of the proposed city railway? I feel sure that Mr. Selfe's scheme would be more costly than the city railway scheme. You must remember that there will also be the cost of extending the line from Redfern to bring the suburban traffic into the city.

2295. *Mr. Wright.*] But suppose all the traffic is left at Redfern? Then you cannot make a comparison between the two schemes, because they would not be serving the same purposes.

2296. You were asked to give the cost of Mr. Selfe's scheme for enlarging the Redfern yard without reference to the city extension? I look upon the rearrangement of the Redfern yard as merely part of Mr. Selfe's scheme for extending the railway into the city. If you ask my opinion as to the cost of making the terminal station proposed by Mr. Selfe, and the cost of making a terminal station at Hyde Park, I would say that Mr. Selfe's station would be much more expensive than the Hyde Park station. Of course, if you had a clear field at Redfern, the cost would be about the same in either case. But, since you would have to make so many alterations at Redfern, I do not think it is possible to say what the cost of Mr. Selfe's scheme would be.

2297. *Mr. Black.*] Do you mean to say that the conversion of Redfern yard, proposed by Mr. Selfe, would be more expensive, not taking into consideration resumptions, than the construction of a new station at St. James'-road, and the laying down of a line between it and Redfern? No; I leave out the intervening line.

2298. And you do not include the cost of resumption? No. There would be resumptions for Mr. Selfe's scheme, but not for the Departmental scheme.

2299. You merely compare the cost of conversion with the cost of constructing a new station? Yes. I think there cannot be any doubt whatever that the cost of altering the Redfern arrangements would be immeasurably greater than the cost of building a new station at Hyde Park.

2300. Mr. Selfe proposes to take for his station a portion of land now practically unoccupied? No; he does not quite do that. He gets rid of the Darling Harbour branch, and of the "roads" on the western side

- H. Deane,
11 Aug., 1897.
- side of the Redfern station. Then he starts to bring the rest of the "roads" into his new station. He would not have a clean field at Redfern. If he had a clean field there, the rearrangement would be a very easy matter.
2301. He would have to do away with the Mortuary station and all the "roads" there? Possibly the Mortuary station might be left. It is outside the site of his proposed station. The Darling Harbour branch would be done away with.
2302. *Chairman.*] The building of a terminal station, such as has been suggested by Mr. Selve, would be more expensive than the building of a new station, because of the disturbance of traffic which it would entail. Yes. It would also carry with it the construction of a new line to Darling Harbour.
2303. *Mr. Black.*] Do you include the cost of a new line to Darling Harbour? That expense is necessarily involved in the scheme.
2304. *Chairman.*] There is also the resumption of land to be considered. For those two items you have no estimate? No. I do not think that Mr. Selve's scheme is at all a suitable one. If it were decided upon, I should have to go into the question of cost as nearly as I could; but it would be a very difficult thing to do.
2305. *Mr. Lee.*] You might give us the approximate cost of Mr. Selve's proposal, the cost of a new line to Darling Harbour, and the approximate cost of Mr. Selve's extension into the city. The total might be compared with the estimated cost of the Government proposal? I am afraid that that would take some time to work out. The proper thing to do to improve the Redfern yard would be to divert Devonshire-street, and to extend the yard further north. I worked out a scheme for that purpose some years ago.
2306. *Chairman.*] A competent engineer would choose such an extension of the yard in preference to Mr. Selve's rearrangement? I do not think there is the slightest doubt about it. Mr. Selve's is a most costly and cumbersome arrangement. In addition to the cost of a new station, you have the cost of removing the Darling Harbour Road and the roads and buildings in the yard as it is arranged at present. You have also the cost of bringing new lines from Eveleigh along the strip of land shown upon the plan in buff, and also the cost of continual alterations, before you can get finally settled down in the new station.
2307. *Mr. Hoskins.*] If Mr. Selve's arrangements were carried out, they would not provide so satisfactory a station as could be provided upon the other side of Devonshire-street? That is so.
2308. *Mr. Black.*] If you carried the railway on to St. James'-road, and provided no other return than that proposed through Hyde Park, would there not be the same number of trains running into the Hyde Park station as now run into the Redfern station? I should think so. The number of trains would constantly increase.
2309. But you would not have the Darling Harbour traffic? No.
2310. That would not make a great reduction in the number of trains? No.
2311. Then how are you going to marshal the trains so much more easily at Hyde Park than at Redfern; you will only have six lines coming into the Hyde Park station? It is not a question of the number of lines. It is a question of having the lines clear for the station traffic. I thought that Mr. Parry would explain that to the Committee. I do not think I could make it any clearer.
2312. Well, I cannot see how you would be any better off at Hyde Park? From the outer points at Hyde Park you will have all the lines clear for the arrangement of trains coming into and going out of the station.
2313. Is that a distance of 1,120 feet? It is 1,960 feet from the point I speak of to the outside of the station. For that distance the lines would be clear for station traffic. At Redfern we have only about 800 or 900 feet of clear space. Then, too, at Redfern you have only short platforms. You have none of the facilities there for getting engines in and out which you would have at the new station.
2314. Why have you not the same clear space at Redfern;—is it because of the workshops there? Because of the lines going off to the workshops, and goods-sheds, and produce sheds, and the branches to Darling Harbour and the Mortuary station. If the arrangements at Redfern were as good as the proposed arrangements at Hyde Park, you would have a clear run into the station from the Eveleigh side of the tunnel. There would be no "roads" branching off on this side of the tunnel.
2315. *Mr. Hoskins.*] If the proposed scheme were carried out, empty carriages would be taken back to Redfern instead of being left at Hyde Park? Yes.
2316. *Mr. Black.*] Would the difficulty at Redfern be lessened by removing some of the repairing-shops and locomotive-sheds to (say) Eveleigh? You would get the necessary space at Redfern if you moved everything but the station out of the yard.
2317. Would there be room for these buildings at Eveleigh? I do not know. You could not get the necessary space at Redfern without clearing away all the branch lines.
2318. If Mr. Selve's resumptions were made, it would lessen the danger of congestion to remove the workshops and sheds from Redfern? I think that their removal is involved in Mr. Selve's scheme.
2319. *Mr. Hoskins.*] What are the engineering objections to an extension of the Redfern station yard into Prince Alfred Park? That would not be an extension of the station yard—it would only be a widening of it. It would not get over the difficulty of want of length, which is now experienced.
2320. If a portion of Prince Alfred Park were taken to widen the station-yard, would not trains coming through the tunnel have to make a very sharp turn to get into Prince Alfred Park? It would be much more inconvenient to get there than to go straight into Redfern station.
2321. Are there any serious engineering objections to the widening of the Redfern yard in that way? I do not think you would gain anything by widening it in that way.
2322. Would you not get increased accommodation for the shunting of trains? No doubt it would be an advantage if you could get more room for goods and produce traffic.
2323. I understood you to say before the Royal Commission that there were serious engineering objections to the taking of any portion of Prince Alfred Park, because of the very sharp curve that would have to be taken to get on to that land? Yes; you could not get round there very well.

THURSDAY, 12 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

2324. *Mr. Hoskins.*] I understood from you yesterday that it would not be convenient to take a portion of Prince Alfred Park to extend the Redfern yard? No; it would not serve any good purpose to do so. Besides, you would have an awkward curve in getting round there from the tunnel.

H. Deane
12 Aug., 1897.

2325. A gentleman has given evidence to the effect that, although the Department consider that they are proposing the cheapest scheme for getting into Sydney, the placing of a terminal station at St. James'-road would cause such a congestion of traffic in King-street as would necessitate the widening of that street; I pointed out to him that it was proposed to give an additional approach to the station by opening a street across the High School site;—do you not think that it would be better, instead of doing that, to make a sweep round into Market-street from St. James'-road—if you do not do that, there is danger of cabs colliding there? I would sooner open a street opposite the station as proposed, though, perhaps, it would be a good thing to round off the corner of Market and Elizabeth streets.

2326. Sharp turns are rather dangerous where the traffic is concentrated? Yes; but I think the difficulty could be met by rounding off the corners of the streets there.

2327. *Mr. Lee.*] You think that that might be done in addition to making the proposed new street? Yes.

2328. You think that both would be required? I think that if the sharp corners were taken off the proposed new street that would answer the purpose better than the rounding off of the Market-street corner. Then, when the houses at the corner of Market-street come to be pulled down, it will be quite in accordance with modern ideas, in regard to the laying out of streets, to round off that corner as well. In London, where there is a great congestion of traffic, the so-called circus are of great benefit.

2329. *Mr. Hoskins.*] Cabs turning sharply round from Market-street might come into collision with other vehicles if the corners were not rounded off? Of course, if the corners were rounded off, they would have a better chance of seeing the traffic in Elizabeth-street.

2330. *Chairman.*] It has been suggested by several witnesses that King-street will have to be widened;—would the difficulty be met by giving a new approach to the station across the High School grounds, and by rounding off the corner of Market-street? Yes; I think so.

2331. *Mr. Lee.*] It is held that, admitting you provide for the congestion between Elizabeth and Castlereagh streets, you do nothing to guard against a congestion of traffic lower down near Pitt and George streets? I have no reason to anticipate any congestion of traffic there.

2332. Is it reasonable to suppose that the bulk of the traffic will find its way to the station directly up Pitt and George streets, so as to congest the lower portion of King-street? I do not see why it should do so. I do not see why the traffic should come specially from Pitt and George streets.

2333. From the east, traffic will be able to approach the station by way of St. James'-road; from the north by way of Macquarie-street, Elizabeth-street, and Castlereagh-street; from the west, by way of King-street, the new street, or Market-street; and from the south by way of Castlereagh and Elizabeth streets;—will not the proposed station differ materially from the present station, inasmuch as all the traffic from Redfern goes in the one direction—towards the city, whereas you would have convenient roads to take the traffic from the Hyde Park station in all directions? Exactly; there would be a choice of roads.

2334. *Mr. Black.*] You admit that there will be an increased traffic at St. James'-road, and your view appears to be that that traffic will all be diverted from Castlereagh-street because of the proposed new opening across the High School grounds. But you do not propose to widen any of the streets leading from George and Pitt streets up to Castlereagh-street. The assumption seems to be that the bulk of the new traffic will come from the south, along Castlereagh-street. That seems to be a most unwarrantable assumption, because the great arteries of traffic now are George and Pitt streets? But there is no reason why people should go along George-street in preference to any other street. I do not see that all the traffic will concentrate in Castlereagh-street. There are plenty of other streets which can be used.

2335. You do not say so, but your action shows that you think so, because you provide a new street for the confluent and effluent traffic between Castlereagh and Elizabeth streets, but no new opening between Castlereagh and George streets. If you provide for the relief of Castlereagh-street why are you not going also to provide for the relief of the streets leading to Castlereagh-street? I have pointed out that the traffic from the east will come down St. James'-road. Elizabeth-street, which is a very important street of access, will be widened, and it will take a great deal of the traffic from the south. For traffic coming from the west, you have this new street 100 feet in width. Castlereagh-street is only 66 feet wide. That means that you will have an approach of 132 feet, taking the two ends of southern and northern parts of Castlereagh-street as separate streets, to this new road which is 100 feet wide. There will be more than enough room for the traffic in Castlereagh-street.

2336. That is admitted? Well, all the traffic will not come up Market-street; some of it will come up Castlereagh-street from the south.

2337. That is also admitted? You have only half the traffic coming up Market and King streets that you would get through the new street.

- H. Deane. 2338. How can you foretell that? Well; how can you foretell that there will be a congestion of traffic between Pitt and George streets. My opinion is that there will not be a congestion of traffic there.
- 12 Aug., 1897. 2339. King-street, between George and Castlereagh streets, is one of our busiest thoroughfares at the present time, and a great deal more traffic will naturally go along that street if the proposed station is built. That appears to be a very serious matter? I do not think so. People going to the General Post Office, and to the lower end of George-street, will undoubtedly cross King-street, and go along Castlereagh-street to Moore-street. Traffic coming from the other side of the city could come up Market-street or up Park-street.
2340. That would depend upon where it came from? Exactly; but it would not all come along Market-street.
2341. I think King-street would get most of the new traffic? Well; there is plenty of room for the straight run of traffic along Market-street.
2342. *Mr. Lee.*] If a bridge were constructed from the highest point on the Sydney side of the harbour to North Shore, at a height of 150 feet above the water-level, would it be possible to get a railway approach to it from Wynyard-square with a grade of 1 in 50? No; I went into that matter some time ago. With a headway of 150 feet, I made the grade 1 in 40, and with a headway of 180 feet, I made the grade 1 in 30.
2343. That is starting from the level of Wynyard-square? No; that is allowing sufficient depth to get underneath Margaret-street.
2344. Where would an approach to a bridge 150 feet high begin? It would rise from a point close to Observatory Hill.
2345. Would you adopt a grade of 1 in 40 for a city railway? I should not like it.
2346. Would it not be highly dangerous? I do not know that you could say that it would be highly dangerous. Of course we have very efficient brakes now.
2347. Would you consider that a proposal to take the railway from Wynyard-square to North Shore on a grade of 1 in 40 would make proper provision for a North Shore extension? If it had to be done, we should have to make the best of it; but it would not be a desirable thing.
2348. Would you recommend it;—would you recommend a grade of 1 in 40 for any of our suburban lines? Certainly not.
2349. Are not the efforts of the Commissioners at the present time being exerted in the direction of cutting down grades? Yes.
2350. Could you recommend at this stage an extension to North Shore upon a grade of 1 in 40? No; I should not do so if I could get anything better.
2351. Suppose you started from the George-street Markets, and were there 18 feet below the surface, what grade would you get? I think you are bound by Wynyard-square in any case.
2352. Why? Because of the road crossings. You must go underneath Market-street and King-street. The first place that you would come out at would be Wynyard-square. Then you would have to go under Margaret-street, and you could begin to rise along the side of Church Hill. You could not disturb the levels of the streets I have named, and you would be going along nearly the highest part of the ridge there.
2353. Approaching a bridge 150 feet high, you could not get a better grade than 1 in 40? No, I am pretty certain about that.
2354. Would an underground railway, going from the crossing of Bathurst and George streets, and thence near the Markets to Wynyard-square, come into contact with any of the main sewers of the city? I do not think so. I made some inquiries about that matter some time ago, and the replies I got were satisfactory.
2355. It has been held by critics that the outlet for passengers provided in your proposed new station is insufficient—that you allow an opening of only 20 feet? There are several ways of getting out of that station.
2356. One witness has told us that “its chief entrance is planned at 54 feet by 36 feet, but it is made of much less practical value by having but one opening of 20 feet for ingress and egress”? That is not the only opening into the station.
2357. How many other openings are there? There is one at the north-eastern end of the station, which will be about 8 feet wide. Then there is the main entrance, 20 feet wide; an entrance into Elizabeth-street at the north-west corner, about 16 feet wide; and the cab entrance, which is about 20 feet wide. There is also an exit by way of the footbridge, which is 15 feet wide, and would have steps leading down to all the platforms.
2358. If it were necessary to enlarge the main opening beyond 20 feet, would it be possible to enlarge it without disarranging the economy of the station generally? I should not recommend any enlargement. This station has been planned upon the very latest and best information. I am perfectly satisfied with it myself. I have seen a great many of the principal stations of the world, and I am quite sure that the arrangements shown on the plan will prove satisfactory. The width of the entrance to which you refer is only a matter of detail, and could easily be altered if, upon further consideration, an alteration was found to be necessary.
2359. But you are of opinion that ample provision is given for entrance and exit? Yes; I have here a plan showing the arrangements for the terminal station, Liverpool-street, London. That station has only recently been finished, and occupies about 12 or 13 acres, which is as nearly as possible what we are to have at Hyde Park. There are 100,000 people going in and out of that station daily.
2360. Two roadways besides a footbridge appear to be provided there? The means of getting in and out of that station are not so good as those shown on the Departmental plan.
2361. After considering the accommodation given in other parts of the world, where the traffic is so much larger, you are of opinion that the provision you make is sufficient? Yes.
2362. *Chairman.*] Most of the alternative schemes which have been submitted to the Committee necessitate the construction of tunnels of various lengths;—have you recent information upon this question;—how is tunnel travelling viewed in Great Britain, where they have the best appliances, and possibly the fullest knowledge in regard to these matters;—are they satisfied with their tunnels there? No. Within the last eighteen months the Metropolitan Railway Company has been applying to have extra ventilating shafts erected, and have been trying to acquire extra land for the purpose. According to a review called *Transport*, in the issue of 5th February, 1897, a Committee has been appointed by the President of the Board

H. Deane.
12 Aug., 1897.

Board of Trade to inquire into the existing system of the ventilation of the tunnels of the Metropolitan Railway. The inquiry has been urgently requested by the London County Council. * * * The Committee are charged to "inquire into the existing system of ventilation of tunnels on the Metropolitan Railway, and to report whether any, and if so what, steps can be taken to add to its efficiency, in the interest of the public." I think that is a sufficient condemnation of the practice of having tunnels where they can be avoided. Members of the British race will probably say that London is the centre of the universe; but in London they have not been able to arrange a tunnel system which has proved satisfactory. Here, a tunnel system would be a great deal worse, because of the heat of our summers.

2363. *Mr. Hoskins.*] Are they not going to make a railway, to be worked by electricity, under the London underground railway? Yes; but, as you say, it is to be worked by electricity.

2364. *Mr. Black.*] Do you not think that people who imagine that they are at the centre of the universe are not so likely to adopt new ideas as people of humble mind elsewhere? I cannot offer any remarks upon that point. The day for electricity as applied to railways has not yet dawned in Sydney. At the present moment we have to deal with steam traction. In carrying the railway into the city we should remember that we have steam traction to deal with.

2365. *Mr. Hoskins.*] One of the witnesses before the Committee stated that the tunnels on the London Metropolitan Railway line were made by people who did not know how to make tunnels properly, and that since then changes have been introduced into tunnel construction which prevent people from suffering from bad ventilation? I have not heard of any of the metropolitan tunnels having been abolished. I travelled through the worst of them three years ago.

2366. *Chairman.*] You maintain your position with regard to the inadvisability of constructing tunnels in Sydney for the use of steam locomotives? Yes.

2367. In the future, when we can use electricity or compressed air or something else, you may modify your opinion upon the subject? Yes.

2368. It was suggested by one witness that the use of compressed air was possible;—what are your opinions upon that point? Experiments have been tried with compressed air, and I believe that such experiments are now being made upon the New York elevated railway; but I say that we have to deal with steam in Sydney at the present moment.

2369. Your remarks with regard to electricity apply also to compressed air; but are emphasised by the fact that electricity is more advanced as a motive power than compressed air is? Yes.

2370. Your remarks with regard to tunnels apply to the schemes brought forward by Mr. Selge, Mr. Neild, M.P., and Mr. Parkes, M.P.? Yes.

2371. *Mr. Black.*] I think you told the Committee that if a railway connection to North Shore by bridge were proposed there would have to be a deviation at Liverpool-street? Yes; you would have to run round from Liverpool-street.

2372. Do you favour the bridge scheme? I do not see the necessity for any North Shore connection. I think, however, that I shall be prepared to deal with the question when the proper time comes.

2373. Do you think that the construction of a bridge is the best way of getting the connection? I do not know that I am prepared to say. I should have to take a great deal into consideration before I answered that question. I object to tunnels where steam locomotives have to be used, and I think that a bridge connection would be very objectionable, because of the grade. When I was before the Committee upon a former occasion, I mentioned that a couple of years ago I recommended a tunnel for an electric tramway. I should not like to say anything beyond that at the present time, or to recommend any further connection, either by bridge or by tunnel.

2374. How far is it in a direct line from St. James'-road to that point upon the water's edge from which you would commence to tunnel under the harbour? The end of Fort Macquarie is about a mile from Hyde Park, in a direct line.

2375. At what distance below high-water mark would you tunnel under the harbour? I think I gave this information before. I cannot very well carry all the figures in my mind; but if I remember aright we should be about 60 feet below high-water mark at the water's edge. You would not get a suitable grade upon a straight line.

2376. How far from St. James'-road would you begin to go down? If I had to go under the harbour I should get down as soon as I could.

2377. At what point? I should start to tunnel as soon as I could after leaving the station.

2378. What deviation would you make from a direct line? You would have to describe a curve in order to get sufficient distance.

2379. Well, what distance would you have to go before reaching the water? That is a matter I should have to go into. It is a very simple calculation. If you wanted to get down 130 feet with a grade of 1 in 50, you would have to make a detour to increase the distance by one-fourth. That would make it about a mile and a quarter.

2380. Would that give a good grade? There are a great many circumstances to be taken into account in determining a grade. I would sooner have a grade of 1 in 200; but, of course, that is out of the question.

2381. That is out of the question if you start from St. James'-road? Or from anywhere else.

2382. I do not know about that? I am quite sure of it. Of course, if you had a railway station under the General Post Office, you could get a better grade.

2383. Do you agree with the statement of Mr. Eddy and other witnesses that the area proposed to be taken in Hyde Park will meet the requirements of the traffic for next twenty or twenty-five years? Yes.

2384. If after that time it is not sufficient, what do you think would be the best course to pursue? I think it is very difficult to say at the present time. I would rather wait until the time arrives, and then study the existing conditions.

2385. But suppose the people of the country would like to know what you propose to do before they permit you to do anything? I do not think they care about legislating for posterity.

2386. That may be your idea—I think that it is our duty to do so? Well, I do not think there is any necessity in this case.

2387. It is a question you do not care to answer? I am sure that when the time comes, means will be found to supply the wants of the city without difficulty.

2388. You have no idea as to what those means will be? Not at the present moment, nor can anyone else say what they will be.

2389.

- H. Deane. 2389. Will the difficulty best be met by resuming more land at Hyde Park, or by creating other stations elsewhere? I should not think it would be met by resuming more land at Hyde Park.
- 12 Aug., 1897. 2390. Then it must be met by making stations in other parts of the city? Very likely.
2391. Where do you think those stations could most profitably be made? I do not know what the conditions will be twenty years hence, so I should not like to say. If I knew what the city would be like in twenty years' time, I should be prepared to give an opinion.
2392. I do not think there can be much difference in the city in the future, because it is circumscribed by the waters of the harbour;—if you look forward 500 years you will only have the same portion of ground available? The city may be broken up into various business centres; but there will be no difficulty about making any lines that are necessary, especially if we can get a motive power other than steam. One could go under any of the streets then.
2393. You think that at some future time it will be necessary to convey traffic through tunnels under the streets? Yes.
2394. Having this possibility in view, do you not think it would be well to defer action now which would destroy the beauty of the city or the comfort of its inhabitants? Your question involves opinions on that subject with which I do not agree.
2395. I do not ask you to say that the construction of the railway as proposed will destroy the beauty of the city or take away the comfort of its inhabitants;—I say that it might? Well, if you will leave that assumption out, I will say that I advocate immediate action. I would not defer the extension of the line into the city.
2396. Why would you immediately extend the line into the city;—because of the danger at Redfern, or to meet the convenience of the people who wish to come into the city? For both reasons. This extension will serve the double purpose of improving the terminal station accommodation and of bringing passengers into the city.
2397. You do not think that if Redfern were divested of the dangers which are now said to be rife there, the other part of the scheme could wait? I might answer that question as a citizen, but as an engineer I would rather avoid expressing my opinions upon the subject. Personally, I believe that it would be a good thing to bring the traffic into the city. I like the proposed scheme, because it combines the two purposes.
2398. The construction of the St. James-road station will involve a cutting about 19 feet deep close to the central avenue of the Park? Yes.
2399. How high will the station roof be? About 70 feet.
2400. At its highest point? No; that is inside.
2401. I mean outside? It would be higher than that. I should think that with the ventilators it would be about 80 or 90 feet high.
2402. Do you not think that the buildings will present a less attractive appearance if they are sunk into the ground on one side? I do not think that that will make much difference. There will be a row of trees along there. We shall not interfere with the existing row of fig-trees. I do not think there will be anything unsightly about the arrangements.
2403. You propose to raise Park-street? Yes, it will have to be raised where we go under it.
2404. Will not that present a considerable obstruction to the traffic? No; the grade on the city side would only be about 1 in 25.
2405. And coming up from Woolloomooloo? From College-street the grade will be much flatter. I have nothing to do with the street lower down than College-street.
2406. Will the fact that you will have a dead-end station at Hyde Park interfere with your shunting operations there? No; the lines will be laid down so as to make the shunting operations as easy as possible.
2407. *Mr. Trickett.*] How long is it since you saw the large railway stations of London? Three years ago. I was there in 1894.
2408. I understand that it is intended to enclose the proposed station from Park-street up to St. James'-road on top and at the sides? Yes.
2409. The approach from Liverpool-street to Park-street will be underground? It will be below the surface of the ground.
2410. The distance from the line to the nearest houses in Elizabeth-street will be about 175 feet? I think that is so.
2411. Do you think that the noise of passing trains will render the whole of the houses in Elizabeth-street between Liverpool-street and King-street uninhabitable? I do not think so. I think that the fact that the trains will be below the surface of the ground will deaden the sound.
2412. When they get into the sheds will the noise be very great? No; it will be very little. The trains will be proceeding at a slow pace there.
2413. I suppose that when a train is arriving at that platform its own momentum will carry it from Park-street? Yes.
2414. If it has been stated that all the houses in Elizabeth-street fronting the Park will become uninhabitable because of the noise of the trains, do you think that that is an exaggeration? It is an exaggeration. No result of that kind has occurred elsewhere, and I do not see why such a thing should happen in Sydney.

John Parry, Out-door Traffic Superintendent of Southern Lines, Department of Railways, sworn, and further examined:—

- J. Parry. 2415. *Mr. Black.*] When you were under examination on the 15th July you stated that if the proposed scheme were carried out, and the traffic became so great that Hyde Park would not meet its requirements, it would not be necessary to resume more land in Hyde Park, because a better plan would be to construct other stations in various parts of the city? Yes; I said that if, in twenty or twenty-five years, population had so increased as to overcrowd the new station, the conditions of the city and of its surrounding might necessitate the establishment of other terminal stations. By looking back upon the past you can form an idea as to how great the changes in the future may be. You ask me what will take place in Sydney twenty years hence. Well, if we look back to the year 1839 or 1840, we look back to a period when there was not a railway in the world. That is only a little over fifty years. Since then the whole world has changed.
- Therefore,

J. Parry.

12 Aug., 1897.

Therefore, it is most difficult to say what will happen in the future; in fact, it is hardly right to ask one definitely what will transpire twenty-five years hence.

2416. You are not alluding to the possibility of flying-machines? It is possible that the use of steam will go out of existence altogether. Other means of locomotion may be invented which will entirely alter the condition of things.

2417. But whatever means of locomotion you have, it will always be necessary to have places where passengers may alight;—stations will always be necessary? Yes; so far as we can foretell.

2418. In your former evidence you spoke definitely about having terminal stations for the traffic coming from North Shore, Balmain, and Woolloomooloo;—where would you put the North Shore station? I have not given that subject consideration.

2419. What about the Balmain station;—have you not considered where it should be located? No; I have not considered any details in connection with this matter.

2420. You have not come to any conclusion in regard to the Woolloomooloo station? No.

2421. So far as we are aware, there might be no sites for the construction of these stations? We could make sites if the absolute necessity arose. I think the Chairman suggested terminal stations for Woolloomooloo and Balmain traffic. I referred only to the possibility of having a terminal station for the North Shore traffic. If in time to come it was necessary to construct a railway to North Shore, the great proportion of the people using it would be people coming into Sydney to business. They would not be people wishing to go to the south or to the west of Sydney. Therefore, I said the best way to give the greatest convenience to the greatest number would be to construct a separate terminal station to which they could be taken every morning, and from which they could be taken every evening.

2422. The question is, would you construct that station? I have not given that question any consideration. I did not know that I should be called upon to give evidence upon the point.

2423. You think that it will be possible to find sites for such stations? I have not searched for any.

2424. But you said that, if necessity arose, you could find a site? Well, if I were to tell you that I could not find a site, you would laugh at me.

2425. Most people say that you cannot find sites now;—you cannot reply to my question? I do not think you expect me to do so.

2426. Have you seen the evidence given by Mr. Selfe? I read some of it in the newspaper.

2427. Have you seen the plan before the Committee, showing Mr. Selfe's proposed arrangement at Redfern yard? Yes; I have seen that plan.

2428. What do you think of his proposal to increase the space at Redfern by taking the Darling Harbour branch underground from some point to the south of the tunnel? It is a feasible proposal.

2429. Would it facilitate the working of traffic there? It would under existing conditions.

2430. Would it not allow you to use ground which is now cut off from use, because of this line running in front of it? We would have additional space on the western side of the yard if the Darling Harbour branch were taken away in a tunnel.

2431. When the Committee visited Redfern, I asked you a number of questions with regard to resumptions upon the Regent-street side of the yard, and you pointed out to me that any benefit which might arise from those resumptions would be nullified by the existence of the Darling Harbour branch as it is now arranged? I did.

2432. Would that reply lose its force if the Darling Harbour branch were taken away in a tunnel, as Mr. Selfe suggests? If the Darling Harbour branch were taken away in a tunnel, that would add to our accommodation; but I certainly would not endorse Mr. Selfe's scheme for providing a new station.

2433. Why? He would build his new station practically upon the site of the existing station. If you began to build a new station at Redfern, you would have to spend an enormous amount of money, and this proposal, instead of looking forward twenty-five years, does not look forward half that period. The grand central station which Mr. Selfe proposes will take up more ground than the existing station, and will not leave room for an expansion of traffic twenty years hence.

2434. Do you think that there is not so much room for the expansion of traffic at Redfern as there is at Hyde Park? If you go to Hyde Park you carry a great part of the traffic away from Redfern, leaving the Redfern property available for other traffic arrangements. The money you spent in taking the station forward is saved by what you leave intact at Redfern.

2435. Do you think that it would cost more to reconstruct a station at Redfern than to build a station at Hyde Park? It would cost more to construct the station proposed by Mr. Selfe than to construct a new station at Hyde Park. The new station is plotted at an angle with the present lines. While it was being constructed the traffic would have to be carried on as usual; but there would be alteration, realteration, and realteration again. This would cause great inconvenience.

2436. Is that inconvenience inherent to any scheme for altering the Redfern station, or merely to Mr. Selfe's scheme? It is inherent to any scheme for the construction of a new station upon the site of the old station.

2437. If you had the diversion of the Darling Harbour traffic, which Mr. Selfe suggests, and the resumptions upon the Regent-street side, which would give you more room for marshalling trains, do you think the Redfern yard would be sufficiently commodious? Before I answer that question I should like to see how it was proposed to alter the Darling Harbour branch. I should like to know where the tunnel is to commence. If the Redfern yard were my property, I would not spend an enormous sum of money in constructing a tunnel in order to add a little more ground to the present inconvenient yard.

2438. It appears to me that the chief thing that is wanted at Redfern is the lengthening of platforms and more room for the management of trains;—is that so? That is so. I think in my previous evidence I fully detailed the inconvenience of the existing arrangements.

2439. You evidently think that an extension of the railway to North Shore will be necessary in the future? I quite think that it will be necessary in the future.

2440. Would it not be possible, by the construction of a line from Redfern to North Shore, to relieve the Redfern station of the northern traffic? That would be a very slight relief.

2441. Do you not think that an extension to North Shore would relieve the present suburban lines by causing the settlement of population upon the fine lands situated between Milson's Point and Hornsby? Such a line would not relieve the present suburban traffic. Traffic upon it would be additional traffic, which would grow up gradually, and increase just as the western suburbs' traffic will increase.

2442.

- J. Parry.
12 Aug., 1897.
2442. If there is a great increase of settlement in the North Shore suburbs, it will naturally be at the expense of the southern suburbs? I do not think so.
2443. A greater area will be provided for the settlement of population? Do you mean to say that in a few years' time all the houses in the western suburbs will be vacant, because they will be building new houses in North Shore?
2444. No, I do not say that; but there may be more settlement upon the North Shore, and consequently less in the western suburbs? You mean that the increase of settlement will be greater on the North Shore than in the western suburbs.
2445. Your principal objection to Mr. Selze's scheme is the difficulty of conversion at Redfern? That is one objection.
2446. That is your principal objection? I think it would be a pity to spend an enormous sum of money in putting down a large station at that particular place.
2447. Do you not think that as population grows Redfern will be more nearly the heart of the city than it is now? Redfern will always have a good station. It can grow as much as it likes, but it will still have a station.
2448. Do you think that Redfern is the proper place for a goods station? It is certainly a very handy place. There is a considerable population around Redfern. As population increases it will become more convenient.
2449. Do you not think that some place nearer the water's edge would be more adapted to a goods station site? If you were a merchant doing business in Surry Hills, you would rather come to Redfern than go down to the water's edge.
2450. While at Redfern you may be near to Surry Hills, you are a long distance from Woolloomooloo and Forest Lodge? Well, an enormous goods traffic is dealt with at Redfern at the present time. All the produce traffic is dealt with there, and large quantities of goods are sent from there to the country.
2451. People do not come there because it is convenient, but because you bring their goods there;— wherever you bring their goods the people will have to come? Certainly. They will have to come to whatever place you make the station.
2452. Do you not think it would be possible to relieve the Redfern yard by removing the carriage-sheds, the locomotive-sheds, and the workshops to Eveleigh? I do not know of any site at Eveleigh to which you could remove them.
2453. I am speaking of making resumptions for that purpose? I am sure you would not do that if the business were your own.
2454. I would sooner resume land at Eveleigh which is worth about 30s. a foot, than take land at Hyde Park which is worth fifty times as much? I do not know anything about Hyde Park. I am simply dealing with the Redfern arrangements as they exist. If you do not do that at Hyde Park, I say, go beyond Devonshire-street and use that property.
2455. You think it would be better to cross Devonshire-street and to construct a new station upon the Asylum grounds? Yes; I think it would be better to extend the station as far as Belmore-road.
2456. Do you not think that the land upon which the Benevolent Asylum stands is more valuable than the inferior land at Eveleigh which Mr. Selze proposes to resume? I cannot give you an opinion upon that subject.
2457. Do you not think the land upon which the Benevolent Asylum, the convent, Mr. Fosbery's house, and the police barracks stand is more valuable than the land upon which the miserable dog-hutches of houses are built between Redfern and Eveleigh? I do not see the utility of resuming land along the line to Eveleigh.
2458. You do not think that a resumption which would permit of the laying down of more lines for the running of trains into and out of Redfern would be of any benefit? I am unable to see what benefit the resumption proposed by Mr. Selze would be.
2459. I thought that your objection to the Redfern yard was that it was difficult to get trains in and out, and that there was no room for marshalling trains there? My argument was that the existing arrangements are too cramped.
2460. Would not an arrangement which would give you room for the laying down of more lines be beneficial? Well, there is nothing on the plan to show what is proposed. If a definite proposal were put before me, I should be able to give you my opinion upon it.
2461. It is not enough to give you the ground; we must also give you a scheme? Exactly. You may resume 100 acres, but if the land resumed is not in a suitable position it is of no use.
2462. Would not that remark apply also to Hyde Park? If Hyde Park is in a suitable position, 12 acres there may be as good as 50.
2463. I cannot quite understand your objection to Mr. Selze's scheme? My point is that I do not know what is proposed by Mr. Selze. All I can see is that he proposes to resume land between Redfern and Eveleigh. I do not see how he proposes to utilise that land.
2464. I understand that he proposes to lay down more lines there? Of course Mr. Selze may be able to see exactly what he is going to do, but I have had no conversation with him upon the subject.
2465. I understood that the line upon the Regent-street side would be used for passenger traffic, and that the other lines marked upon the plan would be used for the traffic going to the sheds on the eastern and north-eastern portion of the yard? Well, the scheme does not commend itself to me.
2466. Mr. Lee.] Have you had any experience regarding the stations in other parts of the world which will enable you to offer an opinion in regard to the exits and entrances provided for by Mr. Deane in the new Hyde Park station? Yes. During my trip to America, at the end of 1893, I visited the principal stations of Jersey city, the Pennsylvania station, Broad-street station, Philadelphia, and Reading station. The two last-named were only just completed at the time. The exits provided by Mr. Deane are far and away beyond what is provided at those stations.
2467. Is the traffic there greater or less than it is here? At times the traffic there is very great.
2468. Much greater than it is here? Yes.
2469. You are of opinion that the entrances shown upon the plan will be ample? Ample.
2470. Of course you take into consideration the side entrances as well? Yes. It may be necessary to divert the traffic from some of the platforms to the north-eastern entrance. As fast as the people get out of the trains at those platforms they will be able to get away from the station. You could not land

J. Parry.

12 Aug., 1897.

5,000 or 6,000 people there in two or three minutes. Then, on the western side, there is an exit to Elizabeth-street 15 feet wide.

2471. The main opening will be towards St. James'-road? Yes.

2472. It will never be necessary for all the passengers to go in to the station or leave by one entrance? No; the object of providing various entrances is to split up the traffic.

2473. To prevent a crush at any one point? Yes.

2474. You do not think that even under extraordinary circumstances there would be any block in an entrance 20 feet wide? If there were a great crowd we should keep the people out in the street until the trains were ready to receive them. We should let them pass into the station gradually as there were trains ready to take them away.

2475. In view of the experience which you have had in other countries, and in this Colony, can you offer any suggestions for the improvement of the proposed entrances;—are you quite satisfied with them? I am quite satisfied with them.

2476. Are you satisfied that they will be ample to enable you to properly conduct the traffic there? Yes.

2477. *Mr. Hassall.*] Do you think that the plan of the station which has been planned by Mr. Deane will be as safe as ingenuity and forethought can make it? Yes. In America I saw the Philadelphia station, the Reading station, the Pennsylvania station—the Pennsylvania line is the best in America—the Boston station, the New Jersey station, and the Grand Central at New York, and I prefer this to all of them.

2478. Were they all dead-end stations? Yes.

2479. You think the proposed station will meet all requirements for many years to come? Yes.

2480. How long do you think it will be before the traffic would increase so greatly that you will not be able to deal with it at the proposed new station? Well, I would point out that an increase in traffic does not necessarily mean an increase in the number of trains. At the present time many of our trains are not full. As the traffic increases you can increase the weight of the trains.

2481. At the present time your engines are not loaded to their full capacity? A few years ago the Melbourne express used to be sent away every night with two engines; now the same train is taken away by one engine, although the load is larger, and it runs more punctually.

2482. *Mr. O'Connor.*] That is because of the improvements which have been made in locomotives? Yes.

2483. *Mr. Hassall.*] So many improvements can be made in the carrying capacity of trains that you do not think it would be necessary to increase the accommodation at Hyde Park for a very long while? That is so.

2484. There will be room enough there to enable you to deal with an enormously large traffic for many years to come? Yes. I made a great study of the traffic between Van Buren-street and the park going to the Chicago Exhibition. The attendance at that exhibition upon one day was about 675,000 people. The numbers carried between Van Buren-street and the park, a distance of about 8 miles, ran into millions a week; but the traffic being concentrated, they were enabled to deal with it by running trains backwards and forwards every two minutes, and at times every minute and a half. Every train was simply packed. Here, however, during the principal part of the day we have very few trains running; but between 5 o'clock and half-past 6 o'clock in the evening there is a great rush of people wanting to get home from business; therefore, we have to run a great number of trains just at that time. For instance, we run trains at 5-15, 5-18, 5-20, 5-23, 5-25, and 5-27. These trains are at the platforms waiting for the people as they come up in the trams.

2485. *Mr. Black.*] How many lines had they at Chicago? I think that the number of lines between the place I mentioned and the park was eight; but the Chicago traffic proper was not dealt with on the eight lines; I think it was dealt with on about four. In very few places in America are the conditions of traffic similar to the conditions here. Here we have fostered suburban traffic; but in America it is only in a few places that they have done that. Until the last few years they have generally ignored the suburban traffic. They have not been in the habit of encouraging people to settle in the suburbs, as we do here, by sending fast trains to the various stations, in order that the passengers may get quickly to their destinations. They have generally only slow trains running to the suburbs.

2486. *Mr. Hassall.*] Here your main traffic is suburban traffic; there their main traffic is other than suburban? Yes. When I was there the "Illinois Central" people, who were looking out for suburban traffic, had not adopted the system of running fast trains, as we have. Here, in the busy parts of the day, we run a through train to Petersham, another to Summer Hill, another making its first stop at Ashfield, another through to Croydon. A quick service like that encourages people to settle in the suburbs more than a continuous service of slow trains would do.

2487. *Mr. Humphery.*] When you were previously examined you said that the improved arrangements which you would have at Hyde Park would enable you to deal with four times the present traffic;—are you still of that opinion? Yes.

2488. *Mr. Roberts.*] Do you know the Victoria station at Westminster, the terminus of the London-Brighton and South Coast Railway? No.

FRIDAY, 13 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the city, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Edward William Knox, sworn, and examined:—

E. W. Knox, 2489. *Chairman.*] You have been a resident of the city of Sydney for a great number of years? Yes; I have lived in Sydney nearly the whole of my life.

13 Aug., 1897. 2490. You gave evidence before the Royal Commission upon city railway extension on the 31st March last;—are your opinions the same now as they were then? Yes; I have no desire to in any way alter the evidence which I gave then.

2491. *Mr. Farnell.*] At that time you were emphatic in your objections to the proposed extension of the railway to Hyde Park;—you still oppose that project as strongly as ever? Yes.

2492. Have you any statement to make in regard to the matter? Yes.

I have carefully read the report of the Royal Commission about the proposed station in Hyde Park, and all the evidence taken thereon, with the result that the opinion I held as to the inexpediency of carrying out this work, has been strengthened and confirmed. It is clear to me that the only demand for such a change comes from the residents in the south-western suburbs, that a very large majority of the ratepayers in the city and other suburbs are strongly, I may indeed say bitterly, opposed to any part of Hyde Park being taken for railway purposes; and the Commission has frankly admitted that, unless the Park can be taken, the extension with the city cannot in any way be justified. Moreover, I think that the advocates of such an extension on a line west of George-street made out a better case than those who demanded the eastern line, and there can be no doubt that the former would be much the most convenient for the short-distance passengers. I still maintain, however, that no such extension should be taken in hand, that the terminus should be between Redfern and Belmore Gardens, and that when it became manifest that some additional accommodation should be provided, this should be obtained by extending the Redfern station northwards—a scheme which Mr. Eddy said could easily be carried out at an expense of from £70,000 to £100,000. Such work should, however, be delayed as long as possible, for there is not, I think, any indication that the number of residents in what are called the railway suburbs will in the early future increase. On the other hand, there is some reason to believe that the expansion of Sydney has practically ceased for a time, and in the event of federation being accomplished, and of the Federal Government having control of the railways, I feel certain that the population of Sydney would decrease.

2493. You say that Mr. Eddy made a statement to the effect that to extend the line from its present terminus to the Belmore-road would cost between £70,000 and £100,000? I took that statement from the evidence given before the Royal Commission. I do not remember the actual words, but I think that Mr. Eddy said that it required that amount to provide "adequate accommodation" at Redfern.

2494. The estimate before us is about £400,000? Mr. Eddy's statement was clear and distinct to the effect that he could adequately provide for an increase of traffic with an expenditure of from £70,000 to £100,000. I think the £400,000 to which you refer includes the erection of a large central station, which Mr. Eddy did not think either desirable or necessary.

2495. Your reasons for opposing the scheme before the Committee are given pretty fully in your former evidence;—have any new matters cropped up, to which you desire to refer, to give additional weight to that evidence? No; nothing of importance. I applied to be examined by the Committee, because I did not know that it was intended to incorporate into the Committee's evidence the evidence given before the Royal Commission.

2496. Briefly, you consider that there is no necessity for an extension of the railway into the city, and that the necessary facilities for dealing with the traffic at Redfern could be obtained for £80,000 or £100,000? Yes.

2497. *Mr. Black.*] I understand that your opposition to the proposal to bring the railway to Hyde Park is based, not only upon your objection to the using of any portion of Hyde Park for a purpose other than that for which it was granted to the people, but also upon your belief that the extension would not give the advantages which are claimed for it? I think that the agitation for the extension of the railway to Hyde Park is solely an agitation upon the part of the residents in the south-western suburbs. I do not think that 10 per cent. of the residents of the city care a straw whether the terminus is at Redfern or at Hyde Park; but they object to the Park being taken for the purposes of a railway station.

2498. Would you favour an extension into the city by some other route, and the resumption of land of an inferior value, or, if practicable, by means of a tunnel? If the people who desire to have the railway brought into the city are prepared to pay the cost of the extension, and do not take any of the parks, I would let them take the railway anywhere they pleased. At present, however, the people who ask for the extension ask for it at the cost of the rest of the community who would not profit by it.

2499. You think that the extension would result in a loss to the entire community for the benefit of a section? Yes.

2500. Have you given any attention to the engineering difficulties in connection with this scheme? No; I am not qualified to speak upon that subject.

2501. Do you think that the erection of a station at St. James'-road would destroy the value of the public buildings in the neighbourhood—the Museum, the Cathedral, the Grammar School, the Synagogue, and other important buildings there? I think that if this proposed station were built it would very soon be necessary to take down St. James' Church and the Law Courts, and it would be necessary to provide another building for the Synagogue.

2502. It is proposed to make a street through from Castlereagh-street to Elizabeth-street, across the High School ground, in order to lighten the traffic in the upper parts of King and Market streets;—is not

King-

King-street very largely congested at the present time? I think you could not count upon King-street being of any practical use as a feeder to the railway, except for foot traffic. It is practically unsafe for cab traffic now. E. W. Knox.
13 Aug., 1897.

2503. The traffic there now is somewhat more than the width of the street gives convenience for? Yes.

2504. If there were a great increase of traffic in consequence of the construction of the proposed station, the street would not be wide enough to meet the demands made upon it? Yes.

2505. Have you any opinions as to the effect which the construction of the station would have upon the remaining portions of Hyde Park? It would practically destroy the rest of the Park. A railway station can never be anything but the ugliest of buildings, with the meanest of surroundings.

2506. Do you think that the smoke and dirt would interfere with the trees and plants in the Park? I do not know that the smoke would be much more than the smoke which is now admitted by the trams.

2507. The trams only run along one side of the Park;—the proposed line would run through the centre of the Park? Yes; but there are a great many more trams than there would be trains.

2508. To make the site of the railway station level with Elizabeth-street, there would have to be a cutting 19 feet deep at the central avenue of the Park? Yes.

2509. Do you think that that would somewhat destroy the beauty of the Park? It would destroy the beauty of the surroundings and spoil the effect of any buildings that you might put up.

2510. Are you aware that it is proposed to slightly raise Park-street in order to enable the trains to pass underneath the roadway? Yes.

2511. Is that a project which commends itself to you? I think it would be a great mistake to do that, because Park-street will be the main avenue from the eastern portions of the city to the centre of the town.

2512. Do you think that to increase the grade would be to interfere with the traffic? Yes.

2513. *Mr. Trickett.*] You say that the residents in the south-western suburbs want the extension; but that the majority of people in the city do not want it? That is so, because only a very small proportion of the residents in the city travel by train at all.

2514. Do you remember the first meeting which was held at the Town Hall to protest against any interference with the Park? Yes.

2515. If I remember rightly, the opinion was then expressed, that there was no objection to an extension of the railway into Sydney; but that the line should not be taken into Hyde Park? I was not present at that meeting, I only know what I read in the newspaper reports. I say now that I have no objection to a city railway extension, provided that the people who want it will pay for it. But the people who want it, want to get Hyde Park for next to nothing, and then they want to be brought into the city for about one-fourth of what they now pay in tram fares. The tram takings will be diminished if the proposed line is constructed.

2516. The late Mr. Eddy gave evidence to the effect that the proposed extension would pay from the start? Yes; but, speaking under correction, I think no evidence has been given as to the extent to which the takings of the tramway would be diminished if the proposed line is constructed. At the present time the railway tram carries a great many of the other services upon its back. That would cease if the proposed extension were made.

2517. The chief spokesman of the deputation which waited upon the Colonial Secretary to report the result of the meeting to which I have referred, said, that the deputation "did not object to railway extension into the city, it simply objected to any part of Hyde Park being taken";—does not that make it appear that it is not only the residents of the south-western suburbs who want the extension? I say that the extension would be a waste of public money. If the public like to waste their money, I shall have no voice in the matter.

2518. When you gave evidence before the Royal Commission on the 31st March, you stated that you thought there was no justification for an extension into the city? I am of that opinion still; but if the people who want an extension are prepared to pay for it, I would let them have it. They are not prepared to pay for it. My statement was that, only a small proportion of the inhabitants of Sydney use the railway, and, therefore, they cannot want to have it extended into the city.

2519. Of course that is only your opinion? I think it is a question of fact as to the proportion of residents in the city who use the trains.

2520. The Engineer-in-Chief for Railway Construction has told us that "from the King-street station northward a pair of lines can be taken in tunnel as shown on the map for connection with an eastern suburbs railway";—would you favour such an extension? I do not think there is the remotest chance that I shall live to see the construction of an eastern suburbs railway.

2521. But do you favour such an extension? I am very strongly opposed to it in conjunction with an extension of the present line from Redfern to Hyde Park.

2522. Otherwise you are not opposed to it? I do not think that it is of any consequence. Mr. Eddy expressed the opinion that it might be necessary to make that railway in twenty year's time.

2523. If we are to have that extension, do you think it would be desirable that the eastern suburbs people should be taken to where the police barracks are now? I think that it is quite unnecessary to hamper any proposal to bring the railway into the city with a proposal for an extension to the eastern suburbs, because I do not think that there is the smallest chance of the residents of the eastern suburbs getting a railway. The people who live in the eastern suburbs have a genuine grievance, inasmuch as they are compelled to pay much more for travelling than the people who use the railway have to pay.

2524. That being so, they are likely to agitate for a railway? Yes; unless they get cheaper tram fares.

2525. I suppose they would like to get quicker transit. I believe that it takes twenty-five minutes to get to the Bondi junction;—is not that a long time for a journey of 2½ miles? Yes; but I think that as a set-off against the disadvantage of slowness may be put the advantage of having a stoppage at the corner of every street.

2526. A great many people have urged, in favour of the proposed construction of the line, the opinion that it would enable the working classes to live out in the suburbs, instead of being cramped up in the city as they are now;—what do you think of that opinion? I do not think that it is of any effect. The people who work within a radius of half a mile of Hyde Park are very few in number. A great many more work within a radius of half a mile of the Redfern station.

2527. You must recognise that it would be a great convenience for the 40,000 people who come to and from Redfern every day, if they could be landed in the city instead of at Redfern, or, as you propose, at

E. W. Knox. Carter's Barracks? I take it that if it were a great convenience for them to be brought to Hyde Park, they would, before this, have offered, through their local representatives, the mayors, to have paid the same railway fares upon the extension as they now pay for tram travelling. Instead of doing so, they have always demanded to be brought right into the city for about a third of what they pay now, and they have been promised that they would be brought in for that.

13 Aug., 1897.

2528. I do not know that there has ever been a demand that they should be brought in for lower fares? A promise to that effect has been made. Mr. Eddy said that there would only be a trifling addition made to the cost of season tickets. I think other statements have been made before the Committee, showing that the additional cost for railway passengers will be very little. Certainly it will be much less than they have to pay for travelling on the trams.

2529. *Mr. Lee.*] The Chief Commissioner asserted before the Commission that it is absolutely necessary that Redfern station should be altered or the traffic removed from there—that it was necessary in the interests of public safety? I am aware that that statement has been made.

2530. If we are not to rely upon the evidence of Mr. Eddy and the Commissioners and their officers, upon whom are we to rely for evidence of this character;—surely you would not set up your opinion against that of these officers upon a matter like this? I do not think I have set up my opinion against that of experts. I have already said that if it were necessary I would provide additional accommodation at Redfern by extending the station northwards.

2531. You have already said that in your opinion it is not necessary to bring the line into the city? I have.

2532. The Commissioners say that it is necessary? I think that they say that it is desirable. There can be no necessity in this matter.

2533. They say that there is a necessity—Mr. Eddy and other officers have shown that if the railway is brought into Sydney the extension can be made to pay;—if you only improve the Redfern station you get no return for the money which you expend there? I have very great doubts about the extension paying, if proper allowance is made for the destruction of the tram traffic which it will cause. I am perfectly confident, too, that it would be a piece of insanity to build a very extensive railway station between Redfern and Belmore Gardens. I would build an adequate station; but I would not put up a building like that proposed, which would be of no service.

2534. The Railway authorities have shown us how the line will pay? I thought it was admitted that they had not submitted any statement showing the reduction of income which would be due to the stoppage of railway trams.

2535. I might refer you to the statement put before us that it is the desire of the Commissioners to remove the railway trams from Elizabeth-street to enable them to give a better service to the other suburbs? I have seen no statement to indicate that the railway suburban traffic has been growing during the last three years.

2536. Perhaps you are not aware that the evidence of experts is that the number of trains run has materially increased during the last two years? Well, it would be a very extraordinary thing if there had been an increase, because in every other suburban borough there has been a diminution in the number of inhabited houses.

2537. *Mr. Fegan.*] Have you seen the statement in regard to the increase in the number of trains which are run? Trains are not passengers. No doubt additional trains have been put on for the convenience of residents in the railway suburbs; but I do not think that there are any figures which will show that the traffic has increased very much.

2538. *Mr. Lee.*] Let me read you this extract from Mr. Eddy's evidence:—

In making your statement you said you thought the country could be recouped for its expenditure by a system of 1d. fares to King-street? What we would do would be to add 1d. to all the fares of the public travelling into Sydney.

Have you considered that a penny increase on the railway would, in a large number of instances, mean a reduction of nearly 2d. on the tramway? Yes.

If that be so, where does the gain to the country come in? We are anxious to get rid of some of the traffic in Elizabeth-street and George-street, because it cannot be conducted satisfactorily, and when we get rid of the railway trams we shall be able to give better services to the various suburbs, which will bring us in more revenue than we shall lose by the short-distance railway traffic.

? But I think I am right in saying that no figures were submitted to the Commission, or have been submitted to the Committee, showing the loss in tram fares.

2539. You have in the extract I have read the positive statement of Mr. Eddy that he would get more revenue by giving better services to the various suburbs than he would lose by getting rid of the railway trams? Yes; but I think you would find that very few of the residents of Sydney would agree with that statement.

2540. I would also like to direct your attention to the evidence given by Mr. Kirkcaldie on the 29th July last:—

At the beginning of 1888, when the locomotive establishments had been removed to Macdonaldtown, and consequently all light engines had to come from there to begin a day's work, and go back after it was finished, the number of trains and engines passing through Redfern yard on the main line, taking three ordinary days in 1888, had increased from 80 or 90 in 1877 to 340, 363, and 355. And in 1897, taking three days in January, the numbers had increased to 555 from 340, to 547 from 363, and to 561 from 355. If we come to exceptional days—on last Eight-hour Day, the 5th October, we passed through the yard 701 independent trains and engines in twenty-four hours. That has nothing whatever to do with the shunting about the yard.

? That only refers to the number of trains, not to the number of passengers. Surely you cannot expect an increase in the number of passengers when the statistical returns show clearly that there has been a decrease in population, or that the population of the suburbs has only just been maintained.

2541. Are you aware that one of the chief reasons given by Mr. Eddy for coming away from Redfern is that there must be longer platforms;—is it known to you that the length of trains has been very largely increased of late years since the introduction of heavier engines? I am quite aware that it is necessary to run long trains, and that the length of the trains has been increased; but I think that there is a cheaper and more effective way of providing for the increase of traffic than by extending the line to Hyde Park.

2542. If the number of trains has increased, and if longer trains are used now, must not that be accepted as strong evidence that the traffic on the line has also increased? Not when you can get all the particulars if you like to ask the Railway authorities for them.

2543.

2543. You cannot tell exactly what the passenger traffic is, because so many travel with season-tickets? E. W. Knox.
13 Aug., 1897.
The point upon which I want to obtain accurate information is as to whether there has been any substantial increase in the number of passengers carried since the end of 1893 or the beginning of 1894.

2544. That is shown by the fact that at the present time more trains and longer trains are being run? I think the evidence of which you speak shows clearly that greater convenience has been given to the residents of the railway suburbs; but I do not think that it goes to show that a larger number of people have been carried.

2545. *Mr. Wright.*] Have you carefully read the evidence given by Mr. Eddy before the Royal Commission? Yes.

2546. Did you notice the remarks which he made in regard to the danger of continuing the present Redfern arrangements? Yes.

2547. He is asked, Question 2572:—

The Commission have been given to understand that the congested state of traffic at Redfern is not only a matter of inconvenience, but is fraught with some danger? Undoubtedly. Where you have to conduct your business under continual stress for want of time, and want of platform accommodation, there must be the element of risk which you wish to see eliminated, in spite of every precaution being taken to carry on the business with perfect safety, which has been fairly successfully accomplished at Redfern.

Then a little further on, Question 2574:—

Mr. Hoskins.] Has there been great danger from the probability of collisions between shunting engines and carriages in the confined space at Redfern yard? There is not much risk in connection with shunting operations so long as the men obey the signals. Everything at Redfern is interlocked, so that you cannot have the signal "off" for an engine to come into collision with an operation going on in another part of the yard. But, of course, if a driver runs past a danger signal, he is liable to come into collision with some other operation that is going forward. It appears from the watching of the tram and omnibus traffic, that a station abutting on King-street would be the most convenient position for a terminal station, and that was the reason for the Commissioners putting forward the scheme which has been inquired into by a previous Royal Commission. Although an alternative scheme was put forward towards the end of the sitting of that Commission, it was simply put forward because it was stated that there was a strong feeling against taking so much of the Park. But we cannot depart from the opinion which was so clearly emphasised at that last inquiry, that Hyde Park is the right and proper position for a general station of the dimensions which you have had placed before you in plans.

I might explain to you that all engines now bringing trains into the Redfern yard have to shunt between the outgoing and the incoming traffic, so that the slightest neglect might any moment result in very signal disaster. Mr. Eddy goes on to say—and these are the words of, I suppose, the greatest railway expert that we ever had in Australia:—

Again, looking at the fact that it must be generally admitted that Redfern station is totally insufficient for the traffic, I would point out that it would be unwise to spend a very large sum of money in connection with the present site, or any site closely adjoining, because you could not charge any additional fare to recoup the interest on the large expenditure. But if, by bringing the line into the city, you convenience the public, and save them expense in travelling along the streets, you can wisely and justly make them pay a small additional fare; and by charging a fare of 1d. to each passenger taking ordinary tickets for each journey, and adding a small sum per month to the season-ticket-holders, and about 3d. a week to workmen, you bring them into the city at a less cost than at present, and you get sufficient revenue to recoup the country absolutely for every penny of expenditure incurred in carrying out this great improvement. Those are the main points I wish to bring under your notice, and I would strongly urge that the scheme for placing a big general station in Hyde Park should be adopted.

In another part of his evidence Mr. Eddy says that the George-street electric tram is not required to convey passengers to the railway station, but that the Commissioners look upon it as likely to be a profitable line irrespective of railway traffic, and that they hope that it will ultimately be continued to the various suburbs. We have had it repeatedly in evidence that the loss of revenue caused by the discontinuance of the railway tramway service would be very slight. There are one or two other matters in connection with Mr. Eddy's evidence to which I would call your attention. He is asked, Questions 2613, 2614:—

Supposing Parliament is disinclined to approve of the Park being taken, would it not be of great benefit to three-fourths of the travelling public? If Parliament takes the responsibility of the complaints of the long-distance public, I am sure the complaints will be very continuous and very strong.

Can you suggest anything but the Park? No; I wish I could.

? I am quite familiar with Mr. Eddy's evidence.

2548. Mr. Eddy was also asked:—

You are aware that it is assumed that once you are placed in the Park, and get 10 acres, it will not be very long before you take the whole—is that fear groundless?

To which he replied:—

I think so. In my opinion it is.

In a subsequent answer, Mr. Eddy explains that the Park will give sufficient accommodation for twenty years to come, and if at the end of that time more accommodation is required, it will be given, not by the alienation of more of the park land, but by an extension of the railway to the Circular Quay? I do not attach the least value to anyone's predictions as to what will happen in Sydney in twenty years' time. I have seen so much changes in twenty years that I do not attach any importance to the predictions of the late Chief Commissioner, who, although an extremely able man, only lived here for nine years. I know a great deal more about Sydney than Mr. Eddy could have known.

2549. But you do not know as much about railway matters? I do not know anything about railway matters.

2550. If Mr. Eddy has told us that there is great danger in leaving Redfern as it is at present, and that an extension into the city would be a great benefit, have we not a right to attach considerable importance to that evidence? Yes; but I think that the alleged danger has been seriously over-estimated. There has only been one serious accident there, and that occurred because the engine-driver disregarded the signals.

2551. There have been at least three accidents within a year or two? Only one serious accident.

2552. We have been told by various railway experts that Redfern yard is now being worked with the constant and daily risk of serious accidents, and that under no circumstances is it capable of meeting the requirements of a larger traffic? Every day of my life I am told by experts that a certain course must be followed; but I follow that course or not, just as I think fit, and I take the responsibility for what is done. It seems to me that the Committee is in the same position. They have the responsibility of deciding what weight should attach to the expert evidence. I do not attach much to it—not with reference to the expenditure of money.

2553. You are not averse to the railway coming into the city? No.

2554.

E. W. Knox. 2554. You are not in a position to suggest any scheme to the Committee? No.

13 Aug., 1897. 2555. Have you read the evidence given in favour of schemes other than the departmental scheme? I have read the newspaper reports.

2556. Do you believe that Sydney could be served by an underground railway? If it were worked by electricity, yes; if it were worked by steam, no.

2557. *Mr. Humphery.*] Do you attach much weight to the report of the Railway Commissioners issued yesterday, and the statement which it contains as to the necessity for immediate steps being taken for the extension of the railway into the city? Is that a fair question?

2558. I understood you to convey that you attach little or no weight to expert evidence? I do not think I said that. I said that in my own business I took it or not as I thought fit, and that the responsibility rested with me.

2559. I would like to read you an extract from the report of the Commissioners which was issued yesterday:—

The proposed extension of the railway into the city is a matter which demands some mention in this report, not with object of advocating any particular route . . . but because of the absolute necessity for a decision in the matter. The time has arrived when it must be emphatically stated that the passenger business cannot longer be conducted at Redfern with reasonable convenience to the public, or without unnecessary risk.

Are you not disposed to attach great weight to a statement of that character, coming from such a source? I should accept it as what is known as an official statement.

2560. If we are told that the passenger traffic has greatly increased, would you credit that statement? I do not see how it is possible that the suburban passenger traffic can have increased.

2561. I will quote another paragraph from the report:—

The coaching traffic shows an increase of £54,774; second-class traffic having increased by £58,407, and miscellaneous traffic by £8,694. First-class traffic shows a decrease of £2,327.

? That is the entire traffic. My remarks apply only to the suburban traffic.

2562. The report continues:—

For the increased money earned there were 1,667,876 additional passenger journeys made.

In the face of that statement, do you adhere to the opinion that it is not necessary to provide better passenger accommodation? I think that that only makes an average of thirty additional passengers for each train. I do not think you want an extension for that. I do not know how many passengers there were carried before. The statement that there has been a certain increase is of no value unless you know what proportion that increase bears to the number of passengers previously carried.

2563. Inasmuch as the earnings from passenger traffic, notwithstanding a large decrease in first-class passenger receipts, increased last year by £55,774, must there not have been a very greater number of suburban passengers carried? I would not say so. I do not know what proportion the increase bears to the total number of passengers carried.

2564. Without distinguishing between long-distance and suburban traffic, may we not fairly assume that a portion of the increased earnings came from suburban passenger traffic? I could not express an opinion without having the figures as to the actual traffic before me.

2565. Notwithstanding the very definite opinion you have expressed as to Redfern being near enough to the city for a terminal station, if we have been told by Mr. Eddy and others that it would be wise to bring the railway into the city, would you not be disposed to value the opinion of experts upon a matter of this kind. You are managing a very large institution, employing a great number of men, and you have control of a vast enterprise;—would you not expect outside opinion to defer to yours in questions relating to management? I should be quite ready to defer to Mr. Eddy in everything relating to the management of a railway, because that is a subject upon which he was thoroughly informed, and about which I know nothing; but upon a question of public policy, I think that I have as much right to an opinion as Mr. Eddy had, and this is a question of public policy.

3566. *Mr. Fegan.*] The Secretary to the Railway Commissioners told the Royal Commission that for the year 1896 the total number of passenger journeys in and out of Sydney was 11,670,000; that is, on the assumption that each ticket-holder made one journey in and one journey out each day; therefore, an increase of 1,667,876 passenger journeys is very considerable? That would be an increase of about 15 per cent.

2567. You will admit that the railway officials are the persons who are most likely to be supplied with the correct figures on this subject? Unquestionably.

2568. In view of this great increase of traffic, is it not necessary that something should be done to relieve the congested state of Redfern;—would it not be better to extend the railway into the city, with some chance of recouping the interest upon the money expended, than to merely improve the terminal station at Redfern? If the business were mine, I would not consider the question of leaving Redfern. I would merely tell the experts that they were going to stay there, and that they would have to make such provision as would make the stations arrangements safe, supposing they thought them to be unsafe.

2569. But, as a business man, would you not like to see a return for your money, even if you spent only £100,000? I do not think it would cost anything like £100,000 to make Redfern unquestionably safe, and to provide longer platforms than there are there now.

2570. According to the figures put before the Commission it would take from £200,000 to £400,000 to extend the Redfern station arrangements across Devonshire-street? I do not in the least believe in the construction of large stations. I think that we should follow the American plan rather than the English plan. We should not run our trains under great glass roofs. In my opinion it would be sufficient to have only the platforms covered in. The trains themselves could stand out in the open air. You do not require a large sum of money to build a station of that kind.

2571. *Mr. Hoskins.*] Have they not a large central railway station in New York? I think they have now.

2572. *Mr. Fegan.*] Do you know that out of the 11,000,000 passengers arriving at Redfern during the year only about 3,000,000 take the railway tram into the city? That to me is a strong argument against the proposed extension, because it shows that the great proportion of the passengers are quite content to get out at Redfern.

2573. It must be remembered that the trams are very slow, because they stop at nearly every corner, and that there is a wait before the tram starts;—do you not think that if the railway were brought on into the city, at least one-half of the 11,000,000 people arriving at Redfern would come on by train? I do not

not

not think so. I think that the very large proportion of the 8,000,000 who do not come on by tram now do not want to come near Hyde Park. They want to come to some place between the Redfern station and the Cathedral. E. W. Knox.
13 Aug., 1897.

2574. There is a great advantage in being able to come right through to your destination without changing? I believe that if the railway were brought into Hyde Park, the greater number of passengers would continue to get out at Redfern.

2575. Do you think that more would get out at Redfern if the railway were extended to Hyde Park? No.

2576. Do you think that a larger number would go on to Hyde Park by train than now travel by railway tram? I think you could count upon getting the 3,000,000 that now travel in the tram.

2577. But there would be no increase beyond that? That is so.

2578. The main point of your evidence is that there is no necessity for going to the expense of continuing the railway into the city? I think that there is no justification for such an expense.

2579. You think that greater accommodation could be given at Redfern? Unquestionably.

2580. What is your real objection to the taking of Hyde Park? I object to the use of land which has been dedicated to the public as a park for any other purpose, whether by a particular section of the community or even by the whole community.

2581. Your evidence to-day is a protest against the handing over of any of these reserves for any other purpose than that to which they were dedicated? Yes.

2582. Have you ever protested against other reserves being used for purposes other than that to which they were dedicated? I think that to a certain extent I was instrumental in preventing the Metropolitan Collieries Company from obtaining 6 acres of land at Bradley's Head.

2583. Did you ever make a protest against the handing over to the City Council of any reserve in George-street? I do not know of any reserve in George-street that was ever handed over to the Council.

2584. Did you ever raise any objection to the alienation of the Métropole site? That site has been private property ever since I was born.

2585. It is not very long since it was built upon? I think it is forty years since it belonged to the Council. I was not in a position to make protest against any alienation then.

2586. Your argument is that, no matter how badly the public convenience may require the use of a portion of the Park for railway purposes, it must not, under any circumstances, be taken? I say that that section of the public which wants the Park should not get it under any circumstances.

2587. You say that these people will not pay for the construction of this line? The Railway authorities have said that they did not propose to charge them for its construction.

2588. You challenged the opinion of the Commissioners that this line would pay interest upon the cost of construction? I think the Railway authorities value that portion of the Park which it is proposed to take at £100,000; but you had evidence submitted to you three or four days ago to the effect that it was worth much more than that.

2589. The Commissioners say that they are willing to place £100,000 upon the Estimates for the resumption of 24 acres at Devonshire-street, which they would make into a park, and in maintaining which they would spend £1,000 a year;—do you not think that that arrangement would be a good one for the public? I am not aware that the Railway Commissioners own any land in Devonshire-street which they can make over to the public. The whole of the population of the Colony will have to pay its share of the £100,000 which you speak of. There is only a small section of the suburban residents of Sydney who would be carried over the extension.

2590. Surely if the extension will give greater comfort and speedier transit to the people of the country, as well as to the people of the city, it should be made? I do not admit that.

2591. You do not mean to say that a separate account should be kept between the city and the country so far as the railway revenue was concerned? If I lived at Mudgee I should not think so, because then I should have to pay three times as much as other people who travel by rail. The residents in the eastern suburbs are told that they must pay high fares in order that the Commissioners may get a return of 4 per cent. upon the working of the railways and tramways; but the man who travels to Mudgee only pays as much as the man who travels from Bathurst, although the Mudgee line is an unprofitable line, while the Bathurst line is a profitable line.

2592. The extra charge made upon the passengers carried would be sufficient to pay for the proposed extension? Yes, if you do not pay for the Park.

2593. *Mr. Roberts.*] Are we to understand that in your opinion the Government would be making a great error of policy in bringing the railway to St. James'-road? Yes, at the present time.

2594. Do you arrive at that opinion from a purely financial view? Yes.

2595. If you had control of the railways you would look upon this as an unremunerative investment? I should look upon it as an undesirable investment, in view of the present position and the immediate prospects of the Colony.

2596. I think you said that you would not come further north with the line than Belmore-road? Yes.

2597. Does it not occur to you that if the railway were brought to St. James'-road there would be a large increase in the suburban traffic, and, consequently, a large increase in the revenue? I think there cannot be any increase in the suburban traffic. So far as my knowledge of Sydney goes, I should say that the population is more likely to diminish than to increase within the next year or eighteen months.

2598. Is not the population of the Colony gradually increasing? The population of Sydney is not increasing to any extent at the present time, and the Colony is poorer now than it has been for the last ten years. There is less ability on the part of the country districts to carry the town, and, therefore, the number of people living in the town cannot increase.

2599. If greater facilities were offered to enable people to get to the western suburbs, is it not likely that the suburban railway traffic would increase? Not unless there were more people to settle in the suburbs, or the people had more money to pay for fares.

2600. If an extension into the city were decided upon, would you prefer a line on the west side of George-street to one on the east side of George-street? I should say that a line on the west side of George-street would serve more people.

2601. Would the fact that such an extension would have to be by means of tunnels prove a serious objection? I do not think it would be desirable to carry these trains underground in this climate. If you had electricity you could use tunnels.

E. W. Knox. 2602. Things might as well remain as they are as to have an electric train in addition to the present trains? Well, that is a matter for the people to decide for themselves.

13 Aug., 1897. 2603. If steam locomotives were to be used and the railways to be brought into the city, you think that it should, if possible, be brought in by means of a daylight line? Unquestionably.

2604. *Mr. Humphery.*] I find it stated in the Railway Commissioners' report that during the last nine years the passenger traffic has increased 50 per cent., and we are told that nine-tenths of the passenger traffic is suburban traffic;—that being so, do you not think that if 1,657,876 additional passenger journeys were made last year, there must have been a large increase in the suburban passenger traffic? I could not offer you any opinion upon the subject.

2605. Would not that be a fair inference to draw? I think so, because of the enormous development of traffic from the North Shore line. I think you would get better information upon the subject if you were to ascertain from the council clerks in the railway suburbs what increase there has been in the number of inhabited houses in those suburbs during the last twelve months. If there has been a decrease in the number of inhabited houses, I do not think there can have been an increase in the suburban railway traffic.

2606. Will you say whether the inference is a fair one as to the western suburban traffic? Can you tell me how many of the 1,667,876 passenger journeys which you have referred to were made upon the North Shore line?

2607. I am not closely distinguishing between the North Shore and the western suburbs passenger traffic? When you speak of an increase of 50 per cent. during the last nine years, I would remind you that the platform accommodation at Redfern has been increased more than 50 per cent. in that time.

2608. *Chairman.*] In your opinion, what is the business centre of Sydney—approximately? A line drawn from the Custom House along George-street to Christ Church.

2609. Give us the middle of that line? I cannot do that. There is no business centre in Sydney, just as there is no business centre in Melbourne. There is no business centre in any of the large towns that I know of. In most of the large towns the different business establishments collect together in different portions of the town. For instance, in Melbourne you have the soft-goods houses in Flinders-lane.

2610. You say that there is no business centre in Sydney? Yes.

2611. *Mr. Black.*] Do you not mean that there are several business centres in Sydney? I say that there is no business centre in Sydney, or rather, that the business centre is a line, not a point.

2612. Would it not be fairer to say that there are various business centres in Sydney;—for instance, Sussex-street is the business centre for produce? I think it is better to say that the centre is a line, and not a point.

2613. *Chairman.*] Is it not a reasonable inference that the Post Office is the business centre of the city? No; I do not admit that. Goldsbrough, Mort's office is as far from the Post Office in one direction as it is possible to get, and at the other end of the town, close to the Haymarket, you have the two principal wholesale grocers, and between the two places various large business establishments are scattered about.

2614. The population between Redfern and Parramatta is 125,000;—do you know how many people live within half a mile of Hyde Park? Very few.

2615. Then, regarding this as a local question, the proposed extension would convenience 125,000 persons, and, at the worst, inconvenience but very few? I think that that is a very unfair way of stating the matter. No doubt in the 125,000 that you speak of you include the population of Newtown, and of the Glebe.

2616. The population of Newtown is included; but not the population of the Glebe;—there are about 19,000 people living in Newtown? Most of those people use the tram, and so do most of the Marrickville people.

2617. Of course, if you take the stand that people do not desire to get closer to Sydney than Redfern is, there is an end to the argument? The figures mentioned by Mr. Fegan prove that conclusively. He says that out of 11,000,000 arriving at Redfern only 3,000,000 come on by tram.

2618. But you know that that is not the reasonable inference to draw from those figures. A few minutes ago you referred to the mayors as the proper exponents of public opinion. Well, the mayors of several municipalities have come here and given evidence in favour of the line, and, if necessary, they are all prepared to do so. They say that it will suit the convenience of the public to be brought to King-street, and surely they know what they want? I do not dispute the statement that it would suit the convenience of a portion of the public to be brought to the top of King-street.

2619. *Mr. Hoskins.*] In reply to a question of Mr. Humphery, you stated that the number of platforms at Redfern had been increased to a greater extent than the passenger traffic had increased;—are you aware that the Railway authorities say that they have been compelled to erect more platforms because of the increase of traffic, but that this has increased the difficulty of working the station? I am aware that that is their statement.

2620. Do you not think that they are responsible for what they say, and that we ought to credit it? I have no doubt that they are responsible for what they say.

2621. And that we ought to credit what they say? Surely that is a matter for you to decide, not one for me to decide.

The Honorable William Robert Campbell, M.L.C., sworn, and examined:—

The Hon. W. R. Campbell, M.L.C.
13 Aug., 1897.

2622. *Mr. Hassall.*] Have you any statement to make to the Committee? My first objection to the proposal into which the Committee are inquiring is based upon what some people call sentimental grounds, but what I might call national or patriotic grounds. It is many years ago since Hyde Park was dedicated to the citizens of Sydney, and I think that the Government have no right to destroy that Park. I think that it would be a great mistake, considering the money which has been spent in beautifying that part of Sydney, that we should take any part of the Park for the purpose of putting a railway station upon it, which would benefit but very few people. To put a railway station upon Hyde Park would close one of the best lungs of the city, or whatever you please to call this breathing-space. In the summer-time the north-easters have a clean sweep across the Domain over that Park to the railway suburbs towards the south and west. If the proposed extension were carried out the erection of a station building on Hyde Park would, to a certain extent, block that current of air. That, in my opinion, is a serious objection to the proposal. It must also be something to the people of Sydney and of the country that it is proposed to

The Hon.
W. R.
Campbell,
M.L.C.

13 Aug., 1897.

to destroy at one swoop a very beautiful park. We know that this Park has been the pride of Sydney for years. There is not a man, woman, or child who comes to Sydney who does not go to Hyde Park, and from there into the Domain. The whole of the traffic from Park-street to King-street, across the Park, will be blocked if the proposal is carried out. Any railway station which is built must be built upon a level, and I am sure that there is a fall of 20 feet from the Queen's statue to Elizabeth-street. Therefore, to get a level site for the station, you would have an immense cutting near the central avenue of the Park. Then, too, you will have to raise Park-street a great many feet in order that the line may go under the roadway without disturbing the traffic. In raising Park-street you are doing what in every other city in the world they are trying to avoid—you are making the grades worse.

2623. *Chairman.*] Park-street is to be raised only 3 feet 6 inches, and the grade is to be 1 in 25? Well, to increase the grade of a street is contrary to the policy which is followed in every other part of the world. Though you say that the street will only be raised 3 feet 6 inches, I think that it will probably be raised at least twice as much.

2624. *Mr. Lee.*] If you took a little time to look at the plans, you would see that an overway 30 feet wide is to be provided to take the people from near Market-street right across the platforms into the middle of the Park? Well, suppose that is so, that is a nice arrangement. You will have people scrambling up flights of stairs to make a crossing which they can make now through a beautiful park. Is that the recommendation that is to be made by a Committee like this? I think that such an arrangement is to be condemned. In this beautiful city, which is to be the Federal city in the future I have no doubt, we have need of all our beautiful parks. In London they have no station in the centre of the city, and they would never think of doing away with any of their parks to make room for a railway station. Victoria station, which is a little bit of a hole near Buckingham Palace, is the station nearest to the centre of the city.

2625. *Mr. Hoskins.*] What about Charing Cross? That is out of the way, near the river. It is not in the middle of London. In London they have spent thousands and tens of thousands of pounds in improving the Thames Embankment, while here it is suggested that we should give up 13 acres of park land for £100,000, and some people have estimated the value of this land at £160,000. I will show you, however, what the Government had to pay a few years ago for some land which it resumed for tramway purposes. I asked a question about this matter a little while ago, and I ascertained that for 2 roods 19½ perches on the western side of Circular Quay, between Pitt and George streets, which the Government resumed in 1883, they paid £98,120, and £212 for legal expenses, or nearly £100,000 altogether; yet it is now proposed to give up 13 acres of park land for £100,000.

2626. *Chairman.*] You think that that resumption is so satisfactory that the Government ought to resume more private land? No. I am comparing what the Government paid for that land with the amount for which they proposed to part with a quarter of the Park. I do not wonder at the Commissioners saying that they want a railway into the city; but if they had to pay value for this land, they would not be able to meet the interest upon the cost of constructing the line. The Commissioners were appointed to work the railways upon commercial lines, and it is not going upon commercial lines to give them this Park. I do not think that the country should give it up. If the railway were a private venture, people would never think of giving up that portion of the Park for £100,000. So far as I can discover, there has been no very great agitation for this railway. According to the ideas of some members of the Committee, if the railway is brought to St. James'-road there will be an immense increase of traffic; but I would point out that at the present time the traffic in King-street is very much congested, and I would like to know how it is proposed to deal with any more traffic there. If the traffic in that part of the city increased, it would be necessary to widen the streets, and the Commissioners would have to pay for widening them. There is very little doubt that if the railway is extended to Hyde Park the Law Courts will have to go, and St. James' Church will have to go. Both those buildings will have to be paid for.

2627. What about the Houses of Parliament? I do not think we shall let them have the Houses of Parliament. We are not going to give them the Law Courts for nothing, and they will not get St. James' Church for nothing.

2628. *Mr. Wright.*] Or St. Mary's? I do not know about St. Mary's. Those people can answer for themselves. I believe that Sydney is actually the capital of Australia. The members of the Committee know what the surroundings of the Redfern station are. Are they anything to be proud of? But if the railway goes to St. James'-road we shall have the same thing perpetuated there; we shall have low eating-houses, and low, mean buildings there. Upon sentimental grounds alone, I think that this is a monstrous proposal, and, as an Australian, I object most strongly to it. The City Council had to pay £250,000 for the Market site, and yet we propose to give up 13 acres for £100,000. If the Commissioners get the Park on these terms, they will be paying very much less than the value of the land. There was a great outcry when Garden Island was taken. At the time it was suggested that a good bargain was being made, because we would get the barracks and other property; but I think a great mistake was made when that exchange took place, and we do not want any more transactions of the kind. At Bradley's Head they were only stopped from using the land for a coal-mine by the agitation which was got up, and if the citizens do not rise and protest against this scheme Hyde Park will be taken. I do not see where all the benefits of this extension come in. I do not see that the Commissioners will be any better off when they get Hyde Park than they are now. They will be jammed right up against the Law Courts. It ought to be very easy to resume enough land at Redfern to make provision against accident there. It would be very easy to take the Asylum ground and the Cemetery. There is a sort of promise that we shall get the burial-ground in place of the 13 acres of Park. What is the worth of that promise? This land was dedicated specially and absolutely to the people of Sydney; but you say that you will take it away because you want it. Then, when we get the 24 acres that you speak of, you will say again, "Oh, we want that land. We will give you some land at Botany Bay."

2629. *Mr. Black.*] Mr. Eddy suggested that that land might eventually be wanted for railway purposes? Yes. What is this promise worth? We have a grant from the Crown, and you take no notice of it. You tell us that you will give us something in place of it; but what is the promise worth? Nothing. It is the most monstrous proposal ever suggested.

2630. *Mr. Lee.*] Mr. Eddy did not make any promise; he simply suggested the arrangements you speak of? Well, "suggested." You know that it was understood that there should be an exchange. The suggestion has been made that Hyde Park should be given up in exchange for land in Devonshire-street; but

The Hon.
W. R.
Campbell,
M.L.C.

13 Aug., 1897.

but I say that that suggestion is worthless. I am sure that there is no greater statesman in these Colonies than the late Sir Henry Parkes, and he always protested against the Park being taken. If I am correct the break-up of the last Parkes Ministry was caused by a dispute upon this very question. He wanted the line on the western side of George-street; but other members of the Ministry wanted it to be brought into Hyde Park. I think the voting was even, and nothing came of it. Sir Henry Parkes was always in favour of going along towards Wynyard-square, through the Rocks, and on to North Shore. He always advised the marriage of North Shore with Sydney. Of course, the great objection to taking the train on the western side of George-street is that you would have to tunnel. But you must tunnel to get any extension from St. James'-road, and to suit the majority of the people you must take them down to the water. I admit that tunnelling is well enough where you have electricity; and, in my opinion, there would be no great trouble in changing from steam locomotives to an electric engine at Redfern before going into the tunnel. A line through Hyde Park will be a very ugly affair. It is the people of the western suburbs who want the extension. There has been no agitation on the part of anyone else for an extension. I do not blame them if they can get the country to bring them a few hundred yards further into the city; but I do not think that the people would be wise in doing what they ask. No doubt people who have land near the Park, which would be made more valuable by the construction of the line, are in favour of it; but otherwise I do not think that many people want the extension. A man coming from the country must take a cab in any case to carry his portmanteau, and he might as well get out at Redfern as at St. James' Park, while to a man who was simply carrying his tools and his swag it would not matter if he had a yard or two further to walk. He would not be coming down into this end of the city at all. It has been decided that an electric tramway should be constructed up George-street. That will greatly convenience people who wish to come down into the city. People wishing to get to the Quay will, no doubt, take the George-street tram in preference to the railway to King-street. Then, too, there will be very few people wanting to get to Woolloomooloo Bay, so that the number of passengers coming to King-street would be very few. To convenience these few people you would destroy what I think is the best park in the world. I do not know any park which is more beautiful. You would inconvenience hundreds of people by destroying a recreation-ground which is necessary for the health of the public.

2631. *Mr. Hassall.*] Do you believe in any extension into the city? I think the railway might come into the city; but I am in no hurry to see it extended.

2632. Could you suggest any other scheme? I think it would be better to take the line to Wynyard-square, and on to North Shore possibly. That would open up and improve what is now a very discreditable neighbourhood. Everyone speaks about the cost of the proposal, but you cannot get good things for nothing. You must pay for what you get. North Shore and Sydney must be brought together some day.

2633. You spoke about this proposal having the effect of closing up one of the lungs of the city;—do you know that it is proposed to open another lung near Devonshire-street, in a neighbourhood where the population is much greater than the population around Hyde Park? I do not see where that park would get its fresh air from.

2634. Have you been on that site? Not very lately. The air coming to that park would have to pass through the smoke arising from the railway yard at Hyde Park.

2635. Does not the air now coming to Hyde Park have to pass over the smoke and dirt of Woolloomooloo? Of course it does; but that is very little in comparison.

2636. Do you not think that a park near Devonshire-street would be as advantageous to the people in that locality as Hyde Park is? Where do you propose to put that park?

2637. On the site of the old Cemetery? Who is going to give it to you?

2638. *Chairman.*] The State owns both places? The State does not own Hyde Park.

2639. I presume that the State could do to Hyde Park what it did with the George-street Cemetery? Well, I suppose there were too few people to protest against the resumption of the George-street Cemetery.

2640. *Mr. Hassall.*] Do you not think that it would be desirable to remove the Devonshire-street Cemetery? Yes; but people are not being buried there now.

2641. You cannot suggest a better route for the line? Well, it is not my business to suggest any route.

TUESDAY, 17 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Edward James Howes Knapp, C.E., Surveyor, made an affirmation, and was examined:—

E. J. H.
Knapp, C.E.
17 Aug., 1897.

2642. *Chairman.*] You are a surveyor and practise your profession in Sydney? Yes.

2643. You have considerable knowledge of the city and its surroundings? Yes.

2644. *Mr. Black.*] Do you desire to make a statement in reference to the proposal now under the consideration of the Committee? I do. I presume that it would not be out of place to mention that last February I addressed the Press in regard to the suggestions which I am about to make to the Committee. I was then in favour of extending the Redfern railway station by taking in Prince Alfred Park and some other adjoining land; but, seeing that such a determined opposition has been set up against the absorption of any of our parks for these purposes, I have remodelled my original proposition.

E. J. H.
Knapp, C.E.
17 Aug, 1897.

I agree with the late Chief Commissioner that the present terminus at Redfern is sufficiently large to deal with the long-distance traffic. The proposal I have to make is for the construction of an underground loopline through the city itself; and inasmuch as it has been said that the Redfern terminus is too small, I would suggest that the area might be increased by resuming land lying between George-street, Regent-street, and the Mortuary receiving house. In view of what we may imagine this city will be some years hence, I think it prudent to look ahead, and therefore I suggest that the Cemetery and all the Government property between Devonshire-street, Pitt-street, Belmore-road, and Randall-street, also be resumed. I know that there will be some sentimental objections raised to any disturbance of the dead; but I hold that the interests of the living are of more importance. I myself have a brother and sister lying in that burial ground; but I would have no objection to the resumption of the whole of it for the use of the public. That would give us about 20 acres in addition to the present site. Upon this ground which I propose should be resumed might be commenced the construction of an up-to-date station, and, when it is built, the present station might, if necessary, be remodelled. I believe that I am right in saying that I saw it reported in the newspaper that the Railway Commissioners intended to expend between £70,000 and £80,000 upon the remodelling of the Redfern station. The route I propose to follow in my city line starts from the proposed new station, and goes through Belmore Park under Elizabeth-street, along by Wexford-street to the junction of Goulburn and Nithsdale streets, where I propose to have a platform; under Elizabeth-street to the east side of the Grammar School grounds, skirting by the public school in William and Yurong streets on to the site of the Industrial Blind Institution, and through Cook and Phillip Parks, where I propose to have another platform extending through to Woolloomooloo-street. Here provision can be made for a railway line to the eastern suburbs. From there it skirts round Sir John Young's Crescent, inside the Domain, and sweeps round by a tunnel underneath the Domain to Macquarie-street, near Governor Bourke's Statue and on to the site of the Educational Department, which I suggest should be resumed. There I would have a station, and from there I would go on to Bridge-street, underneath Pitt and George streets. From there I would cut through into Argyle-place, having a station there, and, circling round the edge of the quarry, I would get round into Kent-street, following under Kent-street all the way until I got to Liverpool-street. From there I would return by a circuitous line to the proposed new station at Belmore-road. If the authorities would not object to a few open cuttings, we might have 110 chains of the line open and 220 chains in tunnel, the total distance being about 4 miles. Such a line would serve a larger number of people than a single line running into Hyde Park. The area within the loop will be served by Elizabeth and (proposed) George streets trams, and not materially interfere with the railway traffic. The reason I have for objecting to the Hyde Park proposal is that it ends in a *cul de sac*, and if, at a future time, it is required to extend the railway to the waters of Port Jackson, this will entail a very much greater expense, because the value of all surrounding property will be enhanced by the construction of the St. James'-road station. I do not propose to have any stations along my proposed line; I would merely have platforms at which passengers could embark or disembark; therefore, I would save the great amount which would be spent in constructing a station in Hyde Park. I have never been in London, but, from what I have read, I believe that on the underground railways there they have only platforms. By the employment of a few extra guards to travel round with the trains, for the purpose of selling and collecting tickets, a considerable saving would be made, as no expensive stations and extra staffs of officials would be wanted. I estimate that, roughly speaking, taking the figures put down for the proposal before you, the cost of the whole 4 miles would be £1,955,000, or, adding 10 per cent., so as to be well within the mark, £2,151,000. Outside it is said that the Railway Commissioners have told their staff that they want a station in Hyde Park. Whether that be true or not I cannot say. I have not come here to dictate to the professional staff of the Department what it should do. I believe that if they have a free hand given to them we have a staff of men in the Department second to none in the world, and capable of carrying out any engineering works, no matter how difficult. I consider it a libel upon their efficiency to say that it is impossible to improve the present station. I believe that they are quite competent to do it without the assistance of anybody outside. I appear before you as one of the public who has an intense interest in this matter. With regard to Mr. Perdriau's valuation of the Park, I would like to say that he is a friend of mine, and against his professional ability no one who knows him can say a word. He justly stands very high in the profession; but I think he has considerably under-estimated the value of the Hyde Park site. If I may be permitted to express an opinion in opposition to his, I would say that his subdivision is hardly a fair one. He gives the depths of some of the allotments as 140 feet; but that is an excessive depth in the city of Sydney. He has also accounted for only two frontages between Elizabeth-street and Macquarie-street.

2645. May I interrupt you here to say that when Mr. Perdriau was last before the Committee I pointed that matter out to him, and he promised to furnish an amended estimate, reckoning four frontages instead of two? I am glad to hear that, because Mr. Perdriau is a personal friend of mine, and one whose professional opinions I value very much. Between Elizabeth-street and Macquarie-street and the sections north of King-street there would be four frontages. I have before me a copy of the trigonometrical survey of the city, and I find that between Elizabeth-street and Phillip-street, the average depth is 155 feet, which, of course, would give, in round numbers, a depth of 77 feet to each foot of frontage. Between Phillip-street and Macquarie-street, the average depth is 240 feet, or 120 feet to each foot of frontage. This is without any back lanes or entrances. Continuing Elizabeth-street and Macquarie-street southerly, I find that I could get four frontages, with an average depth of 87 feet, and access to 20-foot lanes at the rear. Although I do not agree with Mr. Perdriau's figures, I have accepted them in order to compare our valuations. He has valued land in Macquarie-street at £90 a foot. Well, in making some assessments for the Commissioners of Taxation, I valued some of the land there—and my valuation was accepted by the Commissioners at £100 per foot unimproved. But if we take Mr. Perdriau's figures, namely, £75 a foot for the Hyde Park land, we should get for the four frontages, which give, 4,260 feet, £319,500. Mr. Perdriau estimates the same land to be worth £167,250, or £152,250 less. I am bold to say that it would be most difficult to state accurately what price would be given for that land by persons desiring to purchase allotments facing a southerly extension in Macquarie-street. I believe that the figures would be very much larger than those I have given. The site itself is unique, and with a park in front I am certain that the land would realise an enormous price. On the 19th March, 1886, on behalf of a syndicate, I offered Bishop Barry £70,000 for St. James's Church, the Parish Hall, and the site where the parsonage stood. I know that the members of the syndicate were prepared to give more, but that was the offer made. The land we wanted to buy comprised a little over half an acre.

- E. J. H. Knapp, C.E.
17 Aug., 1897.
2646. In proposing to resume land to the west of the railway station, are you aware that at the present time the Darling Harbour branch would cut off that land from the present yard? Yes.
2647. Have you thought out any means of diverting the Darling Harbour branch so as to enable use to be made of the land you wish to resume? I have not; but you might cover over the Darling Harbour line.
2648. Would you sink that line still deeper? Yes. To go back to a point that I omitted to mention in making my statement, I would say that, in order to divert a good deal of the traffic from the upper portions of George and Pitt streets, I propose an extension of Castlereagh-street from the Belmore-road to give more direct access to Redfern and to Waterloo.
2649. Would you carry Castlereagh-street through Belmore Gardens? No; I do not propose to connect the present Castlereagh-street with my proposed new street. To do that, of course, I would have to take the new street through Belmore Gardens. I do not propose to touch Belmore Gardens, because they make such a row about these things now-a-days. The traffic coming down Pitt-street would turn into Belmore-road, and then go along the new Castlereagh-street straight into Castlereagh-street, Redfern, instead of going up George-street and *via* Regent-street.
2650. Going back to the question of dealing with the Darling Harbour branch; you were speaking of taking it beneath the ground;—how much further back would you take it—to the other side of the Redfern tunnel? Yes. You would have to go back a considerable distance in order to get deep enough.
2651. You propose to have a station where the Education Office now stands? No; a platform.
2652. Where do you propose to have your intermediate stations? I would have platforms.
2653. At what points? I would take in the whole of the Educational Department site.
2654. Would that be your terminus? No.
2655. That would be your turning point? No; the turning point would be round in Argyle-place—at the junction of Argyle-street and Kent-street. Further on I would suggest an approach to North Shore by tunnel. I do not favour the high-level bridge connection.
2656. To which point would you tunnel? To Dawcs Point.
2657. And from there to Milson's Point? Yes.
2658. You would have another platform at the corner of Kent-street? Yes. At all the stopping places I would simply have platforms. Of course if more stopping places were required at any future time they could easily be made.
2659. Where would you have your first platform? At Nithsdale-street, and there would be another extending from William-street to Woolloomooloo-street, and another, if necessary, at Macquarie-street opposite the Public Library.
2660. Do you mean in the Domain? In the Domain. There would be another platform at the Educational Department, and another at the corner of Kent and Argyle streets.
2661. Then you are on the return journey? Yes. You might have a platform in Kent-street opposite the gasworks, another at the corner of King and Kent streets, and another at Liverpool-street.
2662. I gather from what you have said that you do not oppose the resumption of Hyde Park upon sentimental grounds? Well partly, and partly because I believe that the proposed scheme will not serve the population who require to use the railway.
2663. You also think that it would be incapable of future extension? Well, it seems to me that while we are about it we should do more than merely bring the railway into Hyde Park, because the proposed line will so enhance the value of surrounding land that any future extension would be very costly.
2664. As a surveyor, how far would you say it was from St. James'-road in a direct line to where a tunnel could be constructed to convey passengers to North Shore;—how far is it from there to Circular Quay? About 42 chains to the nearest point.
2665. That is a little under 1,000 yards? Yes.
2666. Are you aware that the site of the proposed railway station in Hyde Park is somewhere about 77 feet above high-water mark? Somewhere about that.
2667. Are you further aware that engineers say that if a tunnel is constructed to North Shore it will have to be 60 feet below the surface at the water's edge? I cannot say that I am aware of that.
2668. Presuming that to be true, there will be a loss in head between St. James'-road and the Circular Quay—a distance, as you have shown, of less than 1,000 yards in a direct line—of from 130 to 140 feet, if you attempt to construct a tunnel to carry an extension of the line to North Shore? Yes.
2669. Do you think that that is possible? No.
2670. Such an extension is impossible in a straight line, and even if you wound about—a thing which I suppose is not very commendable in a tunnel—it would still be very difficult? Yes, and very objectionable.
2671. The fall would be something like 1 in 7? That would be impracticable for railway purposes.
2672. You spoke of having offered £70,000 for half an acre of land in King-street—that was in 1886; I suppose you are aware that land is considerably reduced in value since then? Undoubtedly.
2673. Has the value of land in the locality we are speaking of fallen 50 per cent? Not far from it.
2674. That would make the land for which you offered £70,000 worth £35,000, which would be equivalent to a value of £70,000 per acre;—do you consider the Hyde Park land to be as valuable as that in Phillip-street, for which you made your offer? I consider it to be more valuable.
2675. If that be so, does it not seem a ridiculous thing for the Railway Commissioners to offer £100,000 for 13 acres of Hyde Park—about £7,692 per acre? I say unhesitatingly that it is not a fair offer.
2676. Some people have thought it a piece of astounding liberality? I am prepared, with a syndicate behind me, to give the Government 50 per cent. more than that, if they will sell the Park.
2677. Another gentleman estimates the value of Hyde Park land at £12,500 per acre;—do you think that that also is an under-estimate? Unquestionably I do. As I have already said, I believe that it would be difficult to state exactly what that piece of ground would fetch if it were subdivided and put up for auction. Its position is unique. I believe that an enormous sum would be paid per foot for any land fronting a continuation of Macquarie-street.
2678. In valuing the land, I suppose you take into consideration, not only its beauty and its position, but the amount which has been spent in making it what it is now? I have not considered that at all. I am treating it just as though it were a piece of bare, waste land.
2679. But do you not think that it would be fair to take into consideration the expenditure upon it? I have not considered that in my estimate; but it would be perfectly fair to consider it to a certain extent.
2680. *Mr. Hoskins.*] Are you aware that Mr. Perdriau's valuations have been endorsed by Mr. Sievers, the Land Valuer for the Commissioners of Taxation? I am not aware of it. 2681.

E. J. H.
Knapp, C.E.
17 Aug., 1897.

2681. *Mr. Humphery.*] How many selling feet would there be in the half acre for which you offered £70,000—approximately? I think St. James' Church stands upon a block of land having a frontage of about 200 feet to King-street. There was another block having a frontage of 57 feet to Macquarie-street, and about 117 feet to King-street, and another block having a frontage of something like 55 feet to Phillip-street. The three blocks had a total frontage of about 317 feet.

2682. How much would that land be worth a foot, at £70,000 an acre? £150 a foot.

2683. Do you not think that that is an extreme price? I think that if the church authorities would accept my offer I could find the money within twenty-four hours.

2684. *Mr. Trickett.*] You believe that property has depreciated about 50 per cent. during recent years? I take it that since 1883 it has depreciated from 40 to 50 per cent.—in some localities 300 per cent.

2685. Are you aware that land in George-street, which some years ago was sold for £1,400 a foot was sold the other day for £375 a foot? Yes; but I never believed that land in George-street was worth the amount which in boom times was obtained for it. Within the last three years £2,000 a foot was offered for 30 feet of frontage to George-street, at the corner of George and King streets. The buildings upon that land are ramshackle constructions, worth nothing. That shows you that when people make up their minds to have a certain spot, they are prepared to give anything for it.

2686. What do you think the land in Macquarie-street is worth at the present time? Well, I assessed the unimproved value of some of it at £100 a foot, and Mr. Sievers has agreed with this, though some months before coming here I altered my valuation to £125 a foot.

2687. *Mr. Wright.*] You are aware that King-street occupies a unique position in the city? Yes.

2688. Do you think that land as far away as Hyde Park would be worth anything like as much as land in King-street? If Macquarie-street were continued south, and the eastern half of the Park were left intact, I should say that the park lands fronting the continuation would fetch a higher price at the present time.

2689. There is no site in the Colonies to be excelled by the present Macquarie-street sites? Well I should consider that portion of Hyde Park to which I am referring of more value than the land in Macquarie-street between King and Hunter streets, because at Hyde Park you are away from the Hospital, and you have an open space in front of you.

2690. Can you tell us why land in Elizabeth-street will not bring £70 a foot, although it fronts the Park? It is not worth more because of the trams.

2691. Are you aware of the selling price of that land before the tramways were made? No.

2692. You are not aware that before the tramways were made no higher price than £40 a foot was paid for that land? No, I am not.

2693. You would be surprised to hear that such is the case? Well, I was not aware of it.

2694. The platforms you provide for the business portions of the city are at Bridge-street, Nithsdale-street, and the intersection of George and Elizabeth streets? Yes.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

2695. *Chairman.*] You have some information to give us in regard to the population in and about Sydney? *W. McIntyre.* I have a statement showing the population of the municipalities between Sydney and Parramatta on the main suburban line, and upon those portions of the other lines within the county of Cumberland upon which the trains run daily to Sydney. 17 Aug., 1897.

2696. How far on the Illawarra line do you go? Not beyond Hurstville.

2697. What is your terminal point on the Western line? Penrith.

2698. On the Southern line? Campbelltown. I also take in Camden.

2699. On the Northern line? Marsfield. If you go as far as Hornsby you include some of the traffic that comes to Sydney by the North Shore line. There are a few small places like Beecroft and Carlingford which I might have included but I could not get an accurate return of the population, and there are unincorporated portions of land—for instance, between Blacktown and Richmond—where there is a large population about which I have no information. The return which I have prepared is as follows:—

TRAINS run daily from the undermentioned Municipalities to Sydney, the population of which is also given:—

1.	2.
Erskineville	Concord
5,495	2,300
Newtown	Ryde
19,943	2,336
Petersham	Marsfield
12,000	675
Ashfield	Dundas
12,646	900
Burwood	
6,300	3.
Enfield	Windsor
2,230	2,000

	Total
	154,798

Oswald M. Master, Contractor, sworn, and examined:—

2700. *Mr. Hoskins.*] You gave evidence before the Royal Commission appointed to inquire into the expediency of extending the railway from Redfern into the city, upon the 6th and 8th of April last? *O. McMaster.* I did. 17 Aug., 1897.

2701. We have that evidence before us;—have you since that time seen any reason for altering or amending or recalling any part of it? I have no reason to recall any part of it; but I wish to amend it and to put in a modified scheme and a reduced estimate of cost. 2702.

O. McMaster. 2702. Will you read any statement which you have to make? Yes.

17 Aug., 1897.

O. McMASTER'S CITY RAILWAY EXTENSION SCHEME.

(Cost, £480,000 for the extension to St. James'-road, including loop.)

My estimate of the total cost of extension from Redfern to Circular Quay is £550,000, which includes £100,000 for land resumptions, £68,000 for covering and ventilating Hyde Park, and £70,000 for Circular Quay extension. I venture, in view of the determined animosity and opposition which have been shown towards the utilisation of Hyde Park for railway purposes, and the generally expressed desire for the extension of the railway to the waters of Port Jackson, to submit the following scheme:—

Description of my scheme.

My scheme provides for central station, loop-line, Circular Quay extension, and future extensions to North Sydney and eastern suburbs.

The scheme now submitted is practically identical with that lately described by me before the Royal Commission, except that I have now modified it, so as to omit for the present the extension to North Shore, though every portion of the work now proposed will be of value, and available without alteration or extra cost whenever that extension is deemed expedient, as, in my opinion, it must be in the near future. This extension will then cost less than in the Hyde Park scheme, by reason of my loop line and Circular Quay extension being so much on the way.

My scheme, shown in red on plan, has for its principal features the utilisation of the Government property at the top of King-street now occupied by the District Court, &c., for the purposes of a central station. A loop line which runs round the Domain and back to the central station for the convenience of working traffic, two lines of way being carried to terminal station at Circular Quay. This station I have designed with a view to permit of future extension to North Shore on the lines proposed by me in giving evidence before this Committee, then acting as a Royal Commission, and which extension, I notice, has been adopted in their Report.

Land required.

It is to be noted that the only land required by my scheme will be 2½ acres of Government property at the top of King-street, together with a small piece of the Domain (now but little used). Starting from Redfern Station, four lines of way will be carried over Devonshire-street, through the Benevolent Asylum Grounds and Belmore Park, to Liverpool-street, along the same route, in a similar manner to that described by the Engineer-in-Chief for Railway Construction in the Hyde Park proposal. Passing under Liverpool-street the lines will be carried just under the surface of Hyde Park to a point near the Queen's Statue, where they will curve into the central station at St. James'-road which will only be about 70 yards east of the proposed Hyde Park station. My object in carrying the railway under the surface is that there may be no interference with the appearance of Hyde Park to which the public have so strongly objected. I would submit that the fact of the line being simply covered would not occasion any discomfort to passengers from smoke and fumes such as might reasonably be the case with a deep underground railway as in St. Gothard and Mont Cenis tunnels.

In the present instance the lines would be so close to the surface that very excellent ventilation could be obtained throughout by means of grids provided at frequent intervals and causing inconvenience to no one. The cut and cover system was advocated by the present Committee when acting as a Royal Commission (see Royal Commission Report, page 16). Half of the distance through Hyde Park is provided to be dealt with in this manner by the scheme recommended by the Royal Commission.

Central Station.

The site I propose for the Central station is on the Government property now occupied by the District Court (and about 70 yards east of the proposed Hyde Park station), comprising an area of 2½ acres in extent, with frontages to Macquarie-street and St. James'-road. In order to give sufficient accommodation to meet the large and increasing traffic to be dealt with, and also to provide sufficient office accommodation to meet the requirements of the passenger traffic, it will be necessary to utilise in addition about 2 acres of the Domain at the rear of these buildings for the purpose of this station. This portion of the Domain is now very little used, and would, I venture to believe, be very little missed.

The station will be of an ornamental character, not underground, three storey's high, the two upper of which will be available for office-room and the basement for waiting-rooms, luggage, &c.

There will be three double and two single platforms provided, or a greater number if desired; the length of platforms will be 700 feet.

It is not proposed to cover all the platforms with one main roof, as in the Hyde Park proposal. In my opinion the great expense of £67,000 is not desirable, because of the great number of trains standing at one time in the central station, which would cause an accumulation of smoke and fumes discomforting to passengers and prove also injurious to the roof itself. In place of this I propose to cover each platform separately and similar to the new suburban stations, leaving the space between platforms entirely open to sky. The whole of the platform and approaches in my scheme will be under cover and protected from the weather and heat.

In the estimate of £200,000 for station buildings in the Hyde Park proposal, £65,000 is set down as the cost of providing office accommodation for the Railway Commissioners. This I do not propose to include in my scheme, since on the figures given the annual cost would be £600 per annum more than is now paid as rent, and I fail to see any advantage in placing the Commissioners amid the noise, bustle, and vibration of a central railway station, at a greater rental.

Entrance to the various platforms will be provided from St. James'-road, the level of which will not be interfered with in any way. It is proposed to take the *outward* traffic by a subway in front of the station into a new road to be constructed between St. James'-road and St. Mary's-road, as shown on plan, 100 feet wide, well lighted, providing for foot, cab, and other vehicular traffic.

Another and obvious advantage is, that whether entering or leaving the station, passengers will descend at all times,—that is to say, to enter the station from St. James'-road they will descend to any platform desired, and when leaving the train, passengers will also descend into the new road approach. To anyone in a hurry to catch a train the advantages of this feature are most marked, since it is practically impossible to ascend steps to a platform in the face of a descending crowd. Suburban passengers know this to their cost.

This is an advantageous feature peculiar to the site proposed, since at no other position of the city (that I am aware of) could such a desirable arrangement be possible, with a scheme in which, if any of the lines are carried past the platforms, and if the Hyde Park scheme is ever to be extended to Circular Quay, this is a *sine qua non*.

It is to be particularly noted as a feature of my scheme that the central station building will not require to be so large and costly as the one in the Hyde Park proposal, since with the loop-line there will be no necessity to provide so many platforms.

From the rear of my central station two loop-lines will be taken through the Domain and adjacent to Cowper Wharf, Woolloomooloo Bay, passing into a subway (beneath the main road to Mrs. Macquarie's Chair) at a point near the residence of the Curator of the Botanic Gardens.

After entering the Botanic Gardens the two lines will be carried below the surface to a point near the stone wall which divides the upper and lower gardens: from thence the loop-line will curve back to the central station, while the two Circular Quay lines will sweep round the Garden Palace grounds in front of Government House stables, to the Circular Quay station, at the intersection of Albert and Macquarie streets. With the 1 in 50 grade for which the line is designed there will be no disturbance of the surface throughout the Botanic Gardens and Garden Palace grounds.

The dotted black lines on plan represent an extension which would be valuable for various purposes, including coaling, shunting, and spare carriages, &c.

The Circular Quay Station.

This will be an open-air station, cut out of the solid rock, with access on the level from Circular Quay, and will prove a great convenience to railway passengers travelling by the various ferry steamers from Circular Quay, and especially so at holiday times.

This station will be simply, easily, and economically worked, as shown on plan, by means of shunting lines at the rear of station, a system free from danger, no passengers being in the trains when shunting. Provision is made for working two down and two up trains at one and the same time.

Future

Future extension to North Shore.

O. McMaster.

17 Aug, 1887.

The Circular Quay station forms the terminus of the works provided for in the present scheme, but the rail level at this point is designed so as to allow of future extension to the North Shore without alteration of any portion of the works herein proposed. This extension will be on the same lines and route (from Fort Macquarie to Kirribilli Point) as originated and already described by me in my evidence before this Committee (when sitting as a Royal Commission), and which idea I notice has been embodied as a tunnel in the plan accompanying their Report.

Advantages of my scheme over the Hyde Park proposals.

The first advantage I claim, and one on which public opinion is unanimous is:—

No. 1. *No interference with Hyde Park.* If this Park be used for railway purposes its value, nearly £800,000 (see page 13, Royal Commission Report), should be added to the estimate for the Hyde Park scheme. The Railway Commissioners recognise the fairness of this when they offered £100,000 to provide other park lands, though the above £100,000 was not allowed for in any estimate submitted for the Hyde Park scheme. £100,000 would hardly be a fair exchange for a property valued at about £1,000,000.

The value of Hyde Park proposed to be resumed for railway purposes must be estimated at almost a million of money, as per estimation of adjoining ground (see page 13 of Report), where 10½ acres adjoining the Park were valued at £922,800, and the property mentioned was not so central as at St. James' road, where values are considerably higher.

No. 2. *Comparative savings in construction of station buildings as follows* (see page 7, Report).—

Roof	£67,000
Administrative offices	65,000
Saving in cost, owing to different design of station providing for a less number of platforms owing to loop, &c.	18,000

Total..... £150,000

Difference in cost of station buildings—namely, £50,000 as against £200,000—£150,000, now £50,000, at 3 per cent is £1,500 which, added to the present rental paid for railway offices—viz., £1,365—makes a total of £2,865 against £6,000 (the interest on £200,000 at 3 per cent.), leaving a difference of £3,135 annual gain in favour of my scheme.

No. 3. Further saving by the construction of only four in place of six lines.

No. 4. No allowance has been made in the Hyde Park estimates for covering the lines through the Park, for which I allow £70,000. If considered the Hyde Park proposal necessitates covering six lines in place of my four, and as it is proposed to take the six lines half through the Park, an amount of £50,000 will need to be added to the present estimate for Park-street proposal. If this is not done the strip of ground left open should be added to the area already proposed to be taken from the Park, and this also has the objection of breaking up the continuity of the Park.

No. 5. No allowance was made in estimate for proposed wall around the Hyde Park Station site, all of which additions are unnecessary to my scheme, and would cost several thousands to carry out.

Loop Advantages.

This station will really be no more underground, as far as facilities are concerned, than Hyde Park proposal, where the foot passengers have to go from one platform to another at a greater height by over-bridges than will be necessary in my scheme. Hyde Park is represented in one place to be a dead-end station, and in the next we are told that this station will admit of extension to Circular Quay, and to the eastern suburbs. If such extensions are carried out it will be impossible to get from one platform to another except by over-bridge, thus destroying any virtue claimed for the dead-end platform.

There would be no necessity in my scheme to interfere with any street, nor to resume any property, nor to alter the tramway service. Mine is a complete city scheme. It will only cost £370,000 extra to take it over to North Sydney, or a total of £800,000, and it will give a more complete, economical, and practical line than can be possible by any other route.

It is noticeable on page 9 of the Report *re Redfern Railway Station*, "that the shunting there is both expensive and troublesome." This may be facilitated by the new station at Hyde Park, but can never be as economically worked as on my loop-line system; and I estimate the attendance and loss of time, to say nothing of the danger in working any dead-end system, at several thousand pounds per annum, and a sufficient reason in itself for adopting the loop.

With the loop-line there will not be the ever-pending danger of collision, unavoidable in a scheme in which the numerous platforms—thirteen in number at least—have to be fed from two lines, as proposed in the Hyde Park scheme.

With my loop-line system the interlocking will be practically nil, thus saving £10,000 in construction and in the working expenses, and maintenance of points and crossings, further thousands per annum, to say nothing of the assurance of safety that my loop-line scheme carries with it, such as avoiding compensation for accidents, also saving in time.

Summary.

In conclusion, I would like to say that mine is no theoretical scheme, but thoroughly practicable, all details having been carefully thought out; therefore I am prepared to prove that my estimate of the cost of the works is a fair one, by giving a substantial guarantee, and undertaking to construct the whole of the works for the amounts stated by me, viz., £480,000 for the extension to St. James' road, including the loop-line, or £550,000 if it be deemed expedient to at the same time continue the line to the Circular Quay, as, in my opinion, certainly should be done. An amount of £100,000 is allowed for land resumption, and included in the above estimates in each case.

With regard to any objections which might be taken to my scheme because of the tunnels which I propose, I would point out that in long tunnels like the St. Gothard and the Mont Cenis one can understand the ventilation being bad, even if no trains ever passed through them; but it must be borne in mind that the tunnels which I propose will give a width for four lines, and there will be no difficulty about ventilating them, because there can be ventilation shafts at distances of 50 or 100 feet. On the North Shore line there is a tunnel which is very little shorter than that I propose through the Park; but no complaint was made about that tunnel. That portion of the Domain which I propose to take is simply a damp corner at the present time. The nearest part of the station would be about 4 chains from the hospital, and the nearest part of the railway would be entirely underground at that distance, so that there would be no vibration felt. I have put down 700 feet as the length of my platforms; but, of course, there is ample room to make them as long as you like, though on a loop line, where it is not necessary to have trains in waiting, long platforms are not required. The Commissioners' proposed station contains thirteen platforms, over the whole of which there is to be one large roof. Now, if there were trains at only half of those platforms, the smoke and fumes from the engines would be very unpleasant to the passengers. These large roofs have been found very inconvenient in many of the large European stations. The soot comes back on to the passengers, and the sulphurous fumes spoil the iron. At Redfern, corrugated iron has been entirely eaten away in a few years from this cause. One of the advantages claimed for a dead-end station is that it avoids the necessity for over-bridges; but once you extend the lines beyond the station—and it is claimed as one of the advantages of the Hyde Park scheme that it renders practicable a further extension to the Circular Quay—you get rid of this advantage, and you have to cross from platform to platform either by ascending an over-bridge or by descending into a subway.

2703. *Mr. Trickett.*] Will that part of the line going through the Botanic Gardens be entirely underground, or will it be "cut and cover"? It will be "cut and cover." From the rear of the station until you get down to the Botanic Gardens proper, the line will be open.

2704. *Chairman.*] You mean the eastern part of the loop? Yes.

2705.

- O. McMaster. 2705. Would the Circular Quay station be on the surface? Yes, the new surface. It would be open to the sky, but it would be 20 feet below the present street surface. Passengers would get from platform to platform by descending from an over-bridge on a level with the surface.
- 17 Aug., 1897. 2706. And with a grade of 1 in 50 you could get under the harbour? Yes, from that point.
2707. *Mr. Lee.*] Does the question of the value of the Hyde Park land enter into this matter at all? It is proposed to set aside a certain amount to purchase land for a new park; but to purchase land of the value of the land which it is proposed to take is out of the question.
2708. Suppose that for the expenditure of £100,000 an area of park land can be provided equal to that which it is proposed to resume? But you must give equal value. As the value of Hyde Park is not £100,000, but nearly £1,000,000, and to substitute another park value must be given for value.
2709. Why must you, if you give equal accommodation? Because you are taking away from the public an asset which cannot be replaced. The great advantage of a loop-line is that it avoids dangerous collisions between outgoing and incoming trains. In the Commissioners' proposal you have two lines of railway, spreading out into thirteen platforms, so that the outwards and inwards traffic cross. It was this crossing of traffic that caused the collision at Redfern.
2710. *Mr. Lee.*] With a loop-line the down trains continually go one way, and the up trains the reverse way? Yes.
2711. *Chairman.*] How many platforms do you propose to have? Eight—three double and two single.
2712. How much do your lines spread? They go into two platforms one way, and into two platforms the other way.
2713. Then trains cannot rest at the main station? Yes, they can, because there are refuge sidings between the platforms. You could have two trains stopping at the station while another train ran through; but there is no crossing from the inward line to the outer line, or *vice versa*.
2714. *Mr. Hoskins.*] Is there anything else you would like to say? In the large station proposed by the Commissioners you would have to cross from platform to platform by means of an overhead bridge. The platforms provided for are so long that it would be impossible to go round, and besides there would, no doubt, be numerous gates to regulate the traffic. If the station were below the surface it would be an advantage, because passengers could then descend directly on to whatever platform they wished to go.
2715. *Chairman.*] The tracing which you show to the Committee allows for very short platforms? They would be 700 feet long, and could be made longer if it were desired. My proposed loop, too, could be made larger or smaller. I do not think that a length of 700 feet is necessary, because I do not think we have any trains twelve cars long.
2716. *Mr. Hoskins.*] What about the country trains? They do not take the ordinary long cars. Of course, at a dead-end station you must have trains waiting; but with a loop line that would be unnecessary.
2717. *Mr. Trickett.*] How do you propose to go from your station at the site of the District Court to where the line enters the Botanic Gardens? That part of the line would be all above ground.
2718. Would it go over a viaduct? No; through a cutting. Then, going towards Farm Cove, it would be on a bank.
2719. *Mr. Black.*] Am I to understand that it is better to have an underground station than a dead-end station where the platforms are connected by overhead bridges? Yes.
2720. Because, I suppose, with an underground station, the approach to the overhead bridge would be on a level with the surface of the ground? Yes.
2721. You were asked a question by Mr. Lee with regard to the valuation of Crown land; the assumption was made that when you diverted a section of Crown land from use to one purpose to use for another it was not worth while to take into consideration its value? Well, in answer to that I would say that the value of the Park would not have come into my calculation at all had it not been that the Royal Commission recommended the expenditure of £100,000 for the purchase of another park to be used in substitution.
2722. So far as railway management purposes are concerned, I suppose that land of the very lowest class is just as good as land of the very highest class? Yes.
2723. For park purposes, undulating land, giving open beautiful views and fresh air, is of most value? I do not think there can be any doubt upon that point.
2724. If you divert land which is eminently suitable for park purposes to the inferior purpose of railway use, is it not fair to assess the loss that results to the country? If you take away park land from the citizens—and you cannot say that it is the Government who own this park—you must provide them with another park of equal value.
2725. *Mr. Lee.*] Of equal convenience—not necessarily equal value? Well, of equal convenience.
2726. In estimating the value of the Park its value for building purposes would be kept in view? Quite so. It has been estimated at what it would bring if it were sold to-morrow. If you realised upon it, it would pay for the construction of the line to North Sydney and City Railway complete, and no cost to the country.
2727. Well, we have not sold any of our parks for this purpose yet? No; but if you did sell them you would lose an asset. If you can get the same convenience from inferior land you must show the difference in value.
2728. Does your scheme provide for both short and long distance trains? Yes.
2729. For the whole of the passenger traffic of the Colony coming into Sydney? Yes.

WEDNESDAY, 18 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park fronting St. James'-road.

Oscar Garibaldi Roberts, sworn, and examined:—

2730. *Chairman.*] You are in business in the City of Sydney, and have a fair knowledge of the requirements of the city? Yes; I have had twenty years' experience in Hunter-street, so that presumably I know a little of the business requirements of the city. O.G. Roberts.
18 Aug., 1897.

2731. It is specially with regard to the financial aspects of the question into which we are considering that you desire to speak? Yes; in regard to that question more particularly.

2732. *Mr. Trickett.*] Perhaps you would like to make a statement to the Committee? Of course, I am not a railway expert; but the position which strikes my mind, as a business man, and one who is interested in property at the Hunter-street end of the city, is that, if Parliament sanctioned the construction of the Hyde Park scheme—which is the scheme that I prefer,—the business men and the property-owners of the Hunter-street end of the city would be prepared, without any delay whatever, to provide the whole of the necessary funds. My reason for making this statement is, first of all, the opinion which I have gathered from many conversations with property-owners upon the subject; and, secondly, because of the marvellous difference in the value of city property at this end of the town which the extension of the railway into the city would make. My feeling, and the feeling of a great many others, is that the southern end of the city is being unduly and abnormally fostered, and somewhat at the expense of the Hunter-street end of the city. At the present time, the railway stops at the southern end of the city, and feeds the business premises at that end of the city; because wherever there is increased population taken to any part of the city, that part necessarily benefits financially, and business premises which in the ordinary way would be worth £5 a week become worth £6, £7, and even £10 a week. If the railway came to the northern end of the city, land at this end would be considerably increased in value, and for that reason business men and property-owners would have no hesitation in supplying the money necessary to pay for the extension. Now, as regards the sentimental objection to the resumption of Hyde Park. At the present time Hyde Park is used in the morning by loafers, in the afternoon by nurse-girls, and in the evening by worse people. We have, too, around the city any quantity of park land. In the greatest cities in the world you will not find as much park land as we shall have round Sydney after a portion of Hyde Park has been resumed.

2733. *Mr. Black.*] Might I ask if your remarks in regard to the use of the Park are based upon hearsay, or upon personal observation? Upon personal observation. Any one who has been through Hyde Park at various hours of the day and night, must necessarily come to the conclusion that I have come to. The facts are self-evident. Speaking in regard to the financial aspect of the proposal, of course the effect of the construction of the line would be to at once employ a large number of men. It seems absurd that Parliament should hesitate for a moment in sanctioning the construction of a railway, about the paying possibility of which there can be no question. It seems, too, that to endeavour to abnormally foster the southern end of the city is unwise and unnatural. In no large city in the world have any abnormal means been able to retain the business in or take the business to a part other than that where it was originally established. One's mind at once reverts to London. Of course, while the east end of London has grown to be, relatively, an important part of the city, the large business transactions of the city have never been removed from the west end. The same remarks would apply to New York. So, when we endeavour here in Sydney, by retaining the railway where it should not be retained, to force the growth of the city in a particular direction, we are endeavouring to do that which it is impossible to accomplish. My feeling is that the principal business places of the city must always be down at the northern end. In order to pay our debts and to live as a nation we must produce wealth, and we must export the wealth that we produce. Therefore, the whole of our wool, our copper, our lead, and other productions must of necessity be brought down to the water at the northern end of the city, and for that reason it seems absurd to try to force business to the southern end of the city.

2734. *Mr. Trickett.*] I understand that you favour the proposal to bring the railway to St. James'-road? Undoubtedly. I think that is much the wisest scheme. Of course, I do not profess to know anything about matters pertaining to the internal working of a railway system, but, as a business man, I think that that is undoubtedly the best position for a station. Property-owners get into the habit of estimating very small influences, and in the letting of property through a series of years we have endeavoured to calculate these small influences. We know that the public is very much like a bird. If a twig is disturbed, the bird flies off and is gone. To me it seems that, inasmuch as the Hyde Park extension would be open to the air, it must necessarily be better than any underground extension. I recollect the unpleasant feeling which was almost invariably created in me when I travelled by the underground railway in London. The difference between the atmosphere above ground and in the underground railway tunnels in England is illustrated very frequently by the action of asthmatic people, who, when they get bad attacks in the open air, go into the underground railway to relieve their sufferings. If there is this difference of atmosphere in England, where the temperature is so much lower than it is here, what would it be in this Colony, where our climatic conditions are so different. To me it seems absurd to have an underground route when you can have an open-air route. The public would undoubtedly take exception to an underground route, and would largely prefer to travel by omnibus or by tram, or even to walk. Therefore, from a financial

O. G. Roberts. financial point of view, the extension is bound to be more successful if carried in the open air than if carried underground. Hyde Park is in a commanding position. It seems to be the right place in which to land people coming into the city. I think that the Hyde Park scheme must strike business men as being the best.

18 Aug., 1897.

2735. Do you think that travellers in that portion of the city north of St. James'-road would be well served by the proposed extension, or do you advocate the continuation of the line on to the Circular Quay? They will necessarily be much better served by a railway to St. James'-road than they are at the present time; but I should conclude that any scheme for extending the railway into the city should make provision for a future connection with the Milson's Point line. To anyone who has observed the signs of the last two years it is evident that there has been more progress in population, and a greater increase of values on the North Shore line than in any other direction round Sydney. That undoubtedly points to the fact that the Milson's Point line will in the future become a very important factor in our railway system, and for that reason I think provision should be made for a future connection. Of course, such a connection is not warranted at the present time.

2736. If the line is continued on to the Circular Quay it will be by a circuitous route going round by the back of the hospital;—for people wanting to get to Hunter-street or to the Post Office, a station at St. James'-road would be as serviceable as any? Quite so.

2737. An extension to the Circular Quay would be a convenience to the people in the neighbourhood of the Quay, and would allow for a connection with the North Shore line? Quite so.

2738. Where do you live? At the present time I live at Hornsby Junction; but I have been living upon the main suburban line, at Ashfield.

2739. As a traveller, you have no interest in the construction of this line at the present time? Not any.

2740. Were you living long at Ashfield? For something like thirteen years.

2741. As a constant traveller, where do you think the bulk of the railway tram passengers get out? Without question at King-street.

2742. You say that as the result of constant observation? Yes, undoubtedly it is so.

2743. That is another fact in support of the statement that a station at St. James'-road would be in a central position for the bulk of the suburban traffic? Yes.

2744. You do not wish to advance any figures to show that the proposed extension would be a financial success? No; though of course I have read the figures which have been advanced by the railway authorities.

2745. You merely wish to say that if the matter were in the hands of the citizens of Sydney the necessary money could be provided at once? Yes.

2746. You understand that at the present time the construction of railways is in the hands of the Government, and that what you suggest is impracticable—that there are no means whereby citizens may lend money to the Government for the carrying out of an undertaking of this kind? I understand that what I refer to would be a departure; but I do not know why it is a departure that should be deprecated.

2747. You think that the advantage to property which the carrying out of the line would create would be such that the money necessary for the work could be obtained at once? Undoubtedly. I know, as a matter of absolute fact, that property has depreciated at a greater ratio at the northern end of the city than at the southern end.

2748. And you think that the fact that the railway now stops at Redfern has a good deal to do with it? I think it is evidence of the fact that the southern end of the city is being better supplied with traffic, and, therefore, with purchasers, than is the northern end of the city—in other words, that the southern end of the city is being abnormally fostered, and somewhat at the expense of the northern end.

2749. Do you think that the whole of the traffic, both country and suburban, should be brought to a Central Station at the northern end of the city? Undoubtedly. It is the country people who more particularly want to come to the northern end of the city, because their principal transactions are in regard to the productions of the Colony, and necessarily their business is done almost entirely at the northern end of the city.

2750. The wool depôt, the shipping offices, and large mercantile offices centre more in the northern end of the city than in the southern? Yes; much more.

2751. Has it not been a source of constant complaint by the regular passengers on the western suburban line that they are deposited at Redfern, and have to use trams and omnibuses to get to their places of business? Undoubtedly. The present arrangement strikes most men who have travelled in other cities as absolutely absurd. The idea of being deposited in a suburb when you want to get into the city is ridiculous.

2752. Have you ever figured out the loss of time which the present arrangement entails? It is very large. To go to Ashfield in the middle of the day would take about thirty-nine minutes. In London you would do the same distance in about twenty-four minutes.

2753. A very influential citizen has strongly urged that the terminus should be extended from Redfern to Belmore Gardens;—do you think that that would be of any advantage to the traffic? Not any; it is simply playing with the subject.

2754. *Mr. Black.* Judging from your evidence, I am inclined to think that you do not believe in city parks? I believe very largely in city parks; they are most necessary. But I think that too much of any good thing is bad. If you made the whole city a park, where would business be transacted.

2755. I understood that your objection to parks was that they were frequented by nurse-girls and loafers? I merely instanced that portion of Hyde Park which it is proposed to take for railway purposes.

2756. If you lessened the area of the Park would you not increase the evil, if it is an evil? Well, at the present time it is concentrated in that particular place. The probabilities are that if you remove the conveniences for a given evil, you must minimise, and possibly remove it.

2757. To another place? Not necessarily; you may remove it altogether.

2758. When you speak of loafers, do you mean men who are voluntarily idle, or men who are compulsorily idle? I think that the majority of those who frequent the Park in the morning are voluntarily idle.

2759. You were speaking about money being raised by property-owners at the northern end of the town to pay for the extension of the railway into the city;—does that proposal refer to any particular route? Preferably to the Hyde Park route.

2760. If some other route were proposed which made a certain amount of land resumption necessary, and which carried passengers to the centre of the city, do you think that property-owners would be as ready to subscribe for it? As a rule, business men do not favour extensive resumptions, but if a route showed financial prospects it would not be ostracised because it was not the Hyde Park route. O. G. Roberts.
18 Aug., 1897.

2761. With regard to what you said about the discomforts of tunnel travelling, do you not think that is an objection of the kind which applies to all new things—the discomfort of the unaccustomed, the fear of the unknown? It is not a fear of the unknown; it is the realisation of experience. You must know that tunnel travelling is at all times unpleasant, even in cold climates, and the unpleasantness must be intensified in a warm climate such as ours.

2762. We have received many different opinions upon this point? I only speak from my own experience.

2763. Have you done much train travelling in this country? Yes; I have travelled nearly every day for probably twenty years.

2764. Have you passed through the big tunnel between Sydney and Newcastle? Yes.

2765. Have you passed through the long tunnel between Sydney and Bulli? Yes; but the experience of passing through those tunnels is not a fair illustration of the discomfort of underground travelling. A tunnel is not the same thing as an underground railway. A tunnel is a construction which gives free vent to and allows the free flow of the air. It is not so with an underground railway.

2766. Do you think that any tunnel in connection with an underground railway system here would be without free vents for the air? Of course modern appliances are very efficacious; but they cannot get a perfect result.

2767. In a city underground railway, the tunnel would have to be open at the Redfern end, and it would be open at the end near the Circular Quay? That of course is evident. But such a tunnel would not be the same as an ordinary railway tunnel, where the train is running upon the same level the whole way.

2768. Not necessarily? Most of the tunnels run practically upon the same level.

2769. With regard to the discomforts of tunnel travelling, I am inclined to think that with our lighter air, the smoke would be more easily dissipated than it is in London? Well; that is rather a matter for experts. I do not know the relative rarity of the air; but in England, presumably, you have the best advice and skill that money can procure, because there the railways are worked with private capital, and are made to pay, and therefore would probably be run upon up-to-date lines. If the underground system is not a success in London, presumably it would not be a success here.

2770. If we carry out an underground railway here we should be able to profit by the experience of people in England, and should thus have a better opportunity of making our tunnels perfect? I think it would be wiser to let somebody else experiment.

John Horbury Hunt, Architect, sworn, and further examined:—

2771. *Mr. Humphery.*] You have expressed a desire to attend again to-day for the purpose of further explaining the scheme which you placed before the Committee some days ago;—what further explanation have you to make? I have brought two plans, upon which the route of my proposed railway is plotted, and I have this further written statement to make.— J. H. Hunt.
18 Aug., 1897.

My desire to appear before you again arises out of the singular statement made to me at previous inquiry, recorded as follows:—"The Committee would be quite unable to recommend your scheme without an estimate of cost. Any recommendation they may make to Parliament must be accompanied by a recommendation of cost." Therefore, to save my scheme from being pigeon-holed, I have resolved to waive my strong objection to giving approximate estimates, especially for nil. I have, however, safeguarded myself, and tried to protect you, by writing down a very liberal figure in the sum of £725,000 for my scheme, carrying with it the following items:—

Purchase all the properties on the Asylum site, also the small parcel of privately-owned land connected therewith, and all other city properties required to be purchased, or the owners thereof compensated.

Remove the human remains from the old graveyard to Rookwood.

Build a portion of a grand central station on the Asylum site, with platform area, &c., equal in all respects to what is now proposed for St. James'-road station.

Convert one-half of the basement-story of the new markets into a station.

Build under a portion of Wynyard-square and so much of the side streets as may be required to make this the chief city station for suburban traffic. No structure will be built above surface of park. In no way will the property in the square be injured. There will be neither smoke, steam, nor noise connected with this scheme.

Resume 50 feet frontage to George-street, so as to make a passenger entrance from the level of the footpath right through to the platform level of station in the square.

Build on this site offices for Commissioners of Railways, with other offices to let: out of this rent pay to the Corporation rent for one-half of basement of markets.

Build under the square in Macquarie-place and continue under Bridge-street into a portion of the vacant land at offices of the Education Department. This will be the Circular Quay traffic station.

Build a small underground station at the cricket-ground site, facing Art Gallery, for the use of suburban visitors to the Botanic Gardens and Art Gallery.

Build above ground a small station at Phillip Park.

From the point A, at the intersection of Goulburn and George streets, right around to the point B, at the intersection of Goulburn and Wexford streets, shown on plan, the road to be in tunnel, with two sets of rails, with signals and lighting plant complete; motive power, electricity.

While my proposal is a tunnel scheme, the longest length is but the distance from Goulburn-street to Park-street; in fact, you will see on examining the plan that it is a less distance than the length of the semi-tunnel for the St. James'-road scheme.

By the time the inward train reaches Macquarie-place (which will be by these short-distance tunnels) they will be empty of passengers, while the outward-bound traffic will commence at the Macquarie-place station, and in travelling to the great central station will pass along these short tunnels.

The real tunnel length of the line exists only through the Domain portion of the route, where the trains will be all but empty of inward and outward bound passengers.

You will please observe and take into consideration when you are making your recommendation, that I have shown on the plan my line extended on to the site of the proposed future city platform (No. viii on plan) while still preserving the circular line. This proposed future city station placed as here shown on the new and future area of the city is to be for passengers and small goods, yet in two distinct stations and sets of rails, the goods to be taken by tunnel on to Darling Harbour station.

To compare the two schemes with fairness, then, you must add to the St. James'-road scheme the value of the Park lands and Asylum lands taken for the use of that scheme. £300,000 is the least value of those lands, and must be added to the £650,000 — £950,000. To this a further sum must be added for the widening of King-street and making a new street as an outlet for the traffic—there is a dead certainty of every penny of half a million being fooled away in trying to make this St. James'-road site fit for its work. £500,000 added to £950,000 equals (say) one million and a half as against three quarters of a million for a complete scheme as proposed by me.

J. H. Hunt.
18 Aug., 1897.

Having now complied with what may be termed the unjust conditions of your Committee, namely, that private individuals supply you gratis with estimates, &c., you will pardon my refusing to give any details of this figure of £725,000. To do so would not be fair. What I have so far done in this matter represents considerable gratuitous labour and thought. The popularity and usefulness of this wisely-established tribunal would be greatly increased if expert services were in a discriminate manner secured and fairly paid. I desire before closing these remarks to place on record my appreciation of the fair and courteous hearing you have afforded to me in these several inquiries.

The Mayor, in his evidence, gave as his opinion that the elevation of the old burial-ground site was at a much greater elevation than Hyde Park. At the close of that meeting I spoke of this to you, Mr. Chairman, and you promised to see and correct any error that may have been made. It now appears as if this statement of yours had gained credence, because this day week, while Mr. Mills was giving evidence before you in regard to this proposed new Park at Devonshire-street, he said, "And it would be the highest park in Sydney." I hope the press will give full publicity to the following facts, namely, only a little crest or ridge of the cemetery is 101'34. The mean level is about 72'00, while the proposed park level would be about 65'00. The level of Hyde Park at the Statue is 96'00, or 31 feet above the level of the proposed new park, while that portion of the Park where the band plays stands at about 105'00 (not less), being 40 feet above the level of your proposed park.

While dealing with errors, I now wish to correct one of mine. I stated at last inquiry that Park-street would have to be raised fully 9 feet. In forming that opinion I had some trouble in getting reliable data to work upon. I wish to fix the 9 feet at 4 feet 6 inches. I find on application at the Town Hall that the present level of Park-street where the line is to pass under to be 85'90, while the rail level at that spot I find to be fixed at 72'50. Allowing 18'00 for the headway and thickness of bridge construction—the difference between 85'90 and 72'50 being 13'40—this is the height from surface of Park-street to rail level, whereas we want 18'00 to gain this we will have Park-street raised 4½ feet at its worst point of grade. Will this be allowed. No, is my answer. I reiterate my previous condemnation of this Hyde Park scheme; it condemns itself to any unbiassed, farseeing, engineering mind.

First—You cannot extend the lines to the north-west unless you bungle up the levels. To the east you can extend, but in that direction no extension is required.

Second—You cannot grade St. James'-road to fit into the station without bungling that important part of St. James'-road.

Third—You cannot extend the station buildings so as to secure proper moving above space or area without curtailing your running length of rails, and, consequently, you will be compelled to raise Park-street to near my first assumed figure—9 feet. Do what you will, a big engineering bungle confronts the scheme, and thousands on thousands of pounds will be wasted over it; you are confronted with objectionable features on the north, south, east, and west.

A tunnel through clean, sweet, sandstone, such as Sydney provides, is very different from a tunnel through the foul soil of London. With regard to my proposed future city station at the Flagstaff Hill section of the city, which I propose to level down for commercial purposes, I have so arranged my passenger line as to go from Wynyard-square straight into that station, and then back out again, and continue on the loop. It is also necessary to make some provision for the carriage of small goods. I do not believe in the proposal of taking the goods from the ships' slings and putting them on to the trucks. (As an architect I would never advocate that, because we should then have no warehouses to build.) The goods should go first to the warehouses, and bulk be broken there. The goods traffic I have arranged for is small goods traffic only.

2772. What is the elevation of the Elizabeth-street frontage at Hyde Park? Eighty-five feet is the official height of the road at that spot. In getting information for the working out of my estimate, I have had to fish where I could. I wrote an official letter to this Committee, asking if you would be good enough to furnish me with the cost of tunnelling for a certain distance, with everything complete for running train, hoping that you would get the information from the Department; but I received no answer to that letter.

2773. In the statement which you have placed before the Committee you have not given any details of the probable cost of your scheme, as opposed to your estimate of the cost of the scheme submitted by the Department;—have you arrived at your figures upon a similar basis? I have arrived at my total by a long series of detailed figures.

2774. Have you, in estimating your total, taken the same basis as that upon which you worked in estimating the cost of the Railway Commissioners' scheme? I did not estimate the cost of the Railway Commissioners' scheme. It would be impossible to do that.

2775. Did you not add £800,000 to the Commissioners' estimate of cost? £500,000; that is for widening King-street and new street.

2776. And £300,000 for the Park? Yes, and £300,000 is the lowest value of the Park and Asylum lands.

2777. Have you arrived at your estimate upon a basis similar to that which you took in calculating the probable cost of the Commissioners' scheme? What you want to ask is: has there been the same fairness of estimation—yes.

2778. Have you included in your estimate of cost the probable resumptions at the Markets and at Wynyard-square? You do not want to resume anything at the Markets—only pay rent.

2779. Have you made allowance for what you propose to resume? I have told you that the rents which would accrue from the George-street offices which I propose to build would many times cover any rent for the Markets.

2780. How do you approach your Markets station? From York-street.

2781. Have you made any provision for that? I am not going to give any details, though I have all the figures down.

2782. I suppose I may take it that you decline to give similar information with regard to the cost of your other proposed stations? Yes; I have about fifteen items altogether. Wherever I could obtain Government information I have done so.

2783. Your statement has been so full that I do not think it necessary to ask you any more questions? I do not want to go into the details of that £700,000.

2784. Will you leave your plans with us? I have already asked the Chairman that the plans before the Committee may be illustrated. I would like both to be reproduced if it can be done, but if I can get this last one reproduced I shall be content; it will be sufficient to show Members of Parliament what I propose, otherwise all that I have done for you will in a measure be lost.

John Upward, Mayor of Ashfield, sworn, and examined:—

J. Upward.
18 Aug., 1897.

2785. *Mr. Clarke.*] You were examined before the Royal Commission some time since? Yes.

2786. Do you wish to make any statement in confirmation or amendment of the evidence you then gave? The subject under the consideration of the Royal Commission was the extension of the railway into the city. The Commission made a definite recommendation upon that subject, and I take it that it is in regard to that recommendation that you are now collecting evidence. I wish now to speak with regard to the proposal before the Committee. As the Members of the Committee are no doubt aware, between 33,000 and 34,000 people come to Redfern by train each day, and it is essential that their convenience should

should be studied. In a report recently issued by the Railway Commissioners, it is stated that it is next to impossible to manage the traffic at Redfern without a certain amount of danger; it is therefore absolutely imperative that some alterations should be made. That brings us to the matter in hand. It has been proposed to merely extend the Redfern railway station across Devonshire-street to the Benevolent Asylum ground. I have not the figures with me; but I believe that that would cost £400,000, and not one penny of extra revenue would be obtained. Such an arrangement might certainly minimise the present danger; but it would not add to the convenience of the travelling public. Then there is the Hyde Park scheme, which, as compared with the other schemes in the matter of affording facilities to the travelling public, and cheapness, seems to be the most feasible that can be adopted, more especially when we find that it is capable of a continuation to the eastern suburbs, to the Circular Quay, if necessary, to North Shore, and it could be made part of a circular city line. Coming to the objections raised against the station at Hyde Park, I take it that they should consider this matter from a business, not from a sentimental, standpoint. Which is it more necessary to consider—the convenience and safety of the vast number of people that travel on the railways, or the convenience of the few people of the class who now use the Park. I think that that question scarcely needs any answer. I notice that one witness recently estimated the value of Hyde Park at something like £70,000 per acre. But when we consider that Sydney is now overstocked with offices, shops, stores, and business places of all descriptions, it is hard to believe that land is worth so large a sum. The demand for business premises in the city does not appear to give the Park land anything like that value. I have been directly interested in what is known as the City Railway Extension Alliance, and have been Chairman of that body since it was formed. Quite recently we sent a number of circulars to every municipality in the Colony, asking the Councils to pass resolutions in favour of the scheme recommended by the Royal Commission. Upon the Illawarra line, from Erskineville right down to Nowra, and on to Shoalhaven, every Council is strongly in favour of the proposed extension, and I think that the Councils may be taken to fairly voice the wishes and opinions of the people they represent. On the western line, we commenced at Petersham, and went as far as Penrith, and we have had favourable replies from Petersham, Ashfield, Burwood, Concord, Strathfield, Auburn, Parramatta, St. Mary's, and, I believe, Penrith. On the Illawarra line there is a population within municipal districts of about 65,000, and on the western line there is a municipal population of about 68,000. We also took the southern line from Granville to Liverpool and Campbelltown, where there is a population within municipalities of 9,000 or 10,000. On the northern line, I fancy that Ryde is the only municipality of any consequence.

2787. *Mr. Farnell.*] No, there are Marsfield, Rydalmere, and a number of others? Well, at any rate, we received a favourable answer from Ryde. In many places on that line there are progress associations, which, when they heard of the Alliance, wrote asking us to forward copies of the petition in favour of the proposed extension. We have received support in places which would not be directly benefited by the extension—places in the eastern suburbs, for instance, Randwick, Woollahra, and Waverley, where there is a population of something like 30,000. We have also received strong support from places where the people are scarcely interested in the matter at all, except indirectly—places like Waterloo, Manly Beach, Leichhardt, and North Sydney, representing a population of 50,000. Within a radius of about 30 miles of Sydney, there are about 150,000 people who would be benefited by the proposed extension, and whose municipal representatives state that they are heartily in accord with the movement for it. In addition to these, there are about 30,000 people in the eastern suburbs who hope to benefit by it to a slight degree, and about 50,000 people who reside in suburbs who would benefit only indirectly, so that altogether there are about 230,000 people whose municipal representatives are in accord with the proposed scheme. We have had many replies from far-distant country towns; but I have not dealt with them, because the people in those places use the railway to Sydney very seldom, and of course feel rather luke-warm about the matter. We have had twenty or thirty replies from country places where they say that it is no business of theirs; but that it is a matter for the city and suburban people to fight out. Nine or ten places have distinctly refused in writing to forward the movement. Most of them give the reason that they prefer the money spent in their own district. I am authorised by some thirty-three councils, either by direct communication through the mayors, or by letter, to state that they would be willing to send representatives to give evidence before the Committee if the Committee desire it.

2788. Have you a list of them? I have been directly authorised by the mayors of the following boroughs to speak on their behalf, viz., Hurstville, Marrickville, Waverley, Leichhardt, Rookwood, Burwood, Kogarah, Randwick, Waterloo, North Sydney, Strathfield, Ashfield, Rockdale, Woollahra, Manly, Parramatta, and Canterbury. The City Railway Extension Alliance, of which I am the Chairman, have letters from the following boroughs, all of whom give their strong support to the scheme, viz.: South Shoalhaven, Shellharbour, Auburn, Prospect and Sherwood, Nowra, Erskineville, Enfield, Ryde, Kiama, St. Mary's, Concord, and Ingleburn. I have also good authority for saying the following boroughs are in favour, viz.: Wollongong, Penrith, Campbelltown, Liverpool. The Railway Alliance has also letters from several of the country municipalities which are of the same opinion, viz.: Condobolin, Cowra, Dungog, Katoomba, and others.

2789. *Mr. Clarke.*] Are the representatives of any of these municipalities coming here? They are perfectly willing to come if their evidence is required; but inasmuch as the Committee has been sitting for a long time, I presume you wish to bring the inquiry to a close shortly. Some twenty councils have authorised me to speak for them, though they are quite willing to give evidence themselves.

2790. You are no doubt aware, from the knowledge which you have gained in travelling on the line, of the danger which results from the use of Redfern yard? Yes; I have already witnessed two accidents there, and the Commissioners in their last annual report emphasised this matter to such an extent that I am afraid that if there is not an alteration soon it will have a very serious effect upon the residential prospects of the railway suburbs.

2791. You have, no doubt, read of the various proposals for extending the line into the city; which do you favour? Taking all things into consideration, I favour the line referred to the Committee, and recommended by the Royal Commission.

2792. Do you consider that the terminus at King-street is central for all purposes? It is very central.

2793. Is it the centre of the business part of the city? I suppose that King-street can be taken as the centre of the business part of the city.

2794. You consider £70,000 an acre an excessive valuation to be placed upon Hyde Park land? From my knowledge of the value of land I consider it excessive.

2795.

J. Upward.
18 Aug., 1897.

- J. Upward. 2795. What is your idea of the value of that land? I should not care to answer that question; it is more a matter for experts.
- 18 Aug., 1897. 2796. We have had evidence from several gentlemen who are pretty well agreed that the whole of the land proposed to be taken is worth from £180,000 to £200,000? I am hardly in a position to say what is a fair valuation; but I consider £70,000 an acre excessive.
2797. *Mr. Lee.*] You are of opinion that to bring the railway terminus to Belmore Gardens would be of no value to the travelling public? It might minimise the existing danger, but it would give the travelling public scarcely any more convenience.
2798. Are you of opinion that it is necessary to extend the line into the city? Most decidedly I am.
2799. Do you live at Ashfield? Yes.
2800. Are the people living there aware that if the line is extended into the city they will have to pay higher fares? Certainly.
2801. Will they be prepared to do that? I believe so. From the evidence given by the late Mr. Eddy, they will be charged only about one-half of what they now pay to get into town by omnibus or tram.
2802. If the charge which is made is sufficient to cover the cost of maintenance and the payment of interest, would you be of opinion that the travelling public would be paying for this extension? Of course they will pay for it, and they are willing to do so.
2803. When you pay your fare, you consider that you are paying your portion of the cost of managing the line? Yes.
2804. Do you hold the opinion that if the western suburbs people require the extension of the railway into the city, there can be no objection to it if they are willing to pay for it? Certainly.
2805. And you consider that they will pay for it by paying additional fares? Yes.
2806. *Chairman.*] We understand that if it is considered necessary, other witnesses will substantiate your evidence? I am authorised to speak for some twenty councils, whom I practically represent to-day, and they would be willing to send witnesses, if necessary.

John Cash Neild, Esq., M.P., sworn, and further examined:—

- J. C. Neild, Esq., M.P.
18 Aug., 1897.
2807. *Mr. Lee.*] You have expressed a desire to give further evidence before the Committee, I believe, in the direction of somewhat altering the route about which you gave evidence upon a former occasion? Yes.
2808. Will you put the matter before us in your own way? Yes; but, first of all, I wish to take advantage of the opportunity to say a very few words with reference to Mr. Deane's criticisms of the proposal I made to the Royal Commission, to place a station in Cook and Phillip Parks. Mr. Deane says, in answer to Question 29, that the length of Phillip Park, fronting College-street, is 600 feet; his signed map makes it 660 feet, and Mr. Perdriau swears that it is 635 feet. I do not know which of the three is correct; but I am prepared to take Mr. Perdriau's statement. Then, in reply to Question 33, Mr. Deane says that a platform 700 feet long would have one end under the Museum and one end under St. Mary's Cathedral. But these buildings are 1,000 feet apart. Therefore Mr. Deane's statement is that a platform 700 feet long would project beyond the limits of 1,000 feet. I do not think I have much to say about that contention. Taking Mr. Perdriau's length of 635 feet, and utilising in tunnel the widths of William-street and Woolloomooloo-street, a total length of 767 feet, or 67 feet more than Mr. Deane says is necessary for his platforms, can be obtained. But I never proposed to place the station parallel with College-street. My description showed that I purposed crossing the parks diagonally, and the words used were "at the east end of the Cathedral grounds." Mr. Deane's signed plan gives the length at this point as 11 chains, or 726 feet. In answers to Questions 40 and 41, Mr. Deane says that "speaking as an engineer, the proposal to put a station in these parks is perfectly absurd, because it is on a slope." In answer to Question 36, Mr. Deane says "the difference in level between the south-west corner and the south-east corner is 37 feet." He also says, in reply to Question 41, that the length of the line is nearly 500 feet, so that there is a fall of 37 feet in 500 feet according to him. Then, in his report to the Minister, he says that the difference in level between the east and west corners at the northern end of the block of land bounded by King, Castlereagh, Market, and Elizabeth streets is 13 feet. This block is 150 feet wide, and Mr. Deane is quite prepared to put a station upon it. Now a fall of 13 feet in 150 is equal to a fall of 43 feet in 500; but in Cook and Phillip Parks, instead of there being a fall of 43 feet in 500, the fall is only 37 feet, which shows that the fall upon the site which Mr. Deane says is a "perfectly absurd" one for a railway station, because of the slope, is less than that upon the land which he says is a very good site. Putting it in another way, a fall of 13 feet in 150 is equal to a fall of 39 feet in 450, whereas in Cook and Phillip Parks the fall is much less, being only 37 feet in 500. Therefore I have shown that the slope of the High School site is much greater than the slope of the site I suggested. Then reference was made to the great dip in the north-east corner of Phillip Park. Of course I recognise that there is a very big dip there; but that dip would be used in my plan for the commencement of a line to Wolloomooloo Bay, and the eastern suburbs, and it would save making a cutting, as proposed by Mr. Deane, in Hyde Park. Mr. Deane also describes the two parks as too small for a station, yet they are $9\frac{1}{2}$ acres in area—to be more accurate, 9 acres 2 roods 30 perches—or a rood and 10 perches, which is little more than a quarter of an acre smaller than the area in Hyde Park, which he says will be ample for the requirement for a central station for twenty years to come. But the Hyde Park station is to be a dead-end station, while mine would be only a passing station, where, of course, so much land would not be required. I think I have now answered the criticisms of Mr. Deane very amply indeed. Coming now to my proposal for a circular line, I want to submit to the Committee a modification of my original suggestion, which is to make the line more essentially a city line. It occurred to me that if the Committee were investigating the proposed construction of a line for the city, and for the city only, it would be better to limit my proposal to a city line. I will read the description of the route which I propose should be followed:—Leaving the Darling Harbour branch railway at Macarthur-street, the line crosses the railway yards on bridge or viaduct, and proceeding north-easterly, crosses Sussex-street on the north side of the Public School. From about this point to Bathurst-street it proceeds in the open, until near the junction of Bathurst and Kent streets the site of the first station is reached. This station extends from the south side of Bathurst-street to the north side of Druitt-street, a length of 10 chains, and has a north-easterly direction, with a slight curve. One chain of the south end of the station would be open, the next 3 chains would be in tunnel, the next 5 chains would be open, and the last chain in tunnel. The line from Druitt-street proceeds by an easy curve under

under George, Pitt, and Castlereagh streets, till the site of the second station is reached on the south side of Market-street, extending to the north side of King-street, and fronting the west side of Elizabeth-street. As I am providing for a circular line, I do not require the full width of the High School block; I only want 1 chain of it. The western side of the block—that fronting Castlereagh-street, where the valuable buildings, such as the Mont de Piété and Metropolitan Hotel are—will be left untouched. One chain at each end of this station would be in tunnel, and 8 chains open. The station would be at the levels provided in Mr. Deane's schemes. Passing northerly, and then curving south-easterly, the line passes in tunnel 16 chains in length under Elizabeth-street, Phillip-street, and Macquarie-street, and the Mint, on the east side of which it comes into open cutting, and passes at the rear of the District Court and the Government Architect's premises, still in cutting; thence passes to the Domain, and proceeding south-easterly in cutting and viaduct, nearly parallel with St. Mary's-road, which is crossed at the junction with Woolloomooloo-street, and entering Phillip Park, reaches the third station, which extends south-westerly to William-street. This station would be raised sufficiently to pass over Boomerang-street by bridge. From William-street the line passes under the junction of William and College streets, and skirts the south-eastern section of Hyde Park in "open-top" tunnel, or "cut and cover," the open space being 12 or 15 feet wide, and occupying that strip of the Park now a useless steep slope. Passing under Liverpool-street to the east end of Lyons'-terrace, the line proceeds south-westerly to the north-east corner of Belmore Park in cutting and viaduct, and crosses Belmore Park on viaduct in a southerly direction near its east side; thence crosses the eastern side of the burial-ground, and passing over Devonshire-street, re-enters the Redfern yard on the east side. There is this great difference between my viaduct and that of Mr. Deane's, that while his crosses nearly the middle of the Park, mine is at one side of it, and mine will be only about one-third the width of his. Stations.—Each station would be 10 chains—660 feet long, and being passing stations, the engine and tender could over-run the platforms, thus giving a length equal to 70 feet in a dead-end station. Stations 1 and 2 would be 1 chain wide, viz., double line of rail and two platforms, each 20 feet wide. No. 3 station would have four lines of rail and an island platform in addition to the side platforms—in all, a width of 2 chains. The island platform for suburban traffic would be reached by overhead bridge, taking off from the higher levels of the Park, and thus having one flight of stairs and by flights of steps from Boomerang-street. The side platforms would be for long-distance trains taking in and discharging mails and luggage. Carriage-ways and cart-roads might be placed alongside the major portion of the length of this station on both sides. Trains following each other every five minutes each way would give a two and a half minutes' service.

2809. What would be the distance from Macarthur-street to the station at the High School site? Sixty-seven chains, 10 chains of which would be station. From Redfern to King-street, or rather to the same latitude as St. James'-road, my line, would only be 10 chains longer than Mr. Deane's, which goes direct. The distances are: From Macarthur-street to the Town Hall station, 35 chains, 10 chains for a station there, 22 chains tunnel to King-street station, 10 chains for King-street station, 16 chains for a tunnel to the Mint, 21 chains from the Mint to the Park station, 10 chains for the Park station, 17 chains cut and cover to Liverpool-street, and 55 chains from there to Redfern—a total length of 196 chains. I have taken Mr. Deane's prices for tunnel construction, brick-lined and with the rails laid, namely, £70 per yard, and I have charged for all my tunnels at that price. Mr. Deane seems to charge the same price per chain for open work—that is, cutting and viaduct—whether four or six tracks of rails are laid. For this he puts down £1,900 a chain. I have put down one-half of this for two lines, or £950 a chain. For my land resumptions, I put down exactly the same price per running chain as Mr. Deane puts down for his resumptions at the southern end of Hyde Park, though I say from my knowledge of land values—and I am a sworn valuator, appointed by the Governor-in-Council—that my resumptions as a whole would not average the same price as Mr. Deane's resumptions at Nithsdale-street. However, he charges £5,270 per chain for a width of 100 feet, and I have, accordingly, put down one-third of that, or £1,757 per chain for my resumptions. For that ragged piece of ground behind the Town Hall, I have charged my scheme with £24,750, which is an absolutely extravagant sum; but I wish to be extravagant.

2810. *Mr. Humphery.*] What is the area of that piece of land? About half an acre. There is no possibility of getting a back entrance to that property, so that business premises constructed upon it would have to allow for archways, and would lose so much of frontage and yard space. I think that my scheme is cheap enough to stand any amount of weighting. I have put down £75 per foot for the whole 5 chains of length. For the strip of land on the west side of Elizabeth-street, near the High School, I have put down £40,000.

2811. Do you go right up to King-street with your resumption? Yes; I resume a chain of King-street frontage. The evidence given before the Royal Commission was that the whole of that block of land not owned by the Government was worth £100,000. I take less than one-half of it, and the least valuable half. It might be said that I ought to have put down £50,000; but the half that I take is altogether the least valuable half, and it has on it none of the large buildings which there are on the Castlereagh-street frontage. My whole scheme comes out in this way: The works, taking Mr. Deane's prices, cost £225,500. In estimating the cost of my platforms, I have put down an extra £100 per running yard for excavation. Mr. Deane's tunnel price is £70 per yard, and I have charged £170 a yard for my station excavations. For the stations, I put down £66,000; for signalling and lighting, I have taken Mr. Deane's price, namely, £14,000, though it must be evident that where the trains merely pass through the stations without shunting the cost of signalling and lighting would be less than where you have a big station and are shunting all day long. For land resumption, adopting Mr. Deane's prices, I put down £86,082. For the land taken for the stations at the back of the Town Hall and at Market-street, I put down £64,750. This makes the total cost of my scheme £456,332.

J. C. Neild,
Esq., M.P.
18 Aug., 1897.

THURSDAY, 19 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and further examined:—

S. E.
Perdriau.
19 Aug., 1897

2812. *Chairman.*] There are various matters into which the Committee suggested that you should inquire;— which would be the best to deal with first? Perhaps the value of the portion of Hyde Park which it is proposed to resume. Mr. Black asked me for another valuation upon a different design of subdivision. Mr. Black thought I did wrong, Mr. Chairman, in not cutting the land up into allotments of smaller depths. I have a couple of plans here which show recent subdivisions of city land made by the Government, and from which it will appear that the design I suggested would very likely be adopted if the Hyde Park lands were to be sold. By a subdivision giving long depths and only two rows of allotments, you would be likely to attract attention, and people would rush after the land. That is very important in these times, when land is a drug in the market. I think that upon the subdivision which I suggested the land would realise as much as upon the other subdivision, and it would sell more quickly. The plan before the Committee shows the area available for subdivision. I have laid out a street through the whole length of the block at the back of the allotments which would front the Park, and you would have two other rows of allotments between that street and Elizabeth-street divided by a lane 20 feet wide, one row fronting Elizabeth-street and the other a proposed new street.

2813. *Mr. Black.*] How many frontages would you get in that way? Three frontages; there would be three rows of allotments. Of course, we can get four frontages; but then the depths would be very shallow, and I do not think the land would realise as much upon such a subdivision. The allotments would be very shallow, they would have no back entrance, and they would not be at all attractive.

2814. *Mr. Wright.*] By your proposed subdivision you would have three double frontages? The row of allotments fronting the Park would also front a street at the back.

2815. That row of allotments would have a double frontage? Yes; the form of subdivision which I think the best has a street abutting on the central avenue, then a row of allotments 82 feet, then another street, another row of allotments, a lane, another row of allotments, and Elizabeth-street.

2816. How many feet frontage will that give altogether? 3,308 feet. I put upon the Elizabeth-street frontage a value of £75 a foot. I put a value of £40 a foot upon the frontage to the new street going through the middle of the block, and a value of £50 a foot for the frontage to the new street abutting on the central avenue. That would give a value of £178,405 for the whole block. Taking the other form of subdivision, with four rows of allotments, I would estimate the Elizabeth-street frontages as worth £60 a foot, the frontages to the middle street as worth £30 a foot on both sides, and the frontages to the street abutting on the central avenue as worth £40 a foot, or £174,070 for the whole block.

2817. *Chairman.*] Have you taken any steps to have your valuation confirmed by some other authority? Yes; they are confirmed by the following minute, addressed to you by Mr. Sievers, the Government Land Valuer:—

I have considered the plan prepared by Mr. Surveyor Perdriau of the proposed subdivision of the land required for the above proposal from Hyde Park.

Undoubtedly the scheme shows the most advantageous treatment from a commercial point of view, and in my opinion, by the most judicious handling, would not realise more than £200,000 in the present state of the property market. Perhaps the Committee might adopt £200,000 as the approximate value of the whole block. I think that that is a very liberal estimate.

2818. You regard it as an extreme estimate? Yes; and one which I think it would take a long time to realise. It must not be forgotten that from that amount must be deducted the cost of forming the new roads and the lane. These prices would not be realised unless the roads were formed like an ordinary city street—wood-blocked, paved, kerbed, and guttered. That would cost about £9,000 for each road.

2819. That would be the cost of the lane and a street? That would be the cost of making the middle street. I have not allowed anything for the lane, and there would also be the cost of making the street abutting on the central avenue.

2820. Therefore, you could not expect to get more than £180,000 for the land? That would be the very most you would get for it if you took off the cost of forming the streets and lane.

2821. *Mr. Lee.*] If this property is not cut up and sold the State will not get anything for it? No.

2822. If you cut it up and sell it, so much of the Park is gone, is it not? Yes.

2823. Ought the value of this portion of the Park enter into our consideration;—has it any bearing upon the question before the Committee? I think so.

2824. Is not the Park State property? Yes.

2825. If it were cut up and sold in allotments, it would disappear as a park? Yes.

2826. If it is taken by the State for State purposes, it still remains;—the State is only using its own? Yes.

2827. If it were cut up and sold the State would get the money? Yes.

2828. That being so, does the value of this land enter into consideration at the present time? Well, if another park is provided in a more suitable position —

2829. That is not the question;—what value can the park land have unless it is sold? It has a value as a recreation ground.

2830. As a recreation ground only;—it has no money value until it is sold? At the present time it is a constant source of expense to the country for maintenance.

2831. *Mr. Black.*] The area which you have valued is under 13 acres? About 11 acres.

2832. Figures before the Committee show that the area of Hyde Park proposed to be taken comprises about 13 acres;—if we deduct from that area the 1 acre and 20 perches in the south-western division of the Park, it leaves a balance which is considerably over 11 acres? I have taken out the area of the block which I have valued, and I have found it to be a little over 11 acres. (The exact area is 11 acres 0 roods 3 perches.)

2833. Do you include that portion of the Park which it is proposed to take for the purpose of [widening Elizabeth-street? Yes. I can give you a separate valuation for the $1\frac{1}{2}$ acre in the south-western division of the Park.

2834. How is it that there is this discrepancy between your figures and the figures previously supplied to the Committee? I think you will find that Mr. Deane told the Committee that the area to be taken was approximately 13 acres. I got a copy of the areas proposed to be taken as adopted by Mr. Deane. I know his figures, but I have taken out the area from the official plan.

2835. You estimate this land to be worth about £16,000 an acre? Yes; that is the rate for the whole block obtained by dividing eleven into £178,000.

2836. In your evidence before the Royal Commission you value the block of land upon which the High School stands at nearly £90,000 an acre? That valuation applies to the land with buildings upon it lying between the High School land and Market-street.

2837. You told the Royal Commission that—

The High School property, together with that portion of the block extending thence to Market-street, comprising an area of 1 acre 1 rood . . . was resumed in November, 1880, at a cost of £88,940.

Further on you state:—

The value of Castlereagh and Elizabeth streets property in that locality is about £70 or £80 a foot. It would come to about £90,000 an acre? Yes.

? That would be for the little piece resumed, and covered with shops and houses. Those figures are perfectly correct. They agree thoroughly with the figures I am giving you now.

2838. You say that land on one side of Elizabeth-street is worth £16,000 per acre, and that land on the other side, which has buildings upon it, which you value at £12,000 or £13,000—you say that you could provide similar accommodation in new buildings for that amount—cost £90,000 per acre? Well, at the time, I was speaking of the cost of resuming a certain block of land, and the buildings, shops, and houses upon it. That resumption was made when property was very dear. £16,000 per acre is for the whole area—11 acres = £178,000.*

2839. Do you consider that the land bounded by Liverpool Elizabeth, Goulburn, and Macquarie streets is more valuable than the Hyde Park land? No.

2840. You know the class of buildings erected upon that land? Yes.

2841. Are they extraordinarily good buildings? There are some good buildings upon it. There is Lyons' terrace, for instance.

2842. But one or two pieces of land there are vacant? Yes.

2843. According to former evidence given by you, the municipal assessment of that land is £9,840, which, capitalised at twenty years' purchase, gives £196,800 for 6 acres? Yes.

2844. Do you not think that you could put up all the buildings upon that land for £40,000, and still have a considerable margin? I cannot give an estimate of the value of the buildings upon that land until I have seen them.

2845. The area in the block I have mentioned is about half the area which you propose to resume at Hyde Park, and is land which you say is inferior in value? That land is inferior in value. The buildings make the difference. I think that if you get the most reliable land auctioneer in Sydney—the man who sells most land in the city—and ask him to value the Hyde Park land, he will fix a lower price than the price I have put upon it. The gentleman to whom I refer is Mr. Gregg, of Richardson and Wrench. You must remember that you have to take in the area of the new streets and the lane out of the Hyde Park block.

2846. Do you think that the buildings erected upon the 6 acres of land to which I have referred are worth more than £100,000? I should think so. The municipal assessment is a fairly good indication of the value of house property; it is based upon the rent actually received.

2847. There are a few good buildings in the front of that block; but behind there are only dirty little two-storey terraces, and some tumble-down cottages? There are some good buildings there. I am quite satisfied that my estimate is correct, and that it will bear the closest examination. If you take out of the Hyde Park block the area contained in the new streets and lane, you have only 6 acres of selling land left, and that is what I say is worth £178,000.

2848. *Chairman.*] That would make the value of the selling land £30,000 an acre? Yes.

2849. *Mr. Black.*] That is to say, about two-fifths of the entire block would be taken for streets? Very nearly one-half of it would be taken for streets. There are the two new streets, the lane, and the continuation of Market-street to be allowed for.

2850. How wide is the lane? Twenty feet, which is the minimum width for a lane under the Act; and the streets are 1 chain wide, which is the minimum width for streets. The width of the streets is about three-fourths of the depth of the allotments.

2851. *Chairman.*] What is the next matter to which you wish to refer? I have here a criticism of Mr. Selge's statement as to land values and the cost of resumption for the route of the proposed city railway, suggested by him in comparison with those of the Hyde Park scheme.

2852. Will you read it? Yes; it is as follows:—

In Mr. Selge's statement he estimates the cost of the $4\frac{1}{2}$ acres to be taken between Devonshire-street and Elizabeth-street for the Hyde Park scheme at £70,000 per acre, which he states is my general estimate for city land.

This

* NOTE (on revision):—Upon reading this Question (No. 2838) and Answer again, I find that Mr. Black in using the information at Questions Nos. 1796 and 1797 of the inquiry before the Royal Commission, has made the mistake of supposing that the amount £12,000 or £13,000 was quoted by me as referring to the total probable cost of new buildings upon an area of 1 acre 1 rood to provide equal accommodation to the present accommodation. Whereas the figures £12,000 or £13,000 were not supplied by me at all, but by the Government Architect, Mr. Vernon, and they do not refer to the probable cost of new buildings upon an area of the 1 acre 1 rood, but to the cost of a new building to provide equal accommodation to that now afforded by the High School building.

S. E.
Perdriau.
19 Aug., 1897.

This is not a fair way of putting it, because the £70,000 per acre includes the land as well as the buildings with which it is covered, and the 4½ acres referred to having scarcely any buildings upon it is not worth anything like that amount.

In my evidence before the Royal Commission, page 56, Question No. 1,248, I state that about £20,000 per acre is the mean of three valuations by different persons of the Benevolent Asylum land, admittedly a very valuable site. These valuations were made by experts for the directors of the Benevolent Asylum who based their claim for compensation upon them. Naturally the directors would adopt a full value.

That value, viz., £20,000 per acre would, in my opinion, be nearer the value of the 4½ acres than £70,000 per acre. 4½ acres at £20,000 per acre = £85,000.

The 11 acres comprising the Hyde Park station site, if subdivided and sold to the best advantage, would probably realise £178,000, which is £16,182 per acre, not £88,730 per acre as stated by Mr. Selfe.

Thus instead of the portions of land referred to as required for the Hyde Park scheme being worth £1,433,000, as stated by Mr. Selfe, £263,000 is nearer the mark.

NOTE.—The area to be taken for the railway station is 11 acres, not 13 acres as stated by Mr. Selfe.

To get a clear and distinct comparison, I will place the two estimates in juxtaposition—

<i>Mr. Selfe.</i>	<i>Mr. Perdriau.</i>
4½ acres, lying between Devonshire-street and Elizabeth-street	4½ acres, lying between Devonshire-street and Elizabeth-street
£270,500	£85,000
Portion of Hyde Park—13 acres.....	Portion of Hyde Park—11 acres.....
1,153,500	178,000
£1,433,000	£263,000
	Add for the 1½ acre of air space in the south-western section of Hyde Park referred to below
	12,000
	£275,000

NOTE.—The area proposed for the openings for air spaces over the railway in the south-western section of Hyde Park is 1½ acre. This is internal land, remote from the street, and as it will remain open as an air space, and the taking of it will not obstruct the view across the Park, it is almost unnecessary to state that the value for it should not be set down at the same rate as that of the 11 acres for the station site which will be taken absolutely—that is £16,000 per acre. I think it would be fair and reasonable, if not liberal, to adopt £12,000 as the detriment resulting from the taking of this 1½ acre.

2853. *Mr. Black.*] What would be the value of the 3 roods 20 perches omitted from your calculation, according to Mr. Deane's figures? I stand by my area.

2854. Who supplied you with your measurements? I made them myself.

2855. How did Mr. Deane get his? I do not know. To continue my statement:—

Mr. Selfe says that I estimated 30 acres of land at the "Rocks" suggested by him to be resumed at £30 per foot frontage, but he has misunderstood what I said, for in reply to question No. 1790, page 80 of the report of the Royal Commission, I clearly state that £30 per foot is the approximate value for the land only. In his valuation of this 30 acres at £398,000, Mr. Selfe led the Committee to believe that he had based his valuation upon my figures, whereas upon page No. 107, I clearly state that, based upon values as per municipal assessments the resumption of this area (it is 24 acres, not 30 acres) would cost between £622,340 and £677,925 (exclusive of the 10 per cent. additional for forced sale, and compensation for disruption of business) plus £2,000 for the Ragged School.

Mr. Selfe bases the cost of resumption of the "Rocks" station site upon the street frontage of the land as at present, which he states is 13,200 feet, and then he takes the credit of having resumed an area thereof of 30 acres, whereas it is only 24 acres. So that he tries, I think rather unfairly, to present his own scheme in a favourable light.

It will be seen that when Mr. Selfe is estimating bare land proposed to be taken for the Hyde Park scheme he inflates the cost thereof by adopting the rate of valuation which should be applied if the land were covered with buildings, but when he is estimating for his own scheme the value of land with buildings upon it he adopts the rate of valuation which would pay for the land only. Mr. Selfe, in reply to question No. 381, states that in using my figures he has adhered to the maxim that "what is sauce for the goose is sauce for the gander." I think the figures given above prove that he has turned that maxim topsy-turvy.

It is necessary to draw attention in this way to Mr. Selfe's statements, because he says that, as he is not an expert in land values, he has adopted those put before the Committee by me; but from the foregoing criticism and what is to follow, I think it will be perfectly clear that Mr. Selfe has not used my values fairly.

At questions 793 to 799 Mr. Selfe says that my valuation for the land is only at the rate of £74,000 per acre (which, of course, is not so), and that it is quite fair if he adopts the same value for the land taken from Hyde Park. He evidently forgot that, by parity of reasoning, in my estimate based upon municipal assessments for the 30 acres at the "Rocks," suggested by Mr. Selfe as a station site, I must also have allowed for land only in the approximate cost (viz., £622,340, + 10 per cent. extra added for forced sale, = £684,574), and that if that be so, the value of the buildings would increase the cost of the resumption alone to considerably over £1,000,000.

When, at questions 796 to 799, Mr. Selfe states that my valuations were for the land only he appears to misunderstand the case altogether. Such valuations for the purpose intended would be useless. Any reasonable mind should, I think, understand that the object of the valuation is to show the Committee what the cost of the resumption would be for the property as it stands, including the land and the buildings as well where there are any.

To show again how Mr. Selfe has under-estimated the cost of resumption of the properties which would be required for his scheme, let us take his proposed station site near the markets, viz., the block bounded by Market, Drnitt, Clarence and Kent streets, which contains 19 acres.

Mr. Selfe calls this area 2 acres, and estimates its value in common with other land at £35,000 per acre =

£70,000
Whereas, by adopting the municipal assessments, which total £5,536, @ twenty years purchase, = £111,120; and adding the customary allowance of 10 per cent. for forced sale, I estimate the value of the same area at

£122,232
To which, of course, must be added compensation for disruption of business.

Now, if we take the block to the north of that just described, through which Mr. Selfe's railway would run, and which is bounded by King, Market, Clarence, and Kent streets, Mr. Selfe estimates the cost of resumption of whatever portion of this block he would require at £35,000 per acre also, whereas by using the municipal assessments for the block, as described in the foregoing example, I estimate that it would cost £108,300 per acre. Leaving disruption of business and severance still to be paid for, and without adding to the cost anything for the loss arising from the Government being compelled, under the Public Works Act, to purchase the whole of any allotment of which they would require a portion only.

Mr. Selfe's Valuation of Hyde Park Land.

Mr. Selfe values 13 acres of Hyde Park for the Hyde Park scheme at £70,000 per acre, a rate which I have shown to be absurd. He also values the 2 acres comprised in Wynyard-square which would be taken in connection with his own scheme at the same rate. Apparently, his object is to throw a glamour of fair dealing over his own figures, but when it is pointed out that his extravagant valuation applies to 13 acres for the Hyde Park scheme, whereas it applies to only 2 acres for his own scheme, or at most to 4 acres, including the Drnitt-street station site, it will be perceived how misleading the estimate is, giving a fictitious advantage to his scheme.

I have also an estimate of the value, based upon the present municipal assessments, of the properties which would probably have to be resumed for Mr. Selfe's scheme:—

S. E.
Perdriau.

The total of the municipal assessments for the year 1897-8 for the properties which would be required for that part of Mr. Selfe's scheme, lying between the Darling Harbour railway at George-street and Charlotte-place, as indicated upon my sketch showing Mr. Selfe's scheme is £30,888, which, at twenty years' purchase, would amount to £617,760, to which add 10 per cent. for forced sale, £61,776 = £679,536, leaving disruption of business still to be paid for, and this would be a very heavy item when it is remembered that the premises are taken of such large businesses as James McEwan & Co., wholesale ironmongers; A. McArthur & Co.; Gardiner & Co.; and Edwards, Dunlop, & Co.'s immense new stone store in Kent-street; which is not yet complete.

The following churches and schools would also be taken:—

The Scots' Church and Hall at Church Hill, approximate value	£11,000
St. John's R. C. Church	3,500
St. Andrew's Scots Church	4,500
Baptist Church and Sunday School	11,000
Congregational Mission Church at corner of Liverpool and Sussex streets	4,000
Total	£33,000

I have compiled two plans from the official plans in the Department, and they show Mr. Greenwood's and Mr. Selfe's schemes as nearly as I could ascertain them. At the present time, the Government would probably be compelled to treat land affected by tunnelling in just the same way as they would have to treat land which they passed over on the surface. They might be compelled to take the whole area of any property tunnelled under. The areas edged blue are those which would have to be resumed for actual occupation by the railway, according to the statements of Mr. Greenwood and Mr. Selfe. Mr. Greenwood's scheme provides a width of 5½ feet, and Mr. Selfe's a width of 66 feet. The red edging shows the extent of the land which the Government might be compelled to resume under the law as it stands. I made inquiry upon this point of the Crown Solicitor's Department, and the effect of the reply I received was that while the Government had power to make a tunnel, it might be compelled to take the land under which the tunnel went.

2856. *Chairman.*] Is that the opinion of the Crown Solicitor? That was the opinion which was obtained from the Crown Solicitor's Department.

2857. *Mr. Black.*] Is there a distinct law upon the subject, or is that common law? I believe that is the common law. I made inquiries in order to satisfy myself upon the point before going into the calculation. I have also here a criticism of Mr. Selfe's statement that he makes his station site a present to the people of New South Wales.

My estimate of the probable cost of the resumption of the "Rocks" suggested by Mr. Selfe, and which by his scheme he says, "makes the 10-acre site for a station a gift to the Railways."

The balance of the "Rocks" site remaining after the station site and new roads shall have been deducted, and suggested by Mr. Selfe to be sold, is 8 acres, and is estimated by him at £396,000, whereas, in my opinion, based upon the best values in that locality, the amount would not exceed £275,000; for the figures giving the result, see my evidence before the Royal Commission.

A reasonable estimate of the cost of resumption of the "Rocks" site is	£600,000
And the cost of excavating the site for a station was estimated by Mr. Foxlee at	120,000
The cost of wood-blocking and repaving the 8 acres of streets which would require remaking would be about	43,560
	£763,560

Also the cost of replacing and rearranging, or perhaps renewing, the sewers and water and gas mains in so large an area as 30 acres in the city would be considerable. No such gigantic proposal has ever been carried out in Sydney, and I know of no precedent in this respect as to cost of such an undertaking. Compensation for the disruption of business must also be added. I shall be very much within the truth if I estimate these items at £36,440, which is only 6 per cent. of the cost of resumption

Total	£800,000
--------------------	-----------------

Thus my opinion of the cost of the resumption, and accomplishing what Mr. Selfe proposes, is about £800,000.

From £800,000 deduct £275,000 for the re-sale of allotments, leaving £525,000, which, less £25,000 for the old material of the buildings, leaves £500,000 as the cost, according to my estimate, of the station site, which, by an ingenious arrangement of figures, Mr. Selfe endeavours to show he would obtain free of cost, and present to the people of New South Wales.

NOTE.—There are about 600 dwellings of various sizes, mostly small and very old, and £25,000 for 600 would be at the rate of about £42 each.

I cannot agree with Mr. Selfe when he proposes to locate the main station for the city railway in a remote part of the city, at the Argyle Cut. This is ancient Sydney, and was a central and important position many years ago, but when the city spread southerly and easterly it ceased to be so: but I quite agree with him that great improvement would accrue by the resumption and subdivision of the "Rocks" district according to a suitable modern design.

John Cash Neild, Esq., M.P., sworn and further examined:—

2858. *Chairman.*] Will you kindly resume your statement from the point at which you were interrupted yesterday? Yes. Taking the total of £456,332, the cost of my scheme, I wish to point out that these figures do not provide for any compensation that may be payable in respect of tunnelling, which involves the question of existing and perhaps future law. Whatever route is selected, it will be necessary for the work to be sanctioned by an Act of Parliament, and I cannot foretell what Parliament may do in respect to amending the existing law in regard to compensation for tunnelling. As Mr. Deane has suggested in his evidence before the Royal Commission, if any buildings were destroyed by the tunnelling, the space above the tunnels could be built over again. Therefore, what has to be considered is, not so much the cost of resumption, as the cost of rebuilding. This matter was fully gone into by Mr. Deane on pages 2 and 3 of the evidence before the Royal Commission.

J. C. Neild,
Esq., M. P.
19 Aug., 1897.

2859. It is held by the law authorities in this country that tunnelling may involve the resumption of the surface land? In that case the question would resolve itself into a question as to the price obtainable by the Government for sites above the tunnels. If the Government had to take over and pay compensation for land under which they tunnelled, they could undoubtedly re-sell the sites for as much as they gave for them. Everyone knows that in London tunnels run for miles under buildings of the most important character,

J. C. Neild,
Esq., M.P.
19 Aug., 1897.

character. Whether compensation is paid or not, the sites above the tunnels will be available for buildings of great height and great weight. In Westminster I lived in mansions seven storeys high, which were built over tunnels.

2860. Your contention is that even if the Government had to pay compensation for the land under which they tunnel, it does not necessarily follow that the buildings upon that land would have to be removed? Undoubtedly. In London there are miles and miles of buildings erected over tunnels.

2861. But the tunnels might, in some cases, go under a public building or a church, and it would be most difficult to arrive at a fair estimate for compensation in such a case? The route suggested by me would not take a tunnel under any building of consequence.* On pages 2 and 3 of the Royal Commission's evidence, Mr. Deane suggests that it might be necessary to pull down buildings, the foundations of which might have been injured, and that these buildings might be re-built. He suggests that they might be re-built and let.

2862. Then there is the question of loss of value from the vibration caused by passing trains? That would not be material where the tunnels were at any reasonable depth, and were carried through rock. As regards my scheme, I admit that that part of my tunnel which passes under Pitt and Castlereagh streets goes through a part of the city where there is more soil than rock, and it is quite possible that some of the buildings there might be injuriously affected; but in other places the tunnels go through solid rock, and I do not think that the buildings above them would be in the least degree affected.

2863. *Mr. Lee.*] Any tunnel scheme must necessarily involve more or less disturbance? Yes; but it is a question of degree, and is impossible to foretell. I compare my estimate of cost—£156,332—with that given by Mr. Deane for the St. James' road scheme (questions 2494, 2505, and 2506 of the Royal Commission evidence), namely, £650,000. I omit the cost of the offices—£65,000—because there are no offices in my proposal; and that makes the total cost of Mr. Deane's scheme £585,000. To that he proposes to add £100,000 to pay for 10 acres of Hyde Park, making the cost £685,000 or £229,000 more than the estimate of my scheme at Mr. Deane's prices. But while I load my scheme with the prospective risks of tunnelling, I think that the Hyde Park scheme should be loaded with the cost of the Benevolent Asylum grounds, and that it would also be a fair thing to reckon in the value of the large area of Government ground between Devonshire-street and Belmore Gardens, $1\frac{1}{2}$ chain in width, which would be occupied for railway purposes. Those two items are a very fair set-off against any charge which might fall upon my scheme in connection with the tunnelling. The dual scheme submitted by the Royal Commission (*vide* appendix on page 146 of their report) is estimated to cost £350,200. I do not know whether that includes the cost of offices for the accommodation of the railway staff, but so far as I can make out from the report, it does not. That scheme, on the same basis of prices for works and resumptions, would cost, in round figures, £390,000 more than my scheme, and it allows nothing for the 5 acres of Hyde Park, for the Benevolent Asylum grounds, and for the large area of Government ground at Carter's Barracks, and thereabouts, which would be taken. There are also one or two other points which I should like to mention. My scheme, at Mr. Deane's prices for both work and land, is £229,000 cheaper than Mr. Deane's Hyde Park scheme, omitting office buildings, and is £394,000 cheaper than Mr. Deane's dual scheme, and the latter, while taking 5 acres from Hyde Park, allows nothing for it. The expense of rebuilding injured buildings (my scheme) could not amount to the cost of Benevolent Asylum land resumption (Mr. Deane), and my scheme avoids the destruction of Government land between Devonshire-street and Belmore Park. My scheme gives opportunity for a tunnel to Circular Quay, equally with Mr. Deane's scheme, but also gives opportunity for connection with a North Shore bridge, which Mr. Deane's does not. It also gives an equal or rather a superior connection with the eastern suburbs. On the plan before the Committee, I have shown by a dotted red line the route of a possible future extension to the Circular Quay, which could be very easily arranged, and of a "take-off" for a line crossing to the North Shore by means of a bridge. It is just as easy to go to the Circular Quay or to the North Shore from the High School site as to go from St. James' road, and an extension to the eastern suburbs could be more conveniently made near the junction of St. Mary's-road and Woolloomooloo-street than from St. James' road, and would avoid a great length of tunnel. My scheme gives three stations instead of one; it gives much greater convenience to the travelling public, *viz.*, at both sides of the city, it avoids the annoyance of a huge terminal station in the centre of the city, and avoids the destruction of Hyde Park.

2864. I do not think you explained exactly how you proposed to get from Redfern to Darling Harbour? I propose to go by way of the existing line. I have heard that line is deemed rather steep. I do not know what the grade is; but if it is a grade over which heavy goods trains can be worked, passenger-carriages could certainly be hauled over it. On the other hand, if it is alleged to be too steep for passenger traffic, about half a mile of resumption, half a chain wide, will be required for the construction of a new line.

2865. You would have to go back some distance? It would be an advantage to my scheme to have a new line from the Redfern yard, because then you would not have to "take off" to follow my route, from a point so near the water, and would consequently have more "head" for clearing the railway-sheds, and an easier grade to the Town Hall site.

2866. But it would be necessary to go under George-street to get down to Darling Harbour? In that case you would have to start further back, just as in the Hyde Park scheme—you "take off" a little further back in order to clear Devonshire-street. I have not the details of the levels of the Redfern yard; but it seems an extraordinary thing that if all the goods traffic of the Colony is worked over the Darling Harbour line a few passenger trains could not be run over it.

2867. Where do you propose to have your Central Station? I do not propose to have a Central Station at all. My main station would be situated in Cook and Phillip Parks.

2868. Of necessity there must be a station where the long-distance traffic can start from and arrive? That is what I am coming to. At this main station I propose to have an "island" platform for suburban traffic, and to use the side platforms for the long-distance traffic. The long-distance trains will be able to remain at the side platforms, and it will be easy to load mails and luggage.

2869. *Mr. Wright.*] Have you gone into questions of grade? I have gone into that question to this extent, that I know pretty well what the grades are from the evidence which has been taken by the Royal Commission.

2870. Can you tell the Committee what will be the height of your Town Hall Station above high-water mark? I have not the figures with me; but, as nearly as I can remember, somewhere between 40 and 50 feet.

2871.

2871. Your next station will be a daylight station between Elizabeth, Market, and Castlereagh streets? Yes, at the level proposed by Mr. Deane; that is, 19 or 20 feet below the surface. That will enable me to pass under Market-street.

J. C. Neild,
Esq., M.P.

19 Aug., 1897.

2872. What will be the height of that station above high-water mark? About 60 feet. The grade between the "take-off" at Macarthur-street and King-street will not be anything worse than 1 in 66.

2873. What is the length, in chains, from your proposed station behind the Town Hall to your proposed station at Market-street? Twenty-two chains.

2874. You pass over Darling Harbour;—from that point to Market-street you have to climb up some 20 feet? If I remember aright, the surface level at the site of my proposed King-street station is 80 feet; and, as the rails will be 20 feet below the surface, they will be 60 feet above high-water mark. From my "take-off" at Macarthur-street I have 35 chains to the Town Hall station. There are 10 chains at the Town Hall station, and then I have 22 chains of tunnel to get to the south side of Market-street. That makes 67 chains altogether; so that I have a rise of less than 1 foot to the chain, even if I start at Macarthur-street at the water's level; but I start from a point 15 feet above water-level, so that I have a very flat line.

2875. What I was anxious to find out was the difference in elevation between your first and second stations? Well, I may say that I have gone carefully over the ground. It is 20 feet. I am not guessing at anything.

2876. Can you tell me the difference in level between your Market-street station and your third station? That is at Cook and Phillip Parks. That station will be midway between the highest and lowest points in those parks which, according to Mr. Deane's figures, would be at a level 18 feet 6 inches below College-street. Therefore, the third station would be almost on the same level as the Market-street station. If there was any difference in level it would be only a few feet.

2877. Have you had your figures as to grades, elevations, and so forth, checked by any professional man;—have your estimates been prepared by a professional man, or are they your own deductions from information received? The figures are taken from Mr. Deane's evidence, and I have used the estimates which he has supplied. Of course, I have been able to get no valuation from Mr. Deane of the 5 chains behind the Town Hall which I would resume; but, as I have put down £24,750 for that land, I do not think anyone would increase my estimate of its value.

2878. You say that the Cook and Phillip Parks station would be on the same level as the Market-street station? I believe that the levels of the two stations would be almost identical. Anyhow, the distance between the two is a good many chains, and that would enable you to provide against a considerable difference in level.

2879. You could, if necessary, drop a foot per chain, and still have a fair grade? Certainly; I do not think one in 66 is a bad grade for a passenger line.

2880. Where would be your next station? That is my last station. I originally suggested a station at the foot of Oxford-street; but I find that that station would only be 16 chains away from the Cook and Phillip Parks station, and I do not think that you could have trains stopping at such short distances.

2881. You contend that upon your proposed line you could provide a two-and-a-half-minute service of trains? With trains following each other every five minutes each way, you would have a two-and-a-half-minute service.

2882. The loading and unloading of long-distance trains takes from twenty minutes to half an hour? Exactly; and therefore I have provided extra platforms at the Cook and Phillip Parks station.

2883. How many platforms have you provided for the long-distance traffic? Two, each 10 chains long, and, as the engine and tender would overrun the platform, you would have more available length than in a "dead-end" station with platforms 700 feet long.

2884. You think that in this way all the requirements of the traffic can be met? Yes.

2885. Your dépôt would still be at Redfern? For marshalling trains.

2886. And for surplus rolling-stock? Yes. The trains would be made up there.

2887. You have apparently given this matter a great deal of thought? Yes; and I have gone over my calculations in half a dozen different ways, to be perfectly sure that the figures are accurate. I have "proved" them, as the schoolboy phrase goes, in every possible way. Whenever any doubt has arisen, I have given it against my scheme.

2888. You think that your scheme will bear the scrutiny of professional men? I believe that it will. Of course, I am not a professional engineer, and an engineer will be able to find some crudities somewhere; but they will not be of much importance. They will not be in regard to grade, or feasibility, and they may be the result of prejudice.

2889. A traffic expert would be the man to determine the question of feasibility? He would be guided, I assume, by a constructing expert.

2890. Not in regard to traffic matters? Well, to answer that question with any degree of positiveness, I should have to be a traffic expert myself.

2891. When the light of day, in the form of criticisms by engineers and traffic experts, is thrown upon your scheme, it may not prove as good a one as you imagine it to be? Of course. One side of a story is always good until the other is told. I think that the aim of the Committee is to ascertain from a standpoint other than that of professional skill, whether the proposal is a good one. I think that in times past the Committee has expressed opinions differing from professional opinions. If a non-professional body may hold opinions diverse from those of professional men, I suppose it is equally competent for professional authorities to hold opinions adverse to the work of laymen.

2892. *Mr. Regan.*] I did not understand you to say that you proposed to interfere with, or to remodel the arrangements of the present Redfern station? I have not heard any technical evidence as to the necessity for alteration in order to improve the grade upon the Darling Harbour branch. In the absence of information upon that point I can say nothing. That is an engineering detail with which Mr. Deane alone is probably competent to deal.

2893. You would still retain Redfern station as a dépôt? Just as Eveleigh at the present time answers the purposes of Redfern.

2894. All your marshalling would be done there? Yes.

2895. But both long-distance and suburban traffic would be taken over the circular line? Yes; a train coming into Redfern on the western side would run round easterly, and a train coming round on the eastern side would run round westerly.

2896.

J. C. Neild,
Esq., M.P.

19 Aug., 1897.

2896. There would be no inconvenience upon holidays or at other times when the traffic was abnormal? No; there would never be any block. You could range one train after another if necessary.
2897. You believe that your scheme is better than a "dead-end" scheme? Certainly, because of the shunting which it will save. You will not have to shunt once in twenty-four hours.
2898. Directly the passengers leave the trains the trains will go on again? Yes; the trains will keep on moving ahead. In London, on the underground railways, they run trains every three minutes.
2899. Without any inconvenience? Certainly; one train is not allowed to leave a station until the station ahead has "rung up."
2900. Have you given the cost of your various stations? I have put down £170 per running yard for my stations.
2901. But one of the stations will be larger than the other two;—do you allow for that? I have averaged the cost of the stations. After making the line right through, I have allowed £66,000 for platforms, roofing, and sundry expenditure in connection with the stations.
2902. You do not make any provision for offices for the administrative staff? No; I leave that out of my scheme, because it has already been left out of some of the schemes submitted to you.
2903. You think there is no necessity for making new provision, since the officers are already provided for? It might be convenient to make new provision: it cannot be necessary. As I do not propose to occupy, with my station, anything like the whole of the block owned by the Government at the High School site, there would be plenty of room for the construction of offices there, or they might be built at Cook and Phillip Parks, and form part of the main station.
2904. Have you made any provision for emergencies in this direction? Certainly. With reference to the question of cost, may I point out that my scheme is so much less expensive than Mr. Deane's, because he requires a six-line track, while I require only a two-line track. Mr. Deane reserves a width of 100 feet for six tracks. I propose to reserve a width of 33 feet for two tracks. In estimating cost, I divide Mr. Deane's prices by two, because I have been unable to ascertain from his evidence whether he charges the same price for putting down four lines of rails as he charges for putting down six lines of rails.
2905. What provision have you made for an extension to the eastern suburbs? All proposed future extensions are shown on the map by dotted red lines.
2906. You believe that your scheme will give greater convenience in working than the proposed scheme, and will effect a great saving in construction? Necessarily. It gives you three stations instead of one, it serves both sides of the city, and it has a station as central as the St. James'-road station.
2907. Do you believe it to be a fault in the St. James'-road scheme that no second station is provided for? If there is no second station between Devonshire-street and St. James'-road, a large part of the traffic will get out at Redfern, and go into town by train or bus.
2908. It was suggested that a station might be made at Liverpool-street? Yes; and in the same way, I could put a station at Liverpool-street, and with less expense, because my station would only have to provide for two lines, while Mr. Deane's station would have to provide for six.
2909. How much of Phillip Park do you take? I take 2 acres of Phillip Park, and 2 acres of Cook Park.
2910. How much of Hyde Park do you take? A strip 12 feet wide, and about 15 chains long. I cross Belmore Gardens on a viaduct.
2911. You do not take any part of Belmore Gardens? No: I cross one side of it with a viaduct 22 feet or 24 feet wide. The St. James'-road scheme viaduct would cross the middle of Belmore Gardens. The portion of Belmore Gardens which would be covered by my viaduct would be about half an acre. Mr. Deane's would cover 1½ acre. Then I take about an acre of the Domain.
2912. Altogether, you take about 5½ acres of park land? Call it 6 acres.
2913. That would not interfere much with the facilities for public recreation offered by these parks? No; it would scarcely be possible to design a scheme which would interfere less. I merely skirt one end of the Domain, I skirt one side of Hyde Park, and I skirt one side of Belmore Gardens. Of course, I materially interfere with Cook and Phillip Parks, but they are so little used that I do not think there can be any grievance about that.
2914. Can you tell us what would be a fair charge to impose upon railway passengers using the proposed extension in order to obtain interest upon the capital expended. The Commissioners say that a charge of 1½d. for the return journey would pay interest upon the cost of their scheme? Well, as my scheme would cost only two-thirds of the amount which the Hyde Park scheme would cost, if the interest upon the Hyde Park scheme could be met by a charge of 1½d., the interest upon the cost of my scheme could be met by a charge of 1d.
2915. Have you gone into the matter? Not more than that. It is not necessary, because I accept the Commissioners' figures. I think that is the fairest thing to do in order to make a comparison.

FRIDAY, 20 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.
 CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEOAN, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the city, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

2916. *Chairman.*] Since last you were here, Mr. Deane, several matters have been referred to you for consideration;—which are you prepared to deal with first? If you will allow me, I should like to make two or three remarks upon Mr. Neild's criticisms of my criticism, wherein he is wrong upon two or three points. He challenged the length given by me of Cook and Phillip Parks along College-street. You will remember that it was only roughly measured from the plan as 600 feet. Mr. Perdriau gives it as 635 feet. As a matter of fact, one park overlaps the other. But if the actual length is only 35 feet more than the length I gave, it is not very much, considering that mine was only based upon a scale measurement of the map. With regard to Mr. Neild's statement that I said that a platform 700 feet long would extend under the Museum at one end and St. Mary's Cathedral at the other, I think if you refer to my evidence, you will see that I spoke of the station, the length of which has been referred to as 1,120 feet—the distance between St. James'-road and Park-street. I assumed that Mr. Neild's station would be more or less parallel to College-street, because, in his description of his scheme, he said that it would be a central station, which I concluded to mean a large station where all the traffic would be dealt with. As regards the fall from College-street down into Woolloomooloo, what I pointed out was, not that the inclination was the objection, but that the difference of level was the objection. I also pointed out that Cook and Phillip Parks had not the right shape for a railway station. The area would be nearly sufficient, if you could adjust it; but there is too much breadth for the length. I have looked at Mr. Neild's modified scheme, and it appears to me that there are a number of objections to it. In the first place, I find that the proposed curves are impossible. To get 10-chain curves, which are the worst that one could do with, it would be necessary to take the line round by the route which I have indicated on the plan by pencil lines. Of course, that is not a very serious matter, and on Mr. Neild's plan the route is only roughly sketched out. With regard to levels, however, I would point out that the level of Sussex-street, where Mr. Neild's line crosses, is 30 feet above high water, while the rail-level there would be 18 feet above the road-level, or (say) 48 feet above high-water mark. The road-level at the corner of Bathurst and Kent streets is 53 feet. Mr. Neild's line goes under those streets, which would make his rail-level about 35 feet. The difference between 48 feet and 35 feet is 13 feet, which means that the line would have to descend 13 feet in a length of 400 feet—a grade of about 1 in 31. Then, at the corner of Woolloomooloo-street and St. Mary's-road the road-level is 36 feet. The rail-level would be 18 feet above that, or (say) 54 feet. For the station, assuming that it would be on a grade of not more than 1 in 300, that would give 57 feet for the rail-level under Park-street. Where the line would cross Boomerang-street the level is about 60 feet, so that Boomerang-street would have to be diverted. You could not get over Woolloomooloo-street and under College-street without diverting Boomerang-street. Mr. Neild proposes to take his line under the new markets. The level of the junction of Clarence and Druitt streets is 53 feet, so that his rail-level there would be (say) 35 feet. Road-level at York-street, where his line would cross, is 69 feet, and the level of George-street about 68 feet. I have assumed that the foundations of the market buildings are 20 feet below the street-level. I do not know that that is quite correct, but I think it is somewhere near the mark.* If the rail-level there were 35 feet, the level of the top of the tunnel would be (say) 55 feet, so that the top of the tunnel would be 7 feet above the foundations of the markets. Of course the construction might be made a little shallower, but it is quite evident that it would be an awkward piece of work. I do not think you could get the line under the markets. There is another difficulty I find with regard to the levels. The rail-level at the corner of College and Park streets would be 57 feet. At the crossing of Macquarie-street beyond the Park the street-level is 75 feet. As the line would have to cross over that street, the rail-level at the place of crossing would be 93 feet, making a difference of 36 feet in a length of 1,800 feet, or a grade of 1 in 50. I find, too, that the height of the viaduct at the north-east corner of Belmore Park, giving a grade of 1 in 66 from Macquarie-street down, would be 45 feet. This is high, but, of course, by no means prohibitive. Where we cross with the Departmental line, Goulburn-street is the critical point, and Goulburn-street is much lower there than at any other point. Mr. Neild's scheme, in common with Mr. Greenwood's and other schemes, provides for the working of traffic round a loop, which I have already shown to be impracticable. Our trains are fixed for certain times of running: they have to work to a time-table. The case here would not be the same as the case on the metropolitan railways in London, where the trains simply run round and round every few minutes. Consequently, here one of the stations would have to be fixed upon as a place where the trains could stop for a longer or shorter time. That station would be practically a terminus, and you would require extra accommodation there. With Mr. Neild's scheme the lines going down to Darling Harbour, and forming the western side of the loop, would be on a grade of 1 in 40, and the trains passing over those lines would practically not enter Redfern station at all, because the Darling Harbour branch is partly in tunnel and partly in cutting, and descends from Redfern yard at a point a good way beyond the platforms, and there is no possibility of making a stopping-place on the steep grade near George-street.

Only

*NOTE (on revision):—The City Architect tells me that this depth may be taken as 22 feet, which would make the interference greater.

H. Deane.
 20 Aug, 1897.

- H. Deane. Only the trains working on the eastern side of the loop could use Redfern station. It seems to me that Mr. Neild's scheme would not accommodate the long-distance trains and the semi-suburban traffic from places like the Mountains and Moss Vale. Those trains would not be wanted to run around the loop, but would have to stop somewhere. Another objection to the loop is that it would reverse the position of the carriages each trip. The Commissioners so arrange their trains now that the first-class carriages are at the Sydney end, and the second-class carriages at the other end. If the trains were run round the proposed loop this position would be reversed each time. To keep the carriages in proper position would necessitate shunting at Homebush, Parramatta, or Hurstville, as the case might be, and I have little hesitation in saying that there is not room for that shunting at those places.
2917. *Mr. Fegan.*] But really that would not matter much? I am informed by the Commissioners that it would matter a great deal. They have adopted this arrangement in order to save time, by preventing confusion. At the present time people using the two classes know exactly where to look for the carriages by which they want to travel. If the carriages were mixed up, people would be running from one end of the station to the other to find their right carriage. People would come into collision with each other, and there would be confusion and great loss of time.
2918. *Mr. Black.*] Do you not think that the Department might adopt a common-sense arrangement and have the carriages painted in different colours, or hang out bannerets, so that people could tell 50 or 100 yards away what class they were? That might be done. At the present time I think there are boards put up on the platforms telling passengers where each class of carriages will stop. Mr. Neild's scheme does not give anything like the accommodation given by the Departmental scheme.
2919. *Mr. Hoskins.*] Do you know whether persons who have houses or warehouses built over the tunnels on the London underground railway were entitled by law to compensation because of the tunnelling? I am not quite sure. I think there was a provision made for what is called an "easement" in some instances; but I should not like to make a definite statement on the subject.
2920. Do you not know that a considerable amount of compensation had to be paid in numbers of cases for alleged damage to foundations from vibration? Yes, I believe that that was so. One other point in connection with Mr. Neild's scheme is that it is essentially a tunnel scheme, and I have already pointed out the objection to tunnels. Of course, I have had to examine this scheme rather hurriedly, and there might be some differences of detail which could be improved or otherwise arranged; but, in the main, I think that my objections are correct. In fact, I think that the difficulties would be rather more than I have made them to appear. Where you have to deal with a steep street, it is more difficult to arrange for a good grade than where you are dealing with a level street or a street with only a slight incline. You cannot touch the grade of a steep street. If you want to raise it, you steepen the grade below the crossing; if you want to lower it, you steepen it above the crossing. Then, too, when crossing a steep street you must get your headway not on the centre line, but on the lower side, which may considerably throw out your calculations.
2921. *Chairman.*] With regard to the matter of curves in connection with Mr. Neild's scheme, it is hardly worth while particularising it? No, except that there would be a very tight fit coming round by the Town Hall. I am not at all sure that the line could be taken in that way.
2922. In the Domain you could get over the objection? Yes.
2923. *Mr. Hoskins.*] Do you not think that the Municipal Council would offer objections to the taking of the railway under the foundations of the Town Hall, or of the market buildings? I should think they would object to a railway going under the market buildings. Of course, the line would have to be kept clear of the foundations of the Town Hall.
2924. *Chairman.*] Would not that involve expensive resumptions? It looks as if you could just squeeze the line in without interfering with the Town Hall, but I am not quite certain that it is possible. A scheme of this kind requires to be worked out in detail at certain points before you can make sure whether it would be practicable. You cannot judge from a mere sketch. For that reason I have not raised any objection in regard to the matter of clearing the Town Hall site, although that would be a difficulty.
2925. You have given the scheme the benefit of the doubt? Yes; I base my objections to it upon the difference of levels and the difficulty of working traffic over such a line.
2926. *Mr. Trickett.*] Several circular lines have been suggested to us, and it has been proposed that trains should run round both ways;—how do you view that proposal? I do not think it would be at all a suitable arrangement. As I have already pointed out in this particular case, trains running down the Darling Harbour branch could not possibly stop at Redfern station, because the line is on a steep grade, and does not emerge from a deep cutting until it gets to the Eveleigh end of the Redfern platforms.
2927. But, apart from that difficulty, would it be practicable to run trains round the loop in both directions? You mean if that difficulty were got over?
2928. Yes? It would be possible; but it would be necessary to fix upon one station for a terminal station, where the trains could stop and wait for time. On the London Metropolitan Railway, which with the Metropolitan District Railway forms a complete loop, the trains run round and round in opposite directions continuously; there is no time-table required. They run every three minutes, or perhaps oftener. No trains coming from outside that loop run on to that loop. They in every case come to a terminal station.
2929. For the merely city traffic, I can see that the loop could be used; but do you think it would be desirable to work on to it the whole of the suburban and up-country traffic? No; that could not be done conveniently.
2930. When a long-distance train arrives, a considerable amount of time is occupied in getting rid of the passengers and putting out goods and luggage;—would not that interfere with the other traffic on the loop if we ran all these trains into the city? You could get over that difficulty if you had a large enough station where you could run the long-distance trains into separate docks: but you would require a great deal more room to do that than seems to be provided anywhere.
2931. Such an arrangement is practicable, but it would require a very large amount of room? Yes. Cook and Phillip Parks would be a very inconvenient site for a central station. I think passengers would just as soon stop at Redfern as be landed there.
2932. Your great objection to that site is that the ground is sloping? That is to say, the difference of levels. One end of the station would be in a deep cutting, while the other would be lifted right up. It would be a frightfully expensive station.

2933. You think that the plan of running trains round a loop in opposite directions would entail considerable expense? You would have to treat the lines as the separate prongs of a fork, which happened to meet at the further end. They would have to be worked separately.

H. Deane.
20 Aug., 1897.

2934. As two separate systems? Yes. The convenience would be that all the trains would start from the same station, the central station that I speak of being the terminus of both systems. The idea of running in from the suburban lines right round the city continuously is impracticable.

2935. Except for suburban traffic? It is not practicable for suburban traffic. If the Committee want further information upon this subject, I would recommend them to call the traffic officers, who would be able to explain the matter more fully.

2936. The difficulty is not an engineering one, but one of practical working? Yes. These difficulties of working must be considered by the engineers in designing a line. I have not said anything with regard to Mr. Horbury Hunt's condemnation of the Departmental scheme. I worked out the station arrangements after repeated consultations with the late Chief Commissioner, and I do not think there is anybody in Sydney besides Mr. Hunt who would so severely condemn any arrangements which the late Chief Commissioner had expended so much thought and time upon.

2937. *Mr. Hoskins.*] Do you think that you have provided sufficient room to allow people to enter and leave the proposed station conveniently? Yes; I have provided quite as much as is usually provided in connection with similar stations elsewhere. I think I explained that matter fully last time I was here. I understand that it is thought that there may occasionally be a block at the new station, just as there is now at Redfern at times on that part of the platform opposite the indicators. I would point out, however, that people congregate on that part of the Redfern platform, because there is no other place for them to go. The people you see there are waiting for their friends, getting information about trains, collecting luggage, passing from one platform to another, and, consequently, the space is often very crowded, and considerable confusion exists. But when people arrive at the proposed new station, they will go at once into the station. All that the openings will be required for will be to admit the public into the station, or to provide means of exit. They will not be required to give standing room for persons waiting about. There will be a large platform inside the building and under the roof, 60 feet wide, where people will go to obtain information about trains, to collect luggage, and so on.

2938. The opponents of the St. James'-road scheme say that there will be a very deep cutting, and a very awkward one, on the eastern face of the proposed station, which will create an obstacle to traffic and greatly disfigure the place;—is it not the case, however, that you propose to give a very easy approach to the eastern side of the station, and that there will be no disfigurement? Yes; that is so. There will be no disfigurement, and everything will be slightly, if not ornamental.

2939. *Mr. Lee.*] Do you want to add anything to your evidence in regard to the necessity of increasing the approaches to the proposed new station? I think I sufficiently dealt with that matter when I was here before. I then showed the Committee the lithographed plan of the new Great Eastern Railway station at Liverpool-street, London, where they run 100,000 people in and out every day—a traffic vastly larger than the traffic which we have to deal with at Redfern. Not only are the means of ingress and egress provided there no greater than I have provided at St. James'-road, but the streets round about, as every one must know who has seen the London streets, are narrow and crowded. It will be seen from the arrangements connected with that station that the difficulties supposed to exist at St. James'-road are merely imaginary.

2940. *Chairman.*] It has been proposed to improve the approaches to St. James'-road station either by widening Market-street or by continuing St. James'-road into Castlereagh-street;—which would you prefer? My suggestion is to make an approach through from Castlereagh-street.

2941. *Mr. Hoskins.*] And to round off the corners of the streets? Yes.

2942. *Chairman.*] You would round off the corners of Market-street as well? Yes; I see no objection to that. I would make everything as convenient as possible.

2943. *Mr. Black.*] I should like to know how you are going to avoid at St. James'-road the dangers which now exist at Redfern? That is a traffic matter which I thought I had already explained sufficiently. Perhaps not being a traffic officer I have not been able to explain it properly. If the Committee would not mind calling a traffic officer to explain it, I think it would be better. I thought the Committee had had the benefit of Mr. Parry's explanation of the difficulties now existing at Redfern yard.

2944. We know what the difficulties are at Redfern, but I do not know why there would not be similar difficulties at Hyde Park? At Hyde Park you have greater length. You have about 1,900 feet there from the outside points to the ends of the platform. At Redfern you have only about 800 feet.

2945. You told me that the distance from St. James'-road to Park-street was 1,150 feet? The outside points are further out from the platforms than Park-street.

2946. But the lines begin to narrow in before you get to Park-street, and consequently there is the danger inseparable from the crossing of trains; you have already told us that between Devonshire-street and the Redfern tunnel there is more room in which to avoid that danger? The clear space at Redfern is only about 800 feet. You cannot go back to the tunnel, because there are other roads coming in before you get to the tunnel. The amount of clear space available for passenger traffic going into the station at Redfern is only 800 feet. At Hyde Park you have only passenger traffic to deal with, and you will have much greater length. Then, too, the engine "roads" which will be provided will render it unnecessary to shunt trains over other lines in order to get the engines which have brought them in away from the platform.

2947. As I understand your explanation, at Redfern you have more operations than you would have at St. James'-road—it is not that there is any structural deficiency at Redfern? Yes; there is a structural deficiency at Redfern. The design of the roads at Hyde Park was decided upon after consultation with the late Chief Commissioner, and he was perfectly satisfied with it. The traffic officers are, of course, responsible for the method of work adopted.

David Kirkcaldie, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

2948. *Chairman.*] Have you had an opportunity of looking into Mr. Neild's scheme? Yes; I saw it about an hour ago.

D.
Kirkcaldie.

2949. Are you prepared to express an opinion with regard to it? Yes. I scarcely think it is a practicable scheme. Apart from any engineering difficulties which may exist, there will be some difficult gradients

20 Aug., 1897.

D.
Kirkcaldie.
20 Aug., 1897.

gradients to contend with. First of all, Mr. Neild proposes to go down the Darling Harbour branch on a grade of 1 in 40. I understand, too, that there are some heavy grades between Darling Harbour and King-street. Mr. Neild, I believe, proposes to run some trains on to the loop on the Darling Harbour side, and others on the Redfern side. That would mean, of course, that all the trains entering on the Darling Harbour side would miss Redfern Station altogether, because the commencement of the Darling Harbour branch is just at the mouth of the tunnel—a long distance from the station. Consequently, this arrangement would render the present Redfern platforms valueless. The only platforms that could be used would be two entirely new ones on the eastern side into which trains coming or going *via* Woolloomooloo on the eastern side of the loop could run. I understand, too, that Mr. Neild proposes to have only a double line of rails. We could not conduct our traffic on two lines of rails. His proposed arrangements would be admirable enough for a circular line where trains can run in regular periods, but we have to deal with trains coming from the west, the north, and the south, with trains going to Parramatta and making their first stop at Strathfield, and with other trains stopping at every station. To have all these trains running round a loop would mix up the traffic so much that it would create the greatest confusion. On the eastern side of Redfern yard, we now deal with the whole of the hay, straw, chaff, and produce traffic; but if the proposed scheme were carried out, that traffic would have to be removed to some other place, though we are pretty well crowded out at Darling Harbour now.

2950. Would it be possible to deal with all the suburban traffic on two lines of rails, leaving the long-distance traffic at Redfern? No. Our suburban traffic is so arranged that through trains for Strathfield often pass other trains going to Strathfield, but stopping at intermediate stations. The proposal made by Mr. Neild would, in effect, bring the traffic off four or six lines of rails on to two lines, which would immediately congest it. It would be of no use having four lines of rails beyond Redfern if you only had two lines to the city.

2951. A loop having only two lines of rails would be valueless? Two lines of rails would not carry the traffic.

2952. *Mr. Trickett.*] It is proposed that some of the trains shall enter the loop on the Darling Harbour side, and that others shall enter it on the eastern side, running round it in the reverse direction? Theoretically that arrangement may appear very good, but it would never be practicable.

2953. Why? Because people coming into or leaving the city for the proposed station at St. James'-road would have to be carried right round by Woolloomooloo.

2954. But the city traffic could come in on the Darling Harbour side of the loop? The trains are so numerous during the busy hours of the day that they could not follow round rapidly enough on a double line of rails.

2955. With a double line of rails this scheme is impracticable? I think so, absolutely.

2956. It would not admit of trains being run in opposite directions at short intervals? Trains could be run at short intervals, but the traffic is too great for a double line of rails.

2957. With a sufficient number of rails, you could carry out the arrangement? Yes; but there would still be the objection that you would be carrying the great bulk of the city traffic right round by Woolloomooloo.

2958. Would it tend to confusion if you had the trains running in opposite directions? I am sure it would. Another objection to the scheme is that there is no place for storing trains. Presumably a train coming on the loop on the Darling Harbour side would have to run round to Redfern, although it might not be required after it reached St. James'-road. Then, by and-by, when it is wanted again to fill up at St. James'-road it would have to be run round the loop a second time.

2959. You have had a great deal of experience in managing traffic; you have visited other countries, and I suppose you have read a good deal about traffic management;—do you know of any place where the traffic is carried on in the method proposed? No.

2960. You think that such an arrangement would lead to very great confusion? I am sure it would. It would also lead to great dissatisfaction to the public.

2961. On the London underground railways the trains run in reverse directions? Yes; but that is altogether a different thing. If you made this simply a circular railway you could run the trains upon it as they do in London.

2962. A circular railway is only suitable for the traffic running in the circle itself—it cannot be connected with outside suburban traffic and long-distance traffic? A circular railway is suitable only for dealing with a regular traffic—something like our own tram traffic.

2963. Traffic independent of main or trunk lines? Yes.

2964. *Mr. Humphery.*] Would it be practicable to treat the whole of the traffic when it reached the Redfern station as a local traffic? It would be possible, but it could not be dealt with so satisfactorily. It would mean that the trains would have to follow each other at certain intervals, say every three or four minutes. That would only allow you to deal with about sixteen or seventeen trains an hour.

2965. How many trains do you deal with now in the busiest hours of the day? On the 22nd June last we dealt with on an average thirty-six trains an hour in and out for nine hours—that is, from 4 o'clock in the afternoon until 1 o'clock on the following morning. In the busy times of an ordinary day we deal with upwards of twenty trains an hour inwards. We could not deal with that number of trains upon two sets of rails, even if they stopped at every station. In London if they deal with about sixteen trains an hour on one line they think they do very well. They have tried as many as seventeen, and even eighteen, but they have been found to be too many.

2966. If the trains were marshalled at Redfern, would some of the passengers have to get out at Redfern, and go on into the city by other trains? Yes. The train which would go round the loop on the western side would not touch Redfern at all. Trains coming in from Woolloomooloo would stop at the platforms on the eastern side of the Redfern station.

2967. *Chairman.*] You have a full knowledge of the traffic coming into Redfern, and you state that it is not possible to carry it round the proposed loop on two lines of rails? I do.

2968. *Mr. Fegan.*] Last time you were here I asked you if there were not a possibility of a mistake at Redfern where you had a man on the ground repeating the signals to the men in the boxes? Yes; there is a possibility.

2969. And a probability? Yes; and a probability.

2970. Had you not to make these effective arrangements because of the small amount of space you have at Redfern? You mean the arrangements in connection with the employment of ground signalmen.

2971.

D.
Kirkcaldie.
20 Aug., 1897.

2971. Yes? No; ground signalmen were first put on because engines frequently got up into the tunnel, and it was thought that the signalmen in the boxes might forget that they were there. The ground-men were appointed to see to that, and to keep in constant touch with the signalman in the signal-box.
2972. But is it not on account of the limited distance at Redfern—because the lines branch right off from the tunnel—that the employment of these men is necessary? Yes.
2973. Do you think that this is a desirable state of things? I do not.
2974. If the railway were extended into the city you would have only the one system of signalling? Yes.
2975. And the interlocking system would then be completely relied upon? Yes.
2976. What grade would you recommend for a railway into the city? I do not think you should have anything greater than 1 in 100, if it can possibly be avoided. One in 100 is the ruling grade upon the main suburban lines, and I think that we ought not to go beyond that.
2977. You would have that grade in the Hyde Park scheme? Yes.
2978. Have you any information to hand as to the number of accidents which have taken place in the Redfern yard? No; but it goes without saying that the risk of accident is greater where the traffic is congested, and the men have not sufficient elbow-room to carry on their work.
2979. *Mr. Black.*] You say that no grade steeper than 1 in 100 should be adopted for suburban traffic;—how would you get down from Hyde Park to Circular Quay for a proposed extension to North Shore with such a grade? I have not given that matter any consideration, but in my opinion you should not have a steeper grade than 1 in 100, if it can possibly be avoided. Of course on the North Shore and Hurstville lines we have steeper grades, but they are not desirable.
2980. Is there anything in Mr. Nield's scheme which would prevent the laying down of four lines instead of two? I do not suppose so.
2981. One of your objections to it would be removed if he had suggested four lines instead of two? There would still be no provision for the storing of trains, and the heavy grades render the route, to my mind, impracticable.
2982. Could you not travel all your trains round the loop at a uniform rate of speed? I do not think so. When people get into a train they want to get to their destination as fast as they can.
2983. As a matter of management, would it not be possible to run all the trains through the city at a uniform rate of speed? There is nothing impossible, but such an arrangement would be very inconvenient. For example, in the afternoons we have a train leaving at 5'15, another at 5'18, another at 5'20, and another at 5'23, all on the fast road. There are also trains on the slow road, in fact, from 5'15 until 5'30 p.m. ten trains at present leave Redfern station, and the number will continue to increase. Such a number of trains could not follow on one line of rails, particularly as some are fast and some slow trains.
2984. According to the figures put before us by Mr. Deane, the distance from St. James' road to Park-street is 1,150 feet, or to the switches 1,120 feet; at Park-street you have twelve lines narrowing down to six—that being so, do you not think that the difficulties and dangers which now exist at Redfern will exist at Hyde Park? No. When a train comes into Redfern now, the engine bringing it in has to stay in the station until the train itself is removed. At St. James' road we shall have three lines of rails between the principal platforms, and the engine bringing in a train will be able to shunt on to the central road, and thus get out again, while the train can stay at the platform until it is wanted to go out again.
2985. Is there no danger where an incoming train crosses the route of an outgoing train? Where an incoming train crosses the track of an outgoing train there must always be some risk; but there need not be accidents if care is exercised. You cannot entirely avoid this risk without an enormous amount of shunting, or having separate arrival and departure platforms.
2986. Then the danger which now exists at Redfern will continue to exist at Hyde Park, but it will be minimised? It will be very largely minimised by the superior arrangements proposed.
2987. It would not be impossible to make Redfern a safe station? There is nothing impossible. If you took in Prince Alfred Park, or a large portion of it, and entirely reconstructed the station, you could make it safe; but you would then be spending a very large amount of money which would neither provide additional convenience to the travelling public or give us extra revenue. Furthermore, it seems to me if you absorbed the whole or portion of Prince Alfred Park, you would be taking a park in a part of the city which is considerably populated in order to save a park in a part of the city which is becoming more and more depopulated every year.
2988. Do you think that city parks are for the use of a resident population? Yes; to a large extent.
2989. I am inclined to think that the history of the great cities of the world is in direct contradiction to that view? I do not think that very many visitors to Sydney go to Hyde Park, except as a means to get from there to some other place. I should think visitors would rather go to the Gardens or the Domain.
2990. Do you not think that the Redfern station could be improved by the resumption of land upon the western side? No, because the Darling Harbour branch has to be contended with.
2991. But you could divert that? But to do that you would, as I said before, require to spend a large sum of money for no practical benefit, either to the public or to the railways.
2992. *Mr. Humphery.*] That is the commercial aspect of the case? That is one consideration, but the greater one is the convenience of the travelling public.
2993. *Mr. Black.*] Suppose Redfern could be improved at a cost of £100,000? I do not think that £100,000 ought to be spent in improving Redfern. My opinion is that it would be a great mistake to spend the money in that way. I am sure that 90 per cent. of our passenger traffic is purely suburban, and it seems to me to be an utter mistake to land these passengers a mile and a quarter or a mile and a half from the business portion of the city.
2994. Do you think it would be possible to meet the demands of the whole of the passenger traffic? You cannot meet all, but you can meet the demands of the great majority. That is all we can hope to do.
2995. Do you not think that in the proposal before the Committee there are two conflicting attempts—one is an attempt to serve the city and suburban traffic, and the other an attempt to bring all the long-distance traffic to a more central point? About 90 per cent. of our traffic is suburban traffic, and it is of no use attempting to deal with the other 10 per cent. at Redfern, where a separate staff would have to be employed to look after it. It would be much more economical and convenient to bring the whole 100 per cent. into the city.
2996. Will not the bringing in of the other 10 per cent. increase the dangers and difficulties connected with the Hyde Park station? Not appreciably.

D.
Kirkealdie.
20 Aug., 1897.

2997. Is not the long-distance traffic carried in longer trains than the suburban traffic? Some of the suburban trains are quite as long as the country trains. Some of them consist of eight or nine cars, while the country trains do not consist of more than seven or eight.
2998. *Mr. Roberts.*] From outside what limits would this 10 per cent. come? From beyond Penrith and Campbelltown. The long-distance traffic comprises trains like the Melbourne express, and the trains from Goulburn, Bathurst, Orange, Tamworth, and places like that.
2999. Where does the strictly suburban traffic come from? From places like Parramatta, Blacktown, Hurstville, Hornsby, and Penrith.
3000. Would a train to Penrith be regarded as a suburban train? It would be to all intents and purposes.
3001. *Mr. Fegan.*] Have you been in any city where the railway line runs through a garden or park? Yes; the train runs through the Prince-street Gardens in Edinburgh.
3002. Are the plants or trees there damaged at all by the smoke or dust? No; those gardens are very beautiful, and I never heard that the flowers and shrubs are injured by the smoke.
3003. *Mr. Humphery.*] Touching the suburban passenger traffic, the last report of the Railway Commissioners shows an increase of 1,500,000 journeys during the year ending June, 1897;—can you say, approximately, how many journeys were made on the North Shore line during the year? I should say, roughly, between 400,000 and 500,000.
3004. What would the increase in traffic on the North Shore line be? It about doubled last year.
3005. So that of the 1,500,000 additional journeys on the suburban lines referred to in the report, 200,000 might be attributed to the North Shore line? Yes.
3006. Have you any suburban radius at Newcastle? Yes; trains going to Maitland and to Teralba are included in the suburban traffic.
3007. What was the increase in the suburban traffic coming to Redfern last year? At least 1,000,000.
3008. The increase in the suburban traffic coming to Redfern last year would be fully 1,000,000? Yes.
3009. *Mr. Lee.*] Will you tell us what are your views about the difficulties of dealing with a large passenger traffic in underground stations? I have seen underground stations, but do not like them. Apart from the inconvenience of working the traffic in them, I think it a great pity that passengers should be required to walk up or down twenty-five or thirty steps to get to a train.
3010. How could you manage long-distance traffic at an underground station? It would be inconvenient, but not impossible.
3011. Passengers nowadays seem to carry much larger packages than they formerly carried, and the luggage is moved about the platforms on wheelbarrows;—would it not be difficult to get it down a flight of steps into an underground station? It would not be taken down the steps. There would be proper lifts.
3012. Then again, the quantity of mail matter carried by the trains is increasing enormously? That too would be taken by the lifts.
3013. A long-distance train has to be run into the platform half an hour before the starting time? Yes; more than that. To get the luggage and parcels and mails stored into a long-distance train takes over an hour.
3014. Could that work be done as expeditiously in an underground station? No.
3015. *Mr. Humphery.*] With regard to the shunting necessary at a terminal station; in any practical scheme could you entirely avoid risk? No; it is not possible to propound a scheme which would absolutely avoid risk.
3016. Do you regard the proposed arrangements for the Hyde Park station as nearly free from risk as would be practicable in any station? I do. I think that some modifications might probably be made in the arrangements suggested; but, taken generally, it is as nicely laid out a station-yard as could well be imagined for our requirements.
3017. And as free from risk? Yes.
3018. In connection with Mr. Neild's proposal, would all the trains carrying suburban passengers have to travel the whole circuit from Redfern back to Redfern? Yes.
3019. That would be three times the distance of a direct line to Hyde Park? Yes.
3020. Would it be necessary to send trains back to Redfern from Hyde Park, or could they remain there to be filled with out-going passengers? With very few exceptions, they would remain at Hyde Park to be filled with out-going passengers. Of course, some of the trains would be sent out to the sheds for washing and cleaning purposes.
3021. *Mr. Trickett.*] If the St. James'-road station were constructed as designed, could you work the traffic by means of fixed signals alone? Yes.
3022. It would not be necessary to have hand-signalling as well? No.
3023. Is that where the great danger comes in at Redfern during busy times? I do not say that the danger is a great one; but there is an element of danger in the arrangement. What I think will tend to minimise the danger more than anything else is the arrangement whereby incoming engines will be able to be taken away from the platforms without moving the trains, and so save much of the shunting which now takes place.

TUESDAY, 24 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the expediency of extending the Railway system of the Colony from the present terminus at Redfern into the City, including the erection of a large Central Station in the north-western division of the Park, fronting St. James'-road.

John Cash Neild, Esq., M.P., sworn, and further examined:—

3024. *Chairman.*] I understand that you have a further statement to make? I have had an opportunity of reading the exceptions taken to my scheme by Mr. Deane and Mr. Kirkcaldie, and to them I wish to make a very brief reply. Mr. Deane says that there would be a fall of 13 feet from the Sussex-street bridge to the tunnel under Bathurst and Kent streets, giving a grade of 1 in 31. My reply to that objection is that I fully expected that it would be necessary to lower Sussex-street where the bridge would cross. I was not questioned about the matter, however, and therefore I did not refer to it, because I did not want to make my statement too long. By lowering Sussex-street 5 feet I can obtain a grade of 1 in 50, and by lowering the street 6 feet I can obtain a grade of 1 in 60. Mr. Deane's second objection to my scheme is that Boomerang-street must be diverted on account of the low level of Woolloomooloo-street and St. Mary's-road, and that the rail level at College and Park streets would be 57 feet under Park-street. I described the line as being carried on a viaduct, not on a bridge 18 feet over the roadway, as Mr. Deane indicates. It would be about 45 feet above the road. This would make the rail level of Park-street 30 feet, not 57 feet. Mr. Deane speaks of a difficulty as to crossing Macquarie-street south at a level of 75 feet. I have shown that the College and Park streets rail level would be 27 feet higher than the level stated by Mr. Deane; and, if this did not give height enough for the bridge at Macquarie-street south, the street might be cut down with great local advantage, or, as it is a ridge running north-east and south-west, a slight curve would avoid the crest altogether. Mr. Deane's fourth objection is as to the difficulty about passing under the new markets. I did not and do not propose to go under the foundations. I propose to pass through them at right-angles in separate arches each 12 feet wide. The line here would separate into two tunnels, 20 or 30 feet apart, so as not to weaken the building. At Question 2930, Mr. Deane says of my Park station, "One end of the station would be in a deep cutting, while the other would be lifted right up." But that station would not be in anything like so deep a cutting as Mr. Deane's proposed high school station, which would be 22 feet below the street level on the one side and 35 feet below the street level on the other side, as is shown in his evidence before the Royal Commission, page 2. But the cutting need not be so deep as I have stated, if the line crossed St. Mary's-road and Woolloomooloo-street, going through the narrow point of the Cathedral ground, instead of passing below it. In this connection, I would like to say that there are many stations in London every foot of which is elevated far above the chimney-pots of two and three storeyed houses. There is nothing unusual in having a station elevated either at one end or at both. This explanation effectually disposes of Mr. Deane's objection as to my levels. Mr. Deane's sixth objection to my scheme is that it is "essentially a tunnel scheme." Well, there are only 38 or 40 chains out of a total length of 226 chains in tunnel—that is, less than one-fifth of the line is in tunnel. Mr. Trickett asked Mr. Deane this question,—“Several circular lines have been suggested to us, and it has been proposed that trains should run round both ways;—how do you view that proposal?” To which Mr. Deane replied,—“I do not think it would be at all a suitable arrangement.” Yet, a moment afterwards he said,—“On the Metropolitan and District Railway the trains run round and round in opposite directions continuously. They run every three minutes. No time table is required.” As a matter of fact the trains there run at intervals of from three to thirty minutes according to their destination, and they run according to a fixed time table, as the members of the Committee will be able to see by referring to the time table which I now hand in. What was Mr. Deane's evidence before the Royal Commission, Questions 180 and 181? He was then asked,—“Supposing that two lines were carried right through the city by one route and came back by another, would that be wide enough to work the traffic?” to which he replied, “I should think it would.” A second question was put to him,—“That is with two sets of rails going right round?” to which he again replied, “I should think it would.” This is Mr. Deane's official description of the proposal reported upon by the three Railway Commissioners, to which reference is made on page 6 of the Report of the Royal Commission:—

In the event of Hyde Park not being adopted as a terminus, and extensions on either side of the city of two lines each were to be made, the proper places for these extensions would, I think, be under the roadway, instead of going under the property on each side. I should have no hesitation in recommending such a course.

That is precisely my proposal. I now deal with Mr. Kirkcaldie's objections. In the first place, Mr. Kirkcaldie objects to the grades, and particularly to the grade from Redfern station to Darling Harbour, which he says is 1 in 40. From Redfern tunnel to George-street is a distance of 27 chains, and from George-street to Macarthur-street, where I take off, the distance is 29 chains. Therefore, the whole distance is 56 chains. The level of Redfern station is 64 feet, and the level of Macarthur-street is, say, 15 feet. That gives a fall of 49 feet in 56 chains, or a grade of 1 in 75. I have no idea why the railway authorities use a grade of 1 in 40 when they can get a grade of 1 in 75. I submit, too, that it is no criticism of my scheme to assert the impossibility of conducting passenger traffic over a line which carries the entire goods traffic of the Colony. Notwithstanding the grades, Mr. Kirkcaldie says of my scheme.—“His proposed arrangements would be admirable enough for a circular line where trains can run in regular intervals.” He also says that he “could not possibly deal with suburban traffic on two lines of rails.” I did not propose having two lines of rails; I proposed having four lines of rails, two in and two out

J. C. Neild,

J. C. Neild,
Esq., M.P.
24 Aug., 1897.

out. The fact that the two sets of lines unite at King-street does not reduce them to two lines. I have two lines on each side of the city—four altogether—two going out from Redfern on the west side, and two going out on the east side. But if what Mr. Kirkcaldie says is correct, why did the Railway Commissioners speak of a double line of rails being sufficient? In reply to Question 2948, Mr. Kirkcaldie says: "The proposal made by Mr. Neild will bring the traffic off four lines of railway on to two lines. It would be of no use having four lines of railway beyond Redfern if you had only two lines to the city." If you run two lines out on the west side and two out on the east side, that makes four lines of rails. In London nearly a dozen lines are brought in to the two-road circular railway. The Metropolitan line belongs to one company, and the Metropolitan District line to another. These two companies run over each other's lines, and with these lines are connected the lines of the London and North-western Company, of the Midland Railway Company, of the Great Northern Railway Company, and of the East London Railway Company. All these companies' trains run, more or less, over the two-line track belonging to the Metropolitan and Metropolitan District Railway Companies. It will be seen from the map which I now hand in that trains come in from districts entirely outside the circle, and run upon the circle. In reply to Question 2955, Mr. Kirkcaldie says: "You would be carrying the great bulk of the city traffic right round by Woolloomooloo." This is so absurdly and transparently not the case that I cannot understand how Mr. Kirkcaldie could have made such a statement. The proposal is to enter the city on the west side, and to only partially use the east side for that purpose. In reply to Question 2956 he says: "I am sure it would tend to confusion if you had trains running in opposite directions"; and in reply to Question 2957, he says that he "knows of no place where the traffic is carried on in the method proposed." All I can say to that is that Mr. Kirkcaldie can never have been in London, or, if he has been there, he did not use his senses when there, because all the world knows that trains run in opposite directions upon the London circular line. I can only characterise Mr. Kirkcaldie's statements as simply reckless evidence. That is the most polite way in which I can describe them. In reply to Question 2960, he says: "A circular railway cannot be connected with outside suburban traffic and long-distance traffic." The map which I have handed in shows that that can be done and is done. In reply to Question 2962, he says: "Trains can follow each other every three or four minutes; that would only allow you to deal with sixteen or seventeen trains an hour." It is evident that if sixteen or seventeen trains an hour could go into the city on one side on one pair of rails, thirty-four trains an hour could go into the city on two pairs of rails; so that on a double circular line you could run thirty-four trains in and thirty-four out in the hour, or sixty-eight an hour in all. According to Mr. Kirkcaldie, the present average is thirty-six trains per hour, eighteen in and eighteen out. Mr. Kirkcaldie simply confused himself and confused his evidence; but I do not think he could confuse the Committee. Mr. Kirkcaldie was asked whether, by my line, the distance from Redfern back to Redfern would not be three times the distance of a direct line to Hyde Park, to which he assented. Mr. Deane's line is 90 chains each way, or 180 chains altogether. As it is 30 chains from the northern end of the platform back to the shunting points, an engine would have to run 30 chains back to shunt, and then go north again 20 chains, allowing 10 chains for the length of a train. So that every engine shunting at Hyde Park would have to run 50 chains, or 10 chains more than half a mile. The length of my circular line would be 4 chains less than the distance by Mr. Deane's line from Redfern to Hyde Park and back. In reply to Question 2943, Mr. Deane said: "The outside points are further out from the platforms than Park-street—it is 1,900 feet from the outside points to the ends of the platforms." That means that engines would have to run south 1,900 feet, and then north 1,200 feet in order to take out a train. You would have to run an engine from the St. James'-road to a point 5 chains south of Park-street to get to the shunting points. That is the evidence not only of Mr. Deane, but also of Mr. Parry before the Royal Commission. I am determined to have my scheme fully looked into before the question is finally dealt with. I am sure that the Committee will not be offended by my saying so; but I am in a position to state that my scheme will be very fully looked into in regard to some of the details which have not come out clearly in evidence. There is one other point to which I wish to refer. The official line is 90 chains long. The distance by my line to a point on the same latitude as St. James'-road would be 11 chains longer on the western side—10 chains of which would be occupied by the Town Hall station, while on the eastern side the distance to the Parks station is 83 chains, or 7 chains less than the length of the official line. Finally, with regard to the running of the railway trams, I find that eighty-five trams run to Redfern in seventeen hours of the day—that is, five per hour, or one every twelve minutes. From Redfern there are 102 trams in eighteen hours of the day, or one every ten and a half minutes. To Paddington there are 252 trams running daily; therefore 30 per cent. more trams run to Paddington than run to the railway. On the Redfern line they frequently run only one car, and never more than two to a train, while on the Paddington line they run three-car trams, so that the tram traffic to and from the railway is not as large by, I suppose, one-half as is the tram traffic to and from the top of Barraek Hill.

3025. *Mr. Roberts.*] There are a great number going to and coming from the railway who do not use the trams? Just so, and on the other hand a great many people take advantage of the buses which run out to the eastern suburbs in such numbers.

Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and further examined:—

S. E.
Perdriau.
24 Aug., 1897.

3026. *Chairman.*] Will you resume your evidence at the point at which it was interrupted last time, dealing with the various questions which were submitted to you, in the order which appears to you to be best? I find, upon reading question and answer again, No. 2836, that Mr. Black, in using the information at questions Nos. 1796 and 1797 of the inquiry before the Royal Commission, has made the mistake of supposing that the amount £12,000 or £13,000 was quoted by me, and as referring to the total probable cost of new buildings upon an area of 1 acre 1 rood, to provide equal accommodation to the present accommodation; whereas the figures £12,000 or £13,000 were not supplied by me at all, but by the Government Architect, Mr. Vernon, and they do not refer to the probable cost of new buildings upon an area of 1 acre 1 rood, but to the cost of a new school building to provide equal accommodation to that now afforded by the High School building.

3027. *Mr. Black.*] Do you disagree with Mr. Vernon's estimate? I have not gone into the matter at all, because it is not my business. Mr. Vernon's figures refer to the cost of building a new High School. In the

S. E.
Perdriau.
24 Aug., 1897.

the evidence before the Committee, page 18, line 29, Mr. Selfe admits the value I give to certain city lands, and, halving these values, he goes on to say that the amounts obtained are the amounts which I gave. He bases his calculations upon the half values, and he says at the same time that he is using my values. This, of course, is quite incorrect. With regard to the resumption at Redfern proposed by Mr. Selfe, I have obtained the municipal assessments for the two areas coloured yellow on Mr. Selfe's plan, which are referred to by him at questions 814 to 818 as containing 1½ and 1¼ acres, and find that they total £4,645, which, at 20 years' purchase, would amount to £92,900, without the customary 10 per cent. addition for forced sale and compensation for disruption of business, which would be considerable for the 400 feet of shop premises fronting Regent-street. Mr. Selfe estimates the cost of the above resumption at £56,000. I will now deal with Mr. Greenwood's estimates. Mr. Greenwood tries to discredit my estimates of cost of resumptions which are based upon municipal assessments, by telling the Committee that I have based the estimates upon nine-tenths of such assessments. In reply, I have only to state that Mr. Greenwood is wrong. There is a gross assessment made, and the net assessment for municipal rating is nine-tenths of same; but for my estimate I, of course, used the gross assessments. If I had used only nine-tenths of same I should have informed the Committee to that effect, just as I would have done if I had used any other fraction of the gross assessments. The Committee do not want to know only nine-tenths of the cost but the whole of the cost. Mr. Greenwood has rushed to a conclusion without inquiry at the Town Hall or of myself, and consequently his conclusion is erroneous. Then I have an estimate of the value based upon the present municipal assessments, of the properties which would probably have to be resumed for Mr. Greenwood's scheme. The total of the municipal assessments for the year 1897-98 for the properties which would be required for the above, as indicated upon my sketch showing Mr. Greenwood's scheme, is £22,285; this amount at twenty years' purchase equals £445,700. This is for resumption alone, which, according to Mr. Greenwood, would be only £256,000 (that is 3¼ acres, at £74,000 per acre)—(see Question 1993 of Report of the Royal Commission); and, according to Mr. Greenwood's statement at question No. 578 of the Public Works Committee inquiry, this should be increased by 40 per cent. to arrive at the actual cost, and the whole would therefore be £623,980. The estimate by Mr. Greenwood (which embraces merely the strip required) is £370,000. Mr. Greenwood allows 10 per cent. for forced sale, 10 per cent. for lessees' compensation, and 20 per cent. for severance = 40 per cent. additional. I have adopted Mr. Greenwood's mode in this case merely for the sake of comparison; I think 10 per cent. extra for lessees' compensation and 20 per cent. extra for severance inadequate. It is misleading to estimate them in this rough and ready way. They would vary so much that nothing but full inquiry into each property should be accepted. An open cutting 18 chains long and 54 feet wide taken out of the road at the Circular Quay, extending from Pitt-street to Maacuarie-street, would be little short of destruction to the road, which is used by so many thousands of persons daily going to the seven lines of mail steamers, the oversea ships, and the ferry steamers, and by hundreds of busses plying to the suburbs. According to Mr. Greenwood's reply to Question 671 this traffic will remain after the railway has been constructed. If so, such a cutting with trains running in would be a nuisance. I would point out that Mr. Greenwood's line, as designed, passes through or under the Town Hall grounds at the north-east corner; it would interfere with the porch, if not actually with the building itself. It would be very ridiculous if 54 feet width would be sufficient for a station for shunting when the Railway Commissioners are asking for a width of 380 feet. At page 27, question 578, Mr. Greenwood says—"In Sydney there are very few leases; they are mostly yearly tenancies or weekly ones." This statement is not correct. I find that the custom is to have a lease. I have also prepared the following description of the land suggested as a railway station site on the western side of the Circular Quay, and rough estimates of the value of the improvements on each block or section of the area:—The land suggested to be taken for the above-mentioned purpose commences at the Queen's Wharf, at the south-western corner of the Circular Quay. It lies between George-street and the dray-road which borders the Quay. The dray-road extends throughout the length of the site as suggested, and averages about 60 feet in width. At the Queen's Wharf it is only 54 feet wide, and at one place it is as much as 94 feet wide. The whole of the western side of the Quay has recently been remodelled, the southern portion is finished, and that towards the north is in progress. New wharfs and cargo-sheds have been erected fronting the dray-road. The vessels berthing here are the Nord-Deutscher Lloyd, the Eastern and Australian, and the German-Australian lines of mail steamers, ranging up to 10,000 tons burthen, as well as the largest sized cargo steamers trading to the port; and as they discharge immense quantities of cargo here to be taken to the various warehouses in the city it is evident that the present dray-road is not too wide for the requirements, hence I conclude that the western side of the said road would form the eastern boundary of the land proposed to be taken for a railway station, and George-street the western boundary. George-street is 15 feet higher than the Quay-road. I purpose considering first that portion of the land extending from Queen's Wharf northerly up to and including the large offices erected by the A.S.N. Co. some years ago, and purchased by the Crown in common with their wharfs and stores adjoining. This portion of land is about 1,100 feet long, and is intersected by Argyle-street and Bethel-street, dividing it into three small blocks of about equal length, described in detail below. At the Queen's Wharf the land is 185 feet wide, at Argyle-street 133 feet wide, at Bethel-street 92 feet wide, and at the northern end 65 feet wide; but at this end, by including the roadway leading to the Quay and resuming the private land extending thence to George-street North, the width might be increased to 195 feet at this particular spot, which, as before stated, is the northern side of the offices lately purchased from the A.U.S.N.Co. The width of the land is, however, only 100 feet at the southern side of these offices, which are 180 feet long. The most southern of the three blocks comprised in the site extend from the Queen's Wharf to Argyle-street; it is 380 feet long, and is a reserve held to be Imperial property. It is one of the properties which are to be ceded to the New South Wales Government in exchange for Garden Island. The land is nearly all occupied by buildings which were formerly the Commissariat Stores, and are very old and require repairs. On the George-street frontage there is a stone store 190 feet long and 50 feet wide, three stories high. Offices in this building are occupied by the Government Analyst, the Government Medical Department, the Mines Department, and by various weekly tenants; the remaining large portion is vacant. Facing the Quay-road there is a stone store 150 feet by 70 feet, four stories high; of this the ground-floor is let and used for storing hides. Portions are used for stores for the Government Architect's Department, and the remaining large portion is vacant. A stone store of one storey, used by the Ordnance Department, occupies 130 feet of the Argyle-street frontage, commencing at

S. E.
Perdriau.
24 Aug., 1897.

at George-street, and is about 65 feet wide. There are various other smaller and unimportant stores of weatherboard, stone, and iron; some are used by various Government Departments, and others are let on weekly tenancies. The value of the buildings on this block is roughly estimated at £16,000. On the next block, extending from Argylo-street to Bethel-street, there are several privately owned buildings, erected upon private land, the municipal assessment for these amount to £754, which at twenty years purchase shows a capital value of £15,080. The remainder of the block is occupied by the Sailors' Home and the Morgue. The Sailors' Home land is vested in trustees, it is also part of the reserve mentioned as comprising the first described block, and is to be similarly dealt with, the land extends through from George-street to the Quay-road, and has a frontage of about 160 feet to each. The through depth is about 120 feet. The "Home" is a four-storied brick and stone building which with the old cottage used as the Superintendent's residence is worth about £2,000. The Morgue and the iron building adjoining are worth about £300. The third block is occupied by the Mariners' Church and the offices above referred to as having been erected by the A.U.S.N. Company. A grant was issued to trustees for the Mariners' Church land on the 1st March, 1858. The Church is of stone and worth about £6,000, and the brick building adjoining, £600. The A.U.S.N. Company's offices are of red brick, five stories high, and cost £36,000 when erected twelve years ago. Parts of the buildings are used for wool stores, part by the Ordnance Department, and the remainder by the Manager of Government wharfs. It appears to me that the railway could not be extended beyond these offices without destroying them. The total value of the buildings upon the three blocks comprised in the proposed site as above is about £60,000. Description of the remainder of the land lying between the A.S.N. Company's offices and Dawes Point, bounded on the west by George-street. This land comprises three distinct portions viz. the remainder of the A.S.N. Company's property which with the wharfs and offices was purchased by the Crown some years ago for £275,000, the depôt for Marine Board launches, and the Dawes Battery Reserve. The extreme length of this land is 1,450 feet, it is very irregular in shape and varies in width from 100 to 690 feet. The Quay-road continues beyond the old A.S.N. Company's offices in front of a row of sixteen bonded and free stores, and terminates at the southern boundary of the block of land next described purchased by the Government about ten years ago, and now used as a depôt for Marine Board launches, Pilot boats &c. The stores are also upon the land purchased by the Government from the A.S.N. Company. They are of stone and brick three and four stories high, are old but in good repair, dimensions about 25 feet frontage by 55 feet deep, which is the extent of the Crown land here. Value about £15,000. Fifteen of them are let to John Upward & Co. The total rentals amount to £800 per annum, his term of lease will expire shortly and he has secured the right of renewal for a further term of three years. The remaining store is occupied as a depôt by the Government Printer. Two galvanised-iron stores of two stories also on this land are worth about £1,400. They are leased to Flood & Co. The lease has two years to run with the option of renewal for a further term of three years. The rent of these is £75 per annum, plus 4d. per bale on all the wool dumped. The land lying between the back of the row of stores and George-street averages about 100 feet in width, this is private land, the street frontage of the block is about 630 feet; one allotment of it 25 feet wide was sold to Virgoe, Son, and Chapman some years ago, during the land boom, for £80 per foot. A brick store, four stories high and worth about £2,500, is erected on the allotment. If the remainder of the land were resumed now it would cost at least £60 per foot. I have no doubt that this land would have to be resumed if it were decided to extend the railway to the western side of the Circular Quay and erect a station there. Cost of 595 feet at £60 per foot, £35,700; value of the sixteen stores, £15,000; value of the galvanised iron stores, £1,600; total, £52,300. £52,300 would represent the value of the buildings which would be destroyed and the cost of the land necessary to be resumed. *Depôt for Marine Board Launches and Pilot Boats.*—This land lies between the land purchased by the Crown from the A.S.N. Company and Dawes Battery Reserve, and was purchased by the Crown for £29,000 about ten years ago. It is bounded on the west by George-street, and of course extends to the water. The water frontage is 115 ft. in length; the frontage to George-street is only 70 ft., and is occupied by a weatherboard cottage. The "Harbour View" Hotel, which is not Crown property, occupies the street frontage, about 35 ft., between the said cottage and the Dawes Battery Reserve. Shortly after the Government purchased the land, a sum of £7,313 was expended in improvements, consisting of a stone-paved patent slip and cradle for steam launches, stone-paved slip for rowing boats, hauling engine, weatherboard cottage, shed, &c., &c. At the rear of these improvements, two large galvanised iron stores were erected at a cost of £1,940; they belong to the Military Department, and are used for a gunnery and store for field guns. The cottage referred to, fronting George-street, is worth about £250. The "Harbour View" Hotel and land changed hands some few years ago for £4,000. I have not supposed that it would be absolutely necessary to resume this property. Value of improvements, £7,313, as above described; cottage, £250; G.I. sheds, used by Military Department, £1,940; total, £9,503. *Dawes Battery Reserve.*—This land was granted to Her Majesty's Officers of Ordnance in Great Britain, and is one of the areas to be ceded to the Government of this Colony in exchange for Garden Island. This land extends from that last described to Dawes Point, and is bounded on the west by George-street, and on the north-east by the harbour. Along the harbour frontage a narrow strip has been reclaimed, and a substantial stone sea-wall erected. In shape, the land may be roughly described as an equilateral triangle, with an area of about 9½ acres, and sides about 800 feet long, the corners of the triangle being at Dawes Point Wharf, the "Harbour View" Hotel, and the Mercantile Rowing Club shed. The south-western half of the area is a hill about 50 feet above high-tide level, sloping north-easterly towards the water. The reclaimed land along the sea wall is level, and varies in width from about 50 to 150 feet. About half the area, comprising principally the eastern portion, is open to the public, and is used, to a limited extent, for public recreation. The remainder is occupied as follows:—Dawes Point Battery, which is an obsolete fort of five guns; the residence of Major-General French; the residence of Captain Hixson; drill shed, cottages, and outbuildings; the Mercantile Rowing Club shed; also a galvanised iron shed and superintendent's cottage, used in connection with the Marine Board depôt above described, and valued by me in connection therewith. A rough estimate of the value of said improvements is:—Dawes Point Battery, ———; stone house occupied by Major-General French, £3,500; stone house occupied by Captain Hixson, £2,500; drill shed and outbuildings, £1,500; two stone cottages and outbuildings, £1,600; * Mercantile Rowing Club shed, £500; total, £9,600. A low estimate of the value of the extra land which it

* NOTE.—The Mercantile Rowing Club Shed would not doubt have to be removed. Perhaps the two residences and the Drill Shed being on the western portion of the land might be allowed to remain.

it would be necessary to resume if the station site extended from the Queen's Wharf to Dawes Point, together with the value of the buildings thereupon which would have to be raised is £120,000; but new premises would have to be provided for the branches or offices of the various Government Departments now accommodated in the old Commissariat Stores and the A.S.N. offices. Also for the Sailor's Home, the Morgue, the Mariners' Church, the Government Printer's Store, depôt comprising patent slips, stores, sheds and jetties, and caretaker's cottage for the Marine Board launches, and for the Mercantile Rowing Club. The following is an estimate of the cost of resumption of certain blocks of the City of Sydney lying immediately south of Hyde Park, and extending from Liverpool-street to Foster-street:—In his evidence before the Public Works Committee, Mr. Alexander Wilson suggested for resumption, for conversion into a park, in lieu of the portion of Hyde Park resumed, those blocks of the city extending from Liverpool-street to Gipps-street, bounded on the west by Elizabeth-street, and on the east by Macquarie-street South and Foster-street.* For convenience in considering Mr. Wilson's suggestion, I have divided the area proposed by him to be resumed into three blocks, in such a way that if the Committee approve of the suggestion, either in part or the whole, they would probably recommend its purchase. No. 1 is bounded by Liverpool, Elizabeth, Goulburn, and Macquarie streets. The mean length is 535 feet, and the mean width 490 feet; area, 6 acres. The total of the municipal assessments for the block is £9,840; capitalising £9,840, at 20 years' purchase=£196,800; add for the Lutheran Church (approximate estimate), £2,000; add for the Unitarian Church, £13,000; public school, £9,000 (this building would probably be allowed to remain); total, £24,000. No. 2 is bounded by Goulburn, Elizabeth, Foster, and Macquarie streets. The mean length is 550 feet, and the mean width 415; area, nearly 5 acres. The total of the municipal assessments for this block is £5,459. Capitalising £5,459 at 20 years' purchase, £109,180; add for the Chinese church, which is not rated, £1,000. No. 3 is bounded by Campbell, Foster, and Elizabeth streets. The mean length is 240 feet, and the mean width 200 feet; area, 1 acre. The total of the municipal assessments for this block is £2,445. Capitalising £2,445 at 20 years' purchase, £48,900. The total estimated cost of resumption as above would, therefore, be £354,880; to which if the buildings not rated be added, £26,000; total, £380,880. I have not inquired into in any way, nor ascertained the cost of resumption, for Mr. Wilson's suggestion, also made in his evidence before the Public Works Committee, to resume the block bounded by Randle and Devonshire streets, in connection with his proposal to cut down the hill in the street there for the purpose of extending the tramway to Botany and Randwick straight along Elizabeth-street to Devonshire-street, instead of the present circuitous route *via* George-street. Mr. Campbell, in his evidence, draws attention to a resumption made by the Government in 1883, when 2 roods 19½ perches cost nearly £100,000. The land which was resumed lies between Pitt and George streets, near the south-west corner of the Quay. Part of it is now occupied by the North City fire-station, and part of it was taken to increase the width of Queen-street.

S. E.
Perdrian.
24 Aug., 1897.

*NOTE.—The block at the extreme southern end of those proposed to be resumed, viz., that bounded by Elizabeth, Foster, and Gipps streets, has been excluded, as it is very small, and contains several important business premises, and many valuable dwelling-houses.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway Extension from Redfern to St. James'-road.

[To Evidence of D. Kirkcaldie, Chief Traffic Manager, Department of Railways.]

COST OF RAILWAY ACCIDENT AT REDFERN ON 31 OCTOBER, 1894.

New South Wales Government Railways,

Chief Traffic Manager's Office, Sydney, 18 August, 1897.

Dear Sir,

In reply to your inquiry, I beg to inform you that the cost of the accident which occurred at Redfern on the 31st October, 1894, in compensation to persons injured and in damage to rolling stock, &c., amounted to between £45,000 and £50,000.

Yours, &c.,

DAVID KIRKCALDIE,

Chief Traffic Manager.

The Secretary, Public Works Committee.

B 1.

GRADIENTS ON SUBURBAN LINES.

New South Wales Government Railways,

Chief Traffic Manager's Office, Sydney, 24 August, 1897.

Dear Sir,

In reply to your verbal inquiry this afternoon regarding the gradients on the Suburban line, I beg to inform you that somewhere about fourteen or fifteen years ago, when the grade near Petersham station was 1 in 80, trains not unfrequently stuck, and it was altered to 1 in 100, and this is now the grade which controls the load on the Main Suburban line. Indeed, it is the maximum grade as far as Picton on the south, with the exception of a grade of 1 in 70 for a distance of about $2\frac{1}{2}$ miles near Menangle and $\frac{1}{2}$ mile south of Douglas Park, each against the down journey.

On the Western line, the grade which controls the load as far as Parramatta is 1 in 100, and between Parramatta and Penrith 1 in 80.

On the South Coast line, the grade of 1 in 60 between Kogarah and Hurstville rules the load of trains running as far as the latter station.

On the North Coast line, between Strathfield and Ryde, the grade which rules the road is 1 in 60; and on the North Shore line, from Milson's Point to St. Leonards, it is 1 in 50 against the down journey.

The engines employed on the Main Suburban passenger trains are not unfrequently required to haul nine vehicles of the American car type. The same engines are only capable of hauling eight cars on the heavier gradients between Sydney and Hurstville, six between Strathfield and Hornsby Junction, and seven between Milson's Point and Hornsby Junction; and as the trains on the two latter lines frequently exceed these numbers, it is found necessary to employ more powerful engines.

I wish to point out, however, that the general policy of the Railway Commissioners throughout has been to reduce the grades—not only to save time, but to enable greater loads to be taken; and within the last few years all those between Granville and Glenlee bank, south of Campbelltown, have been reduced considerably, besides many others throughout the lines; and it is only a question of time when some of those referred to will be taken in hand and dealt with. The Commissioners have under consideration at the present time the advisability of reducing some of the grades on the North Coast line, amongst others at a greater distance from the metropolis.

I may add that if it can possibly be avoided—even at considerably increased initial expenditure—it is most undesirable that grades of a greater severity than 1 in 100 should be constructed, particularly within an easy distance of Sydney, where the volume of traffic is already so heavy and so certain to largely increase.

Yours, &c.,

DAVID KIRKCALDIE,

Chief Traffic Manager.

The Secretary, Public Works Committee.

ROYAL COMMISSION ON CITY RAILWAY EXTENSION.

MINUTES OF EVIDENCE.

THURSDAY, 16 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. WILLIAM JOSEPH TRICKETT, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works,
sworn, and examined:—

1. *President.*] You have prepared a statement in regard to the various schemes that have been proposed for extending the railway system into the city? Yes.
2. Will you be good enough to read the statement? It is as follows:—

H. Deane.
16 Feb., 1897.

I wish, in the first place, to call attention to the conclusions arrived at by the Royal Commission that was appointed by the Government in 1890. A large number of proposals was submitted to that Commission, and they selected certain of these for further consideration. After taking evidence, and after considerable discussion, the following resolution was passed:—"That the Commission approve of the Hyde Park scheme, as put forward by the Railway Commissioners, and that the same be adopted."

In consequence of the objections that were urged against the use of Hyde Park for a railway terminus an alternative scheme was afterwards considered.

On the 3rd of July the Commission met and heard the evidence of Mr. E. M. G. Eddy, Chief Railway Commissioner, upon an amended proposal for bringing the line through the city, the particulars of which are embraced in the following statement:—

"The Railway Commissioners would wish the Royal Commission to understand that they consider the scheme which they have already submitted, providing for a terminal station in Hyde Park, with connecting lines to the eastern suburbs, is, in their opinion, the best that could be adopted; yet, failing to obtain approval of that scheme, and looking at the urgent necessity that exists for a settlement of the question, as Redfern station is altogether inadequate and inconvenient to meet the requirements of the growing traffic, and the tram communication with the railway station calls for a prompt decision, they submit an alternative scheme which, in their opinion, would very fairly meet the requirements of the railway system, and would also be a perfectly satisfactory scheme, so far as the suburban traffic is concerned. The scheme, necessitating as it does the resumption of a large amount of city property, would necessarily be considerably more expensive than if Hyde Park had been adopted for the terminal station. Doubtless a considerable amount of the money expended for property would be recovered by selling some parts of it later on, at a largely-enhanced value, consequent upon the contiguity of railway stations.

"The scheme contemplates the construction of a large terminal station for long-distance traffic on the site of the Benevolent Asylum and Police Barracks, and the projection of four lines therefrom into the city as far as King-street, from which point two lines are taken down to a terminus at the Circular Quay, and the remaining two lines are continued round to the eastern suburbs.

3. *Mr. Wright.*] What is proposed to be done with Devonshire-street? It will have to be lowered.

4. *President.*] How much? According to the way it is worked out on the scheme which is shown on the plan on the wall here, it will have to be lowered about 10 feet.

"It is proposed that the lines which terminate at the Benevolent Asylum station should be laid level, but that the four roads on the eastern side of the station, which are carried forward into the city, should be upon an ascending gradient of 1 in 260, for the purpose of crossing over the approach to the station from the eastern side. Having crossed over Belmore-road, the lines are taken across Belmore Park, Elizabeth-street, and Goulburn-street by viaduct, as in the Commissioners' first proposal, on grades of 1 in 100. From the last-named street the line enters a cutting, and passes immediately along the western side of Nithsdale-street to Liverpool-street, where it is proposed to provide an overhead station. Passing under Liverpool-street, the line is carried in covered way under Hyde Park, parallel to Elizabeth-street, in such a position as will avoid interference with the avenue of trees adjacent to the street, until Park-street is reached, when it curves in a westerly direction and passes under Elizabeth-street near the north-eastern corner of the Synagogue, when it emerges into open cutting, and, passing under Market-street, the main metropolitan station is reached. This station will occupy the area between Elizabeth and Castlereagh streets, and Market and King streets. Booking-offices and waiting-room accommodation will be provided at street level in both King-street and Market-street, with stairs communicating with the various platforms. This will be a daylight station, and will afford every facility for dealing with a large and increasing city traffic. King-street will be widened to a minimum width of 80 feet between Elizabeth and Castlereagh streets. After passing under King-street, the two lines on the eastern side of the station are taken round to the eastern suburbs: the remaining two are carried forward between Elizabeth and Castlereagh streets in open cutting for a distance of about 50 yards, and, after passing under the Victoria Arcade, again in open cutting for a further distance of about 200 yards. From a point on the southern side of Hunter-street the line enters a tunnel, and passing under that street and Bligh-street (to the west of the Union Club), under the building now occupied by the Australian Club, and Bent-street, the line is again in open cutting. After passing through the site now occupied by the offices of the Education Department, the railway is taken under Bridge-street and the New Zealand Loan and Mercantile Agency stores to a terminal station at the Custom House, the main buildings of which it is suggested to adopt for railway offices. It is considered that a station in the position indicated will be found most convenient for dealing with the across-harbour and ocean-going traffic.

"The

H. Deane.
16 Feb., 1897.

"The total length of the line from the present terminus at Redfern to the proposed station at the Circular Quay is 1 mile 51 chains.

"The estimated cost is as follows:—

Works	£835,000
Resumption and compensation
Total.....	£

5. The Royal Commission found in favour of a certain amount of work without knowing what it would cost? Yes; there was no estimate made for resumption and compensation.

6. *Mr. Hoskins.*] Was any estimate made of the cost of resumption? No.

"The station at the Circular Quay would of course be an enormous convenience in connection with the traffic between the harbour and the railway system.

"The station at King-street would be in a most central position for the city; all the existing tram-lines pass along the side of the proposed station, and the proposed new cable tram-line to Woollahra would pass in front of the station.

"Giving booking offices means of ingress and egress at Market-street, practically provides a second station.

"The station at Liverpool-street would also be exceedingly convenient for that end of the town, as well as in connection with the tram-lines to the whole of the eastern suburbs, which would pass in front thereof.

Tunnelling (in four sections).....	725 yards.
Open running and stations.....	2,165 "
Area of Benevolent Asylum and Cemetery	16 acres.
Disturbance of park	2½ "
Works involving disturbance of the park, completed in	6 months.
Liverpool-street, from booking office to platform level	15 feet.
Market-street to platform level.....	15 "
King-street, Castlereagh-street entrance	20 "
Circular Quay	On the level.

"This amended project received the closest attention of the Commission at the meetings held on the 3rd and 7th of July. The Commission, bearing in mind the objections which have been raised to the resumption of any portion of Hyde Park, and the facilities which would be afforded by placing a station on the Benevolent Asylum site for extending the railway round the western side of the city of Sydney, and thus affording means of communication by bridge with North Shore, decided to recommend the above scheme as an alternative to the Hyde Park scheme, and passed the following resolution:—

"That, after consideration of the additional evidence placed before the Commission, this Commission recommends that the latest proposal of the Railway Commissioners—that the central station for long distance traffic be on the present Benevolent Asylum site, and that the present suburban railway traffic be continued through to Circular Quay, as shown on the plan now submitted as an alternative to the scheme already recommended—be adopted. And the Commission further recommends that provision be made at the proposed central station—on the site of the Benevolent Asylum—for carrying a line west of George-street to a suitable point for connecting North Shore by means of a bridge."

This was carried on division.

7. *Mr. Humphery.*] Was any estimate made of the cost of constructing the western scheme? I do not think there was.

8. *Mr. Roberts.*] In this proposal, is Hyde Park avoided altogether? It goes underneath Hyde Park; there would be only a temporary disturbance of the surface of the park.

9. No actual encroachment on the park? No.

10. *Mr. Black.*] Would the surface be raised? It would be left as it is at present. After the railway was finished Hyde Park would be restored to its present condition. Under instructions, I went into the question of the best route for that scheme, and on the 1st December, 1892, I submitted to the Minister a report, which reads as follows:—

I forward herewith a map on which I have shown the course which I recommend for the City Railway Extension.

The railway would consist of four lines of way. In order to clear Devonshire-street the ascent can be made from the point marked A on plan with a grade of 1 in 66. If a grade of 1 in 100 is required, the line would commence to rise from the point B, 450 feet further south.

A station would be built in the Benevolent Asylum grounds for the through line with platform 350 feet long. Rail-level would be here 77 feet above high water in Port Jackson, or 13 feet above the present level at the station.

From this point to Goulburn-street the railway would be carried on a viaduct with sufficient headway for all street-crossings. The grades would be easy.

Goulburn-street would be crossed by a bridge with a headway for the road of 16 feet.

From Goulburn-street there would be a down gradient of 1 in 132 till the line reaches Liverpool-street, which it would pass under.

Through Hyde Park and under Park and Elizabeth streets the line would be in tunnel, or rather covered way, as the excavation would be made in trenches and then arched over, the depth not being sufficient for actual tunnelling. The surface of the park could be restored to its original condition, but one or two ventilating shafts would probably be necessary.

On this portion of the line there would be a down grade of 1 in 95.

The blocks of land bounded by the Synagogue, Market-street, and King-street, on the north and south, and by Elizabeth and Castlereagh streets on the east and west, would have to be resumed for the station, but portions could be resold. Market-street would be carried across the station by a bridge. Rail-level at this point would be 43 feet above high water, and 19 feet below the intersection of Market-street and Castlereagh-street. If between Market-street and King-street the station is put on a rising grade of 1 in 450, rail-level at the end of the station will be 49 feet and platform-level 52 feet above high water; the platform would thus be 22 feet below the road-level at the intersection of King and Castlereagh streets, and 35 feet below the level of the intersection of King and Elizabeth streets. The rails here cannot be brought any nearer to the surface unless Market-street is raised, which is not to be recommended.

Beyond King-street the line would be carried in tunnel to Bridge-street, passing under that street, after which it would emerge and the terminus be placed at the Custom House. A grade of 1 in 66 is obtainable over this portion of the route.

From the King-street station northwards a pair of lines can be carried in tunnel as shown on the map to connect with the Eastern Suburban Railway.

The railway works would be above the level of the main sewer and its principal branches, and would therefore not interfere with them.

The map shows an area on the Benevolent Asylum grounds for a reconstruction of the general terminal arrangements at Redfern, but this does not form an essential part of the present scheme.

The scheme submitted is probably the cheapest obtainable.

It is taking exactly the same route, only that I have gone into the question of levels much more closely than was done at first. The principle is the same, only that I propose to cover over by a tunnel this portion of the line which is shown by an open cutting. That would avoid a considerable amount of expense, because if you had to resume and pull down a property, and you covered the railway over again, you would

would be able to build over the top of the railway and let your premises. Although you would have to incur some considerable cost in the way of resumptions you would get a return for your money.

H. Deane.
16 Feb., 1897.

In October, 1894, a large and influential deputation, representatives of various municipalities near Sydney and leading business men of the city, waited upon Mr. Secretary Young to urge that some determination should be arrived at in regard to the question, and Mr. Young then promised to bring the matter before the Cabinet.

The Minister, in replying, said he had only to say, in the first place, that he regretted his colleague, the Premier, had not, as he had intended, been able to be present, as he knew he had had the carrying out of this extension at heart for some considerable time. He might, for himself, say at once that he was fully impressed with the advantages that would attend the extension of our railway system into direct touch with the deep-sea traffic of the world, and also with the great advantage which it would mean to the passengers now using the railways. He considered the deputation was wise in not going into the question of route, for there would be difficulties to meet with regard to that question, no matter how the proposal might be dealt with. He understood the deputation wished him to bring the matter before the Cabinet, with a view to its being taken up as a question of national importance, affecting the interests of the whole community of New South Wales.

He had no difficulty whatever in promising them that this should be done. The whole matter should be brought before the Cabinet as early as possible, and receive careful consideration. He had no hesitation in saying that the extension of the railway into the city would be of great advantage to the whole people of New South Wales, always supposing that a line were constructed to accommodate not only the passenger traffic but the goods traffic of the whole country; and he gathered that the feeling of the whole of the gentlemen present was that any line proposed to be constructed must be made to accommodate both.

It was, however, a difficult matter to find any one line which would accommodate the passenger traffic and also supply the wants of the goods traffic of the country at the same time. The passenger traffic would probably be best accommodated by a line running direct to Circular Quay, while, on the other hand, the goods traffic might not be. He only desired to point this out to show the deputation the great difficulty there would be in deciding on any one route which would suit the whole community.

The matter would, however, be submitted for the careful consideration of the Cabinet; and he thought the deputation might safely leave it to the present administration to deal with the question thoroughly and bring it to a satisfactory conclusion.

On April 28th, 1896, the Railway Commissioners addressed the following minute to the Premier:—

Office of the Railway Commissioners of New South Wales, Sydney, 28 April, 1896.

The Hon. G. H. Reid, M.P., Premier and Minister for Railways,—

City Railway Accommodation.

We would invite your serious consideration to the question of the long talked of extension of the railway system of the Colony into the city. The matter is one calling for immediate settlement, as the difficulties of working the station at Redfern have increased—and are still increasing—to such an extent that a considerable improvement in the terminal arrangements is, in the interests of safety as well as to provide for the comfort of the travelling public, absolutely necessary.

There are two ways of meeting the difficulty:—

(1) To extend the railway into the city, which course we would strongly recommend.

(2) To build a new terminal station on the Benevolent Asylum grounds and the Cemetery adjoining.

If the increased accommodation is given on the Benevolent Asylum grounds, the estimated cost of the works would be about £400,000. If, however, the line were taken through the south-west section of Hyde Park, bounded by Elizabeth-street, Liverpool-street, Park-street, and the central footway in the park, the works and resumptions could be carried out for a sum of about £550,000.

It will be unnecessary for us to go into the details showing the urgency for providing extended accommodation for the carrying on of the traffic at Redfern, but we can give our assurance that the change is now absolutely necessary and should not be delayed.

The bringing forward of the line to Park-street is now suggested in lieu of the original proposal in connection with King-street, as considered by a Royal Commission in 1890 and 1891, principally in consequence of the considerable expenditure that has since that date been incurred on the Supreme Court and St. James' Church; and we think that the restricting of the interference with the park in connection with this scheme will not create so much opposition as would perhaps be raised if the section nearest the Supreme Court were taken.

We may point out that later on, when railway extension to the eastern suburbs will in all probability take place, the additional cost of the Benevolent Asylum grounds site and that in Hyde Park would have to be incurred, so that, therefore, the difference in the cost of the two schemes is only a postponement of the expenditure of £150,000 to some future date; this postponement, however, would for all time place the city to the disadvantage of having its main station far removed from the heart of the business centre.

The views of the Commissioners in regard to the accommodation necessary to be provided in connection with the new station and junction arrangements have been worked out very carefully by Mr. Deane, the Engineer-in-Chief for Railway Construction, and provide for most convenient arrangements for carrying on a large traffic.

The scheme which brings the station into the city combines with it a considerable improvement of Park-street by levelling the road and also widening it materially in front of the station, and also includes the widening of Elizabeth-street, as between Park-street and Liverpool-street, by 33 feet. We should also propose to run an electric tram service from the top of William-street along Park-street in front of the station and junction with the proposed George-street and Circular Quay electric tram service. This new service and the existing lines would therefore place the whole of the tram services in connection with the proposed new central station.

As pointed out by the Chief Commissioner in his evidence before the Royal Commission to inquire into the City Railway schemes, all large cities in Great Britain have several railway termini. Melbourne has three large stations, but the whole of the traffic in connection with the railways of this Colony, coming into the capital, has to be concentrated in one station, and that station of a most primitive character.

In connection with the providing of the station on the Benevolent Asylum site, we would point out that no additional revenue would be derived from the large expenditure that would be incurred, whereas if the railway were brought into the city an additional revenue would be derived for the extra distance; and when it is borne in mind that the Colony can raise money at 3 per cent., an expenditure of £550,000 would only entail an annual cost for capital of £16,500. There would be provided in connection with the station, office accommodation for the whole of the administrative staff, and rents to the extent of quite £1,500 a year would be saved thereby, thus calling for an additional revenue of only £15,000 per annum from the railway traffic to provide for the capital outlay. This sum and the increased working expenditure would be fully covered by adding one penny to each single journey fare and twopenny for each double journey fare, and a small sum to the season ticket rates, for the extra distance the passengers would be carried.

Another point which would have great weight in settling the subject is the fact that quite ten or fifteen minutes would be saved by a large proportion of the passengers travelling by the railway. This alone in connection with suburban residents and travelling to and from the Mountains, &c., would, we feel sure, lead to a very material increase in traffic.

Attached hereto are maps and plans showing the proposals referred to.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

[11. *President.*] The map on the easel does not appear to show this last scheme? No. This map was prepared in 1894, and there is already so much on the map that I thought it better not to put any more on it. This new scheme differs in some respect from the previous proposal to carry it to Hyde Park independently

H. Deane. independently of the shortening of the line. It is proposed in this new scheme to carry six lines instead of four lines up to the terminal station. The whole of the station arrangements and buildings and office accommodation have been carefully revised, and the scheme is a much more complete one than the one which was previously submitted to extend the railway to Hyde Park.

16 Feb., 1897.

12. *Mr. Wright.*] Practically it takes up a fourth of Hyde Park? Yes.

13. *President.*] Does it carry with it the lowering of Hyde Park? Yes.

14. *Mr. Wright.*] Would you have to lower Liverpool-street also? Neither Goulburn-street nor Liverpool-street would be touched.

15. *Mr. Trickett.*] Does that scheme stand by itself, or is it to be worked in with an eastern suburban scheme? No; that is capable of being worked in with both an eastern suburban scheme and an extension to Circular Quay. I have arranged in the design that the two eastern roads should be made so that they can be lowered, and after passing Park-street you can turn round on the right to the eastern suburbs, or continue right on to Circular Quay.

16. *Mr. Hoskins.*] Who is responsible for the estimate of the cost of that scheme—£550,000? I made out the estimate.

17. Did you make an allowance for compensation to be paid for resuming the Cemetery? No. This estimate has been somewhat added to; I think I can give you the details later on.

In view of these representations, the Minister directed that the necessary plans and estimates be prepared with a view to submitting them to Parliament and the Commission. The instructions of the Minister were carried out and information furnished to the Railway Commissioners to enable them to make the report required by law. This report is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 11 September, 1896.

Proposed Extension of the Railway into the City, 71 chains.

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the costs of construction, inclusive of land and compensation, at £600,000

Annual Cost—

Capital expenditure, at 3 per cent.	£18,000	
Estimated cost of maintaining permanent way, and for traffic, locomotive, and other expenses	8,000	
Total annual cost.....		26,000

Traffic Estimate—

By adding 1d. for each ordinary-passenger journey, and 1s. 6d. and 1s. per month for 1st and 2nd class season ticket-holders, with a percentage reduction per month for tickets taken out for 3, 6, and 12 months; and 3d. per week for workmen's tickets,—a revenue on existing traffic would be realised of	32,000	
Saving in rents for offices for the administrative staff	1,365	
Total annual revenue		33,365

The estimated revenue from the extension is based upon the existing traffic carried to and from Redfern station; but we fully expect that the shortening of the time required for journeying to and from the suburbs, and the reduction in cost by avoiding the daily charges for cabs, trams, and omnibuses will very soon lead to a great increase in the suburban traffic. Increased rents would also be obtained for the refreshment-rooms.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this 11th day of September, 1896, in the presence of,— H. M'LACHLAN, Secretary.	E. M. G. EDDY, Chief Commissioner.	(L.S.)
	CHARLES OLIVER, Commissioner,	
	W. M. FEHON, Commissioner,	

18. *Mr. Humphery.*] Why are six roads required? The Railway Commissioners want to have six roads. There will be two engine-roads, as well as the passenger-roads.

19. *Mr. Wright.*] It is a dead end? No; they go up to the station.

20. *Mr. Hoskins.*] Do you propose to have six roads in the extension to Park-street? Yes.

21. *Mr. Wright.*] What width will you want for six roads? About 75 feet, I think it is.

22. *Mr. Hoskins.*] You will want a little more than 75 feet, because you will not use all the land? Yes.

23. *Mr. Wright.*] You will want 100 feet for six roads? Not so much. You will notice that on that scheme additional lines are shown between Goulburn-street and Liverpool-street. There is a widening of the line between those two streets in addition to the six roads. There are ten roads there.

24. What I meant by the expression a "dead end" was that you would have to work the line with points? It will be all shunting.

25. *Mr. Hoskins.*] It is only intended to take passengers and not goods? No goods. The other four roads are for station purposes—for additional rolling-stock in case of need.

26. A more economical scheme would be to keep the rolling-stock at Redfern and send it up to the terminus when it was needed? Redfern is a long way off from the terminus; it would introduce complications.

27. Do they not do that at Euston Station and Paddington Station, London? Yes. The view of the Commissioners is that when you are making an alteration you should make it as complete as possible.

28. *President.*] You have given us an estimate of £600,000;—does that include the cost of land resumption? That includes £100,000 for land.

29. It includes the £100,000 which the Commissioners propose to pay in for the park? No.

30. Is it the work which is estimated to cost £600,000 alone? No; it includes £100,000 for the resumptions between Belmore Gardens and Liverpool-street. I am not responsible for that. I have not estimated the value of the land myself.

31. Who did? I think Mr. Thompson made the estimate; but it possibly may be added to now, because I am not sure that it allowed for the whole width which it is now proposed to take.

32. *Mr. Humphery.*] Where are the resumptions shown on the plan? The resumptions will be simply covered by the work shown on the plan. There will be no necessity to resume a much wider strip than is already taken up by the roads. It will be necessary, of course, in some cases to take up the corners, but practically that is the width which is required. I will furnish the Commission with some details of the estimate if they like to have the information.

33. *Mr. Hoskins.*] Will your estimate allow a margin for probable actions for compensation for alleged damage to the foundations of houses adjacent to your tunnels? There will be nothing of that sort here.

34. You know that in some countries serious actions have been brought for compensation for damage done to houses by the construction of underground tunnels? But we do not interfere with any buildings which we do not resume.

H. Deane.
16 Feb., 1897.

35. *President.*] Will you now resume the statement which you were making to the Commission? Yes. The following is the official description of the proposal:—

City Extension Railway—Redfern to Park-street.

(Estimated cost, £600,000.)

Length, 71 chains from front of building, Park-street, to end of main building, Redfern. From end of present rails to end of new line, about 69 chains.

LEAVING Redfern Station, six lines of road will be carried over Devonshire-street. To get a headway of 16 feet, Devonshire-street will have to be cut down 9 feet; it will then have a rising grade to Castlereagh-street of 1 in 25, and to George-street 1 in 60. Through the Cemetery the lines will be in bank and cutting and over Belmore-road, and other roads, including Goulburn-street, with a headway of 16 feet 6 inches. From half-way between Goulburn and Liverpool streets the line runs into cutting and under Liverpool-street, where there will be an over-bridge of an average width of 78 feet and 131 feet long. The level of Liverpool-street it is not proposed to alter. From Liverpool-street to Park-street, by the width from Elizabeth-street to centre-walk of Hyde Park, the ground will be excavated for an average depth of 22 feet for the terminus. Park-street will be cut down to a depth of 11 feet in the deepest part for access to front of station, giving a down grade for that street of 1 in 166 and 1 in 310 from Elizabeth to College-street. There will then be one grade from Elizabeth to College-street. The station building fronting Park-street will be 350 ft. x 60 ft. deep, three stories in height and attics, with central tower 200 feet high. This portion of the building will contain central hall, 65 ft. x 36 ft.; booking hall, 96 ft. x 55 ft.; refreshment room, 96 ft. x 38 ft.; and basement under same, general waiting and ladies' waiting rooms with lavatories, &c. The upper floors are offices for the Railway Commissioners and staff, and the various traffic branches. Three lifts will be provided. Facing Park-street will be a colonnade for foot passengers, and a covered way for cabs 25 feet wide, extending the whole length of this frontage. The platforms (five double, 30 feet wide, two single, 21 ft. 9 in. each, and 700 feet long) will be covered with a steel roof 363 feet wide, rising in the centre to a height of 75 feet above platform. On the Elizabeth-street frontage the buildings will be two stories high, extending from Park-street for a length of 700 feet. The lower floor on level of platform will be used for parcels, cloak rooms, inspectors, porters, &c., and the upper as offices for the Traffic Branch. Opposite Bathurst-street and through the building over the platforms there will be two steel foot-bridges with asphalt floors, one 15 feet wide for the general public in direct line from Bathurst to Oxford streets, the other 20 feet wide from the Railway, with stairs for access to the various platforms. The parcels office, 200 ft. x 40 ft., has a basement floor on level of platform, and a ground floor of same size on Elizabeth-street level. From this office Aspinall's patent overhead luggage carrier will be constructed so as to communicate with the various platforms. The cab road through the building between the platforms will be 25 feet wide, and will have entrance and exit at Liverpool and Elizabeth streets. The horse and carriage docks, 406 feet long by 20 feet in width, will be approached from Liverpool-street by ramp 20 feet wide.

The quantities of work to be done are approximately as follows:—Earthwork excavations for Hyde Park Station, lowering Park and Devonshire streets, in addition to cuttings at Nithsdale-street and Benevolent Asylum, 460,000 cubic yards; for foundations, 16,000 cubic yards; concrete in foundations and backing to arches, 11,500 cubic yards; brickwork in retaining-walls, Hyde Park Station, between Liverpool and Goulburn streets, at Park and Devonshire streets; abutments to bridges over Liverpool-street, Goulburn-street, Wexford-street, Campbell-street, Elizabeth-street, Devonshire-street, Belmore-road; arches on piers from Campbell to Elizabeth streets and over Belmore Park—44,500 cubic yards; masonry in copings and string courses, 3,000 cubic yards; steel-work in bridges over above-named streets and station platforms, 1,750 tons; cast-iron columns and parapets, 150 tons; ballasting, 22,800 cubic yards; ordinary sleepers, 13,500, No. and special, 10,000 cubic feet; steel rails and fastenings, 1,400 tons; wood-blocking, 21,000, asphalt, 27,000 superficial yards; kerbing and guttering, 2,500 lineal yards; removing and relaying portions of tram-line, gas-pipes, water-mains and sewers.

The differences in the present proposal and that first approved by the Royal Commission are shortly as follows:—The previous proposal was for a terminal station at King-street, involving a tunnel through the south-west corner of Hyde Park, and the resumption of the north-western corner, St. James' Church, the Registrar-General's Office, and the Supreme Court building. The present proposal involves the resumption of the south-western corner of Hyde Park and the erection of a building fronting Park-street. Provision is also made in the design for an extension of two roads to Circular Quay or the eastern suburbs if required.

Shortly put, the advantages of the extension now proposed are stated to be as follows:—

1. It will provide a new and satisfactory terminal station, Redfern being not suitable for the present large and increasing traffic, and urgently requiring alteration.
2. It will bring the passenger traffic into the city.
3. It will not spoil the most frequented portion of Hyde Park.

Reference to pages 55, 56, and 57 will show that the previous Royal Commission investigated the question of the utilisation of the Park for railway purposes very thoroughly, and arrived at the conclusion that the advantages far outweighed the disadvantages. The scheme recently formulated to bring the railway to Park-street is to be looked upon as inferior to the proposal which brought the railway up to King-street. On the ground plan which is now brought before the notice of the Commission I have shown in lighter colour an extension of the railway up to St. James' road. This, it is thought, would be as practically as good as going up to King-street, but it would leave St. James' Church and the Supreme Court buildings intact. On the other hand the removal of the Registrar-General's Office would be rendered necessary. The Supreme Court buildings have been condemned for many years past. They seem to do their work, however, and I have on that account avoided interfering with them. If, at some future time, it should be thought desirable to remove that building altogether, and St. James' Church as well, a fine open space will result, across which the handsome front of the railway terminus building can be viewed.

With regard to the question of extending the railway into the city there are three considerations to be borne in mind: first, there is the necessity for the improvement to station accommodation at Redfern; secondly, the extension of the passenger lines into the city; while, in the third place, the extension for goods purposes must be looked upon as quite a separate matter.

The extension into Hyde Park is, from an engineering point of view, by far the best scheme that can be put forward. On the other hand, the extension of the railway station across Devonshire-street into the grounds now occupied by the Benevolent Asylum, Cemetery, Police Barracks, &c., may be looked upon as effectively dealing with the question of station accommodation, but it does not deal with the question of bringing the passengers into the city.

It has been said that if the railway had been brought into the city there would have been no necessity for the tramway along George-street. This is, however, a mistake. It is true that one of the objects of the George-street tramway was to keep the railway traffic off Elizabeth-street, and thus relieve the Elizabeth-street traffic. It will, however, have the effect of taking off the traffic of the western tramways as well; and it will, undoubtedly, carry its own proper traffic, and thus, railway or no railway, have sufficient work to do.

At the request of the President, I have looked into the matter of other proposals in substitution or in further extension of the Hyde Park scheme. I am preparing a map, on which will be shown possible extensions for passenger traffic down the eastern and western side of the city and to the eastern suburbs, and, further, an extension of the railway for goods purposes to Woolloomooloo Bay, Pyrmont, and Glebe Island.

With regard to passenger extension other than the Hyde Park proposal, I wish most emphatically to point out that, in my opinion, if the lines are extended underground the traction must be effected by electricity and not by steam. Underground steam lines in cities are rarely put down now. All, or nearly all such railways and tramways that are being now carried out underground are intended to be worked by electricity; and I think I may say that it is only a question of time, and possibly a very short time, before the metropolitan and metropolitan district railways in London will be also thus worked. It is well known to those who have visited London how intolerable a nuisance is the coal smoke in those tunnels. London has an average temperature of, I think, about 47 degrees. How much more intolerable would be the use of steam locomotives in a climate like ours, with a mean temperature of 62.8 degrees, and a maximum temperature of over 100 degrees.

That

H. Deane.
16 Feb., 1897.

That the combination of steam and electricity in different systems on a railway is not impracticable is to be seen by the working of a part of the Baltimore-Ohio railway in the United States of America, where on a short length of line about 2½ miles long, on account of the smoke nuisance, the goods trains, locomotive and all, are drawn through the tunnels by electric locomotives weighing from 85 to 90 tons. The introduction has been completely successful, and it has now been decided to apply the same method to the passenger traffic.

Our railway traffic could be dealt with in the same way. When suburban trains came into Redfern, the steam locomotive could be unhitched and an electric locomotive attached. This is an easy way of getting over what might be a serious difficulty. Another method would be to work the suburban system throughout by electricity. This is a question, however, which the Railway Commissioners will no doubt consider at the proper time.*

In the event of Hyde Park not being adopted as a terminus, and extensions on either side of the city of two lines each were to be made, the proper places for these extensions would, I think, be under the roadway instead of going under the property on each side. I have no hesitation in recommending such a course after seeing in 1894 what was done in the city of Glasgow. Such work could be carried out comparatively economically, and almost without any interruption of the street traffic.

36. The schemes you have placed before us are limited altogether to passenger traffic? Yes.

37. There has been no endeavour made to extend the railway system to the waters of Port Jackson? No; for some time past nothing whatever has been done.

38. That has not been taken into consideration? No.

39. *Mr. Hoskins.*] Did the Railway Commissioners view with favour your suggestion to disconnect the steam locomotives at Redfern and to propel the trains by electricity to Liverpool-street? I have mentioned the matter to Mr. Eddy, but as the proposal which the Railway Commissioners view with favour is the Hyde Park scheme, it really has not come up for decision from a traffic point of view.

40. Do you intend, if the extension of the railway system to Park-street is sanctioned, to press your view as to the propriety and good policy of having the extensions worked by electricity? No; I do not think it is necessary, if the line is only extended to Park-street, because it will be all in the open; there will be no tunnel. Supposing that the Park-street proposal is objected to by this Commission, and they wish to consider any other scheme involving tunnels under roads, or under the Park, and so on, I wish to express the opinion that the locomotives should be electric locomotives, but only in that case.

41. You would then press that view? Yes.

42. *Mr. Farnell.*] You are aware that in England, at the present time, a company is about to construct a railway underneath an existing railway? Nearly all the new projects are underground projects, and electricity is invariably adopted.

43. *Mr. Wright.*] I suppose with these tunnels you could not use steam? I think it would be a great pity to use them with steam. They will be made of the proper dimensions to run ordinary trains through, but it is the inconvenience to the passengers I am looking to.

44. If you were to run ordinary locomotives, partly through open cuttings and partly in tunnels, would there not be great inconvenience caused to thousands of citizens as well as passengers? I think there would be some.

45. *Mr. Roberts.*] There are no tunnels in the Commissioners' Park scheme? None; I would not propose any alteration.

46. *Mr. Wright.*] Have you any scheme prepared yourself? No; I do not propose to submit any scheme. I merely propose to take any instructions from the Commission to look into matters.

47. I suppose you are prepared to criticise any scheme which may be submitted? From an engineering point of view.

WEDNESDAY, 17 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works.
further examined:—

H. Deane.
17 Feb., 1897.

48. *President.*] Have you a plan showing your proposal to convert the Benevolent Asylum estate into a station? Yes; I furnish a plan of a scheme which was worked out some time ago for extending the railway terminus at Redfern across Devonshire-street. This plan has not been so well worked out as the plan of the Park-street scheme, and the few copies which I now furnish to members of the Commission have some notes on them showing some alterations which it is intended to make if this scheme is eventually carried out. Before the completion of the inquiry I expect to be in a position to furnish fairly correct plans.

49. Will you first describe the area? The area is bounded by Devonshire-street and Pitt-street and Belmore-road; and a considerable width of the Cemetery, beside the Benevolent Asylum grounds and the Police Barracks, is taken in.

50. How far does it go to the south-east—to Elizabeth-street? The area includes the blue-tinted portion on the large wall map before you. The railway terminus would absorb a little more than half the area lying between Pitt-street, Devonshire-street, Belmore-street, and Elizabeth-street.

51. *Mr. Humphery.*] Do you take in the whole of the Cemetery? The greater part of it.

52. *President.*] Will you prepare a rough plan showing the various improvements, how the various areas are held, what you intend to take, and your idea in regard to the disposal of the residue? Yes.

53. It has been suggested that any provision you may make for passing over Devonshire-street carries with it the lowering of that street 7 feet or 9 feet;—have you taken into consideration the question of interference with vested interests, or is any property affected by it? Yes; but it is all Crown land with the exception of the Cemetery. In the estimate that was submitted some time ago no provision was made for any compensation or for new buildings.

54.

* NOTE (on revision):—I should like to add that the Chief Commissioner, at a subsequent interview, expressed the opinion that the change of locomotive would be productive of delay.

54. The work itself is absolutely enclosed by Crown lands on either side? Yes.
55. Does it affect the grade of the street to the south-east? Yes; in lowering the street there will be altered grades in consequence.
56. Does it materially affect them? It does not make them bad.
57. Will the approach to Devonshire-street from the north-west be inferior to the approach from the south-east? If you will allow me to explain the scheme you will see how Devonshire-street is dealt with. Several lines are carried over Devonshire-street, and a portion of that street is lowered.* It is proposed to divert the greater part of the traffic of Devonshire-street, reserving only a comparatively narrow subway for cabs and smaller vehicles to pass through, but all heavily-laden vehicles would probably go round the other side. A reference to the plans I have furnished will show that on the eastern side of the station there is a wide and new street, which will not only admit all the traffic, but will also take the tram-lines. In the proposal is included a diversion of the Botany tram-lines. What is left of Devonshire-street is a subway about 30 feet wide, and in consequence of the width that is required for the station, and the length that the street has to be lowered, the resulting grade on the eastern side will be very much steeper than what I pointed out yesterday as necessary for the Hyde Park scheme. In carrying over six roads to run into Hyde Park they are more concentrated than in this scheme, where you have roads passing over the whole width of the station; consequently there is a greater length of Devonshire-street to be lowered to the maximum depth. It would be very difficult to lower that street so as to take all classes of traffic; and it was thought that, although it is desirable to keep the subway at Devonshire-street for cabs and light vehicles, the bulk of the traffic should be turned round by Belmore-road and along the new street, as being an efficient substitute.
58. The new street would be at the junction of the blue and green on the big plans? It would be just within the blue area.
59. Does it mean this: that the lowering of Devonshire-street is likely to obstruct any but light traffic going to the north-west from Redfern to Darling Harbour;—does it render Devonshire-street undesirable for heavy traffic going between Redfern and Darling Harbour? Yes.
60. Have you taken into consideration the effect of this new street on the Redfern traffic? I do not think the effect would be serious; at any rate it is an effect which cannot be avoided. Redfern station must have something done to it. If it is extended over Devonshire-street on to this new site, Devonshire-street must be partially blocked. I do not see really how it could be retained by any amount of lowering and leaving proper grades at the eastern end for heavy traffic.
61. *Mr. Lee.*] What would be the grade at that end? As shown on the plan, it is 1 in 12.
62. What is the present grade? It is not level, but it is very easy.
63. From Castlereagh-street the grade is rather heavy? Yes; but as far as Castlereagh-street it is light.
64. If it is lowered I suppose it will be lowered from the George-street side? Yes.
65. Then there will be a dip-in? Yes; and the drainage has to be provided for.
66. That will practically block all traffic? Cabs and light vehicles will be able to pass along there well enough.
67. It would be a perfect block to all the heavy traffic, which you wish to go from the eastern side of the city round to Parramatta-street? Yes.
68. *President.*] You have a grade of 1 in 12 in and out? No; the grade the other way is easy.
69. *Mr. Humphery.*] Where would it commence—at the Railway Institute, or nearer the railway station? Nearer the railway station.
70. *Mr. Wright.*] Would it not begin almost at George-street? There would be a lowering commencing from George-street.
71. *President.*] Does any extension from Redfern towards the city involve the alteration of Devonshire-street? Yes; any extension affects Devonshire-street, but in the Hyde Park proposal I have arranged to lower Devonshire-street, so as to be suitable for all kinds of traffic, with a 16-feet headway. The worst grade is 1 in 25, which is a good grade. The level of Devonshire-street would be affected by any scheme which went across that street; but if you remove the terminus to Hyde Park, Devonshire-street can be lowered and the grades and headways rendered suitable for all classes of traffic.
72. But with this scheme, in that the extending lines cover a greater length of Devonshire-street, it increases the difficulty, because you cannot get the grade I suppose? Yes; the grade at the eastern end is shortened, and consequently is steeper. The difficulty in all these questions of extension, especially the extension of a terminus, is the difficulty of keeping up the existing traffic while you are connecting with a new station. If you could create a temporary terminus somewhere else, and you had a free hand to do what you like at Redfern, possibly the simplest way would be to raise all the lines some feet up in the air.
73. *Mr. Wright.*] What is the difference between the railway level at Redfern station and the crown of Devonshire-street? 10 feet on the lines of the present station.
74. What is the difference in grade between the platform at Redfern station and the first tunnel going out? I think the lines are exactly level—64 feet above high-water.
75. How far back would you now have to go to raise the lines 2 or 3 feet? You would not have to go back very far.
76. To Eveleigh? No; you would have to go back only half-way from the station. It will depend on the amount you require to rise. If you had a free hand you could raise the line by starting back some chains beyond the southern end of the present station. You could raise the line sufficiently high to get over Devonshire-street without interference with the road traffic.
77. You could not do that without stopping the traffic? No; it is entirely out of the question. Continuing my description. I may mention that this section, which was got out on a large scale so as to be easily visible, shows the line between Devonshire-street and Belmore Road. It will be seen there that immediately after passing Devonshire-street the ground begins to rise, and when you get from the Benevolent Asylum to the Police Barracks you are in a cutting. The ground does not give you any opportunity of getting a road around or underneath in any way. The section of Devonshire-street shows the lowering of that street.
78. *Mr. Black.*] Has that map any connection with the Hyde Park scheme? Yes.
79. *President.*] Or any scheme involving the crossing of Devonshire-street? Yes; but the levels crossing Devonshire-street would be practically the same.

H. Deane.
17 Feb., 1897.

80. *Mr. Wright.*] Would it be possible to abolish Devonshire-street, and provide an overhead bridge for the traffic? That would mean rising to a great height, because George-street is 14 feet below the surface of the rails.

81. What is the difference between the crown of Devonshire-street and your rail level now? It is about 10 feet.

82. An overhead bridge would not necessarily be very high? It would mean rising up to that rail level, and then rising another 20 feet, or in all 34 feet, which, from George-street, must be considered out of the question.

83. *Mr. Hoskins.*] It would cause great difficulty in working, too? It would be impossible.

84. *President.*] The grades on that would be a long way worse than the grade in a cutting? Yes.

85. *Mr. Wright.*] What length of 1 in 12 grade would there be? Probably 120 or 130 feet.

86. *Mr. Humphery.*] Would any scheme mean practically the closing of Devonshire-street for heavy traffic? No; the extension beyond to Hyde Park would not involve it. There are worse grades in Sydney than 1 in 12, but it is introducing a steep grade on a road which had previously good grades.

87. *Mr. Wright.*] I suppose, as a matter of fact, nineteen-twentieths of the heavy traffic to the railway station come from the north along Belmore-road from the city proper, and not from the southern portions? I should think so.

88. The only traffic which a steep grade would affect would be the traffic which comes from the south to the railway? Yes. It would only affect a very small portion of the traffic, and what traffic it does affect could easily go round by the new street. It would have no heavy grades to deal with in going by that way, and it would be simply going a little further.

89. *President.*] Will you be good enough to proceed now with your description of the plans? The platforms are shown as 600 feet long, but they are intended to be 700 feet long. At Park-street the platform is shown as 700 feet long, and these others will be brought in accord with that one. Taking the western side of the station first, there are two lines for country traffic, and between those two lines and the next there is a cab-road, which has its approach from Devonshire-street, and a return on to the wide approach to the station proper. Then comes a platform 33 feet wide, on the other side of the cab-road. Then come three roads, and then another platform of 35 feet. Then come three more roads and another platform of 30 feet. Then come three more roads and another platform of 30 feet; and then two roads, another platform of 30 feet, and another road. It will be seen that there will be eleven platforms and eleven roads, besides the three docks.

90. Why do you say eleven platforms? The first pair of roads on the western side gives practically two platforms. A double platform is really two platforms. There are three single platforms and four double platforms. Between the end of the buildings and the platforms there is a width of 80 feet. That main building is situated right at the end. On the western side of the station there are offices. At the north-western corner there is a cloak-room 100 feet x 40 feet, and the accommodation can be increased in the basement. Then there is a large refreshment-room and closets, a large booking-office and general waiting-room, and on the north-eastern corner there are urinals and water-closets.

91. *Mr. Wright.*] Is it not rather awkward to have the cloak-room and large offices separated from the platforms by a cab-road? They are not; the offices at the side are intended for clerks and porters, and will not be required by the public at all.

92. Your cloak-room will be required by the public, and it is separated from your platform by a carriage-road? No; it is separated from one of the platforms, but you must have a separation somewhere. That passage out is a foot-passage.

93. *President.*] Have the Railway Commissioners approved of that provision? Yes; this has been worked out with the Commissioners.

94. You had better describe now the way your trams are going to leave? The Botany Bay tramway is diverted across the Belmore Park into the new street, and then round into Devonshire-street. On the western side of the station there is a large space for approaching the station and a cab-departure road shown with an incline from George-street up to the north-western end of this approach, going over Pitt-street. Then, as regards the George-street tramway, the line working towards the station will be diverted alongside that cab-departure road and go underneath the approach to the station until it gets up close to the station, and then it rises on to the level. It will discharge passengers and take passengers on the same platform. There will be no crossing of the lines or any interference at all, because people will be able to get off and on at the same platform. It will be extremely convenient to people. The trams as they depart work round the curves shown near Devonshire-street and get back on to the line again. If it is required to connect with the western suburbs, a connection can be made with the other trams, but it was only thought necessary to show the connection with the George-street tram.

95. In the opinion of the Commissioners is the accommodation shown on these plans ample for Redfern? Yes.

96. *Mr. Lee.*] Will you indicate where they exceed the existing accommodation? I will get the length of all the existing platforms. Recently a new platform has been built.

97. *President.*] Will you furnish a comparison between the present accommodation and the suggested accommodation? Yes.

98. *Mr. Lee.*] Through the tunnel under Regent-street, at the end of the railway yard, the whole of the traffic has to pass inwards and outwards? Yes.

99. If you increase the accommodation at Redfern Station, or at 100 yards beyond the station, will not the congestion always be at that tunnel? There will be always a congestion at that tunnel.

100. Is there more space afforded by passing over Devonshire-street than the Commissioners now have? Yes. There is not sufficient length at Redfern. With a greater length a great deal more could be done. At Redfern it is exceedingly inconvenient, and it is very difficult to work.

101. *Mr. Black.*] Do any of your schemes propose an increased tunnel? No; but this plan will give the length that is required to do the shunting operations.

102. *Mr. Humphery.*] Is there accommodation through the tunnel at the present time for more than the existing number of roads, which I understand to be six? I believe it would be much more convenient for the traffic if there were more room in the tunnel. The Commissioners consider the traffic is very much pinched up there.

103. I do not think that quite answers my question. I think it is the different classes of traffic coming in through

through the tunnel which it is difficult to accommodate—that is, after the trains had passed through the tunnel? Yes; and although the traffic is pinched there, if you could lengthen the station at Redfern you would ease the shunting at the station and you would give the accommodation which is really required. For instance, at present some of the trains have to be split up. There is not room for the northern train to draw up at one platform, and, therefore, it has to be divided into two parts. With the exception of two platforms, I think there are no platforms sufficiently long to suit long trains.

H. Deane.
17 Feb., 1897.

104. *Mr. Hoskins.*] If you extended the platforms at the existing station you would increase the difficulties? You cannot lengthen the platforms, because the crossings would interfere.

105. *Mr. Humphery.*] What is needed is increased space and accommodation for trains after they have passed through the tunnel? Yes; you want greater length between the tunnel and the station, and greater length at the station itself.

106. *Mr. Black.*] Has the advisability ever been considered of diverting the goods traffic before coming to Redfern tunnel by means of a cutting or tunnel, making more directly for Darling Harbour? I think it has been under consideration.

107. *Mr. Wright.*] If the city railway were extended by a circular line there would be no necessity for all this accommodation, would there? I think some accommodation would be necessary.

108. If you had a line from Redfern to the city, running by a circular route, would not the Redfern yard be big enough for marshalling purposes? I do not think that has been considered. If the Commission wish that point to be considered, I should have to consult the Railway Commissioners, and then I could report later on.

109. Have you ever considered the question of a circular railway into the city? Yes.

110. *Mr. Roberts.*] Is it possible to get sufficient accommodation at Redfern, without crossing Devonshire-street, by land resumption? No.

111. *Mr. Hoskins.*] Not by taking the park? No; you cannot get at Prince Alfred Park.

112. *Mr. Lee.*] Could you not resume land on the tunnel side, so as to enable the yard to be widened? Yes.

113. *Mr. Hoskins.*] Why could not part of Prince Alfred Park be taken? Because you cannot get round to it; it is sharp off to the right as you pass through the tunnel.

114. *President.*] Is it not possible to shift Devonshire-street to the north and give the desired accommodation? The question of shifting Devonshire-street to the north, and thus lengthening the platforms, has been under consideration; but I know the Commissioners are of opinion that would be only a partial relief—a makeshift. What they want to do, if possible, is to make a complete new terminus, giving the extra length not only in the station but outside of it.

115. Do you submit a sketch-plan of the proposed terminal station at Park-street as suggested by the Railway Commissioners? Yes.

116. Will you be able to explain that plan to-morrow to the Commission? Yes.

117. Are you prepared to hand in an estimate of the cost of extending the railway system to Park-street? I will read the estimate. It is as follows:—

Land resumption between Behmore Park and Liverpool-street	£100,000
Buildings (600 feet roof)	200,000
Construction of line	£260,000
Signals and interlocking.....	15,500
Electric lights	4,500
	280,000
Shelter-sheds and alterations	20,000
	600,000
Add for extension to St. James' Road.....	50,000
	£650,000

THURSDAY, 18 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
The Hon. DANIEL O'CONNOR, M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
GEORGE BLACK, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

118. *President.*] You placed before the Commission yesterday a plan of the proposed extension to Park-street, and an estimate of the cost of the extension? Yes. I have handed in some plans of Park-street for distribution to Members of the Commission, and the plans on the wall will give all the information that may be required.

H. Deane.
18 Feb., 1897.

119. With regard to the item of £100,000 for land resumption, you have said that it is very probable that it will require to be increased, as the width of the line has been increased:—is there any other cost, excepting the value of the park land, which we need add to your total estimate of £600,000? Not unless prices go up very much. That estimate was cut down so as to be adapted to the prices that prevailed some months ago; but prices are beginning to show a considerable rise.

120. Your 10 per cent. allowance would in all probability cover it? I do not think so. I have cut that down also to a minimum. This estimate of £600,000 includes a certain amount of contingencies and engineering expenses, but I should not like to reckon too much on that.

121. What will cover it? I cannot tell how prices will go up.

122. If an estimate were made to-day, is that £600,000, plus what has to be added to the £100,000, the amount? Yes.

123. *Mr. Hoskins.*] Based on an estimate made some months ago? Yes; I think it would fairly cover it now.

H. Deane.
18 Feb., 1897.

doubt you can tunnel if you are deep enough without disturbing the buildings, I doubt very much whether any extension into the city we can make would be deep enough to avoid interfering with the buildings altogether. I do not quite see how a suitable or practicable line could be made far enough down with sufficient cover of sandstone so as to avoid the possibility of damage to houses. All the large and more important buildings in Sydney are carried down to the sandstone, and there is a considerable amount of excavation through the top clay and made ground. In Hyde Park that amounts to about 25 feet I think on the average. If you make a tunnel so as to get under the sandstone down below you get a platform level at a very great depth—probably at from 40 to 50 feet down in places. That means a great number of steps to get up to the surface. If you want to keep near the surface you get partly into sandstone probably and partly into the softer material on top through which the foundations of the important buildings go. As regards the lighter buildings whose foundations do not go down to the sandstone, I doubt very much whether you can tunnel under them without the risk of causing settlements.

144. Does it mean that you must either be under the park or under the streets? Yes, generally speaking.

145. *Mr. Wright.*] Or resume? Yes.

146. *President.*] Under the streets would it be safe enough? Under the streets it would be all right.

147. The Commissioners' scheme is a surface one? It is all open.

148. And the Hyde Park terminus is a surface terminus? —

149. *Mr. Wright.*] How much would the platform be below the level of Elizabeth-street? The station starts with the rails say about 18 or 19 feet below Liverpool-street and rises up to near the altered level of Park-street. The level is below Park-street, but you will have no steps to go down.

150. *Mr. Lee.*] That would be with the object of keeping the line level? I have given a tip-up. Stations are made on a slight grade. There is no harm, but an advantage in having a starting-station made on a grade downwards, because it is then easier to start the trains. As long as the grade is not steeper than the rolling-stock will stand on, then you are all right.

151. *Mr. Hoskins.*] If you had a tunnel to carry eight roads, would it not be so wide that it must interfere with the foundations of the houses on the sides of the streets? Yes; there would not be room, to do it comfortably, for more than two lines.

152. *President.*] Could you put four lines down? Only with difficulty.

153. *Mr. Wright.*] The whole block, from where the lines cross Elizabeth-street till you come to Liverpool-street, must be resumed to the full width you want? Yes.

154. *President.*] How many lines can you put down in a tunnel under a street like Elizabeth-street? There would be room for four lines if you open out the street and cover it in again.

155. Would that affect the buildings? Not unless there are cellars under the pathways.

156. *Mr. Hoskins.*] I do not think the buildings in the lower part of Elizabeth-street are aligned, and therefore it is very irregular in width? There will be, of course, that difficulty to deal with; but in a 66-foot roadway you can just about squeeze four lines in, but you would have to be very careful with your foundations.

157. *Mr. Wright.*] Have you a 66-foot roadway? There are some in Sydney, but mostly they are about 60 feet.

158. Is Elizabeth-street or Castlereagh-street a chain wide? King-street is 60 feet wide, and Elizabeth-street, I think, is a 66-foot road. The proposition of the Commissioners to carry the railway down to the Custom House comprised only two lines. I would much rather have to deal with two lines of way than four. At the same time I think four lines with care could be laid, but it would be very difficult to avoid damage to houses on each side.

159. *President.*] With two lines of way you could do it? Easily.

160. Would they carry all the passenger traffic in the city? No.

161. How is it the Commissioners suggested a scheme which is not likely to carry the traffic? I have given a description of the scheme. Up to Hyde Park there were four lines of rail, but beyond Hyde Park only two lines. Some of the traffic would stop at Hyde Park; two lines would be taken on to Circular Quay and two lines round to the eastern suburbs.

162. *Mr. Lee.*] From an engineering point of view do you favour a terminus at Park-street or one at St. James' Road? Both are equally good for traffic purposes and from an engineering point of view.

163. Which of the two do you prefer? There is no doubt that the St. James' Road extension is better than the other, because it brings the line further into the city, but as regards accommodation and from an engineering point of view they are precisely similar.

164. If it were extended to St. James' Road how would Park-street be affected? The lines would go under Park-street without altering the level.

165. Would not that give you a sunken station at St. James' Road? No, you would rise up in the same way. There is a fall in the ground from Park-street down to St. James' Road.

166. Is there not a block of Government property in the vicinity of St. James' Road—on the western side of Elizabeth-street? Yes; but it is not large enough for a main terminus.

167. Could it be utilised in any way in connection with this scheme? Not with this one.

168. *President.*] The area owned by the Government in the block is about an acre and a half; an acre of land is in the hands of private owners;—the Railway Commissioners require 14 acres for a surface station, I think? Twelve acres, I think.

169. Does it appear that there will be a sufficient area of land at present in the possession of the Government in the block bounded by Market, Castlereagh, King, and Elizabeth streets to make a daylight station? Yes, under the modified scheme.

170. And from that going towards Redfern Station there would be no resummptions at all, and no danger of interfering with any interests until you pass Liverpool-street? No. You can keep clear of any property till you pass Liverpool-street.

171. Just opposite the Public Works Office, at the corner of Phillip and Bridge streets, there is an area of Government land about 150 feet square? I do not know how wide it is, but I think it is about 150 feet long.

172. That is not long enough for a daylight station? No.

173. *Mr. Wright.*] Does not Lady Young terrace belong to the Government? I do not know. I have not inquired.

174. Could you put four lines of rails in the piece of land between Elizabeth-street and Castlereagh-street, where St. James' School stands, and then produce two of the lines to Circular Quay? I do not think you would be able to get in there and out again in the space.

H. Deane.
18 Feb., 1897.

175. Supposing you could put four lines into that area near King-street, could you work the whole of the Sydney traffic in the space available between the two streets? I can only go by what the Railway Commissioners stated in their report to the previous Railway Commission when they recommended that modified scheme.

176. What did they say then? They proposed then, I think, to run some of the trains down to King-street with four lines, and to continue two lines on to the Custom House.

177. It appeared reasonable to the Commissioners that four lines to King-street would do the traffic? I do not think it would be quite that.

178. Would it be possible to run four sets of rails from King-street to Circular Quay? No.

179. Two lines can go on to the Custom House, and four cannot? Yes. I am not sure that you can get two lines on without resuming some of the houses along Elizabeth-street. I will look into this matter and report to the Commission.

180. Supposing that two lines were carried right through the city by one route and came back by another, would that be wide enough to work the traffic? I should think it would.

181. That is with two sets of rails going right round? I should think it would.

182. There would be no necessity for large resumptions for station purposes—no shunting would be required, and hardly any yard accommodation? You would require to have your main station at Redfern. Any shunting required or marshalling of trains or distribution would have to be done at Redfern.

183. *President.*] It would mean a circular resumption right round the city? If you can get under the houses without materially damaging them, of course the houses are left to be used, and you can get a rent from them. You have to resume on account of the damage which you will do, but still the damage, although it occurs, may not render them uninhabitable or unsuitable.

184. *Mr. Hoskins.*] You have heard that the proprietors of underground railways have had to pay large sums to compensate people for alleged damages to foundations of their houses, even though the railways did not interfere with the foundations? I know that there has been a lot of compensation paid. I would wish the Commission to understand that I am not advocating any of these schemes. I am recommending no scheme. I am merely reporting on the feasibility and desirability or advantages of one or the other from an engineering point of view.

185. *Mr. Wright.*] I suppose you are prepared later on to criticise any schemes from an engineering point of view? Yes; but I cannot give an opinion on traffic questions or questions whether a site for a station is desirable without infringing on the rights of the Railway Commissioners. According to the Railway Act they have the power to fix the stations and so on; my duties really comprise the engineering part of the business. I produce a plan of the city of Sydney, in answer to the request of the President, to show what I consider possible lines of railway. It is to be remarked that nearly all these lines shown here have been suggested more or less in one or other of those schemes which have been previously submitted. I have got out what appears to be practicable. I have shown a line from Redfern, in answer to Mr. Wright's inquiries, crossing Liverpool-street into Hyde Park, and turning up into the north-western corner of Hyde Park to Elizabeth-street, and then turning off to the right so as to tunnel right under Macquarie-street, and with a turn come round to Circular Quay. The levels are right enough for a line like that, but as a surface line at Circular Quay was not reckoned desirable, I suppose it to be carried on overhead over Circular Quay, and then to get under the ground on the other side of the city, near Harrington-street, and then follow under Church Hill from Wynyard-square, following as much as possible under the roads—unfortunately you cannot follow the roads altogether—and then coming into daylight about Liverpool-street, and curving round and entering the main station again. That line, where it passes under the Domain, could be lowered and continued down to Fort Macquarie, if required. Then the line on the western side was to be laid down so that it could be continued across by bridge to North Shore; that is the same position, for that purpose, as I submitted to the other Royal Commission. Then there are other connections shown, branching off from the northern end of Hyde Park. There is a line shown turning round to the eastern suburban line, and a double connection is made there by a fork to Circular Quay and Hyde Park also. Starting again at Redfern, there is an extra set of lines starting from the goods side of Redfern Station and running parallel to the other lines as far as Liverpool-street, and then turning off to the right to get down to Woolloomooloo Bay on the other side. That line will pass under the line branching off to the eastern suburban line, but a connection with it can be made by the lower fork. Then, I have shown on the plan some lines off to Pyrmont and Glebe Island. I have a larger plan to show what has been done in regard to Glebe Island. Under instructions from the Minister, I had surveys made, some years ago, from Stanmore and Petersham to connect with Glebe Island and Long Nose Point; it is not shown on this plan, because the plan is not wide enough.

186. That will serve Balmain? Yes.

187. *Mr. Farnell.*] Do you not propose to go beyond Long Nose Point—across Parramatta River? No.

188. *Mr. Black.*] Is the line under Wynyard-square merely a return line, or is it for setting down and picking up passengers? It can be used for picking up passengers, of course.

189. I suppose it would not serve the purpose if run along the waterside? I do not think anything would be gained by running it along the waterside.

190. *Mr. Wright.*] Is it possible to continue a passenger line with a traffic line round the wharfs? I think it would be a great mistake. I think, in any case, the passenger traffic must be separated from the goods traffic; it is done all over the world. It would be most inconvenient to mix them up.

191. Could not a circular line, with a branch to the wharf, be utilised for that purpose? No; it would be too high. A line for goods purposes must be a separate line, and it is immaterial as regards expense whether it is by itself along the wharfs or alongside another line; but the two kinds of traffic cannot be mixed up.

192. You think the goods line must be distinct from the passenger line? Yes; that opinion seems to be held all over the world. Different railway companies, in other parts of the world, I know have gone to very great expense indeed to get the two kinds of traffic separated.

193. Have you made an estimate of the cost of these schemes? No.

FRIDAY, 19 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.
 The Hon. JAMES HOSKINS, M.L.C.
 The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
 HENRY CLARKE, Esq., M.P.
 CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.
 THOMAS HENRY HASSALL, Esq., M.P.
 GEORGE BLACK, Esq., M.P.
 FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
 FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

194. *President.*] You promised to find out whether it would be possible to run four trains into the block bounded by King, Castlereagh, Market, and Elizabeth streets, and for the trains to return? I have tried that on paper, and I find that the area is too restricted. To make a proper scheme it would be necessary to encroach on some of the properties at each end, fronting Elizabeth-street. There is no room to get in the lines and out again and get in two dead-ends.

H. Deane.
 19 Feb., 1897.

195. *Mr. Wright.*] It is not wide enough? It is quite wide enough, but it is not long enough.

196. *President.*] Supposing the line stopped absolutely there, would it be possible to get two trains backwards and forwards—for you have the width of the road and you have the space under the road on both sides, which gives you another 2 chains? You do not want any width on the Castlereagh-street side, because there is not length to get across there. I think it would be possible to scheme out something if they were dead-ends—if you were not carrying the line on any further.

197. *Mr. Hoskins.*] Is there room there for a large station? No; it would be a very small station. The length of the Government land in that block is 360 feet, reckoning from Market-street to the High School boundary.

198. *Mr. Wright.*] What length is it from that point to King-street? 160 feet.

199. Supposing the Government resumed all the land in that block on the northern side of the High School, would that give you sufficient room? I think it would make a fair wayside station, but it would not be a very roomy one.

200. *Mr. Hoskins.*] With a small station, would you not be reviving all the difficulties of working the traffic which are experienced at Redfern Station? This extension in any case will involve the construction of a new station on the Benevolent Asylum grounds.

201. In addition? Yes; you could not get over that; Redfern must be improved.

202. Do I understand that any city extension will necessitate the resumption of the Benevolent Asylum grounds, and that you must have a station there under any circumstances? Yes, unless you bring the terminus on to Hyde Park; but otherwise you must do something at the Benevolent Asylum grounds.

203. Is the Commission to understand that if you extend the railway to the city, say to King-street, or anywhere else, the Benevolent Asylum site, and, perhaps, the Cemetery ground, must be resumed to have a large station there, because the existing station at Redfern is too small? Yes; you are bound to have an improvement of the present terminus station, either by shifting it across Devonshire-street, or by making a new one in Hyde Park.

204. *President.*] Have you taken into consideration the moving of Devonshire-street further north, and, instead of virtually abandoning Redfern Station, working that station in with your proposed improvements? I wish to point out, in the first instance, that any alteration of Redfern Station will entail an entire reconstruction of the passenger platforms and docks; and the easiest way of dealing with it is to make a new station beyond. It is a mistake to suppose that the ground on which the present station is will be wasted. The space will be necessary for the distribution of the trains and for bringing them into the station. Referring to the plan of the Hyde Park scheme, the station is not merely that part lying between Liverpool-street and Park-street, but practically it starts from a point near Goulburn-street. From that point where you begin to manipulate your trains, to the end of the docks at Park-street, the distance is 1,800 feet. Now, if you measure 1,800 feet from where the lines branch off, say at the carriage-shed in the yard at Redfern Station towards Belmore Park, it will carry you nearly to Belmore-road. With the existing heavy traffic at Redfern it will be extremely difficult, and perhaps almost impossible, to make a partial extension into the Benevolent Asylum grounds. The platforms at Redfern are not properly arranged. The station-building was erected a long time ago, when the requirements of the railway traffic were nothing like what they are now. The amount of the traffic then was extremely small compared with what it is now.

205. *Mr. Wright.*] Supposing that Devonshire-street were closed, and a street were run obliquely across the cemetery in its place,—would that give you sufficient room? I do not think that such a deviation could be worked in. I have here a plan—it is rather a rough one—which I have had prepared in compliance with the wish of the Commission to show the proportion of ground which will be taken up by the Benevolent Asylum scheme. It is proposed to take up the space which is tinted red on the map, and which it will be seen forms a very large proportion of that area. The only way of getting the traffic round will be by taking it right round Garden-road. On the eastern side of the station it is proposed to have a wide street (which goes into Devonshire-street) to take the converging traffic.

206. *President.*] Supposing that you drew a line on the map from the old police-station in George-street, parallel with Belmore-road, what amount of line would it cut off? About 150 feet of line, and you lose the end platform and the building and the approach at the end.

207. *Mr. Wright.*] Adding on the space occupied with buildings and with the roadway, what length will it cut off? 320 feet.

208. *President.*] How much platform is wanted? I think it is 70 feet.

209. *Mr. Wright.*] You must have a parcels office and a ticket office at one end available for all the platforms? Yes.

210. *President.*] What is the length from Devonshire-street to the end of your line? About 700 feet.

211. Towards the end you have another 300 feet for your offices? Yes.

212. Surely it would be better to move Devonshire-street further north and keep them altogether? By running the station over Devonshire-street you do not separate the lines.

213. It means either cutting the station in two or abandoning everything in Redfern Station? It would mean the abandoning of the buildings and offices.

- H. Deane.
19 Feb., 1897.
214. The platforms and all the buildings? Yes. When you want to make a change it must be a radical one; it is no good to botch the thing.
215. Is it not a pity to have the thing cut in half by the street? No; it is not cut in half by the street. There will be no gap there, because the lines will be carried over the street.
216. *Mr. Hassall.*] Would any great inconvenience be caused by closing Devonshire-street, as long as you provide access to the trucking-yards and produce-sheds by means of the new road you propose to make? I do not think very much inconvenience would be caused. It was thought desirable to avoid any complaints in the matter, and a subway for light traffic was provided.
217. *President.*] Supposing you had to put your railway-station on the northern side of Devonshire-street, would it not be better if you had no Devonshire-street? It would save expense.
218. *Mr. Wright.*] If there was no Devonshire-street, would you design your buildings so far to the north as you do? Yes.
219. *Mr. Hoskins.*] The proposed station either at the Benevolent Asylum site or at Hyde Park will be for passenger purposes only? Yes.
220. A portion of the yard at Redfern Station is used for the arrival of produce and merchandise. Supposing the passenger-station were shifted to the Benevolent Asylum site or to Park-street, would there not be more room left at Redfern Station for the arrival of merchandise and produce from the country? I think not.
221. Not if you did away with the platforms? No. I think the same space would be required as at present. It is all occupied now. If you did away with the platforms you would do away with a comparatively small width.
222. You do not propose by the alterations which the Commissioners suggest to give any additional accommodation for the inland produce trade? No.
223. *Mr. Black.*] How many feet is it from the Devonshire-street end of the existing platforms to the fence round the Benevolent Asylum grounds? About 120 feet.
224. How many feet do you require to be added on to the space from the mouth of the tunnel to the inner end of the railway platforms to give you room for marshalling your trains? About 1,800 feet.
225. *President.*] Will you be good enough to state what is wrong with the Redfern Station? The length is not sufficient, and there is not room to make the distributing roads right for shunting purposes.
226. *Mr. Hoskins.*] Do they propose to have carriage-sheds at Park-street? No.
227. *President.*] If it is too short from the tunnel to the platforms it is impossible to make any alterations to the south? I understand that the best arrangements of the space have been already made, but they are most unsatisfactory.
228. It is not a question of the site which exists, because that is cut off by Devonshire-street? You would get length of platform, but you would not get proper arrangements for running into the platforms.
229. *Mr. Hoskins.*] You would have a smaller station at the Benevolent Asylum site than the proposed station at Park-street? The building would be of less height.
230. *Mr. Humphery.*] Have you any estimate of the cost of the Park-street building? £200,000.
231. What would be the exact cost of the building which you think would be necessary on the Benevolent Asylum site? Including the foundations, which would be very much heavier at the Benevolent Asylum site, I make it £185,000.
232. Practically there is an inappreciable saving? There is not much saving.
233. There would be a saving of £15,000, but on the Park-street site you would provide offices for the Commissioners? Yes.
234. Which would not be provided on the Benevolent Asylum site? No. I think that is a fair statement.
235. *Mr. Hoskins.*] Why would the foundations be so very expensive at that site? Because you are so high above the ground at that end. There is a great drop in the ground. The platform at Redfern Station is 64 feet above the level of the sea, and Belmore Road, right in line with the station, is only 33 feet above sea-level.
236. You would have to build up the foundations? There would be a great deal of foundation in the north-western corner; but the space below would be utilised.
237. *President.*] At King-street, supposing the railway was to be extended underground to the north, how deep down would you be? With good grades it would be about 35 feet.
238. If it was not to be extended to the north it would be about 20 feet? Yes, at Market-street.
239. You would be deeper at King-street? Yes.
240. Supposing the Government determined to make a railway station at Fort Macquarie, there are two ways to get to the port, namely, either by going straight ahead or by going under the Park. To go straight ahead would simply mean very heavy resumptions to get down to Fort Macquarie? Yes.
241. Would you be deep enough, passing from King-street towards Hunter-street, by keeping easterly so as to get under the Park as soon as possible;—would there be enough for cap for your tunnel to enable it to be made without any interference with the building? If you follow the line I showed on the map yesterday, and get from that corner in Elizabeth-street, and then turn round, you get plenty of depth there to tunnel without disturbing the houses.
242. You would get into the Park somewhere near Governor Bourke's statue? Yes, somewhere near there.
243. Therefore, there would be no resumptions? I do not know about resumptions, but you would not injure the buildings, I think.
244. Parliament could pass a law which would permit the Government to tunnel, always providing that they did not interfere with the buildings? Yes; I am pretty well sure that it could be done, but I would like to look into the matter before I expressed a definite opinion.
245. *Mr. Wright.*] The old surveys by Mr. Whitton show that that could be done? Starting from the north-eastern corner of the Park we could tunnel, but this is different.
246. The rail level was 60 feet below the surface? I know there was great depth; we were right into the sandstone.
247. *President.*] From the Domain, would it be possible to have an underground railway coming out on the surface at Fort Macquarie? Yes.
248. That is apparently the only way you could approach the harbour from Redfern in a northerly direction without heavy resumptions? Without injuring property, because the necessity of resumptions would have to be dealt with afterwards.
249. *Mr. Black.*] In that case I suppose it would not be wise to have a central station at Fort Macquarie? That would not be a central station; it would not dispose of the Benevolent Asylum station.

TUESDAY, 23 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P., (PRESIDENT).

THE HON. FREDERICK THOMAS HUMPHERY, M.L.C.
 THE HON. JAMES HOSKINS, M.L.C.
 THE HON. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
 HENRY CLARKE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.
 THOMAS HENRY HASSALL, Esq., M.P.
 FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
 FRANK FARNELL, Esq., M.P.

John Parry, Outdoor Traffic Superintendent of Southern Lines, Department of Railways, sworn, and examined:—

250. *President.*] What is your position? I am Outdoor Traffic Superintendent of the southern system, Government Railways.

J. Parry.

23 Feb., 1897.

251. Do you come here at the instance of the Railway Commissioners? Yes.

252. You desire to place a return before the Commission? I wish to lay before the Commission a return showing the number of trains in and out of Redfern daily. [*Vide Appendix.*] I have taken two ordinary days, namely, the 25th and 29th January, and the last Eight-hour Holiday. On 25th January the total number of trains and engines in and out for the day was 555, and when the business people were coming into the city between 8 a.m. and 9 a.m.; the total number of trains in and out during the hour was forty-six, and between 9 a.m. and 10 a.m., thirty-nine; the two busiest hours of the morning.

253. What proportion of these is passenger trains in and out of the station? Between 8 a.m. and 9 a.m., of the forty-six trains I mentioned, there would be twenty-two in and eleven out.

254. Does that represent one of your busiest hours at Redfern? Yes; between 8 and 9 would be the busiest hour on an ordinary morning, but on a holiday there would be more.

255. How much would the traffic increase on a holiday? On last Eight-hour Day, which was a heavy holiday, the total number of trains in and out was 701, and between 9 a.m. and 10 a.m. there were no less than fifty-two trains.

256. Will you now state the number of passenger trains between 9 a.m. and 10 a.m. on the separate lines on an ordinary day? Between 9 a.m. and 10 a.m. out of Redfern on the slow lines there were three trains, on the fast lines five trains, and on the goods lines two trains, and into Redfern on the slow lines there were six trains, on the fast lines six trains, and on the goods lines nil—ten trains out and twelve trains in.

257. Out of forty-six trains it appears that thirteen are engines running free? Yes.

258. So that there are thirty-three passenger trains between 9 a.m. and 10 a.m.? Yes.

259. Will you now divide up the thirty-nine trains, in and out, between 9 a.m. and 10 a.m., in the same way? Between 9 a.m. and 10 a.m. ten passenger trains out and twelve in.

260. The difference would be engines and goods trains? Yes.

261. Fifteen engines and two goods trains? Yes.

262. Supposing that instead of the engines running back out of the platforms towards Redfern it was possible to run them ahead towards the city; that would lessen the traffic by about thirty, would it not, in the two hours? Of course light engines would have to go to their shed at Eveleigh.

263. If it were possible to arrange the Redfern yard by an extension towards the city, so that instead of an engine running back at the busiest hours of the day she could go towards a shed further on, you could lessen the number of engines passing on the lines by fifteen in each hour? Although they would not run on these lines, you would have to deal with them in Redfern yard all the same. It does not matter at which end you have your engine-shed.

264. *Mr. Hoskins.*] Do they not run on lines on which trains do not run? As a rule, only goods trains run on these lines, except on special occasions.

265. *President.*] If the work in Redfern yard is limited to passing passenger trains in and out, it is perfectly clear that you have got rid of shunting seventeen in one hour and thirteen in another? We get rid of the shunting of these engines if the trains run through.

266. You would lessen the pressure in your yard very materially? We should if we could run them through to another station; that would relieve the working at Redfern Station, as the engines would not have to shunt about the yard.

267. If the main station is moved to Hyde Park, Redfern then would not be congested? No.

268. There is plenty of room for them all to pass through? Yes; with a modification of the lines there would be ample room for them to pass through.

269. And still to be used, we presume, for an ordinary passenger station? Yes, there would be ample room for an ordinary through station.

270. *Mr. Hoskins.*] And still the engines would be running down to Eveleigh? Yes. I understand the point of the President to be that if the terminal station were removed to the city there would be no difficulty in passing the engines through Redfern from the terminal station to the engine-shed.

271. Redfern would then cease to be congested? Yes.

272. You have chosen the busiest hours? In the morning.

273. Are there busier hours in the afternoon? On the same date, 25th January, between 5 p.m. and 6 p.m., there were forty-five trains, and between 6 p.m. and 7 p.m. thirty-nine trains.

274. That represents your present maximum traffic? On an ordinary day, but not on a holiday. On the last Eight-hour Day the total number of trains and engines in and out of Sydney was fifty-two between 9 and 10 a.m. and fifty between 5 p.m. and 6 p.m. and forty-four between 6 p.m. and 7 p.m.

275. That is, engines running free and trains? Yes.

276. How many engines were there out of the number? There were six engines out of the number between 5 and 6 p.m.; seven between 6 and 7 p.m.; and nineteen between 9 and 10 a.m.

277. I presume there are continual operations going on in the yard in addition to the number of trains? Yes. In addition to the number of trains in and out, every passenger train coming in during busy hours has to be drawn out to liberate the engine which has brought it in. If the coaches have done their work they are simply drawn out and shunted into the carriage-shed sidings. If not they may be run out direct or shunted to another platform, another engine being attached, or the same engine which brought it in, to take it out to form another train. The figures in the return of the number of trains are exclusive of shunting operations, and represent trains passing between Redfern tunnel and Eveleigh. The shunting operations are carried on between the station platforms and the tunnel.

278.

- J. Parry. 278. *Mr. Wright.*] Do not some of the suburban engines push an outgoing train as it is leaving the platform? No, trains are never pushed out; they are always drawn out.
- 23 Feb., 1897. 279. *President.*] They follow up closely? Yes; the coaches are drawn out by another engine, and the engine which brought them in follows up closely.
280. How many of these shunting operations take place in an hour? It would be almost impossible for me to tell you the number of operations. In the morning, for instance, the trains are so thick coming in at times that an engine not required immediately may have to be shunted to two or three different lines to clear other trains, or if a train comes into No. 6 platform the engine may have to shunt out of that platform and go to No. 1 or No. 2 to lay hold of a train to go right away.
281. Have you got a list of the goods trains coming into Redfern Station for a week or a day, or would you prefer to give all this information in the form of a return? It would be better for me to furnish a return now that I know the form in which you desire the information to be given. The return, however, to be furnished, will not give the Commission an adequate idea of the full amount of work actually done in Redfern yard in dealing with trains, because it will not convey to you the large amount of shunting to be done, as previously explained.
282. Presuming it was possible to take 12 acres of land or some such area to the north of the present station, would it be possible to equip it with lines so that it would relieve some of the congestion to the south of Redfern Station? Yes, materially, if sufficiently far away from the present station.
283. Supposing the Redfern Station is to remain as it is, and that you are given an area ahead of that station to make what use you can of it—either in extending the station or in laying down shunting yards—will it do away with the pressure or congestion at the throat of the present yard? I would bring the six main lines straight through Redfern Station—the ordinary bay platforms at Redfern would not then be required. If you get away from the tunnel you can widen out and arrange your platforms and roads in such a way as to reduce the amount of shunting very considerably by providing proper refuge-sidings for the engines to stand in, and for carriages to stand in to strengthen trains.
284. Are we to infer from your statement that it means the abandonment of Redfern Station and the erection of new buildings? Yes, as a terminal depôt.
285. Supposing that it were found necessary to utilise the platforms and buildings at Redfern, with the extension would it be possible, ahead of the station, to carry out any shunting operations to relieve the congestion to the south of the station;—is it possible to utilise it? Not without entirely remodelling it.
286. Have you any estimate of the cost of remodelling it? No.
287. As far as the public are concerned, there is really no difference between a station at Redfern and a station on the Benevolent Asylum site? No.
288. Supposing that each of your thirteen platform-roads were carried on to a point, say 1,000 feet north of the station and brought to another "throat" so that you could work the trains from both ends, would not that obviate a great deal of the difficulty which you now experience? It may assist the shunting operations; but I would respectfully suggest that you can make no alteration to the existing station which will in any way compensate for the expenditure without entirely remodelling the whole thing.
289. *Mr. Hoskins.*] Would not the difficulty which you now experience at the narrow neck where the engines cross over from the different platforms still continue? Yes.
290. That is the most dangerous part of the yard? Yes.
291. Could that be obviated by extending the station further north and removing a number of these platforms so that there would not be such a convergence of roads and engines to one narrow point? In my opinion to extend the present platforms a short distance north and converge the roads again into through roads at the southern end would not be a satisfactory arrangement.

WEDNESDAY, 24 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.	CHARLES ALFRED JEE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
	FRANK FARNELL, Esq., M.P.

John Parry, Outdoor Traffic Superintendent of Southern Lines, Department of Railways, further examined:—

- J. Parry. 292. *President.*] You wish to make a statement bearing upon the evidence you gave yesterday? I do.
- 21 Feb., 1897. 293. Will you be good enough to read the statement? It is as follows:—

- I have prepared, for the information of the Commission, some returns (*Vide Appendix*) showing,—
- (1 and 1A.) The number of trains and engines arriving and departing through Redfern tunnel on up and down lines during each hour of two ordinary days, viz. :—25th and 29th January, 1897.
 - (2.) The number of through-passenger trains, and number of suburban-passenger trains, arriving at and departing from Sydney during each hour on an ordinary day.
 - (3.) The approximate number of passengers arriving at and departing from Redfern Station during the busy hours of morning and evening on an ordinary day.
 - (4.) The number of trains and engines arriving and departing through Redfern tunnel during each hour on last Eight-hour public holiday, 5th October, 1896.

By referring to statements Nos. 1 and 4, it will be seen that on an ordinary day, 29th January, the total number of passenger and goods trains and light engines passing through Redfern tunnel to and from the station and Darling Harbour was 561, and the number during the busiest hour was forty-five. On last Eight-hour holiday the number of trains increased to 701, and the number during the busiest hour of the day was fifty-two.

Statement No. 2 shows that the number of through and suburban-passenger trains in and out of Redfern during an ordinary day was 324. Of this number, thirty-eight were dealt with in the busiest hour of the day. The

The number of through and suburban-passenger trains passing through the tunnel in and out of Redfern on last Eight-hour holiday, 5th October, 1896, was 476, and the greatest number during an hour of the busiest time was thirty-seven.

The number of trains and engines shown as arriving and departing, however, does not represent the work done in the passenger yard, as a large proportion of the passenger trains arriving have to be drawn out from the platforms and shunted to liberate the engines which brought them in, or to place the cars at other platforms to form other trains. There is also a great deal of shunting of the engines to keep them out of the way of incoming and outgoing passenger trains, as there are no refuge sidings between the platforms or the main running lines to allow of the engines being readily shunted clear to take water or stand while other trains arrive and depart; nor are there any sidings between or handy to the platforms where spare coaches can stand, so as to be readily available to strengthen trains, and considerable shunting across the main running lines is occasioned to get to the carriage sidings.

The distance between the ends of the passenger platforms and the junctions of the goods yard and the Darling Harbour branch with the main passenger lines is much too short, and frequently causes delay to shunting operations, both in the passenger yard, the goods yard, and to the goods trains on the branch. The arrangement of the points and crossings is also unsuitable to conduct the traffic satisfactorily in consequence of the limited length, and being hemmed in by the Darling Harbour branch, the yard having been added to, piecemeal, from time to time.

The sidings between Darling Harbour branch and Mortuary for storing carriages necessitate trains of cars to be shunted through the tunnel in the face of the incoming passenger trains when drawing the empty trains out of the sidings to set back into the passenger platforms, besides blocking goods traffic on the branch while the shunting is being done.

Platforms.

There are thirteen platform-roads (including the two recently constructed), but of these, two, viz., Nos. 4 and 7, are useless for trains to arrive at or depart from, they being only 173 feet and 233 feet long in the clear respectively. Nos. 9 and 10 platforms are also much too short to accommodate ordinary seven-car trains without fouling other roads, they being only 313 feet and 248 feet long in the clear, whereas the length of a seven-car train with engine is 410 feet and 424 feet long, according to the class of engine, and it is frequently necessary to run trains up to nine cars, the length of which is about 530 feet, and on holidays it would be an advantage to run even up to twelve cars at times, the length of same including engine being 689 feet.

The lengths in the clear of the eight platforms, Nos. 1, 2, 3, 5, 6, 8, and A and B, are as follows, viz., Nos. 1 and 2, 469 feet each; Nos. 5 and 6, 624 feet each; No. 8, 405 feet; A, 486 feet; B, 482 feet; so that it will be seen that only Nos. 5 and 6 platform-roads will hold trains of more than eight cars and engine clear of other roads. Much difficulty is, therefore, experienced at holiday times by trains standing on one line blocking the entrance to other roads.

None of the platforms are provided with roofing or awning sufficient to admit of passengers' luggage and parcels of long country trains being discharged under cover, and in wet weather this gives rise to complaints.

Main-entrance Platform.

The end platform at the front of the station is most inconvenient and too narrow. There are no means of keeping it clear of persons who are not travellers, but who congregate and stand about blocking the way and inconveniencing passengers. Passengers arriving and departing meet each other on this narrow platform, which at busy times becomes so congested that the porters and officers are unable without much difficulty to pass along from one platform to another, and it is only with the greatest difficulty and risk to passengers that parcels and luggage barrows can be got through.

294. *Mr. Hoskins.*] Is not that the fault of the railway officials;—cannot they prevent stragglers and idlers walking about the end platform? It is all open, and if an officer spoke to a stranger and he said, "I am going away by the train, and am going to get a ticket," you could do nothing with him. I tried energetically once to deal with these people, but I found that I had to drop back; you cannot deal with them. It is the same with the latrines; the building is frequently filled with loafers who simply go there to use the place—they are not passengers, but we cannot challenge them as it is impossible to ask every man who goes there, "What brings you here; have you a ticket!" You may possibly challenge one who had a ticket; you cannot demand to see their tickets before going in.

295. *President.*] Will you now resume the reading of your statement? Yes.

The approach from the streets to this platform also involves much inconvenience and risk to passengers in crossing the main cab approach.

Cloak-room.

This room is too small, most inconveniently situated, and gives rise to much irritation to passengers at busy times. On one of the recent busy days no less than about 1,355 to 1,500 different parcels were dealt with by passengers depositing and calling for same. A great proportion of these parcels were dealt with between the busy hours of morning and evening, and although the maximum number of men who could work in the space were employed, still delay to passengers could not be avoided.

Parcels Office.

The Parcels office is small, and the cart approach to same is too contracted in space to admit of a sufficient number of carts to draw up to the platform to deliver and receive parcels during busy times, and delay to carts takes place in consequence. The difficulty of conveying the parcels on barrows to and from the trains through the crowds of people on the end platform is very great.

Refreshment-room.

The present room is much too small and inconvenient, both from a public and Departmental point of view.

296. *Mr. Roberts.*] Have you a record of the number of passengers carried on Eight-hour Day? No; I am unable to give the number of passengers carried into Sydney on that day.

297. You have, I think, a record of the number carried on an ordinary day? I obtained it simply by counting the passengers in the trains. I had special officers out to count the passengers as the trains were coming in. My opinion is that on the last Eight-hour Day we dealt with about 100,000 passengers,—50,000 in, and 50,000 out.

298. How would that compare with the traffic on an ordinary day? That would be about 150 per cent. more. On an ordinary day the total number arriving in Sydney would be, approximately, about 20,000.

299. *President.*] Nine-tenths of that number would be suburban passengers? More than that.

300. Will you ascertain what proportion are suburban passengers, and what proportion are long-distance passengers? I will get the information, approximately.

301. Would there be 20,000 passengers in and 20,000 out? 20,000 passengers in, and approximately the same number out.

302. *Mr. Hoskins.*] Have they not some arrangement in Victoria at the railway stations by which they do not allow persons not going by train to go on a platform unless they get a special ticket? I believe that is so, and we do so here as far as possible. For instance, we do not allow people to go on No. 3 platform unless they have either a railway ticket or a platform ticket, because we are able to fence off that platform and put a man at the gate; but the end platform, where the cabs approach, we are unable to fence off, and in consequence of the refreshment-room being on No. 5 platform we are unable to fence that off.

303. *Mr. Lee.*] The chief trains start from that platform? Yes.

- J. Parry.
24 Feb., 1897.
304. You do place a barrier across that platform when the principal trains are starting? On the tunnel side of the refreshment-room we do for the mail trains only.
305. The inconvenience to the working of the Department is not caused by the influx of loafers, but because the station is too small to give egress and ingress to the passengers? The difficulty of keeping people clear of the main entrance platform and the space is too small. Referring to the plan of the new station, you will see that no one will be able to pass on to the general platform, which is 57 feet wide, without obtaining a ticket; the whole of the people coming in with tickets will go on to the general platform, and everyone who wishes to go on to another platform from the main platform will have to show his ticket to a porter, and the tickets will be checked to see that the people go to their proper trains. The main platform will be fenced off from the other platforms.
306. The whole of the station will be absolutely under the control of the officers? Yes.
307. And they will be able to control the traffic which they are unable to do now? Yes.
308. No ordinary alteration of the present station would enable you to do that? You would have to take in Devonshire-street to make the alteration necessary to the present station, and then it would be defective.
309. *President.*] You could lengthen the platform too? Yes; but after you have improved the entrance to the station the question of safe working will arise.
310. It is the yard behind the station which becomes the trouble then? Yes.
311. The extreme length you gain is 12 chains, that is, twelve carriages? Even then it is inconvenient to have the general waiting-room, the ladies' waiting-room, the refreshment-room, and all other buildings on these two platforms between No. 3 and No. 5, and No. 6 and No. 8.
312. Where are you going to put the buildings in the new station? In the front.
313. Why cannot you put these buildings in the front too? Even then it means remodelling the whole of the portion of the yard between the platform and the tunnel. Supposing you take up all the sidings you will not have room enough. Even supposing you extended the platforms for a considerable distance north, you would not have room between the ends of the platforms and the tunnel junction to make a proper and convenient passenger yard.
314. Supposing it were possible to move Redfern Station up bodily, how much room would you require between the tunnel and the southern end of the platforms to give you room for a suitable yard? The plan of the new station shows the way in which you get proper arrangements in for working the trains. It is about 1,900 feet.
315. How far from the turning shown on that plan would be the southern end of the proposed station in Park-street? About 1,200 feet.
316. The station proper is 1,200 feet long? 1,200 feet from the outside of the shunting-points to the southern end of the platform.
317. How far is it from the tunnel in Redfern yard to the southern end of the present station? About 980 feet.
318. Therefore, it is 220 feet shorter than you believe is necessary? More than that, because as you will see, the goods branch to Darling Harbour joins the main rung lines about 240 feet back from the mouth of the tunnel and this restricts your yard space to the north of the tunnel.
319. But, supposing that this point were brought nearer the tunnel, in shunting your carriages into and from the platforms you would have a considerable amount of shunting into the tunnel again? You would have trains shunting through the tunnel in drawing out and setting back.
320. Your first objection is that it is too short by 220 feet? The distance is too short.
321. Will you now explain how the goods line turning off into Darling Harbour further blocks the yard? Inasmuch as the goods trains passing to and from the Darling Harbour branches have to travel on these passenger lines up to that distance.
322. *Mr. Hoskins.*] And have to cross the arrival passenger lines? Yes; the arrival and departure a great deal.
323. *Mr. Humphery.*] Your calculation is that 980 feet, less 240 feet, which is taken up by the approach to Darling Harbour, would be available in Redfern yard as compared with 1,200 in the new station? Between the southern end of the old platform and the tunnel we have only 960 feet, but that space is further restricted by this Darling Harbour branch which joins the passenger lines 240 feet back from the tunnel. That gives us a space of 720 feet.
324. *President.*] Would it be possible to cheaply devise any scheme by which the yard could be lengthened towards the south? I do not think so.
325. Did you ever look at it carefully? Yes. It would mean an enormous cost in land resumptions.
326. You have no land there? Practically none, I think, that would be of any use; it would have to be resumed.
327. *Mr. Lee.*] Is it possible to devise a scheme to widen the tunnel by taking land on the eastern side and utilising Prince Alfred Park; if that were done, would it give the relief which is desired? It would mean an enormous cost in land resumptions.
328. *President.*] Can you get 1,200 feet to the south of the present platforms along the main line;—is there no way by which you can devise it at all? I would not like to suggest it.
329. Supposing it is suggested, have you any idea of what it would cost? No.
330. The crucial thing is not the station itself, but the yard behind the station, and you state that you want 1,200 feet;—will you be good enough to explain why you cannot get 1,200 feet to the south of the station? I believe the tunnel would come practically in the middle of your yard, and I do not think you would get the height, and that it would cause a considerable alteration of the streets to get depth for girders which would span over a sufficient width to admit of a clear space for these additional roads and sidings necessary to widen the yard out. Assuming for a moment that it is possible to extend the yard in a southerly direction with the large number of trains we have coming in day by day, amounting on an ordinary day to 500 or 600, besides the enormous amount of shunting going on continually during the day, the inconvenience it would cause would be such that it would be almost impracticable to carry out the alterations in that direction so as to provide a proper station.
331. Will you prepare a statement showing the reasons why it is not possible to extend the yard to the south? I would suggest that it is purely an engineering matter, and although I should be pleased to do anything you may wish I think the engineer would do it more readily and equally well.

J. Parry.
24 Feb., 1897.

If you ask me from a traffic point of view whether it is feasible to extend the station in that direction, I would strongly urge that it should not be done, because of the enormous inconvenience which must of necessity arise to the general public to say nothing of the risk attendant in carrying out the works in the middle of so much traffic. Assuming for a moment, for the purpose of argument, that it is possible to extend the yard in a southerly direction and get the required yard accommodation you will see that the platforms shown on this plan of the existing station have only two roads between them—that is, one for each as a main arrival and departure road. There is no third road between these platforms, and therefore, every train which runs into the platform must, of necessity, be drawn out before the engine can be liberated; whereas, if we had a central independent road, between these platform roads, a train would run into the platform, the engine could cut off, cross over to the middle road, and run back to the southern end of the train and couple on, and thus save an enormous amount of shunting. A second train could arrive at the opposite platform, and its engine could be cut off and use the middle road in the same way.

332. There are only two roads between the platforms at Redfern? Not more than two, and in some cases only one.

333. You regard that as a salient defect, which you cannot get over? It is a very serious defect in a terminal station, where so many suburban trains are arriving and departing. If you will refer to the plan of the new station you will see that that great defect is obviated by having a middle line. That will do away with an enormous amount of shunting. It is a most important point to have three roads between the platforms for suburban traffic.

334. *Mr. Hoskins.*] I believe you despatch the express train to Melbourne from one of the western platforms? From No. 5.

335. You have another platform still further to the west? Yes.

336. When you are despatching the Melbourne express from No. 5 platform, or when you are despatching trains from the more western platforms, each train has to cross over the arrival line to get on to the departure line at the end of the platform? The Melbourne express starts from No. 5 platform.

337. It has to cross over the arrival line? No, it runs straight away on the same line.

338. But some trains departing from the western platforms have to cross over the arrival road to get on to the departure road if they are going to the south? But when you come to the mouth, as it were, of a large terminal station like Sydney you abandon your arrival and departure roads, because trains when they arrive at the entrance to the yard simply branch off so that you can run them into any platform.

339. There would be no danger if the trains were diverted from the main road on to a siding parallel with the arrival main road; but supposing that they have to be taken across an arrival road is there no danger of a collision occurring? There should be no danger, because the lines would be properly signalled, and if a train were departing from one road, and in order to get on to its proper departure road it had to cross an arrival road, the signals controlling the trains on the arrival road would of necessity be at danger, and if the drivers observed these signals there would be no risk of a collision.

340. To ensure a prevention of accidents it is necessary that the driver of an arrival train should be exceedingly careful to look at the signals, and the signalman must be careful to see that the trains are properly signalled? Yes.

341. Is it not unusual at a railway terminus in Europe or Great Britain for trains leaving a station loaded with passengers to have to cross a road on which passenger trains are arriving very frequently? No; it is the usual arrangement in terminal stations. At the Liverpool-street terminus, one of the most modern stations in London, you would find that existing there in just the same way.

342. That is to say, that outward trains cross the arrival train roads with great impunity? Yes, because to conduct a large traffic you must of necessity be able to run the arrival trains to any platform, and also to start trains from any platform to either of the departure roads.

343. Is it not a fact that trains are sent into sidings from the main departure roads where they do not have to cross other roads? No; it is the usual thing at a terminal station to work in that way. Supposing a train was brought into a platform on the west; if it was started with passengers from a platform on the west, it would have to cross the arrival road to get on the departure road; but supposing it does not depart from the platform the engine would still have to draw the coaches out to cross the arrival road in order to place them on some other road to enable them to be put in position for the train to start from another platform road which does not cross an arrival road, so the coaches would have to cross the arrival road any way.

344. If there is a minimum of danger of trains not coming into collision by crossing roads on which other trains come in, how is it that the last accident happened at Redfern Station? That was purely because the driver started without his signal being lowered; the signal stood at danger, and if the driver had waited until the arm fell nothing could have happened, because the incoming train itself locked the levers, so that the man could not pull the signal down while the train was coming in.

345. Is it proposed, do you know, at the new station either at Park-street or at the Benevolent Asylum site that the trains shall be so arranged and ordered as they are now, that trains from one side of the line shall cross over the arrival roads or other roads coming in in an opposite direction? Of course in the arrangement to the station every effort is made to prevent that as much as possible; but in order to get the maximum work from the station it must of necessity be that trains will cross each other as you say.

346. If the railway is extended to Park-street, will there not be less probability of trains having to cross other lines where engines or trucks are being moved about and where there is a possibility of a collision taking place? There would be very much less liability, because you would remove a very large amount of the shunting across the running lines which has to be done at Redfern Station.

THURSDAY, 25 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	GEORGE BLACK, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
CHARLES ALFRED LEE, Esq., M.P.	FRANK FARNELL, Esq., M.P.

John Parry, Outdoor Traffic Superintendent of Southern Lines, Department of Railways, further examined:—

J. Parry.
25 Feb., 1897.

347. *President.*] You desire to make one or two statements pertinent to your last examination? In regard to your inquiry as to the proportion of long-distance passengers who arrive at Redfern per day, I have ascertained that the number of through passengers on an ordinary day would be, approximately, about 1,800—that is, from stations south of Campbelltown, west of Penrith, north of Hornsby, and south of Sutherland. I simply took the trains, counted the passengers, and averaged the number, as I have no means of getting at the exact number without counting the passengers. I have based these figures on the passengers coming in on a Monday. On other days the number would be slightly less perhaps, but it is the maximum traffic which we have to deal with, and which causes the inconvenience.

348. *Mr. Lee.*] You have special excursion trains at intervals through the year which bring in many passengers? We run special excursion trains from the country to Sydney once a month, and sometimes oftener, and on these days have brought in as many as from 1,100 to 1,200 passengers from the south, I suppose from 1,200 to 1,300, or even more, from the west, and 600 or 700 from the north. Then, I suppose, on some occasions we would get equal to five or six of these cheap excursions coming in on the same day.

349. Then the capacity of the station is very much taxed? Yes. On last Christmas Eve, for instance, from nearly 4:30 p.m. to 6:30 p.m. it was with the greatest difficulty the passengers could move about on the end platform next to Devonshire-street, and it was next to impossible to get the luggage and parcels barrows through the crowd. I was there, and I walked backwards and forwards with the object of seeing what more I could do to distribute the passengers. We had special transit officers to regulate the cab traffic and the vans, but even then we were unable to control the traffic properly.

350. *Mr. Fegan.*] Not with a double shift of men? Not with a double shift of men on the station. A cab, for instance, would drive up to the station with a passenger and, say, two portmanteaus to go to the south; a porter would take hold of the portmanteaus, and then lose his passenger, and it would be a very long time before he would be able to get through the crowd and return to take another passenger's luggage. It was due to the porters not being able to get about the platforms. Although we had a double shift on, and an extra staff as well, still we were not able to keep down complaints in consequence of not being able to move about and properly supervise the traffic on the platform.

351. *Mr. Hoskins.*] Surely these difficulties occur on stations in England during holiday times? During holiday times, unless you have very ample room, you do get difficulties, but I do not think they are anything compared to what we got at Redfern Station in consequence of the defective design and arrangements at that end.

352. *President.*] We wish to know the number of suburban passengers per day, speaking approximately;—is it 18,200? The traffic fluctuates, but I think the estimate of suburban passengers from stations up to Campbelltown and Penrith, Sutherland and Waterfall at 18,200 a day it would not be far out.

353. The figures you have given in regard to passengers and trains show that the suburban traffic is the real weight of the whole business? Yes.

354. That is really what provision requires to be made for? The suburban together with the through traffic.

355. *Mr. Hoskins.*] Do you not think that in any arrangements which might be made for traffic at a head station here, the suburban traffic should be separated from the long-distance traffic? No; my very strong opinion is that the whole should be dealt with at one central station.

356. *President.*] What are the other statements you wish to make? The number of through trains arriving here on a Monday is about fifteen; but that number, of course, is increased when we are running cheap excursion trains and on holidays. On last Eight-hour Day the number of through trains arriving in Sydney was about twenty-six—a very considerable increase on the ordinary number. On that particular morning the trains would be made up to the maximum load of the engines, which makes the trains very long, and therefore they cannot be accommodated at short platforms. Both in the busy hours of the morning and in the busy hours of the evening the shunting staff in the station-yard are taxed to their utmost to get the trains in and send the trains out without causing delays. Frequently incoming trains have to stand outside the station-yard before they can get a platform clear, or the shunting-road or the main lines clear from shunting, to get to their platforms. All these cases come before me where delay takes place through trains being blocked outside the station-signals. I look into the causes of the delays, and I am quite satisfied that, although the shunting staff do their very best to get trains through, it is impossible to avoid delays to trains at the signals during busy times.

357. Is there anything else you wish to state? As regards the information asked for of the tonnage of goods arriving at Darling Harbour, and what proportion is for shipment and what proportion for local distribution, the Secretary to the Railway Commissioners has arranged for Mr. Harper to appear before the Commission. You also wished me to speak to Mr. Deane as to what were the objections to extending the station in a southerly direction. I have spoken to Mr. Deane, and he will be prepared to give you further information. I have also seen the Secretary to the Railway Commissioners on the question as to whether or not any plan has been prepared for extending the branch to Darling Harbour further south, so as to keep clear of Redfern yard, and he has promised to look the matter up and see if there are any plans.

358. Supposing Redfern Station were removed, would you be able to deal easily with all the goods you have going down to Darling Harbour on the present track? Yes, as far as the branch itself is concerned.

359. Taking it for granted that Redfern becomes satisfactory, either by removal to the north or by extension to the south, would you be able to work the traffic down to Darling Harbour without any trouble? Yes, so far as the branch is concerned.

360. Could you work twice the traffic without any trouble? As far as the branch is concerned I consider
yes. J. Parry.
361. Could you do four times the amount of work? I would require to consider that matter. But
supposing that we got fourfold the traffic, the only difficulty would be in crossing the main lines, and
bringing it over the main suburban lines. It would not affect Redfern station in the least if the junction
were sufficiently far from the shunting-yard. 25 Feb., 1897.
362. *Mr. Lee.*] At the present time you get over the difficulty to some degree by running the goods
traffic in at night when there is little suburban traffic to be dealt with? Yes; we could accommodate an
enormous increase of goods traffic.
363. Without interfering with the passenger traffic? Yes.
364. Do you remember that the congestion in Redfern yard has come about during the last three or four
years? No; it has been a source of complaint from the time I can remember. In 1881 I interlocked
Redfern yard, and the cry was almost as great then as it is now in regard to not being able to deal with
the trains. Temporary alterations were made and additions given which provided for the circum-
stances, not perfectly, but so that they could get along. Again a further extension was made between
1886 and 1887. Then again the Commissioners, after they took office, made further extensive alterations
to bring the four lines direct into the station, by which an enormous amount of crossing and recrossing of
the Illawarra trains across the main line trains and the main line trains across the Illawarra trains was
obviated.
365. I wish to know whether the quadrupling of the suburban lines has led to further complication in
Redfern yard? No, it simplified it.
366. It involved the construction of more points in crossing the lines? Yes: but before the four
lines were extended to the platforms the Illawarra trains joined the suburban line at the tunnel—all the
traffic, from the Illawarra line and from the main suburban line, simply came on to two roads there.
They had to cross each other's track at the tunnel, and after doing that they had to cross each other's
track going into the various platforms at the station. Then, instead of the traffic on the four lines having
to go on two lines, and then branching out again, the Commissioners extended four lines straight away
to the platform, which enabled the Illawarra trains to come into the station direct, and go away direct,
thereby minimising crossing of the main suburban lines.
367. The additional line outside has not led to any complication inside the yard, but, on the contrary, has
made the working of the traffic there easier? Yes.
368. And the congestion arises from one cause, and that is the increase of traffic? Yes.
369. Will it be possible, by the resumption of land, to extend the Redfern yard? I have thought over
this question since I was last before the Commission, and my own opinion is that it is practically
impossible to extend the existing yard and make anything like a satisfactory arrangement.
370. I suppose if the line were brought into the city, Redfern station would become a suburban station—
an outer city station? Yes, it could be made a very good intermediate suburban station.
371. You admit that a shift has to be made;—do you think it will be more desirable in the interests of
the railway traffic to go on to Park-street than to stay at Devonshire-street? I think it would be better
to go on to King-street; but failing that I am strongly in favour of going to Park-street.
372. You think a station at Park-street or at King-street is preferable to a station at Devonshire-street?
Yes.
373. It means a certain amount of cost and inconvenience to go 150 yards from Redfern to Devonshire-
street? Yes.
374. The additional facilities to Sydney people will be nil? Exactly.
375. It would be no more inconvenient to city people to be put out at Redfern than at Devonshire-street
—would it not be better to bring them straight into the city at once? I say decidedly yes; and, further
than that, if the railway were extended to Park-street or King-street, in my opinion the traffic would
increase enormously, for I have no doubt many business men at the northern end of the city do not go out
to live on the Illawarra or suburban line, or on the north coast line, because they have to take an omnibus
or tram to reach the station. As omnibuses are not very reliable, they have to leave a margin of time to
get the omnibus, and leave a margin of time at the station, in order to catch the train. There is not
the slightest doubt but that from ten minutes to a quarter of an hour, or even more time is lost by a
business man in getting from this end of the city to Redfern and catching the train; whereas if he
could get into his train at King-street, knowing exactly when his train would start, he would just leave
himself sufficient time to allow him to jump into his train, and it would not take more than three or four
minutes to go between Redfern and the city.
376. How will the railway fare between Park-street and Redfern compare with the tram fare and the
omnibus fare? I understand that the Commissioners proposed to charge a fare of 1d. single and 2d.
return, second class.
377. Unless the charge is made equivalent to the fare charged by the trams and omnibuses, would there
not be a danger of a number of the suburban passengers leaving the train at Redfern station and availing
themselves of the trams and omnibuses? The fare would not exceed 1d. 2nd. class single, and 2d. 1st
class single, 3d. 1st class return, and 2d. second return.
378. That would be less than the street rates? Yes. As regards season-ticket holders, their charges
would be almost infinitesimal per day.
379. A large proportion of the suburban fares are collected in the form of season tickets? Yes, very
largely.
380. Does not that very largely facilitate the working of the railway traffic? It saves an immense amount
of trouble for passengers to show their passes instead of tendering tickets. With a season-ticket a man
is saved the trouble of going to the ticket-office every day to get a ticket.
381. You are clearly of opinion that the traffic must increase if the railway system is brought into the
city? I am clearly of opinion that the traffic would increase very largely, and that residents who now
live in the eastern suburbs, and who have to come by tram and omnibus, would take the railway to the
western suburbs.
382. I suppose the Commissioners do not contemplate any branch line for the western side of the city
for passenger traffic? Not to my knowledge.
383. *Mr. Hoskins.*] Have you ever thought of this view: to make a large station suitable for all requirements
of the railway on the site of the Benevolent Asylum, Carter's Barracks, and the Cemetery, and to extend
two,

J. Parry.
25 Feb., 1897. two, three, or four lines with a small station at the terminus for the suburban traffic, and to have the through traffic at the terminus I spoke of, seeing that a large number of the passengers who come from long distances do not make for the offices in the northern part of the city, but have their business in all parts of the city or go out to the eastern suburbs? I cannot say that I have given much consideration to that view. In my opinion it would lead eventually to complaints and inconvenience.

384. You would have plenty of room for shunting on the site I spoke of? Yes; but we bring a large number of suburban passengers in in some of our through trains. For instance, the Penrith train in the morning will pick up 100 or more suburban passengers at Strathfield, and that train will require to go down to the city, because practically it is then a suburban train. So that to be satisfactory there would not really be many trains left at Redfern if you brought all the trains that carried suburban passengers down to the city.

385. I asked that question for this reason: if a large central station were made with sidings and every accommodation, on land resumed at that particular place, very little compensation would have to be paid by the Government, but directly you extended the line further if you wanted a large station in town even though you did take a portion of Hyde Park you would still have a lot of land resumptions? I should still consider it worth the effort to get a city station.

386. *President.*] You promised yesterday to ascertain the smallest area on which such suburban traffic as is required to come to Sydney could be worked? I have thought that matter over, but I am not in a position now to state what area will be able to accommodate the suburban traffic as purely separated from the ordinary traffic, because it would require very careful consideration as to what was country traffic and what was suburban traffic.

387. No goods traffic would go down? No.

388. What area will be required to work all the rest of your traffic? I prefer not to express an opinion at this moment; I could only give a very rough guess.

389. Would four or six lines be necessary to come in? Four lines at the least.

390. Suppose you bring in all the traffic how many lines would you require? We should require six lines.

391. Motive power becomes more powerful every year and the tendency is to have longer platforms and to make bigger engines? Until recent years one of our small engines, which ran the Melbourne express, would only haul right through to Goulburn about three vehicles,—that is, three of our ordinary lavatory type; but the engine of to-day will haul six vehicles, so that the length of your train is doubled.

392. With a population growing, the tendency will be to have stronger engines and, therefore, longer trains? At race time the length of our Melbourne train, including one engine, is about 587 feet. With our cheap excursion trains we use the ordinary old style of vehicle, and the length of an excursion train is about 540 feet. The platforms require to be long to accommodate trains of that length and to leave a little margin for coming and going.

393. We know pretty well what length of yard and width of platforms are required;—now, with six platform lines, what width would you require to carry on the traffic? I would like to have some time to reflect before I answer the question, because it is purely a question of what we would consider suburban trains and through trains.

394. Would the accommodation provided in Mr. Deane's plan of the proposed extension be sufficient to enable you to work your traffic? I have seen the plan which Mr. Deane has submitted to the Commission, and I am of opinion that the accommodation provided is required now, and that it will enable the traffic to be dealt with for a very long time.

FRIDAY, 26 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED JEE, Esq., M.P.
JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
FRANK FARNELL, Esq., M.P.

Stephen Edward Perdriau, surveyor, Department of Lands, sworn, and examined:—

395. *President.*] What position do you hold? I am a surveyor in the Civil Service of the Colony.

396. You have prepared a description of the foreshore of Sydney harbour? I have.

397. Will you be good enough to read the description to the Commission? It is as follows:—

STATEMENT of the ownership and present occupation of the principal-business portion of the water frontage of the City of Sydney, extending from Potts' Point, Sydney, to Jones' Bay, Pyrmont, and illustrated by a map of Sydney.

Commencing at Potts' Point, at the north-western corner of M'Quade's land; from this point, without any break, the Government are the owners of the foreshore extending along the whole of Woolloomooloo Bay, the Domain, Mrs. Macquarie's Chair, the Botanical Gardens, Farn Cove, Fort Macquarie, Sydney Cove, and Circular Quay to the southern side of Dawes Battery, a total length of about 16,460 feet.

WOOLLOOMOOLOO BAY.

The eastern foreshore of this bay, from the abovementioned commencing point at M'Quade's land, southerly to the eastern end of Cowper wharf at the head of the bay, was resumed by Government for wharfage purposes on the 1st February, 1890, at a cost of £172,275; the length resumed was about 1,350 feet, with an average width of about 200 feet, and a total area of 6 acres 3 roods 12 perches. This land is in course of development, and pile wharfs are being constructed to provide five broadside berths, each about 300 feet long, for use principally for discharging timber and road metal. These wharfs will be approached landwards *via* Cowper Wharf, and the two at the inner end are to be available for use by about the middle of April next. By dredging the mud a depth of 28 feet of water at low tide will be obtained at these berths, and the whole of Woolloomooloo Bay is gradually to be dredged to that depth; the work proceeding as the plant can be spared from more urgent work.

Cowper Wharf.

Continuing westerly, Cowper wharf, about 1,400 feet long, with a jetty in the middle about 260 feet long, occupies the head and south-western corner of Woolloomooloo Bay; it is now used almost entirely for over-sea vessels—the Gulf Line for example—cargo steamers of over 3,000 tons gross. These pay no rent for the wharf, but the dues collected by Government under the Wharfage and Tonnage Act during 1896 for Cowper wharf amounted to about £6,000; this includes £250

per

S. E.
Perdriau.
26 Feb., 1897.

per annum for the two sheds used for wool-dumping, and situated at the western side, on what was formerly known as the Admiralty wharf. It also includes the £15 per annum paid by F. Ireland, waterman, for permission to occupy a small area having a water frontage of about 15 feet adjoining the north-western end of Cowper wharf.

The next occupation of the foreshore northerly is by the Health Department, about 370 feet, for a quarantine reserve or depôt; thence bordering the Outer Domain, the remainder of the western side of the bay is used for men's and women's swimming baths, and rowing club and other boat-sheds. This length, about 1,400 feet extends to what may be considered the outer limit of Woolloomooloo Bay, viz., the Domain footpath at the water's edge immediately to the north of the Sydney Rowing Club shed. Close to high-water mark along this 1,400 feet the water is shallow, but the soundings show a depth of about 18 feet to mud at low tide at a distance of about 200 feet off.

398. *Mr. Hoskins.*] Have not the corporation an engine-shed there? Yes; but it is on Crown land.

From the commencing point at M'Quade's to the said outer limit, the length of the foreshore of Woolloomooloo Bay is about 4,535 feet.

399. *President.*] That is all available for wharf frontage if required? Yes.

400. *Mr. Roberts.*] Are all the baths the property of the Crown? The structures themselves are not the property of the Crown; but the land on which they stand is Crown land.

From the commencing point at M'Quade's to the said outer limit, the length of the foreshore of Woolloomooloo Bay is about 4,535 feet, or the same length as a straight line in Darling Harbour, drawn from the north-western corner of the Australian Gas Company's wharf through Pymont Bridge to the foot of Bathurst-street.

WATER FRONTAGE OF THE OUTER DOMAIN AND BOTANICAL GARDENS, FARM COVE.

Continuing from the Sydney Rowing Club shed, the foreshore, being that of the Outer Domain and the Botanical Gardens, about 5,200 feet in length, is used exclusively for public recreation, and for the greater part is delimited by an ornamental stone sea-wall. Skirting the peninsula, at the end of which is Mrs. Macquarie's Chair, it extends along the head and western side of Farm Cove (embracing the 200 feet length let to F. Cavill, on lease for baths, at a rental of £20 per annum) to the gate of the Botanical Gardens, at the southern end of the road lying between Government House grounds and the sea-wall. The depth of water at 150 feet out from high-water mark, on that part lying between the Sydney Rowing Club shed and Mrs. Macquarie's Chair, is from 26 to 31 feet, to mud at low tide. Thence along the remainder of the 5,200 feet the water is shallow close to the sea-wall of Farm Cove, but in the middle of the cove there is a depth of from 16 to 36 feet at low tide. Borings have not been taken in this cove to test the depth of the mud.

AT AND NEAR FORT MACQUARIE

From the said gate northerly, and again westerly, the sea-wall is continued along high-water mark bounding, *in route*, the road last referred to and the reclaimed and level land of Fort Macquarie peninsula, a distance of about 1,680 feet to the North Sydney horse-ferry dock. The fort of course is obsolete; and no practical use, but for public recreation, is made of this 1,680 feet, with the exception of the four small portions occupied respectively by the Men of War jetty, the watermen's boat dock, the jetty for shipment of explosives, and the large sewer at the northern extremity of the point. The water is very shallow at places along this wall. At a distance of 100 feet out it varies from 13 feet to 20 feet in depth at low tide, and borings at that distance out, recently made along a considerable length at the north-eastern corner of the point, show rock bottom at about 13 feet from low tide level.

CIRCULAR QUAY.

From the North Shore horse-ferry dock at the outer end of Sydney Cove, south-westerly, lie, in the order mentioned, the berths of the mail steamers of the Peninsular and Oriental Co., Messageries Maritimes Co., and the Orient Co., a length in all of about 1,500 feet, commanding the depth common to all the berths for over-sea vessels at the Circular Quay, viz., 28 feet at low tide. From the Orient Co.'s wharf, the remaining berth, about 500 feet long, extending to the floating jetty at the foot of Phillip-street, is occupied by ships and steamers promiscuously bringing general cargo and shipping wool and other Colonial produce.

The floating jetty is used for the casual requirements of harbour steamers carrying principally excursionists; and thence westerly the whole of the head of the Circular Quay to the site of the old Queen's Wharf, at Pitt-street north, about 980 feet is occupied by passenger jetties, and with the exceptions of the Princess' Stairs, located about the centre of the Quay, and the jetty immediately to the east of same, the jetties are let at fixed rentals to the ferry companies, viz., Watson's Bay Co., Manly Beach Co., and the North Shore Ferry Co., who occupy the two most westerly jetties. On the western side of the Quay considerable improvements have recently been effected in the erection of new wharfs and sheds, and others are in progress. The most southerly berth, about 460 feet long, is occupied by the Nord-Deutscher-Lloyd line of steamers. It was here that the German steamer "Friedrich der Grosse," of 10,000 tons burden, was berthed, the largest steamer that ever came south of the line. The next berth northerly, about 440 feet long, is under improvement in preparation for the Eastern and Australian line of steamers which now berth at Smith's Wharf, Miller's Point.

The third and most northerly long broadside berth on this side of the Quay, about 409 feet in length, is occupied by the German-Australian line of steamers. This berth, together with the 550 feet (about) in continuation north-westerly, comprised the frontage of the A.U.S.N. Co.'s land, which was resumed by Government in October, 1887, at a cost of £275,000. Two jetties, one of which is 400 feet long, and used by the Port Line and other vessels for general cargo, extend into the Cove from the last-described frontage; and this adjoins on the south the 120 feet now used to berth the Marine Board launches and other harbour steamers of the Government, reaching to the southern side of Dawes Battery. This land, having 120 feet frontage to the water and about 275 depth and 75 feet frontage to George-street North, was purchased by Government on the 8th of October, 1887, for £29,000.

The total length of frontage to the Circular Quay, from the horse-ferry dock to Dawes Battery, is about 5,045 feet.

401. *President.*] What is the length of water frontage from the northern end of the Botanic Gardens to the horse-ferry dock? About 1,680 feet.

The average earnings for each of the seven long berths at the quay, four of which are on the eastern and three on the western side, was about £4,500 for the year 1896.

DAWES BATTERY.

Dawes Battery at Dawes Point, and the smaller area of land westward of George-street North, whereon the Artillery Barracks and public baths are erected, is held under lease at a nominal rental by the Government of New South Wales from the Imperial Government, who are the owners by deed issued to the Ordnance Department. The total water frontage is about 1,980 feet. A proposed exchange, which will in all probability be effected, cedes this land to the Colonial Government.

402. What proposal do you refer to? There has been a proposal made that all the property held here by the Imperial Government shall be ceded to this Government, with the exception of Garden Island, and they leave it to the generosity of the Government to purchase Admiralty House for them at North Shore.

403. Can we take it for granted that the 1,980 feet of water frontage you mentioned will become the property of the Colony in the future? I got that information from the Chief Surveyor, who has gone into the matter fully, and knows the details of the proposal.

THE ASSOCIATED WHARFS.

These are, of course, private property, except where the reclaimed land has not been purchased from the Crown: Commencing with Walker's wharf, at the Artillery Barracks above referred to, they extend westerly and round Miller's Point, and thence south-easterly, finishing with Dibbs' wharf at Clyde-street, a total length of about 4,370 feet. These have

S. E.
Perdriau.

26 Feb., 1897.

S. E.
Perdriau.
26 Feb., 1897.

have thirty-three berths in all, and are known as the back wharfs, Circular Quay being the front wharf. The gradients of the roads of access to these wharfs are very steep, varying from 1 in 10½ to 1 in 15. Ships and steamers berth here, bringing general cargo from England and the Continent, and taking in wool and other colonial produce. There are large wool stores on nearly all these wharfs, notably at the Central, Dalgety's, and Dibbs'. and since the increased measure of freetrade in the fiscal policy of the Colony, some of the buildings formerly used as bonded stores are also available for wool, &c. The wharfs are associated to prevent undue competition for business among their owners, also so that vessels consigned to any proprietor in the Association can berth at any wharf that may happen to be vacant at the time of their arrival. All the berths are valued by the Association, and the wharfages collected by the Secretary, and dividends *pro rata* are distributed at intervals throughout the year. Except during the wool season, lasting about five months, these wharfs could do more business than they get, and the Secretary to the Association, Mr. Benson, stated before the Public Works Committee, about three years ago, that the wharf accommodation of the port of Sydney was four times as great as the requirements, and that at the associated wharfs they only get 270 over-sea vessels a year, whereas they could berth 500.

Some of the associated wharfs, including the land and the stores and jetties, are worth as much as £100,000 each. The value varies very much with the business connection of the proprietor, and evidence on oath is available, showing that, when one of these wharfs was used by a business house in the city, doing a large import trade, the wharfages, if collected, would have amounted to about four or five times the value to be derived by placing the wharf in the Association.

EASTERN SIDE OF DARLING HARBOUR.

FROM CLYDE-STREET TO THE GAS-WORKS.

This frontage—about 675 feet—has not been used for shipping, probably on account of the great difference in level between the Kent-street frontage and high-water mark, and the precipitous character of the land.

The holdings are of comparatively narrow width, with the exception of the site for ferry and landing place—about 260 feet frontage—dedicated 15th August, 1871, which, however, has never been used for that purpose. It is under the control of the Sydney Municipal Council, and the part of it fronting Kent-street is used as a depot for wood-blocks.

AUSTRALIAN GAS-LIGHT COMPANY'S WORKS.

This property has considerable frontage to Kent-street (whereon are the offices and coke yard), and to the harbour about 575 feet. I am informed by the chairman of directors that at a very rough estimate the claim by the company, if this property were resumed, would be about £400,000 for the land, buildings, machinery, and disruption of business.

FROM THE GAS-WORKS TO PYRMONT BRIDGE.

(About 3,200 feet.)

Upon this frontage are located the wharfs of the principal coasting and intercolonial steamship companies, which necessarily must find accommodation in close proximity to the Sussex-street stores, where their cargoes of farm and other produce are sold. Three short lengths of this frontage, viz., that of the sewerage reserve, the Balmain Ferry Company's wharfs, and the Patent Slip wharf, belong to the Crown; and two other portions, viz., those of the Lime-street wharf, about 330 feet, and the Market wharf, about 260 feet, also are Crown property, but are vested in the Municipal Council of Sydney. The Grafton wharf, which adjoins the Gas-works, is now used for over-sea vessels. It was until a few months ago occupied by the A. U. S. N. Co., who have removed to the Lime-street and Patent Slip wharfs, situated further up the harbour. The principal companies occupying the wharfs along this very important trade centre are the North Coast, Union of New Zealand, Huddart Parker, Illawarra, A. U. S. N., Howard Smith's, and the Hunter River New S. N. Co.

FROM PYRMONT BRIDGE TO THE HEAD OF DARLING HARBOUR.

(About 2,080 feet.)

Several of these holdings embrace valuable portions of land reclaimed from the harbour which have not been alienated from the Crown. These are referred to in full detail in a schedule prepared by me and read before the Public Works Committee in 1894, when the proposal to remove the Pyrmont and Glebe Island bridges was under consideration.

There are some valuable wharfs on this southern side of the bridge, viz., the Albion, McIlwraith's two (now R. Reid), the Union Co's., and Russell's wharf (now J. Taylor and others). About a dozen properties are comprised in this length of frontage, and they are used respectively for almost every kind of wharf business. Coastal, intercolonial, and foreign steamers and ships berth here. Some are used for timber, others as coal depôts, and on one is a flour-mill.

Since the bridge opening has been widened to 51 feet, cargo steamers of from 3,000 to 4,000 tons gross register berth at McIlwraith's new wharf; but as the depth of water in the bridge opening is only 22 feet at low tide, the largest vessels must pass through at high water.

WESTERN SIDE OF DARLING HARBOUR.

From the head of Darling Harbour to the western boundary of Darling Island the whole of the water frontage, a total of about 6,810 feet, belongs to the Government.

IRON WHARF AT THE DARLING HARBOUR RAILWAY-YARDS AND NEW PILE WHARF EXTENDING TO PYRMONT BRIDGE.

The iron wharf, commencing at the Fresh Food and Ice Company's Works at the southern extremity of Darling Harbour, extends on a flat curve north-westerly about 1,450 feet, having projections 60 feet wide, extending 40 feet into the harbour, dividing the berths, which are each about 240 feet long. The width of the wharf is 34 feet to the railway, which follows it throughout. The principal business at this wharf is in timber (for despatch by rail) discharged from small coasting vessels, and in railway material lightered from over-sea ships. These berths are not long enough for modern over-sea vessels, and the depth of water commanded is insufficient. The depth of water at the bridge opening is only 22 feet at low tide.

Reference might here be made, in passing, to the fact that the wool, tallow, hides, wheat, and other colonial produce brought by rail to Darling Harbour is there placed upon lorries or drays and carried through the streets to the various stores in the city to be afterwards carted and shipped. The delay and inconvenience to business caused by this process will be avoided by continuing the railway as proposed, and hereafter referred to, to Darling Island, which is to be made the shipping depot.

A new pile wharf occupies the 1,150 feet of space between the end of the iron wharf and Pyrmont Bridge. Here also the depth of water is insufficient, being not more than 20 feet at low tide; but at the one berth, 250 feet long, which projects 40 feet into the harbour, the rock is being excavated to provide a depth of 26 feet to admit of the direct shipment of frozen meat, which will be carried from Geddes' store close by, by means of an overhead tramway.

PYRMONT.

(From Pyrmont Bridge to Darling Island.)

The land from the bridge north-westerly to Murray-street, having about 890 feet water frontage, and bounded by Union-street, was resumed for railway purposes on 14th June, 1881, at a cost of £117,829. Some years ago it was wharfed, and two piled railway jetties, each about 460 feet long and 60 feet wide, and carrying three railroads, were thrown out into the harbour. They are used for shipping coal, shale, horses, &c., earned by rail. Two railroads from Darling Harbour yards cross Union-street at the bridge abutment.

The water is being deepened at these jetties to 28 feet at low tide. That depth has been reached along the greater portion of the eastern side of the more eastern jetty and the wharf. At the other berths it is not more than about 23 feet. The deepening will proceed as soon as the plant can be spared from work which is considered more urgent.

At the root of the more western jetty and on its western side the pontoon is berthed to receive the refrigerating railway car containing frozen meat from the country. Thence it is towed to the Pastoralists' Association Stores at North Sydney. The meat is shipped from the stores direct for Europe, &c.

Continuing north-westerly the block of land bounded by Murray, Union, and Edward Streets, and Darling Harbour, and that bounded by Edward, Alma, Alma extended, and John Streets, a total water frontage of about 1,205 feet, were resumed on the 7th August, 1896, for a public wharf and approaches thereto for the extension of the railway system to Darling Island.

The

The demolition of buildings on the site of the proposed railway lines at the corner of Edward and Alma Streets has already been effected. The claims for compensation have not been settled; consequently the cost of the resumption cannot be stated. This frontage was used principally in connection with the timber trade, but several important portions of the reclaimed land abutting the water has not been purchased from the Crown.

Crossing John-street, Darling Island is reached—an area of 8 acres 1 rood 37½ perches, having about 1,900 feet of water frontage. It cost £135,000 when purchased by the Government on the 4th June, 1889.

The patent-ship and appliances of the old A.S.N. Co., whose repairing shops were located here, have been removed, and the island quarried down to a uniform shipping height.

The scheme for improvement of the berthage includes the construction of a solid quay of concrete, along the water frontage of the island. The depth of water to be provided is, as usual, 28 feet at low-tide. The outer limit of the quay-wall has been located some distance from the present shore-line, so as to curtail the amount of dredging and excavation as much as possible.

CONCLUSION.

Finally, this investigation shows that of the water frontage between Potts' Point, Sydney, and Jones' Bay, Pyrmont, the Government own and are in possession of about 23,500 feet. About 9,800 feet is held by private persons, and three portions, fronting Crown lands, totalling about 870 feet, are held by the Municipal Council of Sydney as trustees. By the addition of the frontage of Dawes Battery, the length owned by the Government will be increased by 1,980 feet (about).

Dividing the total water frontage into sections, according to the uses to which it is put, shows:—

1. Woolloomooloo Bay, from M'Quade's to Domain roadway, immediately north of the Sydney Rowing Club shed—about 4,535 feet.
2. From said roadway to entrance gate to the Botanic Gardens, opposite Government House grounds—5,200 feet.
3. From said entrance gate to the horse-ferry dock at Port Macquarie—1,680 feet.
4. Circular Quay, from the horse-ferry dock to Dawes Battery—5,045 feet.
5. Dawes Battery—1,980 feet.
6. Associated wharfs, from the Artillery Barracks at Dawes Battery round Miller's Point to Clyde-street—4,370 feet.
7. Eastern side of Darling Harbour, from Clyde-street to Pyrmont Bridge—4,450 feet.
8. Pyrmont Bridge to head of Darling Harbour at railway yards—2,080 feet.
9. Western side of Darling Harbour, from the railway yards along Pyrmont to western boundary of Darling Island at Jones' Bay—6,810 feet.

404. *Mr. Hoskins.*] Does your statement of the water frontage in the hands of private owners include the sinuosities of Darling Harbour? I have not followed them closely. At the Central Wharf, for instance, vessels are moored, although the frontage itself is not large enough. This statement does not indicate the berthing frontage; it shows the length of frontage of the land; it does not follow the sides of the wharfs.

405. *President.*] It is the ordinary way in which you measure water frontages? Yes.

406. If Government and private properties are measured in the same way, the comparison is a correct one? Yes.

407. The State is in possession of three-fourths of the foreshores of Sydney proper? Yes.

408. *Mr. Hoskins.*] Some of the other owners have not a legal right to the foreshores of their holdings? That is so.

409. They have not obtained the permission of the Crown to reclaim the land? In many cases that occurs.

410. *President.*] Have you prepared a description of the frontages to Blackwattle Cove? Yes; it is as follows:—

BLACKWATTLE COVE.

Blackwattle Cove lies between Pyrmont and the Glebe; it is within 1½ mile of Redfern Railway Station, and ½ mile of the nearest point on the railway at Darling Harbour.

The water-frontage land on the northern shore of the cove is nearly level, being reclaimed land. It forms part of the Harris Estate, and access to the water is very convenient from Banks-street and Gipps Crescent, which bound the water-frontage allotments. About half the total length of the foreshore, which is about 2,500 feet long, is leased to various persons, and used principally as timber-yards. The freehold value of these allotments varies with their position and depth, from about £30 per foot near the bridge to about £70 per foot at Pyrmont Bridge Road.

The southern foreshore of the cove is about the same length as the northern, but is much steeper, the gradients of the roads leading to the water being very severe. The southern shore is inferior to the northern shore for business, and the design of subdivision of the locality is inconvenient for access to the water; consequently land values are much lower than on the northern side. There is one large timber yard on this side of the bay at the Pyrmont Bridge Road, and about half the remainder of the water frontage is occupied for businesses of less importance, and the rest for residential purposes.

The Government wharf at the head of the bay lies between the Pyrmont Bridge Road and the cove. It is 1,075 feet long, all in one straight line, and forms the head of the cove. The wharf is used for discharging road-metal from vessels carrying up to about 320 tons, and was built when the natural head of the cove was reclaimed from the harbour, and formed into the recreation reserve called Wentworth Park.

Direct access from Blackwattle Cove to the city is provided through Pyrmont, and thence by the bridge to Market-street; but the gradients of the roads traversed and which cross the backbone of the Pyrmont Peninsula are somewhat steep.

The gradient is easy from Blackwattle Cove, *via* Wattle-street, to Redfern Railway Station.

The Glebe Island bridge connects that Island with Pyrmont, and obstructs the natural access to the cove. The bridge opening is situated at the Pyrmont end, and is sufficient to allow of vessels up to 34 feet beam passing through. In the opening there is a depth of 12ft. 6 in. of water at low tide. I was informed that a new pile recently driven at the western side of the opening required to be 50 feet long to reach the rock.

On the 21st November, 1894, the Public Works Committee, after inquiry, reported against the replacement of the bridge by a new structure.

DEPTH OF WATER AND BORINGS TO ROCK.

The depth of water in the cove is from 7 to 13 feet at low tide; in a few places it reaches 20 feet. This is sufficient for the present requirements, *viz.*, for vessels up to about 400 tons burthen, laden with the timber and road-metal referred to above.

The dredge is now at work in the cove lifting mud, which is taken to the large reclamation work in progress about half a mile away, at Johnstone's Creek, Rozelle Bay.

Soundings north of the bridge show a depth of from 18 to 19 feet. Seventeen borings upon two longitudinal sections extending across the bay show a depth varying from 21 feet to 36½ feet in the middle of the bay. At one place there was only 8½ feet to rock. These sections were located respectively north and south of the bridge, and distant therefrom about 100 feet. Borings have not been taken to test the depth to rock throughout the bay.

I desire to point out to the Commission that the assessment of wharf properties by the Municipal Council of Sydney is made on the buildings and land alone; it does not include the machinery, nor the trade done, nor the value of the pile structures extending beyond high water-mark.

411. It does not include the disturbance of trade or the destruction of trade? No.

412. Will you prepare a separate estimate of the value of the wharfs? I will.

413. What is the area of the Gas Company's property? It has an area of about 6 acres (by scale on this map, which is drawn to a very small scale), with a frontage of 575 feet to Darling Harbour.

S. E.
Perdriau.

26 Feb., 1897.

MONDAY, 1 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

John Harper, Goods Superintendent, Department of Railways, sworn, and examined:—

J. Harper.
1 Mar., 1897

414. *President.*] The Commission desire some information with regard to the import and export of goods to and from New South Wales, so as to ascertain the quantity that goes direct from the ships to the railways and from the railways to the ships? It will be absolutely impossible for me to give that information.

415. How far can you go? I can give the Commission information as to the number of bales of wool which came to Darling Harbour last wool season. The number of bales during the period ending last wool season was 429,390. That number of bales was delivered to the various warehouses in town by waggon; 33,816 bales were lightered in Darling Harbour to various wool warehouses, chiefly to Kirribilli, where there is the Australian Pastoral and Finance Co.'s store. During the same period 172,601 bags of wheat and flour passed over the wharfs at Darling Harbour.

416. That is inward? Yes; and there were 140,758 tons of coal and 21,634 tons of shale shipped.

417. That is shipped direct from the railway? Yes. The timber I could not get. Then there were 236 trucks of chilled beef passed out of Darling Harbour, but that does not necessarily mean that it was for direct shipment, as a large portion of it was taken by lighters to Kirribilli, there to be stored and frozen. This practically represents all I can give you, beyond this—that approximately 75 per cent. of that wool was offered in Sydney for sale, necessitating its being shown in the various warehouses.

418. There would be a good deal of the wool in the remaining 25 per cent., I suppose, sent down to Sydney dumped, but even that would not be put on board ship direct? Only a small portion. The Orient Company takes some direct to the ship's side.

419. Nearly all is stored in the warehouses for some time? Yes; it either passes into the hands of wool-brokers or goes into the dumping stores. The 75 per cent. I have referred to represents wool actually offered in Sydney for sale.

420. *Mr. Humphrey.*] About how many bales already dumped arrive in Sydney by rail? About 12,000 or 14,000 bales.

421. *Mr. Hoskins.*] You have no hesitation in saying that only a small proportion of the wool which is sold here is not taken to warehouses before it is shipped? The greater portion of it is sent to warehouses to be dumped; the smaller portion is taken direct to the ship's side. Over 60 per cent. of the whole wool export from Sydney is loaded into ships leaving wharfs on the eastern side of Darling Harbour.

422. *President.*] Where is the residue shipped? Either at Woolloomooloo or Circular Quay; nothing from Darling Harbour railway wharf. Sixty per cent. of last year's clip, if not more, was shipped from wharfs on the eastern side of Darling Harbour, between Dawes Point and the bridge.

423. *Mr. Hoskins.*] Is not that wool sold at auction? It is chiefly wool that has been sold at auction which is sent there for shipment. Most of the foreign buyers ship from Miller's Point.

424. *President.*] Can you divide the remaining 40 per cent.? No, I could not; that is distributed about the city.

425. *Mr. Hoskins.*] Do you think that if warehouses were built, and proper shipping appliances provided at Darling Island, buyers would be disposed to send their wool there for shipment, thereby diverting the trade from where it is now? It will be a long time before it is diverted from its present channel, but there is no room at Darling Island. Two of our modern warehouses would cover Darling Island. Then there is another difficulty. The Pastoral and Finance Association at Kirribilli Point were anxious that all their wool should be loaded in trucks by itself, so that it might be shunted down on to the wharf, and there placed in the lighters; but after two years' experience that was found impracticable, because in picking up the wool at the stations it was found impossible to get a truck load at one station. Wool sent to different consignees would be put into the same truck, so that one truck would contain wool for three or four different consignees, and ten bales of the quantity in the truck might be all that a consignee desires to have lightered. The contents of the truck have therefore to be split up.

426. *President.*] From what you have stated, it would appear that all that could be saved by bringing the railway down to the wharfs is the cost of the dry carriage? I could not say that, because the wool would have to be distributed at the wharfs again.

427. What does it cost the railways to send the wool from Redfern? Threepence per bale all over the city, the contractor providing all the loading and unloading. Roughly it comes to 1s. 6d. a ton.

428. Therefore, the delivery by railway would save 1s. 6d. per ton, but it would be surrounded by conditions which make it impracticable? Yes, that is the position.

429. Do you see any likelihood of any change in the present conditions? I do not, the warehouses being scattered all over the city, and there being a growing disposition for buyers to purchase at different places.

430. The only cure would be to have the whole of the wool trade done adjacent to some particular wharf, and for all the wool to go to that wharf? That is the only remedy. With reference to the figures I have, I was going to add, with regard to the export merchandise trade, that I cannot give the Commission any idea of that at all, even in regard to tallow and hides. What I have said with regard to the conditions surrounding the wool relates also to these two things, tallow and hides. With regard to general merchandise going up the country, I cannot give the Commission any definite idea of that either.

431. How many tons of wool are shipped from Sydney? About 100,000 tons per annum. We carry about 70,000 tons by rail.

432. Therefore, there would be £5,000 a year saved in cartage were it possible to bring the railway to the wharfs? That would not be all saved, because certain services in connection with it would still have to be rendered.

433. Would four-fifths of it be saved? Yes, under the ideal conditions you have mentioned—that is, that all the wool should be brought to one wharf and the whole of the wool trade carried on there.

J. Harper.
1 Mar., 1897.

434. You say that you carry 70,000 tons? Yes.
435. And four-fifths of the 1s. 6d. per ton for carriage would be saved by an ideal system which would place the wool direct into warehouses adjacent to the ships? Yes.
436. And the total amount would be about £4,000 a year? Yes.
437. That is about 4 per cent. on £100,000, at the very best? That would be saved to the consignees of wool; but it is impracticable, because of the existing conditions of the large warehouses dealing with the traffic.
438. What is the total production of wool in New South Wales? It is estimated at 850,000 bales.
439. How much goes to Victoria? I could not tell you. A great deal goes to Newcastle, which we do not see at all here.
440. How much do you carry to Sydney? 429,000 bales were carried last season.
441. How many did you carry to Newcastle? 66,000 bales were shipped direct from Newcastle, and from Morpeth 69,000 bales.
442. And some from Grafton? About 2,000 bales.
443. *Mr. Wright.*] That 69,000 bales from Morpeth comes direct to Sydney? Yes; but a lot of it goes direct on board ship. The residue of the wool, apart from what I have stated, finds its way to Victoria and South Australia.
444. *President.*] What is the coal shipment at Darling Harbour—that is, the coal that goes direct on board from the railway? 140,000 tons.
445. There is no wheat export? No.
446. What about ores? There is nothing shipped from Darling Harbour direct. Not very much ore comes to Darling Harbour. A great deal of it is treated locally, and that which comes to Sydney is shipped from different places, and not from one particular point.
447. What becomes of copper and minerals of that kind? That comes to Sydney, of course, and is shipped, but not from one wharf; it is not shipped from Darling Harbour wharf.
448. What you have said up to this point deals with the export trade;—now, in relation to the import trade? I cannot give you any impression of that.
449. What of the junction of the train service with the water carriage, beyond what it is at present, in relation to sending goods into the country? The necessity for any alteration in the present state of things is very little indeed, for the simple reason that there are very few country houses which indent direct from Home. Most of them are supplied by the distributing houses in Sydney.
450. The goods received become broken packages in Sydney? Yes.
451. With regard to supplies of a heavy description, such as wire-netting, wire-fencing, woolpacks, and so on? Those are just as likely to go from the wharfs on the eastern side as from Darling Harbour, but I could not give you any definite idea on the subject. Captain Jackson would probably be better able to give you the information.
452. If the railway were extended to Darling Island, and suitable wharfs and warehouses were erected there, do you not think that a good deal of the loading for Sydney would be taken there, seeing that the island is in a central part of Sydney? As a matter of fact it is quite possible for ships to go alongside there now, but if Darling Island were made fully suitable for the loading and unloading of vessels it would not really give greater facilities than we have now. It would give increased space, but we do not find vessels going alongside there now.
453. *Mr. Wright.* Would it not give increased depth? Yes, it might; but we have had the flagship, "Orlando," I think it was, on one occasion alongside the wharf at Darling Harbour to take in coal there; so you see we do not want much increased depth.
454. *Mr. Hoskins.*] Is it a fact that half the private wharfs in Darling Harbour are almost empty half the year? I could not say that of my own experience.
455. *President.*] Have you the necessary appliances by which, if required, you could do an export and import trade from the wharfs at present in existence in Darling Harbour? Yes.
456. Have the Railway authorities noticed any tendency to doing a direct import trade? No, except in grain.
457. To what extent? I have given the figures already.
458. That is imported grain? Yes.
459. *Mr. Hoskins.*] If the cultivation of wheat largely extends in this Colony, and Darling Island be properly utilised, could not wheat be brought down by railway and loaded there? That most undoubtedly will be done; but as we have not yet commenced exporting wheat, Darling Harbour is not being utilised for that purpose.
460. *President.*] You have a large frontage for the trade now, and you do not consider that any addition to that frontage is, at present, necessary? No.
461. *Mr. Wright.*] What is the wharfage accommodation at present provided by the Department of Railways at your terminal point north of the bridge? Two jetties.
462. How many berths for ships of a good size are there at those jetties? Four.
463. Are they ever filled? It is quite exceptional.
464. What is principally loaded there now? Coal and shale.
465. What is unloaded? Chiefly railway material, and, during an exceptional season, grain.
466. So that absolutely you have now more wharfage accommodation than you require? Yes.
467. And if your present wharfs were extended to Darling Island you would have an increased wharfage equal to a trade perhaps four times as large as could be dealt with at the present wharfs? Yes, we should decidedly.
468. As a matter of fact, when the railway connection with Darling Island is made, you will have a very long length of wharf, sufficient for any trade you may get? Yes; provision is made for six berths there which will accommodate any vessel.
469. You have already four berths, and with the six you speak of you would have ten berths, each sufficient to accommodate the largest vessels; and then, in addition, you have the berths which are above the bridge? Yes.
470. So you would have berths to accommodate sixteen or eighteen ships? Yes.
471. Would not that be sufficient for the trade of Sydney? I should think so. I might mention that I was a member of a Board who considered the question of utilising Darling Island, and our recommendation was that the lines of railway should be extended to the island, but that, as the Government had sufficient wharfage accommodation, the space provided by the island for warehouses and wharfs should be submitted to

- J. Harper.
1 Mar., 1897.
- to public offer, in order that it might be leased by private persons, and warehouses of proper design erected and wharfs built, as the lessees might consider necessary, it being considered by the Board that we had more than ample wharfage accommodation for the purposes of the Government.
472. Do not the wharfs at Darling Harbour, both north and south, point conclusively to the fact that there is more wharfage accommodation in Sydney than is required? Decidedly.
473. And if you were to construct the additional wharfs you have just mentioned, you would have more than ample requirements for any trade? Yes.
474. Can you tell me if any inconvenience was felt in the past season from want of wharfage accommodation? I have never known of any.
475. Then you believe that Sydney at the present time is amply provided with wharfage accommodation for the Government and for the private wharf owners? Yes, I do.
476. If we had the railway connecting with the private wharfs in Darling Harbour, what proportion of the goods coming from England or other countries would go direct on to your trucks? A very small proportion.
477. Do you think 5 per cent.? I daresay that arrangements might be made to send the heavier goods direct from the wharf.
478. And do you think that the total amount would represent 5 per cent.? With a comprehensive scheme to embrace the whole of the wharfs, I think it would exceed that quantity; but under other circumstances I think that the question of freight so largely controls the vessels that bring out the cargo that the question of cartage from the wharf is only a very small consideration.
479. What proportion of wool do you think would go direct from the trucks to the ship? Only a small portion would go to the ships, and the rest would go into the stores to be dumped.
480. So that, with any possible scheme to supply the goods traffic of Sydney, there would be considerable handling of the goods under any circumstances? Yes.
481. *President.*] Do you know the average charge made for carting goods from the stores to the railway? Two shillings a ton.
482. *Mr. Wright.*] What is the charge for carrying the goods from the ships to the bonds? I could not say.
483. *President.*] Can you tell us what proportion of loading taken from Sydney into the interior represents the heavy class of goods, such as wire and salt? I could not tell you offhand.
484. You might give us the gross amount the railways carry up and down from Darling Harbour? From Redfern, 35,910 tons. That is all goods of all classes.
485. Going inland? Yes. From Darling Harbour, 224,564 tons. That, of course, includes everything that may be sent from Darling Harbour, including coal and timber.
486. How much comes down to Sydney for Darling Harbour? 40,000 tons of hay, straw, and chaff into Redfern and Darling Harbour, exclusive of wool and coal—375,000 tons.
487. *Mr. Wright.*] Does the Government land its own material at Darling Harbour? Yes; it is all landed by contract; it is lightered.
488. Then the ships that bring the material out do not go to the wharf? No; only in the case of having heavy locomotives on board; all the rest is lightered.

TUESDAY, 2 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

- H. Deane.
2 Mar., 1897.
489. *President.*] Have you any further statement to make? No; I came to-day to reply to questions.
490. You now furnish a map showing a complete scheme for city railway? Yes; showing practicable routes for city railways.
491. You have had all the schemes before you? Yes.
492. Any information which you think we ought to have you will see that it is furnished to us? Yes; I have considered the engineering question only.
493. Some days ago you were asked for a comprehensive scheme which would enable the railway to reach the central portions of the city, and which it would be possible to extend to Woolloomooloo Bay, Circular Quay, Darling Harbour, and also to such wharfage accommodation as might eventually be placed in the western portion of the city, and which would be no bar to an extension towards the eastern suburbs? Yes.
494. This plan which you now place before us, pretty well embraces those various objects? Yes. The map on the wall is an enlargement of the map which I produced the other day, and has marked on it the same lines which are located to suit the various purposes mentioned.
495. The map on the wall shows a line extended from Redfern to a central passenger station at Hyde Park; and turning off at Redfern yard to the east is a line which can be constructed by means of tunnels? Yes.
496. From Hyde Park it will reach Woolloomooloo Bay and form a connection with the eastern suburbs? Yes.
497. From Hyde Park, at the central station referred to, it can be extended by means of tunnels towards Farm Cove, and then turning round be run abreast of Circular Quay, and can, partly by means of a tunnel and partly by an overhead way, be taken to Redfern station, thus forming a circular railway? Yes.
498. From the vicinity of "The Rocks" the elevation will be sufficient to enable it to pass from Dawsons Point to McMahon's Point by means of a bridge? From the vicinity of Wynward-square.
499. From the line already mentioned as going to the eastern suburbs it is possible to connect with the circular railway under the Botanic Gardens, and this line can also be extended, after passing Government House, to Fort Macquarie? I should say under the Domain instead of the Botanic Gardens.
500. From Darling Harbour there are shown two lines in red which will reach Johnston's Bay, or any wharfage accommodation which may eventually be placed in the vicinity? Yes. 501.

H. Deane.
2 Mar., 1897.

501. *Mr. Wright.*] What is the object of the two lines? To utilise the frontages over there, and to reach Glebe Island by means of a bridge.
502. And to go to Balmain if necessary, I suppose? Yes.
503. *President.*] Does that appear to you pretty well the scheme which will eventually be accepted for the development of the trade? I cannot go so far as that.
504. Do you know anything better? I think, if it should be shown the lines are required in this direction, these will be practically the routes which will have to be adopted, because these are the routes along which suitable levels will be found.
505. They are all practicable from an engineering standpoint? Yes.
506. If Woolloomooloo Bay is to be approached, this, in your opinion, is the way to approach it? Yes.
507. If Circular Quay is to be approached, this is your idea of approaching it? Yes.
508. If there is to be a bridge taken to North Shore, this, in your opinion, is the best way to take it? Yes.
509. And that a circular railway, passing under portions of Sydney, in your opinion is the best? Yes.
510. In regard to Blackwattle Bay and Glebe Island, you think that is the best way to approach them if they ought to be approached? Yes. In regard to the proposal to approach Glebe Island, I may say that I have had surveys made—of course, under instructions—going down by Rozelle Bay. The lines of these surveys are shown on the map in purple tint.
511. The map also shows an approach from near Stanmore station to Glebe Island, passing over White Bay, and eventually reaching Longnose Point? Yes.
512. It also shows an alternative line keeping westerly from Whitehorse Point and junctioning on to the previously-described line at Rozelle Bay? Yes.
513. Can you suggest anything better? No.
514. You believe that eventually those will be the routes if these be the localities to be reached? Yes; with that proviso.
515. *Mr. Lee.*] If you want to get to Woolloomooloo Bay, where are you going to start your tunnel? From Liverpool-street.
516. There would be two separate and distinct lines in Hyde Park? Yes; it would be essentially a goods line to Woolloomooloo Bay.
517. *President.*] You regard it as wise to separate passengers and goods as far as possible? As far as I can see, it must be done.
518. This line might eventually reach Port Jackson at Fort Macquarie;—would it be possible to bring that as a surface line to the northern end of Hyde Park—that is, to the south of St. James' Church—and then enter a tunnel? Yes.
519. To get to a surface line near St. James' or at the north-western end of Hyde Park, it would be a surface line all the way, or a "cut and cover," or something of that kind? Yes; it would be an underground line between Liverpool-street and Park-street, and from Park-street you would rise till you got to St. James'-road. Your terminus would be a ground-level station.
520. You would really be in your station yard after you passed Park-street? Yes; it would be open.
521. How deep would the cutting be? At Park-street it would be about 20 feet.
522. It could be "cut and cover" and give as much ventilation as is necessary? Yes; up to Park-street.
523. How far south from Liverpool-street could it be "cut and cover"? There would be no tunnel till it reached there; it would be in a cutting to about half-way back to Goulburn-street, which would be crossed over.
524. Supposing you have a surface station at St. James', from there could you reach Fort Macquarie by means of a tunnel? Some of the lines would have to be lowered in order to get properly under King-street and under St. James'-road, and then there would be no difficulty about reaching Fort Macquarie or the eastern suburbs, or any other part.
525. How much would they require to be lowered? Just sufficient to get in the approach to the station—that is, about 15 feet.
526. *Mr. Humphery.*] If you continue the line which is to stop at Park-street to St. James'-road would it be a surface station? It depends upon what you want to do at St. James'-road.
527. How far is it from St. James'-road to Park-street? It is 1,120 feet from Park-street to what is shown on the plan as the end of the station.
528. Would you have sufficient space there for your terminal station and necessary platforms? Yes.
529. *President.*] And for your yards, and all that sort of thing? Yes.
530. *Mr. Humphery.*] Approximately, what would be the additional cost of making that your terminal station instead of Park-street? £50,000.
531. Would you have as much or sufficient accommodation there? Equal accommodation.
532. For six roads? Yes.
533. *Mr. Hoskins.*] How many buildings would you have to resume? The Registrar-General's Office only.
534. *Mr. Humphery.*] That is on the other side of St. James'-road? Yes; but it would interfere with it.
535. My question is based on the assumption that it would be unnecessary to resume any portion of the Government buildings fronting St. James'-road? It would be difficult to get a station in unless you did that, because St. James'-road runs very obliquely.
536. Taking the shortest distance from St. James'-road to Park-street, what is the measurement? To where it bends off it is only 960 feet.
537. Would it be possible, without any resummptions, to provide the necessary accommodation, including station buildings, between St. James'-road and Park-street? I doubt whether it would, because if the front had to be shifted back 100 feet it would interfere with the arrangements altogether at the Park-street end of the station.
538. *President.*] In your opinion it would be wiser for the State to take down the buildings than to impair the beauty of the new structure? It is not a question of beauty.
539. It is not a question of yard or platform, but a question of the accommodation—the buildings and the appearance of the new station? Yes.
540. It means an alteration in the design of the buildings, or taking in the Registrar-General's Office? It means cramping the buildings and spoiling them altogether.
541. *Mr. Hoskins.*] It would be repeating the difficulties at Redfern? The design has been well worked out, and the accommodation is not any too large, and it would be cramping the station; and, in a sense, it would be repeating what we have at Redfern.

- H. Deane. 542. *President.*] Do you propose to have a street on the eastern side of the platform following down from the Park? No.
- 2 Mar., 1897. 543. Only a footway? We should leave the Park avenue as it is.
544. The approach on the side would be a foot-bridge? Yes.
545. From a surface station at the southern side of St. James'-road, is it possible to go to Woolloomooloo Bay? Yes, by lowering the roads.
546. The same lowering which would enable you to get to Fort Macquarie would enable you to get to Woolloomooloo Bay? Certainly.
547. *Mr. Wright.*] The trains coming into your surface station do not go on to Woolloomooloo Bay or Circular Quay? If you lowered some of the roads you could take them round.
548. You would require to have roads on different levels? For that purpose.
549. Would not that be very inconvenient in working your station? I think not, because they could be dropped down from the Park-street end, so as to get the distance down which is required.
550. It would mean that passengers wishing to go beyond that point would have to go in one train, and the passengers to King-street in a separate train? Yes.
551. It would be inconvenient, therefore, to the travelling public? Passengers coming to King-street, of course, could come by either train, but some of them would stop at King-street.
552. Those going beyond King-street would have to go by a special train? They could travel by certain trains only.
553. *President.*] Would that extension, lowered 15 feet, do for the circular railway which you show on the plan? Yes.
554. Would it also do to connect with the eastern suburbs? Yes.
555. In this approach to the station through the Park, how do you propose to protect the ventilating places in the "cut and cover," between Liverpool-street and Park-street? I have not thought that out very much, but I suppose it would be necessary to enclose certain spaces by walls or some other means. I think that probably one way of doing it would be to enclose the open places by walls, and leave long stretches covered over, so that the view might be less interrupted.
556. Presuming it was regarded as unwise to erect stone structures in the Park, would there be any objection to using iron gratings over the cutting? They would be very subject to corrosion.
557. Would there be any other objection than the one that they would not last very long? I do not know that there would; I think the question of durability would be the chief question. It would be rather an expensive arrangement.
558. *Mr. Wright.*] They would not necessarily have to be above the surface? No; but they would have to be protected by strong iron railings.
559. The walls you spoke of would only rise a small distance above the surface? They would have to be high enough to prevent boys from looking over. Where boys can see over they like to throw stones. If they do not see over they are not subject to the same temptation to throw stones.
560. *Mr. Hoskins.*] Would there not be a danger of the smoke from the engines damaging the trees in the Park? I do not know that it would be sufficient for that.
561. *President.*] There would be no more smoke from the engines than from the trams running along Elizabeth-street? More.
562. *Mr. Hoskins.*] Is it not a fact that the smoke from some of the shafts on the Metropolitan Railway, through Temple Gardens in London, has destroyed the foliage of the trees? Smoke is, of course, very detrimental to vegetation. It chokes the pores of the leaves. The less concentrated it was the better it would be; because, if the smoke were concentrated in funnels or ventilating shafts, the trees immediately around there would suffer considerably; but if the whole, or nearly the whole, space were left open there would be less damage done.
563. *Mr. Wright.*] Would it not be possible to have an opening through the Park guarded by ornamental iron railings on either side? Yes.
564. So as not to interfere with the view of the Park and only taking in that bit occupied by the cutting? I am afraid that if you leave it open to the view altogether you will lead the larrikins into temptation.
565. Not if it is railed off? Not if it were screened off so that they could not see through.
566. The larrikins do not interfere with the trams running through the streets? No; but this is the case of a pit sunk below the surface of the ground.
567. Would not the smoke be less destructive to vegetation if it were distributed? Yes.
568. *President.*] That would mean taking a great deal more of the Park? Yes; I am inclined to think, on further consideration, that it might be sufficient only to protect the spaces with a dwarf wall and iron railing, because it is not as though there were a large supply of stones for the boys to throw down. There are no stones unless the boys bring them from a distance.
569. A grating might do? I do not care about a grating very much.
570. *Mr. Wright.*] Suppose this subway were covered most of the distance and some openings were left for the smoke to escape through; even with the best vents you could provide, would not the ventilation and the atmosphere be very bad with the number of trains which would be passing through? I am not in favour of ventilating shafts. I do not think the ventilation would be sufficient. I do not know that I have advocated them before the Commission.
571. You spoke of the place being walled off? They would not be mere funnels or ventilators; they would be large openings walled round.
572. *President.*] Your idea is to have a "cut and cover"? For this particular section, I think, the greater part of the space ought to be left open. I was under the impression that I had conveyed that view to the Commission.
573. *Mr. Wright.*] You think it should be an open cutting, protected on either side by rails? Yes. If you left large places open you might have a considerable length covered over (say 50 or 100 feet at a time), so that people could easily pass across the line and still leave the bulk of the cutting open. There would be no difficulty about the ventilation in that case.
574. *President.*] Is there anything else you desire to tell us? I wish to say that the plan of the station at Park-street has been worked out quite independently of the superstructure. The superstructure with its architectural features has been placed on top. The architectural design has been adapted to the ground plan which was worked out.

H. Deane.
2 Mar., 1897

575. *Mr. Wright.*] The whole of the ground floor would be required for the working of the traffic and the accommodation of the staff? Yes. The ground plan will be exactly the same as it is if no tall building is erected at Park-street.

576. I suppose you do not care to say which scheme you would prefer if left to yourself? I do not think I would care to go any further than I have said—that the Hyde Park scheme is the most satisfactory from the engineering and traffic points of view.

577. *Mr. Hoskins.*] You mean the Park-street scheme? I mean the St. James'-road scheme.

578. *Mr. Wright.*] From an engineering and traffic point of view would it be better, in your opinion, than the circular railway sketched on the map to suit the requirements of the city of Sydney? I am quite convinced that the Hyde Park scheme (putting on one side any objections, sentimental or otherwise, that there may be to using Hyde Park, the carrying of the station to Hyde Park, and the construction of a large central station there) will be a much more satisfactory scheme than any of the others. It might not meet all the requirements, but it would be satisfactory in itself.

579. What I want to know, if you care to express an opinion on the point, is whether, in your opinion, the city would be better served by a circular railway than by the Hyde Park scheme? That I would rather not give an opinion about. I am quite satisfied that the Hyde Park scheme is an excellent one—one which would probably stop agitation for very many years.

580. *Mr. Roberts.*] If you take in the Registrar-General's Office, would it not make a much more complete and satisfactory scheme to go as far as King-street? No, I believe it is better to stop at St. James'-road.

581. *Mr. Hoskins.*] Do you not think if that view of yours were carried out, and the Registrar-General's Office were resumed for railway purposes, it would lead to the judges of the Supreme Court and the lawyers finding fault with the noise at the terminus, and the whistling of the trains, and finally to the resumption of the court buildings? I do not think they would hear a sound, because it would be all covered in. The building at the front of the station would be a break to any sound or whistling, and the platforms and lines would be covered by a large roof. I do not think that any inconvenience would be experienced from the whistling of the trains.

582. *Mr. Roberts.*] Would St. James' Church be left intact? Yes.

WEDNESDAY, 3 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

H. Deane.
3 Mar., 1897.

583. *President.*] You desire to give some information which was asked for yesterday by a member of the Commission? I desire to hand in a return showing the acreage of Hyde Park, the area required for the Park-street station, the area required for St. James'-road station, and the small portion required from the Registrar-General's Office, and what is supposed to be the value of the Registrar-General's Office. It is as follows:—

	a.	r.	p.
Acreage of Hyde Park	40	0	0
Do required for Park-street Station	12	0	34
Do do St. James'-road Station	13	2	38
Do resumed from the Registrar-General's Office	0	0	26
Cost of Registrar-General's Office, £14,000.			

I was also asked to give some information as to the possibility of improving the Redfern station-yard, especially by widening the tunnel. I find that there is no difficulty about doing that—it is only a matter of expense; but whether the widening of the tunnel would effect the desired casing of the traffic arrangements is, of course, a different question. If the tunnel were widened on the eastern side it would interfere with St. Paul's School, but there would be some considerable expense in the work of lengthening the tunnel, resuming the properties, and building retaining-walls. Again, on the other side, if the tunnel were widened there, the Darling Harbour traffic and Mortuary traffic would be kept off the six roads. An alteration of that kind, it seems to me, would not have the desired effect of really lengthening the station. It will be seen from the plan on the wall that the roads leading to the station are very much pinched up a long way on the northern side of the tunnel, and without making a very radical alteration no real improvement could be effected. Then, again, you will have the consideration that Redfern station, even supposing it could be altered so as to bring the trains in comfortably to the passenger platforms, is scarcely large enough to meet present requirements. As the goods traffic increases, more accommodation will be required for it; as the passenger traffic increases, more accommodation will be required in the carriage-yard and carriage-sheds, for there is barely room there now, I understand. So that, even supposing that Redfern station could be made so that the passenger trains could be brought in and out without any great difficulty, it would not be a station which would provide for the future like the proposed stations in Hyde Park. A rearrangement of the station at Redfern would be a tremendous undertaking. To alter six roads and make them suitable while the traffic was going on would be almost a dangerous operation. During the reconstruction and alteration of the roads rendered necessary by the building of the two additional platforms A and B, very considerable difficulty was experienced.

584. *Mr. Hoskins.*] Even suppose that you widened the tunnel, and necessarily widened the road approach to the widened tunnel, would there not still be the same difficulties you now complain of in shunting from arrival platforms to departure platforms, and shunting in the station-yard? Yes; even if you widened the tunnel, in order to make a proper and convenient arrangement for the trains, you would have to remodel the whole yard. There would be room then to remodel the yard, but that would be a very great undertaking indeed.

585. If you continued the present arrival platforms—if you did not extend them further to the west by taking in a portion of Regent-street, you of necessity would be compelled, even though you widened the station and the approaches at the tunnel, to cross over from one road to another? Yes. 586.

- H. Deane. 586. The frequent crossing of engines would exist then almost as badly as it does now? Yes.
- 3 Mar., 1897. 587. *President.*] If Redfern became only a station through which the trains passed, the terminal station being removed elsewhere, it would be no difficult matter to equip Redfern with the traffic going on so as to serve for a great goods station? If Redfern were left merely as a passenger station—a station of considerable magnitude, but still only a wayside station—there would then be room for the expansion of the carriage sidings and the goods, both of which are required.
588. *Mr. Hoskins.*] If the tunnel were widened considerably, of necessity you must widen the approaches to it, and therefore you would have to resume a good deal of land and house property in Regent-street, and further on towards Eveleigh? Yes; there would be a great deal of land to be resumed.
589. Do you not think it would be quite as expensive to widen the tunnel as desired, and to resume all the land required for improving the approaches to the tunnel, as to make a terminus in Park-street, where so little private land would have to be resumed? Yes; I am quite of opinion that the cheapest arrangement in the long run is to bring the station into Hyde Park—to St. James' road rather than to Park-street—and to provide for the loss of any public recreation ground in some way.
590. You entertain very little doubt, I suppose, speaking without having examined the matter minutely, that it would cost twice as much, if not more, to resume the land, widen the tunnel, improve the approaches, and make a wider road, than to take the railway across Belmore Park and skirting Hyde Park to take a small portion of the Park? Yes; that is to say, to rearrange the whole station-yard and to provide the accommodation which is proposed in Hyde Park.
591. *Mr. Lee.*] After that was done it would then only be a temporary station? Yes.
592. It would not meet the requirements of a great terminal station? No, and it would be only sufficient for just a few years.
593. You have now exhausted, from every point of view, the question of the probability of extending Redfern yard and making it answer the purposes of a terminal station? Yes.
594. You are clearly of opinion that whatever decision the Commission may come to it is very clear that there must be a removal from Redfern? Yes.
595. Are you very clear about that question? I am quite convinced of that.
596. *Mr. Hoskins.*] I suppose you are of opinion that with the probably increasing traffic at Redfern there will be a great danger attendant upon working the traffic? Undoubtedly.

James Powell, late Collector of Customs, sworn, and examined:—

- J. Powell. 597. *President.*] You were Collector of Customs for New South Wales for many years? Yes.
- 3 Mar., 1897. 598. You are a Commissioner of Customs at the present time? I am.
599. The Commission will be obliged if you will be good enough to state your views as to the distribution of goods for export and import—that is, products and ordinary commodities? The quantity of goods sent direct to the country is and has been for many years very small. Sydney is a distributing depôt, and the houses outside Sydney importing directly from Europe and other countries are but few. I think the direct importations for the country are so small as to be scarcely worth consideration. The goods from the country—that is, wool and produce generally other than agricultural produce—do not go direct to the ships. I find that it is almost an exception for wool to be sent direct to vessels for transport. If the Commissioners wish to have more accurate information on this subject they should examine the master carriers, such as Shortland & Sons, Mr. James McMahon, the Suttons, Permewan, Wright, & Co., Wright, Heaton, & Co., and Mr. John Meloy; but certainly, as far as the goods shipped to the interior are concerned, I think that where we have direct shipments they are mostly transmitted by water—that is to say, to the Hunter or the Richmond Rivers.
600. But they all become broken packages? They come as original packages, and the bulk of them goes to the Hunter.
601. *Mr. Lee.*] I suppose the largest item of export would be wool? Yes.
602. Is it not the practice for wool to come to the city as the depôt, to be there sorted, classed, offered for sale, and, as a general rule, exportation takes place when the producer fails to get a market in the Colony? That is more frequently the case now than it was years back.
603. Is not Sydney becoming more largely a sale depôt for the produce of the country? All statistics go to show that.
604. That of itself would necessitate the wool being conveyed to the warehouses to be dealt with? That is so.
605. It is sent to its destination by the respective buyers? Yes.
606. You know that more than three-fourths of our wool is exported to London by the second-hand man rather than by the producer? That is so.
607. Would not that prove the fact that the wool has to be dealt with in the city in some warehouse? It has to be, for the purpose of sale, and also for dumping and preparing for shipment.
608. That would preclude the possibility of the wool coming direct by train, and being taken to the ship's side? I am of that opinion.
609. Have you given any consideration to the question of the Government resuming the wharfs on the western side of the city, and constructing a railway round there for the purpose of dealing with the goods traffic to and from the shipping? If with a view to feed the railways, I think the time is not opportune. I do not think the time has arrived for it.
610. If the imported goods have to go into the warehouses for distribution it is not likely that they will be put on the railway? No.
611. They will be conveyed by dray from the ship's side to the warehouse, and the bulk of the wool traffic will be dealt with in the same way? Just so.
612. Therefore, it would appear that there would be very little traffic for a railway if constructed round that portion of the city for that purpose? That is the view I have always taken of it.
613. You have had an extended opportunity of judging of these things? I have had forty-four years' experience of it.
614. You have been able to watch the growth of the trade of the port? Yes.
615. Do you think there is an inclination on the part of the producers to more largely use the port of Sydney than they did a few years ago? I do; I think the railways have helped it.

J. Powell.

3 Mar., 1897.

616. The more the railways have been extended, the more the produce has come here? Sydney has benefited.
617. I suppose Sydney must now be looked upon as really a depôt for the country? I think so.
618. For other than coal? Yes.
619. What would best facilitate the receipt and despatch of goods and produce in the shape of a city railway extension;—do you think it is necessary to extend the railway to the city for the goods traffic? I do not.
620. Do you think it is necessary, in the interest of the passenger traffic, to extend it? I do not feel myself competent to offer an opinion on the subject.
621. Will you confine yourself to the goods traffic? If the goods have to be removed by dray there is no more expense for a long distance than there would be for a short distance. The handling of the goods increases the expense.
622. If goods have to be handled it will make very little difference in cost whether they are handled from Darling Harbour to Mort's buildings, or whether they are brought from Miller's Point Wharf to Mort's buildings? I do not think there would be any difference in the cost of dealing with them.
623. Therefore it would be impossible to expect a revenue to be derived from the goods traffic on a railway along the western side of the city? I see no possibility.
624. Nor do you see how it is going to facilitate the export of the produce? I do not; that is altogether apart from the resumption of wharf frontage.
625. What I want to get at is whether you, after your very long experience, think that the trade of this port could be facilitated in any way by the construction of a line of railway along the western side of the city? I do not.
626. *President.*] If the Government purchases the wharfs on the eastern side of Darling Harbour, and subdivides them, and puts a railway down adjacent to them, and resells them, would it in your opinion be a profitable operation to the State? I think not.
627. You think the operation would end unsatisfactorily, from a commercial standpoint, to the Government? From a commercial standpoint, I believe the Government would be large losers.
628. Why? Because the merchants, and those who would receive payments for their wharfs, would compete with the Government in other parts of the harbour.
629. *Mr. Hoskins.*] Suppose that the Government wished to let these resumed wharfs to private individuals, do you think the Government would be able to get a rent sufficient to pay the interest on the money they had paid for the wharfs? I do not; the rents are being reduced at the Circular Quay.
630. *President.*] You have spoken so far with regard to the present trade of Sydney? Yes.
631. Do you see any probability in the near future of such an expansion of the import trade as would alter your view as to the value of joining the harbour with the railway system;—is trade likely to alter in any way? As cities increase in population, and new cities are created, I believe the distributing trade of Sydney will decrease.
632. As the towns inland become larger they will indent more? They will draw their goods direct from the old country.
633. Is that going on to a very great extent? To a large extent, but not to a very great extent.
634. Can you give us any idea of the percentage? No; I do not think anyone can do that.
635. Is it a quarter of the goods? Nothing like it.
636. Is it 10 per cent.? I could not arrive at it at all.
637. *Mr. Wright.*] It is not more than 5 per cent.? I have no statistics to work on, but I am sure it is very small. If you say it is 5 per cent. I am quite sure you are within the mark. I wish to make a few observations as to the possible trade of the future. I believe, as the country increases, the importations will not increase in proportion to the increase of population. I believe that we shall manufacture our own goods, and that we shall not be so dependent on foreign countries as we now are. I do not speak of any fiscal policy.
638. *Mr. Lee.*] You think that as the population of the country increases we shall supply our wants more than we do now? Yes.
639. And that a railway will not be required to the wharfs to take the stuff away? No.
640. *Mr. Wright.*] Is it within your knowledge that the large firms which existed in the interior are gradually disappearing? From my experience they are disappearing. We had more large firms in the country twenty-five or thirty years ago, I think, than we have now.
641. So that, instead of the distribution taking place in country towns, owing to the railway facilities, it takes place in Sydney, and it has decreased in large country towns? I think so; or the large firms in the country have absorbed the smaller.
642. Such a firm as the firm of Dickson Bros., of Mudgee, has ceased to exist, and no firm has taken its place? Yes.
643. The large firm of Webb & Co., of Bathurst, is now doing a comparatively small business? Yes; in direct shipments.
644. It is the same with Dalton Bros., of Orange? Yes.
645. It does not appear likely that direct importations to country towns will largely increase under any circumstances? The importations will continue, as Sydney is, and will continue to be, a distributing centre. It affords an opportunity to people in the country to keep a smaller stock and to work their business with a much smaller capital.
646. The inference is that there will be a diminishing quantity of goods going direct from the ship to the railway? That is the view I take.
647. From your experience as Collector of Customs, has there been ample wharfage accommodation in this port? I went into the question before a Royal Commission some years ago, and I see no reason to alter the opinion which I then formed, namely, that the wharfage accommodation is quite ample for the trade of the port.
648. That has been your experience for some years past? It has.
649. In the rush of our business, notably in the wool season, has the wharfage accommodation, as far as your knowledge extends, been sufficient to meet requirements? I have never heard any complaints about lack of accommodation.
650. You are aware that recently additional wharfage accommodation has been provided at Pyrmont by the railway authorities, and that they contemplate providing further accommodation at Darling Island? Yes.

J. Powell.
3 Mar., 1897.

651. Is there any likelihood in the near future—say, within the next quarter of a century—of the wharfage accommodation of Sydney being largely deficient to accommodate the shipping? Things have altered very much. The running of the lines of steamers has made a very great difference in the trade of the port. These vessels take up berths at Circular Quay or Woolloomooloo Bay by arrangement with the Government, and, supposing that each of the lines has two ships a month running, that throws out of employment a corresponding number of the sailing ships which we had years ago, and which used to take a very much longer time to discharge their cargoes. These big steamers will put out a cargo in from twenty-four to forty-eight hours. In the old times the ships were at the wharf for a month and sometimes six weeks discharging; so that far less wharf accommodation is required to get through the work than was wanted years ago.
652. The advent of large vessels taking from 12,000 to 16,000 bales of wool, in place of the vessels which took 4,000 or 5,000 bales of wool, has diminished the wharfage accommodation required at the port? The necessity for wharfage accommodation is diminished by the rapidity of loading. Statistics will show that the sailing tonnage is decreasing almost year by year, and that the steam tonnage is increasing.
653. As a matter of fact, the ocean liners—the P. and O. boats, the Orient boats, the Messageries boats, German Lloyd boats, and the Anchor and Gulf lines—are practically capable of doing all the trade of this port? They do the bulk of the trade.
654. For this purpose there already exists ample wharfage accommodation? The bulk of the oversea trade is done by the Government wharfs at Circular Quay and Woolloomooloo Bay.
655. Do you happen to know if the wharfs round towards Miller's Point—Smith's wharf and Moore's old wharf—have been much employed of late years? I have had no opportunity of knowing what they are doing. At one time I was secretary to the Wharf Association, and had to do with wharfs. I do not think they are fully employed.
656. So that there is at all times in Sydney a certain amount of wharfage accommodation over and above its requirements? Always, and a very brisk competition to get the ships.
657. Has not there been a very large discount paid by wharf-owners? I do not know what the discounts are now; but in my time, that is eighteen years back, 75 per cent. was the maximum allowance.
658. Is not that proof positive that the wharfage accommodation at all times has been more than abundant? Most undoubtedly; no better evidence can be given.
659. If the outward and inward trade of Sydney were to increase by 25 per cent., do you think that there would still be wharfage accommodation for the trade? There would be ample accommodation on the eastern side of Darling Harbour, and with the increased accommodation at Woolloomooloo Bay I think there would be quite sufficient for the Government work.
660. At the present time, do you think it would be wise for anyone to build wharfage accommodation as a commercial speculation? I do not think so.
661. As it would not be wise for a private individual to do so, therefore it would be unwise for the Government to do so? That I cannot say.
662. From a commercial point of view, if it would not pay a private firm to build additional wharfage accommodation, it would not pay the Government to do so? The Government do not charge themselves anything for the capital.
663. If they treated it from a commercial standpoint, would it pay them? It would leave a loss.
664. No railway system which could be devised would prevent spirits and other dutiable goods from going into bond? Under the present tariff the bulk of the goods would go into bond under almost any circumstances, because there are no inland country bonds.
665. Have you ever taken part in the agitation to extend the railway from Redfern to the deep waters of Port Jackson? I have had nothing to do with it. As a public officer I have always abstained from taking part in any agitation.
666. But there was a time when you were not a public officer? I never interfered with the matter; I had a fixed opinion which I have not seen reason to alter.
667. *Mr. Humphery.*] Has there been a large increase of inward and outward tonnage during the last ten years? A very considerable increase. The figures showing the commerce for last year will be published almost immediately by the Government Statistician. There has been a gradual increase every year for the last ten years.
668. Notwithstanding the increase, there has been always ample wharfage accommodation? In my opinion, yes.
669. You have expressed an opinion that in all probability our imports would not increase to any large extent in the future, owing to the probability of our being able to supply our own wants;—now, judging from past experience, would not the exports largely increase? I presume and hope that the exports will increase with the increased prosperity of the country.
670. Having regard to the probable increase of our exports, would any advantage arise from connecting our railways with the various wharfs and distributing centres? I take it, as far as we know at present, by selling wool in Sydney, or having the opportunity to sell wool in Sydney, the producers have a chance of testing two markets, and they can elect which they will sell in; but generally, in order to do that, they store their goods for inspection. The wool must go into a store to be handled and dealt with before it is shipped, and therefore a railway would be no advantage to the shipper.
671. Your view is, that the connection of our railways with the various wharfs would not be sufficiently beneficial to justify the expenditure for either the import or export trade? That is my opinion at the present time.
672. *Mr. Lee.*] The articles of produce which it would appear possible to be exported direct from the railway by ships are grain, frozen meat, butter, minerals, and fruit? Yes.
673. Are you sufficiently acquainted with the railway connection with Darling Harbour and Darling Island to be able to say whether enough accommodation is available there to carry on that business? I think more than sufficient.
674. If it were necessary to run these things down by train to the ship's side, the wharfage accommodation already exists? Yes.
675. I think the Collector of Customs licenses some barges to carry railway trucks—to carry goods generally? Yes.
676. Are not railway trucks of frozen meat conveyed from the head of Darling Harbour to the Pastoral Finance Co.'s stores at Kirribilli Point? I think they are, but the Collector of Customs has no control over the meat.
- 677.

J. Powell.

3 Mar., 1897.

677. The frozen meat is transferred from the trucks into the ships? So I understand.

678. If the P. and O. boats, and other large boats, have their wharfs at Circular Quay, it will be quite possible for them to bring their frozen meat alongside in a truck on a barge and put it on board? No difficulty about it at all.

679. *Mr. Humphery.*] You stated that the various lines of mail steamers could nearly do all the trade of the port;—could you say what is the proportion of these mail boats to the whole of the tonnage arriving here? If I referred to public statistics it would be misleading, because these large vessels only bring a portion of a cargo to each port. Although a vessel may be of a very large tonnage, she may only bring a small tonnage of goods to this port—she may bring only 200 tons.

680. In replying to Mr. Wright's question, you were only considering the tonnage of vessels, and not the tonnage in connection with the trade of the port? I kept that in mind also.

681. Are we to understand that that tonnage exceeds all other tonnage? It is superseding the sailing vessels. These liners make three trips to a sailing ship's one trip, possibly.

682. What you wish to convey is, that the wharfage accommodation at the port will be increased because these steam vessels will put out cargoes perhaps three times in the year to an ordinary sailer's one cargo, and therefore the wharfage accommodation does not require to be increased in proportion to the increase in the tonnage of the port? That is so.

683. Can you speak as to the number of sailers entering the port, as compared with the number of steamers? The information is given in the Statistical Register. Speaking from memory, the steam tonnage is larger than the sailing tonnage.*

684. Not the steam tonnage but the number of vessels? The steam tonnage and the number of vessels would be shown.

685. Is that the experience of Newcastle also? No; at Newcastle the bulk of the tonnage is sailing ships. I do not mean intercolonial traffic but oversea traffic.

686. Your advice would apply to Port Jackson only? Yes.

687. *Mr. Hoskins.*] Although the steam tonnage has largely increased, and may still further increase where they can get valuable cargoes like wool, there are cargoes of minerals and other things requiring low rates of freight, which will always use sailing vessels—such as cargoes of shale and ores? Yes.

688. *Mr. Fegan.*] You spoke of the probable loss which the Government will sustain if they resume the private wharfs;—is it not a fact that the Government wharfs are paying well? I cannot say, because I do not know what they cost. I went into the question once, and I found that there had been an enormous outlay at Circular Quay. I went back to the time when the wharf was extended under a contract with Mr. Randal. That was a very heavy expense, and year by year money has been spent on the Quay. If an account were made out I am afraid that there would be a very large loss on the Quay as a commercial matter.

689. I understood you to say that you returned 75 per cent. of the wharfage dues to sailing vessels? I did in a few instances during the time I was secretary to the Wharf Association, but the rates were higher at that time.

690. You do not think the wharfs at North Sydney would compete successfully with wharfs at Circular Quay? I think they might do so. Steam punts and lighters would bring the goods across from the ships.

691. Do you think that they could compete under present conditions, seeing that the ships can lie alongside the wharfs without requiring lighters or tenders? Suppose the Government maintains a high rate of wharfage it would pay anyone to compete with them.

692. I think you will admit that in a commercial fight the Government would be able to retain their position as against private wharf-owners? If the Government competed, of course they would.

693. If it came to a question of returning one-half or three-fourths of the wharfage dues, private owners would not stand in a very good position? The Government could lower the rates, as they have done already. I am better acquainted with the English practice in London. The Government have nothing to do with the wharfs; the dock companies provide the accommodation. But even there outsiders compete with the companies; they put the goods into small steam lighters, and they land them at wharfs on the Thames, and at less rates than the dock companies charge.

694. The rates are more excessive there than they are here? I think some of the rates are very heavy; but you have to look at the value of property there.

695. A few years ago there was an agitation against some of the most powerful dock companies because of the excessive rates they charged? Yes; and they lowered the rates. The dock companies are about the worst paying speculations a man can go into in London. I think the less the Government interferes with these matters the better.

696. *President.*] Do you think there is anything else which it would be of importance to the Commission to know? I am not aware of anything.

FRIDAY, 5 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
The Hon. DANIEL O'CONNOR, M.L.C.
HENRY CLARKE, Esq., M.P.
CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
GEORGE BLACK, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
FRANK FARNELL, Esq., M.P.

Captain John Jackson, Manager of Public Wharfs, made an affirmation, and was examined:—

697. *President.*] You are the Manager of Public Wharfs? I am.

698. You desire to hand in a return? I wish to hand in a return showing the earnings of the public wharfs for the year 1895. The total is £46,434 7s. 11d. [*Vide Appendix.*]

699. What wharfs have you in Woolloomooloo Bay? Only Cowper Wharf.

700. What wharf is the Government erecting there? Two berths on the eastern side where the land was resumed.

Capt. J.
Jackson.

5 Mar., 1897.

701.

NOTE (on revision):—1876, sailing vessels, 1,512; steam, 801. 1894, sailing vessels, 689; steam, 2,270. 1895, sailing vessels, 706; steam, 2,415.

Capt. J.
Jackson.
5 Mar., 1897.

701. How many berths will you have there when the work is complete? Nine, when the whole of what is in contemplation is complete.
702. Does that embrace the whole of the eastern side of the bay and the southern shore? Yes.
703. Where the southern shore takes a bend to the north and on to the rowing-shed will also be available some day for wharf frontage? Yes, to about the Corporation Baths.
704. How many berths could you have then in Woolloomooloo Bay? I think it would give about four more.
705. For first-class ships? They would be large berths, fit for the largest ocean-going boats coming here.
706. Is there ample room there? Yes; we could get any depth by dredging.
707. Between the Domain gates and Fort Macquarie, is there an area available for berths? Not very much.
708. Is it a suitable place for shipping? A part of it.
709. How many berths could be put in there? One good berth.
710. What berths have you in Sydney Cove? Including the P. and O. berth, there are seven berths; one is not quite completed.
711. Does that include the whole of the Government land? No, not the late A.S.N. Co.'s wharf.
712. What berthing-room is there there? It is being reconstructed; there will be five berths there.
713. How many berths does that give you in Sydney Cove? Thirteen altogether.
714. Following down the eastern side of Darling Harbour, right to the southern termination of the Darling Harbour Bay, has the Government any wharfage accommodation? Not on the eastern side.
715. On the western side, how many berths have you as far as the bridge? Eight berths.
716. You have eight berths inside Darling Harbour, suitable only for small vessels? Yes, to the southward of the bridge; but they are suitable for very large boats, too.
717. If the wharfs are properly constructed, what berthing-room will you have there? You could berth four very large ships and four medium-sized ships. You could berth eight ordinarily-sized ships there of, say, 2,000 tons each.
718. Between the northern side of the bridge and the wooden jetties running out into the harbour, what berthing-room have you there? There are three berths on the eastern side—that is, between the jetty and the bridge.
719. What have you at the jetties? The births include the eastern side of the eastern jetty.
720. What, in addition, is there? There are three large berths and one smaller one.
721. The three berths to the north of the wharf include the land between the bridge and the land side of the jetty on the eastern side of the eastern jetty? Yes.
722. How many more have you at these jetties? Taking from the bridge, six large births and one small one.
723. The Government has resumed a large portion of land, extending from these wharfs to the western side of Darling Island? Yes.
724. What room will you have there when the proposed scheme is completed? About twelve large berths.
725. No small berths? The small berths would come in between the jetties.
726. That includes the whole of the Government property, including the places where the ferries are carried on, and the frontages to those areas which are laid aside for public recreation? Yes.
727. Your statement is, that there is a possibility, without interference with private land, of thirteen berths being provided in Woolloomooloo Bay, one berth on the eastern side of Fort Macquarie, twelve berths in Sydney Cove, four large and four medium berths on the southern side of the bridge in Darling Harbour, and three berths to the north of Pymont Bridge and embracing the eastern side of the easternmost jetty, three berths, and a small one at the jetties, and twelve berths between these wharfs and Darling Island for large boats, and also accommodation for the small ones? Yes.
728. Is there enough trade to keep all your wharfs employed? Not all the year round.
729. Is there any time when the Government wharfs are not sufficient to do the trade? Yes, between four and five months in the year.
730. How many more wharfs would you have required to accommodate them this year? I could have done with four more berths.
731. Therefore, if Woolloomooloo Bay had been available and in a suitable position, you would, with these extra wharfs, have had sufficient to do the trade for this year? Yes, ample.
732. And those extensions which we have described round Darling Island and Woolloomooloo Bay appear to be sufficient for a very considerable time? I should say for thirty years. It is an immense area.
733. You make that statement after full consideration? Yes; ships are getting so much larger, and they carry immense cargoes.
734. Are you always fully equipped? Well equipped—equal to any wharf in the world—except at Pymont wharf.
735. They are shipping coal at the jetties at Pymont? Yes.
736. The coal trade there is regarded as temporary? Not that I know of.
737. There must be some alterations for the coal trade, either at these jetties or elsewhere? Yes.
738. Can you suggest a new site for the coal trade? I have not thought of the subject, but I will communicate my views to you in a few days.
739. Have you any suggestion to make in regard to wharfs for the export of wheat? I believe within a very few years the whole of the export trade will go from Darling Island.
740. It is ample for thirty years ahead? From the present Pymont wharf to Darling Island, including the island, will be ample for the next thirty years, if it is properly equipped.
741. The only drawback to the port at the present time is the unsuitability of the coal-loading appliances on the jetties at Pymont? Yes.
742. That is all that is wrong, in your opinion? Yes; my idea is that in a very few years all the Government wharfs in Woolloomooloo Bay and at Circular Quay will be wharfs for nothing else than importing, and Pymont wharf, including Darling Island, will be used exclusively for exporting.
743. Would it be an advantageous thing to connect Woolloomooloo Bay with the railway system? I do not think it would be wise to connect Woolloomooloo Bay.
744. You see no great advantage in bringing the railway closer to the port than at present? No.
745. Do you believe that the connection with the western side of the harbour is sufficient for this purpose? I think so.

746. With the large wharfage you have at Woolloomooloo Bay, ought a railway to Woolloomooloo Bay be constructed at once, or had it better be delayed? I think it will admit of delay.

747. *Mr. Lee.*] The revenue derived from the Circular Quay wharfs for 1895 was £32,000? Yes.

748. What interest does that represent on the capital? I am not able to say. I tried to get the information this morning, but I am informed that it will have to be obtained officially from the Treasury.

749. What are the working expenses of Circular Quay? I can give you the expenses as far as my Department is concerned. I do not know what the dredging might cost.

750. Will you state the annual expenses of the working of Circular Quay? I will have to refer to the Estimates before I can answer the question.

751. Are all the berths from the North Shore horse-ferry right round to Dawes Point permanently let? No.

752. How many berths are vacant? Only one of the large berths. It is the one at the south-eastern corner of Circular Quay. It is used for general purposes—that is, for sailing ships.

753. The berth is only casually let, as it is required for a sailing ship? Yes.

754. I suppose there are times when the berth is vacant? Yes; particularly in the dull portion of the year.

755. I suppose we may draw a great distinction between a permanent rental and a casual rental in this way—that is, in the wool season this berth will be fully occupied by sailing ships? Yes, and by steamers.

756. But there may be four or five months when there will be only an occasional vessel? Quite so.

757. The rented wharfs would be paying the same revenue every month throughout the year? Yes; but we collect the wharfages, which vary according to the quantity of a ship's cargo.

758. Any others? Yes; the old A.S.N. Company's wharf, which is being reconstructed. The old jetties, which are completely rotten, are being taken up. They are doing half of it this off season, and the other half will be done next year.

759. That means the erection of new jetties and new sheds and the deepening of the water to admit of large vessels coming in there? Yes.

760. How many berths are vacant there? When it is completed there will be no berths vacant, because they are all bespoken.

761. Are there any others? Not at Circular Quay.

762. Would that casual berth be suitable for berthing a line of large steamers? Yes; it is the longest berth at the Quay.

763. Is it capable of accommodating ships equal to the Orient and the P. and O. boats? Larger ships.

764. If any company wished to get a permanent wharf they could? Yes. It is 560 feet long.

765. These wharfs are let on an annual rental? Yes; an annual rental is paid in lieu of the usual tonnage dues which would otherwise be paid.

766. Do you collect the wharfage rates? We collect all wharfage inwards and outwards.

767. You get the rent and the wharfage on the stuff exported and imported? Yes.

768. At the vacant berth I suppose they pay tonnage rates and wharfage dues? Yes; the ship pays the tonnage dues, and the consignees either inward or outward pay the wharfage dues.

769. In fixing the rental of a wharf at Circular Quay, how do you arrive at what is a fair charge? We calculate how much tonnage dues a ship would have paid in ordinary circumstances. If she had been charged ordinary tonnage dues she would not have had an exclusive right to the wharf. We charge so much extra in order that the company should have an exclusive right to a berth. The calculation was worked out three years ago. I think the Orient Company would have paid between £1,500 and £1,600 a year in tonnage dues.

770. For having the absolute right to so many feet of wharfage they pay a percentage over and above what they would pay in tonnage dues? Yes.

771. Is there any growing desire on the part of shipowners to secure additional berths at Circular Quay? There has been of late. The E. and A. Co. go there for a berth and pay the ordinary tonnage dues, but they have not an exclusive right to the berth. When they are not using the berth I can use it for any other purpose.

772. If they desired to get an absolute right to the berth, could they rent it? Yes.

773. It suits their business arrangements not to rent it? Just so; it is cheaper for them not to rent it.

774. Is the tendency of the export trade to concentrate itself at Circular Quay or to divide itself at Miller's Point and round Darling Harbour? I think it has a tendency to go over towards Pyrmont.

775. Why? I could not say why; but for years large warehouses have been built at Pyrmont, and I presume it is for the convenience of getting the wool in there for sale. I do not know of any other reason.

776. You know pretty well how the goods are handled which come here from the country? Yes.

777. Suppose a railway were built along the western side of the city and the wharfs became Government property, do you think that a large percentage of the produce of the country could be taken direct to the ships and be sent straight away? No.

778. Why? Wool, for instance, has to go from the railway into the warehouses to be sorted and sold. Then, after the auction sale is over, it has to go from the warehouses to the dumping-places, and then it has to go on board the ships.

779. In other words, it is a product which has to be handled and dealt with before it is shipped? Yes.

780. Wool, I take it, is the largest item of export? No doubt.

781. Consequently it will bring the largest amount of traffic to the railway? Yes.

782. Taking the items which may be shipped direct, such as grain, frozen meat, minerals, and butter, have you seen any of these dealt with directly? I have seen frozen meat dealt with.

783. Will you be good enough to say how it is dealt with at the present time? I do not know how it is dealt with before it comes from Riverstone.

784. Is it the practice to freeze meat in the country? I cannot say.

785. Is it not nearly all frozen in Sydney? I think so.

786. How do they deal with it here? They take it in ordinary carts from the freezing works and bring it alongside the ship—even the Orient Co.'s boats—at night-time; and so they do at Pyrmont wharf and at M'Ilwraith's wharf—in fact, all the frozen meat is shipped in the way it is done in Darling Harbour.

787. Do Geddes freeze their meat at Kirribilli Point? It comes from the country in a railway truck which is put on a punt at Pyrmont wharf and taken over to North Shore.

Capt. J.
Jackson,

5 Mar., 1897.

Capt. J.
Jackson.
5 Mar., 1897.

788. If that is possible would it not be equally possible to bring that car on a barge to the P. and O. or the Orient wharf, or to Woolloomooloo Bay, and ship the stuff direct out of the cars on to the boats? It is possible, but I think it would be more expensive.

789. The frozen meat is transferred to ships in this way by ordinary vehicles as well as by refrigerating cars? Yes.

790. Does that appear to be ample for the business;—do you think it is retarding the business? The only complaint I have had—and that was only a few days ago—was received indirectly from the Riverstone Meat-works, and it was that the Railway Commissioners objected to allow their carts to go through the railway yard at Darling Harbour, because they could have shipped the meat more quickly at Pymont wharf than by going round all the way to M'Ilwraith's.

791. Is that item of export of such weight and importance that it would justify the construction of a railway round the western foreshore for the purpose of shipment? I do not think so.

792. Do you think if a railway were made there would be two train loads of frozen meat in a week for shipment? I am sure there would not.

793. Consequently that item of export is not so large as to justify any great expenditure? No.

794. It has to depend for exportation upon the available space which can be found in the mail steamers? Yes.

795. And in the specially-constructed steamers which have come here occasionally? Yes.

796. But there is no such thing as a daily exportation of frozen meat? No.

797. If it were to increase 100 times, what then? Then it could be accommodated in the new berths at Darling Island. There is no doubt that that will be the great export depôt for wool and frozen meat.

798. You are very clear in your mind that there is no justification for resuming wharfs or constructing railways to deal with that? No; I am sure they would not put it into a truck.

799. The movement of butter is very much easier than that of frozen meat? Yes; it is packed in small cases.

800. Has there been any direct exportation of grain from this Colony? Not to my knowledge.

801. If it should become an item of exportation, how could it be dealt with under existing arrangements? It could go by rail to Pymont wharf, and be shipped direct from the trucks.

802. Suppose that there was a constant trade, how many ships a year could be berthed at Pymont and Darling Island, allowing ample time for a ship to unload and load? I should say 500, but it would all depend upon the despatch which a vessel would get. It would all depend on the appliances and the despatch.

803. Do you think that will be sufficient to deal with the trade of the port for the next twenty-five years? I have no hesitation in saying yes. I do not suppose the Colony will go ahead any faster than it has done during the thirty years I have resided here.

804. Suppose that got filled up, would it then be possible to fall back upon Woolloomooloo Bay if it were all wharfed? Yes.

805. Which would give almost as much accommodation as the two places you have spoken of? Yes.

806. Practically for twenty-five or forty years ahead the Government has ample accommodation for the shipping to take the produce of the country? I thought I was very much within the mark in saying thirty years.

807. Is that your opinion? It is my opinion.

808. I suppose it would be very difficult to calculate the cost of resuming all the wharfs along the foreshore? I think so. I have given some thought to this question, and it seems to me that if the Government resumes all the private wharfs it will unhinge all the importing and exporting business for years. It affects not alone the wharfs, but all the warehouses. It seems to me that if the Government resumes all the wharfs it will have to act for a certain time as a middleman between the producer and the consumer.

809. Is there not existing among the wharf-owners a system of differential or graduated rates? As far as I know the Wharf Association charges full rates. An agreement was made some years ago that no refunds should be made, but there are wharfs outside the Association which do give very large rebates—50 and 60 and even 75 per cent.

810. *Mr. Humphery.*] Are they important wharfs? Yes; they take a very large number of import ships, and some of the export ships as well.

811. *Mr. Lee.*] If the Government resumed these wharfs it would be necessary to make a rate for wharfage or tonnage or fix a rental or have some uniform rate? The Government has that now.

812. If the Government once departed from that and began to make differential rates I presume the wharfage business would result in endless confusion? Not always.

813. Is there not a class of trade carried in ships of a cheap and unimportant character where they cannot afford to pay heavy tonnage or wharfage rates? Yes, there are goods on which the wharfage is very heavy.

814. Where they will have to go to some remote part of the harbour to get cheaper wharfage accommodation? No. It is not the unfortunate importer, but a ring in London that gets the benefit of the refunds, so I understand.

815. Suppose that all the wharfs on the western side were resumed, is there not a class of small shipping trade which would not be able to go to these wharfs? There are all the coasting traders and the different companies which have a fixed business; it would unhinge the whole of their business.

816. *Mr. Wright.*] They pay no wharfage? It is added into the freight in most cases.

817. *Mr. Lee.*] Do you think the Government should resort to that sort of business? I do not.

818. Do they resort to that sort of thing at Circular Quay? No.

819. It is not likely that the State could pursue any such underhand policy as that? No. In order that you may not be under a misapprehension, let me add that I have recommended a refund of the wharfage on the wheat coming from California. If I had not done so, the wharfs outside the Wharf Association would have taken my business away; and the railways besides the wharfs would have been losers.

820. Do you think that if the Government were to resume the western wharfs and put them in a good state of repair and keep them well equipped, and construct a railway at the back of them to convey the stuff to and fro, it would attract any more shipping to them than goes there now? No.

821. *President.*] Which, in your opinion, is the more valuable wharfage frontage in Sydney—Sydney Cove, Circular Quay, or Darling Harbour, embracing also Miller's Point to the north and that area abutting on the bridge to the south. Taking it foot for foot which is the more valuable? Circular Quay.

822. Is it twice as valuable? Yes.

823. Would it rent for twice the money taking it right through? I think so.

824. You cannot tell us exactly what it cost you to earn £32,000 at Circular Quay in 1895? I think it cost about £2,500.

825. The distance, embracing Miller's Point and Darling Harbour, right to the end of the harbour, is twice the area of Circular Quay? I think so

826. If your calculation be correct, then the gross earnings of that extent of foreshore, if it were in the hands of the Government, would be £32,000? Yes.

827. *Mr. Roberts.*] What allowance did you make on the Californian wheat? Thirty per cent.; if I had not done it, I should have lost some thousands of pounds.

Capt. J.
Jackson.

5 Mar., 1897

TUESDAY, 9 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Captain John Jackson, Manager of Public Wharfs, further examined:—

828. *President.*] You have obtained some information which was desired by the Commission on Friday? I beg to hand in a return showing the cost of the management and collection of the revenue for the year 1895. [*Vide Appendix.*]

829. Does it show the interest on the capital expenditure on each wharf? No; that information is being prepared.

830. *Mr. Hoskins.*] Have you the cost of all the Government wharfs? The Treasury is getting that information prepared, and I am preparing the whole of the revenue returns since 1874.

831. *President.*] Will you be good enough to give the figures for each wharf? In 1895 the cost for Circular Quay was £2,201 19s. 6d.; for Cowpor wharf, £667; for Pymont wharf, £583; for Darling Harbour, £314 4s.; for Blackwattle wharf, £354; for Byron Bay, £125; for Woolgoola, £125; for Coff's Harbour, £125; and for White Bay, £65. I may state that the cost of the collection in the case of the two wharfs to the northward is more than the revenue—the cost exceeds the collection by about 50 per cent.

832. You were asked to consider the respective values of the foreshores of Sydney Cove and Darling Harbour, right from Miller's Point to the end of the harbour for leasing purposes, and to submit a comparative statement based on what is obtained by the Government for the Sydney Cove wharfs, to enable us to form an opinion as to what may be reasonably expected from the wharfs from Miller's Point to the head of Darling Harbour? I must qualify the statement slightly. Circular Quay is of far greater value if all things were equal. Circular Quay is of the greatest value for the present trade, but some of the Darling Harbour wharfs—that is, the intercolonial wharfs—are of greater value for that purpose than Circular Quay would be, because Circular Quay or Farm Cove would never be suitable for the intercolonial trade. The whole business of the intercolonial trade is centred in Sussex-street.

833. Can you make a comparative statement, taking 4,000 feet of frontage in Sydney Cove and 4,000 feet of frontage in Darling Harbour—that is, 2,000 feet above the bridge and 2,000 feet below the bridge? It is only guesswork, but I should say that the wharfs in connection with the intercolonial trade at Sussex-street are of equal value with Sydney Cove wharfs.

834. Taking it right through, does the State get a fair return from Sydney Cove? I think so.

835. Can you make a statement as to 4,000 feet in Sydney Cove and 4,000 feet in Darling Harbour, taking an average of their respective values? There are some parts of Darling Harbour which are of very little value. There are 4,000 feet at Darling Harbour, above the bridge, not worth, I suppose, one-fourth of what Circular Quay is; but there are other parts of Darling Harbour which are—for instance, the Union Company's wharf, Huddart Parker's wharf, and the North Coast Company's wharf.

836. Would 8,000 feet in Darling Harbour, taking the length we have described, be twice as valuable as 4,000 feet in Sydney Cove for leasing purposes? I think 4,000 feet of the wharfs I mentioned would be of equal value to 4,000 feet at Circular Quay.

837. Would the other 4,000 feet be one-half, or one-third, or one-fourth of the value? It all depends upon what business there is to do.

838. Is it one-half the value? I should say about half.

839. Taking the whole of Darling Harbour right through, a foot of Darling Harbour would be worth, for leasing purposes, about three-fourths of a foot in Sydney Cove? That would be it, approximately.

840. Have you taken into consideration that, generally speaking, in Sydney Cove the boats are berthed parallel to the frontage, whereas in Darling Harbour they are generally berthed at right angles? Nearly in all cases.

841. Does not that fact alter your statement in any way? I do not think so. I do not consider the boats at all; I consider the frontages for leasing purposes.

842. If it were in the hands of the Government, you think you could collect for a length of the foreshore we have described, foot for foot, three-quarters of what you get for Sydney Cove? I think so.

843. If it were resumed, could we base the returns on that proportion? Yes; I would leave the jetties out altogether.

844. Is it your opinion that if the Government were to resume the frontages to the extent of 8,000 or 9,000 feet you would get between £40,000 or £50,000 a year from the lessees, or would you get more? I think we would get £40,000 a year; but, of course, it would depend a great deal upon the business done.

845. We cannot separate your reply from the information upon which you base it? There is no basis to go on except the value of the Circular Quay wharfs.

Capt. J.
Jackson.

9 Mar., 1897.

Capt. J.
Jackson.

9 Mar., 1897.

846. Do you consider that is a fair basis? The only basis we have is the public wharfs.
847. Taking the basis of the public wharfs, do you think it is reasonable to suppose that you would get £40,000 or £50,000 a year if the wharfs were resumed? I think so.
848. *Mr. Hoskins.*] Is it not a fact that a great many of the wharfs in Darling Harbour have scarcely a vessel lying at them for six months in the year? The principal part of Darling Harbour is taken up with intercolonial ships.
849. I mean the wharfs where the foreign vessels lie? Those wharfs are round at Miller's Point.
850. *Mr. Humphery.*] In estimating the value of Darling Harbour have you taken into consideration the fact that the jetties berth a larger number of vessels than can possibly be berthed if the vessels lie broadside on at the Quay? I have thought of that; but I would rather leave the jetties out altogether.
851. How can you leave the jetties out in estimating the value of the wharf frontage? If we take Circular Quay as a basis it is all frontage.
852. *Mr. Wright.*] You have jetties at the lower end of Circular Quay? Yes; but we do not use them very much. Jetty berths are never anything near the value of a broadside berth. At a jetty of (say) 35 to 40 feet they put two vessels to discharge inward cargo. In my estimation that is not right. When two vessels discharge inward cargo at a narrow jetty the cargo all becomes mixed.
853. *Mr. Humphery.*] At Circular Quay, lying broadside on, what frontage would you require for one of the Union Co.'s largest boats? About 300 feet.
854. With 300 feet frontage at Darling Harbour, how many jetties could you have? Two.
855. Which would accommodate four vessels? Probably.
856. Does it not follow, if you are using jetties at Darling Harbour and not at Sydney Cove, that for business purposes Darling Harbour must be more valuable to the lessees? It is of as much value I think as Circular Quay for that particular business. For the Union Company and the coasting boats in the intercolonial trade I think it would be fair to say that it would be of equal value to Circular Quay, but I do not think it would be of any greater value.
857. Is this what you wish to convey: that the rent obtained from one berth at Circular Quay would be equal to the rent obtained from four berths in Darling Harbour? As you put it, I think it is right. A large berth at Circular Quay would be equal in value to two jetties at Darling Harbour.
858. In estimating the leasehold value of the frontages to Darling Harbour, does your estimate of an annual rent of £40,000 or £50,000 include Sydney Cove, Miller's Point, and Darling Harbour? The whole of Darling Harbour, which starts from Miller's Point.
859. What properties would you include in your estimate? I would take from Smith's wharf right up to the iron wharf in Darling Harbour.
860. Upon what do you base your estimate? It is only an approximate estimate.
861. Would it not be more correct to say it is a random guess? It is very random.
862. It is not based on any figures or any knowledge? Except the value of Circular Quay. I told the Commission on Friday that I know nothing about the collections they have.
863. The opinion you have expressed as to the annual value of these frontages may be regarded as a random estimate? It is simply my own idea of what it would be.
864. *President.*] Regarding that opinion as an approximate statement of the value of the frontages in Darling Harbour, can we apply it round to Dawes Point on the same basis? Round by Dawes Point there are some very large broadside berths.
865. Is it as valuable as Circular Quay? No.
866. Would your three-quarters value still pretty well hold? Yes.
867. You were also to think over the question of broken goods, and the value of a railway to the foreshores of the harbour;—can you make a statement in regard to those matters? I have made a statement as to the exports. I do not think the goods put from the ships into the railway trucks would be enough to pay for the greasing of the wheels. Nearly all the cargo which arrives here is taken to the warehouses.
868. Do you know the dray freight from the ships to the railway? It varies, but I think it is 1s. 4d. a ton now.
869. Can we take 1s. 6d. a ton as a fair estimate? I think so.
870. A comparison between the cost of 2 miles carriage, road and rail, would not be a fair one, because the route is not direct? No. It has to go to warehouses to be repacked, but of course there are a few exceptional cases where it goes direct.
871. With regard to a general principle or general expenditure, those cases are not worth considering? No.
872. We infer from your evidence that Sydney is a distributing depôt for the Colony? Undoubtedly.
873. The goods are broken here? Yes.
874. Have you formed any opinion as to which will be the best shipping depôt for coal in the port? I think Glebe Island.
875. How would you get to Glebe Island? By train.
876. If the coal has to come from Eveleigh to get to Glebe Island without passing over a bridge, you would have to turn back along the southern line some little distance? I do not know anything about the lines of railways.
877. In forming an opinion as to the best place in the harbour to carry on the coal trade you have to consider the accessibility of the place? A branch railway would have to be constructed from a main line to Glebe Island.
878. You propose, in reaching Glebe Island, to cross over a bridge near the present bridge? Yes; but I could not say where.
879. Why do you believe it is the best place to ship coal at? In the first place because it belongs to the Government, and in the second place because there is deep water. There is plenty of room for constructing shoots on the island. I think the coal could be shipped by shoots instead of cranes, which would save an immense deal of labour and cost; I mean something on the same principle as the Stockton Coal Company has at Stockton wharf at Newcastle. It saves all the hydraulic machinery and everything else.
880. In your opinion the present coal-shipping appliances in this port are unsatisfactory? Yes.
881. And after considering the question you have come to the conclusion that the best shipping place will be Glebe Island? Yes.
882. Where do you think that wheat will eventually be shipped? I think it will be shipped from the wharfs which will be constructed between Pyrmont wharf and Darling Island, including the latter.

Capt. J.
Jackson.

9 Mar., 1897.

883. Where is frozen mutton to be shipped? At the same place, and the railway will bring it to the warehouse if necessary.
884. Where is the wool to be shipped? At the same place.
885. There is ample room there in conjunction with what you have got elsewhere? Yes.
886. You regard Woolloomooloo Bay as an import bay? Yes.
887. You do not believe it is necessary to connect the bay with the railway? No; I consider Woolloomooloo Bay and Circular Quay will in a very few years be used exclusively for importing.
888. And no connection is necessary with the railway, because there will be no trade direct from the wharfs into the interior at present? No.
889. *Mr. Hoskins.*] Do you think there ever will be a large trade done through the Woolloomooloo wharfs? There is a good deal of trade done there now.
890. All you are doing now with the new wharfs is to unload broken metal there for the streets? It is past the wool season now; but Woolloomooloo Bay has been pretty fully occupied during the past season.
891. With three berths; but what about the berths which are going to be built round towards Potts' Point? Only two berths are going to be built, and I think there is a firm in Sydney which will take the two.
892. As regards the import trade and export trade of Sydney, is it your opinion that Sydney is amply supplied with wharfs, and will be supplied for many years to come? Yes.
893. *Mr. Clarke.*] In your estimate of the annual revenue to be derived from Darling Harbour, did you include the associated wharfs from Walker's wharf to Smith's wharf? No.
894. Then there would be a further income derived from those associated wharfs? I think so.
895. Do you think that Darling Island would not be a very good place to ship coal from? I think it would be a pity to put coal there. I think it will be occupied by other products.
896. Do you give any rebates on wharfages? Yes; on wheat.
897. It is the custom, I believe, for the owners or agents of vessels to receive rebates? Yes, where they can get it.
898. And sometimes something is given to the captain as well? I do not know.
899. Are you aware that sometimes as much as 50 per cent., and even more, has been refunded? I am quite sure it has been as much as 75 per cent.
900. If the Government resumed the wharfs that would put an end to any rebates? I do not think so.
901. Would the Government give rebates? No; but even if the Government did not there would be plenty of foreshore where private people would put up wharfs and give rebates and compete with the Government.
902. *Mr. Hoskins.*] Suppose that the wharfs in Darling Harbour were resumed by Government, do you or do you not think that people would start wharfs in other parts of the harbour with the view of attracting customers? Of course they would.
903. Therefore, the expectation of the Government that they would get all the trade would not be realised? No; it would pay people to put wharfs on North Shore and punt the things across.
904. *Mr. Clarke.*] Are you aware that some of the associated wharfs in certain parts of the year are almost idle? All wharfs—the Government wharfs as well as the others—are.
905. That is not the case in Darling Harbour? Not at the Pyrmont wharfs, which are nearly always occupied.
906. I mean at the private wharfs? They are not fully occupied; no more are the wharfs in Woolloomooloo Bay or Circular Quay in the off season.
907. Are you aware that nearly all the private wharfs in Darling Harbour are pretty well occupied at the present time? Yes.
908. Do you think that the appliances at the private wharfs in Darling Harbour are quite sufficient for the public? I think so. Private owners seem to me to improve their properties as they are required.
909. Do the steamship companies charge wharfage in Darling Harbour? I do not think they do. In some cases they may, and in other cases they do not. I think it is generally added on to the freight.
910. Are you aware that most of the butter when it comes from the country, either by rail or sailing vessels, is sent to refrigerating rooms in various parts of the harbour, and that it is then carted to the various shipping places? Yes.
911. It would not be any benefit to the butter trade if a railway were made round the wharfs? I do not think so.
912. *Mr. Hoskins.*] Is it a fact that a number of the private wharf-owners at Miller's Point and Darling Harbour have not obtained a permit from the Government to build their wharfs in the harbour? I am not prepared to say that.
913. You do not know whether they pay any rent to the Government for the right to occupy the foreshores? I think they do; I think the Department of Lands look pretty well after that.

WEDNESDAY, 10 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C. |
 The Hon. JAMES HOSKINS, M.L.C. |
 The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C. |
 HENRY CLARKE, Esq., M.P. |
 CHARLES ALFRED LEE, Esq., M.P. |

JOHN LIONEL FEGAN, Esq., M.P. |
 THOMAS HENRY HASSALL, Esq., M.P. |
 GEORGE BLACK, Esq., M.P. |
 FRANCIS AUGUSTUS WRIGHT, Esq., M.P. |
 FRANK FARNELL, Esq., M.P. |

William Thow, Chief Mechanical Engineer, Department of Railways, sworn, and examined:—

914. *President.*] What position do you hold? I am Chief Mechanical Engineer for Railways.
915. Have you any knowledge of the various schemes of railway extension before this Commission? I have no distinct knowledge of them, except what I have gathered from the Press from time to time.
916. You are aware of the Commissioners' proposal to extend the railway system to a site in Hyde Park? Yes.

W. Thow.

10 Mar., 1897.

W. Thow. 917. You are not prepared to make a statement on the relative merits of a surface line and a line in a tunnel? No. Generally speaking, I consider a surface line very much better than a line in a tunnel. I should always prefer a station that had not to deal with a line running through tunnels. My experience of the underground railway in London would lead me to think that where tunnels could be avoided they ought to be avoided.

10 Mar., 1897.

918. Take, for instance, the question of a station site, and then divide that question into two, namely, the convenience of passengers and the convenience of working such a station, and then draw a comparison between an underground station and a surface station? Both the convenience of the public and the convenience of working are much greater on a surface station.

919. Why? The fact that passengers have to ascend and descend, even though you may give them the best appliances for that purpose, is an immense objection to a station underground.

920. The approach to the station is better on the surface than it is underground. Unquestionably. Then for the working of the station you have the thing before you in daylight; whereas, if you adopt a tunnel as an entrance to the station, you can see no farther than the mouth of the tunnel. The simplicity of working a station in daylight, as compared with a station which is approached by a tunnel, is very great indeed.

921. Is it a very vital thing, in your opinion? For successful working, I think it is.

922. You think it is almost vital? I think so. I should consider it so if I were choosing between a station on the level and a station approached by tunnels.

923. You do regard it as a vital question? I regard it as being a most important question. I do not say that both stations cannot be worked, because we know that they can. In that sense, perhaps, the word vital would be an improper one to apply to it. We know that a station may be approached by a tunnel and still be worked; yet the difference is so great that, generally speaking, I should say the importance of a station not approached by tunnels is very great.

924. In regard to efficiency, there can be no doubt about a surface station? None whatever.

925. In regard to the cost of working, is there any doubt in regard to a surface station? The cost of working is less.

926. Therefore, in regard to efficiency, convenience, and cost of working, a surface station, in your opinion, is infinitely better? Yes. Now, let me say what I meant by approaching stations in tunnels. I am speaking upon a question which would be illustrated by an underground line such as the underground line in London, where the tunnels approach the station from each side, and where the tunnels are long and continuous. A short tunnel is an inconvenience; but then it is not an objection to the same extent that long continuous tunnels are. Another distinction: tunnels on both sides of a station must make it much more difficult to work than one tunnel on one side of the station, especially if that tunnel is a short one. I want you to understand the idea of a station approached by tunnels that I had in my mind when I was speaking just now.

927. Why will an underground station be more costly than a surface station;—do you mean that it will require more hands to work it? Undoubtedly, simply because your view is limited of the working which has to be brought in to it and taken out of it. It would require an increased number of signals, I take it, as well as an increased number of hands.

928. Would it be a serious matter to have the suburban traffic brought into a terminal station in Sydney by a great length of tunnel, say a tunnel 30 chains long? I should very much prefer to have an approach without a tunnel unless the tunnel were a long way off.

929. Is there any objection to a tunnel on the line of route not immediately contiguous to the station? It depends upon how far it may be from the station. I think, for instance, the tunnel at Redfern is a very great inconvenience. That will give you an idea of what I mean. All the traffic has to pass through the neck of a bottle as it were, just a short distance from the station, and anything of that kind must inconvenience the traffic.

930. Imagine a tunnel midway between the stations leaving a distance of 2,000 feet between the end of the tunnel and the terminal station? I should think it would be a great inconvenience.

931. What objection would there be to working a line with a tunnel in it provided that you had the same width of line and that it was contiguous to the station? No difficulty unless it congests the traffic. On the Hawkesbury line there is no inconvenience in having a tunnel beyond the inconvenience of increased capital cost.

932. Take the question of the inconvenience to the passengers travelling in a tunnel 30 chains long? With regard to ventilation, I do not think there would be any difficulty.

933. You could keep the tunnel clean? I think so.

934. You could construct the tunnel so that it would not affect the travelling public? Not materially.

935. How would you propose to ventilate a tunnel of that kind? That would depend a good deal on its position. There are various ways of ventilating a tunnel. An ordinary fan and other means which produce a current of air are tried. The descent of water, for instance, carrying down a current of air with it, where the natural conformation and the supply of water are suitable, has frequently been used for the ventilation of tunnels, and very successfully, too.

936. In your opinion, a tunnel, as far as the travelling public are concerned, can be sufficiently ventilated? As far as that length of a tunnel is concerned, I do not think there would be much objection to it in the way of ventilation.

937. Have you travelled through the tunnels on the Illawarra line? That is a single line, and you can never get a single line tunnel clear because of its width. The tunnel in which it is proposed to carry the suburban traffic could be ventilated much more easily than a tunnel on a single line. I do not think there would be any difficulty in keeping a tunnel to accommodate four sets of rails moderately free.

938. Are there any other means by which you can ventilate a tunnel? Other means are used. Fires, for instance, are sometimes used, but it depends on the position, the conformation of the ground, and the construction of the tunnel, what means are used. I do not think there is any difficulty in finding a mechanical means for ventilating a tunnel.

939. Suppose that instead of passing through the parks with a cut and cover, or an open cutting with abundant ventilation, you were 30 feet under the park going from Liverpool-street towards St. James' Church, and the tunnel were 30 chains long, how would you ventilate it? I am not prepared at present to say what means I should adopt, but I have no doubt that mechanical means could be used to ventilate such a tunnel.

W. Thow.
10 Mar., 1897.

910. There is an idea abroad in the community that the moment you enter a tunnel you suffer some inconvenience, and the question is whether that inconvenience is sufficiently great to justify huge land resumptions? I think the question is simply one of convenience to the public.
911. Why, in your opinion, is a surface line better than a line in a tunnel? Simply because you have a free open line, and you are not submitting the traffic or the public to the inconvenience of a tunnel.
912. What is the inconvenience of a tunnel? There are various inconveniences.
913. Would there be any inconvenience in regard to ventilation? That you could make the ventilation in a tunnel as pure as the outside air I do not believe, but I do believe that the ventilation of such a tunnel could be effected. In the Mount Ceniz tunnel there is good ventilation. There is no inconvenience, comparatively speaking, in passing through that tunnel.
914. *Mr. Hoskins.*] The locomotives do not burn coal? They use the ordinary locomotives, and the ventilation is very good. That people travelling through the tunnels would not prefer to travel in the open air I do not believe for a moment, but still there you have an example of ventilation in tunnels.
915. Have you ever travelled by the London and North-Western Railway from London to Liverpool? Yes.
916. You are aware, I presume, that as you approach the terminal station at Liverpool you have to go through a tunnel on an incline? Yes.
917. There is very much traffic on that railway? Yes.
918. Is there any great inconvenience caused by that tunnel? I think so. I would very much prefer an open cutting.
919. Have you ever heard of the authorities of that railway saying that great inconvenience is caused by the tunnel? I am quite sure that railway people would prefer an open line. There is no railway man who would prefer a tunnel in entering an important station if he could get rid of it.
920. In the case of the underground railways in London, is the smoke in the tunnels an inconvenience? It is a great inconvenience.
921. Why? Because they cannot ventilate the tunnels to any extent; they have to trust simply to natural ventilation.
922. Why cannot they be ventilated? They have not the means of doing it without going to very heavy expense; it has never been provided for.
923. What would the heavy expense be? They would have to acquire property, put down engine-houses and fan-houses, and carry their fuel, and go to a very large expense indeed for every length of tunnel.
924. If it be so expensive a thing to do in London, why is it that it may be done so simply here? Because we would have only one tunnel, I take it, to deal with, whereas there they have tunnels right along the whole route.
925. They have air-holes in the Temple Gardens? They cut their tunnels where they are able to do it, and allow the air to pass out. There is nothing more than mere natural ventilation in those tunnels.
926. *President.*] In the underground railways in London the smoke is a great public inconvenience? The gases passing from the engine are.
927. There will be as much smoke from an engine in Australia as there is from an engine in London? Just about the same, I think.
928. There would be the same amount of smoke in a railway tunnel in Sydney as there is in an underground railway in London? Yes.
929. Unless some special trouble were taken here which has not been taken in London there would be serious inconvenience here? Unless you ventilate the tunnel by special means I think it would be a serious inconvenience.
930. Is there a special need for ventilation in London? I think so. Wherever you have a long tunnel there is a special need.
931. Notwithstanding that fact it has not been done? Not in the underground tunnels.
932. Although it has been so serious a matter, it has been regarded as wiser to allow the public to submit to the inconvenience rather than go to the expenditure of ventilating the tunnels? No. I do not think the difficulty which has since arisen was properly understood when the tunnels were made. It was assumed at the time the underground railway was inaugurated that locomotive engines could be constructed so as to confine the gases in the fire-box and smoke-box of the engine until they came to an open place, and then allow them to escape. That was the idea on which the engineers who constructed the underground railway worked, and the fact that the gases could not be confined in the engine became apparent afterwards. The tunnels have since become very foul indeed from the escape of those gases and the enormous increase of traffic which took place.
933. *Mr. Hoskins.*] I suppose you know that it is proposed to substitute electric railways under the underground railways in the metropolis? I think it is very likely that they will. The idea at the time was that they would not have to abandon the use of steam in the tunnels. Instead of allowing the steam to pass up the chimney they took it back into tanks and condensed it there, so that steam could be used all the time the train was in tunnels. The only object they had in view was to confine the gases from the fire-box in the engine, so as to prevent their emission in the tunnels.
934. *President.*] Is it a fact that in some of the recent legislation in London, the Board of Trade has prohibited the use of steam, and that in a recent Act, which was obtained by the proprietors of some important underground railway, it was made imperative that no steam should be used? I have no doubt that was the result of their experience of the underground railway.
935. Of a tunnel? Pardon me, sir, not of a tunnel, but of the underground railways. You have a special system which is totally different from ordinary railway tunnels.
936. The members of the Board of Trade are presumed to be men pretty well up to date? Precisely so; but I should think that the Board would never say that no railway company was to construct a tunnel.
937. You grant that the Board of Trade did say, in connection with tunnel work for carrying passengers in London, that they should use electricity, or rather, that they should not use steam? Where they have a repetition of the underground railway, certainly I should think the Board of Trade tried to get the best accommodation for the public that they could.
938. Does it not appear to you that the Board of Trade regarded the working of steam engines for passenger traffic in tunnels, in London, as a serious matter? Judging from the experience it has had with the underground railways, I should say yes.

- W. Thow. 969. The Board of Trade has as full a knowledge of means of ventilation as it is possible for anyone to obtain? I think so.
- 10 Mar., 1897. 970. Notwithstanding that, they believe that it was unwise to extend the system of tunnels worked by steam in London? Apparently.
971. Will you explain how you can ventilate an underground railway in Sydney and not in London? I do not think you will succeed any better in the ventilation if your underground railway here is similar to the underground railway in London.
972. Therefore, if it be an underground railway in Sydney, the differences, which are sufficiently strong to weigh with the Board of Health, ought to prevent us from constructing here a railway worked by steam? Certainly. I would not recommend an underground railway for Sydney.
973. You would have no objection to a portion of the railway being underground? That would depend on the length of the portion.
974. Will you limit your length? If it was a long tunnel I think it would be an objectionable thing; but if it is only a short tunnel ventilation can reduce the objection.
975. Give us an idea between a short tunnel and a long tunnel? I have no doubt that a tunnel, say half a mile long, would be an objectionable thing, as far as the passengers are concerned; but I do not say that even a tunnel half a mile long it is impossible to ventilate.
976. *Mr. Humphery.*] Will you explain how the tunnel through Mount Ceniz is satisfactorily ventilated? That tunnel is constructed with two inclines, ascending from a lower level to a higher level; they are not equal inclines in length, and towards the centre of the tunnel there is a natural draught.
977. *Mr. Hoskins.*] Have they not fires at the end? I am not quite sure that they use any other means than the natural means I mentioned; but I think they have openings near the apex of the tunnel.
978. *Mr. Lee.*] Have they an exhaust fan there? I do not think so; I do not think they have any mechanical appliances, unless it be fires.
979. *Mr. Roberts.*] Is there any difference between the ventilation of that tunnel and the ventilation of the St. Gothard tunnel in Switzerland? I have not been through the St. Gothard tunnel, but I know the other very well.
980. *Mr. Humphery.*] How is the smoke disposed of? It simply passes out with the air.
981. By what means—by openings to the surface? By the draught through the tunnel to the points where the air escapes.
982. What distance apart are the shafts? I am not sure; I do not think there are many shafts.
983. How wide is the tunnel? It is only for two pairs of rails.
984. It would be much easier to ventilate a tunnel able to accommodate three pairs of rails than to ventilate a tunnel to accommodate two pairs of rails? It would give a better chance for ventilation.
985. *President.*] The pollution of the air depends on the amount of smoke introduced into the tunnel? Yes.
986. How many trains a day pass through the Mount Ceniz tunnel? I am not able to tell you just now; but it is not a very rapid traffic.
987. Would there be half a dozen trains a day? Fully that, I should say.
988. It is probable that every train entering that tunnel would go into pure air,—that the tunnel would have had time to clean itself between the departure of one train and the arrival of another? I think that is very likely.
989. Do you know the traffic which comes into Redfern? Yes; we have 300 or 400 engines passing through Redfern tunnel every day.
990. *Mr. Parry*, in his evidence, said:—"On the 29th January, an ordinary day, the total number of passengers and goods trains, and light engines, passing through Redfern tunnel, to and from the station, and Darling Harbour, was 561, and the number during the busiest hour was forty-five. On last Eight-hour holiday the number of trains increased to 701, and the number during the busiest hour of the day was fifty-two." Suppose that thirty trains an hour pass through the Redfern tunnel in the morning, that is a widely different thing to consider from one train passing through a tunnel in an hour? Yes.
991. Then the question of ventilation becomes a serious question? The adoption of a tunnel is a thing which I could not recommend, but at the same time I think there are means of ventilating tunnels which might mitigate very considerably the evil you suggest.
992. The evil would still exist? To a certain extent it would undoubtedly; but that it would allow the tunnel to be as foul as a Wollongong tunnel or the underground railway tunnels in London, I do not believe for a moment.
993. Although the Board of Trade appears to regard the question of ventilation as almost insuperable, you do not think it is? I do not think it is under certain circumstances. As far as an underground railway is concerned it seems to be insuperable, and if you have a similar case in Sydney it will be insuperable here too.
994. What is your opinion with regard to using electric engines as far as Burwood or Strathfield on the western line, and Hurstville on the southern line, and running these electric engines right into the central station wherever it may be? I do not see any necessity for it. I think it will be a great mistake to introduce two systems of traction on these railways.
995. You dismiss that idea if it carries with it the extension of electricity to the suburban lines? Yes. The evil of having two systems of traction between Eveleigh and any terminal station you may erect in Sydney will be enormous. I think it ought to be placed altogether out of consideration.
996. Do you think we could apply electric traction to the whole of the suburban traffic? I do not think it would be a good thing to do. I think it would be almost as great an evil as to have a break of gauge there.
997. It is not worth consideration, you think? I do not think there is any necessity for adopting it, as far as the Sydney traffic is concerned.
998. *Mr. Wright.*] The suburban traffic is quite distinct from the through traffic? Yes, as far as the engines and carriages are concerned.
999. You do not think we should adopt electric traction for the suburban traffic alone, leaving the through rails for the through traffic? I do not see any necessity for it. To introduce it as a novelty would be a mistake, I am sure.
1000. *Mr. Lee.*] Would it be necessary, if it were applied to suburban traffic, to apply it to the long distance

distance traffic also? I do not think it would be necessary. I think the importance of having steam traction for the long-distance traffic would certainly never bring about a substitution of electricity for steam.

1001. Why would it be as bad as a break of gauge to have an electric engine run out to Hurstville on the line on which steam traction is now used? Simply because you introduce two systems of traction instead of one. At present we can take any engine we have and put it on to any train.

1002. Why cannot you do that with an electric engine? You cannot.

1003. *Mr. Hoskins.*] If you had a sufficient number of engines you could? It would make another system. It would be worse than running tram-motors and our locomotives on the same road.

1004. *President.*] Therefore we can dismiss the question of working the suburban traffic by electricity at present? I do not see any necessity for it.

1005. *Mr. Hoskins.*] I suppose you know that a portion of the Pennsylvanian railways—a large system in America—is now worked by electric engines? I know that they have been using it on some parts of their lines, but only as a trial.

1006. But they do work them? I think they have been making experiments with it, but I do not think they have adopted it yet.

1007. *President.*] An underground system of railways may become necessary in Sydney some day; electric traction in a tunnel is not a serious matter, and therefore it may be possible to do the whole of the passenger traffic from the suburbs by means of a system of tunnels, whereas if you preserved the steam you had to have a surface line or a specially-ventilated line? I think the steam will deal with our passenger traffic on the suburban line or the main line sufficiently well for the next half century at all events. Therefore I do not see any necessity to introduce electric traction unless it be on the ground of economy, and I am not aware that there is any economy in it. Unless it be on account of economy there would certainly be no attraction in introducing electricity in place of steam, as far as I can see.

1008. *Mr. Hoskins.*] In America they hold that economy is power? I doubt that. I do not think they have got very much out of electricity on railways in that respect. What I am looking at is simply economy of working. Unless electricity can be put in place of steam, for say 90 per cent. of the money which steam costs, I do not think there is any attraction for it.

1009. *President.*] Will you state the length of tunnel which you believe can be advantageously ventilated, and which will not be any inconvenience to the travelling public? I said that a tunnel under half a mile long might be ventilated by mechanical means in a way which would not be disadvantageous to the public.

1010. Would you say more than half a mile in length? I do not know that I should. I think half a mile is quite long enough for any tunnel to be ventilated by mechanical means; but if the question were put before me as to whether I should prefer a line with no tunnels to a line with tunnels, I should say, undoubtedly, the open line is by far the better.

1011. Suppose that a surface line will cost £500,000, and a tunnel will cost £250,000, then you have the question of cost also to weigh? I can only say that an open line would still, in my opinion, be worth a very great deal more than a tunnel.

1012. From a working standpoint, and also from the standpoint of comfort to the passengers, what do you think? It would be justifiable, I think, to spend more money on an open line than on a line with a number of tunnels in it.

1013. Is it possible to shut off steam at Redfern, and by any contrivance—by the attachment of an electric motor or by cable, or by any other contrivance—to satisfactorily work the line into the city, or must the train go right on with the steam locomotive? It is quite possible, but it is not satisfactory.

1014. *Mr. Humphery.*] Is it being done anywhere at the present time? It has been done in several places. It used to be done on some of the earlier lines in England.

1015. *Mr. Hoskins.*] At Lime-street station? It used to be done there, and I think also at Euston. I think the Glasgow tunnel from Queen-street station is still worked by rope. A cable is used, but the locomotive is also used, and has been used to my knowledge for thirty or thirty-five years. It used to be worked separately by a rope, and when the train arrived at the top of the incline the rope was taken off and the locomotive was put on, but the inconvenience of the delay to the public—the waiting to change the system of traction was so great that they sent the locomotive down into the station, and they now work the trains by locomotive and cable combined.

1016. *President.*] They are all abandoned? They are all abandoned, practically. At Lime-street station and at Euston they have put on powerful engines to do the work.

1017. *Mr. Lee.*] The one in Glasgow was used for the purpose of getting up a grade? They are all used more or less for that purpose, but the Glasgow grade was stiffer than the grade at other places. The first purpose was to do away with the locomotive in the tunnel at Glasgow, and they worked the train by a rope; and then they found the delay was so great that they now put the locomotive on and unhook the rope when they get to the top and let the train go on.

THURSDAY, 11 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, G.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

1018. *President.*] You are the Secretary to the Railway Commissioners? Yes.

1019. Have you a return showing the number of passengers in the railway trams which comes as far as King-street and beyond it? No; but I will furnish a return to the Commission. [*Vide Appendix.*]

1020. Can you state the number of passengers that arrives at and departs from Sydney station? For the year 1896 the total number of passenger journeys in and out of Sydney was 11,670,000. That includes it. Each season-ticket-holder made one journey in and one journey out each day.

1021.

W. Thow.

10 Mar., 1897.

H.

McLachlan.

11 Mar., 1897.

H.
McLachlan.
11 Mar., 1897.

1021. Have you divided the number into long and short distance passengers? I have divided them in the same way as the return was divided for the Royal Commission in 1890. The number of passengers booked to and from all stations within a circle embracing Ryde, Parramatta, Loftus, and Sydney, was 7,916,000—that is, what you may call suburban passengers. The journeys of the season-ticket-holders came to 2,550,000.
1022. That is within the suburban area? All season-ticket-holders. There are a few outside the suburban area, but I did not separate them. The number of passengers outside the stations I mentioned was 1,204,000.
1023. The suburban traffic represented 10,500,000 passengers? Practically.
1024. Therefore $\frac{1}{10}$ ths of the passengers traffic to Redfern is suburban traffic? Short traffic, that is in passenger journeys, but of course the money would be different.
1025. You will furnish the other information I asked for? I will furnish a return showing the number of passengers who arrive and depart from Redfern station by tram and the number of tram passengers who go as far as King-street. [*Vide Appendix.*]
1026. What does it cost per train-mile for the suburban traffic? That has never been worked out to my knowledge.
1027. Would that be a fair index to the cost of the whole traffic of the Colony? I should think so.
1028. What does it cost per train-mile for the whole Colony? According to the last report it was 4s.
1029. *Mr. Hoskins.*] It would be practically less in the suburbs? I would not like to say; it has never been worked out.
1030. *President.*] If the railway station is to be so situated that you will run half a mile beyond the distance to which you now carry passengers, it will cost you 8s.—that is for the journey and the return—for every mile you run? That is based on the same average.
1031. Supposing the railway station were placed down towards Fort Macquarie, and it should turn out that very few passengers went down to that point;—if that station were half a mile beyond the needs of the passenger traffic you would do 8s. worth of unnecessary running in every journey of the train? I do not know if you could actually work it out in that way.
1032. Can you make any suggestion? A good deal would depend on the cost. You may require to have a very expensive staff at the station, and a very large number of men in addition to your officers, and you may only run a small train mileage, consequently the cost would be heavier than 4s. The locomotive details of running come to perhaps 1s. 4d. or 1s. 6d. per mile, and the traffic details perhaps come to 1s. 4d. per mile; but then of course if you had a very expensive terminal staff the cost per mile for each additional mile, if the mileage was a short one, would come to more than 4s. It would be a very difficult question to average right through.
1033. Taking, for instance, a station at King-street, and presuming that a train is useful to suburban passengers as far as Bridge-street. If the main station be established down towards Fort Macquarie, and there be no passengers to be carried beyond Bridge-street, you will have done that amount of unnecessary running of the distance between Bridge-street and Fort Macquarie? Yes.
1034. Taking that into consideration, and imagining a large terminal station near Government House grounds, with the present set of traffic in Sydney, what would be the extra cost to the railways? The extra cost would be very largely made up of the terminal expenses.
1035. But you require to have terminal expenditure somewhere? You would require to have two terminal expenditures there, I take it. You would want an additional station.
1036. Suppose the King-street station remains a wayside station, through which your trains run, it would not mean additional expense, but a transfer of terminal expenses? No. You would have the expense at both places.
1037. The same expenses? No.
1038. If your terminus is at Redfern, or at Hyde Park, or down towards the Governor's residence, in each case you have terminal expenses? Yes.
1039. There will not be a very great difference? Still the maintenance and management of two stations must necessarily cost a great deal more than one. For instance, if you extended the railway into the city you could not do away with the whole of the staff at Redfern station.
1040. Redfern would be simply a wayside station, and the expenses there would just be the expenses of an important wayside station? Yes, for the passenger business.
1041. You could better make a comparison with such a station as Newtown than with a terminal station? Yes.
1042. It is a question simply of the running mile? Yes.
1043. What would the running of a train-mile cost? I would not like to say off-hand, but the average throughout the Colony is 4s.
1044. What does that include? It includes repairs of stock, management—it practically includes everything. That is the whole train mileage divided into the working expenses. If you ask what is the cost of running between Newtown and Sydney, or between Bourke and Byerock, of course the same average applies to both. It would take a lot of time to work out the exact cost between different points.
1045. This extra mile into the city would cost exactly the same as a mile between Macdonaldtown and Strathfield. Suppose that Redfern were pushed a mile further ahead, and that the terminal expenses were the same in each instance? There would be the extra cost of the additional station, which must be fairly heavy, and the running expenses of a mile.
1046. What are they? I would not like to answer a question of that kind off-hand.
1047. Have you any idea? In working out the estimated cost of the Sydney extension to Hyde Park the Commissioners have not attempted to work it out on the basis of an average train-mile of 4s.
1048. Suppose that Redfern were extended 1 mile towards the south, would it cost you 4s. for every train which ran over that 1 mile? If you want to know the cost, I think the matter will have to be gone into very carefully; it would not do for me to hazard a guess.
1049. Would it be 4s.? It would be simply absurd for me to attempt to give an answer. The question will have to be considered very carefully. If you want to know the estimated cost of another station a mile ahead from Hyde Park, you will have to consider how many trains you are going to run, and how many men you are likely to want. Any information which I might give on those points at the present time would be absolutely misleading to the Commission. You cannot average the question. It seems to me

H.
McLachlan.
11 Mar., 1897.

- me that it would be rather an idle expenditure to go a mile beyond King-street for the shunting. One object of the Commissioners is to have a station central for all the general business of the railways—for booking, parcels, and offices. You would want a considerable area for a central station; but if you had to duplicate that shunting accommodation somewhere else a mile away it would mean a very heavy expenditure, without much corresponding benefit.
1050. It would mean no great expenditure in regard to shunting, because the same operation has to take place wherever the terminal station is? You would require to have two establishments.
1051. There would be a terminal station and a wayside station? This wayside station would be a central station. I cannot see much advantage in going on an additional mile for a shunting station.
1052. Can you furnish any information in regard to that aspect of the case? I will mention it to the Commissioners. It would want a great deal of working out.
1053. *Mr. Lee.*] I suppose it is owing to the urgent necessity for some change being made for Redfern that this question of city railway extension now becomes one of pressing importance? Yes; that is one of the principal causes.
1054. What are the other causes? The other is to give the public the benefit of a central railway—to bring the railway into the city.
1055. One cause is the overcrowded state of Redfern yard, and the incapacity of Redfern station; and the other is the desirability of giving the travelling public—the passenger traffic only—closer connection with the city? Yes.
1056. If it were possible to overcome the difficulties at Redfern yard, and give the Commissioners all the accommodation they require to carry on the traffic, would there be any urgent necessity to bring the railway into the city? As the Commissioners point out, to do that would cost nearly as much as to bring the railway into the city, that is, provided that Hyde Park is given to them. They point out that they could enlarge, and get the accommodation they want, by extending the railway over Devonshire-street, if they are granted the Benevolent Asylum ground.
1057. I am not speaking of that, because then it becomes a question, if you are going to move the station to the north, whether it is worth while to go 100, 300, or 400 yards? Yes.
1058. The pith of my point is, that if Redfern yard, by the resumption of land adjacent to it, could be made sufficient for all railway purposes, would there be any urgent necessity to extend the railway system to the city? I think there is, for the convenience of the public.
1059. For any other reason? Not if you are going to give the accommodation at Redfern by the acquisition of land to the south of the station. Your proposal is to acquire an extensive area of land to the south of Sydney station, to give the accommodation required at Redfern. That would cost an enormous sum, and you would get no benefit from it. You would not convenience the public; you would be absolutely spending that money for nothing. But if you extend the railway into the city the Commissioners think that it will return the interest on the capital outlay.
1060. Your point then is this: that it is possible to acquire land south of the railway yard to give the required accommodation? I should think it would be; but it would be a most inconvenient thing to do, because you would interfere with the whole of the working at Redfern. To attempt to remodel Redfern, and at the same time to be carrying out improvements on the existing site, would be a most confusing and a risky, dangerous thing to do.
1061. It has been shown to the Commission that the remodelling of Redfern yard could not proceed simultaneously with the working of the traffic;—is it held by the Commissioners that it would be impossible to remodel the yard, no matter what additional land is given to them? I do not say that it would be altogether impossible, for nothing is impossible, but it would be a most risky proceeding.
1062. We have strong evidence on that point. The Engineer-in-Chief for Railways says that it could not be done? I do not think that anything is impossible, but I think it would be a most risky and dangerous thing to attempt to do.
1063. Your next point is that, even if you did acquire that land, it would be acquired at an enormous cost, and the Commissioners would get no extra revenue from it? No; and it would be no convenience to the public either.
1064. All things considered, the better plan is to go north? Yes.
1065. And, when shifting to the north, in the long run it would be more economical to go right on to Hyde Park? Yes.
1066. At Hyde Park you would deal solely with the passenger traffic, parcels, and small goods of that kind? Yes.
1067. Redfern station would be retained for a goods station, as usual? No; at Darling Harbour we deal with our goods.
1068. You would still receive at Redfern? We make up certain truck-loads, and deal with the hay traffic there.
1069. Would you not carry on the same business then as you do now at Redfern, as regards the goods portion? We might do that. The greater part of the goods business is done at Darling Harbour; it is only a limited traffic which is dealt with at Redfern. Full truck-loads of general goods, and the hay and straw business are dealt with at Redfern.
1070. Do we understand that, even under these altered conditions, you require nearly all the Redfern yard for the purpose of the traffic? The Commissioners propose to do the marshalling of trains, and the washing of trains at Redfern as at present.
1071. More so than to contemplate any increased accommodation for the despatch or receipt of goods? I think so.
1072. That is chiefly why it will be confined solely to Darling Harbour? Yes.
1073. Do the Commissioners view the introduction of the goods traffic into the city at any point as a serious matter in connection with city railway extension? No; not to my knowledge. They think the requirements are fairly and reasonably met by the existing arrangements, as far as I am aware.
1074. Have they formulated a scheme, or do they favour the extension of the railway on the western side of the city to bring them in direct contact with the wharfs and the ships? Not at the present time.
1075. Are they of opinion that the facilities which exist at Darling Harbour, and which may be offered at Darling Island, will be sufficient for the export trade of this country for some years to come? Yes.
1076. Is that the basis they are working on? That is, I understand, their opinion.

H.
McLachlan.
11 Mar., 1897.

1077. With regard to a possible extension of the railway from Redfern to North Shore, would it not be necessary to make that extension along the high land by Church Hill? I believe you would have to go back nearly to the Town Hall to get a proper level for a bridge.
1078. Practically, that is the only way the goods traffic can be dealt with? The proposal more seriously considered some years ago was to have an underground line to North Shore.
1079. If a line were made across the harbour, either on a bridge or under the water, do you think it would be largely used for goods traffic? I do not see that it would be.
1080. Would it not be confined almost absolutely to passenger traffic? I should think it would be a passenger line.
1081. Would we be right in inferring that, inasmuch as the railway policy of this country for years has been to concentrate the goods traffic at Darling Harbour and make that place a *dépôt* for the receipt and despatch and shipment of goods, it is not very likely that they will create a great extension to North Shore to do what they already have the facilities to do? I should think not. It would be an expensive thing to do, and I do not think it is required.
1082. And it would give no more accommodation? Where you concentrate your business it is more economical to deal with it. Instead of having two staffs you have one.
1083. Has not that been the policy of the Railway Commissioners for years—they laid out the Darling Harbour scheme? Yes.
1084. Was not Darling Island resumed at an enormous cost to give that accommodation? Yes.
1085. If there is any departure from that policy now, then a large amount of the expenditure in the past will be thrown away? Yes; it seems to me that that is the policy which is continuing—to conduct your goods business at Darling Harbour.
1086. And the Commissioners have adopted that after very full consideration, believing that it will offer every accommodation for the import and export trade for many years to come? Yes.
1087. There are some large works at Kirribilli Point, North Shore, dealing with wool, meat, and other produce? Yes.
1088. Has there been a tendency to send that stuff down by the North Shore line? No. The tendency has been to send it from Darling Harbour.
1089. For what reason? I do not know. It may be more convenient to ship it from there. The Meat company did at one time talk of having a connection with the railway. I do not know how far they got with it so that they might get direct railway shipment.
1090. Is it not a fact that the Department of Railways now permits its refrigerating cars to be carried on barges from Darling Harbour to Kirribilli Point? Yes, they are so carried.
1091. The refrigerating cars come down from the country and are wheeled on to the barges by rails and towed to Kirribilli Point, where the produce is unloaded into the ships? Yes.
1092. Could any system be devised which would move that refrigerating car more cheaply than it can be moved in that way? That is their interest. No doubt they have looked at that question and adopted what they believe is the cheapest plan.
1093. Could any possible railway extension be carried out which would admit of a refrigerating car being moved as cheaply as it is now moved? If they had a railway direct to their works it would be cheaper.
1094. But there is the initial cost? That is entirely their affair.
1095. You do not have to bear the cost of towing the cars across the harbour? No.
1096. You simply have to put your trucks on to their barges, and away they go to any part of the harbour? Yes.
1097. Of course you look forward to a large development in the shipment of meat? That is expected to happen.
1098. Suppose that it did increase very largely;—if it is possible to convey your refrigerating cars on barges to Kirribilli Point, would it not be possible in the future, even if Darling Harbour and Darling Island should become overcrowded with vessels, to convey your trucks in the same way to the ships at Circular Quay or any other part of the harbour? It would be possible, but of course the accommodation at Darling Harbour and Darling Island ought to suffice for very many years to come.
1099. But if it were necessary to convey that produce to the P. & O. boats, the Orient boats, the North-German Lloyds boats, and the other boats, it could be very easily transhipped by adopting the barge system? Yes.
1100. And avoid, if necessary, the carriage of produce in vehicles? It could be done.
1101. Therefore the Commissioners do not view with favour the extension of the railway into the city beyond Hyde Park for goods business? No.
1102. And they rely entirely on that extension for passenger traffic? Yes.
1103. They say that as they are forced to make an alteration in consequence of the inconvenience at Redfern station it will be more economical, in the interests of the State, to remove the station, not to Devonshire-street, but to Hyde Park? Yes; they think that the best plan in every way, looking at the whole of the circumstances, is to take the railway to Hyde Park. They would prefer to go to King-street if it could be done.
1104. If it were possible to give the Commissioners all the accommodation they require at Redfern, would it not be possible to so arrange the tram service there as to suit the passenger traffic almost as well as it would be suited by a central station? No.
1105. If they had a tram system extending through the main streets of the city, would not that offer very much larger accommodation to city people than the existing state of things? Of course you could improve the tram facilities, but at the same time it certainly is not so convenient as a railway.
1106. But after all with your central railway station you will still be some distance from many city residences? Yes.
1107. If you had a tramway system, such as I suggested, you could take them to their own streets, or, possibly, to their own doors? The Commissioners propose to have a connection with the railway station. The trams will run alongside our station in Elizabeth-street. The Commissioners propose, sooner or later, to have electric trams running, and in one of their reports I think they propose to run an electric tram along Park-street to connect with the George-street and Elizabeth-street trams.
1108. *Mr. Hoskins.*] Mr. Lee asked you a question about constructing a bridge from Sydney to North Shore, and I understood you to say that you believed that the approach to the bridge would have to be started

40
H.
McLachlan;
11 Mar., 1897.

started from about the Town Hall, have you well considered that reply? It is an engineering question, but I understand that it will be necessary to go right back to the Town Hall to get the proper approach for an overhead railway bridge to North Shore.

1109. Have you had that information imparted to you by persons who may be regarded as competent to give an opinion on the subject? I am simply stating my recollection of some evidence which was given before the Royal Commission in 1890. I think it was Mr. Foxlee who said in his evidence that they would have to go right back to near the Town Hall.

1110. *Mr. Wright.*] Can you state if the Commissioners have ever thought to any extent about using electric traction for the suburban traffic? It has been thought of, but no scheme has been worked out.

1111. Would it be possible to work the suburban traffic by electric traction while the through traffic was still conducted by steam? I would not like to answer a question of that kind, but I know that the Commissioners have had electric working of one sort and another under their consideration, but I do not know what views they have formed on the subject.

1112. Are you aware whether the practice is pursued in any other part of the world? Not to any extent. There are one or two connections I think in America worked by electricity, but even the Metropolitan company of London has not yet started to use electricity in its underground railways.

1113. Are the underground railways still worked by steam? The Metropolitan company's I think are.

1114. *Mr. Lee* spoke about the conveyance of meat by lighters from Darling Harbour to various parts of the port;—is not that rather an expensive mode of transit? It does not affect us.

1115. It affects the consumer to a certain extent;—is it not rather an expensive system of traffic? Naturally. It would be much more convenient and cheaper if the railway ran to the works. The Meat company at North Shore had an idea of running a railway to its works, but, as *Mr. Lee* pointed out, you would have the initial cost of the railway extension.

1116. Still all the meat companies have to employ steamers to tow the barges? Yes.

1117. Is there any possibility of a line being made to connect the northern foreshores of Port Jackson with Sydney, so that the northern traffic could come in by that line in preference to coming round by Homebush? I think that is very far ahead, because with the northern traffic coming in by the suburban line, it gives you an opportunity of disembarking suburban business and making your connection better, otherwise you would split up your traffic.

1118. You would save a considerable mileage by the North Shore extension? I do not know that there would be much difference in mileage, because the people would simply get into a local train at Hornsby.

1119. Suppose you had a connection with the city from North Shore, no doubt you would have frequent trains from Hornsby to the city, and passengers coming from the north would disembark there? I do not think there is any proposal to bring the goods.

1120. If people desired to bring their goods in by that route, there would be a necessity to break the trains at Hornsby? As they do now the trucks would have to be shunted off at Hornsby and brought on by the local service to Milson's Point.

1121. That would entail extra expense? Yes.

1122. It would be most inconvenient to attempt to bring your terminus goods business down in that way? Yes.

1123. Have you any idea of the passenger traffic which you are likely to obtain, judging from what the North Shore ferry boats now carry? The Commissioners lately have not given consideration to the extension of the city railway to North Shore; we have had no figures worked out.

1124. In their opinion is it desirable that eventually there should be a connection between the North Shore railway and the Redfern railway? It might be desirable in years to come, but there is no immediate necessity for it now.

1125. We can leave out of our consideration any possible connection between those two points? For the present, certainly.

1126. I understand that after duly considering the whole situation, the Commissioners approve of the Hyde Park scheme in preference to any other? Yes.

1127. Would that be in preference to a circular system of railways? Yes. In their report the Commissioners point out that ultimately, when the necessity arises, you can extend from the central station to the suburbs, but there is no pressing necessity for the work to-day.

1128. *Mr. Roberts.*] What extra revenue per passenger do the Commissioners expect to receive if the railway is carried as far as Park-street? They propose to charge a penny for each passenger on each journey, and then to add a certain amount on to the prices of season tickets. The price of a workman's ticket they propose to increase by 3d. a week. A workman who lives at Petersham is now brought into Redfern Station for 1s. 3d. a week, so that if the railway is extended to Park-street a workman can go from Petersham to Park-street for 1s. 6d. a week.

1129. *Mr. Hoskins.*] On what basis do they estimate the number of passengers? On the actual number of passengers who travelled last year.

1130. *Mr. Roberts.*] Do you think the Commissioners would expect to get any more revenue if the railway terminus were located at St. James' road rather than at Park-street? They would charge the same amounts as I have quoted, but it would be more convenient to have the stations at King-street. The opinion of the Commissioners is that King-street is the better position.

1131. You are in a position to say that the Commissioners favour King-street as a terminus for passengers? It has been their opinion right through that it is the most central and convenient situation, but seeing that so much opposition was raised to their proposal on the ground that it would absorb so much of Hyde Park, they said give us half of what we ask for, as it is the next best thing to do.

1132. *Mr. Fegan.*] It is not the intention of the Commissioners to take the terminus down to Circular Quay? No.

1133. They are decidedly against the terminus being located at Circular Quay? What they suggest is that a terminus at Hyde Park or King-street will be quite sufficient with a central station.

1134. And that Darling Harbour will do the goods traffic? Yes.

1135. *Mr. Hoskins.*] Suppose that the railway is extended to Sydney, do the Commissioners, taking your estimate of the number of passengers, make any allowance for the probability that a number of those passengers will get out at Redfern? No. They have simply taken as an estimate the number who travel to-day to Sydney. No doubt some of the passengers will get out at Redfern. But, on the other

H.
McLachlan.
11 Mar., 1897.

hand, the additional accommodation will induce additional people to come into the city; for instance, people at Eveleigh, Macdonaldtown, and Newtown, if they could get into Sydney by train rather than by omnibus, would come in by train. Besides, there is the additional growth which is going on. There has been a very big growth since the figures were obtained for the Royal Commission, 1890. The estimate is based on the number of persons arriving at Redfern station to-day.

1136. What is the increase? Four million passengers per annum.

1137. *President.*] Is it not the intention of the Commissioners to alter the steam traction on the trams? Yes.

1138. Is it their intention to preserve existing routes? There is no proposal to alter the routes at present, except the one which they outlined along Park-street.

1139. You have no information in regard to what the route should be? You would have the trams alongside the proposed station, and you would bring in a tram from William-street to Park-street, and that would intersect the Elizabeth-street tram and the George-street tram.

1140. As far as you know, it is their intention to preserve the routes of the trams? As far as I am aware, it is.

1141. You will no longer have the railway trams running along Elizabeth-street? No; but you will have the other trams. The railway trams would run along George-street.

FRIDAY, 12 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

H. Deane.
12 Mar., 1897.

1142. *President.*] In regard to the ventilation of tunnels, Mount Ceniz has been cited as an example;— will you explain why, with regard to such traffic as we have in Sydney, Mount Ceniz tunnel is not a good example, and how the natural conditions there enable ventilation to be possible that would not obtain under such circumstances as we have here? At Mount Ceniz the natural conditions are favourable. The traffic through the tunnel is not very great, and being open at the end to the natural air-currents, the tunnel generally gets pretty well ventilated; but sometimes it is not, because I have been through the tunnel and found it rather stuffy. Generally, the ventilation is fairly satisfactory.

1143. The reason why, it is satisfactory in your opinion is, first, because of the sparseness of the traffic, and, secondly, because as one entrance is higher than the other there is a natural draught, which cannot be expected in all circumstances? No. In the case of a metropolitan line you do not have the same favourable circumstances, everything being below ground, and at the ends you are, in addition, more or less surrounded by buildings which will stop your current.

1144. The metropolitan is the better example for us to reason from? The metropolitan district railway would be. I notice that at Mount Ceniz, although the ordinary ventilation of the tunnel is left to natural causes, there is an 8-inch pipe, with cocks at intervals, and there is an arrangement also for drawing off the bad air along the bottom of the tunnel. It may interest the Commission to hear something about the St. Gothard tunnel. I will give some particulars from a report of Dr. Stapff, which are to the point. He says:—"Natural ventilation depends on differences of atmospheric pressure at the two ends—temperature and moisture. The difference of level acts according as the internal air is lighter or heavier than the external, and the augmentation of the volume of air entering and becoming warmer interferes with the circulation, and friction does as well. Very slight atmospheric differences alter the directions of currents." That, of course, is easily to be understood. You would get that in all tunnels where you depend on some atmospheric influence to clear them. "In the worst case you get a current of 4 feet per second, which would clear the tunnel of smoke in three hours and three quarters; so that to ensure ventilation it would be necessary that once at any rate in twenty-four hours there should be that interval between the trains. Unfortunately, at each change of direction of the wind there is an interval when the air is at rest, and sometimes the changes are so frequent that the current may be arrested for four days at a time." It is in cases like that where artificial ventilation arises. You get that condition occurring in all tunnels—in the Mount Ceniz as well as the St. Gothard. Dr. Stapff says:—"Such a state of things will only arise about once a year, and when the ventilation of the tunnel is very bad it will be better to stop the traffic rather than go to the expense of having ventilating arrangements." Of course, to do anything of that sort in lines which have a large traffic upon them is altogether out of the question. "It will be foolish to provide costly methods of artificial ventilation, and the best plan will be to provide compressed air through a pipe with cocks at intervals, or supplying the workmen, so that they can get what air they want at any part of the tunnel." That is what seems to be provided at the Mount Ceniz tunnel. The difficulty in tunnel ventilation can be seen from this report, and from general considerations. If the traffic is very great, and there is no time to clear the tunnel between the passage of the trains, the next train that goes through gets into the smoke left by the previous train; and it is all the worse if the next train goes in an opposite direction, and churns up the air, as it were. Ventilating-shafts are not by any means satisfactory, or, at any rate, they are rarely satisfactory. At the St. Louis tunnel in America there is a large ventilating-shaft in the centre; and it has been observed that when a train enters the tunnel at one end there is a great column of air from the tunnel rising up through the shaft, and after the train has passed the shaft the air is drawn down again and follows the train. It has not always the effect of carrying the smoke out of the tunnel. In this case you may say it brings in fresh air (which is an important thing), but it leaves the tunnel behind the train (which was supposed to be ventilated by the shaft) unventilated. One of the most

H. Deane.
12 Mar., 1897.

most efficiently ventilated tunnels is, undoubtedly, the Mersey tunnel. I think there are four ventilating fans, two of them being 40 feet and two 30 feet in diameter. In special cases it may be easy to ventilate the tunnel, and when the traffic increases there will be very great trouble. It is anticipated that sooner or later there may be very great trouble with the Mersey tunnel.

1145. Which do you quote as the best example? The Mersey tunnel is about the best example of a well-ventilated tunnel for suburban traffic. There is an apprehension even there that with increasing traffic it will get choked. I suppose the means adopted now are about as complete as they possibly can be. When I was in England, I went to see the ventilating fans in that tunnel.

1146. *Mr. Lee.*] How long is the tunnel? It is 4,960 feet long under the river.

1147. *President.*] They have got that tunnel ventilated, with how much traffic going through a day? About 300 trains a day pass through the tunnel.

1148. If in the Mersey tunnel—with the very best appliances, with 300 trains a day—they are apprehensive that very soon they will require better means of ventilation, it will appear reasonable that even the ventilation in the Mersey tunnel—which you suggest as being the best obtainable—would not do for a tunnel here? It might not. I do not know whether, if you made a tunnel here, that number of trains would go through the tunnel; but then, as I pointed out previously, there is always the difference in climate to be considered. Liverpool is in a cool climate, in about latitude 53° or 54°, whereas we are in a very much lower latitude, having a very much higher mean temperature, and a very much higher maximum temperature in summer.

1149. *Mr. Fegan.*] During half the year they have fogs at Liverpool? Yes.

1150. *President.*] Is this the position: that with suitable conditions and few trains it seems possible to keep a tunnel perfectly clear, but that with unsuitable natural conditions or a heavy traffic, the trouble at once becomes apparent? Yes.

1151. And, notwithstanding all the appliances which science has in attendance, where the traffic would be similar to such as would be coming into Sydney, they view the future with apprehension? Yes.

1152. And the engineers are hoping to devise some scheme by which the tunnel would be kept clear—by electricity, or something else? Yes. A metropolitan railway tunnel is either broken up into a number of sections, in which case you would want a ventilating apparatus for each section, or else you have one or two long sections, and then the longer the section the greater is the difficulty, because of more trains passing through at the one time, or the shorter the interval between them.

1153. What is your view in regard to tunnels in which steam is used in connection with the passenger traffic of Sydney? I should not like to see them here; I should not like to see them used with steam traffic. I think they ought to be avoided, if possible.

1154. Do you view it with serious apprehension? Yes.

1155. Would you recommend to the Commission any scheme in which there is a large amount of tunnels at present? No, I should not, until some arrangement could be made to work it with some other kind of motive power.

1156. Can you explain your views in regard to some other scheme by which the work could be done, or in regard to electric traction? Before I answer your question, will you allow me to add that tunnels on the ruling grade, as I pointed out at the time of the Zigzag inquiry, are specially bad, because the boiler is doing its best, and there is the maximum amount of fuel being burnt, and very likely some priming, which makes it all the worse. Then again, the engines always, at some time or other, have to carry a maximum load. The rails may get greasy, and the engines may get stuck up in consequence in the tunnel, and then it is particularly unpleasant to the passengers.

1157. Generally speaking, you dismiss tunnels as unsatisfactory? Yes; I think they should be avoided.

1158. Will you now state your view with regard to the use of any other motive power, or with regard to electricity as a motive power? I should think it is probable that in future the Railway Commissioners will consider the question of using electricity. It is a point on which I have some hesitation in giving a definite opinion, but I think there is no doubt, from the way in which traction questions are being considered in America for short-service trains, that electricity is coming into favour.

1159. The question of motive power really does not come under your consideration? No. If you do not have steam you will have electricity. Electricity is undoubtedly used. I mentioned on the first day of the inquiry the Baltimore and Ohio railway. I saw a report, which was made last year, in which the working of the trains by electricity was pronounced to be perfectly satisfactory.

1160. *Mr. Hoskins.*] There are heavy grades on that line? I do not know that there are heavy grades. I have not seen a section of the line, but they have three electric locomotives working through there now, and they work all the goods and passenger traffic as far as I can make out. There was a very favourable report about this time last year of the working of these locomotives, which led to the conclusion that they are at least as economical as steam locomotives.

1161. *President.*] They were brought into use because of the difficulty of ventilating the tunnel? On account of the difficulties of ventilating the tunnel.

1162. And on that line they preferred to use electricity rather than to ventilate the tunnel? The difficulties were too great in the way of ventilation. In the *Street Railway Journal* of March, 1896, there is an account of the experience with electric locomotives in Baltimore.

1163. *Mr. Hoskins.*] Is not there a railway in America in which an electric motor is attached to a train within a mile or two of the terminus to take the train into the station? That is probably the one which you are thinking of. The electric motor is run on in front of the whole train.

1164. *President.*] Is steam shut off? Yes. They apply that to goods and passenger trains. Whether that is applicable to our case in Sydney, in case we had tunnels, is a matter for consideration. There is no doubt that it could be done. There might be an objection to the delay of putting the locomotives on, but it is perfectly practicable.

1165. The objection would be to the delay, and the cost of the locomotive? Yes.

1166. You would want a good number of locomotives? I stated, in regard to the Baltimore line, that the working of that line is cheap enough—that it is worked as economically as with steam locomotives.

1167. *Mr. Hoskins.*] Have they ascertained that electric motors can be worked as cheaply as steam locomotives? That is what they say in this report. There has been very little done elsewhere in the way of large electrical locomotives, but where electric motors are placed under the cars they are worked very cheaply. An example of cheap working is undoubtedly given by the Liverpool overhead railway.

1168.

H. Deane.
12 Mar., 1897.

1168. Is that worked cheaply? Yes. There is a long account of that in the Proceedings of the Institution of Civil Engineers, vol. 117. There is a great deal about the use of electricity on tramways and railways in different volumes of the Proceedings of the Institution. The advantage which is claimed for electricity as applied to motors under the carriages is that instead of having a big locomotive, and having to take a long train, you can run your trains just as you want them, short or long.

1169. *President.*] Are you speaking of the accumulator system? No; of the usual system, with an electrical conductor laid along the line overhead or between the rails.

1170. Is it virtually the trolley system? The trolley or shoe system.

1171. *Mr. Hoskins.*] It would not be applicable to running long passenger trains through Sydney from Redfern? No; it would not be very applicable in that way, but what is claimed for the electrical working of tramways or railways, if carried out properly, is that the trains would be short and run at more frequent intervals. I cannot say what the difficulties may be in the way of altering the suburban system some day; it may have to be considered. It is really a matter of traffic working, on which I cannot give an opinion.

1172. On a long-distance journey—say, from Bourke—the accumulator system could not be made applicable to a train running up to King-street? No; it would never do to use electricity for long-service trains.

1173. *President.*] You advise the Commission not to have tunnels if they can possibly be avoided? Yes.

1174. The same thing applies to a surface station as against an underground station? Yes.

1175. You also advise the Commission not to have an underground station if it can possibly be avoided, but to have a surface station? Yes. That is one reason why I think the Hyde Park scheme is so much preferable to anything else, until it is settled definitely what other method can be substituted for steam in working the suburban railways or bringing the traffic into the city.

1176. You can go on from Park-street in any direction? Yes.

1177. *Mr. Lee.*] You cannot go east without a tunnel? You can eventually go east by sinking and going in a tunnel, but if you can do without tunnels for the present until that question is decided you are all right.

1178. *President.*] What you told the Commission before was this: That if you go as far as King-street, and eventually electricity or some other power is used on the lines which enables the tunnels to be used pleasantly for passenger traffic, then by lowering 16 feet the lines which are required to go on you can then tunnel, and go down to the Circular Quay, or go round by a circular railway, or in an easterly direction? Yes.

1179. Would that be a difficult operation? No.

1180. Therefore an extension of a surface line, or as far as possible a surface line to Hyde Park, would fit in eventually with a tunnel scheme, and a circular railway, and an extension to the eastern suburbs? Yes.

1181. *Mr. Humphery.*] Your remark applies to a central station either at Park-street or St. James' road? Yes.

1182. *President.*] Would you regard the lowering of some of the lines 16 feet as a very serious operation? It would not be a very serious operation. In the design for the buildings I would provide for the foundations being arranged so that the lines could be sunk and carried through the buildings—that is to say, the basement of the buildings would be arranged so as to form tunnels in future for the railway.

1183. *Mr. Wright.*] Would your sunken extension be continuous with the lines leading from the station? They will be part of those lines.

1184. There will be no break? No.

1185. *President.*] Do you believe that a tunnel half a mile long—say, from King-street towards Fort Macquarie—could be ventilated? I do not like the idea of it at all.

1186. Have you any idea how long it would be? I think it is a little under a mile from the Queen's Statue to Fort Macquarie.

1187. It would be a tunnel all the way? No; it would be open at the end. There would be about 60 chains of tunnel I should think.

1188. You regard it as a serious matter? Yes, I should, especially as that tunnel would be on the ruling grade, whatever that might be.

1189. Would the same objections apply to a tunnel to North Shore? Yes; for steam locomotives.

1190. How deep is the harbour—80 or 100 feet? I have sections across the harbour, but it is not 80 feet. I think with a depth of about 80 feet we can have a tunnel right under the bottom.

1191. I saw some soundings taken there up to 150 feet? That is a deep hole off Blue's Point, that is between Blue's Point and Dawes Point. Recently I have had some borings obtained between Dawes Point and M'Mahon's Point, and we ran just on the edge of that hole.

1192. You believe that a tunnel across the harbour is practicable? You would not go across there; you would go across further east, but I do not believe in a railway tunnel at all; I do not see the necessity for it.

1193. At a depth of 80 feet you believe you would have sufficient cover to make a tunnel? I am sure of it. I went into that question in connection with a tramway scheme I proposed.

1194. A scheme to embrace the wharfs could not possibly fit in with a tunnel scheme if the tunnel were 80 feet below the surface of the water? No.

1195. You would have to go a long way back to get a fall of 80 feet? Yes.

1196. A railway to serve the wharfs cannot go under the harbour? You cannot get down.

1197. You want to go back so far as to fall 80 feet with a reasonable grade, which might be very far removed from the wharfs? Yes.

1198. How high would a bridge to go over the harbour be? That depends on what the authorities decide. I recommended some time ago that it should be 160 feet. I have gone into the matter with Mr. Darley, and we are of the opinion now that it ought to be a little higher than that.

1199. Will you take 200 feet as an extreme limit? It would not be more than 200 feet; it would be between 160 and 180 feet.

1200. Taking it at 180 feet, where would your approach start from to get that height? That again depends on the grade. If I remember aright, with a grade of about 1 in 30, you could start from Wynyard-square and get up there without any difficulty.

1201. From the level, say 20 feet below the western side of Wynyard-square? I am speaking from memory, but I am quite certain that you could get up from that level.

1202.

H. Deane.
12 Mar., 1897.

1202. If it were decided that a grade of 1 in 30 was unsuitable, and you wanted a grade of 1 in 60, it would take you back between Wynyard-square and the Town Hall? I do not know whether you would get it, because the ground falls away very rapidly. The further you carry your grade back the further you might be off the surface.

1203. *Mr. Lee.*] Admitting that you could get into a tunnel on the Sydney side 80 feet below the surface of the harbour, where or how would you get out on the other side? You could get out at the upper end of Lavender Bay with a railway tunnel.

1204. On the level? Yes; with a steep grade.

1205. What would the grade be? About 1 in 40 would do it.

1206. *President.*] Where would the entrance to your tunnel be on the Sydney side? If you insist upon having a tunnel, which I think is objectionable, you would start down from the station at Hyde Park, and dip under the harbour at Fort Macquarie, and passing under Milson's Point, come up again at the head of Lavender Bay.

1207. Somewhere near the steps? Yes.

1208. *Mr. Humphery.*] And strike the existing railway? Yes.

1209. *President.*] With regard to a tunnel to connect the railway system with the railway at North Shore, it is possible, starting from the northern side of Hyde Park, to pass under the harbour at a depth of about 80 feet by way of Fort Macquarie, and gradually rise until the North Shore line is joined at the head of Lavender Bay? Yes.

1210. But in your opinion a tunnel $1\frac{1}{2}$ mile long, with a grade of 1 in 40, would be a matter not to be seriously contemplated at present? Yes.

1211. Can you give us the cost? No.

1212. What is the cost of a running-yard? A running-yard of tunnel would cost about £70, and when you came into mud it would cost at least £125 or £200 a foot. There might be all sorts of difficulties to encounter. It might cost between £600 and £1,000 a yard to take the tunnel through the mud.

1213. On this tunnel there will be about 450 yards of mud;—how much is that going to cost, approximately? I should think the minimum cost would be about £600,000. There are between 450 and 500 yards through the mud, and the rest would probably be all rock.

1214. Is that fully equipped with the lines laid in the tunnel? It would be fully lined and the rails laid.

1215. Therefore, your estimate of the approximate cost would be about £600,000? Yes.

1216. *Mr. Lee.*] Is that the only possible route for a tunnel across the harbour? I think it is.

1217. Would it be possible to get under the harbour from near Miller's Point or Dawes Point? No; there is a very deep hole there.

1218. You do not think that is a possible route for an underground railway? No.

1219. If a bridge connection with North Shore is contemplated, it must be by way of Church Hill? Yes.

1220. And if a tunnel connection is contemplated it must be by way of Fort Macquarie? Yes.

1221. *Mr. Humphery.*] It was never at any time contemplated to take a tunnel from Miller's Point to North Shore? No.

1222. What is the greatest depth of your soundings between Fort Macquarie and North Shore? It was a little under 60 feet.

1223. *President.*] In regard to the cost of a bridge, it is not possible to give any definite estimate? Yes.

1224. But with a grade of 1 in 30 the approach on the southern side of the harbour would require to start from Wynyard Square, and would necessitate a considerable amount of resumption? Yes.

1225. On the northern side where would you come out? You would land north of McMahon's Point on some jutting crags which are about 120 feet above the water.

1226. Where would you join the North Shore line then? Opposite the head of Berry's Bay.

1227. *Mr. Lee.*] If an underground railway were made by way of Fort Macquarie to Lavender Bay, would it be possible to connect a railway going round the western foreshores of the harbour—round Miller's Point, Dawes Point, and Sydney Cove—with that underground railway? There would be very great difficulties in the way. An ordinary railway with steam locomotives you could not carry round Miller's Point and Dawes Point, because the curves are too sharp.

1228. If a railway were made round the western foreshores, would it be possible to connect it with a railway under the harbour? No; you could not get down fast enough.

1229. *President.*] Since you have to lose 80 feet to fall 80 feet, and your ruling grade is 1 in 40, the fall must commence 3,200 feet, or considerably over half a mile from the harbour, and, therefore, for over half a mile, at least, you must be falling all the way back towards the wharfs? That is so.

1230. *Mr. Lee.*] To make it possible you would have to make a loop-line to join the underground line at half a mile back? Yes.

1231. *President.*] The approach must be fully half a mile back? Yes.

1232. *Mr. Lee.*] Therefore, that scheme is out of the question? I think so. As regards the estimated cost of the proposed station at Hyde Park, I wish to explain that the roof, which is an expensive structure, would cost £67,000, leaving about £133,000 for the building. No doubt the building could be cut down, but it would not look at all nice not to have a fine building there. It need not be as large as the building shown on the plan here, because there is spare accommodation in that building.

TUESDAY, 16 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.	CHARLES ALFRED LEE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.

HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Stephen Edward Perdriau, Surveyor, Department of Lands, further examined:—

S. E.
Perdriau.
16 Mar., 1897.1233. *President.*] You have brought some information which the Commission desires to have on various points? Yes.

1234. Will you describe the Benevolent Asylum site and the Cemetery? I will read a description of the tenure of the lands and of the improvements thereon comprised in the Benevolent Asylum site, Devonshire-street Cemetery, and contiguous areas:—

THE land referred to embraces the block of about 24½ acres on the opposite side of Devonshire-street from Redfern station, within the following boundaries:—On the north-east by Garden-road, on the east by Elizabeth-street and private properties, on the south by Devonshire-street, and on the west by George and Pitt streets.

The following institutions, &c., are located upon the land:—The Benevolent Asylum, Christ Church Parsonage, the Police Barracks and the residence of Superintendent Brennan, the Sydney Female Refuge, the Convent of the Good Samaritan (formerly called the House of the Good Shepherd), the Pitt-street tram-cleaning yards and coke depôt, the Devonshire-street Cemetery, and the South Sydney Morgue and caretaker's residence.

THE BENEVOLENT ASYLUM.

THE Asylum is managed by a Board of Directors, with the Governor as Patron, and Sir A. Renwick as President.

The land occupied by the Asylum lies at the corner of George and Devonshire streets, and is about 3 acres 2 roods 23 perches in extent, including a proposed street 1 chain wide extending along the eastern boundary. By a plan of survey made in 1848 the area at this site proposed to be granted was 3 acres 1 rood 15 perches. The difference between the two areas—2 roods 13 perches—is that of the proposed street, which has apparently never been used as such, and is occupied in common with the 3 acres 1 rood 15 perches. Several of the out-buildings are erected upon the proposed street. The old papers in the case cannot be found; but it appears from the Half-Monthly Returns of 1848 that it was decided to issue a grant for the 3 acres 1 rood 15 perches. This was not done, however, and an application for a grant made by Mr. W. Briggs, a director, on account of the Board of Directors, in 1893, was not complied with. The Minister (Mr. Copeland) decided that the matter should stand over.

I was informed that the land has been used for its present purpose continuously from the year 1818. The main building bears the date 1820. It is about 150 feet long and 25 feet wide, with two wings of about the same dimensions. All are of brick on stone, two-storied, and with slate roofs. In the court-yard, between the wings, there is a building 55 feet long, 25 feet wide, and of similar construction to the main building. There are three other brick buildings of one storey each, with iron roofs, which do not look quite so old as the main building. They are about 50 feet by 20 feet each, and used as kitchens, laundry, &c. Also several other inferior one-storied out-buildings, parts of which are of wood and brick, with galvanised iron roofs.

The whole of the buildings bear evidence of considerable age, but are well preserved, and in good repair. As above stated, the main building is 77 years old.

I would estimate the value of the buildings on this site at the present time at £

The directors, considering the buildings antiquated and unsuitable for their requirements, petitioned the Government on the 20th February, 1895, to resume the property, purchase another site for them with part of the money, and give them the balance to provide funds for carrying on the work of the institution.

The institution is supported by contribution from the public and Government aid.

Of the total receipts for 1896, £19,530, the Government contributed £14,000.

Perhaps it would be well to read the said application, of which I have a copy.

The Hon. J. N. Brunker, Esq., M.P., &c., &c., Chief Secretary,—

Sir,

Benevolent Society of New South Wales, 492, Pitt-street, Sydney, 20 February, 1895.

Referring to the difficulties connected with the management of this Society, regarding which a deputation waited on you on the 26th October, 1894, I have now the honor, in accordance with the wishes of the Board of Management, to submit for your consideration certain important matters in connection with the institution. As you are aware, steps have been taken by the Board and staff to make the best provision possible for the inmates; but the medical staff have been assured that these arrangements were merely of a temporary character, the medical staff threatening otherwise to resign, in view of the serious responsibilities which rest upon them in the discharge of their duties, as medical attendants, in an old and now dangerous building.

The Board therefore suggest that the Government resume the Benevolent Asylum site, in accordance with the terms and conditions of the Lands for Public Purposes Resumption Act, and that the Government also resume simultaneously "Ultimo House," Harris-street, Ultimo. The latter property is situated next to the Technological College, and comprises the same area of land as that on which the last-named building is erected. It is believed that the cost of resuming the land for the purposes of the Technological College was £25,000. Valuations had been made of the Benevolent Asylum property, and the average of these valuations amounts to £73,333.

The Board would therefore respectfully urge upon the Government the expediency of resuming the Benevolent Asylum site, and granting compensation to the Society. From this amount the Government could deduct a sufficient sum wherewith to resume "Ultimo House" property, which could be made suitable for the general purposes of the Benevolent Society. The balance remaining to the credit of the institution, after the completion of the suggested resumptions, could be applied to the erection of the necessary buildings, and towards carrying on the operations of the Society.

The Board respectfully call your attention to the fact that various applications have been made to them by several persons, who are offering large amounts, for leases of portions of the asylum grounds for building and other purposes, which would largely augment the Society's funds. The Board, however, are not desirous of doing anything until they have an answer from you upon the subject generally.

I have, &c.,

ARTHUR RENWICK,

President.

Submitted, 22/2/95. For the consideration of the Cabinet.—J.N.B., 22/2/95. To stand over until question of railway extension is decided.—G.H.R., 23/11/96. Inform.—J.N.B., 23/11/96. The President informed, 25/11/96.

CHRIST CHURCH PARSONAGE.

THE allotment occupied by Christ Church Parsonage is the property of the Church, having passed from the Crown many years ago by deed of grant. The land has a frontage of 100 feet to Pitt-street, and adjoins the northern boundary of the Benevolent Asylum grounds; the depth of the land varies from 180 feet to 278 feet, and the area is 2 roods 14 perches.

This is a good site, having a gentle fall from the back line to the road. The position is suitable for some businesses, and is probably worth £70 per foot=£7,000.

The parsonage is a large two-storied house, built of brick on stone, plain in design, and is said to be about thirty years old, but is in very good repair. I was informed that a year ago about £300 was expended on it in general repairs and painting. At the present time the house is worth, perhaps, £800 to £1,000.

Say £8,000 for the house and land.

POLICE

POLICE BARRACKS AND SUPERINTENDENT BRENNAN'S RESIDENCE.

S. E.
Perdriau.
16 Mar., 1897.

THIS land, total area about 5 acres 3 roods 11 perches, is bounded on the north by the Sydney Female Refuge and Garden-road, east by the Devonshire-street Cemetery, south by the Benevolent Asylum and Christ Church Parsonage, and on the west by Pitt-street, the Sydney Female Refuge, the Convent of the Good Samaritan, and the tram depôt.

Police Barracks.—This site comprises about 4 acres 8 perches of the above, with a frontage of about 345 feet to the south side of Garden-road. The barracks (about 140 feet long and 23 feet wide) are of stone, two-storied, stables being on the ground floor and living rooms on top. The building is old but substantial and in good repair. The other buildings on the site are dormitories of weatherboard with iron roof (length about 83 feet x 22 feet), stone, one-storied building (about 33 feet x 23 feet) used as an armoury, police stores of two-stories weatherboard and iron roof (about 40 feet x 20 feet), hay and corn store, small brick dwelling, and various stables built of stone, brick, and weatherboard. On the Garden-road frontage there is a drill ground about 240 feet x 80 feet.

Superintendent Brennan's residence occupies the remaining area of about 1 acre 3 roods 3 perches, in shape nearly a square, and having about 276 feet frontage to Pitt-street. The residence is a cottage of ten rooms and out-offices, about thirty years old. Present value about £600.

SYDNEY FEMALE REFUGE.

THE land—area, 2 roods 15 perches—occupied by this institution was formerly part of Carter's Barracks. It is Crown land, and has been held by the institution since the year 1843, under what may be termed "permissive occupancy."

This area is bounded on the north by the Convent of the Good Samaritan, on the south by the grounds occupied by the Police Department in connection with the residence of Superintendent Brennan, and on the east by the Police Barracks grounds.

In the year 1858 the Government undertook to reimburse the society the value of the improvements on the land, if at any time the same should be resumed. When the society entered into possession there were old buildings on the site, but these were demolished and the present buildings erected, it is said, between the years 1867 and 1875; these are of brick on stone, two-storied, and with slate roofs. The building occupies the whole of the Pitt-street frontage of about 95 feet, and has two wings extending along the northern and southern boundaries for lengths of about 102 feet and 120 feet respectively. All the buildings are about 25 feet wide.

The present value of the buildings is about £

The object of the Refuge is to reclaim unfortunate and abandoned females. It is supported by contributions from the public and by the proceeds from the work of the inmates. The total receipts for the year 1895 amounted to £696.

CONVENT OF THE GOOD SAMARITAN (formerly House of the Good Shepherd).

THE tenure under which this 3 roods 1 perch (which also originally formed part of Carter's Barracks) is held in connection with the abovementioned convent is one of "permissive occupancy" on terms precisely similar to those of the Sydney Female Refuge.

The land has a frontage to Pitt-street of about 120 feet, and a depth of about 275 feet.

The Pitt-street tram-cleaning and coke yard adjoins this land on the north; on the east it is bounded by the grounds of the Police Barracks; on the south by the Sydney Female Refuge.

The buildings hereon are very extensive, consisting of a convent of 32 rooms, two school halls, and a chapel for the nuns and others resident upon the premises. The main building is a handsome structure of red brick and stone, and was erected in 1869; the chapel and school adjoining the convent on the north were erected in 1860, as were also two of the large out-buildings; another large out-building was erected in 1849. All the buildings are in good repair.

TRAM DEPÔT.

THE Pitt-street tram-cleaning sheds and coke depôt—area about 2 roods 31 perches—embrace the land lying between the Convent of the Good Samaritan and Garden-road, and is bounded on the west by Pitt-street, and on the east by the Police Barracks ground.

This site is Crown land, and also formerly formed part of Carter's Barracks.

The Railway Commissioners are in possession, but have no title except "permissive occupancy."

DEVONSHIRE-STREET CEMETERY AND SOUTH SYDNEY MORGUE.

THE total area of this cemetery is 11 acres 3 roods 11½ perches, according to the original plan of subdivision showing the areas as granted to the various denominations.

The cemetery was closed about ten years ago, and now presents a deserted and neglected appearance. Upon the portions allotted to the Roman Catholics and the Congregationalists there are small sextons' residences, value respectively about £60 and £30; and on that of the Hebrews a small weatherboard shed or office, value about £10. Upon the Quakers' portion there is a small brick meeting-house, erected in 1868, and a brick dwelling of two rooms, with an iron roof over shingles. This is evidently much older than the meeting-house. The two together are probably not worth more than £250. Upon the Church of England portion, and near Garden-road frontage, are erected the South Sydney Morgue and caretaker's residence. These are about fourteen years old, and, I was informed, cost about £1,800, the cottage costing £1,000 of that sum.

In the event of this land being resumed and used for any other purpose it is not likely that any claim for compensation could be sustained; but the duty would no doubt devolve upon the Government of carefully removing the mortal remains and of re-interring them satisfactorily elsewhere.

1235. At whose cost was the morgue built? It was built by the Government.

1236. *Mr. Wright.*] Is not the road you speak of as Garden-road also known as Belmore-road? It is also known as Belmore-road and Carter-road.

1237. *Mr. Humphery.*] What buildings would be interfered with by the extension of the railway system to Park-street? Three or four out-buildings of the asylum, the barracks, the dormitories, some of the stables, and the hay and corn shed.

1238. Approximately, what distance would the nearest rail be from Pitt-street? Speaking roughly, it would be about 500 feet.

1239. *Mr. Hoskins.*] You cannot speak with any precision of the buildings which would be taken, because it may be necessary to extend six or eight sets of rails? I am guided by the plan on the wall before you.

1240. *Mr. Humphery.*] Any buildings within 400 feet of Pitt-street would not be interfered with? It would not interfere with any important buildings except the barracks.

1241. *Mr. Hoskins.*] Would not the parsonage be interfered with? No; the grounds of the parsonage are altogether clear. The Sydney Female Refuge, the Convent of the Good Samaritan, and the superintendent's residence are all clear.

1242. That scheme would not take the Benevolent Asylum building at all, but only some of the out-buildings? According to the plan on the wall here three or four of the out-buildings will be affected.

1243. *Mr. Humphery.*] Will you now proceed with the other statement you wish to make? The next is a statement of the population within a radius of half a mile of two central points from the city. Taking the junction at Elizabeth-street and St. James' Road as the centre of the half-mile radius, the residential population is 15,000.

S. E. Perdriau.
16 Mar., 1897.

1244. You do not include any persons who come within that radius for business purposes? No. I asked the Statistician to supply me with a number of people who sleep on the premises within that radius. Taking Carter's Barracks as the centre of a half-mile radius, the population is 31,000. I thought that that information was required to give an idea of the value of a piece of recreation land to the public near those centres.

1245. Will you now state the parks, together with their area, which are easily accessible to the people within those centres? The parks within a short distance of the intersection of Elizabeth-street and St. James' Road are—the Outer Domain, 90 acres; Garden Palace grounds and Botanic Gardens, 60 acres; Cook and Phillip Parks, 8 acres; Hyde Park, 40 acres,—making a total of 198 acres; that is not including Government House grounds, which measure 40 acres. The parks within easy distance of Carter's Barracks are—Belmore Park, 10 acres, and Prince Alfred Park, 18 acres 3 roods, making a total of 28 acres 3 roods.

1246. Will you now state the difference in level between the point opposite Sydney railway station and Christ Church? From a point in the centre of Devonshire-street, immediately opposite the steps at Redfern station, to the tram signal-box in George-street, the fall is 5 ft. 9 in.; to a point opposite the old police station the fall is 11 ft. 4 in.; and to a point in Pitt-street, opposite Christ Church, the fall is 17 ft. 6 in.

1247. Will you now give the Commission some information as to the value of the Benevolent Asylum ground? I have made a very rough estimate of its value—I have not gone into the matter carefully. In my opinion £73,333 is a low estimate of the value of the land as it stands; but the Benevolent Asylum is practically a Government institution.

1248. *Mr. Wright.*] How much is that an acre? About £20,000 an acre.

1249. What would be the street frontage of the block if it were cut up for sale? I have not got the length.

1250. The value is very much governed by the fact whether the railway is taken further on or not? Yes.

1251. *President.*] You have made some valuations of different blocks in the city according to the municipal assessments? Yes.

1252. *Mr. Hoskins.*] Are you taking present values or boom values? I am taking the most recent assessment—for the year 1897-8. It was used for 1896-7, I think, for the first time, so that it is quite a recent assessment.

1253. *President.*] Will you read your estimate of the value of the different blocks? My statement is as follows:—

Valuation (by adopting the municipal assessments for 1897-8) for the block of the City of Sydney, bounded by Elizabeth, King, and Castlereagh streets, and the High School—not owned by the Government. Area, 2r. 12p.

The total of the municipal assessments for the above-mentioned portion of the city for the municipal year 1897-8 is £4,053.

Capitalising £4,053 at twenty years' purchase	£81,060
If twenty-five years' purchase be adopted, the amount would be.....	101,325

NOTE.—The above is calculated adopting the recent municipal assessments, which are based upon rentals received during times of commercial depression. No allowance is made in the above valuation for disruption of business, nor for the 10 per cent. increase always allowed by Government for a forced sale.

Valuation (by adopting the municipal assessments for 1897-8) of that block of the City of Sydney bounded by Castlereagh, Market, Pitt, and Park streets. Area, 5a. 1r. 13p.

The total of the municipal assessments for the above-mentioned portion of the city for the municipal year 1897-8 is £26,248.

Capitalising £26,248 at twenty years' purchase	£524,960
If twenty-five years' purchase be adopted, the amount would be	656,200

NOTE.—The above is calculated adopting the recent municipal assessments, which are based upon rentals received during times of commercial depression. No allowance is made in the above valuation for disruption of business nor for the 10 per cent. increase always allowed by Government for a forced sale.

Valuation (by adopting the municipal assessments for 1897-8) of that part of the City of Sydney bounded by Elizabeth, Park, Pitt, and Liverpool streets. Area, 10a. 2r. 2p. Area, if the streets are included, 12a. 3r. 29p.

The total of the municipal assessments for the above-mentioned portion of the city for the municipal year 1897-8 is £34,832.

Capitalising £34,832 at twenty years' purchase	£696,640
Add for St. Andrew's School-room, St. George's Church, and the Pitt-street Congregational Church and School-room, not included in the above	52,000
	<hr/>
	£748,640

If twenty-five years' purchase be adopted, the figures would be	£870,800
	52,000
	<hr/>
	£922,800

NOTE.—The above is calculated adopting the recent municipal assessments, which are based upon rentals received during times of commercial depression. No allowance is made in the above valuation for disruption of business nor for the 10 per cent. increase always allowed by Government for a forced sale.

1254. Therefore, to resume an area contiguous to the Park large enough to meet what the Railway Commissioners say are their requirements—namely 12 acres—would cost, approximately, £1,000,000? A great deal more than £1,000,000, I think, with the disruption of business and the 10 per cent. increase.

1255. Have you prepared a rough estimate of the value of the private wharfs from Dawes Point to the head of Darling Harbour? Yes. A rough estimate of the value of the private wharfs on that line of frontage, extending from Dawes Point to the head of Darling Harbour, is £2,037,300. This estimate is for the wharfs and water-frontage properties alone, and does not include any sum which might be demanded by the Municipal Council or other property-owners for the closing of streets, nor does it include any sum for disruption of business, nor the 10 per cent. increase of value always given by Government in cases of resumption.

1256. Previously, going about 400 feet back from the water, you gave us an estimate approaching £3,000,000? Yes.

1257. What proportion of this estimate of £2,037,300 is included in the former estimate of £3,000,000? For that other estimate I took the municipal assessments, which do not include anything for land occupied below high-water mark, because that is beyond the city boundary. 1258.

1258. Can you tell us what that amount is approximately? No. In the other case I included a number of small properties which have been excluded from this estimate.

1259. You cannot tell us the bare value of the wharfs which were excluded from the previous estimate, not being included in the municipal valuations? I have not separated them. The solid land—that is, the freehold—is included in both estimates, but the jetties are only included in this estimate.

1260. What portion of that second estimate represents the value below high-water mark, and therefore is not included in your previous estimate? To give you that information I would have to estimate the value of all the different wharfs and piers.

1261. Does half of it represent the jetties and piers? I do not think so. It will be very difficult indeed to separate the wharfs from the freehold.

1262. It is not possible to say what the resumptions would be? I would not like to give an opinion offhand.

1263. Beyond the sum of £3,000,000 which you first mentioned, there is an unknown quantity in such interests as may exist below high-water mark? Yes. I do not think that the whole of these frontages could be resumed under £5,000,000, paying for disruption of business and giving the 10 per cent. increase.

1264. *Mr. Hoskins.*] And including the liberality of assessors against the Government? Yes. My experience is that it is possible to show figures to prove the value of a wharf to a particular individual so much more than people generally think it is worth.

1265. *President.*] That is from Dawes Point to the head of Darling Harbour, and going, roughly speaking, about 400 feet back from the water? Yes.

1266. You desire the Commission to understand that that is an approximation of the value? It is a very rough estimate.

1267. What rentals do the Government receive for special leases in that portion of Darling Harbour extending from Dawes Point to the head of Darling Harbour? The total is £7,387 per annum. The frontage from Dawes Point to Potts' Point is Government property.

1268. Have you a statement of the passenger traffic by the ferry steamers from Circular Quay? The passenger traffic by the ferry steamers from Circular Quay for the year 1896 was as follows:—

By the North Shore, neutral Bay, and Mossman's Bay ferries	5,000,000
Manly ferry	900,000
Watson's Bay ferry	115,000
Floating Jetty, at Phillip-street	38,000
Prince's Stairs and the public jetty eastward thereof	155,000
Total	6,208,000

This is the number of individuals; the number of passages would be double, viz., 12,416,000. The number of passengers by the north shore ferry was supplied by Mr. Goddard (chairman of directors), and the number of passengers by the other ferries was supplied by the managers on the wharfs.

WEDNESDAY, 17 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
GEORGE BLACK, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

1269. *President.*] You desire to give further information to the Commission on several points? I was asked to say what the approximate cost of a bridge to North Shore would be. An estimate without details will be a very rough one, but I should think that a bridge starting with approaches about Flagstaff Hill, rising over the harbour with a headway of 180 feet, and falling on the other side in the way I pointed out the other day would be necessary, and with accommodation for rail and road traffic would cost about £765,000.

1270. What would the grade be—1 in 40? I find that a grade of 1 in 30 will be necessary to get up from Wynyard Square.

1271. Where will a grade of 1 in 40 take you? On to the surface of York-street.

1272. Would you approve of a 1 in 30 approach? If the bridge had to be made I do not see how one could get out of it; it is quite practicable.

1273. *Mr. Hoskins.*] Would it not be very awkward to erect a bridge with such a steep approach? You would want more motive power.

1274. *Mr. Lee.*] Would you have that grade on the bridge also? No; it would be practically level.

1275. *Mr. Hoskins.*] Would that bridge permit of vessels being towed underneath without having to strike their masts? Yes; all but very few. Only the topgallant masts would reach the bridge if they were not struck. Some few might, but I think if a bridge had to be made, a height of 180 feet might be considered a considerable height.

1276. *President.*] If it were thought wise or necessary to have a grade of 1 in 40 the approach must come down to York-street? Yes; but they would come on the level, and it would be a very difficult thing to deal with the grades. When I said a grade of 1 in 40 the other day I was speaking only from memory, and I find that a grade of 1 in 40 gives a headway of only 150 feet.

1277. Does your estimate include the cost of land resumptions? I do not know what that would be.

1278. Would it be considerable? I expect it would. The buildings would not be of a valuable class.

1279. How long would your approaches be? Taking the two sides the approaches are 4,000 feet; that is 2,200 feet on the Sydney side and about 1,800 feet on the other side.

- H. Deane. 1280. That is above the surface? Yes.
- 17 Mar., 1897. 1281. It means the resumption of half a mile of land of the width necessary? Yes.
1282. Of that cost you have no estimate? No.
1283. *Mr. Lee.*] Suppose that Hyde Park is adopted as a central station for passenger traffic, and in the future it is desired to have bridge or railway connection with North Shore, could the railway be extended from that central station? No; not to go across there direct.
1284. Therefore, if Hyde Park is adopted at the present time as a central station, and railway communication across the harbour is required in the future, it will have to be by means of a separate line? Yes.
1285. Why is the underground traffic in London carried out with such small station accommodation as compared with the station accommodation which is proposed to be provided at Park-street according to the plan on the wall? On the underground line in London the trains run all the way round; there is no terminal station at all. Only certain portions of the traffic which come in from outside terminate at the same place—Margate-street. For instance, the Great Northern trains, the Midland trains, and the Great Western trains come into Margate-street, and the South-Western trains come into the district line at Gloucester-road, I think, so that very little of what might be called terminal accommodation is required.
1286. It is rendered unnecessary in consequence of its being a circular railway? Yes.
1287. And the terminal stations are situated on the outskirts at convenient places? Yes.
1288. Taking into consideration the different circumstances existing in this country, where the State owns the railways, where there are so many large public buildings, and where the railway offices are accommodated in existing buildings, can you explain the necessity for having such a large central station, which is to include the whole of the administrative offices? I can explain what is necessary and what is not, and the different purposes for which the offices are necessary. Of course it is understood that the accommodation which is provided in this proposed station is for the future as well as the present—at any rate for a good many years to come. The accommodation provided is really more than ample for the immediate necessities, but when you are building it will be a very false policy not to provide a little for the future.
1289. In other words, you adopt it as a central station for all time? I will not say for all time; that just depends upon how Sydney increases. I think a report which was made by the Railway Commissioners to the previous Commission will show that.
1290. The main object being to get away from Redfern and to get into the city, I wish to know why a less important station would not be sufficient to meet the requirements? As to the ground plan, I reply that it will be undesirable to lessen the accommodation. It will not only be undesirable to lessen the number of lines coming in and the area of the platforms, but it will also be undesirable to lessen the space given for passenger accommodation in the big halls, the waiting-hall, and the refreshment-rooms, and so on. As regards the storeys above of course it is a question of expediency. Those are not absolutely necessary for the station itself, seeing that the railway offices are now accommodated elsewhere, and can no doubt be accommodated in the future; but it would be a very great convenience, and, I think, altogether desirable, that accommodation should be made for the Railway Commissioners and their officers, and that has been done. I know the Railway Commissioners are of opinion that that should be done. In the building that is shown there on the case there is a storey which is unnecessary, and which, in fact, I have assumed to be cut out in this estimate of £200,000. That estimate includes the roof, which is to cost £67,000, and the building itself, which is to cost £133,000. The building would consist of ground-floor, two storeys, and the roof.
1291. You are clearly of opinion that it is wise to make this ample provision? Yes.
1292. *Mr. Humphery.*] Would the only difference in the cost be the saving of the two storeys provided for the accommodation of the Railway staff? No; the ground-floor and the roof would remain the same, but —
1293. Therefore the only saving would be in the cost of the one storey? I think you could cut out half of the £133,000.
1294. In what way could you cut out half the £133,000 if you had to provide good foundations and a roof as shown on the plan there? By cutting out the unimportant storeys; but, as I say, I think it would be a very undesirable thing to do.
1295. How would you do it? You would have the foundation, the main floor, and the roof. The ground floor will have to give the same accommodation, but the walls need not be as heavy, nor need the walls of the basement be as heavy.
1296. How many storeys could you omit? You could omit two.
1297. You say the cost of the two storeys would be equal to £65,000? I should say, without going carefully into the matter, that the building might be cut down to about one-half. I should like to have an opportunity to consider the matter in detail before I expressed a definite opinion; but, speaking approximately, I should think that about half could be cut out.
1298. Instead of saying one-half, will you be good enough to express the amount in figures? About £65,000.
1299. £65,000 might possibly be saved by a sacrifice of two storeys of the proposed design? On account of the thinning of the walls, the cutting out of the storeys, and the cutting out of the tower, and the lessening of the roof; but it has to be borne in mind that if this be done you could never put the other storeys on unless you provide the wall of the right dimensions. If, in the future, it were decided that more accommodation was wanted, extra storeys could not be put on safely.
1300. Therefore there would be no economy in effecting a saving now if it should be contemplated at any future time to raise the building? No; it would be actually a loss.
1301. Suppose the terminal station is placed at St. James' Road, have you considered whether it is possible to avoid taking in a portion of the Registrar-General's Office? I do not consider that it could be conveniently done. Everything is packed in as tightly as possible on that plan. There is the parcel's office in the corner of Park and Elizabeth streets, which is a very necessary part of the station accommodation. And on the other side there is a loading-bank for carriages and horses, which is also a very necessary part of the station accommodation. If the front of the station is moved back towards Park-street that accommodation would have to be limited, because there would not be room for it.
1302. What would be the difference in cost if the terminal station were placed at St. James' Road instead of at Park-street? £50,000.

H. Deane.
17 Mar., 1897.

1303. Would £50,000 cover the injury done to the Registrar-General's Office, and the bridge over Park-street, and all the additional work in connection with the terminal stations? £50,000 would not cover the injury done to the Registrar-General's Office. The injury done to that office would be probably about £14,000.
1304. Are we to understand that £64,000 would be the difference in cost between a terminal station at St. James' Road and a terminal station at Park-street? Yes.
1305. You would be obliged to have a bridge at Park-street? The roadway will be replaced by a bridge, but the level of Park-street will remain just the same as it is. The £50,000 I mentioned as being additional cost is a correct estimate. The extra works will come to more than £50,000, but then there will be some savings.
1306. Can you furnish the details of that sum of £50,000? I ran them out roughly, but I have not the details here.
1307. Would it make any difference in the lines between Park-street and Liverpool-street? It would not be exactly the same. There would be the extra cost of the Park-street bridge, and the length of the lines between Liverpool-street and Park-street, for these six lines will be carried on further; but against that cost, Park-street will be kept at its present level instead of being cut down and made a wide street, as was proposed in the other scheme; and there will be a saving in excavation and foundations by taking the railway on to St. James' Road. The ground is lower there, and consequently there will be less excavation and less walls to build up. The result is, that the net extra cost is £50,000.
1308. Plus the injury done to the Registrar-General's Office? Yes.
1309. Are we to understand that you regard St. James' Road site as a better site for a terminal station than the Park-street site? Yes; and the Commissioners much prefer it.
1310. Will you briefly state your reasons for that preference? It will bring the traffic practically on to King-street, which is a better centre than Park-street.
1311. In regard to a comparison of the cost of the two sites, why do you regard the one as better than the other? A station at St. James' Road will accommodate the traffic better; it will bring the passengers further into the city, and it is worth while to bring them from Park-street to St. James' Road.
1312. The cost of a terminal station at St. James' Road will be less, if anything, than the cost of a similar station at Park-street? It will be less.
1313. *Mr. Hoskins.*] Even although you have to pull down and rebuild the Registrar-General's Office? That is not included. The actual cost of the station Mr. Humphery was referring to will be less, but the total cost of the line will be more.
1314. *Mr. Roberts.*] Would all the platforms be on the surface at St. James' Road site? The platforms would be at the surface.
1315. How far south would you have to travel from St. James' Road before you went into a tunnel? You have to get under Park-street; you are about 20 feet below Park-street where you cross.
1316. From Park-street to Liverpool-street? It would be underground.
1317. Not necessarily a tunnel? Most of it open.
1318. When you come out at Liverpool-street do you go overhead then? You emerge about half way between Liverpool-street and Goulburn-street; then you go over Goulburn-street by a bridge; and from that point to the Benevolent Asylum grounds you are on a viaduct.
1319. Will it be necessary to have a large station at the Benevolent Asylum grounds? If you have a terminal station at Hyde Park you do not want a large station on the Benevolent Asylum grounds. I presume the accommodation at Redfern will be more than ample.
1320. Would there be any station between Redfern and St. James' Road? I do not think so.
1321. *President.*] A station could readily be arranged at Liverpool-street? Yes.
1322. *Mr. Humphery.*] Would it be possible to prevent the cutting down of Devonshire-street to the extent which you mention is necessary? Not if the line is carried over and the street retained in its present position.
1323. It would not be less than 9 or 10 feet? No. If Devonshire-street could be abolished a road might be made from about where the Female Refuge is, and you could deviate it to the east of the line as shown in this plan of the Benevolent Asylum site.
1324. Will it not be possible to bring the new road from a point opposite the old police station? No.
1325. We were told yesterday that there is a considerable fall between Devonshire-street and Pitt-street, opposite Christ Church? So there is.
1326. In that case would it not be possible to bring the new road from a point opposite the old police station? No.

William Robson Benson, Manager of the Wharf Association, sworn, and examined:—

1327. *President.*] What position do you hold? I am the manager of the Wharf Association.
1328. We are informed that the length of the wharfs under your control is 4,370 feet;—will you be good enough to enumerate the different wharfs? Parbury's, Walker's, Hoffinung's, Dalton's, the Central, Dalgety's, Towns', Moore's, the Adelaide, Smith's, and Dalgety's, formerly Dibbs'.
1329. How many ships could you berth at the associated wharfs? Twenty-nine.
1330. Are they usually full? No.
1331. What proportion is used—a half? For the last two or three years these wharfs have not all been filled with ships.
1332. In the wool season are they full? In the wool season there is a strain on the wharfs; but still I have never had to make any extraordinary provision for berthing ships.
1333. Generally speaking, will you say that half the berths are used? Taking all the year round, I think one-half would be a fair average to take.
1334. And in the wool season? They are fairly well filled.
1335. How long does the wool season last? About four months.
1336. For eight months in the year you use one-half of your accommodation, and for the other four months you use pretty well all of it? Yes.
1337. Can you give the values of these wharfs and the returns which they yield? No; I did not know that I should be called upon to furnish this information. It is rather a difficult matter to value the wharfs

W. R. Benson.
17 Mar., 1897.

W. E. Benson. wharfs as a whole. You would have to take each wharf individually; because if one particular wharf had a particular business connected with it, it would be of more value than another wharf which was used for ordinary business.

7 Mar., 1897.

1338. *Mr. Humphery.*] How many berths in connection with the wharfs controlled by this Association would be available for ships of large tonnage? About one-half; that number would berth ships of 3,000 or 5,000 tons carrying capacity.

1339. *Mr. Lee.*] How does your Association view the proposal of the Government to resume all those wharfs? The Association as a body has not given the matter any serious consideration; in fact, as a matter of discussion, it has never been brought before the Board officially.

1340. Would a line of railway, running round the wharfs, facilitate the shipment and discharge of goods? I cannot see how it would facilitate either one or the other. When we take into consideration, first, the fact that not 10 per cent. of the imports go to the country, and secondly, that nearly the whole of the wool which comes by rail is sent to the warehouses for sale, and that afterwards it has to be dumped for shipment. From the 1st July, 1896, to the 3rd March, 1897, the arrivals by rail were 470,328 bales, and by sea, 124,648 bales, and out of that number, 424,000 bales went into the warehouses and were offered for sale by auction. Nearly the whole of the wool which comes by rail is first sent to the auction-room and submitted for sale.

1341. Therefore, wherever you had your railway, as far as the wool was concerned, there would be the same cost in cartage? The wool would have to be carted to the warehouses and the auction-room.

1342. *President.*] Does the same remark apply to hides and tallow? Yes.

1343. To frozen meat? No; it is shipped direct, but then it is pretty well dealt with in warehouses specially prepared for its reception, and then it is taken straight from the freezing chamber into the freezing chamber of the ship.

1344. *Mr. Lee.*] Then you hold that there is no present necessity for the construction of a goods line of railway round the wharfs? I cannot possibly see where the benefit would come in at all. I think that figures could easily be procured to support this statement. Most of the goods which are imported for the country are small lines which are taken into the warehouse here and repacked. Only a proportion of the original contents of a case are forwarded to the country, and the remaining portion of the case is filled with other goods.

1345. In consequence of expensive land resumptions, the construction of a railway line round the wharfs would be a very costly matter? Very costly indeed.

1346. Consequently, you do not see where the revenue is to come from to pay the interest on the cost of construction? Speaking from my present knowledge, I cannot see how it could return a fair interest on the money expended.

1347. The imports are not carried direct by rail from the ship, and the exports are not carried direct from the railway to the ship, and therefore you do not see how the revenue is to be got? Precisely.

1348. *Mr. Hoskins.*] I suppose the wharf-owners place different values on different wharfs? Decidedly; there would be great difference of opinion as to the value of a wharf.

1349. That difference of opinion is based frequently on the superior facilities afforded by one wharf over the other for discharging and loading ships, and also on the fact that one wharf is used more than another? Exactly.

1350. *President.*] Is the state of things you have mentioned in regard to your wharfs, there being for two-thirds of the year twice as much wharfage as you require, significant of all the wharfs in Sydney? Of the private wharfs especially.

1351. You have no doubt of that? No.

1352. *Mr. Lee.*] When articles such as minerals, coal, shale, and frozen butter, and possibly grain, require to be exported, are they not sent direct from Darling Harbour? Yes; coal especially, and grain probably. Of course there are the Government wharfs there specially equipped for shipment of coal. There are also other wharfs in Darling Harbour belonging to the Government where the ships can go alongside and take the grain out of the trucks.

1353. Under these circumstances your wharfs cannot compete with the Government wharfs? At our wharfs we do not compete with the Government so far.

1354. For the export of such articles as I mentioned, the requisite facilities already exist, and are being increased at Darling Harbour and Darling Island? Yes; I presume they would be quite ample. I do not know exactly what quantity of grain is exported just now. The quantity of shale, I think, is not great. Coal is another matter. Whether these quantities are going to increase is another question. Whether the increase of wharfage accommodation in that particular direction is equal to the increased requirements I am not prepared to say. I presume it would be, from my personal observation in that direction.

1355. Do you know whether any of the produce of the country, or the shipping coming to the ports, has suffered in any way from the want of railway communication to the wharfs? No; I am not aware of that.

1356. Is it handicapped in any way by the dray carriage? No; that is a matter I have not given consideration to.

1357. It is not handicapped, to your knowledge? I do not know a ship which has been refused a berth from want of accommodation.

1358. *Mr. Hoskins.*] You have not heard in recent years, I suppose, of vessels having had to wait some time to be able to get a berth for discharging cargo? No. There have been occasions, probably, when ships have been booked for a particular berth; but at the same time I have had perhaps twelve or thirteen berths vacant. A ship which has been booked for a particular wharf has had to wait to get a berth there.

1359. *Mr. Humphery.*] In speaking of the export of grain, did you wish to convey that the grain would be sent direct from the country to the ship, or to a depôt, to be collected there and then shipped? It is very possible, if improvements are made at Darling Harbour, that provision will be made there for granaries contiguous to the wharfs. As far as my knowledge enables me to say, there is ample accommodation just now for ships to go alongside and take all the grain that is likely to be exported.

1360. *Mr. Hoskins.*] Have you ever heard of the export and import business of the port being retarded in consequence of the absence of railway communication to the wharfs? As a matter of conversation, probably; but, from a business point of view, I do not know that I have heard a remark made about it.

1361. *President.*] Do you think that your views in regard to this matter have fairly well been brought out? I think so. We have twenty-nine berths, and if we reserve seven berths for loading purposes, that leaves us twenty-two berths for working purposes. The average rate of discharge at a berth is 400 tons per day, and taking 300 working days for the year—which is a liberal allowance—that means the discharge of 8,800 tons per day, which is equal to the discharge of 2,640,000 tons per year. Allowing each ship a capacity of 3,000 tons cargo, the associated wharfs could berth 880 ships a year; but where you are going to obtain those ships outside the P. and O. Co., the Orient Co., the North German Lloyds, the Messageries, and other companies, I do not know.

1362. How many vessels do you obtain? I cannot give you the figures just now.

1363. Under 300? Outside the intercolonial ships and the big steamers, I do not believe that 300 over-sea ships arrive in this port in a year.

W.R. Benson.
17 Mar., 1897.

THURSDAY, 18 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1364. *President.*] You are the Engineer-in-Chief for Public Works? Yes.

1365. You have prepared a statement showing the shipping and wharfage accommodation in Sydney in comparison with the shipping and wharfage accommodation in other ports where a large trade is done? Yes; I have prepared a return in respect of fifteen leading ports. You cannot get information about all the ports. All of which I could get the length of wharfage I have completed to date. I am only able to make up the returns to the year 1888. I could get later information about some of the ports, but I thought it well to put all of them on the same footing. I could only get the tonnage of shipping up to the year 1888 in the edition of Mulhall in the possession of the Department.

C. W. Darley.
18 Mar., 1897.

1366. Will you read your statement? It is as follows:—

STATEMENT showing the total wharf frontage, and the business done in connection therewith, in some of the principal ports of the world.

Port.	Wharfage.		Tonnage.		Tonnage per foot of wharf.
	Year.	Lineal feet.	Year.	Tons.	
London	1888	133,121	1888	12,940,000	97.20 tons
Liverpool.....	1888	182,631	1888	10,310,000	56.46 "
Newcastle-on-Tyne	1888	18,090	1888	5,220,000	288.55 "
Cardiff	1888	26,780	1888	8,080,000	301.71 "
Shields.....	1888	1,814	1888	1,990,000	1,097.02 "
Hull	1888	38,616	1888	3,400,000	88.04 "
Glasgow	1888	34,267	1888	2,540,000	74.12 "
Bremen	1888	14,824	1888	2,370,000	159.87 "
Bordeaux.....	1888	28,800	1888	2,930,000	101.70 "
Havre	1888	46,084	1886	4,030,000	87.44 "
Antwerp	1888	40,967	1887	3,665,000	89.46 "
Sydney.....	1893	36,960	1893	3,490,785	94.44 "
Newcastle, N.S.W.	1893	11,580	1893	1,753,485	151.42 "
Melbourne	1893	23,888	1893	4,158,773	174.09 "
Port Adelaide.....	1893	24,961	1893	1,923,911	77.07 "

In making a comparison with Sydney, such ports as Cardiff and Newcastle-on-Tyne must be omitted, because they are coal-shipping ports, which are used night and day. In both Newcastle and Cardiff some of the wharfs are double-decked. Shields shows an immense tonnage, but that is a fishing trade. The ships lie possibly 50 feet deep at the wharf, and to get on one ship you have to cross a number of others. Although there are only 1,800 feet of wharfage at Shields, it is said to be all given up to fishing boats. Melbourne and Adelaide must also be struck off the list for the purpose of comparison, because every P. and O. boat which comes to Sydney is entered twice in those ports. We know there is not the amount of shipping at Melbourne as there is at Sydney.

1367. *Mr. Hoskins.*] Have you the figures for the port of Hamburg? I could not get the tonnage of the shipping at Hamburg.

1368. *President.*] Such ports as London, Hull, Glasgow, Bremen, Bordeaux, and Antwerp are a fair example of the trade which is done in Port Jackson? I think so.

1369. In estimating your 94 tons to the foot available, what amount of foreshore in Sydney did you take as a basis? I did not take the foreshore in Sydney. I took the frontage of the wharfs actually available for ships to lie at.

1370. Will you state the length of the wharfs you took in Sydney? 36,960 feet.

1371. Is that all foreshore, or did you take the jetties into consideration? All the jetties were taken into consideration. In the case of a double jetty I took both sides.

1372. If a jetty was 40 feet or 100 feet long you counted both sides? Yes; if both sides were available for ships to lie at.

1373. Not the length of the foreshore? No.

1374. If you have the foreshore at (say) Antwerp or Hull, and the foreshore at Woolloomooloo Bay, an estimate becomes possible, for the same amount of foreshore available at either place will enable the same amount

- C. W. Darley. amount of wharfage to be constructed ; but if you take the number of wharfs where ships lie on both sides, and the wharfs in Circular Quay where ships lie abreast on, and in other places the wharfs are run out a considerable number of feet into the water, you have a false comparison? It seems to me you must take what is known in England as "quayage." I do not see what good the length of foreshore would be to you all. If you go into Liverpool you will find the docks are one inside the other. The actual room for ships to lie at is the only basis on which you can go to make a comparison.
1375. If you take a comparison of Woolloomooloo Bay properly equipped, with all the water frontage utilised, the eastern side of the bay might show, not 1,350 feet of direct foreshore, but 3,000 or 4,000 feet if the wharfs are run out into the bay? It is not possible to make a comparison with other ports if you take any fanciful thing for Sydney, and it is not in our power to take the same for other ports ; you must take the actual quayage. To make a comparison, we can but get the quayage in other ports. If you ask me the possibilities of Sydney I will answer you. I am dealing with the wharfage at Sydney as it is. At Bremen and Liverpool they are increasing their wharfage every year, as we are doing.
1376. With regard to the present, the amount of trade at Sydney is 94 tons to the foot of wharfage available, and it stands about midway among the ports of the world? Yes.
1377. That is a very fair comparative position? A very fair position.
1378. Therefore, the present wharfage of Sydney, compared with that of other ports of the world, appears to be not more than is usually necessary to do such a trade? Yes ; it is working fully up to its capacity, as compared with most other ports. The wharfage is worked better here than at Liverpool, Hull, Glasgow, Havre, or Antwerp. It shows better results than do all those ports, getting more actual tonnage per foot of the wharfage.
1379. *Mr. Hoskins.*] At Liverpool they have docks inside the docks? Yes ; but we allow for the quayage of the docks.
1380. *President.*] In Woolloomooloo Bay how much foreshore is occupied by the wharfs you have included in your return? All the wharfs constructed from the west side round to the south-east corner, and the first wharf on the eastern side.
1381. Does it include the Admiralty Wharf, Cowper Wharf, and the first wharf round towards Challis-street? Yes.
1382. In the return you have embraced about 1,400 feet lying between Challis-street and the northern end of Admiralty Wharf in Woolloomooloo Bay? Yes, together with the two sides of the pier there.
1383. It includes all the wharfage lying within that area? Yes.
1384. There is nothing else in Woolloomooloo Bay? No.
1385. There is nothing else till we come to Fort Macquarie? Not till we come to the P. and O. Co.'s wharf.
1386. From there it embraces the whole of the foreshore, going round the associated wharfs down the eastern side of Darling Harbour to the point of the harbour, and then up along the western side of the harbour to Pyrmont Bay, at the western side of the two "T" wharfs? It excludes Dawes Point, where there is no wharfage.
1387. You have excluded those portions of Woolloomooloo Bay which eventually may be used for shipping ; all that area fronting the recreation ground and Botanical Gardens to the Governor's Steps ; that area between the Governor's Steps and the end of Fort Macquarie ; and that area lying west from the jetties in Pyrmont Bay and embracing Darling Island? Yes.
1388. You have excluded all those places? All I took was the actual finished wharfage available for shipping to lie at.
1389. With regard to wharf extension on the eastern side of Woolloomooloo Bay,—what wharfage have the Government at present unutilised ; a length of 1,360 feet is shown here as suitable for wharf extension? Yes.
1390. Beyond the Admiralty Wharf, going north, we have a distance shown of about 2,000 feet to the pumping-station, which eventually may be used for wharfage, if it becomes necessary—that is where the baths stand? Yes ; it has not, so far, been contemplated to put wharfs there. It is under the public park, and it was thought undesirable to encroach any further on that side of the bay.
1391. In Woolloomooloo Bay, from the pumping-station to Potts' Point, we have unutilised, at present, a distance of about 3,000 feet? Yes.
1392. From the end of the Gardens, near the Tarpeian Way, to the western end of the point of Fort Macquarie, there is a distance of about 1,680 feet, a portion of which might be used where the Man-o'-war Steps are located? I do not think there is any site available there. I think that is required for Man-o'-war Steps and for the North Shore Ferry. A wharf could be made there, but it is wanted for an approach to the Man-o'-war Steps, and we are going to construct a new ferry dock on that side for the North Shore Ferry Company.
1393. That is there, available for State purposes, if required? It is State frontage.
1394. At Dawes Point there is a distance of about 1,980 feet which is not very well situated, but which will be available for State purposes when the arrangements between the Imperial Government and this Colony are completed? Yes.
1395. From the western end of the jetties in Pyrmont Bay, round to the termination of the Government property in Darling Island, there appears to be a length of about 2,000 feet approximately? I have nothing before me, but no doubt that is correct.
1396. It appears there is a length of nearly 9,000 feet at present unused for wharfage purposes? Only partly available and of doubtful utility. That sharp curve of Dawes Point is not, I think, a suitable place to put ships or wharfs. Ships would project out into the navigation too much. I do not think Dawes Point is of much use for shipping.
1397. *Mr. Hassall.*] It would be right in the fairway? It is very close.
1398. *President.*] Taking, for instance, 5,000 feet in Sydney Cove, 1,400 feet in Woolloomooloo Bay, and 11,000 feet to the end of Darling Harbour, the foreshores abutting on to the wharfs which you have chosen for your present statement with regard to Sydney Harbour cover approximately 20,000 feet of foreshore? I will see if the figures are correct.
1399. It appears that the available State-owned property, not including the Gardens or recreation-ground, is about 9,000 feet? I will verify the figures.
1400. That means that the State has in its possession, without going beyond Jones' Bay or Potts' Point, contiguous to the city of Sydney, an area pretty well equal to half the foreshore that is at present utilised? Yes.
- 1401.

1401. That being so, the present foreshores under the same system of utilisation would enable half as much more trade to be done from Sydney as is at present carried out? No; you cannot draw that conclusion from it, because the wharfs in Darling Harbour are very largely used for the coastal trade; they are in constant use and they are crowded very thickly together. If the Government makes use of every wharf we could not construct a series of jetties such as exist in Darling Harbour. C. W. Darley,
18 Mar., 1897.
1402. You utilise 20,000 feet of foreshore, and there are pretty well 10,000 feet yet to be utilised? I will look into the figures. I do not think we will get a very great length of practicable wharfage frontage available after the wharfs in course of construction are filled up. There is the whole of Darling Island to be added on, for it is all available. I think the whole of Dawes Point and the western side of Fort Macquarie must be excluded.
1403. Do you feel inclined to express an opinion with regard to the amount of work done off the Sydney wharfs? This return shows that the wharfs are fairly well worked up to their capacity.
1404. We are informed on all sides that they are not? It depends on circumstances altogether. Some sort of loading, such as wool, is slow to take in. It could be worked off more rapidly.
1405. *Mr. Lee.*] Is it not correct to say that some of the wharfs are not worked to their full capacity—that they are vacant during some months of the year? No doubt; they are built for a certain trade.
1406. You are charged with the construction of wharfs in Port Jackson? Yes.
1407. You are now constructing one wharf or more at Woolloomooloo Bay? Two berths are in course of construction.
1408. Are they being erected in consequence of some special demands for berthing there? Yes.
1409. Special demands from new lines of steamers? Special demands from the Treasury. Captain Jackson brings pressure to bear on the Treasury. He reports that he has not berths enough to meet the demands, and the Treasurer then asks the Minister for Works to construct more berths.
1410. But it does not follow that it means the making of preparations for some new line of steamers coming here? There are certain companies coming here and asking for big berths.
1411. There is a difference between a large ocean-line of steamers and casual sailers; for instance, a regular line of steamers requires a permanent wharf? That tells against them to some extent, because companies, like the P. and O., the Orient, North-German Lloyd's, the Messageries Maritime, and the Eastern Australia—the Japanese Company are asking for a wharf now—permanently occupy a large length of wharf, and pay a rent which represents a very large interest, I believe, on the cost of the work.
1412. The wharfs at Woolloomooloo Bay will be used more for the general trade of the port? Yes. Some of them may be leased to some of the companies which are coming here. One of the two American lines used to be berthed in Woolloomooloo Bay, but I expect that it will have to come back there.
1413. Is there any special reason for the shipping requiring to go to Woolloomooloo Bay;—does it offer any advantages over the wharfs on the western side of the city? Woolloomooloo Bay is better than what are known as the private or "back" wharfs, because it has a good approach.
1414. How do you account for the shipping desiring to get to Woolloomooloo Bay, and thus necessitating the erection of new wharfs, when the associated wharfs on the western side of the city are not fully occupied? Because there is an extra charge of 6d., I think, for every ton taken away from the "back" wharfs. Goods taken away from the Government wharf at Circular Quay or Woolloomooloo Bay are taken 6d. a ton cheaper than are goods from the "back" wharfs on account of the very bad approach and the steep hills.
1415. It offers an advantage to ships? Yes.
1416. That is one reason why the demand is for Government wharfs? When we have to import a large quantity of pipes we always stipulate that the pipes must be landed at a Government wharf. In one or two cases a large quantity of our pipes was landed to suit the ship and the shipowners at a "back" wharf, and the carriers charged us 6d. per ton extra for the carting. This charge the owners had to pay.
1417. It is done so much cheaper than it can be done by the Wharf Association? That is one reason.
1418. That is one reason why these ships want to go to the Government wharfs? Woolloomooloo Bay has a better approach; the grades are good.
1419. *Mr. Hoskins.*] There is more water there than there is in Darling Harbour? There is plenty of water there; it is a mere matter of dredging if any place shoals up.
1420. *Mr. Lee.*] When your frontage at Woolloomooloo Bay is filled up with jetties, and you have made provision at Darling Island, do you think there will be sufficient wharfage in this port for the next twenty-five years to come? It is hard to say what will happen in twenty-five years, but I fancy it will be sufficient for some time.
1421. It will be more than sufficient for present requirements? Yes.
1422. Apparently it will offer accommodation for the next twenty years? There is no doubt that it will answer for some time.
1423. If all these sites are filled up, and all the berths are occupied, how can we extend the wharfage so as to accommodate extra ships? In different ways. The wharfage could be distributed and spread by going further to the west, making more use of Blackwattle Bay and utilising Roselle Bay.
1424. Do you think there is any probability of the foreshore of North Sydney being used? I doubt where you could utilise it to any extent. Lavender Bay might be used in connection with the railway; but the approaches to North Shore are not good. A good deal of railway traffic might be done at wharfs in Lavender Bay.
1425. One drawback would be that it would be separated from the city, where all the depôts and distributing houses are? Yes.
1426. As far as the produce of the country is concerned at the present time, and making an ample estimate for its increase in twenty-five years, you think, when all the Government sites are filled up, there will be ample accommodation? When the wharfs at Darling Island and Woolloomooloo Bay are completed, there will be ample accommodation for the next ten or fifteen years.
1427. Have you given any attention to the question of the desirability or otherwise of the Government acquiring all the wharfs on the foreshores of Port Jackson? I have often expressed the opinion that the private wharfs on the east side of Darling Harbour should not be interfered with—that they are better in private hands. I do not think the Government could utilise them to the same extent as they are utilised now.

- C. W. Darley. 1428. You think that they should remain in private hands? That has always been my opinion. If they were taken over by the Government, pressure would be brought to bear at once to commence reconstructing them, and I am satisfied that no engineer could design a set of wharfs right off on a sheet of paper which would answer or suit conveniently all the various trades that are now carried on there. The different companies have designed their wharfs, and have carried them out exactly to suit their particular trade and their steamers, and no one system of wharfage which could be constructed would answer that purpose. One company, for instance, has its jetties a certain distance apart, which exactly suits its steamers, and the steamers again suit its trade. Then the wharfs are arranged as regards both length and position, and fitted with appliances and connected with warehouses exactly to suit the trade. You will find the Hunter River wharfs fitted up in a certain way to deal with hay. The Clarence River wharf deals with another class of trade and another class of boats, and the wharf was built for that trade. To attempt to do what Sir John Coode was asked to do some years ago—to design a whole series of wharfs in Darling Harbour—would upset the trade and yet not give the necessary accommodation. He prepared a scheme to cost a very large sum which I do not think after all gave anything like the accommodation which at present exists.
1429. As a matter of fact the accommodation there has originated and has grown according to the requirements of the trade in the port? According to the requirements of the trade and the various requirements of the individual companies.
1430. And if the Government were to devise a set system of wharfs there, it might so happen that it would not suit a portion of the trade? There is no doubt that a large amount of space would be wasted; you could not get the same amount of trade into one set design.
1431. *President.*] Can you furnish the Commission with Sir John Coode's report? Yes; it was never printed.
1432. *Mr. Lee.*] Have you ever made an estimate of what it would cost to resume these wharfs? No.
1433. You have never had occasion to do that? No.
1434. Therefore, you would not like to express an opinion as to whether a revenue might be derived sufficient to pay the interest on the cost of construction, and the working expenses of the wharfs? No. I was in England when Sir John Coode was preparing his scheme. I went into his charting office and he showed me the first scheme he had prepared. I pointed out some weak points, and he so agreed with me after I had explained the matter to him—he was not here long enough himself to study the trade of the port—that he laid aside his first scheme and prepared another. I explained to him that no doubt it made a very nice-looking design, but it would never answer the trade of Sydney; and that no one connected with the Government could think of recommending the scheme he submitted.
1435. If it were thought necessary for the State to resume these wharfs for the purpose of constructing a railway along that foreshore, it would involve the resumption of considerably more land than the wharfs stand upon? It would require the land necessary for the railway too.
1436. At the present time it would be most difficult to form a correct estimate of what the cost of such a railway would be? I have not gone into that at all.
1437. Has it ever come under your knowledge that there has been a demand on the part of the wharf-owners at Darling Harbour to have railway connection with the wharfs for the purpose of facilitating the business of the port? I know there has been a demand from some, but on the other hand there are some wharf-owners there who, I suppose, rarely send any of their goods to the railway.
1438. Have you studied the question of the receipt and distribution of goods? Not to any great extent.
1439. Are you prepared to express an opinion as to the desirability of taking a railway there? I would leave that to experts who have gone into the matter. I have my own opinions, but I have not gone into the matter.
1440. It has never come under your knowledge officially to deal with? No.
1441. *Mr. Clarke.*] Are you aware that a great many of the private wharfs, particularly the wharfs under the control of the Wharf Association, are not fully occupied for nearly two-thirds of the year? I can quite understand that a portion are not occupied out of the wool season; but at a certain period of the year, when there is a rush, we have hardly wharfs enough to berth the ships.
1442. We have had evidence that a great many of the private wharfs are not fully occupied for about two-thirds of the year? I would not have thought that it was so much as that.
1443. In the event of the Government resuming the private wharfs in Darling Harbour, would it not be very inconvenient—in fact almost impossible—for the trade to be carried on in that particular place while they are being reconstructed? It would interfere with the coastal trade very largely no doubt.
1444. Would it be possible to carry on that particular trade during the course of their reconstruction? A certain portion of the trade must be interrupted and interfered with and temporary provision made for the time.
1445. What wharfs could you take them to where they could carry on their business without suffering considerable inconvenience? You stated just now that a number of wharfs are vacant for eight months in the year; those wharfs might be made use of.
1446. Would those wharfs be suitable for the trade which is carried on in Darling Harbour and which chiefly comes by steamer from various ports on the coast north and south? They could be made use of, but they would not be so suitable as the present wharfs, because they would not have special stores to deal with the trade. There is no doubt that in reconstructing the wharfs for private services inconvenience must be caused during the process of reconstruction.
1447. It would be almost impossible to carry on the present trade in Darling Harbour without causing great inconvenience to the general public? Yes; as you came along to reconstruct each wharf in its turn, each company must be interfered with and put to inconvenience.
1448. If these wharfs to which you allude are occupied for four months in the year for their own purposes, there will be no room at those wharfs during that period for the present trade in Darling Harbour—will they not be shut out from those wharfs for four or five months in the year? I dare say, if it were absolutely necessary, some place could be found. For instance, if the wharfs of the Clarence River Company came to be reconstructed, there is no doubt that some place could be found to carry on their trade temporarily while their wharfs were being reconstructed. What I hold is, unless they were reconstructed on the same lines as they are on now, a large number of companies would have to be squeezed out. I think that quite a third of the companies would be squeezed out of the frontage unless the wharfs were reconstructed exactly on the same lines as they are on now. 1449.

1449. Do you not think that the wharfs in Darling Harbour suit the public quite as well as they would if they were resumed by the Government? That is and always has been my opinion. C. W. Darley.

1450. *President.*] Have you taken into consideration the future trade of Port Jackson? Yes. I say the future ocean trade, if it grows to a very great extent—and no doubt it will grow as the Colony will grow—must be provided for in other parts of the harbour, but you cannot make that provision and sacrifice the coastal trade. The bringing of produce into Sydney must be provided for for all time. We cannot squeeze that out or sacrifice it to the ocean trade. 18 Mar., 1897.

1451. At present it appears that the future trade of the Colony from Port Jackson will be in coal, wool, frozen mutton, wheat, timber, and things of that kind; are your present coal jetties suitable? No. There is no coal trade yet to speak of. The cranes were only erected on the jetties in a tentative manner, to see how the trade would grow.

1452. It is not your intention to permanently ship the coal at Pyrmont? No.

1453. Where do you intend eventually to ship the coal from? It just depends. These cranes were put up simply to test the trade, and see whether it would grow; but since they were put up there seems to have been a tendency for the trade to decrease rather than to grow. I think it is rather less now than it was then. If it grew to any great extent we would have to devise some other scheme. My idea was to get a good coal shipping depôt at Long Cove, and to bring the railway down to that point from Petersham.

1454. That will not do for Illawarra coal? We could bring the branch line to Long Cove under the western railway at Petersham.

1455. It appears probable that eventually some considerable coal trade will be done from this port? Yes.

1456. It appears probable also that a large wheat trade will eventually be done from Port Jackson? Yes.

1457. There will be a large wool trade, and then there will be ores and other things to ship;—can you advise the Commission where, in your opinion, a great wheat-shipping place should be? The wheat will come down by rail, and therefore Darling Island will be a very suitable place for carrying on a trade such as that.

1458. You have already pointed out that you cannot depend on Darling Island and Woolloomooloo Bay to meet the requirements of the port of Sydney with certainty for much more than fifteen years? Yes.

TUESDAY, 23 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, further examined:—

1459. *President.*] You wish to hand in some plans? Yes; a plan of the west side of Farm Cove, showing soundings and borings, and also two plans of Darling Harbour and Sydney Cove, showing works recommended by Sir John Coode in his report dated 28th February, 1889. Sir John Coode's estimate of the cost of his whole scheme was £800,000. C. W. Darley. 23 Mar., 1897.

1460. Under that scheme, would the accommodation be more than is at present afforded? According to Sir John Coode's scheme there would be 11,050 feet of frontage, giving accommodation for thirty-two vessels averaging 300 feet each. The number of berths at present available on the same space is forty-six, as against thirty-two available under the new scheme.

1461. Are we justified in believing, then, that the accommodation furnished by Sir John Coode, after an expenditure of over £750,000, would be less than we have at present? It would be better for large ships, but less for small ships, and altogether what I call unsuitable for the trade that is required. It would simply drive away the Darling Harbour produce trade, for the greater portion of the proposed wharfage would be accessible only to railway traffic.

1462. Are there any resummptions under Sir John Coode's scheme? It includes resumption; but that is not included in his estimate. It includes resumption of the whole of Darling Harbour between Pyrmont Bridge and Dibbs' Wharf, but does not interfere with Dibbs' Wharf.

1463. His estimate is about £750,000, not including resumption? £800,000, not including resumption.

1464. And after paying for resumption, and this sum of money for construction, the port would be very little better than at present for the purposes for which it is used? It would not be suitable for the present traffic. Quite half of the frontage would not be accessible for dray traffic, and seeing that a large proportion of the produce landed in Darling Harbour is distributed by means of drays into the city, the accommodation for so distributing cargo would not be improved. Fully half of his frontage would be accessible only to railway trucks. You could not get drays and trucks along the wharfs properly.

1465. You have already informed the Commission that after a series of years Darling Harbour has been adapted for a certain sort of traffic, and had better be left alone? Yes.

1466. And those remarks apply to Sir John Coode's scheme or any other? Yes; that is my opinion.

1467. *Mr. Humphery.*] What has actually been expended in connection with the accommodation which has been supplied in lieu of Sir John Coode's scheme? We have done nothing on that side where he proposed to carry out his scheme which did not clash with anything the Government proposed to do, but dealt only with improvements on the eastern portion of Darling Harbour at present occupied by coastal trade.

1468. Has any expenditure been incurred in connection with that portion of Darling Harbour with which Sir John Coode's scheme deals? A large private expenditure, of course, but no Government expenditure.

C. W. Darley. 1469. What is the next point? I wrote a minute, which, perhaps, I may read to the Commission. You asked me to express an opinion about wheat-shipping, and also as regards dealing with coal, also the frontage and number of berths, which I have put in a separate return [*vide Appendix*].

WOOLLOOMOOLOO BAY.

Frontage available east side, 1,450 feet, along which five eschelon berths—four each 300, and one of 280—are partly constructed. Two of these are now being completed, thus providing five good berths for large vessels. South side or head of bay there are 1,710 feet of wharfage, including 520 feet frontage to a jetty suitable for small vessels. On west side, assuming that the space now occupied by baths, boatsheds, &c., was to be set apart for shipping berths, a length of about 1,500 feet could thus be made available for five more berths, without encroaching very seriously upon the Park. I cannot, however, recommend that this Park frontage should be so utilised. Altogether, in Woolloomooloo Bay there is 4,300 feet frontage, and a possible quayside of 3,187 feet.

From the northern bath site around Mrs. Macquarie's Point, Farm Cove to Fort Macquarie, a length of about 6,250 feet is wholly frontage to the inner Domain and the Botanic Gardens. I do not look upon any of this frontage as being available for shipping purposes. It has very properly been set apart for public purposes as Park frontage, and should be inviolably kept as such.

CIRCULAR QUAY.

The Government wharfage in Circular Quay, exclusive of the head of the Cove (1,000 feet), which is devoted to ferry traffic, amounts to 4,835 feet, providing twelve good berths, nearly all suitable for steamers of the largest class.

Round Dawes Point, from and including the Marine Board boatsheds to end of George-street, a distance of 1,600 feet, is Government property, but cannot be looked upon as available for wharfage purposes, being too near the fairway and entrance to the Cove; besides, owing to its exposed position, vessels could not lie alongside a wharf there very comfortably.

DARLING HARBOUR.

Inside Pyrmont Bridge the Government owns a wharfage of 2,600 feet, which is almost wholly set apart for general railway purposes.

North of Pyrmont Bridge, including the two jetties now used for shipping coal, &c., there is a wharfage of 2,440 feet, equal to five good berths. When the coal trade, now temporarily carried on there, can be moved to a more permanent coal-shipping wharf, these jetties will be available for the frozen meat trade, and will probably more than suit the requirements for some years to come.

I was asked the other day what position was suitable for the frozen-meat trade. I do not think the Department could possibly get a better position than those jetties. There are five good berths, and rails laid on the wharf, which is suitable for the frozen-meat export trade. Some meat is shipped there now, and if the trade developed it could all be done there.

DARLING ISLAND AND PYRMONT BAY.

Around Darling Island it is proposed to construct a concrete quay wall, which will provide 2,550 feet frontage. In the bay between Darling Island and Pyrmont jetties a timber wharf with two jetties can be constructed, providing four large and one small berths. It is not, however, proposed to construct these berths at present, until it will be seen how the trade develops, and to what use they could best be put.

The concrete wall around Darling Island is now about to be commenced. When the eastern side, 1,350 feet long, is completed, it is proposed to try leasing it in three berths, with room for stores on shore, as it has been represented that a better revenue could thereby be secured.

No determination has yet been come to as regards the use to be made of the western side, but probably if a wheat-shipping trade springs up this will be the place to locate it, having railway connection and a concrete wharf wall, with good foundation. Large granaries could be constructed for receiving and storing the grain in bulk and rapidly loading vessels when they come alongside.

With a proper system of elevators, large hoppers, &c., truck-loads of wheat can be rapidly taken into the store and weighed, and held in readiness for issue to vessels coming to load.

Should a permanent coal trade be developed in Sydney for shipping railway-carried coal it will be necessary to provide a suitable site for the trade, and I am of the opinion this can best be done in Long Cove. Over a mile of good water frontage can be obtained above Long Cove Bridge, where quite three-fourths of the water frontage is already Government property.

I may here say that I have doubts as to any trade for railway-carried coal ever springing up in Sydney; but if it does, that is the place for its shipment.

1470. Is there any reason for bringing coal to Sydney by rail if you have a good port at Newcastle and another at Kembla, and the coal trade develops? If a good port were established at Kembla I think there will be no longer any need for providing for coal-shipping in Sydney. At present some coal is coming forward to Sydney, simply owing to the absence of a good port in the south to ship from.

1471. The coal for shipment comes chiefly, I suppose, from the Metropolitan mine? Yes.

1472. And the western coal is used for household purposes? Nearly all.

1473. And not for export? I do not think it is shipped to any extent.

1474. *Mr. O'Connor.*] Did I understand you to say that if a good port for coal shipment were established in the south there would be very little need for one in Sydney? Yes; if there were a good port in the south I think the coal would gravitate to the south rather than to Sydney. I think the Metropolitan coal would go south, the gradients being in favour of its going to Kembla rather than to Sydney.

1475. If a good harbour were established at Kembla, or south somewhere in that direction, do you think that the coal would go in that direction, and not to Sydney? I think it would.

GLEBE ISLAND.

As the trade of the port develops, and demands for greater shipping space arise, it will be possible to cut down Glebe Island, and convert it into a valuable shipping depot.

A scheme has been outlined which shows it possible to provide 4,150 feet of wharfage below Glebe Island Bridge, but this can be increased by construction of shipping jetties at north end, where eight berths could easily be obtained.

Inside the bridge, about 2,000 feet of wharfage can be provided, making in all, including White Bay, some 7,330 lineal feet—nearly a mile and a half—without any resumption.

1476. *President.*] Would it be a serious matter to have a swing-bridge across to Glebe Island, to be used for railway purposes? No; it would not be a serious matter.

1477. In many parts of the world there are swing-bridges over which railways pass? Yes; at nearly all the ports in England some railway traffic crosses opening bridges.

1478. It would not be a serious matter to pass over by means of a railway swing-bridge? No. Glebe Island has a great future in providing for the development of the trade of Sydney.

1479. Now, in regard to the cost of wharfage at Woolloomooloo Bay, can you divide it into two,—namely, the cost of what is already completed, and what has yet to be carried out? Up to the present, in Woolloomooloo Bay, £71,290 has been spent on wharfage.

C. W. Darley.
23 Mar., 1897.

1480. Since what date? From 1860 to the present date—that is, from the time when the circular wharf, originally known as Cowper Wharf, was commenced.
1481. And your present scheme? An expenditure of £12,696 will complete the wharfs on the eastern side. There is a contract let now for £5,000 for two berths, and £7,400 would complete the northern three berths on the eastern side.
1482. Have you a full scheme for Woolloomooloo Bay? Yes, for the east side.
1483. Does it extend past the Admiralty Wharf on the western side? No; I do not propose at present to go on the western side—the scheme is drawn up only for the eastern side.
1484. What will the full scheme cost when complete? £12,696—that is, for five berths.
1485. In Woolloomooloo Bay do you include the cost of dredging? No; intermittent work is generally charged to the dredge service.
1486. You have no estimate of the cost of dredging? No.
1487. Can plenty of water be obtained in Woolloomooloo Bay by dredging? Yes; there is no rock there down to 28 or 30 feet.
1488. Now, as to Sydney Cove on the eastern side, from January, 1879? I put that down as the date when the present permanent wharfs were commenced, excluding the old wharfs that have since been removed. On the eastern side £136,807 has been spent—that is, upon the P. and O., Messageries Maritime, the Orient Company's Wharfs, and the wharf on the south side. On the western side we have spent £93,441, and the completion of the berths at the old A.S.N. Company's Wharf, which work is now in course of completion, will cost £15,512. That is, of course, exclusive of land resumption.
1489. Does that include the whole of Circular Quay, or right to the point of the land known as Dawes Battery? Yes. The total cost of the existing wharfs, including the sheds—everything charged to the vote—and adding thereto £15,000, the estimated cost of completing the wharfs, amounts to £245,761. That is since 1879. Previous to that—that is, between 1860 and 1879—there were £40,460 4s. 11d. spent. But a great deal of that was spent on wharfs which have been pulled down when other wharfs have been constructed.
1490. They form no part of the present wharfs? No.
1491. £245,000 has been spent in the construction of various wharfs? Yes, since 1879.
1492. What has been the resumptions? For resumption of land on Circular Quay and Dawes Point, £304,008.
1493. Therefore the total amount spent on Circular Quay up to date which you think it is reasonable to include—that is, excising previous expenditure on things which have outlived their usefulness—is £549,000? The total expenditure reported to me in the construction of Circular Quay up to date, including the £40,000 I spoke of, and the land resumption, is £574,722 1s. 10d. That is the total expenditure from 1860; and the liabilities on account of the completion of work in hand, by the reconstruction of jetties at the old A.S.N. Company's Wharf, makes a total expenditure, when complete, of £590,234 9s. 4d.
1494. In your opinion there is a sum of £40,000 for previous works which should not be taken into account now? Yes; that I think should be written off, because the expenditure has gone through reconstruction.
1495. Then, in addition to that, there has been some dredging, has there not? There has been dredging and rock removal; but of those items I have no record here. I think that this expenditure includes removal and deepening of rock, but not the dredging of mud.
1496. So, roughly speaking, there is £600,000 invested in Circular Quay? I think that would be a fair way of putting it.
1497. *Mr. Humphery.*] We have had £442,753 revenue from Circular Quay, but there are annual charges against that? The annual charges are, I think, comparatively small.
1498. *President.*] Now for the expenditure on the western side of Darling Harbour? The construction of wharfs and jetties and the extension of wharfs in Darling Harbour, from 1864 to date, have cost £254,127 2s. 4d.
1499. Between what limits;—between the southern end of the bay and what point to the north? Including the Pymont Jetties.
1500. To the north-western end of the Pymont jetties? Yes.
1501. Then, from those jetties all round Jones' Bay, have you a comprehensive design for the whole of that portion? Yes.
1502. What is that to cost? £101,872.
1503. Has the whole design been approved of by Parliament? No.
1504. But you are going on with a portion of the design? The Minister has approved of a small portion being commenced.
1505. Although there has been no approval of the whole of it? No approval of the whole of it.
1506. Then the Department is going on with an expenditure which forms part of an expenditure that will amount to over £100,000? Yes; if the whole work is completed.
1507. *Mr. Hoskins.*] Two or three years ago the Public Works Committee, after a long inquiry, at which you gave evidence, recommended the construction of a new bridge at Pymont, from Sussex-street, and also recommended that it should be undertaken as soon as possible, mainly on account of the evidence of Mr. Hickson, who represented that although the bridge had been repaired and might last two or three years it might give way at any moment; and yet we do not hear of anything being done in the matter;—can you tell us what is being done in reference to that bridge? The bridge is being carefully watched, and certain work done to give it as long a life as possible; but no money having been voted by Parliament for reconstruction, no reconstruction can be done.
1508. Is it in contemplation to give effect to the recommendation of the Committee? I think Parliament will have to be asked to vote money very soon for the reconstruction of the bridge.
1509. *Mr. Wright.*] Would it be possible to furnish the Commission with a statement showing the total expenditure on the different wharfs in Sydney, say, from 1850 up to the present date, out of Loan Votes; I think, if my memory serves me rightly, the first improvement on the Circular Quay was made in 1853—from Queen's Wharf to Campbell's Wharf? Yes; I think that such a return could be obtained. The return which I have to hand into the Commission is complete from 1860. Our books go back only to 1860.
1510. Are there any means of ascertaining what was spent before that time? A good deal of that was Imperial expenditure; but a statement concerning it might be obtained from the Treasury.

- C. W. Darley. 1511. I suppose that the expenditure prior to 1860 was not very large? Not very large. I think I am right in saying that the whole of this expenditure is from Loan Votes.
- 23 Mar., 1897. 1512. I want, if possible, to ascertain the total expenditure from 1850 to 1860;—that could be obtained, I suppose, and, if added to this, would give us the total expenditure? I will make inquiry, and see if that can be obtained.
1513. Are you personally in favour of the construction of a coaling wharf in Iron Cove? Certainly not in favour of doing anything now; but I say that if a trade sprung up I would be inclined to recommend that a coaling wharf should be constructed there.
1514. Would there not be sufficient space at Darling Island for it? No.
1515. Well, what about Glebe Island for the coal trade—at the head of Johnson's Bay? I think Glebe Island is too valuable for the coal business. It is better to use it in connection with the city. If the city trade increases in connection with the shipment of wool, produce, and merchandise, it would be better to let it spread out towards Glebe Island rather than use it for the coal trade.
1516. In the event of Glebe Island and all the foreshores being utilised would any more wharfage be required for the next century almost? We do not know how the trade may develop; but I have grave doubts as to whether we are going to have in Sydney a railway-borne export coal trade. Some coal may be won on the harbour, and it may be shipped from places near where it is won.
1517. You think the bulk of the coal sent to Sydney by rail will be for local consumption? Yes.
1518. *President.*] Have you any knowledge as to what is the nature of the bottom of Blackwattle Bay? The greater part of the bay we can dredge 28 feet or 30 feet without touching rock.
1519. So there appears to be no reason why Blackwattle Bay could not be used for the coal trade; you do not want to build a new railway if you can possibly help it, and tunnelling through the hill would bring you on to Blackwattle Bay? Yes.
1520. And if there are 28 feet or 30 feet of water available there, and there is no trouble in working a swing-bridge between Johnson's Bay and the Cove, why should not coal shipping be done there? There is no Government land available, except at the head of the bay, and that would not be suitable for coal shipping. I now put in a return showing the water frontage and quayage at Sydney Harbour, and also a return showing the expenditure on Government wharfs in Sydney Harbour, up to date.

Walter Liberty Vernon, Government Architect, Department of Public Works, sworn, and examined:—

- W L. Vernon. 1521. *President.*] The Commission desire to know from you the value of the various buildings in the area immediately north from Devonshire-street, known as the Benevolent Society's grounds;—have you a statement? Yes.
- 23 Mar., 1897. 1522. Will you read it?

In accordance with the request of the Chairman (handed to me yesterday) to the effect that a rough valuation of the buildings set forth in the list accompanying it was required, I have the honor to report that a preliminary inspection has been made, and approximate valuations set down, as follows:—

Benevolent Asylum, buildings, fences, &c.	£16,400
Christ Church Parsonage, fences, &c.	1,800
Police Barracks and Superintendent's residence	6,000
Sydney Female Refuge.....	7,000
The Convent of the Good Samaritan.....	13,000
Tramcar sheds, &c.	600
South Sydney Morgue and residence	2,400
Friends' Meeting-house, &c.	500
Sextons' cottages	200
Railings, gates, &c., to Cemetery	1,000
Total.....	£48,000

1523. That is for every building on that area? Yes. The greater portion of the buildings is old and obsolete, and generally only suitable for present uses; and I estimate that if similar accommodation had to be provided in new buildings the cost would probably be between £75,000 and £80,000, as against £48,000, the present values. This of course does not include the value of the land.

1524. That would be the cost to the State if it were necessary to find the same amount of accommodation as you have at present in these old buildings? Quite so.

1525. There is no question of title at all—you only include the bare value of bricks and mortar? Yes, that is all.

WEDNESDAY, 24 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.	CHARLES ALFRED LEE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
The Hon. DANIEL O'CONNOR, M.L.C.	GEORGE BLACK, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
	FRANK FARNELL, Esq., M.P.

Stephen Edward Perdriau, Surveyor, Department of Lands, further examined:—

- S. E. Perdriau. 1526. *President.*] What is the first information you have to give us to-day? As regards the cost of resumption of a strip of land 100 feet wide between the Redfern railway station and Circular Quay. The shortest distance from Redfern station to Circular Quay is 130 chains. If the strip taken be 100 feet wide the area included would be within a fraction of 20 acres, without including any land required for stations. The municipal assessments for the present year show that if that block of the city bounded by Elizabeth, Park, Pitt, and Liverpool streets, comprising an area of 10 acres 2 roods 2 perches, were resumed, the compensation, at twenty years' purchase, would be £748,040, and at twenty-five years' purchase, £922,800. If the value of the 20 acres comprised in the strip 130 chains long and 100 feet wide
- 24 Mar., 1897.

S. E.
Perdriau.
24 Mar., 1897.

wide be estimated in the same way, and *pro ratâ*, it would cost £1,424,285 to resume at twenty years' purchase, and £1,755,624 at twenty-five years' purchase, without allowing anything for severance, for disruption of business, or for the 10 per cent. for forced sale always paid by Government. No doubt many valuable properties would be served if such a strip of land were resumed, and under section No. 78 of the "Public Works Act of 1888" the constructing authority could be compelled to purchase many large and expensive buildings situated wholly or partly upon the area resumed, and thus the cost of same would be greatly increased.

1527. *Mr. Wright.*] If I understood you rightly, you have based the valuations on the valuations for the best portion of the city? I do not think it is the best portion of the city.

1528. You have valued the portion between King-street and Market-street? No; between Liverpool, Park, Pitt, and Elizabeth streets. That is not the best part of the city.

1529. You do not take in King-street? No.

1530. Then that is a medium part? Yes, a medium part.

1531. *Mr. Lee.*] Do you know if that passes through any very expensive buildings? I did not try to locate the area, but of course a great many buildings would be affected.

1532. *Mr. Humphery.*] That starts from Redfern railway station and terminates at Circular Quay, and avoids the Park? You may fairly say that is an imaginary strip.

1533. You propose to take a strip 100 feet in width from the Redfern railway station to the Circular Quay, on the western side of Elizabeth-street? Yes.

1534. It might appear from the evidence that in estimating for the 100-foot strip you have taken the cheapest portion of the city west of Elizabeth-street? I do not think that is the cheapest portion of the city. When you get nearer the head of Darling Harbour there is much cheaper property there; but I think that the value of property on this line is rather under the average than over that of city property.

1535. *Mr. Lee.*] Can you tell us what the practice in this country is when land is taken underneath a building—can you tell us how the compensation is arrived at;—is the surface value paid? I do not know what powers the Act gives in that respect.

1536. You have no precedent in the office to guide you where land has been resumed underneath a building for a tunnel? I believe that the Water and Sewerage Board do not pay anything for tunnelling.

1537. *President.*] What is your next statement? You asked me to ascertain the area comprised in Glebe Island.

1538. What is the area? The area of land comprised in Glebe Island is $34\frac{1}{2}$ acres, and the Government's reclamation at the head of White Bay, adjoining the island, and lying between it and Balmain, comprises 12 acres, all level land, making a total area of about $46\frac{1}{2}$ acres.

1539. There will be a good deep-water frontage for a great deal of it? The deepest part would be on the eastern side of the island—about from 18 feet to 19 feet.

1540. It includes the whole of Glebe Island? Yes; road, abattoirs, and everything else there.

1541. What next? You asked me to ascertain the principal landing-places for passengers by steamer at North Shore. The chairman of directors of the North Shore Steam Ferry Company has informed me that before the tram service was started two-thirds of the passengers by their ferry steamers landed at the Lavender Bay wharf, at the head of that bay. The traffic is now diverted to the tram, and at the present time four-fifths of the passengers by steamer go to Milson's Point. The population of the borough of North Sydney, according to the Government Statistician, was 18,180 in February, 1896. The town clerk of the borough has stated to me that at the present time the population is, approximately, 19,483.

1542. Have you brought a map showing the position of the borough of North Sydney? Yes.

1543. What is the gross amount of fares collected by the North Shore Ferry Company? About £40,000 a year, reckoning the passengers at a penny per head.

1544. *Mr. Lee.*] Is there any parcel of Crown lands within the city boundary that could be converted into a park for the city people? Of course there is the Devonshire-street Cemetery.

1545. That is not Crown land at present? If what remains of the bodies buried there was removed the Government could get control of that land again, of course.

1546. Is there any other land, vacant or otherwise, that could be utilised for a city park? No; I do not think so.

1547. Do you know of any site that could be given to the public in substitution for what they would be deprived of if a portion of Hyde Park were taken away to be used for railway purposes? You could give them part of Government House grounds. Government House, they say, is tumbling down, and a substitute must be found for it pretty soon. It is in a very rickety state, the Architect says. They are now spending money on it, and are always doing so.

1548. If the Government House grounds were devoted to reserve purposes, do you not think that they would be more likely to become absorbed in the Botanical Gardens than be made a park somewhat on the same lines and for the same uses as Hyde Park now? Yes, perhaps they would; but there are 40 acres there.

1549. Do you think it would be desirable to set up another park in the city, to be used in the same way as Hyde Park is now used? Well, if land had to be resumed, it would be, of course, at enormous expense; and there is a very large area of land available now for recreative purposes, extending from Liverpool-street northward to the water—for the parks practically extend from Liverpool-street to the water—their total acreage being, I think, 230 or 240 acres, including the 40 acres of Government House grounds.

1550. And the public have access to a portion of that land at all times, day or night, and to the Gardens all day? Yes; Sundays and all other days.

1551. Take Hyde Park, for instance;—you know it pretty well? Very well.

1552. Is it really used at the present time for the recreation of the citizens or their children? I do not think so; it may be by the children.

1553. Is it not largely taken possession of by the loafing classes? Yes, it is, almost entirely.

1554. As a matter of fact, does it offer to the citizens or their children that recreation which it was supposed to afford? I do not think it does, except where the band plays on the eastern side. A good many children collect there in the afternoons when the band plays, but the western portion of it is used almost entirely by loafers.

1555. Are you of opinion that the citizens would suffer no serious loss if they were deprived of that portion of Hyde Park which it is proposed to take for railway purposes? I do not think they would.

S. E.
Perdriau.
24 Mar., 1897.

I think that the suburban residents would be benefited to a very great extent indeed by the railway coming right into the city, and also that a very large proportion of the inhabitants of the Colony would receive a direct benefit by being brought right into the heart of the city by the railway.

1556. What portion of the community would suffer, and in what respect, if that portion of Hyde Park were taken for railway extension purposes? I think, principally, the Domain loafers.

1557. The average citizen would not be deprived of any right whatever? I think not.

1558. That is to say, that irrespective of the portion required for railway purposes there would be ample room for recreation purposes? Yes. It so happens that at that particular place there are many large and contiguous reserves.

1559. Not very far from there is a smaller park? Yes; Cook Park and Phillip Park.

1560. Hyde Park has not been used for many years for vehicular traffic;—it is used only for pedestrian traffic? That is all.

1561. And has not the construction of the Centennial Park had the effect of attracting a large number of the citizens to that park for recreation purposes, particularly driving? No doubt it has, because there is a road there specially made for the purposes of driving.

1562. In that respect the Centennial Park has advantages far beyond anything that could be offered by Hyde Park? Yes. People living within an equal distance of Hyde Park and Centennial Park would never go to Hyde Park for recreation, but would go to the Centennial Park.

1563. The Centennial Park has a large area? Yes.

1564. Do you remember how much? Under the Centennial Celebrations Act the area to be left for a park is a square mile.

1565. It has been very largely improved, and is being beautified? Yes; more than £250,000 has been expended there.

1566. At the time that park was granted to the public there was no demand for extra park sites in the city, was there? I think not. I do not think it was intended particularly as a park for the city, but more for the surrounding suburbs; but of course it is very close to the city.

1567. But all those suburbs, now you may say, are part and parcel of the city—connected with the city by tram and every other means of conveyance? Yes.

1568. And it is no more a park for the suburbs than for the city—it is available for all? Yes.

1569. Is it not largely used by the city people? Yes. I have seen thousands of the city people there, especially on Saturdays, Sundays, and holidays.

1570. If this large park has been conferred on the citizens of Sydney recently at enormous expense, do you think that the citizens would suffer in any way if a small portion of Hyde Park were taken for necessary railway purposes? I think the taking of 10 acres out of Hyde Park would hardly be noticed by the citizens.

1571. It is only proposed to go up to about the middle walk? Yes; the south-western corner of the Park.

1572. Therefore it would leave all the facilities for pedestrian communication between Oxford, College, and other streets as well as it does at present? Yes.

1573. It would only prevent people from going direct through to Elizabeth-street between Liverpool and Park streets? Yes.

1574. But they could get to either of those points by taking a diagonal path? Yes.

1575. Therefore there could not be any great inconvenience to those who use the Park for pedestrian purposes? I do not think so.

1576. You are of opinion that the location of a railway on that portion of the Park would be a benefit not only to the citizens but also to the Colony at large? Yes.

1577. *Mr. Humphery.* Supposing, instead of having a terminal station between Park and Liverpool streets, it were placed between St. James' road and Park-street, would your replies to Mr. Lee's questions be equally pertinent? I think so. I suppose that the same quantity of the Park would be taken—10 or 12 acres—and it would not much matter which portion were taken. Of course there is a good deal more pedestrian traffic across that portion of the Park towards King-street than there is across the southern portion of the Park.

1578. You mean diagonally? Yes; from Boomerang and College streets. That part of the Park is more used.

1579. I am speaking now of the north-western corner? Yes, the north-western 10 acres of the Park, bounded by Macquarie-street.

1580. Then the pedestrian traffic will come out at St. James' road instead of in Elizabeth-street;—is that what you mean? Yes; somewhere about the Queen's Statue, instead of going diagonally.

1581. *Mr. Wright.* As a matter of fact the bulk of the pedestrian traffic goes that way now, does it not? Yes, I think the greater part of it does.

1582. *Mr. Humphery.* How many acres are there of the Devonshire-street Cemetery that might be utilised for a park? About 11 acres.

1583. Comparing that area of land that might be made available for a park at Belmore-road—I mean the site of the Devonshire-street Cemetery—with the portion of Hyde Park which it is proposed to be taken for railway purposes, there would be twice the population inconvenienced? There would be, according to the Government Statistician's figures.

1584. Have you been over that land? Yes, I have been into it from various points; it is subdivided by fences.

1585. Would it be a suitable position for an addition to Belmore Park? I think it would be, certainly. It is very suitable land for a park, being elevated.

1586. And very central? Yes, it is central. There is a very dense population, especially to the east of it.

1587. And you think that as far as utility goes—not intrinsic value—it would be a fair exchange for the north-western corner of Hyde Park? Yes; I think the figures prove that the population benefited would be twice the number.

1588. *Mr. Wright.* I gather from your remarks that you consider that the outcry against utilising a portion of Hyde Park for railway purposes is more sentimental than anything else? Yes, I do.

1589. And that the citizens would practically suffer no loss by the appropriation for railway purposes of that portion of Hyde Park asked for by the Railway Commissioners? Yes.

S. E.
Perdriau.

24 Mar., 1897.

1590. And you think that the land to be taken from the Devonshire-street Cemetery would be in every way as suitable, or even more suitable, for the requirements of the citizens of that part of the city than the portion of Hyde Park proposed to be taken? Yes.

1591. In making your calculation of the cost of the resumption of land you include resumptions right from Devonshire-street, do you not? Yes.

1592. And you are aware that there is a large portion between Campbell-street and Devonshire-street which is to a certain extent Government property, including Belmore Park and the Cemetery grounds, the resumption of which would not necessitate any great expense? It would of course depend entirely upon where the railway ran. You might interfere with Christ Church Parsonage, and the Convent, and the Refuge.

1593. But if you can avoid interfering with the Parsonage, and the Benevolent Asylum, and the Convent of the Good Samaritan, by taking a railway to the back of them at a sufficient distance, and then passing through Belmore Park, how many chains of resumption would you save? There would be something saved there.

1594. Can you give us any idea of the number of chains that would be saved? At a rough guess I should say perhaps 25 or 30 chains.

1595. That would reduce your total then to a little over 100 chains? Yes.

1596. And it would correspondingly reduce the cost of resumption? Yes. I am afraid that those figures do not convey anything like the extent of the probable cost of such a resumption.

1597. Of course to those figures would have to be added the cost of severance and destruction of buildings? Yes.

1598. Allowing for the lesser distance going through Belmore Park, you think that the original figures would be more than borne out by the result? Yes.

1599. So there is no hope of getting a railway through the city for less than £2,000,000 for resumption alone? No; under a clause of the Public Works Act, if a building is touched at all the owner can compel the Government to take the whole of it.

1600. Can you tell me what is the resident population within a certain distance of the north-western corner of Hyde Park? Within half a mile radius of the junction of Elizabeth-street and St. James'-road the total resident population is about 15,000.

1601. And those are the only people who can actually claim any particular right to this Park? Yes, I think so.

1602. And you are under the impression that depriving those people of the convenience of having the Park close to their door would be more than counterbalanced by the gain to the population of the Colony generally if this railway were constructed? Yes.

1603. Very much more? Yes, I think so.

1604. *Mr. Fegan.*] Whom do you call loafers. You say that this Park is chiefly used by loafers. You do not call a loafer an unfortunate man out of work who is doing his best to get work, do you? Certainly not.

1605. Well, what reason have you for saying that the majority of the people who frequent this portion of the Park are chiefly loafers? That is the opinion I formed of the people there; I have seen them for twenty years, and that is what their appearance was. They are not working-men, but men that will not work.

1606. *Mr. Black.*] If the Park were closed would they cease to exist? No; if you take 10 acres they will go on to the remaining 30 acres.

1607. Well, if the closing of that portion of the Park would not wipe out those men whom you call loafers there would not be any benefit to the public in that direction if it were closed? I did not suppose that we were going to effect any reform in that respect.

1608. In fact you would only make the evil worse by concentrating them in a smaller area, if there is any evil? Well, at that particular place you have over 200 acres of land available for those particular people, and if you distributed them over the remaining 190 acres you would hardly notice any difference there.

1609. You have no idea in your head of having admission to the Parks by ticket? No.

1610. *Mr. Fegan.*] In answer to Mr. Lee you said there never was any agitation for more park room when the Centennial Celebrations Act was passed? I do not know that I said that directly, but I do not remember any.

1611. Do you know there was an agitation against taking away any portion of this Park? I believe there was an agitation some years ago.

1612. And a very strong agitation; even some of the most prominent people in Sydney took a part in the agitation against taking any portion of this Park for railway purposes? The gentleman I particularly remember is Mr. Macintosh.

1613. He occupies a very prominent position in the public life of the Colony? Yes; and no doubt his opinion is very valuable.

1614. And there were Sir Alfred Stephen and others? Yes. Sir Alfred Stephen was one of the trustees of the Park.

1615. Therefore, so far as the agitation was concerned, it was not owing to these unfortunate men but to some of the leading men of the time? Yes; there were some of the leading men connected with it.

1616. I think you will admit that the feeling is almost the same yet? I daresay it is.

1617. When the Bill was before Parliament I suppose you heard that a number of the representatives of the people were against handing this Park over for railway purposes? Yes; they thought that the taking of a quarter meant eventually the taking of the whole of it. That was the principal reason, I think; but I read the Railway Commissioners' statement, and they said they would not dream of asking for any more than 10 acres, because they would not make the Hyde Park station the main terminal station. Redfern would continue to be that, or rather the depôt.

1618. *Mr. Lee.*] This is for passengers only? Yes.

1619. You do not think that 10 acres near Belmore Park would compensate for 10 acres in the heart of the city, do you? I think the figures giving the population in the two portions show that 10 acres at Devonshire-street Cemetery would benefit twice as many people as 10 acres on the north-west corner of Hyde Park.

S. E.
Perdriau.
24 Mar., 1897.

1620. But you know it is really not those people who live in the near vicinity of Hyde Park who avail themselves of the advantages which Hyde Park gives to the people for recreation and other purposes, under the beautiful shade-trees such as there are not in the Domain? I think the Inner Domain is preferable to Hyde Park for shade-trees.

1621. But is it not a fact that no other park in the Colony gives the same facility for shade and enjoyment as Hyde Park? I must say that I have not seen very many people using Hyde Park for that purpose—I mean that I have not seen many people whom I would consider to be respectable people using it for that purpose. They mostly go into the Domain or the Inner Domain.

1622. Does not that statement bear out what I have said, namely, that the people who live in the different business places near and around Hyde Park do not frequent the Park, and that other unfortunate people come from other parts of the city because they appreciate the shade and the surroundings of the Park? Yes. It is not unlikely that a good many of those people whom I call "loafers" would collect where the cemetery is now if that were made into a park.

1623. Many people go to Hyde Park who are homeless, but are not loafers, and who walk about from morning till night looking for work? Very likely.

1624. And I have seen people go in there the state of whose pockets would not afford them any other means of getting rest? Yes; but they would not have to go much further to get to some other part of the Park.

1625. To be waylaid, perhaps, by tricksters? I have seen as many tricksters on this portion as elsewhere.

1626. Do you think there is the same protection in the Domain as in Hyde Park? We only propose to take a quarter of Hyde Park.

1627. But at the present time the Park is open to the public gaze, and in the daylight a man cannot commit robbery without being detected;—the police are there, and the public are on the alert? Yes; they are nearer than they are in the Domain.

1628. Do you not think that it is much better in that respect? There is no doubt that some people would be inconvenienced by the taking away of 10 acres, but I think that on the whole it would be of benefit to the country generally.

1629. How would it benefit the suburban people? It would avoid the necessity of changing from the train to the tram at Redfern.

1630. The expense of travelling would be about the same? I suppose the expense would be about the same—not much difference.

1631. Not having to change from train to tram would be the principal benefit? Yes.

1632. How much time would that save—about a minute? I think more than that. Even in the morning it takes fully a minute I think to change, but at other times in the day it must sometimes mean a loss of six, seven, or eight minutes.

1633. Do you think it is fair to go to the enormous expense of constructing a railway from Redfern to Park-street or Market-street, as the case may be, and take perhaps one of the most valuable sites for recreation in Sydney, in order to save that short space of time, seeing that you are about to construct an electric tramway along George-street? That will serve the people to some extent, no doubt.

1634. And you have also the steam tram service in Elizabeth-street? The railway, of course, would compete with the present tram service.

1635. And successfully, too, would it not? Yes.

1636. What is to become of the tramway then—there would be a loss on that portion of it, would it not? I think that portion of the tram service would hardly be wanted at all—that is the railway tram.

1637. In your calculation you have not informed the Commission the amount of loss that would be sustained by the pulling up of the tramway? No; that would be a matter for the Engineer-in-Chief for Railways.

1638. Perhaps you could estimate the value of that property? I could find that out for you.

1639. *Mr. Roberts.*] Is it not true that since the extension of the tramways into the various suburbs business people now have residences for their families in the suburbs who used fifteen or twenty years ago to live at their place of business with their families? I believe that is a fact. In fact the population of the city proper is not growing so fast on that account.

1640. Is it not a fact that the families of at least (say) 75 per cent. of the business people of Sydney now reside in the suburbs? I daresay that is about the proportion.

1641. And therefore is it not fair to assume that there is not the demand for Hyde Park as a recreation-ground at the present moment that there was twenty years ago? Yes; I certainly think that is the case.

1642. *Mr. Hassall.*] The traffic through the north-western portion of Hyde Park principally comes from Woolloomooloo, does it not? Yes.

1643. And in the event of that portion being resumed for railway purposes no very great inconvenience would be caused to anyone by being obliged to make a detour along College-street into St. James'-road? No; it would not make half a minute difference.

1644. So the resumption of that portion for railway purposes would not, to any great extent, inconvenience the public who use that short cut to the city? No.

1645. Is it not a fact that that particular portion of the Park is, to a certain extent, infested by people who do not care to work? I have always thought so, especially at night-time.

1646. There must be, of course, some amongst them who would be only too glad to obtain employment, but as a rule, is not Hyde Park overrun—day after day, week after week, and month after month—by people lying about there to the detriment of those persons who would like to use the Park for recreation purposes? Yes; lying about on the benches and elsewhere.

1647. From what you yourself have seen you think it is not a desirable place to send girls and children to at the present time? No; very undesirable.

1648. How far is it from that portion of Hyde Park to the Domain? About 200 yards.

1649. So that even if the public were deprived of that portion of Hyde Park they have the Domain right alongside of it, which they could make use of? Yes. I think that is the principal reason why they would not feel any inconvenience, because at that particular place there is such an enormous area of park-land available—from Elizabeth-street right down to the waters of Port Jackson.

1650. You may say that it is a continuation of park-land right from Elizabeth-street to the waters of Port Jackson? Yes.

1651. And if an area of 10 acres were taken out of it it would hardly be missed? Hardly at all.
1652. You think that in view of the largely-increased convenience to be conferred on the public by the extension of the railway to that particular point it would more than counterbalance any little inconvenience the people might suffer by being deprived of that portion of the Park? Certainly.
1653. *Mr. Clarke.*] Do you consider that, as a whole, with Moore Park, the Centennial Park, the Domain, and other parks, the people of Sydney are as well situated in that respect as are the people in any other part of the world? I have not travelled enough to express an opinion on that, but I have always thought that it would be a valuable thing if they had a piece of park land in the western portion of the city, which is not very well served.
1654. Which part do you mean? Well, we have Wynyard-square there, but that is about the only piece of available land in the western part of the city until you get to Blackwattle Bay—Wentworth Park.
1655. But in the eastern portion the people are well off for parks? In the eastern portion of the city the park-land extends from Dowling-street, Surry Hills, up to Randwick and Waverely—that is, including Moore and the Centennial Parks.

S. E.
Perdriau.
24 Mar., 1897.

THURSDAY, 25 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
The Hon. DANIEL O'CONNOR, M.L.C.	GEORGE BLACK, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
CHARLES ALFRED LEE, Esq., M.P.	FRANK FARNELL, Esq., M.P.

Norman Selffe, M.I.C.E., M.I.M.E., sword, and examined:—

1656. *President.*] What are you? I am an engineer.
1657. At present practising in Sydney? Yes.
1658. You are aware of the project before the Commission to extend the railway into the city for the conveyance of passengers and for the conveyance of goods? Yes.
1659. You have given the matter some consideration? A great deal of consideration.
1660. And have a scheme you believe to be a satisfactory solution of the matter we are considering, and desire to place it before the Commission;—will you explain it? I have been asked to place it before the Commission—I have placed it before the country—and I shall be glad for the Commission to consider it. I think it will be better for me simply to outline my scheme, and then leave you to ask me to come here again, for it took the other Royal Commission three days to go into it. I may say that the scheme was misrepresented then in a way that I am sure it will not be represented before this Commission. I should like to say before going into an explanation of the scheme that I am not an advocate of any hard and fast line to a few feet or chain or two. I am an advocate more of certain definite principles which I laid down, and I show in my scheme a solution of the difficulties which they involve. I am prepared to admit at once any improvements if they achieve the same results.
1661. You approach the matter simply on general principles—you are willing to accept any amendment in regard to details? Yes; with regard to small details.
1662. The plan which you have now placed before the Commission shows your proposed line going down towards Darling Harbour, and then going northerly; you have an alternative scheme starting from Eveleigh Station; do you desire to consider that at all, or do you consider this is the better one? I only know of one scheme.
1663. There is an alternative loop-line? That alternative loop-line, which was referred to by some of the Government officers, is merely Mr. Deane's line; it was only drawn on my plan as showing how goods could be brought from Darling Harbour to Circular Quay apart from the passenger line.
1664. As far as you are concerned we say nothing about that? Excepting for goods. That is a scheme that belongs to two or three other plans. I think you mean the loop that terminates at the Commissariat Stores, and goes round by Miller's Point.
1665. On the western side of southern George-street station there is a loop? That is part of Sir Henry Parkes' scheme.
1666. It appears here on this plan of yours? I put it here as it is for the Commission to consider it; but that really was a suggestion on Sir Henry Parkes' plan that was submitted to the previous Royal Commission.
1667. Your main scheme turns off on the western side of Redfern station? At the tunnel.
1668. And follows down to the first George-street station;—will you give us a rough description of it, first of all? My whole scheme is based on five leading points: First, the distribution of the present suburban passengers throughout the city. Secondly, a provision for the connection of all the eastern suburbs with the city extension. Thirdly, that the extension should go hand in hand with the improvement and not the disfigurement of the city, and that, if possible, the improvement of the city should accompany the carrying out of any scheme. Fourthly, that the connection of the North Shore line should be an integral part of the whole scheme, whether it be carried out now or in the future. Fifthly, that the cost of any system should be estimated on a rational and business-like basis, and not in the way in which the cost of my scheme was estimated on previous occasions.
1669. Will you describe the route, and then we will turn to the various heads? The route I propose is to turn off at the Redfern tunnel, follow the Darling Harbour branch down as far as George-street, widening it and easing the grade, and making a station somewhere opposite Christ Church, on the ground where Pennell's store used to be, or in that neighbourhood; then proceed by means of a viaduct right across the Haymarket valley, on a level over the top of the premises held by Hoskins and Tangye; and so on over Hay-street, striking Brickfield Hill about Messrs. Goodlet and Smith's yard, where the railway would enter a tunnel. The corner of Goulburn and Kent streets is so much below the corner of Bathurst and George streets that it is possible for a train to go over the lower corner and be underground at Bathurst-street—the ground rises so much. My original intention was to utilise the site on which the new market buildings are now erected.

N. Selffe,
M.I.C.E.,
M.I.M.E.
25 Mar., 1897.

N. Selfe,
M.I.C.E.,
M.I.M.E.
25 Mar., 1897.

1670. Before that, between Bathurst and Liverpool streets, do you enter your tunnel? Yes. I intend to make an easy curve, as shown on the plan. The line goes in amongst what are practically slums in this district—pig-pens, and so on, where the stock is sold—and then it gets out about Goodlet and Smith's yard. It then goes into a short tunnel under the very widest part of George-street, where ventilators could be placed in the middle of the roadway—very long, narrow openings—which would ventilate the tunnel. That is between Druitt and Bathurst streets.

1671. Now you have come to the station? Yes. The City Council having now built on that site it becomes a question whether the basement of those large market buildings could or could not be used for a station. That was the site that I selected as being the most central site in Sydney, and at that time practically vacant, for when I designed this scheme that was practically a waste site. The whole scheme is now subject to revision from the fact of the markets being there. This matter is apart from the object of this Commission; but I hold the opinion that that basement is totally unsuited for the markets, and it would be better to blast out all the brickwork put in there—hundreds of tons—and utilise it for a station. That basement is 22 feet deep.

1672. How deep down would you put the running road? The line only needs to have 15 feet clear over it, and the basement is about 4 feet deeper than is necessary for a railway.

1673. Will that seriously interfere with the buildings now up? That is a question I have never gone into. It would be no difficulty to put the whole of the upper part on columns, for the underground railway in London runs in amongst buildings, at the Mansion House and many other places. But that opens the question that if that building is not to be used as a station there is nothing to prevent the line going at the back of the Town Hall—going a little further west. That would not interfere with my scheme as a whole. I merely selected that site because at the time I proposed this scheme it was a vacant site, awaiting something to be done with it; and to my mind it appeared that—it adjoining the principal civic buildings of the country—there could be nothing more suitable than to put a railway station there.

1674. You practically transfer it from George-street to York-street? Yes; and go at the back of the Town Hall. It does not alter my scheme, except in the details.

1675. Your tunnel still continues about 40 feet deep? No; only deep enough to get covering. York-street, from Market-street to Wynyard-square, is very level, and I had alternative schemes either to go under York-street—in “cut and cover,” as it is called—that is, you open one side and build a wall, and then open the other and make an elongated Redfern tunnel, or you resume property right through from Lassetter's to the Savings Bank, which would, of course, involve considerable expense in separating properties. That is another question of detail, and not of principle, because the tunnel under York-street, from Market-street to Wynyard-square, could be very well ventilated.

1676. At the south-western side of Wynyard-square you propose to have another station? As much of Wynyard-square as is necessary. That would be a daylight station.

1677. You would still be in a tunnel, but would open the station right out? Yes; open the station right out.

1678. You then proceed by a tunnel to Charlotte-place? Yes; there would be a very short tunnel beyond Wynyard-square to get to Charlotte-place. The line would, at Wynyard-square, practically divide into three branches—the left-hand side going up by the old “Three Crowns,” to go along to the Princess-street Bridge for connection with the North Shore line; the central part going down to 30 acres, which I propose should be resumed on the Rocks, and which is illustrated by plans I have here. Plan No. 3 shows 30 acres of slums, where you can shake hands across the streets in many places. Plan No. 4 shows the same site as Baron Hausmann might have treated it if he had ever been in Sydney. From the eastern side of Princess-street, taking in Gloucester, Cumberland, Cambridge, and Harrington streets, up to Argyle-street, I propose to resume 30 acres. At the time I drew up this scheme I was told on very good authority—some land agent friends—that £30 a foot would be the maximum price for any property there. Then, from Hunter-street, where now George-street runs, turning and twisting about, going down to the old Queen's Wharf and Commissariat Stores, I propose to make a new George-street, a chain and a half wide, running straight and level right through to Dawes Point, not interfering with the old street at all, but going right over the site of the present Harrington-street. Then on the block bounded by the new George-street and Argyle-street, and by a new Gloucester-street at the back, an by an extension of the street which has just been widened, coming from the Circular Quay near the fire station, you would have a Circular Quay railway station which would be within a biscuit-throw of all the harbour steamers. This is a matter I do not go into details about, but speaking from a general passenger's point of view, I would say that such trains as the Liverpool and Penrith trains might start from a station like that, and that, with the suburban, would give you a regular service of trains up and down the western side of the city, not more than a chain or two from George-street. The line to the left hand, running along the backbone of the ridge, continues until it crosses Argyle-street almost level with the present Princess-street Bridge. From Princess-street the ground runs level to where there is a wall looking into Dr. Mitchell's garden (now Trinity Church Parsonage), and then the line would run on until it got above Dawes Battery high enough to go to the North Shore. Whether carried out now as part of the scheme, or five or ten years hence, my scheme provides for that North Shore extension as an integral part of it, and does not delegate it to someone in the future to spend two or three million pounds to get to North Shore because we had a city railway which did not take such connection into account. (The reason why I worked this part of the scheme out was because the Chief Commissioner for Railways, in giving evidence before the other Royal Commission, said that if the railway had to go to North Shore we would have to have another western line, and I thought it would be better to have one city scheme instead of two.) Then going around the back of St. Patrick's Church the line crosses over Essex-street by a bridge, and goes across Circular Quay on a viaduct, there being a station at about the present site of the Water Police Court, from which point the scheme becomes common with Government schemes, going round into Paddington, Waverley, and Woollahra, and taking a route on which there does not seem to be any difference of opinion—the eastern suburbs scheme. The central point of my scheme is this: that having got to Wynyard-square—whether the line so far follows my direct route or goes a little more to the west—I have from that square three connections—one being to the North Shore, another to the terminal station, where 30 acres could be resumed cheaply, and to which point the railway would bring all the suburban passengers who might want to go down to the harbour steamers, and the third to the eastern suburbs. All the harbour steamers from Manly, Hunter's Hill, and Parramatta are making the Circular Quay a focus, and my opinion is that any railway scheme that does not give you a station in close proximity to Circular Quay would not meet the requirements of a large bulk of the passengers.

N. Selge,
M.I.C.E.,
M.I.M.E.
25 Mar., 1897.

1679. *Mr. O'Connor.*] I suppose you know that at the Circular Quay there is a large parcel of land which now belongs to the Government? I am aware of that. My own opinion, given for what it is worth, is that you could buy land for £30 a foot and sell it for £300 a foot, although not, perhaps, to-day. But before the previous Royal Commission they debited me with £1,500,000 for the resumption of land, and so many thousands of pounds for levelling it, and yet gave me no credit for a resale of 20 acres with the new George-street frontage.

1680. We have now ascertained the general principles of your scheme? Yes, except this: that in connection with that scheme—more as a negative value than as a positive one—there is this which, I think, cannot be too forcibly brought before you: I am now exhibiting to you a bird's-eye view, showing the present railway buildings at Redfern, the Darling Harbour line, the place where the new bank is at the corner, the Cyclorama, the Benevolent Asylum, Belmore Gardens, and so on. Approximately, there are 50 acres there. Now, if a line is run across there, and there is a series of brick arches to carry it, there will be 50 acres of the centre of the city converted into slums in one act; because, what can you do with it if you take this site and build arches all over it for the railway. You can only back carts through those arches—you cannot lay out streets. I say that there is a future value in that land which would pay for the whole city railway. This is the way it could be done: Our city is most peculiarly situated, because from Liverpool-street, at this end of the town, to Cleveland-street, Redfern, there is only one cross thoroughfare by which you can get from the east to the west—that is Devonshire-street. Under many schemes that have been brought forward Devonshire-street is to be practically shut up, because it is going to be made into a gutter; but I say, instead of making it into a gutter, make it into a magnificent thoroughfare 120 feet wide, build a grand station facing this grand thoroughfare, carry a 120-ft. avenue right through the site of the present burial-grounds, and make a square there—call it Trafalgar-square or Maddison-square, according to which city you take the name from—and then you have 10,000 feet of frontage either for Government buildings or for sale; and surely the taking away of 10,000 feet of frontage, with all these squares and wide streets, is a point that should be considered when it is proposed to have a lot of brick viaducts for the railway. Do not carry the railway there, when the great cost will be the loss to the city of that magnificent site.

1681. *Mr. Wright.*] It is not proposed to carry the railway over brick arches? The plans show brick arches. Belmore Gardens is 30 feet below the high part of the Burial-ground, and under my scheme if 10 feet were taken off the top of the Burial-ground and put in Belmore Gardens you would have a most magnificent site of 30, 40, or 50 acres, which could be tastefully laid out, and on which you could erect public libraries or museums, or anything else.

1682. *President.*] The reason why you are making this explanation and showing the present state of things adjacent to Belmore-road is to show why you desire the railway to keep west and not to go into that portion of the city? That is it. I desire to show that whether Hyde Park is taken or the site of the present burial-grounds, a fair estimate should be made of the value of the ground, not only its present but its prospective value, because I say that we should be able to make what the city has not got now—a grand centre. It is a fact that we have not got what you may call a centre of the city. Now there is a possibility of making a grand central square, which you might call Trafalgar-square, and around which grand public buildings could be put, and you would have a large avenue from the station, and in the course of a very little time that property would sell at very high prices. However, that is only a detail; but my contention is, that judging by the experience of London, Paris, New York, and Berlin, four typical cities, this site is nearer the centre of the city for long-distance travellers than are the main termini in those cities, and it is only the suburban passengers we want to bring round the city.

1683. Let us now turn to your scheme itself: Your scheme proposes to leave the Redfern yards on the western side, and your first station lies about opposite Christ Church. How many lines do you propose to bring into the city? Four lines.

1684. Have you any idea what the cost of that first portion would be? Only the Commissioners' estimate.

1685. You have made no estimate yourself? No.

1686. Are you prepared to accept the Commissioners' estimate for that portion as correct? Yes.

1687. What was the Commissioners' estimate for that portion? On page 115 of the Report of the previous Royal Commission, the Commissioners laid out the Hyde Park scheme, but they left out any provision to compensate for taking St. James' Church, the Supreme Court, and the Registrar-General's Office. For the land that they then required at Hyde Park, Belmore Gardens, and the burial-ground, I put down £500,000. I also put down £250,000 for the new sites, and the rebuilding of St. James' Church, the Supreme Court, and the Registrar-General's Office, and I brought the net cost out at £1,600,000. That came to £17,000 a chain. On my own scheme Mr. Foxlee's estimate, made on behalf of the Railway Commissioners, was £2,600,000, but he put nothing down for the resale of this new site. From information which I have obtained from experts, I put down the value of New George-street at £500,000, and New Gloucester-street at £150,000, and the capitalised value of the sites under the Haymarket viaduct at £50,000, making total credits to the western scheme amounting to £700,000, which were omitted altogether. That brought out the net cost at approximately £1,900,000, or £14,000 a chain as against £17,000 a chain for the Hyde Park scheme.

1688. You agree with Mr. Foxlee's estimate of £2,667,770, but you think you should have a credit of £700,000? Yes. They naturally made my scheme cost as much as they could.

1689. But you have no estimates which you think would be likely to be more reliable? No; I am not in a position to impugn the correctness of their estimate.

1690. What area do you propose to take at George-street station, opposite Christ Church—the first stopping place? It would only be a passenger station. I should take whatever is necessary. A platform, I think, would be about 600 feet long.

1691. But you would want more than one platform if you had four lines? Yes; but I do not suppose that fast trains would stop there.

1692. You cannot work four lines with only one platform about 600 feet long? If the Railway Commissioners want 1,000 feet they would have to have it. I would not presume to give any opinion on that.

1693. In your opinion is 600 feet long, and as wide as necessary, sufficient for an ordinary passenger platform? Yes.

1694. What area that would be you are not prepared exactly to say? No.

1695.

N. Selfe,
M.I.C.E.,
M.I.M.E.
25 Mar., 1897.

1695. Then coming to the next station, contiguous to the Town Hall, in regard to the area, and the cost of that, you are not prepared to express an opinion? That is all included in the £2,000,000.

1696. But the position is altered now to some extent, because you were hoping to get a pretty well vacant place—the property of the city council—which now you would have to resume? I reckoned that site would cost pretty well £250,000. We have a good criterion for that value. The corporation gave the Government £120,000 for the market site, and I take that as being something definite from which we could estimate values in that locality.

1697. Then your passing central station, adjacent to the present new market buildings, in your opinion, would cost £250,000? I think pretty well that. I do not think it would actually cost that now, because things are much lower in price than they were at the time I made my estimate.

1698. At Wynyard-square you propose to take such portion of the reserve as may be necessary? Yes.

1699. You do not exactly define the area? No.

1700. Then passing Charlotte-place you come out into the open, and pass into the Rocks, as you mentioned? Yes.

1701. What area do you propose to do your shunting upon in the Rocks? I propose to take 10 acres, but under my scheme there will be no shunting wanted there. I propose to have what are called traversers. When an engine runs to the end of a line, instead of as it does now at Redfern, stopping for a train at the entrance of the station in order that the engine may run down and take up another line, if traversers are used, the same as in Eveleigh yard, the engine can be pushed out and put on a middle line. There would be three lines between two platforms, instead of two.

1702. That would necessitate a third line, and therefore your four lines down there would become six? Yes; I would have six lines on that station.

1703. In your opinion will six lines deal with all the suburban traffic that should go down to your terminal station at Circular Quay at present? They will until the population is four times what it is at present.

1704. You believe they will;—you have made the necessary calculation? Yes they will, because you will have the other stations for the passengers to get out at. You will have passing stations all down the side of George-street and the railway would go across the Circular Quay. It would only be some trains that would run into that station. Of course the railway management would not run more trains into that station than they could deal with there, because they would have a line on each side of it.*

1705. Did you not inform the Commission that the North Shore line was a matter to be kept well in view, but it might not necessarily be constructed at present? Yes.

1706. That being so you could not utilise that for traffic at all? No; not until it was built.

1707. For the time being, for a city railway, without taking into consideration the North Shore extension and the eastern suburbs extension, this terminal station would require to do your reversing work? All the reversing work that was required there; but that would be limited in quantity, because you would have the line to Circular Quay and the station on the Water Police Court site as well as this, and there would be no shunting at the Water Police Court site, because it would be a wayside station there.

1708. You reverse there and go back? No. I go right to Paddington and go in a circle.

1709. But, except so far as the future is concerned, we have not at present under consideration the eastern suburbs or the North Shore extensions, excepting that they must be kept in view if any railway works were carried out, and must fit in with them and not be antagonistic to them;—therefore, if your city scheme embraces one station at the Rocks and another down near Circular Quay, until the eastern suburbs extension or the North Shore extension is built, all the shunting or reversing must take place at those two stations for the time being? Just so.

1710. Therefore, you would have to keep some of your traffic from Circular Quay; in other words, at Charlotte-place, and whatever trains are required to go to Circular Quay until the eastern suburbs extension was made would require to shunt there, or reverse there, and go back? As the Mansion House station on the underground railway in London sufficed for years for all the shunting of the enormous traffic of that railway before the circle was completed, and considering that Sydney is only a very small fraction of the population of London, I see no difficulty in dealing with the traffic at this station in the meantime as was done at the Mansion House station. I was in London and travelled on that line the very day the extension was opened. I travelled dozens of times whilst the enormous traffic of twenty different lines was running into the Mansion House station, and the shunting was properly regulated. What could be done there could be done here, and the Rocks station would suffice with proper management, if it were necessary to make it suffice.

1711. *Mr. Hoskins.*] They have a reversing line at the Mansion House station, have they not? If provision is made by having six lines instead of four an engine could be at the other end of the train ready to go out before the passengers were all out of the train.

1712. *President.*] How long is your tunnel—about a mile? It is about 40 chains from entering at Goodlet and Smith's down to Essex-street, from which two stations have to be taken out. It is about half a mile from the time it enters the tunnel to the time it finally leaves it; but during that, it is in daylight all in front of the Town Hall; it has a station at the Markets site or behind it, and if it ran between George-street and York-street it would be in daylight the whole way, there not being any tunnel at all except of course under Market and Barrack Streets.

1713. It would be an open cutting between the buildings? Yes; just walled in. In the report of the previous Royal Commission I see there is a section, the scale being 10 chains to the inch, and according to that the distance from the entrance to the tunnel to Essex-street is 75 chains.

1714. It is nearly a mile, is it not? Yes; it is nearly a mile. I took the other scale just now.

1715. The distance, therefore, is nearly a mile, out of which will come the stations where you propose to have them open, and you can, you think, have an open cutting? It can all be open. The question whether it is open or a tunnel is a mere matter of expediency and cost; it is no part of my plans.

1716. *Mr. Hoskins.*] What is the length of tunnel altogether under your proposed scheme? There is a little under half a mile of tunnel altogether, but from the time you enter the first tunnel to where you leave the last the distance is 75 chains—that is, approximately, a mile.

1717.

* NOTE (on revision):—I do not desire to give any opinions on railway management, but base my opinion as to the adequacy of this station on the fact that the Chief Commissioner, Mr. Eddy, approved of a Circular Quay station (see Report of Royal Commission) with only two lines instead of six, and 1½ acre area instead of 10, and stated in answer to Question 22 (3 July, 1891) that such a scheme was equal to forty trains an hour each way.

1717. *President.*] In your opinion would there be any difficulty in ventilating tunnels? I do not think there would, but I think it very desirable not to have tunnels.

1718. You would avoid them if you could? Yes.

1719. Your first point was distribution. You maintain that your line distributes the passenger traffic better than any other proposal? I do not say that. There is a number of other schemes, such as Mr. John Young's and Mr. Mountain's, and that run on the western side of the city.

1720-1. You believe that it would satisfactorily distribute the passengers coming in from the suburbs? Yes, where they would require to go.

1722. And that is made clear from its contiguity to the Circular Quay and the main business parts of the city? Yes.

1723. Your second point is that you could readily connect the eastern suburbs with it? Yes.

1724. You are borne out in that by a contemplation of the Government schemes? Yes. What is called Sir Henry Parkes' scheme was afterwards adopted in the Works Department. I take no credit for suggesting a scheme connecting Paddington, Waverley, and Woollahra. I may say that my original circular railway returned up through Woolloomooloo, and through Bourke-street, Surry Hills. That was the railway I proposed twelve or fourteen years ago.

1725. Your third point is that such a line as that, with the utilisation of the property near Belmore Park, will make the city more beautiful rather than less beautiful? It will improve the city rather than disfigure it, and at less actual cost.

1726. Your fourth point is that from or adjacent to Wynyard-square or Charlotte-place the best approach to a bridge to North Shore could be commenced;—it fits in with that? Yes; it fits in with that, because I would not make any portion of this city railway of steeper grade than 1 in 50. I understand that proposals have been made for inclines of 1 in 30, but as the Railway Commissioners have spent money all over the country in reducing the grades it would be a retrograde step to contemplate any portion of this railway, or the North Shore railway, being steeper than any other grades in the country.

1727. Your last point is that you believe that the result obtained will be commensurate with the amount of money spent? If the estimate is made out on a business-like basis it will be found that this scheme will not cost any more for extra accommodation than the Hyde Park scheme costs for limited accommodation.

1728. With regard to your resales, they are all made perfectly clear by the plans you have put before the Commission? Yes.

FRIDAY, 26 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Edward Maxted, Manager of the Sydney Benevolent Asylum, sworn, and examined:—

1729. *President.*] What are you? Manager of the Sydney Benevolent Asylum.

1730. The building at present situated immediately to the north of Devonshire-street is under your control? Yes.

1731. Will you explain to the Commission the operations of that institution? Yes. The objects of the Benevolent Asylum are:—

1. The object of its original foundation, namely, to relieve the poor, the distressed, and the aged, by affording them assistance in the form of provisions, &c., and small sums of money to assist in payment of rent, &c.

2. As a receiving asylum for homeless and deserted children and foundlings, and for children awaiting removal to other asylums.

3. As a receiving hospital for sickly mothers with infants, who cannot be received in the infirmary or other hospitals, or who may be suffering from the diseases of women.

4. As a lying-in hospital.

5. As a training institution for midwives and nurses.

6. As a school for practical instruction in midwifery, in affiliation with the University of Sydney.

7. Department for treatment of midwifery cases of poor women in their own homes.

So there are seven divisions of work in connection with the Benevolent Society.

1732. Before entering into the question of the use of the institution will you tell the Commission your revenue, and how you derive it? The revenue of the Benevolent Society is obtained from general subscriptions by the public, from midwifery fees, from Government subsidies, legacies, and from interest on invested moneys. Those are the principal items of revenue.

1733. And the amount? Last year the revenue amounted to £19,000.

1734. How much of that was contributed by the Government, and how much was received from the public? £14,000 was contributed by the Government, and the balance was made up in the way I have mentioned; but I may state that last year was a special year. The Society undertook the relief of the unemployed, and the Government paid wholly for that work, so that there was, I may say, a special revenue of something like £4,000 that we would not get under ordinary circumstances.

1735. Well, give us an idea of what you regard as a fair average amount. As it appears at present, the contribution is about £3 by the Government to £1 received from private sources? Yes. £4,000 received last year as a special subsidy from the Government cannot, of course, be regarded as ordinary revenue, and therefore the £19,000 received last year is not a fair index of the general revenue of the Society, which is approximately £15,000, or, in other words, roughly, £3 contributed by the Government to every £ received from private sources.

1736. With regard to all your objects excepting the first one—the relief of the poor—is it necessary that you should have so central a position; the distribution of alms might perhaps require a central situation

N. Selve,
M.I.C.E.,
M.I.M.E.

25 Mar., 1897.

E. Maxted,
26 Mar., 1897

- E. Maxted.
26 Mar., 1897.
- situation such as you have, but excepting that particular work these seven appear to be purposes that could be discharged just as well a couple of miles away? No, I think not. For instance, take the lying-in hospital. Large numbers of women are brought to the doors of the asylum in labour. They are confined probably within half an hour, or a few hours, of admission.
1737. How many women are confined there in the course of a year? Approximately, I should think, in that way about one hundred and twenty.
1738. How long does a woman generally remain there? She comes in destitute, and, after confinement, we endeavour to get a place of service for her as soon as possible.
1739. How long would she remain there? It depends on circumstances; sometimes a month, sometimes six. If you take an average I suppose the time would be six or eight weeks.
1740. She would be able to be removed in a month? After fourteen days in the ordinary course.
1741. You say that there would be perhaps one hundred and twenty women who would come there in actual labour; and therefore to take them a greater distance would be an important matter, and, dividing the twelve months equally, you would have about six beds occupied at the same time by women of that class? I think about twenty beds.
1742. It is possible at the end of a month to remove them to anywhere else, where they could wait as well? In the ordinary course it is possible to remove them after a fortnight; a month would be the full limit.
1743. Now, with regard to the third object? That is "as a receiving hospital for sickly mothers with infants." It is not necessary, absolutely, to have a central position for that.
1744. You would not require to be central in connection with object No. 2? You would want a central position for foundlings.
1745. To which they could be taken? Yes.
1746. They do not require to live at a central institution? No; it is better they should not live there on account of health. They want more fresh air. I have in my spare time, during a long period, compiled a history of the institution, dating from 1813, when it was under another name. In 1818 it was founded by Governor Macquarie as an asylum for the poor, blind, aged, and infirm, and the present building was erected in 1820, and I have written a complete history of its operations to within a few years back. I have it in a printed form, and will forward a copy to you.
1747. In regard to objects 1 and 4 there is some reason for having a central position? Good reason for having a central position.
1748. But with regard to the other objects a central position is not absolutely essential? Quite so.
1749. And in regard to object No. 4 only a limited number of the cases that would come under that head would make a central position absolutely essential? Those are the labour cases; but after a time they might be removed to where there are healthier surroundings.
1750. The matter resolves itself into this: The purposes of the Benevolent Asylum could be met by having a central position where alms could be distributed and a limited number of labour cases—say, a dozen—could be dealt with at the same time, and the residue of the work that is carried on in the present institution could be done at some place not quite so central? That would be possible. But it is the opinion of the Board of Directors that it is not desirable to do that. The opinion of the Board is that the site of Ultimo House, at Ultimo, which is centrally situated and retired, on a hill, would meet all the combined purposes of the Benevolent Society. There would be opportunities of proper classification by shutting off the different departments by means of high walls and so forth, and if that property were resumed the Board of Directors consider it would meet all the purposes of the institution, provided that the Government were to supply the necessary funds by resuming the present site and were to grant compensation under the Land for Public Purposes Resumption Act.
1751. It has been stated in a letter received by Mr. Brunner from your President that your Society requires £73,333? That was merely an average estimate.
1752. And as much more as you could get? Yes. It has been variously estimated at something like £97,000, £65,000, and £57,000.
1753. You have no title-deeds, I believe? A title was prepared in the year 1849. It was in the Colonial Architect's Department, and it was seen by a former manager of the institution, who has sworn an affidavit that he has seen it, but we have not been able to trace it since. It was prepared, but not signed.
1754. You believe then it was the intention of the Government to issue it, but it has never been issued;—that is your position? Quite so.
1755. And you are in possession? Yes, since 1820.
1756. Have not the same Board of Directors under their control a large building at Randwick where 700 people could be housed? No; some land was granted conditionally that the Society should erect a building and remove some of its inmates there. It was dedicated to the institution for that particular purpose, and it is a grant the deeds of which we applied for fourteen years ago, but a reply was sent to the institution to the effect that the original conditions had not been fulfilled, and that the land had been leased or loaned to the Randwick Asylum for grazing purposes.
1757. Still, your ownership of your institution is simply an incidental ownership—the State owns it after all. In fact I may say that both institutions are State properties to all intents and purposes, but are vested in your Board for management? The Board of Directors dispute that; they claim absolute ownership of the Benevolent Asylum site.
1758. Well, they are really the possessions of the people of the Colony for general purposes? Yes; the purposes of the Benevolent Society and the Government are practically one so far as the interests of the poor are concerned.
1759. Therefore we have two institutions, one working at Devonshire-street—which you have already described—and another lying almost empty a few miles away at Randwick? There are no buildings at Randwick.
1760. There is a large industrial school? That is the Randwick Asylum—a private Society altogether. There are 49 acres of land at Randwick that have not been built upon at all.
1761. I was not speaking of those 49 acres, but of the building that has been erected at Randwick for the children? That has nothing whatever to do with the Benevolent Society.
1762. Would it serve your purposes? To some extent.
1763. All these purposes, except 1 and 4? Not so well as the property at Ultimo; in fact I think it would be inconvenient, on the whole.

1764. Does it not strike you, that if the community has a large building that must have cost many thousands of pounds, and was probably built by the State, it will be a wise thing to use that building? I think it would be wise to use it for purposes for which it would be suited; but it would not be suited for all our purposes. The work would be split up, whereas now it is concentrated. If the various departments of the Society were separated that would be objectionable.

1765. Supposing that you had a place at your present position in which there were twelve beds, and also had accommodation there where alms could be distributed, and then some suitable accommodation elsewhere to deal with the other cases which you have enumerated under the several heads, could not your institution go on well enough;—I presume you would say, "Yes, if it is at Ultimo"? I do not think it is wise to split up the departments of the institution. I think we could have proper supervision at Ultimo.

1766. But apparently the State would have to provide £73,000 to give you that accommodation, whereas all the accommodation you require for the distribution of alms and certain other purposes could be afforded on 200 or 300 feet of land at the present site, at a cost of £3,000 or £4,000;—if it were possible to give you proper accommodation elsewhere for those cases that need not be dealt with on a central site you could surely carry on your business? Not so well, I fancy.

1767. Will you tell us why? Because we would have separation of the various departments of the institution, and would require more supervision, and would not have the work so well in hand. We would have to go to one district for one class of work, and to another district for another.

1768. *Mr. Lee.*] Surely in the present building the accommodation is very limited? Yes; it is very limited, and very bad altogether. That is why we want other premises.

1769. *President.*] You believe the present building is unsuitable? Yes, quite.

1770. It is about seventy years old? Seventy-seven. In case a single woman comes in for her first confinement we have to place her perhaps with a woman who has been in four or five times. That is objectionable on moral grounds. Besides, the children whom we shelter there, waiting to pass through, are constantly in view of pregnant women. That is also objectionable.

1771. This all proves a change is necessary? Certainly.

1772. *Mr. Lee.*] Surely under modern conditions those are cases that should be treated in a more private place than in the centre of a great city? It would be more private at Ultimo.

1773. I should like you to look at the question from this point of view: If the present insufficient premises should be required for railway purposes, and you have to move, what will you do then? We have already asked the Government to take the place and give us compensation and enable us to put up another building at Ultimo.

1774. That narrows it down to what the President says—that all your business could be just as well done there? Much better.

1775. *Mr. Wright.*] When you speak of Ultimo, I suppose you mean the old Ultimo House? Yes.

1776. *President.*] Your Board contemplates removing to Ultimo? If we can get the Government to do what the Board require.

1777. *Mr. Lee.*] Is this exactly the position: The directors are quite willing to give up the present site; all they wish to be sure of is that the Government will either provide them with another and a more suitable site of equal value, or will allow them compensation for this site, and then they would purchase another for themselves? That is precisely the position the directors take up.

1778. *Mr. Clarke.*] Are you aware what title the Randwick Asylum holds? No; I do not know what their position is.

1779. Is it not the same as that of the Benevolent Society? I have no idea.

1780. The Randwick Asylum is a semi-Government institution? At the present time they do not get any Government subsidy, but I do not know what their position is.

Stephen Edward Perdriau, Surveyor, Department of Lands, further examined:—

1781. *President.*] You wish to make a statement in regard to Mr. Selfe's evidence, which has been brought under your notice? Yes. In my previous evidence it will be remembered that in my opinion the cost for land resumption for any line passing through the city from Redfern to Circular Quay, where the land is privately owned and occupied, would not be less than £1,750,000. I have explained that such a valuation was, at best, an approximation. I have looked carefully into Mr. Selfe's scheme, and, taking that as the route, I see no reason to alter my opinion, and believe to provide room for even four lines of rail and the necessary station accommodation (with respect to which Mr. Selfe gives no definite opinion regarding area or exact location, one of his sites being now occupied by the new markets, which would necessitate resumption, I presume, towards York-street) would certainly bring it up to these figures for an open cutting. The Commission will of course understand that figures of this kind are only given as an approximation of what it would cost to resume. In any resumption cases, the total amount which the Government will have to pay is never known till their conclusion, and interests which appeared to be of little moment prior to resumption frequently become expensive ones before the case is settled. In verification of my valuation, I would direct the Commission's attention to evidence given by Mr. Foxlee, based upon figures furnished apparently by the Government Valuator, which are almost in accordance with mine. Of this valuation I was not aware until asked by the Secretary to inquire into the matter. The question of the resumption and resale of the locality known as "The Rocks" may reduce the figures somewhat, but my experience with regard to the resumption and resale by the Crown is that it is not usually attended with profit.

1782. *Mr. Lee.*] Do you think that £30 per foot for the 30 acres proposed to be resumed at the Rocks would cover the cost of resumption? A very large portion of that property is used for residential purposes, and I do not think that on the average perhaps it would cost more than that, provided you did not take the George-street frontage.

1783. But have you figured out what taking those 30 acres means? No; I have not gone into the matter. I know the locality well, and that the tenements are of a very poor character.

1784. But 30 acres of the city anywhere must include an enormous number of buildings? Yes; but I think that is one of the inferior portions of the city.

1785. That is very true, but 30 acres is a very large area to resume in the city? Yes, it is indeed.

1786.

E. Maxted.
26 Mar., 1897.

S. E.
Perdriau.
26 Mar., 1897.

S. E.
Perdriau.
26 Mar., 1897.

1786. And I presume that it would be almost impossible at the present moment to fix a price per foot by way of valuation for 30 acres of land in that locality? I do not think it would be very difficult.

1787. You would first of all have to make frontages to the various properties and treat them all as frontages irrespective of their depth? Yes.

1788. And I presume that the depths are not uniform? No.

1789. Therefore you would have an enormous area to deal with? Yes.

1790. Do you think that £30 per foot would cover the cost of resuming property in that part of the city? I really do not think it is worth very much more. That is of course for the land only.

1791. Thirty acres of land in that part of the city includes the rocks or slums, but it also includes a number of very valuable buildings. It is an enormous area in the city, and it is one mass of streets, and I am sure that you would be astounded when you came to measure up the frontages? There is a great deal of frontages. That is the oldest portion of the city, and in those days they divided the land, as they did in London, into very small allotments.

1792. If you were to figure out the frontages included in those 30 acres, and take it at £30 per foot, what do you think the grand total would be? I should like to measure it first.

1793. Taking the value of the land on the basis given by Mr. Selge, what is your opinion as to the value of the buildings on those 30 acres? I have not looked at them carefully, but the majority of them are certainly not first-class buildings.

1794. *President.*] Have you any further information to give us now? The question asked by Mr. Fegan relative to tramway and rolling-stock affected by the extension of the railway into the city will be answered by Mr. McLachlan on behalf of the Railway Commissioners. I think that the only portion of the tramway that would be rendered unnecessary would be the curve from the station to the present main tramline.

1795. And the railway would relieve the Elizabeth-street traffic a little? It would relieve the Elizabeth-street traffic a good deal, and that is very necessary.

1796. Have you anything else? Yes; a statement Mr. Jee asked for—a statement of the value and present occupation of that block of the city of Sydney bounded by King, Elizabeth, Market, and Castlereagh streets: The area of this block is about 1 acre 3 roods 12 perches. The High School property, together with that portion of the block extending thence to Market-street, comprising an area of 1 acre 1 rood, belongs to the Crown; it was resumed in November, 1880, at a cost of £88,940. The High School, said to be at least forty years old, is a two-storied brick building about 100 feet long, by 47 feet wide, with iron roof, and was formerly known as St. James' School. The grounds have frontages of about 177 feet to both Elizabeth and Castlereagh streets, with a through depth of 155 feet. After the resumption some of the buildings were demolished and a galvanised-iron school-room erected, occupying about 120 feet of the Castlereagh-street frontage, adjoining the High School ground on the south. The shops upon the remainder of the 1 acre 1 rood remain much as they were when resumed; they front Elizabeth, Market, and Castlereagh Streets. The gross rental now received by the Government for them is £25 5s. per week. I have already given evidence before the Commission relative to the value of the remainder of the block under description—2 roods 12 perches—lying between the High School and King-street, showing that the resumption of the same would probably cost £100,000. At the time of the resumption the High School building was valued at £5,500. I have here a valuation of that building by Mr. Vernon, the Government Architect, which is as follows:—

In accordance with the instructions of the President, I have the honor to report I have made an approximate valuation of the High School and the iron building adjoining it in Elizabeth and Castlereagh Streets.

I value the buildings as at present as follows:—

The brick buildings, including walls, closets, sheds, pavings, &c.....	£5,300
The iron buildings, fences, pavings, closets, &c.	2,100
	£7,400

The brick building is old and inconvenient, and the wood requires repairs. The closets and fencing are old and very much out of date.

To provide similar accommodation in new buildings would cost about £12,000 or £13,000.

The value of Castlereagh and Elizabeth streets property in that locality is about £70 or £80 a foot.

1797. It would come to about £90,000 an acre? Yes.

1798. If you take that as a fair index of the value of city land, and if 20 acres are required for a running road down to the Quay, you have to reckon £1,800,000 for your running road, if you have an open cutting—that is, without taking severance into consideration? Yes.

1799. That pretty well agrees with what you have previously said? Yes, I think it agrees pretty well with it. Disruption of business is also an important item.

1800. Have you any other information? The number of passengers by the railway tram has already been stated before the Commission by Mr. McLachlan. It is 3,000,000 per annum. I understand that the North Shore tram traffic is as follows:—Cable, 2,083,496; electric, 388,686.

1801. But those two trams are virtually the same service? Some passengers would no doubt go on both trams.

1802. *Mr. Humphery.*] The electric tramway is an extension of the cable? Yes, from Ridge-street, North Shore, to Mossman's Bay.

1803. *Mr. Wright.*] The cable tram carries practically the whole of those passengers? There are many who travel on the electric tram who do not go down to Milson's Point.

1804. *President.*] Anything else? You asked for the number of passengers in and out of Milson's Point Railway Station. Mr. McLachlan says he will supply that information.

TUESDAY, 30 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.
 The Hon. JAMES HOSKINS, M.L.C.
 The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
 The Hon. DANIEL O'CONNOR, M.L.C.
 HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
 JOHN LIONEL FEGAN, Esq., M.P.
 THOMAS HENRY HASSALL, Esq., M.P.
 GEORGE BLACK, Esq., M.P.
 FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

George Pile, sworn, and examined:—

1805. *President.*] You have been in business in Sydney for a considerable number of years? Yes.

1806. Do you desire to make a statement in regard to the subject under the consideration of the Commission? Since I first moved in this matter—and that is fully twenty years ago, possibly more—what I might term the axis of employment—that is, the centre of employment for the majority of the people who use the railway to come from their homes in the suburbs to their places of business in town—has been considerably changed. When I first interested myself in the first City Railway Extension League I considered that Pitt-street was the centre of employment; that almost as many suburban residents were employed at places on the eastern side of Pitt-street as were employed on the western side; and I had a plan prepared showing a suggested route for an extension of the railway under Castlereagh-street. Since that time, however, the axis of employment has shifted greatly to the west, and from Market or from DrUITT street on to Bridge-street, or even further, more people have their offices and places of business to the west of George-street than to the east of it. I should say that the centre of employment is not in any case to the east of York-street, and if you want the city railway to give the greatest convenience to suburban residents, for whose benefit chiefly it would be made, I think you would serve most people by taking it somewhere along the line of York-street. All the large drapery warehouses in the town are in York and Clarence streets. That part of the town I might call the St. Paul's Churchyard of Sydney. All the produce trade of Sydney, which is enormous, is done in Sussex-street, and most of the shipping, or at any rate sufficient shipping to give employment to a very large number of men and clerks, comes to Darling Harbour; while a very large number of people are employed at Pyrmont, which is a rapidly-growing manufacturing centre. On the other side of York-street we have George-street, where the shops do chiefly a retail business; Pitt-street, where there are a number of offices; Elizabeth-street, in which a good number of solicitors have their offices; and Phillip-street, where there are a number of Government offices. In these places there are not so many people employed as in the places of business west of George-street.

G. Pile.
 30 Mar., 1897.

1807. By what route would you extend the line? In giving evidence on this subject before a former Commission, I suggested that the railway should commence at Dawes Point, to the west of Harrington-street, and that it should go underneath York and George streets. Unless you took the line very largely underground the cost would be so enormous that it would be idle to ask Parliament to sanction the work. If the Government are not prepared to meet the expense of constructing this line, they had better be content to bring the railway as far as Belmore, and there connect it with a good tramway system.

1808. Do you regard a connection with the waters of the harbour as of any value? We have that connection now at Darling Island.

1809. Do you believe that that western connection will be sufficient? I am inclined to think that the cost of taking the railway to Dawes Point, which would enable a connection to be made with Circular Quay, would be so great that the suburban residents might be as well served by a complete and efficient system of tramways.

1810. But you would advocate the extension of the railway to Dawes Point if the scheme could be carried out for a reasonable sum? Yes.

1811. You are speaking now only upon general principles; you are not prepared to go into details in regard to this proposal? On a former occasion I made some calculations in regard to the cost of resumptions, which I put down at over £600,000, and careful inquiries into the cost of tunnelling, and so on, made me estimate the cost of the whole work at over £1,000,000.

1812. *Mr. Roberts.*] Where would you propose to have the principal station? I think that the head passenger station should be between Charlotte-place and Argyle-street, somewhere near the southern end of Wynyard-square.

1813. Would the station you speak of be sufficiently large to do the work of the present Redfern station? In my opinion a railway into the city is only required for the suburban traffic, not for long-distance trains. A person going 200 miles into the country could take his luggage in a cab up to Redfern.

1814. We have it in evidence that the accommodation at Redfern is at the present time not sufficient for the proper conduct of the traffic there, and that it is absolutely necessary for the safety of the public that that accommodation be increased? Ample ground for a station might be got at the place which I suggest. Between Charlotte-place and Dawes Point you could, with a little resumption, get a piece of land nearly as wide and a good deal longer than the station-yard at Redfern.

1815. Would you resume the whole of the locality known as "The Rocks"? I would not take the whole of that part of the town, only a portion of it. There is a large piece of land there on which are built small low houses, which is not very valuable. Then, too, you could reclaim largely.

1816. Where would you reclaim? To the east of Dawes Point, where Pile's or Cunningham's wharf used to be, and where the boatsheds are now. That part of the harbour is not put to much use at the present time. I have examined the whole of that ground well, and I know that there are a good many acres there. The length of the portion of which I speak would be more than a quarter of a mile—in fact, nearly half a mile.

1817. *President.*] In estimating the cost of resumption at £600,000, did you propose the resumption of so large an area as 10 or 12 acres? I do not recollect the area which I proposed should be resumed. My estimate was based on the value of land per foot, extending from Charlotte-place. Of course, a portion of the ground to be taken would be comprised in streets. You would take much of Gloucester and

G. Pile.
30 Mar., 1897.

Cambridge streets. I had the levels taken, and I find that they would suit. It would be rather low at Argyle-street to take the railway under there; but, at the same time, you could do it.

1818. Your scheme, then, does not differ very widely from part of that of Mr. Norman Selve? My original suggestion was that the line, starting from Redfern, should go between Pitt and Castlereagh streets as far as Goulburn-street. Goulburn-street would have to be closed, because the levels would not suit, and you would have to go under Liverpool-street. Since I made that suggestion, several valuable buildings have been erected in that part of the town, including the very expensive market buildings in George-street. I originally proposed to take the railway under the site of the markets.

1819. *Mr. Humphery.*] You propose to resume the whole of the land between Charlotte-place and Dawes Point. Would not that render necessary the closing of that part of George-street which merges into Fort-street? The line would cross George-street somewhere about where Union-street comes in—a little to the west of Campbell's gates. You would bridge that part over.

1820. So that the shunting operations would take place on overhead bridges? The trains would pass underneath iron viaducts.

1821. You would not close any street? Several streets would have to be closed—the lower portion of Gloucester-street and Cambridge-street, for example—and some little lanes. You would also have to stop Goulburn-street between Castlereagh and Pitt streets.

1822. *President.*] Adopting your alternative system, where would you propose to extend the railway? The Government have already tramways running along Elizabeth-street as far as Belmore Park. These tramways, I believe, they intend to run on the electric system in future. Parliament has also voted money for a line of electric trams down Harris and George streets. I think that a tramway should also be made along Kent-street, from its lower end. Such a tramway would serve the people engaged about Kent and Sussex streets and on the wharfs.

1823. But where would you fix upon as the best site for a railway station? I would take part of the Benevolent Society's grounds, and make Pitt-street from 80 to 100 feet wide, as far as Hordern's refreshment-room. I would also widen Belmore-road to the same extent, and then I would recommend that the railway terminus should be moved from Devonshire-street to Belmore-road. The land taken near where the Female Refuge now stands could be used for a cab-stand, while part of the Benevolent Society's ground could be used for offices connected with the railway.

1824. That arrangement would bring Redfern railway station a quarter or half a mile nearer the city? This morning I estimated the distance at about 30 chains.

1825. How would you extend the tramways from this new railway station? The Government have already a tramway along Elizabeth-street. The Botany tramway turns down Devonshire-street, but I should recommend that Castlereagh-street South be continued to join Elizabeth-street opposite Toohey's brewery, and that the Botany trams should go along that new piece of road. I understand that the Railway Commissioners contemplate removing the western traffic into George-street as soon as the George-street line is finished, leaving Elizabeth-street for the eastern traffic. I would advise that the railway trams, which now go along Elizabeth-street, should go along Elizabeth-street as far as Toohey's brewery, and turn down opposite the proposed new station. I would also suggest that the trams going along George-street should turn round by Hordern's, and have their terminus in Belmore-road, opposite the new station. The Kent-street tramway I would take up Liverpool-street to join the eastern line. Anyone coming from Kent-street and wanting to get to the railway could get out at George-street and take another tram, while if he lived in the eastern suburbs he could go straight home in the same tram. I think that in this way the convenience of the citizens would be better served than by the construction of one line of railway through the city. I do not think that the Commissioners' scheme considers the convenience of a large number of the citizens at all.

1826. Are you opposed to the use of Hyde Park for the purposes of a railway station? I do not think the citizens of Sydney are much interested in that proposal. Hyde Park is used most by country people who are staying in Sydney for a time.

1827. *Mr. Hoskins.*] It has been stated in evidence by the railway authorities that if the railway were extended into the city a track 100 feet wide would have to be made to accommodate six lines of rails;—can you give the Committee any idea as to the cost of making a tunnel 100 feet wide through sandstone? No. In the estimate which I mentioned just now I allowed for a roadway 40 feet wide, which I was told by a railway expert at the time would be ample.

1828. What did you allow for the cost of tunnelling a road 40 feet wide? Ten shillings per cubic yard.

1829. Have you calculated the difference in cost between a tunnel and an open cutting? Well, a great deal of the open cutting might be through clay. It all depends upon the depth. In any case, if you can blast you can get out mixed stuff—sandstone and clay—at 1s. 3d. a cubic yard.

1830. You consider open cuttings much cheaper than tunnelling? Yes; but you could not have an open cutting through George-street.

1831. Have you considered that if a tunnel were taken through Sydney the Government might have to defend a great many actions for damage alleged to be done to the foundations of houses by vibration and in other ways? If the line was properly packed there would be very little vibration. I have travelled for many years past the School of Arts at Newtown, which was so flimsily built originally that before it was finished the walls tumbled in; but notwithstanding the immense traffic near there now the vibration is not felt.

1832. You know that the London railway companies have had to defend many actions for alleged damage to foundations? I daresay that that is so, but then London is built on clay. I believe you have to go down several hundred feet to get to the solid chalk there.

1833. It has been stated in evidence that to resume a much smaller piece of land than you were talking about would cost £1,750,000? If I recollect Mr. Perdrian's evidence, he was speaking of land in a much better part of the city. I am speaking of land that you can buy for from £10 to £15 a foot.

1834. When the claims for compensation were brought before the Court, evidence might be given to show that this was the best situated land in the city and the most likely to improve in value? I have had a good deal of experience in cases of this kind, and I know that the Judges always expect the evidence given to be as to the value of the land at the date of resumption. You cannot go into the box as a prophet.

Edmund Compton Batt (Batt, Rodd, and Purves, Limited, Sydney), sworn, and examined:—

E. C. Batt.

1835. *President.*] You are in business in Sydney as a partner in the firm of Batt, Rodd, and Purves? Yes.

30 Mar., 1897.

1836. Can you make a statement in regard to the scheme before the Commission? Well, first of all I may say that I do not consider that an extension of the railway into the town by either the eastern or the western route alone will be of any great practical use to the citizens of Sydney. A line following the eastern route would leave the whole of the western suburbs and that part of the town where the people are poorest, and could least afford to pay additional fares, absolutely without better communication than they have now, while a line following the western route would leave the whole of the eastern suburbs practically unsatisfied. From measurements that I have made many times, I am confident that a station at Hyde Park would be as much out of the way for most people on the west side of George-street as the present station at Redfern.

1837. *Mr. Hoskins.*] But suppose the George-street tramway is made? Well, a tramway means another fare, and involves the changing of vehicles.

1838. *Mr. Humphery.*] Do your remarks apply to the proposed terminal station at Park-street? Yes; I do not think that it is necessary to have a terminal station there at all. What I would suggest is a circular railway to serve both the eastern and the western parts of the city. The trains would then run in opposite directions round the city, and they would pass through Redfern as they now pass through any of the suburban stations. This would relieve the congestion of traffic at Redfern, which is caused mainly by the suburban traffic. If the greater part of that traffic were taken away from Redfern there would be plenty of room there for a terminal station. People going long distances—to Melbourne, or back into the country—could as easily get a cab and drive to Redfern then as they do now.

1839. *President.*] The suggestion to bring the line through Hyde Park, parallel to Castlereagh-street, round by the Circular Quay, and back by a route parallel to George or York streets, meets with your approval as a scheme for dealing with the suburban passenger traffic, and you think that people going long distances might start from a central station at Redfern? Yes. That is practically the suggestion which I made to the Railway Commissioners some months ago.

1840. That scheme, if carried out, would mean either very long tunnels or a great deal of expensive resumption? I have been over the route; and some years ago, when a former Commission was sitting, with the assistance of a surveyor, I made out an estimate of the cost of a line on the west side of George-street; but the papers were burnt in the big fire of 1891, and I have now no notes except those taken lately. I do not think that the western extension would cost more than the eastern extension. Any quantity of land is to be got there at a reasonable price, just as on the eastern extension, until you get up to Market-street; towards the northern end there is no land of very high value.

1841. Are you able to express an opinion as to the total cost of resumption or of construction? No.

1842. Do you desire to express an opinion with regard to the question of dealing with goods traffic? No. I quite agree with the Commissioners that the narrow neck of land at the Redfern tunnel is a great source of danger and inconvenience; but I do not see why this should not be remedied by making some alteration in the Mortuary arrangements and resuming a little land there. The cost, I think, would be immaterial. I would either resume St. Paul's Church or take a piece of land on the other side of the line, whichever suited the purpose best. If this were done I think you would have all the room you wanted for the rearrangement of the line now going under George-street, and to give access to the Redfern yard. I remember speaking about this matter to the Commissioners years ago, and I hold that with this improvement the Redfern yard will be big enough for all the traffic for the next 100 years—that is, if the passenger traffic is taken on into the city in the way I have suggested.

1843. A circular line through the city would save shunting? Yes. I do not suppose they would have to interfere with the trains once a month, unless to take off an extra or defective carriage. I was asked the other day what I would do with the through trains under this arrangement. I say that the express traffic must stop at Redfern, and the fast trains when they come on to the city lines must go round the circle just like the ordinary suburban trains.

1844. *Mr. Humphery.*] Is it your view that it is necessary only to make provision for the ordinary suburban traffic, which can be done by the construction of a line down the west side of George-street, turning round at the Circular Quay, and coming back on the east side of George-street, under Hyde Park? Yes; without resuming any city land at all. For a large central station I have seen it stated that 20 or 30 acres will be required to be resumed; but I do not think so much land will be wanted. The Commissioners have already shown us that a large area is not required for a suburban station, and all that would be wanted on this line would be a platform from which the passengers would walk on to the trains. People going long distances would have to drive with their luggage to Redfern.

1845. *President.*] Do you desire to express any opinion in regard to the goods traffic? I think that is a matter altogether apart from the present scheme. The carrying out of the scheme I suggest would not interfere with any project for dealing with the goods traffic. I might add that in this matter I am not pledged to any particular detail of route; I am simply speaking of the scheme as a whole. I have seen several estimates of the approximate value of the land to be taken; but I do not think any of them are correct, or that correct estimates can be made until it is determined exactly where the line shall go. In my opinion the cost of the western route has been very much over-estimated. I believe that it would be much less than people think.

1846. *Mr. Wright.*] Are you acquainted with the railway facilities of other cities? Yes; I have been all over the Continent, and know all the railways in Great Britain.

1847. Is there any city in the world where everybody has a railway station within a few yards of his door? No; and in London, Glasgow, and Paris I know of no main-line stations except at the outskirts of the city.

1848. A twenty minutes' walk would take you from one end of Sydney to the other? I would not say that; but Sydney is situated on a narrow peninsula.

1849. Would not a railway down the middle of the city serve all purposes? Not so well as a railway on both sides of George-street.

1850. But with a railway down the middle of the city would not the commercial people of Sydney be as well served as the commercial people in other parts of the world? No. They had to build the underground railways in London in order to take people from their business-places in the city out to the suburbs in which they resided, and that is what we want here.

1851. But London is a very much larger city than Sydney? Yes, I admit that; but we want something like

- E. C. Batt. like the Metropolitan railway to supply the wants of our citizens. It has been a crying shame that for years, while we have been multiplying our tramways, which I think are of comparatively little use, we have done nothing to carry out a comprehensive scheme to provide for the city traffic.
- 30 Mar., 1897. 1852. Do you think that the circular railway you speak of would not cost more for land resumption than an extension requiring a large central station? I think that more land would be required for a central station than for a circular line. I saw by the newspaper that it has been estimated that a line going down the western side of the city would require the resumption of 20 or 30 acres of land; but I think that ridiculous. I fail to see why you should require a tract of land more than 30 feet wide.
1853. The Commissioners say that for a terminal railway they would require six lines of rails, and for a circular railway four lines? Well, they run the London railways with less than four lines.
1854. You think that a double track would be sufficient for a circular railway? Yes.
1855. And that for intercolonial and interior traffic Redfern should be the terminal station? Yes.
1856. You contend that this accommodation is absolutely necessary to meet the requirements of the city traffic? Yes. To show how the traffic has grown, I may say that I can remember when one 4-horse bus was sufficient to carry the passengers arriving at Redfern by any particular train, while now five omnibuses and a double tram are sometimes insufficient, independent of those walking and using other vehicles.

WEDNESDAY, 31 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREYS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	GEORGE BLACK, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
CHARLES ALFRED LEE, Esq., M.P.	FRANK FARNELL, Esq., M.P.

Edward William Knox, sworn, and examined:—

- E. W. Knox. 1857. *President.*] What evidence have you to offer? Evidence more particularly with regard to amalgamating the passenger and goods traffic.
- 31 Mar., 1897. 1858. Are you aware of the proposal of the Railway Commissioners to take a portion of Hyde Park for a railway terminus? Yes.
1859. Do you approve of this? No; I am altogether opposed to it, on the ground that no one has the right to dispose of the Park in that way, but principally because I think there is no justification for moving the railway terminus into that position in the city. The cost would be very considerable. The station could not at any time be anything but an eyesore, and it would be, in fact, moving the station—which we may now regard as central, to a position where it will be more or less eccentric, so far as the resident population are concerned; in other words, I think that, for the long-distance traffic, between the present station and the Haymarket is, and is likely to be, the most convenient spot for a central station.
1860. You propose to have your central station so that no railway communication shall come into the city a distance further north than the Haymarket;—you propose to stop all passenger traffic there? I said the central station.
1861. How then do you intend to serve the city? I did not give any consideration to that question, because I think that traffic is amply provided for by the present and projected tramway service, and provided for in a way which will be much more efficient than a railway service could be, as no railway will have stations at the corner of every street.
1862. What do you mean by the Haymarket? Belmore Market stands on the site of the old Haymarket.
1863. What land do you propose to use for your terminal station? I think the station might be extended northwards, or, if it were decided to build a new one, it might be placed in the Belmore Gardens or their immediate neighbourhood.
1864. Your idea, then, is to come as far north, perhaps, as Belmore-road? Not further.
1865. Because if you come further you have the same objection with regard to Belmore Gardens as you have with regard to the Park? I thought Belmore-road was on this side of the Park.
1866. It is on the southern side of the Park? I do not put Belmore Gardens on the same footing as Hyde Park.
1867. But still you recognise the same principle exists? Not altogether; because I think, if the station be made on the Belmore Park, almost a similar area might be added to the Prince Alfred Park from the present railway-yard.
1868. Why do you see any reason why Belmore Gardens may be used for railway purposes and not a part of Hyde Park? Because if you give the Railway Department a footing in Hyde Park the whole of it will be occupied by shunting-yards in ten years. It would be found, when a quarter of it was gone, that the Park would be disfigured with buildings and advertisements of all descriptions, and the general feeling would be that, having unwisely let a portion of the Park slip, the rest of it might just as well go.
1869. You think that although the public feeling might be strong in the first instance with regard to the first quarter, the other three quarters might go easily? So much damage would be done that it would not be worth while preserving the rest.
1870. And you take the whole of Belmore Gardens at once? There is a street railway through the Belmore Gardens at the present time.
1871. You urge, then, that we should bring the Redfern station as far as Belmore-road, and from there serve the passenger traffic of the city with a tram service such as is projected, with such alterations as may be necessary? Yes.
1872. You do not think it a material thing that the 20,000 or 40,000 passengers from the suburbs who use the railways daily should be asked to tranship, as it were, into trams at the site you suggest? I think that wherever you put the station there must always be a certain amount of vehicular traffic to the destinations of the passengers; in other words, if you land a man, whose office is at the Custom House, at Hyde Park, he will want some means of conveyance, especially if the weather is wet.
1873. And you would give him a tram? I would, because he would have the option of getting off at any street corner he wished.
- 1874.

1874. Then it would require to be a very different tram service from that in existence from the railway at present? I do not know why. E. W. Knox.

1875. Do you think that is satisfactory? But there is another tram service which is to come into existence through George-street. I used the words "present and projected" when I commenced my statement. 31 Mar., 1897.

1876. Do you think any suburban passenger loses half an hour a day—a quarter of an hour on each trip—because of the absence of a city railway? My opinion is that the residents in the southern and western suburbs are carried into town on much better terms than are the residents of any other suburbs, and they are carried at the expense of the residents of the other suburbs. I know of no reason why the man who lives at Double Bay should pay twice as much for his fare into town as the man who lives a further distance in the other direction, both being carried in vehicles run by the Government.

1877. What is the fare from Double Bay? Threepence.

1878. How far is Double Bay from Sydney? Two miles to the corner of Pitt and King streets.

1879. How far is it from King-street to the railway station? I do not know; but I have just been informed by a man living at Summer Hill, 6 miles from Sydney, that it costs him 3d. a day to get in by train and tram.

1880. Losing sight for the time being of the comparative services in various parts of the city, you believe there is no justification for the extension of the city railway much beyond the present terminus? I think, when the question is fairly considered, that it will be found that the extension of the city railway much beyond the present terminus cannot pay, taken by itself.

1881. The Railway Commissioners are of opinion that it will? I thought they said that if they were given Hyde Park, and could make the central station there, they could make interest on the cost which would have to be met.

1882. Your proposal is to allow the railway system to terminate, approximately, at Redfern. In order to get into the city, passengers have to pay a fare of 1½d. each. It is probable that they would continue to pay that for any tram service which is given them; therefore the tram would be doing for a fare of 1½d. a service which the railway should certainly get something from if it lands them (say) at the corner of King and Pitt streets;—why should the railway carry them for nothing? It should not. The passengers would save nothing, because most of them would take some other means of conveyance.

1883. From where? From Park-street. The distance from there to the Custom House is 1 mile.

1884. You say you do not see where the returns will be? I said that when the question was fairly faced the return would be found to be inadequate for the cost of the line.

1885. Because of the presence of the George-street tram and other means of communication? Yes.

1886. Are you aware that the Elizabeth-street tram cannot be well worked with the present traffic upon it? I know it is very heavy.

1887. And to relieve it of the present railway service you would provide a more efficient service for the suburbs? But the probability is that the George-street tram will take almost the whole of the railway service.

1888. Do you think a passenger from Summer Hill or any other suburban station would get out at Redfern and enter the electric tram running along George-street, or would continue to King-street and get out there and walk the distance separating the two systems, it not being much more than 200 yards? I understood that the proposal to have a station at King-street was altogether withdrawn. In wet weather the bulk of the passengers would unquestionably leave the station at Redfern and take the tram.

1889. Even if the railway station were at the junction of Elizabeth and King streets? Yes.

1890. You believe that George-street is more centrally situated? It goes without saying.

1891. The question is how much? It would be more central probably for three-fourths of the people. There is a very large office population on the western side of George-street.

1892. Are you aware that there is a necessity for the railway authorities to move from Redfern? I understand it is necessary to provide additional accommodation, which is a different thing.

1893. Are you aware that the Railway Commissioners believe that if the railway is not extended a new station will require to be laid out somewhere about the Benevolent Asylum ground? I have heard that stated. At the same time I do not accept it.

1894. *Mr. Hoskins.*] It has been stated that in extending the Redfern yards southward, and in making the yard wider, the cost of resumption would be as great as the cost of resuming land in the city? That might be, but I did not suggest that the railway-yard should be extended southward, but northward, over Devonshire-street. You would get no more revenue from it, but you would get additional accommodation at a very small cost. I hold that money expended on a large railway station, with important buildings around it, is money thrown away.

1895. *Mr. Humphery.*] Is there any other city in Australia where the terminal station for suburban passengers is so far distant from the centre of the city as ours? There is no other large city in Australia which is situated like ours. The business part of Sydney is on a narrow tongue of land.

1896. Is not the terminal station in Melbourne close to what is regarded as the heart of the city? It is at least half a mile from the Post Office. It is a mile from Goldsbrough-Mort's woolstore, and it is three-quarters of a mile from Parliament House.

1897. How far is the Brisbane terminal station from the heart of the city? The heart of the city of Brisbane is the steamer-wharfs, which are three-quarters of a mile or a mile from the station.

1898. How far is it from the Post Office to the Brisbane station? Probably half a mile. The Brisbane station is quite outside the business of the town.

1899. How far is it in Adelaide? It would be hard to get far in Adelaide from the centre of the town.

1900. As a matter of fact, is not our terminal station for suburban passenger traffic less convenient than the terminal station in any other city in Australia? Not considering the proportion of the traffic which comes by it.

1901. Have you ever lived in the railway suburbs? No.

1902. Would it not be more convenient for the thousands of people living in the suburbs to be deposited at or not far from King-street? Yes, if they were prepared to pay for it; but they wish to be carried to the corner of King-street at the cost of the rest of the community, who I think might well object to that being done.

1903. Is it fair to say that, if we are told by the Commissioners that they are prepared to make an additional charge for transit from Redfern to or somewhere near King-street? But the suburban people ask for a very large expenditure for a central station, which I maintain is not required.

1904.

E. W. Knox. 1904. You think it is unnecessary to make any change beyond providing the additional accommodation which is found to be absolutely requisite for the management of the railways? That is so.

31 Mar., 1897. 1905. And that it would be better to spend as much money at Redfern in making the necessary alterations as would be needed to give a terminal station in the city? Yes; if that expenditure is necessary at Redfern.

1906. If we are told that it will be necessary to spend almost as much on the site of the Benevolent Asylum as to bring the railway into Sydney, are you still of opinion that it would be better to spend the money, as suggested, upon the old station site? Somewhere between the present station and the Haymarket.

1907. Although that would not give any greater convenience to suburban-railway passengers than the present station? Yes.

1908. Have you considered the question of the goods traffic? Yes.

1909. Are you prepared to express any opinion as to the desirableness of connecting the railway with the various wharfs of the city? Yes. I would first say that I think the goods traffic and the passenger traffic should be kept altogether apart. Then, as regards the proposal which has been made that the wharfs on the eastern side of Darling Harbour should be resumed, in order that the railway line should be taken along that side of the harbour, I would say I think there is not the smallest justification for such a proposal. The cost would be enormous, and the convenience problematical. There is not now, nor is there likely to be in the immediate future, any unbroken trade between the country and the sea—in other words, there would neither be traffic inwards nor outwards direct between the country districts and the sea; and under those circumstances the wharfs which the Government already control at Darling Harbour are adequate for the present, or for a very considerable expansion of the trade which requires wharfage premises adjacent to the railway line.

1910. Is it within your knowledge that there has been any difficulty in obtaining all necessary wharfage accommodation for our shipping? The wharfage accommodation in Sydney is at present considerably in excess of the trade.

1911. Is it likely to continue so for any long period? I think the present wharfage accommodation is equal to a very much larger trade than we have now, and there is ample room for expansion.

1912. What is your opinion as to the probability of any direct trade, which would not need intermediate handling, reaching the shipping, or passing from the shipping into the country; take the wool traffic and all our produce, and give a little attention to the coal traffic, and also to the dead-meat traffic? So far as the wool trade is concerned, I think the tendency is entirely towards the sale here of the whole clip. I think the proportion of wool which will go direct from the station to the ship is likely to diminish rather than increase. So far as the coal business is concerned, I think the present arrangements are adequate for a long time to come. The mines on the coast can ship more cheaply than any mine can ship in the harbour, and I think it extremely improbable that any further provision would have to be made for coal during the next five years. The only other commodity which is likely to be shipped would be wheat, in the event of the production considerably exceeding the consumption. That may come to pass this year or next year, but I think it unlikely that any considerable quantity would ever have to be shipped; because when you come down to export values on the basis of 1895 prices, you will find that the production of wheat is an unremunerative industry so far as the Colony is concerned—in other words, it could only be grown at those prices by the exhaustion of the land upon which it is cultivated.

1913. What about the meat trade? I think it will be found that private enterprise is quite ready to deal with the meat trade if it is secured from Government interference. At present I am disposed to think that private enterprise is prevented from entering on the business by fear of Government interference.

1914. With regard to the produce from the country, your opinion is that it must reach a distributing depot before finding its way to the shipping? Yes; and that applies in the same way to the imports.

1915. And the imports, in the same way, would not be sent direct from the ship's side to the country, but must pass through a distributing medium? Except for a very small proportion.

1916. Have you formed any opinion as to the probable value of all the wharfs which would be necessary to have a complete system of railway communication? The probable value is the probable sum the Government would have to pay for them. I could not say what figure would be asked for the wharfs.

1917. Do you think it would run into millions? Yes.

1918. Do you think, as a commercial transaction, there would be any appreciable return for the outlay which must be incurred in carrying out a scheme of this kind? The only way in which the interest could be paid would be by an increase of the wharfage rate, which would hamper the trade in Sydney in the same degree as the higher wharfage rate in Melbourne hampers the trade there.

1919. Therefore it would be more economical to allow the existing state of things to continue than, by making a connection with the railway, to largely increase the cost of shipping, especially as the Government already holds the larger proportion of the wharfs in Sydney, and can thus keep down the wharfage rates and prevent any combination to raise them;—are you aware that several new wharfs are being constructed in Woolloomooloo Bay? Yes.

1920. Do you think they will be fully occupied? Not unless they give rebates much in excess of what the private wharf-owners are prepared to give.

1921. Are you of opinion that Woolloomooloo Bay is as convenient for shipping as Sydney Cove, Miller's Point, and Darling Harbour? It certainly is not.

1922. Why? Because it is further from the principal stores and the railway station.

1923. Is the storage accommodation in proximity to the wharfs sufficient to attract shipping? There is no storage accommodation in Woolloomooloo Bay except the wharf-sheds.

1924. Of course any complete system of wharfage connection with the railway must include Woolloomooloo Bay? I do not think there is any reason for that.

1925. Assuming such a thing as the resumption of all the wharf frontages for the purpose of railway connection, would you omit Woolloomooloo Bay from such a scheme? I do not see any particular advantage in carrying the railway to Woolloomooloo Bay, because I think the Government own sufficient water frontage in Darling Harbour for any railway works they wish to carry out.

1926. You concede that it would be an incomplete system? I cannot see that the Colony would derive any advantage from throwing away more money by connecting Woolloomooloo wharfs with a service from which they could get no business.

1927. *Mr. Black.*] Are you of opinion that as regards population Redfern station is centrally situated? It is more central than any other position you could get about Sydney. E. W. Knox.
31 Mar., 1897.
1928. Do you know the Flinders-street station, Melbourne? Yes.
1929. Do you know the low-lying lands away from the city towards Port Melbourne, St. Kilda, and East Melbourne? Yes.
1930. Is there not a radius, on each side, of from 1 to 1½ mile, nothing more nor less than a desert waste, hardly built upon, and in some cases merely a depôt for rubbish? Within, I think, half a mile of the river it is all built upon, and to a great extent with stores, most of which are, however, empty.
1931. I mean on the other side, going towards the sea, as it were; there is a large quantity of land taken up by public parks; there is a Government reserve; there are the banks of the Yarra and a sort of common which lies between the railway station and what used to be known as Emerald Hill; further along there is a great deal of desert waste land behind where Langland's foundry used to be situated? Yes; I was speaking of on or about the Falls Bridge, where the ground is thickly built upon; but above the railway station there is a great expanse of vacant land.
1932. In fact, almost from Spencer-street right up to what is known as Jolimont? Yes.
1933. Would you not say that, so far from the Flinders-street station being in a central position, possibly the Melbourne Public Library would be more nearly the centre of the city? The Post-office, I think.
1934. Do you know Adelaide? Yes.
1935. The Adelaide railway station used to be situated on the North Terrace;—would you consider that the centre of the city? It has the city on one side and the parks on the other.
1936. Then, to say that the Sydney railway station is less central than that of any other city of the Colonies is to make a misleading statement? I do not think it quite squares with the facts of the case.
1937. Is it not a fact that the extension of the city of Sydney to the north is barred by the waters of Port Jackson? Yes.
1938. Is it not likely that in years to come the Redfern station will, so far from being central, be situated much more to the north of the virtual centre than it is now? The trend of the trade of Sydney is towards Redfern, south of the Town Hall.
1939. You might alter the centre of population by building a bridge to the North Shore which would induce a large settlement on the northern shores of the harbour? No; because you would get too far away; then the settlement would have to be on the crest of the ridge to a great extent.
1940. But suppose you did alter the centre of population—that would not necessarily make the removal of the Redfern station compulsory, because it would simply mean that the bridge could be used as a means of carrying a railway, which would lessen the concentration of traffic at Redfern, and thus make that station more equal to the requirements than it is now? I think you can never make Redfern station anything but central.
1941. Do you see any advantage to be gained to the public by bringing the railway to Hyde Park? To the general public, no.
1942. Do you think there is any advantage to be gained for administrative purposes? No.
1943. Do you know of any demand from the country people for conveyance to the water's edge? No.
1944. The demand is from suburban residents? From residents in the southern and western suburbs—not in the eastern, northern, or north-western.
1945. Is it not evident that if it is the demand of the suburban residents which has to be met, no matter where they may be situated, the country cannot be benefited by the removal of the railway station;—would not a loop line—something which would take the traffic out of Redfern station in one direction and return it to Redfern station by another—be more likely to meet the demands of the public? I think, considering the material of the ridge upon which Sydney is built, and the way in which the town is laid out, that the convenience of the public can for the future be more easily met by the extension and improvement of the tramway system than by any extension of the railways into Sydney.
1946. In other words, by a system of light railways running more continuously than they do now, and on the streets? Yes.
1947. *Mr. Clarke.*] Do you think the accommodation for passengers would be increased by bringing the railway to Hyde Park? I do not think any advantage corresponding with the cost would be gained.
1948. You object to any portion of Hyde Park being taken for railway purposes? Entirely.
1949. You know that the traffic at Redfern is very much congested, and that it is necessary to have increased accommodation? I believe that to be the case.
1950. You think the extension of the railway over Devonshire-street, and placing the station on the site of the Benevolent Asylum and the Cemetery, would be sufficient? Yes, for the next few years. There will always be a difficulty at the Redfern tunnel, whether the station is on the Benevolent Asylum site or Hyde Park.
1951. Are you of opinion that it would not be to the public interest to resume the wharfs on the eastern side of Darling Harbour, from Dawes Point to the railway station? I am.
1952. Do you consider that for export business the wharfs now in possession of the Government give sufficient accommodation? I think that if carefully managed they would be sufficient for the entire trade of the port—that is, assuming, of course, extra wharfs are put on Darling Island.
1953. Do you think you could do away with private wharfs altogether? I would much prefer to do away with the Government wharfs.
1954. Do you think the wharfs at present in Darling Harbour, and in fact all over Sydney Cove, give sufficient accommodation? Yes; and I am quite sure that any business is conducted more cheaply and better by a private enterprise than by any Government.
1955. Is Woolloomooloo, for some portion of the trade, not a very convenient place for landing goods? It is as convenient as any other place, only you have to pay a little more for cartage. You cannot get out of Woolloomooloo Bay without going up a fairly steep hill.
1956. *Mr. Fegan.*] You say a necessity exists for greater accommodation at Redfern on account of the congested nature of the traffic? I said I understood that was the case.
1957. You say the traffic is so congested that you would remove the station northward? If I said that, I said what I did not intend. I said that more land might be taken there in order to allow the increase of the station accommodation.
1958. One proposition is to resume the ground upon which the Benevolent Asylum is situated, and
to

E. W. Knox. to erect a station and platforms there at an estimated cost of £400,000;—would it not be better to carry the line to Hyde Park, in order that the Commissioners may obtain a return upon the capital expended? I am quite against the expenditure of £400,000 upon the Benevolent Asylum site, and I am quite confident that such an expenditure is unnecessary. The traffic can be worked with wooden platforms covered with galvanized iron just as well as with big brick buildings. Anyone who has seen the traffic go out of Spencer-street station on a busy day knows what can be done with a station which I should not think cost more than £20,000.

31 Mar., 1897.

1959. If the evidence of the Railway Commissioners goes to prove that the extension is necessary, and that the proposed buildings are not out of the way of the requirements of the day, you would, I suppose, give some consideration to that evidence? Yes; but if I had to find the money I would not find it.

1960. But if the Railway Commissioners can show that by their proposed scheme they will be able to recoup themselves for the outlay, is not their proposition a fair one? No; I do not approve of their having Hyde Park at all, and I do not think they say they can recoup themselves unless they get Hyde Park.

1961. Do you think there is any more opportune time than the present for the resumption and buying of land for the construction of the railway? It is quite certain the value of land is being depreciated; but it seems to me quite probable that its value will be further depreciated if, for instance, there is any further addition to the land tax.

1962. You have stated that the Railway Commissioners are asking the general public to pay for the extension of the railway when only a comparative few will benefit by it? I stated that the extension would be built at the cost of the general community, rather than at the cost of the people who profited by it.

1963. If the Commissioners have shown that by charging a fare of 1d. or 1½d. into the city they can pay the interest and redeem the capital, will not the charge be upon the shoulders of those who travel by the railway? I do not think the Commissioners propose to redeem the capital out of the fares.

1964. If our railways pay interest on the money borrowed, are they not doing fairly well? Yes.

1965. If it is shown that the proposed extension will pay the interest on the capital expended, would you not admit that those who will profit by it are those who pay for it? But I hold that the expenditure is not warranted on any ground. If the country has the money to spend, it would be much better to spend it in the extension of railways into the country. A railway down the valley of the Lachlan, for instance, would attract a large amount of trade to Sydney which is now lost to it.

1966. As a whole, you are against the extension of the railway into the city? Yes.

THURSDAY, 1 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

William Greenwood, Assoc. M.I.C.E., sworn, and examined:—

1967. *President.*] Have you been occupied on any works in the Colony? Yes; I built the Pott's Hill reservoir, for the Government, and the Circular Quay. I have been engaged on a good number of works.

1968. Have you a scheme which you desire to lay before the Committee? Yes; I produce a plan and section of it. I take it that this Commission has to deal with the City Railway, consequently I have only shown a line from Redfern to the Circular Quay, but it forms part of a circular railway which will go round the eastern suburbs—to Woolloomooloo, Paddington, Woollahra, Waverley, and Randwick.

1969. Your levels are so situated that they will permit of that? Yes.

1970. Will the same remark apply to an extension to North Shore? Yes. The proposed line, which was designed ten years ago for a double line of railway, traverses the heart of the city; it passes through the busiest portions and accommodates all the western and northern ferries. It is capable of extension to North Shore by a high-level bridge, or train ferry, or subaqueous tunnel, through either Dawes Point or Fort Macquarie, and forms part of the circular railway through the eastern suburbs—Randwick, Kensington, North Botany to Erskineville. The line being circular is easier and cheaper to work. The cost of the land, buildings, &c., is light, owing to the non-interference with valuable buildings. It passes through a considerable amount of vacant land. The cost of construction is very low, as the material from the cuttings will be utilised for the buildings. There will be stations at the Town Hall, Wynyard-square, and Circular Quay. They are all wayside stations for passengers only. Goods depôts will be provided at all the eastern suburbs—Randwick, North Botany, Waterloo, &c. I propose a loop-line from about Petersham to the east of the Warren Brick Company's works at St. Peter's, resuming about 70 acres of land for gravitation sidings to accommodate all the goods traffic, whether suburban, Illawarra, Belmore, southern, western, or northern. Circular railway:—The line about to be described forms a portion of a projected railway from Redfern via Circular Quay, Woolloomooloo, Darlinghurst, Paddington, Woollahra, Waverley, Randwick, Kensington, Botany, and Erskineville, joining the Illawarra branch, through Eveleigh to Redfern. Route:—A railway commencing at the northern end of Redfern terminus, passing over Devonshire-street; thence across the Benevolent Asylum grounds and tramway sheds, passing on a viaduct over Garden-street, Belmore Park, Hay-street, Belmore Markets, and Campbell-street; thence in open cutting east of the Natatorium, under Goulburn-street, passing west of the New Masonic Hall, under Liverpool-street, turning in a north-westerly direction under Pitt-street, Union-lane, and Wilmott-lane, and passing west of Water and Sewerage Board Offices; thence under the junction of Bathurst and George streets, passing in front of the Town Hall, and by a tunnel from Druiett-street under York-street to Wynyard-square; thence in an open cutting under Margaret-street and lane, passing east of the Scots' Church, under Jamieson-street and

W.
Greenwood,
Assoc.
M.I.C.E.
April, 1897.

and Church Hill, through the reserve; then under Charlotte-place, skirting the east side of Harrington-street, and curving under George-street, at its intersection with Essex-street; then in a north-easterly direction under Pitt-street and Alfred-street, passing under the crown of the road in front of the Custom House; thence under Phillip-street at its intersection with Albert-street. It is called Alfred-street at one end and Albert-street at the other. Future extensions:—If it be decided to connect with North Sydney by a bridge a junction would be effected at the Wynyard-square station; but if a tunnel be decided upon, then by a junction at Circular Quay station. Stations—Redfern station:—A new station to be built in the Benevolent Asylum grounds—terminal as to all long-distance traffic, but through for local or suburban trains. The suburban traffic, which is 90 per cent. of the whole, would go right through. Benevolent Asylum station, being terminal only for long-distance traffic—and all the suburban trains passing through this station will be relieved of all the shunting. Mr. Parry stated before the Commission that it was not the traffic so much as the shunting in the Redfern yard which caused the difficulty. The local traffic being 90 per cent. of all the traffic, it follows that much less siding and shunting accommodation will be required at the Benevolent Asylum station than would be the case at Hyde Park station, because there it would be dead-end station. Shunting at a terminal station blocks the incoming and outgoing trains, whereas by trains passing through all lines are left free. There is no terminal station on my line in the sense of a dead stop, because it forms part of a circular railway. The Town Hall station would be through or wayside station, extending from Bathurst-street south towards Wilmot-lane. It would be a daylight station, and the booking-office would be at the south-eastern corner of Bathurst and George streets—that is to say, that the building now occupied by Hepworth, the tailor, would have to be resumed, remodelled, and made into a station. Wynyard-square would be a through or wayside station, extending from Wynyard-street northerly, with a booking-office at the south end of Wynyard-square. It is possible it might be better to resume the building at the corner of Wynyard-street and York-street, and utilise it as a booking-office, instead of building on the Wynyard-square portion. At Circular Quay there would be a through or a wayside station extending from the west side of Pitt-street to Loftus-street—that is to say, from Crane's store to the Paragon Hotel—with a booking-office opposite the North Shore Ferry. Pending the extension to the eastern suburbs, provision for shunting would have to be provided on the proposed extension east of Circular Quay station. If you made the line to Woolloomooloo or to Paddington at the same time it would not require it.

1971. Let us take it for granted that the only question this Commission deals with is the line for passengers into Sydney. You have got to Circular Quay, and you require some area for shunting purposes? Yes.

1972. You lose the benefit of the loop line by temporarily stopping at the end of the Quay? I do not presume you would stop at the Quay. I presume when you are making the railway you will make the circular railway.

1973. But supposing it was determined to stop at the Quay? I would continue the railway forward beneath Phillip-street towards Woolloomooloo, and would use what would form the main line in the future for the shunting-ground.

1974. Would you put four lines right ahead? No; only two.

1975. And you think they could be used for shunting purposes? Yes.

1976. They would be in a tunnel? Yes.

1977. And anything beyond the two lines which eventually went round the eastern suburbs would be a heavy expense? For the eastern suburbs certainly two lines would be ample.

1978. Could you shunt on those two lines? I do not think for one moment you would stop at the Circular Quay. The line through Woolloomooloo, Paddington, Woollahra, and Waverley would pay from the start.

1979. Then you say you would only require a wayside station at the Quay, because if your scheme is accepted you believe it would be wiser to carry out the eastern suburbs extension at the same time? Assuredly. I may say that my estimate of the cost is with regard to a line from Redfern to the Circular Quay. With regard to the advantages of the line I may state that the line would serve the heart of the city—a district at present unprovided with tramways. Hence it would create its own traffic without abstracting traffic from the existing Elizabeth-street tramway. Redfern Station:—Long-distant travellers encumbered with luggage would invariably take cabs from this station, which is as central for Sydney as any point you could name. The Town Hall station being in close proximity to the new markets would be very convenient for the general public. Wynyard-square station being within 100 yards of the General Post Office would be very central for the general public, and in addition to accommodating the numerous offices, warehouses, and manufactories in York, Clarence, Kent, and Sussex streets, would also give convenient access to the ferries at King, Lime, and Erskine streets. The Circular Quay station, in addition to affording accommodation to the northern portion of the city, would also give direct access to the numerous ferries plying to the northern shores of the harbour, Manly, &c. A projected station at the main entrance to the Botanical Gardens, near Lady Macquarie's Drive and the Art Gallery, would accommodate a large amount of pleasure traffic. The cost of this line would be cheaper than that of any other route, as it does not necessitate the purchase of any valuable buildings, and for a considerable distance passes through vacant land. The most valuable building on the whole route is the one at the corner of George and Bathurst streets—Hepworth's, the tailor. Next to that, the Naval Brigade Hotel, at the corner of Essex-street and George-street is the most valuable. With regard to the George-street electric tramway, I do not think my proposal will make the slightest difference to it. When the first tramway was laid down in Sydney, Mr. Goodchap had to give a distinct promise that when the Exhibition was finished he would take it up. On that promise the tramway to the Exhibition was constructed; we all know the result. The next tramway was for the racing people to Randwick. Following that, the whole of the tramways have been built. At that time everyone said the 'buses and cabs would be ruined. I, myself, laid out the line in Oxford-street, and every cabman who came along did his best to run over me. At first it was single line, and was subsequently made into a double line. The fact is that the growth of Sydney is so great that you may put down an electric tramway in George-street and it will not make any difference to the railway. With regard to electric tramways, I may state that I rode from Falcon-street to the Military-road on the electric tramway nine months ago. If the tramway in George-street is the same as that, there will be a swaying, pitching motion of the cars like the pitching of a ship at sea, and the people will prefer the railway to the tramway.

W.
Greenwood,
Assoc.
M.I.C.E.
1 April, 1897.

1980. *Mr. Fegan.*] Instead of having an electric tram along George-street would it not be possible to give the convenience required by means of a train? I do not think so. Increased facilities cause increased traffic.

1981. *President.*] What will be the length of the line? One mile and 70 chains. The Benevolent Asylum station will be a true surface station. We have heard of stations in Hyde Park, passing beneath Liverpool and Park streets, described as surface stations, but as a matter of fact they are 20 feet below the level of Elizabeth-street. From Belmore-road to Campbell-street, across Belmore Park and the Market there would be a viaduct with 40-foot spans. In preparing an estimate of cost I had no borings, but I assume the foundations to go down 15 feet.

1982. What is the length of your viaduct? Twelve or 13 chains. I do not propose to disturb any of the streets excepting Devonshire-street and Pitt-street North. At Goulburn-street there are 20 feet of depth in cuttings, and from there to Bathurst-street it varies up to 30 feet.

1983. What is the length of the road which will be cut? With the exception of 30 chains of tunnel in York-street, the whole of the line is in an open cutting. York-street and some parts have from 3 to 5 feet of shale and bastard rock. At the Circular Quay the rails will be practically 12 feet below the present road—6 feet below means high-water mark. With regard to sewers I am somewhat at a disadvantage, because I cannot get information as to their locality. The main sewer which falls to Bondi, in Harrington-street, I go beneath. There is one in Liverpool-street which I am above. There is a small one in Devonshire-street, but that is common to every scheme which crosses Devonshire-street.

1984. Now with regard to the cost? I may state that you have had a statement of cost of land put before you which told you nothing but that the land would cost £1,200,000. How that was arrived at I do not know. The Government officials in valuing land for a scheme not suggested by themselves usually value it at ten times more than they would were the scheme suggested by themselves. I have prepared two estimates—one for a double line, and the other for a quadruple line; they are as follows:—

<i>Estimate of Cost—Double Line.</i>		
Land, 2½ acres at £103,600.....	£259,000	
Works	138,182	£259,000
Stations, &c.	140,500	
	£278,682	
Contingencies, 10 per cent.....	27,868	
Engineering, 5 per cent.	13,934	
	320,484	
		£579,484
<i>Estimate of Cost—Quadruple Line.</i>		
Land, 3½ acres	£370,000	
Works	224,928	£370,000
Stations, &c.	156,600	
	£331,428	
Contingencies	30,000	
Engineering	15,000	
	426,428	
		£796,428

FRIDAY, 2 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq. M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
The Hon. DANIEL O'CONNOR, M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
FRANK FARNELL, Esq., M.P.

William Greenwood, Assoc. M.I.C.E., further examined:—

W.
Greenwood,
Assoc.
M.I.C.E.
2 April, 1897.

1985. *President.*] When we ceased yesterday you were about to give information with regard to the cost of your scheme? Yes. I should like to correct an impression that has got abroad that I propose a terminal station at Circular Quay. My proposal is that we should have a circular railway. With regard to the cost of the land: The area required will be 2½ acres for a double line and 3½ acres for a quadruple line. On the double line there will be 45 chains 36 feet in width; on the four lines there would be same length, 54 feet in width.

1986. The Departments say that the lowest estimate is 80 feet width? They only require 80 feet for six lines of rails.

1987. *Mr. Hoskins.*] But they require spare land on each side of the line? No; they build vertical walls about 4 feet 6 inches from the rails. There is no need to go beyond the ordinary bridge width.

1988. *President.*] You believe 54 feet is ample for four lines? Yes.

1989. And you propose to have perpendicular walls? That may or may not be. As a matter of fact the ground in many places is of such a nature that you would not require a wall at all.

1990. Is 54 feet sufficient if the walls are perpendicular? Yes, and it is if they are not.

1991. Then the question resolves itself into one of batter? That is a mere nothing.

1992. Are you prepared to give us the details as to the cost of the land? The way in which I got at it was this: I got the city assessments for the wards and I divided it by the number of acres of land in the wards; that gave me the assessment value. To that I added one-ninth, the assessment being nine-tenths of the rental.

1993. How do you get your result from that? The mean assessment value is £3,325 per acre; to that you add one-ninth, which gives you £3,695 per acre for the average rental—I take it at £3,700. I take it at twenty years purchase, and that gives me £74,000 per acre. I allow 10 per cent. for compulsory purchase; I allow 10 per cent. for lessees' compensation; I allow 20 per cent. for severance; and that gives £103,600 per acre.

W.
Greenwood,
Assoc.
M.I.C.E.

2 April, 1897.

1994. That amount is pretty well the same as we have had placed before us on several occasions, excepting that the area taken by you is much less;—supposing you had to resume 20 acres of land, the cost would virtually be £2,000,000? I hope to show the absurdity of doing that.

1995. You have reduced the width to 54 feet? Yes.

1996. If we had a basis of 100 feet in width, you would reduce it by one-half? Yes.

1997. If we had a basis of 80 feet, you would reduce it to 50 feet, or three-eighths? Yes.

1998. Then that explains a good deal of it? No; only a portion. Mr. Perdriau said it would take 130 chains to get from Redfern to the Circular Quay on the west side of Elizabeth-street. To get from Redfern to Hyde Park you have 50 chains in length, but you only pass through 20 chains of private land. He assumes that, if you go on the west of Elizabeth-street, you pay for the whole of it, but, as a matter of fact, you only pay for 45 chains. The saving in length is in 30 chains from Redfern to Campbell-street, no matter whether you go east or west of Elizabeth-street, for which you do not pay.

1999. Then what is the total length of your proposed line from there to the Quay? From that point to Bathurst-street it is 20 chains, which I pay for. Then I begin to pay again from the northern angle of Wynyard-square to Pitt-street to Cranes, which is 25 chains.

2000. Your contention is that since from Bathurst-street to Wynyard-square the line will be in a tunnel, you do not require to pay for land? Certainly.

2001. What is the length of your tunnel? Thirty chains. It has been suggested that there may be compensation to pay. I point out, however, that the Postmaster-General has built a tunnel along Barrack-street, Clarence-street, and the whole length of Pitt-street, and I am not aware that he has paid one penny compensation for damage to buildings.

2002. What is the size of that tunnel? When completed it will be about 4 ft. 6 in. in width and about 7 feet high.

2003. I suppose you could not get a safer place in Sydney in which to make tunnels? You certainly could not get a better place than York-street.

2004. *Mr. Hoskins.*] I suppose there is a greater probability of injury to property from tunnels along which trains weighing hundreds of tons pass than there is from shallow tunnels used to convey the telephone wire? That is not the case. So far as vibration from a train running through the tunnel of sandstone rock is concerned, you will never know there is one there if it is once built. I have assumed that I have purchased the whole of the land all the way through, but in England I should not do so. I should pay for the easement to go beneath the property.

2005. *President.*] We have now got as far as Pitt-street? The rest is Government ground up to Circular Quay.

2006. Have you taken into consideration the ventilation of the tunnel? Yes.

2007. How will you ventilate it? By ventilating shafts along the street.

2008. Where would the outlet be? In the centre of the street.

2009. *Mr. Hoskins.*] Like the sewers? No; they might resemble the urinals in the street.

2010. What cover would you have in the streets? From 10 to 20 feet.

2011. *Mr. Humphery.*] What is the depth of the sewers in the streets? York-street is on the ridge, and the waters fall to Darling Harbour. There are no sewers in York-street, excepting small pipes.

2012. Do you go below the sewer in Pitt-street? There is only the Tank-stream there. There are pipe sewers, but the fall is so great that you can do anything you like with them.

2013. *Mr. Wright.*] Where do you cross Pitt-street? At Union-lane. There is only the Tank-stream at Pitt-street which could be diverted alongside the railway. There would be no difficulty about that.

2014. *President.*] Can you give us the cost of your construction? You may take it roughly that it is £42 per yard right through.

2015. What is the cost of the portion from Redfern to Bathurst-street? £65,000. That is for a distance of 60 chains. The next 40 chains, including crossing George-street, will cost £81,000. If you deduct that from £225,000 it leaves the balance—say £79,000—for the remainder. That is for works. Yesterday I gave you the stations at £156,500, or a total of £381,428. To that you have to add £30,000 for contingencies and £15,000 for engineering. It runs to about £42 per yard for the whole of the railway for double line, or £68 for quadruple line.

2016. Of which one-fifth is tunnelling? Yes. There are the contingencies and engineering to be added, which will make it about £50 per running yard for double line, or £76 for quadruple line.

2017. Even if this work which you suggest were carried out, it would not be complete or effective until you joined Circular Quay with St. Peters. Therefore you have to continue that work at once, or provide a temporary terminal station at Circular Quay, or build enough of the southern extension to shunt upon? Yes, that is a very small quantity.

2018. Have you any estimate to enable you to judge what the eastern extension would cost? About £50,000 a mile for the whole distance.

2019. How many miles? One route makes it 14 miles—of which there would be only about 10 to construct from Circular Quay.

2020. It would cost, then, about £500,000 right through? Yes.

2021. What is the estimate for the shunting conveniences which would be necessary beyond your railway at Circular Quay? The railway would finish at the Paragon Hotel. From there to Phillip-street there are from 8 to 10 chains spare ground for shunting.

2022. You take it for granted that you could use that for shunting purposes? Yes.

2023. The question is whether you would be permitted to use it? I would point out that all the roads would cross to every point in the same way as they do now.

2024. But you first of all lay down four lines of railway. That means some obstruction. If you shunt and move the engines round it means that a considerable amount of traffic will be brought into existence which is not there now, and which might interfere with the ordinary traffic? No; cabs and other vehicles cross there now in such a way that you do not know where they are going. If they are confined to the roadway you will know where they are going.

2025.

W.
Greenwood
Assoc.
M.I.C.E.
2 April, 1897.

2025. You have stated that you will be 6 feet below high-water-mark at Circular Quay? Yes.
2026. How do you propose to get to the North Shore boats? The station will be somewhere near the revolving advertisement board. Being 12 feet below the roadway you could, if you thought fit, construct a subway for the whole of the passengers.
2027. Do you think that would be satisfactory for the 6,000,000 people who at present land at Circular Quay? Decidedly. I propose to shunt directly in front of the Custom House as far as Phillip-street. I then start upon a rising grade to take all the goods traffic from the Quay.
2028. Do you know how many passenger trains per day would require to come to Circular Quay? Probably 200.
2029. Spread over a period of fifteen hours? About that. I point out, however, that for every train coming in to the Quay there must be ten trams coming into the Bridge-street yard, where they can deal with the traffic without trouble.
2030. What area do you propose to shunt upon? Eight or ten chains in length and four lines of rails in width. Four lines with switches will be sufficient to do all that is required. The idea of shunting in front of the Custom House is only a temporary measure, my contention being that there should be a circular railway.
2031. *Mr. Hoskins.*] If it is a fact, as has been stated in evidence, that the railway station at Redfern is so cramped that it is no longer useful except as a wayside station, where would you put all the rolling-stock which is kept at Redfern Station for the service of trains? Ninety per cent. of the traffic will not stop at Redfern. If the line is made as a circular railway, Paddington will correspond with Ashfield, as regards a terminal station, for about 30 per cent. of the trains; 30 per cent. might go as far as Randwick, and the remaining 30 per cent. would complete the circle. The whole of the long-distance traffic, of course, would stop at Redfern.
2032. Then you do not propose any additional accommodation for the long-distance traffic? Yes; I propose a new station in the Benevolent Asylum grounds.
2033. How much land do you presume would be required at your proposed new station? As far as the rails and platforms are concerned, about 250 feet in width.
2034. Would that make provision for the large amount of rolling-stock which of necessity must be kept at the station where there is the largest number of trains? You still have the old yard at Redfern left. You have the same room plus the room you get across Devonshire-street.
2035. Then, if the station on the Benevolent Asylum site were built, and the Department continued to use the Redfern station for keeping rolling-stock, you would, when you were forming trains to be despatched from the Benevolent Asylum site, require to run carriages between it and the Redfern station? Yes; if you were marshalling a train to go to Bourke, you would do as you do now.
2036. What do you anticipate would be the cost of the Devonshire-street station? I have put down £100,000 for it.
2037. Then, in reality, you would have two shunting stations in addition to Redfern, namely, the Benevolent Asylum and the siding near the Custom House? The siding at the Custom House is merely temporary. I am assuming that the Government will carry the railway right round.
2038. You propose that the railway should be 54 feet wide? Yes.
2039. Is that sufficient for working the traffic between the Redfern station and the Benevolent Asylum? No. Although the railway itself would be only four lines wide, the Benevolent Asylum station platforms would be 250 feet in width.
2040. What would be the width of the road or roads between Redfern and the Benevolent Asylum? Between the buildings themselves there would be a width of 250 feet, occupied either by rails or platforms. There would be ten or twelve platforms to the whole length of that station.
2041. That would take up a large amount of ground, would it not? 800 feet by 200 feet is not a great extent. It would mean about 5 acres of ground being taken up by the rails and the platform.
2042. I gather you do not anticipate that the Government will be subject to actions-at-law for damages to the foundations of premises, caused by the construction of tunnels? I do not say so. They are liable, of course, but I would be glad to undertake to cut down the whole of York-street vertically, from top to bottom, for a very small amount of compensation.
2043. But would the contractors undertake to make good any actions-at-law brought against them for compensation? They would.
2044. If the contractors undertook to meet all claims for compensation would it not tend to increase the cost of the work? No; because there is no danger whatever. For instance, there was not one penny paid in compensation in connection with the excavation of the new markets.
2045. But that excavation does not abut on private property? No; but there was not a piece of stuff which fell.
2046. Will the whole of the tunnel be of solid rock? Yes.
2047. Is not some of the Sydney sandstone rock very jointed? Some of it may be.
2048. *Mr. Humphery.*] What would be the cost of your complete scheme, including compensation? £500,000 more than I have given for the line to Phillip-street.
2049. Have you estimated that that will cover not only the cost of construction but compensation for the resumption of land between Circular Quay and St. Peters? Yes; but the figures I have given with regard to Redfern and Circular Quay I am prepared to swear to. With regard to the others I am only expressing an opinion.
2050. What width of resumption have you between Circular Quay and St. Peters? Where land is dear you would merely buy a vertical strip for a double line, but where it is cheap you would buy more and would not erect retaining-walls.
2051. What portion of the 10 miles from the Circular Quay to St. Peters, *via* Paddington, would be in a tunnel? I could not say without taking a section.
2052. Then your estimates in connection with that line are approximate, and not the result of calculation or survey? Yes.
2053. From the Quay to St. Peters, *via* Paddington, you have adopted the plan and scheme of the Engineer for Railways? Yes.
2054. So that the only portion of the scheme for a circular railway which will be original in your design is from Redfern to Circular Quay? Yes. It is only ordinary engineering work to go round the suburbs. On

pages 48 and 49 of the report of the Royal Commission on the extension of the railway into the city and the North Shore bridge connection, Mr. Deane boils down the whole of the schemes to three, and pins his faith on the scheme marked "L." My scheme betters "L." He says:—

The value of any proposal must be rated according to the extent to which it complies with the following requirements: For convenience of working the traffic, it should have either a large space for a terminal station, or should have a loop for returning trains, so that shunting may be avoided, or it must form a complete loop itself. [I form the complete loop by making the circular line.]

It should be capable of extension to the North Shore, either by bridge or otherwise; it should pass through the present Redfern station, in order that this may form one stopping-place; it should be capable of extension to the eastern suburbs, and should be continuous with such a line, so that passengers may be able to travel without change between those two suburbs and to any part of the city. [That, my scheme does.]

The line should be in cutting or on viaduct all or nearly all the way, and tunnel or covered-way should be avoided as much as possible, on account of the difficulty of properly ventilating the same, a difficulty which, in the climate of Sydney and with a smoky coal, is a very serious one. [They told you the other day there was no difficulty in ventilating a 30-chain tunnel.]

Mr. Deane's scheme, marked "L," is to cost £2,000,000 to get to the Quay, and I propose to do it for one-third of the money, including land resumption. With regard to the "L" scheme, the report states:—

On the condition that suburban traffic only is carried beyond Redfern, he sums up the *pro* and *con* of the proposal thus:—"Advantages of modified route—(1) Takes the western side of George-street, and therefore serves the suburban traffic best; (2) allows of terminal station if required at Harrington-street; (3) allows of loop if required instead of terminal station; (4) allows of connection with North Shore by bridge; (5) allows of connection with North Shore by any other method, as by tunnel, equally with any other scheme; (6) can be extended past Circular Quay; (7) can be extended to eastern suburbs.

The only disadvantage which he sees in regard to the line is the great cost in resumption.

2055. *President.*] It is further north than yours? That is the beauty of it. His line is too low down. Further on he says:—

The position of the loop, as suggested by Mr. Munro for the modified line, is quite practicable, but it misses the best station, Wynyard-square.

That is where I have a station. There is not one thing which Mr. Deane recommends which I do not do. The Chief Commissioner and Mr. Deane say in this report that the long-distance traffic is not to go beyond Redfern station, and that is what I say too. On the whole, there is not one objection raised by Mr. Deane in this report which could be applied to my scheme.

2056. *Mr. Humphery.*] Have you kept in view the strong opinion that the goods and passenger traffic should be kept separate? I do not lose sight of that. I propose that you should have your goods stations on the circular railway. There will be no goods stations at the Town Hall, Wynyard-square, or Circular Quay; but the trucks will go alongside the ships if the ships are at the Quay, and the produce can go straight into the ships. The wool also can go direct into the stores.

TUESDAY, 6 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Oswald McMaster, Civil Engineer and Contractor, sworn and examined:—

2057. *President.*] Are you accustomed to the construction of railway works? Yes.

2058. Do you desire to lay before the Commission a scheme which you regard as the best for bringing the railway to the city? Yes. I will describe the scheme "A," which provides for a station at the position now occupied by the District Court, and also takes up 2 acres of the Domain at the rear of the Colonial Architect's present Department.

2059. I believe the route you suggest is similar to that of the Railway Commissioners and all other routes, until you pass Liverpool-street, and then the line takes a turn to the north-east? Yes. I may explain that although I adopt the same route as the Railway Commissioners, I do not take the same amount of land. I allow the same amount of money in the resumption, although I only provide for four lines instead of six. The features of scheme "A" are as follows:—

This scheme, which is shown in red on plan, has for its principal feature the utilisation for the central station of the Government property at the top of King-street, now occupied by the District Court, &c., with a loop-line running round the Domain and back to the station for the working of the suburban traffic; and an extension to the North Shore, to connect with the North Shore and Hornsby railway at a point near the present terminus at Milson's Point. It also provides an intermediate station at the intersection of Albert and Macquarie streets, with a level approach from the Circular Quay.

Land required.

It is to be noted that the only land required for this scheme will be the 2½ acres of Government property at the top of King-street (together with a small piece of the Domain at the back, now but little used); a narrow strip at the King-street end of Hyde Park; and a belt, less than 1 chain wide, extending from near the Technological Museum round the lower portion of the Domain at the back of the Art Gallery —

2060. Would that be open? Yes; it would be built on piers.

The only resumptions required will be in that portion of the line between Redfern and Liverpool-street, and the extent of these to be used for railway purposes will be less than in the Railway Commissioners' scheme, owing to the reduction in the number of lines of way between Redfern and the central station, as subsequently explained. If it be deemed advisable to construct the railway through Hyde Park by the cut-and-cover method, as shown on plan, then the whole of Hyde Park will be left in its present state, and no portion of the line, on the Sydney side, will pass under any private building or through any private property between Liverpool-street and Fort Macquarie, or even to Lavender Bay.

Description of scheme.

The description of this scheme is as follows:—Starting from Redfern station, four lines of way will be carried over Devonshire-street and through the Benevolent Asylum grounds and Belmore Park to Liverpool-street, along the same route, and in a similar manner to that described by the Engineer-in-Chief for Railway Construction for the Park-street proposal. Passing under Liverpool-street, the lines will be carried under Hyde Park by the cut-and-cover method, where the depth below surface does not allow of tunnelling, and under Park-street to a point near the King-street end of Hyde Park, where they will curve into the central station at the top of King-street. My object in carrying the railway

W. Greenwood,
Assoc.
M.I.C.E.,

2 April, 1897.

O. McMaster.

6 April, 1897.

O. McMaster. railway underground is that there may be no interference with the surface of the Park. As far as cost of construction goes, I estimate that there would be a saving of over £60,000 by keeping the line in open cut throughout, and this would no doubt meet with the approval of the Railway Commissioners, by reason of the increased facility of working. Still, if, in the opinion of the Royal Commission, it is thought undesirable to encroach upon the Park, I would submit that the fact of the line being covered would not occasion any discomfort to the passengers from smoke and fumes, such as might be the case with a deep underground railway. In the present instance the lines would be so close to the surface that very excellent ventilation could be obtained throughout by means of ventilating grids—suitably spaced at frequent intervals—and causing inconvenience to no one.

Central Station.

The central station, as proposed, will occupy the area of Government property bounded by Macquarie-street and St. James'-road—about 2½ acres in extent—and will also extend back a short distance into the Domain. The station-building will be three storeys high, the two upper storeys above the level of the street, to provide the office room required by the Railway Commissioners, and the lower one for station accommodation at platform level. Entrance to the station will be provided from King-street, at the present level of the street, by means of steps leading down to the different platforms, as in the present suburban stations, and also outlet to or from a new road to be constructed between retaining walls from Elizabeth-street, at the junction of St. James'-road, passing under the lines and coming out in front of St. Mary's Cathedral, as shown by neutral tint on plan A. This road will be 100 feet wide, and will give access to the station for cab and other vehicular traffic, as well as providing for the exit of passengers from the various platforms.*

The loop-line to which I refer, after passing out of the central station, goes in an easterly direction, and then north to within a short distance of Woolloomooloo Bay; it then turns round under the Botanical Gardens in a westerly direction, and returns to near the northern entrance of the central railway station, pretty well parallel with Macquarie-street. The tunnel commences about the Curator's house on the edge of the Botanical Gardens, and continues until the line returns to King-street.

2061. That is to say, the first half, as you go east from the proposed central station, is open? Yes; and from there, as it turns and enters the Gardens again near Woolloomooloo Bay, some of it will be open and some underground. The whole of it can be kept underground through the Gardens.

2062. If the Commission determine to adopt your scheme it will be possible to have the whole of your loop in tunnel excepting near to Woolloomooloo Bay, where there can be an open resting-place for your traffic? Yes.

2063. *Mr. Humphrey.*] Would a 12-chain curve lengthen the line? Yes, about one-eighth of a mile.

St. James'-road will be left in its present state, the levels being in no way interfered with. It is to be particularly noted, as a feature of this scheme, that the central station-building will not require to be so large and costly as that proposed in the Government scheme, since, with the loop-line as shown, there will be no necessity to provide more than six, or at the outside ten, platforms under the main roof, and these, being required to accommodate only one train at a time, can be made considerably shorter than those shown in the Government proposal. With the loop-line there will also not be the danger of collision, essential to a scheme in which the central station is a dead-end and where a considerable amount of shunting will be required.

From the back of the central station, as proposed, the line will be taken in open cut through the Domain to a point near the Art Gallery, and thence as an elevated railway round the lower portion of the Domain and adjacent to Cowper Wharf, Woolloomooloo Bay, passing into a tunnel (under the main drive to Mrs. Macquarie's Chair) at a point near the residence of the Curator of the Botanical Gardens. A station can be very easily provided at Woolloomooloo Bay if so desired, though, personally, I see no great necessity for one in such a position at present.

The dotted black lines on plan represent an extension which would be valuable for various purposes, including possibly coaling, shunting, and spare carriages.

If it be deemed expedient to proceed with the North Shore connection at the same time as the city extension—and I very strongly advise that this should be done—then three or four lines will be carried from the central station (as shown on diagram)—two to serve North Shore traffic, and one or two for loop-line purposes only. After entering the Botanical Gardens the three (or four) lines will be carried below the surface to the stone wall which runs between the upper and lower gardens, whence the loop line will curve back again (in tunnel) to the central station; and the two North Shore lines will sweep round under the Garden Palace grounds, in front of Government House stables, to the intermediate Circular Quay station at the intersection of Albert and Macquarie streets. With the 1-in-50 grade for which the line is designed, there will be no disturbance of the surface throughout the Botanical Gardens and Garden Palace grounds.

2064-5. Have you a platform in proximity to the Water Police Court in your scheme? Yes; and it will be 20 feet below the surface, the proper depth for convenience of working, and more convenient than on the surface.

Circular Quay Station.

This will be an underground station, cut out of the solid rock, and open to the air above, to which access will be obtained on the level of overbridge by an airy and well-lighted subway, to be constructed from the Circular Quay beneath Albert-street. It is thought that this station will prove a great convenience to passengers from the western and eastern suburbs who wish to travel by the various ferry steamers from the Circular Quay to Manly, Neutral and Mosman's Bays, &c., and especially so at holiday times.

From the Circular Quay station the two lines to North Shore will continue in tunnel to Fort Macquarie, as shown, and thence under the harbour in a double subway of special design to Beulah-street, Kirribilli Point, whence they will be taken underground on a rising grade to connect with the present North Shore and Hornsby line at a new station midway between Milson's Point and the head of Lavender Bay.

Subway under the Harbour.

No scheme for the city extension can be considered complete which does not provide for connecting with North Shore, and for bringing the rapidly-increasing traffic on the North Shore and Hornsby line, either over or under the water, into the city. In the present scheme provision is made for taking two lines under the harbour in a double subway, about 1,700 feet long, consisting of two cast-iron tubes, each 20 feet in diameter, encased in concrete, and having a concrete lining. By adopting two tubes in preference to a single large section of subway the ventilation will be much improved. Large ventilating shafts will be provided on either side of the water, and each train as it passes through will then draw the air in the tube after it, and there will be no confusion of air currents from trains travelling in opposite directions, as would be the case in a single subway with a double line.

Construction of Subway.

The method in which it is proposed to construct the subway is as follows:—First, a strip of the bottom of the harbour along the line of section will be dredged until the surface mud and silt have been removed and the surface of the underlying clay exposed. Then into the excavation thus formed the sandstone spoil obtained from the excavations for the line on both sides of the water will be tipped, and well rolled in layers, the finer portions of sandstone and sand being carefully filled in between the larger blocks of stone, so as to form a homogeneous mass. A layer of bluestone ballast 2 feet thick will then be spread on the sandstone, and the top surface rolled level and well consolidated by means of a heavy roller.

It may be thought that it is not practicable to roll under the harbour; but it is practicable if you load the roller with lead or other material. If the lead weighs 13 tons it will only weigh 1 ton less under the water. It is practicable to take a large roller underneath and roll the sandstone.

2066. *President.*] Has it ever been tested? Yes; it has been done in rivers. I have done it myself. The depth would be about 55 feet.

2067.

NOTE (on revision).—This subway will carry tramways, if desired. It is required for convenience only, as it admits the traffic to the city descending in place of climbing; so that to enter the station you descend, and to leave the station you also descend.

2067. You have no doubt a 1-in-50 grade would bring you from the described station at Albert-street to the deepest part of your tunnel? Yes.

O. McMaster,
6 April, 1896.

The subway will then be built on shore in lengths of 50 feet—complete all except the internal lining—floated out, sunk, and connected together under water by divers, no difficulty being anticipated in this part of the work. At the ends special arrangements will be made for the connecting up of the subway from bulkheads near the ends of the sections of tunnel on either side of the water. This method of construction is held to be both feasible and economical in a case like the present where shield tunnelling is out of the question, owing to the quantity of overlying silt, and the depth at which a shield-driven tunnel would have to be carried.

The clear waterway over the top of the subway when completed will be 40 feet below high-water mark, a height far in excess of any probable requirements, and at the depth at which the subway will be founded the velocity of the tidal current will be so slight that the tendency to cause scour or silting-up will be practically nil. The maximum pressure, due to dead and live load, which can come upon the foundation of the subway will be less than a quarter of a ton to the square foot, a quantity well within the limits of safety, and it is not at all probable that there will be any subsidence in the foundation; however, to be absolutely on the safe side, provision is made for correcting any such variation that may occur by spraying in cement and sand through tubes spaced at frequent intervals over the bottom surface of the subway. The subway will be on the level throughout, the ruling grade of the line on each side of the water being 1 in 50, as against a gradient of 1 in 30, which it has been stated in the evidence given before the Commission, would be required in approach to any bridge between the City and North Shore, giving the necessary clearance for masted vessels. The cost of the subway would also be considerably less than that of any bridge that could be built over the harbour.

The cost of my subway throughout, including the dredging and putting everything in place, will not run above £170,000—that is, for two lines of railway. I estimate the cost of the line from Redfern station, including the loop-line, the station-buildings, and back again to King-street, at £536,000.

2068. That is the complete scheme to enable you to work a terminal station? Yes; it is a complete city scheme.

North Shore Approach.

The line on the North Shore side has been kept under the streets as much as possible, in order to avoid resumption.

It will rise from the Beulah-street end of the subway on a grade of 1 in 50 to near the front of the North Shore station, which it is proposed to construct at the position shown on plan.

The total cost from the loop to North Shore will be an extra £330,000, so that I should connect Redfern station with Milson's Point at a cost of £366,000.

2069. *Mr. Humphery.*] But the Circular Quay station would not be practicable unless you extended the line to North Shore? It certainly could be used in the city extension, but it would be in tunnel, and would not be very convenient to work; but it would cost so little extra to take it to North Shore, and the Circular Quay station would essentially be a North Shore station.

Scheme B.

If, in the opinion of the Commission, it is deemed expedient to have the central station in Hyde Park, then I would submit for their consideration the scheme shown on plan marked B, which embodies all the points of scheme A, viz., the loop-line, intermediate station at Circular Quay, and connection with North Shore by means of a subway. The resumption required on the Sydney side in this scheme would also be nil (between Liverpool-street and Fort Macquarie), since the route lies everywhere through or under park lands and Government property, with the exception of that portion of the loop-line which passes under the centre of Macquarie-street, and this portion will be kept everywhere well clear of the building-lines of that street, so that there will be no damage to property or disturbance of the foundations of buildings.

As will be seen from the plan, a central station is provided at the King-street end of Hyde Park, with a new roadway for vehicular traffic, similar to that shown on the Government plan. This station, however, can be made of smaller dimensions than in the Government proposal, owing to the reduction in the number and length of the platforms, due to the inclusion of the loop-line in the scheme, as before referred to; and the additional area of the Park, in front of the station, required by the Railway Commissioners for shunting purposes, will not be necessary in this scheme, so that the total encroachment on the Park will be only 6 acres, as against 12 acres stated to be required for the Government proposal.

Route B.

From Redfern to the central station the route followed will be similar to that in the Railway Commissioners' scheme. After leaving the central station the line will curve under the District Court, &c., at the back of which it will come to the surface again, and it then follows practically the same route as in scheme A, with the exception that in this case the loop-line will return to the central station by way of Macquarie-street, as shown on plan.

The cost of this scheme will be, approximately, the same as for scheme A.

Suggestions for Working Traffic.

Should it be deemed advisable to adopt either scheme A or scheme B, including the North Shore connections, then I would suggest that the railway traffic might be worked in the following manner:—

1. Long-distance trains from the west and south, after depositing passengers at the central station, to run round loop and back to Redfern, for cleaning, inspection, &c.; long-distance trains from the north to come by way of North Shore line to the central station, and thence to Redfern for the same purpose.

2. Suburban trains from the western suburbs to Parramatta, from the Northern Line, between Strathfield and Hornsby, and from the Illawarra suburbs, to be so arranged that a certain percentage would run round the loop back to the central station, and start thence again to their respective suburbs, the loop being sufficiently long to allow of a number of trains lying there till their starting-times. The remainder to continue on (stopping at the Circular Quay station) under the harbour and by way of the North Shore line to Hornsby, thus providing a continuous service between the western suburbs, &c., and the North Shore and Hornsby line, and *vice versa*.

In conclusion, my opinion is, firstly, that the city extension is a very urgent matter, and should be proceeded with at the earliest possible date; secondly, that the route followed should lie on the eastern and not on the western side of the city. Upon the question of whether the Royal Commission considers the utilisation of Hyde Park for railway purposes expedient or otherwise will depend the position to be adopted for the central station—and this is really the crucial point of the whole matter; but in any case I would strongly oppose the idea of any extension which stops short of King-street, and from the many persons I have conversed with on the subject I am certain that the majority of the travelling public are also of my opinion. Either of the schemes which I submit will serve the public convenience in this respect, and they also make provision for other requirements, which will certainly have to be dealt with immediately upon the completion of the city extension, and which should consequently be considered therewith.

2070. *Mr. Lee.*] You would come through the Benevolent Asylum and Belmore Gardens, as proposed by the Railway Commissioners? Yes.

2071. You would make no alteration until you got to Liverpool-street? No.

2072. At Liverpool-street you would keep deeper to get under the Park, instead of keeping on the surface, as proposed by the Commissioners? Yes.

2073. What would the cover be composed of? Brick arches or iron troughing.

2074. Will the cover be above the surface? No; 3 ft. or 4 ft. under.

2075. So that practically it will be a tunnel? Yes; but it will be much cheaper to construct.

2076. *Mr. Humphery.*] What will be the length of your longest tunnel? Two-thirds of a mile.

2077. *Mr. Lee.*] You propose to take 3 acres of the old Brigade Office? Two and three-quarters there, and 2 acres in the Domain.

- O. McMaster. 2078. Do you propose to take the present frontage to Albert-street? I would take the site now occupied by the District Court, the Barracks, round by the road to the Domain, and then take 2 acres square in the back of the Domain, never now used.
6 April, 1897.
2079. Would that interfere with the Mint? No.
2080. What would be the effect of having that railway station alongside the Infirmary? They would never know it was there. You could not see it from the Infirmary.
2081. It will practically be a city station? Yes; but there will be no outlet into the Domain. It will be in Macquarie-street and King-street.
2082. And there will always be the noise incidental to working a large station? There will be a noise, certainly; but I do not think it will be any greater than what is made by the tram traffic in Elizabeth-street—not so much.
2083. At all events you would take inside the Domain wall a square 2 acres? Yes; it would interfere only with one little road, which might be shifted a chain.
2084. It would block the road? Yes; but it could be moved out any distance, being on the level surface.
2085. Where is your next resumption? I have no more resumptions then.
2086. Would your trains be running above ground between that point and Woolloomooloo Bay? Yes; on brick arches, or you could fill the ground in.
2087. Would the arches be sufficiently high to admit of traffic underneath? Yes.
2088. Do you cross the head of the bay or keep to the foreshore? We keep inside the Domain the whole way.
2089. Above ground? Yes; until we get round near the Curator's house, and we go almost under his house.
2090. *Mr. Humphery.*] What is the estimated cost of the loop? First, 14 chains would cost £5,000—that is what is above ground; the loop from the Domain would cost between £29,000 and £30,000.
2091. What is the length of the loop? About a mile.
2092. Would there be any platform? It has been proposed to put a platform opposite Cowper Wharf, but I do not think it is necessary.
2093. It would be practicable? Yes; you could come out almost level with the Art Gallery.
2094. With much additional cost? Only the cost of the station and platforms.
2095. *Mr. Lee.*] That could be done at any time? Yes.
2096. *Mr. Wright.*] Would it not interfere with the purpose for which you design the loop? No; but it would mean another station.
2097. *Mr. Humphery.*] How would it be practicable to have the station at the Circular Quay, in connection with your scheme, for a loop from King-street round Woolloomooloo and back to King-street? It will be easy, but you will have to go down near the wall in the Gardens, and the line would have to be out in the open in places.
2098. Do you mean it would be a lengthening of your loop? It would make the loop larger, and you would go nearer to the shores of the Gardens.
2099. Would it be practicable to have the loop larger and provide a station at the Circular Quay? Yes, and come up Macquarie-street.
2100. *Mr. Wright.*] Would it be practicable, without destroying any portion of the Botanical Gardens? There are certain portions of the Gardens where you would have to run on the surface.
2101. *Mr. Humphery.*] What would be the increased length of your loop, and the additional cost? It would increase the loop about three-quarters of a mile.
2102. Would it double the cost? No; it would cost about £15,000 extra.
2103. Would you be able to provide all the necessary conveniences in connection with the terminal station in the same way in which you propose to provide them by the plans submitted? Yes; you could do everything else, but the curves at Circular Quay station would be rather sharper.
2104. What would be the difference in the curves? I think the curves rounding on Circular Quay station, in the loop, would be about 8 chains.

WEDNESDAY, 7 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
HENRY CHARKE Esq., M.P.
CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
GEORGE BLACK, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
FRANK FARNELL, Esq., M.P.

Frederick Harrison Quaife, M.D., sworn, and examined:—

- F. H. Quaife, 2105. *President.*] Have you any scheme which you desire to place before us? Yes. I hand in a plan—
M.D.
6 April, 1897. portions of sections 33 and 34 of the city of Sydney—upon which I delineate a portion of my idea and also a tracing unincumbered by any buildings.

2106. Will you read your statement? Yes; it is as follows:—
A modification of the 1890 Hyde Park scheme proposed by the Commissioners, saving a considerable area of the Park, and giving an area for the terminus equal to that stated to be required.
Levels of the important points are official, kindly supplied by Mr. Deans, who also supplied a practicable curve (railway).
My remarks refer to the area for the station and yard at Park-street, and some important ones to the levels and conditions of the southern quarter of the Park.
Plan is drawn on a copy of the large city official map—sections 33 and 34—on a scale of 40 feet to the inch.

Boundaries of the Land.

Castlereagh-street, north-west corner, to a point 60 feet along King-street East, beyond the Supreme Court about 400 feet; from that point to Park-street, parallel or nearly so with Castlereagh-street, about 1,440 feet; from Park-street point 145 feet to within 15 feet of south-east post of entrance to Park; thence curved line of 12-chain radius to a point about 30 feet from corner north-east of Synagogue; thence a line proceeding to that corner and along the northern boundary of the building to Castlereagh-street; thence back to starting point at King-street, about 1,205 feet, along east alignment of Castlereagh-street. It

It might be necessary to take about 45 feet more at Park-street, east of above, and thence to join the second line through the Park to a point about 580 feet from Park-street; and, also, a strip along Park-street east of that, sufficient for a roadway. The area of this land is nearly 13 acres, and includes all that is wanted for the station buildings, platforms, lines, and approaches.

To this should be added the rest of the site of St. James' Church, and that part of St. James'-road east of the line from King-street to Park-street, on the eastern boundary of the station ground. Of the above addition there are almost two-thirds of an acre, and it is meant to be added to the Park in lieu of some taken away. It is bounded east by a curved line from the church to the entrance of the avenue. It is shown by red and black lines in the plan.

F. H. Quaife,
M.D.

7 April, 1897.

Contents of Principal Area.

1. Tower and about one-fourth of the church.
2. Supreme Court and Land Titles Office.
3. Western half of St. James'-road.
4. Part of the Park—190 feet wide in the straight, and lessening at each end.
5. Elizabeth-street from King-street to the Synagogue.
6. Market-street, east of Castlereagh-street.
7. All the property from the Synagogue north boundary to King-street.

Appurtenances.

Area taken from Park is 5 acres, and $7\frac{3}{4}$ acres to avenue are left, including two-thirds of an acre more, added as described above.

Of this area the State already owns a large portion, viz. :—1. The Supreme Court and Registrar-General's office.

2. The land on which the High School stands and on to Market-street.

The square block at King-street, between Elizabeth and Castlereagh streets, and also all south of Market-street to Synagogue would have to be resumed. This should be now much lower in value than formerly. There is not much good property on it. The old Court-house would have to be replaced probably where the Mint is, and that could be moved out to spare ground in the Barrack area. Such an institution should not occupy so magnificent a site as it does. A good part of the ground in Castlereagh-street has only rookeries and boardings on it. Of course the church would have to be paid for, and it is unfortunate that a fine new building should have been erected for an additional Court-house close to it; but that is, after all, a small matter if the great public convenience of a railway terminus is considered.

Four hundred feet are taken because I understand that Mr. Eddy considers it necessary, or less of the Park might be interfered with.

The expensive and fine Synagogue is to be carefully preserved, and this limits our facilities of approach, as we must enter the ground from the south to the eastward of the central line of the station. The gentle curve necessary on the western side conveniently causes the widening of Castlereagh-street by about 30 feet, making it about 92 feet wide, which would give fine room for the great vehicular traffic which would be concentrated there. We still then get about 370 feet of width for the station.

I have followed as closely as possible the published plan for the Park-street station, and have provided room for similar platforms and lines; also an interior cab-road to go in at Castlereagh-street and rise over two of the westernmost lines to a road out at the Synagogue, on a grade of about 1 in 13 for 170 feet, then a level or slight rise over the bridge. Beside the Synagogue, a road nearly 30 feet leads out to Castlereagh-street, and has a gateway to Elizabeth-street; also a 5-foot footpath along the Synagogue wall. There, also, on the Castlereagh-street front, is provided a large luggage office, 100 x 85 feet, with a second front to a road-space opposite the Synagogue, but separated by a wall from the roadway mentioned above. Such an office is provided in the Park-street plan, and is to be on the surface of the ground, and have a lift from the long western platform to its floor. This may be done here, but I would have underneath this building a basement which might be used for electric power plant for the lighting of the station, and also for part of the power necessary for working the tramways proposed to be converted from steam ones into electric ones. It would be found probably more economical to run the current from this central point than from the Rushcutter's Bay station as proposed, and, if necessary, the room could be extended nearly up to the Synagogue, giving a very large space indeed.

Room in the yard is provided for seven distinct platforms from 20 to 27 feet wide, with the necessary room for the lines between, as proposed by the Commissioners' plan. The bridge at Park-street is also made wide enough for all the lines required, with two supporting piers, each 3 feet 9 inches thick, with room for three lines between the piers and abutments and four lines between the piers.

The levels shown are official, and give plenty of headway by raising Park-street from 1 to 2 feet over the bridge, and an easy grade on each side to Elizabeth-street and towards College-street. I think a fall of about 1 foot in the 580 from the ends of the platforms will require a 2 feet rise at Park-street; more fall would of course require less. According to Mr. Deane, a rise of 2 feet 6 inches to 3 feet at Park-street would take them out level.

The level for the rails at the platforms is 64 feet, being 3 feet as required below the level of Castlereagh-street at Market-street, or 67 feet. The other levels at various points are shown on the map. The land rises on each side in Castlereagh-street. At King-street it is 74 feet, at Elizabeth-street 85, and near Phillip-street 95. At Park-street, near eastern boundary of the station land, the level is 82 feet; and hence there would have to be a deep cutting with retaining-wall from Park-street to King-street. Hence there would be required the excavation of the whole land from Castlereagh-street to the eastern wall, and this would be advantageous, as tunnels to the Quay and the eastern suburbs could run out from the last pairs of rails under Phillip-street and so on into Macquarie-street with plenty of head over them—20 feet being required for a double tunnel, but 15 feet or upwards for a bridge (10 or 11 feet left over the tunnel). A tunnel can run along Macquarie-street to the Quay without any compensation payment by keeping it on the eastern side of the street. The level of the station would provide for all sanitary arrangements. The platforms are all of the same length as in the proposed plan, and the carriage road is 30 feet wide.

At King-street there is a widening of 10 feet for the extra traffic, and a roadway for cabs to the front of the station at the least part 35 feet wide, and as these cabs would be all taking people to the trains they would merely set down and drive away. The cab-stand would be in Castlereagh-street. I do not presume to go into station arrangements, except in so far as to indicate what seems practicable. The general level is so near that of the land at Castlereagh-street side that there would be everywhere very small descents to the platforms by either steps or inclined planes.

The traffic across the Park at Market-street would be provided for by either an over-head bridge or sub-way, from which, if necessary, communication with the platforms can be made, and ticket offices provided for requirements.

The trams along Elizabeth-street would be diverted across the Park-street bridge, and would curve round to the east side of the railway ground, and be carried on an elevated railway to King-street, where, by a reverse, they would pass across the cable tram, as at present, and pass into Phillip-street, joining the present lines at the north side of Hunter-street, and the awkward and very expensive curve from that street to Elizabeth-street would be abolished. The viaduct would be as light as possible, and its eastern edge would rest on the railway boundary wall, the other on the ground and eastern platform on iron posts; it would have to be about 22 feet or 24 feet wide. The curve at Park-street could be made much easier than the present one at Hunter-street, and there would be a gentle rise from Park-street to King-street. Here note that as the trams are probably to be converted into electric, the works would be much lighter than necessary to carry the present steam trams.

As the great mass of traffic would pass to and fro west of the station, it would be a great advantage to remove the trams as proposed, as the traffic would no longer have to pass over the tram lines, and the entire tram traffic would be virtually only the length of the Supreme Court further away. I consider this point of especial value.

In advocating this plan it is well to point out that there has been a great increase in important offices and buildings within an easy radius of the site. Castlereagh-street, Elizabeth-street beyond King-street, and Phillip-street, are becoming more used, and as the area required becomes greater, Woollloomooloo, near the water, will be taken up more and more; also the eastern part of the city, Darlinghurst, &c., should be considered.

If the station is west of George-street, the eastern part of the city and the eastern suburbs will be left out in the cold, as the people will have to cross the main business parts of the city to get to it, while a railway to the east will be rendered almost impossible by the tremendous cost of ground and destruction of important buildings.

The main features of advantage in this plan are :—

1. Its central position for a station, taking generally the city and suburbs, and the easy distance from it to the most important centres.
- 2.

F. H. Quaife,
M.D.
7 April, 1897.

2. The case with which lines can be taken to the east and the Quay, when required.
3. The comparatively small amount of valuable property to be resumed.
4. Half of the property required is already in the hands of the State.
5. About 7 acres of the Park are saved, and possibly more may be on revision by the experts.
6. The removal of the old Court-house and St. James' Church will be no loss, but rather a boon, to the architecture of the city.
7. The station is close to the general traffic, especially since the cable tram has been introduced.
8. The cost of construction of the proposed electric tram in Park-street would be saved—some £12,000 or £15,000. I should think this may be put against the removal of the new Court premises built next the church.
9. The proximity of the station to the great hotels and boarding-houses, clubs, public offices, the Library, Domain, Botanic Gardens, Hospital, &c.
10. The widening of Castlereagh-street would be a great advantage, and would probably quite make up for the closing of Elizabeth-street at the part required.
11. The great advantage of ending at King-street, so much nearer the centres than Park-street.
12. The southern part of the Park, where the new station is proposed, is much the better planted and grown than the northern part. Along the middle of it is a high ridge, from Bathurst-street to the avenue, and on this are the finest trees, and there is such a height here that by curving the line east from the Unitarian Church a good head could be got over the line, and tunnelling might get under these very fine trees without injuring their roots. North and south of them the ground might be opened, cut down, and, as much as possible, re-covered in. Near Park-street there is no valuable timber, as an inspection will show. The trees in the northern section are mostly old: Numbers have lately been lopped to make them grow better. If the lake in the southern part is injured a new one might be constructed somewhere else in the Park to make up for it. The drainage will probably rather improve matters than otherwise in such a shaly soil. How little the presence of a high cutting injures trees may be seen near the Cleveland-street bridge, where there are some very fine and old trees in the grounds of St. Paul's Church, Redfern, which abut upon the railway yards.

The objections no doubt are:—

1. Mechanical. This the railway engineer alone can settle; but I have, so far as I know, avoided any.
2. The closure of streets. The gift of a fine railway terminus will quite make up for this.
3. The compensation. On any other route, the Park excepted, this will be simply enormous. It should be taken on the land-tax returns sent in by the proprietors, and with the usual additions for compulsory resumption and for buildings.

The block next King-street no doubt is the most valuable. The High School might be removed to the vacant semi-circle at the Colonial Architect's Office—a much more suitable and quieter place; and, as I said before, the Law Courts to the present site of the Mint.

It would be fully worth the money to bring the station to King-street, and the additional distance would be only so much nearer the Quay for any extension.

I do not see why so much provision for horses and carriages should be made as proposed; there are about 540 feet of line frontage in the Park-street plan. All the racing stables, I think, are out Randwick and Waterloo way, and room for horse-box trains could be most conveniently got at Redfern or on the Benevolent Asylum site; but a little room for casual purposes may be easily supplied, and in my plan would require a little extension of the width of the Park-street end of the enclosure. This is shown in the plan.

Values.

Taking Mr. S. Perriau's values, as published, the area of the land from the Synagogue to Market-street is about £260,000; the King-street block, £102,000; making £362,000. I would remove the Mint to Green's Road at the Barracks; remodel the whole site on which it stands, adding the space out to Albert-street from the Domain to Macquarie-street. On this area there should be room for fine Law Courts of all kinds, a new High School in a much quieter and equally convenient position, and a new St. James' Church, equally convenient with the present. The whole might be named Victoria Crescent, to commemorate the glorious reign soon to be celebrated.

2107. You have made a statement with regard to the cost of the land to be resumed between Castlereagh-street and Elizabeth-street, but you have not given us any statement of the cost of the erection of a new St. James' Church, Supreme Court, and Registrar-General's Office? No. With regard to the law courts, some day—whether the railway goes there or not—the question of new buildings will have to be faced. As far as I can see, the only space suitable for them—to provide buildings worthy of the city—is the space where the Mint is.

2108. Your scheme carries with it the resumption of the block of land between St. James'-road and King-street with buildings thereon, and also the block of land extending northerly from the Synagogue to King-street? Yes.

2109. But the amount of Park resumption is limited to 5 acres instead of 12? Yes.

2110. You propose to widen King-street and Castlereagh-street? Yes.

2111. Your scheme, however, closes Elizabeth-street, and renders necessary a deviation of the tram-line? Certainly.

2112. What area, in addition to the 5 acres of the Park, do you propose to take? The whole area between Castlereagh-street and Elizabeth-street.

2113. Your central station, then, would be bounded on the west by Castlereagh-street, which would be widened, and on the north by King-street, which would be widened; then at Phillip-street you pass into the Park, and take that area until you come to a point pretty well north, or midway between Market-street and the Synagogue; and then you come down easterly to Elizabeth-street—or do you propose to extend your area from Phillip-street to Park-street? Yes. There will be a high retaining-wall right through to Park-street, excepting that there will be a little extension to the east at Park-street to accommodate horse-boxes and so on, if necessary. My area would be practically the same in extent as that proposed by the Railway Commissioners, with this addition: the area would be considerably longer than the Elizabeth-street and Park-street plan, and would, therefore, be in their favour. I understand, from some of the evidence given the other day, that one of the difficulties is to get a long enough position to enable them to have a clear sight and ways. This plan would, I think, be between 150 feet and 200 feet longer than the Liverpool-street to Park-street plan.

2114. As a medical man, how do you view the curtailment of parks in a city like Sydney? If Hyde Park were the only park within a long distance, I would be one of the last to meddle with an inch of it; but when I know there are upwards of 200 acres of park land, including the 40 or 45 acres of Hyde Park, within a stone's throw, which for beauty and sanitary purposes are infinitely superior to Hyde Park, and when I know that the convenience of millions of people is involved in bringing the railway into the city, I cannot for one moment hold the opinion that Hyde Park must be absolutely sacred. I look upon it as just as righteous and proper to take the necessary piece of Hyde Park for a great railway terminus, in order to bring about an improvement in the traffic conditions of the people, as to erect a great building like the Art Gallery in the middle of the Domain. If there was no objection to doing this, there can be no objection to taking this small area of the Park. At the same time I do not put my plan forward as a better scheme than the Hyde Park scheme of the Railway Commissioners, but I think you must come to

some

some sort of compromise. I would sooner not spend a large sum of money to shunt the railway to the west, in order to spare the Park; but I would sooner spend that large sum of money in having the railway than leave the Park alone and not have it. I cannot believe that any enlargement at Redfern will serve the people. I have a map of the city of Glasgow, which has a population of 600,000 to 800,000 people. I spent five years there thirty years ago; at that time there were two railway stations there—or, properly speaking, three, because there was a station on the south side of the Clyde, near the bridge, that belongs to the Caledonian Railway Company. They had another in the north part of the town, in a very awkward and inconvenient position, from which the mail trains to London started. The North British railway station was on a very convenient site, close to George-square. It is a small station, and they had to work the trains up and down a tunnel, on a steep grade, by means of a cable. What has been done since then? The old College—the University of Glasgow—not a stylish or handsome building, but one hallowed to generations of Scotchmen by the work it has done, and also the University grounds in the east end of the city, have been sold to one of the railway companies. There is now a fine station on that site. When I left they were building the Union station at Enoch-square, near the water. It communicates principally with the lines on the south side of the river. The Caledonian Company, finding they were out in the cold on the south side of the river, got power to resume a large block of land in Argyle-street, and they built a magnificent station there, simply because they had to compete with the Union and other stations round about. As a matter of fact, there are now five central stations in the city of Glasgow, all within comparatively easy reach of the business centres of the city.

2115. *Mr. Fegan.*] The companies paid large sums of money for the lands you have described? Yes.

2116. The University, I suppose, profited by the large sum of money paid for the resumption of land for station purposes? Yes.

2117. In the present instance you propose to take from the people a recreation ground without giving them anything in return? Do we not give them a magnificent railway station?

2118. The people who generally make use of the Park would not use the railway station? But there are 200 acres within a stone's throw.

2119. Not as convenient? Yes, as convenient, and better. How many yards is it from the centre of this piece of land to the entrance of the Domain near St. Mary's Church, and how many poor people go into that part of the Park? Many are afraid to go into Hyde Park because of those who are there. Hyde Park itself—at any rate the part in question—is by no means an airy place. If the houses facing Elizabeth-street, opposite the part of the Park proposed to be taken, remain, there may be some objection to depriving them of their frontage—(I do not think so, however); but, as all the property to Castlereagh-street would be taken, that objection fails. Castlereagh-street is wholly and solely a business street, and will become more of a business street if the railway goes there. I believe Hyde Park contains from 40 to 45 acres, and surely to goodness 35 acres is enough to exercise in. Then there are the Botanic Gardens and the Domain within a stone's throw. The people who cannot walk from Hyde Park to the Domain to recreate themselves do not deserve to be considered.

2120. *Mr. Black.*] Some of them are too footsore to walk; you are raising the question as to whether certain people have any right to a foothold on the earth at all? I should like to know why they could not walk 150 yards, and be in a better position and in a part of the Park that is better kept. This part of the Park, which seems to be thought so desirable for these people, is the very worst part. It slopes west. If you go there on a hot summer's afternoon you will find the people lying under the trees, such as they are, and all the wind they get there is the west wind, which is not a healthy one. On the other side of the avenue they get the east and south-east breezes, which are better. The question in my mind is: is it worth while to expend a large sum of money to buy land to escape taking part of the Park?

2121. Then there is another question: is it necessary to have another central station when you have one at Redfern? I do not consider Redfern in the city at all; it is one of the most stupid of places for a station.

2122. Is it not nearer the centre of the city than any other so-called central station in Australia? On the contrary, it is the worst possible place.

2123. Name one which is nearer to the centre of a capital city? I think both the Melbourne stations are nearer.

2124. I think if you struck the centre of the city you would find it very near to Redfern station? No; it is at the corner of Hyde Park. Then you have to look to the extension of the city northwards.

2125. What purpose is to be served by moving the station? Bringing the traffic to the main avenues of communication.

2126. *President.*] Your attitude is this: although you view with apprehension any curtailment of the Park area, you believe that there are national interests which would justify us in taking 5 acres of it, seeing that there is so much other park land available? Certainly.

2127. You would take park land only as a last resource? Yes. I would be prepared to spend a good deal of money to escape it, but I do not think it would be wise to resume such properties as you find from Castlereagh-street to Pitt-street; you would resume property which would cost no end of money. I think it is better to sacrifice a piece of the Park than to do that, especially in view of the fact that there will be so much left. I have seen it advocated that, if the railway went round the western side, the station might be placed in Wynyard-square. That is a beautiful little park, with a great deal of advantage to the people round about; and I cannot for the life of me understand people arguing that a station should be put in it, seeing that they would not get one worthy of the name. That park would be absolutely destroyed, but in Hyde Park we have a piece which, in my opinion, can be spared. If you were going to take the whole of Hyde Park I would be opposed to it.

F. H. Quaife,
M.D.
7 April, 1897.

THURSDAY, 8 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL EGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Oswald McMaster, Civil Engineer and Contractor, further examined:—

- O. McMaster. 2128. *President.*] I want you to describe the advantages of the loop-line over such a dead-end platform as that at Redfern? My loop-line saves two lines running back to Redfern to take the engines to be cleaned. Another advantage is that it entirely avoids shunting arrangements, and does away with a large item of expenditure in the shape of points and crossings. It also affords more room for idle trains.
2129. And reduces to a minimum any likelihood of danger in the station? Yes; that is impossible, because there are no points and crossings.
2130. *Mr. Hoskins.*] You propose that there should be some place in the neighbourhood of Lady Macquarie's Chair for cleaning engines? Yes; not so far down, but opposite the baths.
2131. Do you know how much room the Locomotive Department occupies at Redfern for that purpose? Yes. This would only be for the running trains, and quite different.
2132. Do they not occupy about 30 acres? Not so much. They use it for locomotives and tenders and for storage room. Mine would only be used for the daily traffic, for immediate use only.
2133. *President.*] Would a loop-line and resting-line be sufficient? Yes; it would accommodate all the traffic which can be anticipated for many years.
2134. *Mr. Hoskins.*] I suppose you know there is very little flat land between the baths and Lady Macquarie's Chair? I do not go past the baths; only as far as the baths.
2135. *President.*] With regard to the extension to North Shore, you propose to pass round the loop in order to get a grade which will enable you to have a station at Circular Quay at sufficient depth to enable you to pass through the subaqueous way? Yes.
2136. What is the grade? The steepest grade I have anywhere is 1 in 50, and that is the ruling grade throughout the Milson's Point line.
2137. You also contend that your scheme can be extended, and join the North Shore line, between Milson's Point and the head of Lavender Bay? Yes.
2138. Supposing it is not wise, for financial reasons, to extend the line to North Shore at present, you can so locate it that it can eventually be extended? Yes; that is one of the features of the scheme.
2139. It would provide for a loop round Government House, which would meet present requirements? Yes. The proper thing to do, then, would be to take an 8 or 10 chain loop from below the Albert-street station and proceed in front of the Garden wharf in front of Government House, and return to the same station, at the Water Police Court, which would work the slow suburban traffic. The fast suburban traffic could be worked on the loop shown on the plan. The two loops would work admirably with each other.
2140. The first loop would not be wasted under any circumstances? No.
2141. And the second loop would not be wasted when you extended to North Shore? Certainly not.
2142. In your scheme, going to Woolloomooloo Bay, you take the people coming *via* Redfern, or eventually from North Shore, away from that part of the city lying between Circular Quay or Albert-street, and your central station near the statue; might it not be possible to locate your central station more to the east, by which it would be closer to the city; by this means the people would be more in touch with the city all along? That could be done.
2143. Are there objections to it? Yes. One is that, bringing the line on a higher level than what I advocate at Circular Quay, would necessitate a further expenditure going to North Shore.
2144. Would that be a serious expense? No; but it would be of very little advantage, excepting that it would bring the Circular Quay station a few chains nearer to the Quay itself. The total distance from the floating-jetty on to the Circular Quay station, under my present scheme, is 8 chains, which might be reduced to 5.
2145. Perhaps it might be better to put your extension to North Shore under the Albert-street station? Yes; but in making the loop at Circular Quay, I propose that the train should come out on the surface. It might come out at the Man-of-war Steps.
2146. But that will not do to go to North Shore? No; but it would not increase the expense from this Circular Quay station to the North Shore, because it would be at the proper level.
2147. If the central station were in the Park, abreast of the mouth of Market-street, it would be 30 feet lower than where you propose to put it; saving that 30 feet might permit you to take a more direct road to Circular Quay? It would. The 30 feet you gain by not rising to the top of Albert-street would allow you to come out on the surface at Circular Quay; but that would not permit you to go on to North Shore without further expense.
2148. I presume you claim for your station that it will be in closer touch with the people at Woolloomooloo, Pott's Point, and the eastern suburbs? Yes. I claim that the cable tramway running along there would be an advantage to my central station, and it will not be far from the Elizabeth-street station.
2149. Against that, you will grant this: that people who are walking to the station, or using any means of transit except the tramways, are removed to a worse position—just the distance that Elizabeth-street is from your station; they have to walk that much further? It depends on which position you take as the centre of population of the city.
2150. *Mr. Lee.*] The bulk of the railway traffic would leave the train at your central station at Albert-road? Yes.
2151. That would be further away from the intersection of King and Elizabeth streets than the proposed Hyde Park station? Yes.
2152. It would be still further away for those passengers who get out at Market-street and Park-street by tram? Yes; but, against that, you are nearer Hunter-street and the north-eastern portions of the city, which are equally important with those on the south which now have Redfern. 2153.

2153. Would the people who now get out at Market or Park streets be likely to use a train which would put them down at Albert-road? No; but if you had a station at Park-street many people would want to take a tram on to Hunter-street. O. McMaster.
8 April, 1897.
2154. Your argument really is that it is impossible to devise any system which will serve the whole of the people? It is absolutely impossible. My scheme allows for an extension, and it is in an elevated and picturesque position, and capable of being enlarged to any extent as time will demand.
2155. *President.*] You recognise that the Redfern Station has become so dangerous that something must be done? There is no getting out of that argument; it is quite unsafe.
2156. And you propose to extend four lines into the city and to establish a central station at Albert-street, your reason being because of its accessibility to the eastern suburbs and the present and prospective means of transit by tram through the city; the land there is not valuable and it is an imposing central site? Yes, and it is not occupied at the present time and suits the eastern suburbs connection.
2157. From there for the fast traffic you propose a loop to go to Woolloomooloo Bay, and an extension to the eastern suburbs, which will be of benefit to shunting and working the fast trains into the central station? Yes.
2158. You propose to extend that to such a level towards Circular Quay that you will be able to pass under and to join the North Shore line as described; you also intend to have a loop under the Government House grounds to shunt the slow traffic, which does not require to go over to North Shore; the scheme is complete in itself in giving access to Circular Quay, and it carries an extension to the eastern suburbs and North Shore? Yes.
2159. The question of a station-site at Albert-street, although you regard it as the best position, does not dominate the scheme? Certainly not.
2160. The general idea might be obtained, perhaps, just as well by taking a portion of the Park, or by resumption of some place a little to the west of the Park? Yes.
2161. You think that the loop-line round Government House grounds might be done away with, seeing that you are going to shunt your traffic on the loop near Woolloomooloo Bay? Possibly, by a system of points and crossings, which would not be dangerous, because they would be past or at the rear of the platforms.
2162. *Mr. Lee.*] Where would the proposed subway from the central station to Elizabeth-street come out? About the back of the Lands Titles Office, in the Park.
2163. That would necessitate taking a little of the Park? Yes, about 100 feet.
2164. Would it interfere with the ordinary road traffic? No; it would give more facilities for it. It would be 100 feet wide with a headway of 20 feet.
2165. Would it be an eyesore? Anything but that.
2166. I suppose the subway would carry a tram? Yes; but they are already there, and might just as well run over the top, but may also run through the subway.
2167. I think you will admit that a tramway service in connection with the railway should be part and parcel of it? It might be worked with the present system by putting the tramway through the subway.
2168. Have you worked out your estimate of cost? Yes; it has been carefully gone into and checked. It is estimated on the basis of the work I did on the Milson's Point railway; and I would be prepared to put down a substantial deposit as good faith to carry on the work.

John Upward, Mayor of Ashfield, sworn, and examined:—

2169. *President.*] Can you give us any opinion as to local thought in your municipality with regard to the extension of the railway? The people along the western suburbs line are unanimous that the present terminus is not in the right place, and that their wants are very badly served. J. Upward.
8 April, 1897.
2170. You desire an extension into the city? Yes.
2171. Why? Passengers are at present put down about a mile from the centre of business, which is an inconvenience. For the majority of the people it means taking a bus or a tram. Transhipment from one to the other means a loss of over five minutes; then there is the slower conveyance, which means a further loss of seven or eight minutes. It means the loss of from fifteen to twenty minutes on each journey.
2172. Is it your opinion that those who travel to their business in the city, through the absence of a city railway, lose approximately half an hour of their time? Fully that.
2173. Where do the Ashfield people desire to have the station located? I think the majority would be better served by a station between King and Hunter streets.
2174. Do you regard King-street as a fairly central position? I think the block between King and Hunter streets is the most central in the city. The further away from there the more unsatisfactory it will be.
2175. Do you regard the junction of Castlereagh and King streets or King and Elizabeth streets as fairly central positions? Any part of the city ranging between Kent-street and Castlereagh-street.
2176. How would you view an extension on the western side of George-street? If taken in connection with a circular line I think it would be most satisfactory.
2177. What is your view with regard to a station approaching or somewhere near Circular Quay? It would be of immense use, because of the large traffic from North Sydney, Mosman's, Manly Beach, and Watson's Bay.
2178. You think the railway should be extended, if possible, to the Quay, because of the travelling public there, and those whose business lies with the ships and wharfs? Yes. My idea is that one of the various loop-lines which have been suggested would be the best. It would require a large amount of space for a terminal station. Such a scheme as that which Mr. Norman Selfe has suggested seems to be one which would serve the convenience of the public most.
2179. If the people of Ashfield could be placed by railway in the vicinity of Castlereagh and King streets, and then on to Circular Quay, they would probably be well satisfied? Yes.
2180. And if it were possible to bring the line closer to George-street, and terminate it at the Quay by a western route, they would also be satisfied? Yes.
2181. *Mr. Lee.*] Do you think a central station on the site of the old Brigade Office would be convenient for western suburban passengers? It would be more convenient than the present one; but I still adhere to my opinion that a circular line would be most convenient. 2182.

- J. Upward. 2182. Supposing that, in the event of that not being practicable, it were brought in on the eastern side only, do you think a station in that position would meet the requirements of the bulk of the city and western suburban people? Of course it would be much better than the present terminus.
- 8 April, 1897. 2183. Would it not place them in this position—that the saving in time between Redfern and the station point would be at least half the time it now takes to come down in the tram? Yes; there would be a saving of time.
2184. Do you think the passengers would be likely to leave the train at Redfern, and seek their offices by means of the tram down George-street—that is, if King-street were made the terminus? Only a few. I myself would have to take some other conveyance to the end of Circular Quay.
2185. If the line is brought in on the eastern side, you are of opinion that it should be extended to Circular Quay? Yes.
2186. Thereby giving the large number of business people on the northern end of the city easy access to their places of business, and enabling the traffic by ferry to get direct communication to and from the suburbs? Yes.
2187. You think it would be wiser to extend to Circular Quay than to allow the station to remain in the centre of the city? Certainly.
2188. Do you think the present and prospective traffic would justify the extension? Yes.
2189. *President.*] A scheme has been suggested to land the passengers somewhere near the new markets, and then extend towards Circular Quay;—would that meet with disapproval? No. One great reason why the western suburban people wish for an extension is that, owing to the congested state of the traffic at Redfern, there is a constant fear that the accidents which have happened of late may recur.
2190. Then you are always travelling with apprehension? Yes. With regard to the goods traffic, it appears to me to be absolutely unnecessary to consider a line for goods traffic round the waters of Port Jackson, Sydney being a distributing depôt. Every day I am brought in close contact with the discharging of cargoes around Sydney, and I know that only a fractional part of the quantity which comes into Sydney is ever required to go direct up country.
2191. *Mr. Roberts.*] Are you the proprietor of one of the bonded warehouses? Yes; the Metcalfe Bond.
2192. And you have a thorough knowledge of the shipping trade of the port? Yes.
2193. Do you think the present facilities for the export and import trade will be sufficient for the next twenty-five years;—you know the head of Darling Island, where the Government has built wharfs? Yes. I have no doubt that it will have to be availed of, or a better scheme provided along Darling Harbour than we have at present.
2194. Do you think there is not any necessity for bringing the railway round the wharfs of Darling Harbour or Circular Quay? No; not for goods. Of course, it is hard to say what the shipping will be in twenty years time, but as far as we can see ahead, we have plenty of wharfage accommodation.

FRIDAY, 9 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.	CHARLES ALFRED LEE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	GEORGE BLACK, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

John Stinson, Mayor of Burwood, sworn, and examined:—

- J. Stinson. 2195. *President.*] The Commission wish you to give your views with regard to the extension of the city railway, and to refer to the inconvenience from which the Burwood people suffer, and which we may presume would be remedied by the extension? So far as I can gather it is highly desirable indeed that the railway should be extended. Anyone who travels regularly by the suburban trains will see the immense amount of inconvenience occasioned to travellers by being deposited at the outer edge of the city, and having to find their way down as best they can. They suffer not only inconvenience, but a loss of ten minutes each way, so that really out of a day's business hours, of seven hours, a business man loses twenty minutes each day going to and from his office; that is over and above what you would have to expend in travelling if the railway were extended to King-street.
- 9 April, 1897. 2196. What about the question of the apprehension of danger? That is a matter which has prevented many people from settling in the western suburbs, and it is one strong reason why many of them are seeking a home elsewhere. They know from bitter experience that there is a certain element of danger in travelling into the Redfern Station, particularly in the busy hours of the morning. Knowing that a great deal of shunting is being done there, the danger is ever before them. I can speak of several residents who are looking out for a home elsewhere for that very reason.
2197. Are you prepared to express an opinion as to what portion of the city would be most suitable for the suburban residents to reach? With regard to the passenger traffic, I think the general impression is that the route should be by Hyde Park. The terminal station, for the present, at any rate, should be somewhere about King-street—on the site of the Supreme Court buildings. Of course I do not mean to say that that ought to be a permanent terminal station.
2198. Do you attach any weight to an extension to Circular Quay? I think that ought to be the ultimate object, possibly with a view to connecting with the North Shore railway. I think the old Supreme Court buildings might be profitably removed, and that a portion of Hyde Park might also be given up. Although it is spoken of as one of the lungs of the city, I think a portion of it might be lopped off, especially as the harbour constitutes such an immense lung, and one of which the city can never be deprived. I think sentiment ought to give way to commercial advantages in regard to the Park.
2199. *Mr. Lee.*] If the central station were placed on the site of the Benevolent Asylum would it meet the case? It would not; it might just as well be left where it is as go there.
2200. Would the extra fare into the city deter passenger traffic? No; because a large number of people who use the tram now pay more than what extra fare would be. At present the Government lose a very large amount from people travelling on foot, who would otherwise use the train right into the city. In the mornings particularly a large number of people walk from Redfern or take 'buses to their offices.

2201.

2201. I believe that in fine weather many walk as a matter of exercise? I do not think, if the train were running to King-street, many people would alight at Redfern for the purpose of walking as a matter of exercise.

J. Stinson.
9 April, 1897.

2202. Does not the present tram service offer facilities which the railway would not offer by putting people down at certain streets? Yes; but it is indisputable that during the busy hours of the day most of the passengers get out at the same street. In the busy hours of the day King-street is the centre of all the tram traffic.

2203. *Mr. Wright.*] The Government have submitted a scheme for a permanent station at Hyde Park between Liverpool and Park streets;—in your opinion, would that position be central enough to meet the requirements of the citizens? I do not think it would. If we are going to have a city railway at all, we ought to have it at the most central point, where the traffic is concentrated.

2204. Do you think it is correct to contend that the centre of the city lies between King and Hunter streets? I am not prepared to say that is the most central portion, but I know there is a very great deal of traffic finding its way into the trams at Hunter-street and King-street—larger than is found at any other point on the tram route between King-street and Redfern.

2205. Is there not a larger traffic at Market-street than at Hunter-street? I think not.

2206. If the officials say there is, are they likely to be correct? Of course, I would not set up my opinion against theirs.

2207. At any rate, between Market-street and Hunter-street the great city traffic is conducted? Yes; so far as I have been able to observe.

2208. *Mr. Clarke.*] Do you say the Supreme Court would be the best site for a station? Yes.

2209. I presume you would remove St. James' Church and utilise that block? Yes.

2210. You do not think the proposal of the Commissioners to go to Park-street is suitable? I do not.

2211. You are aware that it is necessary to have more room at Redfern than there is at present? I am.

2212. Would a new station on the site of the Benevolent Asylum be suitable for the general public? I do not think it would be worth the trouble and expense of constructing it.

2213. You are aware that the electric tram is shortly to run down George-street? Yes; it will supply a different service from that which is now supplied from the railway station.

2214. Would not that suit the public equally as well as a railway into the city? I do not think so, because it will necessitate a change at the Redfern Station, loss of time, and so on.

2215. Do you not think the tram is quite as convenient to the public as a railway would be? I do not see why the George-street tram could not be worked in conjunction with the city railway.

2216. Would you then have as many passengers for the railway? I think so. If the passengers using the city railway did not get in at King-street or Market-street they might use the electric tram to Redfern and take the train there.

2217. Would not the tram and the railway be competing with each other? I do not think so, when they are both running in the same interests.

Hon. John Macintosh, M.L.C., sworn, and examined:—

2218. *President.*] I understand you desire to be examined purely from the Sydney aspect of the question before us? That is all.

Hon.
J. Macintosh,
M.L.C.
9 April, 1897.

2219. Do you wish to make a statement? Yes. Twenty-eight years ago, all to the north of the present railway-bridge at Redfern comprised the railway establishment of New South Wales—that is, from Devonshire-street to the railway-bridge. That was hardly occupied; the result being that the Government gave Albert Park to the Corporation—not requiring it for railway extension. Since that time, Darling Harbour has been established. There are large works at Clyde, with 100 waggons frequently waiting there for produce to be delivered. I think, if the present railway were extended to Belmore-road, it would be the most central part of the city, and would be for the convenience of the people. I will point out that the Railway Commissioners require one quarter of Hyde Park on the north-west side. It is about 400 feet in width, and is a narrow spot for a railway station. 100 feet would require to be taken on the west side for a road to widen Elizabeth-street; a road would also be required on the eastern side. The Belmore-road site will give length and breadth for any permanent establishment. I take it that there must be no break on our railways from Perth to Townsville. It is inevitable that some day or other a bridge must be built across to North Shore. I think the Government should resume land on the eastern side of Darling Harbour parallel with the middle of Barker-street, off Bathurst-street. When we make a through trunk-line to go across the harbour, there should be a platform at the bottom of Market-street. I think, if the Railway Commissioners use Hyde Park at all, they should use the whole of it. In view of the good "get away" there is at Belmore-road, I think that is the most suitable place for a station. The tramways are convenient to it, and the difference in cost between travelling in them and in a railway into the city would be only one-half penny or one penny. The time lost in travelling by tram or 'bus to any portion of the city would not be more than two or three minutes. If it is intended to get to the eastern portion of the city, a tunnel could be made from, say Margaret-street, underneath George-street, along to Circular Quay, and from there we could go to wherever is thought proper. I think a continuous line is desirable. Ten or fifteen minutes would take any passenger by tram or 'bus from the furthest corner of Sydney to the present station, and the railway would not be more than two or three minutes quicker. Personally, I think we require an improved tramway service. I would have no objections to filling up Darling Harbour almost to the bridge, and to making a higher road where the present Pymont Bridge is situated. I do not think Darling Harbour is utilised as much as it ought to be. There is a large amount of empty space, and almost every owner has encroached upon the public land. The extension of population cannot be to the north of Belmore Park, but is going on all round—west, east, and south.

2220. *Mr. Hoskins.*] It has been stated that if a terminal station is constructed at Belmore-road it would cost about £350,000, and no revenue will be received; whereas if the railway is extended to Hyde Park the revenue from passengers will pay the interest on the money spent? I cannot conceive that that is correct. I look upon the matter as altogether beyond a money matter; we must look for the convenience of the general public.

2221. *Mr. Humphrey.*] A suggestion has been made that instead of the terminal station being at St. James'-road, it should be placed on the present site of the Government Architect's office, and that there should

Hon.
J. Macintosh,
M.L.C.
9 April, 1897.

should be a loop-line at the back, so that, instead of having a great number of lines for shunting purposes, the traffic could be worked by means of a loop? That plan was considered by a Royal Commission some years ago, but there were a number of objections to it. I opposed it, because it is not the way to get through to Brisbane.

2222. Assuming it would be possible to connect from there with the North Shore line, would you see any objection to the plan? Yes; it is impracticable to make a bridge from the east of Elizabeth-street.

2223. What is your objection to the site I have mentioned? It would take up too much of the land about there. The Mint would have to go, and also the law offices. I do not think it would be a desirable place, seeing that the Infirmary, which cost about £250,000, might have to be disturbed.

2224. I asked the question on the assumption that that property would not be greatly interfered with;—do you see any objection to the railway being brought from Redfern to that position, other than the fact that it would be impracticable to extend it to Milson's Point? Yes; it would not be central. It would be nearer Potts' Point, but it would be further from Balmain, the Glebe, and Surry Hills.

2225. Do you see any objection to the line passing through the Park, assuming the terminal station to be beyond it? Yes; the Park being for the use of the public ought not to be disturbed if it can be avoided.

2226. Do you wish to convey that you are of opinion that the passenger traffic should be carried to Darling Harbour? I have no objection to seeing a platform there.

2227. But do you propose that the railway should be extended there? It should follow the present line. A siding could be made at Eveleigh, and you would have a straight course onwards.

2228. Then your idea is that the passenger traffic, instead of coming to the Redfern terminus, should be deviated so as to turn off where the goods traffic goes to Darling Harbour? Yes; that is, for through traffic.

2229. Then you think there should be a different line for the through traffic, and that the suburban passenger traffic should be landed at Belmore-road? Practically speaking, the main railway station of Sydney should be a side station for through passengers. As I have already stated, there cannot be more than two or three minutes difference to a passenger going to any part of Sydney by tram, and 1d. difference in fare.

2230. Do you not recognise that instead of there being two or three minutes difference, the actual difference is about half an hour daily? I think it would be impossible for any man to prove it would be ten minutes difference.

TUESDAY, 13 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
GEORGE BLACK, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Frederick William Parsons, Mayor of Strathfield, sworn, and examined:—

F. W.
Parsons.
13 April, 1897.

2231. *President.*] Are you prepared to speak as to public opinion in Strathfield with regard to city railway extension? Yes.

2232. Why do you desire the railway extended, and have you any special part of the city which you desire to reach? It is unanimously thought by the people in the western suburbs generally that there should be some alteration to the present terminus. Some months ago large meetings were called in nearly all the western suburbs, and resolutions were unanimously carried to the effect that the time had arrived when some alteration should be made at Redfern, and when the railway should be extended to the city. All the meetings were agreed that it would not be wise for the residents in any way to hamper the Government by suggesting routes. The agitation was principally aroused through the accident at Redfern two years ago, and also because of the great inconvenience travellers are put to in changing. If you leave Strathfield at twenty minutes to 9 in the morning, you arrive at Redfern at five minutes to 9. If there is no extra delay on the trams, you are landed at King-street about ten minutes past 9. Therefore, it takes you as long to travel from Redfern station to King-street—which is practically the centre of the city for business purposes—as it does to travel 8 miles from Strathfield to Redfern. On the return journey it takes longer, because there is no dependence to be placed on the time you meet the trams. If you want to catch a particular train you must give it five or ten minutes grace. It is very generally considered that the proposed extension to Park-street would not meet the difficulty, but that it should be further and more complete. The committee appointed by the Railway Extension League, under whose auspices the meetings in the suburbs were called, thought that if there was an extension anywhere it would be better than nothing, as it would, perhaps, be the commencement of a further extension. The committee, which consisted of the mayors of the boroughs and some of the aldermen, considered, however, that it was not in their province to suggest any route.

2233. Would we be justified in regarding the intersection of Castlereagh or Elizabeth and King streets as a fairly central position? I think that would meet the convenience of the majority of the travelling public. The largest number of people are landed about King-street.

2234. Approximately, would the present route of the tram-line suit them fairly well? It would.

2235. It has been suggested that the central station should be placed near the old Colonial Architect's Office? I think a station anywhere about there would be convenient. As long as the public could be brought within a reasonable distance of the Post Office they would be satisfied.

2236. If you were given a choice between the corner of Castlereagh and King streets and the old Immigration Barracks, how would you decide? Upon the corner of Castlereagh and King streets, because it is nearer the Post Office. If there were difficulties in the way, however, I do not think the difference in distance would weigh very largely with the public.

2237. *Mr. Black.*] Do not the people of Strathfield seem to be inclined to think that the Government chiefly exists as a public means of lessening their private expenses? No; they are prepared to pay an additional price for being carried from Redfern to King-street, although we think we pay too much at the present time.

, 2238.

2238. If it were discovered that the Government, at the public expense, cannot provide the people with that convenience, except at a loss, would the people of Strathfield still be prepared to demand it? I do not think they want anything unreasonable; but they are given to understand that an extension to the central portion of the city would bear a handsome return.

2239. What do you call the central portion of the city? Say Castlereagh and King streets.

2240. Would not Park-street suit your purpose? It would not suit it as well, because you would be left a considerable distance away.

2241. Then there would still be an agitation to have it carried further on? There would. If the station is at Park-street, and the people have to get into a tram to go to Park-street, they might as well continue on to Redfern.

2242. Is there any necessity to remove the Redfern station in order to gain your end? We have two ends in view. We do not, for instance, care about the frightful risk which is run at Redfern every day. I speak personally, because I was in the accident which occurred two years ago. Again, we think we have every right to ask that we should be carried from Redfern to the end of our journey at a reasonable cost.

2243. The increase of room at Redfern is your first object? No doubt.

2244. Then the removal of the station is not necessary to achieve that object;—is it necessary to achieve the second object? Yes.

2245. Do not you think you could come to the city by train without moving the railway station? The people could only be brought to the terminus. Of course, you could construct a fresh line altogether, and bring the people in another direction.

2246. Could not you run out the train at one side and bring it back by another? Yes; if there is an objection to put a central station in an expensive part of the city, the difficulty could be overcome by constructing a loop-line.

2247. *Mr. Wright.*] Is it not a fact that Strathfield is better served than any other western suburb;—cannot you get from there in under half an hour? Yes; I think we are as well served from Strathfield as anywhere. The people of Ashfield and Petersham have slower trains and take longer to get in.

2248. *Mr. Humphery.*] Is it not a fact that you lose fully twenty minutes a day travelling to and from Redfern? Fully that.

2249. Allowing ten minutes additional for a train to come to King-street, you would save twenty minutes a day? Fully.

2250. What is the population of Strathfield? About 2,500.

Charles O'Neill, C.E., sworn, and examined:—

2251. *President.*] Have you a statement to place before the Commission? Yes.

The scheme, as shown by the plan produced, connects the proposed line with the present railway at a point about 200 yards south of Eveleigh station; thence by tunnel to Prince Alfred Park (28 acres), which is proposed to be added to Redfern station.

From the exit of the tunnel the railway will be carried overhead across Devonshire-street and the Burial-ground, &c., on to Elizabeth-street at the junction of Hay-street (from this point an additional connection could be made with Redfern station); thence along Elizabeth-street, easing the grade by extra height of rail-level at the lower end; thence along Hyde Park, close to Elizabeth-street, to Market-street; thence curving round to the Government offices, head of King-street, which will be made a central station; thence along the outer Domain grounds to a station nearly opposite the Colonial Secretary's Office, at head of Bridge-street. From this station a connection might be made with the North Shore railway by tunnels and lifts.

The line being overhead saves the cost of resumptions and other expenses, and the road along Hyde Park boundary, under the railway, will be more comfortable for pedestrians, as it will be sheltered from the rain and shaded from the sun.

The cost of a double line of railway, as shown, from Eveleigh to the station at Bridge-street will be £300,000. The cost of a railway by tunnel from Bridge-street to the North Shore line at the head of Lavender Bay will be £320,000.

2252. You propose not to enter Redfern yards at all, but by a detour to the east to pass around and pick up the line proposed on the northern side of Belmore Gardens? That is so. It would go over Elizabeth-street to Hyde Park. At Elizabeth-street it is proposed to carry it over the street by putting in pillars at the edge of the footpath. That has been done with great success in New York. There is not much cart traffic in that street, and it would not interfere with existing arrangements.

2253. The first part passes to the eastern side of the present Redfern terminus. Then the line gradually approaches near the same locality as the scheme of the Commissioners, and your terminus is not far from the point suggested by Mr. McMaster, and from there it becomes a scheme somewhat similar to his? Yes.

2254. *Mr. Lee.*] As Devonshire-street will have to be crossed, what advantage will there be in diverting from the main line on the south side of the tunnel? I think you would not have the height to cross the street with the main line without lowering it.

2255. You would have to do that in any case? I would not touch it; I would cross over it.

2256. Have you taken the levels to show that it can be done? I am satisfied it can be done.

2257. But the engineer's evidence is to the contrary? With the present level of the railway, you would have to lower Devonshire-street to cross.

2258. Is that your only reason for suggesting a divergence on the south side of the tunnel? No; to ease the traffic. By connecting the line at Eveleigh, you would bring a great deal of the traffic away from Redfern station.

2259. Your chief reason for going round by Prince Alfred Park would be to get a better crossing over Devonshire-street? No; my scheme gives the whole Park as additional station room, and the railway would be carried overhead to Bridge-street.

Myles McRae, sworn, and examined:—

2260. *President.*] Have you given consideration to the question before the Commission? Yes.

2261. Would you like to make a statement? During the last ten years I have occupied the position of Mayor and alderman in several municipalities of the metropolis, and I have taken an active part in advocating the extension of the railway into the city. Some years ago, in the Kogarah Council, I passed a resolution urging the Government to extend the railway in accordance with the alternate scheme of the Commissioners of passing through the Devonshire-street Cemetery, Belmore Park, and Hyde Park, making provision for a model and a grand central station, worthy of the city, in Hyde Park, fronting King and Elizabeth streets. In the resolution I asked the co-operation of the metropolitan and the country municipalities, and received replies from about ninety-five of them, extending on the Great Northern,

F. W.
Parsons.

13 April, 1897.

C. O'Neill,
C. E.

13 April, 1897.

M. McRae.

13 April, 1897.

M. McBae. Western, Southern, and Illawarra railways. I presented the replies to the late Sir Henry Parkes. Prior to that he was under the impression that the country was against the extension, and he was surprised. I acted as a member of the City Railway League for a number of years, and I may say that the travelling public, including the vast suburban, country, and through passengers, are in favour of this extension. It savours of statesmanship, inasmuch as it exempts resumptions, and is calculated to return a surplus, over and above the interest required for construction and the working expenses, of something like £50,000 or £60,000. The surplus profit will go a long way in making up the deficits in connection with the railways in the interior. It is fortunate for New South Wales that we have such a grand position as Hyde Park. The assumed sentimentalists who, through a side issue, condemn the action of the Commissioners in taking a few acres of the Park, although the Devonshire-street area provides a larger area for recreation purposes than the Commissioner propose to take, consider that to be nothing. I believe that if Mr. Eddy—the greatest authority on railway matters in Australia—propounded a route which would pull down half the city, regardless of expenditure and the mutilation that would take place, we would have to-day the father of white elephants visible to the naked eye in all its hideousness, because no Government could withhold the pressure which would be brought to bear against them in favour of pulling down the city.

2262. *Mr. Black.*] Who is this father of white elephants? This railway. I venture the opinion that if Mr. Eddy had propounded a scheme which would have pulled down half the city, regardless of expenditure, it would have been a positive fact to-day. The pressure which the interested log-rollers and axe-grinders would have brought to bear no Government could have stood, but because Mr. Eddy's scheme exempts resumptions it falls flat, so far as interested persons are concerned. The whole body of the people have been in favour of the extension for the last twenty years. It will pay as well and better than any railway extension which can be proceeded with in Australia, putting New South Wales out of the question altogether. The Commissioners, and those under them, have spoken in the plainest terms of the danger at Redfern. The confusion and the tension upon those who have the overseeing of the work at Redfern is so great that—not taking into consideration the transhipment and loss of time—relieving stations have become an absolute necessity. For directness, economy, convenience, and comfort Mr. Eddy's route has no rival. As money can be borrowed at a low rate, and there are a large number of the working classes out of employment, it is a mystery to me why the work has not been carried out years ago. Even if the tunnel at Redfern were widened, the cost would, in my opinion, exceed the cost of extending the railway into the city, and it would only be a temporary expedient at best. The Chief Commissioner, in giving evidence as to the accident which resulted in the loss of so many valuable lives two years ago, stated that they did all that human ingenuity could do. I consider that Sydney is much worse off than Melbourne or Adelaide. For instance, Spencer-street station abuts on Bourke and Collins streets, the two principal streets of Melbourne, in the heart of the city; the Flinders-street and Princes' Bridge stations front Flinders-street—the main streets of the city, running at right-angles, terminating almost in front of those two stations. Then, if you go to East Melbourne, Richmond, and North Melbourne, those stations are on a par with the Redfern station, as far as the city proper is concerned. Thus, instead of having one station, as we have in Sydney, they have five stations in Melbourne. In Adelaide the station terminates at Rundle Terrace, alongside Parliament House.

2263. Do you call that a central station? Yes; in the heart of the city. Hindley-street is one of the principal streets of Adelaide. King William-street is another, and it is within 150 yards of the station, Parliament House, the principal banks of Adelaide, and Government House are within a few hundred yards of it. Wood, Son, & Co. are building an enormous warehouse opposite it. There are several large hotels, and McLean Bros. and Rigg have the largest ironmongery establishment in Adelaide opposite it. There is another railway line in King William-street. That street is 3 chains wide, and the railway which runs to Glenelg terminates within 100 or 200 yards of the General Post Office in King William-street.

2264. What is the difference between Glenelg railway and our steam tramways? There is a vast difference. Our streets were never adapted for tramways in the first instance. When the tramways were first being resorted to, I condemned the action of the authorities in interfering with the limited thoroughfares the people had to move in, especially so far as the eastern suburbs were concerned. In Melbourne they have a splendid tram service, but their streets are wider, and there is not the cut-throat business there which we have here between the tramways and the omnibuses. The difference between the railway at Port Adelaide and the tramways is, that they ring a bell there to warn people on the streets. Here they do not. There the streets are double and treble the width of ours, and they are adapted to tramways. The reason why the City Railway League did not suggest Mr. Eddy's scheme—although all were in favour of it—was because they did not want to hamper the Government. They did not want to give the Government the loophole of saying that they would not adopt this or any other route. The whole of the population of New South Wales is in favour of extending the railway into the city.

2265. Is it a burning question in the country districts? I received replies from ninety-five municipalities, including Peterfield, Bourke, Albury, and Kiama. There is no doubt the country is in favour of the extension to the city.

2266. For passengers? Yes; but unfortunately some of their representatives are against the extension.

2267. Do representatives of the country constituencies usually run counter to the wish of the people? Their idea is a fallacious one. They were under the impression that if money were voted for the extension of the railway to the city it would prevent them getting an extension into the interior. That is a fallacious idea. The surplus profits derivable from this expenditure would assure them railway extension to the interior.

2268. *President.*] Your attitude is based partly on the danger of the Redfern station, and then upon the profitableness of the enterprise itself? Yes; and with the introduction of the cable tramway the confusion will be worse confounded. I have seen hairbreadth escapes during my residence in the suburbs, and I have seen elderly people receive shocks which they never got over. If they got out of the way of a tramcar, the chances are that they will run into a bus, cab, trap, or pedestrian.

2269. You approve of the Park-street site, rather than resume land? Yes. Twenty-eight years ago, when I came to Sydney, nearly the whole of the residences surrounding the Park were occupied by private families. To-day they are public offices, and the only persons to whom the Park is beneficial are the "Johnny Warders"; decent persons scarcely go there.*

*NOTE (on revision).—A portion of Hyde Park is urgently required in the public interest, in order to protect their lives from accidents, which will take place at Redfern if the railway is not extended into the city, and that quickly. The matter brooks of no delay.

2270. Will you furnish the Commission with a copy of the resolution you speak of, and the names of the municipalities which have replied to you? I will see the council clerk at Kogarah, and will endeavour to have them sent to you. I consider that, with the knowledge we have gained, if an accident takes place at Redfern, the Government will now be liable to impeachment as well as heavy damages.

M. McRae.
13 April, 1897.

2271. Mr. Hoskins.] Why do you think the street of Sydney are not adapted to tramways? They are too narrow. Take Oxford-street. If you are in a 'bus and the tramway is coming along the 'bus has to stop.

2272. You are aware that Parliament has sanctioned the laying down of an electric tramway in George and Harris streets? A greater mistake was never made; it will prove a calamity.

2273. Have you ever been in America? No.

2274. Are you aware that Broadway, New York, is not in the greater portion of it wider than George-street, and that there are two or three tramways besides an overhead railway in it? I know that the electric tramway will intensify the danger at Redfern, and I believe that it will injure business people in George-street.

2275. Mr. Black.] You say it is only the sentimentalists who will object to the taking over of Hyde Park for railway purposes? There is a number of assumed sentimentalists. They have not dared to question the utility of Mr. Eddy's route.

2276. Supposing the sentimentalists prove to be in the majority? But they are not. There are only a few. I know it from practical experience.

2277. You say that the Flinders-street station abuts on Bourke and Collins streets,—does not our station abut on George-street? But there are the Flinders-street and the Princes' Bridge stations at Melbourne.

2278. You also speak of Richmond and East Melbourne as being stations within the metropolis,—why do you not quote Eveleigh, Newtown, and Stanmore as being within the city of Sydney? They are not in Sydney. They have five stations, and we have only one at the west end of Sydney.

2279. If the Richmond and North Melbourne stations are metropolitan stations, so is Eveleigh? No; they are as much metropolitan stations as is Redfern. Again, the rates charged by the Commissioners for the metropolitan passengers are 20 per cent. more than is charged in Melbourne. That portion of the railway system of the Colony within the metropolitan district pays between 15 per cent. and 20 per cent. on the expenditure incurred—this is accounted for by the enormous suburban passenger traffic—and it is unjust that they should be compelled to break the journey at Redfern, and lose valuable time there in transhipment from train to 'bus, tram, or other mode of conveyance. Take the cost of a workman's weekly ticket from Redfern to Auburn and from Redfern to Oatley stations,—price 2s. 6d.; distance to each station 10 miles; the cost per week from Redfern into the city per 'bus or tram, a distance of a little over a mile, is the same, being an increase of from 800 to 1,000 per cent. on the mileage rate, not taking into account the jostling, danger, and confusion at Redfern, which is being intensified and increased every month.

WEDNESDAY, 14 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. JAMES HOSKINS, M.L.C.

HENRY CLARKE, Esq., M.P.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

CHARLES ALFRED LEE, Esq., M.P.

The Hon. DANIEL O'CONNOR, M.L.C.

JOHN LIONEL FEGAN, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Stephen Edward Perdriau, Surveyor, Department of Lands, further examined:—

2280. President.] Have you obtained the particulars which the Commission requested you to obtain? Yes; I have two plans, one of which shows the borough of North Sydney and the boundaries, and the approximate position of the junction of the railway over the bridge with the present line, and the junction of the railway by the tunnel at the head of Lavender Bay. The other plan is a plan of Sydney, showing the line proposed by Mr. Wearne. I also have the following information to furnish:—

S. E. Perdriau.
14 April, 1897.

VALUATION (by adopting the Municipal Assessments for 1897-98) of that part of the City of Sydney extending from the Synagogue northerly to Market-street, bounded on the east by Elizabeth-street, and on the west by Castlereagh-street. Area about 2 acres 0 roods 8 perches.

The total of the municipal assessments for the above-mentioned portion of the city for the municipal year 1897-98 is £7,194. Capitalising that amount at twenty years' purchase... £143,880
If twenty-five years' purchase be adopted the amount would be 179,850

NOTE. The above is calculated adopting the recent municipal assessments, which are based upon rentals received during times of commercial depression. No allowance is made for disruption of business, nor for the 10 per cent. increase always allowed by Government for forced sale.

If that portion of the block fronting Castlereagh-street for a length of 191 feet (area about 1 rood 10 perches), extending northerly from the Synagogue, be excluded, as shown on a plan recently prepared by the Engineer-in-Chief for Railways, the assessments would be reduced by £1,042, leaving £6,152 to be capitalised to show the cost of resumption of the block as proposed to be altered.

EXCLUSION OF PART OF THE BLOCK LYING BETWEEN THE HIGH SCHOOL AND KING-STREET.

Upon the plan recently prepared by the Engineer-in-Chief for Railways, and referred to above, a site for a proposed station is shown between Castlereagh and Elizabeth streets, and extending from the Synagogue to King-street. This proposal excludes properties at the corner of King and Castlereagh streets, having a total frontage of about 111 feet to King-street and 107 feet to Castlereagh-street—an area of about 36 perches—of which the assessments amount to £1,979 per annum.

Evidence relative to the value of the block of which this 36 perches forms part was given by me before this Commission on the 16th March, 1897.

It will be necessary to deduct £1,979 from the £4,053, leaving £2,074 to be capitalised, to ascertain the cost of resumption of the part of the block required if this proposal be adopted.

The site at "The Rocks," proposed by Mr. N. Selve to be resumed in connection with his scheme for extension of the railway into the city, comprises an area of about 24 acres in one of the poorest and least attractive portions of the city. The land fronts the following streets, viz.:—Princes, Cumberland, Gloucester, Cambridge, Harrington, Grosvenor, Essex, Little Essex, Globe, and Argyle streets, and Charlton-court. The total length of frontage is about 14,870 feet.

The gross annual value for municipal assessments of this area is £31,117, which at twenty years' purchase would show a value of £622,340; at twenty-five years' purchase it would be £777,925. About £2,000 must be added for the Ragged School in Harrington-street, which is not rated.

The line as designed passes under St. Patrick's Church. This building would, perhaps, be affected. With the adjoining convent it is worth, probably, not less than £15,000.

The estimate above does not include anything for disruption of business, nor for the 10 per cent. additional always given in Government resumption because of its being a forced sale; nor for a claim which might be made by the Municipal Council for the streets closed; nor for detriment to neighbouring properties if depreciated in value by closing such streets.

If the 24 acres were resumed and the buildings demolished, and the streets rearranged as suggested by Mr. Selve, the depths of the new allotments would be much greater than at present; consequently there would be much less street frontage for resale.

Mr.

S. E. Perdriau.
14 April, 1897.

Mr. Self estimates the area he proposes to be resumed at 28 acres—11 acres of streets and 15 acres of allotments. If laid out afresh according to his plan, he says the station would occupy 8 acres, streets 8 acres, and allotments 10 acres. These 10 acres, subdivided into allotments for resale with an average depth of 80 feet, would give about 5,500 feet of selling frontage. A fair average price might, in my opinion, be estimated at about £50 per foot. Thus the amount derived would be about £275,000. The present value of the George-street frontages at this part is from £40 to £60 per foot. It is hardly possible to estimate the increment in value consequent upon the establishment of the railway station as proposed by Mr. Selfe.

Mr. Foxlee, in his evidence given in the year 1891 before the Royal Commission on City Railway Extension, stated that the cost of excavation alone for this station would be about £120,000.

I have a letter from the Council Clerk at North Sydney, supplying the population of the borough at date as 19,483, distributed in the wards as follows:—Belmore, 4,680; Kirribilli, 5,250; Tunks, 1,742; Victoria, 4,933; and Warringah, 2,878. There are three replies from the Railway Commissioners. They are all addressed to the Secretary of the Commission, and are as follows:—

Sir, Office of the Railway Commissioners, Sydney, 27 March, 1897.
Referring to your request to be furnished with certain particulars of the passenger traffic at Milson's Point Station, I am directed to inform you that the number of passengers arriving at Milson's Point Station during the year 1896 was 735,873, and the number departing 746,917, or a total of 1,482,790.

I have, &c.,

H. McLACHLAN,

Secretary,
per W.H.C.

The Secretary, Royal Commission on City Railway Extension.

Sir, Office of the Railway Commissioners, Sydney, 29 March, 1897.
In reply to your letter of the 25th instant, I am directed to inform you that it is ascertained the total number of passengers travelling on the North Shore Cable and Electric lines is as follows—for the year 1896:—

Cable lines	2,083,496
Electric line	388,686

Grand total..... 2,472,182

I have, &c.,

H. McLACHLAN,

Secretary,
per W.H.C.

The Secretary, Royal Commission on City Railway Extension.

Sir, Office of the Railway Commissioners, Sydney, 6 April, 1897.

I am directed by the Railway Commissioners to state in reply to the queries put in your letter of the 2nd instant, as under:—

- Q.—What effect the extension of the railway into the city would have upon the Railway Tram Service Rolling Stock?
A.—Five motors and thirteen cars would be released from their present work, and would be available for other services which require supplementing.
Q.—What is the value of the portion of the tramway which would be superseded?
A.—No portion of the tramway would be thrown out of use, but a much needed relief would be given to the Elizabeth-street line, which is one of the reasons put forward by the Railway Commissioners as rendering the George-street line necessary.
Q.—Whether any rolling stock now used for the railway tram would be unsuitable for the other tram-lines?
A.—No. None of the stock released would be unsuitable for the other tram-lines.

I have, &c.,

H. McLACHLAN,

Secretary,
per W.H.C.

The Secretary, Royal Commission on City Railway Extension.

I have been to see Mr. John Wearne, and he made a statement which I took down, and he also gave me a written statement. First of all he wrote the following letter:—

Gentlemen,
I beg to suggest that the Commission view a route from our flour-mills in Goulburn-street. It has been suggested by many practical men that there is a very practical and inexpensive route this way from Redfern to the city.

Yours, &c.,

JOHN WEARNE,

Flour-mills, Goulburn-street, Sydney.

Royal Commission on City Railway Extension.

The statement which he handed to me, written by himself, is as follows:—

COME from the railway, I think Nos. 9 and 10 platforms, under George-street, and under Inglis and Sons' yards, under Valentine-lane, Ultimo-road, Engine-street to Hay-street, somewhere between the brewery and McEwan's stores; along by Dixon-street, taking Jones' wood-yard and others, to the mill; from here tunnel to Kent-street near Drutt-street, at the back of the Town Hall; from there to Wynyard-square. This would be very central for the Post Office and banks.

A station at Hay-street.

A station at the back of the Town Hall.

A station at Wynyard-square.

This is the statement I took down at Mr. Wearne's dictation:—

Proposed Extension of the Railway into the City of Sydney.

DESCRIPTION of the position of the railway, to be used as a passenger line only, as proposed by John Wearne, miller, of Goulburn-street West, Sydney:—Commencing at the western end of the Redfern railway terminus, and extending northerly, as nearly as practicable in a straight line, to the western end of Goulburn-street, at Dixon-street, at my flour-mill; thence north-easterly to a point on Sussex-street, a little to the south-east of Foley Brothers' new produce store, crossing Sussex-street and Liverpool-street still in a north-easterly direction, and so continuing and crossing Kent-street diagonally to a point a little westward of the Town Hall, where I suggest a station. From this point I suggest proceeding by tunnel in as nearly a straight line as practicable to Wynyard-square, which, in my opinion, should be the terminal station. I also suggest a station at Hay-street. I have carried on business at this site for the last fourteen years as a miller, and suggest the above-described route merely as a layman, unacquainted with railway construction. The advantages of the route are shortness, and the inexpensiveness of the land and buildings affected, and the large number of employees, &c., who would daily use a railway in this position. I have made no investigation, and cannot form an estimate of the probable cost of my scheme, nor of the revenue of the railway if constructed. The position of the railway suggested by me is that shown by a red line on the map of Sydney, by Mr. Surveyor Perdriau, to-day, at my direction, and is initialled by me.

JOHN WEARNE,

April 1st, 1897.

Witness—STEPHEN E. PERDRIAU.

NOTE.—The line proposed by Mr. Wearne would be about 95 chains long, of which he proposes a total length of 60 chains should be in tunnel.—S.E.P.

The following is a description of Glebe Island:—

GLEBE Island comprises an area of about 34½ acres, being about 34½ chains long and about 10 chains wide. It extends into the harbour north-easterly from Balmain at a point near the south-western end of the borough, and was, as the name implies, an island. It is now a promontory, the greatest height being towards the north-east. Many years ago a causeway, about 1 chain wide, was built connecting it with the mainland. Within the last few years an area of about 12 acres, lying to the north-west of the island, and joining it with Balmain for a length of about 12 chains, was reclaimed from the harbour by the Crown. The reclamation was effected to abate the nuisance caused by the stench from the mud flat. This land is not used, except a small piece railed off for a cricket ground. The two areas combined are about 46½ acres. The island is bounded on the north by White Bay, dividing it from Balmain; east by Johnstone's Bay and Blackwattle Cove, dividing it from Pyrmont; and south by Rozelle Bay, dividing it from the Glebe and Annandale. The

The total length of the water frontage of the island, including that of the reclamation, is about a mile. The reclamation is, of course, level; but the whole of the island has a bold rocky foreshore—in fact the solid rock shows freely all over the surface, and at a few yards back from the shore line a height of 15 feet above high-water level is reached, the height rapidly increasing by rugged rocky slopes until the highest point is reached, which is 90 feet above high-water level.

The central portion is a plateau from 70 feet to 90 feet above high-water level. Stone for Government works elsewhere is now being quarried at the northern end near the water.

The island occupies a peculiarly central position. It is within comparatively easy reach of the city and nearly all the populous suburbs.

From the city it is approached *via* Market-street, Pyrmont Bridge, Pyrmont, and Glebe Island Bridge, and is distant about $1\frac{1}{2}$ mile by road from the General Post Office.

The nearest point on the Darling Harbour railway is within seven-eighths of a mile of the island, in a direct line, and Petersham railway station is within $2\frac{1}{2}$ miles by road. The main Sydney road from the Ryde and Hunters Hill districts, *via* the four bridges called Five Dock, Long Cove, Glebe Island, and Pyrmont Bridges, crosses the southern portion of the island, and forms the frontage road of the Abattoirs.

The Abattoirs.

The Abattoirs for the Sydney and Metropolitan District occupy the area of about 7 acres lying southward of the road, and the small space on which the mutton houses are erected, northward of the same.

The desiccating works situated at the southern extremity of the island are now disused, the blood and offal being conveyed to sea in punts.

There are six dwellings of various sizes and material scattered over the more northern section of the island, all occupied by officials connected with the Abattoirs.

The small Post and Telegraph Office located here was closed a few months ago owing to the insufficiency of business.

Upon the high land northward of the road, and immediately opposite the Abattoirs, there is a large tank or reservoir hewn out of the solid rock. It is about 240 feet x 35 feet, and 20 feet deep. Water for flushing the slaughter-houses is pumped from the harbour into this tank. The pumps are said to be capable of lifting 40,000 to 50,000 gallons per hour.

There is no permanent occupation of any part of the island excepting in connection with the Abattoirs. The Abattoirs are said to be thirty-six years old and antiquated, and it is held that nothing short of entirely new and much larger and higher buildings could bring them up to present requirements.

There is no railway to the island, and the cattle and sheep, &c., are driven here from the sale-yards at Homebush, a distance of from 7 to 8 miles; and as the total for the year is between 900,000 and 1,000,000 it is evident that the objections raised in the populous suburbs *en route* against the cattle-driving nuisance are not without foundation. It is considered by those competent to judge that no other site in the metropolitan district presents such advantages for Abattoirs as Glebe Island. Its central position has already been referred to.

It is all high land, and being almost isolated by the surrounding broad stretches of salt water, objectionable odours are dissipated before they reach the surrounding residential districts. (Complaints have, however, been made from time to time with regard to the unpleasant smells, particularly at Glebe Point; but there does not appear to have been any sustained effort by the public for the removal of the Abattoirs.)

Such extensive deep water frontage affords unequalled facilities for the shipment of meat for foreign countries.

An advantage of a very peculiar nature is that the island is entirely free from blow-flies. It is said that none have ever been seen there.

Cattle are sometimes brought by sea to the island, whence they have to be driven to the sale-yards at Homebush to be sold. They are then driven back and slaughtered.

A light line of railway leaving the main line at Stanmore station, *via* White Creek—a distance of little more than 2 miles—has been suggested to overcome the nuisance arising from cattle-driving, and the reclaimed land might be used for sale-yards; but those engaged in the trade state that if the Abattoirs were removed any considerable distance from the city the result would be an increase in the price of meat.

For many years no blood nor offal has been allowed to go into the harbour, but no doubt pollution occurs to some extent from the surface drainage.

Soundings and Borings.

Commencing at the bridge on the east side and thence northerly and round the eastern end of the island, the depth of water at 100 feet out from high-water mark is from 7 to 15 feet at low tide, deepening to 19 feet in the middle of the bay between the island and Pyrmont; but that depth is not reached within 600 feet from the northern portion of the island towards Balmain. Along the north-western foreshore the water is shallow. At 200 feet out from high-water mark it varies from 5 feet to 12 feet in depth at low tide.

Borings to rock were taken in 1881 on the foreshore extending from the bridge north-easterly and round the eastern end of the island. These show that, at 200 feet out from high-water mark, rock is reached at a depth of 20 feet, and less from low-water level.

The officer in charge of such work is, however, doubtful whether the plan affording the information *re* borings stated above is correct.

From about the middle of the sea-wall of the reclamation above referred to, a pile jetty about 240 feet long and 30 feet wide has been thrown out into the harbour.

The locality of the jetty had previously been dredged, as well as a channel to the same from the harbour, so that now vessels drawing up to 20 feet of water can be accommodated.

Apparently no soundings nor borings have been taken on the south side of the island from the bridge.

Robert Smith, Solicitor, sworn, and examined:—

2281. *President.*] How long have you resided in Sydney? Thirty-six years.

2282. Do you desire to make a statement to the Commission of your views? Yes. What I have to say has mostly to do with the proposed extension of the railway to Circular Quay by way of Darling Harbour on the eastern side. It must be evident to anyone who studies the matter that to extend the railway from its present terminus at Darling Harbour round the eastern side of that harbour to Circular Quay or Dawes Point would be a wicked waste of public money. It would be a great interference with the actual traffic going on at those wharfs day by day. It would interfere with the mode in which the wharfs now get rid of their produce, by that produce having to cross the rails, and having to wait for the trains to get out of the way. It would also very much interfere with the lettable values of the properties on that side of Darling Harbour. Looking, however, at the necessity which may exist, either now or in the future, for connecting the railway at Darling Harbour with the Government wharfs at Woolloomooloo Bay and Circular Quay, I would suggest the propriety of connecting Darling Harbour with Cowper Wharf by means of a tunnel. Scarcely any expense would be incurred for land-resumption if a tunnel were carried under Liverpool-street to Elizabeth-street from the head of Darling Harbour, and then by tunnel or open cutting under Hyde Park and round to Cowper Wharf. The railway could thence be carried by a short tunnel to the western side of Farm Cove—that is, the Botanic Gardens—and it would then be within a stone's throw of Fort Macquarie. If Fort Macquarie were to be made a goods terminus the line I speak of is entirely a goods line—the area of land could be increased considerably by the cuttings out of the tunnels. The line of railway, so far as it encroached on Farm Cove, need not interfere with the Botanic Gardens at all, because it would be carried over an extra line of filling with material taken from the tunnels. By this means the railway for goods traffic—and that is, so far as I can see, the only

S. E.
Perdriau.

14 April, 1897.

R. Smith.

14 April, 1897.

- R. Smith.
14 April, 1897.
- only object of carrying a railway at all to Circular Quay—would be carried close to Fort Macquarie, and it would then enable the goods which would arrive at Darling Harbour to be distributed either at Cowper Wharf or at the entrance of Circular Quay. If it were considered necessary to extend the railway round the Quay—although I am certain the public would find it a great inconvenience—it could eventually be carried round to Dawes Point, and could terminate there. By this means, without interfering with private property in any way (excepting a very little resumption at the head of Darling Harbour), the Government could have a line, or a double line, of railway for goods purposes connecting all their wharfs. Then all the outcry there has been about bringing the railway to the Quay would be met.
2283. *Mr. O'Connor.*] Have you located that portion of the Quay upon which you propose to put a station? Fort Macquarie.
2284. Would you continue it round? I would not advocate that; but if it were necessary it could be carried round the Quay to Dawes Point. Personally, I do not think there is any necessity for carrying the goods lines further than Darling Harbour, but, if it is considered necessary, they can be continued in the way I suggest with the expenditure of a mere bagatelle for resumption. The line from the head of Darling Harbour to Cowper Wharf would be a very short and inexpensive one to construct, and it would meet the object the Government had in view, a few years ago in resuming Cowper Wharf. They will have a second main wharf communicating with the railway. Of course, it is always open to the Government to widen the line to Darling Harbour by widening the George-street tunnel—that is, if the traffic renders it necessary.
2285. *President.*] Your first contention is, that if the Government wants to bring the railway system of the Colony into touch with the wharfs, they have wharfs at Woolloomooloo Bay, Darling Harbour, and Circular Quay, where this work can be readily carried out? Yes.
2286. Your second contention is, that to resume Darling Harbour and to put a railway along it would leave it worse than it is at present? That is so. The vessels now have two ways of discharging. They discharge into lighters on the one side and on the wharfs on the other. If they want to get their goods to the railway, it is more economical to take them to the train than to bring the train to the goods, and that can be done by discharging the goods into lighters, and taking them across to the present railway terminus. If the goods would not stand handling, railway trucks could be carried on railed lighters, and the goods could be landed in them.
2287. *Mr. Hoskins.*] Do you propose to have a goods terminus at Fort Macquarie? No; I would leave it where it is at Darling Harbour, but I would have a branch to that point.
2288. Therefore, that terminus would be used not only for goods brought by vessels, but for the loading of produce into the vessels? No; that terminus would only be used for the purpose of receiving cargo, which would go to Darling Harbour and be made up into proper truck-loads, and taken up country. It would only be a terminus for receiving and discharging goods, but not a terminus in the same sense as is the Darling Harbour terminus for making-up trains for the country.
2289. Are you aware that vessels cannot lie within several hundred yards of Fort Macquarie on account of the shallowness of the water? I know that vessels come to within a comparatively few yards, where the P. and O. Co.'s boats lie, of Fort Macquarie—200 yards, or something like that. The cartage from there would be the same as it would be if the goods had to be carted 10 feet. It is not so much the cartage which cost the money as the handling. Goods could be trucked to the ships' sides from Fort Macquarie, or lines of trains could be carried—if the people are unwise enough to allow it—right round Circular Quay from that point.
2290. But, in consequence of the rocks projecting for some distance into the harbour at Fort Macquarie, vessels could not lie close? I would not propose that they should. I would take the goods to the vessels and not the vessels to the goods. It is more economical to carry goods on the water than it is on land.
2291. *Mr. Humphery.*] Your idea is that the present connection with Darling Harbour is sufficient? I think so.
2292. But if it be desirable to connect other wharfs, then the Government wharfs at Woolloomooloo Bay might be connected, and they would be ample for all commercial purposes? Yes; I believe that at the present time Darling Harbour is ample for all commercial purposes, but the Government have, at great expense, resumed Cowper Wharf, and if they have more traffic they can connect their railway with it.
2293. And you would not go beyond Cowper Wharf? No, unless the public called for it.
2294. And then an extension might be made in the direction you have pointed out? Yes.
2295. You say the cost would be inappreciable compared with other schemes;—you refer to the cost of the tunnel merely? Yes.
2296. You have made no provision in your estimate for compensation to property owners who might claim to be affected by reason of the tunnel;—what is the law upon that subject? According to my idea, the Government could not undermine private properties without giving compensation. I think it would be most dangerous to attempt to do so, because many of the houses are so frailly built that quarrying underneath them would be sure to shake their foundations, and the Government would be let in for large compensation claims, and would have to pay more than if they resumed the land. But I do not propose to go under private property. I would carry the line under Liverpool-street. A very slight amount of compensation would have to be given to join the tunnel under Liverpool-street with the present terminus, and that would have to be provided for. Possibly it would amount to £20,000 or £40,000. Chadwick's property on the one side, or Kidman's property on the other, would be all that would be required in connecting the railway with a tunnel under Liverpool-street.
2297. Is it your opinion that there could be no claim for compensation by owners of property with frontages to the streets under which the proposed tunnel would be constructed? There could not, unless the construction was so badly carried out as to cause damage to the foundations. I only suggest a tunnel for a double line, which would not require a width of more than 24 feet. With regard to the passenger-traffic, I think it is a most important thing for the railway system, and for the credit of the city itself, that the railway should be in a more central position than it is at present.
2298. *Mr. Lee.*] Do you admit that there is any necessity for the removal on other grounds from Redfern? I do not know. I know nothing about the traffic or the engineering question.
2299. If good reasons exist for removing the station from Redfern, or giving increased accommodation at Redfern, to admit of the traffic being safely carried on, are you of opinion that it would be desirable to make that removal in the direction of an extension into the city, whereby a charge could be made to cover the cost of expenditure? I am of that opinion. I would point out that if the Government extend the area of the present

present site at Redfern they must deprive people there, who are very crowded together, of some of the ground which they would naturally expect to be in the Park. For instance, supposing it were possible to take a line from the Eveleigh station into Prince Alfred Park, at George and Cleveland streets, we might then utilise a great deal more of Prince Alfred Park; but what would the people of Redfern say about it. We should be taking from them a park which they are in the habit of using, and for whom—practically for a few aristocrats who use the east end of the city. We would be taking air spaces from the people of Redfern because we grudge, out of our multitude of spaces, giving up a little bit of land on the east side of the city, where the resident population is very small indeed, and where the amount of recreation ground is excessive. It appears to me to be a possible but expensive deviation to resume a portion of the municipality of Redfern, and to carry the railway through George-street, Redfern, into the middle of Prince Alfred Park; and then to shut up Devonshire-street and take a portion of the cemetery, where so many of our ancestors are buried, and to make the railway station out of that and the Benevolent Asylum site. If we could extend it in that direction, I for one would not advocate it, out of consideration for the women and children of Redfern who want air space.

R. Smith.
14 April, 1897.

2300. Admitting that it would be possible to resume sufficient area of Prince Alfred Park to give the accommodation, you see at once the enormous expenditure which would be incurred, and no revenue derived? Quite so. I would point out that Sydney is more inconveniently situated, so far as her principal railway station is concerned, than almost any modern city. Having regard to the climate, and the fact that you have to walk such a distance to get to Redfern, our railway station is, to my mind, at a great disadvantage when compared with the railway stations of Brisbane, Melbourne, and Adelaide. The people who really use the railway live too far away from the station.

2301. If the railway can be extended into the heart of the city, and a charge made low enough for the people to pay, and which will be sufficient to return the interest on the money expended, are you of opinion that it should be extended into the heart of the city? I have no doubt about it at all.

2302. Where, then, in your opinion, should the terminus be? The terminus ought to be at Hyde Park, and it should not go further north than Market-street. Park-street, which is only a new street recently opened through the Park, would then become an unnecessary street, and could be closed. Bringing the railway station there would, of course, improve the value of property in Park-street. My idea is that if the railway terminates at Market-street we would save the Supreme Court, and all the objections to the sacred ground at St. James' Church would be taken away. We would also make immediate communication with Woolloomooloo. Market street would be carried on to join Boomerang-street and Woolloomooloo-street. I would advocate the carrying of an electric tram from the terminus in Market-street, across Market-street, past the public markets, over a new bridge which will have to be built at Pyrmont, and out to the Glebe. Thus the people of the Glebe will be brought into the centre of the city and have access to the railway station. If necessary, the electric tram could go down Woolloomooloo-street. I would leave a little boulevard of trees to front the railway station, and would continue Market-street parallel with St. James'-road.

2303. You favour Market-street for a site rather than Park-street? Yes.

2304. How would the site of the old Immigration Barracks suit? My impression is that that site is not large enough. It would require the taking down of the Mint.

2305. No; but it would absorb a small portion of the Domain? One could do it then, but in such case I would not stop at the Barracks, but would take the old cricket ground—that is the ground on the Domain—which is really not wanted now. I would also carry Moore-street straight into the Domain, so that the real railway traffic could go down there. By this means you would give access from the railway station to the Post Office, Commercial Bank, and the Bank of New South Wales. If I could not get Hyde Park, I would take, not the Hyde Park Barracks, but the Domain. I would then have the railway station almost in front of the new Houses of Parliament, and in view of the harbour, Garden Palace grounds, Art Gallery, and other ornamental buildings, but still in a position which is not by any means as central as Market-street.

2306. Do you use the train daily? No; it is too far from the centre of the city.

2307. Are you in possession of any facts which would assist us in deciding whether the present traffic is carried on under great danger? No; I have heard it said that the traffic is carried on under great danger, but I suspect all that could be met by additional resumptions at Cleveland-street.

THURSDAY, 15 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES LOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FROAN, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANK FARNELL, Esq., M.P.

William Cowper, sworn, and examined:—

2308. *President.*] Are you a resident of Sydney? Yes, I have been a resident for nearly twenty years.

W. Cowper.

2309. Have you given the question of the extension of the railway into the city serious consideration? Yes.

15 April, 1897.

2310. Will you explain your scheme? I have had a good deal of experience in the old country in resuming land for the large new Town Hall, Manchester, for the Sheffield-and-Lincolnshire and Lancashire-and-Yorkshire stations; also for improvements for the London and North-Western railway and the Oldham Bridge and Guide railway resumptions, and for the Manchester and Salford Corporation in widening Deansgate, which cost £2,500,000. We did that improvement and made a profit of about £250,000. My scheme is this:—I propose to give to the city one large goods station which will consist of three stories, and one large central station which will be 350 to 400 yards in length, running from Liverpool-street to Hay-street, and lying between Elizabeth-street and Pitt-street. That is what I term the principal passenger station. I then provide you five other small stations which will be something similar to the Gore-street station, London; only one or two will be open ones. I then provide you with a traffic scheme for Woolloomooloo, with a traffic scheme for Circular Quay, and for all the wharfs along Sussex-street to the terminus. I start at the present station at Redfern and extend all the traffic lines into what is now termed

W. Cowper.
15 April, 1897.

termed the Burying Ground, the Benevolent Institution, including Belmore Park, and terminating at Hay-street. After getting all these lines down to a lower level, which I take from Hay-street and the present market, I there provide sidings for a goods station. I return then to Redfern station, and rise over Devonshire-street by one or two bridges—I have only provided one in my scheme there—on to a higher floor over and above the level of Hay-street, by about 15 feet as far as I can judge, which will give a clear headway underneath of 15 feet. I then level that floor which is 15 feet above Hay-street over the whole of Belmore Park, and all the grounds included in those streets—that is to say, between Elizabeth-street, Pitt-street, Devonshire-street, and Hay-street. I use that level entirely for a passenger traffic and continue forward on the same level up to Liverpool-street, where I get my central and principal station. I then take a lower level for two of the suburban lines. I give a fall of about 1 in 50, and so get a sufficient depth to strike with a tunnel underneath Liverpool-street and Elizabeth-street into Hyde Park. I then come underneath Hyde Park to Park-street, and I get there a small underground passenger station with staircases emptying into Park-street. I then go forward, still underneath, to the Domain gates on the left-hand side. Inside the Domain, I propose forming another station—not a very large one—sufficient for all the suburban trains to empty at, because I intend all suburban trains to run on these lines down to wherever they go. Then I go forward with a branch line to Woolloomooloo. I propose putting a small passenger station there, and then to continue goods tram-lines in connection with that station in the tunnel to different parts of the wharfs. Then I start at the Domain gates with another tunnel, and come to the Domain-road and get another small station there similar to Park-street station for the use of people wishing to go to the Gardens and elsewhere. I continue this tunnel to Fort Macquarie and there empty on to that ground which I propose to utilise for a goods tram-line in connection with this line, which would connect all Circular Quay and some of the wool warehouses with it. Then I return to Redfern railway station again and on to the siding which adjoins the siding running down to Darling Harbour, and I continue that with a rising grade up to what I term the third storey. The third storey extends only as far as Hay-street, and includes all the land, as before stated, up to the Redfern station, or nearly so. It might be needful to leave 50 or 100 yards adjoining Devonshire-street for the sake of getting a proper grade down to the lower station. Therefore, the upper storey would not need to come quite so far as Devonshire-street. It would stop short 50 or 100 yards. I propose to use the upper storey for wool, hides, and such goods as have auction sales attached to them. I get an outlet by a bridge across Elizabeth-street to Mary-street, or somewhere about there, so as to give an outlet for all the goods which come into that upper station. I think, as nearly as I can calculate, the bottom ground resumption will consist of 32 acres. Taking the three stories together, we should get 96 acres of station accommodation proper. I reckon the main station consists of about 11 acres, and I think I might put with it the Fort Macquarie fortification land of 10 acres. That will give about 117 acres of traffic accommodation.

2311. Where did you get your areas? I have estimated them. Then I start and branch out of the lowest storey into Hay-street with two traffic tram-lines for the accommodation of goods along Sussex-street and Sussex-street wharfs. I continue that line through Sussex-street, through the Gasworks, down to the Kent-street wharf and two others. There might be some improvement difficulties to deal with, and I think the wharf-owners, as well as the Government, would have to yield very much, so as to bring the matter into working possibility. Most of those wharfs would then be on a level with this goods-traffic tram-line; but there are others, before we get down to the lower part of Sussex-street, which would lie much lower than Sussex-street. I propose that the wharf-owners in these cases should provide a bridge or some means on a level with Sussex-street, so as to admit the trucks to go over and above the wharfs which are on a lower level, so that goods might be by such means wound up by steam power and placed in the trucks and the trucks run forward again into Sussex-street upon the Sussex-street goods-traffic line. This would bring all the goods in connection with my Belmore Park underground goods station, and could be put into communication with all the principal lines at present running into Redfern station.

2312. *Mr. Lee.*] What would be the cost of carrying out your scheme? Including the cost of the Belmore station, resumptions of land from Liverpool-street to Hay-street and from Pitt-street to Elizabeth-street, and the buildings and land connected with the Roman Catholic Schools or Church, and the tunnelling through the Park to Fort Macquarie only—I do not include anything outside the tunnel; and the same with Woolloomooloo,—I do not include anything beyond tapping the main outlet—and including six platform stations (I include the lower platform in the main station as one of the stations), and the large passenger station, the cost will be about £2,000,000.* I have tried to pass with single lines on the same principle by Wexford-street to Redfern station on two different forms—one is marked with a black cross line,—and I think I could get through to Redfern station by that line (that is, including the tunnel and stations) for £250,000.

2313. Additional? No; alone. I take that as a separate scheme. I tried then to pass down Wexford-street, making less or fewer resumptions, and only taking about 1 acre out of the land belonging to the Blind Institution and Police Barracks, and I think I could connect Redfern station by saving those resumptions for £225,000.

2314. Of course, all these are merely estimates of costs? That is all; there might be something saved or something to add.

2315. How do you propose to get goods to the third storey? The two lines adjoining the line which runs to Darling Harbour I propose continuing by a bridge across Devonshire-street into the upper storey. From that point it would be convenient to run the sidings to all parts of the upper station. I may state that I have only seen one scheme, and that is Mr. McMaster's. I think his scheme for passing under the harbour is one of the best I have ever seen, and I think it might be attached to my scheme.

2316. You would accept Mr. McMaster's scheme beyond Fort Macquarie? I would.

TUESDAY,

*NOTE (on revision):—In this sum I have included £10,000 for the extension of Castlereagh-street into Elizabeth-street, with a careful grade, so as to get all the traffic to run through this new street, in place of continuing to run through Devonshire-street. I also intend to run the trams out of Castlereagh-street on to the second level portion of the station, along the Elizabeth-street side, and so to come out at the corner of Liverpool-street into Elizabeth-street. I also purpose diverting the George-street trams, at the corner of Devonshire-street, to the second level station, and to run them along Pitt-street side to Liverpool-street, or nearly so, giving a curve round the front of the station into Elizabeth-street; or to run them up Castlereagh-street to join Elizabeth-street at some other point. Thus I get all the trams and trains to come together at my new central station, Oxford-street trams excepted.

TUESDAY, 20 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Stephen Edward Perdriau, Surveyor, Department of Lands, further examined:—

2317. *President.*] You have been asked to furnish some information with regard to Mr. Greenwood's scheme? Yes, as to the value of land. The amount to be resumed would be about 5 acres, allowing a width of 80 feet. That is the portion of land to be resumed which Mr. Greenwood calls the open cutting.

2318. You leave the question of the land which would be under an overhead railway or over a tunnel out of consideration? Yes.

2319. Suppose we take it for granted that the open cutting and the overhead railway would require the resumption of land, leaving the question of the land under which the tunnel is an undecided one at present, how much would the area be then? I have excluded the station in the open cutting; it would be 6 acres 2 roods 20 perches.

2320. Have you made the width greater down to Circular Quay? No; the same width all the way—80 feet.

2321. What would be the value of the 6½ acres? About £500,000.

2322. What does Mr. Greenwood estimate it at? He takes a smaller area—3½ acres—and he puts it at £370,000. I think his estimate of 3½ acres at that amount is fair, but it does not include the 10 per cent., nor compensation for the forced sale or the disruption of business.

2323. In that 3½ acres he does not include the land which would require to be resumed under an overhead railway, nor any extra width necessary for stations? No, and he proposes to go under York-street; and Mr. Foxlee, in criticising Mr. Selfe's proposal to do the same thing, said York-street was not sufficiently wide for four lines without interfering with the foundations of buildings. You would have to shunt at the Quay in a tunnel, and in a part of the city very much used for traffic, especially by omnibuses. I think the land between the Custom House and the water's edge is reclaimed land. Mr. Greenwood also takes 2 acres of Wynyard-square for a station.

S. E.
Perdriau.
20 April, 1897.

John Cash Neild, Esq., M.P., sworn, and examined:—

2324. *President.*] You represent the electorate of Paddington in the Legislative Assembly? Yes.

2325. Do you wish to make a statement? I wish to submit with a great deal of respect, and at the same time very strongly, that, in my opinion, and in the opinion of a great many citizens with whom I have conversed, to bring the railway line to the top of King-street and leave it there would be a highly undesirable plan to adopt in the interests of the public. I also wish to say that I am one of those who are strongly opposed to interfering with what I may describe as the garden of the poor—Hyde Park. Perhaps I am not out of order in recalling the fact that when, a few years ago, a proposal was made to interfere with the Park for railway purposes, a very large public meeting was held in the Park during the lunch-hour, attended by several thousands of persons, at which resolutions were unanimously adopted disapproving of any interference with the surface. That meeting was not organised by any agitators. It was presided over by the Hon. James Norton, M.L.C., and the resolutions were spoken to by a large number of influential citizens. Assuming that it is considered desirable to bring the railway into the city, I submit other things than the mere convenience of a certain section of the population residing on the railway line should be considered. It is impossible to get a line which will absolutely convenience all the community. I have thought out a scheme which I admit at once I cannot give any estimates for— for two reasons. One is that I am not a civil engineer; and another is that as far as the value of the properties is concerned I have not gone into the matter. The first part of my proposal differs very little from those which have been made by a great many persons. My proposal is as follows:—

J. C. Neild,
Esq., M.P.
20 April, 1897.

LEAVING the Redfern station (which is not in Redfern, but in the city), the line would cross over Devonshire-street and pass into the grounds of the Benevolent Asylum, on the site of which a large passenger station should be constructed. Thence, passing behind the Female Refuge, the line would cross Belmore Gardens and Hay-street on a viaduct, thus avoiding material interference with the gardens, and in no way disturbing the tram-line.

Passing under Goulburn-street, the line would reach a slightly sunken station to occupy the area of land bounded by Goulburn and Liverpool, Castlereagh and Elizabeth streets. From this point the line would pass, in tunnel, under Hyde Park in a north-easterly direction, and enter Cook Park on the north side of William-street, near its junction with Boomerang-street. Neither Liverpool, Elizabeth, College, nor William streets would be interfered with. Boomerang-street would, however, be closed, and the cable tram-line taken *via* William-street.

Cook and Phillip Parks, now absolutely useless and unused, and having, with Boomerang-street, an area of about 12 acres, would be cut down and levelled, providing a splendid site for the central station close to the top of King-street, and having access to the cable tram on two sides.

From the north-east corner of the station the line could be taken to Woolloomooloo Bay to accommodate passenger and goods traffic, and thence run eastward through Paddington, Woollahra, Waverley, Randwick, and westward through Waterloo to the Illawarra line, as has been frequently proposed.

The city line would cross Woolloomooloo-street on a viaduct at the east end of the Cathedral grounds, and shortly after entering the Domain would pass, in tunnel, north-westerly to the south-east corner of the Circular Quay. An underground station, to accommodate passenger traffic to the Domain and Gardens, the new Houses of Parliament, the Public Library, &c., could be established between the Cricket Ground and the Bourke Statue, and another large underground station, with outlets by flights of steps to Phillip-street and very slightly ascending footways to the Circular Quay, could be placed at the site of the Water Police Court, thus amply providing for the waterside passenger traffic.

A short tunnel would take the line under Macquarie-street and the Inner Domain to Macquarie Point, where a goods station could be established.

From the south-east corner of the Circular Quay the line would pass, in cutting, to the western side of the Quay, where another station could be constructed on and about the site of the old Commissariat Stores, from which point a short tunnel and open line, skirting George-street North, would enable the railway to reach Dawes Point, whence it could hereafter be taken, in steel tunnel, under the harbour, to unite with the existing line at Milson's Point. The Dawes Point branch would render valuable the large Government property formerly occupied by the A.S.N. Company.

J. C. Neild,
Esq., M.P.

20 April, 1897.

The main line would pass, in tunnel, westerly, under George and other streets, the Observatory Hill, and Kent-street, and a station could be constructed between the line of Kent-street and Darling Harbour, on the vacant land north of the Gas Company's premises, where any necessary reclamation could be readily carried out with the material from the tunnel. The erection of wharfs at this point would prove a most profitable expenditure, both as regards wharfage dues and railway traffic.

A short line, in tunnel, under Kent-street, would tap the goods traffic of the Grafton wharfs, and another, that of Miller's Point.

The cost of removing the rock excavated in the construction of the line might be reduced to a nominal sum by removing it in punts to, say, Rose Bay, and building an island in the useless shallow water there; an island which would, in time, become an added beauty to the harbour. It would cost as much to cart as to excavate, possibly more.

The length of the tunnels would be, approximately:—

1. Under Hyde Park, a little over a quarter of a mile.
2. Under the Domain, a little under three-quarters of a mile.
3. Under the Observatory, a little over a quarter of a mile.

Say one and a half miles in all.

The city block to be resumed contains nothing but squalid and paltry structures.

One of the great costs of a city or suburban railway will be the difficulty of getting rid of the material excavated, and I submit that the cost of removing rock excavated in the construction of the line might be reduced to a nominal sum by running it in tramways to punts and removing it to the shallow waters of Rose Bay, now useless for shipping, and building one or more islands there, which would add to the picturesqueness of the locality, and probably have a use hereafter. The main points in favour of my scheme are these: There would be no buildings of any value destroyed. The cost of resumptions would be reduced to the smallest possible minimum, and no public park, or place of recreation of any value would be interfered with. I take it that it is impossible to obtain an absolutely central site. If you go to Melbourne, the stations are all at the side of the city. If you go to Adelaide and Brisbane, it is so, and if you go to London, the same thing obtains. You will find stations in London only just across the Thames; and the distance between the waterside stations—Charing Cross, Blackfriars and Cannon-street—and the Liverpool-street, Paddington, Euston, or St. Pancras station, or away to the west the Victoria station, is to be measured by miles, and requires from twenty minutes to half an hour of cab-driving to reach them.

2326. You believe that the city railway should be brought in touch with Woolloomooloo Bay, Circular Quay, and Darling Harbour? I do.

2327. And any extension to the city should carry with it the possibility of extension to the eastern suburbs? Yes. As an old business man I certainly think the goods traffic of the Colony has quite as much occasion to be considered as the passenger traffic, because there is steam, and there is to be electric tram communication with Redfern. There are abundance of buses and cabs. The time occupied in getting from any central portion of the city by any of these means is a matter only of a few moments, whilst for the goods traffic the time occupied amounts to an hour or thereabouts. The cost of moving a ton of goods to Redfern station is very much greater than to move a passenger or two.

2328. You, in your scheme, save resumption as much as you can. Then you save the people's park, and then you bring your scheme into touch with the Government wharfs at Woolloomooloo Bay, Circular Quay, and Darling Harbour. Those three things control your scheme, with the possibility of an extension to the North Shore and eastern suburbs? Exactly.

2329. And a scheme which does that—although not exactly on the same lines as yours—meets your approval? Yes.

2330. *Mr. Humphrey.*] You mentioned the terminal stations at Melbourne, Brisbane, and Adelaide, as not being in the heart of the city; are we to understand that you mean they are not nearer the main street of the city than the position you propose for the Sydney terminus at Boomerang-street? Not materially.

2331. You do not desire to convey that the present Redfern station is as near the Sydney Post Office as are the Brisbane, Adelaide, and Melbourne stations near the post-offices there? No; the Melbourne, Adelaide, and Brisbane stations are much nearer the post-offices than ours is.

2332. Do you think the present station is sufficiently near to the main business centre? If nothing more is to be considered than the passenger traffic to and from the city. If the suburban extensions and goods traffic are to be excluded from consideration, a proper site for the railway station would be about the site of the present Benevolent Asylum. If only the passenger traffic from the western suburbs is to be considered, the Colony ought not to be put to the expense of bringing a line further than the site of the Benevolent Asylum. I admit that the present site is considerably inconvenient, as well as somewhat distant. It cannot be approached by foot passengers without considerable risk in connection with passing trams and vehicles. It is too busy and dangerous a point.

2333. The present position with regard to the Benevolent Asylum is this: That almost the same expenditure would be necessary there as to make a terminal station nearer to King-street, and there would be no return upon the expenditure, inasmuch as the travelling public would not be required to pay more than they pay at the present time, whereas by bringing the station nearer to King-street an additional charge could be made, which would cover interest on the cost of construction. Having that in view, as well as the present inconvenient position of the Redfern station, do you not think it would be desirable to extend the railway into the city instead of leaving it as you suggest at the Benevolent Asylum? I say plainly I am not in favour of keeping the station at or near Devonshire-street. I think it ought to be brought further.

2334. You think it should be somewhere near to St. Mary's Cathedral? Yes.

2335. That site would be as convenient to the public as the proposed Park-street or St. James'-road sites, or even the site of the Government Architect's Office? There is practically no difference between the site I suggest and that of the Government Architect's Office, but my great objection to bringing it to the position you describe would be the destruction of valuable buildings and Hyde Park. I do not think the short distance between St. James'-road and Cook and Phillip Parks sites would warrant the destruction of the buildings and Park which I have spoken of.

2336. You regard the 10 acres of Hyde Park at the corner of St. James'-road and Elizabeth-street as much more valuable than Cook or Phillip Parks? I do.

2337. You would rather sacrifice Cook and Phillip Parks than the 10 acres along Elizabeth-street and St. James'-road? I would utilise instead of sacrifice. I do not know that beyond the feeding of a few stray

stray cows, either Cook or Phillip Park are put to any purpose. I think a great deal of care should be exercised in connection with tunnels. There has been any amount of difficulty with the Underground Railway in London, and it is the most filthy mode of travelling I have ever experienced, even though the engines are supposed to be free from smoke. My suggestion involves only about a quarter of a mile of tunnel to reach the central station. The ventilation could be accomplished by openings in the Park which could be made ornamental. I am quite certain that if the George-street electric tram is as successful as we hope it will be, a large number of people will prefer to travel by it than to go through a tunnel.

J. C. Neild,
Esq., M.P.
20 April, 1897.

2338. Have you any hesitation in saying that if it is possible to avoid a tunnel, in extending the railway, it should be done even at additional cost? I think so.

2339. Is it your view that wherever the temporary station may be built in the city, we should keep in mind the further extension of the railway, so as to touch Circular Quay, and come round by way of the suburbs, to connect with the Illawarra line? Certainly.

2340. *Mr. Black.*] If money is to be spent on giving increased railway accommodation, the returning portion—that is to say, the line itself—will be that which carries the passengers? The passengers and goods.

2341. That is to say, the mere removal of the station to a point which may be considered more central, which will be merely a place of ingress and egress, would not of itself constitute any reason for asking people to pay $\frac{1}{2}$ d. or 1d. additional fare. It is not the station which benefits them, but the line itself? Yes.

2342. Then if the central station is left where it is, and the passengers are carried further on by a line, that of itself will constitute a sufficient excuse for asking them to pay an additional fare? I take it for granted an additional fare will be paid.

2343. But not because of the removal of the station alone? No.

WEDNESDAY 28 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.
The Hon. JAMES HOSKINS, M.L.C.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.
The Hon. WILLIAM JOSEPH TRICKETT, M.L.C.
The Hon. DANIEL O'CONNOR, M.L.C.
HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.
JOHN LIONEL FEGAN, Esq., M.P.
THOMAS HENRY HASSALL, Esq., M.P.
GEORGE BLACK, Esq., M.P.
FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
FRANK FARNELL, Esq., M.P.

John Wright, Civil Engineer, sworn, and examined:—

2344. *President.*] I believe that for a number of years you were employed by the Government as a constructing engineer? Yes.

2345. Are you aware of the various schemes which have been from time to time suggested for the extension into the city of the railway? Yes.

2346. Do you desire to make a general statement? Yes. In the many proposals which have been made, with the exception of one, it has been found necessary to mine tunnels. As far as the railway practice of the old country and America is concerned, tunnels have been found most uncomfortable, and people now realise the fact that they are unhealthy. In addition to that, they involve great initial cost as well as great cost of maintenance. It has struck me for some years past that no proposal would be better than one to connect the north with the south.

2347. That is the present railway system in the south with the North Shore and Hornsby one? Yes. Complaint is made as to the congestion of traffic at Redfern. It does not matter from what part you come—south, west, or north—you meet a dead end. If any loop could be found—for example, a loop which will connect the Northern line with Redfern, so that there will be a clear way right through—the cost of making it would be warranted, because of the facilities which it would give for relieving the Redfern traffic. I do not think it is possible that any tunnel under the harbour would be less costly than an over bridge. So far as shipping is concerned, we are getting lower down with our masts. About six years ago I ascertained the heights of all the vessels. The "Cutty Sark" was the highest—about 171 or 172 feet. Now we get steamers under 100 feet. The largest steamers now afloat have masts of from 100 to 120 feet. The easiest way of getting out of our difficulty is, I think, to connect the north with the south as suggested. The various loops for eastern suburbs could be arranged from Redfern, but in what manner I am not prepared to say. That is a matter for the Railway Commissioners. My principal reason for giving evidence is to bring before you the fact that it would relieve nearly one-third of the traffic of the Colony if we had a loop and an overhead bridge going to North Shore.

2348. You understand that there might be a need to bring a large number of trains into the city to carry the suburban passengers who would not be required to pass to North Shore? Yes.

2349. Therefore, that does not cure the evil? No; but it takes away one-third of it at once.

2350. What is your idea with regard to the position of the bridge? One or two have been suggested, and I think the best will be one from the Observatory to Blue's Point, or from Dawes Point to McMahon's Point.

2351. What height? If the exigencies of the wool traffic demand that wool vessels shall go beyond it, it will have to be of such a height as to enable them to pass clear. It should be about 170 feet. If the vessels strike their topmasts 150 feet would be ample.

2352. What about the cost of the bridge? That was estimated by Sir John Fowler at about £750,000. When Sir Benjamin Baker was out here, however, he told me it could be constructed for about £500,000 or £600,000; that includes the approaches. There were two proposals—one with cylinders and the other with cantilevers—only one pier in the centre.

2353. What would be the cost of the resumption between Redfern and the southern approach to the bridge? About £800,000. That estimate was made in the year 1891 or 1892.

2354. Have you any idea of the cost of the North Shore resumptions? It would be very light now. There is only about a mile of line to construct from between Edwards' road and Blue's Point, and it is not much built upon.

2355.

J. Wright.
28 April, 1897.

- J. Wright. 2355. What would be the cost of the construction of the line from Redfern to the bridge approach? According to the official estimate, made six years ago, it would be £26,000 or £27,000. That was for a double line only.
28 April, 1897.
2356. Was it all open? Yes.
2357. Any of it overhead? Yes; some of it about the Haymarket, and the residue was on the surface, or in slight cuttings in one or two places.
2358. Does the resumption include the area required for station sites? Yes; of course they would be limited, and as narrow as possible.
2359. Does the £30,000 carry with it the construction of the railway stations? Yes; I think only two were proposed.
2360. Therefore the works and the resumption required from Redfern until you reach the northern side of the harbour—say McMahon's Point—would cost £1,430,000? About £1,500,000.
2361. To that requires to be added the cost of the resumption on the northern side of the harbour, and the construction of the line on the northern side of the harbour? Yes.
2362. You believe that in both instances the cost would not be very great? I do not see how it could be on the northern side of the harbour, because it is not built over, except very slightly at one point. When I went over I do not think there were more than 200 houses, and I do not think 1 per cent. has been added since.
2363. How high would the cliffs be at the northern approach to the bridge? There is rather a long approach on the northern side. The cost of that approach is embraced in the £600,000 for the bridge.
2364. How far from the water would the bridge be at the point at which the railway would touch it? On the North Shore side about 30 to 35 chains from the water.
2365. You require that to get a grade to the bridge? Yes.
2366. *Mr. Hoskins.*] Do you think one-third of the people who now use the North Shore ferry would go so far out of their way to the Observatory to get to the bridge? I can only reply from the results of the construction of the Brooklyn Bridge in America. The ferry traffic there was reduced from about forty boats to four.
2367. *President.*] Would the bridge be fit for the carriage of all traffic? Yes; and the railway as well.
2368. *Mr. Humphery.*] Have you considered the proposal to extend the railway from Redfern to Park-street or St. James's-road? Yes; I do not see how that will alter the present congested condition of Redfern; it will simply bring it a little further on.
2369. Then you have not seen the proposal to have a loop? Yes, I have. The one loop runs as far as there.
2370. One proposal is that there should be a loop near the Art Gallery, so as to render unnecessary the dead end to which you take exception? But supposing that for the next six or ten years, which is very likely, the increase of traffic is as great as it has been during the last six or ten years, you will still be in the same fix, unless you have something to take away some of the western, northern, or southern traffic.
2371. Would it be practicable to extend the railway from or near the central position mentioned in the direction of Dawes Point, and by bridge to North Shore? Yes.
2372. Therefore, although, perhaps, for present purposes, the terminal station might be regarded as being fixed in the vicinity of King or Park street, it would not prevent any future extension if it were thought necessary? I think it would.
2373. Why? Because you would not have sufficient elevation in King-street to get across to North Shore.
2374. Could it be extended from the neighbourhood of King-street to Dawes Point? The levels are rather against it, because there is a great dip in George-street, and it would be some trouble to get over.
2375. Your idea is that a railway extended from Redfern must be kept to the west of George-street? Yes.
2376. Therefore, your extension would essentially be to connect with the North Shore railway? Yes; I simply suggest it as a means of relieving the present congestion at Redfern. It would be one means of taking away one-third of the traffic. Of course, the northern traffic will increase more than any other traffic.
2377. *Mr. Hoskins.*] What is the difference in the elevation between Redfern station and the Observatory? I do not know, but it is not very much.

J. Horbury Hunt, Architect, sworn, and examined:—

- J. H. Hunt. 2378. *President.*] Have you considered the question of a city railway? Yes, for many years.
28 April, 1897.
2379. Has the map on the wall been prepared under your supervision? Yes.
2380. Do you desire to make a statement? I should like to read my views, which are as follow:—

As an old colonist—but more especially as an architect following my profession in this city these thirty-five years—and, further, having for the past twenty years devoted much thought to the subject before you, while during the same time advocating through the public Press the practicability and possibility of making Sydney a beautiful commercial city, prompts me, gentlemen, to come before you to-day for the purpose of entering my strongest protest against any attempt to insert the thin end of the wedge of destruction to Hyde Park, which is certain to be its ultimate fate, by placing on any portion of that site a railway station—I care not how magnificent the conception of that building may be.

All of us must admit that there will be a great national and civic advantage to a young and fast-growing city like this by having its metropolitan railway station well placed.

Yet a chief city station with all its advantages is not the only, neither is it a paramount, feature in either our civic or national requirements.

Let it be remembered, however, that the metropolis of any nation is in a way national property.

In all earnestness, I ask, shall one of the main features of a naturally beautiful city as Sydney undoubtedly is, I repeat, shall that feature be now taken from us; yea, lost to posterity for ever. Gentlemen, I submit that this is no trifling question—one not to be brushed to one side simply to satisfy the requirements of a few rabid advocates of this Hyde Park station. I make no hesitation in saying that nine-tenths of these advocates have never carefully considered this important question, while very few have any fitness or disposition of thought for matters of this kind, simply their own selfish wants ruling their determination; and to fully satisfy those wants these men would have no compunction whatever in placing this big station building in the midst of the Botanic Gardens.

With every respect to our brother civil engineers, and especially our deservedly respected Railway Commissioners, I must say that these big railway structures are at best but ugly-looking fabrics, the larger in bulk the more intense in their inherent utilitarian ugliness.

On these grounds alone, a chief railway station should not be thrust into juxtaposition with our city architecture of the type that should adorn the frontages to Hyde Park. Big warehouses and a railway station are fitter companions.

All this will by some be termed sentiment—in fact, several who have already given evidence before you and to a previous Commission have spoken jeeringly of sentiment. Those gentlemen are, I fear, just a bit ignorant of the fact that this particular trait of character was notably very prominent in our ancient city builders, and cannot well be set to one side by our modern city builders.

Every true advocate for making Sydney a beautiful commercial city will require, and they will stoutly contend for, the absolute preservation of the whole existing area of Hyde Park.

The advocates of the Hyde Park scheme can depend on it that any attempt to obtrude on the Park any railway station or open cutting will be resisted in a surprisingly effectual manner. There are hundreds and hundreds of citizens who in other ways than coming here to protest will make their power felt. Why, it is a fact that such a proposal of vandalism would not have forty-eight hours' life in Victoria.

The streets bounding the Park will provide our coming architects with most valuable frontages for important future buildings in addition to several now surrounding the park.

The present or some closely-following Government will do well for the nation by making these sites secure for the purpose here advocated.

The necessity for preserving this our most important city square as such (and not to be turned into a railway yard) will, I am confident, when once brought straight home to your intelligence, be accepted in the manner and for the purpose which I now desire to set out.

If I were an autocrat as well as an architect, I would at once assign to our future Public Library the whole of the sites of the present Law Courts, St. James' Church, and the Registrar-General's Offices. Then, for our future Courts of Justice (to embrace all the Courts, except the Criminal), also the Attorney-General and Registrar-General's Departments, I would give thereto the sites of the District Court, Equity Court, and the Mint.

No better position can be named for those important offices. The architecture of such a group could then to exceptional advantage be seen and enjoyed from the Domain on the one side and from the Park on the other.

We have on the next and adjoining site the Cathedral of St. Mary's, which, when completed, will be one other grand feature in the Park view.

Next comes the Museum, which, when finished, will be a very imposing building.

Following on comes our Sydney Grammar School. The site adjoining this should be taken for the Technical Museum. Then at the corner of Liverpool and College streets I would place the Girls' Public High School (removed from its present position opposite the Registrar-General's Offices), thus completing the north and east side of our city square, while on the east side preserving that beautiful outlook over Cook Park. (Sentiment again).

On the south side, at the corner of Oxford and Liverpool streets, I would place the future new Anglican Cathedral, this site to be in exchange for St. James' Church property, together with the old parsonage property site. Let it be remembered that the present St. Andrew's is but a parish church. Permit me parenthetically to say that when the Church of Rome has completed its fine structure, then the Church of England will be aroused to a spirit of emulation; then this will be unquestionably the site for its cathedral.

On the west and fourth side we have the Synagogue, also the Oddfellows' Hall. This hall some of these days, no doubt, will be made more imposing architecturally, the remaining sites to be taken for various large public buildings, for instance, a grand opera house, while another will go for a grand theatre. Sites on this side of the Park are eminently suitable for the last-named buildings, as they would have the protection of streets on all sides. Others of these sites, with those on the south side, to be in time taken for various important buildings here might properly be found homes for all our learned and scientific bodies.

Hyde Park thus surrounded on its four sides with buildings of the public character here set forth, and of good architecture, then this Park would be a spot in our city which even the ultra-utilitarian man would be justly proud of—yes, as proud as all of us are of the harbour—while few cities could compete with us in two such fine civic features. Will it not, therefore, be a great national mistake—yea, a big blunder—to intrude into this city square such a building as proposed, with its surroundings. Do what you will with a railway station, it will be foreign to the architectural capabilities of this part of our city. On the other hand, to do anything that will prevent the future conception of what I have so imperfectly set before you, will be a positive disgrace to our intelligence, and a disregard to our trustship for our successors, who may, to our shame, ask where exists the proof of the need for destroying this city square.

REDFERN v. HYDE PARK.

On this plan of the city I have ventured to plot down my views of the extension of the railway into the city, with extended wharf accommodation, new sites for warehouses, together with some street improvements, all of which I respectfully submit should be taken up as one study, because they are each important features, and, from a commercial point of view, in any comprehensive plan of railway or other city improvement, they should not, in the interests of the whole city, be considered one aside from the other.

It is contended—and rightly so—that the railway terminus should be near the centre of the city, but what centre—that of 1897 or that of 1997?

In 1863 I was engaged in building a block of buildings near the Exchange, the site for those buildings having been fixed upon, because at that time (thirty-four years ago) that locality was considered to be about the centre of the city, while the old post office (standing on the present site) was spoken of as "up the town." Therefore, those of us who have had many years' practical experience of the growth of this city can best bear testimony to the fact that year by year the active commercial centre of the city is tending Redfernwards, where it will no doubt permanently fetch up ere fifty years have rolled by. On the other hand, it must be remembered that our toilers for daily bread are not now all engaged in Pitt, George, and York streets, as of yore. Do we not see springing up in every direction about Redfern places of business where thousands of employees will be speedily required; quick and easy access to the central station just as much if not more so than those of us in the north-west part of the city, where we are limited in city area, while to the south-east there is no such limit.

It will be admitted on all sides that a metropolitan station wisely placed requires plenty of space all about it, within and without its own boundary lines. This, I think, is well provided for by my scheme, which, in a great measure, is that of one of those set forth by the Railway Commissioners. The area embraced in my plan being about 35 acres taken within the station fences, while on the outside of those lines there will be a road 100 feet wide; also a large square at each of the three angles where the roads meet, the larger of these having an area of about 5 acres. By this plan the city would have for the present and far into the future ample provision for its railway requirements. In these proposed station grounds there will be about three and a half times the area of the proposed Hyde Park scheme.

To seriously compare the many and important advantages of the Asylum site, together with its ample future requirements and great capabilities as against the few and less important capabilities and restricted future requirements that this Hyde Park scheme possesses, might well be termed playing with such comparisons. Now, as against the Asylum site, there cannot be advanced and successfully supported any railway engineering or civil engineering difficulty, or any architectural or civic objections thereto, for it has not any. Whereas, with Hyde Park site, neither railway engineering combined with civil engineering skill can make it a site for a station such as this city will be demanding ere long.

The Chief Commissioner says, in answer to 404 (previous inquiry), "How long do you think the station (Hyde Park) you have proposed ought to last?"—"I should think it ought to last twenty-five years; but, as I have already said, I would rather suggest, if any further accommodation were required, that the scheme to the west of the city should be considered." On page 22 the Chief Commissioner further says, "It is absolutely necessary that the station should be on the street level. . . . It would be most unwise to adopt any underground station or anything of the kind to deal with the main traffic of Sydney." Here we have the most reliable evidence from the highest authority amongst us showing that Hyde Park is not a perfect spot for the terminus, because it will be good for only twenty-five years; while the fatal objection to it is that it is an underground station. Mark the Commissioner's words—"It would be most unwise to adopt any underground station or anything of the kind." Mr. Eddy informed the Commission that the Lancashire and Yorkshire Company had recently spent £975,000 to bring their station to street level by only a few feet.

It will be found that after the novelty of the new station has passed away which generally awaits upon new things, then the business public who are to be brought into the city from beyond Redfern, and shot out at Hyde Park, 25 feet below the street level, there left to climb up innumerable steps, and wend their way to the vicinity of Wynyard Square—mark

you,

J. H. Hunt.
28 April, 1897.

J. H. Hunt. you, the buses, trams, and cabs are supposed to be dispensed with by the adoption of this Hyde Park site—then on the homeward trip to have to climb up the King-street hill, and of a hot summer afternoon to sit in a carriage sunk down into an excavation 25 feet deep; imagine all this, and the wail to follow, and the indignation that will be expressed for having adopted this what will be called "Dutch oven" terminus, or, on the other hand, "All-to-one-side-of-the-city terminus"; while the eastern residents will be severe in their censure for the unpardonable damage done to the Park grounds.

28 April, 1897.

FLAGSTAFF HILL.

For fully twenty years past I have advocated, through the public press, a scheme for resuming the whole of the Flagstaff Hill and its surroundings to the extent shown on this plan by the neutral tint, and levelling the whole of that area down to the present level of the Circular Quay. This importantly-situated section of our city as now existing is, from a commercial point of view, all but useless to us. On this newly formed area of the city could then be placed with great present and future advantage a truly city station at street level—in the position, for instance, shown on the plan by a red tint—with one or two underground stopping places *en route* to Redfern.

TRAMS.

I am of opinion that our Railway Commissioners are capable of serving in a most efficient manner the wants of the city people as well as the near-at-hand suburban residents, by trams traversing the city streets north and south, east and west; picking up and putting down the travelling public almost at their will, to an extent that never could be attained by a railway service for such short distances. On this plan I have indicated some extension of our tram service.

FLAGSTAFF HILL FOR WHARF AND WAREHOUSE ACCOMMODATION.

Those who are alive to the future commercial importance of this city will commend Mr. Reid for his forethought in commissioning you to take into consideration the desirableness of resuming the whole of the wharf frontages of Darling Harbour, and reconstructing that line of wharfage and improved warehouse facilities. No doubt all this will appear to some men a stupendous order; however, it is not a work to be done in five or twenty-five years. In conjunction with the Premier's project, I submit my scheme as set out on this plan for resuming the whole of the Flagstaff Hill locality, and level it down, as before stated. We could then have one line of wharf frontage for Circular Quay to the head of Darling Harbour, with an immense area for modern warehouses, thus making this important section of the city our chief seat of commercial activity.

As your Commission does not include the street question, it would be out of order in making any reference to what I have shown on this plan. It is, however, a question that cannot well stand out of the two subjects before you.

I may go further into this at a future examination; therefore, it will be well to omit alluding to so small a reform here.

THURSDAY, 29 APRIL, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. WILLIAM JOSEPH TRICKETT, M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY HASSALL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Alderman Charles Edward Jeanneret, sworn, and examined:—

Alderman
C. E.
Jeanneret.

2381. *President.*] You are an Alderman of the City of Sydney? Yes.

2382. Are you aware of the proposal before the Commission? Yes. I know the details of the Hyde Park scheme, and I have seen reports of the other scheme.

29 April, 1897.

2383. Do you wish to make a statement with regard to your views? Yes. My opinion is that the railway should not at present be extended into the city further than it is now. The existing site is the most central, and the centre will gradually extend towards the south-west, so that ultimately Newtown or Stanmore will become the central point of Sydney instead of Redfern; at any rate, at present, the railway should not be extended this side of Prince Alfred Park, which might well be resumed by the Government, or if necessary Devonshire-street could be closed, and the Benevolent Asylum taken in. My opinion is that Prince Alfred Park is of very little use in its present form to the City of Sydney, and the streets which surround it could also be taken.

2384. Lying east of the park? Yes.

2385. *Mr. Hoskins.*] We have had it in evidence that the railway cannot be taken into the park inasmuch as it would require too sharp a curve? I do not know what engineering difficulties there may be. I am only speaking as a citizen, and I think I know the views of most of the citizens on the subject. The majority of the citizens are strongly opposed to any resumption of Hyde Park for the purpose of a railway station. I will quote a resolution passed by the City Council on 21st January, 1891. I may say I am not authorised by the Council to appear here, but I think some one ought to be authorised to appear. The resolution states:—

That this Council protests most emphatically against any portion of Hyde Park being resumed for railway purposes, and urges the Government to reject any such proposal as inimical to the best interests of the people.

2386. *President.*] Was that resolution passed unanimously? Yes. I may say the matter has been brought up a good many times recently in the City Council, and I have never heard any expression of opinion on the part of any Alderman in favour of the extension to Hyde Park. I have heard many expressions of opinion against it. I think the opinion of the City Council is that the scheme is one which must be carried out, and that their objections should be made after the report of the Commission has been submitted. I dissent from that view. I think that now is the time for the Council to object.

2387. In your opinion would there be a protest from the City Council? There would be if they thought the Park was going to be taken. I imagine a protest has been conveyed to the Government, and has not been brought officially before the Commission.

2388. Have you any information to lay before us with regard to an extension into the city, should it be thought desirable, from Redfern? I have no information of an engineering character, but speaking from a commonsense view of the question I think the establishment of the electric system of tramways does away altogether with the necessity of any extension into the city. It will be far more convenient for the majority of the people than any railway.

2389.

2389. That pretty well covers your case? Excepting that there is a possibility, for the purposes of goods traffic, of an extension round the harbour. I believe it would be desirable to extend the line by means of a new street between Sussex-street and Darling Harbour. I have been thirty-five or forty years doing business on the eastern shores of Darling Harbour, and I feel convinced that there is a need for some way of communication with the railway by means of iron rails round the harbour foreshores. I am not of opinion that there is at present a large traffic there which goes to the railway, but there is an immense amount of traffic to different parts of the city, and it is conducted under very difficult conditions indeed. It is raised from the water up to Sussex-street very suddenly. The congestion is increasing in the streets there every day. A large portion of the traffic which used formerly to come to Circular Quay has been moved to the head of Darling Harbour. The ships are crowded round those shores to an unprecedented extent. All the ships of the A.U.S.N. Co., which used to be brought to Circular Quay, and some of them to Grafton Wharf, are now centered close to the bridge. All the steam companies, in fact, are now seeking wharfage accommodation in Darling Harbour, on the eastern side. The consequence is that the traffic is increasing there to a marvellous extent. The question is: how is it to be carried out in the streets. In my opinion it could be met without much expense, and perhaps without any at all, by starting a street from the head of Darling Harbour, near the railway line, and carrying it between Sussex-street and Darling Harbour, as far as the Gas-works. It would become part of Sussex-street at Dalgety's Wharf, before getting to the Gas-works. Then it could be continued by a tunnel under the Flagstaff or to Circular Quay, and thence, if need be, to North Shore; but not by means of a bridge. I do not think a bridge is necessary. I think it could be carried there without a bridge with less expense. I am strongly of opinion that another street is needed between Sussex-street and the Harbour, and it could be an iron or steel rail street. That would enable railway trucks or railway engines to be carried along the street, and there would be no great interference with the vehicular traffic which otherwise would be there. The idea of running railway lines and the railways in the public streets is not a new one. It is done all over the world. There is a number of streets and lanes which could be taken in, so that the resumptions would be very little, and the frontages which could be sold would, in my opinion, recoup the Government or the Municipal Council for any outlay they might make in creating the new streets. A great mistake is being made at Darling Harbour at the present time. There is an unwillingness on the part of the Government to increase what is called the line of reclamation in Darling Harbour. They give away a few inches at a time when, in point of fact, the matter should be dealt with in a bold spirit, and more room given there than there is at present. The vessels lying in Darling Harbour now overlap the line of reclamation by nearly half their length. If all these vessels are moored end on to the shore it might be just as well for the Government to extend the limit of reclamation, and give a great deal more room for the loading and discharging of cargo, and at the same time obtain more revenue for the State.

Alderman
C. E.
Jeanneret.
29 April, 1897.

2390. You are speaking rather of the extension of the wharfs than of the reclamation itself? This is with the view of making more room for the street, because if you take away a part of space which exists there for making the street wider, what are you going to do with the stores. You must make up for that in some way. There is nothing to interfere with vehicular traffic in the putting down of iron or steel rails to carry trucks, whilst they would be an immense convenience to all the shipping companies. I do not mean to say there is no large up-country trade there at present, but what there is is increasing every day. Of course it does not follow that if you put rails of this kind down you will require regular sets of trains there.

2391. You are looking rather to the future? Yes; but there is a great necessity for a change now. It is more apparent now than it has ever been before.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

2392. *President.*] You have had the various matters which have come before the Commission placed before you from time to time? Yes. I propose to explain what has been done towards preparing an alternative scheme.

H. Deane.
29 April, 1897.

2393. The Commission understands that owing to the limited time at your disposal any estimate of cost of the alternative scheme must be regarded as approximate? It is very rough indeed.

2394. I suppose that the alternative extension, as far as the Park, is similar to the proposal which has already been explained? A proposal has been worked out, under instructions, to show what can be done as an alternative scheme to bring the railway into the neighbourhood of Hyde Park without materially interfering with the Park—abolishing the principal station in the Park and substituting one pretty close up between Elizabeth-street and Castlereagh-street, which, as far as position is concerned, will answer equally well.

2395. And also bringing the railway in touch with Circular Quay? Yes. The site is across Market-street, between the Synagogue and King-street. The station will be below the level of Market-street, between Castlereagh-street and Elizabeth-street, and it is proposed to close Market-street for traffic.

2396. You refer to that part of Market-street between Castlereagh-street and Elizabeth-street? Yes.

2397. Will you explain the scheme? The difference between this scheme and what is known as the Hyde Park scheme is very material. In the first place there are only four lines provided instead of six, from Redfern into the city.

2398. May we take it for granted that this scheme will do all that is claimed to be done with the scheme placed before us in the first instance? Not quite, I think. In some respects it does not do as much, and in other respects it does more. The line follows the same route, practically as the other, until it approaches Park-street, where it diverges so as to pass under Elizabeth-street in the neighbourhood of the Synagogue, and to form a station between that point and King-street. The centre of the station will be very near the position which Market-street occupies between Castlereagh-street and Elizabeth-street. The station there will be an underground station with three double platforms, booking offices and waiting-rooms.

2399. Although underground it will be open above, I suppose? Yes; it is proposed to cover it with a large roof, properly ventilated.

2400. *Mr. Lee.*] What depth will the platform be below the surface? The depth below Market-street will probably be about 14 feet. At the end of the station, and just opposite the Registrar-General's Office,

H. Deane. Office, there will be a new and wide street, about 60 feet between the kerbs, so as to give proper access to the station. The station buildings will be on the level of the street there, and will be chiefly facing the new street.

20 April, 1897.

2401. *Mr. Humphery.*] Does that mean that King-street will be there widened 60 feet? No; King-street will not be touched. The station will stand back from King-street towards the High School.

2402. Is that south of the Mont de Piété? Yes; that would be left intact.*

2403. *President.*] The object being to save resumption? Yes.

2404. *Mr. Hoskins.*] How will you manage about tramways? They will not be interfered with. Although it has been suggested that they should be removed, I think the tramways in that position will be an advantage rather than otherwise, because people will be able to change from the railway to the tramways or *vice versa*. Northerly from the station the line will divide into two. Two lines will be carried in a loop under the Domain and come out into the open air, facing Sir John Young's Crescent. Two lines continue down in tunnel, making for Macquarie-street, and they enter the Inner Domain just to the north of the gates, emerge from the tunnel nearly opposite Bridge-street, pass under the entrance to Government House, and a terminal station is made from Bridge-street down, having its centre a little to the north of Albert-street. Here there are provided two double platforms, 500 feet in length, with booking offices near the top of Albert-street, and access to the platforms by overbridge from those booking offices, and also by subway under Macquarie-street from the level of Circular Quay. It will be seen that the Woolloomooloo loop crosses the other lines, and the object of it is this: in bringing the lines from Redfern into the station, near Hyde Park, the quick trains will have to be brought on the western side, and the slow trains on the eastern side, so as to preserve the arrangement which exists at present. The quick trains—that is the country trains—will thus be brought in on the Castlereagh-street side of the station, but it will not be desirable to take them further down. That will be the terminus of that traffic. I may say that the whole of this arrangement has been made after consultation with the Railway Commissioners. It is arranged in this way: that the long-distance traffic—that is to say, the traffic to the Mountains, Moss Vale, and so on, should be brought in and terminate at the new station between Castlereagh and Elizabeth streets. In order to provide for the arrival and starting of those trains a loop is run round under the Domain, as shown on the plan. As that crosses the other lines, those lines have to descend at a more rapid rate, which can be done with a grade of something like 1 in 50, and pass underneath the lines running down to the neighbourhood of Circular Quay. The suburban traffic proper will be brought into the station on the eastern side—that is on the Elizabeth-street side, and will afterwards be run—some of them at any rate—through to the terminal station near Albert-street. The Chief Commissioner considers that an arrangement like this, shown on the plan, with two double platforms, and four lines will sufficiently provide for the traffic without any large station yard for shunting purposes. It will be seen that there are engine roads there, and when trains come in they can be backed upon them and run out again. The object of having a number of platforms is to allow the trains to wait there until it is time for them to start out again. It is quite clear that they could not run in and out immediately. If a train is late there must be an allowance in the time-table, so as to allow of its starting again punctually. That means that room must be given for the trains to stop while waiting for time. It will be seen that the only tunnel through which passengers will be conveyed will be on the line at the Albert-street station. The loop line into the Domain is merely for empty trains, and is a substitute for a large terminal station with sidings. On the Sir John Young's Crescent side of the loop, a number of sidings are shown for standing trains.

2405. *President.*] That is open? Yes.

2406. All the rest is tunnel? Yes.

2407. The open part would be under the fall of the hill, and would not be seen? It would not be seen much. In the Domain proper—that is to say, the part most frequented by the public and the main drive down to Macquarie Point—the line is underground, and only emerges on the water side of the Art Gallery.

2408. *Mr. Humphery.*] How far will the nearest part of the loop be from the Art Gallery? About 150 feet. Of course, that line is not definitely fixed in position. It could be brought either nearer or further away.

2409. Would that be a convenient place for a passenger platform? It is not intended to construct a platform. That part is only intended for shunting purposes.

2410. *President.*] Could a station be put there if required? No doubt; but probably some further expense would have to be undertaken.

2411. Could the line be fitted on to the extension to the eastern suburbs? It could.

2412. It is the first step towards eastern extension eventually? Yes; I think it might be fitted on to that—or, rather, the eastern suburban line might be fitted on to this.

2413. *Mr. Fegan.*] What time would be lost in going round the loop? No time would be lost. The loop is only for standing trains. Passengers would arrive at the station between Castlereagh and Elizabeth streets, and in departing for the longer distances they would start at the same station. Passengers would not be conveyed round the loop unless some further provision were made for doing so.

2414. Then if a train comes in from the Mountains the passengers get out at the station between Castlereagh and Elizabeth streets, and the train runs round the loop, so as to be ready for returning? Yes; it runs round there, and waits in one of the sidings until it is wanted.

2415. Does that mean more rolling-stock than you have at present? No; certainly not.

2416. *Mr. Hoskins.*] How much land do you require for the proposed station? I have not gone into that question, but Mr. Perdriau has done so.

2417. *Mr. Wright.*] Is the proposed line from the Quay to the Domain gates underground all the way? Yes; it is underground until you come to Bridge-street.

2418. What is the length of the tunnel? 743 yards.

2419. Could it be successfully ventilated? Tunnel ventilation is never quite satisfactory, but it is not so serious a matter for the smaller number of passengers who would go down there.

2420. I suppose you cannot possibly get down there excepting by tunnel? You must go down by tunnel. I would point out that as there would be a smaller number of passengers going down there, the trains would be lighter, and the steam from the locomotives would not be so severe.

2421. What is the total length of the tunnels on the loop? I have not measured the length, but I may say passengers will not be conveyed there.

2422.

* NOTE (on revision):—I find that I was mistaken. The Mont de Piété building would be required.

2422. They may be conveyed there some day? Yes, eventually.
2423. What do you imagine will be the length of the tunnel in the loop? About half a mile.
2424. You said the platform in Market-street would be 14 feet below the level? Yes.
2425. That being the case, could not Market-street be covered over? It would be very easy to arrange that it should be done, but it would be an extra expense. I do not think it would be necessary, and the Chief Commissioner thought it would be a pity to do it.
2426. For a long time past there has been an agitation to continue that street through to St. Mary's Cathedral? Of course it could be done if the levels of the rails were kept down 2 or 3 feet more.
2427. Where do you enter the Park? At Liverpool-street.
2428. *President.*] Do you propose to "cut and cover" through the Park? As shown on the plan, it is proposed to cover half, and leave half open.
2429. So that the area of Park land taken will be comparatively small? Yes; it may be said to be practically nothing, because there are lots of portions of the Park, such as flower-beds, where the people do not walk. Practically the use of the Park would not be interfered with, and the objection of running underground would be reduced to a minimum.
2430. Would you interfere with any avenue of trees? No.

H. Deane.
29 April, 1897.

TUESDAY, 4 MAY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P., (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.	HENRY CLARKE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	CHARLES ALFRED LEE, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	GEORGE BLACK, Esq., M.P.
The Hon. WILLIAM JOSEPH TRICKETT, M.L.C.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
The Hon. DANIEL O'CONNOR, M.L.C.	FRANK FARNELL, Esq., M.P.

John Young, sworn, and examined:—

2431. *President.*] Have you had a long experience of the city of Sydney? Yes.
2432. And a full knowledge of the projects for the extension of the railway into the city? Yes.
2433. I believe you submitted a scheme to a previous Commission? Yes; but I do not press it now. That scheme applied only to the mercantile traffic.
2434. Before the previous Committee you stated:—

J. Young.
4 May, 1897.

First.—I would like to consider the best position for the central station or terminus of the Southern, Western, Northern, and Illawarra main lines that converge into Sydney for the long-distance traffic, especially so as to be capable of extension hereafter. Second.—The suburban and local traffic taken in connection with the central station, but extended for local traffic only to suit both Sydney and suburbs. Third.—The resumption of the foreshores of the east side of Darling Harbour for the purposes of public jetties, wharfs, &c., as far as the gasworks—of giving a road to relieve the traffic of George and Pitt streets—selling the frontage to road for the purpose of erecting warehouses—and making a goods and passenger line in rear of same—to Circular Quay from Darling Harbour.

—? Yes. I desire to give evidence as to the best means of facilitating passenger traffic into Sydney. I may say I have seen Mr. Deane's plan of what he calls his western line. My idea is that the central station should be on that block of land comprised in the Cemetery and Benevolent Asylum, and bounded by Belmore Road, Elizabeth-street, and Pitt-street. That is a considerable area, and should give accommodation for the next twenty-five or thirty years. I built the present railway station in 1871, and what was thought sufficient in 1871 for the passenger traffic is, after twenty-five years, found to be totally inadequate. That shows that if this block of land is now a little more, perhaps, than is absolutely required, it will not be more than sufficient, at any rate, a quarter of a century hence. It has this advantage, namely, that the Government control the whole of it. They have control of the Cemetery, because they could remove the bodies to some other place and utilise the area. They have the Benevolent Asylum, which wants pulling down, and the police residence close to it, which is not of much value. There is the convent at the corner, and I presume the Government could make arrangements to get it, or they could do without it until it is convenient to remove it. A similar block of land could not be got in any other part of Sydney. I maintain there is not a sufficient area at Park-street for a central station unless the whole of the Park is taken up. In addition, there would be a great expense in getting to it. Compensation would have to be paid for the resumption of houses and land. The construction of bridges and culverts, the interference with water and sewerage, and so on, would be very expensive. In England the Great Northern and Great Eastern and other companies have areas in London, which are covered by the carriage-sheds alone, quite equal to the whole of the area we have at Redfern, and surely Sydney is going to be as large, at any rate, as one small district of London. The present station must cost an enormous amount of money in connection with shunting, because the space is so confined. With regard to accidents,—if you have sufficient room there is less liability to them. Everything is in favour of a large area. You could not get the necessary area at Circular Quay, for the simple reason that it is not there. These are the considerations which induce me to come to the conclusion that the spot I have mentioned is the most eligible for a central station. Now we come to other considerations. If a traveller comes with a portmanteau or two to Redfern, or the particular spot I have indicated, a shilling ride in a cab will take him to any of the hotels, the majority of which are within a mile and a half distance. If the railway station were at Park-street they would pay just as much to get from there to an hotel as from Belmore; therefore it cannot be said that the spot I name is unsuitable, because it is too far distant. It is as central as any other place in Sydney—in fact, more so, because Sydney cannot extend northwards very much. The suburban traffic must concentrate to the same point. It may be objected that the suburban travellers wish to go direct to their places of business. I point out, however, that an unbroken line to Park-street would not enable them to do that, inasmuch as many people have to go as far as Bridge-street, Hunter-street, or the lower parts of Pitt and George streets. The manner in which the suburban passengers get to their places of business must be upon a totally different system from that. I desire to call attention to the elevated railways in America, and the application to them, during recent years, of electric power. I wish to show how similar

J. Young.
4 May, 1897.

railways can come into the city of Sydney, so that the whole of the city may be supplied. Mr. Deane's plan of the western route is intended for a steam-line from Belmore Markets, Belmore Park, and the block of land which I consider should be the railway station. Mr. Deane, by means of excavations, embankments, and cuttings, to Circular Quay, makes that line a most expensive one. Being built for locomotives, it cannot go beyond certain grades; therefore there is an immense amount of tunnelling and cutting. What I propose is—and it is not a novelty although it is new—that Mr. Deane's western line, instead of being one constructed with embankments and cuttings, should be an elevated line worked by electricity. In New York they have similar lines worked with cables and electricity. The old style is being abandoned daily for electricity. Mr. Deane's western route scheme has been surveyed with an immense amount of judgment. The whole of the frontages both to Sussex-street and Kent-street are preserved. That is the great merit of the plan. Most of you are aware that a warehouse fronting a particular street seldom goes to the full extent of its ground. There is generally a yard behind. In this instance nearly the whole of the properties are like that, and the elevated line could go to the rear of those properties. Another advantage of my plan also is this—that the inequalities of the line can be adjusted by the length of the columns, and not by the cuttings and embankments. That must make an enormous difference in cost. An elevated railway can be adapted to the contour of the land it passes over. With electricity you can also have steeper grades. The only objection which can be urged against that idea is that the suburban passengers have to change at the central terminus. If you make a line through any portion of Sydney they will still have to change. Again, if you have an elevated railway, not only could you have it on the route shown on Mr. Deane's plan, but you could have it anywhere—almost between any of the streets. In America they are put in the streets themselves, but I should not like to see that done in Sydney. I prefer that the line should be put in the position shown on Mr. Deane's plan. It would relieve the streets of a large amount of traffic. I have had a good deal to do with omnibuses. I was the chairman of the Omnibus Company for fifteen years. The company is now defunct. We had 1,000 horses, and ran 130 omnibuses. Members of the Commission may not know exactly how it is that so many omnibuses are running in the streets at present. If we had a cable or electric line, the cars on which ran every three minutes, it would knock all the omnibuses off. If, however, your services are twenty-minute services, there is plenty of time for half a dozen omnibuses to run, because people will not wait.

2435. *Mr. Humphery.*] Has not the difference in fare something to do with it? I do not think so.

2436. *Mr. Trickett.*] What you say is borne out by Melbourne experience? Yes; I may say it does not pay to run omnibuses at 2d. I advocate an elevated railway on the site surveyed by Mr. Deane, and there is no reason why you should not have roadside-stations and stopping-places. I understand the Government is going to generate all the electric power for all the tramways in Sydney at Pyrmont. The same power could be applied to this and all other elevated railways in Sydney. I admit that some might say, "There is a store which goes right through from one street to another." There is no reason why the railway should not go right through it. It could be bricked over. There would be no steam and no noise. The store could go over it or under it, as is best. My scheme does not destroy property on either side; therefore it must be the cheapest. Pillars could be put in the back yards of the houses to support the line, and it would not interfere with the foundations. No doubt there would be some compensation to be paid, but it would be very small compared with what would have to be paid if you made embankments and tunnels. My scheme would be somewhat similar to a tramway scheme. The locomotives and carriages could be made as light as possible. The carriages might be made, as in America, so as not to weigh more than a ton. That would make a vast difference in the wear and tear of the railways, and, of course, that would mean economy. Of course, people would have to change at the central station, but docks could be put in the platforms, and it would mean simply going out of one carriage into another, and they would run every three minutes. There would be a continuous stream of traffic. At the terminus I would cut across the Domain to Woolloomooloo Bay. There would be a way then for the people to get to Cowper Wharf and other places without going halfway round Sydney. If it is not desirable to deface the Park by means of an elevated railway, go under it. When you come to Cowper Wharf you can go across the head of it, tunnel under Potts' Point, and then you are at Rushcutters' Bay. You could get from there to Circular Quay, I suppose, in less than a mile, and have a straight line. Then it would be quite possible to come up the valley by the Museum, thus making a circular railway.

2437. *Mr. Humphery.*] Is it your view that we should have an electric circular railway? Yes.

2438. Independently of our present railway system, but admitting of passenger connection? Yes.

2439. *Mr. Lee.*] How would you approach the overhead railway in the city in order to enter the cars? You would require staircases in order to get up to them. They do not find any difficulty about that in America. The railways there are in the streets themselves, and the staircases come down upon the sidewalks.

2440. *Mr. Hoskins.*] Was not the overhead railway in New York found to be a great nuisance? No; they are building them continually.

2441. Was it not found that the grease was continually dropping upon the people upon the pavements; that the shopkeepers could not show their goods; and that the trains were taken close to people's bedrooms? Yes. That is what I object to; but under my scheme there would be no oil, because there would be no engines. The line would not go close to people's bedrooms, because it would be at the back instead of in the front. In New York they are in the front, and over the footpaths, but they are altering them every day and converting them into electric railways.

2442. *Mr. Roberts.*] Do not the overhead lines spoil the appearance of New York? Yes.

2443. Would they not spoil the appearance of Sydney? Yes, if they were in the streets; but I would put them between the streets.

2444. *Mr. Lee.*] They must cross some of the streets? Yes; and with whatever system you adopt you must do the same.

2445. *Mr. Hoskins.*] How could large loads of wool, such as those you see in the streets of Sydney during the early parts of the year, be taken under the elevated railway? The line could be made sufficiently high to suit any load. It is done in other parts of the world, and why not here.

2446. Is there any place in the world besides New York where the elevated railways are run on the side of the street, level with the first floors of the houses? Yes; in Philadelphia. Of course, a year makes a vast difference in America, and great alterations are being made.*

2447.

* NOTE (on revision):—The physical conformation of New York is very much like that of Sydney, both being built upon narrow peninsulas bounded by their respective harbours, and the central depôt being placed away from the crowded streets of each metropolis.

2447. Would an elevated railway be necessary if we had a comprehensive system of street tramways? I think, if you had a complete service of the kind proposed, you would not want the other. J. Young.
 2448. *President.*] You intend the elevated electric railway to work in combination with the railway system, but not in extension of it. The same carriages, of course, would not run? That is so. 4 May, 1897.
 2449. Do you know anything about the cost of it? I know it is the cheapest scheme you could adopt.
 2450. *Mr. Lee.*] Do you wish us to understand that the cars to be used would be separate from those used on the railway lines? It would not matter if they were the same, but I would not advise it.
 2451. If this is going to be an electric system for the city only, how are you going to pick up the suburban traffic and bring it in without a change of cars? I do not say there would not be a change of cars.
 2452. Do you think the suburban passengers would ever use the line, if they had to make a break from one train to another? Yes. Of course, you could never make a line to suit everybody.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

2453. *President.*] The Members of the Commission made an inspection, last Friday, of the vacant piece of land near Devonshire-street, and we now wish to get your opinion as to the possibility of cutting down the street to a depth of 8 or 9 feet, and letting the railway cross by an overhead bridge, without disturbing the traffic. We would like to know if you consider that that would be a wise way of extending the railway from the present terminus, or, whether you would suggest a solid embankment across the street, some deviation being made to provide for the traffic by a slightly different route. We also wish to know from you where you think it would be wise to place the trams, supposing such an arrangement were made. Another point in regard to which we shall want you to give evidence is this: Suppose the proposed loop-line is left out of the scheme, and part of the shunting is done down towards Circular Quay, how wide would the station in Hyde Park have to be. We want to know how wide it would have to be with a loop-line and without a loop-line. If this area were taken fronting Castlereagh-street, how far should we have to go into the Park to get the necessary width, and would it be possible to bring the tram along the present route of Elizabeth-street, overhead. There will be two lines of rails, one from Hyde Park to the Circular Quay, so that not more than a width of 30 feet would require to be resumed between those two places? If you want to take both classes of traffic down to the Circular Quay—
 2454. No, only one class—the long-distance traffic will stop at Hyde Park, while the suburban traffic would go down to the Quay? You would not gain anything by what you propose. You would want the loop-line for shunting purposes.
 2455. Suppose you determined to go on to the Circular Quay with the suburban traffic? You would want two lines for that, and two lines in addition for shunting the long-distance traffic.
 2456. With no loop and no extension, it was proposed to have a dead-end station 5 chains wide; but it might be well to have a station as narrow, where it is adjacent to the Park, as it can possibly be, consistent with efficient working of the traffic. One way to narrow it is by shunting the suburban traffic elsewhere; but inasmuch as the long-distance traffic is not to go down to the Circular Quay, but is to stop short at Hyde Park, that will render it necessary to have a greater width than you have shown on your plan. I want you to tell us what that width would be—how wide the station would be without a loop, and how wide it would have to be with a loop:—will you look into these matters, and give us an opinion in regard to them later on? I will. H. Deane.
 4 May, 1897.

FRIDAY, 7 MAY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHREY, M.L.C.	CHARLES ALFRED LEE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL FEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
The Hon. WILLIAM JOSEPH THICKETT, M.L.C.	GEORGE BLACK, Esq., M.P.
The Hon. DANIEL O'CONNOR, M.L.C.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANK FARNELL, Esq., M.P.

Stephen Edward Perdriau, Surveyor, Department of Lands, further examined:—

2457. *President.*] You have seen the exact area likely to be required for a station if the Hyde Park station were rejected and land were taken alongside of it for that purpose? I know the boundaries of the area, and I have made a valuation, which is as follows:— S. E. Perdriau.
 7 May, 1897.

VALUATION of that portion of the city of Sydney lying between the northern side of the Synagogue and King-street, and bounded on the east by Elizabeth-street, and on the west by Castlereagh-street; excluding that portion now owned by the Crown, which embraces the High School property and the properties between it and Market-street: also excluding the Metropolitan Hotel, in King-street, and the adjacent properties easterly to within 45 feet of Elizabeth-street. Total, £190,000.

Separate valuations follow below for those two portions which Mr. Deane, Engineer-in-Chief, thinks might be excluded:—

No. 1.—We value the Monte de Piète property and the two small properties between it and the Metropolitan Hotel at	£21,500
No. 2.—We value the Castlereagh-street frontage of the property lying between the Synagogue and the northern boundary of M'Carthy's stables at	£20,000
Thus our valuation for the properties which would require to be resumed to provide the station site proposed by Mr. Deane as an alternative to the Hyde Park site is about	£150,000

This estimate is exclusive of the customary allowance of 10 per cent. for forced sale, and of any claims which may be set up for disruption of business; the claims, however, under the latter head cannot be very great. There are only three hotels included in the area proposed to be resumed, two of which are of a very second-rate order.

EDWARD J. SIEVERS.
STEPHEN E. PERDRIAU.

2458.

S. E.
Perdriau.
7 May, 1897.

2458. You believe your estimate is an ample one? Yes.
2459. It is not proposed to take the Monte de Piète property? No.
2460. Your valuation is £160,000 plus the incidental expenses which you think would not be heavy? Quite so. There is a good deal of vacant land in the block.
2461. You think it is as cheap a resumption as it would be possible to make for the purpose? Yes; I think so as regards locality, there is 200 feet frontage to Elizabeth-street which is not built upon, and 177 feet to Castlereagh-street.
2462. That explains to some extent the comparative cheapness of the resumption? Yes.
2463. Do you care to express any opinion as to the site of the proposed station from the point of view of city traffic? Speaking individually, I regard it as a good substitute for the park site.
2464. Would it suit the travelling public as far as you know? I believe it would do so very well indeed.
2465. Mr. Sievers has collaborated with you in making this valuation? Yes.
2466. And the Commission can regard your estimate as being reliable? Yes; we worked it out by taking the municipal assessment, and then by taking the values of the land; the values we put upon it are higher than are the owners' values. The municipal valuation came to about £180,000, the other valuation came to £200,000; we split the difference and made the value £190,000. I think £160,000 would be the full amount.
2467. *Mr. Hoskins.*] That does not include 10 per cent. for forced sale nor claims for disruption of business? No; there are no important buildings.
2468. *President.*] Would it be difficult to get another site in the neighbourhood suitable for railway traffic which would be as little occupied by buildings as is the site under consideration? I think there are very few blocks in the city in such a good position which contain so much vacant land.
2469. Can you suggest any place in the City of Sydney where a railway station site could be got for a smaller amount, of course, having in view the remainder of the line from that point to Redfern? I do not think there is any other place in the city as economically suitable.
2470. *Mr. Lee.*] You have now had ample opportunity of estimating the cost of the respective resumptions in various parts of the city in connection with this railway? Yes.
2471. You have inquired into the original scheme for Hyde Park? Yes.
2472. You have also inquired into the alternative schemes submitted by Mr. Deane, and one or two of the schemes which have been proposed by citizens? Yes.
2473. Are there any of these schemes in which resumption of land can be carried out as cheaply as it can in connection with the Hyde Park scheme? There is not the slightest doubt that the others are not nearly so cheap.
2474. That particular scheme stands out beyond all the others for cheapness of resumption? Yes.
2475. *President.*] Is there anything else you wish to tell the Commission? No, except that it struck me, when I was preparing the plan which I laid before you, that it was rather a coincidence that there should be such a piece of land in such a position, and so suitable for a railway station where the Crown owned so considerable an area, and where so large an extent of the land not owned by the Crown was not built upon.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

H. Deane.
7 May, 1897.

2476. *President.*] You have had an opportunity of looking into the alternative scheme adjacent to that involving the taking of a portion of Hyde Park? Yes.
2477. Do you think that if Parliament were averse to the taking a portion of the Park, the alternative scheme to which I refer would be the best substitute? It seems to be the best alternative scheme.
2478. The proposal submitted to the Commission was for a line to Hyde Park. Would it be possible, by having a loop line such as is shown on the plan, going towards Woolloomooloo, to work the whole of the traffic on that single loop without going to the Circular Quay? Yes.
2479. Therefore the extension from Hyde Park to Circular Quay would be an extra expense, and would be common to both schemes? Yes.
2480. *Mr. Lee.*] If the loop were abandoned and the line were extended to Circular Quay, would it be possible to work the traffic without the loop? I believe that would be unsatisfactory, and I will explain why. The corresponding substitute or alternative to the Hyde Park scheme is a station between Castlereagh-street and Elizabeth-street with the Woolloomooloo loop. The extension to the Circular Quay is an addition, and would not provide the right facilities for shunting. The Woolloomooloo loop is a substitution for the shunting arrangements in the large station.
2481. *President.*] And is put in to make the station as narrow as possible? Yes. If you suppose for a moment that that loop is not constructed, and that you want to have a loop down near the Circular Quay, it means this—that the loop or terminus will have to serve a double purpose, because, if you construct both the lines as far as that, you will have to take some traffic down there, and if you take traffic and empty trains down there you will want four lines of way, whereas the Woolloomooloo loop is only a single loop; there will thus be no saving of expense by going down to the Circular Quay.
2482. Then the case is this—we can, by a loop towards Woolloomooloo, as you have explained, and by a station between Castlereagh-street and Elizabeth-street, do what was submitted to the Commission in the first instance by the Railway Commissioners, but perhaps not so satisfactorily? Quite so.
2483. The extension to Circular Quay is possible under the alternative scheme? Yes.
2484. Is it possible under the Commissioners' scheme? Yes.
2485. How would you get it under the Commissioners' scheme? It was proposed that two of the lines should be lowered so as to take them underneath the front of the station in tunnels. I think I explained that, and that the foundations of the building were to be made so as to permit of the lines being taken through afterwards without any further expense.
2486. The extension of the alternative scheme to the Quay, if the Commission determined that it could wait a little while, would be the same, whether from the alternative station site or from the Park? Approximately it is the same.
2487. Can you give us the cost of the railway in sections, cutting out the cost of the piece to the Quay, and giving that to us subsequently? Yes; but the figures are no more than a rough approximation. I have estimated for the Devonshire-street deviation, together with all the work involved, £40,000.

2488.

H. Deane.

7 May, 1897.

2488. Is that common to any extension into the city? It might be considered so.
2489. *Mr. Lee.*] It would not be common to a scheme under which you had a central railway station at Devonshire-street? No.
2490. *President.*] What is the next section? For the next section up to Liverpool-street, I have allowed £95,000, from Liverpool-street to Elizabeth-street crossing £70,000, and from Elizabeth-street to King-street, including the station, £164,000; the Domain loop is put down at £72,500, and I have taken for signalling and lighting £14,000.
2491. Does that cover the whole of the work in the alternative scheme? Yes; the total is £455,500—that is, without the Circular Quay piece.
2492. The resumption from Belmore Park to Liverpool-street has been given at something like £100,000, and Mr. Perdriau estimates to-day that at least £165,000 will be required for the railway station site, making a total of £750,000 for the work? Yes.
2493. What was your estimate for the Railway Commissioners' scheme as far as Park-street? £600,000.
2494. How much would it take to bring that line from Park-street to St. James'-road? £50,000.
2495. Does that include the resumption? Between Belmore Park and Liverpool-street.
2496. Then the alternative scheme is dearer than the Commissioners' scheme by £55,000? Yes.
2497. Are you aware that the Railway Commissioners suggested that £100,000 should be debited to the railways if the Park site were given to them? I have heard so.
2498. If the railways were debited to that extent, then this scheme becomes cheaper than the Railway Commissioners' scheme by £45,000? Yes.
2499. What is the cost of the work from King-street to the Circular Quay? £94,000.
2500. That is common to and in addition to both schemes? Yes.
2501. Do you think you could get through from King-street to the Quay without any resumption? I think the line could be carried underneath without interfering with property, but there might be some liability for compensation if settlement occurred.
2502. From your knowledge of the formation and the depth, do you think that the line could be extended from King-street to Circular Quay without interfering with any buildings under which the railway would pass? Yes.
2503. You have no doubt about that? I have no doubt but that the thing could be done.
2504. Your knowledge of the formation and depth makes your mind absolutely certain upon that point? Yes.
2505. You desire to put in an estimate of the cost of the alteration of railway yards at Redfern? Yes, I omitted that. The total amount I make it would be £735,500, instead of £715,000. I should like to point out another thing in the other estimate. The estimate for the alternative scheme does not include any office accommodation; the other one does. In answer to Question 1298, I stated that if accommodation was not required the cost of the buildings would be cut down by £65,000, so that that would have to be deducted from the original amount; in order to make a comparison with the £650,000, which was the total to bring it up to St. James'-road, the amount must be reduced by £65,000. That would make £585,000, and now, as suggested by the Railway Commissioners, £100,000 could be debited for the Park. That makes a total of £685,000. I have made inquiries about that £100,000. I have not been able to see Mr. McLachlan, who is away, but I saw the Chief Clerk, and he told me that he was not aware that there had been any correspondence on the matter. He did not think that there had been anything in writing at all about it. It had been referred to by the Chief Commissioner at the annual dinner of the Commercial Travellers' Association, a report of which appeared in the daily papers. There he mentioned that it would be reasonable to debit the Railway Department with, say, £100,000, to provide for open spaces in crowded districts like Redfern. I do not think that that is the first occasion when it was mentioned. But it evidently expressed what was looked upon as a reasonable thing to do.
2506. How would the two schemes come out then? The scheme with the Hyde Park Station at St. James'-road £685,000, and for the alternative scheme £735,500, giving a difference of £50,500.
2507. *Mr. Humphery.*] Are we to understand that the difference in the entire cost and compensation for the disturbance of business, and the resumption of land between the Castlereagh and the Elizabeth streets site, and a similar site at Hyde Park, would be £50,000? No, no. I am comparing the original scheme brought up to St. James' Road with this alternative scheme.
2508. You make this distinction—that in the St. James' Road scheme you would have 10 acres? Yes.
2509. And you would have besides the buildings for offices? Yes.
2510. Which you have not taken into consideration in estimating the difference of £50,000? Yes. I have deducted £65,000 for the buildings.
2511. Have you taken into consideration in the Castlereagh-street scheme the value of land already owned by the Government? No. These figures were given to me this morning as Mr. Perdriau's estimate. That is all that I know about it.
2512. *President.*] Keeping in view what you previously said with regard to the area under consideration on the northern side of Devonshire-street, will you explain what you believe will be the wisest course, and give your reasons? If provision is to be made for extending the station accommodation at Redfern across the site of Devonshire-street, I am of opinion that Devonshire-street should be diverted, because it will be impossible to leave it in its present position, and to lower it sufficiently, and to get under all the roads that would require to be extended. Lowering the whole of Devonshire-street would be impracticable. It would have to be lowered throughout the whole of its length to provide for the extension of the yard. If the station yard is not extended, and only four or six lines, as the case may be, carried towards the city, Devonshire-street need not be diverted. The lowering then would not be a serious matter, as I have already explained; but if it has to be diverted, I consider that it should be done in one of the ways sketched on the map.
2513. *Mr. Humphery.*] You did not tell us why it should be diverted? It would have to be lowered for nearly the whole of its length in front of the station, and that would not be impracticable, but the grades at the end would be unworkable.
2514. *Mr. Lee.*] In other words, if you want to extend the yard across Devonshire-street, and make the same use of the Cemetery site as you are now making of the Redfern yard, then you would have to take entire possession of Devonshire-street? Yes.
2515. *Mr. Humphery.*] Do you say it is necessary to extend the Redfern railway yard across Devonshire-street to the Cemetery? It is not absolutely necessary for the scheme.

- H. Deane. 2516. Therefore, if it is not necessary, it would not be necessary to divert Devonshire-street? Yes.
- 7 May, 1897. 2517. And by taking the four lines from the railway across Devonshire-street, you could lower Devonshire-street, and render unnecessary the deviation? Yes.
2518. If you deviate Devonshire-street, there would be a great gain resulting in increased accommodation to Redfern station yard? In the future.
2519. *Mr. Lee.*] I think you have already shown us that at Hyde Park four lines of railway would be sufficient for the passenger traffic? Yes; under this modified scheme.
2520. That being the case, where would be the necessity for extending the Redfern yard across the whole of Devonshire-street? It would be very desirable to provide for the future.
2521. If four lines of railway are sufficient, with your proposed additions there to carry on the passenger traffic, why would it be necessary to take Devonshire-street? I should say it would not become necessary, but I was asked to look into the matter by the Commission.
2522. *President.*] Is this your attitude: That the platforms at Redfern are not sufficiently long. To extend the platforms it becomes necessary to extend Devonshire-street further north, because then if you do not do so, you have too contracted a space between the end of the platform and the road. That is point one. Point two is, that if you put a cut of 8 feet down in Devonshire-street you leave it worse than it is at present. Point three is, that it is absolutely certain that if you want a compact yard you cannot have a street running through it; therefore, if you can get a better street and lengthen the platforms, and get a compact yard, and make provision for the future by extending the street to the north, that is what should be done;—you, therefore, recommend that it should be extended to the north? Yes; that is about it. I considered at first in connection with the extension of the line by carrying four or six lines into the city, Devonshire-street might be lowered, and I was asked to look into the matter of deviating Devonshire-street. It will be remembered that I pointed out when we were considering the question of making a large terminal station on the site of the Benevolent Asylum, that it was then proposed to deviate the bulk of the traffic of Devonshire-street right round by Garden Road, leaving only a passage for cabs on the line of Devonshire-street. At the request of the Commission I have looked into the matter of the deviation of Devonshire-street, and although I consider it is much more costly than to lower Devonshire-street, it makes a much better job, and provides for the future, which the lowering of Devonshire-street would not do. If Devonshire-street is lowered, and afterwards the Railway Station has to be extended, the whole of that work will be thrown away, because it would have to be deviated sooner or later. If this line comes to be constructed it would be a fitting time to deviate Devonshire-street, and this plan shows how I propose that it should be done. I do not think it is a necessary part to either one or the other of these schemes, and perhaps it is not fair to debit to the one estimate the whole cost, and not to debit the other.
2523. *Mr. Wright.*] It is your opinion that under any circumstances the Redfern railway yard should be extended northwards? Yes.
2524. That the yard is too small altogether for the purposes for which it is designed? Undoubtedly.
2525. Therefore it is necessary that it should be extended to the north over Devonshire-street? Yes, sooner or later.
2526. And whatever extension will take place ultimately that piece of ground will be required for railway accommodation? No doubt about it.
2527. *President.*] How much is the amount of the other item which you put into your estimate? £40,000.
2528. You can say it is not part of the scheme; it belongs really to something else? It does.
2529. So that £40,000 should be taken out? Yes; a good part of it.
2530. *Mr. Lee.*] The closing of Devonshire-street would necessarily involve the use of the whole of Devonshire-street Cemetery for railway purposes? Up to the deviation.
2531. All that portion except the part required to give a roadway? There is a portion between the deviated road and Belmore Road which would not be used.
2532. Therefore the question of utilising any portion of Devonshire-street Cemetery as a park comes to an end? The northern part would be available.
2533. You have no necessity to take that portion, what you would take would be the southern portion, nearly up to the boundary wall between the Church of England portion and the Roman Catholic? Yes.
2534. That would be required for railway purposes if Devonshire-street were closed, would it not? Yes; the southern part would be available for the extension of the station.
2535. If you had to fill in Devonshire-street to the level of your railway yard, or to excavate the Cemetery to the level of the railway, you would have possession of that part as you have of the Redfern yard? Yes.
2536. Therefore we can hardly look upon Devonshire-street as a recreation ground in substitution for any portion of Hyde Park that may be taken? Of course it need not be taken if the Railway Commissioners say that they do not require the extra area.
2537. *Mr. Hoskins.*] If Devonshire-street were lowered 6 or 10 feet to take four lines of railway, would it not cause a great difficulty with regard to the traffic between George-street and Devonshire-street? If Devonshire-street were lowered.
2538. Yes; only to permit of four lines of rails? No; we could make the grades quite satisfactory. I think the deviation makes the best job, although it is much more expensive than lowering the street. Whether we utilise the whole of the Cemetery as a park, or only the northern portion of it, I do not think it will very much matter. Suppose the whole of the Cemetery were converted into a park, it would be accessible from the deviated road just as well as from the present street.
2539. *Mr. Lee.*] The residents of Redfern would be put to very little inconvenience if Devonshire-street were closed, and the proposed new road made? Yes.
2540. And closing Devonshire-street would necessitate the diversion of the tram down past Devonshire-street, to join at the northern corner of Belmore Park? Yes; that forms a considerable portion of the expense.
2541. There are no engineering difficulties in taking that tramway there? No.
2542. *Mr. Wright.*] In your opinion, is there any necessity to deviate Devonshire-street; if it is closed could not the traffic go by Belmore Road just as well? I do not think that would do very well; it would be a long way round.

2543. Would it not be the most direct route into the city? Yes; but for any traffic from Parramatta-street that would go along Devonshire-street to Surry Hills it would be rather a serious inconvenience. If the traffic goes round Garden Road, or Belmore Road, as it is called, it would be dropping down into a hollow and rising up at the corner of Elizabeth-street, which is quite a steep hill.

H. Deane.
7 May, 1897.

2544. There would then be a space of land between Cleveland-street and Belmore Road without access to Parramatta-street? Yes; without any proper access.

2545. If you could get through from Castlereagh-street North into the Cemetery, would you not have the most direct track into the city? You would; but there would be a nasty grade and heavy work where the deviation of the tramway is shown.

2546. Could not the trams now running to Botany be diverted altogether from their present course, and go up Elizabeth-street? That is what is proposed.

2547. Then the connection between Redfern, Botany, and Sydney would be shortened by the proposed route? Yes.

2548. *Mr. Lee.*] Have you shown the difference of cost between the covered way across the portion of Devonshire-street and the entire resumption of it? I have given the particulars as to the lowering of the street.

2549. *President.*] What would be the grade of Devonshire-street after it was lowered? One in twenty-five; that is for four lines.

2550. *Mr. Lee.*] Would the six lines of railway admit of general passenger traffic coming into the city from long distances as well as the suburban traffic? Yes.

2551. *President.*] Four lines would bring in everything, would it not? Yes; in connection with the alternative scheme.

2552. *Mr. Lee.*] Then you have made provision for four lines as your alternative scheme? Yes; there were six lines in connection with the Hyde Park scheme.

2553. With four lines could all the passenger traffic be dealt with at the terminus in the city? I believe it could; but that is one of the points on which I have to consult the Railway Commissioners.

2554. We will come now to Liverpool-street, where you first touch the Park;—will the railway going through the Park there be all cut and cover? I propose that it should be half open and half covered in.

2555. Of course the open portion of it must be looked upon as a resumption of the Park? I do not think that it is exactly the same.

2556. The portion that will be open will not be available to the public? Not to walk over, but it will be open for them to view the Park. I think I am correct in the view that it is not necessary to walk over the entire park.

2557. Would it not be possible to put the line entirely out of sight—entirely under the Park? Certainly, it would be possible; but it was the ventilation that I was thinking about.

2558. I should like to know whether the whole of the line could not be kept under cover going through Hyde Park? Yes, it can be done.

2559. Would it be at a greatly increased cost? It would be more expensive.

2560. Would it be much more? I can give an approximate idea.

2561. *President.*] How far is it? Altogether, 508 yards to the crossing of Liverpool-street. Where the rails are shown in blue lines on the map, I have intended the line to be open, the other parts to be covered over and the surface restored. The whole line can be covered over, of course, from Liverpool-street to the crossing at Elizabeth-street; but I am afraid it would make the atmosphere more choky and disagreeable.

2562. But would it not be possible to provide for extra ventilation to get over a difficulty of that kind? I do not consider that the ventilation of lines of this kind is ever successfully carried out.

2563. Can you not devise a scheme by which we can pass through that park without depriving the public of a foot of the surface? We can do it by covering the whole of it over; but I do not recommend it. I think that leaving small spaces interferes very little with the comfort of people using the park.

2564. What is the length of the openings on each side of Hyde Park? 150 feet.

2565. How many are there? Four openings, making altogether 600 feet.

2566. Then the portion to be covered between those intervals would be about 600 feet, so that while you are taking that portion away from the public you might as well take the whole? I do not agree with that. I do not think that the taking of little patches like that is anything like taking a strip or a large patch.

2567. Does that loop go under Parliament House? Yes, but it is a long way down.

2568. I suppose it is deep enough to prevent any inconvenience? Yes, it is right down in the solid sandstone, far below the foundations.

2569. What would be the cost of lowering and bridging Devonshire-street? The estimate is £21,200.

2570. *President.*] And what is the cost of the other? The other I put down at £40,000. That includes the deviation of the tramway.

TUESDAY, 11 MAY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.

The Hon. WILLIAM JOSEPH TRICKETT, M.L.C.

The Hon. DANIEL O'CONNOR, M.L.C.

HENRY CLARKE, Esq., M.P.

CHARLES ALFRED LEE, Esq., M.P.

JOHN LIONEL FEGAN, Esq., M.P.

THOMAS HENRY MASSAHL, Esq., M.P.

GEORGE BLACK, Esq., M.P.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

Edward Miller Gard Eddy, Chief Commissioner for Railways, sworn, and examined:—

2571. *President.*] Would you like to make a statement? Perhaps it will simplify the matter if I do so. It has been recognised for many years that the accommodation at Redfern is quite insufficient for the business which has to be conducted there, and of recent years the traffic has grown very materially indeed. Generally, the public cannot obtain that amount of comfort in travelling that they are entitled to expect; but at holiday

E. M. G.
Eddy.
11 May, 1897.

E. M. G.
Eddy.
11 May, 1897.

holiday times everything is in a state of congestion, the public are much inconvenienced, and the traffic is not conducted with that regularity that the Commissioners would like to see. It is not only the dealing with the trains, but the minor facilities, such as cloak-room accommodation, the obtaining of tickets, waiting-rooms, refreshment-rooms, and all that sort of thing—everything is too small for the business which has to be conducted. Again, it is quite clear that Redfern is not the terminal point at which the bulk of the passengers wish to arrive. The outpourings from the trains into the trams, and the large numbers of people carried by the trams and the omnibuses into the city, show clearly that it will be far more convenient to the public for the trains to go into the centre of the city. That has been the experience in all parts of the world. Railway companies have spent very large sums of money in all directions in endeavouring to bring their passengers as near to their destination as they possibly can. That has not only been a great convenience to the public, but it has been a source of very great profit to the railways, as the tendency in all big centres of population is for the people to go away from their places of business, and to reside in the suburbs. It is a complete change from the old system, when the owners of shops and businesses used to make it a point to reside on their premises. That has been going on in Sydney in very much the same sort of way as it has been going on in other parts of the world. That brings us to the point as to which would be the most convenient part to which to extend the railway.

2572. The Commission have been given to understand that the congested state of traffic at Redfern is not only a matter of inconvenience, but is fraught with some danger? Undoubtedly. Where you have to conduct your business under continual stress for want of time, and want of platform accommodation, there must be the element of risk which you wish to see eliminated, in spite of every precaution being taken to carry on the business with perfect safety, which has been fairly successfully accomplished at Redfern.

2573. Working at full pressure, and under great stress? Absolutely great pressure.

2574. *Mr. Hoskins.*] Has there been great danger from the probability of collisions between shunting engines and carriages in the confined space at Redfern yard? There is not much risk in connection with shunting operations, so long as the men obey the signals. Everything at Redfern is interlocked, so that you cannot have the signal "off" for an engine to come into collision with an operation going on in another part of the yard. But, of course, if a driver runs past a danger signal he is liable to come into collision with some other operation that is going forward. It appears from the watching of the tram and omnibus traffic, that a station abutting on King-street would be the most convenient position for a terminal station, and that was the reason for the Commissioners putting forward the scheme which has been inquired into by a previous Royal Commission. Although an alternative scheme was put forward towards the end of the sitting of that Commission, it was simply put forward because it was stated that there was a strong feeling against taking so much of the Park. But we cannot depart from the opinion which was so clearly emphasised at that last inquiry, that Hyde Park is the right and proper position for a general station of the dimensions which you have had placed before you in plans.

2575. *President.*] If there be nothing else to consider, for the traffic and the public that is the place? That is the place. Then, with regard to the point which has been raised as to open spaces, it is not as though the only open space there was Hyde Park. There are open spaces of about 227 acres surrounding this block of 10 or 12 acres which it is proposed to take, and at the end of that open space you have the waters of the harbour. Of course, the Railway Commissioners would not for a moment think that the open space question should be entirely ignored, and therefore we recommended before the last Royal Commission—and we wish to place it before you gentlemen—that there should be open space, to the extent of the open space taken from Hyde Park, given to the public elsewhere; and, if necessary, that open space should be increased. If it were possible to obtain the necessary amount of land from private individuals on the site proposed for this station we would not suggest taking the Park. We would say, "Purchase that amount of property." But we do think, in the interests of the people—because the whole of the people will have to pay for any unnecessary expenditure incurred—it would be unwise to purchase buildings for the purpose of pulling them down to create an open space. Therefore, as private property cannot be obtained for the site, we, with all respect, suggest that the merits of the case be met by taking from a part of the city where there is a surplus of open space the amount required for the convenience of the people, and to provide elsewhere, where it would be of much greater value, open space to the same extent, and, if necessary, to a greater extent, than that which is taken from the people here. I also wish to place before the Commission the necessity, in dealing with railway traffic, especially when it is going long distances, and people take a large amount of luggage with them, of having your platforms on a level with the surrounding streets. In other parts of the world, where stations have been made above the level of the streets, and in some instances below the level, there has been the greatest possible amount of difficulty experienced; and every effort has been made later on to get rid of the different levels. In Liverpool, for instance, the Lancashire and Yorkshire Company spent from £350,000 to £400,000 simply to lower the rails to the level of the adjoining streets, and then they extended the station at the same time by spending another £600,000. I only mention that to call attention to the necessity, in dealing with a terminal station for long-distance traffic, of the passenger platforms being on a level with the streets, up which the cabs will drive, and deliver their luggage to the trains. Again, looking at the fact that it must be generally admitted that Redfern station is totally insufficient for the traffic, I would point out that it would be unwise to spend a very large sum of money in connection with the present site, or any site closely adjoining, because you could not charge any additional fare to recoup the interest on the large expenditure. But if, by bringing the line into the city, you convenience the public, and save them expense in travelling along the streets, you can wisely and justly make them pay a small additional fare; and by charging a fare of 1d. to each passenger taking ordinary tickets for each journey, and adding a small sum per month to the season-ticket holders, and about 3d. a week to workmen, you bring them into the city at a less cost than at present, and you get sufficient revenue to recoup the country absolutely for every penny of expenditure incurred in carrying out this great improvement. Those are the main points I wish to bring under your notice, and I would strongly urge that the scheme for placing a big general station in Hyde Park should be adopted.

2576. With regard to the reason you mention as a sentimental reason, presuming that dominates the whole case, and that Parliament decides that Hyde Park must remain intact; assuming also that Parliament decides that a small portion of Hyde Park shall be given;—can you advise, in those two cases, what would be the wisest thing to do, so far as the traffic is concerned? With regard to the first condition, I think

E. M. C.
Eddy.
11 May, 1897

think the wisest course would be for the Railway Commissioners to spend a reasonable sum of money in connection with the existing station at Redfern until such time as public opinion will force the railway forward to the centre of the city. I am certain that will come. Under the second condition, I think it would be possible to make a scheme which would be fairly satisfactory, but it would not be so satisfactory as the putting of the large station in Hyde Park. A scheme which would be fairly satisfactory could be worked out by taking about one-half the area in Hyde Park already suggested, and placing in that area a station for long-distance traffic, with about five platforms, and a cab-drive between two of the principal arrival lines. Then, in the space now occupied by the High School, a local station could be created, at which all the suburban trains could be dealt with. You have this advantage under a scheme of that nature: that practically the terminus is at one spot; but if you were to place a suburban-line station in the city, and leave the long-distance traffic at Redfern, from the moment the new arrangement came into operation there would be nothing but dissatisfaction expressed by those people who found themselves left at Redfern, and who wanted to get down to King-street, which they would be able to do in about two minutes if their trains were sent forward in the same way as the local trains would be sent forward. Therefore, I would very strongly urge that there should be no separation of the two classes of traffic by a distance, such as from Redfern to King-street.

2577. Would that be your main objection to the long-distance traffic remaining at Redfern? Yes.

2578. Therefore, the case stands thus: without taking the Park it is possible to deal with the suburban traffic, but it is not possible to deal with the long-distance traffic, or with a combination of the two? No.

2579. There is not width enough, in point of fact, between Castlereagh and Elizabeth streets to take comfortably more than the suburban traffic; therefore, there must be an encroachment on the Park if the whole system finds its terminus approaching King-street? That is so.

2580. Could you shunt your suburban traffic between Castlereagh and Elizabeth streets;—I ask that, because the map shows an extension to Circular Quay? Yes; I think the suburban traffic could be dealt with at that station.

2581. What is your view with regard to an extension, for general purposes, such as is shown on the map, to Circular Quay? I do not think the time has come for that extension. The extra traffic which would be gained would not, in my opinion, pay for the outlay.

2582. But still it would be some convenience, but not sufficiently great? It would be a traffic which would be carried without charge, because whether you took the line to King-street or Circular Quay you would have to charge the same fare.

2583. I presume you are aware that 6,000,000 persons land at Circular Quay yearly, which must mean some traffic for the railway, and the extension of the railway almost in touch of that landing place would be very convenient for the public, but you think it is not sufficient? I do not think you would get sufficient return at the present time to justify the large additional outlay.

2584. I suppose that the two stations would be practically parallel? Yes.

2585. We have had under consideration the question of a loop;—is it possible to get such relief from such loops as have been proposed, to enable a station, such as is shown between Castlereagh and Elizabeth streets, to bring the whole of the traffic in—that is to say, without encroaching on the Park at all? It would be impossible. At present there are thirteen platforms at Redfern. They are insufficient for the business now. Therefore, it would be impossible to deal with all the traffic on six platforms.

2586. The relief a loop gives is not sufficient? That would be a mere nothing as compared with the accommodation of the passengers on the platforms alone.

2587. The loop remains perhaps for relief at some future time? Yes.

2588. How many lines of rails do you propose to bring in? Six; if we bring the long-distance traffic in.

2589. *Mr. O'Connor.*] Does your scheme in any way propose to interfere with St. James' Church and the Courts? No.

2590. *President.*] Would you approve of a long-distance station down towards Government House? No; I do not think it would be as convenient as Redfern. People would have to go out of their way to get to that point.

2591. Would there be any other reason why it would be unsatisfactory? No; nothing beyond the fact that it would not suit the public, and we are trying to make a station to accommodate the public.

2592. The approach to Circular Quay must be by a tunnel? Yes.

2593. Would there be an objection in that? I have the strongest objection to tunnelling work in Sydney. It is found very disadvantageous in other parts of the world where the temperature is not nearly so high as here. I am sure it would be found most unpopular in Sydney.

2594. If electric traction were possible, would your objection to tunnelling be removed to a certain extent? I do not think that we can deal with a state of things which does not exist.

2595. If we had electricity, would a good deal of the objection be removed? Undoubtedly; but we have not arrived at that state of things yet.

2596. We must consider the matter on the basis of the traction we have at present? Yes.

2597. You see no immediate chance or likelihood of the suburban traffic being run by electricity? It is not suburban traffic only which has to be considered; you would have to deal with trains going outside the suburbs. The people, for instance, living at Campbelltown, would expect to come forward to the full extent of the railway. Even if electricity could be adopted for purely suburban work, it would be a long time, I think, before we should be able to work long-distance trains economically by that power. That question has not been solved in any way yet.

2598. Do you think it is reasonable to anticipate that the suburban traffic could, in the future, be worked by electricity? I think we might be able to experiment with the purely suburban traffic before many years are over.

2599. But we must not regard it as a certainty for the purposes of this inquiry? No.

2600. When you speak of long-distance traffic, what do you mean;—can you form any idea as to what trains would not go to the railway station between Castlereagh and Elizabeth streets? For the present, it might be possible to work the Campbelltown trains and trains going to the Mountains at slack times, but I fear it would not be possible to work those at busy times. There would be too much luggage to be dealt with. In dealing with the suburban traffic I think you should deal with the purely suburban service, like that to Homebush, Hornsby, and Hurstville.

E. M. G.
Eddy.
11 May, 1897.

2601. For the present it might be possible in slack times to bring Mount Victoria and Moss Vale to the suburban station site? Yes.
2602. And the South Coast trains? No; I think there is too much milk traffic in those trains.
2603. Could the Newcastle trains come in? No; none of the mail or express trains.
2604. Would it be possible to locate the station at the top of King-street, in the Domain, at the back, as it were, of the Hospital and Mint? I think it would be very disadvantageous to put a railway station alongside the Hospital. When anyone is dangerously sick in a house we go the extent of putting straw and tan down so as to deaden the sound of the ordinary traffic. Here you concentrate all kinds of people who are sick—many of them in a dangerous state—and it would not be wise to locate the station alongside them, so as to annoy them with the whistling, vibration, and movement of trains. In addition to that, I do not think the site is altogether as convenient as we could wish. Again, we should be taking up a site which I have always understood has been decided upon for many years past for the whole of the law courts—a most advantageous position for them.
2605. Would it be possible to stop your long-distance traffic at Liverpool-street? It would be very costly to provide a station there; the levels are so much against the scheme.
2606. There is not sufficient level before you commence to fall towards Belmore Park? No; the fall is very rapid there.
2607. The length is only 400 or 500 feet, and you want more than that for your stations? Yes; the platforms must be 700 feet.
2608. Supposing a railway station was projected on the southern side of Belmore Park, how would you view it? Unless we can come forward to Hyde Park, I would strongly deprecate spending any very large sum of money. I would only advise the judicious expenditure of a moderate sum—say £70,000 or £100,000—to make Redfern station answer its purpose until such time as it is decided to bring the railway forward into the city.
2609. You insist that if suburban traffic comes in, all traffic should come in? Yes.
2610. What proportion of the whole of the traffic is suburban? A very large proportion.
2611. Would it be seven-eighths? A return which I had prepared some time ago showed that there were 203 purely suburban trains, twenty-five trains running to places like Campbelltown, Penrith, and the Mountains, and twenty-eight long-distance trains. Then, of course, at holiday times those long-distance trains are duplicated in nearly every instance.
2612. Therefore about three-fourths of the traffic is suburban? Yes.
2613. Supposing Parliament is disinclined to approve of the Park being taken, would it not be of great benefit to three-fourths of the travelling public? If Parliament takes the responsibility of the complaints of the long-distance public, I am sure the complaints will be very continuous and very strong.
2614. Can you suggest anything but the Park? No; I wish I could.
2615. *Mr. Wright.*] Would the proposed station in the Park for long-distance traffic be a surface or underground station? A surface station. The cabs would drive to the front of the station.
2616. The station would extend from St. James'-road nearly to Park-street? Yes.
2617. *Mr. Trickett.*] That would block up Market-street as a through street? Market-street would end where it is to-day. It does not go through the Park, and the station does not interfere with it.
2618. But for the suburban traffic, you could make it sufficiently low to let Market-street go over it, or you could block the street? The scheme before you provides for a low-level station for the suburban passenger traffic. Market-street need not be interfered with. In coming from Redfern under the Park, you must be sufficiently low to go under Elizabeth-street, which necessarily places you under the level of Market-street.
2619. *Mr. Humphery.*] What is your opinion as to the question of annual cost, by way of comparison between a suburban passenger station in the city and the country station at Redfern, and both stations in the city;—would it be more economical to work the two stations at St. James'-road, or have the suburban station there and the other at Redfern? I think it would be about the same, because having a station for the suburban traffic would require you to keep two independent sets of men.
2620. Assuming you could have a terminal station for long-distance passengers and suburban passengers at the Park, you then would have surface stations, and the cost would be less than having them separated by Elizabeth-street? The cost of working would be decidedly less, and it would be more convenient for the public also.
2621. Have you considered that? I think I have made myself clear—that in my opinion the large station should be built near King-street; that everything should be under one roof.
2622. That was your evidence before a previous Commission; but I speak of your evidence to-day. You are of opinion that the terminal station for long-distance passengers might be at St. James'-road? I say distinctly that in our opinion every line should be in the one station at Hyde Park, and the alternative of putting the local passengers on one side of Elizabeth-street, and the through passengers on the other side, is simply because it is urged sufficient space will not be given in Hyde Park for the whole of the traffic to be dealt with there.
2623. I think, by your former scheme, you proposed to come up to King-street;—do you think you could get sufficient accommodation between St. James'-road and Park-street? Yes; that is the modified plan before you now, as prepared by Mr. Deane.
2624. That is the plan you favour? That is the plan which has been worked out.
2625. That is to say, you will take 10 acres of the Park instead of 5 for the country trains, and I suppose a sufficient area between Elizabeth and Castlereagh streets for the suburban trains? Yes.
2626. In the event of the scheme for the suburban station being placed between Elizabeth and Castlereagh-streets, could provision be made for ultimate extension? To where?
2627. Northward, to join any bridge which may be made to connect Sydney with the North Shore? I should not propose that, because I am decidedly of opinion that there should be no bridge to the North Shore; therefore, I am not proposing that this station should be considered a proper connection for the North Shore.
2628. If you have a surface station at St. James'-road for the long-distance trains, would it be possible to extend the line northward? The foundations could be so arranged for the station that two of the lines, or perhaps four, if necessary, could be lowered so as to go forward to the eastern suburbs or to the Quay at any future time.

2629. Then the Hyde Park scheme, as far as St. James' road, would admit of the extension of the line northward, or to include the eastern suburbs? That is so.
2630. Your opinion is that it should be so carried out? Yes; Mr. Deane has promised to arrange the foundations so that that could be done. E. M. G.
Eddy.
11 May, 1897.
2631. In the event of an expenditure for the temporary improvement of Redfern station being decided upon, would the carrying out of the improvement involve the interruption of railway operations to any extent? All alterations interfere with the working of the traffic.
2632. Would it seriously interfere with it? We should have to carry it out in such a way as to interfere as little as possible; but you must see that if you are working a station where everything is carried on at high pressure, and there is no leisure time, if you put a lot of workmen in to pull the place about, you must necessarily interfere with the regularity of the service.
2633. And in that way there would be more expense than would be necessary if you made a terminal station at a distance from Redfern? It is always much cheaper to begin with a clean sheet of paper, and let your men go on without interruption, as opposed to a scheme under which you would be interrupted by the trains every few minutes.
2634. *President.*] Have you seen the plan showing an extension of the railway station over Devonshire-street; you are aware that the level of Devonshire-street from the railway level is not sufficient to allow traffic to pass readily under it; therefore, there will require to be a dip in Devonshire-street of about 1 in 25; the amount to be taken out will be from 6 to 9 feet; we have discussed the question whether it would be better to deal with the whole of the area bounded by Devonshire-street on the south, and going into Belmore Park on the north, and whether it would be wise, in view of future contingencies in connection with the railway, to leave Devonshire-street as level as it was in the first instance by projecting the road a little to the north? Anything which can be done to add to the area of railway property at Redfern will be of immense value in years to come.
2635. You want all you can get? Every yard which can be given.
2636. Have you seen the plan? Yes.
2637. Would that meet with your approval? Yes.
2638. Or any modification of it? That gives the maximum amount of ground.
2639. As close to that as possible would meet your views? Yes.
2640. Would it be useful to you to be able to extend the length of the station in a northerly direction? Yes. Redfern has to deal with goods traffic as well as passenger traffic, and it also has to store a large number of carriages for the general working; and additional space is much required for all purposes.
2641. If Devonshire-street were filled up and moved bodily northwards, you would be able to lengthen your platforms without interfering with your yard? Yes.
2642. Would that be of any advantage? Yes. If Parliament definitely decides not to extend the railway into the city, that is the direction in which we shall have to alter the station. The platforms require to be lengthened. The space in front of the station, in which all the passengers land from their cabs or 'buses, requires to be greatly enlarged, and the waiting-room and cloak-room accommodation also requires to be increased. Therefore, the only way to deal with that work is to lengthen the station towards the Benevolent Asylum.
2643. Therefore, you approve of Devonshire-street being moved to the north? I should like to see it done.
2644. Presuming Parliament thought it wise to bring the suburban traffic into the city, would it then be of advantage to you to have Devonshire-street—that is, if Redfern remained the terminus for the long-distance traffic? Under any conditions, the giving of that additional land to the railway property would be of immense advantage.
2645. Do you suggest any reason why the Cemetery should not be laid out as a park? No; I think it would be a very admirable thing to do.
2646. *Mr. Wright.*] Would it not be better to keep the whole of them for future railway requirements? I dare not suggest that myself; but I should be glad, of course, to have every acre we can get at Redfern in addition to what we have already. It will certainly be of service in years to come.
2647. *Mr. Humphery.*] Would it not be fairer to exchange that portion for any land you take from Hyde Park? That is what I suggest.
2648. *Mr. Hoskins.*] You require an extension of room at Redfern? We should very much like to see Redfern enlarged.
2649. *Mr. Wright.*] How long do you suppose the accommodation provided between Castlereagh and Elizabeth streets and at the Park would be sufficient to meet the growing requirements of our traffic? If you have the two stations as suggested, I think you might safely calculate to go on for twenty years.
2650. If the traffic increases as it has done during the last six years, do you think the Redfern yard will be capable of conducting your business? It is not capable of conducting the business of to-day.
2651. But I mean with the proposed extensions? The extensions will not give us any more room for the goods traffic or for standing passenger vehicles than we have to-day.
2652. Therefore you think, under any circumstances, an extension of the Redfern yard is very desirable? Yes.
2653. *Mr. Humphery.*] Mr. Wright has asked you how long the proposed stations in Castlereagh-street and Hyde Park would meet all possible extension of traffic, and you have stated twenty years;—assuming that you had 10 acres of the Park, for which you first asked, and had your complete terminal station there, both for long and short-distance trains, how long do you think the provision you could make there would meet all possible developments? I think it would meet the requirements for about the same period of time.
2654. You could not make better provision on the 10 acres than would be possible on the two sites? Not with the scheme as it stands. We have eleven platforms in the big station. It is proposed to have six platform lines in the local station, and five platform lines on the reduced plan for the long-distance traffic, so that practically the accommodation is equal.
2655. And without taking any more of the Park it would be possible to provide for additional accommodation for the expansion of the traffic? As I have previously said, I would not contemplate taking any more of the Park for railway purposes than is now suggested. When the time came for increasing the accommodation, it would have to be increased by adopting some other scheme. A very considerably increased traffic could be dealt with in the general station by projecting two or four lines, as was originally contemplated, forward to the eastern suburbs or elsewhere. That would make those platforms simply
platforms

E. M. G.
Eddy.
11 May, 1897.

platforms for calling at, instead of having to stand for five minutes to get rid of passengers, and to load up again and go back. Another way to relieve the station would be practically to adopt the scheme which is now under your consideration for putting a local station between Elizabeth-street and Castlereagh-street. You could then throw out of the big station, which required more accommodation for its long-distance traffic, a very large proportion of the trains to the side station; but if the traffic of Sydney had grown to such a state that that large station could not deal with it, very likely relief would be afforded in other directions. Sydney will become so large that there will be a necessity to relieve it in other ways. I do not look with any apprehension to the idea that the Railway Commissioners will ask for more of the Park by-and-bye.

2656. You are aware that it is assumed that once you are placed in the Park, and get 10 acres, it will not be very long before you take the whole;—is that fear groundless? I think so. In my opinion it is.

2657. *Mr. Trickett.*] If you got that portion of the Park about St. James'-road for the long-distance traffic, and the site opposite for the suburban traffic, would you require the loop-line to Woolloomooloo Bay, shown on the plan, for the purpose of shunting? For the moment it need not be made; but it should be a part and parcel of the scheme which could be carried out later on, with this modification, that instead of making it a loop, I would terminate in a group of sidings into which the trains could run, and then by keeping one line in each group free as an engine line, the engines could run round the trains and go back in the same direction. I say that, because of the necessity for working the suburban trains always with the carriages in the same relative positions to the platforms. You can see that if some of the trains were to run down to Circular Quay, and returned with their carriages in the opposite relative positions to what they had gone there, and then other trains went into a loop and ran round, the two sets of trains when they got to the first halting place would be changed in their positions. One would have the first class and the other the second class in the front, so that there would be confusion all along the line. The people would never know whether the first or the second class was coming in front. Therefore there would be a continual running up and down to adjust matters. Now the carriages are run on the suburban lines with their classes in their proper positions to correspond with the notice boards on the platforms requesting first-class passengers to wait in one place and second-class passengers in another place.

2658. You have stated that you are averse to any proposal for a bridge to North Shore;—are you in favour of any connection between Sydney and North Shore for railway trains? Not at the present time. I do not see the necessity for it.

2659. *Mr. Fegan.*] You stated in your opening remarks, that, as a rule, business people left their business houses and lived in the suburbs; therefore it is not those people who get the benefit of open-air spaces such as Hyde Park; if the Commission saw its way to recommend the use of Hyde Park, or as much of it as is required for railway purposes, would it not be possible to convey the old Cemetery and the Benevolent Asylum grounds to the people for use in place of the portion of Hyde Park which you require? That is what I would recommend the Commission to do. I have proposed that there should be provided in other districts, where open spaces are more necessary than about Hyde Park, a space equal to or greater than is taken from Hyde Park.

2660. And chargeable, of course, to the cost of the proposed line? Yes; of the railway construction.

2661. *President.*] You made a statement on one occasion with regard to an amount of money which should be set aside for the purchase of parks? The only thing given in evidence by me was a recommendation that the Cemetery should be laid out as a pleasure ground, and that £1,000 a year should be debited against railway expenses for keeping those grounds in order. But I would even go further now, and say that, if necessary, as much as £100,000 might be added to the railway capital to provide open spaces in districts needing them more than this part of Hyde Park is needed for the purpose.

2662. *Mr. Roberts.*] Have you considered whether Cook Park and Phillip Park would be suitable for a terminal station, or do you regard their position as too much out of the centre of the city? I do not think their position is so convenient as the top of King-street; and, again, the formation of the land is not so convenient for making a station.

2663. The fact of Hyde Park being so level would, I imagine, render it favourable for a terminal station? Yes.

2664. *Mr. Lee.*] What is your opinion as to the desirability of railway extension for the conveyance of goods to the deep waters of Port Jackson? That is a very big question. I have not gone into the matter with the view of formulating any scheme, because it is not an urgent one, so far as the railways are concerned. The bulk of the goods traffic to and from the railways breaks bulk in Sydney, and any future development of railway traffic in connection with the sea within a reasonable period of time can be met most amply by the extension of the Darling Harbour lines to Darling Island.

2665. For which you are making special provision? The Department of Public Works is now carrying out the railway extension.

2666. Therefore, the urgent necessity for extension is confined entirely to passenger traffic? Yes.

2667. If, in the far future, the contemplated extension does not meet requirements, they can be met by an extension to the western side of the city, which could also be made available for further goods traffic, if necessary? I would not like to give an opinion with regard to the goods traffic and a line which does not exist, because all railway experience is in favour of absolutely separating the goods and passenger traffic when you get into a densely populated neighbourhood.

2668. But, inasmuch as the City of Sydney is the depôt for the commerce of the country and for the shipping of the port, and also the depôt for the railway system, the question of dealing with the goods traffic will arise. You have already told us that sufficient provision has been made for dealing with the exports of the country, such as frozen meat, at Darling Island and Darling Harbour;—if it were thought necessary to utilise the Government property on the eastern side of Woolloomooloo Bay, could that be reached by an eastern extension from the proposed terminus in Hyde Park? No; it would have to be an absolutely independent line. It would never do to take any of the goods traffic along the proposed city extension.

2669. Are we to understand that this line must be looked upon as a passenger line for all time? Yes.

2670. But if it were found necessary to connect the Government shipping property with the railway system for the carriage of goods, I presume there would be no insuperable difficulty in making the connection from some portion of the railway system? No.

2671.

E. M. G.
Eddy.
11 May, 1897.

2671. Therefore, with the facilities which you have on the western side of Darling Island for the exportation of goods, and the large areas held by the Government on the western side, you are of opinion that in the future, if required, all the convenience for the exportation of the produce of this country can be offered from the Government centres which can be connected with the railway system? Yes; it is possible to make an enormous development with the railway system, and export and import at Glebe Island by making a branch line from somewhere about Petersham, and running to Glebe Island. An enormous amount of wharfage could be provided.

2672. But you are of opinion that the traffic at present does not warrant it? There is nothing at all urgent with regard to the matter.

2673. What is your opinion with regard to the contemplated proposal to resume all the wharfs on the eastern side of Darling Harbour, and to extend the railway along those wharfs? I have not considered it, and I would not like to give an opinion.

2674. You think it is not necessary to go outside the accommodation provided at Darling Harbour for railway purposes? No.

2675. And so far as produce arriving from the country for direct shipment is concerned, you are capable of dealing with at the present time? At Darling Harbour and the proposed extensions at Darling Island.

2676. Will you be able to deal with the exportation of meat in large quantities if the rate should increase? Yes; with an enormous quantity at Darling Island.

2677. Therefore, there is no need to anticipate any difficulty in the future from that point of view? No.

2678. As a matter of fact, you have for several years past been organising the railway extension at Darling Harbour, and Darling Island has been acquired for the express purpose of providing for exportations? No; Darling Island was acquired for the export business largely, and up to now we have found that the extensions which were carried out at Pyrmont have met all the requirements: but now there are indications that the export business will increase, and therefore the Department of Public Works is moving on with the preparation of Darling Island for its original purposes.

2679. And your Department will be prepared to deal with them when they are completed? Yes.

2680. In short, then, you are not in favour of the extension of the city railway to the deep waters of Port Jackson;—you are not in favour of the extension of the railway for the conveyance of goods, but you are in favour of the extension of the railway for both long and short distance traffic to a centre at Hyde Park if possible? Yes; as close to King-street as possible.

2681. *Mr. Hoskins.*] Is it intended to extend the proposed George-street electric tramway to the railway platforms from which the steam tramways now leave? Yes.

2682. Seeing that the tramway will take the large majority of people engaged in business in the city nearer their places of business than the Elizabeth-street tramway does, have you considered whether that tramway will not carry a good many passengers whom you probably anticipate will travel by the extended railway to Hyde Park, and, therefore, reduce your estimate of receipts? No. I think the number of people travelling will be in excess of the estimate, because a good many people who now come in—say, from Newtown—by omnibus, will go in the railway train, as they will be taken into King-street so much more quickly than they can now travel by the road. Again, with regard to the tram, the difficulty in dealing with an electric tram system is the enormous number of people who will be turned out of the trains to be carried away by the trams in a few minutes. The electric trams, I am afraid, will not in the busy times be quite equal to the necessities of the case, because they will be required to do what railway trains have been doing up to Redfern station, and a tram service is not capable of doing that. Therefore, I would be very pleased indeed to see the George-street electric tram service relieved of a very large proportion of the present railway traffic, so as to be able to give much more satisfaction to the local traffic in George-street, which will, we think, be very large.

2683. *Mr. Fegan.*] Have you any reports from your officers in reference to the delay which has been caused during holiday times to trains leaving and coming into Redfern station? Yes; we see the working every day.

2684. Can you let us have those reports? They are in the shape of returns. I do not think they would be of the slightest value. The Commission could only learn broadly that at holiday times the trains are so numerous that the insufficient platform accommodation causes them sometimes to be blocked back as far as Hurstville, and it has taken trains an hour or more to come from there to Sydney, the whole key of the position being the insufficient platform accommodation at Redfern.

2685. *Mr. Roberts.*] If there were two distinct stations—one for the long distance, and the other for the purely suburban traffic—would the working expenses of each station be considerably increased? There would be a considerable increase over the expenses of working the whole of the traffic in the one station.

2686. *President.*] Three-fourths of the traffic is suburban; that can be worked between Castlereagh and Elizabeth streets; the proposal to put a station on the other side of the road, taking 180 feet of the Park, you do not view with favour? I would much prefer to see the whole of the traffic under one roof. Failing that, I should like to see the scheme referred to carried out in preference to leaving the question unsettled.

2687. Then, since three-fourths of the traffic is suburban traffic, the commercial basis of the extension is the suburban traffic? Yes.

2688. The suburban traffic passengers, if they could get to King-street, would come there irrespective of what happened to the long-distance traffic? Yes.

2689. Although it would inconvenience one-fourth of the travelling public, it would really be a better paying line by being a suburban line only? I do not think so. You would have to eliminate a very large number of passengers from the calculation as to the revenue. I would also point out that the land for this suburban station is estimated to cost £160,000, and I fancy the works will be very heavy.

2690. *Mr. Humphery.*] Is the land between Elizabeth and Castlereagh streets, and King-street and the Synagogue, of less commercial value than a similar area taken out of the Park? Not the land. If the land were there free from buildings, like the Park, I would say, "Buy it."

2691. *Mr. Wright.*] I suppose you think it is unfair that the railway expenditure should be burdened with a large sum of money, when there is vacant land which would cost you nothing? I do not look at it from the point of view of railway capital, but from the point of view of the people who own the railways. It does not matter what is put upon the railway capital, so far as the Commissioners are concerned. It

seems

E. M. G.
Eddy.
11 May, 1897.

seems to me an unwise thing to burden the users of the railway for all time with an unnecessary amount of capital, which means, of course, paying more rates every year than are necessary.

2692. If the scheme of double stations is adopted, will there be a station at Liverpool-street also? Yes; I think there should be booking-offices facing Liverpool-street, so as to drop all those who want to go to that neighbourhood about the Town Hall.

2693. I suppose there would be a platform? Yes.

2694. You are aware that a portion of the land on the site of the proposed Castlereagh-Elizabeth street station is already Government property, and that the Government are getting next to no revenue from it? Yes.

2695. Therefore, the same remark would apply to that property as applies to the Park? Yes.

2696. *Mr. O'Connor.*] Supposing Parliament decided not to concede your request with regard to the resumption of a portion of Hyde Park, would the portion Mr. Wright alluded to as already belonging to the Government meet all requirements? It would only meet part of the requirements of a local railway station, which local railway station would not meet the requirements of the long-distance traffic.

2697. If, in the future, the city extends towards where the railway station is at the present time, would not that site meet all requirements? Although buildings for residential and other purposes may increase in the direction of Redfern, the business of Sydney will demand that those people shall come into the heart of the city and go out from the heart of the city. Therefore, the argument that the city is extending that way is not an argument against the extension of the railway; because, although the people do not reside in the city, if Sydney business increases, as we expect it will, the number of people coming in to business every day will increase, and those people will have to go home at night.

2698. You state that if you take 10 acres of Hyde Park you have ample accommodation for twenty years;—is it not fair to assume that in twenty years land will increase in value, and would it not be better to take up sufficient land now for 100 years? No; I think it would be more desirable to modify the arrangements, and take the people nearer to the destinations they wish to get to under the altered conditions of the city. It will be necessary to review periodically the requirements of the travelling public, and to meet them as circumstances change.

2699. Is it not clear, from your own statement, that the portion of the Park referred to will only give accommodation for twenty years, and that eventually you must take the whole of the Park? No; I think the arrangements would have to be modified. As I have pointed out, that station could be made to accommodate a large and increased number of trains by projecting a part of the lines out of the station towards the eastern suburbs or towards the harbour, or across the harbour if the business increased very largely; and then when it gets beyond that stage you could create a local station alongside, on the site now discussed, and so relieve the big station of a large number of trains, and thus enable it to accommodate the long-distance traffic for a very much longer period of time than would otherwise be possible.

2700. Have you considered a scheme for the continuation of the railway from the present site in Darling Harbour along the wharf, on the eastern side as far as Market-street; a proposal has been made to carry the railway round;—have you studied that side of the question? No; because there is no necessity in connection with the railway traffic at the present time to have such communication. The amount of direct export and import is comparatively small, as compared with the amount of business which breaks bulk in Sydney, or has to be dealt with in Sydney for some purpose or other.

2701. Do I understand that the goods freight, as distinguished from passengers, is not of sufficient importance, in your estimation, to warrant a departure of that kind? The goods traffic must be kept absolutely separate. As I have pointed out, the accommodation at Darling Harbour and Pyrmont, plus the accommodation now being provided in connection with Darling Island, will meet the necessities of the export and import business direct with the railways for a long period of time.

2702. Would you make the terminus at Darling Island? Yes, for the present.

2703. Supposing there is a consignment to Goldsbrough, Mort, & Co., of Circular Quay, would they not have to go for their goods to Darling Island? To Darling Harbour.

2704. Would it not be better for them to be able to get their goods somewhere nearer home? You could not do it. Because there happened to be one package from the interior consigned to them you could not run a truck to them. The trucks come down loaded with consignments to a number of people.

2705. I only mentioned Goldsbrough, Mort, & Co. as an instance; nearly all the stores of the city are centred at Circular Quay? Yes; they are spread about—they are even at Pyrmont; so that the running of the trucks to Circular Quay would not suit the whole of them. A great deal of the wool is delivered in Macquarie-street.

2706. If you get 10 acres of the Park, you think it sufficient to carry you on? Yes; for many years to come. Then other arrangements could be made. If we found the station was insufficient for business requirements, other arrangements in the direction of relieving it would be made.

2707. If, at the end of twenty years, it was found that the 10 acres were inadequate, what course would you suggest? The extension of some of the lines through the station to the eastern suburbs; and, when that was found insufficient, the construction of a local line, either alongside, or on the western side of the city, or wherever it was found the then largely-increased business required the new accommodation.

2708. *Mr. Clarke.*] In the event of the main station being formed at St. James'-road, might not objection be taken to it by those who attend the Supreme Court, St. James' Church, and St. Mary's Cathedral, as an eyesore and an annoyance, because of the smoke? I do not think the station would be an eyesore. I think it would be an ornament, and there would not be enough smoke to cause annoyance. The Supreme Court is recognised by everyone as being rather too noisy at the present moment, and the sooner it is removed from its present position the better.

2709. You do not want to go further than St. James'-road at present? No; but I look forward to the time when the ground occupied by the Supreme Court and St. James' Church will be thrown open, so as to form a large open space in a very busy part of the city.

2710. Might it not cause those who attend the Supreme Court, St. James' Church, and St. Mary's Cathedral—the latter of which is not likely to be removed—annoyance? I think not. We will take care not to run the trains during service time. We do not do so now.

2711. *Mr. Humphrey.*] Would not the initial expense be very much greater if you had two station sites upon which to provide buildings than it would be if you concentrated the whole of your terminal arrangements and buildings on one site? Everything, both in regard to cost of construction, working, and convenience of the public, would be better met by having one station instead of two.

2712. *Mr. Black.*] In making your statement, you said you thought the country could be recouped for its expenditure by a system of penny fares to King-street? What we would do would be to add 1d. to all the fares of the public travelling into Sydney.

E. M. G.
Eddy.

11 May, 1897.

2713. Have you considered that the penny increase on the railway would, in a large number of instances, mean a reduction of nearly 2d. on the tramway? Yes.

2714. If that be so, where does the gain to the country come in? We are anxious to get rid of some of the traffic in Elizabeth-street and George-street, because it cannot be conducted satisfactorily, and when we get rid of the railway trams we shall be able to give better services to the various suburbs, which will bring us in more revenue than we shall lose by the short-distance railway traffic.

2715. Do you mean you will tempt more people to travel? We shall carry by the trams more people than we carry to-day. We cannot efficiently carry on the business with the different suburbs, because of our inability to put more trams on the lines; therefore, the omnibus people are carrying more people than they otherwise would.

2716. You expect that with increased facilities there will be a sufficient number of passengers carried between Redfern and King-street in excess of those who now travel by tram between Redfern and King-street to recoup the country in its expenditure in railway extension? Yes.

2717. In your proposal, are you actuated by a desire to relieve the over-burdened Redfern Railway Station, or by a wish to carry the public further into the city? The overburdened condition of Redfern causes us to make some alteration to carry on the business satisfactorily. That necessarily raises the question: what is the best thing to carry out? The public continually complain of being landed at Redfern when they wish to come into Sydney, and having to pay a tram fare, and occupying twenty minutes to do what a railway train would accomplish in about three minutes. Therefore we felt that we should be acting unwisely in the interests of the country, to propose a large expenditure at Redfern without raising for settlement the broader question of whether there should be an extension into the city.

2718. Could you not accomplish your object of carrying people to King-street more rapidly simply by an extension of the railway line without the removal of the central railway station? Yes, if you have sufficient accommodation at the terminus to deal with all the traffic; but we are not proposing to remove Redfern station; it will remain there for everybody's use as it is to-day.

2719. But you are proposing to make another station somewhere else as a main station? Yes.

2720. I suppose you consider that the chief station of any city should be central? Yes.

2721. Do you not think that Redfern is near the centre of the city of Sydney? It is not where the people wish to get to, and what we require to do is to put the station at the spot to which the people wish to travel, and the bulk would be accommodated by having it at King-street.

2722. Do you not think you could take the people where they wish to get by running a line of rails past the place to which they wished to get? Yes, a certain class of traffic; but not long-distance traffic. Long-distance travellers wish to get to the railway station, and take their seats in comfort, and they always make a point of getting there when they are travelling with their wives and families fifteen or twenty minutes before time. You cannot deal with that traffic at a roadside station.

2723. Supposing you had a connection with North Shore by a bridge or tunnel to convey trains across, and that Redfern could thus be fed from the north as well as from the south,—would not that attain some of the demands of those people? It does not want to be fed, but it wants to be relieved.

2724. If there were an extension to North Shore, and perhaps another in the Paddington, Waverley, and Woollahra direction, possibly Redfern would be better than any other central point you could name? I do not think so. I think King-street is the most convenient point for the eastern suburban line. The people in the eastern suburbs want to come to King-street and not to Redfern for business.

2725. Then the difficulty of route presents itself? No; a route has been worked out for an extension through Paddington, and out ultimately to Double Bay, Rose Bay, and South Head.

2726. Would not that mean very heavy resumption? Necessarily, and the time has not come for it. The tram service meets the requirements of the people at the present time.

2727. *Mr. Hassall.*] The extension of the railway into the city is only to deal with the passenger traffic? That is all.

2728. In view of the facilities afforded at the present time, which are likely to be materially increased by the construction of the electric tramway down George-street, do you think it is absolutely necessary to bring the railway further into the city? Yes.

2729. Which then, in your opinion, is the best site for the railway to be brought to? Hyde Park.

2730. The alternative proposals are merely submitted in case the Hyde Park site may not be agreed to? That is all, and they are submitted with very much regret.

2731. In view of the large areas of land available in the vicinity of King-street, you think you would be justified, taking into consideration the benefits which would be conferred on the whole Colony by the extension of the railway into the heart of the city, in asking the people to give you one portion of Hyde Park, in order to afford them facilities for getting into the city? Yes; to use it for their own purposes. If public feeling is so strong as to require the maintenance of the same open spaces as we have to day, I would recommend that the railway capital should be debited with the cost of providing an equal amount of space or more elsewhere where it would be of more service to the masses of the people than the space taken away for the railway station.

2732. In other words, you are of opinion that the space you ask for in the corner of Hyde Park can be put to better use, and utilised in a far more profitable manner than it can be under existing conditions? Yes.

WEDNESDAY 12 MAY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.	CHARLES ALFRED LEE, Esq., M.P.
The Hon. JAMES HOSKINS, M.L.C.	JOHN LIONEL PEGAN, Esq., M.P.
The Hon. CHARLES JAMES ROBERTS, C.M.G., M.L.C.	THOMAS HENRY HASSALL, Esq., M.P.
The Hon. WILLIAM JOSEPH TRUCKETT, M.L.C.	GEORGE BLACK, Esq., M.P.
The Hon. DANIEL O'CONNOR, M.L.C.	FRANCIS AUGUSTUS WRIGHT, Esq., M.P.
HENRY CLARKE, Esq., M.P.	FRANK FARNELL, Esq., M.P.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, further examined:—

- H. Deane.
12 May, 1897.
2733. *President.*] If we take a small portion from the Park for a station for the long-distance traffic, and the area between Castlereagh and Elizabeth streets for a station for the suburban traffic, will Elizabeth-street be left intact between the two stations? Yes; and there would be subways underneath. The station for the long-distance traffic will be a surface station as near as possible. The other one would be sufficiently below the ground to allow of an extension afterwards under King-street, if required.
2734. *Mr. Hoskins.*] Is it proposed to have very elaborate station buildings? No; not more than is necessary. Of course in those positions they would have to be presentable buildings.
2735. *Mr. Lee.*] Are the proposed stations to face the same street;—is it proposed to make a new street, or to continue St. James'-road through the High School building, and make a street through there, and then let both stations face that street? That would probably be done.
2736. *President.*] That is on your plan? Yes.
2737. *Mr. Lee.*] Therefore, anyone approaching the stations could drive to one or the other? Yes.
2738. Although they would practically be separated, they would for all purposes be together? Yes; and there would be subways to connect them. I understand that you wish to know whether the fronts of the two stations will be in one line. If they were to be actually in one line it would be necessary to pull down a part of the Registrar General's Office.
2739. Without having to go so far as that, and making St. James'-road the northern boundary of your extension, how will the station then stand in relation to the proposed station on the High School ground? If the site between Castlereagh and Elizabeth streets is taken for the suburban trains, and an additional station is made for the main-line traffic without interfering with the Registrar General's Office, I think the main-line station would have to stand a little back from the other.
2740. Then it is proposed to make a new road from Castlereagh-street to Elizabeth-street, which would give access from the western side of the city to the long-distance passenger station? Yes.
2741. Without compelling people to go through King-street? Yes.
2742. That is the intention? Yes.
2743. Under the original proposal—that is, the Hyde Park scheme—how was it proposed to cut off the remainder of the Park from the portion taken—by an iron fence or a wall? That is a detail which could be suitably arranged. One day when I was before the Commission that matter was discussed, and I think the conclusion was that an iron railing would serve perfectly well round the openings.
2744. Would the same remark apply to a lesser portion of the Park being taken for the alternative scheme? Of course that would be entirely blocked by the station walls. I doubt whether anything would be gained there by the construction of iron railings. A complete corner of the Park would be taken—not mere isolated patches such as you would have in carrying the line between Liverpool and Park streets. I think it ought to be fenced or walled off securely.
2745. If it is necessary to erect a wall I suppose it would not be a very costly matter? No.
2746. How far will the Castlereagh-street platform be below the ground? Fifteen feet.
2747. Necessarily an important station like that will require a good access to it by means of steps, and steps which are not of a steep character;—would you be able to get a sufficient pitch there from the station to the surface without intruding upon the kerb in Castlereagh-street? Yes; there would be a staircase down to each platform. The arrangement would probably be as indicated on the plan. The plan shows the new street with a footpath and verandah running in front of the building. Passengers would enter through the booking offices.
2748. At which end is it proposed to have the booking offices? In the middle, facing the new street.
2749. Where would be the entrance to the Castlereagh-street station? There would be two entrances. The main entrance would be from the new street, and it would probably be in the centre of the building.
2750. Will that be the only one? No; it is proposed to have one at the other end of the station.
2751. Will there be no entrance from the street between those two points—either in Castlereagh or Elizabeth street, or both? It is not proposed to have them, and I do not think they will be required; but I am quite sure the Railway Commissioners will endeavour to serve the public interest in that respect.
2752. In sinking there to get your levels, are you likely to interfere with the existing sewerage and gas and water communications;—will you interfere with the sewerage at the top of Bathurst-street, where there is a ventilating shaft? No. I may add that passengers coming from the station through the new street will get on to a bridge or verandah running along the building, and from that bridge there will be staircases to each platform. There will be three platforms and three sets of staircases. The same will be the case at the further end of the station.
2753. You will enter at one end and leave at the other? You could enter or leave at either end, as passengers required.
2754. If that is going to be the dead-end of the extension, how is the shunting to be carried on? There will be engine roads—that is to say, short spurs, where an engine could stand and be run back on to the train after it comes in and when it is time for it to go out again; and when the engine which brought the train in is thus relieved, it can run out and take up its position for the next train.
2755. You have sufficient room to admit of that being done? Yes; that can be arranged.
2756. And more accommodation will be provided at the long-distance passenger station to enable the trains to be properly marshalled? Yes.

2757.

H. Deane.
12 May, 1897.

2757. Why would it be necessary to encroach on St. James' Road, assuming you could take that corner of the Park for a terminal station? It would only be necessary if you wanted to bring the fronts of the two buildings up in a line.

2758. What length have you provided for terminal station platforms for suburban passengers? The platforms are arranged for 500 feet; the length of the station would be 660 feet.

2759. Would you require a greater length than that if, instead of putting your station between Elizabeth and Castlereagh streets, you put it in the Park, for suburban and country passengers? I do not think they could be placed both together.

2760. Did not your original plan propose that the terminal station for all passengers should be in Hyde Park? Yes; but then the accommodation was very much larger.

2761. Assuming that the whole accommodation you originally intended to provide were provided at that corner of Hyde Park, why would you require so much greater length there than you appear to require in the suburban passenger station now under consideration? The arrangement for the original station was much more extensive and more complete, and being an end station a good deal of room was taken up in having the buildings at the end and having an end-crossed platform. The station in Castlereagh-street being sunk below the surface of the ground, the buildings will be on the street level over the lines. I understand it will be necessary in this case, if the line stops here now, to provide for its future extension towards the harbour.

2762. There is a suggestion before the Commission that the long-distance passengers should have accommodation at St. James' Road? Yes.

2763. What length will you require to provide that accommodation? About the same length as was provided before. The platforms were about 700 feet in length. Probably the length will be a few feet more than is shown on the first plan.

2764. What would be the maximum length of the space required for the long-distance passenger station between St. James' Road and Park-street? It will take up the whole of that length.

2765. Why do you require so much greater length there than for the suburban passenger station? A great deal of that will be above the ground. The other will be covered over. In the case of the suburban traffic the length I have given you—660 feet—is really only that part of the station which the public use; but the approach to that station under Elizabeth-street from Park-street is just as necessarily a part of the station, although a good deal of it is covered over.

2766. But is the width of the approaches greater for the suburban passenger station than would be necessary for a long-distance passenger station? No, it is not. The width is rather less, because there are only four lines coming into the suburban station.

2767. According to the evidence you have given, you must encroach upon St. James' Road, and it will be necessary to take a portion of the Registrar-General's Office? I said you would have to take a portion of the Registrar-General's Office if you wanted to bring the two stations in line, but it is not necessary to do so. The long-distance station could be set back.

2768. If the long-distance station could be set back by separating the suburban from the long-distance passenger traffic, would not it be possible to set back the general terminal station, supposing you had both stations adjoining in Hyde Park;—why cannot you put your general station on the 10 acres of land without rendering it necessary to take any portion of the Registrar-General's building? I think I pointed out that if the station was set back there would not be as much room for a parcels office and a horse and carriage dock. With a big station there is a big splay, and you want to go further back for a big splay than you would for a narrower one.

2769. If you had the whole of the passenger traffic concentrated on the one terminal station, would not it be possible to construct your station as to avoid that resumption of the Registrar-General's Office which you first thought was necessary? Looking at that plan which has been worked out for the big station, I do not see how it could be brought further back, because it takes up the whole of the length between Park-street and the Registrar-General's Office.

2770. *Mr. Hoskins.*] Where do you propose to diverge from the main line to go to the proposed station in Castlereagh-street? We should have to diverge on the southern side of Park-street.

2771. Would not you require to resume a good deal of valuable property to do that;—how would you get across the level of the street to the High School? The property which you would have to take to carry out that scheme has been reported upon by Mr. Perdriau.

2772. *Mr. Humphery.*] Will you make it clear why it is necessary to have so much greater length for the general station than you appear to require for two stations? It is rather difficult at the present time for me to give any detailed explanation, seeing that the details have not really been worked out; but I might point out that when you separate the long-distance traffic from the other you virtually make a smaller station—you halve that portion of the station. That portion of the station will require a smaller approach for itself, and a narrower approach than will the big station; that is to say, the splay will not be so great—it will only be one-half. I am assuming that the passenger traffic diverges south of Park-street. Then one can take the other portion as a distinct thing by itself; and for that portion there will be less splay. If you have to move the station buildings a little further back from the Registrar-General's Office there will very likely be room for a parcels office in the corner, between the two sets of lines.

2773. *President.*] How close would your line go to the Synagogue? As close as we could without affecting the construction.

2774. *Mr. Trickett.*] Practically, within a few feet? Yes.

2775. Would that interfere with public worship in that building? I think they will hear the rumble of the trains.

2776. *Mr. Clarke.*] Do you think it would be advisable to resume the whole of the land up to King-street in lieu of the proposed new street? I do not think there is any necessity to go up to King-street. In my opinion, it is better to stop clear of it.

THURSDAY, 13 MAY, 1897.

Present:—

THOMAS THOMSON EWING, Esq., M.P. (PRESIDENT).

The Hon. FREDERICK THOMAS HUMPHERY, M.L.C.

The Hon. JAMES HOSKINS, M.L.C.

FRANCIS AUGUSTUS WRIGHT, Esq., M.P.

FRANK FARNELL, Esq., M.P.

J. Horbury Hunt, Architect, further examined:—

J. H. Hunt.
13 May, 1897.

2777. *President.*] I understand you desire to place further evidence before the Committee? I desire to add to my previous remarks by bringing to your immediate consideration my proposal for a city railway station, and other matters, as shown on my plan; when I say station I do not mean terminus. The site I suggest will eventually be the very eye of our future city business life, for it is a certainty that this section of the city known as Dawes Point will be levelled down and relaid out as here indicated by this plan. It looks to be a big undertaking. However, it must be carried out before long. Therefore any railway extension to the city—regardless of the future rebuilding of this part of the city, I submit, will not be wise. A station placed as here indicated, with the proposed improvement of this section of the city is, I think, self-evident as being the proper site both from a commercial and general point of view. The station as here placed would be entered direct from the higher ground at back from a tunnel without interfering with any streets—it would also be midway between the harbour portion of Circular Quay and Darling Harbour—which must be admitted a good feature. To lay down any railway scheme by which it will be required to complete such scheme in the future—by bridging the harbour from Dawes Point to Milson's Point—would clash with this proposed improvement, which I repeat must ere long take place at Flagstaff Hill and Dawes Point. I was prompted to ask for this further opportunity of speaking to you, because of the present proposal to tunnel across or bridge the harbour. I maintain that if any attempt is made to bridge the harbour from this point, then this proposed station improvement will clash with it, and, if at some future date it should be undertaken, then it will involve a tremendous expense. Any railway project fixing on Dawes Point as a bridge site, will have to fight this city improvement project on the one hand, while it will have on the other Darling Harbour interests to contend with. The future of Darling Harbour and the Flagstaff Hill section of the city, are two big factors in the future helping onward of Sydney to her great commercial position. Anything that may be done with our new railway station, which will interfere with us as architects in dealing with this important section of the city, will be a very serious matter. I contend that the North Shore railway connection should be as indicated on my plan—by a suspension-bridge from the city to Balmain, Goat Island, and Ball's Head, thus taking the traffic to a broader area of North Shore—namely, to the west of St. Leonards. The platform elevation of a bridge at this position would not interfere with the waterway to the docks. Any form of tunnel communication I would condemn. When the public came to experience the fact of having to travel underground four or five times the distance represented by the initial difficulty—namely, some 30 or 40 chains of harbour surface—depend on it then the fat would be in the fire. The land connection for a bridge at Ball's Head is naturally all that can be required for such a project, while the approach from Sydney *via* Balmain will be easy for railway and all other kinds of traffic. Do what you may, pray look well to the future position of this city.

[To Evidence of H. McLachlan, Secretary to the Railway Commissioners]

TRAM TRAFFIC BETWEEN REDFERN RAILWAY TERMINUS AND KING-STREET.

Office of the Railway Commissioners, Sydney, 15 March, 1897.

Sir,
In compliance with the request of the President of the Royal Commission on City Railway Extension, relative to the tram traffic to and from the railway, I am directed to inform you that the number of passengers travelling to and from the railway by tramway is 3,000,000 per annum.

With reference to the point of entering and leaving the trams, I am to say that the principal stopping-places are King and Market streets, and it is estimated that about one-fourth of the passengers travel beyond King-street.

I have, &c.,

H. McLACHLAN,

Secretary.

The Secretary, Royal Commission on City Railway Extension.

C1.

THE SYDNEY AND BRISBANE TRAFFIC AND THE NORTH SHORE RAILWAY.

Office of the Railway Commissioners, Sydney, 5 May, 1897.

Sir,
With regard to your question as to whether the through traffic between Sydney and Brisbane could be carried over the North Shore railway, I am to point out that it would not be practicable to work the traffic in the way indicated. In the first place, the traffic in connection with the Sydney main suburban line is much greater than that on the North Shore railway, while the traffic from the Southern and Western lines has also to be considered. Further, the facilities *via* the main suburban line are much superior to those existing on the Milson's Point line, the latter being a single one only.

I have, &c.,

H. McLACHLAN,

Secretary.

The Secretary, Royal Commission on City Railway Extension.

E.

[To Evidence of S. E. Perdriau.]

STATION SITE FOR LONG-DISTANCE TRAFFIC.

THE total length of the land suggested as a site for a station for long-distance traffic is 665 feet, and the width is about 130 feet, giving an area of 1 acre 3 roods 18 perches.

This includes the block above described bounded by Liverpool, Elizabeth, Goulburn, and Castlereagh streets, and that part of the block lying immediately to the south thereof referred to above as portion No. 1, together with the intervening portion of Goulburn-street.

The municipal assessments for this area amount to £3,913. This at twenty years' purchase would represent a value of £78,260.

If twenty-five years' purchase be adopted the value would be £97,825.
13th May, 1897.

STEPHEN E. PERDRIAU.

E 1.

CITY PROPERTY VALUATION.

VALUATION (adopting the municipal assessments for the year 1896-1897) of that block of the city of Sydney bounded on the north by Liverpool-street, on the east by Elizabeth-street, on the south by Goulburn-street, and on the west by Castlereagh-street—Area, 1 acre 1 rood 36 perches.

THE municipal assessments for the above mentioned block amount to £2,865 per annum, and this at twenty years' purchase would represent a value of £57,300.

If twenty-five years' purchase be adopted the value would be £71,625.

NOTE.—The above valuation is exclusive of the customary allowance of 10 per cent. for forced sale and for compensation for disruption of business.

There is not a first-class building in the whole block—they are mostly small, inferior, and old-fashioned, and the businesses carried on are comparatively unimportant.

13th May, 1897.

VALUATION (adopting the municipal assessments for the year 1896-1897) of that block of the city of Sydney bounded on the north by Goulburn-street, east by Elizabeth-street, south by Campbell-street, and west by Castlereagh-street. Total area, 1 acre 1 rood 14 perches.

As requested, I have subdivided the block into three portions as follow:—

Portion No. 1.—The northern portion—area 1 rood 22 perches—embraces the frontage to Goulburn-street, and extends southerly 130 feet along Elizabeth-street and Castlereagh-street. The municipal assessments for this portion amount to £1,048. This at twenty years' purchase would represent a value of £20,960.

Portion No. 2.—The south-eastern portion—area 1 rood 36 perches—extends from portion No. 1 southerly along Elizabeth-street to Campbell-street, a total length of about 320 feet with an average depth of about 65 feet, backing on to portion No. 3. The municipal assessments for this portion amount to £1,044. This at twenty years' purchase would represent a value of £20,880.

Portion No. 3.—The south-western portion—area 1 rood 36 perches—extends from portion No. 1 southerly along Castlereagh-street to Campbell-street, a total length of about 320 feet with an average depth of about 65 feet, backing on to portion No. 2. The municipal assessments for this portion amount to £1,279. This at twenty years' purchase would amount to £25,580.

The total assessments for the block amount to £3,371, and this at twenty years' purchase would be £67,420.

13th May, 1897.

STEPHEN E. PERDRIAU.

F.

TOTAL COST OF GOVERNMENT WHARVES.

The Treasury, New South Wales, Sydney, 18 March, 1897.

Sir, In compliance with your request, I am directed to hand you, enclosed, copy of a return which has been furnished by the Department of Public Works, showing the total cost of Government wharves, &c., in Sydney Harbour up to the present time.

I have, &c.,

Public Wharfs Office, Circular Quay, 17th March, 1897.

JOHN JACKSON,
Manager.

H.

YEARLY EXPENDITURE ON GOVERNMENT WHARFS.

Sir,

The Treasury, New South Wales, Sydney, 8 April, 1897.

With reference to your letter of 24th ultimo, I have the honor to hand you, herewith, a statement showing the yearly expenditure on the Government wharfs in Sydney Harbour up to 31st December, 1896, so far as can be readily ascertained from the books of the Department of Audit.

I also enclose, for the information of the Commission, a copy of the Audit Department memorandum which accompanied such statement.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

The Secretary, Royal Commission on City Railway Extension.

PAYMENTS from the Account Charges on Collections, the Annual Vote "Public Wharfs," and other Votes under the Colonial Treasurer for the service of Public Wharfs generally, from 1874 to 31st December, 1896.

Year of Payment.	Amount.		
	£	s.	d.
1874	1,077	15	1
1875	1,593	17	4
1876	1,788	2	1
1877	1,395	11	1
1878	1,341	6	3
1879	1,801	12	5
1880	1,497	15	8
1881	1,652	14	4
1882	2,019	3	10
1883	2,546	1	1
1884	3,192	14	11
1885	2,846	7	0
1886	4,399	0	11
1887	3,680	17	2
1888	3,379	17	0
1889	5,031	8	5
1890	5,031	4	9
1891	4,518	5	3
1892	7,990	9	7
1893	6,458	19	5
1894	5,656	19	3
1895 (January to June)	2,804	16	7
1895-6	5,220	1	9
1896 (July to December)	2,267	16	1
Total expenditure on salaries, &c., exclusive of payments under Public Works Department and interest on loan expenditure.	79,192	17	3
Total revenue received, as per statement compiled by Captain Jackson	533,939	10	10
Net revenue	£ 454,746	13	7

Memo.—It is not possible to furnish information of expenditure on each wharf without very considerable labour. A return, however, has been prepared which shows approximately the salaries, &c., paid in administration of the Sydney wharfs; the sum, however, is exclusive of payments under the Public Works Department and interest on loan expenditure. I may point out that the bulk of the expenditure incurred for wharfs was out of loan moneys, hence the amount of interest owing by this service must be considerable, and instead of any net revenue, as mentioned in a letter of the Secretary of the Public Works Committee, dated 24th March, 1897, there must be a larger net expenditure.

Sir,

The Treasury, New South Wales, Sydney, 5 May, 1897.

With reference to your letter of date 24th March last, I have now the honor to hand you, enclosed, a statement prepared by the Department of Public Works, showing the yearly expenditure under the Public Works Department upon Government wharfs in Sydney Harbour from 1st January, 1874, to 30th December, 1896, exclusive of purchase of land.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

The Secretary, Royal Commission on City Railway Extension.

Department of Public Works, Account Branch, 27 April, 1897.

RETURN showing the Yearly Expenditure under the Public Works Department, upon Government Wharfs in Sydney Harbour from 1st January, 1874, to 30th December, 1896 (exclusive of purchase of land).

Year.	Amount.	Year.	Amount.
	£ s. d.		£ s. d.
1874	2,146 3 7	1886	3,894 2 0
1875	3,565 14 2	1887	5,749 16 1
1876	1,528 9 2	1888	26,255 8 2
1877	1,242 1 3	1889	37,084 1 6
1878	2,818 14 1	1890	51,871 19 1
1879	7,912 12 2	1891	23,591 5 3

1885	15,432 1 6		
		Total	£ 392,355 9 5*

* Reducing the net revenue stated above to £62,391 4s. 2d.

I.

[To Evidence of H. Deane, Engineer-in-Chief for Railway Construction.]

ESTIMATED COST OF LOOP-LINE SCHEME.

THE following are the particulars of the estimate for the alternative scheme for bringing all traffic, except the Melbourne expresses and mail trains, into a station between Elizabeth and Castlereagh streets, at or about the site of the High School :—

Lowering Devonshire-street	£21,200	
To Liverpool-street	95,000	
Elizabeth-street	70,000	
Station	164,000	
Signalling and lighting	14,000	
Shelter-sheds at Redfern	20,000	
Loop, Inner Domain	72,500	
		456,700
Resumption		260,000
		<u>£716,700</u>

I 1.

ESTIMATED COST OF DUAL SCHEME.

THE following is an estimate of bringing the Suburban traffic into a station below Elizabeth-street and Castlereagh-street, and all long-distance traffic, including expresses and mails, into the corner of Hyde Park :—

Lowering Devonshire-street	£21,200	
To Liverpool-street	95,000	
Elizabeth-street	70,000	
Station, High School site	80,000	
Signalling and lighting (say)	12,000	
Shelter-sheds at Redfern	20,000	
		298,200
Resumption		260,000
Widening for two lines	122,000	
Station work, Hyde Park	39,000	
Station, Hyde Park, with two storeys above ground-floor	122,000	
Signalling and lighting (extra)	9,000	
		<u>202,000</u>
		<u>£850,200</u>

I 2.

THE ST. JAMES' ROAD STATION.

THE station at St. James' Road can be constructed so that there will be no interference with St. James' Road, St. James' Church, or the Registrar-General's offices. Park-street may require to be raised slightly, but not more than 2 or 3 feet, if anything.

The level of Park-street, where the line passes under it, is 90.50, and the level of the rails at the same point is 72.50, which is nearly the same as Elizabeth-street where Market-street abuts, so that although the ground rises along St. James' Road, it will be seen that the entrance to the station at that place will be practically at the street level.

H. DEANE,

Engineer-in-Chief for Railway Construction.

28th May, 1897.

J.

Department of Taxation, Sydney, 25 May, 1897.

ESTIMATED COST OF RESUMING CITY PROPERTY FOR RAILWAY PURPOSES.

Sir,

As desired by you, I have devoted as much time as possible, at so short a notice, to reviewing the figures supplied by Mr. Perdriau to your Commission in connection with the City Railway Extension.

Regarding the resumption of a strip of land 100 ft. wide from the present terminus to the Circular Quay, I am of opinion that, provided the surface is to be resumed, the cheapest route will follow that reported upon in 1891, crossing the Benevolent Asylum, Belmore Park, and running between Castlereagh and Elizabeth streets, and having as a terminal point the Custom House. This route would probably be 50 per cent. cheaper than a western scheme.

I hesitate before giving you even a rough estimate without a plan of some sort showing a proposed route and buildings required to be taken.

As to the resumption of a strip of land round the foreshores of Darling Harbour from Dawes Point to the present railway terminus, I have perused the figures of Mr. Perdriau, amounting in all to £5,000,000; and, stupendous as they may seem, I question whether they are at all over-estimated.

The taxing of the unimproved value of this property has naturally given us a large insight into the money sunk in these water-frontage properties, and when the disturbance to business is taken into account the figures are enormous.

Two claimants would have cases aggregating some £700,000, which they could possibly substantiate. In this connection, I would like to point out that the wharfs when resumed would not be of equal value to the State as to the individual; as they are used as an adjunct to other businesses, and, worked conjointly with other branches of mercantile business, they have special values.

Should such a gigantic scheme as the resumption of the foreshores of Darling Harbour be carried into effect, such sums would be claimed, and possibly sustained as damages, as would prevent the wharfage, as a Crown asset, paying interest for many a long year to come.

I do not think a strip of land 100 ft. in width, extending from Redfern to the Quay, comprising an area of 20 acres, could be obtained for an expenditure of £1,800,000 on the western side of the city.

In the case of the North Sydney Railway to Milson's Point, no claim was made for land through which the tunnel was constructed, except where the surface was prejudicially affected.

EDWARD J. SIEVERS,
Government Land Valuer.

The Secretary, Royal Commission on City Railway Extension.

PLAN.

Condobolin to Euabalong Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM CONDOBOLIN TO EUABALONG.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Condobolin to Euabalong," have, after due inquiry, resolved that it is not expedient that the proposed railway be constructed, but they recommend, in connection with any proposal for a railway to Hillston, that a survey be made for a line from Koorawatha, with a view to its consideration in conjunction with existing surveys; and, in accordance with the provision of sub-section (iv), of clause 13, of the Public Works Act, report their recommendation to the Legislative Assembly:—

GENERAL STATEMENT.

1. The first action in connection with this railway extension as a separate proposal, the Committee were informed by the Under Secretary for Public Works, "was taken in April of this year, when the Railway Commissioners, in a letter to the Colonial Treasurer and Minister for Railways, pointed out that as the line to Condobolin was approaching completion, it was most desirable that an extension forward to Euabalong should be proceeded with without delay, as such a line would have a most important bearing upon securing to New South Wales the traffic of the centre of the Colony." They, therefore, urged that a survey of this section should be completed, and an estimate for the construction of the line submitted, in order that the Government might consider the desirableness of carrying out the work.

This letter, forwarded to the Minister for Public Works with a strong endorsement of the Commissioners' recommendation by the Colonial Treasurer, led to an estimate of cost being prepared, a survey having already been completed in connection with the proposed line from Condobolin to Broken Hill; and, in accordance with the provisions of the Public Works Act, the Railway Commissioners were invited to submit their report on the proposal. This they did on 2 July last, and on 5 August, on the motion of the Minister for Public Works, the proposed extension was referred by the Legislative Assembly to this Committee for consideration and report.

In their report, the Railway Commissioners, referring to the route of the railway as one favourable for the purpose of opening up and securing the traffic of the centre of the Colony, point out that, in view of existing lines, it will, when the time arrives for such a further extension, form a direct line to Hillston; and the Under Secretary for Public Works, in his statement to the Committee, speaking for the Minister for Public Works, mentioned the bearing which the question of railway connection with Hillston has upon the subject of the present inquiry, and explained the action taken in the past to give Hillston railway communication. This direct intimation, that, while the proposal referred to the Committee was a railway from Condobolin to Euabalong, the real objective point to which

which it was intended the railway from Condobolin should be carried is Hillston, made railway communication with Hillston a question in the inquiry demanding full consideration before the proposal actually referred to the Committee could be properly decided.

In 1889, it was explained by the Under Secretary, a survey was made from Temora through Barmedman, to the Hillston district, Wyalong being at the time unknown as a gold-field.

In 1894 a route was surveyed from Barmedman *via* Wyalong and Cudgellico; and, during this survey, a line from Temora through Barmedman was permanently staked in anticipation of Parliamentary sanction. That line was referred to this Committee, who recommended that the matter should be postponed; and a second reference, with an amended estimate of cost, in 1895, resulted in the proposal being negatived. The following year the trial survey of a line from Condobolin to Broken Hill, passing 4 miles north of Euabalong, was made, and at the same time a line was explored from Condobolin to Cudgellico. Later a report was obtained on a line from Mossgiel to Hillston; and in 1897 an application was submitted to the Department of Public Works to have the Temora to Hillston line taken by Mandamah, a route which would leave out Barmedman and Wyalong.

In December, 1896, this Committee reported against a proposal to construct a railway from Condobolin to Broken Hill, but suggested, with regard to Hillston, that it might be reached from Cowra, or some point adjacent thereto, *via* Grenfell and Wyalong; and, in accordance with this, a trial survey was ordered from Koorawatha to Wyalong, which, after explanation and report, was begun, and is now well advanced.

The Committee were further informed by the Under Secretary that, when the line from Condobolin to Euabalong was first mooted, the Hillston Farmers and Settlers' Association forwarded to the Department of Public Works copies of resolutions protesting against the construction of the line, and advocating one from Wyalong to Hillston, as best serving the interests of the district.

DESCRIPTION OF THE LINE.

2. The proposed line is 48 miles 8 chains in length, with a ruling grade of 1 in 100, and the sharpest curve 20 chains radius. With the exception of a few slight rises and spurs, which have been avoided as much as possible, the line may be regarded as a surface one. Commencing at 329 miles 62·50 chains from Sydney, it skirts to the north the maximum flood area of the Lachlan River, bearing slightly northwards for that purpose as far as 355 miles. The Cugong Range is crossed at 359 miles, and the line then takes a course slightly to the south towards Euabalong, terminating at the Mount Hope Road, 377 miles 70·50 chains from Sydney.

ESTIMATED COST.

3. It is estimated that the line will cost £108,225, or £2,250 per mile.

Among the items of the estimate are earthworks, £7,994; timber bridge and small timber openings, £2,591; level-crossings, cattle-stops, fencing, &c., £2,842; permanent-way material (60 lb. steel rails), £30,006; freight, £7,323; plate-laying, ballasting, and sleepers, £33,121; station works and buildings, £7,129; water supplies, £3,000; and mileage and gradient posts, telegraph, and miscellaneous, £2,193. Engineering and contingencies, estimated at 12½ per cent., amount to £12,024.

RAILWAY COMMISSIONERS' REPORT.

4. The report of the Railway Commissioners estimates the annual expenses at £7,006, and the traffic at £3,726, which represents a yearly loss of £3,280.

The annual cost comprises interest on capital expenditure, at 3 per cent., £3,246, and cost of permanent way and traffic and locomotive expenses, £3,760. The traffic estimate is made up of live stock and goods, £2,550; passengers, £600; and mails, £576.

Remarking

Remarking upon the fact that the estimated traffic revenue barely covers the estimated working expenses, and that the balance, together with the interest on the capital cost of the line, will therefore form a charge against the general railway revenue, the Commissioners observe that ordinarily such a financial outlook would demand a report adverse to the construction of the line, but in this case there are, in their opinion, special features which recommend the extension as one that should be carried out. "While the construction of the line," they say, "cannot be urged, as an extension which will be in itself remunerative, it will contribute new traffic to the main line, and is worthy of careful inquiry and consideration, as being a line which will tap a portion of the Colony where the traffic is not at present directly rail-borne, and to an extent is commercially lost to the Colony."

THE EVIDENCE.

5. In addition to the Departmental evidence taken by the Committee in the inquiry, a large amount of information was obtained by a Sectional Committee, who visited the district through which the line would go. They examined witnesses along the route, and then, bearing in mind that Hillston is the objective point in relation to the proposed extension, proceeded to Hillston *via* Cudgellico. From Hillston they returned to Sydney by way of Rankin's Springs, Yalgogrin, Ungarie, Wyalong, Barmedman, Bimbi, Morangarell, and Grenfell, at each of which places witnesses were heard in regard to railway communication with Hillston and the route likely to prove most beneficial to the districts concerned and to the railway system generally.

Neither the evidence given before the Committee nor the result of the investigation made by the Sectional Committee is favourable to an extension of the railway from Condobolin to Euabalong. Even the Railway Commissioners, as ascertained from their Secretary, do not support the line as strongly as the terms of their report would imply. Though, according to a rule they have laid down that where a line pays working expenses, and is at the same time a feeder to the main railway system, its construction is worth considering, they think the proposal one that may with advantage be carried out; yet they say that the route of the line is not the only one to Hillston deserving consideration, and that it may not prove so beneficial as some other. The Railway Goods Superintendent, now Chief Traffic Manager, who for the information of the Commissioners examined the country and estimated the traffic likely to come to the line, does not consider that any extension from Condobolin westward and along the Lachlan will be profitable. The traffic, he states, will not pay interest on the capital cost and working expenses, and it may not even meet the latter. He is also doubtful of the extension being of any material advantage to the main lines, and, therefore, he is of opinion that its construction on that ground could not be justified. Other witnesses competent to express an opinion upon the prospects of the line are equally unfavourable to its construction.

COUNTRY TRAVERSED BY THE RAILWAY.

6. From Condobolin to Cugong, a distance of 29 miles, the route of the proposed line traverses alienated and reserved land; and from that point to Euabalong, a distance of 19 miles, the land is in the Western Division and partially reserved. Much of that under pastoral lease will not be available for small settlement until the year 1900 or 1918. Of holdings under leasehold, the leases of which will expire between now and the year 1900, there are, in the Central Division, 122,030 acres and, of those in the Western Division, the leases of which will not expire until 1918, there are 236,470 acres. There are also in this division, within the limit of the proposed railway's influence, 142,180 acres held under occupation license, and 240,780 acres untenanted, probably in consequence of scrub, rabbits, and low rainfall. In addition to these areas there are, within 20 miles on either side of the railway route, 450,030 acres of alienated land, 190,500 acres held under settlement and improvement leases, and 173,270 acres of reserves.

Generally, the country within the area which would be influenced by the proposed railway is not suitable for agriculture. Much of it is inferior, and covered with great belts of mallee. This mallee country is not only waterless, but, from the loose nature of the soil, ground tanks cannot be relied upon to furnish a permanent water supply.

supply. In the vicinity of Cugong there is a limited extent of good agricultural land, a portion of which is about to be cultivated in association with dairy farming; but, apart from this, the land along the railway route is devoted to pastoral occupation, and that is not in a flourishing condition. "Droughts," the Sectional Committee say in their report, "have been attended by such disastrous results, and the depredations of vermin have been so serious, that many holdings, which were at one time regarded as fair fattening country in average seasons, are now either abandoned or poorly stocked." Between Euabalong and Hillston, *via* Lake Cudgellico, the land improves, and offers opportunities for settlement and cultivation; but it does not appear that extending the railway to Euabalong would bring about results of that kind in any material degree. Wheat, no doubt, would be grown within reach of the line, to the south and south-west of Euabalong, and as far as Cudgellico, but not in any appreciable quantity.

TRAFFIC.

7. Agriculture is plainly not the source from which the proposed line may be made profitable; and, with this important factor absent from its prospects, the railway cannot be regarded as one that would lead to any material increase of settlement and, consequently, to the development of the country through which it would pass. Most of the traffic expected by the Railway Goods Superintendent consists of wool, hides, and produce from, and return merchandise to, the pastoral holdings in the district. About 1,000 tons of wool are represented in the traffic estimate; but 200 or 300 tons of this quantity, it is explained, would go to Condobolin whether the railway were extended to Euabalong or not. Fat stock is an important item, set down in the estimate at £1,400; but half of the stock so taken into account will reach Condobolin, it is said, irrespective of the extension to Euabalong. Goods, copper, &c., are estimated at £450, the copper being looked for from the mines around Mount Hope. The Sectional Committee ascertained that the copper mines in operation at Mount Hope are the New Mount Hope and the Great Central mines, and were assured that the reduction of haulage charges would admit of the treatment of a vast quantity of ore which, under existing circumstances, is unpayable. The present output of the mines is despatched to Sydney, *via* Cobar, but would be taken to a railway at a reasonable distance on either side of the Lachlan, if such a line were constructed. Passenger traffic is estimated at £600, which represents 2,000 passengers per annum, but the estimate is described by the Goods Superintendent as mere conjecture, and a most favourable one. As to the extent to which the main lines may be benefited by an extension of the railway to Euabalong it is impossible to speak definitely or even approximately.

In the opinion of the Sectional Committee the carriage of fat stock, and passenger and mail receipts, must mainly be depended upon to meet the annual expense connected with the line, and they point out that the fluctuations of season are so great that no reliance could be placed upon traffic derived from the chief of these sources of revenue. Further, a portion of the earnings of the railway would probably be represented by leakage from the main lines and the Cobar branch.

RAILWAY EXTENSION TO HILLSTON.

8. These unsatisfactory traffic prospects, which, it may be stated, were known to the Committee during their inquiry in 1896 respecting the proposal then before them for an extension of the railway from Condobolin to Broken Hill, of which the length from Condobolin to Euabalong was a section, make it necessary to look in some direction other than from Condobolin for a route to connect Hillston with the railway system of the Colony.

Hillston may be reached by various routes, of which the following have received some consideration:—

- (1) From Condobolin, *via* Euabalong and Cudgellico.
- (2) From Temora, *via* Barmedman and Wyalong.
- (3) From Koorawatha, *via* Grenfell and Wyalong.
- (4) From Young, *via* Grenfell and Wyalong.

The importance of Wyalong seems to justify its inclusion in any extension to Hillston. From Temora to Wyalong a railway route has been surveyed; and from Koorawatha, *via* Grenfell, to Wyalong a survey is in progress. For the purposes of railway construction the country between the main Southern Railway and Wyalong

is fairly well known, but the information available is not so complete in respect to that between Wyalong and Hillston. A survey from Temora through Barmedman to the Hillston district, in 1889, and another in 1894, from Barmedman to the same objective by way of Wyalong and Cudgellico, have made it known that a railway can be constructed to Hillston without much difficulty. The efforts of the Railway Construction Department have been directed to the finding of a practicable route. A surveyor of that Department, at the instance of the Committee, made an exploration between Wyalong and Hillston, *via* Yalgogrin and Rankin's Springs, and his report will be found published with the evidence given before the Sectional Committee. Leaving Hillston, the route, as located, takes a course almost due east, passing to the south of the Lachlan Range, and along the stock route to Rankin's Springs, and thence in a north-easterly direction to Malongla homestead, from which it proceeds to a point a mile to the north of the township of Yalgogrin, and in a direct line to Wyalong. A deviation could be made to serve the Lake Cudgellico district by bringing the railway to within a distance of 28 miles from the Lake township. This explored route is favourably viewed by the residents of Hillston, who regard it as centrally situated, and such as would serve both the agricultural and pastoral country to the north and the agricultural country to the south.

The route to Hillston, considered by the Committee to be the best, is from Koorawatha *via* Grenfell and Wyalong. In their report on the proposed railway from Condobolin to Broken Hill, a line to Hillston was recommended "from Cowra or thereabouts *via* Grenfell and Wyalong." In the present inquiry, the Committee have ascertained, more definitely than previously, the nature of the country between Koorawatha and Grenfell; and the evidence obtained indicates that, starting from Koorawatha, the country presents no difficulty from an engineering standpoint to railway construction. All along this tract of country population is increasing, and cultivation is progressing on large and small properties. On the former, the work is carried out on the halves or share-system, and up to the commencement of the recent hot weather the yield of wheat was very satisfactory. Much more would be done if the district were given railway communication. At present, cultivation can be carried on profitably only within a certain distance of the existing railways, as outside that distance the cost of road-carriage is too high to permit of a profit to the cultivator. Beyond Grenfell the line, extending in a westerly direction through the Bland country, and thence proceeding *via* Wyalong to Hillston, would pass through a very large area of land suitable for wheat cultivation, but at present overgrown with pine scrub and infested by rabbits and wild dogs. A cheap means of conveying produce to market, such as a railway should afford, would lead to extensive agricultural settlement in these parts of the Colony, and consequently to the reclamation of districts which are now waste land. Such a route as this for a railway, would also fairly divide the country lying between the Parkes to Condobolin line and the South-western Railway to Hay.

At Hillston the railway would reach the area within which the Victorian differential rates for wool traffic prevail, with the result that much of the wool that now goes from the district to Melbourne would be secured for Sydney. "It is estimated, on the basis of present stocking," the Sectional Committee say in their report, "that there would be 2,000 tons of wool contributed to a railway at Hillston, and that the annual output of fat stock would be 100,000. Wheat would be grown extensively, and would contribute to the traffic. In the Hillston district, at the present time, there are about 10,000 acres under crop, the average yield being 14 bushels to the acre with an average rainfall of 17 inches."

RESOLUTION OF THE COMMITTEE.

9. From the nature of the evidence in the present inquiry, and from the information obtained in their inquiry of 1896, the Committee do not consider it expedient that the proposed extension from Condobolin to Euabalong should be carried out. As pointed out in the report of the Sectional Committee, the new traffic likely to be secured to the line may be gauged by the inferior country traversed, the circumstance that much of the land in the district will not be available for small settlement until after the expiration of twenty-one years, and the conditions of climate in the

locality. In the opinion of the Committee, the railway from Parkes to Condobolin should not, for the present, be extended beyond its present terminus; and with regard to Hillston, they recommend a survey for a line from Koorawatha. Their decision is expressed in the following resolution :—

“That, in the opinion of the Committee, it is not expedient the proposed Railway from Condobolin to Euabalong, as referred to the Committee by the Legislative Assembly, be carried out; but they recommend, in connection with any proposal for a railway towards Hillston, that a survey be made for a line from Koorawatha with a view to its consideration in conjunction with existing surveys.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 7th December, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM CONDOBOLIN TO EUABALONG.

TUESDAY, 31 AUGUST, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.
 CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Condobolin to Euabalong.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You have a statement to make to the Committee in reference to the works now under our consideration? Yes; it is as follows:—

R. R. P. Hickson.

31 Aug., 1897.

EXTENSION OF THE RAILWAY FROM CONDOBOLIN TO EUABALONG.

The first action in connection with this extension as a separate proposal was taken in April of this year, when the Railway Commissioners, in a letter to the Colonial Treasurer and Minister for Railways, pointed out that as the line to Condobolin was approaching completion, it was most desirable that an extension forward to Euabalong should be proceeded with without delay, as such a line would have a most important bearing upon the securing to New South Wales the traffic of the centre of the Colony. The Commissioners, therefore, urged that the survey of this section be completed, and an estimate for its construction submitted, so that the Government could consider the desirability of carrying out the work.

The Colonial Treasurer, when forwarding this letter to the Minister for Works, minuted:—"I strongly endorse this recommendation."

Mr. Young thereupon issued instructions for an estimate to be prepared, the survey having already been completed in connection with the proposed line from Condobolin to Broken Hill, and this was submitted by the Engineer-in-Chief for Railway Construction on the 26th June.

In accordance with the provisions of the Public Works Act, the Railway Commissioners were then asked to submit their report on the proposal, which they did on 2nd July, in the following terms:—

Length—48 miles 8 chains.

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a light railway line (exclusive of land and compensation) at..... £108,225

Annual Cost—

Capital expenditure at 3 per cent. £3,246

Cost of maintaining permanent-way, and traffic and locomotive expenses 3,760

Total annual cost £7,006

Traffic Estimate—

Livestock and Goods £2,550

Passengers 600

Mails 576

Total estimated traffic £3,726

It will be observed that the estimated traffic revenue barely covers the estimated working expenses; the small balance, together with the interest on the capital cost of the line will therefore form a charge against the general railway revenue. Ordinarily, such a financial outlook would demand a report adverse to the construction of the line; but there are special features in this case. A glance at a map of the railway system of the Colony will at once indicate the favourable position of the route for the purpose of opening up and securing the traffic of the centre of the Colony; and it will, in view of existing lines, form a direct line to Hillston, when the time arrives for such an extension.

While the construction of the line cannot be urged as an extension which will be in itself remunerative, it will contribute new traffic to the main line, and is worthy of careful inquiry and consideration, as being a line which will tap a portion of the Colony where the traffic is not at present directly rail-borne, and to an extent is, commercially, lost to the Colony.

(Signed) CHARLES OLLIVER,
 WM. M. FEHON.

The estimated cost of the Condobolin to Euabalong line is £108,225, or £2,250 per mile, exclusive of land and compensation.

R. R. P.
Hickson.
31 Aug., 1897.

It is an extension westward of the Parkes to Condobolin railway now under construction, and begins at 329 miles 62·50 chains from Sydney and skirts to the north, the maximum flood area of the Lachlan River bearing slightly northwards for that purpose up to 355 miles. The Cugong Range is crossed at 359 miles, when the line takes a slightly southerly course towards Euabalong, terminating at the Mount Hope road at 377 miles 70·50 chains. The country is flat almost throughout, nothing steeper than 1 in 100 grades being used.

On the 5th instant, on the motion of Mr. Young, the House referred the proposal to the Parliamentary Standing Committee on Public Works, for their consideration and report.

As bearing somewhat on this inquiry, I find that in 1889 a survey was made from Temora through Barmedman to Hillston direct, Wyalong being then unknown as a gold-field.

Subsequently, in 1893 a surveyor went over the line with the view of suggesting deviations for improvements. These are on record but were not surveyed.

In 1894, supported by a report from Mr. McKinney and recommended by the Engineer-in-Chief in preference to the direct route, a survey from Barmedman *via* Wyalong and Cudgellico to Hillston was made, but not estimated, the plans being still incomplete.

During this survey a line from Temora through Barmedman to Wyalong was permanently staked, in anticipation of Parliamentary sanction, estimate £104,430. The Public Works Committee, however, to whom it was referred, recommended postponement in May, 1894, having in view, no doubt, the Railway Commissioners' report to that effect—subsequently an amended estimate was submitted by Engineer-in-Chief amounting to £92,000 in 95/487. The Roads Branch strongly recommended a light railway, but the Railway Commissioners remained hostile, 951,185-387, and a second reference to the Committee resulted in its rejection, 27th June, 1895.

The Condobolin to Broken Hill trial survey, which passed 4 miles north of Euabalong, was made in 1896, and Mr. Stuart, at the same time, explored a line from Condobolin to Cudgellico, south of the Lachlan, report (with rough estimate of £130,688, or £2,253 per mile) dated 11th August, 1896, and Mr. Cumming reported, 14th September, 1896, on a line from Mossiel to Hillston, which lengths, with the western portion Cudgellico to Hillston of the survey of 1894, formed a deviation, *via* Cudgellico and Hillston, of the Broken Hill line.

There was also an application, in April, 1897, to take the Temora-Hillston line *via* Mandamah, which would leave out Barmedman and Wyalong. After this rejection of the Broken Hill line in December, 1896, and at the initiative of the Public Works Committee, who suggested that Hillston might be reached from or near Cowra, *via* Grenfell and Wyalong, a trial survey was ordered from Koorawatha to Wyalong, which, after exploration and report, was begun and is now well advanced.

It might be pointed out that when this line was first mooted, Mr. Carroll, M.P., forwarded a letter from the Hillston Farmers' and Settlers' Association covering copies of resolutions protesting against the construction of the line from Condobolin to Euabalong, and advocating one from Wyalong-Hillston as serving the best interests.

2. Have you any other information to give us? No.

3. You have no knowledge of the country? No.

4. *Mr. Fegan.*] Is the line now proposed part of the proposed line from Condobolin to Broken Hill? The Condobolin to Broken Hill line passed 4 miles north of Euabalong.

5. *Mr. Trickett.*] Can you tell us why the proposed line from Condobolin *via* Lake Cudgellico to Hillston, on the south side of the Lachlan, has been abandoned? No.

6. You have not been consulted upon the policy of the alteration of the route? No.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works,
sworn, and examined:—

H. Deane.
31 Aug., 1897.

7. *Chairman.*] Have you a statement to make? I have here the usual detailed estimate of cost. I will read it to the Committee.

CONDOLIN TO EUABALONG.

Estimated cost of a single line of railway 48 miles 8 chains in length, with 60-lb. steel rails. Ruling grade, 1 in 100. Sharpest curve, 20 chains radius.

Description.	Estimated Cost.	Average Cost per mile.
	£ s. d.	£
Earthworks	7,994 0 0	166
Timber bridge and small T. O's.	2,501 13 6	54
Level crossings, cattle stops, fencing, &c.	2,842 0 0	59
Permanent-way materials	30,006 0 6	624
Freight	7,923 0 0	152
Platelaying at 1s., = £4,232 16s.	33,121 11 6	689
Ballasting one-quarter at 3s. 6d., = £3,703 14s.		
Sleepers at 4s. 3d., = £25,185 1s. 6d.		
Station-works, sidings included.....	3,284 0 0	68
Station buildings, passenger station, £300; waiting-sheds, £200; passenger platform, £300; goods-shed and platform, £400; station-master's cottage, £225; loading banks, £350; Grain-shed, £250; carriage-shed, £200; engine-shed, £500; 5-ton crane, £220; 20-ton weighbridge, £300; stock-yards, £400; turn-table re-erected, £200	3,845 0 0	80
Water supplies	3,000 0 0	62
Mileage and gradient posts.....	721 10 0	15
Telegraph	721 10 0	15
Miscellaneous.....	750 0 0	16
	96,200 5 6
Engineering and contingencies, 12½ per cent., nearly	12,024 14 6	250
Total cost.....	£108,225 0 0
Average cost per mile	£2,250 0 0

8. *Mr. Wright.*] That covers the cost of everything except land, I suppose? Yes. Nearly all the land is Crown land.

9. *Chairman.*] The proposed line apparently passes some miles to the north of Euabalong? Yes, about 5 miles to the north of Euabalong. The country near Euabalong is subject to floods.

10. Have you been over this country? I have been to Euabalong, and I have studied the various points along the route where there is anything special to note.

11. It would not be possible to have a line with fewer engineering difficulties—that is, so long as you keep off the flooded country? There are a few slight rises and spurs, which, however, have been avoided as much as possible, so as to make the line as nearly as possible a surface one.

H. Deane.
31 Aug., 1897.

12. *Mr. Hoskins.*] Have you had a survey made of the line from Condobolin to Hillston? No; there has been an exploration from Condobolin to Cudgellico on the south side of the river, and a survey from Cudgellico to Hillston.
13. How long is it since you were asked to survey a line to Euabalong without going on to Hillston? The line before the Committee was surveyed last year. It is part of the proposed Broken Hill line.
14. Was it not suggested to take the Broken Hill line through Hillston? No; that line was to have gone north of the river.
15. Would not a line to Hillston, on the south side of the river, accommodate a larger area of settled country than a line to Euabalong? An examination of the country on the south side of the river was made at the request of the hon. member for the Lachlan, Mr. Carroll. I think one of the reasons given why that examination should be made was that the country on the south side of the river was more available for settlement, being situated in the Central Division, whereas the land on the north side of the river was largely in the Western Division.
16. Would not a line from Condobolin to Hillston attract more of the traffic which now goes to Hay and then down to the Murrumbidgee to Echuca than a line from Condobolin to Euabalong would attract? In one way it would, because it would have its terminus much further west.
17. Is there not a good deal of settlement round about Hillston? I have not been to Hillston.
18. *Mr. Roberts.*] Are the Committee to understand that the proposed route is that approved of by the Railway Commissioners for an extension to Hillston? Yes.
19. Would not a line from Wyalong to Hillston serve a larger number of people? I am not prepared to answer that question. A line through Hillston *via* Wyalong would certainly pass through a good deal of country which is already settled, and where a considerable amount of grain is grown.
20. Is it not a fact that the population of Wyalong still continues to be about 5,000? I do not know what the population of Wyalong is.
21. Can you say whether it has increased or decreased since the Committee inquired into the proposal to extend the railway there from Temora? No; I cannot say.
22. The average cost per mile of the proposed line is estimated at £2,250. Was not the line from Berrigan to Murray Hut constructed for £2,000 a mile? £2,000 a mile was the estimated cost of that line.
23. Why should the line now under our consideration cost more? You will see by looking at the map that it is necessary to go round in places to avoid flooded country and the spurs of the hills. About halfway between Condobolin and Euabalong you have to cross the Cugong Range. Although as a whole the country is fairly level there, it is not so favourable for railway construction as the country between Berrigan and Murray Hut.
24. For earthworks, you put down £166 per mile? Yes; that is £16 per mile more than I allowed for the Berrigan line. I put down £15 a mile more for timber bridges than I put down for the Berrigan line. The principal difference is in regard to the cost of the permanent way. It was suggested to me that the Berrigan to Finley line should be made as cheaply as possible, and there I allowed for one-sixth of ballasting at 3s. Here I have allowed for one-fourth at 3s. 6d. That makes a considerable difference in the estimate.
25. Is not the Berrigan to Finley line the cheapest line in the Colony? It will be. The Jerilderie to Berrigan line has turned out very well.
26. What will it cost per mile? It will cost a little over £2,000 a mile.
27. Where will you get your sleepers? I do not know. We shall have to go some distance for them. We have had to pay the contractor 3s. 6d. or 3s. 8d. for sleepers for the line from Bogan Gate to Condobolin. He complains that the country is becoming cleared of timber suitable for sleepers. The forests out there are of a very poor character.
28. Sometimes you got sleepers for as little as 2s. 6d.? I have got them for less than 2s. 6d. at Narrabri.
29. Will the extra cost of the sleepers be gained by the Railway Department in freight? Not entirely.
30. Is it proposed to make the passenger and general station accommodation as cheap as that recommended for the other light lines which have recently been approved of by the Committee? Yes; all the accommodation will be of a cheap class.
31. Is the country between Condobolin and Euabalong subject to floods? The surveyed line keeps clear of the flooded country; but the flood waters of the Lachlan spread out to the north a considerable distance. The channel of the river becomes very small as you go down it, and it is not capable of containing the water that comes down in flood time.
32. I see that you allow 12½ per cent. for engineering and contingencies;—is not that more than the usual allowance? Latterly I have generally put down 12½ per cent. I found that 10 per cent. was scarcely enough.
33. Do you regard the figures which you have furnished as thoroughly reliable? Yes. I do not always check the calculations, but I fix the prices upon which they are based.
34. What weight of rails will you use? Sixty-lb. rails.
35. Were 60-lb. rails used on the Narrabri to Moree line? Yes.
36. Since that line was made there has been a heavy rainfall in the district;—has anything taken place in consequence of that rainfall which has altered your opinion as to the desirability of constructing these light lines? No. I am thoroughly satisfied with the Narrabri to Moree line, though a great deal of damage was done to it by the late rains.
37. What was the nature of the damage done to the line? The country through which it passes is country with which it is very difficult to deal. If a light line of railway answers in that country, it must answer in country not liable to the same contingencies. The country between Narrabri and Moree is, on the whole, very flat. In flood time the creeks overflow, and the water spreads over the surface of the land in every direction for miles. You cannot tell then where it is going to flow. In several cases, when we expected it to flow in one direction and only in that direction, it flowed in another direction altogether. The damage done to the line was of two kinds. Damage was done to the approaches to bridges and culverts which had not been protected. In the future these approaches will be protected by sheeting, so that the liability to damage will cease. The waterways provided on the Moree line seemed to be large enough to carry the water coming down the water-courses; but when the water spread all over the country it ran over the line wherever there was any depression, and scoured away the ballast underneath the sleepers on the lower side, necessitating repairs before the line was safe for traffic again.

H. Deane.
31 Aug., 1897.

38. How long was traffic interrupted? For three days. The cost of the labour employed to put it right, together with the value of the services of the engines used, must have been about £100. In view of the fact that the waterways were not sufficient, I have arranged for a number of extra waterways to be put in. This work will cost about £4,000; but I think it will make the line safe against all contingencies in the future. Of course you cannot be absolutely certain that nothing will happen to a line, because you sometimes have washaways on lines that have been twenty or thirty years in existence; but we shall be fairly well provided against the chances of damage by excessive rainfall. Where the water did not go over the line the permanent way was in excellent condition. In spite of the heavy rains and the two or three days' soakage, the embankments had not become unreasonably soft. The line had not gone down and become lumpy, as one might have expected, and as many people said it would. The rails presented an excellent surface, showing, I think, that the construction is eminently suitable. Unless we have again to cross similar blacksoil country at right angles to the creeks, we shall not have anything like the same difficulty in the future. It is the fact that the Moree line runs at right angles to the creeks that has caused all the damage.

39. It is a fair thing to say that these light lines have up to the present been a success, and have answered your expectations? Yes.

40. What is the ruling grade in the proposed line? 1 in 100.

41. Is that in both directions? Yes; it is just as easy to get it going one way as the other.

42. Will the ballasting be heavier than you have on other pioneer lines? I will only ballast where I think the line wants it.

43. Can you say how many miles of line will be ballasted? The station yards will be ballasted, and I will put ballast where there are soft cuttings and low places, as well as at the ends of the bridges. I have allowed for the ballasting of one-fourth of the whole distance, but I do not think that anything like so much as that will be required.

44. How many sleepers do you propose to put down to the mile? I will put down the same number of sleepers as I am putting down on the Parkes to Condobolin line—fourteen to the 10-yard rail.

45. Is that the number put down on the line from Jerilderie to Berrigan? Yes.

46. You see no necessity to put the sleepers more closely together? No, I do not think it is necessary. The ground is pretty firm all the way along.

47. *Mr. Wright.*] When you were being examined before this Committee, in reference to the proposal to extend the railway from Condobolin to Broken Hill, you said, "A deviation of the route between Condobolin and Mossiel has been proposed which is strongly recommended to the consideration of the Committee—that is, one crossing the river a little below Condobolin, and proceeding along the Southern line of the river to Cudgellico, where it would meet the survey already made between Cudgellico and Hillston." I would like to know what you have to say about that deviation now? At that time I recommended the deviation for consideration.

48. You give the following reasons why the deviation should be adopted:—

This route has many advantages over the northern one on the other side of the river. The country on the southern side of the Lachlan lies wholly within the Central Division, whereas the greater part of that on the northern side lies in the Western Division, and is consequently not so well adapted for settlement. It also does away with the necessity of a branch line to Hillston from the northern route.

Yet the Railway Commissioners recommend a line from Condobolin passing through Euabalong as the most direct route to Hillston? All I said while under examination before was, that the southern route had many advantages. The advantage of avoiding a branch line to Hillston does not exist now, however, because the proposed line is put forward as part of an extension to Hillston direct.

49. You speak of the deviation as one that is "strongly recommended"? It was recommended for consideration. The Minister and the Commissioners have now decided to recommend the route before the Committee.

50. What was your impression of the country between Condobolin and Lake Cudgellico? There is some very good country there; but the western end of it is infested with rabbits.

51. Is not that country better than the country on the north side of the river? I think that the country that the proposed line goes through is better than the country on the south side of the river. Part of the country that would be traversed by a line crossing the river at Condobolin would not be so good.

52. You would have to go through the Dundoo Hills? Yes. This is what Mr. Stuart, one of my engineers, who went over the line, says about the matter:—

Most of the country passed through, excepting the ridges, is of comparatively good quality, all fine sandy loam, suitable for agricultural purposes. It is, however, for the most part covered with box, pine, and mallee scrub, the greater part of the settlement, after passing Wallaroo Creek, being to the southern side of the proposed line, and scarcely any between it and the river.

53. You are aware that there is considerable agricultural settlement round Lake Cudgellico? I do not know that there is considerable agricultural settlement. There is some agricultural settlement there. I suppose it is increasing.

54. There is a good deal more as you get nearer to Hillston? I have not been to Hillston.

55. Have you any description of the country north of the river? No; but I know the route that the line follows on the north side of the river.

56. What do you find the country like on the north side—6 miles back from the river? It is very good country, except on the ridges; red sand and red soil country.

57. Covered with a dense pine scrub? There is a good deal of scrub.

58. It is scrub country on both sides of the river? Yes; no doubt.

59. Do you think that the country on the north side of the Lachlan is likely to be taken up for agriculture? Perhaps for a few miles; but as you proceed you reach the limits of agricultural country.

60. However, you do not deal with the commercial aspect of these questions at all? No.

61. Do you think it would be more difficult to cross the river at Condobolin than to continue on by the proposed route? No.

62. The cost would be about the same? Yes.

63. You must, in any case, cross the river to reach Hillston? Yes.

64. A line *via* Cudgellico would be shorter than a line *via* Euabalong? It looks shorter on the map.

65. So far as one can judge the most direct way of reaching Hillston is through Cudgellico? I think there would be a saving of a few miles by adopting that route.

66. *Mr. Hassall.*] The proposed line forms part of a contemplated extension to Hillston? I think the circumstances under which the line has been submitted are explained in Mr. Hickson's statement. H. Deane.
67. Has any consideration been given to an extension from Temora to Hillston? No. We have made surveys between Temora and Hillston. 31 Aug., 1897.
68. Of your own knowledge, do you know which would be the preferable route? If you wanted to get to Euabalong or to Hillston with the least possible expense the proposed route is the best route, because it involves least construction.
69. In extending the line from Condobolin, if you brought it on the south side of the river, it would not much matter how near to the town of Condobolin you crossed? I do not think it would matter much where we crossed. The Lachlan does not collect water from any important tributaries; in fact, its volume rather diminishes as you go down.
70. *Chairman.*] Will you furnish the Committee with estimates of the cost of a line from Temora to Barmedman, of a line from Temora to Wyalong, of a line from Barmedman to Hillston, of a line from Wyalong to Lake Cudgellico, of a line from Lake Cudgellico to Hillston, of a line from Lake Cudgellico to Condobolin, of a line from Wyalong to Grenfell, and of a line from Grenfell to Koorawatha? Yes; I will do so. [*Vide Appendix.*]
71. Will you also let us know the distance to Hillston from Orange, passing through Molong, Parkes, and Euabalong; the distance from Blayney, passing through Wyalong; and the distance from Sydney, passing through Temora by both the southern and western lines;—what the Committee want to ascertain is which is the best way of approaching Hillston, having regard to shortness of route, easiness of grade, and the value for agricultural and pastoral purposes of the country traversed? I will endeavour to procure the information you desire. [*Vide Appendix.*]
72. *Mr. Roberts.*] Do you intend to fence the proposed line? No; not right through.
73. No accidents have happened upon the unfenced lines which you have constructed which make it necessary to fence these railways in the future? No.

WEDNESDAY, 1 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

<p>The Hon. FREDERICK THOMAS HUMPHERY. The Hon. JAMES HOSKINS. The Hon. CHARLES JAMES ROBERTS, C.M.G. The Hon. WILLIAM JOSEPH TRICKETT. The Hon. DANIEL O'CONNOR. HENRY CLARKE, Esq.</p>		<p>CHARLES ALFRED LEE, Esq. JOHN LIONEL FEGAN, Esq. THOMAS HENRY HASSALL, Esq. GEORGE BLACK, Esq. FRANCIS AUGUSTUS WRIGHT, Esq. FRANK FARNELL, Esq.</p>
--	--	---

The Committee further considered the proposed Railway from Condobolin to Euabalong.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

74. *Mr. Hoskins.*] Have you come here to make any statement to the Committee in respect to the proposal to make a railway from Condobolin to Euabalong? No, I understood that the Commissioners, H.
McLachlan. statement had been presented to the Committee. 1 Sept., 1897.
75. That statement shows that there will be a probable loss of £3,000 a year in the working of the proposed railway? Yes.
76. Can you give us any reason from what you have heard why the Commissioners suggest the construction of the proposed railway, seeing that it is estimated that there will be a considerable loss in the working of it? In the first place it will be noticed that the loss will be practically in interest, that is to say, the traffic will cover the working expenses. Consequently you have to make up the interest, and the Commissioners always think it worthy of consideration that the construction of a line may be entertained where there is a prospect of it paying working expenses, and a prospect of the main line, or the parent system, reaping some advantage from the extension. Not only that; in this case they look upon the line as being one that will help to bring traffic to the lines which we have hitherto lost. At the same time they do not make any strong recommendation in favour of the line. In their concluding remarks they say—
- While the construction of the line cannot be urged as an extension which will be in itself remunerative, it will contribute new traffic to the main line, and is worthy of careful inquiry and consideration, as being a line that will tap a portion of the colony where the traffic is not at present directly rail-borne, and to an extent is commercially lost to the colony.
77. Have the Commissioners any estimate of the probable traffic which this line will divert to the main line? Yes. Mr. Harper already has made an estimate. I have not gone into the details, as I understand that he is coming here, and will himself go into details.
78. Is it considered that the extension of this western railway to Euabalong will tend to attract traffic, especially wool and stores, which now cross from Willandra over to Hay, and are taken down the Murrumbidgee River to Echuca? Yes.
79. Do the Commissioners know whether they can carry wool as cheaply from Euabalong as it could be carried by team from Willandra down to Hay, then *via* the Murrumbidgee and Echuca to Melbourne? Yes, they think they can gain a new traffic, which at present goes by road to Hay, and down the river to Melbourne.
80. Mainly station traffic? Wool and return goods.
81. I suppose Mr. Harper has travelled over this district, and is well acquainted with it? Yes.
82. The Commissioners recommend this line to be what is termed a pioneer line—a cheaply constructed light line of railway? Yes.
83. Can you say whether the traffic which has been taken over the Parkes to Condobolin line has been satisfactory? We have only a short section open—22 miles. It is not open to Condobolin yet, only to Bogan Gate.

H.
McLachlan.
1 Sept., 1897.

84. Has that been satisfactory? The Commissioners have not any definite information upon it at present. We have not had a wool season since the line was opened.
85. I notice by the return furnished by the Railway Commissioners in their annual report that the loss on the Molong to Forbes and Parkes railway, over and above working expenses, is very small—some £2,000 or £3,000 a year? Yes; the traffic on that line has been very satisfactory.
86. A good deal of the traffic taken from Hillston is taken by road, or by the existing railway to Bogan Gate? At the present time it goes *via* Hay.
87. We have no means of ascertaining the traffic in the Willandra district, but is there much loading to Parkes and Forbes and the lower Lachlan? Not a great deal, I think, at present.
88. The loss on the Parkes and Condobolin railway is about £2,000 a year? Yes, estimated.
89. Do the Commissioners estimate that there would be additional loss on the construction of the Condobolin to Euabalong line over and above the loss on the Parkes and Condobolin line? Yes. This is in addition to the Parkes and Condobolin line.
90. It is estimated that there will be a loss of £4,000 a year as between the receipts and working expenses and interest on the line from Parkes to Euabalong? Yes, considering that section by itself. That does not give any credit for the new traffic brought to the parent system.
91. You anticipate that the proposed Condobolin and Euabalong line will act as a feeder to the Parkes and Condobolin line? Yes.
92. *Mr. Humphery.*] About how many bales of wool do you expect to get should the extension be made from Condobolin to Euabalong? Mr. Harper's estimate is 1,000 tons.
93. Is that traffic additional to the traffic that will be secured by the extension to Condobolin? Some of it would be. I have not got the details. Roughly, we expect to get 1,000 tons of wool carried on the extension, and a good deal of that would be new traffic.
94. Can you say how much of the country north of Hay would probably be served by this extension? There would be very little immediately north of Hay. The country north of Hillston would be served by it.
95. Upon the subject of rates, have you any information to give to the Committee? The Commissioners have not considered the question of rates, because Hillston has been looked upon as the objective point, and the rates would depend upon various circumstances. No definite arrangement has been considered. A great deal would depend upon what the charges would be by river and rail on the other side added to the cartage to Hay and whatever railway station is established in the district.
96. Has the estimate of the earnings been based upon the competitive rates? What has been allowed for 1,000 tons has been 1½d. per ton per mile.
97. Is that the lowest rate for which you are now carrying in competition with the Victorian lines. Circumstances alter rates a good deal. That is a low rate for wool.
98. In your opinion, is that rate sufficiently low to secure the whole of the wool that you estimate will come by this proposed extension? Mr. Harper thinks we shall get 1,000 tons at that rate.
99. *Mr. Hoskins.*] You do not estimate these rates to be cutting rates, the rates charged for long distances? Yes. The rate would be higher than the rate from Hay to Sydney; but it is difficult to go into the question of rates on account of so many varying circumstances.
100. *Mr. Humphery.*] What would be the value of that 1,000 tons of traffic over the branch and main lines to Sydney? It would be worth about £3,600 right through. It would be worth about £300 to this particular branch.
101. What would be a fair proportion to estimate as the profit? Taking it roughly at 50 per cent. that would be £1,800.
102. Have you included that £1,800 in the estimated earnings? No. Although there is a direct loss on the branch, if you could give credit to the parent system for the traffic, it would make a considerable difference; and the Commissioners have laid it down as a rule, that where a line pays working expenses and is a feeder to the main system, then under certain circumstances the branch is worthy of consideration, although it may not pay the interest on the cost of construction.
103. Are the Committee to understand, that although there would be an estimated loss of between £3,000 and £4,000, that loss might be regarded as likely to be reduced by £1,800, or £2,000 additional profit, that will be earned by the main line and the branch to Condobolin, by reason of the extension to Euabalong? To a considerable extent. I could not say exactly what proportion would be new traffic of that 1,000 tons.
104. Without fixing the amount you are prepared to say that there would be a very large additional profit on the main line by this extension? Yes.
105. Do you know whether the Railway Commissioners are of opinion that there should be any extension beyond Euabalong? Their idea was to get to Hillston. That is the point they have been looking forward to. They look upon Hillston as the objective point to get to.
106. At present the intention is to make Euabalong the terminus? Yes.
107. Do you propose in the immediate future to recommend a further extension? That is a matter for the Government. The Commissioners do not recommend lines; but I think you will find that their report indicates that they look upon this as part of an extension forward.
108. Have you considered whether the proposed extension from Condobolin to Euabalong would be more profitable than an extension on the south side of the Lachlan? As a rule the Commissioners do not go into routes in the same district; the line is surveyed and laid out by the engineers, and the Commissioners do not report in regard to a route on one side of the river as against one on the other.
109. Are the Commissioners not prepared to express an opinion whether it would be better to have a line for traffic purposes on the south side of the Lachlan? I do not think they are. It has not been referred to them, and they have never expressed an opinion in regard to it.
110. I suppose Mr. Harper will be able to give a comparison of the traffic that probably will be secured by the construction of the line as proposed, instead of the line on the south side of the Lachlan? He has been in the district, and he will be able to give the Committee any information.
111. Do you estimate at present that there is a substantial profit on the carriage of wool at existing rates from that district? Yes.
112. *Mr. Hoskins.*] You have reduced the wool rates lately, have you not? Yes, but it does not so much affect the long distances. Some of the competitive rates were not touched.

113. *Mr. Humphery.*] Is there a prospect of much stock coming by this route? Yes, it is estimated that we shall get some fat stock from that district. At the present time a man with a small lot of stock could not afford to send to the railway station the distance that he has to go to-day, but if a line is put into the district we think that it would encourage the development of the stock traffic. Mr. Harper has estimated fairly well for stock traffic.

H.
McLachlan.
1 Sept., 1897.

114. How long has the Bogan Gate line been opened? Three or four months.

115. You are not able to speak as to its prospects? It is only a section. It is too early to form an opinion until we get to Condobolin as to what the result will be.

116. I suppose you do not expect a very large passenger traffic on this extension? No.

117. What have you estimated that you will receive for carrying the mails? £576.

118. Do you know what the present cost is? I do not.

119. *Mr. Lec.*] Has there been any alteration in the boundaries or lines fixed by the Victorian Railway Commissioners in this Colony, under differential rates, since 1895? No, I do not think there has been anything considerable.

120. If this line is extended from Condobolin to Euabalong then you will, for the first time, have entered into the Lachlan country—upon that area within which the Victorian differential rates prevail? Yes.

121. Have you estimated whether, if this line is constructed, it will be possible for the Commissioners to convey the wool to Sydney at the same price as it is conveyed to the Victorian railway station under the differential-rate system? Yes; Mr. Harper thinks that under the estimate he has given we shall gain that traffic. I may say that Mr. Harper is not including traffic on the other side of Hillston as likely to come to Euabalong. If we get to Hillston, we should get the competitive wool to a large extent, and the traffic, as estimated for, is considerable. There is a local traffic, although a good deal of it goes through Hillston to Hay; then is river-borne towards Melbourne. Of course we should be in a far better position to compete if we were at Hillston, that is about 70 miles further on.

122. The differential rates in that locality are very harassing? Yes; Victoria allows a good rebate for wool.

123. If the Commissioners could get a railway of this kind, would they be able to secure the trade, notwithstanding those differential rates? Yes; they will have a railway into the district, whereas the others have a long road cartage.

124. I presume that the rate has been cut so low that it would be almost impossible for the Victorian Commissioners to reduce it? I should not think they could reduce it with any profit.

125. Unless that country is pierced by a railway, for all time the trade will flow in the direction of Victoria? Yes.

126. And there are no other means of diverting that traffic so as to bring it to our railways? Not to my knowledge.

127. That would lead one to suppose that although at the commencement of the railways the loss would be some £3,000 a year, there is a reasonable probability of attracting trade in time, so as to eventually make it pay? Yes.

128. I presume you have not any other piece of line in the Colony where you have such difficulties to contend with? On the south-western lines, at such places as Jerilderie and Hay, there is severe competition.

129. If there happens to be bad weather, I suppose the wool would have to come by railway? Yes, where we were within reasonable distance of it.

130. In time of flood it would be impossible for them to send their wool over that country? The shortest carriage would affect the destination of the wool.

131. You think that the conditions are such as will admit of successful competition for that trade? The Commissioners think so.

132. *Mr. Wright.*] Have you ever had pointed out to you what traffic we are likely to secure by this extension? Yes; Mr. Harper has given a report on the matter.

133. Do you know the country likely to be affected by it? Yes; as far back as the Willandra country.

134. You are aware that the whole trade below Mount Hope comes already to the existing line? North of Mount Hope.

135. And to Mount Hope? Some of the Mount Hope traffic will come into Condobolin.

136. Are you not aware that all the traffic west and north of Euabalong down as far as Roto comes in? Still, the further west you extend the railway the further west will your influence extend. If you extend the railway 40 miles westward, you will bring to your railway the traffic from country 40 miles west of your terminus.

137. Did I understand you to say that you expect 1,000 tons of additional traffic? We expect 1,000 tons of wool.

138. Over and above what you get at present? 1,000 tons of wool over this extension, and a great portion of that would be new traffic.

139. What proportion? I have not got the details. Mr. Harper will give them.

140. 1,000 tons of wool over this line; what return traffic would that represent? Mr. Harper in his report gave it generally. He gave us an estimate from general goods traffic of 1,500 tons—that is, including everything, inwards and outwards.

141. 1,500 tons over 50 miles of railway would produce a very small revenue? Yes.

142. The passenger traffic could not possibly be large? No.

143. What is the estimated revenue from all sources? £2,750.

144. Considering that you are only going to get 1,500 tons, that is a very high estimate? That is 1,500 tons of general goods. Then there is wool, live stock, passengers, and mails.

145. Do you notice on the map the proposed deviation from Condobolin, across the river, to run by Lake Cudgellico? Yes.

146. Does not that strike you as being a more direct route? I think it would save something. Mr. Harper is, I believe, inclined to recommend that from his own observation. The Commissioners do not go into details as to routes.

147. Would not a line running south of the Lachlan to Hillston intercept a larger volume of traffic that goes to the Murrumbidgee than this proposed line? It seems a short route, but I do not know the country.

148. Would it not be likely to intercept a larger traffic going south to the Murrumbidgee than this line will touch? It seems to be a greater convenience, because the traffic must drain from the north.

H.
McLachlan.
1 Sept., 1897.

149. *Mr. Roberts.*] Is the Committee to understand that, with a view of reaching Hillston, the Railway Commissioners recommend a route by way of Condobolin and Euabalong, in preference to any other route as shown upon the map? I might say, with regard to the question of route, that the Commissioners do not go into alternative routes. They were asked to report upon the railway from Condobolin to Euabalong, and they have reported upon it favourably, to some extent, as an extension towards Hillston; but whether an alternative route should be considered, I think they would not say that that is the only route which could be considered. They reported upon the route submitted to them, but they would like to say that there is a good deal worthy of consideration in the idea of extending the railway in another direction to reach Hillston from another point.

150. Would that be from Koorawatha to Grenfell, Grenfell to Wyalong, Wyalong to Cudgellico, and Cudgellico to Hillston? The Commissioners would not say any particular town, but they consider it worthy of consideration whether a route could not be got. One point which influences them is that in one case you have to make a long length of railway about 180 miles, whilst you could reach Hillston from Condobolin at present by only a little over 100 miles. Consequently, the country would have to spend a much smaller sum of money to reach the objective point.

151. That is, if all the lines were sanctioned at once? Yes.

152. Do you know anything as to the population of Wyalong, and whether it is increasing? The traffic has not been increasing for the past twelve months through Tomora, which is our railway station.

153. Is it as good as it was two or three years ago? It is not.

154. To what extent does it show a decrease? The earnings are about the same for 1896 as they were for 1894, so there has been no growth.

155. It is practically stationary? Yes; the first few months after Wyalong opened we had a rush of traffic, but there has been no growth since 1894.

156. Do you regard Wyalong as the principal feeder of traffic through Tomora and Cootamundra lines? Yes, it is the principal feeder. There is a certain amount of local traffic. One great reason for considering the alternative route is the better class of country that it would open up, and the development there is already in connection with the wheat traffic.

157. *Chairman.*] Presuming you wanted to send goods to Cowra, which way would you send them? We should send them west usually.

158. Why? Because it would be nearer.

159. Supposing goods were to be carried to Koorawatha, how would you send them? I think Koorawatha is about the dividing point. I have not figured out the exact distance.

160. Which way would Cowra traffic go? It would go west.

161. If there is a line in the western country starting at Koorawatha, it would be immaterial which way you sent the goods? We should have the alternative route.

162. What line is doing the heaviest work at present? The western line. I may say that I have got some figures indicating the business on the west and south. I simply take two items—wool and live-stock—giving an idea of the business. On the southern line during last wool season we brought into Sydney 151,969 bales of wool; by the western line, 265,048 bales of wool. On the southern line we brought 3,172 head of cattle; on the western line, 26,772 head of cattle. On the southern line we brought in 465,146 sheep; on the western line, 749,730 sheep. That is the traffic of the season just closed, showing that the business is much bigger on the western line than on the southern line.

163. If there is any new country to develop from a railway standpoint, it would be more convenient for you to work it by the southern than by the western line? I should almost think so, looking at the traffic.

164. Therefore, if there be anything else to be considered, it would be better to bring the produce from the western district by the south than by the west, by the southern and by the western line? If the distances are equal, I think so.

165. You are aware that Wyalong and the country contiguous are auriferous? Yes.

166. Is there any advantage in having auriferous country in connection with such a place as Lithgow? Yes, on account of smelting. You do not want to go further than the case of Cobar. There has been an immense development at Cobar, and I think that Lithgow, and the railways materially assisted in that development. There is one thing in favour of Euabalong, it would bring the Mount Hope mines nearer to the railways. At present a number of the mines at Mount Hope are shut down, because they cannot afford the road expenses, but no doubt the extension of the railway would have a material influence in helping auriferous development.

167. If the line were brought through auriferous country and also tapped an area of grain-growing country, and the point where you constructed the present line at Koorawatha, the tendency would be to bring grain by the southern line, and take ore by the western line? Yes, that might happen, the line going to Lithgow.

168. It is a possibility worth considering? Yes.

169. What is the policy of the Commissioners in regard to a line calling at Grenfell;—is the time coming when a connection with Grenfell would be justified? The Commissioners make it a rule never to initiate an opinion. If asked for an opinion upon a line they give it. In this case they have reported upon a line from Condobolin to Euabalong. They were asked to do so. They do not like to make suggestions as to an alternative route. At the same time they think that consideration should be given to an alternative scheme in this instance.

170. The time may be nearly here for Grenfell to be entitled to railway communication? The Grenfell district is growing very extensively in production. In 1893 the yield from the county of Monteagle was 208,000 bushels, but in 1897 that had increased to 350,000 bushels.

171. Are you prepared to make a statement at all as to the justification of a connection to Wyalong? The Railway Commissioners are not favourable to it.

172. You have no information or statistics about Wyalong? Comparatively recently, the Commissioners reported in regard to Wyalong that they could not recommend the construction of a line.

173. Since Hillston is west of Euabalong, and since you say that you will intercept the traffic west of Euabalong, the probability is that Hillston would intercept more than Euabalong, partly because it is further west, and partly because it is further south? Yes, Hillston is the objective point which we want to reach.

174. Therefore, if your rates can be made so that the whole of the trade will go to Hillston, that is the place to go for? Yes. In connection with an alternative route to reach Koorawatha or Condobolin, the mileage would be the same in either case, because although you may have to make some additional miles of railway the total length to Sydney would be about the same.
175. And the approach would be a little easier than by Koorawatha? It has not been surveyed.
176. But in no part of the country west of Grenfell are there heavy grades? No; going to Cudgellico would be eastward of any range.
177. You have already told us that a line coming from Blayney *via* Koorawatha to Hillston would be worked at a greater expense than a line *via* Murrumburrah to Hillston? I do not think I said that. I said it would probably be more convenient to bring it by the south; that it would be better to divide our traffic.
178. How would it really stand with regard to cost, supposing both the lines were of the same capacity? I do not know that it would make a great difference. Certainly it would be more convenient.
179. Will you describe the line *via* Blayney to Orange and Parkes;—how would it compare with the line *via* Blayney to Koorawatha? I could not speak from memory.
180. Blayney is common to any western extension; if going west you want to know if there is more bad country on that route than going by Blayney, Koorawatha, and that way? I will put a section of the line in.
181. You have nothing to say with regard to settlement on the route of the line? I think it would tend to bring about agricultural settlement.

H. McLachlan.
1 Sept., 1897.

John Harper, Goods Superintendent, Department of Railways, sworn, and examined:—

182. *Mr. Humphery.*] Have you reported to the Railway Commissioners as to the probable earnings of the proposed extension of the railway to Euabalong? Yes; I will read my report.—

J. Harper.
1 Sept., 1897.

PROPOSED RAILWAY FROM CONDOBOLIN TO EUABALONG.

(Length, 48 miles 3 chains; estimated cost, £108,225; interest at 3 per cent., £3,246 15s.)

As directed by the Commissioners I have looked into this matter.

It need scarcely be said that this proposed extension really forms part of a national scheme. In a sense it is intended to serve a district which has been more or less alienated in its trade relations with New South Wales.

I am sure the Commissioners will recognise that under the circumstances it is most difficult to give anything like an accurate estimate of the probable traffic which may be secured by the construction of the line. It is, however, certain that a further western extension will necessarily have the effect of producing new traffic for carriage on the existing lines. For this reason as well as the fact that the district in the neighbourhood of the line is one of good soil and sufficient rainfall, developments will, no doubt, take place where the possibility offers for farmers engaging to a larger extent in production than they are at present.
