1898.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

FISHERIES OF THE COLONY.
(REPORT OF COMMISSIONERS OF FISHERIES FOR YEAR 1897.)

Presented to Parliament, pursuant to Act 44 Vic. No. 26, sec. 69.

Printed under No 1 Report from Printing Committee, 30 June, 1898.

Report of the Commissioners of Fisheries for New South Wales on the Fisheries of
the Colony, for the year ending 1897.

Sir,

We have the honor to submit our Annual Report on the Fisheries and Oyster Fisheries of the Colony for the year 1897.

The constitution of the Board remains the same—Dr. J. C. Cox, whose term of office expired on the 19th October, having been reappointed President.

Finance.

The revenue for the year is £2,980 14s. 4d., a slight increase on last year's receipts, and £448 in excess of the expenditure, which amounted to £2,532 16s. 1d.

The revenue is obtained principally from license fees, rent on oyster-culture leases, and deposits on applications for oyster leases, and we think it could be considerably augmented if supervision could be given to the various oyster-producing waters in different parts of the Colony.

This would necessitate additional expenditure in the appointment of extra inspectors; but we consider the expense would be justified by the additional revenue that would be received in taking out oyster leases consequent upon a proper protection of Crown lands.

Official Staff.

During the early part of the year, it became apparent that the administration of the Department was in an unsatisfactory state, certain matters having arisen that called for a strict investigation.

At our request the Public Service Board held an inquiry into the working of the Department and the conduct of some of the officers, the result of which was the transfer of Mr. Smithers from the position of Secretary and Chief Inspector to that of an Assistant Inspector, and Mr. L. F. Mann, Clerk and Draftsman, to a position in the Survey Department.

The offices thus vacated were filled by the appointment of Mr. J. A. Brodie to the former position, in conjunction with the office of Visiting Magistrate to Lord Howe Island, and Mr. A. Reid as Clerk, while the drafting work is performed by a draftsman of the Survey Department, who visits the office as occasion requires to deal with the cases.

The Inspectorial Staff is still too weak to satisfactorily carry out the work of the Department, and could with advantage be further increased if the necessary funds were available.

Oyster-culture.

It is with much satisfaction that your Commissioners are able to report that the supply of oysters for the year has been greatly in excess of the number produced in 1896, and the largest return for the last ten years. This increase in the production is very gratifying, as it shows that notwithstanding the disease existing in some waters, the greater portion of the rivers are slowly but steadily recovering their former productiveness, and each year, as the conditions improve, we may expect a further improvement in the growth and cultivation of this mollusc, as the lessees are day by day gaining valuable experience in oyster-culture.

A comparison of the returns shows that 14,749 bags were consigned to market during 1897 as against 12,287 for the previous year, and detailed information as to the quantity taken from each river may be seen in Appendix "G."

There is a great difference in the condition of oysters grown in the various waters along the coast, some localities being more suitable to oyster-cultivation than others, on account of the salinity of the waters and the nature of the beds being more congenial to the life of the mollusc; and we find that the best grounds, and from which oysters have been taken in large quantities, are Camden Haven, Manning River, Cape Hawke, and Clyde River, the consignments from these waters being of excellent quality, and much sought after in the metropolitan market.

In addition to oysters locally produced, 2,367 bags were received from other Colonies; but, as a set-off against this importation, 3,022 bags were exported to Victoria, Tasmania, and West Australia.

There are considerable areas on unleased Crown lands eminently suited for oyster-culture; but for the want of cultivation the oyster does not thrive beyond a certain limit, and it only requires practical men to come forward and take up these waste lands, with a view to proper improvement, and the yield from ostreaculture would be sufficient to supply the whole of the demands of the local market, and to afford a surplus for exportation to the adjacent Colonies.

The issuing of leases for oyster-culture has been seriously delayed in consequence of the reorganisation of the Department, and the necessity to amend the form of lease so as to meet present requirements.

Certain new provisions were found necessary and were included in the new form of lease after Regulations had been issued (1) To enable the Governor to modify the boundaries of the areas leased upon certain conditions; (2) To resume the whole or any portion of the area leased for any public purpose as defined by the Lands for Public Purposes Acquisition Act or the Crown Lands Acts; (3) To determine that every lease shall be held subject to any conditions, stipulations, and covenants on the part of the lessee which may be imposed by any Act of Parliament hereafter to be passed dealing with the protection, cultivation, or sale of oysters.

It has been the custom to issue leases for a term of fifteen years, with a right of renewal upon application being made by the lessee during the twelfth year; but in view of the proposed new fisheries legislation, in which it is provided that ten years shall be the life of a lease, we have determined not to issue any further leases for periods exceeding such term.

Steps are now being taken for the completion of all outstanding applications, and in a very short time the majority of leases will be ready for issue.

A heavy fall of spawn was deposited in the waters of Camden Haven during the early part of the year, and also in the Hunter River, but in other waters the fall has been light.

It is usual to expect the spawn to be deposited in the warm weather, but it has been noticed in some waters to have set in slightly in the depth of winter, and in other localities the fall has been general all through the year.

The worm or mud disease is unfortunately still in our midst, notwithstanding the strenuous efforts made by some of the lessees to eradicate the evil.

The localities suffering most in this direction are the Hunter River, Port Stephens, Tweed River, Clarence River, Crookhaven River, and part of George's River.

Your Commissioners have given very careful consideration to this disease, and would point out to lessees that the most successful way to deal with the evil is to remove the whole of the affected oysters from the banks and deep waters to the shore for a thorough drying.

The shells should be allowed to dry in this manner for a few months, when it will be found that the worm is dead; the shells, clean and fit, to be placed in the same or other waters as spat collectors.

We would strongly urge oyster-cultivators to continually dredge and lift all oysters that are affected with the worm and treat the shells in the manner indicated; and if this practice is effectively carried out there is every likelihood of the disease being successfully fought.

The

The worm which causes all the destruction is said to spawn about November, and it is considered that the best time to carry out this work would be the months immediately prior to its spawning.

Every year we have reports that oyster-stealing from Crown lands for the purpose of sale is carried on, and the past year has been no exception. The waters that suffer most are those that have no local supervision, such as Port Stephens, Manning River, Clarence River, &c., and with the limited staff at our disposal we find it difficult to afford other than a casual protection to them.

On account of the deterioration of the Moreton Bay oysters through the mud disease that has now firmly established itself there, it is more than likely that Queensland will have very few oysters to put on the market for some time to come.

The effect of this will in all probability cause an increased demand for those produced in this Colony's waters with a corresponding increase in the price, and there is every likelihood of the next season being a very profitable one to oyster-cultivators.

There are very few places in the world better adapted to the growth and culture of the oyster than New South Wales, which has a favourable climate and numerous inlets and creeks with water of a strength eminently suited to the improvement of the bivalve; but notwithstanding these favourable conditions, it is to be regretted that in some localities the natural beds have been temporarily exhausted through the improvidence of the lessees, who strip their beds without any regard to future supply.

A considerable number of lessees are quite satisfied to let the spawn attach itself where it will, and take their chance of getting a share on their foreshores, instead of placing artificial spat collectors in the waters. If they would follow this course, they would obtain considerably more from a general spawning than at present, and the expense incurred in laying them down would soon be justified by the good results that would follow.

Fisheries.

The supply of fish is principally obtained from the home fisheries, from which the means of transit are quick and regular, and it is satisfactory to note that the supplies from some of the remote fishing grounds along the coast have considerably increased during the year.

The following list will show the number of baskets of fish sent to the Markets during the year:—

Lake Macquarie	12,676	Shoalhaven River	1,040
Tuggerah Lakes	10,372	Hastings River	729
Lake Illawarra	9,063	Bateman's Bay	1,821
Hawkesbury River	8,843	Bermagui	720
Clarence River	5,848	Richmond River	655
Brisbane Water	3,058	Macleay River	345
Ulladulla	2,638	Wagonga	171
Cape Hawke	2,463	Eden	80
Manning River	1,151				

This list does not include those caught at George's River and Port Jackson, which are taken direct to the market by the fishermen.

A considerable quantity of fish from Port Stephens, Hunter River, and Lake Macquarie are taken to Newcastle, and forwarded direct to the different country towns along the northern railway line, where it is distributed in time for the morning meal.

A reliable return of the fish sold at the Eastern Market, Woolloomooloo, cannot be furnished, as the Market Inspector is not in a position to supply the particulars, and the Inspector of Fisheries, who visits these Markets, cannot attend daily owing to the nature of his duties, which keep him frequently occupied during the night looking after closed waters.

It has been ascertained that 38,295 baskets of fish have been disposed of at Hudson's and McFadyen's Markets, Redfern, at varying prices, particulars of which are given in Appendix "F."

Although most of the grounds from which supplies are received are within easy access to the market by rail or steamer, fish frequently arrive in the warm weather in an inferior condition, and we would urge upon fishermen the advisability of gutting and packing the fish in ice in properly constructed boxes when they are forwarded to market. In this manner they would arrive in a condition satisfactory both to the vendor and the public, and would without doubt realise much higher prices than those brought to the market in their natural condition. The cost of providing this means of preservation would soon be covered by the increased prices obtained, and the quantity of fish condemned as unfit for food would be considerably reduced.

Crayfish have been obtained in large quantities from Broughton Island, mostly by Greek and Italian fishermen, who, when there is a glut in the market keep them alive in enclosed yards in certain portions of the harbour, and place them on the market in moderate quantities, so as to maintain a standard price.

Your

Your Commissioners would invite special attention to the practice of sending to market large quantities of female crayfish during the spawning season. This crustacean is considered a great delicacy when heavily charged with ova, and meets with a ready sale when in this condition, and the practice is that crayfish fishermen lay themselves out to market this crustacean when in full roe, and thereby prevent millions of ova being deposited in the waters.

If this short-sighted policy is continued it will eventually lead to the extermination of this species ; and as there is no provision in the present Fisheries Acts which will allow of protection being afforded to crayfish, we would urge upon the authorities not to lose sight of this matter when the question of introducing new legislation to deal with the fisheries of the Colony is being considered.

In the homes of the poorer classes fish is considered as a luxury to be availed of only occasionally, and it is reasonable to expect that any scheme which would result in the supply to these families and throughout the country of this article of food in a cheap and abundant manner would give great profit to any enterprising persons engaging in such an undertaking, as well as being a national gain to the community at large.

This is a matter for private enterprise, and it is hoped some company will be shortly formed with this end in view.

The principal sources of supply are:—Lake Macquarie, Tuggerah Lakes, and Lake Illawarra, and to conserve these fields to the greatest possible extent we have adopted the practice of closing against the use of fishing-nets for a period of two years all the tributaries of these waters, which in addition to the existing closures of the channel entrances afford every facility for the young fry to attain a mature state, and also for the free and undisturbed ingress of schools of fish from the deep waters of the ocean.

The beneficial result of exempting these waters from the use of fishing-nets has made itself apparent, and it is gratifying to record that many of the professional fishermen are agreed that these closures, though restricting them in their field of operations, are quite necessary for the protection of the young fish and the continuity of the supply.

Amateur line-fishing is very extensively carried on in those waters within easy access of the metropolis, and it is greatly to be deplored that vast numbers of immature fish, mostly whiting and bream, are killed every week during the fishing season by line-men.

It is no exaggeration to state that over 500 dozen of these undersized fish are taken every week during the summer months, and we think it only right to point out that amateur line-men are, to a great extent, responsible for the scarcity of full-grown fish.

Several large shoals of fish have been observed travelling along the coast in a northerly direction, particulars of which are as follows:—A species of whitebait in February; maray or pilchard in April and September; sea-mullet in February, March, April, and May; salmon in October and November; sea-garfish in January, March, April, and May; bream in May, June, July, and August; black-fish in April; whiting in January, September, and December.

We have to record that the usual capitation allowance has been paid for the destruction of forty-one sharks during the year. They are in all cases measured by a responsible officer, who gives a certificate of destruction before the reward is paid.

Inland Fisheries.

Practically there is very little benefit derived from the inland fisheries; a few cod are sent to Sydney occasionally, but the bulk of fish are caught in the Murray River, and find their way to the Melbourne market *via* Moama and Koondrook.

19,044 lb. were so exported to Victoria, and this is over 10,000 lb. in excess of the quantity so exported during 1896. The increase is no doubt due to the protection that was afforded to a portion of these waters by closing them against the use of fishing-nets for a period early in the year.

The bulk of fish now obtained here are caught on long lines stretched across the river with numbers of baited-hooks attached.

There is no regular fishing carried on at Lake George, although the waters are said to be full of fish. Occasionally cod of 50 lb. weight are caught, but they do not take the bait freely, owing to the plentiful supply of fish-food in the lake. The total catch recorded for the year does not exceed 500 lb.

Representations having been made as to the desirability of closing certain portions of the inland waters against the use of fishing-nets, we, after satisfying ourselves as to the necessity for such protection, recommended the closure, for a term of five years, of portions of the Cudgegong River, flowing past the town of Mudgee, and the Bogan River, fronting the town of Nyngan. This is in addition to numerous other closures in other localities in past years.

Owing to the small staff of Inspectors at our disposal, we are unable to afford any supervision to the Inland River Fisheries, and were it not for the efforts of the police, to whom we are much indebted, there is no doubt much illegal netting would be carried on.

Fish

Fish Acclimatisation.

As in former years, a large quantity of trout ova was received from the Acclimatisation Society at Wellington, New Zealand, consisting of 50,000 brown trout (*Salmo fario*) and 50,000 rainbow trout (*Salmo irideus*).

About 10 per cent. of the *S. irideus* were found to be lifeless on the arrival of the steamer; but the majority of those remaining were successfully hatched out, and proved to be a very lively and healthy lot.

A great percentage of the *S. fario* contracted black ophthalmia and blue swelling of the yolk sac, and their numbers were reduced considerably by this disease.

Notwithstanding these adversities, several thousand were reared at the hatching-house, and distributed in the fry stage to the following waters, viz.:—Macquarie, Fish, Campbells, Winburndale, Burrie, Narranarra, Conjola, Pambula, Towamba, Enderick, Corang, Scotcheys, Cudgegong, Belabulah, Coombing, Lachlan, Middle Arm, Quidong, Bombala, Delegate, Upper Queanbeyan, Moonbah, Yarrangobilly, Thredbo, Cottage Creek, Black Lake, Cathcart, Eucumbene, Buckley's Crossing, Boloco, Snowy, McLachlan, Crackenback, Jindabyne, Wollombi, Mooki, Kentucky, Armidale, Moredum, Molong, Pudman Creek, Turon, Bell, Capertee, Wollondilly, Dingo Creek, Wallerawang, Burrowa, Bowning, Ourimbah, Lithgow Water Supply Dam, and Breeding Ponds, Mittagong.

Three hundred young trout have been retained in the hatching-ponds, and it is the intention of your Commissioners to keep them till they reach the yearling-stage, when they will be liberated in suitable streams.

The rainbow trout appears to be the most suitable species of the *Salmonidæ* yet introduced into this Colony; they are hardy and healthy, and better able to thrive in the changeable temperatures of our inland waters than the *S. fario*, and it is our intention to secure a further supply of this species next season.

Trout may now be said to be thoroughly acclimatised to the cooler waters of New South Wales, and from authentic reports furnished by residents in the various country districts where they have been liberated they are said to be thriving remarkably well.

In the New England waters and the tributaries of the Snowy River, trout of several pounds' weight have been seen to rise clean out of the water, and there is no doubt these are some of the fish or the progeny of those liberated by your Commissioners.

Great interest is taken by many residents in the country districts in the acclimatisation of this valuable species of the *Salmonidæ*, and we are indebted to many sportsmen for the efforts that have been frequently made to conserve the fry when liberated.

The hatching-ponds at Prospect are in a satisfactory condition; the work in connection with them has been ably carried out by Assistant Inspector Glading during the process of hatching and distribution.

The success of the hatching depends greatly on the water-supply arrangements, and we are pleased to state that the Engineer for the Prospect Waterworks has afforded every facility to ensure a regular water-supply to the hatching-house.

Attention is invited to the accompanying Reports of the Chief Inspector and the Assistant Inspectors on the fisheries under their charges, and the tabulations in the appendices, from which much detailed information will be gathered.

In concluding our Report we would again earnestly express our hope that an early opportunity will be taken to introduce new legislation with a view to remedying the evils existing under the present Fisheries Laws which we have frequently pointed out render it impossible for us to administer this important Department in a satisfactory manner.

We have, &c.,

JAMES C. COX,
J. R. HILL,
S. H. HYAM,
W. R. CAMPBELL,
FRANK FARNELL.

Fisheries Inspectors' Reports.

Sir,

Department of Fisheries, Sydney, 1 March, 1898.

I have the honor to furnish a report on the Home Fisheries of the Colony for the year 1897.

Port Jackson.

Fish have been fairly plentiful in the harbour, notably mullet, garfish, and bream, but in the Parramatta and Lane Cove Rivers they were very scarce at the latter end of the year. The closure of these waters will, however, be the means of replenishing them with plenty of fish.

Prawns were numerous at the latter part of the year, and in the upper parts of Parramatta River they reached a very large size.

There are a number of Italians fishing for prawns, and the majority use a class of net which, while it does not come within the provisions of the Sunk Nets Act, has practically the same disastrous effect as a sunk net; it is a net with a deep bunt, and is sunk below the surface, and dragged along the bottom in such a way as to scrape the bottom clean. They do a lot of injury to the feeding-grounds, but nothing can be done to prevent their use.

There are about seventy fishing-boats, with an average of two men to each boat; but a number of them travel about to the waters north and south when the fish are more plentiful than here.

Assistant Inspectors Hellings and Glading have been very energetic in the performance of their duties in the main portion of the Harbour and in Middle Harbour, and report that the fishermen generally keep well within the law. Assistant Inspector Smithers is generally engaged in looking after the Parramatta and Lane Cove Rivers, both of which were closed in October last for a period of two years. These closures did not meet with the approval of the local fishermen at the time they were closed, but they seem to be now satisfied that the closures were necessary for the recovery of the fish supply and the protection of the young.

The quantity of fish taken from Port Jackson cannot be given correctly, as they are taken direct to the Fish Market from the boats by day and night, and there is no means of ascertaining this information.

Lake Illawarra.

This is one of the most important of our fisheries, as well as being invaluable as a breeding-ground and nursery for fish. All kinds of fish abound here, and bream, mullet, flathead, garfish, and whiting have been caught in large quantities by the local fishermen.

Over 10,000 baskets of mixed fish were taken from this lake during the year, and as it is so conveniently situated as regards transit to the metropolitan markets, it may be looked upon as one of the most valuable of the home fisheries.

The tributaries of the lake were closed against net fishing for a period of two years from the 14th October, and it is confidently expected that this will have a valuable bearing on the future supply of fish to the lake.

The average number of fishermen working during the year was thirty-two, with about sixteen boats.

Lake

Lake Macquarie.

This lake continues to be the most productive of our fishing-grounds, as over 12,000 baskets of fish were sent to market, which just about equals the previous year's record.

A good proportion of the fish caught here are consigned to the proprietor of the ice-works at Newcastle, who supplies all the principal northern towns with fresh fish, and many country families are thus enabled to enjoy this article of food for their morning meal in as fresh a condition as those distributed in the city.

On account of the great quantity of fish in these waters they are very much worked by fishermen, and the temptation to evade the law by netting in closed waters seems to have been very great, as the assistant inspector is continually kept going to protect some of the closures.

It is an exceptional thing to find schnapper in any of the lakes in quantities; but in May and June last eighty-two baskets of this class of fish were caught in three hauls at Wangi Wangi Point.

The lake is not oyster-bearing; there are a few stunted ones in isolated spots, but they do not grow well.

George's River.

Fish of all kinds were in abundance during the early part of the year, but the heavy freshes later on drove great numbers of them away.

Fishermen had great difficulty in following their avocation successfully on account of the immense quantity of blubber during the summer months, and frequently had to lift their nets and let the fish escape, through their inability to haul them to the shore when so freighted.

Woronora River, which has been closed the whole of the year, was alive with fish, and is a constant source of supply to the lower waters of George's River.

During the latter part of the year and following the close season prawns were very abundant, and some very large specimens have been netted at Lady Robinson's Beach.

There are over 10,000 yards of foreshore under oyster lease, and the majority of the leases are well stocked. The deep-water beds are badly affected with the worm disease, the same that exists in the Hunter River, but fortunately this does not extend to the bankers.

Hawkesbury River.

Fish have not been so plentiful in these waters as formerly, and the scarcity is probably due to the great numbers of immature fish that have in the past been killed by the pretty general use of the garfish net, which is most destructive to young fish, and the great quantities of undersized fish caught by amateur line fishermen.

Several of the creeks leading into the main river have been closed against net-fishing, and it is expected that the protection thus given will have the effect of increasing the supply in the open waters.

About ninety-four fishermen are following their occupation on these waters, and their catches are forwarded to the Sydney markets both by rail and steamer.

There are very few deep-water oyster-beds, and the bulk of oysters removed from this river are from the rocky foreshores, which are eminently suitable to their growth.

Their condition has been very good, and they always command a good price in the market.

The foreshore oysters are all clean and healthy, but some of those below low water-mark have the worm disease.

This disease has affected some of the deep-water oysters for some years, but it does not appear to be spreading.

A good deal of pilfering off Crown lands has been going on during the year, and can be very easily carried on owing to the rugged and precipitous foreshores which afford excellent cover to the illegal oysterers. It is not unusual for several men to be taken out in a boat and landed on different points with cans and bags, and when they are disturbed by the approach of the inspector they disappear into the hills, where they hide until the inspector leaves the locality.

Special efforts have been made to put a stop to this practice, and some convictions have resulted.

Tuggerah Lakes.

This is a very valuable fishing-ground, and comes next to Lake Macquarie as regards the quantity sent to market.

The entrance to the lake was open from April, and remained so during the year.

Several large shoals of mullet, bream, and black-fish came in from the sea, and through the closure at the channel entrance were enabled to have undisturbed access to the lake waters.

Steps have been taken for the resumption of a site for an inspector's residence at the channel entrance, and it is hoped that it will be speedily carried out so that the ground may be enclosed.

The bar at the mouth of Wyong Creek has become so shallow that it is with difficulty that the fishermen can pilot their boats into the creek to catch the steamer which comes down twice daily.

A channel should be cut to admit of boats passing freely in and out, and would be a great boon to the professional fishermen and visitors.

Unless the Government carry out the work, I do not see how the necessary deepening of the entrance can be accomplished, as the fishermen have not the time or implements to effect it.

Brisbane Water.

Netting was carried on so vigorously that the natural supply became exhausted, and the whole of these waters were closed from the 7th September, 1897, till the 30th April, 1898.

In the early part of the year fish were plentiful, and many thousands were caught by amateur line-men, who in the season, when the sport is good, visit Woy Woy in great numbers. Thousands of bream and whiting of an unmarketable size are caught by amateurs, who as a rule do not return them to the waters, and it is to a great extent due to this wholesale destruction of young fish that there are so few of a large size in these fine waters. Professional fishermen, by the use of garfish nets, also caused the destruction of numbers of young fish, which were in many cases left on the beaches.

The local people are continually agitating for the permanent closure of these waters against net-fishing, on account of the number of visitors who would then frequent them, and thus be a means of support by circulating money in engaging boats and dwelling-houses.

Hunter

Hunter River.

As a fishing-ground this river is not worked to any great extent, as the supply is small in comparison with the other waters adjacent to the metropolis.

There are about sixteen fishermen engaged here, and the few fish they get are disposed of in Newcastle.

Prawns have been plentiful at times during the year, but they are very small.

The oysters are still very much affected with the worm disease, notably in the back channel and round Sandy Island. Mr. Gibbins has pretty well all the oyster-bearing portion under lease, and is doing good work in trying to clean the river of the disease. He has dredged several thousand baskets of affected shells, and placed them on dry land, where they are undergoing a process of bleaching. Three thousand baskets of dried shells have been taken to Camden Haven to be laid down for catching spat in those waters, and there is no doubt that the lessee will be amply repaid in the near future for the trouble and expense he has been put to in this direction.

Port Stephens.

The class of fish caught here is equal to those in any of the Home Fisheries, and frequently one hundred baskets are sent to Newcastle by the steamer Gosford, which boat trades daily to Newcastle from Nelson's Bay.

Lobsters also in the season are caught in immense quantities.

The oysters are rather poor, and a good many have the worm disease.

For the want of an inspector in these waters, there is a great deal of oyster-stealing, both from Crown lands and off leases, and although special efforts have been made to check this illegal work, the practice still continues.

The police have been very active in trying to bring the parties to justice, and several convictions have resulted.

It would be a great advantage to the Department and the lessees if some permanent supervision could be established over these waters, and would be the means of securing additional revenue for oyster-culture leases.

Cape Hawke.

From reports furnished by Mr. Inspector Massingham, it appears that fish of all kinds have been very plentiful; but on account of the irregular steamship arrangements, tons of fish have been thrown away at times when the steamer did not arrive up to time.

Owing to the shallowness of the water on the bar, only small boats can enter, and occasionally they cannot get across, so it is not to be wondered at that these crafts are frequently delayed by bad weather and from other causes.

Vast quantities of oysters are consigned from Wallis Lake, and are of a very fine quality; they are quite free from the disease, and the fact of their being so is due to the action of Inspector Massingham, who promptly caused the removal of a number of diseased oysters which were laid down on one of the leased areas.

From the different rivers north of Cape Hawke fish have been regularly sent to market during the winter months, but very few in the summer.

On the whole, the fishing industry may be said to be in a satisfactory state; but fishermen would serve their own interests and those of the public if they made a practice of packing their fish in ice during the hot weather, as by doing so they would reach the market in prime condition, and realise prices which would repay them for the cost of the ice.

I have, &c.,

J. A. BRODIE,
Chief Inspector.

Sir,

Forster, 15 January, 1898.

I have the honor to submit Report of the Net and Oyster Fisheries of Wallis Lake for the year 1897:—

Net-fishing.

With reference to the spawning of the different kinds of fish which are the most abundant in these waters, from personal observation I may state that mullet are the most plentiful, and, during the months of March and April, immense shoals travel northward along the coast, and enter the inlets on their way, to deposit their spawn on the muddy and weedy bottoms.

Black-fish are also in abundance, particularly in the lake, where there is abundant feed and shelter for spawning, which takes place in April.

Bream are also most plentiful during this season, at which time they enter the inlets in shoals, and deposit their spawn on hard and uneven bottoms, such as oyster deposits. I quote this from experience while at the Clarence, where they are in full-roe immediately after the sea-mullet go out.

Whiting enter the inlets during the warm summer months, and are then in full-roe, and shed their spawn on sandy bottoms; they, like the bream, frequent the shelly bottoms; their fry are found in these places in large numbers.

Jew-fish appear in the inlets in shoals during the winter season. As to their time and place of spawning, I may state that I have opened these fish at all seasons, but have never yet detected any sign of spawn, and, from frequent inquiries, cannot elicit any information on this point; but I think it reasonable to infer that they do not spawn in the inlets. I also incline to the opinion that all fish on our coast travel northward when schooling.

Flathead are in abundance in these waters during the summer months; the hard clean bottoms of the lower waters are well adapted for their feeding and breeding grounds, and they afford capital sport for the angler. They are also in full-roe during summer.

Tailor are in abundance during the whole year, but more particularly so in the summer. Although considered excellent eating when fresh caught, they are not much sought after on account of their tendency to turn soft during transit, and are seldom taken unless of exceptionally large size. These, like the jew-fish, are very rarely found in roe; it is, therefore, difficult to determine when or where they shed their spawn.

There

There are also several different kinds of fish known in Australian waters which periodically enter the inlets to the north and south, but are very rarely known to enter here, amongst which are the king-fish, salmon, herring, mackerel, rock-cod, trevally, and nannygai.

Whilst dealing with the various kinds of fish, I may state that on the 17th March a school of albacore found their way into the harbour, some of which were speared by the half-castes; but the fish being little known no use was made of them.

It seems rather remarkable that these fish should enter here, as they are essentially a deep-water fish, and the entrance to this port is seldom more than 7 feet in depth.

Of prawns there are plenty in these waters; but prawn-fishing is not carried on owing to the length of time it takes to get them to market.

Crabs, unfortunately there are too many, and may well be classed as vermin, as they are very destructive amongst oysters. Their powerful claws enable them to crunch through the shell and consume the oyster.

The output of fish for the year was 2,463 baskets, the greater number of these being mullet and black-fish.

This does not by any means represent the total catch, as great quantities of fish are destroyed, principally owing to the non-arrival of the steamer.

The usual custom is for the fishermen to make their hauls on the night previous to the expected arrival of the steamer in the morning; but it is to be regretted that it often occurs that the steamer does not arrive in time, when, consequently, the whole catch is lost. The non-arrival of the steamer is caused sometimes owing to there not being sufficient water on the bar, or bad weather and unavoidable accidents, but from whatever cause the serious loss of fish and labour is to be deplored.

The mode of transit to the metropolis is in large cases holding from five to ten baskets of fish, packed in ice, and carried on the steamer's deck.

Of the state of the waters for netting, I may state that there are miles of good hauling-grounds; but by far the largest area is practically closed against the use of nets on account of the growth of marine vegetation and rocks and other obstructions.

The only net that is used is the ordinary hauling-net, 300 fathoms in length. This concession has been granted for a period of three years, on account of the very extensive flats over which the nets have to be hauled, and renders the 150-fathom net totally inadequate; and I think the long net is preferable to the shorter one, as the fisherman can often obtain all they require in one haul, instead of having to make a number of hauls, and thus constantly harass the fish, and destroy the feeding and breeding grounds.

With reference to the destruction of fish caused by the different nets, I think the present hauling-net the least objectionable; but if it is desirable to conserve the fisheries, I think it might be better to increase the mesh from $2\frac{1}{4}$ to $2\frac{3}{4}$ inches. Any fish that escape through this mesh is not of much value for consumption.

Line-fishing is not carried on to any extent, only being limited to the residents and half-castes for their own consumption. I think if the resources for line-fishing in these waters were better known numbers of pleasure-seekers would be inclined to pay it a visit; there is every facility for boating, fishing, and bathing, both inside and on the sea-beach, while the scenery and climate is all that could be desired.

There are no closed waters under my supervision; and I do not think the closing of any portion is absolutely necessary, unless a portion near the entrance to allow the schools to pass in unmolested, a considerable portion of the lake waters being already naturally closed against the use of fishing-nets.

The number of fishermen employed during the year was twenty-one, and fishing-boats seven. The district is capable of sustaining a much larger fishing population; but the means of transit is insufficient at present; but I am informed that a more suitable steamer will shortly be placed in the trade. There were six half-castes employed in the industry, but they do not pay a license fee.

Two illegal nets were seized and confiscated; also two prosecutions for fishing without licenses, and verdicts obtained in both cases.

Oyster Fisheries.

The general condition of the oyster-deposits may be regarded as satisfactory, a very large portion being well stocked. There are three very extensive areas well adapted for breeding-grounds which supply the bulk of the oysters which are sent from here. In addition to those sent directly from these areas, two men are almost constantly employed in thinning out and removing to other areas, which are suitable for fattening purposes, though they do not produce nor catch spat to any great extent.

There are also numerous areas held as spat collectors, the spat adhering to mangroves and cobbler's pegs, and are well suited for removal to other localities, where they soon mature.

All the oyster deposits in these waters are on shallow ground, which renders the removal of oysters from one area to another comparatively easy, as compared to deep-water deposits, where the dredge has to be employed.

The method of cultivation carried on is by removing from areas where they become too thick, and from the mangroves along the foreshores, and placing them on the shallow flats, where they are barely covered at low tide. It is on these flats where oysters thrive best, and not in deep water.

The condition of oysters is generally best during the winter months, but they are also in fair condition throughout the summer.

With regard to disease, it is to be regretted that a small consignment of oysters were sent here in the early part of the year, and, through ignorance of the presence of disease, were laid down on one of the leased areas, but were promptly removed under my supervision, the whole area being completely cleaned up and laid on the bank to bleach, the operation being completed within three days from the time of being laid down, since which no further disease has appeared, the whole of the oyster-bearing areas being perfectly free from disease. It is very fortunate, in this case, that the oyster-deposits are in shallow water, which renders the cleaning up of an area easy to accomplish. Had the diseased oysters been placed on deep-water deposits, the thorough cleaning up would have been next to impossible, and the disease permanently planted.

Referring

Referring to spat, the fall has been extremely light. This may be accounted for by the heavy fresh in the rivers during the month of June, at which time, I believe, the usual fall occurs (subject, of course, to climatic conditions). From the appearance of spat deposited on the stones near the entrance, I think that a good fall would have come in from the sea, and have been deposited on the leases, had it not been for the fresh water coming down, which destroyed it.

I am of the opinion that oysters shed their spawn every year; but sometimes under unfavourable conditions, and thus it becomes destroyed.

The last noticeable fall of spat occurred during May or June, 1896. This I infer from the size of the spat at the time of my arrival, viz., 15th July, 1896.

As to the age at which oysters are considered marketable, a great deal depends on the amount of feed which is brought to them by the influence of the tides. As far as my experience goes, at all places near the sea where the water is clear and salt, oysters do not mature so quickly as where they are situated on or near muddy bottoms, of course bearing in mind the mud is not so deep as to cover them.

I think in these waters it may be fairly assumed that it takes two and a half to three years for oysters to become of a marketable size.

In reference to this subject I may state that during the time I was stationed at the Clarence the flood of 1887 destroyed 87 per cent. of the oysters in that river, after which there were none taken for market for a period of two and a half years.

The output of oysters for the year has been 2,241 bags.

There have been twelve applications for oyster leases, comprising 2,100 yards of foreshore measured and reported on, making the total area under lease and applied for as 23,050 yards.

In addition to the public oyster reserve at Forster an area of 400 yards has been granted for the same purpose at Toncurry.

Manning River.

The oyster fisheries of this river differ from those of Wallis Lake in so much as they are deep-water beds, situated in the main river and the various tributaries, and extending for about 8 miles up. The south channel, forming the largest area, being a continuation of oyster-bearing ground almost the entire length. The oysters in this river are not generally in good condition except during the summer months, consequently are not worked to any extent except during that season.

Unfortunately the disease has been in evidence in this channel for several years; a portion of Scott's Creek appears to be the worst affected of any in the district. From casual visits I am not in a position to state positively whether the disease is increasing, but from what I have seen I do not think it is decreasing.

For the use of the public there has been two areas reported on and granted as public oyster reserves, one situated at the Old Bar, the other at Khappinghat Creek, the older reserves being situated, one at Luthrie Bay, the other near Harrington, making four extensive areas in the Manning district set apart for public use.

With regard to the area of leased oyster-ground, 6,400 yards have been applied for and reported on during the year, making a total of 18,850 yards of foreshore under lease and applied for.

In addition to the measuring of these areas, the whole of the leases have been measured and the boundaries readjusted.

Net-fishing.

Owing to the limited time at my disposal whilst visiting this district I am unable to furnish particulars regarding this industry, but I think the class of fish usually sent from here are better than those sent from Wallis Lake, being chiefly bream and whiting, but, unfortunately, like many other rivers on the coast, it has a bad entrance, and a serious loss of fish results, owing to the unfavourable state of the bar in bad weather, the steamer being unable to cross in or out.

Camden Haven.

I have paid two visits to this locality during the year for the purpose of measuring and reporting on oyster leases, and I found the oysters in good condition, free from disease, and the areas well stocked. The whole of these areas are held by one lessee, and are, like the Manning River leases, situated in deep water, and are only worked during the summer season, when good results are obtained, the leases being well and systematically worked.

The area under lease in this district I am unable to state, having no plan in my possession.

Net-fishing is not carried on to any extent, owing chiefly to the uncertain means of transit.

I have, &c.,

J. MASSINGHAM,

Assistant Inspector of Fisheries.

Sir,

Swansea, 15 January, 1898.

In reference to your letter of the 4th instant, I have the honor to furnish replies to the lines referred to therein, according to their respective numbers for the year 1897.

1. Mullet and black-fish spawn about March, April, and May; bream, flathead, schnapper, whiting, flounder, garfish, and tailor about December and January. I have caught bream in roe at different periods of the year.

2. Fish deposit their spawn wherever they may be when it is ripe—I think on shallows and in creeks principally.

3. Young fry is first seen on shallows at the head of bays and in creeks.

4. Bream may be seen everywhere, and travel during May, June, and July, and as late as September.

Whiting to be seen principally on the sand-flats about the sea entrance, and very often accompany bream in their travels. River-garfish like to be amongst the narrow silky weeds of flats; sea-garfish to be found principally on the coast, but plenty were caught in the lake this year; they also travel during the winter months; mullet are found in deep water, shallows, mud-flats, and creeks, and travel as black-fish do, in March and April.

5. Shoals of mullet may be seen between December and April; bream, whiting, schnapper, jew-fish, and garfish in shoals between May and September; tailors school in January, February, and March.

6. The total number of baskets of fish caught for sale during the year is 12,676.

7. All fish are sent to market by rail.

8. The water is in an excellent state for netting purposes.

9. The nets used for fishing here are the general hauling-net, the diver-net, the garfish-net, and the meshing-net; the effect of these on young fish is not injurious here; the water as a rule is deep and affords plenty escape.

10. Line-fishing by amateurs is carried on here continually between the months of October and April.

11. The parts closed against the use of fishing-nets are the lake entrance and portion of the lake embracing an area of about 6 square miles of water. I am sure if the entrance was not closed the fish supply of the lake could not be so good. Cockle Creek and Dora Creek are also closed, but only from a very recent date; these are great places for small fish of all kinds.

12. The average number of fishermen and boats engaged during the year is seventy and twenty-five respectively.

There are no oysters in Lake Macquarie worth cultivating. A trial was made of small oysters taken from the mangrove flats of the channel entrance and laid down in the lake, but it proved unsuccessful, the oysters all died.

During the months of March, April, May, June, and September fish were caught in great quantities by nets; these months of every year yield the best supplies of fish. On the night of the 9th May, R. Parker caught at Wangi Wangi Point eighteen baskets of schnapper weighing from 1 to 5 lb. each by himself with a short net; the next night he joined with C. B. Johnson's crew, and caught at the same place forty-six baskets of the same sized schnapper at one haul with 300-fathoms net; and again in June, Dunn's party also landed eighteen baskets schnapper.

In January, February, March, and April large catches of red bream, black bream, whiting, flathead, flounders, and tailors were caught by amateur-line fishermen within the boundaries of the lake-entrance closure; the majority of the fish would be in roe at that period of the year. The total number of baskets of fish taken during the year exceeds the catch of the previous year, 1896, by two and a half baskets, with about the same number of fishermen employed.

I have, &c.,

F. ALDRICH,

Assistant Inspector of Fisheries.

Sir,

Wyong, 11 January, 1898.

In reply to you memo. of 4th January, I have the honor to submit the following:—

1. The schnapper, bream, tarwhine, and whiting are full-roed in from November to January; black-fish and flathead, January to March; mullet, March and April; river-garfish, in August; sea-garfish, in July; long-tom, February and March. I have seen all those fish full-roed at other times of the year; but those times mentioned are about the main time.

2. In my opinion the fish spawn while travelling in the mouths of estuaries and rivers and in sheltered bays.

3. The young fry are first seen in shallow water on the flats of rivers or lakes and bays. I have seen large shoals of small fish, from $\frac{1}{2}$ inch to 1 inch, in drains and round the edges of the lake behind the weeds, and the water has been so hot that I could scarcely bare to wade in it. Still the young fish seemed to enjoy it.

4. As to habits, all kinds of fish are caught at times on the same ground; but, as a rule, the schnapper and bream like a rocky bottom; whiting, a sandy; mullet and flathead, a sandy or muddy bottom.

5. On 14th, 22nd, and 23rd April, large shoals of mullet went out; on 23rd April, a shoal of black-fish came in; on 5th and 6th July, large shoals of mullet were on the entrance flats, and on 7th very large shoals of some small fish were on the beach outside the entrance, but I was unable to see what sort they were, as they were a long way out.

6. The output of fish for 1897 was 10,372 baskets.

7. The fish are brought to the mouth of Wyong Creek, where they are basketed up. They are then put on board the steamer and taken to Wyong and carted up to the railway-station, where they await the arrival of the fish train, which arrives there about 11 p.m.

8. At present the waters are in fair condition, there not being so much slime and weeds on the bottom; but the weather is very much against getting good hauls. The north-east winds have been exceptionally heavy this summer, and this is the worst wind which blows for Tuggerah Lakes, there being not many sheltered hauls with a north-easter.

9. Hauling, garfish, meshing, and divers nets are used. The garfish-net is the most injurious net if not properly used; but in this lake there are few hauls where the fishermen land. I have not seen many young fish killed in this lake, as the nets are generally hauled to a back net out on the flats, clear of the weeds, and the small fish are mostly all in-shore.

10. There is not much line-fishing done here.

11. The entrance, and 1 mile on either side, and 1 mile out into the lake, is the main closure here, and this gives the fish a chance to go out or in without being disturbed. There is also a large flat in the Middle Lake closed, which is a regular breeding-ground for small fish. Ourimbah, Wyong, and Wallarah Creeks are also closed. The effect on the entrance closure is that the fish can travel either way without being molested.

12. The average number of men has been fifty-seven, with twenty-three boats.

13. The condition of the only oyster-bed under lease is good, and is suitable for oyster-culture, there being a great many whelks all over the bed. The lessee has put a lot of ti-tree stakes on his lease, but up to the present nothing has adhered to them except barnacles.

14. The oysters are in good condition, and there is no disease.

15. The first notice of any young oysters appearing on the whelks or shells was in October.

16. The oysters here are marketable in about two years.

The

The supply of fish up to the end of June, 1897, increased by 1,012 baskets. This is attributable to the closures opening to net-fishing in February, but the take for the whole year has decreased by 1,050 baskets.

The take for 1896 was 11,422 baskets; for 1897, 10,372 baskets; decrease, 1,050 baskets.

I think that the weight the fishermen are allowed to catch the fish at is too small. Not one fish enumerated in the schedule has got the sign of a roe in it at the weight opposite their name, with perhaps the garfish only. The consequence is that all kinds of fish must decrease.

When I was here some seven years before, the fishermen would not put any small fish in their baskets, although they were over the weight they were allowed to catch them at. They said they would spoil the sale of the other fish. Now they are glad to send them the bare weight, and they do not get the catches they got formerly.

The entrance opened on 24th April through the heavy sea breaking over, and there was a very large entrance up till the end of the year; but it has since closed up considerably, and is likely to close altogether if rain does not soon come.

CHARLES GORDON,
Assistant Inspector, Tuggerah Lakes.

Sir,

Brisbane Water, 15 January, 1898.

In compliance with your request, I have the honor of forwarding the following report:—

Fish in these waters spawn as follows:—Schnapper in November, December, and January; bream, tarwhine, and whiting in December and January; black-fish and flathead in January, February, and March; mullet in March and April; garfish in July and August. Fish spawn, while travelling, in the mouths of estuaries, bays, and creeks. The young fry are first seen in shallow water in bays, creeks, and flats.

Bream like a rocky or gravelly bottom; whiting, a sandy; garfish and black-fish, a weedy; mullet, a muddy; flathead, a muddy or sandy; and schnapper, a rocky bottom.

I saw several shoals, in months of October and November, making their way to bays and creeks.

The output was 3,058 baskets of fish for the year ending 1897. Some are sent from Woy Woy per rail; some are carted from Terrigal, and sent per rail from Gosford.

There is no netting carried on here at present. Hauling, meshing, garfish, and divers nets are used when the waters are open. The garfish-net is injurious to small fish.

Thousands of people come here every year line-fishing.

The whole of Brisbane Water is closed. The waters are plentifully supplied with all kinds of fish at present.

When waters were open to net-fishing, there was an average number of boats here of twenty, with about forty-three men.

Oysters.

The oyster-beds are in fair condition, and are suitable for oyster-culture, and most of the lessees are cultivating their areas by shifting their oysters and laying them on more suitable grounds. The oysters are generally in fair condition; no disease. They spat more or less during the whole year. The oysters grown in these waters are marketable in about two years. The output was sixty-four bags for the year ending 1897. Total area under lease is 2,700 yards.

I have no other information, unless, I think, the waters should be permanently closed for the use of the general public.

I have, &c.,

JOHN CAIN,
Assistant Inspector of Fisheries, Brisbane Water.

Sir,

Hawkesbury River, 14 January, 1898.

In compliance with instructions of the 4th instant, for a report on the condition of the Fisheries and Oyster-fishing industry—the spawning and habits of the various kinds of fish—I hasten to comply therewith.

1. Times of spawning of different kinds of fish.—The times of spawning, as shown here, have been noted by experience; but floods and drought have also their effect. Schnapper spawns January to middle of February; black bream, yellow-fin bream, tarwhine, black-fish, and flathead during the same months; sea-mullet, April to middle of May; flat-tail mullet and tallegalann mullet (two kinds) during the same months; whiting, April; flounders, July-August; sole, during same months; trevally, September; perch, teraglin, during same month; garfish, February; cray-fish, October-November.

2. Places of spawning.—Generally the lower part of river and lakes, estuaries.

3. Where the young fry are first seen.—The young fry generally move up to the heads of creeks, where the water is not too salt.

4. Habits of the fish, and the months in which they travel.—Shoals of the different species of mullet may be said to travel more than any other fish, principally in March, April, and portion of May; at other times of the year they will drop up and down river with the tide. Bream, whiting, and tarwhine also travel in March and April.

5. Observation of shoals of fish.—Mullet commence to gather in March, some 20 miles up river, and come down to the heads in large shoals, when a change of wind to the south, south-west, or west will then have the effect of starting them travelling, always north direction; and an easterly, north-east, or north wind will stop their travelling for a few days. They will enter into every river, lake, drop their spawn, and cease travelling. Have also observed shoals of bream to come down river, go outside for a few days, and come in again. Shoals of pilchards generally move on the coast in the winter months in a northern direction.

6. The output of fish.—The total quantity of fish sent to market from this river during 1897 is 8,843 baskets; but of this quantity a large percentage were only half-baskets.

7. Their transport to market.—The greater part are sent by train; some by steamer.

8. The general state of the waters for netting.—In all open waters fish may be said to be scarce.

9. The class of nets used, and whether they have any injurious effect on young fish.—The net principally used on this river is the garfish net, a net most destructive to all and any kind of young fish, who are drawn ashore daily, and killed by thousands.

10. The extent to which amateur line-fishing is carried on.—Amateur line-fishing is carried on to a large extent in this river, and great quantities of small illegal fish are often caught for sport and destroyed.

11. Specify the waters that are closed, and state what effect the closure has had regarding the fishing industry.—The following waters are closed at present :—Three-quarters of the whole of Mooney Creek—all the upper part—about 10 miles; the whole of Mullet Creek, about 5 miles; the whole of Marra Marra Creek, about 4 miles; two-thirds of Berowra Creek is closed—all the upper part—6 miles; three-quarters of the whole of Mangrove Creek—all the upper part—about 12 miles; four-fifths of the whole of Cowan Creek is closed—all the upper part, with creeks—14 miles. The effect the closing has had is that mullet may be said to be fairly plentiful in the closed waters of Mooney Creek, Mullet Creek, and Berowra Creek; whereas fish of any kind continue very scarce in Cowan Creek, owing to the amateur element catching everything big and small.

12. The average number of men and boats employed during the year.—The number of licensed fishermen during 1897 was ninety-four, and the number of licensed fishing boats was thirty-six.

I have, &c.,

P. SMITH,

Assistant Inspector.

Sir,

Referring to your memo. of the 4th instant, I have the honor to report on the condition of the Oyster Fisheries of the Hawkesbury River :—

13. The general condition of the oyster-beds, their suitability for oyster-culture, improvements made, &c.—I beg to state that there are at present very few oyster-dredging beds on the Hawkesbury River; that oysters on this river grow mostly on rocky foreshores. Oyster-beds, which did exist in Berowra Creek some twenty-five years ago, and which yielded some thousands of bags of oysters yearly, have long since been allowed to be destroyed, partly by floods and partly by man. The oyster foreshores of the Hawkesbury River and tributaries are particularly suitable for oyster-cultivation on a large scale; many thousands of bags of oysters could be grown yearly, and much employment could be created, but at present everything tends to the total destruction of the industry.

14. The condition of oysters; any disease existing.—Marketable oysters are generally very scarce, and there are also some worms still in the oysters, but the worms are mostly confined to the low-water line and low-water oysters.

15. When did the last fall of spat occur?—The oyster foreshores on the main river and tributaries extend over a large area, and different localities have different times of spatting. For instance, Berowra Creek spats in the winter months, whereas many other localities spat in the spring and summer. A difference of two months will occur in Mooney Creek between the oysters in the upper Mooney Creek and the oyster foreshores in lower Mooney Creek. Very young spat may be found, by looking for it, all the year through, being carried about with the tide from one creek to another.

16. At what age are the oysters grown in your waters marketable?—The age at which oysters are of marketable dimensions, and fast growth, depends on the strength of the salinity of the water. In water having a salinity of about $5\frac{1}{2}$ per cent. oysters would grow to marketable dimensions in eighteen months or less; whereas, in waters having a 9 per cent. salinity, oysters would take a much longer period to come to marketable size, perhaps three or four years.

17. The output during the year.—The total quantity of bags of oysters shipped during 1897 is 712 bags.

18. The area, in yards, of oyster leases.—The area under lease at present comprises 3,900 yards of foreshores; there are also 4,400 yards held at present on sufferance occupation.

I have, &c.,

P. SMITH,

Assistant Inspector.

Sir,

9 March, 1898.

We have the honor to furnish you with information regarding the following matters in connection with the waters of Port Jackson.

1. Times of spawning of different kinds of fish.—Black bream, November to February; mullet, March to May; garfish, January to March; whiting, March to May and June; schnapper, December to March; crayfish, during the winter months.

2. Places of spawning.—Shallow, sandy, weedy, and rocky bottom in quiet localities.

3. Where the young fry are first seen.—Same answer as No. 2.

4. Habits of fish, and when they travel.—Mullet, harbour fish until spawning time, when they travel along the coast; bream, harbour and sea fish, carnivorous; garfish, sea and river-fish, herbivorous; black-fish, harbour fish, herbivorous; schnapper, kingfish, and teraglin, sea-fish, carnivorous; whiting, harbour and sea fish, carnivorous; with the exception of scaley garfish, they all travel more or less at spawning time.

5. Observations of shoals of fish.—Invariably travelling north.

6. The output of fish.—We cannot supply this information.

7. Their transport to market.—In baskets carried by hand and carts.

8. The general state of the waters for netting.—Fairly good, with the exception of blubber, which has been very thick.

9. The class of nets used.—Chiefly garfish and prawn nets, which have a most injurious effect on young fish and spawn.

10. The extent to which amateur line-fishing is carried on.—It is extensively carried on.

11. Closed waters.—Parramatta River and tributaries above Abbotsford and Bedlam Point, and Lane Cove above Onion's Point. The effect of closure allows fish to spawn and mature without being harassed by fishing nets.

Oysters.

13. There are no oyster leases in Sydney Harbour, nor is there any improvement or artificial cultivation carried on, and it is unsuitable for oyster-culture, there being so much traffic all over the foreshores.

14. The condition of oysters generally is poor. We know of no disease existing.

15. We cannot say when the last fall of spat occurred.

16. With the exception of a very small portion of the harbour, we have not seen a marketable oyster on it for years.

17. The output during the year.—Nil.

18. The area of oyster leases.—Nil.

In conclusion, we beg to call your attention to the injurious effect caused by the prawn-nets used by the Italians. Although not coming within the meaning of the Sunk Nets Act, they are nothing but a sunk net with a deep bunt instead of a bag.

We have, &c.,

RICHARD HELLINGS.
GEORGE GLADING.

Sir,

Concord, 11 February, 1898.

I beg to submit a brief report upon the fisheries of Port Jackson and tributaries for part of the year 1897. The supply of fish, notably mullet, bream, and whiting, has been only fairly good, fortunately for the general public, as this gave a supply of fresh fish, which was much needed during the warmer months.

It is impossible to state the exact number of fishermen using nets in these waters; but the limit would be at least seventy boats at work; out of these two-thirds will be manned by foreigners.

While the net-fishermen are helping to denude the fish supply by destroying the young fish, they are assisted in this destruction by the line-fishermen, who catch vast quantities of immature fish. It would be quite impossible to give an estimate as to the quantity of small fish destroyed; but the amount is massive and shameful. I may state that the net-fishermen catch also what the lines could not catch, and leave the same on the beach to rot, whilst the line-fishermen catch bream, whiting, and flathead of such a minute size that they are altogether too small for human consumption.

Part of Parramatta River and the whole of the Lane Cove River have been closed against the use of fishing-nets, and to state what effect such closures have upon the fishing industry I can only state that, in my opinion, such closures do not give forth the result sought for, as they do not protect the fish such as mullet, flathead, and bream in adult stage, as the feeding-grounds have been ruined, and only in Lane Cove River are there deep holes for the fish to seek protection. The great value of the closures referred to rests in their protecting travelling fish until the next change of weather and as nurseries for young fish.

The spawning of edible fish cannot be mentioned for any particular month on account of local or climatic conditions, and that the spawning does not take place in the closures referred to, as fish spawn in the mouths of rivers or bays as they travel along the coast in the purer water. The fry, when hatched, then seek the more brackish waters, as a rule. This will account for the fry being seen all over the harbours, lakes, inlets, where there is shelter and quiet waters. I have seen thousands of fry in the basins at Wollongong, Kiama, and Shellharbour, and other places along the coast.

Schnapper are found in spawn, January to March; black bream, November to February; mullet, April to August; sand-mullet, April and May; sand-whiting, October to December; trumpeter-whiting, March to April; garfish, October to February; river-garfish, July; tailor, about October; trevally, December.

The hauling grounds are now being taken up by moorings, wharfs, reclamations, &c., otherwise hauls are clear, the other trouble being the quantity of blubber, the class of nets used being prawn-net, garfish-net, hauling and meshing, the two latter being very much in the minority unfortunately, thus leaving the two most destructive implements of fishing to be used. There are no oyster leases in the harbour; but a fair quantity of oysters are to be found upon the rocks at Vacluse.

Large shoals of pilchards and herrings passed along during the season; a few entered the harbour and a few hauls were made with small catches, and the prices realised were not large. Mackerel were also caught in quantities, but did not bring even fair prices.

I have, &c.,

FRED W. SMITHERS.

Port Hacking, 15 January, 1898.

REPORT on the fisheries and oyster fisheries under my control for the year 1897.

1. Times of spawning of different kinds of fish in the waters of Port Hacking?—Black bream spawn between January and February; they are also supposed to spawn in August and September. Black-fish spawn between February and March. Whiting spawn between November and December. Sea-mullet spawn in the month of June. River-garfish spawn in the month of February. Sea-garfish spawn between September and October. Flathead spawn between March and April. Flat-tail mullet spawn from March until June. Schnapper spawn from January to February.

2. Places of spawning?—The majority, in fact all these, spawn in the bays, inlets, and on sea-beaches.

3. The young fry are first seen in great numbers in the bays and inlets of these waters.

4. Habits of the fish and the months in which they travel?—Sea-mullet and flat-tail usually seen in shoals travelling north in the months from March until June. Whiting and hard-gut mullet usually seen in shoals travelling north in the months from November until February. Black bream and black-fish, usually seen in shoals travelling north but twice a year, between the months of November and December, and also in May. Sea-garfish are usually seen in large shoals, principally on sea-beaches, from January until June. River-garfish are usually seen in heads of bays and inlets all the year round, and principally travel out by heavy flood-waters. Flathead (river) go in fair shoals, and keep to the bottom where it is sandy and patchy ground. The majority of these fish travel in these months with south to south-west winds.

5. Observation of shoals of fish?—I have observed the Australian salmon last October and November entering the waters of Port Hacking nightly and daily, and the sea-mullet also from March until May 31st, and the sea-garfish from January until May 31st, all in large shoals.

6. The output of fish?—There is no output of fish from here except what are obtained by the amateur fishermen.

7. Their transport to market?—There is no transport to market from here to my knowledge.

8. The general state of the waters for netting?—The waters generally are in a good state for net-fishing.

9. The class of nets used, and whether they have any injurious effect on young fish?—There are no nets allowed in Port Hacking.

10. The extent to which amateur line-fishing is carried on?—It is carried on to a great extent, almost daily. I have observed dozens of boats with four and five dozen red bream, young schnapper, and whiting weighing from 2 to 4 oz. caught by amateur fishermen.

11. I think that if the waters of Port Hacking were opened up for net-fishing once in every three years, for three months, it would be an advancement to the fishing industry.

12. There has been no boats or men employed during the year 1897, as the waters have been closed.

Oysters.

13. The general condition of oyster-beds are only fair. The suitability of Port Hacking as a field for oyster-culture is very doubtful, and I would not advise the granting of further leases for some time at least. There has been some artificial cultivation carried on on the leases already granted.

14. The condition of oysters, any disease existing?—The oysters are rather small, but there is no disease existing.

15. The last fall of spat occurred during the months of June and July.

16. At what age are the oysters grown in your waters marketable?—The oysters of Port Hacking would not be marketable for eighteen months or two years after the fall of spat.

17. There was no output during the last year, 1897.

18. The combined area of the two oyster leases granted is about 800 yards, one of them being 300 and the other 500 yards.

19. There are lots of oysters in Port Hacking, but rather small; I consider that with proper cultivation there is a grand opportunity of developing the oyster industry.

To the Department of Fisheries.

I remain, &c.,

W. H. NEWTON,
Port Hacking.

Sir,

January 15, 1898.

I have the honor to submit the following report of the fisheries under my supervision during the year ending 31st December, 1897:—

Woronora.

This river has been closed against net-fishing during the year. Fish of all varieties have been plentiful up to June, when the flood came down and cleared them all out; and then again in July another flood came, which left the river almost destitute of fish for a time. After the fresh had subsided, fish began to accumulate again, and in October it was a living mass of fish, especially hard-gut mullet. In November large lots of the said fish left the river in shoals every change in the weather, but a lot of the fish travelling from the southward came in to the river. At the present time there is a fair supply in the river.

George's River.

These waters have been open during the year. In the early part of the year great quantities of black bream were caught by line fishermen up to the time of the fresh in June. Greater quantities were caught by line than for years past. Plenty of fish of all kinds have been in the waters during the year, but owing to the quantity of blubber the men could not kill the fish, this being the worst year for netmen for years past. During the freshes in June and July great quantities of fish were caught, especially black bream and whiting, upwards of 500 baskets of the two latter, principally between the bridge and Dover Point. This has been an exceptionally good season for trumpeter-whiting, about 1,000 baskets being killed between April and June, principally about the mouth of the river and Botany Bay. Those fish do not travel far up the river, very few being caught above the bridge.

Sea-mullet.

This has been an exceptionally good season for these fish, great shoals of them coming in the Heads, but they kept too wide off the work for the men to kill them, only seven or eight boat-loads being killed out of as many hundreds.

Prawns.

During January and February a good supply and quality were killed in Cook's River, Kogarah Bay, and Salt Pan Creek, but the following months they were very scarce. Owing to the scarcity the waters were closed from 1st June to the 30th September, which has greatly benefited waters, as since the opening the boats have been getting very good freights.

I beg to draw your attention to the number of men working without a license, especially prawning, and it is impossible for me to prove sale against them, for if I send anyone to buy from them they say they are not fishing for sale; and, to the best of my opinion, licensed fishermen take their fish and prawns to the market, and sell them in their (the licensed men's) name.

The only remedy I could suggest would be to compel any person fishing with a net to be the holder of a license.

Oysters.

Areas under lease 10,200 yards, quantity collected from same 525 bags during the year; the leases generally are in good order and are fairly well stocked. The oysters on the mangrove leases are slightly touched with mud or worm disease; all the deep-water beds are badly affected with same. The lessees cannot improve their holdings by collecting spat off the Crown lands not under lease. As their permits were cancelled some years ago they have to wait until the oysters grow on their lease and catch whatever spat they can by laying out bushes, logs, stone, and other material. Owing to the cancellation of the permits the oyster pilferers collect all oysters from the Crown lands for their own consumption so they say. I would like to call your attention to the 15th section of the Oyster Fisheries Act, under which there are about 200 persons collecting oysters daily from Crown lands and oyster reserves.

I have, &c.,

J. D. GRANT,

Assistant Inspector of Fisheries.

Returns

Returns Relating to Fish.

1. Times of spawning of different kinds of fish?—Black bream and black-fish, about December; school whiting, flat-tail mullet, and flathead, about January; trumpeter-whiting and flounder, about September; sea-mullet, about May and June; sea-garfish, about March and April; river-garfish, about October; sole, about August. The above is about the regular time of spawning, according to my opinion; but I have found large roes in almost all kinds of fish at all times of the year.

2. Places of spawning?—In all inlets, boat harbours, sea beaches, mouths of bays, rivers, and lakes, when the fish are travelling.

3. Where the young fry are first seen?—In all inlets, boat harbours, along the coast, and in all parts of the river.

4. Habits of fish, and the months in which they travel?—Black-fish, black bream, sand-whiting, trevally, hard-gut mullet, November; sea-garfish, sea-mullet, February; salmon herring, murray pilchard, and other coast fish, from September. The above is about the regular time of travelling, although the state of the weather, in a great measure, regulates it.

5. Observation of shoals of fish?—I notice, when fish are congregating in shoals, they are preparing to travel, generally previous to bad weather.

6. The output of fish?—It is impossible to give the output of fish from this district.

7. Their transport to market?—Principally by carts, from all parts of the river and Botany Bay; also a few by train.

8. General state of the waters for netting?—Several of the principal hauls are not workable since the freshes in the river during the winter months, owing to large hummocks and long weeds. The blubber also have been worse this year than ever known in this district. It is impossible for the men to kill any quantity of fish, as they cannot land their nets if they shoot wide.

9. The class of nets used, and whether they have any injurious effect on young fish?—General hauling, or mullet-net; meshing, prawn, and garfish. The prawn and garfish nets have a very injurious effect on young fish.

10. The extent to which amateur line-fishing is carried on?—Amateur line-fishing is carried on to a great extent in this district. The following will give you a little idea of the extent:—In March last year, on the 7th, there were over twenty-five skiffs, with from three to five persons in each, fishing between Common's Point and the mouth of the river, distance about 2 miles. I had an interview with one of the parties, who had between ten and twelve dozen red bream (young schnapper), weighing from 2 to 5 oz., of which I weighed about three dozen; they told me that the other boats all had more than they had, as they threw all the smallest of theirs overboard. I do not think that any of the parties belonged to the Amateur Fishermen's Association. I have frequently noticed letters from the Secretary of the Amateur Fishermen's Association asking amateurs not to kill small fish.

11. Specify the waters closed, and state what effect the closure has had regarding the fishing industry?—The only waters closed in my district is the Woronora River from the Como Bridge to the head of the river. The closure, I consider, has a very beneficial effect, as that river has very little blubber, and if open the nets would clear all the fish out of it. Previous to the floods during the winter months, there were more black bream caught in George's River than has been caught for years past (line fishermen).

12. The average number of men and boats employed during the year?—Men, eighty; boats, thirty.

Oysters.

13. The general condition of oyster-beds, their suitability for oyster-culture, any improvements or artificial cultivation carried on, &c.?—The mud or worm disease is still very bad on all deep-water beds, the mangrove-beds are all more or less affected. The only artificial culture tried to any extent was by the Hon. T. Holt, in Gnawly Bay, where he expended some thousands of pounds on the French and English system which proved a complete failure.

14. The condition of oysters any disease existing. Oysters generally in good condition?—I find that oysters artificially laid, or oysters on wood, bottles, &c., stuck in the mud, leaving oysters clear of mud, take the disease much quicker than those naturally growing on the beds.

15. When did the last fall of spat occur?—It is impossible to say when the last fall of spat occurred, as you can find spat from the size of a threepenny piece on the rocks all the year.

16. At what age are the oysters grown in your waters marketable?—Oysters generally grown to marketable size in twelve months, though many of them are too tender in the shell to remove from the rocks.

17. The output during the year?—525 bags.

18. The area in yards of oyster leases?—10,200 yards under lease; 2,700 yards applied for but not yet granted.

19. Any further information regarding the fisheries and oysters-fisheries that you think will be of interest to the public?—I would certainly recommend the closing of the whole of George's and Woronora Rivers, from the punt crossing Dover Point to Sylvania, during the winter months, as the blubber leaves the river during the winter, and the fish are very quiet and dormant then; the nets working great havoc amongst them during the cold weather. The blubber in summer protects the fish.

I have, &c.,

J. D. GRANT,

Assistant Inspector of Fisheries.

Sir,

Wollongong, 13 January, 1898.

I have the honor to forward the following report on the fisheries under my supervision for the year ending 31st December, 1897:—

The principal fish caught in Lake Illawarra are bream, tarwhine, flathead, mullet, garfish, black-fish, whiting, and jew-fish.

The time of spawning, approximate, of the different varieties of fish frequenting Lake Illawarra—Bream, August, September, and October. I have examined these fish in December, January, and February, and found some of them full-roed. The place of spawning of these fish I have not been able to ascertain from my own observation. I find the young fry first appear in the creek, and work from the creek into the

the lake. These fish appear in large shoals along the coast in July and August, and in August, September, and October they work into the lake. When caught on the sea-beaches during the colder months they are in very poor condition. These fish are caught in large numbers by the hauling-net; as many as 100 baskets have been netted at one time during the season. It was not an unusual occurrence to net thirty and forty baskets at a haul. The grounds most frequented by these fish are of a clean sandy bottom, the home of the cockle in which the bottom of this lake abounds. On a clear day the presence of these fish can be detected by working slowly over the hauling-grounds and keeping a keen watch on the bottom for holes that have been made by the bream in search of food, and other times by the muddy appearance in patches of the water, the effect of the working of these fish on the bottom. Numbers of these fish are caught by amateur line-fishermen during the months of September, October, November, and December; they then take off and are not caught in any quantity by the line or net until about April. Throughout the year there have been large numbers of young bream distributed all over the lake from 3 to 4 inches in length.

Tarwhine.—These fish I have found full-roed in November and December, but am unable to give definite information as to when or where they spawn. The young fry I have first noticed on the sand-flats adjacent to the entrance of lake. I have never noticed these fish schooling; they are generally caught in company with the bream, but never in the lake in any quantity, and not at all in the creeks. They are caught freely with the line.

Flathead are in full roe in December, January, and February. I cannot definitely say where they spawn. The young fry I first notice during the months of February and March, on the shallow sand-flats in the entrance of the lake and shallow flats of the lake. Probably they spawn in the sandy banks in deep water within the entrance and lake. The adult-fish school in the warm summer months, and are then caught by net and line in large numbers. Two species only are caught in Lake Illawarra—the sand, and brown, or mud flathead. Large numbers of these fish are caught by amateurs off the coast, the principal grounds being off Clifton and Long Point, near Shellharbour. The bottom on both of these grounds is a mixture of fine sand and mud, the ground off long point being of considerable extent.

Mullet.—Time of spawning, March, April, and May. Places of spawning.—From my observations of these fish, I find that they spawn in the lake and creeks. On the 1st of April, 1890, an exceptionally large shoal of mullet worked into Lake Illawarra. These fish were full grown and in full roe, also in splendid condition. On the morning of 21st May following, whilst getting into my boat, my attention was arrested by what at first sight I took to be a sediment in the shallow water; on closer observation it turned out to be myriads of young fish. I at once examined the whole of the flats in the bay—Kelly's Bay—and found it literally swarming with young mullet of about 1 inch in length. These fry, after a few days, disappeared into deeper water; and, during the spring and summer of that year, the tributaries and shores of the lake were alive with young mullet from 2 to 4 inches in length. During the months of March, April, and May these fish shoal up and migrate to the north. Shoals of hard-gut migrate during December and January, and right through the year small schools are constantly seen off the sea entrance of lake, generally travelling in a northerly direction. The modes of capture are by the meshing-net and hauling-net, and by the process known as bull-ringing.

Flat-tail Mullet.—Time of spawning I cannot definitely state. I have found these fish full-roed during November and December. The young fry I first notice during the months of August and September at the head of the creek, and on the shallow flats in the lake; fair shoals work into the lake during the months of March and April.

Garfish (River).—These fish spawn during the months of September and October in Lake Illawarra. I have found the roe fully-developed in January. The places of spawning are amongst the reeds which abound on the flats in this lake. The fry are first noticed amongst the reeds in small detached schools of about 1 inch to 2 or more in length. They are not a very plentiful fish in Lake Illawarra, and in consequence are only now and again captured by the process termed bull-ringing.

The sea-garfish appear off this coast in immense schools. During April of this year a very large shoal was noticed off Shellharbour. These fish are full-roed from November to January. I cannot say where these fish spawn. They are not caught in any quantity, as they do not work into the lake, and it is only when they work into the comparatively smooth beaches at Bombo, Kiama Harbour, Shellharbour Basin, and Perkin's Beach, Port Kembla that any attempt is made to catch them.

Black-fish.—Time of spawning, February and March. I have found these fish full-roed during the months of November, December, and January. I am unable to say definitely where these fish spawn, as I have first noticed during May and June the fry in water-holes amongst the rocky sea-beaches and also amongst the reeds in the lake. These fish frequent the rocky points of the coast, where there is a quantity of sea-weed, also all through the reedy bottom of the lake. This fish appears in large shoals off the coast at different times of the year, and work their way into the lake. They are more in evidence in this fishery during the winter months, when large quantities are netted.

Whiting, Trumpeter and Sand—time of spawning. I am unable to say definitely when these fish spawn in the lake. I have found them full-roed in January, February, and March. The young fry I have first noticed during the months of August and September on the sandy-flats in the entrance of lake. Small shoals of these fish have been noticed off the sea-beaches during the months of September, December, and January. In consequence of the weeding up of the sand-flats in Lake Illawarra during the last two years, these fish are not caught in any quantity. At times two and three baskets are taken in one haul, but this is a rare occurrence. At times good sport is had with the line at the mouth of the Tom Thumb Lagoon when fair numbers of sand-whiting have been caught.

Jew-fish.—Time of spawning. I am unable to give any definite information about the spawning of these fish. The young are frequently taken in good numbers during hauling operations. The larger and full grown play sad havoc with the school fish in the lake, and they are a serious source of trouble to the fishermen. When they happen to encircle a shoal of them they go through the strongest nets with ease, and when this happens the fruits of a day's work are lost by the escape of the smaller fish through the torn nets.

Crayfish.—Small variety. These fish, as heretofore, have not been utilised. They abound in large numbers amongst the reefs of the Five Islands. At times a few are caught in Wollongong Harbour by amateurs. Spawning: Not one of these fish has been caught about this portion of the coast carrying the spawn. They shed the shell during the month of October, and start to migrate at the latter end of November to December and January, keeping close in shore, and in a northerly direction.

Prawns.

Prawns.—Time of spawning. I have never been able to obtain any information, or from my own observations, as to when these fish, or crustacea, are carrying the spawn, although I have during each season examined them. They migrate from Lake Illawarra during the month of February. As they do not carry well in the green state the local fishermen do not care about working them. A few have been caught for local consumption only.

Observations of Shoals of Fish.

Large shoals of fish have been noticed during the year by your inspector and have also been reported to him from time to time by schnapper fishermen and others who have noticed them off this coast. During the month of February large shoals of small fish were reported to me as having been seen at sea. These fish were small and had the appearance of whitebait. Unfortunately my information was received too late to be of any use in the way of ascertaining the species. Some of the local residents caught them in large numbers with hoop nets, the fish having been left by the tide in holes along the rocks. Colour, of a bluish tint above to a silvery white of the sides; length, 2 to 3 inches.

During February, March, April, and May large shoals of sea-mullet were noticed travelling north; these fish when caught were full-roed and in good condition.

Shoals of bream and whiting were noticed off the entrance of lake during the month of September. These fish did not appear to be travelling, as they lay along the beaches for some weeks. During this month some very large shoals of fish were reported to me as having been seen at sea. The description given was that of the murray or pilchard, about 9 inches long, and seemed to be of a uniform size. These fish were travelling in a northerly direction. Some schnapper fishermen who were fishing off Shellharbour reported to me, during the month of April, an enormous shoal of murray on the outer fishing-grounds. These fish were working in a northerly direction.

A very large shoal of sea-garfish was noticed by me to the south of lake off Shellharbour during the month, and was travelling in a northerly direction.

Large shoals of salmon were off the coast during the month of October, travelling north.

None of these vast shoals of fish were utilised by the local fishermen, who have not the proper appliances for their capture in the open sea.

During the months of September and October small schools of whales were seen off the coast.

10,853 baskets represents the total output of Lake Illawarra for 1897, showing an increase of 4,192 on that of the previous year; 1,790 baskets were consumed locally. 9,063 baskets were forwarded to the metropolitan market.

The total catch from Lake Illawarra is railed to Sydney, less the local consumption. From the several railway stations adjacent to the lake, the means of transit are crude, close boxes being principally used to pack the fish in for transit. The class of railway carriages used are according to the train they are forwarded by; if by the passenger train, they are forwarded to Sydney in the brake-van and by luggage train, they are forwarded in open trucks and closed vans.

The catch is principally forwarded at night in the summer, and by day during the winter months. Notice is used by the fishermen during transit, and the fish seem to carry well.

Considering the large quantity of fish and the mode of transit, the quantity condemned on arrival at the metropolitan markets as unfit for human food is very small.

The general state of this water for netting has been good during this year. Operations have been carried on with varying success. Some of the principal hauling-grounds have been overgrown with weeds which have interfered with hauling operations to a material extent.

The class of nets used in these waters are hauling and meshing nets. The hauling-nets that are used in the process termed bull-ringing are used more frequently than the hauling-net proper. These nets are shot from the boats in a circle, and are hauled back into the boat. It will be seen that during the working of these nets that a fair length is off the bottom of the lake in consequence of both ends of the net being in the boat, one at the stern, the other at the bows, and are used generally in the centre of the lake amongst shoal fish, and cannot have an injurious effect on the young fish.

Garfish-nets are not generally used in this fishery, and are always used in the process termed bull-ringing, so that very few fish other than garfish are caught. Should any fry of the varieties get meshed, they are early released by the fishermen when hauling the net into the boat.

I would draw the attention of the Commissioners of Fisheries to the extremely long hauling-lines that have been used this year for the first time by the local fishermen during hauling operations. I am of opinion that these extremely long lines, from 2 to 500 fathoms, will not only have an injurious effect on the supply of the finer sorts of ground fish, and will also, in a great measure, ruin the feeding-grounds as well as disturb any spawn that may be deposited within the scope of these nets and ropes.

Amateur line-fishing has not been carried on to the same extent during this as in former years, although at times fair catches have been made in Mullet Creek and the lake entrance, bream being the principal variety caught, with a fair quantity of red bream and flathead.

Amateurs have had very good sport during the year on the several schnapper-grounds off this coast, at times very large numbers of schnapper and flathead have been taken.

The closed waters of Lake Illawarra comprise the tidal water of the channel entrance into the lake, including an equal distance of about 1 mile on each side of entrance, extending a distance of about 40 chains into the lake. Mullet Creek Closure.—Mullet Creek with the shores of the lake to a point on northern side about a quarter of a mile; and from the mouth of creek, southern bank, to the extremity of Kanahooka Point, such reservation extending half a mile into the lake. Both these portions of the lake are closed for a period of two years from the 23rd of September, 1896.

The other closures comprise the whole of Hooka Creek, Brook's Creek, Wollingury Creek, and Macquarie Rivulet for a period of two years from the 14th October, 1897.

The effect of these closures, especially that of the lake entrance, is obvious. The school and the finer sorts of ground fish have free ingress and egress from the sea to the lake, and are not disturbed or harassed by nets when working their way to and from the lake, and as the lake draws its supply of marketable fish from the sea the value of this single closure cannot be overestimated.

Mullet Creek reserve, as a breeding-ground and nursery for young fry, has been of great importance to this fishery; at times during the spawning season is alive with bream. The bottom of this creek from the fresh water to within half a mile of its mouth consists of a fine sand admirably adapted for spawning purposes. During the mullet season these fish work into this creek in large numbers. Young

Young fry are always in evidence in this water. Regarding the other recent closures, they have not been closed long enough to have any appreciable effect on this fishery.

The average number of men and boats employed during the year has been from twenty-two to forty men and from twelve to twenty-one boats.

Oyster Fisheries.

The oyster fisheries in my district are very small, and consist only of one lease at the Minamurra River, and from which no oysters have been taken for some years. I only visit the locality when specially instructed to do so.

The oyster deposits in the Tom Thumb Lagoon and entrance of Lake Illawarra are in fair condition, no disease existing. There was a fall of spat in the Tom Thumb Lagoon during the month of December. Oysters in these waters are fit for market at two years old.

Oyster lease, Minamurra River—400 yards.

I have, &c.,
D. W. BENSON.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SEA FISHERIES.

(REPORT UPON TRAWLING OPERATIONS OFF THE COAST OF NEW SOUTH WALES, BETWEEN THE MANNING RIVER AND JERVIS BAY, CARRIED ON BY H.M.C.S. "THETIS," UNDER THE DIRECTION OF FRANK FARNELL, ESQ., M.P., TOGETHER WITH SCIENTIFIC REPORT ON THE FISHES, BY EDGAR R. WAITE, F.L.S.)

To The Honorable J. N. Brunker, M.P., Chief Secretary,—

Sir,

As the result of an interview, which I had with the Right Honorable the Premier and yourself, at your office on the 5th January last, you were pleased to authorise me to make all the necessary arrangements for the purpose of making a test of our Offing Fisheries, in order to prove whether trawling operations would be practicable or not. You did me the honor to appoint me superintendent of the expedition, and in such capacity I have acted during the progress of all the experiments. The time specified by you, and embodied in the contract to which you and Captain Neilsen were parties, was stated to be three months, and it was thought by both Captain Neilsen and myself that that time was to be allowed for actual trawling operations. I regret to say, however, that, owing to the time occupied in fitting up the "Thetis" and delays which occurred through no fault of those in charge of the trawling operations, the three months originally decided upon was reduced to about six weeks' practical work. I feel confident that, had the time originally set apart been at our disposal, we would have proved the ocean-floor to be suitable for carrying on trawling operations for hundreds of miles along our coast. However, the result of the operations already carried out goes to prove beyond doubt that this mode of fishing can be carried on in connection with our Offing Fisheries, and with success.

It must be borne in mind that the object of the expedition was not of a commercial character, but simply to prove whether all the conditions necessary for carrying on successful trawling operations exist off our coast. By securing the services of Captain Neilsen and his men, no aspect of the question was left in doubt. On the contrary, whatever practices were in vogue in connection with the development of the fisheries in the North Sea and other waters they were adopted in connection with these experiments, and it must be gratifying to the Government to find that Captain Neilsen's report is of such a satisfactory character.

I prefer not to enter upon details in regard to the question of the great success attained by this expedition, on account of the prominent part which I have taken for years with a view of having such an expedition organised, but I think I will not be encroaching too much if I express the opinion that the result of the experiments has strengthened me in my belief in regard to the great field which is available for the development of the fisheries in this respect.

With

With regard to our Offing Fisheries, I think we can certainly say that, during the few weeks we were occupied in connection with the experiments, we gained a very considerable amount of information. Our fisheries, like our agricultural efforts, are liable to great fluctuation on account of the climatic conditions of the Colony. In other words, a certain ground may be very productive of marketable fish to-day, but in a week hence the yield may be poor. This raises the question of having a properly equipped steamer placed in charge of an experienced fisherman, for the purpose of carrying on exploration work over a period sufficient to allow of a more accurate knowledge being obtained of marine natural history. The large problems connected with our fisheries must now be looked upon in no haphazard way. What we require is to establish a means by which we can acquire information which might lead to a scientific study of the life, histories, and habits of fish and the animals on which they feed. This would enable us to draft a measure, which from a Legislative stand-point, and for all practical purposes, would allow of the question of the development of the fisheries being made one of paramount importance. What chemistry is to manufacture, the science of complete Natural History must be to our fisheries. For it is evident that no clearly beneficial legislation can be instituted which has not for its keynote a proper understanding of the laws which govern the lives of the animals affected, and of the relations which these laws bear to the influence of man. Recognising the necessity of this, I have no hesitation in recommending the fitting out, in a thorough manner, of a steam-trawler, to be available for at least two years. This, I am glad to say, has been done by the authorities connected with the Cape Government, and it seems to me to be the most effective method of providing channels through which information of a reliable character can come. Not only that, but it has proved the most effective means of catching the best species of edible fish.

When I started the agitation for exploiting our waters some years ago, and the carrying out of experimental work in connection with the development of our deep sea fisheries, I was met with many adverse opinions on the possibility of successfully proving the ocean-floor to be suitable for trawling operations. This opposition continued up to even the very date of the fitting out of the "Thetis." The points put forward by my critics were as follows:—

- (1.) That the waters off the coast were so full of obstructions that a trawl could not be towed.
- (2.) That trawling operations must be confined to one direction, as they could only be carried on with the current, not against it or across it.
- (3.) That the waters off our coast were too transparent; therefore, trawling would have to be done at night-time.
- (4.) That the fish were not in sufficient quantities off our coast, as there was not sufficient animal life for them to feed upon.

Needless to say, I paid special attention to the objections referred to, and am glad to say that the first cruise disproved all the contentions put forward by my critics, for the result of the experiments of this cruise proved that there were no serious obstructions except that of a wreck (the "Minora"), the net having become fast only once, and that on the obstruction mentioned. Then, I may say, I trawled for hours at a time with the current, against the current, and across the current, with the best of results. Again, I trawled at night-time and during the day with no varying results. Fish were caught, during night and day, of the best varieties, of the best quality, and in quantities that I have no hesitation in saying would form a payable basis on which to start commercial operations. Lastly, investigations were made with a view of testing the presence of food for fish, and as a result of these investigations, the sea was discovered to be teeming with animal life for the fish to feed upon.

The

The results obtained in connection with the succeeding tests are equally satisfactory, for—although the obstructions met with were a few—it was never contemplated, from the first, that the whole of our coastal waters would be found free from reefs or rocks; but sufficient grounds have been located which, for the production of good, edible fish, can be called prolific and payable. Comparing the expedition and its results with those obtained in other parts of the world, the work shows, in my opinion, phenomenal success. I am glad to have the opinion so expressed, endorsed, and borne out by men who have had a life-long experience in connection with trawling operations in other parts of the world. Not only that, but if our experiments are compared with those that have lately taken place at the Cape, it will be found that while they have been successful there, we have been more so.

Over 180 miles of our coastal waters, north and south, and up to a distance of 20 miles east, have been exploited in depths varying from 8 to 90 fathoms. As far as actual results are concerned, the grounds which were between 10 and 60 fathoms proved most prolific of fish-life. The bottoms trawled over were shown by the soundings taken to be sand, sand and shell, sand and gravel, sand and mud, brown sand, mud and shell, and soft mud.

One particular feature of the experiments made north of Port Jackson is the fact that during the whole of the operations not 25 lb. of seaweed were brought on board, nor did we encounter much in most of the hauls in the south; but there were three trawls in the Shoalhaven Bight and one in Jervis Bay that produced a considerable amount. In the latter place it took an hour or more to free the net of the weed, as it was a small red substance which became entangled in the meshes, and this, to a certain extent, stopped the freedom with which the trawl should go through the water. Where the larger weed was found was in depths from 10 to 20 fathoms, but no inconvenience was caused by the fact of its having been encountered by the trawl. As a matter of fact, the Shoalhaven Bight might possibly have been fished a few days after, and there would probably have been no sign of seaweed in it. The deposit of this seaweed, I should think, depends entirely upon the force of the sea, and the direction whence it comes, as well as on the influence of the tide.

With regard to the existence of reefs, of which we had indications from time to time, I might mention that I carefully located the spots on the chart, and fished them with hand-lines to prove their capabilities as schnapper-grounds. These grounds will be available for carrying on the system of well-boat fishing as an adjunct to trawling, or separately. In either case profitable occupation will be found in these localities.

As will be seen from the accompanying record of trawling operations, the best species of edible fish were caught. Those represented were Sole (3 species), Flounder (3 species), John Dory, Whiting, Schnapper, Trumpeter, Rock Cod (3 species), Gurnard (3 species), Boar Fish (2 species), Skate, Flathead (2 species), Teraglin, and Nannygai. The other fish caught were represented by Ray (3 species), Leather-jacket (of which only 20 were caught south of Port Jackson), small Sharks (4 species), Boxfish, Bullrout, Walking Fish, Numb Fish, and others. Crustaceans were represented by Crabs (3 species), Prawns (2 species), Crawfish, and Crayfish. It may be mentioned that for food purposes the Trumpeter caught is comparable with that found in Tasmanian waters.

I wish to lay special emphasis on the fact that the "Thetis" was not equipped for the purpose of catching fish for commercial purposes. The mission I undertook was simply to prove whether the ocean-floor was suitable for trawling operations to be carried on over it; but it is gratifying to find that I can accompany my oft-repeated contention with the fact that if I had so desired I could

could have caught fish in sufficient quantities to ensure a financial success, for, as will be readily seen, had I chosen to tow over the grounds which proved themselves so prolific of the best classes of fish over and over again, the returns would have been more than satisfactory. Instead of doing this, new grounds were in every instance tested, although the direction in which the operations were carried on was in some instances the same. Then, again, if I had had a suitable steamer, properly equipped, I could have tested the waters in many depths closer to the coast, where it is quite possible the fish were congregated in greater numbers at the time of the year we were trawling.

The results obtained from the operations connected with this expedition need not be looked upon, as regards its actual fish supply, as a basis which might offer itself for consideration in connection with the development of the industry by private enterprise, inasmuch as, with a steam-trawler, such as has been mentioned, five or six times as much work could have been done. Taking these facts into consideration, I have no hesitation in saying that there are fields open and available for the development of our fisheries, such as will yield the best species of fish in such quantities as will handsomely repay those who care to enter upon the industry with a spirit of enterprise. As to the non-edible section of the fish, which must be caught in certain proportions, I may say that every one could be put to profitable use, and to an extent that would pay for its collection.

It will be remembered that part of the work connected with the "Thetis" expedition was to be devoted towards testing the waters off the coast, for the purpose of ascertaining whether shoal-fish could be caught in quantities sufficient to lead to encouragement being given to people to engage in catching them for the purposes of canning, smoking, &c. I regret to say that, although a good lookout was kept during the whole time the "Thetis" was engaged on her work, no sign of shoal-fish, *i.e.*, fish that periodically visit our coastal waters, was apparent. However, I trust that at a later period of the year, when the certainty of the Pilchards approaching our coast is assured, an opportunity will be afforded for testing the use of the surface-net as a means of capture. Very little extra expense will be required; indeed, with the exception of the wages of the crew nothing further will require to be done.

I am pleased to say that the gear which was in use during the "Thetis" expedition is in splendid order and condition, and has not suffered by way of damage. The fact is worth recording that £5 would cover all the damage done during the whole of the operations. This is something which can be viewed as unprecedented. If the Government does not choose to carry out my recommendation of properly equipping a steam-trawler, I have no doubt that a ready sale can be effected in respect of the gear, which is now stored at Cockatoo.

Before concluding, I would like to say that, having heard so much of the fisheries of Lord Howe Island, I deemed it advisable to proceed there with a view of testing the ocean-floor in that vicinity. Unfortunately the weather was so fearfully boisterous that a thorough exploration could not be entered upon. However, the observations that were made went to prove that there is but a limited field available, inasmuch as it is only within a reasonable distance of the Island that the waters are shallow enough for carrying on trawling operations, and when soundings were made in these areas they were found to give indications of rough ground. It was, therefore, deemed inadvisable to risk the loss of a net and gear by putting it over. Although the waters around Lord Howe Island were not tested with the trawl, the opportunity was taken to carry on experiments with the handline and seine, with such results as to convince me that the wealth of the waters, so far as fish producing is concerned, are phenomenal, and that a large field awaits development at the hands of man. The edible species of fish caught there are such as could be treated in many ways that would mean
profitable

profitable occupation, as they embrace the following :—Mullet, bluefish, flounder, garfish, salmon, trevally, and kingfish. It may also be mentioned that from indications on the sea beaches, it has been gathered that there are large deposits of the pearl oyster within a reasonable distance of the land, so that by dredging operations this may prove to be a profitable industry, as well as the collection of Bêche de mer, several specimens of which were obtained.

I am pleased that the Chief Secretary allowed an opportunity for some of the Museum authorities to accompany me on the expedition, for, I understand, they have obtained very valuable specimens, and that the operations have proved beneficial to them from a scientific standpoint.

I have much pleasure in sending the report of Captain Neilsen, as well as one from Mr. Edgar R. Waite, F.L.S., of the Australian Museum (who accompanied the Expedition), which I am certain will prove interesting to the public.

I may state that, while believing the results of the expedition to be thoroughly satisfactory, and that the industry can be built up on a commercial basis, there are difficulties which will have to be overcome before people will be found ready to embark in the enterprise. I refer to the question of having a thorough and comprehensive system of distribution established. This, it appears to me, can only be accomplished by the aid of private capital, and now that it has been proved that the supply of fish for distributive purposes can be augmented from the wealth of our waters off the coast, I think there will be but little difficulty in inducing capitalists to provide the necessary funds and machinery for carrying on operations and supplying the public with fish food at a price which will come within the reach of all. I may add that I have all along recognised this fact, and that I am engaged upon the work of pointing out to capitalists the great possibilities of profitable investment which await them in the development of the fields of piscine wealth abounding off our coast.

It might be worth mentioning that during my experience on the "Thetis," on two or three occasions I was struck with the abominable sight of having brought on board in the trawl a pestilent mass of slaughter-house refuse, which gave out a most unwholesome smell, and which more emphatically impressed on my mind the necessity for some action being taken with a view of having this refuse either treated as a bye-product, or having it consigned to the deep at a greater distance from our coastline.

I have, &c.,

Legislative Assembly, 12th May, 1898.

FRANK FARNELL.

PARTICULARS OF HAULS.

FIRST HAUL.

Operations were commenced on Saturday, 19th February, 1898, by testing the grounds off Broken Bay. The steamer left the bay at 7 a.m., and we lowered the trawl at 7.14 a.m. in 20 fathoms of water, the soundings giving gravel and sand. It was raised at 9.30 a.m. in 32 fathoms, the soundings giving fine sand. The position was east from Broken Bay about 3 miles, and the distance covered by the trawl was about 5 miles. The following species were represented:—Schnapper, flounder, teraglin, whiting, gurnard, red mullet, flathead, stingray, fiddler, shovel-nose ray, leather-jacket, box-fish, dog-fish, saw-fish, batray, swimming crabs, and squid. A feature connected with this haul was the fact of several fish being full of roe, notably flathead and whiting.

SECOND HAUL.

On the same day, the 19th, the trawl was lowered at 11.20 a.m. in 32 fathoms—the soundings giving sand—and was raised at 1.20 p.m. on account of having become caught. The net was found to be torn at the cod end, and to have become foul of some obstruction. The latitude and longitude were carefully marked by those on board, and there is every reason to believe that the location of the obstruction points to it as being the wreck of the "Minora," which sank about 10 miles off Barranjoey some time ago. The haul was not without result, however, as the following species were represented:—Whiting, schnapper, John Dory, flathead, leather-jacket, bellows-fish, box-fish, gurnard, fiddler, and crayfish. Careful soundings were taken of the locality where the net met the obstruction, which gave the bottom as fine sand. Owing to the net having been torn, it was decided to run into Broken Bay and effect the necessary repairs, which were attended to on the Saturday afternoon and Sunday morning.

THIRD HAUL.

A start was made from Pittwater at 5.15 a.m. on Monday, the 21st, the course taken being south-east to the 31-fathom line, about 6½ miles out from Barrenjoey. The trawl was lowered at 6.53 a.m., the soundings giving sand and shell, and it was raised at 9 a.m. in 55 fathoms, when the soundings gave sand, shell, and mud. The result of this haul was nil, on account of the net having become twisted, the foot-rope getting over the head-line in shooting and completely closing the mouth of the trawl.

FOURTH HAUL.

The trawl was again lowered in 55 fathoms at 9.30 a.m., the soundings giving sand, shell, and mud, and was raised at 11.30 a.m. in 84 fathoms. The course taken during this haul was back over portion of the ground covered by the previous haul, and then round and going due east, and when the trawl was raised the soundings gave mud and shell. The result of this haul showed the following species represented:—John Dory, whiting, gurnard, flathead, flounder, cucumber-fish, box-fish, skate, stingray, saw-fish, and leather-jacket, besides a quantity of squid.

FIFTH HAUL.

The trawl was lowered for the third time this day at 12.45 p.m. in 84 fathoms, the soundings giving mud, and it was raised at 2.30 p.m. in 67 fathoms, the soundings giving soft mud. The result of this trial showed the following species represented:—John Dory, boar-fish, flathead, gurnard, skate, flounder, banded percis, angel shark, and leather-jacket. One thing to be noticed in regard to this haul is that, although the operations were carried on in an easterly direction, the water became reduced in depth, evidently showing that the trawl had been lowered in a hole or valley. A careful examination of the Admiralty chart failed to show the location of this hole. It must be noted that the fish collected from the net were full of roe.

SIXTH HAUL.

The trawl was lowered at 3.10 p.m. in 67 fathoms, the soundings giving soft mud, and was raised at 6.30 p.m. in 80 fathoms, the soundings giving coarse sand. This haul proved almost profitless on account of a somewhat similar accident happening as before, namely, the foot-rope getting twisted with the head-line, and completely closing the mouth of the trawl. The banded percis and flounder were the only fish obtained.

SEVENTH.

SEVENTH HAUL.

On the same date the trawl was lowered at 7 p.m. in 69 fathoms, the soundings giving coarse sand. The course taken was towards the shore, and the trawl was raised at 10.40 in 62 fathoms, the soundings giving fine sand. The following species were represented:—Nannegai, Sergeant Baker, gurnard, flathead, boar-fish, John Dory, morwong, red gurnard, perch, skate, leather-jacket, stingray, and angel shark.

EIGHTH HAUL.

On the morning of the 22nd the trawl was lowered at 6.15 a.m. in 25 fathoms, the soundings giving sand. The course taken was north along the coast from Broken Bay. It was raised at 9 a.m. in 28 fathoms, the soundings giving coarse sand and gravel. As a result, the following species were obtained:—Whiting, John Dory, gurnard, flathead, schnapper, stingray, leather-jacket, stone-lifter, box-fish, crabs, and squid. During the time the net was being hauled on board great numbers of whiting escaped, which were edible and marketable, and this can only be accounted for by the fact of the boat being so unsuitable for successful operations.

NINTH HAUL.

The trawl was lowered in 28 fathoms at 9.45 a.m. the same day, the soundings giving sand, and it was raised at 12 noon in 28 fathoms, the soundings giving brown sand. The course steered was north and off Cape Three Points. The following fish were caught:—Gurnard, flathead, flounder, skate, whiting, John Dory, leather-jacket, box-fish, stingray, stone-lifter, swimming-crabs, and squid.

TENTH HAUL.

The trawl was lowered again at 1.30 p.m. in 28 fathoms, the soundings giving brown sand, and was raised at 5 p.m. in 28 fathoms, the soundings giving fine sand. The course steered was off Cape Three Points, towards Tuggerah, going north. The result showed the following fish represented:—John Dory, gurnard, flathead, flounder, sole, skate, stingray, batray, shovel-nose ray, star-gazer, box-fish, saw-fish, Port Jackson shark, dog-fish, leather-jacket, crabs, and squid. As an evidence of the way in which the foot-rope gripped the ground on this occasion, it may be mentioned that amongst other things that came up during this haul were 30 fathoms of 4-inch Manilla rope.

ELEVENTH HAUL.

The trawl was lowered at 6.5 p.m. in 28 fathoms, the soundings showing sand, and was raised at 11 p.m. in 34 fathoms, the soundings showing sand. The course taken was off Tuggerah Lakes, going north to Bungaree Norah, then round east to south towards Port Jackson. The result of this haul showed the following species to be represented:—Flounder, flathead, nannegai, gurnard, skate, teraglin, John Dory, stingray, leather-jacket, box-fish, dog-fish, shovel-nose ray, crabs, and squid. During this haul the trawl brought in a heavy log, weighing over 10 cwt.

TWELFTH HAUL.

The trawl was lowered in 34 fathoms at 12.30 a.m. on the 23rd, the soundings giving sand, and was raised in 23 fathoms at 5.30 a.m., the soundings giving fine sand. The course taken was from off Cape Three Points, towards Port Jackson. The result of this haul was that the following species were represented:—Nannegai, flounder, John Dory, flathead, schnapper, teraglin, red mullet, gurnard, morwong, Sergeant Baker, skate, box-fish, stingray, leather-jacket, dog-fish and squid.

These hauls concluded the trials connected with the first experiment. The steamer was allowed time to coal and obtain supplies, and a fresh start was made on Friday, the 25th February.

THIRTEENTH HAUL.

When off Cape Three Points, the trawl was lowered at 7 p.m. in 41 fathoms, the soundings giving mud and sand, and it was raised at 9 p.m. in 51 fathoms, the soundings giving mud and shell. The course taken was north-east, and after trawling for two hours it was found that an obstruction had been met with which caused the warp to part, and the foot-line to break in the part where it was specially weakened, the only other damage done being a slight tear in the net. Some little delay was also caused by the bolt of the roller connected with the gangway giving way. The result of this haul was that the following species were represented:—Nannegai, flathead, gurnard, skate, red gurnard, perch, flounder, dog-fish, stingray, stone-lifter, and two or three small sharks.

At the completion of this haul the damage which had been done rendered it necessary for the steamer to go into Broken Bay again and have the necessary repairs effected. The greater portion of the time was occupied in re-measuring and splicing the wire-warps, which had to be run off the barrel of the winch and measured on to it again.

FOURTEENTH

FOURTEENTH HAUL.

We left Broken Bay at 5 a.m. on Saturday, the 27th, for the grounds off Bungaree Norah. The trawl was lowered at 7.15 a.m. in 25 fathoms, the soundings giving sharp brown sand and shell, and was raised at 9.45 a.m. in 32 fathoms, the soundings giving sharp sand, gravel, and shell. During the progress of this haul the net again became twisted, the foot-line getting crossed with the head-line, and thus completely closing the mouth of the net. It may be mentioned in connection with this haul that the unsuitability of the boat for trawling was responsible for the net not being properly lowered.

FIFTEENTH HAUL.

The trawl was lowered off Bird Island, about 6 miles to the east in 32 fathoms, the soundings giving sharp sand, gravel, and shell, and was raised at 12 noon in 45 fathoms, the soundings giving fine sand. The necessity for raising the net was brought about by the fact of the trawl showing indications of having met with some obstruction. When hauled up, it was shown that the cod-end of the net was torn slightly, and that the foot-line was broken at the specially weakened part. The following fish were represented in this haul:—Schnapper, parrot-fish, boar-fish, longfin, John Dory, saw-fish, Port Jackson shark, and leather jacket. A notable fact in connection with this haul was the discovery made when the schnapper kind were being gutted. In every case where the bream and squire were opened they were found to be full of roe and milt, evidently proving that these fish do not require to arrive at the stage of a schnapper before their powers or reproduction can be used. It has been asserted by the most competent authorities that the red-bream at his stage of growth never spawned, and the same opinion existed in regard to the fish at a later stage, namely that of a squire. The facts brought to our knowledge by opening these fish and subsequent specimens of the same class prove that the conclusions arrived at in the past were erroneous.

SIXTEENTH HAUL.

The trawl was again lowered at 3 p.m. in 72 fathoms, the soundings giving fine sand, and was raised at 6 p.m. in 90 fathoms, the soundings giving fine sand, gravel, and shell. The result of this haul was nil, and this is accounted for by the fact of the cod-end of the net having got over the foot-rope in shooting, owing to the strong current which prevailed, and the unsuitability of the boat.

SEVENTEENTH HAUL.

On Monday, the 28th, we determined upon going further north, and accordingly lowered the net on the grounds off between Broughton Island and Seal Rocks. The trawl was lowered at 6 a.m. in 29 fathoms, the soundings giving sand and shell, and raised at 8.40 a.m. in 48 fathoms, the soundings giving sand, mud, and shell. The result was that the following species were represented:—Whiting, horse-mackerel, John Dory, pipe-fish, yellowtail, bellows-fish, skate, gurnard, stingray, leather-jacket, and porcupine.

EIGHTEENTH HAUL.

The trawl was lowered again at 2.15 p.m. in 32 fathoms, the soundings giving gray sand and shell. It was raised at 2.40 p.m. in 32 fathoms, the soundings giving sand and shell. The shortness of this haul is accounted for by the fact of the trawl having become caught. No damage was done, however, but the weather was so boisterous and unsuitable that we determined upon putting into Port Stephens for shelter. The result of the haul only produced the following species:—Two old wives and a box-fish.

NINETEENTH HAUL.

On Tuesday, 1st March, the trawl was lowered off Port Stephens at 10.15 a.m. in 35 fathoms, the soundings giving mud, gravel, and shell, and was raised at 12.15 p.m. in 58 fathoms, the soundings giving mud. The result of this haul was nil, the same cause being responsible as previously stated, namely the unsuitability of the boat for shooting the net. Besides this it may be mentioned that the net used on this occasion was a new one, and it was the first time it had been put in the water, and this fact may be responsible for it not having gripped the bottom.

TWENTIETH HAUL.

We again lowered the trawl at 1 p.m. off Morna Head, going south, in 32 fathoms, the soundings giving gravel and mud, and raised it at 1.30 p.m. on account of its having become caught. No great damage was done to the net, excepting a tear here and there. The following species were represented:—Whiting, gurnard, skate, bat-ray, leather-jacket, small shark, and bellows-fish. Owing to the state of the weather it was determined to seek shelter again, and for this purpose we went into Port Stephens, the opportunity being taken for repairing the net.

TWENTY-FIRST

TWENTY-FIRST HAUL.

On Wednesday, the 2nd, we left Port Stephens at 6 a.m., and commenced operations off Newcastle Bight, by lowering the trawl at 8.15 a.m. in 28 fathoms, the soundings giving clean gray sand. It was raised in 42 fathoms at 10 a.m., the soundings giving soft mud. The result of this haul was estimated to be about three-quarters of a ton of fish, consisting of whiting, flounder, John Dory, flathead, schnapper, nannegai, gurnard, red mullet, skate, saury, stingray, leather-jacket, box-fish, dog-fish, morwong, one giant-ray weighing 160 lb., bellows-fish, percis, crabs, and a quantity of squid.

TWENTY-SECOND HAUL.

Still continuing in the Newcastle Bight, the trawl was lowered at 10.30 a.m. in 42 fathoms, the soundings giving mud. It was raised at 1.15 p.m. in 26 fathoms, the soundings giving sharp sand. This trial proved to be better than even the last, as it was estimated that the cod-end contained over a ton of fish. The following species were represented:—Red mullet, nannegai, bull's-eye, whiting, flathead, skate, old wife, flounder, gurnard, John Dory, bat-ray, shovel-nose ray, leather-jacket, prawns, boar-fish, Port Jackson shark, white shark, one cray-fish, and a giant-ray estimated to weight 2 cwt.

TWENTY-THIRD HAUL.

Still continuing in the Newcastle Bight, the trawl was lowered at 2 p.m. in 20 fathoms, the soundings giving sand, and was raised at 3.45 p.m. in 16 fathoms, the soundings giving coarse sand and gravel. The result of this haul was very satisfactory, inasmuch as over half a ton of fish were caught. The following species were represented:—Sole, flounder, schnapper, John Dory, tailor, teraglin, flathead, saurus, nannegai, whiting, silver bream, gurnard, stingray, stargazer, saw-fish, toado, batray, fortescue, bulls-eye, squid, and one shark about 7 feet long. On the completion of this haul, Newcastle was sought, and we remained there over the night. On the following day an attempt was made to continue the experiments off Newcastle, but unfortunately the sea was too rough, and rendered it necessary to return to port again.

TWENTY-FOURTH HAUL.

On the 4th March another attempt was made, the trawl being lowered off Nobby's at 7 a.m. in 21 fathoms, the soundings giving fine sand and mud. It was raised at 9 a.m. in 48 fathoms, the soundings giving soft mud. The result of this haul was very satisfactory, inasmuch as the following species were well represented:—Whiting, gurnard, flathead, red mullet, banded sole, flounder, nannegai, yellowtail, beardy, skate, angel shark, stingray, fiddler, shovel-nose ray, numb-fish, batray, Port Jackson shark, small sharks, saw-fish, wobbegong shark, box-fish, and squid.

TWENTY-FIFTH HAUL.

The trawl was lowered again at 9.30 a.m. in 48 fathoms, the soundings giving soft mud, and was raised at 10.15 a.m. in 42 fathoms, the soundings again giving soft mud. The trawl, after being down for three-quarters of an hour, became caught on some sunken wreckage. This was proved to be the case by the fact that a ship's plank with muntz-metal sheeting attached, and an anchor with a fathom of chain weighing about 10 or 11 cwt., were brought on board. Some two hours were occupied in ridding the net of these obstacles, and the net suffered in consequence, but the repairs were easily effected. These articles are supposed to have belonged to the "Alhambra," which was wrecked on or about this spot about 12 years ago. The observations taken by the Captain of the "Thetis" go to prove that it was the wreck of the above-named boat we had become foul of. The result of this haul showed the following species to be represented:—Whiting, gurnard, John Dory, teraglin, flathead, nannegai, skate, flounder, fiddler, batray, numb-fish, rock-cod, saw-fish, and stingray.

TWENTY-SIXTH HAUL.

The trawl was lowered between Newcastle and Red Head at 1 p.m. in 32 fathoms, the soundings giving soft mud, and was raised at 3 p.m. in 20 fathoms, the soundings giving fine sand. The result of this haul was that the following species were represented:—Whiting, flounder, John Dory, flathead, gurnard, old wife, pilehard, yellowtail, skate, leather-jacket (small), box-fish, saw-fish, batray, shovel-nose ray, stingray, toado, Port Jackson shark, crabs, and squid.

TWENTY-SEVENTH HAUL.

On Saturday, the 5th March, the trawl was lowered off Crowdy Head, near the Manning River Bight, at 7.40 a.m., in 22 fathoms, the soundings giving fine sand, and was raised at 9.40 a.m. in 23 fathoms, the soundings giving fine sand. The distance trawled was about 6 miles, and the following species were represented:—Whiting, flounder, gurnard, flathead, skate, red mullet, horse-mackerel, toado, fiddler, stingray, shovel-nose ray, stone-fish, and leather-jacket (small).

TWENTY-EIGHTH

TWENTY-EIGHTH HAUL.

The trawl was lowered off the Manning River Bight, going south-east, at 10.10 a.m. in 23 fathoms, the soundings giving fine sand, and was raised at 12.10 p.m. in 30 fathoms, the soundings giving fine sand. The distance trawled was about 6 miles, and the following species were represented:—Flounder, flathead, gurnard, skate, star-gazer, stingray, leather-jacket (small), fiddler, crayfish, and squid.

TWENTY-NINTH HAUL.

Operations still being conducted in a south-easterly direction off the Manning Bight, the trawl was lowered at 12.55 p.m. in 16 fathoms, the soundings giving sand, and was raised almost immediately after it had been shot, on account of indications showing coarse ground. When the net was hauled up, it was found that the foot-rope was broken at the point where it is specially weakened. No other damage was done, and though the net was only down five minutes, the following species were caught:—Red-mullet, schnapper, and mailed-fish. A sounding was taken immediately the net was hauled on board, and it indicated a sandy bottom. The trawl was lowered again about the same locality at 2 p.m. in 16 fathoms, and there being again evidence of foul ground, it was hauled up five minutes afterwards. The result of this haul was nil, and the damage that was done was confined to the otter boards being injured. From observations that were made, and from the use of the hand-line, it transpired that the Manning Bight contains patches of rocks, but there is not the slightest doubt that if a suitable steamer had been available, operations could have been carried on successfully in some portions of the Bight. However, the weather was so terribly bad that it was dangerous to navigation to approach any closer than the 16-fathom line. Shelter was sought for the night in Hawke's Bay.

THIRTIETH HAUL.

A start was made on the 6th March by lowering the trawl off Cape Hawke at 8 a.m. in 35 fathoms, the soundings giving sharp brown sand. After leaving it down for five minutes, the net showed signs of being hauled over rough ground; consequently it was hauled up, no damage having been done. The result was that gurnard and red mullet were represented.

THIRTY-FIRST HAUL.

It was lowered again at 9.40 a.m. in 27 fathoms, the soundings giving brown sand, and was raised ten minutes later in 25 fathoms, the soundings giving sharp sand. The result of this haul was that gurnard, flounder, and skate were represented.

THIRTY-SECOND HAUL.

The trawl was lowered again in a shallower depth off Cape Hawke, and trawled south along the bight. It was lowered at 12 o'clock noon in 16 fathoms, the soundings giving fine sand, and was raised at 1.50 p.m. in 12 fathoms, the soundings giving sharp sand. The result of this haul was that the following species were represented:—Flounder, sole, gurnard, skate, flathead, stingray (small), and Port Jackson shark. The distance trawled was about 5½ miles. The weather becoming more boisterous, it was decided to make for Port Stephens, where we spent the night, leaving there at 6 a.m. on the 7th to trawl in a southerly direction.

THIRTY-THIRD HAUL.

We lowered the trawl in the Newcastle Bight at 8 a.m. in 22 fathoms, the soundings giving sand, mud, and shell. It was raised at 10.10 a.m. in 24 fathoms, the soundings giving sand and shell. The sea was rough, and a strong south-easterly wind blowing. However, the haul was a very satisfactory one, inasmuch as the edible portion of the undermentioned species were well represented:—Flounder, John Dory, schnapper, whiting, tailor, skate, gurnard, flathead, box-fish, stingray (two or three), star-gazer, fiddler, batray, numb-fish, crawfish, crabs, and squid. It came on to blow so heavily from the south-east that it was determined to make for Broken Bay, where we stayed over the night. It was then found necessary to make Sydney, for the purpose of obtaining supplies for the vessel, and we, therefore, left Broken Bay at 4 a.m. in the morning, and after coaling and receiving supplies, we left again on the 10th to conduct operations in the waters south of Port Jackson.

THIRTY-FOURTH HAUL.

We lowered the trawl at 4.20 p.m. in 35 fathoms, the soundings giving fine brown sand, and it was raised at 5.25 p.m. in 41 fathoms, the soundings giving fine sand and shell. The distance trawled was about 3 miles, and the trawl having shown signs of having met with an obstruction, it was hauled up earlier than usual. The result of the haul was that the following species were represented:—John Dory, skate, flathead, gurnard, boar-fish, stingray, Port Jackson shark, box-fish, and saw-fish.

THIRTY-FIFTH

THIRTY-FIFTH HAUL.

As it was determined to make Port Hacking that evening, a move was made in that direction, and the trawl was lowered at 9.15 p.m. in 33 fathoms, the soundings giving fine gray sand. It was raised at 11.15 p.m. in 38 fathoms, the soundings giving fine gray sand. The result of this haul was that the following species were represented:—Flounder, John Dory, flathead, gurnard, nannegai, skate, chimera (small rare sharks), stingray, shovel-nose ray, crab, and squid.

THIRTY-SIXTH HAUL.

On the 11th March the trawl was again lowered off Port Hacking at 8.55 a.m. in 25 fathoms, the soundings giving fine gray sand. The spot chosen for the shooting of the net was evidently in too close proximity to the headland, for the net was no sooner over than it became caught. The haul was not without result, however, as John Dory were represented. The net was slightly torn, so we went into Botany Bay for repairs.

THIRTY-SEVENTH HAUL.

After the repairs had been effected, the trawl was lowered off Botany Bay at 5.20 p.m. in 50 fathoms, the soundings giving soft mud, and was dragged in a southerly direction till 7.30 p.m., when it was raised in 50 fathoms, the soundings giving soft gray sand. The result of this haul was that the following species were represented, the edible portion being well represented:—John Dory, flounder, flathead, skate, gurnard, cucumber-fish, chimera, stingray (6), crab, and squid (no leather-jackets).

THIRTY-EIGHTH HAUL.

The trawl was lowered off Port Hacking on the 12th March at 7 a.m. in 46 fathoms, the soundings giving sand and mud. The sea was rather rough, with a strong wind from the south. The trawl was raised at 9 a.m. in 55 fathoms, the soundings giving mud and small shell, the distance trawled being about 5 miles. The result was again very satisfactory, more particularly as to the quantity of John Dory. The following species were represented:—John Dory, flounder, whiting, gurnard, flathead, skate, cucumber-fish, boar-fish, stingray, stargazer, bellows-fish, leather-jacket (1), prawns, crabs, and squid.

THIRTY-NINTH HAUL.

It was lowered again off Marlee Head, going south, at 9.50 a.m. in 50 fathoms, the soundings giving sand and mud, and was raised in 50 fathoms, the soundings giving soft mud. The distance trawled was about 5½ miles, and the result was again very satisfactory, more particularly in regard to the quantity of John Dory. The following species were represented:—John Dory, flathead, gurnard, whiting, skate, flounder, red mullet, yellowtail, stingray, angel shark, saw-fish, dog-fish, fiddler, and leather-jacket (2).

FORTIETH HAUL.

Still going south, the trawl was lowered at 12.45 p.m. off Wattamolla in 50 fathoms, the soundings giving mud. After trawling for five or ten minutes some slight obstruction was felt, and the trawl was hauled up. No serious damage was done to the net, excepting that which was necessary in order to release a 4 or 5-cwt. boulder, which had become foul of the trawl. Owing to the unsuitability of the arrangements in connection with the landing of the trawl, it was necessary to cut the net in order to allow the stone to go over. Another attempt was made by lowering the trawl at 3 p.m. in 56 fathoms, the soundings giving soft mud. The direction in which it was intended to trawl was north, off Wattamolla. However, it was found necessary to haul in the trawl again, inasmuch as it was reported that one of the boiler tubes had burst, and operations could not therefore be proceeded with. We returned to Port Hacking for repairs, which were carried out by the engineers.

FORTY-FIRST HAUL.

On Sunday, the 13th, we left Port Hacking at 6 a.m. and lowered the trawl at 7 a.m. off Jibbon in 60 fathoms, the soundings giving soft mud. We trawled for about 6 miles, and raised the trawl about 9 a.m. in 71 fathoms, the soundings giving mud, sand, and shell. The following species were represented:—John Dory, flounder, flathead, gurnard, percis, cucumber-fish, crabs, and squid. It may be noted that during this haul there were no stingrays or leather-jackets caught.

FORTY-SECOND HAUL.

It was lowered again off Wattamolla, going south towards Bulli, at 9.35 a.m. in 71 fathoms, the soundings giving mud, and after trawling about 6 miles it was raised at 11.50 a.m. in 72 fathoms, the soundings giving coarse sand and gravel. The following species were found to be represented:—John Dory, flounder, nannegai, flathead, gurnard, rock cod, red gurnard perch, skate, banded percis, morwong, boar-fish, long fin, cucumber-fish, stonelifter, stingray, angel shark, sea horse, crayfish, crawfish, and squid. It may be noted that there were no leather-jackets in this haul.

FORTY-THIRD

FORTY-THIRD HAUL.

After steaming north to a point off Maroubra Bay, the trawl was shot at 2:15 p.m., the course taken being in a southerly direction towards Port Hacking, in 43 fathoms, the soundings giving fine gray sand. It was raised at 4:20 p.m. in 66 fathoms, the soundings giving soft mud. The distance trawled was about 6 miles. The result of the haul was a very satisfactory one indeed, inasmuch as large quantities of the edible portion of the following species were represented:—John Dory, flounder, gurnard, flathead, cucumber-fish, skate, stonelifter, stingray, leather-jacket (3), crabs, and squid. On the completion of this haul it was reported that one of the boiler-tubes had burst, necessitating permanent repairs to be made. Consequently a return was made to Sydney, and advantage was taken of the opportunity to obtain coal and other supplies, as well as to make permanent repairs to the boiler.

FORTY-FOURTH HAUL.

A fresh start was made on the 15th March, when the trawl was lowered off Bondi, a southerly direction being taken. It was shot at 4:20 p.m. in 49 fathoms, the soundings giving fine gray sand, and after trawling for about 3 miles an obstruction was felt, which rendered it necessary to bring the trawl on board. This was at 5:10 p.m., in 53 fathoms. The haul was not without result, as the following species were represented:—Flounder, flathead, gurnard, and boar-fish. No damage was done to the net, and after having sheltered in Botany Bay for the night, a start was made again on the 16th March.

FORTY-FIFTH HAUL.

The trawl was lowered off Cape Solander, and towed in a southerly direction to off Marlee Head. It was lowered at 6:50 a.m. in 55 fathoms, the soundings giving soft mud, and was raised at 8:50 a.m. in 66 fathoms, the soundings giving soft mud. Although the indications had shown that the trawl was well on the bottom, it was found that it had become foul through the foot-rope getting twisted with the head-line, and completely closing the mouth. The result of this haul was nil.

FORTY-SIXTH HAUL.

In order to test this ground again the trawl was lowered at 9:10 a.m. off Marlee Head (a northerly direction being taken) in 66 fathoms, the soundings giving soft mud, and was raised at 11:10 a.m. in 50 fathoms, the soundings giving mud and sand. The distance trawled was about 3 miles. The result showed the following species represented:—John Dory, flathead, flounder, skate, gurnard, cucumber-fish, chimera, angel shark, leather-jacket (1), saw-fish, crabs, and squid. It may be noted that during the progress of this haul a great deal of slaughter-house refuse was encountered, a large quantity being subsequently picked up in the trawl. This appears to be conclusive evidence of the fact that this refuse is not taken far enough out to sea before it is deposited, as observations show that it has been brought along the coast with the current. It would be hard to discover a more sickening spectacle, as well as a more objectionable one, as the stench from it had the effect of causing one or two of the hands to retch. On the completion of this haul it was found absolutely necessary that the net should be washed, and for that purpose we went into Botany Bay.

FORTY-SEVENTH HAUL.

The trawl was lowered off Bulgo Head, and the net was towed in a southerly direction. It was lowered at 3:50 p.m. in 63 fathoms, the soundings giving mud, sand, and shell, and was raised at 5 p.m. in 57 fathoms, the soundings giving rough bottom. During this haul the net met with an obstruction, which parted the foot-rope at the specially weakened portion. The result of this haul showed the following species represented:—John Dory, gurnard, banded percis, flathead, flounder, boar-fish, stingray (1), cucumber-fish, and squid. Again the abominable slaughter-house refuse was in evidence, and a good portion came up in the cod-end of the net. This locality would be about 10 miles from that over which the trawl was drawn just previously, clearly showing that this refuse deposits itself in a southerly direction along the coast for many miles.

FORTY-EIGHTH HAUL.

On the 17th March the sea was too rough to attempt trawling, consequently it was not until the 18th that operations were again commenced by lowering the trawl off Wollongong at 7:25 a.m. in 56 fathoms, the soundings giving mud, gravel, and shell. It was raised again at 8:30 a.m. in 55 fathoms, the soundings giving rough bottom. The following species were represented:—John Dory, gurnard, flounder, flathead, long fin, nannegai, morwong, gurnard perch,

perch, cucumber-fish, rock-cod, red mullet, stingray, angel shark, walking-fish, skate, boar-fish, and dog-fish. During the progress of this haul an obstruction was met with which caused the foot-rope to part and the cod-end of the net to be slightly torn. It may be specially mentioned that the quality of the fish caught during this haul was very prime.

FORTY-NINTH HAUL.

The trawl was lowered again about nine miles off Wollongong and towed in a south-westerly direction. It was shot at 10.25 a.m. in 75 fathoms, the soundings giving mud and small stones, and was raised at 12.30 p.m. in 63 fathoms, the soundings giving fine sand and mud. The result of this haul showed the following species to be represented:—Flathead, gurnard, flounder, skate, cucumber-fish, stingray, dog-fish, rock-cod, stargazer, crabs, and crawfish. It may be mentioned that during the progress of this haul a great strain was noticed on the warps. This would seem to indicate that the otter boards and foot-rope were gripping the bottom very firmly; so much so, indeed, that the cod-end contained a great quantity of the bottom which had been trawled over. This shows clearly that the bottom in that locality is very open, consequently it would necessitate a slight adjustment of the boards in order to prevent a recurrence on any future occasion when operations are being conducted. It took some considerable time for the net to be brought on board, as it is estimated it contained some tons of sand and mud when first raised, and sufficient time had to be allowed for this material to free itself from the cod-end of the net. The immense strain on the trawl, which was intensified by the unsuitability of the boat, proved to have caused some slight damage to the net, and in order that the necessary repairs might be effected the Port of Kiama was sought.

FIFTIETH HAUL.

Leaving again on the 19th March, the waters south of Kiama were explored by lowering the trawl off the Shoalhaven Bight and towing it in a south-south-westerly direction. It was lowered at 7.30 a.m. in 18 fathoms, the soundings giving fine gray sand, and was raised at 9.30 a.m. in 15 fathoms, the soundings giving fine sand. This haul proved very gratifying, inasmuch as the following edible species were well represented:—John Dory, whiting, flounder, sole, flathead, boar-fish, and prawns. Besides these the following non-edible fish were caught:—Angel shark, Port Jackson shark, batray, stingray, fiddler, and box-fish. One particular feature connected with this trial was the fact of the capture of large soles and flounder, also a fine sample of prawns.

FIFTY-FIRST HAUL.

Following up the grounds off the Shoalhaven Bight, and still proceeding in a south-south-westerly direction to a point where a north-easterly course was steered, the trawl was lowered at 9.45 a.m. in 15 fathoms, the soundings giving fine sand, and was raised at 11.45 a.m. in 15 fathoms, the soundings giving fine sand. During the progress of this haul the following species were represented:—Sole (three species), flounder, flathead, whiting, gurnard, hammerheaded shark, Port Jackson shark, batray, stingray, shovelnose-ray, toado, bullrout, and prawns. It may be mentioned in connection with this haul that large soles and flounder again predominated, also large prawns.

FIFTY-SECOND HAUL.

Operations were still continued in the Shoalhaven Bight by steering a north-easterly course, and lowering the trawl at 12.45 p.m. in 19 fathoms, the soundings giving fine sand, and raising it at 2.15 p.m. in 20 fathoms, the soundings giving mud and gravel. The following species were represented:—Sole, flounder, flathead, whiting, gurnard, rock-cod, John Dory, schnapper, trumpeter perch, stingray, batray, Port Jackson shark, angel shark, numb-fish, box-fish, leather-jacket (1), prawns, and squid. It may be mentioned that again the soles and flounder, and also the flathead, were very large in size.

FIFTY-THIRD HAUL.

Still continuing operations in the Shoalhaven Bight by going about 5 or 6 miles further south, the net was lowered at 2.55 p.m. in 23 fathoms, and was raised owing to an obstruction at 3.5 p.m. in 23 fathoms, the soundings giving on both occasions sharp sand. The result of this haul showed the following species represented:—Schnapper, trumpeter, Sergeant Baker, skate, batray, and leather-jacket. By fishing this ground with the hand-line it was ascertained that it was, in all probability, a reef running out from King Horn Head. During the progress of this haul the net was torn, and, while it was being repaired, a course was steered to Jervis Bay.

FIFTY-FOURTH

FIFTY-FOURTH HAUL.

The net was lowered at 6.30 a.m. on the 20th March inside Jervis Bay in 10 fathoms, the soundings giving fine white sand, and was raised at 8.35 a.m. in 11 fathoms, the soundings giving fine white sand. The following species were represented:—Sole, flounder, flathead, gurnard, fiddler, angel shark, stingray, batray, leather-jacket, box-fish, and numb-fish. The ground trawled over was about 5 miles long, and the edible fish caught were of fine quality and size. During the progress of this haul a large quantity of small red seaweed was met with, which became entangled in the meshes of the net, and considerable time was occupied in bringing the trawl on board, and afterwards in freeing this seaweed from it.

FIFTY-FIFTH HAUL.

After this a course was steered north-east to off Crookhaven Heads, and the trawl was lowered at 5.15 p.m. in 15 fathoms, the soundings giving fine sand, and was raised at 6.25 p.m. in 15 fathoms. The necessity for raising the trawl so soon after having been lowered was brought about by the fact of its becoming fouled on rough bottom, and when brought on board it contained two large basalt boulders, weighing between 6 and 7 cwt. The following species were represented:—Flounder, flathead, red rock-cod, stingray, batray, numb-fish, and fiddler.

FIFTY-SIXTH HAUL.

Continuing operations in a northerly direction, the trawl was lowered off Botany Bay, about 8 miles east, at 7.55 a.m. on the 21st March in 79 fathoms, the soundings giving coarse sand, and was raised at 10 a.m. in 79 fathoms, the soundings giving gravel and shell. The result of this haul showed the following species to be represented:—John Dory, boar-fish, flounder, flathead, gurnard, skate, gurnard perch, long fin, percis, cucumber-fish, stingray, batray, angel shark, sea-horse, and squid.

FIFTY-SEVENTH HAUL.

It was lowered again at 11.30 a.m. off Marlee Head in 59 fathoms, the soundings giving mud. It was towed in a southerly direction, and was raised at 1.50 p.m. in 54 fathoms, the soundings giving mud. The result of this haul was that the following species were represented:—John Dory, flounder, boar-fish, gurnard, saw-fish, angel shark, and leather-jacket. It may be mentioned that the net when hauled on board showed evidences of having contained slaughter-house refuse, although it had freed itself of it during its progress through the water.

FIFTY-EIGHTH HAUL.

Again the trawl was lowered off Port Hacking, at 3.10 p.m., in 28 fathoms, the soundings giving sand and shell, and it was raised at 5 p.m., in 42 fathoms, the soundings giving mud and shell. The result of this haul was that the following species were represented:—John Dory, gurnard, morwong, flathead, skate, whiting, flounder, stingray, batray, and squid. Amongst the fish was one giant ray, weighing 180 lb.

FIFTY-NINTH HAUL.

The final haul connected with the expedition was made on the 25th March, when the trawl was lowered off Narrabeen, at 4.30 p.m., in 30 fathoms, the soundings giving sharp sand, being raised at 6.20 p.m., in 32 fathoms, the soundings giving sand. The distance trawled was about 5 miles, and the following species were represented:—Flathead, gurnard, flounder, skate, stingray, shovel-nose ray, box-fish, fiddler, stargazer, Port Jackson shark, leather-jacket, crabs, and a quantity of squid.

The above haul was made for the purpose of not alone testing the grounds off Narrabeen, but in order to obtain a supply of fish, to be consumed on the trip to Lord Howe Island, where it was intended also to carry out experiments. Unfortunately, owing to the heavy weather prevailing and the unsuitability of the ocean floor as shown by the soundings taken, the trawl was not shot, it being deemed advisable not to risk valuable gear by so doing. It may be mentioned that from observations made it would appear that there is but a limited area around the island that would be available for carrying on trawling operations. Though these were the conclusions come to in regard to the possibility of trawling being carried on off the coast of Lord Howe Island, an investigation into the fisheries was not neglected, for on several occasions the hand-line and the seine were used for the purpose of testing the capabilities of the waters. The experiments showed the waters there to be teeming with species of very fine edible fish, which can be caught by the modes just mentioned, and capable of being utilised in many ways. Amongst the species caught were flounder, garfish, blue-fish, salmon, sea mullet, rock-cod, and kingfish.

RECORD of Trawling Observations made on board s.s. "Thetis" during 1898.

Haul	Date	Place.	Time trawl lowered.	Time trawl raised.	Depth where lowered. Fathoms.	Depth where raised. Fathoms.	Distance covered. Miles (about).	Result.	Description of grounds trawled over.
1	19 Feb.	Off Broken Bay	7:14 a.m.	9:30 a.m.	20	32	5	Fish	From gravel and sand to fine sand.
2	19 "	do	11:20 a.m.	1:20 p.m.	32	40	5	do	From sand to fine sand.
3	21 "	Off Barranjoey	6:53 a.m.	9 a.m.	31	55	5	Nil...	From sand and shell to sand, shell, and mud.
4	21 "	do E.	9:30 a.m.	11:30 a.m.	55	84	5	Fish	From sand, shell, and mud to mud and shell.
5	21 "	Off Broken Bay, E. by S.	12:45 p.m.	2:30 p.m.	84	67	4½	do	From mud to soft mud.

TRAWLING MASTER'S REPORT.

To the Honorable J. N. Brunker, M.P., Chief Secretary,—

Sir,

I have the honor to submit to you my report in connection with the recent trawling experiments, carried out under the superintendence of Mr. Frank Farnell, M.L.A., in the waters off the coast of New South Wales.

I was appointed on the 5th January this year to carry out operations in connection with testing the ocean floor and its suitability for trawling. I was led to understand that it was the intention of the Government to not only equip the steamer, but allow an opportunity for operations being carried on for a period of three months. This, I regret to say, has not been done. Consequently, the time occupied has been only that which was allowed from the time the "Thetis" was fitted up. In all, the actual time absorbed in connection with trawling operations has been five weeks.

Notwithstanding the limited time at my disposal, I am pleased to be able to report that, so far as the experiments have been carried out, I have come to the conclusion that the waters between the Manning River and Jervis Bay, and for a distance of 20 miles from the coast, have proved, beyond expectation, most suitable for trawling operations. When I contrast the difficulties that beset such expeditions in English and other waters, I am inclined to believe that the result of the operations carried on here can be considered unprecedented. I anticipated that I would meet with obstructions, and that very great damage would be done to the fishing nets and gear, but I am glad to say that, when it is taken into account that no nets have been lost and that the whole of the gear remains intact and in good and sound condition now that the expedition is finished, I am justified in believing that further experiments will prove the sea bottom equally suitable for carrying on trawling operations. The results so far speak for themselves, and show what great possibilities there are before the fishing industry if the capture of fish is entered upon by means of steam-trawlers.

Deep-sea trawling being a new departure on this coast, no authentic records are obtainable as to the habits of the fish at different seasons of the year. It might be necessary to obtain this before inducements were held out for people to enter upon the development of the industry on a large scale. I may point out that the time allowed for the recent expedition was hardly sufficient to allow of the making of a more thorough trial, as we were only able to trawl over the same ground once, whereas grounds that were found suitable for trawling should be fished at short intervals, and thus give an opportunity of finding out at what time or season of the year fish abound on any particular ground. A great deal of this work could have been done had the expedition lasted for some time longer, even for the three months which was originally decided upon. Our experiments have proved that, at the time of the year when we were trawling, all the fish were found to frequent the shallow waters, but, owing to the "Thetis" being unsuitable for working inshore grounds at this time of the year, when the strong easterly winds prevail, we were unable to get trials which, in my opinion, would have proved most satisfactory,—for the closer we fished to the shore the larger quantity of valuable fish we were able to catch, such as soles, flounders, &c. I may here point out that on no occasion did we approach the coast nearer than 8 fathoms, and it was only on one occasion that this was done, when the haul proved most valuable and satisfactory. I may state that, owing to the heavy winds and seas we had to encounter during the progress of the experiments, it was not deemed safe or advisable to venture any closer than was done; and it was only on a very calm day that the 8-fathom line was fished. The nearest approach to the shore other than on this occasion was about 15 fathoms.

With regard to the quantity and quality of the fish caught, I consider that the expedition has proved that a deep-sea fishing industry could be well established, provided a proper means of distribution were also established. It must be remembered that my task was simply one to test the ocean floor for trawling operations, and the commercial aspect of the question was not entrusted to me at all. However, I am bound to state that if I had been fishing for a living, even with the disabilities under which we laboured, namely, in connection with the unsuitability of the boat, I think I would have been able to make a commercial success of it, because grounds which were proved to be prolific of fish life, and which gave us splendid hauls, could have been worked over and over again.

I regret to say that opportunity did not afford for testing the surface net. Of course this can easily be accounted for by the fact that the shoal fish, such as the pilchards, do not visit the coast until later in the year. I have no doubt but that a trial in connection with the surface net would prove satisfactory and encouraging.

The conclusions I have come to in connection with the expedition are—

- (1.) That the grounds off the New South Wales coast are most suitable for carrying on trawling operations.
- (2.) That with a properly equipped steam-trawler much more satisfactory progress could be made in connection with any future experiments.
- (3.) That the results prove conclusively to me that there is a large opening and field available for augmenting the supply of fish which now comes to the Sydney market, and my experience of twenty-seven years amongst the steam trawlers convinces me of the foregoing.

I have, &c.,

Sydney, 12th May, 1898.

CARL AUGUST NIELSEN.

REPORT ON THE FISHES.

BY

EDGAR R. WAITE, F.L.S.,

Zoologist to the Australian Museum, Sydney, and Naturalist to the Expedition.

(With twelve Plates.)

By way of introduction, it may be advisable to give some reasons why, as a representative of science, I was instructed to join H.M.C.S. "Thetis" on her recent trawling cruise. The general impression appears to be that my sole object was to secure specimens of natural history for the Australian Museum. Although present for that purpose, other duties were required of me. Mr. Frank Farnell recognises, and he is one of the few who do so, that to be of any real value, investigations should be carried on in a scientific manner, or, in other words, the observations should be, if not exhaustive, at any rate exact. We may be told, for example, that soles and flounders were taken in such a haul, or that gurnards and sharks were secured in another. This, however, conveys but little; many different kinds of soles, and, at least, half-a-dozen flounders, have been recorded from our coast. Some of these are of the highest value, while others may be of indifferent worth. My remarks will, perhaps, bear further emphasis. At mention of the word sole, the common Black Sole of the market (*Synaptura nigra*) will probably be understood; as a matter of fact, two examples only of this species were obtained, it being peculiarly an estuary fish. The sole most commonly taken was the Narrow-banded species (*Solea macleayana*, Pl. ix), smaller, but to my taste, of much better flavour than the Black Sole.

Then again we have five or six kinds of gurnards, but of this number only two are large, the remainder, although much more plentiful, are of comparatively small size. The reason for my having mentioned sharks, in this connection, may not be clear; I will therefore explain that, whereas some sharks are the worst enemies of fish, others feed exclusively upon sea-eggs (*Echinoderms*), and such unconsidered trifles, so that it is necessary to specify the kind of shark. The examples quoted will be sufficient, but there are many other forms, seldom distinguished by the commercial man, and even offering much difficulty to the trained ichthyologist.

The expedition was not, however, undertaken to increase our knowledge of the economy of the fishes; and, beyond their correct identification, it was mainly sought to prove, or disprove, certain contentions as to whether the waters off our coast could be successfully trawled. Also to ascertain, if possible, if trawling could be carried on remuneratively.

The

The vessel was not, therefore, fitted out for exact scientific research, and the following notes on the fishes are compiled simply from an examination of such as the trawl alone secured. To know the exact names of the fish with which we are dealing is, of course, necessary, but in order to take advantage, to the full, of such an important source of food, very much more should be learned. We should be acquainted with the habits of the various species, whether they are migratory to any extent, where and at what seasons they breed, if the ova sinks or floats, and whether the different kinds feed upon vegetable substances or are scavengers, carnivorous and predatory, or omnivorous in taste. We should be especially versed in the habits and rate of growth of the fry, and successive kind of enemies which threaten them. A thousand and one other things must be learned by careful and patient study, aided by all the scientific methods of research adopted in Europe and America.

The net of the trawl being intended for economical and experimental purposes, the mesh was very much larger than used on purely scientific expeditions; consequently the smaller organisms among which a zoologist would expect to reap the richest harvest were not obtained. The importance of these smaller organisms is too apt to be overlooked, yet the very existence of all commercial products of the sea depends upon them: from their study a naturalist may hope to tell a fisherman that which he most needs to learn, for the smaller and inedible sorts of fish and the minute animal life, so abundant on the floor of the ocean, become, either directly or indirectly, food for a large number of edible fish.

A microscopic examination of such material might also add to our knowledge of the diseases of fish, for organisms imperceptible to the unaided eye have ruined important industries alike in the sea and on land. To-day the once-flourishing oyster fishery of Southern Queensland is absolutely destroyed by the ravages of an inconspicuous worm. A few years ago the foreshores of Port Jackson were putrid with the carcasses of shell-fish, slain by myriads of infusorian animals (*Glenodinium rubrum*), each of which measured only one-thousandth of an inch in length. This will serve to show how important scientific research is, and what a bearing it has on the economic aspect of our fisheries.

Near the mouth the mesh of the trawl was about 5 inches, and, in consequence, whole basketsful of fish escaped. Indeed, the first indication of a successful haul, on the net nearing the surface, and long before it could be seen, was the large number of dead gurnards rising to the surface, belly upwards, and floating away astern. When whiting had been netted many were lost in this way.

In consequence of the unsuitability of the "Thetis" for trawling, the net had to be passed along the beam to the quarter before it could be got aboard. During this manœuvre quantities of large fish escaped over the ground line. The most valuable kinds lost in this way were Nannygai, Dory, Boar-fish, and Flying and Red Gurnards, but Skate, Leatherjackets, and others also escaped.

Whenever rocks were encountered the fishes obtained were few in number, but on such occasions we reaped a rich harvest of invertebrates, comprising sponges, ascidians, gorgonias, crustaceans, etc. Numerous feather-stars (*Comatula*) were obtained, while in 80 fathoms, off Botany Bay, between 200 and 300 hitherto rare echinoderms were hauled on board, and the trawl contained but little else. As these were indeed desiderata a large number were preserved.

At first the trawl was also worked at night, apparently without any variation in the results, but as such gave double work and prevented sleep, night-work was soon abandoned. On such occasions, however, a most beautiful spectacle was presented by the phosphorescent appearance of the fish as they darted hither and thither within the net, or lay on the deck a glowing mass. At night also it was only a moving streak of phosphorescent light that indicated the presence of a shark silently accompanying the vessel.

Without going into many details, some account of the various collecting implements used may be of interest.

TRAWL.

The type used was that known as the Otter trawl, wherein the mouth of the net is kept distended by means of two large boards—the otters. Our trawler, Captain Nielsen, had introduced several improvements on the usual type of Otter trawl, but as he is, I understand, himself writing a report on the expedition, such need not be referred to here. It may, however, be mentioned that, in place of the usual single warp, two were used, and the advantage of this was on one occasion clearly demonstrated. At station 13 the for'ard warp broke, notwithstanding the fact that it was composed of the best wire-rope, an inch in diameter. Had the net not been held by a second warp, we should have lost everything—an experience not new to me. This double warp does away with

with the necessity of a bridle, and, had we been able to pay it out over the stern instead of over the port side, its advantages would have been still further increased. In working an Otter trawl at varying depths some nice adjustment is necessary to ensure the boards always running at the correct angle. In shallow water the warp paid out was about three times the indicated depth, but in deeper water the proportion was lessened in consequence of the greater weight of the warp. If hemp, instead of wire, had been used, much more rope would have been required.

DREDGE.

This consists of an iron frame, to which is attached a net, and the dredges I took aboard were specially designed for collecting the smaller fish, crustaceans, worms, and other forms, which the trawl was not calculated to retain. Having no appliances for running out a separate warp, the dredge had to be attached to the bunt or cod-line of the trawl, and I was so unfortunate that the very first time it was put over, rocks were encountered, and notwithstanding the fact that the frame was constructed of iron bars thicker than a broomstick, the appliance was broken and twisted out of all recognition. This in itself was a small matter, and the duplicate on hand could soon have been attached; it was, however, evident that the dredge had contributed so largely to the damage sustained by the trawl on that occasion, that I could not again think of subjecting it to similar undesirable possibilities. I next tried a bag within the bunt end, and was thus on several occasions enabled to retain some of the mud and sand which, on examination, proves to be rich in invertebrates; but as considerable trouble was entailed in securing and removing the bag, I did not care to try the good nature of our trawlers too frequently.

TOW-NET.

Speaking generally, a tow-net consists of an iron ring, to which is attached some material allowing the water to pass through easily; this is cone-shaped, and a bottle at the smaller end retains the organisms which enter the mouth. A tow-net is designed to secure the pelagic or surface organisms which directly or indirectly become food for fishes. The net is usually let out astern on a line, and so held captive; owing, however, to the comparatively great speed at which we trawled— $2\frac{3}{4}$ to 3 knots—and especially in a choppy sea, or with the current against us, it was found that two men were required to haul the net in. This extra pressure, bringing the speed up to 4, or even more knots, "started" the material, and eventually I lost a net owing to the breakage of the tow-line. In order to avoid this extra pressure, and also to dispense with the services of two ill-spared men, the following plan was tried and succeeded so well that it was ever afterwards adopted. A boom was run out for'ard from the upper deck and the tow-line passed to the quarter, where a tripping-line attached to the rim of the net enabled me to haul it up at any time single-handed.

In fine, bright weather, a half-hour's run was sufficient to quite fill the bottle with *Salpa*, *Velella*, *Physalia*, *Medusa*, and other pelagic forms.

When at anchor, I used a cane-rimmed net, much lighter material, and supported the neck of the bottle with corks; it was thus floated away by the current or the wind, and although passing a much less quantity of water per minute, did good work.

The tow-net was also occasionally run at night, and the phosphorescent organisms, *Copepoda*, *Salpa*, etc., quite illuminated the bottle in which they were received. Every ripple on the water was also lighted with them, but the effect was most brilliant when they were concentrated in the bottle of the tow-net.

THERMOMETERS

THERMOMETERS.

As it was advisable to take such observations as could be readily made, instruments were secured for recording the temperatures of the air, the surface of the water, and the bottom of the sea respectively, the latter, kindly lent by the Government Astronomer, was of the self-registering type, so that the observations were rendered quite accurate. It was seen that the surface was generally a few degrees warmer or cooler than the air and was very constant, while the bottom was much colder, not always in proportion to the depth. The following figures will illustrate this more clearly and precisely :—

TEMPERATURE.

Station.	Air.	Surface.	Bottom.	Depth.
3	70·0	72·2	61·5	31 fathoms.
14	73·8	72·3	64·0	25 "
27	72·6	72·0	60·4	23 "
37	72·2	72·1	65·0	50 "
45	69·5	72·2	63·4	55 "
48	69·8	72·3	67·0	55 "
56	69·9	72·5	66·2	79 "
59	73·8	71·9	67·2	30 "

RESULTS.

Now that the trawling experiments are concluded, let us hope for the present only, divers opinions have been expressed as to the economic results of the expedition, and although it is not my province to deal with this aspect of the question, some few notes may be acceptable. Certain persons have been apt to judge of the results by the amount of fish brought to port. This, however, is a wrong measure to apply, for if fish were wanted, the careful observations made and preserved show exactly where such could be obtained. When a fruitful bank was discovered it was not further worked but new fields were sought, sometimes successfully, sometimes less so. Such are also the conditions in the North Sea (where my first trawling experiences were gained), and elsewhere. The whole ocean floor is not suited for trawling, and it must be remarked that comparatively speaking the bed of the sea was little more than scratched, and that whole areas are yet to be discovered and worked.

Among the more notable edible fishes obtained may be specially mentioned the Dory. This prime table fish was proved to be very common in certain places, notably within three miles of the coast, off Botany Bay. Mention may also be made of a Boar-fish (Pl. iii), which previously almost unknown, was taken in fair quantities, and proved to be of good edible quality. The Narrow-banded Sole (Pl. ix), a most exquisite fish, although only taken at four stations, was there so plentiful that if its haunts were more thoroughly explored there is little doubt that it would yield a good return. Among the better known fish trawled in large quantities may be mentioned Nannygai, Flathead, the Large- and the Small-toothed Flounders, and the Trumpeter Whiting; to say nothing of the Gurnards, Skate, Red Mullet, and other kinds. For more precise information the reader is referred to the accompanying list of fishes obtained, the marketable species being specially marked with an *.

Anyone looking into the literature of our fishes will soon become aware how little we know comparatively of the distribution of many of them. To a large extent the fishes of our coast-line, as we know them, are those of Port Jackson and the area immediately outside the Heads. How far to the north or south of this area they extend we cannot say, while of the fauna of the deeper water lying to the eastward we know practically nothing. The results obtained by the "Thetis" expedition show how much may be learned with but little outlay; the known range of many of our commonest species has been increased to the limits of the area covered, while not a few fishes are now recorded for the first time from our coast, and two species are described previously unknown to science.

A more comprehensive and technical account will, in time, be published by the Trustees of the Australian Museum, together with a full treatise of all specimens, both vertebrate and invertebrate, obtained by the expedition, to be prepared by the several specialists of that institution.

The present report is of a popular character, and has been prepared rather for the benefit of the commercial than the scientific community. To this end the technical names employed are not necessarily those of strict science, but are those by which the various fishes are best known to amateurs both in science and fishing, to those who may have neither the inclination nor the training to follow

follow to its ever-changing end, nomenclature. My meaning may probably be better understood by the following illustrations. Perhaps not ten persons in the Colony would understand the fish referred to under the name *Pagrosomus auratus*, or *Sparosomus auratus*; hundreds, however, would recognise it under *Pagrus unicolor*, while everyone knows it as the Schnapper. *Pomatomus saltatrix*, or *Pomatostomus saltatrix*, are names unfamiliar to the economic student; he would, however, recognise in *Temnodon saltator* the familiar Tailor. It must not be hereby understood that I in any way deprecate scientific usage, but writing as I am for the practical and not the scientific man (a distinction I do not altogether agree with), my language is couched accordingly. Until some thoroughly scientific and comprehensive work on the whole of the fishes of the Colony is prepared, which would serve as a standard for many years to come, it is, in my opinion, better to use throughout familiar names rather than introduce here and there, some popularly unintelligible terms as I have above instanced.

That I have written the following pages for the multitude and not for the one, will be at once clear by the practice of first giving the universally familiar vernacular, followed by the commonly accepted technical cognomen.

Some of the notes attached may not be of general interest, I may, therefore, explain that these have been suggested by inquiries I have had, and are in answer to such.

The actual operations extended from February 19th to March 25th, and during this period the trawl was lowered sixty-one times. On two occasions when the net was fouled, it was raised and at once dropped over the same spot, so that the number of stations is reckoned at fifty-nine.

The first thirty-three together with the last haul were made north of Port Jackson and extended to the Manning River, the depths tested being from 10 to 90 fathoms. Not usually working more than about 8 miles from the shore, one essay was made at 19, and another 26 miles distant.

The remaining hauls as represented by stations 34 to 58 took place between Port Jackson, southward to Jervis Bay, at depths varying between 10 and 80 fathoms.

The following stations were barren as far as fishes are concerned:—3, 14, 16, 19, 45; mainly due to the net becoming twisted, or otherwise getting out of order, while being lowered. At stations 6, 18, 29, 30, 31, 36, very few fish were taken, the net or otter boards having fouled obstructions, such as rocks or wreckage.

PARTICULARS OF STATIONS.

Station.	Date.	Hour.	Locality.	Direction trawled.	Distance from shore in miles.	Depth in fathoms.	Nature of bottom.
1	1898.						
1	19 Feb.	7:14 a.m. to 9:30 a.m.	Off Barranjoey Head	E.N.E.	2½ to 4½	20 to 32	Gravel and sand.

DESCRIPTIVE LIST OF FISHES.

Old Wife. *Enoplosus armatus*.

Stations 18, 22, 26.

Although this common little fish is best known swimming around the wharfs and jetties of the harbours, it is, as our records show, not confined to shallow water, having been taken in 48 fathoms. It is an excellent fish for the table, but cannot be obtained in large quantities, for it occurs chiefly in rocky ground where the net cannot be used, and it very seldom takes the hook. It does not usually attain to a length greater than 8 or 9 inches. The only three examples obtained in the trawl, were taken between Newcastle and Port Stephens.

Bastard Longfin. *Anthias lepidopterus*.

Station 15.

(Plate I.)

Off the coast of New South Wales, this fish is certainly rare, but is better known in Victorian, Tasmanian, and New Zealand waters. When obtained it is generally mistaken for the next species to which it bears very great resemblance. Our specimens were all taken together, off Tuggerah Lakes in 32-48 fathoms. The largest measures only $7\frac{1}{2}$ inches in length, but examples have been recorded of 12 inches. The scarcity of this fish will not warrant its being regarded as a food-fish of the Colony, whatever its edible character may be. *Cæsioperca lepidoptera* is a less familiar name.

Allport's Perch. *Callanthias allporti*.

Station 15.

(Plate II.)

Previously known only from the coast of Tasmania. Six examples were taken by us off Norah Head, 36 miles north of Port Jackson, in 32-48 fathoms. They were probably netted among rocks, as obstructions were met with which rendered the raising of the trawl a necessity. Our specimens do not wholly agree with the published descriptions of the species, but critical comparisons are reserved for the more technical treatise previously announced.

The accompanying figure, drawn from one of the *Thetis* specimens, will show the general form. The colour is rosy, with the margins of the scales yellow; the cheeks and under parts exhibit bright blue reflections. A large patch, extending from above the eye to the dorsal fin, is yellow, which is also the colour of all the fins; but the tail has a purplish patch on the upper and lower edge next the body. It may be noticed that the three allied genera, *Anthias*, *Callanthias*, and *Caprodon*, were all obtained at station 15, and that the two first-named were taken nowhere else.

Longfin. *Caprodon longimanus*.

Stations 15, 42, 48, 56, 57.

This fish has a peculiar distribution in the South Pacific Ocean, occurring off the coast of New South Wales, New Zealand, and Chili. Here it is by no means common, but can scarcely be mistaken when secured. The late Tenison-Woods gave it the above popular name on account of the length of the pectoral fin. The Longfin occurs in rather deep water having been trawled in depths varying from 32 to 80 fathoms, on sandy, muddy, or rocky bottom. If sufficiently common it would be a good marketable fish, attaining a length of 18 inches. It has generally been confounded with and named *Caprodon schlegelii*, a Japanese species.

Half-banded Sea Perch. *Plectropoma semicinctum*.

The distribution of this species is similar to the above-named, ranging from Australia and New Zealand to Chilian waters. It was not taken in the trawl, the specimens obtained being secured by lines off Cape Hawke in company with Schnapper, Sergeant Baker, Sweep, and other rock fish.

Grey-banded

Grey-banded Perch. *Epinephelus septemfasciatus*.

Station 51.

In 1867 two specimens of this fish were sent from Sydney to London. These are, I believe, the only examples previously known from Australia. I am therefore pleased to be able to once more record it from our waters; it is a fine fish, attaining a length of 12 inches. The only example trawled was taken in Shoalhaven Bight in 15 fathoms or under. While apparently rare in Australian seas, it has a wide distribution, ranging from the tropical Atlantic through the Indian Ocean to Chinese and Japanese Seas.

Wirrah. *Plectropoma ocellatum*.

Station 25.

The scientific name of this fish should be *Acanthistius serratus*, but is not used above for reasons previously stated. The only two examples secured were obtained by the trawl in the vicinity of a wreck in 48 fathoms, the anchor-chain and a plank of which were hauled aboard. Although easily caught with the hook and tolerably common, the Wirrah is accounted of little value for the table; it is said to be good only when boiled. It appears to be a very local species, confined to the coast of New South Wales, and more common in the vicinity of Port Jackson than elsewhere. Our specimens were trawled off Newcastle. It will scarcely be necessary to point out to those persons acquainted with this fish that Tenison-Woods' figure (Pl. iv) represents the Bull's-eye and not the Wirrah as stated.

Trumpeter Perch. *Therapon curvieri*.

Station 52.

One specimen only was obtained, in 20 fathoms, off Shoalhaven Bight. If examples of this fish were required we should prefer drawing the seine in Botany Bay or Middle Harbour. Around the shores of Port Jackson it is a very common little fish, and is frequently caught by boys on the wharfs, in company with yellow-tails. Although small, seldom exceeding 8 inches in length, it is a delicious table-fish, and is sometimes taken to market in immense quantities; but, as far as my experience goes, it does not appear to be in much demand, doubtless on account of its small size. When dying this fish emits the "tooting" note which has earned for it the sobriquet "Trumpeter Perch."

*** Boar-fish.** *Histiogaster elevatus*.

Stations 5, 7, 15, 22, 34, 38, 42, 44, 47, 48, 56, 57.

(Plate III.)

One result of the trawling experiments is that of establishing the presence off our coast of a Boar-fish in tolerable quantities. The number of stations (12) at which it was obtained shows that it is by no means rare, nor confined to any particular area. Judging by our limited trials, it appeared to be most plentiful about the 50-fathom line, but was obtained between the extremes of 26 and 84 fathoms. In almost all cases it was taken on sand or mud, and should, therefore, be easily secured by means of a trawl. If regular trawling operations were carried on, there is no reason why this fish should not yield a good return. As to its table properties, it is, as we had means of proving, of excellent flavour; and I regard this as one of our best discoveries from an economic point of view. This is not the Boar-fish which has been previously figured, but a species hitherto known only from one or two examples. It seems to run about 10 inches in length, but some were obtained slightly larger. It is probably a small species, but specimens of other kinds have been obtained over 30 inches in length. An interesting fact is, that young examples of only 2 or 3 inches were secured, proving that the species breeds in our waters, and is not necessarily migratory.

In the "Edible Fishes of New South Wales," p. 31, one of the authors of this species remarked that it is probably the Japanese *H. typus*, Schleg. An examination of the specimens trawled by the "Thetis" shows that such is not the case, and that it is quite a distinct species. It is to be noticed that no examples of the better known Boar-fish, *Histiogaster labiosus*, were obtained, the only other species secured proving to be new, and mentioned below.

* Farnell's

* **Farnell's Boar-fish.** *Histiopertus farnelli.* (New species.)

Station 50.

(Plate IV.)

It is much to be regretted that only one example of this new fish was secured. As it was taken almost at the limit of our operations, it is possible that had we gone further south we should have again picked it up, in company with other interesting forms. It is to be deplored that the funds available did permit trials to be made below Jervis Bay, for on the southern portions of the coast I expected we should make good hauls. The fish is rather small, measuring only 8 inches, but it may attain larger dimensions. It was taken in Shoalhaven Bight, in the comparatively shallow water of 15-18 fathoms. A full description will be published in the Museum Report. For the benefit of those interested in these matters it may be briefly described as follows, the figure being mainly relied upon to convey a general idea of the appearance of the fish. It is with particular pleasure that I associate with this species the name of Mr. Frank Farnell.

D. 7/17, A. 2/10, V. 1/5, P. 17, C. 17.

The length of the head is 3 and the height of the body 2 in the total length. The diameter of the eye is $3\frac{1}{2}$ and the length of the snout $2\frac{1}{4}$ in the head. The interorbital space is greater than the eye by one-sixth its diameter. The forehead rises abruptly to the second dorsal spine, which marks the highest point of the fish, the height then declines by an even convex curve to the tail; the lower profile is also convex. The first three dorsal spines are stout, the third being twice the diameter of the eye. The fourth is slender and long, and curiously bent, as are also those which follow. The anal fin is short, the second spine being the longer, and slightly larger than the third dorsal. The ventrals are long, reaching to the second anal ray. The spines are as long as the head, the rays somewhat longer. The colour is creamy grey, with black markings, the disposition of which is sufficiently indicated by the figure.

Long Roughy. *Trachichthys elongatus.*

Station 25.

(Plate V)

Off Newcastle, in 42-48 fathoms, we got two examples of this curious little fish, not before recorded from the coast of New South Wales, although its habitat has been vaguely stated as "Australia." It is also known from the Great Barrier Island, New Zealand. The genus to which this fish belongs is allied to that which includes the Nannygai, and the common name is applied in reference to the peculiar character of the scales. The common species is called the Roughy, simply.

Red Bull's-eye. *Priacanthus bennebari.*

Stations 22, 23.

The name Bull's-eye is also applied to *Pempheris*, but the fish here referred to will be recognised from the figure (Pl. iv) of Tenison Woods' work, which is erroneously described as representing the Wirrah. The Red Bull's-eye was but twice obtained in the trawl, in 16-40 fathoms off Newcastle. Although sometimes included as a food fish, and occasionally attaining a length of 12 inches, it is not often taken of edible proportions.

* **Sweep.** *Scorpiis equipinnis.*

Richardson. Voyage, Erebus and Terror, p. 121. Tenison-Woods, p. 37, pl. vi.

Not once having entered the trawl, this little rock fish finds a place in the list by virtue of it having been taken at two places with the hook, in company with the Half-banded Perch, Schnapper, Red Rockcod, Rainbow fish, Sergeant Baker, and Leather-jacket. It was first secured over Schnapper Rock, between Cape Hawke and Crowdy Head, and secondly on Young Banks, the favourite schnapper-grounds, off Crookhaven Bight. It is a good food fish when of maximum dimensions—say 12 inches—but it is unfortunately more frequently caught of only half this size. The correct technical designation of the Sweep is probably *Cæsiosoma equipinnis*.

* **Red Mullet.** *Mullus porosus.*

Stations 1, 12, 21, 22, 24, 27, 28, 29, 39, 48.

Although frequently exposed in the market, the Red Mullet is not very eagerly sought after. It is possible that its table properties are scarcely known here, while in Britain the European species is esteemed the greatest delicacy, and the Romans of old sought for it far and wide, and paid fabulous prices for single specimens. Apparently not sufficiently common to entice anyone to fish exclusively for it, the Red Mullet would nevertheless be a welcome addition whenever taken, for if a regular supply could be obtained by trawling there is no doubt that purchasers would always be forthcoming.

* Schnapper.

* **Schnapper.** *Pagrus unicolor.*

Stations 1, 2, 8, 12, 15, 21, 23, 29, 33, 52, 53.

Judging by the inquiries made as we on the several occasions entered port, a stranger might have thought that there was only one fish in our waters, and that the Schnapper. We were by no means anxious to obtain this fish, for its advent was a tolerable indication that we were in the vicinity of rocks, objects of all others to be avoided in trawling. At four out of the above eleven stations the net was badly torn, and at several of the other stations, where the damage was less severe, the numbers of sponges, gorgonias, and other rock-frequenting forms sufficiently indicated the nature of the obstruction encountered. Occasionally, Schnapper were obtained on ideal trawling-ground. It was, however, then significant that not more than one or two individuals were netted.

The circumstance of Red Bream (young Schnapper) of 2 lb. weight taken in full breeding condition was considered to be of great interest and considerable importance. Taking into account the number of small Schnapper secured in such mature condition, we can scarcely believe that this phase of schnapper life is unknown to fishermen.

* **Black Bream.** *Pagrus australis.*

Considering the comparatively large number of stations at which the Schnapper was secured, one might have expected that one Black Bream at least would have been trawled; such was, however, not the case. On the other hand, this experience is quite in accord with the known habits of the species, frequenting the coastal and estuary areas rather than the more open seaway. Lines put down on the recognised schnapper-grounds failed to secure them, and they were obtained only in the sheltered harbour of Port Stephens.

* **Morwong.** *Chilodactylus carponemus.*

Stations 7, 12, 21, 42, 48, 53.

It is to be noticed that although neither of the nearly-related fishes, the Jackass fish nor the Carp was obtained, the Morwong was gathered in considerable quantities. Hitherto almost unknown, excepting from adult examples, we were fortunate in netting young ones. Most of them were collected in deep water, say 45 to 75 fathoms, and none were got in less than 23 fathoms. Beyond enabling us to note the fact, our observations were not sufficiently extensive to empower us to form any definite opinion as to the breeding habits of this species, a subject at present quite unknown. I believe that had operations been continued further southward we should have met with greater success with the Morwong, as it is peculiarly a southern form, known from Victoria, South Australia, and New Zealand. Station 21, in the Newcastle Bight, is, I believe, the most northern point whence it has so far been recorded.

* **Bastard Trumpeter.** *Latris ciliaris.*

Station 53.

Common in New Zealand waters, the Bastard Trumpeter is scarce here, and when secured is only taken with the line off rocky ground. We were, I may say, unfortunate enough to trawl one example, for on this occasion, when Schnapper were also taken, the trawl had scarcely reached the bottom when it became fouled and got rather badly torn. This took place off Shoalhaven Bight, in 23 fathoms. The species under consideration is not to be confounded with the Trumpeter proper, a fish prized in New Zealand above all others. Dr. Hector writing on the moki, as the Bastard Trumpeter is called in New Zealand, says that "it rarely takes the bait, but is chiefly caught with the net. The quality of this fish is very varied, and much affected by the nature of the feeding-ground, for though usually rich and well-flavoured, it is frequently, even during the proper season, insipid, and with the strong rank taste that characterises it when out of season."

* **Red Gurnard Perch.** *Sebastes percoides.*

Stations 7, 13, 25, 42, 44, 48, 56.

The estimation in which this fish is regarded as food apparently differs greatly. In Tasmania it is said to be held in great esteem, but in New Zealand one writer describes it as being almost worthless as food. The examples obtained by the "Thetis" were generally so small that our cook did not deem them worthy of preparation. Most of the areas covered by the above enumerated stations were sandy, and would indicate that this species is not so wedded to rocks as has been thought. It was only gleaned in deep water, the least depth being 41, and the greatest 80 fathoms. Although lines were put down on many of the recognised schnapper-reefs, the Red Gurnard Perch was never hooked.

* **Rough-scaled**

* **Rough-scaled Rock-cod.** *Scorpaena scabra.*

Stations 7, 42, 48, 49.

This must be a rare fish, it is so little known. First described from Port Jackson ten years ago, from specimens only $2\frac{1}{4}$ inches in length, it was afterwards taken at Lord Howe Island, represented by examples measuring $3\frac{1}{2}$ inches in length. We have now taken adults, the largest of which measures 12 inches. Four examples only were obtained, one at each of the four above-named stations, all being in comparatively deep water, namely, from 55 to 78 fathoms, and taken off the coast in the limited area between Port Jackson and Port Kembla.

* **Red Rock-cod.** *Scorpaena cruenta.*

Station 55.

The only occasion on which this fish was netted, the trawl encountered rock and brought up two large basalt boulders, from which a wealth of invertebrate life was taken. Wherever lines were put over on the various schnapper-grounds the Red Rock-cod was taken, its capacious mouth receiving the largest bait. Even though its flesh may be well-flavoured, it does not find much favour as a food-fish.

Fortescue. *Centropogon australis.*

Station 23.

But little need be said about the Fortescue. It is known to every wharf-fisher, man or boy, and dreaded for the painful wounds that it inflicts with the dorsal and, more especially, the preorbital spines. This matter is further mentioned under the Bullrout, next considered. Two examples were obtained at the somewhat unusual depth of 16-19 fathoms, the species being better known in shallow water, cruising around the piles of the piers and jetties.

Bullrout. *Centropogon robustus.*

Station 51.

The fact of our having trawled this species in Shoalhaven Bight extends the known distribution in a southerly direction; its range, therefore, as far as is known, is from this station to the Mary River, Queensland, where it was obtained by the "Challenger" expedition. The Bullrout is what may be termed a fluvio-marine species, ranging from the sea through brackish waters to the rivers above tidal influence. Respecting the painful wound caused by the dorsal and preorbital spines of this species, the author of the "Edible Fishes of New South Wales" (p. 68) writes:—"No doubt any such wound would cause pain, but the state of the sufferer's health, his nervousness, and his belief in the superstition of its poisonous qualities are all factors, which must be taken into consideration. Personally the writer has been 'stung' on many occasions, both by the allied Fortescue (*Centropogon australis*) and by the British Weever (*Trachinus vipera*) and never felt any more inconvenience than would result from a similar stab of a knife. The fact is the wound is merely a deeply punctured and viciously inflicted one, without any venomous properties whatever."

I also, on more than one occasion, have been stung by both the Australian and British species mentioned, and, without being either nervous or superstitious, my experience is that such wounds are painful in the extreme. Further, I cannot agree with this writer as to the absence of venomous properties. Although the spines are not perforated they are deeply grooved, and the grooves are charged with a fluid-mucous possessing poisonous properties, the truth of which is sufficiently apparent to the majority of persons who have the misfortune to be stung.

Mailed Fish. *Monocentris japonica.*

Stations 5, 10, 28, 29.

Several examples of the rare and curious fish were acquired in depths varying from 17 to 84 fathoms, northward of Port Jackson. Although a near relative of the Nannygai, it would scarcely be sought after, even if common, for its complete bony armament would render preparation for the pot somewhat difficult. It is inactive in habit, and lures its prey by means of a luminous disc on each side of the lower jaw: these organs are of crimson colour when first the fish is caught. In addition to Australian waters, this species (the only known member of the genus), occurs off Mauritius and Japan, and was first described from this latter source. It is a small fish, not exceeding 6 inches in length.

* Nannygai.

* **Nannygai.** *Beryx affinis.*

Stations 7, 11, 12, 13, 21, 22, 23, 24, 25, 35, 42, 48.

The Nannygai is certainly not a poor man's fish, always fetching a high price in the market. That it is plentiful in the deeper waters, and can be freely obtained by means of the trawl, was amply proved. It was, however, noticed that those so taken were mostly of small size; my notes indicate that these smaller fish were secured on sandy bottom, and it was not until the soundings showed rock that we netted larger individuals. The line must, therefore, be relied upon for fine specimens. There may still, however, be good work for the trawl to do. The Nannygai is only obtained during the warmer parts of the year, and not until operations have been carried on for a full twelve months can the habits of this and many other of our valuable food fishes be definitely ascertained and taken advantage of. A glance at the particulars of the twelve stations above enumerated shows that once only (station 23) was the Nannygai obtained in less than 20 fathoms.

Much requires to be known of the distribution of this fish. It ranges from our coasts to New Zealand, and unexpectedly occurs also in Tasmanian waters. Its northern limit and its winter quarters have not been found. Its distribution in time is of exceeding interest, for some of its nearest allies form the majority of the fossil and oldest known bony fishes from the cretaceous or chalk formation.

Bull's-eye. *Pempheris compressus.*

Station 10.

This fish is not to be confounded with the Red Bull's-eye, previously catalogued; seldom exceeding 5 inches in length, it cannot be classed as a food-fish, and need not here be considered at greater length.

* **Teraglin.** *Otolithus atelodus.*

Stations 1, 11, 12, 23, 25.

A New South Wales fish, and not known beyond the borders of the Colony. The economy of the Teraglin is little known; regarded only as a spring visitor, and yet taken at the very first haul, it seemed as though we were to learn something: this experience, however, was not maintained, and altogether we did not take more than a dozen examples, none of which exceeded a foot in length. Although sometimes taken in the seine, the Teraglin is more often caught with the line at moderate depths; there is, therefore, no reason why it should not be obtained by the trawl in spring, when it visits the coast in large numbers. Attention may be drawn to the fact that the soundings at all the above-named stations showed a sandy or muddy bottom—the depths ranging from 16 to 48 fathoms.

Another name proposed for this fish is *Atractoscion atelodus*.

* **Yellow-tail.** *Caranx trachurus.*

Stations 17, 24, 26, 39.

One scarcely expects to meet with this fish while trawling and indeed those secured were obtained under quite adventitious circumstances. Few of them were perfect, the others were damaged due to having been more or less digested by some carnivorous fish. On two occasions partially-digested Yellow-tails were ejected by John Dorries and as these latter fishes are known to be predatory feeders, it is possible that most of the Yellow-tails were secured by their efforts and the remainder taken as the trawl approached the surface. All the specimens secured were small, not exceeding 6 inches in length. In recent works this species should be looked for under the name *Trachurus declivis*.

* **Kingfish.** *Seriola lalandii.*

This fine fish was freely taken by the line off Seal Rocks and afforded good sport to such members of the expedition as were not at the time engaged in repairing the trawl.

The interest of fishing and of net-mending was, however, greatly eclipsed by the excitement aroused in watching the seals (*Otaria fosteri*) to the number of 100 or more. As the "Thetis" steamed close up to the rock, the movements of these animals, as they fought with one another or otherwise disported themselves, were followed with the keenest interest.

* Samsonfish

* **Samsonfish.** *Seriola hippos.*

The Samsonfish was never taken, but in Port Stephens a small herd was playing around the boat, jumping clear out of the water and generally behaving themselves much after the manner of dolphins. They were readily recognisable from the Kingfish by their shorter and more robust forms.

* **Tailor.** *Temnodon saltator.*

Stations 1, 23.

Probably encountered as the trawl neared the surface, two Tailors were taken; had the season been spring, instead of autumn, more might have been caught, but the seine and not the trawl is the correct implement to be used for this species. At any time, it is scarcely a favourite with fishermen on account of the damage it does to their nets.

* **John Dory.** *Zeus australis.*

Stations 2, 4, 5, 7, 8, 9, 11, 12, 15, 17, 21, 22, 23, 25, 26, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 46, 47, 48, 50, 52, 56, 57, 58.

The following lines were published in 1883:—"This is one of our very best food-fishes, always in demand and bringing a high price in the markets, sometimes as much as 1s. per lb.; but the supply is so irregular that it can only be looked upon as a rare delicacy." These words are equally true to-day, and yet we can safely say that the John Dory is not a rare fish on our coast. As will be seen by a reference to the stations quoted, it was trawled on no less than thirty-three occasions. At station 36, Dories were the only fishes taken; and at station 37, twenty-eight large individuals were obtained in one haul of two hours' duration, immediately south of Botany Bay and within 3 miles of the coast. Depth, between the extremes at which we trawled, seemed to have no effect on its numbers it being equally common either at 16 or 84 fathoms. Indeed the known habits of the British Dory indicate that it may swim freely at the surface for when the Pilchards approach the shore this fish is often taken in considerable numbers. The only Pilchard obtained by us was voided by a Dory (station 26) and the single Mackerel was obtained in the same way (station 38) while as has been previously mentioned many of the Yellow-tails secured, had been partially digested, doubtless by Dories. When these latter fish were in the trawl the fact was generally made apparent by numbers of dead examples rising to the surface and floating away (owing to their peculiar conformation) on their sides: many were washed over the ground line and thus lost.

Mr. Cunningham remarks that "the dory has a peculiar and interesting method of securing its prey. It does not overtake it by superior speed like the mackerel, or lie in wait for it like the angler, but stalks it and approaches it by stealth. It is able to do this in consequence of the extreme thinness of its body, and the peculiar movement of its hinder dorsal and ventral fins. The dory places itself end on towards the fish it desires to devour, and in this position it is evident that it excites no alarm on the part of its prey. The appearance of the dory seen in this way is a mere line in the water, to which no particular significance can be attached. I have not particularly noticed the effect of the ribbons of membrane, which project from the dorsal fin. But I have observed that the movements of the dory are very gradual, except in turning: it alters the position of its body by a turn of the tail or side fins, and then slowly swims forward by vibrating the second dorsal and ventral, a movement which causes very slight disturbance of the water. The whole appearance of the dory in these actions is suggestive of suppressed excitement, his eyes being fixed on his prey. I do not recollect seeing him actually swallow another fish, but have no doubt that he gets near enough to a sprat for example, without alarming it, to seize it by the sudden elongation of his curious jaws."

* **Mackerel.** *Scomber pneumatophorus.*

Station 38.

The only example obtained was a partially-digested individual ejected by a Dory as it lay on the deck. The Mackerel is, of course, a surface fish but it has been stated that it is much more liable to be taken near the bottom than the British Mackerel, if this is correct it is a rather curious circumstance, for the species are so very similar that many writers regard them as identical. It is most unfortunate that their habits differ so much. In Britain, the Mackerel is taken in vast quantities as it periodically approaches the coast; here the supply is too precarious and the movements of the enormous shoals, sometimes seen, too erratic, or shall we not say too little understood to maintain such an industry.

* Horse

* **Horse Mackerel.** *Pelamys chilensis.*

Stations 17, 27.

(Plate VI.)

Originally described from the coast of Chili, as indicated by its technical name, the Horse Mackerel is also known from Japanese, Indian, and Australian Seas. Port Phillip in Victoria, and the Port Jackson district in New South Wales are the only Australian habitats recorded. We are, therefore, able to extend the known range materially. Station 17 is off Broughton Island, north of Port Stephens, while station 27 is much further north, off the Manning River, and was the most northern point at which the trawl was lowered. Some of the specimens obtained were in spawn.

Star-gazer. *Ichthyoscopus inermis.*

Stations 8, 10, 23, 26, 28, 33, 49.

Although under no circumstances could this fish be claimed to be of economic value, it is interesting to mention that this is the first time it has been recorded from Australia. We have, however, known it to have been taken previously off Newcastle. It is known to extend from Indian to Japanese Seas, and in common with other members of its group, lies hidden among sand or mud on the ocean-floor, whence one of the native Indian names *Nillum koranjan*, a diver into the mud.

Stone Lifter. *Kathetostoma laeve.*

Stations 9, 13, 42, 43.

Like its near relative, the Star-gazer, this fish lives at the bottom, hidden in the sand or mud, its eyes and the top of its head alone remaining above. The fact of the trawl having secured fishes of such habit indicates how closely it must have swept the ocean-floor.

* **Banded Percis.** *Percis allporti.*

Stations 4, 5, 6, 13, 21, 42, 43, 46, 47, 56.

This spindle-shaped fish is almost unknown to our fishermen, but, as experience shows, can be obtained in some numbers by means of the trawl. It was never taken in very shallow water, and most numerous in the deepest areas tried; this will account for its non-recognition by fishermen, and is a circumstance quite in harmony with its known distribution. It is to be regarded as a southern form, occurring off Tasmania and in Bass's Straits, and does not appear to have been previously recorded further north than Twofold Bay. While it was taken in our trawl in the Newcastle Bight it will be seen that most of the stations are south of Broken Bay. Although the edible properties of the Banded Percis were not investigated there is little doubt that it would be acceptable on the table, and would be worthy of preservation by trawlers.

Naked-spotted Percis. *Centropercis nudivittis.*

Station 46.

Hitherto this species, the only member of the genus, was known from a single specimen, taken at Maroubra Bay. At the above-named station, only 8 miles south of the original locality, we secured a second example of somewhat larger size.

* **Trumpeter Whiting.** *Sillago maculata.*

Stations 1, 2, 4, 8, 9, 13, 17, 20, 21, 22, 23, 24, 25, 26, 27, 33, 38, 39, 43, 50, 51, 52, 58.

It has been stated that, except in the matter of spawning, our two species, the Trumpeter and the Sand Whiting (*Sillago ciliata*) do not differ materially in habit. Such a statement is by no means borne out by our experience.

The Trumpeter Whiting was trawled on no less than twenty-three occasions throughout almost the whole area traversed, namely, from the Shoalhaven to the Manning River, and at all depths ranging from 16 to 84 fathoms. The Sand Whiting was never once taken. My experience indicates that, of the two, it is only this latter species that is caught by hook and line off the ocean-beaches or bays, while, as seems probable, the Trumpeter Whiting is more partial to deep water, and would probably be the fish taken by the trawl; so much, however, depends upon season and other conditions that it is not safe to speak dogmatically upon such slight data as was afforded by the limited nature of the trawling operations. The Sand Whiting is said to spawn along the sand-banks of the bays and rivers, otherwise in shallow water. Many of the Trumpeter Whiting taken were heavy in spawn, while some had apparently just shed their ova. Is it not possible, therefore, that this species spawns in the deeper water in which it was taken?

* Walking

Walking Fish. *Antennarius nummifer.*

Station 48.

The fishes of this genus are greatly creatures of circumstance. When near the coast they lie among stones or sea-weed, and walk about by means of their arm-like fins; they are most imperfect swimmers, and are carried about by winds and currents, attached to floating sea-weed; thus they have a wide distribution in tropical and sub-tropical seas. Owing to this circumstance, and to the fact that individuals vary both in colour and markings, a great number of untenable species have been described, rendering their determination a matter of much difficulty. They are popularly known as Anglers, Fishing Frogs, or Frog-fishes, in addition to the name above applied. The only example secured was taken off Wollongong, in 55 fathoms.

*** Flathead.** *Platycephalus fuscus.*

Stations 1, 2, 4, 5, 7, 8, 9, 10, 11, 12, 13, 20, 21, 22, 23, 24, 25, 26, 27, 28, 32, 33, 34, 35, 37, 38, 39, 41, 42, 43, 44, 46, 48, 49, 50, 51, 52, 54, 55, 56, 58, 59.

The array of stations at which this common fish was obtained speaks for itself, and indeed leaves but little to be said. It may, however, be noticed that such figures as 78, 80, and 84 fathoms, scarcely bears out the statement that the flathead is found only at moderate depths. As the trawling took place during the known spawning season of this fish, it was not surprising to find many of the examples heavy with ova, while not a few small fry were trawled, indicating that breeding had already taken place.

*** Bass Flathead.** *Platycephalus bassensis.*

Stations 8, 9, 13, 39, 44.

It was only at the above-mentioned stations that I definitely recognised this species, but it is more than probable that some were overlooked. When the quarter-deck of the vessel was simply one mass of fish, it was quite impossible for me to personally examine every specimen of Flathead, Gurnard, or Sting-ray. Most of the other fish I saw, and in case of the slightest doubt, specimens were always placed in my hands before being disposed of.

Gurnard. *Lepidotrigla sp.*

Stations, 1, 2, 4, 5, 7, 8, 9, 10, 11, 12, 13, 22, 24, 25, 26, 27, 28, 32, 34, 35, 37, 38, 39, 40, 41, 43, 44, 46, 47, 48, 49, 51, 52, 56, 57, 58, 59.

The three or four species taken are not discriminated by fishermen, and indeed require a very critical examination for their determination. Work of this description is reserved for the publication shortly to be undertaken by the Australian Museum, as previously mentioned. *L. pleuracantha* is a scarce species, and was observed only at Station 52, but was no doubt overlooked elsewhere for reasons given in the note on the Bass Flathead.

As the net neared the surface large numbers of dead gurnards rose to the top and floated belly upwards, with their pectoral fins extended; they were taken at almost every haul, sometimes in extremely large numbers.

Unlike the Red and the Flying Gurnards the several species of *Lepidotrigla* do not attain a large size, seldom exceeding 9 inches in length.

*** Red Gurnard.** *Trigla kumu.*

Stations 1, 2, 5, 10, 11, 12, 13, 17, 21, 26, 31, 33, 38, 39, 40, 41, 46, 47, 52, 54, 58, 59.

A glance at the above figures might give one the idea that the Red Gurnard was a plentiful species; this, however, would be scarcely correct, for although taken on twenty-two occasions, not more than five or six were averaged at each take, while some of the stations are represented each by a single individual.

*** "Flying" Gurnard.** *Trigla polyommata.*

Stations 1, 11, 38, 40, 41, 43, 46, 56, 57.

This species was taken less commonly than the last, but all the specimens were of large size, smaller ones being almost unknown so far north. The Port Stephens district is regarded as its most northern range; and in confirmation of this it is to be noticed that it was never obtained north of Tuggerah Lakes, and only twice north of Port Jackson. Although generally known as Flying Gurnards by the fishermen of New South Wales and Victoria, and for which reason that name is used, it must be mentioned that these fishes have not the power of flight even as understood of the true Flying Gurnards of the genus *Dactylopterus* and the Flying Herrings, *Exocoetus*. The name Sharp-beaked Gurnard has been proposed for this species.

Crested

Crested Blenny. *Cristiceps aurantiacus.*

Station 32.

In 10-12 fathoms, between Cape Hawke and Charlotte Head, our only specimen of this beautiful little fish was taken. Of more interest to a zoologist than a fisherman, further remark is not here called for.

Rough-billed Pipe Fish. *Fistularia serrata.*

Station 17.

This is usually supposed to be the commoner Pipe Fish of the genus inhabiting our coastal waters, and has been so regarded in literature. A careful study of the specimen collected, however, shows that this is not the case, and that in future the familiar form will have to be known as *Fistularia depressa*, a species taken by us at Lord Howe Island, and included with the fishes at the end of this report.

The Rough-billed Pipe Fish was taken off Broughton Island, in 29-48 fathoms, and was of a lovely terra-cotta colour throughout.

Bellows Fish. *Centriscus scolopax.*

Stations 2, 4, 9, 13, 17, 20, 21, 25, 37, 38, 41.

(Plate VII.)

This interesting species is now, for the first time, recorded from Australian waters. It is best known in the Mediterranean and adjoining parts of the Atlantic, and occasionally extends to the British coast. It has also been recorded from Tasmania; but the late Sir Wm. Macleay doubted the identification, remarking:—" *C. scolopax* I have never seen here. Mr. Johnston's *scolopax* (Tasmania) is probably *C. gracilis*." Mr. Macleay had not seen Tasmanian specimens, and his conclusions were somewhat hasty.

This species differs from *C. gracilis* in its comparatively shorter body, much longer spine, and also in colouration. It was obtained at eleven stations, and altogether about fifty specimens were taken. Its known distribution on the New South Wales coast, as determined by our observations, is from south of Port Hacking to Broughton Island, and its vertical range from 23 to 84 fathoms.

We have now three species of Bellows fish (Trumpet Fish, Snipe Fish, or Sea Snipe, as these forms are variously called) in Australian waters, namely, *C. humerosus*, from South Australia; *C. gracilis*, from Port Jackson and Maroubra Bay (taken at this latter place by my colleague, Mr. Whitelegge, last April), and *C. scolopax*, as above recorded.

The accompanying figure, drawn from one of the "Thetis" specimens, will give a good idea of the appearance of the species delineated.

Brown Puller. *Heliastes immaculatus.*

Station 30.

Caught occasionally off the coast, this little species is by no means common, but judging from the name by which it is known to the boys, it affords good sport when hooked. The designation "Brown" is in contradistinction to the Black Puller applied to *Parma squamipinnis* and the Blue Puller, *Parma microlepis*. The species taken was secured off Cape Hawke in 35 fathoms, where the trawl struck rock the moment it touched the bottom. Two or three Gurnards and the Brown Puller were the only fishes then obtained.

Keel-headed Parrot-fish. *Novacula jacksoniensis.*

Station 32.

(Plate VIII.)

The only example of this fish, previously recorded from the coast of New South Wales, was obtained at Manly many years ago. It is, therefore, of some interest to be able to confirm its presence in our waters, and I take this opportunity of figuring it. As will be seen by reference to the plate, it is a very unmistakable form. It was secured in the comparatively shallow water of 10 to 12 fathoms, between Cape Hawke and Charlotte Head.

*** Rainbow Fish.** *Coris lineolata.*

A fish of but small economic value. This species was never taken in the trawl. Examples were secured by means of the line, but being at the expense of better fish were not deemed welcome. It is not found northward of our colony, but what its northern limit may be appears to be unknown. I am, indeed, not certain that it has been previously recorded from, although doubtless taken off Schnapper Rock, between the Manning River and Cape Hawke, where
we

we hooked several specimens. This fish is said to be known to the Sydney fishermen by the name Maori, but I have invariably found it to be called Rainbow-fish. The latter appellation is applied, in print, to a species *Heteroscarus castelnaui*, but which we may remark is quite unknown to fishermen. The writer of the "Edible fishes of New South Wales" remarks, "How or why this fish obtained its vernacular name (Maori) it would be difficult to say, since it is not a native of New Zealand, nor indeed is the genus represented there." May not the explanation be found in the blue streaks which adorn the face, suggestive of the tattoo pattern of the Maori?

* **Silver Belly.** *Gerres ovatus.*

Station 23.

This fish, known only from sandy stretches in comparatively shallow water, was not expected at the depths at which we trawled. The only specimen secured was taken in 16-19 fathoms off Newcastle. The Silver Belly is taken in the seine throughout the year on suitable ground, and with a boat more adapted to trawling than the "Thetis" might be obtained in large numbers in shallow water close in shore, together with many other edible species.

Beardie. *Lotella callarias.*

Station 24.

Not sufficiently common in the market to be specially noticed, nor accounted of much value as food when caught by the line-fishers, the Beardie is of considerable interest from a scientific point of view. It is here one of the few representatives of the Cod family, which in the northern hemisphere includes so many fish of the highest marketable character, the capture and preservation of which provides food and employment for thousands. The Beardie is also known as the Ling.

Australian Cod. *Pseudophycis bachus.*

Stations 24, 25.

Equally unimportant with the above, this species was twice obtained, both hauls being contiguous, and off Newcastle. It has been noticed that the surface fishes of this family are almost confined to temperate and arctic zones, while the deeper inhabiting forms have a much wider range as is usual with deep-sea fishes generally.

* **Large-toothed Flounder.** *Pseudorhombus arsius.*

Stations 1, 6, 9, 11, 12, 21, 22, 23, 25, 26, 27, 32, 41, 42, 43, 44, 46, 47, 49, 50, 51, 54, 55, 57, 58.

Our experience shows that flounders and soles of various species are abundant on our shores, and may be obtained in more than remunerative quantities by means of the trawl. At present we are mainly dependent on the supply obtained by hook and line, and hence the prices charged for these prime food fishes are often prohibitive. Some species are certainly taken with the seine in shallow water, but the scope of this net is limited to the beaches; the trawl, on the other hand, not only rakes the ocean-bed, but, by reason of its greater weight and power, forces the ground-fish from their hidings in the sand and mud.

Described as being essentially a tropical species, the Large-toothed Flounder did not appear to be a whit less common in Shoalhaven than in the Manning Bight (Station 27), and, therefore, probably extends along the whole length of the seaboard of the Colony. Station 54, our most southerly haul, was within Jervis Bay.

This flounder was taken most freely in the shallower water, and the greater depth—up to 80 fathoms—yielded but one or two examples.

* **Small-toothed Flounder.** *Pseudorhombus multimaculatus.*

Stations 1, 4, 5, 6, 9, 10, 11, 12, 22, 23, 24, 26, 27, 28, 31, 39, 41, 43, 44, 46, 47, 48, 50, 51, 52, 54, 56, 57, 58.

Hitherto this flounder has been recorded on our coast only between Cape Hawke and Botany Bay. The former point was within 20 miles of the northern limit of our operations, so that we cannot extend its known range further than the Manning River in that direction. Southward, however, it was taken freely all along the coast, being especially plentiful in the Shoalhaven Bight, and obtained at our most southerly station (54), namely, within Jervis Bay. The specimens examined revealed the fact that they were in spawn, about half developed, so that approximately the breeding season may be fixed about June. This species was taken more abundantly than the Large-toothed Flounder, and was secured at all depths between 10 and 84 fathoms, being, however, comparatively scarce from 50 fathoms to the greater depths.

Crested

Crested Flounder. *Lophonectes gallus.*

Stations 1, 2, 4, 7, 9, 11, 13, 28, 33, 35, 37, 38, 41, 42, 43, 44, 46, 47, 48, 49, 50, 54, 55, 56, 57, 58.

It is a matter for regret that the Crested Flounder, the commonest flat fish secured, does not attain larger dimensions. The largest taken did not exceed 7½ inches, while few were more than 6 inches. Even at this size it should be very acceptable for the table, for what it lacks in size it makes up for in numbers. If carried out commercially, there seems to be no reason why this fish should not yield a good return for trawling. Immense quantities of fry, under 2 inches in length, were retained in the trawl whenever mud was brought up, indicating the breeding-season to be during the height of summer. Whether these fry frequent the mud only, or whether they are also found in sand and sifted out of the trawl with it, it is not possible to say.

This fish was taken all along the coast from Jervis Bay to the Manning River, and at all the depths tested from 10 to 84 fathoms.

Long-snouted Flounder. *Ammotretis rostratus.*

Station 50.

Shoalhaven Bight would appear, as indicated by our 50th station, to be a veritable haunt of flat-fishes. Of our seven species, the Narrow- and the Many-banded Soles were the only ones unrepresented, while, on the other hand, the Long-snouted Flounder was the only example of that species taken there, and the Black Sole was secured in but one other locality. The species now under consideration is very uncommon on our seaboard, and is apparently equally rare in Victorian waters, where it also occurs. If not distinct from a southern form, it ranges to Tasmania and New Zealand, and it is under the name of that species that we have here included it. The single example taken was trawled in 15-18 fathoms. It is said to be a better flavoured fish than either of the other flounders of the genus *Pleuronectes* above-mentioned.

*** Narrow-banded Sole.** *Solea macleayana.*

Stations 23, 24, 32, 51.

(Plate IX).

Two interesting and important observations have been made with regard to this species, namely, its distribution and season of spawning.

Previously it was known only from a very small portion of our coast-line, ranging from Port Hacking in the south to Lake Macquarie in the north. At station 51 we secured it very freely off the Shoalhaven River in 15 fathoms; while its northern range was extended to Cape Hawke, off which point (station 32) it was trawled in 10-12 fathoms. As against the plentiful supply obtained it may be argued that it was only taken on four occasions; it will be well, therefore, to point out that this species is most probably an inhabitant of shallow water, and that most of our stations indicate a greater depth than suits it. Station 23 was in 16-19 fathoms; and although 21-48 fathoms was sounded at the 24th station it is quite possible that this fish was taken when the trawl was first lowered, and before it descended to greater depths. It may be further pointed out that it was obtained most abundantly in the shallowest water wherein we trawled.

As far as I am aware, the breeding-habits of this species were previously unknown; it is, therefore, with particular pleasure that we are able to report knowledge gained. All the specimens of sufficient size were full of almost ripe ova, and as the extreme dates are 2nd and 19th March, the end of that month may be approximately determined as the spawning-season. Eleven inches is recorded as the maximum size obtained, but 8 or 9 is about the average. On evidence it is mature at a much smaller size, for a large number of our specimens measuring only 6 inches in length were in full spawn. As to its edible properties, all on board the "Thetis," where it was freely partaken of, pronounced it to be of admirable flavour.

*** Black Sole.** *Synaptura nigra.*

Stations 23, 50.

Writing on this species, the author of the "Edible Fishes of New South Wales" remarks:—"The Sole appears to be a purely estuary fish, never, so far as we can ascertain, having been recorded from the open sea." This statement now no longer applies, for we took two examples, one off Newcastle, and the other in Shoalhaven Bight. After all, one may naturally expect to find this fish inshore, as it occurs in all the estuaries of the New South Wales coast. Had we trawled in shallower water we might have taken more specimens, those secured having been obtained in 15-19 fathoms. Many-banded

Many-banded Sole. *Synaptura fasciata.*

Station 10.

(Plate X.)

One of the rarer soles, this species has not, I believe, been previously taken other than in Port Jackson. The only specimen we obtained was trawled between Cape Three Points and Tuggerah Lakes in 28 fathoms. Roughly speaking, it may be distinguished by its elongate form and the numerous black bands, about twenty in number, which extend across the body from the snout to the tail. Possibly not inferior to its congeners for table use, we had no means of testing its toothsome-ness, the single representative being "sacrificed" for the benefit of science.

Saury. *Saurus myops.*

Station 23.

A few examples of this fish are occasionally taken in the seine, but on the whole it is scarcely recognised and accounted of no value. The only specimen secured was trawled in 16-19 fathoms off Newcastle.

*** Saury.** *Saurus truculentus.*

Station 21.

The specimen originally described was taken in Port Jackson, and measured 20 inches in length. Our example, the second only known, was trawled in Newcastle Bight, and measured 18 inches. It may be mentioned that some of the Australian representatives of the genus are inadequately described, and their determination is therefore somewhat difficult. The same remark applies to many of our fishes, for, as Dr. P. P. Carpenter said, with the best desire for accuracy and the greatest care, it is hardly possible for an author to so describe that his readers shall see specimens as he sees them. This difficulty is largely removed when descriptions are accompanied by figures, helps to identification which Australian authors have rarely furnished.

*** Sergeant Baker.** *Aulopus purpurissatus.*

Stations 7, 12.

The two stations at which this fish was trawled were off Port Jackson, in 62-69, and off Broken Bay, in 23-34 fathoms respectively. It was also taken with the line at three other places, namely:—Schnapper Rock, south of the Manning River; off Broughton Islands, north of Port Stephens; and southward, off Shoalhaven Bight. Although doubtless well known from the first-named locality, I am inclined to think that it has not been absolutely recorded so far north before.

*** Cucumber-fish.** *Chlorophthalmus nigripinnis.*

Stations 4, 13, 37, 38, 41, 42, 43, 46, 47, 48, 49, 56.

This fish, apparently taken only in the trawl, is quite unknown to fishermen. Although not reaching any great size, it was taken so freely that I think it would form a good marketable fish if the trawl was used commercially on our coast. It was never taken in less than 41 fathoms, and most numerous in the deepest trials (up to 84 fathoms). In still deeper water it is quite probable that we should have found it even more plentiful, for off Twofold Bay the "Challenger" expedition obtained it in 120 fathoms, the first time it was ever taken. Our examples reached a length of 8½ inches.

Flying-fish. *Exocoetus evolvans.*

Under the heading "Flying-fish, *Exocoetus volitans*," in "A voyage to New South Wales," White wrote (p. 295):—"This fish is so well known to Naturalists, and is so frequently seen in every voyage, that it is unnecessary to give a particular description of it." Whether this fish, of which a recognisable figure is given (pl. 52, fig. 2), was obtained off this coast or not, is by no means clear, and the species has not therefore been included in the fish literature of the Colony.

During the gale we encountered off Wollongong, on March 16th, two Flying Fishes were blown aboard, and on examination they proved to be of the species in question. This fish, known from the Mediterranean, Indian, Chinese, and, in fact, most temperate and tropical seas, has been recorded from North Australia, but is now, for the first time, definitely identified from the coast of New South Wales.

* Pilchard.

* Pilchard. *Clupea sagax*.

Station 26.

The Pilchard is one of those fishes which would pay well if its movements and occurrences off our coast were thoroughly investigated and advantage taken thereof. Beyond the fact that this fish "annually appears in countless myriads" but little is known. Unfortunately we were unable to throw any further light on the subject, doubtless owing to the season at which operations were conducted not being the proper one, for Macleay says that the usual time of the annual visit of the Pilchard to the coast of New South Wales is in June and July, approximately. This is a cogent reason why investigations should be carried on for at least one complete year, then something might be learned; but after all the only real way of furthering the fishing interests of the Colony is for the equipment of a boat entirely for this and for no other purpose, and a biological station as a necessary corollary.

The only Pilchard obtained by the "Thetis" was a partially-digested example ejected by a John Dory.

Some further remarks are suggested by inquiries, occasionally made, as to whether we have a Sardine in Australian waters. Although not generally known, the Sardine of commerce is none other than the young of the European Pilchard (*Clupea pilchardus*), and the following extract from Mr. Cunningham's writings will, I am sure, be read with interest:—"There is no difficulty in distinguishing the fully-developed Pilchard at any size; it more resembles the Shads than the Sprat or Herring, but is easily distinguished from the former by the more slender body, larger scales, and weaker ventral spines. The question whether Pilchards and Sardines are the same or not is frequently raised, and the correct reply to it is the following: The Sardine of commerce is prepared on the west coast of France, from Brest southward to La Rochelle, and therefore the fish is taken in a part of the sea which is near to, and not separated from, that where the Cornish Pilchard fishery is carried on. The Pilchard extends throughout both these parts of the sea, and the Sardine is not a different fish. Pilchard is the Cornish name for it, Sardine the French. But the fish which are preserved in oil and tinned are small, young fish, from about 5 inches to 6½ or 7 inches in length, and these are not regularly caught by the Cornishmen. The difference in the product is due to the difference in the mesh of the nets used. On the other hand, full-grown Pilchards, 8 to 10 or 11 inches long, occur on the French grounds, and are fished there in winter; they are distinguished as *Sardines de dérive*, which means drift Sardines, Sardines caught by drifting with the nets without bait, while the small fish of the summer fishery are called *Sardines de rogue*, because salted Cod's roe, called *rogue*, is scattered in the water as a bait to attract the fish before the nets are shot. (An Australian would, I think, felicitously express this by the single word "Berley.") Nets of various meshes are used in this fishery, and the fishermen use the mesh which is the right size for the fish present at the time. Seines, however, have come into use in the summer fishery in recent years. There is no reason to doubt that the small Sardines could be caught in Cornish waters; in fact, they have been frequently taken in the seines there, but were not wanted, because not suited to the Cornish trade."

Although our Pilchard is not the same species as the European one, this is no reason why it should not be turned to similar account, nor why examples up to a year old should not be called Sardines, and so treated. Two conditions are, however, necessary; first, to obtain definite information as to the time the Pilchard visits our waters, at present stated to be June and July, and to verify the following remark by Macleay:—"The shoals are described as enormous, covering miles of sea, and accompanied by flights of birds and numbers of large fishes. These shoals are generally observed from 1 to 3 miles from the land, and are always proceeding in a northerly direction." The second condition would be to secure a race of fishermen, who, like the Cornish and North Sea fishermen, would follow the fish 10 or 40 miles out if need be, and experience few of the hardships to which the home fishermen are subject.

I have previously referred to the myriads of infusorian animals occasionally occurring on our coasts; it is such creatures that form a large proportion of the food of the Pilchard. Two French naturalists, MM. Pouchet and de Guerne, investigated the food of the Sardine, and found that the intestines of these fishes were crowded with minute infusorian organisms, which literally filled the digestive tubes, being recognisable even in the rectum. They concluded that the number of individuals of *Peridinia* found in the viscera of one specimen was no less than 20 millions. My colleague, Mr. Whitelegge, tells me that one species of *Peridinia* (a whip-bearing infusorian) found in the digestive tract of the Sardine, is identical with specimens abundant off the coast of New South Wales, and that many other species of the same group abound.

Spiny

Spiny Sea-horse. *Solenognathus spinosissimus.*

Stations 46, 49, 56.

Only found on the beaches after heavy weather, this curious fish is apparently an inhabitant of deep water. Several examples were trawled in from 50 to 80 fathoms, while at this latter depth a male was obtained in an interesting condition. As is well known, it is the males in the family *Syngnathidæ* who take care of the eggs and tend the young, and in the specimen referred to the eggs, glued to the under-side of the tail were fully incubated, many of the young escaping as the fish was handled.

Banded Sea-horse. *Solenognathus fasciatus.*

Station 42.

This species is much rarer than the Spiny Sea-horse, and was only once taken, in 70–78 fathoms, south of Botany Bay. It was first obtained by the members of the "Challenger" expedition off Twofold Bay, in 120 fathoms. Very closely allied to the commoner form, it can only be distinguished by a critical examination. It is scarcely necessary to mention that none of the Sea-horses are of any value from an economic point of view, but are of the highest interest to the naturalist.

*** Common Leather-jacket.** *Monacanthus tomentosus.*Stations 1, 2, 4, 5, 7, 8, 9, 10, 11, 12, 15, 17, 20, 21, 22, 26, 27, 28, 33, 44,
52, 54, 57.

Well known, too well known, as is the Leather-jacket. I rather fancy that we have extended the published range of the species, it now being recorded from off the Manning River and Jervis Bay, and of course all the coast-line lying between these two points. Previously its occurrence was summed up in the following words:—"The only localities from which this species can be recorded with certainty are the metropolitan district of New South Wales and King George's Sound." It was trawled by the members of the "Thetis" expedition at all depths between 10 and 84 fathoms, and was taken at all reefs where line and hook were put overboard, proving as irritating as usual by cutting the lines with its sharp teeth or monopolising the bait intended for more esteemed fish. In this connection, however, I would remark that "Leather-jacket" is by no means to be despised, but, as with the Skate, mentioned later, prejudice insists that it is not to be eaten.

Leather-jacket. *Monacanthus trachylepis.*

Station 49.

One specimen was obtained off Wollongong in deep water. It is not infrequently taken by the trawl in Port Jackson, and has also been received from Broken Bay. These are the only recorded localities for the fish.

Box fish. *Ostracion lenticularis.*

Stations 1, 2, 4, 8, 9, 10, 11, 12, 18, 21, 22, 23, 24, 26, 27, 32, 33, 50, 52, 54, 59.

Although obtained at so many stations, not more than two or three individuals were secured at each haul—a matter for small regret, however, considering how useless the Box-fishes are from an economic standpoint.

Crescent-tailed Toado. *Tetrodon lunaris.*

Stations 23, 26.

Inhabiting the Red Sea, the Indian Ocean, the Malay Archipelago, to China, the Pacific and the coasts of Brazil, this species may be considered to have a wide range. It has not previously been identified from New South Wales, but only just escaped, as it is recorded from Moreton Bay. On two occasions we secured it off Newcastle in 16 to 32 fathoms.

Porcupine Fish. *Dicotylichthys punctulatus.*

Stations 17, 23.

Well known, but useless as food for either man or fish, this species may be very shortly referred to; its skin is used by natives of the Gilbert Islands as a war helmet.

SHARKS

SHARKS AND RAYS.**School Shark. *Galeus australis.***

Station 20.

The only example of this shark obtained was a small specimen 3 ft. 6 in. in length. It was taken in 23-30 fathoms, off Morna Point. The members of this genus live on the bottom, and the British species, the "Tope," and from which ours scarcely differs, is very troublesome to fishermen, unbaiting the lines and scaring the fish that would otherwise be taken.

Hammer-headed Shark. *Zygæna malleus.*

Station 51.

In 15 fathoms off Shoalhaven Bight we netted a large number of these sharks. They were, however, all of small size, ranging from 1 to 4 feet in length. Curiously enough, this was the only occasion on which they entered the trawl.

The Hammer-headed Shark was the species most frequently seen, and when "Shark, oh," was called, it was generally to observe one of these brutes swimming alongside the "Thetis." The largest example noticed was computed to be about 12 feet in length (off Seal Rocks). On one occasion one of the sailors, having strung some skate, hung them over the stern in order to wash off some sepia from the cuttle-fish. Small thought was given to the shark cruising alongside, until it was discovered that the skate had been eaten off, and the shark, like Oliver, was "asking for more." At night, also, sharks kept pace with us, as indicated by the phosphorescent glow which accompanied their movements.

Hound. *Mustelus antarcticus.*

Stations 11, 12, 21, 37, 48, 49, 52.

This small shark is very common and feeds on the bottom, apparently occurring in patches over the ocean-bed. Though not frequently taken it was plentiful where secured, a dozen or more having been brought up at each of the above-mentioned stations. Newcastle Bight (station 21) is the most northerly point whence it is known; Broken Bay has hitherto had that distinction.

Grey-nurse Shark. *Odontaspis taurus.*

Station 23.

On hauling the trawl aboard off Newcastle, out of from 16 to 19 fathoms of water, some little excitement was caused on discovering that we had a shark in the net; on being hauled aboard it swept the fish right and left until despatched. It was a Grey-nurse and measured 8 feet in length. A somewhat larger example was hooked in Broken Bay. Sharks were specially attracted to the "Thetis" on account of the amount of food thrown over, such comprising mainly the inedible species, as sting-rays, fiddlers, dogfishes, &c. There has been no previous authentic record of the Grey-nurse having been taken north of Port Jackson.

Spotted Dogfish. *Scyllium anale.*

Stations 2, 10, 12, 13.

On the British coasts dogfishes are very troublesome to fishermen, and it was urged by some, that trawling could not be carried on in Australian waters on account of the numbers of these little sharks peopling our waters. If anyone suffered it would be the line-fishers for the net was certainly never interfered with. Having trawled on both British and Australian coasts I am inclined to think that dogfishes are more numerous there than here. The Spotted Dogfish was not taken commonly, the four stations not yielding more than a dozen individuals.

Collared Dogfish. *Parascyllium collare.*

Stations 1, 8, 10, 11, 13.

This handsome species was freely obtained at each of the above represented stations, all between Broken Bay and off Tuggerah Lakes. As it was known previously only from outside Port Jackson it would seem as though it is very locally distributed. This dogfish was taken in from 20 to 50 fathoms, but had been previously recorded in 70 fathoms off Port Jackson.

Wobbegong.

Wobbegong. *Crossorhinus barbatus.*

Station 24.

Obtained so freely by means of the trawl in Port Jackson, it is a little remarkable that we secured but a single specimen on the "Thetis." It has been pointed out that the fleshy fringe on the sides of the head is a unique feature among sharks and is explained by the fact that lying concealed on the bottom, amid rocks covered with vegetable and fernlike animal-forms, the shark closely assimilated thereto by its mottled and varied colouring, and by the fringes surrounding the head—such assimilation enables it to approach its prey unobserved.

Port Jackson Shark. *Heterodontus philippi.*

Stations 10, 15, 20, 21, 22, 23, 24, 25, 26, 32, 34, 50, 51, 52.

In the face of such a formidable array of stations it may be well to mention that this shark is one of the harmless kinds, and my readers may be reassured on learning that none of the specimens secured were longer than 2 feet, while the majority were but little over 18 inches. This shark is not known to grow larger than 4½ feet. Although a careful look-out was kept for the crested species (*Heterodontus galeatus*) it was never secured, and notwithstanding the fact, all the egg-cases I saw southward in the shop-windows of Wollongong and Kiama were of this latter species, those of our commoner form being either rare or quite unknown.

Angel Shark. *Rhina squatina.*

Stations 5, 7, 24, 32, 34, 35, 43, 46, 48, 50, 52, 54, 57.

Not being a commercial enterprise, angel sharks were not required as fertilisers, and were therefore returned to the place from whence they were taken. A few large examples were netted, chiefly females, which gave birth to many living young on deck, but for the most part the specimens were small. The known northern range of this species on our coast is now extended to Cape Hawke, it not having been previously recorded north of Port Jackson.

Saw-shark. *Pristiophorus cirratus.*

Stations 1, 4, 10, 13, 15, 20, 21, 24, 25, 26, 34, 37, 38, 40, 46, 57, 58.

This species must not be confounded with the Saw-fish, which is unknown from Australian waters. It never attains a greater length than 4 feet, while saws alone of the Saw-fish are not infrequently obtained 6 feet in length and a foot broad.

Numbers of Saw-sharks were frequently entangled in the meshes of the trawl and proved of some trouble, the sharp teeth of the saw rendering extrication an awkward matter. In this respect little specimens, not exceeding a foot in length, were equally annoying with the adults. The known distribution on the coast of New South Wales is now extended northward to Morna Point (station 20.)

Shovel-nosed Ray. *Rhinobatus bougainvillii.*

Stations 1, 10, 11, 22, 24, 25, 26, 32, 51, 59.

Several of these stations are recorded by virtue of a single representative and at none of the others were more than three or four taken. Of no benefit, they yet gave us small trouble, and those not required as museum specimens, were simply heaved overboard in company with sting-rays, fiddlers, and other undesirable acquisitions.

Fiddler. *Trygonorhina fasciata.*

Stations 1, 2, 21, 22, 23, 24, 25, 27, 28, 50, 54, 55, 57, 59.

As may be noticed, very little is known of our shark fauna north of Port Jackson. One result of the "Thetis" trawling expedition is the extension of the known range of many species of both sharks and rays, and one shared by the familiar Fiddler, which is now reported from the Manning Bight (station 27.)

Numb-fish. *Hypnos subnigrum.*

Stations 21, 24, 25, 52, 55.

Also known as Cramp-fish, Torpedo, and Electric Ray, this species was provocative of a good deal of amusement whenever it appeared on board. The uninitiated however shortly learned to recognise it and respect it for its qualities, so that soon no one could be persuaded to touch it even with an iron-prodder. However, at the 55th station I, unwittingly, placed my hand on the largest example obtained (2 feet 3 inches), and received a shock, with subsequent bantering, sufficient to satisfy me for the remainder of the day.

So

So much interest is evinced in this fish and its electric properties, as evidenced by the numerous inquiries I frequently receive, that I here popularise a paragraph by Dr. Gunther, in the hope that it may be acceptable:—

“The electric organs with which Numb-fishes are armed are large, flat, uniform bodies lying one on each side of the head. They consist of an assemblage of honey-comb-like prisms, divided into cells, each filled with a clear, trembling, jelly-like fluid; 470 prisms have been counted in each of the two batteries. The fish gives the shock voluntarily when it is excited to do so in self defence, or intends to stun or kill its prey. The electric currents created exercise all the other known powers of electricity; they render the needle magnetic, decompose chemical compounds, and emit the spark. The upper service of the electric organ is positive, and the lower surface negative. Examples which attain a width of from 2 to 3 feet are able to disable by a single discharge a full-grown man.”

Tasmanian Numb-fish. *Narcine tasmaniensis.*

Station 42.

After what has been written above, the intelligence that we have discovered another Numb-fish on our coast may not be popularly acceptable. I have, however, no alternative but to make it known. It belongs to a genus (*Narcine*), hitherto unrepresented in Australian waters, and is a species described from Tasmania. It was taken off Wata Mooli, once only, in 70 fathoms, and is not likely to occur in shallower water, for it is well known that the more southern forms are generally found off our coast in deep water, at a temperature more suited to their constitution. A signal instance is that of a large shell (*Voluta mamilla*), taken in the waters of New South Wales for the first time by the “Thetis,” and hitherto regarded as a characteristically Tasmanian species.

*** Skate. *Raja australis.***

Stations 4, 5, 7, 10, 11, 12, 13, 17, 20, 21, 22, 23, 24, 25, 26, 27, 28, 31, 32, 34, 35, 37, 38, 39, 42, 43, 46, 48, 49, 53, 56, 57, 58.

On thirty-three occasions this valuable Ray was taken in the trawl, sometimes in enormous numbers. Considering the estimation in which skate are held in Europe, it is rather surprising that here they are classed with the Sting Rays, and are in fact not often distinguished from them. Of such account did some of my fellow voyagers consider this fish, that they preferred it to more esteemed kinds, and, as a consequence, Skate was generally to be found on the table of the “Thetis.” On asking such fishermen as know the Skate why they do not send it to market, I am told that it is unsaleable; if this be so, prejudice must be at the root of the question, and prejudice is a difficult matter to overcome. The same sentiment may be traced to the Australian natives aversion to hares and rabbits, animals which in Britain are regarded almost as luxuries, and the former classed as game, for the unauthorised destruction of which heavy penalties are inflicted. The native products—kangaroos and wallabies—are scouted as food also; why is this? The question of the skate as food is one which I recommend for the consideration of Mr. Farnell, who had many opportunities of gauging the edible properties of the fish. Apart from its considerations as an agricultural fertiliser, there would be no need for commercial trawlers to return the fish to the waters, for a ready sale could always be commanded among the Chinese and coloured population of the Colony.

As to further evidence of its edible value, I may refer to the paragraph on the Hammer-headed Shark, from which it will be seen that this epicure did not disdain skate-flesh.

At stations 49 and 56 egg-cases of this species were obtained with the embryo living within.

Giant Sting Ray. *Trygon pastinaca.*

Stations 21, 22, 23, 58.

Four of these huge rays were taken, and aggregated nearly a third of a ton, their respective weights being 160 lb., 220 lb., 140 lb., and 180 lb. approximately. At station 22, off Newcastle, the contents of the net were estimated to weigh a ton, to which the ray contributed nearly one-fifth, as shown by the scales.

Common Sting Ray. *Urolophus testaceus.*

Stations 1, 4, 7, 8, 9, 10, 11, 12, 13, 17, 20, 21, 24, 25, 26, 27, 28, 32, 33, 34, 35, 37, 38, 39, 42, 43, 47, 48, 49, 50, 51, 52, 54, 55, 57, 58, 59.

This was one of the most unwelcome species met with, in consequence of its ubiquity and profusion. Although of small size, its tail is armed with a barbed spine, which suggests cautious handling. The odium in which it was held on board could be well gauged by observing the viciousness with which the men employed impaled it with the iron prodders provided, before whirling it over the bulwarks. The spines of sting rays were formerly used by Polynesians with which to torture their victims, and are largely utilised as arrow heads, awls, and needles by many of the islanders.

Sting

Sting Ray. *Urolophus bucculentus*.

Stations 11, 24, 25.

Not readily distinguishable from the above without careful examination, this species may have occurred more freely than I have recorded, for I could not personally examine every individual sting ray before it was cast overboard. This species was also taken on the line off the jetty at Nelson's Bay, Port Stephens.

Eagle Ray. *Myliobatis aquilla*.

Stations 1, 10, 20, 21, 22, 23, 24, 25, 26, 50, 51, 52, 53, 54, 58.

Of almost cosmopolitan distribution, this ray has received many popular names, and on some parts of the English coast is called the Miller, in allusion to the form of the teeth. Each jaw forms part of a circle, and from a peculiar rolling motion, added to the crushing power of the teeth, the genus has obtained the name of *Myliobatis*—that is, Mill Skate. Other names are Bat Ray and Whip Ray.

Ghost Shark. *Chimæra ogilbyi*. (New Species.)

Stations 35, 37, 46.

(Plate XI.)

Three genera of Chimeras are known. The earliest described is the typical *Chimæra* represented by the following species:—*Ch. monstrosa*, from the coasts of Europe, Japan, and South Africa, found only in deep water; *Ch. (Hydrolagus) collieri*, from the Pacific coast of North America, abundant about Puget Sound and in South-eastern Alaska. This species swims at the surface, and is common about wharfs, while there is no evidence that it descends to very considerable depths. A single specimen identical with *Ch. collieri* in every respect of colour and form, with the exception of what may be an individual character, has been named *Ch. neglecta*. In the absence of further particulars, I prefer to regard this specimen as of *Ch. collieri*. A third species was in 1868 described under the name *Ch. affinis*, from Portugal, but since recognised from the North American side of the Atlantic at depths varying from 200 to 1,200 fathoms. It is very common in deep water on the American coast. We have now to add a fourth species, which I propose to name *Chimæra ogilbyi*, in recognition of the researches made on the fishes of Australia by my friend Mr. James Douglas Ogilby, of this city. This species is more fully discussed below.

The second genera of Chimeras, named *Callorhynchus*, is known by one species from the Antarctic basin and the South Pacific. It is the only Chimera hitherto found in Australian waters, but has never been taken off the coast of New South Wales.

Harriotta is the third genus of Chimeras represented by two species, namely, *H. raleighana*, known from the Eastern coast of North America, in depths ranging from 707 to 1,081 fathoms, and *H. pacifica*, from Japan.

Judging by analogy, and remembering that *Ch. ogilbyi* belongs to the genus *Chimæra*, I was at first inclined to regard it as *Ch. monstrosa*; it differs from this northern species by not having a distinct anal fin, by the front margin of the dorsal spine not being so markedly keeled, by having the snout more produced, the hinder margin of the second dorsal rounded, and the tail fins less developed. It finds its nearest ally in the Peninsula and North American *Ch. affinis*, but differs therefrom by having the tail produced into a long filament and the fins much lower, by the truncated ventral fins and by the dorsal spine being sub-acute at the base and distinctly keeled above. It also differs in hue, being of a beautiful silvery colour, with circles and splashes about the head—*Ch. affinis* being described as uniformly plumbeous.

When the trawl came up at 10 p.m. on March 10th, the kerosene flares revealed two Chimeras, and my fellow trawlers were, I think, somewhat amused at the enthusiasm I displayed at the capture of a couple of sharks, to which I was told I was quite welcome. The haul (station 35) was made within two miles of land, just outside Bate Bay, and directly off Port Hacking, in from 22 to 38 fathoms of water. Both these specimens were females, and as I much wanted to secure a male, Mr. Farnell kindly consented, on the following day, to run over the same ground; rock was, unfortunately, encountered as soon as the trawl was lowered, and on hauling it up it was found that the only fish taken were three Dories. After mending the net in Botany Bay another haul (station 37) was made, this time further out in 50–52, and I was extremely pleased to find four more Chimeras in the trawl—again all females. No more examples were met with until March 16th, when at station 46, off the old ground, in the deeper waters of 66–50 fathoms, a seventh specimen was secured, which, strangely enough, proved to be another female.

Here,

Here, then, at our very doors we discovered the presence of a shark, apparently common, belonging to a genus never before taken south of the equator in our region, and frequenting the shallow (shallow for members of the *Chimæridæ*) water of 22 to 66 fathoms. Into what depths this fish may journey or what un conjectured forms may exist in the abyssmal regions off our shores, remains for the future to reveal.

While studying the literature of the family *Chimæridæ* I have been surprised at the number of errors and misprints which have been perpetrated, and as this is the last opportunity afforded I may crave a few lines for what may not be quite suited to a popular essay like the present.

In "Oceanic Ichthyology," one of the most recent and pretentious publications on fishes, an extremely good figure of *Chimæra colliei* in the "Voyage of the Blossom" has been copied, but in some unaccountable way has been named *Callorhynchus antarcticus*, and so printed in the table of contents, notwithstanding the fact that it is correctly described in the text. By a typographical error *Hydrolagus* appears as *Hydbolagus colliei*. It is from "Oceanic Ichthyology" that my figure of the tail and ventral fin of *Chimæra affinis* have been reproduced. In the description of that species the following conflicting statements occur:—"The pectorals extending to the outer axil of the ventrals," and, again, "the pectoral terminating much in advance of the ventral." I presume that in the latter quotation "first dorsal" should be read for "pectoral."

In a French edition of "Cuvier's Animal Kingdom," the fishes by Valenciennes, an extraordinary figure is given on Pl. 113, purporting to be of *Chimæra monstrosa*, and said to be drawn from nature, the locality given being the Seas of Iceland. The peculiarity is that, though the figure, as a whole, represents *Callorhynchus*, the snout lacks the characteristic appendages. As *Callorhynchus* is a southern type, how came the artist to represent this genus from a specimen taken in the Seas of Iceland? Is *Callorhynchus* a bipolar form, or had he access to southern material?

Lastly, an amusing misprint occurs in Macleay's "Fishes of Australia." This reads:—"Ventral organs confluent into two pairs of laminæ in the upper jaw and into one pair in the lower." The passage becomes clear when "Dental organs" is read.

LORD HOWE ISLAND.

On March 25th the "Thetis" left Sydney for Lord Howe Island, it being intended to test the trawling character of the ground around its shores. In consequence of the extremely rough weather this proved to be impossible. After a passage of seventy hours, as against the usual thirty-six, we were landed on the island, and there left for eleven days, the "Thetis" being blown to sea in the gale, returning to Sydney for coal and supplies before taking us off.

During the first few days on the island the weather was too boisterous and the sea too high to permit of any marine work. Afterwards we were enabled to get on to the reef, and also to draw the seine in the lagoon. The "Thetis" had, unfortunately, nearly all our collecting apparatus and preservatives on board, so that we were not able to secure much material. The enormous quantities of fish, both among the rocks and on the beaches, surprised me, and seemed to indicate that a profitable fish industry might be established in connection with the island. This was first pointed out by Mr. Robert Etheridge, jun., who, together with Mr. Robert Barnes, accompanied us.

In 1888 a party from the Museum spent some time on the island, and the results were embodied in a valuable little publication. Since that time sundry additions have been made to the known fish fauna, and a few more are here chronicled; but, granted favourable weather and other circumstances, much might yet be done by a properly-organised expedition.

*Black Rock-cod. *Serranus dæmelii*.

Anchored off the island, the members of the expedition obtained many fine examples by means of the line, all of which afforded good sport. This fish is freely caught by the islanders, and attains a large size. I was told that it is sometimes secured 5 feet in length and 6 stones in weight.

*Red Rock-cod. *Trachypoma macracanthus*.

This is not the Red Rock Cod of Sydney, where it is unknown. It is very common among the rocks around the island, and we caught several with hook and line from the "Thetis." I also secured an example with my hand, and saw many more on the coral reefs from which the water had receded, leaving these fishes in the small pools and channels connecting them.

* Salmon

* **Salmon.** *Arripis salar.*

This is accounted one of the best fishes of the island; it is abundant and caught easily. Small and half-grown examples were taken in the seine every time we put it out, and the boys never failed to hook numbers when fishing off the beaches. On the mainland the Salmon is not regarded with much favour, and may frequently be had in the markets at a very low figure. Examples of 18 inches and under find more buyers, who under the name Salmon-trout imagine they are taking a different species. These smaller examples are, however, undoubtedly of finer flavour. On Lord Howe Island the larger fish were by no means to be despised, they were eaten perfectly fresh and had not undergone the mauling to which fish purchased in Sydney are so often subject before reaching the consumer.

Big-eye. *Apogon norfolcensis.*

In a large rock pool containing 6 or 7 feet of water I saw two or three specimens swimming about in company with other kinds. We obtained examples in the seine when drawn in the lagoon at night.

* **Blue-fish.** *Girella cyanea.*

In order to fully appreciate the name, this fish must be seen taken alive out of the water, it is then of a blue colour, the purity of which is only excelled by the sky above, it quickly changes colour and assumes a leaden hue. No sooner were our lines thrown over the side of the "Thetis," as she dropped her anchor outside the reef, than they were unhesitatingly tackled by Blue-fish, which were being constantly hauled aboard; the numbers of these fish peopling the waters around the island must be incredible, for the boys when fishing do not require to stay out very long in order to secure an ample supply. Examples were taken in every haul of the seine from which they made desperate efforts to escape; small specimens up to a foot in length could be caught by means of a rod when standing on the beaches. As the bait taken was invariably an animal one it may be that the Blue-fish is less partial to a vegetable diet than its black relative of the mainland, for of the Black-fish (*Girella tricuspidata*) Tenison-Woods writes:—"They may be caught in abundance in shallow water with the line, the only bait being a green confervid weed obtained on wood under sea water." When searching the rock pools for small fishes and shell-fish, &c., I obtained many Blue-fish an inch or under in length.

* **Sandy Bay Cod.** *Scorpena cooki.*

The only examples I obtained of this species were taken on the line from the "Thetis." The inhabitants of the island told me that although good eating, they did not trouble much about Rock Cods when they could get Blue-fish and Salmon so easily.

Butterfly-fish. *Pterois volitans*

One of the inhabitants of the island brought me one of these fishes, which he had found dead upon Ned's Beach, on the east side of the island. Formerly supposed to be capable of flight, as practised by the Flying-herrings and Flying-gurnards, the membrane connecting the fin-rays of the Butterfly-fish is neither long enough nor strong enough to enable it to raise itself above the surface. It is, at the same time, one of the most quaint and curious fishes one could wish to see, and is sometimes called Red Fire-fish.

* **White Trevally.** *Caranx georgianus.*

The seine always yielded us a tolerable supply of Trevally, but none of those taken exceeded 18 inches in length. The common Yellow-tail of the mainland did not appear to be known to the boys on the island. Their Yellow-tail is the fish next mentioned.

* **King Fish.** *Seriola lalandii.*

The excitement of catching Blue-fish was occasionally varied by hooking a King fish, whose powerful struggles rendered its presence unmistakable.

Dragonet. *Callionymus longicaudatus.*

A male of the Long-tailed Dragonet was brought to me by one of the islanders, he having just picked it up alive on the beach. This is the first time a member of the genus has been recorded from the island, and, I believe, only the second instance of the species being taken in Australian waters. It is a very wide spread form, ranging from East Africa, the Andamans to the Malay Archipelago, China, Japan, and beyond.

Blenny

Blenny. *Salaria quadricornis.*

On the ocean-beach many of the rockpools contained examples of this species, and I obtained specimens by baling out the water. The fish in the larger pools, where baling was impossible, seemed to be bigger than those I secured, but with fish, all the world over, the largest ones are always just missed. The finest example obtained measures $5\frac{1}{2}$ inches in length.

Hardy-head. *Atherina lacunosa.*

I obtained four specimens from a rockpool, but they are too small to render their determination a certainty. As far as can be ascertained, however, the species does not differ from that which is so very common on the coast of New South Wales. This is the first time that an Atherine has been recorded from the island.

* **Sea Mullet.** *Mugil dobula.*

A glance at the literature of Lord Howe Island would indicate that this Mullet has not been recorded from there. I was ignorant of this when on the island, and, therefore did not make special inquiries on the subject. When baling out the rockpool above referred to, I obtained a single small specimen, which the boys called a Mullet, but whether they failed to distinguish it from the next species or not, I cannot say.

* **Tallegalane.** *Myxus elongatus.*

(Plate XII.)

This Mullet is very common around the island, and was always taken in our seine net. The accompanying figure of this species is from a very careful drawing I made some time ago.

Tobacco-pipe Fish. *Fistularia depressa.*

As mentioned under the heading Rough-billed Pipe fish, the Tobacco-pipe fish, is the common species of Port Jackson, and is now, for the first time, recorded from Lord Howe Island. We took an example by the seine on drawing it in the lagoon. The members of this genus are sometimes known as Flute-mouths, to distinguish them from the Pipe-fishes (*Syngnathidæ*), more nearly allied to the Sea-horses. To those who know the greedy little Sticklebacks of English ponds it may be interesting to learn that the members of the genus *Fistularia* are really gigantic marine Sticklebacks.

Glyphidodon brownriggi.

I have previously recorded this little fish from the island, and in a rock-pool secured a single example.

Parrot-fish. *Labrichthys inscripta.*

There are many other members of the family recorded from the island, but this was the only species that fell into our hands. Many examples, up to 20 inches in length, were taken by hook and line from the "Thetis," as she lay at anchor outside the lagoon.

Panther Flounder. *Rhomboidichthys pantherinus.*

Known from the Red Sea, the east coast of Africa, to the Malay Archipelago, and beyond, this species has not before been enumerated from Australian waters, whence the only other species of the genus known was described from Port Jackson by the late Sir Wm. Macleay. Our only example was netted in the seine within the lagoon.

* **Garfish.** *Hemirhamphus intermedius.*

Walking along the sandy beaches, within the lagoon, a visitor is struck with the enormous quantities of Garfish frisking about almost at his feet. The boys wade in a few yards and catch large numbers merely by throwing in a baited hook and line. They are extremely fine fish, and by drawing the seine can be obtained in almost any quantity.

Painted

Painted Eel. *Muraena nebulosa.*

Collecting on the reef, in company with Mr. Etheridge and one of our boys, we disturbed one of these beautiful eels, and in turn all had it in our hands; it, however, fully maintained the proverbial reputation of the eel family, and finally escaped into deep water. I afterwards saw another example, and the boys told me that it is very common on the reef, but is sometimes not seen until almost trodden upon, so well does its striking colouration harmonise with the coral-formation among which it lives.

Silvered Leather-jacket. *Monacanthus nitens.*

Four years ago I first recorded this pretty little species from the coast of New South Wales, the only time it had been taken in Australian waters, and I am now able to add it to the known fauna of Lord Howe Island. It was swimming in a rockpool on the east side of the island, and I secured it by baling out the water.

Box-fish. *Ostracion fornasini.*

One specimen only was taken in the seine; the species has been previously recorded from the island, and is said to be occasionally washed ashore after storms.

Toado. *Tetrodon stellatus.*

Known from Port Jackson, and widely distributed from the Indian and Pacific Oceans, and extending to the Red Sea, and the African coast, this species has not been previously recorded from Lord Howe Island. Two small specimens were taken within the lagoon by means of the seine.

ANNUAL REPORT.

To The Honorable Sydney Smith, Esq., M.P., Minister for Mines and Agriculture,
&c., &c.

Sir,

I do myself the honor to submit the following report upon the working of that division of the Department under your control, which deals with mining interests, also the progress of mining and the results obtained during the year 1897.

I am pleased to acknowledge the ready assistance and the zeal which the heads of the branches and the gentlemen under them have at all times devoted to the work of the Department, thus enabling me to keep abreast of the business with the decrease in the staff at my command. It is also gratifying to note that the Wardens, Mining Registrars, and other officers under them on the fields—many of whom were comparatively strange to the work owing to the changes effected by the Public Service Board—are now thoroughly initiated in their duties, and the field work is proceeding in a manner deserving every commendation.

LEASE BRANCH.

MINING ON PRIVATE LANDS.

The number of applications for special or owners' leases, lodged in terms of section 25 of the Mining on Private Lands Act of 1894, during the year ending 31st December, 1897, was 89, covering an area of 1,863 acres 3 roods 13 perches.

The number of ordinary or general leases (other than by owners of the land) applied for during the same period, was 109, covering an area of 1,213 acres 0 roods 9 perches.

The total number of applications lodged during the year was 198.

The aggregate area applied for was 3,076 acres 3 roods 22 perches, as under:—

	a.	r.	p.
Gold	2,103	0	8
Silver	376	0	0
Gold and silver	40	0	0
Silver and lead	460	0	0
Tin	20	0	0
Machinery sites, races, &c.	77	3	14
Total	3,076	3	22

During the year 542 applications were dealt with, covering an aggregate area of 16,799 acres 1 rood 33 perches.

Of this number 364 were approved, of which 163 were for special or owners' leases, and 201 for ordinary or general leases. The total area for all leases approved being 10,844 acres 3 roods.

The balance of the number dealt with, viz., 178, were refused for various reasons, covering an area of 5,954 acres 2 roods 33 perches, and of these 88 applications were for special or owners' leases, covering an area of 4,280 acres 2 roods 2 perches, and 90 were for general or ordinary leases, embracing an area of 1,674 acres 0 roods 31 perches.

Of the 364 applications approved—

341 were for leases to mine for gold, covering.....	9,741	2	35
2 " " silver "	120	0	0
2 " " gold and silver.....	660	0	0
1 " " silver and lead.....	80	0	0
2 " " tin.....	130	0	0
16 for machinery sites, races, dams, &c.	113	0	5
	10,844	3	0

The number of applications of all kinds lodged during the past year, is less than those made during the previous year, the decrease being in both special and general leases, the numbers being respectively:—

1896.		a.	r.	p.
Special leases	183	area 3,193	0	0
Ordinary or general leases	307	" 3,423	0	37
	490	" 6,616	0	37
1897.				
Special leases	89	area 1,863	3	13
Ordinary or general leases	109	" 1,213	0	9
	198	" 3,076	3	22

But the number of applications which received the approval of the Governor, during the year 1897, very much exceeds that of the previous year, although the area so dealt with is less—the applications approved during 1896 being 230, area 14,063 acres 3 roods 5 perches; during 1897 being 364, area 10,844 acres 3 roods—and is accounted for by the fact that comparatively few of the applications for special leases were approved for large areas.

Besides the areas applied for to lease, 578 authorities to enter and mine on private lands have been granted by various Wardens, in terms of section 2 of the Mining Laws Amendment Act of 1896, embracing an area of some 7,268 acres, as per table, as under:—

To mine for gold	532	area 5,355 acres.
" silver	29	" 1,114 "
" silver and lead	8	" 419 "
" gold and silver	2	" 20 "
" tin and silver	1	" 40 "
" silver, tin, and lead	1	" 80 "
" tin	5	" 240 "
	578	7,268 acres.

Also 97 agreements between the owners of private lands, in terms of section 11 of the Mining Laws Amendment Act of 1896, have been submitted for your concurrence; but in the great majority of the cases this could not be given, either because the land sought to be so dealt with was "alluvial" land, which, under the section 11, is exempt from such agreements, or because of other informality; but doubtless the most of the parties have taken advantage of other sections of the Acts. In only 25 cases could your concurrence be given, and the area embraced is some 360 acres.

In addition to the holdings above specified, some 160 agreements between the owners of alienated lands and holders of miners' rights or mineral licenses have been registered by the various Mining Registrars, and a considerable area of land is held under prospecting licenses granted by the various Wardens, but information as to the quantity so held is not readily obtainable.

The decrease in the number of applications lodged for ordinary or general leases during 1897, as compared with the previous year, may be accounted for by the operation of the Mining Laws Amendment Act of 1896, which came into force on the 10th December, 1896. This result was fully anticipated, the mining public having to a very great extent taken advantage of the privileges conferred under the various sections of the Act. Under section 2 of the Act referred to, any holder of a miner's right may apply to the Warden of the district in which the private land desired to be prospected is situated for an authority to enter and prospect and mine for gold, provided such land is subject to the provisions of the Mining on Private Lands Laws, and on the issue of such authority and payment to the owner of rent, as fixed by the Warden, and compensation to the Warden, for the owner, as assessed by him, may carry on mining operations during the currency of the authority, which may be for a period of twelve months, renewable by the Warden, and, during the currency of the authority, provided the rent be paid up, the holder may apply for a lease of the land so held, or any part of it, for mining purposes.

These remarks apply also to the holder of a miner's right or mineral license, with regard to mining for silver, lead, tin, or antimony on private lands, provided the minerals in the land are reserved to the Crown.

There is little doubt that many persons who desired to obtain access to private land have taken advantage of facilities provided under this section of the Mining Laws Amendment Act of 1896, and have, without having to wait for a lease, proved the land to their satisfaction, only applying to lease in those cases where results or prospective results have warranted further expenditure, and in cases of failure have abandoned the land, and in this direction the Act appears to give much greater satisfaction than that which it partially superseded.

Taking a general view of the matter, seeing the number of applications made for leases, and of authorities to enter that have been issued, the operations under the Mining on Private Lands Laws have been very satisfactory.

MINING ON CROWN LANDS.

With regard to the acquisition of Crown lands for mining purposes, the number of applications made during the year ending 31st December, 1897, was 1,498, for an aggregate area of 22,664 acres 0 roods 39 perches.

Of these, 1,224 were for lease for gold-mining, for an area of	a.	r.	p.
and the balance, 274, for mineral leases, for an area of	9,197	2	21
		13,466	2	18
		22,664	0	39

The number of applications dealt with during the same period was				
1,871, of which 1,581 were for lease for gold-mining, for an area of	...	12,707	0	3
and 290 were for mineral leases, for an area of	12,412	0	0
		25,119	0	3

The

The following table shows the areas applied for during the year ending 31st December, 1897, and the minerals and metals to be mined :—

	a.	r.	p.		a.	r.	p.
Gold	9,197	2	21	Cinnabar	80	0	0
Silver	936	1	11	Silver, lead, copper, and zinc	40	0	0
Copper	1,240	0	0	Silver, lead, iron, and copper	210	0	0
Copper and silver	421	0	0	Opal	20	0	0
Coal	999	0	0	Silver, lead, and iron	74	0	0
Silver, lead, and copper	3,113	2	34	Tin and copper	35	0	0
Coal and shale	4,255	0	0	Silver and lead	860	1	13
Tin	140	2	0	Antimony	227	0	0
Marble	40	0	0	Oxide of iron	20	0	0
Diamonds	120	0	0	Copper, silver, and tin	40	0	0
Tin and diamonds	110	0	0	Silver, lead, and zinc	79	3	0
Manganese	86	0	0	Limestone	84	0	0
Ironstone	80	0	0	Wolfram	40	0	0
Silver, bismuth, and copper	75	0	0				
Silver, lead, and tin	80	0	0	Total	22,704	0	39

The area held under applications for leases which had not received the approval of the Governor-in-Council on the 31st December, 1897, was :—

	a.	r.	p.		a.	r.	p.
Gold	1,797	1	21	Copper and silver	80	0	0
Copper	571	0	0	Coal	168	0	0
Silver	290	0	0	Limestone	20	0	0
Coal and shale	2,380	0	0	Antimony	40	0	0
Copper, silver, and lead	340	0	0	Silver and lead	154	0	0
Iron flux	80	0	0	Tin and diamonds	100	0	0
Marble	40	0	0				
					6,061	1	21

MINING ON AND UNDER RESERVED LANDS, ROADS, &C., UNDER AUTHORITIES GRANTED IN TERMS OF SECTIONS 27 AND 28 OF THE MINING ACT OF 1874.

The number of applications received for permits or authorities to mine, in terms of sections 27 and 28 Mining Act, 1874, on and under roads, reserves, &c., during the year 1897, was 214, being 32 less than 1896.

The number dealt with during the year was 224; of these, 97 were granted and 127 were refused, showing a decrease of 78 on the number of similar applications dealt with during the year 1896.

The following table shows the area of reserved lands comprised in permits or authorities granted during 1897, and minerals to be mined :—

	a.	r.	p.		a.	r.	p.
Coal	5,662	3	12	Tin and gold	1	0	0
Shale	1,905	3	9	Copper and silver	40	0	0
Coal and shale	20,656	0	30	Silver and lead	2	0	33
Gold	273	1	21 $\frac{3}{4}$	Gold and silver	12	0	0
Copper	95	3	9				
Cobalt, nickel, and manganese...	5	1	14		28,654	2	8 $\frac{3}{4}$

This table shows the area of reserved land held under authorities to mine, issued prior to 1897 and in force on 31st December, 1897, and minerals to be mined :—

	a.	r.	p.		a.	r.	p.
Coal	16,258	0	37	Copper	64	0	15
Shale	8	2	32	Gold	190	2	25
Coal and shale	1,472	1	36		18,117	3	13
Tin	123	2	28				

This table shows the area of reserved lands held under authorities in force on 31st December, 1897, and minerals to be mined :—

	a.	r.	p.		a.	r.	p.
Gold	308	3	32	Cobalt, nickel, and manganese ...	5	1	14
Coal and shale	8,783	2	5	Tin	123	2	28
Silver and lead	2	0	33	Shale	8	2	32
Coal	19,472	1	38		28,859	1	9
Copper	154	1	27				

The areas granted under these sections during the year 1896 exceed that during 1897, the falling off during last year being principally in lands to be mined for coal and shale, but there was a slight increase in copper lands granted during 1897 over that granted during the previous year.

The areas held under authorities in force on 31st December, 1897, show a considerable increase on that held on 31st December, 1896—the increase being 5,863 acres 2 roods 13 perches.

AUTHORITIES TO DIG AND SEARCH ON CONDITIONAL LEASEHOLDS.

During the year 86 applications were received through the Warden's offices for authorities to dig and search for gold and other minerals on lands which have been conditionally leased. Of these only 18 could be favourably considered and they have been granted and authorities have issued. The applications which have been granted were for authorities to dig and search for minerals other than gold, silver, lead, tin and antimony, the remainder being for authorities to dig and search for the minerals specified, and which can be dealt with under the Mining on Private Lands Act, were declined and in those cases where the conditional leaseholds had not been brought under the operation of the Mining on Private Lands Act, the necessary proclamation under the Mining Laws Amendment Act was published and the applicants were notified that they could proceed under any one of the several provisions of the Mining on Private Lands laws. In cases where the conditional leases had already been made subject to the above laws the parties were notified as to how to obtain the right to conduct mining operations on these lands. In a good number of these cases the applicants have in consequence of these notices proceeded under one or other of the provisions of the Acts, and in very few cases have any complications arisen. In those cases where any clashing of interests has taken place, the Warden who had charge of the matter has been able to adjust the interests, placing the parties entitled to the land in occupation.

As before mentioned, the Mining Laws Amendment Act of 1896 came into force on 10th December, 1896. Under section 7 of this Act any conditionally leased land may by proclamation in the *Government Gazette* be brought under the operation of the Mining on Private Lands Act, and this Act removed a very inconvenient disability which formerly existed regarding the power to authorise mining on these lands. When the Act came into operation some 200 applications for authorities to dig and search on these lands were in abeyance, but as early as could possibly be done the conditional leases affected were proclaimed to be private lands under the provisions of the Act, and each applicant for authority was given beforehand notice of the date on which he could proceed to obtain the right to operate on the lands. This necessitated the issue of a great number of notices which were sent under registered covers, and although many of the applicants took advantage of such timely notice and proceeded under the directions given I am pleased to be able to state that no serious hitch occurred, and in the very few cases where any clashing of interest did occur the matters were definitely settled by the Warden in charge of the district, and the persons entitled to the land were placed in occupation. Whilst dealing with this question I may state that during the year some 82,129 acres of conditionally leased lands were brought by proclamation under the operation of the Mining on Private Lands laws as per Schedule hereto, thus opening to the prospector a very large area which previously was practically closed to him or only capable of entry under very unsatisfactory conditions, and the records of the Department show that a very large number of authorities to enter in terms of section 2 of the Mining Laws Amendment Act of 1896, as well as several agreements under section 11 of that Act, embrace portions of these conditionally leased lands. I might here remark that in this matter as well as in connection with section 2 under which authorities to enter and mine on private lands are issued the Mining Laws Amendment Act has operated so well as to fully justify the anticipation expressed in my report for the year 1896.

TABLE of Conditional Leases proclaimed to be subject to the provisions of the Mining on Private Lands Laws.

* Proclamations of 14/9/97 to take effect from 16/7/97.

During the year 1897 only twelve applications were made by owners of alienated lands for permits to mine for and remove the minerals in the land which, under the terms of alienation, were reserved to the Crown, but this may be accounted for by the operation of the Mining on Private Lands Acts, which provide for mining on these lands for gold, silver, lead, tin, and antimony.

Of these applications six were granted and permits issued, being to mine for minerals other than those enumerated above.

During the same period seven applications were made for authorities to dig and search for gold, &c., on residential leases on gold and mineral fields. Of these, two were approved and authorities issued, and five had to be refused.

Under section 23 of the Crown Lands Act of 1895 provision is made for the granting of settlement leases over somewhat extensive areas of Crown lands. The lands embraced by these holdings are exempt from the operation of the Mining Act of 1874, and also from the provisions of the Mining on Private Lands laws, but the Secretary for Lands has made provision in the form of lease to be issued for authorised search for gold and minerals, and on discovery for the resumption of so much of the leasehold as is required for mining purposes. Under this provision any person duly authorised by the Secretary for Mines may enter and search for gold or other mineral on such portion of the settlement lease as may be suitable, but so as not to interfere with any improvements on the land; and in the event of discovery so much of the settlement lease as may be required for mining purposes may be resumed or withdrawn therefrom if the importance of the discovery warrant such a course, when the discoverer will be held to be the first applicant for a claim or lease, as the case may be, of the land or part thereof occupied by him for the purpose of searching.

During the year only three such applications have been lodged, and of these two have been approved and one refused; but it is anticipated that in the future when it is generally known that these leaseholds can be operated upon in the above manner a considerable number of these authorities will be applied for. It is not expected that this system of searching will prove more satisfactory than did the almost same method operate in connection with conditional leases under the Mining Act of 1889, being somewhat cumbersome and, on account of delay to the prospector, by reason of the necessary action to be taken before he can make a good title to the land likely to cause serious dissatisfaction and trouble, but the method of procedure is the best that can at present be arranged. The matter will not be lost sight of, and endeavours will be made to have the system improved.

Another matter I would invite attention to is the Church and School Lands Act of 1897, which came into force on the 6th December last. Under this Act, all Church and School lands become Crown lands under the Mining Act of 1874, and can be so dealt with. This will throw a considerable area of auriferous and mineral lands open to occupation under the Mining Act of 1874, which previously could only be occupied under the Church and School Lands Mining Acts, and will probably result beneficially far as mining occupation is concerned.

It is also provided that the lessee under any lease of Church and School lands for mining purposes now in force, may apply within a period of six months from the date of this Act, to convert his lease into a lease under the provisions of the Mining Act of 1874.

The investigation of titles under the Mining on Private Lands Act has, since April, 1896, been carried out in the Department.

In all applications for leases under this Act it is necessary to investigate the title to the land applied for, in order that the proper persons may be joined in the lease, and the compensation money and rent made payable to the persons entitled thereto. This work involves a large amount of searching in the Land Titles Office, Registrar-General's Office, &c., and the perusal of a large number of title deeds, &c. In many cases, owing to the unwillingness of owners to produce evidence of their title, the investigation has been made from such information as could be obtained from the records of the Registrar-General's Office, and from other available sources. The same work has had to be carried out in regard to the payment of compensation to owners under authorities to enter issued under the Mining Laws Amendment Act, the Department having to be satisfied as to ownership before payment of the money can be authorised. Applications for permits under section 7 of the Land Act, 1884, have also entailed similar work.

The undermentioned cases have been dealt with by the officers in charge of this work :—

REGISTRAR LEASE AND INQUIRY BRANCH.

The following table, giving area of Crown and private lands held under lease at the 31st December, 1897, and the minerals to be mined for, shows satisfactory progress in the mining industry.

The area held for gold-mining purposes is 9,166 acres in excess of that under lease on the 31st December, 1896; of this 4,567 acres were for leases taken up on private property, the balance being Crown lands. There is also an appreciable increase of nearly 6,000 acres in coal and shale lands, and many of the leading minerals show satisfactory improvement.

As regards diamond-mining there are now about 3,000 acres under lease, and in the Bingara district efforts are being made to bring a permanent supply of water on to the field. Should this be accomplished, there is no doubt that this class of mining will receive a good impetus.

During the year 442 gold leases, representing 2,693 ac. 2 rd. 36 per., 120 mineral leases, representing 4,188 ac. 1 rd. 16 per., and 5 private lands leases, representing 2,540 ac. 1 rd. 42 per., were cancelled. The total area of land thus thrown open was 9,422 ac. 1 rd. 14 per., and nearly 75 per cent. of this area has since been re-applied for.

There has also been a noticeable increase in the transfers of mining properties registered in the Department, which may be regarded as indication of the increased activity in mining generally.

A marked improvement, and one which is appreciated by the public, has been made in the system of issuing plans. In place of the ordinary lithograph, which is necessarily at times months behind date, the Department is issuing heliographs for the principal districts, and the public are now able to obtain information up to the date of inquiry. This arrangement has, I am pleased to say, given very general satisfaction.

As an evidence of the work performed by the Department throughout the year attention is invited to the fact that 1,700 leases were delivered, and, allowing for the leases cancelled, there are now 1,133 more leases in force than at 31st December, 1896.

The rents and royalties have been, as a rule, promptly paid, and less difficulty has been experienced in collecting the revenue this year than hitherto.

RETURN

RETURN showing the area of Crown and Private Lands held under Lease at 31st December, 1897, and the Minerals, &c., to be mined for.

THE COAL MINES REGULATION ACT, 1896.

This Act, which came into force on the 1st October, 1896, repealing an Act passed in 1876, has been found to work well. A very complete report on the working of our collieries during the year, by Mr. A. A. Atkinson, the Chief Inspector of Collieries—who arrived from England early in September to take up the position—forms an appendix to this report.

THE PROSPECTING BOARD.

The amount of the Prospecting Vote for the year is again £25,000.

During the year 1897 prospecting operations have been vigorously carried on throughout the Colony, both under the vote and also by means of private enterprise.

A matter which has received the Board's attention during the year is the question of increasing the reward of £1,000 offered for the discovery of payable quartz at a depth. It is a noteworthy fact that the deepest quartz mine in New South Wales has only reached a little over 1,000 feet in depth, while in Victoria payable stone is being raised from five mines over 3,000 feet in depth, and from seven mines over 2,700 feet in depth; the deepest being Lansell's No. 180, at Bendigo, which, at the end of 1896, had reached

reached 3,352 feet. At Charters Towers the shaft on the Brilliant Extended Block is down 2,558 feet, while the Brilliant Extended shaft is only a few hundred feet less. The saddle formation, which occur in the districts referred to, are favourable to deep sinking. This fact should not, however, deter our mine owners from exploiting their ground at a greater depth. With the object of testing the reefs on the Wyalong field at a lower level, the Board recommended that aid be granted to the Lighthouse claim to continue the 360-foot shaft to 500 feet. At the end of the year the shaft had reached 504 feet.

The following is a copy of the amended notice of reward for deeper sinking:—

AMENDED NOTICE OF REWARD FOR DISCOVERY OF PAYABLE GOLD AT A DEPTH.

NOTICE is hereby given that the following rewards are offered for the discovery of payable gold at deep levels, viz. :— £2,000 to the person or persons who shall first discover and make known to the Minister for Mines and Agriculture a payable gold deposit at or below 1,500 feet, and £3,000 to the same or other person or persons first discovering and making known to the aforesaid Minister payable gold at or below 2,000 feet.

The depths in each case being measured from the top of the shaft, which may be vertical or inclined.

The deposit in each case shall be deemed payable when 250 tons from it have been broken down, raised, and treated (at approved works) from or below the depths named, under the supervision of officers of this Department, and when the claimant or claimants prove to the satisfaction of the Minister for Mines and Agriculture that such operations have been attended with profitable results.

The right is reserved by the aforesaid Minister to make check-tests of stone to be treated.

The reward to lapse if not claimed within five years after date of this notice.

The proposed Drainage Race, Araluen Valley.

Consideration of this scheme has received the Board's earnest attention; but in view of the importance of the undertaking, and the large amount required to carry out the work, it was decided to have the most complete information on the subject before making their recommendation to the Minister. With this object in view, Mr. Geological Surveyor Watt, M.A., &c., was instructed to proceed to the Valley and make a thorough examination of the locality likely to be affected by the proposed race. Mr. Watt went fully into the matter; and as his report will prove of interest to a large number of miners and others interested in the proposal, it is given in full.

THE ARALUEN VALLEY AND ITS ALLUVIAL DEPOSITS.

The valley of the Araluen Creek, which is formed by the junction of Major's, Deep, and Bell's Creeks, has a general north-west and south-east trend, and is almost entirely surrounded by elevated mountains.

The part of the valley considered in this report is 3 miles in length and three-quarters of a mile in width, and lies between the village of Araluen and Crown Flat.

Owing to the fact that the creek hugs its south-west bank, no alluvial deposits of any extent occur on that side; but on the other side alluvial deposits and talus slopes extend for at least half a mile from the present bed of the creek.

The area covered by these deposits in this part of the valley is a large one, as shown on the accompanying map by letters A, B, and C.

Of the areas so marked on the map, A represents approximately the extent of the worked ground. The other two areas, marked B and C, indicate roughly the extent of the unworked or "virgin" ground.

The object of indicating them by different letters is to emphasise the fact that the deposits covering those areas differ widely in their character and origin, and must, therefore, be considered separately.

Worked Ground.

The alluvial workings have been almost entirely confined to an average width of about a $\frac{1}{4}$ of a mile, and include the present creek bed.

This ground, which has yielded an enormous amount of gold, has been completely worked out, with the exception of a few isolated blocks. These scattered, unworked pieces of ground were left standing owing either to the poverty of their contents or to the difficulty of coping with the water.

Unworked Ground.

Of the "virgin" ground the blocks in the bed of the creek mentioned above do not require serious consideration in connection with the proposed race owing to the paucity of their number, their small size, and the doubtful value of their auriferous contents.

In Bruce's claim, which is situated on the edge of the *unworked ground*, marked "B," there is some evidence that the creek deposits are beginning to taper off against the talus slopes from the mountains on the north-east side of the valley. In the open workings on this claim it was observed that on the creek side the depth of wash was about 10 feet, while on the hill side it did not exceed 4 or 5 feet.

Work on the claim adjoining Bruce's on the north-west was suspended on account of the poverty of the ground, caused by the presence of large blocks of barren deposits.

Within the same area, and on the hill side of these claims, some prospecting was done in 1882 by the owners of the Burrell Estate. Seven or eight shafts were sunk and a little driving done without discovering anything of a payable nature. I was informed that the sinking varied from 5 to about 20 feet, and that merely colours of gold were obtained.

The shallow sinking on the sites of the prospecting shafts compared with that in the bed of the creek, which is nearly 30 feet, indicates, what might have been surmised, that the bed-rock rises as we approach the foot of the mountains, making it probable that the greater portion of the gold, which in the Araluen Valley is invariably fine, would have been swept down into the main channel of the creek.

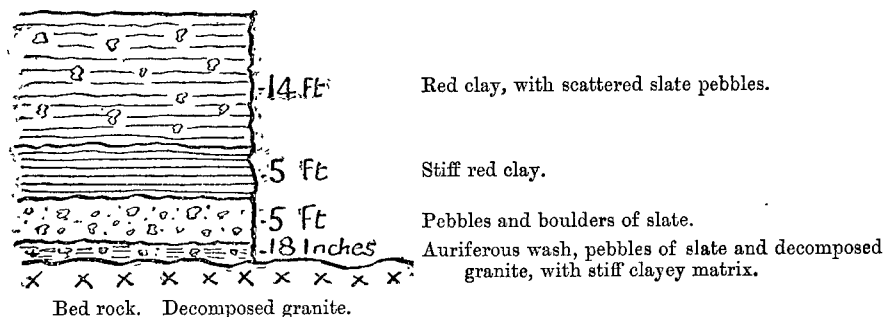

The following is a section of the deposits as seen in Bruce's claim:—

It will be observed that, with the exception of the 3 feet of loam at the surface, the strata consists of sand with numerous boulders of granite at the base.

The other division of unworked ground, viz., that marked C as mentioned above, differs widely in structure and probable origin from that just described.

As seen in the accompanying sketch, the strata exposed in Barrett's claim consists very largely of red clay, with scattered pebbles and boulders of slate. The wash, which varies in thickness from 4 feet on the creek side to about 18 inches on the hill side, is of a very stiff clayey nature, and rests on a bed-rock of granite.

As to the origin of the greater portion of the materials composing these deposits, I think there can be little doubt but they have been brought down by Stony Creek, which flows over altered slates near the junction of the granite and the sedimentary strata.

There are two claims (Barrett's and Doogan's) in which work is being done on the edge of this ground, and from both of which fairly payable results are being obtained.

Emphasis is laid on the difference in the character and probable origin of the materials covering this area from those occurring in the main creek, for the purpose of showing that it is impossible to argue in favour of the presence of gold over the hatched area (C) from the circumstance that it was present in large quantities in sandy deposits (A) of the main creek.

Schemes proposed.

In November, 1892, a proposal was made to cut a race up the valley for a distance of about $3\frac{1}{2}$ miles, to drain off the water and enable the ground to be worked without incurring the heavy expense entailed by the employment of steam pumps.

This proposal was subsequently modified, levels were taken, and later borings put down by the Water Conservation Department to enable an estimate of the cost of the race to be arrived at. The revised estimate of the cost of the proposed race of the size and length suggested—viz., 6 feet high, 6 feet wide at the base, and 5 feet at the top, and $2\frac{1}{2}$ miles in length—is about £11,000.

A modification of the size of the race has been suggested to me by several of the Araluen diggers. It is very generally held locally that a race of the proposed size would be much larger than what is required, and that one 4 feet square in section throughout, or 4 feet square at the upper end and 5 feet square at the lower end, would be large enough, and could be constructed for £6,000 or £7,000.

In the absence of the requisite data I am not in a position to comment on this suggested modification, but simply put it forward for consideration as the opinion expressed to me by several of those locally interested.

In support of the scheme it may be urged that—

- (a) As described above, there is a fairly large area of unworked ground, some portion of which may possibly carry gold in payable quantities.

Some of the most enthusiastic of the local supporters of the scheme even went so far as to assert that they thought the whole of the alluvial deposits in the creek bed would pay to put through, if, as they thought probable, the men were in the near future reduced to work for about £1 per week.

These deposits comprise the whole of the worked ground, and consist for the greater part of old "strippings," "tailings," and "forkings." But as the concentration of the gold in the wash-dirt appears to have been fairly perfect, owing to the loose and open character of the overlying material, it might reasonably be expected that these would be of a very low value, and would scarcely pay, even under the most favourable circumstances.

- (b) There might be a distinct lead within the area occupied by the unworked ground, marked C, on the map. At the present time, however, there is practically no evidence of the existence of any such lead.
- (c) There would be a great saving in the cost of winning the gold, enabling ground to be worked which would otherwise not pay.

Against the proposed scheme it may be urged that—

- (a) Although a large area of ground is available for working, the little evidence that exists as to the value of the area marked B does not support the belief that extensive deposits of gold will be found on this land, while there is practically no evidence as to the value of the remainder of the unworked ground, viz., that marked C.
- (b) In the two claims (Barrett's and Doogan's) working on the red clay deposit, and on the edge of the area marked C, it is found possible to cope with the water at a trifling cost by means of a Californian pump, worked by a water-wheel. By this means the water is raised 9 or 10 feet to the level of a drainage race.
- (c) The greater part of the ground to be worked, being that portion, which it is acknowledged will be especially served by the proposed race, is similar to that met with in Barrett's and Doogan's claims, and it is, therefore, reasonable to suppose that—with tolerably favourable seasons—there will be no great difficulty in coping with the water.

Summary.

That there is a very large area of ground in the Araluen Valley which has not been worked can be seen on a glance at the accompanying map. This fact alone would not justify the construction of the proposed race, for the important question arises—does this "virgin" ground contain auriferous deposits of sufficient value to enable them to be profitably worked in the event of the race being constructed?

To this query I can only answer that on one portion of the ground, viz., that marked "B," there is a claim working apparently with payable results, but that all the indications point to a diminution in the yield of gold and, perhaps, its gradual disappearance as the workings advance towards the hills on the east side.

On the other portion, marked "C," we have to deal with deposits of different constitution and probably of different origin, on which practically no prospecting has been done.

The two claims working on the edge of it are obtaining results which, although they do not compare with those formerly obtained in the main creek leads, are yet considered payable. In the absence of evidence, furnished by prospecting, it can be only said that none of the rich leads have ever been traced into it, and that the very fact that so little work has been done on it indicates a want of faith in the value of the ground.

In conclusion, I can only say that as the justification for the expenditure of the large sum of money required for the proposed work must be found in reasonable expectations of the Government being recouped for its outlay, and as the present state of developments do not permit such expectations to be entertained, I cannot recommend the carrying out, at present, of the scheme.

I would, however, suggest that—as no doubt can exist as to the advisability of further prospecting the area marked "C"—nothing definite be done in connection with the construction of the race until the ground has been further prospected.

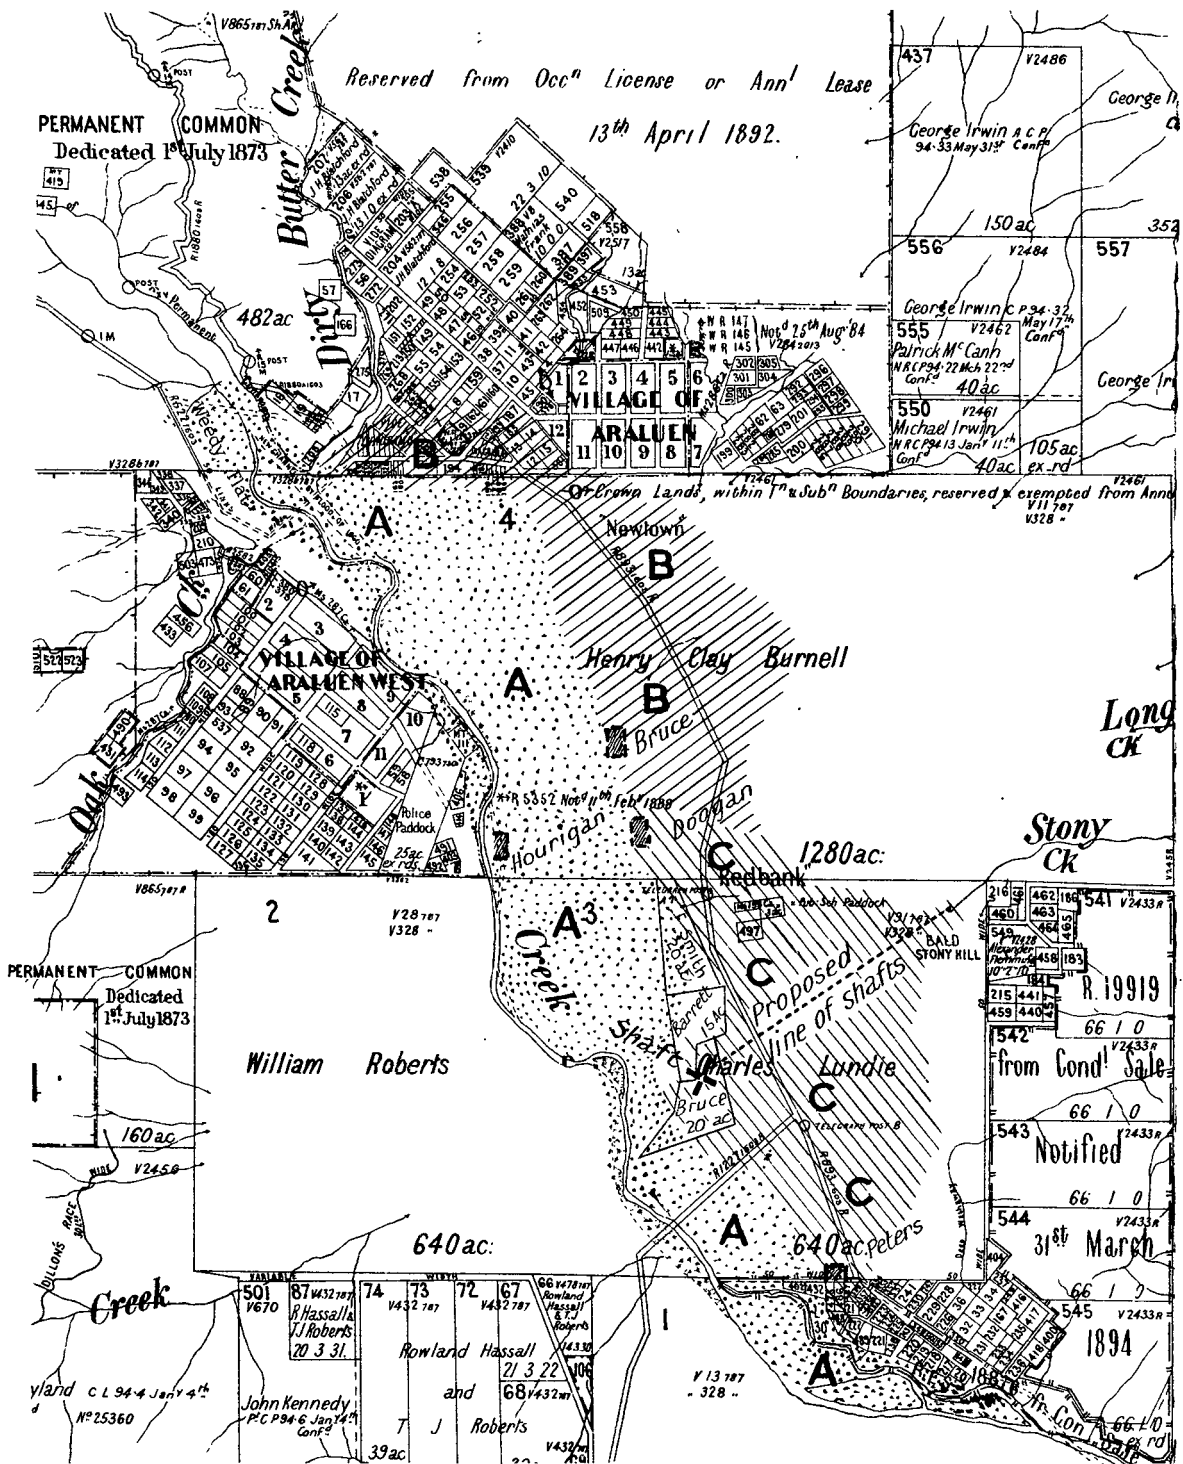

The Board unanimously adopted Mr. Watt's report. Tenders were called for, and the work is now proceeding. The result of the operations will settle the point whether the expenditure of the amount required to carry out the proposed race will be justified.

The geological examination and testing of the country lying on the Victorian Border have been completed by Mr. Geological-Surveyor Carne, F.G.S., and his report on the results from the examination forms an appendix. The

THE ARALUEN VALLEY

Parish of Araluen. County of St Vincent.

Scale 0 40 80 Chains

Reference.

- A A** Worked ground.
- B B** Un-worked do.
- C C** do. do.

The indications found by the Government diamond drill, prospecting for the deep lead at Forest Reefs, proved so encouraging that the promoters, known as the Ballarat Gold-mining Company, have started sinking on the lead, and they expect to reach bottom at an early date.

The Board held 36 meetings during the year. Of that number—

Mr. McLachlan, Chairman, attended	35	Mr. Watt, Geological Surveyor	20
Mr. Pittman, Government Geologist	20	Mr. Milne, Inspector of Mines	8
Mr. Slee, Chief Inspector of Mines	29	Mr. Godfrey,	1
Mr. Sullivan, Chief Clerk	...	Mr. Hooke,	4
Mr. Carne, Geological Surveyor	...	Mr. D. McCulloch, Secretary to the Board	36
Mr. Jaquet,	...				12

The absence of the Geological Surveyors and Inspectors of Mines in the country prevents their regular attendance.

Mr. E. C. Whittell, an officer of the Geological Branch, was kept fully employed during the year reporting on applications for assistance from the Vote, and has given satisfaction to the Board.

The total number of applications for aid received during the year was 1817, a slight decrease as compared with 1896.

These were dealt with as under:—

Aid granted in	1896.	1897.
Aid refused in	523 cases.	533 cases.
Applications abandoned	985 "	889 "
Applications for public batteries	39 "	68 "
For reward for the discovery of new gold-fields	41 "	13 "
For free treatment of ore	21 "	9 "
Miscellaneous cases	21 "	15 "
	212 "	292 "
	1,842 cases.	1,817 cases.
Applications awaiting inspection at the end of the year	59	43

The foregoing figures only give the number of the papers brought before the Board for discussion, the total number of communications received in connection with the administration of the Vote during the year being 5,223.

That the efforts made to have the applications dealt with as expeditiously as possible after receipt have been eminently successful is proved by the table, which shows that at the end of the year only 43 applications awaited inspection.

Some idea of the immense area of country to be dealt with by the Board may be gained from a glance at the following list of the localities visited during the year by the members. It will be seen that without a very large staff of officers it would be impossible to visit each locality oftener than twice a year, and in cases when applications are received from a district just after its inspection, some little delay must necessarily follow.

List of localities visited by the Board during the year.

RETURN

RETURN showing successful results from the Prospecting Vote during 1897.

1. *E. D. Considine and Party, one-mile north-west of Sunny Corner*, received aid to sink from the level of an old tunnel put in some years ago by the late Captain Johnson. At about 100 feet a reef averaging from 18 to 24 inches was struck. The last two crushings therefrom, 400 tons, yielded 265 oz., or at the rate of about 14 dwt. per ton. As the stone is easily got and can be treated cheaply, the party are well satisfied with their prospects.

2. *The Caledonian Gold-mining Company, Williamstown Flat, near Adelong*.—Early in 1896 this Company, consisting of a party of working miners, took up this land upon which a shaft had been sunk to 218 feet and abandoned. With the object of testing the reef at a greater depth, the Board recommended that aid be granted to continue the shaft to 300 feet, and at that level the reef averages 5 inches wide and showing gold in payable quantities.

3. *W. S. McAlister and Party, of Grey Mares, Bogong, via Kiandra*.—The site of this mine is situated about 15 miles north of Kiandra, and is inaccessible during certain months of the year. In 1894 operations were begun to sink on a promising reef which had been traced on the crown of the hill, but the water was found to be so heavy that work had to be suspended. After inspection, the Board decided to assist the party to put in a tunnel from the lowest possible level, with the result that at about 350 feet the reef was struck, averaging 2 feet 6 inches wide, and showing free gold right through the stone. On driving to the south the reef improved both in width and quality, and the party are now pushing on with the erection of the necessary crushing-plant. This discovery has led to a revival of prospecting operations in the locality.

4. *Benjamin Field* received aid to test a piece of alluvial ground upon the left-hand bank of Spring Creek, in the Moonbi District. On bottoming the shaft he was then working in, prior to starting work under his grant, he struck payable gold, and immediately wrote in reporting the fact, at the same time withdrawing all claim to the aid granted. This action on the part of Mr. Field is so rare that the Board consider it worthy of special mention. The lead has been proved to be about 90 feet wide with wash averaging 3 feet thick, and yields over 7 dwt. per ton.

5. *William Ovington, of the Victory Mine, Forest Reefs*, wrote to the Board as follows:—"I am happy to inform you that the Victory shaft has bottomed on one of the best leads that has ever been found in the Western District, the wash being between 6 and 7 feet thick, and going about 15 dwt. to the ton."

From 1891 to 1895 a considerable amount of money had been expended by the Department in testing this land. The original party had to abandon the ground, but it was again taken up, and from the information gained by the work carried out under the aid, the new party soon struck the lead as stated above.

6. *John Robyns* received aid to put in a tunnel on the north-east end of New Chum Hill, Kiandra. At 525 feet the wash dirt was struck 2 feet thick, averaging from 3 to 5 dwt. per ton. A large area of good payable wash has already been proved, and blocking out is now being rigorously proceeded with. The mine is now known as the Giandarra Gold-mine.

7. *Taylor and Walsh, "The New Come up Deep Lead," 13 miles E. of Bungonia*, were aided to sink a shaft with the object of testing the deepest part of the ground. The shaft bottomed in a natural basin, and the prospects were so promising that the party have applied for a lease of the land now held by them.

8. *George Parkhill, Mount Dromedary, near Wagonga*, received aid to continue their 210-foot tunnel another 200 feet. At 410 feet the vein is about 5 inches wide, and averages about 2 oz. of gold per ton. There is every appearance that the vein will increase in width as it is followed into the hill.

9. *B. Roberts and Party* were aided to further test the Old Condobolin Copper-mine at Condobolin. At the 44-foot level stone was struck, which, on a bulk treatment by the Illawarra Company, gave a general average of 19 per cent. of copper, 4 dwt. of gold, and 3 oz. 17 dwt. of silver per ton. A syndicate has been formed to work the property.

The Board dealt with 15 applications during the year for the free treatment of ore at the Government Metallurgical Works, but in 5 cases it was found, after careful inquiry, that the applicants were in a position to pay the usual charges, and these applications were refused. The Board are willing to assist the struggling prospector in this direction, but have a duty to perform in guarding the revenue from the works from imposition.

Nine applications for the reward offered for the discovery of new mineral fields were inquired into, but in no case was the applicant able to make good his claim.

A copy of the notice is again given in full for general information:—

REWARD FOR THE DISCOVERY OF NEW MINERAL FIELDS.

NOTICE is hereby given that the sums undermentioned will be paid as rewards for discovering, on and after this date, new Reefing or Alluvial Gold or Tin Fields, or new Deposits of Silver, Copper, Diamonds, or Precious Opal.

The sum of £500 will be paid to any person or persons who shall first discover a new Reefing or Alluvial Gold or Tin Field, or a new deposit of Silver, Copper, Diamonds, or Precious Opal, provided—

- (1) That the site of the discovery be distant not less than 10 miles from the nearest mine in which similar payable mineral has been or is being obtained.
- (2) That such discovery be made known to the Minister for Mines and Agriculture within what he shall deem to be a reasonable time after such discovery.
- (3) That if it be proved to the satisfaction of the Minister that within six (6) months after he has been notified of such discovery not fewer than three hundred (300) miners have been profitably employed in mining upon such field or deposit.

In the event of the Minister being satisfied that at the expiration of twelve (12) months after he has been notified of such discovery not less than five hundred (500) miners have been profitably employed in mining upon such new field or deposit, the discoverer or discoverers shall be entitled to claim a further sum of £500.

The Minister shall be the sole judge as to any matter in dispute in regard to an application for reward.

GEOLOGICAL SURVEY.

The Government Geologist, Mr. E. F. Pittman, has, as usual, employed part of his time in field work, the remainder being devoted to the supervision of his Branch.

A considerable number of papers in reference to proposals by the Lands Department for the cancellation or reduction of gold-field reserves, with a view to subsequent alienation, have been dealt with by him.

During the earlier months of the year he was engaged in investigating and mapping the geology of the Gunnedah Coal-field. He reports that a considerable amount of work still requires to be done before a geological map of this district can be issued.

He also assisted Professor David in a geological examination of a considerable area of the Moonbi Ranges, near Tamworth. He points out that it is important that the section of country between Tamworth and Gunnedah should be carefully studied, with the object of establishing the relationship between the Devonian and Carboniferous formations which are both represented there. Mr.

Mr. Pittman was also occupied with the work of the "Royal Commission on the Spontaneous Combustion of Coal Cargoes," of which he was a member. The Commission sent in its report on the 28th April, and was subsequently reappointed for the purpose trying further experiments, and of watching the effect of the recommendations already made.

In July Mr. Pittman made an inspection of the Wentworth Mines at Lucknow, and gave evidence in the District Court in a case of alleged ore-stealing.

During the early part of the month of September he accompanied Mr. Boulton, Superintendent of Public Watering-places, to Grenfell and Finley, near Berrigan. At the former place a number of springs were inspected, with the object of ascertaining whether boring for artesian water was advisable. He reported that the springs were merely local, and that the geological formations consisted of granitic and palæozoic rocks, so that there was no probability of artesian water being found in the neighbourhood.

At Finley a site for a bore was chosen, Mr. Pittman reporting that, although the occurrence of artesian water in this district is by no means certain, a trial bore is warranted, more particularly as the experience of the Hay Bore points to the probability of, at any rate, a sub-artesian supply being obtained.

Towards the end of the year the Government Geologist visited Western Australia, and was absent eight weeks. The object of this trip was primarily the inspection of the celebrated telluride deposits of Kalgoorlie. It was thought probable that similar deposits may occur in this Colony, but may have been overlooked by prospectors owing to their not being familiar with the rare, but extremely valuable, tellurides of gold, and to the fact that these ores may be easily mistaken for iron pyrites by the uninitiated. A voluminous report of the trip was submitted.

Very little geological surveying was performed during the year by the officers of this Branch, owing to the fact that a considerable portion of their time was occupied in reporting upon applications for aid from the Prospecting Vote; but the Public Service Board have approved of the appointment of two additional Mining Inspectors, and when these officers get fully to work the geological staff will be enabled to devote nearly the whole of their time to their more legitimate employment in the geological survey of the Colony.

The services of Mr. J. A. Watt, M.A., B.Sc., were secured for the position of third geological surveyor on the 3rd March. Mr. Watt had a very successful career at the Sydney University, and was highly recommended to the Public Service Board by Professor David. He has already given satisfactory evidence of his fitness for the position.

Mr. J. E. Carne, Geological Surveyor, was occupied for about four months in continuing the prospecting operations, which were commenced during the previous year, along the Victorian Border. The results, so far as the discovery of payable deposits, were unsuccessful.

He also made an examination and report on the site of the proposed dam at Denman, in connection with the scheme for the prevention of floods in the Hunter Valley.

Mr. Carne, in addition to dealing with a number of Prospecting Vote cases, and performing the duties of Acting Government Geologist during Mr. Pittman's absence in Western Australia, furnished the following reports:—

1. On the Geology and Mineral Resources of the south-east border of New South Wales, between Cape Howe and the head of the Murray.
2. On the "Luck of Roaring Camp" Reef, near Brown's Camp, Victorian Border.
3. On the Geology and Auriferous Deposits of the Wolumla Gold-field.
4. On the Occurrence of Tungsten Ores in New South Wales; with a Register of Localities.
5. On Chrome Iron Ore: Its Mode of Occurrence, Mining, Dressing, Uses, and Value; with a Register of New South Wales Occurrences.

Mr. Geological-Surveyor J. B. Jaquet's time has been mainly occupied with applications for aid from the Prospecting Vote, and Lands Office papers referring to proposed cancellation of gold-fields. He has also furnished the following reports:—

1. On a Supposed Diamantiferous Volcanic Pipe at Bingara.
2. On Rigby's Reef, near Major's Creek.
3. On the Bundarra Copper Lode.
4. On the Newly-discovered Deep Tin Lead, near Elsmore.
5. On a Further Examination of the Ironstone Deposit, near Seaham.
6. On the Cobaltiferous Deposit at Port Macquarie.

Mr.

Mr. Geological-Surveyor J. A. Watt was employed, in conjunction with Mr. Jaquet, in examining and reporting upon the Captain's Flat lodes. Mr. Watt, in addition to dealing with a large number of Prospecting Vote cases, supplied the following reports:—

1. On a Supposed Diamantiferous Deposit on portion 292, parish of Upper Tarlo, county of Argyle.
2. On the Iron Ore Deposits of Carlo's Gap.
3. On Winter's Reef, parish of Barratta, county of Cunninghame.
4. On the Nanima Creek and Gooda Gold-fields.

The Curator of the Museum, Mr. G. W. Card, has completed the arrangement and labelling of the rock and mineral collection, while Mr. W. S. Dun, Assistant Palæontologist, has done the same with the fossil collection. The Museum, therefore, now offers special facilities for students and mining men to acquire a good knowledge of the rocks and mineral deposits of the Colony.

LIMESTONE CAVES.

For some years past complaint has been made of the accommodation for visitors at the Jenolan Caves. Arrangements were therefore made to resume the premises forming the old accommodation house occupied by Mr. Jeremiah Wilson. The Government Architect was authorised to prepare designs for a new building. One wing of a new structure has been completed. It has an imposing and picturesque appearance. It is solidly built of limestone, and contains ample accommodation. The dining-room is capable of seating sixty guests. For the recreation of visitors a detached billiard and smoking room has been erected.

It is proposed to let the premises by tender, and it is hoped that visitors will shortly find themselves as comfortably provided for as if at home.

In other directions no trouble has been spared to add to the attractions and convenience of the Jenolan Caves.

The Public Works Department has completed on the main road leading to the caves house one of the most beautiful little bridges in the Colony, built of limestone.

Many improvements have been carried out in the caves themselves. New entrances have been constructed where access was not easy.

The Director of the Botanic Gardens has been invited to remodel the plantations and to terrace and plant the slopes surrounding the accommodation house.

Plans of the caves will be found at the end of this report.

MINING SURVEYS.

The number of mining surveys made during the year was 1,366. Of these, 936 were made by surveyors on salary and 430 by surveyors remunerated by fees paid by mining applicants.

At the beginning of the year there were 6 surveyors on salary employed by the Department. Four of these have since been transferred from the temporary to the permanent staff of the Department; 1 voluntarily retired in the month of January; and 1 has been retained on a temporary basis—the exigencies of the work up to the present necessitating his continuous employment.

At the close of the year there remained only 107 cases awaiting action by surveyors, and all of these related to applications very recently made.

The 1,366 surveys made comprised the following:—

Gold leases	882
Mineral leases	124
Mining tenements	117
Mining permits	41
Private land leases	200

Two underground surveys of the previously unsurveyed parts of the Hetton and Stockton Collieries were also made for the purpose of determining whether encroachment of coal-workings had occurred upon land adjoining the colliery properties.

CHARTING, &c.

Mining Leases on Crown Land.—The number of gold and mineral lease applications relating to Crown land dealt with in the Charting Branch during the year was 1,820.

Mining Permits.—The number of 27th and 28th section applications dealt with was 227.

Mining Leases on Private Land.—456 applications to lease land under the provisions of the Mining on Private Lands Acts were dealt with.

Mining

Mining Tenements.—305 plans of measurements under the Mining Board Regulations were examined and charted.

Mining Lease cases outstanding at close of year.—At the close of the year there remained undealt with in the Branch 49 gold and mineral lease applications, 3 applications under 28th section, and 9 applications for leases of private land.

Authorities and Agreements, M.P.L. Acts.—During the year 659 applications for authorities to enter private land for mining purposes, and 174 agreements relating to mining on alienated land were investigated and dealt with.

Reserves under 26th section, Act of 1874.—109 reserves, under 26th section of the Mining Act of 1874, were described, gazetted, and charted.

Mining District and Divisions.—In 123 cases alterations were made in the boundaries of mining districts and divisions. This was necessitated by the policy of the Public Service Board in determining that Police Magistrates should have jurisdiction as Mining Wardens over the localities in which their ordinary judicial duties were performed. The alterations involved the preparation of many elaborate descriptions and illustrative maps.

Notation of Plans.—1,346 notations of transactions relating to leases, &c., were made upon plans during the year.

Plan Drawing.—1,472 plans of mining surveys were drawn.

Heliography.—6,736 heliographs and ferrotypes of mining plans and illustrations for the Public Watering Places Branch were printed.

Plan-mounting.—4,739 plans, maps, &c. were mounted.

Maps supplied to Wardens and others.—“Charted up” copies of maps were forwarded as follows:—

To Mining Wardens	282
District Surveyors	31
Mining Surveyors	47
Others	12
Total	<u>372</u>

Forestry.—During the period that the Forest Branch was connected with the Department, illustrations of 743 forest reserves were prepared for the use of mounted police assisting foresters.

Resumptions.—7 cases relating to resumption of parts of the surface of leases required for various public purposes were dealt with.

Map Records, Private Lands—Work. 304 maps of parishes, &c., were prepared, charted up to date, and placed in use for charting leases and authorities under the Mining on Private Lands Acts.

Revisal of Proofs.—75 proofs of Lands Department maps were revised with regard to mining information before publication by the Department of Lands.

Compilations.—34 maps of prominent mining localities have been compiled on tracing linen and retained as standards, from which heliographic copies are taken when required—the maps being brought up to date at the time of each printing.

A complete series of plans of the Wagga Experiment Farm was prepared in the branch for the Department of Agriculture.

A comprehensive plan of the underground workings of the collieries under the Delta at Newcastle is now in course of preparation. This work was undertaken under Ministerial authority for the purpose of assisting and facilitating the work of the Chief Inspector of Collieries.

Miscellaneous.—In addition to lease applications, surveyor's reports, and numerous other unregistered documents, 6,204 papers were received and dealt with during 1897.

Personal.—During the year the branch was weakened by the prolonged absence on sick leave of Mr. E. J. King, the Examiner of Charting, whose death on 13th December last closed a career of over thirty years duration, during which he had won the esteem of his fellow officers and given faithful service to the State.

The only other changes affecting officers were the transfer of Mr. Quinn to the position of Librarian, and of Mr. Dimelow to the Department of Lands when the forestry work was taken over by that department.

Owing to the diligence of the staff the work of the branch at the present time is as closely up to date as the conditions will allow. There are no arrears, and the whole of the records and machinery of the branch are rapidly approaching a state of complete efficiency.

COMPILATION OF MAPS, &c.

Sheets 4 and 7 Mining Districts of New South Wales, left in hand at the end of 1896, were completed and published.

The following compilations were revised, and forwarded to the Lands Department to be published as new editions:—

Parish.	County.	Parish.	County.
Alma	Yancowinna.	Nadbuck	Yancowinna.
Byjerkerno	Farnell.	Tara	do.
Coolamigal	Roxburgh.	Wyalong	Gipps.
Kirk	Yungnulgra.		

THE MINING SCHOOL.

The Mining School at the University of Sydney has been open to the public since 1892, and at present it numbers nineteen students, all of whom are working for their degrees in mining engineering. All the students who have already passed through the school have found suitable employment on mines. Of these, seven have taken the Degree of Bachelor of Engineering, in mining, and are in receipt of salaries averaging over £300 a year. One of these, Mr. E. S. Simpson, B.E., holds the position of Assayer and Analyst and Mineralogist to the Geological Survey of West Australia; Mr. A. R. Weigall, B.E., has lately been appointed Manager of a Mine at the Celebes, at a salary of £1,000 a year; Mr. E. W. Nardin, B.E., has been offered a salary of £750; and another student a salary of £1,000 a year for somewhat similar positions. Amongst others, who have been through a portion only of the course of instruction at the school, Mr. J. A. Watt, M.A., B.Sc., has been appointed Geological Surveyor to the Government of New South Wales; and Mr. T. Blatchford, B.A., is Assistant Geologist on the Geological Survey of West Australia; while Mr. H. B. Gritton has recently been appointed Assistant Assayer to the Royal Mint in Sydney.

Commenting on the proposal to establish Schools of Mines in Queensland, the Royal Mining Commission in their report says:—"After consideration of this evidence your Commissioners do not feel inclined to recommend the establishment of a general system of Schools of Mines, at the same time they think that some incentive should be given to youths wishing to obtain a thoroughly sound education in the science and practice of mining. For this purpose they suggest that half a dozen scholarships be granted to allow students to attend the Sydney School of Mines."

The fact should be emphasised that the University of Sydney Mining School is open to the public without any restriction, and it is not necessary for a student desirous of going through a part only of the mining engineering course to pass any kind of entrance examination, or to matriculate. Several students have, for example, studied assaying and chemistry only, at the Mining School, and to those who have passed their examinations satisfactorily the University has granted certificates of proficiency in those subjects.

In order, however, to qualify themselves for the full degree of Bachelor of Engineering in Mining, the University requires students to pass an entrance examination and to attend all the prescribed courses of instruction (except in the case of students who can adduce proof of having already passed elsewhere an equivalent or partly equivalent examination, as, for example, students from the Technical College, who have passed in mineralogy, geology, &c. Such students may be excused attendance at such portions of the courses of instruction at the University, as those in which they have already passed elsewhere). Although it is possible for students to obtain certificates of having passed in special subjects at the Mining School, there can be no doubt whatever that it is a decided advantage for them to complete the whole course of study necessary for obtaining the Bachelor of Engineering degree.

Students in the Mining School have the use of the finely equipped laboratories, belonging respectively to the Chemistry, Engineering, Physics, and Geological Departments, and attend the lectures given by the following:—Professor Liversidge, F.R.S., M.A., LL.D., Professor of Chemistry; Professor Warren, Wh.Sc., M. Inst. C.E., Engineering; Mr. E. F. Pitmann, Assoc. R.S.M., Government Geologist, New South Wales, Mining; G. H. Knibbs, L.S., F.R.A.S., Underground Surveying, &c.; Professor Gurney, M.A., Mathematics; Professor Threlfall, M.A., Physics; Professor David, B.A., Geology and Mineralogy.

Mr. James Taylor, B.Sc., Wh.Sc., A.R.S.M., the Government Metallurgist, New South Wales, has lately been appointed, with the approval of the Hon. the Minister for Mines and Agriculture, Lecturer in Metallurgy. Students have also the advantage of being assisted by a staff of well qualified demonstrators.

Arrangements are almost complete for giving students practical experience in the separation and concentration of ores and the separation of metals by amalgamation and other processes, the necessary plant having been provided at the Mining School, but the building for it not yet having been erected.

The Government Experimental Metallurgical Works at Clyde, as well as at the electric furnace at the University, are also available for giving the students practical experience in metallurgy.

During part of the vacation the Lecturer in Metallurgy arranges to take students for excursions to works in the Colony where metallurgical operations are being carried on.

Any

Any one desirous of joining the Mining School, can obtain full particulars on application to the Registrar of the University, Glebe, Sydney. A Summary, however, may be given here of the present curriculum of studies at the Mining School, together with list of fees and nature of entrance examinations for those who wish to obtain the full degree of B.E. in mining.

Students wishing to qualify for the mining engineering degree can enter the school if they have passed: (1) The Entrance Science Examination; (2) The Senior Public Examination; or (3) If they have attended the lectures in the First Year Arts Course and passed the First Year Examination in Arts; or (4) If they produce evidence of having graduated in Arts or in Science.

As regards (1) See calendar of University of Sydney, for 1897, pp. 56-58, and appendix, pp. cxcvii-cciv. The subjects are Latin, one of the three languages Greek, French, or German; and Arithmetic, Algebra, Geometry, and Trigonometry, that is two languages and four mathematical subjects. It is provided, however, (v. calendar, 1897, p. 32) that "Students of the Technical Branch of the Department of Public Instruction, whose certificates of attendance and examination in that branch are accepted by the Senate as an equivalent to a portion of the curriculum prescribed for candidates for the degree of Bachelor of Mining Engineering, shall be considered to have passed the Entrance Examination, if they satisfy the Examiners in the following subjects, viz.:—In two of the four languages—Latin, Greek, French, German; and in four of the following subject, viz.:—Arithmetic, Algebra, Geometry, Trigonometry, Elementary Surveying, and Astronomy, Mechanics, applied Mechanics." The Technical College Students can therefore, under the above conditions, study as subjects for examination two modern languages, such as French or German instead of either or both the classical languages Latin and Greek, as well as any four of the other subjects, as regards (2) the languages in any two of which the Students must pass are similar to those specified under (1) and in the mathematical subjects Students may take any four of the following:—Arithmetic, Algebra, Geometry, Trigonometry, Elementary Surveying, and Astronomy, Mechanics, applied Mechanics. (For further particulars see manual of Public Examinations for 1898, published by Angus and Robertson, Price, 1s. 6d.)

Any students who are not graduates (the latter being entitled to enter the school without any preliminary examination) are strongly advised to enter the Mining School by passing either the Entrance Science Examination or the Senior Public Examination in the prescribed subjects.

The Entrance Science Examination is held at the University, commencing this year on March 7th, and the Senior Public Examination is also held at the University, as well as at numerous local centres in New South Wales and Queensland, and commences on November 14th.

The fee for the Entrance Science Examination is £2, and that for the Senior Public Examination £1 10s.

By passing either of the above examinations in the prescribed subjects, students should be able to obtain their B.E. degrees in three years, instead of in four years, as if they simply matriculate they are required to attend the lectures and pass the examinations in the First Year Arts Course before they can be admitted to the Mining School.

The courses of instruction given to Mining Engineering students during the first, second, and third years, are specified on page 33 of the 1898 calendar.

The first year is devoted chiefly to Science, Mathematics, and Drawing; the second year chiefly to Civil Engineering and Surveying, Chemistry, Geology and Mineralogy, and Mechanical Drawing; and the third year to Metallurgy and Assaying, Mining, Civil Engineering, Materials and Structures.

The fees amount to about £40 for the first year, £35 for the second year, and about £47 for the third year. The fee for the B.E. degree, as for all the professional degrees, is £10; that is, altogether, £132. This, with sundries, including travelling expenses when visiting mines, may amount to £155.*

The aim throughout has been to make the curriculum thoroughly sound as regards both theory and practice.

The School has been liberally subsidised by the Government from the Department of Mines Vote for School of Mines and Assay Works, and the fact may be repeated here that any member of the community may attend any of the classes at the Mining School, on payment of the prescribed fee to the Registrar, and may be admitted to examination in any particular subject, and if successful may be granted a certificate of proficiency in that subject.

The various laboratories in connection with the Mining School are open to the public for inspection all the year round between the hours of 9 a.m. and 5 p.m., except for about a fortnight during January.

If the Senate of the University and the Department of Mines continue to support this school, the success of which has been already assured, as strenuously in the future as in the past, it will hold its own with any similar teaching institution in any part of the world. The public are already awakening to its usefulness,

* Details of fees are appended.

usefulness, and the well-trained young mining engineers who graduate from time to time, and obtain suitable appointments on important Australian mines cannot fail little by little to help to raise the whole standard of mining throughout Australia, and will thereby contribute not only to increasing the output of the minerals, but also establishing the mining industry on a surer and more stable basis.

APPENDIX showing Details of Fees at Mining School, University of Sydney.

THE GOVERNMENT METALLURGICAL WORKS, CLYDE.

DURING the year, the metallurgical works—under the charge of Mr. James Taylor, B.Sc., Wh.Sc., A.R.S.M.—have been extended by the installation of both chlorination and cyanide plants.

The chlorination plant consists of a 30 feet by 10 feet three-hearth reverberatory furnace, with capacious dust-chamber, the roof of which, being constructed of iron plates, forms a drying-floor for ores and concentrates. The Plattner process of chlorination has been adopted as being best suited for experimental work. There are two leaching vats, each 7 ft. in diameter and 2 ft. 6 in. deep, each taking up to 3 tons of roasted material at a time. Two similar vats serve as precipitating vats, and these are followed by a sawdust filter-box, and two vats charged with scrap iron for the precipitation of copper. The chlorine used is produced in a lead generator from sulphuric acid, salt, and manganese dioxide.

The cyanide plant consists of a smaller leaching vat, 7 ft. diameter and 2 ft. 6 in. deep, taking about 3 tons of ore, and a larger one, 8 ft. 6 in. diameter and 3 ft. 6 in. deep, taking about 6 tons of ore. There are the necessary tanks for strong cyanide solution, stock cyanide, and alkaline wash solutions; also a couple of sump tanks built in cement, with a steam pump for returning the weak solutions either to wash the ore or to the cyanide storage tank as may be desired. There are also two sets of zinc boxes, for weak and strong cyanide solutions respectively.

The crushing and amalgamating plant has been kept tolerably well employed, and has worked satisfactorily. To this part there has been added, during the year, a Johns' Disintegrator for pulverizing samples, and one Roberts' Washer for alluvium.

The number of parcels of ore, &c., received for treatment during the year is sixty-three, weighing 210 tons. They include one tin, one chromium, and one auriferous copper ore; two each of alluvial wash, tailings, and concentrates; and the remainder are gold ores. The gold ores varied in richness from traces of gold to the rich yield of 48 oz. from 64½ lb. of stone. The ores have come from all parts of the Colony; and in several cases, two or more parcels have been sent by the same party.

As originally fixed, 10 tons was the maximum limit per parcel of ore, but for convenience of transport by rail in complete truck loads this limit has been extended to 12 tons.

One machine has been sent to the works for experimental trial, namely, a centrifugal amalgamator. Several trial runs were made with it under the direct supervision of the inventors, when it was removed to treat tailings owned by the inventors, before any decisive results had been obtained.

Numerous inquiries are made, and visits paid to the works by persons desirous of information as to the treatment of ores of all kinds, and every effort is made to help such cases.

Owing to the decision of the Public Service Board, all metallurgical specifications submitted in application for Letters Patent, are now referred to Mr. Taylor for investigation and report. Forty-nine such cases were dealt with during the latter half of the year. This entails a considerable amount of search work at the Patent Office.

The following is a copy of the report such as is usually furnished to the owner of a parcel of ore which has been treated at the Metallurgical Works. This is published so that miners and others may know the nature of the information they can obtain from these works:—

Sir,

I have the honor to inform you that the parcel of ore forwarded by you, and stated to come from the X.Y.Z. Co.'s claim at Omega, has been sampled, amalgamated, and concentrated, with the following result:—
The ore is white quartz with very little mineral.

Net weight of parcel	t.	c.	q.	lb.	tons.
	10	3	1	6	= 10·1652.
This was coarse crushed to about ¾-inch cubes, automatically sampled and assayed, giving:—					
	oz.	dwt.	gr.	oz.	
Gold.....	0	8	6	=	·412 per ton.
Silver.....	0	2	9	=	·119 „

The

The ore was next wet-crushed to pass a 30-mesh screen with holes .026 inches across, and passed over electroplated amalgamated copper plates, provided with mercury riffles and trap. The amalgam from the plates yielded—

Smelted gold	oz. dwt. gr.	oz.
	2 19 3	= 2.956

This was sent to the Bank of N.S.W., from whence the following returns were made:—

Weight, before melting	2.98	} Fineness: gold .8530; silver .127.
,, after ,,	2.98	
Standard gold	oz. 2.773	£ s. d. value gold 10 15 11
Fine silver allowed.....	.31	,, silver 0 0 5
		£10 16 4
Bank charge		0 5 0
Cheque for proceeds		10 15 4

On receipt of your receipt this cheque will be forwarded to you.

The riffle concentrates yielded a further small button of gold weighing .054 oz., and estimated to contain .046 oz. of fine gold.

From the plates the pulp was passed over two Frue vanners, Nos. 1 and 2, approximately half going over each machine. No. 1 has an ordinary smooth rubber-belt, whilst No. 2 has a Dick's felted belt.

The concentrates from No. 1 vanner weighed .0549 tons, equal to .54 per cent. of total ore, and assayed—

	oz. dwt. gr.	
Gold	3 9 16	= 3.483 oz. per ton.
Silver	0 11 8	= .567 ,,

The concentrates from No. 2 vanner weighed .3211 tons, equal to 3.16 per cent. of total ore, and assayed—

	oz. dwt. gr.	
Gold	0 14 4	= .708 oz. per ton.
Silver	0 3 17	= .185 ,,

These concentrates contain the pyrites carried by the ore, along with more or less quartz sand. By carefully panning off a portion of the sample there was obtained 0.77 per cent. of pyrites, showing that the pyrites may be reckoned not to exceed 1.0 per cent. of the ore.

The smooth belt vanner No. 1 produces a valuable material which could be treated by chlorination, or could be sold for smelting. No. 2 vanner saves more gold, but the concentrates would not bear transport, though they might be treated on the mine if produced in sufficient quantity to keep a small chlorination plant going.

The tailings from the vanners are run into a series of pits. No. 1 retains the coarse or sandy portion; this weighed approximately 9.5142 tons, and assayed—

	oz. dwt. gr.	
Gold	0 2 14	= .129 oz. per ton.
Silver	0 1 7	= .065 ,,

The overflow from No. 1 pit runs into No. 2, which is specially arranged to facilitate the deposition of slimes. This pit contained slimes estimated to weigh 0.2 tons, assaying—

	oz. dwt. gr.	
Gold	0 3 6	= .162 oz. per ton.
Silver	0 1 23	= .098 ,,

Pit No. 3, also designed to settle slimes, collected what was estimated to weigh .075 tons, and assaying—

	oz. dwt. gr.	
Gold	0 3 14	= .179 oz. per ton.
Silver	0 1 23	= .098 ,,

Calculating the total amount of fine gold in each portion, we get the following tabular statement of the distribution of the gold before and after treatment:—

	Total.	Percentages.	Per ton of ore.	
	oz.		oz.	oz. dt. gr.
Gold in the ore	4.1880	100.00	.4120	0 8 6
,, bullion	2.5214	60.20	.2480	0 4 23
,, riffle concentrates.....	.0460	1.10	.0045	0 0 2
,, concentrates, No. 1.....	.1912	4.56	.0188	0 0 9
,, " No. 22272	5.43	.0223	0 0 11
,, tailings	1.2273	29.30	.1207	0 2 10
,, slimes, No. 2.....	.0324	.77	.0033	0 0 1
,, " No. 3.....	.0134	.33	.0014	0 0 1
	4.2590	101.69	.4190	0 8 9
,, excess of assay0710	1.69	.0070	0 0 3
	4.1880	100.00	.4120	0 8 6

The last line, "Gold in excess of assay," is due to unavoidable inaccuracy in working. The finer slimes are richest. This would appear to indicate that some gold must be carried away by the water, but the amount can only be small or a deficiency would appear in the table rather than an excess.

Mr. John C. H. Mingaye, F.C.S., Analyst and Assayer to the Department, reports as follows:—

Geological Survey Branch.

During the year 1897, 5,131 numbered samples were received for assay and analysis; 95 quantitative and qualitative analysis made, and various reports given of examinations of waters, fire-clays, &c., &c. The total number of assays, excluding those made for gold and silver, are 939, which, if the gold and silver assays are included, totals 6,182 assays.

The

The following figures show the work received in the laboratory since the year 1883—

Year.	Samples.	Year.	Samples.
1883	242	1890	3,323
1884	664	1891	4,082
1885	1,428	1892	3,570
1886	1,807	1893	3,015
1887	2,222	1894	3,816
1888	5,245	1895	4,826
1889	3,287	1896	6,013
	1897.....		5,131 samples.

The following assays have been made for various metals.—

Antimony	23	Mercury	8
Arsenic	6	Nickel	8
Bismuth	23	Iron	45
Chrome	18	Platinum	8
Cobalt	25	Tin	57
Copper	530	Tellurium	12
Lead	74	Tungstic Acid	4
Manganese	26	Zinc	10

* Gold and Silver, 5,243 assays.

The following analyses were made of water:—

- (1.) Kelly's Camp Artesian Bore.
- (2.) Warroo Springs "
- (3.) Kerribri Creek "
- (4.) Youngerringa "
- (5.) Barringun "
- (6.) Native Dog "
- (7.) Sibraas "
- (8.) Enngonia "
- (9.) Well-water from the Young Co-operative Roller Flour Mill Company (Limited).
- (11.) " " " " "
- (12.) (No 1355). " District unknown " " "
- (13.) Water from Bacon's Well, Gunnedah.
- (14.) " the Gutter Tank at Bobadah.
- (15.) (No. 1791) Bottle of foul-smelling matter, believed to contain petroleum oil.
- (16.) Water from Dolgelly Artesian Bore.
- (17.) " Carinda "

Metallurgical Branch.

The total numbered samples received for the year were 518. These consisted of average samples of crushed ore, concentrates, tailings, slimes, amalgam, cyanide solutions, &c.

The following assays have been made of various metals and substances:—

Gold and silver	379	Zinc	4
Platinum	18	Antimony	2
Tin	27	Bismuth	2
Tungstic trioxide	6	Arsenic	1
Lead	6	Iron	1
Copper	12	Sulphur	1
Chromium sesquioxide	1	Lime	2
Retorting amalgam and smelting gold	59	Insoluble matter	4
Moisture	12	Testing ore for acidity, percentage ..	5
Miscellaneous assays and tests	42	" sol for cyanide consumption and gold contents ..	20

or a total of 604 assays, tests, &c.

Experiments have been conducted on small average samples, with a view of ascertaining if the ore is suitable for treatment by cyanide or chlorination.

Reports were given, at the request of the Government Metallurgist, on the action of cyanogen on metallic gold, and ammonium cyanide on gold. (*Appendices A and B*).

On two different occasions Mr. Mingaye received a subpoena to attend and give evidence in the alleged gold robbery case at Lucknow—*Regina v. Sommerville*—the case being heard at Bathurst. This necessitated his absence from the office for ten days.

Mr. R. Vale, who received the appointment of Assistant Assayer in the laboratory, after a competitive examination in both theoretical and practical work, has shown himself capable of performing his work in an efficient manner.

APPENDIX A.

EXPERIMENTS showing the action of cyanogen (CN) on gold.

A SERIES of experiments were made with a view of ascertaining the solubility of gold, or otherwise, in a solution of cyanogen, at the request of the Government Metallurgist.

The cyanogen was prepared by heating mercuric cyanide (HgCN₂) in a tube, washing the gas in distilled water, and passing it into a flask containing an accurately weighed sheet of pure gold, suspended in distilled water —

I. Weight of pure gold	26 2650 grains.
" " after contact with solution for 18 hours	26 2570 "
Gold dissolved	0.0080 "

II.

II. A fresh solution of cyanogen made, and the experiment conducted as per previous one:—

Weight of pure gold.....	26.2570 grains.
" " after contact with solution for 1.75 hours.....	26.2545 "
Gold dissolved.....	0.0025 "

III. Weight of pure gold.....	26.2545 grains.
" " after contact in solution for 45 hours.....	26.2370 "
Gold dissolved.....	0.0175 "

Gold dissolved in the three experiments..... 0.0280 grains.

The solution from the three trials were filtered and evaporated down to dryness in a lead dish, free from gold, the mass being scorified and cupelled. Weight of gold recovered from solution, 0.024 grains.* The bullion, on being parted with $2\frac{1}{2}$ times its weight of pure silver, did not loose weight = pure gold.

IV. In this experiment the gold was placed in a tube,  with 5 cc. of distilled water, and the gas passed in to saturation—shown by the peach-coloured flame when the gas was burnt at the extreme end of the tube. The ends were then sealed, and the gold kept in contact with the solution for nineteen hours:—

Weight of pure gold.....	17.929 grains.
" " after contact in solution for 19 hours.....	17.920 "
Gold dissolved.....	0.009 "

The solution was filtered, and evaporated down to dryness in a leaden dish, the mass being scorified and cupelled. The solution was of a light yellow colour. Weight of gold extracted from solution, 0.009 grains.

V. The experiment was repeated, with the difference that a few drops of pure hydrochloric acid were added to the distilled water in which the gold was kept for twenty hours. There was found to be no loss of weight.

VI. Experiment conducted as above for twenty hours.—No gold dissolved.

Water dissolves about $4\frac{1}{2}$ times its volume of cyanogen. A saturated solution would thus approximately contain about 0.95 per cent.

It is a well-known fact that cyanogen readily decomposes at the ordinary temperature, yielding a number of products; hence it is impossible to have, for any length of time, a solution which shall contain cyanogen only. The products of decomposition are—ammonia, oxalate and carbonate, hydrocyanic acid (HCN), azulmic acid, urea, and, possibly, other complex compounds.

For reference, I quote the opinions of various authorities on this subject:—Water dissolves cyanogen, the solution slowly decomposing excepting an acid be present (Gianelli, T., 1856, 435), with separation of brown flocks of azulmic acid (Pelouse, A., Richardson, A., 26-63) and formation of ammonia, oxalate, and carbonate (Vaquelin, A., 9, 113, 22), and also hydrocyanic acid and urea (Wöhler, p. 15, 627; Watt's Dict. Chemistry, vol. II, page 357).

Cyanogen.—“The products of decomposition of this substance have again been studied, and, in the main, the results of previous observers have been confirmed. When solution of cyanogen in acids, or dilute acetic acid, hydrochloric acid, or sulphuric acid, are allowed to remain at the ordinary temperature, no change takes place. An aqueous solution yields at the ordinary temperature or more quickly at 100 degrees—azulmic acid, oxalic acid, ammonia, carbonic anhydride, hydrocyanic acid, and urea.” (By J. Zetell Minatash, 14, 223-232, Chemical Soc. Journal.)

Water absorbs about 4.5 times its volume of cyanogen gas. The solutions, on standing, soon become dark-coloured, and then contain ammonium oxalate, ammonium carbonate, prussic acid, urea, and numerous other products. (Dict. Applied Chemistry, Thorpe, vol. 1, page 637.)

Experiments 1, 2, 3, and 4 show that by passing cyanogen gas into water containing a weighed amount of pure gold, that an appreciable amount of gold had dissolved, which was recovered from the solution, and weighed. Experiments 5 and 6 show plainly that, in the presence of dilute hydrochloric acid, when these decomposition products are not formed, that the radicle cyanogen has no so-called selective action on gold.

Mr. W. Skey, F.C.S., Government Analyst, New Zealand, has carefully studied the cyanide process, and published several papers on the subject. He (Mr. Skey) is strongly of opinion that cyanogen is unable to attack gold, and was, I believe, the first to venture an opinion on this subject. In reply to a letter to the Government Metallurgist he (Mr. Skey) states as follows:—“I should state here that I attempted to show, and I believe that I have shown, that cyanogen is absolutely unable to attack gold, and that the products of its decomposition are so slow about it that cyanogen itself is useless for the KCN process. In my experiments I keep the cyanogen intact—at least prevent its decomposition—during the experiment, by a few drops of hydrochloric acid in the aqueous solution, and use gold-leaf for the test of insolubility.”

After carefully considering the question, and experiments made, also the various opinions expressed by numerous authorities as to the ready manner in which a solution of cyanogen in water decomposes, and the nature of the products formed, Mr. Mingaye is of opinion that it is most probable that an alkaline cyanide is formed, which would account for the gold dissolved in experiments 1, 2, 3, and 4.

That cyanogen has no so-called selective action on gold, Experiments V and VI show this, and confirms Skey's experiments.

APPENDIX B.

Experiments showing the Action of Solutions of Ammonium Cyanide (NH₄ Cn) on Gold.

Exp. I.—A strong solution of Ammonium Cyanide used.	
Weight of pure gold.....	9.829 grains
" " after standing in solution for 2 hours.....	9.782 "
Gold dissolved.....	0.047 "
Exp. II.—The same solution used for Experiment.	
Weight of pure gold.....	9.782 grains
" " after standing in solution for 17 hours.....	9.550 "
Gold dissolved.....	0.232 "
Exp. III.—Weak solution of Ammonium Cyanide used.	
Weight of pure gold.....	8.055 grains
" " after standing in solution for 2 hours.....	8.014 "
Gold dissolved.....	0.041 "
Exp. IV.—Weak solution used as per Experiment III.	
Weight of pure gold.....	8.014 grains
" " after standing in solution for 17 hours.....	7.841 "
Gold dissolved.....	0.173 "
Exp. V.—Very weak solution of Ammonium Cyanide used.	
Weight of pure gold.....	9.854 grains
" " after contact in solution for 2 hours.....	9.829 "
Gold dissolved.....	0.025 "

INSPECTION

* A very small portion of this solution was lost in evaporating.

INSPECTION OF MINES OTHER THAN COAL AND SHALE MINES.

Mr. Slee, F.G.S., Chief Inspector of Mines, reports 35 fatal and 41 non-fatal accidents in connection with the metalliferous mines of New South Wales during the year.

The number of fatal accidents correspond with the number reported for 1896, but an increase of 5 non-fatal as compared with that year.

Of the 35 fatal accidents, 14 occurred in silver, 7 in auriferous quartz, 8 in auriferous alluvial, 2 in copper, 1 in tin, and 3 in limestone mines.

The percentage of fatal accidents in 1897 is 1:120, as compared with 1:148 during 1896, and non-fatal 2:465 as against 1:181 for the same period.

The number of men employed in and about the metalliferous mines of the Colony during the year was 31,229 as compared with 30,478 in 1896.

The undermentioned localities were visited and inspected during the year:—

By the Chief Inspector.

West.—Carcoar, Orange (twice), Forest Reefs, Nymagee, Overflow, Cobar, Newbridge, Parkes, Alextown, Peak Hill, Stuart Town, Macquarie River, Forbes, Condobolin, Blayney.

South.—Murrumburrah (twice), Berthong, Young, Temora, Wyalong, Yalgogrin, Cootamundra, Wagga Wagga, Grong Grong, Cooma, Cowra Creek.

North.—Uralla and Newcastle Districts, &c.—The Chief Inspector, while visiting these districts, also dealt with applications for aid from the Prospecting Vote, and during the year adjudicated at several places as Warden for the Colony.

By Inspector Milne.

West only.—Bathurst, Blayney, Byng, Brown Creek, Burruga, Black Springs, Burnt Yards, Binni Creek, Bobadah, Byrock, Burrendong, Burra Burra, Booramugga, Bunnamagoo, Capertee, Clear Creek, Cheshire Creek, Crudine, Caloola, Carcoar, Canowindra, Cowra, Cargo, Cobar, Eramby, Eurrunderee, Flyer's Creek, Forest Reefs, Galley Swamp, Gilgunnia, Girilambone, Hill End, Hobby Yards, Illford, Junction Point, Lewis Ponds, Lucknow, Mudgee, Mullion Creek, Mitchell's Creek, Molong, Mandurama, Mount Allen, Mount McDonald, Mount Hope, Mount Drysdale, Mount Boppy, Mumbil, Macquarie River, Newbridge, Nymagee, Nangeribone, Oberon, O'Connell, Perth, Palmer's Oakley, Rock Forest, Rockley, Restdown, Sofala, Sunny Corner, Stuart Town, Tuena, Trunkey, Vermon Hill, Walli, Warne, Woodstock, Wellington, and Wattle Flat.

A considerable number of the places mentioned in the above list have been inspected two or three times, and some, four times during the year.

The inspector reports that the regulations are generally complied with.

While visiting said districts Inspector Milne reported on numerous applications for aid from the Prospecting Vote.

By Inspector Hebbard.

In addition to the very frequent inspection of the mines in the immediate vicinity of Broken Hill, Inspector Hebbard also visited and inspected the mines at Pinnacles, Balaclava, Rockwall, Angas, Thackaringa, Silverton, Yabba, Purnamoota, May-bell, and Tarrawingee,

By Inspector Godfrey.

North.—Bingara, Bulladelah, Copeland, Coolongolook, Crow Mountain, Hillgrove, Ironbark (Woods Reef), Moonanbrook, Paddy's Creek, Rawdon Vale, Stewart's Brook, Upper Gloucester, and Whispering Gulley.

West.—Cobar, Carlisle, Diegon, Eugowra, Forbes, Fifield, Platina, Gilgunnia, Girilambone, Gulgong, Cudgebegong, Mount Drysdale, Mount Allen, Mount Hope, Mount Bobby, Myall, Mudgee, and its localities, Nymagee, Overflow, Peak Hill, Parkes, Pinnacles, Restdown, The Rookery, Tomingley, and Windeyer.

South.—Barmedman, Billy's Look-out, Buddigower, Grenfell (twice), Temora, Scrub Yards, Springdale, Wyalong (for two months), Yalgogrin, Adelong, Braidwood, Bungonia, Corang, Gundagai, Jerralong, Nerriga, Quartzville, and Snowball.

Inspector Godfrey's reports show that the regulations are generally complied with. He, also, while in the foregoing-mentioned districts, reported on a considerable number of applications for aid from the Prospecting Vote.

By Inspector Hooke.

Adelong, Armidale, Bago, Billapalula, Brungle, Barmedman, Bygalorie, Bringabong, Burrowa, Breakfast Creek, Coolongolook, Coolac, Combaning, Chandler River, Carabost, Cullinga, Craiglea, Demondrille, Dungog, Garangula, Gundagai, Gundaroo, Gooda Creek, Hillgrove, Harden, Humula, June Reef, Moonan Brook, Murrumburrah, McMahon's Reef, Muttama, Metz, Melrose, Nanima, Nottingham Hill,

Hill, Niangula, Nundle, Reefton, Rockvale, Rye Park, Stewart's Brook, Springdale, Stockinbingal, Sherwood, Sunnyside, Swamp Oak, Tumut, Toomoorooma, Temora, Tumbarumba, Tia, Uralla, Ungarie, Wyalong, Walcha, Wee Jasper, and Yass.

Inspector Hooke reports that the Regulations are generally complied with, and while in each district he also reported on a large number of applications for aid from the Prospecting Vote.

DIAMOND DRILLS.

The total depth bored in 1897, was 2,378 ft., or 235 ft. 3 in. more than during the year 1896.

Diamonds used in 1897, cost 4s. 11¹/₆d. per ft., as compared with 2s. 1³/₆d. in 1896.

The average cost per ft. for boring during 1897, was 20s. 2³/₆d., as compared with 11s. 4¹/₆d. in 1896.

The increase in the rates per foot was owing to very hard and broken stratum, and an increase in the cost of diamonds of fully 100 per cent. per carat.

The earnings of the diamond drills for the year was £1,047 1s. 3d., and the amount paid into the Treasury, as revenue from diamond drills, was £593 12s. 0d., in addition to the sum of £491 8s. 9d. transferred from Prospecting Vote to the credit of Revenue Account—Drills, in all, £1,085 0s. 9d.

MINERAL PRODUCTS.

The aggregate value of the mineral products of this Colony to the end of 1897, is £123,053,111 19s. 9d.

The value of such products for the year was £4,685,273 14s. 1d., or an increase of £206,904 18s. 8d. on the value of the minerals won during 1896. The following table shows an increase of £104,760 and £100,369 respectively, in the value of the coal and copper won during the year, as compared with 1896.

At the close of the third quarter of the year it was expected there would be a substantial increase in the yield of gold for the year, but, owing to the extremely dry weather, and the consequent inability of the mines to crush the stone raised, may be attributed the slight falling off in the yield. The value of the output was more by £15,053 than the previous year, but there was 3,854 oz. less. The decrease in the value of the silver and silver-lead won is traceable to the decline in the value of lead during 1897, as the output was really 2,079 tons in excess of 1896. The same remarks apply to tin, but should the value increase, many of the deserted claims will be again taken up. The large increase in the value of opal won is entirely due to the energy with which the White Cliff Opal Field is being developed. It will be seen, therefore, that our mineral industry is on the increase, and the prospects of this increase being maintained during 1893 are very encouraging. Should seasonable rains visit the Fields, there is every indication that the present year will be a record one as far as all classes of mining are concerned.

The following table shows the aggregate value of minerals, the product of New South Wales, for the years 1896 and 1897 respectively compared:—

Minerals.	Quantity.	Value.		Quantity.	Value.		Increase in Value.		Decrease in Value.	
		£	s. d.		£	s. d.	£	s. d.	£	s. d.
		1896.			1897.

* The greater part of the silver produced is exported in the shape of silver lead. † Not manufactured from the ore, but old iron.
‡ Includes £20,000 omitted from the 1896 output.

The following return shows the quantity and value of gold, coal, shale, copper, tin, silver, silver-lead ore, and the several other metals and minerals produced in the Colony of New South Wales during the last ten years:—

GOLD.

The value of the gold won since the opening of our gold-fields to the end of 1897 is £44,488,371 8s. 4d.

The quantity won during the year, as will be seen from the following table, is less than during 1896, but the value is greater by £15,053.

The Wyalong and Hillgrove fields are maintaining their yields, but the late strike at Lucknow had the effect of greatly reducing the yield from that district. The employment of more suitable machinery, and processes for the treatment of refractory ores, will, ultimately, have the effect of increasing our gold yield, and permit of many of the mines now abandoned being profitably worked. The large Works erected at Illawarra and Cockle Creek, for the treatment of ores, must also have a beneficial effect on our mining industry.

TABLE showing the Quantity and Value of Gold won in the Colony of New South Wales from 1851 to 1897.

The following information is compiled from the reports supplied by the Wardens and Mining Registrars of the several mining districts and divisions. These officers experience a difficulty sometimes in procuring all the details of the work being carried on in their respective districts. It is gratifying to note that, with a better acquaintance with the districts under their charge, a more complete *resume* of the mining work may be anticipated.

THE BATHURST MINING DISTRICT.

Canowindra Division.

About 65 men are still in the Canowindra Division, and the returns therefrom are fairly satisfactory, being 406 oz., as compared with 358 oz. the previous year. The Blue-jacket Gold-mine, at Belmore, employ 34 men, who have been engaged principally in development, work during the greater part of the year—the depth of the main shaft now being 430 feet. This accounts for the small quantity of stone raised and treated, which was only 265 tons for 222 oz. The party working the Old London Reef, at Barcy's Rock, raised 57 tons for 81 oz. Several parties are testing the private lands under their authorities to enter. On the whole, the prospects of this division are considered satisfactory.

Cowra Division.

The mining industry in the Cowra Division has not been so active as in former years. About 40 men have been constantly employed in the vicinity of Woodstock working alluvial ground principally, but the total yield from this source could not be ascertained.

Mount McDonald Division.

The Mount McDonald Field is one on which real solid improvement has taken place during the year. The mines have received the benefit of capital and energy, with the result that the field is in a fair way to become one of considerable importance. The yield of gold has risen from 421 oz. in 1895, 586 oz. in 1896, to 1,771 oz. in 1897, with every prospect of a still further substantial increase.

At the commencement of the year the Olliver's Freehold Gold-mining Company of Hongkong were engaged sinking a main shaft on the Eureka portion of their property, for the purpose of striking the reef at a greater depth than any previously reached on this line of reef. When the shaft had reached a depth of 206 feet it was decided to drive for the reef at 150 and 200 feet from surface. At the 150-foot level the reef averaged 2½ feet in width of payable stone. At the 200-foot level the reef had widened out to 5 feet, and of good quality. During the last few months the shaft has been sunk an additional 105 feet, the reef varying from 5 to 7 feet.

It is the intention of the Company's manager to resume sinking as soon as possible, intending to sink at least 100 feet every year. A new main shaft has been started on the northern portion of the property, also a prospecting shaft on the south end, in which payable gold has been found.

Finding the old battery which has been in use for many years insufficient for present requirements, it has been discarded, and a new 20-head of heavy stampers has been erected, with four Watson and Denny pans, capable of treating 200 tons per week. In addition to this, the Company are erecting another 20-head battery on the property, and expect shortly to have 40 head of stampers in constant work. One great drawback to mining operations here has been the scarcity of water owing to the very limited rainfall during the year, and, in order to prevent this drawback in future, the Company have constructed a large new dam, and are also enlarging and cleaning out the old one.

The

The New Balmoral Gold-mining Company have during the year done a considerable amount of work on various portions of their property, with more or less success. At present they are sinking a main shaft on a portion of their property known as the "Queen Mine." The shaft is down about 350 feet, at which depth it is intended to drive to intersect the various reefs and veins worked by tunnelling near the surface, and which are all dipping towards the shaft.

The Great Eastern and Caledonian Gold-mining Company of Hongkong, formed for the purpose of working properties lying south of the Olliver's Freehold Mines on the Eureka line of reef, commenced active operations about three months ago, and are engaged in sinking two main shafts—one on the Great Eastern and one on the Caledonian property—their intention being to sink to a depth of 200 feet and open out to cut the reef worked previously down to the water-level with considerable profit. In addition to these, they are sinking two underlay shafts, in which they have some good ore. These operations, which at present are purely progressive, are being carried on with considerable energy and skill, and success is confidently anticipated.

Several co-operative parties have been working with only partial success.

The Woodstock Gold-mining Company (Scrubby Rush) and the Lord Hampden Gold-mining Company (Mount McDonald), after a somewhat chequered career, shut down.

In addition to lode-mining, a number of Europeans and Chinese were engaged during a part of the year fossicking on the Abercrombie and Lachlan Rivers, with varying success.

Altogether the outlook for the coming year, if favoured with a good rainfall, may be regarded as brighter than it has been for many years past.

Carcoar Division.

With the exception of a little fossicking, there has been no actual gold-mining done in this Division during the past year; but very extensive preparations are being made to mine on a large scale at no distant date, and as soon as suitable machinery can be erected. The Gallymont Gold Fields (Limited) are at present developing their property, and they have discovered no less than four distinct lines of gold-bearing reefs. These lines are being opened up on a thorough system by Mr. Eissler, the Company's consulting engineer.

The erection of a very large and complete plant is being proceeded with, and tramway construction is at present going on. This Company employs over 150 men, and when the batteries are completed the manager is confident of being in a position to crush 3,000 tons a month steadily, which will give employment to 300 men.

The other mines in the district have done nothing worthy of note during the year. The banks purchased 1,224 oz. 14 dwt. 9 grs. of gold during the year, valued at £4,592 9s. 1d.; but it is questionable if all this gold was won within this division. There are 26 men throughout the district, principally fossicking for alluvial, with varying success.

Blayne Division.

Gold-mining in this division is practically a thing of the past, the two principal mines, namely, the Brown's Creek Gold-mining Company and the Last Chance Company at King's Plains, having shut down. A number of fossickers, however, manage to make a living in the locality, and won among them about 164 oz. Attention is being given to the copper deposits of the locality, several of which are very promising. There is a probability that the old Annandale Coppermine will be again in full work, a trial smelting being found satisfactory to the present owners.

Newbridge Division.

The quantity of gold won in this division during the past year exceeds the return of 1896 by 303 oz., the increase being principally from quartz-mining. During 1896 there was a difficulty with parties who had quartz claims not being able to have their quartz crushed, there being no battery in this division. However, early in 1897, a 12-head battery was erected on Warren's property, at which the miners have been able to get a return from their quartz.

Another battery is now in course of erection on Mr. Collins' property at Sugar Loaf. This mine appear to be one of the best in this division, although no returns have been obtained from it so far. The owners have about 2,000 tons of quartz at grass, from which they expect a return of an ounce to the ton; the reef at the 100-foot level in this mine being 20 feet wide, and, it is said, gold can be seen plainly in the stone.

One party in this division received aid from the Prospecting Vote during the year to sink 100 feet from the 69½-foot level at the "Hard Shaft"; the distance has not been completed yet. The party is sinking on the reef, which is about 2 feet wide, and carries a trace of gold; the sinking is very hard.

There is very little doing in the alluvial mines. It cannot be ascertained what quantity of loads were washed, as most of them are fossicking in the creeks, and cannot give any return of how many loads they treat. All the alluvial gold obtained here is sold to the local storekeepers, so there is a difficulty in obtaining the exact quantity of alluvial gold won. There is very little mining being done on private land.

Trunkay Division.

The Trunkay Gold-field produced 124 oz. of quartz and 1,762 oz. of alluvial gold during the year, valued at £6,607, as against 1,447 oz. in 1896, and 2,340 oz. in 1895. The reason the amount of quartz gold is so small is owing to the fact that the Alma battery, which used to crush for the public at a small rate, was removed to the Crudine early in the year. This caused the small leaseholders and claimholders to abandon their work. The unusually low state of the Abercrombie River from the drought permitted, however, a number of the men to fossick in its bed, and some very good returns were obtained.

Messrs. Crees and Francis, on Wright's Reef, raised and treated 100 tons for 100 oz. Work is still being carried on at the Mount Gray Mine by Mr. Clarth, but no information is available as to results. The Bathurst Gold-mines (Limited), from which so much was expected, is unfortunately defunct. After the erection of their splendid battery they were compelled to liquidate. The battery has since been sold to a Bathurst syndicate and removed. Near Bombah, on the Abercrombie, Messrs Yates and Party have taken up an area of land for sluicing purposes, and have already cut a large head race from the river. The miners in this division do not take advantage of the Mining on Private Lands Act to any great extent, and the gold won from freehold lands may be put down under 50 oz.

Tuena Division.

The Tuena Division shows a slight decrease in the gold yield—the figures being 1,818 oz., as compared with 1,961 during 1896, the bulk of it being won from alluvium. Had there been anything like a fair average rainfall the output would have been greatly increased, as sluicing operations were all but brought to a standstill. The alluvial gold won was principally from the creek and river claims, and a number of these claimholders are stacking their washdirt till rain falls.

Tennent and Party at the Golden Dyke have raised about 200 tons, which they purpose sending to the Junction Point battery for treatment. From previous crushings they expect it to average about 7 or 8 dwt. per ton. This return is considered good enough if there was a battery at hand. The syndicate working on Victoria Flat are trying about 10 tons from their reef by the cyanide process, and expect it to yield about £4 worth of gold per ton. As soon as water is available they start on a larger quantity of stone taken from the 60-foot level, where the load averages from 3 to 4 feet wide. About Junction Point several parties are working the old reefs and making fair wages. A good deal of prospecting is going on in this locality, and one or two good surface shows have been discovered which will be further developed. Ray and Party, working the "Union Jack" at Markdale, have a promising reef, from which a crushing of 5 tons yielded 1 oz. per ton. About 80 tons of similar stone is at grass, which will be sent to the Junction Point battery as soon as teams can travel. At the present there is no water on the road. Several reefs have been opened up around Markdale, which give very good assays, but the refractory nature of the stone prevents it being treated locally. Some nice coarse gold was obtained in the bed of the Mulgowrie Creek, and one or two parties did fairly well; as usual, the great drawback to constant or efficient work being the scarcity of water.

Rockley Division.

The returns from Oberon are the highest for years past, viz., 1,098 oz. from alluvium, and 634 oz. from quartz, or a total of 1,732 oz. After a long delay the Mount David Gold-mining Company started crushing in October with a 10-head battery, and to the end of the year had put through 511 tons for 203 oz. valued at £882. The Company will soon have a 20-head battery at work, when better results are expected. It is said that £30,000 have already been expended on the property. Fully 70 men are now employed in and about the mine. At Rutherford's battery on Gilmadyke, some 7 miles from Rockley, about 300 tons of quartz were crushed for 80 oz. of gold. At Caloola Creek Messrs. Garbutt and Party with their new mill put through about 1,400 tons of lode stuff for 150 oz. of gold, valued at £560. Several other parties

parties are ready to start work in this locality, but are delayed owing to the scarcity of water. The drought had also a serious effect on the working of the alluvial claims, the men being unable to treat their washdirt when raised. A nugget 4 oz 16 dwt 21 grs. was found by a prospector at Davy's Creek, about 10 miles from Rockley, on Church and School Lands. The men, as a rule, in this locality can generally win sufficient gold to keep them in rations.

Burrage Division.

The mines in Burrage Division have been worked in a spasmodic manner during the year, but, notwithstanding, the yield has increased to 408 oz., as compared with 328 oz. during 1896. The Burrage Gold mining Company has done very little work during the past twelve months, and their 10 head battery has been idle during that time. The Company have a very large lode of pyritous quartz that is estimated to yield $\frac{1}{2}$ an oz. free gold per ton, but the want of the necessary capital to develop the property seems to be the drawback. On the Isabella River M'Vicar, Phillips, and Party have been constantly at work, and have erected a 3 head battery, with which they have crushed about 86 tons for a yield of 96 oz. of gold. Water has become so heavy in the underlay shaft as to compel them to commence the sinking of a main shaft, which is now down about 90 feet. This party have struggled against many difficulties during the past three years, but expect to reap their reward when the reef is struck in the main shaft. The majority of the leases adjoining have been abandoned after doing a little prospecting work on them. Woodburn and Sons, about $1\frac{1}{2}$ miles north of M'Vicar and Party, have struck a reef about 30 feet from the surface, which is 2 feet wide, and gives very fair prospects of gold.

At Little River very little work is being done. Hill and Hunt have abandoned their tunnel after putting it in some 500 feet without striking the wash. This party were in receipt of aid from the Prospecting Vote. At Jacob's Valley Watson and Party put a tunnel in 160 feet into a basalt hill, and struck a body of very promising wash, but it was not payable. The prospects are considered well worth following up in this locality. At Mount Werong about 40 men are employed, with varying success, the want of sufficient water being a great drawback. Munn and Party, who have a gold-saving machine and large dams, have done fairly well during the year.

Messrs Cotton and Docker have taken up about 25 acres in gold leases for sluicing purposes about 4 miles down the Abercrombie River from Mount Werong. They are now carrying out the preparatory work—such as the cutting of races and the construction of dams.

James Anderson and Party have also taken up an area of ground under lease for the same purpose, and intend working on a large scale. A few fossickers are still scattered throughout the division, and seem to be able to make a living. Just before the end of the year one of them unearthed a nugget weighing 2 oz 8 dwt. at the junction of the Isabella and Golden Gully.

The total number of men employed in the division mining for gold may be set down at 150.

O'Connell Division.

With the exception of a shaft being sunk at Breakfast Creek by Messrs Condon, Coutts, and Party, the mining in this division may be deemed fossicking. About 50 men, however, manage to make a living working the alluvial ground in the creeks and gullies, and it is estimated that during the past twelve months some 200 oz. of gold were won by these men. There is no immediate prospect of a revival in quartz mining.

Oberon Division.

In the Oberon Division about 200 men are gold mining, and the quantity of gold won was 361 oz., or 21 oz. less than the previous year. The work carried on, however, has been principally of a prospecting nature. Greater confidence is being shown in the possibilities of this district. A strong syndicate has taken up ground at the Black Bullock Mount, and also on Lambert's land, and are expending a large sum in thoroughly testing their property. The prospects met with are very encouraging, and the prospectors are sanguine that success will ultimately crown their efforts.

Bathurst Division.

The returns show that about 147 men are scattered throughout this division principally fossicking, and on the whole mining work is carried on in a very desultory manner. The men only turn their attention to such work when other employment is not available.

At Limekilns Sinclair and Party are testing a reef of a fairly promising nature, but the want of water prevented the party putting through all the stone raised, and were ultimately compelled to apply for suspension of the labour conditions.

Wattle Flat Division.

This division, formed during the year, was originally included in Sofala. There are 620 men employed mining for gold around Wattle Flat, and the total quantity won is estimated at 1,984 oz. The Great Victoria Company (Limited) have their main shaft down 414 feet, and the lode averages 2 feet wide, with an easterly dip. A crushing of 115 tons yielded 94 oz. of gold. At the Daisy Bell Mine the main shaft is down 101 feet, where the vein is 2 feet wide. A large quantity of stone has been raised, and the party are busy erecting a 5 head battery. Some very fair stone is being raised at Spring Creek, and the Eldorado party are awaiting the erection of a plant to commence crushing. A large number of parties are in receipt of prospecting aid in this locality, and have good indications of striking something payable.

Sunny Corner (Mitchell) Division.

This division is at last receiving the attention it deserves from investors, with the result that several properties are being opened up which are likely to be heard of later on. The yield of gold has increased very considerably, as will be seen from the following comparative statement of the last three years—

1895	3,645 oz.
1896	1,826 „
1897	4,169 „

With the exception of Sunny Corner Silver mine, which has been idle since December, 1896, every mine in the division is actively at work, which shows that confidence in the district has been renewed. The Paddy Lackey is working steadily, the year's output being 414 oz. from 550 tons.

The Big Hill Gold mine is now considered among the payable mines of the district, the stone treated being 1,576 tons for 710 oz. The prospects of this mine are so promising that the owners propose sinking a new shaft to a depth of 500 feet. The Ashton Gold mine is also raising stone of a similar quality. During the past twelve months a very complete crushing and cyanide plant has been erected at the Lagoon Creek by an English company, at a cost of £17,000. Another company, known as the Paddy Lackey Deep Level Extended, has been formed to prove the ground adjoining the Paddy Lackey to a depth of 1,200 feet. This venture is looked upon as likely to prove successful.

This is a favourite locality with fossickers, 200 of whom may be found scattered throughout the division. They all appear to be doing fairly well.

Orange Division.

In reviewing the year's operations in the Orange Division we find a big falling off in the output from the Lucknow mines, which has seriously affected the returns from this division, which in 1895 ranked as the largest gold producer in the Colony. For the sake of comparison the figures for the last three years are given—

1895	83,342 oz.
1896	21,446 „
1897	12,524 „

Although the Lucknow mines are responsible for this falling off, it must not be imagined that these mines are any the less valuable, as during the past year the strike, which lasted for several months, had the effect of seriously hampering the operation of the companies. The fact that very extensive prospecting operations have been carried on show that in the near future it may reasonably be expected that some handsome returns will be the result. The Wentworth Proprietary Company, Lucknow, are now on good stone, and have their main shaft down 900 feet. The stone raised was 6,225 tons, which yielded 5,281 oz. of gold. In the same locality the Aladdin Company have two shafts down 600 and 700 feet respectively. Their output for the year was 6,064 oz. from 3,027 tons of stone. This Company have also a good show of ore ahead. The D Arcy Estates Gold mining Company (Limited), also at Lucknow, have the deepest shaft on this field, having reached 920 feet, some ore has been raised and sent to England for treatment, but the returns are not yet to hand. The Wentworth

Extension

Extension Limited, are still sinking for the lode, and have now reached 628 feet. It is gratifying to know that full work is now proceeding in these mines, and that the sad effects of the strike are disappearing, the men left out of employment having drifted into other localities and started prospecting on their own account. Large works are about to be erected on the Macquarie River on the deep ground. The Victory Company at Forest Reefs are raising wash, but hardly up to expectations. The Ballarat of New South Wales Gold Mining Company, also at Forest Reefs having locating the deep lead by means of the Government diamond drill are vigorously proceeding with their shaft, which at the end of the year had reached 157 feet. The company hope to strike the old great extended lead, and probably the junction of several leads with this shaft, when rich returns may be anticipated. Extensive prospecting operations are being carried out at Byng, in the vicinity of Whitney Green, from which important developments are expected at any time, the indication being exceptionally promising and the erection of large works are in contemplation. The Springfield Pastoral and Estates Company Limited, Byng, intend employing a large number of men, and a private township is being laid out on the estate. The deposits at Bulga, are being used at the Lake Illawarra Company's smelting works for flux, and thus promises to open up a field for labour. The Blechnington Mine is now being worked, and the shareholders have hopes of speedily getting a return for their enterprise. The Coolgardie Gold Syndicate at Four mile Creek, Cadia, is reported to be on good stone, but no reliable information is to hand as to the field. The Belmonte and Great Bluff Reefs at Ophir are idle, and though small leaders rich in gold are continually being discovered, they are not permanent.

Molong Division.

The gold yield from this Division is very small, about 38 oz. Mining matters, however, have a tendency to improve. The Copper Hill has been taken up by a syndicate, who propose thoroughly testing the hill, which undoubtedly contains a large deposit of highly mineralised lode stuff, and in days past turned out some high-grade copper ore. Several prospectors are carrying on work in the locality, under aid from the Prospecting Vote, but no discovery worthy of notice has so far been made. Work on Delaney's Dyke is practically at a standstill.

MUDGELE MINING DISTRICT.

Cobbora Division.

On the Tucklar Gold-field, which is principally confined to alluvial workings, about 250 miners have been at work during the year. The yield of gold amounts to 2,457 oz. from 8,628 loads of dirt washed; value, £3 15s. per oz.

At Cranky Jack's Gully, situate 4 miles east from Tucklan, about 20 men have been fossicking, the yield of gold being 120 oz from 600 loads of dirt. And at Cobbora Gold-field, situate 5 miles south from Tucklan, 30 miners have been at work, the yield of gold being 300 oz from 1,500 loads of dirt.

Want of water has been the great drawback in this Division. The miners are now compelled to leave for want of water, even for domestic use.

At the end of the year there were only about 150 miners in this Division, owing to scarcity of water.

The total number of loads of dirt washed in this Division is 10,728 for a yield of 2,577 oz. of gold, valued at £3 15s. per oz.; value of gold won, £10,788 15s.

The yield from this district is regulated by the rainfall. In 1896, which was exceptionally dry, the quantity of gold won was 2,454 oz. When water is plentiful, this is a favourite locality with fossickers. They speak well of the prospects obtained, and anticipate good results. These fields were last year included in the Denison Town Division.

Leadville, late Denison Town Division.

Owing to an alteration in the boundaries of the Mining Districts, the Tucklan, or Stringy Bark, and Cobbora Diggings, are now embraced by the Cobbora Division, where the returns from these fields will be found. Consequently there are no returns to report from this Division.

Gulgong Division.

The Gulgong Gold-field, whilst showing a decided increase in the number of men engaged in the search for gold, has been somewhat restricted in the output, as compared with the previous year. During the year 1897, six thousand (6,000) ounces of gold were won in the Division, being a decrease of one thousand (1,000) as compared with 1896. This is greatly due to the fact that the rich gold bearing lead at Yamble, on Mrs. C. M. Lowes' private land, which enhanced last year's output, has been worked out. There have also been other forces at work to militate against an increase. The opening out of reefs throughout the district, from which few crushings have yet been taken, being so much dead work, which only at the present moment will begin to give proof of their good yielding qualifications. Hitherto, in all previous reports, gold has been won from alluvial leads, that from reefs and lodes having been infinitesimal; but with this year's returns the metal taken from reefs may be put down at five hundred (500) ounces.

A large area of land, both on Crown and private property, has been taken up. Twenty-four (24) gold-mining leases were applied for on Crown lands, embracing an area of one hundred and forty-eight (148) acres; six (6) gold mining leases were applied for on private land, covering an area of 24 acres; twenty-four agreements, under section 33 of the Mining on Private Lands Act, were registered during the year. On the whole, the activity of 1896 has been well sustained throughout 1897, and the outlook for Gulgong at the present time in the direction of quartz reefing is very encouraging. The difficulty of exploring these reefs may be judged from the fact that they lie under the old alluvial leads, having formerly fed those rich ancient water courses, the caps having practically only been denuded, and the rich stone left behind. Much interest must attach to these discoveries, for most of the reefs are found in intrusive diorite dykes, which intersect the strata in various parts of the field, which have no connection with the usual flat leaders hitherto found, which pinched out at the junction of the intrusive rocks with those of sedimentary origin, and, as sufficient work has not as yet been done on them to trace them down to the slate, nothing definite can be stated as to their lasting quality. It is more than likely, however, that they will prove to have been formed about the same time as the intrusion of the diorite dykes, and that they traverse the slate country, and, if so, their permanency is a surety.

A few rushes of slight importance occurred during the year, the most important being that to Scabby Gully, on Mr. J. Jackson's private land, about 5 miles north west from Gulgong. At one time about three hundred (300) men were camped there, but as only a few claims reached payable dirt, the miners soon left. Egan and Party washed as much as 30 oz. to the load, but barely a colour could be obtained in some of the surrounding claims.

Helvetia Lead and Moussy's Paddock still maintain their reputation, though many of the claims have been worked out. The famous No. 1 Duggan's Paddock (Helvetia) still continues to maintain its $\frac{1}{2}$ oz. to the load, yields taken from dirt which, in some places has a 50 foot face. The workings in the claim are of curious formation, huge pillars of limestone obtrude from the bottom, and the wash is followed through caves and caverns which sparkle with calcite crystals of varied forms. The present holders are by no means working out the whole of the dirt, which is a yellow pug, containing masses of concretionary nonstone and zircon; occasionally fossil bones and teeth are met with, and it is unfortunate that many fine specimens cannot be procured for the museum. The output from the various claims for the past year was about 7,000 loads for 2,000 oz. of gold.

As before mentioned, quartz reefing has engaged especial attention. On the Black Lead, at its junction with the Paramatta Lead, Hasenkan and Party cut a reef in their Shellback Claim at 95 feet, in what proves to be a rich dyke, traversed by a mass of minute quartz leaders. A 2 ton crushing yielded 57 oz. of gold, and many other crushings yielded good results.

The Happy Valley Reefing Syndicate cut a huge body of quartz, carrying gold in their south shaft, which prospected well, but, at the time of writing, no battery test had been made. The reef was going down almost vertical, and gold showed freely in the stone.

For nearly two years, prospecting has been pushed forward by the Salvation Hill Syndicate on a huge pyritous formation to a depth of 160 feet. Several assays have been made, with most encouraging results. Free gold shows frequently throughout the workings, and the owners are well pleased with the property, believing that in the near future important discoveries will be made.

The Royal George Syndicate, at Cullenbone, have a shaft down 170 feet on a reef, and have commenced to put in a level to the south at 90 feet, on a chute of stone which averages from 3 to 4 oz. to the ton, and a crushing is being taken out. Work at Cudgebegong is still being pushed forward, and many other reefs are being opened out.

Hargraves

Hargraves Division.

The returns from the Hargraves Field show that 2,326 oz. of gold were won as compared with 2,280 during 1896. Stewart and Warry, and Spratt and Milton, are doing good work on leases held by them close to the town, and have had several small crushings with satisfactory results, but owing to an influx of water at about 50 feet, deep sinking has been found impossible without a large expenditure in pumping machinery, which the lessees are not in a position to incur. Several reefs carrying good prospects have been traced to water level. Genuine efforts are being made by several of the leaseholders to develop their properties, but on the other hand it might be truly said that many of the leases are held for purely speculative purposes. About 300 men are employed throughout this Division.

Mudgee Division.

The principal mining in this Division at the present time is being carried on by fossickers, who manage to earn a living at the work. Several grants from the Prospecting Vote were made during the year, but no new discoveries have been reported as the result. The Mount Margaret Mine at Stoney Pinch is idle, the indications being disappointing. Some very good prospects have been obtained from reefs on private land at Log Paddock and Eurrundery, and eleven authorities to enter have been granted. No application for leases, however, have yet been lodged. The Mudgee Gold-field with others has suffered severely from a great scarcity of water for mining purposes.

Windeyer Division.

Mining matters have not been very brisk during the year in this Division. Messrs. Winter Brothers have a very good claim from which they crushed 573 tons of quartz and the quantity of gold won was 585 oz. They have about 250 tons at grass but are delayed for want of water for crushing purposes. This party have just completed erecting a 5-stamper battery. Messrs. Liebenritt and Party have endeavoured to work the Gully Claim, but have had a deal of water to contend with. They had several small crushings out of this shaft, which barely came up to expectations. Liffley and Party's claim, known as the Golden Gate, has been practically abandoned. There has been eight gold-mining leases applied for comprising an area of 34 acres, the majority of which have been executed. The alluvial mining is almost at a stand-still; there are, however, a number of men fossicking about the various creeks with varying results. About 1,400 oz. of alluvial gold have been bought by the local storekeepers, valued at £3 17s. Cd. per oz., and about 1,732 oz. quartz gold from the various leases, valued at £3 18s. per oz. This is an increase of about 700 oz. over the yield for 1896.

Peak Hill Division.

At Peak Hill, mining has not been very brisk during the past year owing to the exhaustion of oxidised ores, and also on account of the scarcity of water during the early part of the year. The treatment of refractory ores by calcining and grinding in amalgamating pans has not been altogether a success, as high as 6 dwt. per ton being left in the tailings. In face of all the disadvantages this field has to contend with it is satisfactory to note that the yield last year has been maintained, the figures being 6,453 oz., as compared with 6,428 oz. won during 1896. The Peak Hill Proprietary Company treated during the year, 2,802 tons for a yield of 1,131 oz. They have continued developing their mine, and the main shaft is now 600 feet deep, and shows a fairly large body of ore which the company have been advised to treat by chlorination. This company sold some 30,000 tons of tailings and the purchasers are now erecting vats to treat these tailings by the cyanide process. It is expected that the treatment will be difficult as the tailings contain copper and charcoal, the latter having got mixed with the tailings through an experiment in burning ore in the open air. Sixty-six per cent. extraction is all that is expected by the purchasers. The Proprietary's 35-head battery has not been fully employed, the only free ore crushed during the last half-year being that obtained by tributors.

The Crown of Peak Hill in sinking its main shaft struck the Great Eastern chute at a depth of 320 feet, and worked it profitably to a depth of 560 feet. In continuing operations below this depth a large influx of water took place which will retard work till a sufficient pumping plant is erected. This company has also a valuable asset of tailings which they have sold, and the proceeds are to be devoted to developing the mine.

The Great Eastern Mine still employs a fair number of men, and about pays expenses. Recently, at the 250 feet level, a chute of payable ore was discovered which has been tested in quantity with satisfactory results.

In Wythes and Mooney's Mine no work of any importance has been done during the past year, although it is supposed to contain some valuable deposits of pyrites ore. This mine is now being worked by tributors. The year's returns from this mine have not been made available.

At McPhail, 9 miles north of Peak Hill, the Myall United Gold-mining Company have completed their battery of 40 stampers, and have opened up their mine on an extensive scale. The yield of gold from this mine was not up to expectation, scarcely exceeding 6 dwt. per ton. Two thousand tons of quartz per month are put through the battery, and the yield is about payable. Cyanide vats are erected to treat the tailings, and it is said that the returns from this source are satisfactory.

Another mine at this place, belonging to Tattersall, Ashby and Party, has given satisfactory returns during the year, the ore yielding from 14 to 24 dwt. per ton, which gives a fair margin of profit over working expenses.

At Tomingley, the Tomingley Gold-mining Company, Limited, has done a large amount of prospecting work, and raised 500 tons of ore which, when crushed, gave a satisfactory return. Waddell and Party have a cyanide plant here treating tailings from stone crushed many years ago, returns being very satisfactory. In this Division no fresh discoveries have been made during the year, and very little prospecting has been done.

Wellington Division.

The principal mining carried on in this Division during the year has been at the Mitchell's Creek Freehold Gold Estate. The quantity of stone treated exceeds that of previous records, being 13,500 tons, which yielded 9,084 oz., valued at £32,382.

The number of hands employed by this company now reaches 208. No other quartz-reef in the Division has proved payably auriferous.

The alluvial mining has been confined principally to the Macquarie River, owing in a great measure to the scarcity of water. The quantity of alluvial gold won is estimated at 200 oz., but it is next to impossible to obtain an idea of the quantity of wash-dirt put through.

TAMBAROORA AND TURON MINING DISTRICT.

Hill End Division.

During the year the principal mining operations for quartz gold has been carried on at Red Hill, Tambaroora, and Hawkins' Hill, while a few parties have been working at Cline's Gully, Sally's Flat, and Macquarie River with payable results. The total quantity of quartz treated at the various batteries for the year is 5,844 tons for a yield of 2,450 oz. 11 dwt. 12 gr., an increase of 1,131 oz. on last year's returns.

In alluvial gold-mining there has been a very large falling off in the yield owing to the very dry season and scarcity of water for mining purposes. As the alluvial gold in this Division is won by fossicking and sluicing, it is not possible to give the quantity of wash-dirt treated.

During the year 200 Europeans and 48 Chinese have been employed in alluvial mining who have won 1,326 oz. 3 dwt. 3 gr. of gold, being a decrease of 1,358 oz. on last year's returns. Several Companies are still prospecting and working the basalt hills near Macquarie River for alluvial gold, but so far without any payable results.

Rylstone Division.

There has been no systematic mining carried on in this Division during the year. Miners have been engaged principally in prospecting and fossicking, and it has been found difficult to arrive at an estimate of the quantity and value of minerals won.

At Tabrabucca two parties have been working for some months, but the results have not been satisfactory enough to warrant a hope that a permanent industry will be created.

Operations

Operations have started again at the Cudgegong Copper-mine, but the work last year was confined to pumping water from, and opening up, the old shaft. There was no output of ore, but the parties interested anticipate that during the current year a number of men will be employed if sufficient capital is forthcoming to develop the mine.

There is no machinery in the Division, and the ore raised was treated outside the district. There were no new finds during the year.

Sofala Division.

While no remarkable discoveries have been made in this Division for 1897, the yield of gold has been fairly maintained, considering the drought which has prevailed all the year. In 1896 the yield was 4,753 oz., and 4,086 during the year under review.

There are very few alluvial miners who have won more than a bare living, away from the Turon River, for the reason that the mullock would not pay to cart to the river. At Jew's Creek, a few miles west of Sofala, which, in 1896, gave several miners good returns, has not returned any gold this year. There are about 40 alluvial miners at Box Ridge and Lower Turon who have been doing fairly well, notably A. Burke, whose average for the year has been about £4 per week, and the others much less. At Tobin's Oakey, about 15 men have been earning good wages, owing to the dry season, the ground being very wet. At Palmer's Oakey about 70 men are earning a bare living in and about the creek. The Moonlight Race, owned by Tacke and Party, has not been running during the year, and this race usually kept 25 men employed sluicing above the junction, and gave very fair returns. At Upper Turon about 40 miners are getting fairly good returns on and near the river. In the immediate vicinity of Sofala 100 miners are earning a bare living, with a few exceptions, namely, Oldman and Sons, who are winning about 1½ oz. per week each in an extended alluvial claim between Row's Hill and Turon River in from 20 to 30 feet of sinking. Brazenall and Party, at Razorback, have a lot of washdirt stacked, which yields 5 dwt. per load, but the scarcity of water prevents them treating it.

The Turon Gold-mines (Limited) has a plant valued at £1,000. They have a 10-head battery, with several portable engines, a steam winch, sheds, and offices. They have several shafts, varying from 50 to 400 feet in depth, the vein of quartz averaging from 1 to 4 feet thick; there are 12 men employed at present sinking on the vein and raising ore for crushing when a sufficient water supply is available. The vein underlays 46 degrees, with a N.W. and N.N.W. strike.

The Surface Hill Gold-mining Company (Ltd.) are putting in a tunnel at present 420 feet in length, deepest level about 179 feet; 5 men are employed, and during the progress of tunnelling have cut several small leaders, but not anything payable yet.

The Reilly's Creek Amalgamated have a plant valued at £300. A very complete 6-head battery has been erected. The deepest level is 90 feet, depth of shaft 100 feet, vein varying from 1 to 7 feet; underlays west strike north and south. During last six months they have crushed 397 tons for a yield of 196 oz. of gold, valued at £692.

The returns from Newcastle and Stockton Gold-mining Syndicate, at Surface Hill, were not available.

The Big Oakey Gold-mining Company have a plant valued at £2,000. They have a 10-head battery erected, and employ 4 men. A tunnel 400 feet has been put in along the lode, which averages from 1 to 4 feet in width. About 147 tons of quartz have been crushed, which yielded 6½ oz. of gold, valued at £221. There is a great quantity of ore at grass waiting for water to start crushing.

The Caledonian Quartz Claim, owned by Crawford Bros., crushed 87 tons for 44 oz., valued at £156.

The Whalen's Hill Gold-mine, owned by W. H. Campbell, has a shaft 225 feet in depth, where the lode is 3 feet. There are 280 tons of ore lying at this mine waiting for water to crush.

O.K. Gold-mining Syndicate, tributed by W. E. Franklin, have several shafts, varying from 90 to 160 feet in depth. They crushed during the year 71 tons, for a yield of 60 oz., valued at £184.

Elkins' Extended Quartz Claim, Back Creek, Crudine, crushed 254 tons, yielding 188 oz., valued at £670.

The Halpin's Secret Gold-mining Company, at Box Ridge, treated 18 tons, which yielded 2 oz. 6 dwt. per ton; 8½ tons, which yielded 1 oz. 3 dwt. per ton; and 45 tons, treated at a local battery, returned 12 dwt. 2 gr. per ton. It is considered this would be a valuable property if capital were brought to bear on it.

The Razorback Antimony and Gold Mine, owned by Wm. Brazenall, has now been proved to a depth of about 260 feet. Some 60 tons of ore are at grass, but a difficulty is experienced in treating it.

The Queenslander Gold-mine, owned by W. B. Neales and J. C. F. Johnson, have a very complete plant. This mine is worked on the open-cut system. The lode is from 40 to 50 feet wide, and in free gold will average 6 dwt. per ton, with a very large percentage of pyrites, which yielded on assay 7 oz. per ton. They have crushed about 200 tons during the year, and have several hundred tons at grass, which will be treated when water is available.

There are many more reefs in this district awaiting capital to develop them. One very large reef on private property, leased by Wm. Flynn, on Waverley Run, Crudine, is about 15 feet wide where worked, and can be traced for 200 yards on surface, a crushing from which of 10 tons yielded 10 oz., valued £38. There are also on this property two more large reefs carrying pyrites. The owners have started an open-cut along the reef, but will have to cart the ore 4 miles for treatment.

Ironbark or Stuart Town Division.

There is a decrease of 334 oz. in the gold yield from this Division as compared with 1896, the figures being 3,190 oz. The decrease is in the alluvial gold, attributable to the want of water for sluicing purposes. During the year special gold leases, aggregating 975 acres of the Macquarie River bed, were applied for to work the drift by steam dredges and hydraulic sluicing. This is an entirely new branch of mining in New South Wales, and, if successful, will add greatly to the importance of the district. This system of mining is being successfully carried out in New Zealand, and as the bed of the river is believed to contain gold in payable quantities the necessary energy and enterprise on the part of the promoters will not be lacking to make the venture a success. An effort was made on the river at Weir's Point to work some ground by hydraulic sluicing, but the machinery proved inadequate, and work has been abandoned for the present.

LACHLAN MINING DISTRICT.

Cargo Division.

The Mount Durnard Syndicate (Limited) are erecting new machinery in this Division, valued at £8,000, and if rain would fill the dams a full complement of men would be put on. The Ironclad Mine is unfortunately idle, the valuable machinery erected being unsuitable for the refractory ore to be treated. It is feared that unless a new method is adopted the mine must remain closed. No other properties are at work in this locality, but a little prospecting is being done in the creek and on the flat.

Cudal Division.

The returns from this Division during the past year may be put down as nil. Messrs. Payne and Tonkin are, however, sinking at Reedy Creek, and have hopes of opening up a copper lode carrying a small percentage of gold. At Boree some work has been done to test the wash underlying the basalt, but as yet no payable returns have been got. Messrs. Summerfield and Party have received prospecting aid to test a gossan lode on Prior's land, and are now down about 60 feet, where the lode is some 6 inches wide. A few other parties are in receipt of aid to test some land in the vicinity of Paling-yard Creek. No results have followed the expenditure so far.

Forbes Division.

In the Forbes Division, the mining work done during the year, I regret to say, as regards mining, has been principally of a prospecting nature, and this has been greatly hindered by the want of water, which has prevented alluvial mining to a great extent, and has seriously affected quartz-mining, as the batteries were unable to treat the stone, the returns from which were required to enable the owners to carry on work. In this Division, in years past, the alluvial mining has been very profitable; but so far it may be safely said that no payable reef has been discovered.

Sinclair's Mine is part of an auriferous belt which extends for many miles north of Forbes, through Parkes, Allectown, and Peak Hill, to Tomingley, and probably on to near Dubbo. The negotiations for the purchase of the mine were completed, and the Company have lost no time in starting to prove its value. A main shaft is down 80 feet to the water-level, and there are three other shafts, the same depth, for ventilation, together with 800 feet of driving. To deal with the water, machinery is required; three engines are being erected—one for crushing, one for winding, and one for pumping. The Company intend to thoroughly prove the mine at a depth. At the present there are 500 or 600 tons of stone at grass, showing fair gold.

The

The crushing plant of ten stampers is nearly complete, and then only water is required to put the mine in full work. Two large dams of 5,000 yards each have been made, and the first heavy thunderstorm will probably fill them. The name of this company is "The Lachlan Gold-field Company (Limited)."

North and south of Sinclair's Mine claims are at work, but they are not on the reef.

On Thomson's Hill, half a mile south of Sinclair's, Foster and Party are working on what appears to be the same belt as Sinclair's. They have raised a quantity of stone, which is reported to be of good quality.

South of Forbes several quartz claims are working, but on the Britannia line of reefs there is no report of any important discovery.

Two private parties are working the "Rise and Shine" or "Fountain Head" Reef or Lode, in the town, from which very rich specimens were obtained some years ago. Indications are favourable, but as yet these claims are not thoroughly proved.

At the Pinnacle, which is about 22 miles south of Forbes, the two principal mines are the "Pinnacle Gold-mining Company," and "The Croker's Reef Mine." On the first-mentioned mine work has been going on for eighteen months, but the results are only partially satisfactory; 60 men have been employed; one shaft has been sunk 100 feet, starting at the 120-foot level, making in all 220 feet. Another shaft has been sunk 180 feet. From this mine 2,000 tons of quartz have been crushed, averaging about 5 dwt. per ton. At the present time the manager proposes to open up the mine still further, to prove if the shoots containing gold are extensive. On Croker's Mine an average number of 15 men are employed. Two shafts, 200 feet apart, have been sunk to a depth of 90 feet. These shafts are connected at the 90-foot level, and drives are being extended north and south from them. From this mine about 2,000 tons of quartz have been crushed, yielding from 3 to 5 dwt. per ton. It is under the same management as the Pinnacle Mine, and at present is closed down to make arrangements for further capital. It is to be hoped, in the interests of mining in this Division, that the necessary capital will be forthcoming to prove these mines to a depth, and this will probably be done in the Colony, if not by English capital. To leave a mine which contains a large reef carrying gold nearly payable, without proving it to a depth, would be simply expending money for another company to probably reap the benefit. All the working in connection with these mines is very cheap. The reefs are large and easily worked. The gold is mostly free, and contains nothing to interfere with amalgamation. A 30-stamper battery has been erected by the Company to treat the stone from both these mines. This battery does not crush for the public. There is a public battery of five stampers. In all there are about nine mines at work in this locality, seven of them employing from 20 to 24 men.

At the "Ironbarks" a syndicate of eight have a payable mine. They have crushed 350 tons, yielding from 12 dwt. to 3 oz. per ton.

On the "Soldier's Reef" three men are working; they have crushed about 25 tons for a yield of from 12 to 15 dwt.

Other small parties of miners are working in this locality, taking out a few tons of stone, and trying the various reefs. The country is soft slate, easily worked, and it is probable that payable reefs will be discovered. Plenty of rich shoots of gold-bearing stone have been worked in this locality on the surface, but there are no workings to any depth.

At the Pinnacles a village has been laid out, and when the mines are in full work the population is about 400.

Parke's Division.

There is a considerable falling off in the returns of gold from this Division, the yield being 9,064 oz. as compared with 12,500 oz. won in 1896.

The principal mines worked at Parkes during the past year are the Bushman's, the Dayspring, the Golconda, the Phoenix, the Birthday, the Kohinor, Quayle's, and Burgess and Smith's Mine. The Bushman's Mine comprises an area of 49 acres, and has been worked for many years—first as claims and then as leaseholds. The depth of the mine is 700 feet. Three hundred and ninety feet were sunk during the past year; drives were put in to the extent of 1,080 feet; 85 men are employed; 3,023 tons of quartz were crushed for a yield of 2,063 oz. 18 dwt. of gold; 4,684 tons of tailings were treated for a yield of 562 oz. 5 dwt. of gold. Various improvements have been made in the mine. A cyanide plant has been erected, smelting furnace, assaying office, &c., and the mine has been equipped with three new patent safety cages.

The Dayspring Mine embraces 30 acres of land. During the past year this Company have driven 300 feet at the 200-foot level, and 250 feet at the 300-foot level; also 150 feet at the 400-foot level. They have crushed 2,500 tons of stone for an average yield of 6 dwt. per ton. This is payable. One dividend of £500 has been paid during the past year. The prospects of this mine are fairly good.

The "Golconda" is worked by a few hands, and at no great depth—say, 120 feet—rich specimens were obtained. No crushing is yet to hand, and the work done is confined to sinking and a little underhand stoping.

The Phoenix (a tribute party) are working on a cross leader at the 400-foot level. The stone crushes over 2 oz. per ton, but the country is very hard, and the tributors are not making more than wages.

The Birthday Mine—about 4 miles south of Parkes—did a considerable amount of work, driving and back-stopping until their water supply gave out. The reef is a large one, consisting of alternate large bunches of ore and then intervening pinches. The results of crushings are not easily obtainable, but it is reported that 6 dwt. per ton is the average yield. The Company have erected a 10-stamper battery, and have recently purchased an adjoining block. This is considered a valuable property.

At the "Kohinor" little work has been done, the last crushing not being payable.

At "Quayle's" the same leader is being worked as in the Phoenix, the cross reef is small but rich; but the party are not, it is said, making wages.

Burgess and Smith's Mine at Reed's Gully.—The owners have a small battery of five head of stampers. They are working a very large formation, but only follow the quartz leaders in it. These leaders are occasionally very rich, but do not average 1 inch in width.

Fifield and Carlisle Division.

During the year in this Division only 37 tons of quartz were crushed, for a yield of 52 oz. 5 dwt. of gold, valued at £198 11s. As regards alluvial, 7,209 loads of washdirt were puddled for a yield of 882 oz., valued at £3,351 13s., and 1,966 oz. of platinum, valued at £2,949. Mining in this Division is in a very languishing condition, many of the miners having left for Claremont, in Queensland. Carlisle is now practically deserted; but there is no doubt that this district will, later on, attract the attention of miners. It is certainly auriferous, and probably contains payable reefs.

Condobolin Division.

In this Division there are a few mines at work, but it is questionable if any of them are payable under present circumstances. The most promising mine is that known as "Winter's," on Mowabla Run, about 15 miles north of Condobolin. A recent crushing of a few tons gave 3 oz. per ton. This mine wants proving to a depth, where, if the reef continues as large and valuable as it is near the surface, the mine will be a very valuable property. Some copper lodes are being prospected about Melrose and the Yellow Mountain. At the last-mentioned place Byrum and Party are reported to have made a valuable discovery, and they have applied to lease 40 acres for copper. At Cujong work is about to be resumed in the claim known as the "Yellow Streak," from which some very rich stone has been raised. It will now be thoroughly prospected, and if payable stone is obtained other mines at present idle will resume work.

Alectown Division.

At this place little mining has been done during the past year. In this Division the principal mine is the "Monte Carlo," about half-way between Alectown and Peak Hill, which is said to have paid a dividend of £62 per man during the past year. These miners are industrious, and will thoroughly prove the mine before they leave it. Just below the "Monte Carlo," on a wide flat, a party of prospectors seeking alluvial gold, at a depth of 60 feet, got some excellent prospects, but could not trace the gold any distance. The prospectors abandoned the claim, but another party have taken their claim up. It is very probable there is a lead in this locality, but the flat is so wide it requires a large number of shafts to prospect it. Very little gold was got in this Division last year, probably not more than 150 oz. In Beazley paddocks very little work, if any, has been done for some time, but one or two leases are held under the "Mining on Private Lands Act."

Grenfell Division.

The Grenfell Division shows a slightly increased yield of gold for the year as compared with 1896. The figures being—1896, 1,761 oz.; 1897, 1,780 oz., of the value £6,855. The dry weather has very much retarded operations. Several applications for suspension of the labour conditions have been made to the Warden, the cause for suspension being owing chiefly to the want of water.

The "Enterprise" Mine has changed hands, and it is said that it is the intention of a Victorian Company to work the property with vigour during the current year. Two Cyanide Works are in full swing, treating sand or battery tailings. These works have been erected at a cost of about £4,000. The cost of one being £1,500, that of the other £2,500. There are two batteries on the field at Grenfell, and a Huntingdon Mill at the Seven-mile. At the "Pinnacle" there are also two batteries. About 220 miners found employment in the Division, 170 (say) in quartz, and the remainder in alluvial.

Murrumburrah Division.

There has been little improvement in mining operations in this Division for the year 1897. There is, however, a good deal of what may be termed fossicking going on at the Reserve near the red bridge at Currowong, and a little round about Cullinga and Murrumburrah. In that part of the Division it is estimated that probably fifty or sixty men find employment. There were purchased locally 1,992 oz. of gold of the value of £7,685, but by far the greater part of this gold must have come from Cunningham Creek. Tilden's Proprietary Gold-mining Company has closed down, and has, I understand, disposed of the whole of its plant and machinery. The purchasers, some of whom are local men, intend shortly to reopen the mine and work it with vigour. Two parties have been receiving aid from the Prospecting Vote, one at Berthong and the other near Wombat, but they do not appear to have been very successful.

Gundagai Division.

There has been a considerable falling off in the quantity of alluvial gold won in this Division during the year; but the decrease in that direction is amply made up for by the increase in the quantity won from quartz, the total quantity won from both sources being 3,438 oz., as compared with 2,600 oz. won during 1896.

It is almost impossible to get an accurate return of the workings of either. In the case of alluvial, the results are brought in small quantities to the local storekeepers, who are not furnished with the quantity of washdirt treated, and, in the case of quartz, as there has been no machinery until recently in the district, the stone has been treated at the Adelong batteries, and the gold, the result of the crushings, sent through the local storekeepers and Banks.

Notwithstanding these difficulties, the returns furnished show an increase of 838 oz. over that of last year, with the prospect of a considerable increase during the present year, in consequence of the fact that the Camden Exploration Company, at Johnston's Hill and Mount Kimo, and the Booth Reward Company, at Coolac, are erecting extensive machinery to thoroughly test the gold-bearing quartz of those localities.

During the past year, 18 applications for gold leases on private lands, and 13 applications for ordinary gold leases have been lodged, and 174 applications for authority to enter. This alone is an evidence of increased activity in mining matters.

The prospects of the mining industry in this Division are brighter than they have ever been, and the result of the development of Johnston's Hill, Mount Kimo, and Booth's Reward Claim, will decide whether this Division contains gold in payable quantities, and determine the permanency of the field.

Some very good returns have been made during the year, notably from the Turn of the Tide Mine, on Johnston's Hill—102 tons were put through for 743 oz.; from Beezley's Gold lease, 44 tons for 163 oz.

The Howell's Consolidated Gold-mine (Limited) are working the Prince of Wales Mine on the Kimo Ranges. They are now down with their main shaft 340 feet, and employ 120 men. A complete winding plant, with a 20-head battery, has been erected, and over 3,500 tons of stone are at grass ready for crushing. The party working on the Jackalass Lead, South Gundagai, raised 630 loads, which yielded 175 oz. of gold. Several parties are vigorously carrying on prospecting work, in the hope of discovering new leads, and some important discoveries are expected in this direction.

Temora Division.

The output of gold from the Temora Field during the year is 3,419 oz., as compared with 4,066 oz. in 1896. Although there is a reduction in the output the prospects of the field are much improved. During the year there were three new payable reefs found, two of which were found through assistance from the Prospecting Vote. There are twenty parties prospecting with very fair prospects of finding payable gold, as they are following reefs containing gold. Want of capital among the mining population is a great drawback to the development of the field. There are two parties prospecting for alluvial on private property. The details of crushings as far as can be ascertained, were 258½ tons of stone for 254 oz. 5½ dwt. of gold. Several parties are still carrying on work in the hope of striking a second bottom, which they are sanguine will prove rich. In the interest of the district it is to be hoped their efforts will prove successful.

Barmedman Division.

Mining matters were very dull and showed no improvement upon the previous year. The total yield of gold for this Division, was 4,693 oz., valued at £15,213 4s. 3d. The Barmedman Cyanide and Milling Company, have done good work with satisfactory results. The Fiery Cross Gold-mining Company has been under suspension. The capital was exhausted through the great expense in trying to cope with the great influx of water, but an attempt is being made to secure capital, and, if successful, work will be proceeded with. The last suspension expires early in February. Eighty-five miners' rights were issued, and twenty business licenses. One application for lease under the "Private Lands Act," was received. The lessees at the lease held under the "Mining upon Private Lands Act," known as "The Golden Hope," did a considerable amount of work without satisfactory results, and employed two men for four months. The total number of men employed in connection with mining was twenty-eight. If the required capital is procured for the Fiery Cross Mine, it is probable that mining generally in this Division, will improve during the year 1898.

Reeflon Division.

Owing to the depth reached—the water-level—and the want of capital, mining has not progressed as it should have done. Four claims were worked, viz., the Pioneer, Enterprise, Sydney Claim, and the Prospectors (Higgins and Party). The quantity of stone raised was 1,439 tons, which yielded 1,339 oz., valued at £4,500. In 1895 the yield was 1,603 oz., and, in 1896, 2,255 tons were treated for 1,820 oz. The yield for 1897 is 266 oz. less than 1895, and 383 oz. less than 1896. Fifty miners were employed. Six gold-mining leases were applied for, embracing an area of 36 acres 1 rood 10 perches. The machinery (a 10-head battery) is valued at £500. A small cyanide plant is being erected to treat tailings. It is considered that no great improvement will take place until outside capital comes in. The Enterprise and Pioneer Claims have always paid fair returns.

Wyalong and Wyalong West Divisions.

It is impossible to separate Wyalong and Wyalong West Divisions, and, therefore, they are dealt with as one. The yield of gold for Wyalong has been as follows:—

1894—9,649 oz., valued at.....	£35,946.
1895—21,497 oz. ,,	£91,863.
1896—33,495 oz. ,,	£130,000.
1897—34,370 oz. ,,	£137,480.

The exact total yield of gold cannot be obtained, as a great quantity goes away privately, and the Cyanide Works do not give the exact returns for private reasons, and a great quantity of gold has been taken direct to Melbourne, chiefly by the Messrs. Neeld and Duncan Brothers. The reason assigned is, that a better price is obtained and that the charges at the Mint are lighter.

It will be seen that 30,750 tons were treated for 23,900 oz., and in addition to this 4,000 tons of mullock yielded 470 oz. So that the yield for the whole field, without the mullock, was over 1 oz. per ton. This may be considered a highly satisfactory result. The table given later on shows splendid yields in many cases.

Two thousand one hundred miners were employed, being 261 less than the year 1896. This can be accounted for by the number of leases applied for and upon which no labour was employed pending the issue of the leases, and, in some cases, through work having ceased through want of capital to procure machinery and appliances to work in an efficient manner.

The value of the machinery upon the field is about £80,000. The population is 4,200, being about the same as in the year 1896.

The work done by the local batteries and works is as follows —

Name.	Kind of Works	Tons Treated	Yield		
Nicholls and Reymond	Battery	5,555	oz	dwt	gr
Gough's	"	3,996	5,971	0	0
Cox's	Mill	1,834	3,273	0	0
West's	Battery	341	1,792	0	0
Neeld's	Chlorination works	1,600	192	0	0
Duncan Brothers	Cyanide works	8,550	4,970	0	0
Channon's	"	5,530	5,110	0	0
Sully's	Chlorination and cyanide works	800	3,140	0	0
			5,000	0	0

* Quartz only, tailings not included but estimated in total, 5,000 oz includes gold from tailings

Deeble Brothers works are not yet completed

Ore has been treated away from the field at the following places —Dapto, Ballarat, Clyde, Cockle Creek, Wallaroo, and Footscray

Sulphide ore exists at a depth, and some from Bolte's Claim (now called the Lucknow) yielded 22 oz per ton. This claim is now down 300 feet in the solid granite and the reef is over 3 feet wide, and 10 tons treated yielded as before stated.

Before long the works upon the field will treat all the ore raised. The price no doubt will be reduced

The following table shows some particulars of some of the principal mines —

Name	Depth	Deepest Level	Ore Raised	Yield
	feet	feet	tons	oz
Cuirajong	280	225	1 200	1,452
True Blue	260	260	354	376
Klink's	210	200	275	1,877
Bolte's	304	304	324	1,275
Shamrock and Thistle	235	235	492	2,406
Harry's Find	150	150	299	436
Neeld's	200	200	Not obtainable	
White Reef	327		980	1,264
Junction	354	354	409	919
Perseverance	295		418	1,134
Bantam	280		112	253
Golden Fleece	218	218	532	668
Waratah	215	210	124	436
Mallee Bull	350	350	85	114
Great Britain	210	240 (underlay)	28	62
Lighthouse	504	490	No reef yet.	
Princess	380	360	316	742
United Anglo Australian	270	180	No crushing yet.	
Christmas Gift (Block)	275	275	46	73
Klondyke	260	160	263	432
Christmas Gift	210	150	259	374

Miner's Right	100	90	99	67
Doyle and Party	153	150	30	25
Santa Claus	128	128	115	213
Pooley and Party	200	180	98	151

The yields at the Shamrock and Thistle and True Blue are exclusive of tailings and concentrates. The Shamrock and Thistle received £700 for their tailings and concentrates

The Daisy is down 335 feet and has had a few small crushings

The Barrier is down 254 feet, but work has been at a stand-still owing to a dispute among the shareholders

The Lighthouse is down 504 feet and is now cross cutting at 490 feet, and is in 23 feet in a W S W. direction. It is expected that the reef will soon be struck and appearances point that way. Good work has been done upon this mine, which received aid from the Prospecting Vote to test the reef to a greater depth than hitherto reached on the field

During the year the Prince of Wales was sold to the Australian Exploration Company at a good figure, and the Company took up adjoining ground. This Company has erected a most complete plant at great expense. A good mineralised reef has been struck in No 1 shaft, but none of it has yet been treated, but ore is being raised and bagged for treatment. Twenty four men were employed and more will be put on

The True Blue has been lately keeping 10 stampers constantly going. The reef is from 4 to 5 feet wide at the 200 feet level. Besides this stone is being kept for chlorination

The Called Back Mines are to be worked again, and one lease has been purchased by a Melbourne syndicate.

The Pine Ridge promises to improve and present indications are favourable

Work is being carried on in the vicinity of Bartley's with fair prospects

About twelve to fifteen mines have been fossicking for alluvial at Billy's Lockout, but the dry season has been a great drawback

A party is prospecting upon East Bland Station with fair prospects

The prospectors are still at work at Mount Monai. Two or three parties have been prospecting at Buddigowai

A great deal of dead work has been done upon many mines at great expense, which will tend to increase the output for 1898. Although the number of miners employed was less than the previous year, more experienced and practical men were employed and several experienced managers were brought to the field. The work taken as a whole has been more legitimate and efficient, and will lead to the mines being properly and expeditiously worked. Taking everything into consideration the returns and state of the field is satisfactory. The yield is the result of about 100 claims. It has now been proved beyond doubt that the reefs go down and return their richness, and that the field has been proved to be permanent.

The reduction of the labour conditions has had a good effect and will be the means of causing 1898 to be the most prosperous year for Wj along since its discovery. Capital has already been invested.

Yalgoggin Division.

The yield of gold for the year was 1,631 oz., from 539 tons, being slightly over 3 oz. per ton, and was valued at £5,872. The yields for previous years were —1894, 348 oz.; 1895, 804 oz.; 1896, 1,250 oz. Therefore, the yield for 1897 exceeds that for 1896 by 381 oz. Sixteen claims are upon gold. The

Ten gold-mining leases for Crown lands, comprising an area of 63 acres, and thirteen applications for gold leases under the Mining upon Private Lands Act, comprising 141 acres, were applied for. There were about 200 miners on the field.

A number of authorities to enter under the Mining Laws Amendment Act were granted, and some were converted into leases. Barnett and Gough completed the erection of their ten-head battery, and it was at work for nearly three months. This was a great boon to the field. Duncan Brothers have commenced to erect a cyanide plant, and have purchased a quantity of tailings ready for treatment. These works will be a great advantage, as all tailings will be treated upon the field. The ore being mineralised, the tailings will pay for treatment, and this will increase the profits of the mines.

The following list gives some particulars of some of the claims:—

Name.	Depth.	Deepest Level.	Ore raised.	Yield.
	feet.	feet.	tons.	oz.
Great Central	140	90	6	18
Great Eastern	90	90	17	58
Mosgiel Syndicate	238	150	20	108
Democrat	170	123	9	23
Black Coon	108	100	202	508
Piccaninny	145	116	98	535
Day Dawn	100	100	2½	9
Mount Allan	30	30	28	28
Eureka	170	110	60	135
Shelly and Party	112	100	90	200

The width of reefs varies from 4 inches to 2 feet.

The machinery is valued at £700, and a much larger yield for 1898 is anticipated.

During the latter part of the year outside capital has been invested. Capital has been put into the Birthday Syndicate at Waldron's conditional purchase, and if this syndicate is successful a great impetus will be given to mining in this Division.

The surrounding country is auriferous, and there is every appearance that Yalgogrin will become a large and prosperous field. The town has been greatly improved during the year by the erection of buildings, &c., and this shows the confidence of the residents as to the permanency of the field.

Young Division.

In this Division mining operations for several years past have presented a singular uniformity. With the exception of the work which is being carried on, under the Mining on Private Lands Acts, no new feature has appeared. The year 1897 will long be remembered in the district, as being one of the driest years of which the inhabitants have had any experience. Mining operations have been much retarded in consequence, and the sluicing claims which yielded fairly well in more favourable seasons, have scarcely done anything. Operations are being chiefly confined to alluvial, little being done in quartz. The South Burrangong Mine, which in former years yielded considerable quantities of the precious metal, ceased operations, and shut down, it would appear finally, having removed or sold their plant and machinery. Good results are expected to accrue from the Day Dawn, a quartz mine situated about 6 or 7 miles from here at Stoney Creek, and owned by a local syndicate. The owners are receiving aid from the Prospecting Vote, and are carrying on operations with some vigor. The stone appears to get more promising as they go down, and it is intended soon to send some tons for treatment at Dapto. Sanguine expectations are entertained as to the result. Clifton and Party, who are carrying on operations about a mile from here, are also receiving aid from the Prospecting Vote. The reef is small, about 3 inches. The locality in which it has been found, has in years gone by, yielded considerable quantities of gold. It is intended soon to subject a parcel of the stone to a proper test. No reports have been received of any rushes for the year, nothing sensational in that way having occurred.

As far as can be ascertained 2,134 ounces of gold have been won in the Division of the value of £8,376. This shows a considerable falling off, which I am inclined to attribute almost wholly, to work at the sluicing claims having been suspended during the greater part of the year. It is estimated that probably 200 professional miners find employment mining and fossicking in the Division.

TUMUT AND ADELONG MINING DISTRICT.

Albury Division.

The output of gold in this Division shows a decrease of 236 ozs. on that of the previous year. It principally includes quartz-mining at Black Range, Cumberoona, and Stony Park; the yield being a little over 800 oz. from 1,017 tons of stone.

Application has been lodged for a large area of land near the Black Range, and a syndicate is being formed for the purpose of testing the locality for a deep lead which is supposed to exist there.

Briese's Paddock, situated between Albury and Jindera, and which was originally held under conditional lease, has been brought under the provisions of the Mining on Private Property Act, and there are now on it two claims, which are being worked with some degree of success.

About 150 men are engaged in mining throughout this Division.

Walbundrie Division.

Within this Division only three leases under the Mining on Private Property Act are being worked, viz., the Lone Hand, the Welcome Find, and the Goodwood, at Bulgandra, employing in all about twelve men, as against about 50 who were working at the commencement of 1897. About 300 tons of stone have been crushed during the year for a yield of about 270 oz. of gold.

Germanton Division.

Mining has practically ceased in this Division, and the returns are nil.

Corowa Division.

The only mining carried out in this Division is that done by the Corowa Deep Lead Company, who, on the strength of the results of boring operations on private lands in the vicinity of Corowa, has erected a very extensive plant, costing something like £7,400, with a view of sinking shafts to test the value and extent of the underlying deep leads. A portion of the Prospecting Vote is being applied to assist in this work.

The provisions of the Mining on Private Property Act, by which miners can obtain permits to mine upon private lands by paying rent and compensation to the owner, has only been availed of to a small extent, and so far practically without result.

Adelong Division.

The importance of the Adelong field as a gold producing centre is becoming apparent, and the bright anticipations of last year have been fully realised. The following figures will show the increase in the output within the past few years:—

1895	3,923 oz.
1896	2,754 oz.
1897	19,690 oz.

The

The extensive operations of the Gibraltar Consolidated Gold-mine (Limited) are responsible for this very gratifying increase. The following facts and figures will give some idea of the magnitude of the mining operations of this Company. There is nothing in the past history of this Division approaching them, and the Company may be congratulated on the very complete and modern plant they have erected to treat the body of ore at their disposal, a description of which may prove interesting—the estimated value of which is £60,000.—30-head stamp battery, 12 free vanners, chlorination works for treating 100 tons of concentrates per month, cyanide works to treat 1,400 tons of tailings per month, air compressors capable of operating 20 rock drills, 4 shafts equipped with hoisting machinery driven by steam, 2-140-horsepower Lefell turbines for water to operate air compressors and battery, also auxiliary steam power plant for same, shafts connected with the battery by two self-acting incline tramways, water race for water power 3 miles in length. The development work is as follows:—Radcliffe shaft, down 467 feet has reef opened for a length of 700 feet on levels connected with crosscut 200 feet in length, with Calico reef running parallel with same; O'Brien's shaft, 360 feet, opened on 350 feet level for 100 feet in length; Perkins' shaft, 270 feet, opened for a length of 300 feet on the 170 feet level, connected by means of crosscut 140 feet in length, with Chinaman reef running parallel with same; crosscut on the 270 feet level has now struck Chinaman's reef, therefore the workings are on five distinct reefs. Deepest level—Radcliff's, 455 feet; width of lode or vein, average 18 inches; dip or underlay, average 12°; bearing or strike, North 35° East. The number of men employed averages about 350. The number of tons crushed was 10,271, which yielded 18,416 oz. of gold. This does not include the yield from concentrates and tailings.

The Proprietary Gold-mining Company's mine under tribute contracts crushed 113 tons yielding 106 oz. The depth of the shaft is 570 feet and the deepest level at 540 feet.

The Caledonia old line of reef which lay dormant for upwards of twenty years was taken up as a local undertaking in May, 1896. The depth of the shaft is 300 feet, and deepest level 298 feet. Prospecting aid was granted for sinking from depth 228 feet. 34 tons were treated at the battery yielding 59 oz., value £236 6s. As this line is in a direct course between the Old Hill and Proprietary Mines it is claimed to be a continuation cropping out originally in a small rich shoot. This mine is only in its infancy, with capital (all indications of stability being present) it will form another producing medium for this field.

The Lady Mary crushed 527½ tons for 275 oz. 2 dwt. 18 gr. (value £1,018), and concentrates treated, value £142. The depth of the shaft is 574 feet and deepest level 540 feet. This company's property is now worked by tributors.

Another local undertaking which bids fairly well at present is the old Challenger mine. The operations are directed to the extreme north of the old outcrop. A winding engine and all other appliances are in evidence. After bailing out the old workings, the sinking of the shaft has been started on a small vein showings pyrites and gold.

The Kurrajong Company's mine is now in the hands of a party of tributors.

The old Victoria mine, now lying idle under suspension, is reported as likely to make a fresh start. Capital will be required to insure success in ground already worked to a depth of 1,000 feet.

The falling off in the yield of alluvial gold, when compared with the yield for 1896, may be attributed to the ceasing of work in Shepard's lease and the small yields from the Bardwell's freehold. The Adelong Creek below Shepard's is looked after with a keenness to assure other projects for 1898.

Ballow Division.

The mines in this Division have had another very unfavourable year to contend against, the rainfall being about 14 inches below the average. This has greatly interfered with sluicing operations, and nearly all the claims have suspended work.

Measures have been taken to develop the reefs at Paddy's River, about 16 miles south of Batlow township. A quartz battery of six heads is now being erected. There are a great many reefs in the vicinity, and should they prove payable a number of men will find employment.

It is estimated that the quantity of gold won during the year is 1,000 oz., or 350 oz. less than the quantity won during 1896.

Tumbarumba Division.

This Division also shows a decrease in its gold output, the figures being 2,700 oz. for the year, as compared with 3,021 oz. in 1896.

The reduction is directly traceable to the exceptionally dry season, when all mining operations were to a great extent in a state of stagnation for the whole year, this being especially noticeable during the latter half of the year.

For this reason, and also the fact that the alluvial workings are practically all upon old ground, the year has been, as regards alluvial mining, dull and uneventful; and apparently the only change at all probable during the year 1898 will be caused by the introduction of new and more powerful pumping machinery. This new machinery is now in course of erection, and will be first used at the ground held by the Tumbarumba Flat Sluicing Company.

There were no rich finds of alluvial deposits made during the year, and practically no new ground was opened up.

The alluvial workings throughout the division are all shallow, and are worked, in nearly every instance, by sluicing.

There are no good alluvial claims being worked upon any private lands.

The year has also been an uneventful one as regards quartz-mining, the lack of water having retarded progress upon many of the claims held, and several applications for suspension of the labour conditions have for this reason been made.

A great drawback to this branch of the mining industry undoubtedly has been the difficulty of getting the stone properly treated, there having been up to the present no efficient battery working in that part of the Division where it is most required for the purpose of testing stone. This impediment will, however, be to a considerable extent removed during the year 1898.

A great number of the quartz reefs give upon assay most favourable results, and many of them, so far as they have been proved, give every indication of containing large bodies of payable stone; therefore, during the coming year, great improvement may be justly anticipated, and the amount of gold won will be largely increased.

In other years, when there has been a larger rainfall, the large amount of water met with has been a great obstacle to the testing of many of the quartz reefs, and it is to be regretted that the opportunities offered by the past dry year were not availed of by those who ostensibly wish to test their ground by sinking.

A marked feature in this Division is the small number of Chinese working on the fields, there being only two in the entire Division.

Narrandera Division.

During the year 1897 the progress of mining in this Division has been much retarded owing to the great scarcity of water, and to the non-existence (locally) of a stamper battery or other machinery for the effective treatment of the ore raised—at present there are some seven mines being worked, but during the year there were fully ten parties at work on various parts of the field.

At Junece Reefs, altogether some 600 tons were raised during the year, but of this quantity only about 96 tons were treated, for a return of 70 oz., valued at £270 approximate.

The bulk of the stone has been raised at the Dusthole and Doctor's Reefs properties, but none of this stone has yet been treated. The proprietors apparently being anxious to pass the prospecting stage before commencing crushing operations. The majority of these mines are being worked by poor parties on a small scale, and the country being extremely hard, necessitating the constant use of explosives, progress is consequently very slow. The deepest shaft on this field has been sunk to a depth of 250 feet on the Dusthole Reef.

At the Rockdale mine a band of blue and green carbonate of copper ore assaying 24.96 per cent. of metallic copper, and over 6 oz. silver, was met with at a depth of 70 feet, while sinking on the reef. From this mine samples of stone treated at the Mines Department, Sydney, at Wyalong, Footscray, and Ballarat have assayed from 3 to 7 oz. gold per ton. Prospecting work is now being vigorously proceeded with at the 100-ft. level. From 30 to 40 tons of stone from this level and from the main shaft are now at grass awaiting special treatment, as an ordinary stamper cannot treat the ore efficiently. At the Eurongilly Field during the latter part of the year a number of strangers have been prospecting in alluvial ground, but owing to it being so soon after the miners' Christmas holidays, it was impossible to find any of them on the field to get authentic information. The principal mine at Eurongilly is the Pioneer Gold-mining Company. The main shaft has been continued from 225 feet to 297 feet, and at 265 feet a level 3 ft. x 6 ft. has been put in along the reef N.W. for 50 feet, and also a crosscut westerly 15 feet. The country gone through is blue slate, exceedingly hard, every bit having to be shot

shot out. At 250 feet a "horse" composed of a kind of diorite very hard comes in and takes the place of most of the reefs, then about 1½ feet wide, which was pushed over to the hanging wall. The reef has since varied from 10 inches to 1 inch at present on hanging wall at 297 feet, the lowest depth sunk.

Notwithstanding the intrusion of the "horse" the channel has remained intact, the walls being well defined, smooth, and solid being between 5 feet and 6 feet apart. At 265 feet the quartz is in each wall with the "horse" between, but from this point the foot-wall has been undisturbed, as I understand the party intend going on with 50 feet of sinking authorised by the Prospecting Board, and following down the quartz vein on the hanging wall. In some parts of the reef passed through in sinking, specimens have been obtained ranging as high as 2 oz. 19 dwt. per ton, but there is very little stone of this description. The intrusion of the "horse" has upset all calculations, and having to penetrate it from 250 to 297 feet, it will be easily understood that very little quartz has been taken out when the reef is but a few inches wide. There are signs, however, of a new make of stone, and it is hoped that in a few feet the disturbing elements will disappear, and a payable reef be brought to light, which will justify the great expenditure incurred. When 11 feet more have been sunk the shaft will be completed to its authorised depth, and then it is intended that a drive of 50 feet along the reef should be made, as was done at the 265-foot level. Another reef has been discovered on this property to the east of the old workings, and a shaft has been sunk to a depth of 15 feet. The stone carries a little gold, and it is intended to have a trial crushing of 3 tons when opportunity offers, but like the Junee Reefs Gold-field there is no battery available in the neighbourhood at the present time. This same reef was very rich on the surface, a crushing of 2 tons yielding as much as 50 oz. gold, but before the time of the present holders, who are endeavouring by prospecting to find out whether there is anything of a similar nature below the old workings. There is a party of alluvial miners adjoining the Pioneer Reef at present getting 4 dwt. to the load.

Cooma Division.

Partly owing to the liberal conditions of the Mining Act Amendment Act of 1896, and to the fact that reef gold has been found near Cooma, there was an unprecedented demand for miners' rights during 1897:—

Issued during 1897—Miners' Rights	350
„ Business Licenses	3
„ Mineral Licenses.....	2

Twenty-three applications for gold-mining leases were received, comprising an area of 144½ acres: Of these, 3 were situated at MacAnnally, 5 at Colinton, 3 at Cowra Creek, and 12 at Bushy Hill, near Cooma.

The find at Bushy Hill caused considerable excitement, being about 2 miles distant from the town, and fairly rich.

A trial crushing of 4 tons, from Solomon and Party's ground, yielded 13 oz. 4 dwt. 22 gr. of gold per ton (exclusive of what might be in the tailings). The country is considerably broken, and the gold is found with felsite.

The deepest shaft at Bushy Hill is down about 38 feet, and it remains to be seen whether the lode continues.

Under the Mining on Private Lands Act, 12 applications were lodged to mine for gold by owners and parties to agreement. The work has, however, practically ceased for the present, the results not being very satisfactory, although rich quartz was found on and near the surface.

Very little alluvial digging is done in this division. Most of the alluvial gold is obtained from river beds and banks about Numeralla, and is the result of fossicking rather than organised work.

The quantity of alluvial gold won, about 308 oz., valued at about £1,125, as against 603 oz. last year; and of quartz gold, 1,374½ oz., valued at about £1,950, being an increase of 295 oz., as compared with 1896.

At Colinton, the quartz fissures are 2 feet and more wide, underlying west and bearing north and south. The returns are about an ounce to the ton.

The depth of the deepest shaft is 360 feet, and of deepest level, 295 feet (a tunnel).

In the Cooma Proprietary Gold-mine, at Colinton, there are alluvial deposits, besides the quartz reef, which will pay well for sluicing, but a large capital is required.

At the Colinton Gold-mines Company, there is a battery of 5 head of stamps, and 10 head are in course of erection; also, winding and pumping plant for 800 feet. The value of the plant is about £750.

Cowra Creek, which includes MacAnnally and Fiery Creek. These reefs are not rich, yielding about ½ oz. to the ton; but the country is not difficult to work. The reefs vary in width from 6 inches to 2 feet 6 inches. The underlay is to the east and the bearing north and south. In this locality the deepest shaft is 107 feet.

At Cowra Creek there are 4 batteries, viz., (1) Murray's, 5 head stamps, water-power; (2) Sands', 13 head, steam; (3) Leurs and Party, 5 head, steam; (4) Williams, 10 head, with two Berdan pans. At MacAnnally, a battery, 8 head, steam-power, is in course of erection by A. Reed. At Fiery Creek, Rheinberger and another own a battery, 4 head, steam.

All these batteries were erected by the proprietors to crush their own stone, but they are also availed of by other parties, the charge for crushing being 10s. a ton.

Near Cooma the work is only in the preliminary stage.

As nearly as can be ascertained, the number of gold-miners employed in this Division is 179, viz., 21 on alluvial and 158 on reefs, all Europeans.

Silver.—A company, at Dartmoor, near Cooma, is being formed, and, when floated, work will commence. So far, only trial shafts have been sunk.

Kiandra Division.

There were 1,200 oz. 11 dwt. 17 gr. of gold won in this Division during the year, valued at £4,622 5s., which is an increase of 423 oz. 11 dwt. 11 gr. on the yield of last year. The New Chum Hill Hydraulic sluicing claim is being worked with eight men, with payable results. The Giandarra Gold-mine during the year has been proved payable, and a large reservoir is being erected and water races cut, so that the work may be carried on in a more extensive scale. The Empress Gold-mine at the Nine-mile, owned by J. M. Lett, has a tunnel 1,100 feet long; he rose 36 feet and struck the wash, but such a large quantity of water is coming through the wash that he has temporarily abandoned the work, but intends to put in a shorter tunnel on a level with the wash. Assistance is being granted to Eastwood and Party from the Prospecting Vote, to drive a tunnel into Surface Hill, to cut their large reef at a low level, which they expect to do in four weeks. Schaefer and Party are receiving aid to drive on their reef on the Eight-mile Ridge, they are down 47 feet, and the reef is 3 feet wide, a trial crushing from which yielded 7 dwt. per ton. Johnson and Rowe, at the Boogong, who were granted aid to drive a tunnel 365 feet, have struck the reef at a depth of 120 feet from the surface; they have driven 35 feet north and 60 feet south; the reef is 2 feet wide at north end, and 5 feet at south end, and a trial crushing sent to Dapto yielded 15 dwt. per ton. This party has also another reef 3 feet wide, 701 feet lower down the hill, and have sunk a shaft 30 feet, and driven 15 feet south and 20 feet north. This reef yields better gold than the top one. They propose putting in a tunnel 1,400 feet long, to cut both reefs at a low level, and are now erecting two Huntington mills, which will be worked by water power; they have 38 acres of gold leases, and have twenty men employed, but expect to have fifty men at work in three months time. There are over 200 men employed in this division, and the fossickers on the Tumut and Murrumbidgee Rivers are doing well. During the year there were eleven gold leases applied for, covering an area of 84 acres, and two mineral leases of 40 acres each. This division has not looked so prosperous for some years.

Jindabyne Division.

This is another new Division formed during the year. Mining matters are, however, progressing very slowly, and it is questionable if the miners are making more than low wages. Operations are confined to the alluvial ground, from which 3,750 loads of wash dirt were treated for 333 oz. of gold, valued at £1,250. No new finds reported during the year.

Captain's Flat Division.

Captain's Flat has been the scene of great activity during 1897. The Lake George Mines United have erected new stacks, flues, and furnaces; a tram line has been constructed, powerful pumping and winding machinery purchased, and the property fitted up with electric light at a cost of upwards of £60,000, but unfortunately the construction of the water, jackets being faulty, work had to be suspended from time to time, and ultimately fresh jackets obtained. Consequently, with the exception of one month, work has been intermittent. The quantity of ore treated has been 25,000 tons, producing matte of the value of £33,033. When work is in proper swing the manager expects to treat 2,000 tons weekly. The Directors are so satisfied that the mine can be profitably worked on a large scale that additional furnaces are shortly to be erected. The deepest shaft (Powell's) is 595 feet, and the lowest level 500 feet, the lode at this depth being 30 feet wide. The

The Lake George Proprietary has been recently floated, and adjoins the leases of the Lake George Mines on the north-west. Two shafts, 60 feet and 100 feet, have been sunk, and the management appear satisfied with their prospects. Another recently-floated company, the Lake George North, has a shaft down 80 feet, but as yet have not proved the value of the lode, which is 30 feet wide on the surface. The present population of Captain's Flat is about 1,700, and this number will be largely increased if the contemplated works are carried out. The effect of the drought is now showing itself, and the Molongo River has virtually stopped running, and the question of a water supply will now involve a scheme of water conservation. There are, however, a number of good permanent springs in the immediate vicinity that are fully sufficient to meet the present requirements.

Bungendore Division.

Mining matters in the Bungendore Division are in a very languishing condition. Bywong is almost deserted, and with the exception of the Lone Hand Claim, the same might be said of Mac's Reef. This claim gives the best returns in this Division, namely, 48 tons for 50 oz., but there must be something wrong when it takes twelve months to raise 48 tons of stone. The fact that the only four batteries in the district being for a long time idle for want of water is sufficient to account to a very great extent for the decline in the mining industry in this Division.

Gundaroo Division.

Mining matters in this Division have been very quiet during the year. There are only five claims on gold, and they do not produce the metal in anything like payable quantities. T. Alchin, "Sterling Star," Dairy Creek, treated 30 tons for 10 oz. The owner of this claim is at present receiving aid from the Prospecting Vote.

Thomas Booth's "Lady Ida," Dairy Creek, treated 10 tons for a yield of 16½ oz.

Kershaw and Co., "Who'd a Thought it," Dairy Creek, crushed 7 tons, yielding 6 oz.

Ward and Co., Dairy Creek, crushed 6 tons for 16 oz. 3 dwt.

P. Cassidy's gold lease, Dairy Creek, treated 8 tons for 13 oz. 16 dwt.

The alluvial gold purchased locally amounted in the aggregate to 48 oz. 2 dwt., valued at £192 8s. This gold is won principally by fossickers on Brook's Creek.

The "Sleeping Beauty," situated about 4 miles west of Gundaroo, after laying idle for over twelve months, has been taken up by a local company, also a claim on the south of it, but up to the present the work done on both properties has been confined to surface prospecting.

Notwithstanding the fact that a great deal of prospecting has been done during the year at Dairy and Brook's Creeks, very little good has resulted therefrom.

There is a marked decrease in the returns of gold won during 1897, as compared with the previous year; the yield for 1897 being 111 oz. 11 dwt., as against 195 oz. for 1896.

Four applications have been received during the year for gold-mining leases on private land.

Two applications for suspension of the labour conditions were the only matters dealt with by the Warden's Court during the year.

Queanbeyan Division.

The valuable discoveries of the year in the Queanbeyan Division are in the north-western portion lately transferred to the Yass Mining District. The valley property, 2 miles from Queanbeyan, has been opened out, and a quantity of ore sent to the Cockle Creek Works proved to be valuable as a flux. At Mount Blundell £600 has been expended in development, and efforts are now being made to procure machinery to treat the ore locally.

Prospecting operations for copper are now being actively carried out at Paddy's River, and fair prospects obtained. The money is found by a Melbourne syndicate, who appear to have every confidence in their ultimate success.

At Hall work has ceased and, the ground deserted. The locality is well worth a further trial, and will, probably, be again prospected when the ground is available.

At Cowhill a shaft has been sunk some 80 feet on the underlay, and the reef continues about the same width, from 8 to 10 inches. The stone looks promising, but shows no gold to the naked eye. Twenty tons sent to Sydney for treatment yielded something under ½ oz. per ton.

The Gooda Creek Mine is still actively worked; five shafts have been sunk 80, 30, 25, 60, and 30 feet respectively, and are all on gold. The following are the crushings for 1897:—

Treated at Clyde:—

2 tons, yielding.....	44 oz.
6 " "	66 "
10 " "	105 "
5 " seconds, yielding	27½ "

Treated at Dapto:—

9 tons, yielding.....	51½ "
21 " mixed, yielding	73½ "
8 " "	36 "
8 " "	24 "
8 " yielding	128 "
7 " seconds, yielding	9 "
84 " yielding	6 oz. 14 dwt. 10 grs. per ton.

This has proved a valuable property, and although the country is very hard and the miners young farmers, without previous experience, good work has been done; and it is a pity that adjoining properties have not been more faithfully worked. Some rich finds were made by James Remington and Butts, Crocker, and Party during the year. James Remington is one of the old school of miners, and has had much practical experience both in New South Wales, Victoria, and Western Australia. He is now upwards of 70 years of age, and while prospecting at Nanima he was camped at Gooda Creek, 6 miles distant, and walked to and from his work daily. The first crushing was loam and rubble from the surface; 10½ tons giving a return of 22 oz. 5 dwt. A second crushing, 7½ tons of picked stone, returned 139 oz., or 18½ oz. per ton. The shaft is now 150 feet on the underlay, and the vein looks as rich as ever. There are about 150 tons of mixed stone on the surface awaiting treatment.

Butt, Crocker, and Party's ground is about half a mile to the south-east of Remington's, and, although in a different line of country, the formation is very similar. From this claim a crushing of something under 9 tons gave a return of 273 oz. 5 dwt. 21 grains, while the tailings assayed 7 oz., and were ultimately sold for £20 per ton for 5 tons. A second crushing of 5 tons of seconds, being the whole width of the shaft (5 feet) after the vein had been taken away, returned 7 oz. 12 dwt. The main shaft is down 50 feet, and a second shaft, some 40 feet distant, 20 feet, both on good gold. They have some 200 tons at grass. This party, in conjunction with Mr. Trig, of Yass, have erected a 5-head battery with all the latest improvements, but when everything was ready for a start the water failed. Efforts were made to obtain a supply by means of sinking and driving, but with only partial success. Several of the reefs at the back of the old Nanima Homestead were again applied for, but the battery being unable to crush has been a great blow to the field, as few of the miners can afford to wait for any length of time.

A valuable report on this field, by Mr. Geological-Surveyor Watt, will be found attached to the report of the Government Geologist in this volume.

Tooma Division.

This is a new Division of the Tumut and Adelong Mining District, proclaimed during the year.

There are employed 50 alluvial and 30 quartz miners. Quantity of gold won during the year, about 800 oz.; value, £2,400.

There has so far been no return from quartz-mining of a payable nature. The Bogong Reefing Co.'s claim being now put back in Kiandra Division through an alteration in the boundary, thus leaving this Division with a very small amount of reefing going on.

Toolong Creek, from which place most of the alluvial gold has been won, is now almost worked out, many miners not earning enough to pay for food.

Kanchoban Creek, from which good results were expected last year, was almost a complete failure, and is now abandoned.

A good amount of prospecting is being done on small creeks and streams back in the mountains, but with what success is not known.

Prospecting on quartz is being carried on at Toolong. Herman and Party have put in a tunnel 130 feet, and are now seeking State aid.

Bringenbrong Reefs are yet being worked by Schammel and Party without showing any tendency to improve. Mining generally within the Division is very slack, and the number of miners fast decreasing.

THE SOUTHERN MINING DISTRICT.

Braidwood Division.

Mining in the Braidwood Division has been almost wholly confined to the Shoalhaven River and its banks, and owing to the low state of the water fossickers have made good wages in the river-bed.

Jembiacumbene Creek has been almost deserted. Nothing has been done at the claim held by Harmer and Jeffcoat, although the introduction of improved machinery has long been promised.

The Mayflower Gold-mining Company opened up a piece of ground known as "The Willows" near Belle Vue, and obtained fair results; if not payable, gave promise of being so. This land is now being worked by McCarron and Party, who appear confident of success.

The quantity of gold won compares favourably with the previous year, being 920 oz., or an increase of some 145 oz. The men at work number about 50 all told.

Araluen Division.

At Araluen the gold production has been severely affected by the drought, but still the yield, 2,800 oz., as compared with 2,773 oz. in 1896, is most satisfactory when it is taken into consideration the length of time the field has been worked.

The only work on new ground has been at Barratt's Claim, where 74 oz. were taken out of the first cut; but the work is very heavy, there being 40 feet of sand and loam to be removed by horse and dray.

The work now undertaken by the Department in connection with the proposed tail-race through the valley to drain it will prove conclusively the existence or otherwise of the supposed lead at the foot of the ranges on the eastern side of the valley, and also whether gold exists in sufficient quantity to warrant the construction of the race. The work is now being carried on by contract.

Major's Creek Division.

The gold yield from this Division is some 1,600 oz. short of that of 1896. This, however, is easily accounted for by the dying out of the rush at Back Creek, combined with a dry season. Prospects, however, look brighter than for some years past, and there appears a reasonable hope that before long the valuable mines so long idle will once more be at work again. During 1897 700 tons of stone have been crushed for a return of about $\frac{1}{2}$ oz. of free gold per ton; but the return from the pyrites is not yet to hand. The lessees of the Snobs' Reef, having worked out the shute of gold at the 186-foot level, are now preparing to sink their shaft to 250 feet. On Dargin's Reef, which is generally looked on as the mine of the district, work has been recommenced on a small scale. The shaft is 220 feet deep, and the reef at that level is 30 feet in width. Three hundred tons have been recently crushed at the local battery, but the returns are not yet to hand. The pyrites have been sent to Queensland for treatment. Preparations to work Rigby's Reef are now in hand. This is one of the best shows in the district. At Snowball the company formed for the purpose of cutting the big granite bar and working the ground above it having come to grief, their claims were declared abandoned, and the miners obtained possession of the much-coveted ground; but, as anticipated, notwithstanding they had the advantage of the expenditure of £1,500 in constructing a tail-race, no one has been able to make tucker out of the ground, and the miners on the field do not exceed 20.

Some 40 miners are still making fair wages at Back Creek; but the best of the ground has been worked out long since. A large amount of prospecting has been carried on in the locality without success.

Messrs. Roberts and Hassall, as hitherto, have proved themselves true friends to the *bonâ fide* digger, allowing any holder of a miner's right to prospect their land without fee until they remove washdirt, stipulating only that the holes dug be carefully refilled.

Little River Division.

The gold yield at Little River—2,000 oz.—won by the individual miner or small parties of diggers, is very pleasing, and shows what might be accomplished if a supply of water for sluicing purposes was available. The discovery of four nuggets of 45 oz., 10 oz., 7 oz., and 7 oz., respectively, serve to uphold the reputation of the locality as the producer of the heaviest gold in the district. Nothing has been done in quartz-reefing, but there is every probability of the Day Dawn Mine being worked shortly. This should be a good-paying property, and if the venture proves successful it will tend to encourage quartz-mining in the district.

Nerriga Division.

The Nerriga Division is still a greater sufferer from the continued drought, as, with the exception of the Shoalhaven River, the diggers are wholly dependent on water brought on to the ground by means of races. Under these circumstances the gold won, 920 oz., is as much as could be expected. Alluvial wash at a depth of 40 feet was discovered near the Corang River, but, with the exception of the prospectors, no one else has found anything payable. It would, however, be likely to repay further prospecting. The Leech Exploration Syndicate have purchased the leases hitherto worked by Mr. H. I. Gordon, and have also applied for a large area of ground adjoining. They have had the ground and stone thoroughly examined and tested, and appear perfectly satisfied with their prospects, and are now preparing to work the land on an extensive scale. Another company has purchased certain leases held by Mr. Howe at Welcome Reefs, and propose to erect machinery and put on labour in a few weeks, so that there is every appearance that a fair trial of the Nerriga quartz reefs will be made. Efforts are still being made to float several large sluicing companies, but so far without success, the great drawback being the difficulty of obtaining sufficient water at a reasonable cost; but small parties selecting favourable localities have a much better chance of success.

Nowra and Yalwal Divisions.

In the Nowra and Yalwal Mining Divisions of the Southern Mining District there was very little mining work done during the past year beyond prospecting and experimenting with the cyanide process. The results of the treatment of tailings under this process have proved so very satisfactory to all, that arrangements have now been made for the erection of two large plants at Yalwal, on the Homeward Bound and the Pioneer Mines, and it is stated that plants of a similar kind will also be erected on other mining properties during the present year. The Homeward Bound Gold-mining Company have commenced work for the erection of their plant, which, when completed, will be capable of treating the tailings from about 80 tons of ore per day. The Pioneer, who have amalgamated with Hay and Party, also intend to proceed at once to erect the cyanide plant for treating 500 tons of tailings weekly. When these plants are at work, with what are at present on the field, and other such plants which will likely be erected during the present year, the long-felt depression, caused chiefly by litigation for so long a time, will disappear, and the field once more will become active and more prosperous than of late. The results already obtained from cyanide treatment in Yalwal is estimated to average about 1 oz. to the ton. At the Eclipse Cyanide Works 40 tons of tailings treated yielded 63 $\frac{1}{2}$ oz. of gold. Very little has been done in alluvial mining; an estimate of about 50 oz. would be about the amount of gold found. No mining operations of any description have been done at the Nowra Division of the district. 8,470 tons of stone were raised at Yalwal during the past year, yielding 1,156 oz. of gold, of the value of £4,205.

Ulladulla Division.

Very little mining has been done in this Division during the past year. Sinclair and Party were for some time prospecting on private land near Termeil. A shaft was sunk about 40 feet, and some very fair prospects obtained, but owing to the very hard nature of the country and want of capital the shaft was abandoned. Some months afterwards, 5 acres, including this shaft, were applied for by Sinclair under "Authority to enter," M.P.L. Act. The area was defined, inquiry held, and rent and assessment fixed, but the holder of the authority proceeded no further with the matter.

On Hyam's 4-acre lease at Conjola about £50 have been expended in sinking and driving. During the early part of the year a little prospecting was done on the Murramarang Beach, about 18 miles south from Milton, but as far as I can earn very little success was met with. From the sand along this beach some 26 oz. of gold were obtained during 1896.

Nelligen

Nelligen Division.

There has been a slight improvement in mining matters in this Division during the past year. Although there has been a falling off in the amount of gold obtained from quartz, as compared with the previous year, that obtained from alluviums has increased from 20 oz. to 120 oz. for 1897.

At Brimbramalla M'Leod and Party, through aid received from the Prospecting Board, struck a gold-bearing reef averaging about 2½ feet wide. The party erected a five-stamper battery, and have crushed 220 tons for 100 oz., but the party feeling confident that through the pyrites far more gold was lost than saved, have decided to erect a Cyanide plant to treat the tailings.

In Coates' Claim a reef varying from 8 inches to 4½ feet has been struck, and a shaft sunk 45 feet, from which about 40 tons gold-bearing stone have been raised, none of which, however, has yet been crushed, owing to the distance from a battery.

A number of alluvial miners are at work in the division, the majority of whom are making fair wages.

A little excitement was caused a few weeks ago through the reported discovery of a copper lode at the head of Currowan Creek, but the same has been abandoned; very little work, so far, has been done in connection therewith.

There are in this Division a number of gold-bearing reefs that would, I believe, pay well for working if proper crushing appliances were conveniently situated.

Bateman's Bay Division.

The mining industry in this Division is not in such a satisfactory and progressive state as was anticipated at the end of 1896. A fair amount of prospecting has been carried on. The Big Hill Gold-mining Company have disposed of their leases to a company styled the "Bateman's Bay Syndicate," David Bevan, Manager. Eight men are at present employed.

From Fitzgerald's Reef 47 tons of stone returned 50 oz. gold.

From a new reef at Cullendulla, Ryan Brothers had 2 tons 17 cwt. stone treated for a little over 5 oz. On the leases held by the "Dick Consolidated Gold-mining Company" a considerable amount of work has been done, the particulars of which are not available.

Moruya Division.

On 17th December last, the Anglo-Australian Exploration Company (Limited) obtained four months' suspension in connection with their four leases at Sandy Creek, for the purpose of erecting powerful machinery to cope with the water which has now become very troublesome.

Some £3,000 or £4,000 have been expended by the company on these leases. About 600 or 700 feet of sinking and 130 feet driving have been done, all through very hard granite, water having to be contended with from the surface. On the same company's leases at Bimbimie a tunnel has been driven into the hill for about 700 feet, through hard granite rock interspersed with diorite dykes. About 500 feet of sinking have been done on the reef, the deepest shaft being 109 feet through hard granite; the reef runs north and south, dipping west. It is estimated the company have expended about £5,000 on these leases.

Kino and Lewisson, on their 10-acre lease about a mile north from Bimbimie, are sinking two shafts on the reef one being down about 40 feet.

From the Italian Mine at Turlinjah, 7 tons 3 cwt. 3 qr. 16 lb. of stone obtained at the 60-foot level and forwarded by Stratham and Party to the Metallurgical Works, Clyde, for treatment returned 1 oz. 14 dwt. 3 gr. smelted gold.

Johnston, who had this mine on tribute, crushed 240 tons at his own five-head battery, but the result has been unobtainable owing to Johnston having left the district.

Another parcel of stone, 1 ton 3 cwt. 3 qr. 8 lb., taken by Statham from the 25-foot level on the Golden Russel Reef, treated at the Metallurgical Works, Clyde, assayed as follows:—

Gold	1 oz. 10 dwt. 17 gr. per ton.
Silver	7 dwt. 20 gr. per ton.

Stratham is now forwarding to the same works for treatment another parcel of 6 tons from the 30-foot level.

The mineral lease of 20 acres, known as the "Moruya Silver-mine," formerly held by Adams and Upward, was cancelled on the 18th May last owing to violation of the labour conditions, and the land reapplied for on same date by F. H. Guy.

Along the river towards Merricumbene a few miners are at work in the alluvial, just making sufficient to live upon.

A considerable amount of prospecting has been carried on in the Division during the year.

Nerrigundah Division.

Increased activity in mining in this Division may be safely anticipated during the present year. Although it has generally been looked upon as an alluvial field, it will, it is thought, develop into an extensive reefing district.

A considerable amount of genuine prospecting has been carried on during the year, resulting in the discovery of two valuable reefs; one recently discovered by Latty and Party is about 2 feet wide, and has been traced for about 70 yards, gold being obtained in several shafts along the line. The main shaft is down about 15 feet, from which a trial crushing of 11½ tons yielded the very satisfactory amount of 48 oz. 10 dwt. This find is all the more important as no prospecting for reefs has ever been done previously in this locality. In consequence of this find, several leases have been applied for.

The second reef mentioned was quite recently cut by the Bumbo Gold-mining Company at the 130-foot level, while driving a tunnel into the hill. The reef, which is 4 feet wide, it is said looks very rich. None of the stone has yet been raised. The company have a quantity of stone at grass, obtained from other reefs on their leases, which they intend to crush shortly. The company have just completed the erection of a new five-head battery, which is connected with the mine by an aerial tram-line about half a mile in length.

Williams and Party, also of Bumbo, have struck a rich-looking reef, but being unable to get stone to the local battery on account of the very rough, mountainous country surrounding them; they have quite recently despatched 20 tons to the Illawarra works for treatment. On account of the quality of the stone a good return is expected.

Sparrow and Party on their lease at Tinpot have cut a small reef which is estimated to return fully 6 oz. per ton, but owing to the influx of water, which at this locality appears to be very troublesome, suspension has been granted in order to allow the erection of powerful pumping machinery to cope with same.

A few others are quartz-mining with very good prospects. About 120 miners (European and Chinese) are working in the alluvial, the majority of whom are making fair wages.

Wagonga Division.

Considerable activity has been exhibited during the year in prospecting for gold in this Division. Twenty-four "authorities to enter" under the Mining on Private Lands Act were issued, and in the majority of cases leases of the land thus held have been applied for. A number of distinct gold-bearing lodes—some apparently very wide, and traceable for miles—have been discovered running through this land, but whether they will prove payable remains to be seen. Several mining experts of considerable experience have inspected and tested some of these lodes, and in view of their reports the lessees are about proceeding with the erection of extensive gold-saving machinery on the most modern principles. These leases will in all probability afford employment to a large number of men. There is an abundance of splendid timber and water in the locality.

From a lode discovered on Easdown's Lease, near Nooroma, 109 tons gave a return of 122 oz., in the following order, viz. :—

38 tons quartz	Yielded 26 oz. gold.
12 "	" 72 "
59 " (seconds)	" 24 "

Two other small lots, totalling about 40 tons, returned a little over ½ oz. per ton. The width of the lode has so far not been ascertained. The crushings have been taken from different portions. In one instance the 59-ton lot was quarried over 9 feet in width. At the deepest level—viz., 44 feet—the lode is all over the shaft; therefore, until driving is commenced, it would be difficult to form any idea as to the extent of the lode at that depth, but it is estimated to be fully 50 feet wide. The character of the lode is felsite, intersected with ironstone and laminated quartz veins. This lode has

been traced and proved to be gold-bearing for over a mile. Quite a stir was caused by this discovery, resulting in a number of leases being applied for. South-west from Easdown's about 2 miles another lode has been opened up by Cotter and Party. This lode is about 18 feet wide, of ironstone formation, from which payable prospects have been obtained. North-east from Easdown's the old Carrington Mine has been retaken, and work resumed. The old shaft has been continued to a depth of 125 feet, and a payable reef 3 feet wide discovered.

Bowen and Party are making arrangements for hydraulic sluicing on a large scale in connection with their alluvial leases at Makin's Creek. They are now erecting a dam, to cost about £500, and intend erecting pumping plant, at an estimated cost of £6,000. They expect to start washing in about three months' time.

C. Cowdroy claims to have discovered a payable reef towards the north-western end of Mount Dromedary. A parcel of 6 tons has been sent to Sydney for treatment.

W. Braithwaite, at Mount Dromedary, has done a lot of dead work. He had 9 tons of ore treated for 16 oz. gold. Parkhill and Party, who have just finished driving, on aid received from the Prospecting Vote, have raised a quantity of stone, none of which has yet been crushed. Judging from appearance, it has much to recommend it.

From Fraser's "Bell of Australia," near Narooma, 73½ tons stone yielded 17½ oz. gold.

Cobargo Division.

There has been no improvement in mining in this Division during the year, fossicking at Montreal being the only place where digging is now carried on. There are about eight miners working there, and a few others working in the old and abandoned ground, but owing to getting nothing payable, mining operations ceased. About 80 oz. of gold approximately were obtained during the year, but it is almost impossible to give the number of loads of dirt washed, the diggers kept no tally of the stuff treated.

Riley Bros.' Claim at Coolagolite has been idle during the year, the result not being up to expectation.

Bega Division.

There is little to report in connection with this Division. A small quantity of gold was found in a reef on portion 45, parish Tanja, county Dampier, by J. Phillips. Twenty tons of quartz were raised for a return of 5 oz. of gold. The work on this portion has since been abandoned. Some ten men have been "fossicking" over an area of about 8 square miles at Tanja, some short distance from the above-mentioned claim, and won about 53 oz. among them. The quantity of the gold is mostly fine, and sold at from £3 16s. 6d. to £3 17s. per oz.

There are no indications at present of an increase in mining in this district. The absence of new finds may be accounted for, partly, by the want of water, the season being an extremely dry one, and the difficulty experienced by miners in obtaining a supply close to localities where a fresh discovery might be made.

Wolumla Division.

In this Division work steadily progresses. Some good returns from small parcels have been received. The Mount Momsen Gold and Silver-mining Syndicate treated 80 tons for 429 oz. of gold and 1,586 oz. of silver; Bradey and White, 18 tons for 53 oz. of gold; the McDonald Proprietary, 23 tons for 130½ oz.; Messrs. Schuback and Party, 19½ tons for 161 oz.; Messrs. Pierce, Cox, and Party, 14 tons for 25 oz.; Messrs. Meaken and Party, 6 tons for 36 oz. gold, and 42 oz. silver, and 4 tons from Murphy's Claim yielded 30 oz. of gold. The miners on this field seem not to have the necessary means to develop their claims to any great extent, hence the successful working of the field is somewhat retarded. The character of the country has not altered, although it has been stated that a defined quartz reef has been discovered in one of the leases. This, however, lacks confirmation. It is strange that there has been no prospecting outside the present holdings; but it is considered that with a little more energy and capital the Wolumla Mines will give exceedingly good returns for some time to come. Mr. Hough of Pambula is about to erect a battery and cyanide plant on the field, and proposes charging at the rate of 25s. per ton. He guarantees 95 per cent. of the gold.

Pambula Division.

Mining in this Division has been quiet during 1897, no fresh discoveries having made of any importance, although a large number of miners have spent much time in prospecting many parts of the Division.

Parish of Yowaka.

The prospecting of cancelled gold lease portions has caused eight applications for gold leases to be made, in the aggregate covering 32 acres; no new ground taken up. The Mount Gahan Company are engaged sinking a deep shaft, and have now reached 450 feet without any encouragement.

The Pambula Mines have spent large sums of money with little success.

The Falkner Company (Limited) (with which are included the Great Victory Gold-mining Company's leases) have been constantly at work, and have raised a large quantity of good ore during the year.

Parishes of Wyndham and Gnupa.

A large amount of work has been done on the mineral leases belonging to the Jingera Mineral Proprietary Company, twenty-five men being employed from expiry of suspension in March until 30th June, since when, eighteen men; 1,430 tons ore raised during year, of which 146 tons have been sold and exported, leaving 1,284 tons added to 780 tons remaining at grass, making present total of 2,064 tons awaiting treatment. Estimated value of bismuth sold and exported, averaging 8½ per cent., £3,100, silver associated with bismuth, £264.

At Scotchie's Creek, upon private lands, eight blocks were marked out to search for gold, upon three blocks gold has been obtained, but whether payable has not been ascertained.

A crushing from Robertson and Donnelly's Gold Lease, Jingera, at a local battery:—

Ore, 36 tons, yielded.....	2 oz. 5 dwt. per ton.
Tailings, 25 tons, yielded	12 dwt. „

Parish of Burragate.

Under agreement with owner (George Keys) Henry Grant and Party are working 6 acres, part of portion 19, and also Morgan and Willilams' 20 acres adjoining. Upon Crown lands several miners are prospecting, without success so far.

From Thomas J. Simpson and Party's prospecting protection area (Crown lands), 3½ tons ore, crushed locally, yielded 18 dwt. gold, and 3 tons tailings treated by cyanide process, 23 dwt.

Parish of Yuglamah.

Mark Southwell and Party have completed sinking under aid. Samples forwarded to Department for assay, 5th July, 1897, yielded:—

Gold	2 oz. 13 dwt. 8 gr. per ton.
Silver	1 oz. 19 dwt. 5 gr. „

Sample sent by Southwell to Newcastle for assay went 6 oz. gold and 7 oz. silver and 3 oz. lead. But Southwell is of opinion that the expense of getting ore to Sydney or Newcastle for treatment would make the ore not payable. About 4 tons at grass. Width of vein, 9 inches; depth of shaft, 72 feet; underlay to the west; bearing north and south.

There are several miners prospecting, and it was thought a silver lode had been discovered. Two 40-acre leases were applied for.

Parish of Nungatta.

Messrs. J. Lawson and G. Strangridge, miners, report 50 tons raised; quantity of gold won 20 oz., valued at £3 10s. per oz.; depth of shaft 80 feet. Messrs. J. and A. Brown report 20 tons raised; quantity of gold won, 20 oz., valued at £3 17s. 6d. per oz. There are several other parties of miners at work in this locality. Brown reports the crushing machine used would not save the gold, and that there are a number of reefs carrying gold from 3 to 10 dwt. per ton, and capital required to sink into the solid.

Parish

Parish of Coolangubra.

Several prospecting areas have been registered, and late in the year 25 acres applied for as gold-mining leases. J. C. Denny and Party report 6½ tons crushed yielded 5½ oz. gold, valued at £22. About a dozen men are prospecting, and it is expected before long this part of the Division will receive more attention from miners generally.

Parish of Howe.

Messrs Jensen and Party, to whom aid was granted in June, 1897, continued their shaft down to 72½ feet, when they discontinued sinking, and mean to tunnel into the hill. They have a small battery, worked by water-wheel, also small cyanide plant, valued at £150. Twenty tons raised, crushed 10 tons, yielding only 1 oz. gold. Depth of shaft, 74 feet; width of lode, 3 feet; underlay to the east.

Delegate Division.

This Division was formed during the year, and embraces part of the Bombala Division. There are about forty Chinese working in different parts, principally on the Craigie River, and they appear to make fair wages. Of course accurate information is very difficult to obtain from Chinese as to what amount of gold they get. Mead and Party, of Brown's Camp, are still working their reef, which averages about 1½ oz. to the ton. They appear to be well satisfied, and intend to continue working. Brown and Party, of the Blue Bell Reef, at Black Jack, are still working, and the last crushing of 15 tons went 3 oz. per ton.

At the end of the year mining was very quiet, owing to the great scarcity of water.

HUNTER AND MACLEAY MINING DISTRICT.

Copeland Division.

The gold yield from this Division totalled 722 oz., or 219 oz. more than the yield for 1896. Although it is satisfactory to be able to report an increase, no matter how slight, still the result of crushings for the year have not come up to anticipation.

The Lady Belmore has been idle in consequence of excess of water, and the party are unable to purchase machinery for pumping and winding.

The Mountain Maid has been worked satisfactorily. The yield per ton from stone crushed was only about ½ oz., but the party made good wages, and were pleased with the result.

The Gloucester River Company crushed about 400 tons, which yielded about 5 dwt. per ton, which is not payable. The company have gone to considerable expense in erecting a crushing plant, which is driven by a Pelton wheel. A little stone has been raised from the Centennial, Sawyer's, Boronel, and Cobark Reefs, but the result has hardly reached expectations. There is no doubt that this field is languishing for want of capital to purchase the necessary machinery to deal with the water.

There are seven or eight old miners fossicking in the creek and gullies, and make a living. The total amount of gold won from alluvial is 197 oz.

It is said that an attempt is to be made to revive the beach mining from Port Stephens in a northerly direction.

Dungog Division.

In the Dungog Division matters have been very quiet. The Wonga Wonga, at Lower Wangat, showed most activity in pushing on work, their only return, however, being about 160 oz. from the Hidden Treasure Reef. The proprietors, however, expect to do a large amount of work during 1898, and if they can obtain the assistance of capital, will develop a large area in Lower Wangat.

At Upper Wangat, the Mountaineer Reef is again being worked, and lower down the hill, the ground formerly abandoned by the Brandon syndicate is opening up good prospects. Whispering Gully, which, two or three years ago, caused a mild sensation, is again being prospected, a small parcel of alluvial being sold in Dungog at £3 10s. per oz. There is evidence of good prospects in the reefs in this gully; but, as a rule, the men working have absolutely no means, and are apparently content to pick here and there at the outcrop, and, by dollying small quantities, eke out a precarious subsistence. It is thought that the advent of capital here would result profitably.

The Monkerai Field is virtually abandoned, except that one small syndicate is doing desultory work for little profit. The gold here is not, in any instance, continuous, but in blows and shoots, and though some good shoots have been discovered, the men appear to lose heart so soon as the vein pinches out.

The Cherry-tree Field, near Dungog, is quite abandoned, and the machinery removed, but it is considered that the ground is by no means worked out.

Some time since, a small reef, returning ½ oz. to the ton, was found in a paddock at one end of the town of Dungog, which appeared to be an offshoot from the Cherry-tree Reef. This was on private land, but, for unexplained reasons, the place has been abandoned.

Kempsey Division.

Practically speaking there appears to be very little *bonâ fide* gold mining in the Kempsey Division, and what there is is at present only of a desultory kind. The mines at Deep Creek have been idle during the whole year, though there is a probability this year of operations being resumed. There has been a little fossicking throughout this Division, but very little gold has been obtained. There has also been a little prospecting on the beaches, but of an unsatisfactory nature.

Taree Division.

There are about thirty miners prospecting for alluvial gold in this division, principally at or about Cell's River (which is situate 55 miles from Taree), the majority of whom are earning small wages. About thirteen others are regularly employed as quartz miners at Cell's Field, where some good stone has been crushed during the year by a water-power battery. This plant is owned by the Deep Valley Gold-mining Company who raised and treated some 600 tons of stone for 300 oz. of gold.

It is stated that there is a certainty of considerable capital being placed on Cell's Field by outside capitalists; consequently a more prosperous report for the year 1898 may be looked for.

PEEL AND URALLA MINING DISTRICT

Glen Innes Division.

The quantity of gold won in this Division during the past twelve months is just about the same as that won in 1896, viz., 565 oz.

Gold Reefing.—With the exception of the Glen Elgin Gold-mining Company very little mining has been done at Glen Elgin. They have several shafts down, averaging a depth of 80 feet, and have tunnelled in various directions for a distance of 665 feet. They have crushed about 130 tons of quartz for 115 oz. of gold. Four other leases on the same line of reef have been applied for, but little or no work has been done by the lessees as yet.

Alluvial gold-mining is confined to Skeleton Creek, Big Flat, Hogan's Creek, and the Mann River. There are about twenty men, obtaining fair results.

Kookabookra Division.

There was little or nothing done in quartz mining in this District during the year. The owners of the Butcher's Gold-mine at Bare Hill put a few tons of quartz through their battery at the end of the year, but were compelled to shut down owing to want of water.

Over 100 miners, Europeans and Chinamen, were employed during the year alluvial sinking on the old Oban Diggings, Paddy's Gully, Mitchell River, and Nowland's Creek, but owing to lack of water only half time was worked. Their earnings would be from 10s. to 15s. a week per man.

The output for the year was 386 oz. of gold, 15 tons of tin, and about 300 oz. of topaz; total value, £1,912 10s. The output of gold for 1896 was 620 oz.

Armida

Armidale Division.

There is a big decrease in the value of the gold won from the mines around Armidale as compared with the output for 1896. For the year 1896 the yield was estimated to be 1,700 oz., but for the year under review the yield may be put down at 486 oz. The exceptionally dry season is responsible for the decrease, the mines being prevented from working more than half time.

There is a report current that a good gold reef is likely to be struck at Puddledock, about 7 miles from Armidale, but no official notice has yet been made in the matter. Several applications have been made on Hillard's private land for authority to search, and it is said a lease will shortly be applied for; but sufficient time has not yet elapsed to try the ground and prove its value. In other respects mining matters have been quiet in this district, beyond applications for authority to search in different parts, but most of them have been abandoned.

Hillgrove Division.

Hillgrove is situated 18 miles east from Armidale, and is a very active mining centre indeed. The gold returns show that during the year the total quantity of stone treated within the division was 26,706 tons, which yielded 21,556 oz., valued at £77,747. These figures do not, of course, include the returns from Metz, late Hillgrove West Division, which are given separately. The total output from the field, including Metz, is 31,886 oz., valued at £114,656, or a decrease of 5,966 oz. on the previous year.

Baker's Creek Gold-mining Company is still the premier mine of the district, and crushed during the year 13,552 tons, including concentrates, for 13,052 oz. 11 dwt., worth £46,504, being 502 oz. in excess of last year.

The sum of £15,000 was paid in dividends, being £5,000 more than the previous year. There are two stamper batteries going, one of 40-head and the other 20 head. The main shaft has been sunk to 900 feet, and they are now driving for the reef at this level. At No. 11 level a new development has recently taken place in the shape of a well-defined reef which was not met with in the upper levels. On the whole the mine looks well, and should be a good producer for many years to come.

The Eleanora Gold and Antimony Mining Company kept 30 head of stampers at work crushing 12,410 tons for 5,402 oz., and 629 tons concentrates for 2,563 oz., valued in all at £29,363, also 10 tons white metal, valued £200. A large quantity of old tailings have been treated, and return a small profit after paying expenses. The main shaft has been deepened to 610 feet, when sinking was discontinued, and attention paid to the working of the upper levels. This mine paid one dividend during the year amounting to £2,500.

Of late the company has little more than paid expenses, and as the calling power is exhausted it is the intention of the directors to reconstruct and raise fresh capital to more fully develop the deeper ground.

There is plenty of room for further development in this mine, and, with the expenditure of a little more capital, should once more be restored to the dividend-paying list.

The Baker's Creek Consols Gold mining Company have a 10-head battery, but only crushed 451 tons for a yield of 258 oz., worth £878. This proving unsatisfactory the battery was stopped, and the mine is now being further developed, and from present appearances should turn out well. The battery is likely to commence crushing again at an early date.

The Cooney Proprietary Mines, Limited, was originally known as the Baker's Creek No. 1 Extended, and was purchased, together with the Golden Gate Syndicate, in the early part of the year by the United Australian Exploration, Limited. In this mine a tunnel has been driven 600 feet to intersect the Baker's Creek reef and other known reefs on the eastern side of the gorge, the course of the tunnel being at about right angles to the course of the reefs. It is proposed to carry this tunnel in about 2,000 feet. A large amount of dead work must be done before this mine can be proved, and will take at least another twelve or eighteen months to accomplish.

The Hillgrove Proprietary Mines, Limited, was originally known as the Golden Gate Syndicate, and was purchased by the United Australian Exploration, Limited, and is being worked in conjunction with the Cooney Proprietary, which it adjoins on the north east. The tunnel being driven in the Cooney Proprietary will eventually intersect this property, which can then be worked to advantage. The company is at present engaged sinking winzes and driving levels.

A parcel of 28 tons was crushed during the year by the old syndicate shareholders for 30½ oz., worth £113 10s. This Company promises well, and should, by the end of the year, give employment to a large number of men.

The Hopetoun Gold mining Company crushed during the year 156 tons for 210 oz., worth £735. This mine has been virtually hung up, having only had about five men employed, and it is not known what is contemplated in the future.

The Cosmopolitan Gold mining Company crushed 25 tons for 12 oz., worth £43, and have only two men employed.

The Garibaldi Gold mining Company had suspension during five months of the year, and only had one small crushing, the returns of which are not available. The mine has been let on tribute for some months past, the company finding a share of the cost which embraces development to a limited extent. The tributors have had several very fair crushings, and although every endeavour to obtain the returns have been made they have proved unsuccessful. This mine, which belongs to an English Company, and is in want of more capital, which they are at present endeavouring to raise.

The "Phoenix" gold mine at Rockvale was conditionally purchased by the New Zealand Mines Trust, Limited, in November last, and they were occupied well up to the end of the year in putting the mine in working order. They have a 30 stamper battery and four Frue vanners. The operations for a considerable time will consist in sinking and putting down levels to open up the ground, crushing only such ore as is taken out thereby. They are really only prospecting the mine with a view of ascertaining its value before completing the purchase. This mine has good prospects. The returns from the old company are not available.

Thomas Keys and party have a 25-acre lease at Warm Corner, with a reef averaging from 1 to 6 feet. They are at present only prospecting.

There are also a number of other parties prospecting in this locality, and they all speak highly of the field, which should give employment to a number of miners during the coming year.

The Surface Hill Prospecting Syndicate at Rockvale during the year extended their shaft to 242 feet. They sunk 162 feet through the basalt, and after they bottomed, turned out a duffer.

The miners on this field have been considerably handicapped through want of water during the year, but the copious rains that have fallen of late will ensure a plentiful supply for some time to come. There is a large area in this district which has not yet been fully prospected, and it is generally considered that, with expenditure of more capital, a number of payable reefs will be discovered.

The total number of men employed in this division is 530.

Metz (late Hillgrove West) Division.

The total yield of gold being 10,330 oz., valued at £36,609, as compared with 13,481 oz., valued at £47,551, won in 1896.

Mining operations have been carried on uninterruptedly in this division during the year.

Hitherto water was the greatest hinderance the mines had to contend with, but this year has been totally different to those of the past; rain fell so constantly that during the whole year the supply at the West Sunlight has been abundant, the three dams almost continuously running over, although at times water was not plentiful in Baker's Creek, which supplies the Sunlight Mine, but not sufficiently low to impede operations.

Not much prospecting has been carried on. Murgatroyd and party are still driving in the hill on the east side of the Sunlight in the hope of intersecting the Sunlight Reef. This is a very deserving syndicate, working continuously for the past four years without any return, but are sanguine of success.

Peterson and party are still working their gold Lease No. 170, and, with sufficient capital to develop their property, it should prove satisfactory. Nothing has been done at the Starlight Mine during the year. The owners have applied to convert their property into a lease, as it is held as a quartz claim, till they have applied for the surrounding blocks; so this will give them a larger and more convenient area to develop.

The West Sunlight Reef Gold mining Company's crushing power consists of twenty heads of stampers with six vanners. During the year they crushed 7,202 tons for 4,794 oz., valued at £17,548. This mine is for the first time in a position to give a return to the shareholders. Recently the crushings have been remarkably good, and is now in a position to declare a dividend. The mine appears to improve in value as it deepens, hence its prospects for the future are very satisfactory. The stone at the 800 feet level is better than any that has been met with yet. There are about 120 men employed in and around the mine. The value of the plant is estimated at £10,000. This is the fourth mine on the Hillgrove Gold-fields that has been successful in giving the shareholders a return for money invested. This

The mine, owned by the Sunlight Gold-mining Company, has had a successful run, and has paid two or three dividends during the year. They are just about to commence sinking operations. The crushing power consists of forty stampers and concentrating plant.

During the year they crushed 11,148 tons for 5,326½ oz., valued at £18,326. The plant is estimated at £10,000. A mine with the great capacity this has, and run by eighty hands, speaks magnificently for its prospects, the reef itself averaging from 3 feet to 15 feet wide.

Fuller and Party, who took over the old Hopetoun property, are still working with satisfactory results. They crushed for the year 156 tons for 210 oz., valued at £735. They have no battery of their own, consequently have to haul the stone from the bottom of the falls.

This year has been a most successful one for the miners, as there has been continuous work throughout, and the mines are now in a better position financially than ever they were, so that without any of the fresh developments that are in sight we can safely predict a successful year for 1898.

Uralla Division.

In this Division some 300 men are at work, principally fossicking, and, as far as can be ascertained, they won among them about 1,600 oz. of gold. When water is plentiful it is said these men do fairly well in this locality.

Swamp Oak and Niangala Divisions.

A few years ago a good deal of attention was centred in this Division, from the rich crushings obtained from several reefs, almost surface stone, which were never fairly tested at a depth, the only exception being the Highland Mary. When this lease became the sole property of Messrs. Brown Bros, their knowledge of mining, and by able management, it was shown that the reef carried better gold at a depth than on the higher levels. This property has since been sold to the New South Wales Gold-field (Limited) Company, a wealthy English company, but is still under the active and able management of Mr. A. J. Brown (one of the former owners). The company are going in for a systematic development of the mine, powerful winding and pumping gear have been erected, and they have introduced the Ingersole Rock Drills Compressor, which appears to be doing its work admirably, effecting a saving in time and money. A new main shaft is being sunk, 12 feet by 4 feet, to cut the reef at 350 feet, but the company intend cross cutting, to cut the same at 240 feet. This depth has been reached, and the cross-cut in some 30 feet; they expect to cut the reef in a few weeks. This reef was worked by the former owners, Brown Bros, to a depth of 135 feet, in a shaft about 66 feet from the present main shaft, and driven on for over 300 feet, most of the stone being stoped to that level, leaving a good reef under foot the whole of that distance. The last crushing taken out by them of 257 tons gave a return of 1,070 oz., without treating the tailings, which gave assays from 15 dwt to 1 oz. 17 dwt. per ton. Alongside the reef there is a splendid black slate, which strengthens the opinion that the reef will carry good gold throughout, and found to be richer at a depth. The company have also erected a most complete cyanide works, which give good results, the stone formerly raised and crushed by the ordinary battery process giving a return of 4 oz. per ton; the tailings treated by cyanide have increased this yield by nearly another ounce. This is very satisfactory; it also shows the amount of gold that was lost previous to this process being introduced. The company intend to erect a powerful battery on the mine, and save the cost of handling the stone once it leaves the face of the reef for the battery, and from there the tailings will be trucked to the cyanide vats. This plant will not be erected until the reef is cut; the present battery will be used until that time. Most of the ground adjoining the lease has been secured by this company, holding about 69 acres, and during the last few months they have purchased the Victory leases, which adjoins theirs on the eastern boundary, being only about 200 feet from their main shaft; the Victory proved itself a good payable reef to the 80-foot level, and after a little dead work had been done was abandoned, and was taken up again about the time the Highland Mary changed hands. At the southern end of the latter leases are the Little Tichbourne, Surprise, Rising Moon, and Storm King leases; it is generally believed the Highland Mary reef extends through these leases. In the early days of this field good gold was won from the surface to a depth, when the gold cut out. Very little prospecting was done, and the leases abandoned. They have again recently been taken up, with every probability of being thoroughly prospected, and this cannot be done without a considerable expenditure of capital. The Sheba is another worthy of further prospecting; crushing from this reef averaged over an oz. per ton; the gold schute is a long one, but the reef is "bunchy"; this may be accounted for by the country being somewhat thrown about. A drive at a low level would be the less costly and most thorough mode of testing it. The Routine Flush, which has been worked and abandoned several times, is now in the hands of a Sydney syndicate, who are sinking on the reef, and have about 50 tons of stone at grass. There is great anxiety on this field, awaiting the cutting of the reef on the Highland Mary, and, if successful, there will be a splendid opening in this locality for a profitable investment of capital.

At Niangala.—The principal properties there are—The Jersey, Just in Time, South Jersey, and Morning Star, as well as about 160 acres freehold—have been acquired by the New South Wales Gold field, Limited, and worked under the same management as the Highland Mary leases at Swamp Oak. The crushings from Jersey and Just in Time have been highly satisfactory, ranging from 1½ oz. to 6¼ oz. per ton; these two reefs are the only ones commanding the attention of the company at the present time. The Morning Star is principally development work; the Jersey Shaft, which is now down about 150 feet, is being trimmed and retimbered; this is found necessary owing to its unsafe condition; when this is completed sinking will again be continued and the shaft put down 300 feet. If the reef is still in the bottom a good main shaft 12 x 4 will be sunk; they have erected suitable winding gear, steam pump, and poppet heads, with many other improvements, though work has been somewhat slack owing to the timbering of the shaft; when this is done employment will be found for a good number of men. In addition to the leases worked by the company several others have been taken up during the past year that have proved from their small crushings to be payable properties, but require capital for their proper development. The progress in mining on this Division during the past year is very marked, and with every appearance of its becoming a prosperous little gold-field.

At Shearin's Creek, also in this Division, prospecting has been energetically carried on during the past year, and there is a good prospect of success; the prospector's lease, known as the Camp Fire, has crushed 100 tons, with a result of 1 oz. 4 dwt. to the ton. The Brindle does not show so well; 17 tons were crushed for a return of 14 oz. 16 dwt. This place will show a decided improvement in its mining prospects during the current year.

At Paradise there is but little mining going on at present. A Newcastle syndicate has recently taken up some leases, which may lead to a revival in mining.

In the vicinity of Glen Morrison very little mining is being done at present.

Tamworth Division.

A new find in quartz at Stock yard Creek, near Lumbri Railway Station, about 22 miles from Tamworth, is the only find of importance made during the year; but insufficient development work has been done to justify an opinion being formed as to its being payable or permanent. Seven tons were forwarded to Sydney from the lease known as the Lucky Mine, with a result of 1 oz. 12 dwt. to the ton. Considering the size of the reef, nearly 3 feet wide, with easy working, the above may well be considered a handsome return. An alluvial find at Spring Creek, in this locality, is giving employment to a number of men, who are doing fairly well. The gold yield for the year is estimated at 150 oz., as compared with 260 oz. in 1896.

Nundle Division.

The quartz mines which have produced good stone in this Division during the year are Gazely's, the Golden Gate, the Black Snake, and the Christmas Reefs, and still have every prospect of a continuance of prosperity. About 1,752 tons were crushed, the result being 2,943 oz. of gold, valued at £9,772.

The Tamworth Gold-mining Company (floated in London for £85,000), with its capital and splendid machinery, has not had a payable crushing. Mr. Fuller, the chairman of the London directors, is now on the field supervising the working, and testing the value of their property by crushing from several veins, and exploration. His advent on the field has been a great benefit, having permitted the machinery of the company to be used in crushing for the local mines. Previously the stone had to be carted to Bowling Alley Point, the cost of cartage alone then exceeding the now full cost of crushing. This has given an impetus to mining in the locality, by causing stone to be crushed with a payable result that could not have paid the more than double cost of cartage and crushing. Very great credit is due to the New South Wales Exploration Company (Limited) for the admirable work they are doing in exploration of their properties (about 96 acres) and valuable prospecting in the interests of the district. Should their efforts prove successful the prosperity of this field is assured for many years by remunerative employment being found for a large body of miners. At

At Bowling Alley Point.—The principal mining in this locality is now upon private lands—that of the Peel River Company. Two or three claims are on payable gold. It is expected that the formerly exceedingly rich claim (quartz), the Marquis of Lorne, will again be tried by a strong Company. The Tamworth Proprietary Company have abandoned their leases, and their new and up-to-date machinery left unemployed. One of the leases has been taken up, with good prospects of being made to pay. Claims often pay the working miners handsomely that will not bear the cost of a large Company, with a directory, legal manager, secretary, and other expenses. There is very little work being done upon Crown lands, and what is being carried out is principally fossicking.

Stewart's Brook Division.

The quantity of gold produced during the year within this Division was 2,280 oz., as compared with 4,440 oz. in 1896. The decrease is accounted for by the fact that the Moonan Brook Field was formerly embraced in the Division, but was during the year proclaimed as a separate Division.

The principal mines in this Division are the New Royal Standard, the Stewart's Brook, the Bluey, and the Lady Grace. Each of these Companies have erected batteries on their properties.

This gold-field has ceased to be, in a great measure, a poor man's field. To get at payable gold the work has to be carried on in deep ground, necessitating a large outlay of money. So much is this the case that the Stewart's Brook Company and the adjoining leaseholders, the Durham Syndicate and Wooderson and party, having exhausted their capital, have had to apply for a suspension of the labour conditions to enable them to form one large Company, and to place it on the market for capitalistic purposes. The Stewart's Brook Company have already expended over £5,000 in machinery and labour. With the introduction of more capital there are excellent prospects of these properties employing a large number of men and returning handsome dividends to the shareholders. One Company on this field has already done this for some years past. This Company, the New Royal Standard, besides paying regularly good dividends, has formed a reserve fund of £1,618 14s. 2d. The question of treating the tailings has been receiving the serious attention of its manager, Mr. John Davies, and a small cyanide plant has been erected, at a cost of about £450, capable of treating 200 tons a month. Two assays of these tailings showed them to contain, in the one case, 1 oz. 7 dwt. 18 gr., and in the other, 1 oz. 6 dwt. 3 gr. Should the tailings contain this amount of gold, and such a large percentage be recovered, the Company has a nice sum forthcoming from the 900 tons stacked at the battery. This mine is looking well.

Following is a list of the principal crushings on the field during the year :—

Mine.	Tons.	oz.	dwt.
The Royal Standard	713	1,813	14
The Bluey	552	152	9
The Stewart's Brook	900	600	0
The Lady Grace	150	37	10
Imperial Standard	12½	11	0
The Lady Maude	40	29	16
Adam's Syndicate	28	29	5
Rose and Party	17	16	6
The Here's Luck	20	24	19
The Iron Duke	6	4	7
Towns and Party	22½	15	11
Marshall and Party	2	1	16
Scott and Party	5	2	19
R. H. Carter	131	276	12

Moonan Brook Division.

This Division formerly formed a portion of the Stewart's Brook Division. During the year there has been a considerable impetus in gold-mining; a number of new reefs have been discovered, chiefly at Omadale (the Denison) and Dry Creek, some of which, though small, are rich, but do not appear to go to any depth. As a rule, these are worked whilst gold is obtained, and then abandoned. The most important discovery is at Omadale Brook, and the reef, named the "Federation Reef," appears to extend in a northerly direction through the Sugarloaf Mountain. This reef is well defined, and the owners are working it in a systematic manner. They have crushed 50 tons, which gave 74 oz. of gold. At the foot of the mountain is another vein, recently discovered by William Towns. It is rather small, but the ground is favourable. A trial crushing of 3 tons produced 9 oz. 9 dwt. of retorted gold. Adjoining Towns' lease another has been applied for by two men, who obtained good specimens. Half a mile to the south-west of these workings Towns and Son discovered another reef, which, like the other, is small but very rich, 24 tons having produced 90 oz. 5 dwt. of gold. On the north side of the Sugarloaf Mountain Messrs. Hall and Wharton have a very promising reef. Their shaft is down about 80 feet, and fine gold can be seen all the way down. Fourteen tons from this reef gave 30 oz. of gold. It is believed to be a continuation of the Federation Reef. A tunnel has been started by another party to cut this reef further up the hill. These men are in 150 feet, and have another 150 feet to go. The rock is chiefly slate, and not difficult to work. Other small finds are numerous, but no stone from them has been treated. About forty men are at work on this part of the Division.

Five mines are receiving aid in this Division, and of these three will be profitably worked, it is believed. The total yield of gold is estimated at about 927 oz.

The following crushings were made during the year :—

	Tons.	oz.	dwt.
At Moonan Brook—			
Hinson and Party	61	154	9
Teague and Party	27	29	5
Williams and Gunter	31½	40	12
Steinback and Urquhart	10	6	0
Simpson, Tilso, and Simpson	75½	69	16
Baker, Smith, and Campbell	5	6	7
Amidy and Dunbar	5½	14	15
J. Saxby	3	1	10
Spencer and Black	3	2	2
McElroy	5	4	15
Omadale Brook and Dry Creek—			
Johnson and Son (Perseverance)	97	131	0
Towns and Son	27	100	5
Urquhart	2½	5	10
Bakewell and Company	6	3	12
Winness and Party	31	95	0
Gaslick and Party	27	25	0
Hall and Party	14	30	10
J. R. Woods	7	4	10
Sharp and Party	5	2	15
Sellers and Party	3	0	9
The Federation Company	50	74	0
Skeins and Party	15	10	15
Oram and Party	15	1	5
Patrick Ahearn	7	2	10

The alluvial workings on the Stewart's Brook, Moonan Brook, and Omadale Brook fields are poor, few, and far between, and the mining is essentially quartz-mining.

There are seven batteries altogether, namely, four at Stewart's Brook, two at Moonan Brook, and one at Omadale Brook. Dry Creek, which is 5 miles from Omadale, is without a battery; and as the road is a very difficult one to get over, this is a serious drawback to the miners there.

Mr. R. H. Carter's mine is the only one on private property in the district. It is on his own land. He has crushed during the year 131 tons, giving 276 oz. 12 dwt. of gold.

The

Barraba Division.

The gold won within the Barraba Division is just the same as for the previous year, viz., 600 oz.

At present there are about 150 miners on the different fields, viz., Crow Mountain, Wood's Reef, Ti-tree Creek, and Gulf Creek.

Crow Mountain has been very quiet during the year, owing to scarcity of water for crushing purposes.

Advantage has been taken of the Mining Laws Amendment Act by many of the miners to obtain authorities to enter and prospect the neighbouring private lands, with good results in some cases.

Several parties have been aided from the Prospecting Vote, and are vigorously testing their reefs.

The Barraba Crow Mountain Gold and Silver Mining Exploration Company has been formed, with Mr. Ernest Samuel Hunt as manager, and is expected to improve the Crow Mountain Field.

The Dodger Mine, owned by the Inverell Crow Mountain Company, is still putting forth good gold.

Messrs. John Dyson and Party, of the Red Flag Mine, have had some good crushings during the year.

Wood's Reef has been dull during the year, and few claims have been worked. Towards the close of the year however, owing to the energy displayed in the matter by Mr. G. F. Bradshaw, a company decided to erect a cyanide plant on the field, and, as the machinery is in course of erection, Wood's Reef is expected to forge ahead. The Golden Jubilee Mine, owned by Messrs. McLauren and Party, is still showing rich stone, and good returns have been received from crushings.

Bingara Division.

Gold-mining in this division for the past year has been very slack, owing principally to scarcity of water and want of capital and machinery to develop the mines.

A crushing from the Perseverance Claim of about 4 tons gave a return of 13 oz. to the ton. The syndicate are vigorously testing their ground, but unfortunately have no machinery on the mine.

About the middle of the year a small rush took place to some ground situated 1 mile east of Bingara, which has kept a few miners employed. The find is, however, not of great importance. It is estimated that 380 men are employed gold-mining throughout the division, and they won about 1,068 oz. of gold. With a favourable season this quantity could be largely increased.

NEW ENGLAND MINING DISTRICT.

Fairfield (Drake) Division.

Although the yield of gold from all sources during the past twelve months shows a considerable decrease on the yield of the previous year, it must not be looked upon as a sign that the mining industry is in a languishing condition, as present conditions point to the fact that mining in this district will have a long term of prosperity. And the prospects of the field never looked brighter during the last ten years than they do at the present time. The chief cause of the shortage in the yield of alluvial gold is due to the protracted drought during the greater part of the year, in consequence of which there has been a scarcity of water for sluicing purposes, and on many parts of the field mining has been reduced to fossicking. Quartz mining, from the same cause, has been very much retarded owing to an insufficiency of water to work the batteries, and several parties who had large parcels of stone ready for the mill were unable to have it treated, which accounts to some extent for the shortage in the return of gold from quartz mines, but now that the drought has fairly broken up there is an abundant supply of water for all purposes, we may look forward to a large yield of gold during the incoming year.

The "Lady Jersey" Mine, at Long Gully, distant about 6 miles south of the township of Drake, which, for a number of years has been the premier gold mine of the district, shows a decrease of over 500 oz. of gold on the yield of the previous year. This, however, must not be attributed to the poverty of the mine, but to another cause, for which, no doubt, a remedy will be found in time, and that is, a cheap and effective method of dealing with the refractory ores which are found in the deep levels of all our mines. The mine is now being worked at a depth of 140 feet from the surface, and the lode, which is composed of zinc blende, copper pyrites, and quartz, varies in width from 1 inch to 2 feet, and traverses a felstone formation. In the deeper levels the ore is not so rich in free gold as that which has been obtained in the higher levels of the mines, where oxidation has taken place, and although the ore by assay gives a large return of gold, it is impossible, with the gold-saving appliances on hand, to extract from it the whole of the gold contents. All concentrates are, however, saved for future treatment, when a better class of machinery for that purpose is available. The "Lady Jersey" Company have, during the past year, crushed and treated 1,364 tons of stone, for a yield of 1,707 oz. of gold, of the value of £4,911, and they have also 500 tons of concentrates on hand. The gold-saving appliances on this mine consist of a 5-stamp battery and one Frue vanner, driven by an 8-h.p. portable steam-engine. The value of the plant is £900. The men employed continuously during the year number thirty-six.

The "Pioneer" Mine, at Mount Carrington, near the township of Drake, is another mine similar in character and formation to the "Lady Jersey," and below the 100-foot level. Owing to the refractory nature of the ore, very little of the gold can be extracted by the old-time gold-saving appliances at present in use on the field. The "Pioneer" Company hold an area of 31 acres in gold-mining leases, and have expended in the development of their mine during the past four years not less than £4,000, without much profit accruing therefrom beyond having a large quantity of ore at grass, which, though rich in gold, they cannot have satisfactorily treated locally. This company, I might mention, has done a good deal of *bonâ fide* prospecting on their property, and have sunk one shaft to a depth of 200 feet, proving the existence of an auriferous lode at that depth, and they have sunk other shafts, varying from 80 to 100 feet in depth. The average width of the vein or lode at the deepest level is 1 foot, and is well defined. During the past year they have crushed about 195 tons of stone from the 80 feet level for a yield of 151 oz. of gold of the value of £453.

The "Nil Desperandum" is the next mine of importance on Mount Carrington, and has come conspicuously into prominence during the last two years, by its marvellous yield of gold. The deepest workings in this mine at the present time do not exceed 100 feet and the vein of ore operated on averages only 1 inch in width. Only 50 tons of stone have been raised from this mine during the year, which was crushed at one of the local batteries for a yield of 379 oz. of gold. The tailings from this parcel were collected and forwarded to Sydney for further treatment, with the result that 80 oz. of gold were extracted therefrom, bringing up the total yield from the 50 tons of stone to 459 oz., of the value £1,556.

The "Rainbow" Mine is the next to occupy an important position in this locality, and consists of a 2-acre gold lease held by Messrs. Parker and O'Connor, and is situated almost on the crown of Mount Carrington, overlooking the township of Drake. The deepest shaft on this mine is only 110 feet deep, and payable gold has been obtained to that depth, but the lowest level at which mining operations are carried on at the present time is 50 feet, at which depth a main drive has been put through the whole length of the lease, exposing a payable lode which averages 1 foot in width. The mine is worked by only two men, who have during the past year raised and treated 57 tons of stone for a yield of 140 oz. of gold of the value of £420.

The "All Nations" Mine which during the greater part of the year was shut down in consequence of some disagreement between the original shareholders, has now been taken over by a new syndicate, and mining operations have been resumed. The new company are now sinking a main shaft for pumping purposes from which it is intended to drive into the old workings below the 110 feet level where the former company some years ago profitably operated on a rich chute of stone, which they were obliged to abandon in consequence of the great influx of water at that depth. About 100 tons of stone taken from the upper levels of this mine during the year have been crushed for a yield of 90 oz. of gold of the value of £315. The new proprietors are going earnestly to work, and being men of some means there is no doubt but this mine will give a good account of itself before the end of the present year. They have in connection with their mine a six-stamp battery driven by an 8 h.p. portable engine, and a 4 h.p. engine for pumping. The value of the mining and crushing plant is £400.

The "American Barber" Mine is a gold lease of 5 acres of land, situated on the northern slope of Mount Carrington, held by Mickle and Party. Some very rich patches of gold have been met with in the mine from time to time, and payable returns have been obtained from the parcels of stone crushed. During the past year this party have raised and treated 88 tons of ore for a yield of 146 oz. of gold of the value of £530. The deepest shaft in the mine is only 100 feet deep, and the lowest level worked is 87 feet. The lode which is very much impregnated with copper varies from 1 foot to 3 feet wide.

The "Lone Hand" Mine, owned by Messrs. Staunton and Taylor, is a 2-acre gold lease, and is situated on the southern slope of Mount Carrington. The lode or vein in this mine is very small, being not more than 3 inches wide, but is extremely rich. It cannot, however, be termed a true fissure lode but merely a vein of quartz traversing a hard felstone formation,

formation, and, which adheres so closely to the enclosing formation that a portion of the country rock must be taken with the vein. The deepest workings on this vein do not exceed 60 feet from the surface. A parcel of 17 tons raised during the year and treated locally gave the magnificent return of 141 oz. 13 dwt. of gold, of the value of £500 13s. This, like many other mines on the field, is a two-men's claim.

Ward Brothers, on the north side of Mount Carrington, are the holders of a gold lease of 2 acres of land, and the lessees have during the past year been operating on a small auriferous vein about 4 inches wide, and their efforts have been attended with a fair show of success, as they have raised and treated during the year 44 tons of stone for a yield of 63½ oz. of gold of the value of £237

The Lady Hampden Mine at Sawpit Gully, near Drake, which is an immense deposit of auriferous and argentiferous matter of a refractory nature, is owned by a syndicate of Sydney gentlemen, who have expended a considerable sum of money on its development; but owing to the difficulty experienced in having the ore successfully treated locally they have had to suspend operations for a time for the purpose of sending a parcel of the ore to Europe, with a view to ascertain the best and cheapest method of treatment and the class of machinery adapted for the manipulation of this description of mineral.

The chief characteristic of this field is that as soon as the oxidised auriferous belt of country is passed through, which occurs at a depth of from 50 to 80 feet, the ore met with is of a refractory nature, and then the miners' troubles commence, inasmuch that the gold contents cannot be extracted or separated from the other base metals with the gold-saving appliances at present in use on the field. Unfortunately the ore is not sufficiently rich in gold to send to distant metallurgical works for treatment with any hope of leaving a fair margin of profit to the producers; therefore the mineral must remain on hand an unmarketable commodity until the advent of more improved and efficient gold-saving appliances by which these refractory ores can be treated locally. Not until the complex minerals can be treated on the ground will the prosperity of this, as a gold-field, be permanently established.

The oxidised ores extend over a very large area of this field; and notwithstanding that they do not extend to any great depth, there will be profitable employment found for small parties of miners for many years to come. Attention is now being directed to the Red Rock mines, distant about 12 miles west of Drake, and gold leases comprising an area of 40 acres have been recently taken up by some Sydney people, and no doubt that with well-directed energies that part of the field will be brought into prominence once more. The ore in that locality is of rather a low grade, but still by working the mines on a large scale and on economical lines success must follow.

At Lionsville, in the southern portion of this Division, mining is progressing steadily, and although no sensational discoveries have been made, an increase in the mining population has taken place during the past year, and several of the abandoned mines retaken up. Several parcels of stone from the reefs near Solferino have been treated at Bassett's battery with most encouraging results.

The alluvial mining in the Fairfield Division is spread over a very large area of country, and embraces Timbaria, Poverty Point, Millera, and McLeod's Creek in the south; and Tooloom, Pretty Gully, Mosquito Creek, Frazer's Gully, and Lunatic Reefs in the north; and about 320 European and Chinese miners find profitable employment on these old diggings, and the average earnings in some places is about 30s. per week.

Tenterfield Division.

There are only about forty Europeans engaged in mining pursuits in this Division. Of these twenty-two are working at Boonoo Boonoo, six prospecting for the rich gold reefs that were successfully worked some years ago, the remaining sixteen are fossicking for alluvial gold which is generally found in the numerous creeks and gullies abounding in that locality. There are one five-head and one three-head batteries and one Huntingdon mill of a total value of probably £500, all of which are idle pending the result of prospecting which is being vigorously proceeded with. At Bolivia, which is some 24 miles south of Tenterfield, Lambert and Party have sunk a depth of 40 feet, following a conglomerate reef; and at Sandy Flat Devon and Party are prospecting for gold under aid from the Prospecting vote, while some six other parties are prospecting in the neighbourhood, all so far without payable results.

CLARENCE AND RICHMOND MINING DISTRICT.

Grafton Division.

The value of the gold won in this Division is 1,719 oz., as compared with 780 oz. in 1896.

The number of miners employed throughout last year in this Division has not been so large as during the previous year.

The rush to Yugilbar, which took place during the latter part of 1896, owing to the sensational crushing of 85 tons for 500 oz. from Penrose and Rise and Shine Reefs, collapsed, and the miners dispersed to other parts of the district. There are, however, several quartz leases being prospected at Yugilbar, but with varying success.

The only large company in this division, the Walter Scott, has been idle throughout the year, and the proprietors are now endeavouring to dispose of the property.

Nana Creek Division

This Division, which embraces the Bucca Creeks, Coramba, Orara, &c, has made wonderful progress during the year as a gold producing centre, and for the sake of comparison the yields for the past few years are given:—

1894	427 oz.
1895	1,554 „
1896	2,256 „
1897	11,234 „

It is also satisfactory to note that, as the mines are being more fully developed, their permanency is becoming more assured, and the miners have removed their wives and families to the field, which is beginning to wear already quite a settled appearance. The principal mine in the Division is owned by the Beacon Gold-mines (Limited), who crushed 5,980 tons of stone for a yield of 8,916 oz. of gold, valued at £32,000. This company has a most complete plant, valued at over £5,000, and they employed on an average 100 men. Their main shaft is now down 180 feet.

Numerous other small crushings took place, the total quantity of stone raised and treated in the Division during the year being 8,883 tons for a yield of 11,234 oz., as stated.

At Tallewadjah Creek and neighbourhood mining is making steady progress, and the crushings, though small, are regular and satisfactory. The battery has been kept going continuously for some time past, and each one using it appears to be perfectly satisfied with the returns. They are not large or by any means sensational; still, they appear to be sufficiently good to give a fair living and leave something over, with the show of something better turning up at any time. It appears to be a poor man's diggings.

Quite a small township has sprung up around A. R. Everingham's battery, chief of whom work their own ground, and nearly all get a little gold. The 5½ tons got from the old Currajong reef was knocked out for a yield of 9 oz., representing three men's work for about three weeks, and others are doing as well.

The reefs are not at the present large; they are working shows, but with the number of reefs that are known to exist in this range, there should eventually, if not now, be a good opening for a company to tunnel from near the bottom of the hill and cut the whole of them. This, of course, will to a great extent depend upon what size the reefs will be at deeper levels than now being worked. The deepest shaft on the field is that of the Joker, the property of the Everingham's, about 75 feet. In it the reef has been proved to increase in size as it goes to that depth, hence it is reasonable to suppose that the others may likewise do so, and the indications, judging from the general appearance of the country rocks, are that they will live to a depth and prove permanent.

With a range that rises to a height of about 600 or 700 feet at a tolerably steep angle the advantages to be derived from a low tunnel, as suggested, are manifest, while the cost of same should not be great, and with this completed all the reefs could be worked from one or two main levels, the drag up and down the hills avoided, and the heavy cost of carting abolished.

Many of the workings are held by virtue of the prospectors' miners' rights enabling them to mark off prospecting protection areas. Several gold-mining leases have been applied for.

At the Record Reign, about a mile to the south on a branch of Tallewadjah, the company has a fine battery. The manager, Mr. R. U. Thomas, reports that in cross-cutting a north and south reef has been cut which carries gold. The cross-cut was continued and connected with the shaft hitherto known as the "Homeward Bound," at somewhere between 60 and 70 feet from the surface, and showing about 3 feet of stone carrying fair gold. He then continued driving east to the western shaft, and then put in a cross-cut south about 30 feet for the middle reef. The shaft known as McKinnon's, not far from the mouth, has been connected with the tunnel, and stoping here has been commenced.

Little Nymboi.—Henderson and Stuart have worked the old Waratah, and driven for the reef at the 40 feet level. They intend putting through a crushing of 20 tons from their original lease. A few gold leases have been applied for here. The gullies are raked by fossickers but nothing startling found.

The Lower Bucca Reefs are situated as the crow flies, about 9 miles east of Nana Creek. The country consists of slate and sandstone, and dips north in the more eastern portion of the field, which in the west from what is seen in the mines opened the strata appear to be vertical and striking north-west. Although gold has been got in some cases in the sandstone the best has been obtained when the reef entered the slate country, and points to the conclusion that the slate will eventually be found the true gold-bearing strata of the field. In the neighbourhood of Mr. D. Pont's "Mountain Maid," gold-lease 381, C. and R., portion 73, which is the centre of the township, the country is a mass of rotten slate and clay mixed, and the reefs consisting of fragments of quartz, which in most instances require only the hammer and gad to break. Most of the shafts about have all been sunk by the pick only. With the exception of Mr. D. Pont's none of these reefs have turned out in any way regular. His shaft, well timbered throughout and having first-class laddering, is down 105 feet, with a lode 4 feet wide. Its dip is about 1 in 10 to the east bearing north and south. From some of the reefs fairly good returns have been got. In size they average fairly, and where they have been cut in settled and solid country the percentage of mineral they contain is at once noticeable. The "Blue Mystery" is the first and most important reef. This is a very fine body of stone with well-defined walls running vertical nearly as true as a plumb and striking north-east. General width of the reef, 2 feet, and it carries a high percentage of mineral. The reef was first discovered in the small creek near the shaft when it formed a bar a couple of feet above the level of the watercourse. A shaft was then sunk on the east bank, and at 25 feet a drive put in a length of 75 feet on the reef.

At Coramba, outside the Coramba King and Evening Star mines, the property of Alfred Cadell, Esq., there is little if any permanent mining work in their immediate vicinity being carried on, and but for him mining at Coramba would be very far behind Tallewadjah Creek and other mining centres in this Division. From statements made by several good and thoroughly practical miners their resolve is to quit Coramba for another part of the field, the reason given that outside Mr. Cadell's properties there is nothing whatever to induce them to remain.

Following is a list of batteries in the Nana Creek Division at the close of the year 1897 :—

The Beacon Gold-mines (Limited).—Their battery is situated at Upper Bucca Bucca, in the parish of Moonee, and comprises ten head of stampers, with a 50-horse power engine.

Alfred Cadell, Coramba.—His battery is situated at Coramba, in the parish of Moonee, and comprises ten head of stampers, fitted with automatic feeders, amalgamating plates and appliances, Berdan pan, &c.

George Tyson, Fernmount.—His battery is situated on the south branch of the Upper Orara River, in the parish of Coff. It consists of five head of stampers, amalgamating plates, &c.

Thomas Henry Barbour, Lower Bucca.—This battery has been in work throughout the year. It is located at Lower Bucca, in the parish of Moonee. It has eight stampers.

Thomas Robert O'Grady, Whiteman Creek, *via* Grafton.—This battery is known as the Nana Creek Battery. It is a 10-stamper one, with amalgamating plates, &c.

Record Reign Gold-mining Company (No Liability), Glen Innes.—This battery, situated near Tallewadjah Creek, in the parish of Bagawah, is under the management of Mr. Richard Wren Thomas. It consists of ten head of stampers, with amalgamating plates and other appliances for the extraction and retention of the gold.

Elijah Henderson, Little Nymboi.—This battery is situated at the Little Nymboi, in the parish of Comlaroi. It has four stampers, and amalgamating plates and all requisites.

Albert Roland Eveingham, Nana Creek Road.—The site of this battery is at Tallewadjah Creek, in the parish of Bagawah. It consists of three head of stampers, with amalgamating plates, &c.

H. Robinson, E. Symington, H. Cross, S. McNamara, Hillgrove.—This company's battery, a new one by Hodgkinson, of Newtown, Sydney, is situated at the Little Plain, near Mole Creek, in the parish of Wilawan. It has ten head of stampers, each 7½ cwt. The engine, by Robey, with boiler, is portable, and is of 16-horse power.

The Coramba Queen Gold-mining Company (No Liability), Melbourne.—The battery is erected at their mine at Coramba, in the parish of Moonee. It has ten head of stampers, driven by a 16-horse power 10-inch cylinder portable engine, by Robey. There are two of Halley's percussion tables and amalgamating plates.

E. F. Sharpe and J. J. Morrow, Nana Glen.—This battery is situated at the Morning Star Creek, on their M.T. 41, in the parish of Bagawa. It has two head of stampers, worked by a 4-horse power horizontal engine with a vertical boiler. There are amalgamating plates and all requisite appliances.

The total number of miners employed throughout the division is estimated at 400.

Dalmorton Division.

There is considerable improvement in the returns for the year from the Dalmorton Gold-field as compared with that of 1896, viz., for the present year 855 oz. 15 dwt. gold, and 339 oz. 5 dwt. for 1896, being an increase of 516 oz. 10 dwt., and it is believed this return will be exceeded during this year.

There are very few mines in operation at the present time the Mount Rea Gold-mining Company, at Mann River, being the principal. A ten-head stamper battery has been erected on this mine during the year at a cost of several thousands of pounds, and from thirty to forty men have been continually employed on and about the mine and battery. 733 tons of quartz have been crushed, but the returns are not up to expectations, still it is thought that a good result will be obtained during this year, by a more judicious management, and with this end in view, a new manager has now taken charge of the mine. The reef is from 6 to 12 feet wide, and if the whole of it can be payably worked, it will be the means of employing a large number of men.

The "Little Dora Mine" at Mann River is again at work after a few months suspension, and the last crushing gave a better return than any during the last two years. It is, therefore, the intention of the syndicate who own it, to further test the value of the mine by opening it up more thoroughly. A "Woodbury Concentrator" has also been added to the crushing plant, and by this means a large quantity of valuable concentrates is saved, instead of running to waste as hitherto.

The "Hawk Eye" Mine has been tried again but with rather an unsatisfactory result; and a small party of men are now working it on tribute and expect to make wages, but no return is yet to hand.

The only mine at work about Dalmorton is the "Carbine" and that is being tested with a view of ascertaining whether it can be profitably worked by erecting a battery on it, it is a fairly large reef and easily worked, and could be made to pay well at ½ an oz. to the ton.

A new find at Stockyard Creek is being well prospected by a Hillgrove syndicate, who intend putting machinery thereon should results warrant it.

The foregoing is a brief summary of all the work at present carried on in this district in reefing, which is a very small amount for so large an area of auriferous country, but no doubt a fresh start will be made shortly to work a number of known reefs which could be made to pay with the aid of capital, the want of which has been a great drawback to this district.

The alluvial returns show an increase of 135 oz. for the year, caused by a greater number of fossickers being at work, but no new finds have been made, and generally speaking, there is a bare living in alluvial about here. One fossicker found a nugget of 30 oz. together with about 14 oz. of smaller pieces in a small patch, but his luck stopped at that, and no more could be found in that gully.

The public crushing battery has been removed from Dalmorton to Corinda Creek (in the Woogoolga Division), as there was not sufficient work for it here, but the value of mining plant has increased during the year from £6,800 to £8,700.

Ballina, Lismore, and Maclean Divisions.

As McAuley's Lead, situated on the sea beach in the vicinity of Jerusalem Creek, has practically been worked out, mining in these Divisions has fallen off considerably. the quantity of gold won so far as can be traced being only 74 oz. There is very little prospecting work being done, but owing to the late copious rains a little improvement may be looked for.

for. A large number of the miners have made their way to the promising fields of Coramba and Bucca Creek. About the end of April the Government prospectors testing the beaches in the neighbourhood of Byron Bay were withdrawn. Although encouraging prospects were found, no lead sufficiently rich to warrant it being taken up and worked with the machinery now in use was discovered. A large area was thoroughly tested.

Woogoolga Division.

Mining matters have been rather dull in this Division during the last few months, owing to some of the crushings not proving satisfactory, and the influx of water into some of the workings.

A five-head stamper battery valued at £400 has been erected at Corinda Creek by Mr. W. Peters, who has put several small crushings through with satisfactory results. Twelve miners are on gold, sixty men are employed in the various mines in the Division, and twenty men are engaged in working alluvial.

Two hundred and sixty-five tons of ore were crushed during the year, which yielded 382 oz. 7 dwt. of smelted gold, valued at £1,481 9s. One hundred and twenty oz. of alluvial gold, valued at £432, was obtained in the various creeks at Corinda, and on the beach near Woogoolga.

The Wedding Bells, Lady Helen, and Thos. McCallum and Party's Mine are the principal ones in the Division, and are situated at Corinda Creek. At the Wedding Bells Mines the shaft is down 160 feet on a 15-inch vein carrying good gold. One hundred and eleven tons of stone raised from this mine yielded 241 oz. 14 dwt. of gold. The Lady Helen Mine on the same line of reef has a shaft down 130 feet on a 15-inch vein; 46 tons of stone raised from this mine gave a return of 22 oz. 12 dwt. of gold.

Thos. McCallum and Party's Mine, which were found during the year, is distant about 2 miles in a northerly direction from the Wedding Bells line of reef; 16 tons of stone taken out of this mine yielded 47 oz. of gold. It is estimated that stone now being raised from the mine will average 4 oz. of gold to the ton. Five tons of ore raised from Newhaven Mine (E. R. Webb) yielded 22 oz. of gold. The reef having cut out at the 30 feet level, the lease appears to have been abandoned.

Alfred Cobb and Party were granted aid to prospect the beach and terrace at Red Rock, 12 miles north of Woogoolga, and although a good deal of work was done, no payable gold was discovered.

It is expected mining matters generally will improve in this Division in the near future, and that several of the claims now lying idle will soon be worked again, and with the expenditure of a little capital will prove payable.

COBAR MINING DISTRICT.

Cobar Division.

It is pleasing to be able to report that the condition of the mining industry in this Division is highly satisfactory.

The introduction of further improved and extensive machinery, together with the better provision for water conservation, has done much towards developing the different mines on this field. A large amount of capital has been introduced during the year, one company—the Cobar Gold-mines (Limited)—having expended over £30,000 in connection with their property at Fort Bourke, 1 mile out of town.

The actual quantity of gold won during the year was 27,211 oz., made up as follows:—

From local batteries	15,285 oz.
From reductions made at Lithgow and Illawarra.....	11,926 ,,
	27,211 oz.

This latter quantity is mostly saved in connection with the treatment of copper-matte, and goes to show what an important part the saving of gold from copper ore is having upon the output of the Colony. The total value of the gold, silver, and copper raised during the year in the Cobar district may be estimated at about £300,000.

It is estimated that during the three and a half years the tributaries have worked the Great Cobar Mine about 7,500 tons of copper and 40,000 oz. of gold have been produced, the total value of which is little short of half a million sterling.

Notwithstanding the great improvement on former years the anticipations formed at the beginning of the year with regard to some of the Cobar mines have not been fulfilled. First there was the temporary suspension of operations on the "Cobar Gold-mines" (Fort Bourke) and "Cobar Gold-mining Company" (Chesney)—the first-named company through insufficient cyaniding plant and other mining drawbacks, and the latter company owing to the failure to reconstruct or refloat. These two mines, it is stated, will before long be worked again on a large scale, and will eventually yield abundant quantities of gold and copper. The recent severe drought also seriously interfered with several of the batteries, and has prevented systematic prospecting operations from being carried on on many promising shows in the outlying fields.

The prospects for the year 1898 are, however, bright and hopeful. In the immediate vicinity of Cobar the copper syndicate have recently added another 60-ton water-jacket furnace to the number already in use, which necessarily means increased labour and output.

Large interests in the Peak Silver-Gold Mines have also been acquired by this syndicate lately, and these mines are being systematically prospected, with gratifying results.

The Chesney and Fort Bourke Mines, previously referred to, present enormous possibilities, containing as they do immense bodies of ore carrying both copper and gold in payable quantities. There is hardly any doubt that if these mines are judiciously managed they will probably give employment to some hundreds of workers.

During the year copper ore has been found in the Occidental, Young Australian, Great Western, and Berribungie Mines, which are now being worked for gold, and the presence of copper seems to establish beyond all reasonable doubt the existence of large and in most instances of payable copper and gold ores for a distance of over 4 miles on the Cobar reefs.

At Florida, 30 miles in an easterly direction from Cobar, the Anglo-Australian Exploration (Limited) have lately purchased several gold mining leases, and have now some sixteen men employed in sinking two shafts and prospecting works. A lode, varying from between 3 to 10 feet wide has been exposed for a considerable distance on this property carrying gold in fair quantities.

Two other parties are also prospecting in this district, viz., Budd and Smith, and Prendergast. The prospects of this portion of the district are encouraging.

At Restdown, which is quite a new field, situated about 35 miles south from Cobar, some thirty or forty prospectors are working on small but well defined gold reefs. Two or three trial crushings were recently made at Cobar resulting in a return of over 1 oz. to the ton. Some fifty leases have been applied for in this locality during the year, and it is expected that most of them will be working as soon as a good rain has fallen. About 520 men are employed throughout the Division mining for gold.

Mount Drysdale Division.

The output of gold from the mines at Mount Drysdale has not been so great as during 1896. The mines are very patchy but easily worked. There is no present indication that any improvement may be expected in this Division during the coming year.

Gilgunnia Division.

There is a decided increase in mining activity at this field, and some of the mines have improved, and two more claims have been added to the list, crushing with payable results. The total quantity of gold won is 900 oz., as compared with 621 oz. for the preceding year. It is said that some of the claims at Four-mile have had small crushings which went over an ounce per ton. Several grants have been made from the Prospecting Vote to thoroughly test this field. No new finds of importance have, however, been made in this locality, but as prospecting operations are being carried on in the neighbourhood with fair prospects, fresh discoveries of some moment may be reported at any time.

Nymagee Division.

At the Overflow Company's mine good solid work has been done; the main shaft (a large three-compartment shaft) has been sunk to a depth of 100 feet, and drives have been extended to connect with the other workings; a good winding plant has been erected, and a cyanide plant is almost completed; some 2,500 tons of ore are already at grass, and everything is ready for treating the stone from this promising property on a fairly large scale. During the year a township has been surveyed near this property and named "Bobadah," and it boasts of a population of about 300.

Prospecting work is also being carried on for copper, silver, tin, and gold in many parts of this Division, with varying results.

ALBERT

ALBERT MINING DISTRICT.

Milparinka Division.

There is a great falling off in work done and of gold won in this Division as compared with previous years, arising from the long continued drought which has prevailed now for the last three years. There has not been a general rainfall during that period. Some slight showers fell, but there has not been a supply of water sufficiently plentiful to be of any real service to the miners during that period to allow of them mining to advantage. Water and feed have been so scarce that many have left the field to look for work elsewhere.

The drought had become so intensified and general throughout the district that some alarm was caused. Later accounts show that the late copious rainfall extended to this field—the fall averaging from 5 to 8 inches.

There were about sixty gold leases in force during the early part of the year, but as the proprietors were nearly all poor miners, they could not fulfil the labour conditions, and more than one half were cancelled whilst others were declared void from the leases not being executed.

None of the leases have been developed; there has been no sinking on any of them to any depth; the principal work has been in open cuttings, following the course of small leaders as erasing from an inch to 3 inches, carrying good free gold, but not payable. Such leaders intersect all the ground on the fields; no true reef has yet been opened out. There has only been six or eight trial crushings, done at the public battery, none of which were up to owners' expectations, being under an ounce to the ton, when the proprietors became disheartened and would not carry on work.

The battery is now shut down, it being impossible to draw firewood owing to no feed for horses, with an insufficient supply of water. Further, the lease owners were unable to cart stone to the battery to keep it in work. There is now about 50 tons of stone at grass ready to crush.

Alluvial mining in the Division was brought to a complete standstill through the dry weather, but a few men are trying dry-blowing, by which they make a bare living.

This field can hardly be considered a true alluvial field, as there has not yet been a defined lead of gold discovered. It is massive gold, very patchy, and found in small pockets that soon cut out when it may require much dead work before another pocket is found.

Tibooburra Division.

Owing to the great drought mining operations in this Division, as at Milparinka, have been greatly retarded. The miners, about 100 in number, have managed, however, to win 814 oz. of gold, which, under the circumstances, is very creditable. As the year 1898 opened with a general rain, a larger increase in the return may be expected. The alluvial gold won on this field is spread all through the soil near the surface, and the sinking is seldom over 2 feet deep. When water is scarce dry blowing is resorted to.

Broken Hill Division.

This is essentially a silver-mining district, and the only gold won during the year was by The Broken Hill Proprietary Silver-mining Company, who, in connection with their silver smelting operations, saved 3,326 oz. of gold at their Broken Hill works, 738 oz. at their works at Port Pirie, or a total of 4,064 oz. The quantity saved by the company during 1896 was 4,389 oz. The Diamond Jubilee Mining Company tested 20 tons of ore from their leases in the parish of Robie, which yielded 16 dwt. of gold per ton, and 7 per cent. copper. Two areas have been applied for as gold-mining leases on this company's mineral leases.

I am indebted to J. MacDonald Cameron, Esq., F.I.C., the Deputy Master of the Royal Mint, for the following information:—

QUANTITIES of Gold, the produce of New South Wales, received into the Royal Mint, Sydney, during 1896 and 1897, compared.

SUMMARY.

District.	1896.	1897.
	oz.	oz.
Bathurst	8,103·23	5,451·40
Tambaroora and Turon	3,345·30	6,903·11
Mudgee	9,799·86	9,694·00
Lachlan	12,061·72	13,522·04
Albert	1,137·67	875·48
Southern.....	4,285·00	5,838·59
Tumut and Adelong.....	6,785·45	5,238·47
Peel and Uralla.....	11,715·26	19,726·82
Hunter and Macleay	126·92	188·69
Clarence and Richmond	1,776·26	2,992·69
New England.....	2,392·83	1,712·74
Mixed—Western, Northern, and Southern.....	34,342·73	22,747·55
Localities unknown	107,463·96	108,522·97
	203,336·19	203,414·55

From the above table it will be seen that the quantity of gold sent to the Mint in 1897 exceeded that sent in 1896 by only 78·36 oz. The large quantity received under the heading of "Localities unknown," is principally gold bought by the Bank of New South Wales. The bank makes no note of the districts from which the gold is won.

The following table is compiled from information kindly furnished by the Collector of Customs:—

EXPORT OF GOLD, 1897.

Gold.		Quartz Tailings and Pyrites.		Total.	
Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
oz.	£	Packages.	£	oz.	£
104,319	403,258	26,478	60,005	119,555	463,263

The system adopted by the Department in arriving at the output of gold for the year is to add the quantity received at the Royal Mint to that exported through the Customs, deducting, of course, the quantity exported by the Mint which appears in the Customs Return. The following figures show how the yield for the year is arrived at:—

	oz.	£	s.	d.
Gold exported in bars, dust, quartz, and concentrates	119,555·0	463,263	0	0
Gold received by the Mint, the product of the Colony... ..	203,414·55	755,306	7	9
	322,969·55	1,218,569	7	9
Less the quantity exported by the Mint through the Customs	30,752·00	130,156	0	0
Estimated yield for 1897	292,217·55	1,088,413	7	9
The yield for the year 1896 was	296,071·19	1,073,360	4	7

Arrangements were completed early in the year whereby the Department was enabled to issue quarterly returns of the gold won within the Colony, and the figures are forwarded to the Agent-General in London for publication. The following statement gives the yield for each quarter:—

	oz.	£
Quarter ending 31st March	63,633	238,611
„ 30th June	63,616	238,786
„ 30th September	94,991	351,803
„ 31st December	69,977	259,213
	292,217	1,088,413

The gold received at the Mint during the quarter ending the 31st December was only 52,375 oz., or 42,616 oz. less than during the quarter ending 30th September, and also less by 22,328 oz. than the corresponding period of 1896.

RETURNS

RETURNS of Gold for 1897 from Mint and Mining Registrars compared.

District	Mint.	Mining Registrars.	Excess.	Deficiency.
	oz.	oz.	oz.	oz.
Bathurst	5,451·40	31,936	26,484·60
Tambaraora and Turon	6,903·11	11,060	4,156·89
Mudgee	9,694·00	26,939	17,245 00
Lachlan	13,522·04	65,207	51,684·96
Albert	875 48	5,129	4,253 52
Southern	5,838 59	16,521	10,682·41
Tumut and Adelong	5,238·47	30,665	25,426·53
Peel and Uralla	19,726·82	43,392	23,665·18
Hunter and Macleay	188 69	1,394	1,205 31
Clarence and Richmond	2,992·69	14,386	11,393 31
New England	1,712·74	5,535	3,822·26
Cobar		27,211	27,211·00
Mixed—North, South, and West	22,747·55	22,747 55
Localities unknown	108,522 97	108,522·97
	203,414·55	279,375	131,270·52	207,230 97
				131,270·52
The returns from Mining Registrars exceed returns from Mint by				75,960·45

From the foregoing table it will be seen that the return furnished by the Mining Registrars exceeds the quantity received at the Mint by 75,960, but is only 12,642 oz. less than the total yield for the year. This may be considered satisfactory, in view of the fact that these officers have to obtain the information from mines extending over a very large area. The difference in their figures and the total yield, as computed in Sydney, may be accounted for by the gold which is sent out of the district in the form of matte, in copper and other ores, but which must be accounted for at the Customs, if exported; or, if the ore is treated in New South Wales, the gold ultimately reaches the Sydney Mint.

MINING Registrars' Returns of Gold for 1896 and 1897 compared.

District	1896	1897	Increase.	Decrease.
	oz.	oz.	oz.	oz.
Bathurst	43,686	31,936	11,750
Tambaraora and Turon	12,281	11,060	1,221

	158,838	0 17 20	141,762 10 21		189,671	0 16 11	156,186 5 21

Note.—This Table only shows the yield of gold where the quantity of stone treated is ascertainable.

The two preceding tables, showing the average yields from the alluvial and quartz mines in the Colony, are unfortunately not as complete as desired. The difficulty of obtaining the necessary data for this compilation has been drawn attention to in nearly every Report issued by the Department. The miners do not take the trouble to keep a record of their operations, and, in many cases, they decline to make their returns public. Until they see their way to assist the Department in the manner required, there is little hope of the information in these tables being as complete as they ought to be.

The number of miners employed in gold-mining during the year was as follows:—

	1896.	1897.
Alluvial	9,228	8,028
„ (Chinese)	710	1,002
Quartz	12,069	12,256
	<u>22,007</u>	<u>21,286</u>

This is a reduction of 921 on the total number employed during 1896. As a large number of the men working the alluvial ground are practically fossickers, who take to this mode of earning a living when other employment fails, their number is liable to sudden fluctuation. There is an increase in the number of quartz-miners employed of 187.

Dividing the quantity of gold won, viz., 292,217 oz., by the total number of men employed, viz., 21,286, it shows that each man on an average won 13.21 oz., valued at £51 2s. 7d. This is a very few shillings less than the average earnings for 1896. But when the fact is taken into account that a number of the men follow other pursuits during a portion of the year it will be seen that this method of arriving at the actual earnings of the gold-miners can be taken only as a rough approximation. Further, no allowance is made in the calculation for the expenses incidental to mining.

COAL.

The total output of coal for 1897 is actually the largest since the opening of our coal-fields in 1829, the increase for the year being 474,074 tons over the output for the previous year. The total output, as shown in the following table, was 4,383,591 tons, as against 3,909,517 tons in 1896. It is very satisfactory to note that our foreign and intercolonial export trade have both recovered from the severe shock they received from the lamentable strike in 1890. The table shows that the Colony has at last fully recovered the ground lost at that time, and our foreign and intercolonial trade was larger last year than it has ever been.

There is every indication that 1898 will be a record year so far as the coal trade is concerned.

Good progress has been made during the year at the Sydney Harbour Colliery Works, Balmain. The surface excavations for the site of colliery works and machinery are all but completed, the level area having been largely increased by filling in the space enclosed by the large retaining-walls which have been erected fronting the harbour.

The work of shaft sinking was begun in the "Downcast" shaft on May 24th, and in the "Upcast" shaft on 22nd June, the winding of the *débris* being carried out by two 5-ton steam cranes pending the arrival

There were employed in and about the coal and shale mines of New South Wales during 1897 9,979 men, as compared with 9,460 during the previous year.

The total number of fatal accidents for the last twelve months were 16 as compared with 24 during 1896, and 63 non-fatal as against 62 during the same period.

The following table is intended to show that the safety of our mines can bear comparison with the coal-mines in the United Kingdom:—

SUMMARY of persons employed, number of fatal accidents (deaths), and ratios of the number of persons employed, and the number of fatal accidents in and about the "United Kingdom" and "New South Wales" Coal-mines, since 1874.

Year.	United Kingdom.				New South Wales.

* Excessive number of falls of coal and Lithgow disaster caused this high death-rate.
 † Bulli catastrophe and excessive falls of coal caused this high death-rate.
 ‡ Hamilton pit crush, excessive falls of coal, and over-winding of four men at South Burwood sinking pit caused this high death-rate.

The following table shows that the coke manufacturing industry is in a thriving condition, the quantity and value of the output for the year being more than double that turned out during 1896. There is no doubt but the manufacturers now see the advisability of producing a first-class article, and if they adhere to that course there are great possibilities for the trade in the Australian colonies alone.

In the Northern District the Purified Coal and Coke Co., Newcastle, and the Singleton Coal and Coke Co., Singleton, are still the largest manufacturers, and in the Southern District large quantities are produced at the extensive works at Unanderra and Bulli.

Shale mining shows very little indication of any immediate improvement, and although prospecting work for new deposits has been actively carried on by the present companies and private individuals during the year, no new discoveries of any importance have been reported during the year. First-class shale finds a ready market in Europe, and the total quantity exported during the year was 21,930 tons, the value of which on board ship is given at £44,511. Some very promising seams are being opened up in the Capertee District, and appearances indicate that it is from this locality that the Colony must look for the bulk of future supplies.

SILVER AND LEAD.

During the year the extensive silver-mining operations at Broken Hill, in the Albert Mining District, were responsible for serious loss of life, and especially was this so in the early part of June, when five fatalities were recorded in quick succession. These unfortunate accidents produced a feeling of doubt among certain of the public as to whether the miners of this district were working under conditions as favorable as should be expected; and when it was represented that accidents were on the increase, and that this was to a large extent due to incompetency and mismanagement on the part of the officers of the mines, and to the miner being required to work in places specially dangerous, the Government, recognising the importance of the matter, deemed it desirable that a thorough investigation should be made, and to that end His Honor Judge Murray was appointed as a Royal Commission to inquire—

1. Into the cause or causes of accidents which have recently taken place in certain mines and quarries in the Albert Mining District.

2. Whether the provisions of the Mining Act, 1874, and the Regulations relating to the inspection of mines other than coal or shale made thereunder, are sufficient to secure the safe working of the mines and quarries in the said district, especially in regard to the use of explosives and the system of timbering, and of working large lodes adopted. And, if they are not sufficient, to suggest in what respect and to what extent they should be added to, or amended.
3. Into the truth of the statement that the number of accidents in such mines and quarries has largely increased, and the cause of such large increase.
4. Whether the open-cut system of work is specially dangerous; and, if so, whether this is due to such work being carried on at night; and whether such system should be prohibited; and, if necessary, to suggest regulations for the purpose of safeguarding the lives of the miners and other persons employed in that class of work.
5. Whether the risk to the persons employed in the said mines and quarries is increased by reason of incompetency on the part of managers and subordinate officials.
6. Whether the services of additional inspectors are necessary.
7. As to the best means of making known to all persons employed in and about the said mines and quarries the statutory enactments and Regulations relating to the inspection of such mines and quarries; and to make any recommendation which he may deem advisable in the premises.

The Commissioner sat at Broken Hill, where the great bulk of the mining operations of the Albert Mining District is carried on, and inquired exhaustively into the above, and all other matters affecting the safety of workmen and others employed in and about the mines. In the report subsequently presented by the Commissioner, it is shown (*inter alia*) that the incompetency of men representing themselves as miners, and having no real knowledge of the work, had contributed very largely to the cause of accidents, but that there has been no appreciable increase in the number of accidents, nor have the men been required to work under specially dangerous conditions, or under officers wanting in competency; and that the appointment of an additional inspector is unnecessary. The Commissioner also deals in detail with the Regulations under the Mining Act, 1874, and suggests alterations and conditions which would make them more applicable to mining as carried out under the improved conditions of the present time. The report, together with the minutes of evidence, has been printed, and copies may be obtained from the Department.

* NOTE.—In the Annual Report for 1888, 11,739 tons 7 cwt. of silver ore, valued at £164,620, was omitted from the table. The bulk of the silver is exported in the form of silver-lead.

The information for the following notes relating to silver-mining in New South Wales is gleaned from the reports sent in by the Wardens and Mining Registrars:—

THE ALBERT MINING DISTRICT.
Broken Hill Division.

The prosperity which prevailed in the silver-mining industry in this important Division during 1896 was continued during 1897, notwithstanding the severe checks sustained through the creep in the Junction Mine and the disastrous fire in Block 12. Though the price of silver declined slightly during the year, there is an increase of £341,916 in the gross value of the product of the field as compared with 1896. The increase in the value of lead has been an important factor in producing this result, and partially due to the increased output. The Broken Hill Proprietary Company's mine still holds premier position on the field, and employs on an average 2,300. The quantity of ore raised by the Company during the twelve

twelve months was 384,319 tons, and the total value of the product—viz., gold, silver, lead, and copper—was £1,287,732 4s. 10d. The fifteen furnaces in blast at this mine at the date of the outbreak of the fire in Block 12 were closed down on the 12th September, but seven were blown in again on the 24th of the same month, the remainder being dismantled. The next important mine—the Broken Hill Proprietary Block 10 Company (Limited)—raised 100,000 tons of ore, valued at about £430,000. This Company employ over 600 men. The Block 14 Company, which employs 600, raised 107,471 tons of ore, valued at £400,000. The British Broken Hill Proprietary, 95,975 tons, valued at £223,061. This mine employs 500 men. The Broken Hill South Company employ on an average 360 men, and during the year raised 82,084 tons of ore, the gross value of which is estimated at £226,750. The Broken Hill Junction, 62,200, estimated to be worth £234,881. The North Broken Hill Company, 31,107 tons, valued at £154,326, and the Junction North Company, 18,200 tons, estimated value £126,881. These are the principal mines on the field, which altogether employ 5,950 men. During the first half of the year the number of men employed was 6,500, but owing to the big fire and the closing of the Broken Hill Proprietary Company's smelters a considerable reduction took place. The new smelting-works started by the Company at Port Pirie have no doubt absorbed a large number of these men. At the end of the year the population of the Division was 26,166, or an increase of 989 over the previous year. This shows that the district continues to advance in prosperity and importance, which is of course entirely due to the increased activity at the large silver mines previously referred to. The past year has not been a favourable one for the outlying mines from Broken Hill proper, but efforts are still being made to develop them, so far without any important results. The total value of the metals produced on the field is estimated as under:—

	£	s.	d.
Roasted sulphide of silver, 90 tons	57,761	1	0
Matte, 6,653 tons	116,119	18	11
Silver-lead bullion, 16,803 tons	720,189	11	6
Concentrates, 96,974 tons	1,023,053	5	3
Ore, 261,078 tons	1,435,333	6	0
Total for 1897	£3,352,462	2	8
„ 1896	£3,010,546	2	0
Net increase.....	£341,916	0	8

The total quantity of ore raised from the mines during the year is 1,011,961 tons, and the total quantity of silver won was 13,447,177 oz. These figures do not include the silver from new smelting-works of the Broken Hill Proprietary Company at Port Pirie, and as the bulk of the silver is exported in the form of silver-lead, they can only be taken as approximate. The Sulphide Corporation (Ashcroft's process), Limited, have taken over the Central Mine, and now employ about 650. The quantity of ore raised by them was 130,000 tons.

BATHURST MINING DISTRICT.

Cowra Division.

Prospecting operations are being carried on for silver deposits in this Division by Mr. C. A. Ashcroft, of Cockle Creek, who has some twenty men employed. It is said the prospects are fairly promising.

Mitchell Division.

The Sunny Corner Silver-mine has not been reopened since it shut down in December, 1896, consequently silver-mining in this locality is a dead letter for the present. There is no immediate prospect of this mine being restarted.

Orange Division.

At Lewis' Ponds the Smelting Company of Australia are carrying out some preliminary prospecting work by driving under Spicer's old workings. Some twenty men are employed on the work, and it is understood that the Company contemplate the erection of extensive works in the locality.

NEW ENGLAND MINING DISTRICT.

Fairfield (Drake) Division.

At the White Rock Silver-mine work has been steadily progressing during the past year, and considerable additions have been made to the mining and reduction works. At the mine a large building has been erected over the main shaft, and on the first floor is fixed two large rock-breakers, into which the ore is delivered when brought up the shaft. The crushed mineral is then passed on to another floor, where there are two sets of revolving sorting tables. When classed the ore is then to be passed through the "Wall" and "Chrom" rolls, of which there are two sets of each. The crushed ore will then be taken on trucks about a quarter of a mile to the chloridizing and lixiviation works. The Company are at present erecting three of Howell's roasting and chloridizing furnaces, and when completed the plant will be capable of treating 300 tons of ore per day. The main shaft at the mine has now been sunk to a depth of 180 feet, and driven about 60 feet north and south. 113 men are employed on this mine and works, and the value of the whole of the plant is estimated at £51,000.

It probable that about the middle of this year the White Rock Silver Reduction Works will be in full operation, which, it is to be hoped, will considerably increase the mineral products of this district.

Emmaville Division.

Silver to the value of £5,120 was won in this Division during the past twelve months.

Mining in this Division has fallen off to some extent, owing in a great measure to the low prices ruling for ore. The silver-mines at Webb's continue to be worked on an extensive scale, and apparently will continue for some years if the present prices ruling are maintained.

The Mount Galena Silver-mines have been granted suspension of labour for some time past, and, as a result, are idle.

The Silver Prince Silver-mine was taken up recently, but as yet no work of any kind, except a small shaft, has been done.

Deepwater Division.

About twenty men were employed in the vicinity of Castlerag by syndicates prospecting for silver ore, but no payable ore was raised during the year.

Wilson's Downfall Division.

Silver-mining at Rivertree has improved during the year. There are now about thirty men at work on good payable lodes. The ore is picked, bagged, and sent to Aldershot, Queensland; Cockle Creek, Newcastle; and Lake Illawarra; the returns from the two last-named works being more satisfactory to the miners, which is likely to command their trade. From the expense of forwarding the low-grade ore, of from 20 oz. to 40 oz. of silver is ignored, whereas, if there was machinery to treat the ore on the spot, there would have been a large return from this field. 75 tons have been forwarded for treatment, realising £1,884, by which it will be seen the ore is of high value. Mr. C. T. McDonald has taken up a mineral lease on the old Wangabah mine, and a shaft has been sunk 100 feet, and two tunnels have been driven 70 feet each. As they go down the ore improves, and the lode is more defined. Messrs. Jones, Barlow, and party, Qualy and party, and Thomas are working on good lodes, the average yield of silver being 220 oz. per ton of picked ore. Messrs. C. T. McDonald and Coulston and party are prospecting at Rivertree and Cullen's Creek. They are working on lodes, but as yet they have not had any ore treated. In Rivertree and the locality there is a marked improvement for the better on the previous year.

PEEL AND URALLA MINING DISTRICT.

Hillgrove Division.

The Ruby Silver-mine, at Rockvale, situated about 25 miles N.E. of Armidale, has been taken over by the New Zealand Mines Trust (Limited) conditionally, and is being vigorously prospected.

They are sinking three new prospecting shafts, and driving on the lode at the 100-foot level. A contract has been let for sinking the main shaft a further depth of 100 feet, and they are also prospecting several parallel lodes along the surface. No stone will be treated until the mine has been satisfactorily proved, and only such ore is taken out as is necessary to sink and drive, and is stored for future treatment. The ground passed through is being established by assay. A property known as Balsers' Prospecting Area and another known as Silver Point have also been taken in hand by this Company, the development of which is to be proceeded with at once.

SOUTHERN

SOUTHERN MINING DISTRICT.

Rye Park Division.

The Wallah Silver-mine, which has been worked for several years, would, it is thought, pay if suitable machinery was erected on the ground. At the present time the ore has to be carted to the Yass Junction, 26 miles, and hence to Dapto by rail. There are deposits of fluxes in the immediate neighbourhood, and an abundance of several kinds of timber, such as ironbark, stringybark, box, gum, &c.

Captain's Flat.

The Lake George Mines, Limited, in addition to the gold, copper, and lead, won 93,372 oz. of silver in connection with their copper-smelting operations as compared with 70,000 saved during 1896. This Company employs 700 men. The Lake George Proprietary are developing their property at present, but will, it is said, reach the producing stage during the current year. The Lake George, North Mines, No Liability, are also in a similar position.

Moruya Division.

A few men are testing an argentiferous deposit in the vicinity of Moruya, but although fair specimens of ore were obtained nothing of a payable character has been struck so far.

Panbula Division.

Several promising gossan lodes are being tested in this Division, and twenty men are vigorously carrying on the work. A parcel of 146 tons were exported to Europe for special treatment, which is estimated to contain silver to the value of £3,100 and £264 worth of bismuth.

COBAR MINING DISTRICT.

Cobar Division.

Two mines at the Peak, viz., Messrs. Barrass and Connelly's and the "Conqueror," produced silver during the year to the extent of 121,251 oz., valued at £11,762. The ore was treated at the Great Cobar Company's works. This is the first report of silver in any quantity being won in this locality.

TIN.

The information contained in the following notes on the tin-mining industry is taken from the reports sent in by the Wardens and Mining Registrars.

PEEL AND URALLA MINING DISTRICTS.

Tingha Division.

There has been a falling off in the output of tin-ore produced during the last twelve months from this field of about 60 tons, the output being estimated at 402 tons, of a local value of £13,668, as compared with 500 tons, valued at £16,000, raised during 1896. The production of diamonds is estimated at 8,489 carats, of a local value of £3,000.

The European mining population has slightly increased during the last twelve months in the Division, but a falling off in the immediate vicinity of Tingha. The Chinese mining population is about the same as last year. The principal mines at present employing the most labour are the Elsmore Valley Tin-mining Co. and the Inverell Diamond and Tin Fields Co. (Limited). Both these Companies have upwards of fifty men employed. The general opinion is a large return may be expected from the diamond and tin mines situated at Boggy Camp, about 15 miles west of Tingha, during the present year, as there is apparently a fair amount of capital forthcoming to thoroughly test these mines.

The European mining population is estimated at 325. Over 100 of these are working on the tin and diamond mines. The Chinese are estimated at 100, making a grand total of 425 miners in all.

There is also an increase in the value of mining machinery in this Division, which in all amounts to the value of £4,880 10s.

Generally speaking, the mining industry in this Division may be said to be improving.

Glen Innes Division.

There has been about 66 tons of tin obtained during the year at Hogan's Creek, Big Flat, and Mount Mitchell, the price averaging about £28 per ton. Prospecting work is still being carried on vigorously.

Emmaville Division.

The quantity of tin won on the Emmaville field during the past year was 600 tons, valued at £20,000, only a slight falling off as compared with the output for 1896. Tin-mining is still carried on all over this Division by small parties of men and by men singly, but it is questionable if they average wages at the work. Numbers of Chinamen are leaving the field, which goes to show that the payable ground is worked out. The Glen Smelting Company at Tent Hill still continues to employ a large number of men. The Rose Valley Deep Lead Company won about 100 tons of stream tin for the year, valued at £36 5s. per ton, twenty men being employed. The depth of the deposit here is 132 feet, the wash averaging about 2 feet thick and 25 feet wide. The Ottery Mine is still working with good results. Several parties are still working at Vegetable Creek with varying success. There are 400 Europeans and 170 Chinese mining for tin within this Division.

NEW ENGLAND MINING DISTRICT.

Deepwater Division.

The quantity of tin won in this Division during the past twelve months was 250 tons, valued at about £8,000, taken principally from alluvial ground. The number of men employed is 125 Europeans and 30 Chinese.

Wilson's Downfall Division.

There has been a great falling off in the tin-mining industry in this Division compared with 1896, the tin ore won being 80 tons, valued at £2,592, which is a decrease of 70 tons as compared with the previous year. The decrease is due to the dry season, the low price of tin, and no new finds having been discovered for the year. The mining done has been of a fossicking character in abandoned workings, and many of the Chinese have left here for Texas, Queensland, tobacco-growing, owing to the low price of tin, which only averages £30 per ton on the field. From the failure of the tobacco crop at Texas many of the Chinese are returning to their old employment.

HUNTER AND MACLEAY MINING DISTRICT.

Kempsey Division.

About sixty men are engaged mining for tin in this Division, but so far none of the mines have turned out payable, although some of the parties have great hopes.

The Jubilee Tin-mining Company at Gundle has done more work than any of the others, but it may be said that it is in its infancy yet. This Company has sunk eight shafts to a depth of 30 feet, and have raised 700 tons of ore, which is valued at £700. The Company have imported machinery to the value of £1,900. This will include a 15-head battery with three Woodbury vanners.

Another tin-mine in the vicinity of Gundle is known as No. 4. At present they are only prospecting, although a great deal of work has been done. The Company has 600 tons of ore at grass, waiting to be treated. There are a few others in this locality, but nothing of any value has been struck.

The presence of a battery on the field, it is thought, will cause some of the mines to be developed.

Bendemeer

Bendemeer Division.

About nine men are still working the alluvial tin ground at Giant's Den, the output for the year being 11 tons 11 cwt., valued at £106 16s. 9d. Although prospecting work has been carried on during the year, no fresh payable tin-bearing deposits have been discovered.

COBAR MINING DISTRICT.

Gilgunnia Division.

At Euramby, which is situated 55 miles S.E. from Gilgunnia, Hogan and Party have recently had about 10 tons of ore from their Tin Mine treated at the Government Works, Clyde. The return was 4.83 per cent. of tin, besides showing the presence of other minerals, a result which is considered very satisfactory, when the immense bodies of stone that are exposed are taken into consideration.

TABLE showing the quantity and value of Tin exported from the Colony of New South Wales, since the opening of the Tin-fields in 1872.

Year.	Ingots.			Ore.			Total.			
	Quantity.		Value.	Quantity.		Value.	Quantity.		Value.

Includes tin refined both from New South Wales and imported ores.

COPPER.

PEEL AND URALLA MINING DISTRICT.

Barraba Division.

The Cornish Copper Mines at Gulf Creek were actively worked during the most of the first half of the year, but during most of latter half-year, suspension of labour conditions has been the order of the day.

Improved smelting arrangements have been made during the year, and tested with good results. About twenty-five men are employed in copper-mining in this locality.

Bingara Division.

Prospecting for copper lodes is very active in the vicinity of Upper Bingara, a few of the parties being in receipt of Government assistance. There has been no output so far.

Hillgrove Division.

During the year a valuable find of copper was made at Hall's Peak on the Chandler River, and eight leases have been applied for.

At the lease known as the Sunnyside Copper Mine, they have opened out the lode for a considerable distance. They have also driven a tunnel which shows the main lode from which assays made at the Mines Department went as high as 45 per cent. copper, 17 oz. silver, and 11 dwt. of gold per ton. This property is at present under offer to a company, and in the event of a sale taking place active operations will be carried on at once. Miller and Party have been actively engaged in opening out their lease, and by costeaning they came across a large body of mineral carrying rich veins of copper ore. They intend to cut a tunnel right across their ground.

TAMBAROORA AND TURON MINING DISTRICT.

Obely Division.

The Goodrich Gold and Copper Mining Company have started operations at Goodrich. The width of the lode is said to be close on 130 feet. A shaft is now being sunk on the lode to a depth of 150 feet, and the company at present employ fifteen men. There is every prospect of this mine developing into a permanent one.

Rylstone Division.

Prospecting operations for copper are being proceeded with in the neighbourhood of Rylstone, and it is said that very fair indications have been obtained.

SOUTHERN MINING DISTRICT.

Rye Park Division.

At Rye Park, about 20 miles from Yass, there are two parties of miners at work, one on a lead and silver lode, and the other on a copper lode. These men raise the ore and send it to the Dapto works for treatment, and it is said they are making more than good wages. These works at Dapto are a great boon for the working miner, if he would only take advantage of them. There are hundreds of small lodes of both copper and silver (or lead and silver) that would pay small parties of miners to take in hand, the same as they are doing at Rye Park. These lodes may be too small to tempt a company

Company to take them up, but they would pay good wages if worked by small parties of practical men. In former time it was useless to start such an enterprise without a large capital for smelting works, &c., and now all the men have to do is to raise the ore and despatch it to Dapto.

The Mayfield Copper Mine is still being worked by a party of four men. During the year the output was valued at £1,605. The main shaft is down 108 feet, and the lode averages 3 ft. 6 in.

Cooma Division.

About 1 mile from Bushy Hill a copper lode is being opened up which promises to become a valuable property. A bulk sample taken from a depth of 20 feet yielded 18 oz. silver, 8½ per cent. copper, and 1½ per cent. lead. Its position is ¼ miles from Cooma, on private property.

Kiandra Division.

The copper lodes at Lobb's Hole are again being opened up, and it is said a very fair ore is being exposed. Arrangements are being made to have a parcel sent to Sydney for treatment.

TUMUT AND ADELONG MINING DISTRICT.

Captain's Flat Division.

The Lake George Mines, Limited, is the most important copper mine in the Southern Mining District, and in addition to producing a large quantity of gold, silver, and lead, accounted for 336 tons of refined copper, or 131 tons more than the quantity produced the previous year. Several other mines are in course of being opened up in this Division, and it is expected that the output of copper from this District during the current year will be largely increased.

COBAR MINING DISTRICT.

Cobar Division.

The premier copper-producing mine in New South Wales is undoubtedly the famous mine at Cobar, owned by the Great Cobar Mining Syndicate, which produced during the past twelve months 2,461½ tons of refined copper, valued at £108,306, not including the value of the gold saved in connection with the copper-smelting operations. This company have a very complete plant at the mine, and refining works at Lithgow, erected on the most approved principles.

Mount Hope Division.

The Mount Hope Copper Mining Company's mine is being worked on tribute. The quantity of ore raised was 734 tons, which yielded copper valued at £5,340. The main shaft is now down 346 feet, and 40 men and boys are employed in and about the mine. The Great Central Copper Mine, situated at South Mount Hope, is also being worked by tributors, who have been engaged during the best part of the year in putting the mine in thorough repair, and in the erection of concentrating plant, consequently the output was limited, being only 1,200 tons of ore, valued at about £4,500. The number of men employed is 50.

Nyngan Division.

The Girilambone Copper Mining Company (no liability) employ about 200 men, and have a very complete plant, valued at £20,000. The copper-bearing formation is 500 feet wide, bearing 24° west of north, on which the Company has sunk a main shaft to 320 feet, and the mine is being further developed rapidly. During the past twelve months 17,154 tons of ore were raised, the copper contents of which was 733 tons. Refining has been commenced by the Company, and so far 173 tons of almost pure copper is the result.

MUDGE MINING DISTRICT.

Wellington District.

Numerous inquiries have latterly been made in this locality for areas likely to prove payable for copper mining, and several leases have been applied for. At the Bolara Copper Mine no work has been done during the year.

LACHLAN MINING DISTRICT.

Condobolin Division.

Some very promising copper lodes are now being opened up in the vicinity of Condobolin, several of the mines receiving aid from the Prospecting Vote. One of these parties, testing the old Condobolin Copper Mine, struck ore at the 44-foot level, yielding 19 per cent. of copper and 4 dwt. of gold per ton.

BATHURST MINING DISTRICT.

Bathurst Division.

A Bathurst syndicate has acquired 40 acres in the parish of Melrose, and have a party of men employed extending a drive in search of a copper lode. It is said the indications are very promising.

Rockley Division.

The old Summer Hill Copper-mine, near Rockley, is again being tried, and will probably be worked at a profit. During the year ore to the value of £500 was sent away.

Burrage Division.

The Burrage Copper-mine, owned and worked by Mr. Lewis Lloyd, has been working full time during the past year, employing about 150 men and boys, raising 8,907 tons of ore, estimated value of copper sold, £34,896 from this mine, which looks better for the past few months than it has for years. About 150 men find constant employment. Messrs. M'Kenny and Hall have a 40-acre lease, which they are working for copper, about 1 mile south of Burrage Mine. They are down with the prospecting shaft about 40 feet, and have a very fair show of copper.

Messrs. Stain, Cassalls, and party have a show for copper on their 40-acre lease, about 1½ miles south-east of the Burrage Mine; there is some very rich ore near the surface. The lode is small, which it is hoped will improve when depth is attained.

It is considered that there is a great future for this locality in copper-mining, but very little capital has been spent so far in prospecting the district for that metal.

Blayney Division.

Several parties have been prospecting for copper in the division, but without any successful result.

The old Annandale Copper-mine has been taken up by a syndicate, who are now unwatering the mine with the view of again working the old lodes. They are raising ore from the shaft known as Marks' with the view of having a trial smelting. So far they seem satisfied with the result of the ore raised. It is anticipated that within a very short time they will have 100 men employed in and about this mine.

ALBERT MINING DISTRICT.

Broken Hill Division.

During the year the Broken Hill Proprietary Company saved 1,161 tons of copper contained in matte, and 24 tons in roasted sulphide of silver, the total value of which was £56,880. A good deal of attention is being given to copper lodes outside of Broken Hill proper, but as the work done during the past twelve months has been principally development, the returns so far are very small.

TABLE showing the quantity and value of Copper exported from New South Wales, from 1858 to 1897.

Year.	Ingots.		Ore and Regulus.		Total.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.

Includes copper refined from New South Wales and imported ores.

IRON.

The establishment of works for the manufacture of iron from the ores of the Colony received a check through the death of Mr. Joseph Mitchell, who had the formation of a company in hand. Mr. Mitchell visited Europe and received promises of support from several capitalists, and it was shortly after his return to this Colony that his death took place. The negotiations are still being carried on by his executors. It is said that a syndicate of Sydney gentlemen has been formed for the purpose of testing the iron-ore deposits at Curlewis Gap, and it is proposed to erect a small furnace and make a practical test. Large quantities of ironstone are being sent from Marulan, Orange, Newbridge, and Blayney to the Illawarra Works to be used as flux, the gold contents of the ore helping to pay the extra cost of railway carriage. A report by Mr. Geological Surveyor Jacquet on the iron-ore deposits at Seaham, will be found attached. Mr. Jacquet also took samples from an important bed of ironstone near Clarence Town which was, locally, supposed to contain, like the deposits at Ironstone Mountain, considerable quantities of titanitic acid, a most objectionable ingredient from a smelting point of view. These samples on being analysed in the Survey Laboratory yielded no titanitic acid in appreciable quantities. Nothing has yet been done to discover the width of the bed or beds, and subsequent investigation may show that valuable deposits of magnetic iron ore occur in the Raymond Terrace and Clarence Town Districts.

The Eskbank Iron Works still continue to produce a large quantity of finished iron. Mr. Sandford, the owner, states that during the year he turned out 3,239 tons, valued at £21,862. About 190 men and boys are employed in and about these works.

ANTIMONY.

The total quantity of antimony exported during the year was 169½ tons, valued at £3,612, as compared with 132¼ tons, valued at £1,834, exported during 1896. Antimony mining at Hillgrove, the principal mining centre for antimony in the Colony, is practically dead. The Hillgrove Antimony Mining and Smelting Company have not done any work during the year, and are not likely to resume operations while the price remains so low. The low price, combined with a limited demand, has practically stopped prospecting operations for antimony ores.

BISMUTH.

BISMUTH.

The value of the bismuth exported during the year was £800, and was got principally on the Pambula Gold-field. This is another metal for which there is little demand; consequently little attention is paid to it by the miners.

PLATINUM.

Platinum-mining in New South Wales was confined during the year solely to the Fifield Gold-field, where the metal is found associated with the gold in washdirt, the total yield for the year being 1,966 oz., as compared with 2,900 oz. in 1896. The want of water has been the great drawback to efficient mining on this field, and prevents the claims being worked more than half time.

CHROMIUM.

The chrome-mining industry cannot be said to be in a flourishing condition, the exports for the year being 472 tons less than the quantity exported during 1896. The Gundagai District still continues to be the principal source of supply in New South Wales. Chrome ore is found in many districts in the Colony, but till its market value increases it is questionable if any active steps will be taken to open up the deposits. Among the appendices will be found "Notes on Chromic Iron Ore," by Mr. Geological-Surveyor Carne, wherein full and complete information is given on this subject.

MANGANESE, NICKEL, AND COBALT.

There was no actual mining for manganese or nickel going on in the Colony during the year. Prospecting work is, however, being carried on by Messrs. Telfetsen and Wyburn for cobalt behind the town of Port Macquarie. A good deal of preliminary work has been done, and the Department is assisting them to put a tunnel into the hill. A full description of the deposit is given by Mr. Geological-Surveyor Jaquet in his report which will be found in the appendices attached.

TUNGSTEN.

There is practically no mining going on at the present time in New South Wales for tungsten. Mr. C. S. McGlew is carrying on prospecting operations about 12 miles from Glen Innes, on Hogan's Creek, but he has not yet been successful in striking ore sufficiently rich for export purposes. A pamphlet on the "Occurrence of Tungsten Ores in New South Wales," by Mr. Geological-Surveyor Carne, F.G.S., has just been issued by the Department, copies of which may be obtained at the Government Printing Office.

DIAMONDS.

A large area has been taken up on the Boggy Camp Diamond and Tin Field by capitalists, with a view of working the ground on an extensive scale, and the necessary machinery is being erected, and the indications give promise of considerable developments in the near future. During the year the output of gems from this field was 8,489 carats, valued at £3,000. At Bingara work at the diamond-mines has been practically suspended, owing to the want of water and capital, but with better times and proper machinery there should be a great future in store for this branch of the mining industry at Bingara.

OPAL.

The White Cliffs Opal Field in the Wilcannia Division continues to make steady progress, and the value of the gem-stone won during the year is estimated at £75,000, as compared with £25,000, the value of the output for 1896. The population may be put down at 1,000 persons, 600 of whom are miners. The great drawback both to residence and mining is the scarcity of water.

About 40 miles N.E. of White Cliffs lies the Purnanga Opal Field, but here again the great scarcity of water and feed has retarded development. Some very fine parcels of opal have been unearthed on this field, bringing as high as £7 per ounce. The surroundings of this field are similar in every respect to the White Cliffs, and when a favourable season permits of full work being carried on some splendid returns may be anticipated. On the whole, the condition and prospects of the opal-mining industry in the Wilcannia Division may be considered as highly satisfactory.

Mr. Warden Brown, in his report, states:—

THE WHITE CLIFFS OPAL FIELD

Has made steady progress during the last year. The town itself has increased fully fourfold during the year, owing chiefly to men bringing their families out to settle down, and men working on the field making substantial houses for themselves, in preference to camping on their blocks in tents. A great drawback to the field is scarcity of water, and for some time past water has been carted from the Government tank, a distance of 2 miles, at a cost of 3s. and 3s. 6d. per 100 gallons. This is a very great inconvenience, and a heavy drag on families who are making a bare living. The want of water is not only a great drawback to domesticated families, but also to the mining population. During the past two years the average rainfall has been very little, if anything, over 7 inches, which, in a hot, dry climate, such as this, is a great calamity. The work on the field has been vigorously carried on during the year, and, generally speaking, has been very extensive all over the field. Unfortunately, there are many who have worked hard for the past two years with the result of earning bare rations, while there are others who have struck payable opal the first day of commencing work, and have been on it ever since. The work done on some of the (*i.e.* the 100 feet) blocks, has been very good indeed, and reflects great credit upon the holders. The leases also have been well worked, notably the Company's blocks. The open cut system adopted by the Company's manager (Mr. E. F. Murphy, J.P.) has been carried on extensively, and will be sure to develop the blocks more than any work that has been done on the field since its existence. I regret the Company's application for amalgamation of blocks was refused, as I believe the amalgamation would have done more towards developing the block under the open cut system than any work hitherto attempted on the field. The expense of working these amalgamated blocks has been very great, but, I believe, has paid, and I think will pay in the future. I have no doubt of the permanency of the field, and though it may never assume very large proportions, it will, at any rate, always hold its own, and will always be entitled to

be

be considered among the first opal fields of Australia. The erection of a telegraph line to White Cliffs is a step in the right direction, and will be of great advantage to opal buyers and sellers, business people and the public generally. If the Government could see their way to supply better facilities for water conservation it would be a great benefit to the field, and I would recommend the consideration of it. At present there is not more than three months' supply on the field. It is a most difficult thing to arrive at a correct estimate, the opal buyers being very reticent as to the amount purchased and expended by them. I have taken a good deal of time, and gone to a good deal of trouble over the matter, and I am quite sure I am well within the mark, and don't overrate it in the slightest degree, when I say that the output of opal from White Cliffs for the year 1897 in value amounted to at least £75,000.

The only other place in the district where opal is being found is Purnanga, where opal was discovered in 1896. There was then from ten to fifteen men on this place, but owing to no water the field was virtually deserted, only one party, Michael Flanagan and mate, remaining on the field without intermission. They have had to cart water 5 miles, which has entailed at least 30 miles every time water is carted. Thus to the water to get the horse, 5 miles; back to the camp with the cart, 5 miles; back to the water with cart, 5 miles; back to the camp with water, 5 miles; back to the water with horse, 5 miles; and back to the camp, 5 miles; making a journey in all of 30 miles. Purnanga is the nucleus of a permanent opal field, if a water supply is available, and I would recommend the Department to do something in that direction. I think if the Department allowed £100 towards it, the men on the place, now numbering six, would give a certain portion of their time gratis towards making a dam or tank. If there was water there, I have no doubt the place would soon be prospected with good results. The opal found there has been of fairly good quality, selling up to £7 per ounce, and the output for the year has been about £250.

Prospecting work is being carried on near Coonabarabran, where very fair indication of the presence of marketable opal has been found.

EMERALDS.

The emerald mine near Emmaville has been taken up again and sinking is being proceeded with, it being the intention of the present owners to test the deposit at a depth. There were no gems produced during the year.

MARBLE.

It might truly be said that the marble deposits of New South Wales are not receiving the attention they deserve, as no serious effort has been yet made to supply the local demand. A large number of surface specimens have been polished in the Bathurst Gaol, revealing the existence of many beautiful varieties of marble not hitherto known. These are on view in the Mining and other museums in Sydney.

LIMESTONE.

The quantity of limestone produced by the Tarrawingie Flux Co., at Tarrawingie, near Broken Hill, amounted to 67,590 tons, valued at £41,798, which was all used by the silver-smelting companies at Broken Hill. The works at Cackle Creek are obtaining limestone from the Myall Lake District, and when the works are in full swing employment will be found for a large number of men. The extensive works at Cullen Bullen are now supplying large quantities of lime and cement to the building trade and others.

PLUMBAGO.

Mr. D. S. Smith, at Undercliff, in the Wilson's Downfall Division of the New England Mining District, sent away from his claim there, in 1896, 27 tons of plumbago to Newcastle (N.S.W.) and to England, for which he received 20s. per ton. This will hardly pay, and the owner has allowed the lease to lapse. The other leases taken up for this mineral in the locality have consequently been abandoned.

A sample of 1 ton was also sent to the Chicago Exhibition, which was ultimately sent on to the large works at Massachusetts for trial. Mr. L. S. Brown, of the Springfield Facing Company, Massachusetts, U.S.A., says:—"We are positive that it would make a very good facing, and could be used to advantage wherever German lead is used in the manufacture of foundry facings. It is true that it would probably be impossible to ship it to this country at the price we pay you, as we can buy a powdered German lead at 1½ cent. in New York, or an Italian lead which closely resembles it at about 16 dollars per ton. On any work in the foundry where the facing is used wet—such as dry sand or cores—it would be a very good article indeed, and in any market you could reach think it would pay to have same used."

ALUNITE.

Work is still proceeding at the alunite mine at Bulladelah, and the quantity of stone exported during the year was 724 tons, as compared with 1,372 tons during 1896. This is the only locality in New South Wales where this mineral is being mined for. The stone is sent to the Company's works at Runcorn, in England, for treatment.

SUMMARY showing the Mineral Products of the Colony to the end of 1897.

During the year there has been a decided inclination on the part of the public to invest in gold-mining properties, and much attention has been given to low-grade ores. This, undoubtedly, is a movement in the right direction, as it has in other countries been amply proved that low-grade properties, when carrying large quantities of ore, can be made to pay and give much more constant and satisfactory results to investors than the fitful and sometimes phenomenally rich patches which are occasionally met with in other classes of mining.

In concluding this report, I venture to express my belief that there are signs that a considerable expansion will shortly take place in the mining industry in this Colony. The introduction of capital, and the employment of modern methods and machinery are doing much to render possible the advantageous working of properties and mining fields which, under old methods, were unprofitable, but under the new, give every promise of returning dividends to those who embark in the enterprise. A large amount of confidence is being felt in the extent and stability of our gold and mineral fields, and it is gratifying to report that they are attracting the attention of genuine capitalists and promoters of mining enterprise. There are many localities where the advent of capital would enable mines to be worked on an extensive scale, thus not only ensuring the development of our latent resources, but also affording avenues of employment to large numbers of our industrial population.

I have the honor to be,

Sir,

Your obedient servant,

A large, elegant handwritten signature in cursive script, reading "W. C. Lachlan". The signature is written in black ink and features a long, sweeping underline that extends across the width of the signature.

Under Secretary for Mines and Agriculture.

Department of Mines and Agriculture,
4th March, 1898.

CHIEF INSPECTOR OF MINES AND SUPERINTENDENT OF DIAMOND DRILLS' REPORT.

In submitting my annual report for the year 1897, I have the honor to inform you that the following is a list of accidents reported to me by Wardens, Coroners, Inspectors of Mines, and Mining Registrars, as having occurred in the Metalliferous Mines in New South Wales during the year 1897.

Table A.—Showing fatal, serious, and minor accidents, which may be cited as true mining accidents, being exclusive of the accidents which occurred on the surface.

Table B.—Showing fatal, serious, and minor accidents, which occurred on the surface; therefore not true mining accidents.

Table C.—Number of persons who suffered through lead-poisoning in connection with the Broken Hill Mines, as is given in accordance with the provisions of the Lead Poisoning Act in monthly returns from the managers of the Broken Hill Mines during the year; also a comparison since 1895.

Table D.—Number of persons employed in the Metalliferous Mines of New South Wales; percentage of persons killed or injured; also value of machinery up to 31st December, 1897.

Out of a total of 29 persons killed, 12 lost their lives in silver-mining, 6 in auriferous quartz-mining, 5 in auriferous alluvial mining, 2 in copper-mining, 1 in tin-mining, 3 in limestone or flux mining in connection with Broken Hill Smelting Works.

The fatal accidents during the year, with verdicts of Coroners' Juries or Magisterial Inquiries, are as follows:—

Fatal Accidents both above and under surface (exclusive of Broken Hill) during the year, with Verdicts of Coroners' Juries or Magisterial Inquiries.

Date.	Name.	Name of Mine.	Locality.	Remarks and Verdict.
14 Jan ..	A. E. Goodwin ...	Eleanora Mine..	Hillgrove	Killed by fall of skid-board down shaft. Verdict: Killed by skid-board; and rider added that skid-boards should be better secured and stronger.
23 Feb...	Alfred Hayden ...	Gotlee's Flat ...	Tingha	Killed by fall of earth. Verdict: Accidental death.
9 Mar..	Wm. Henderson..	Caloola G. M. ...	Caloola	Labourer, cutting out foundation for Huntingdon Mill when ground fell on him. Accidental.
5 May..	T. R. Prinable ...	Lawson's Plains.	Rockley	Fall of earth. Verdict: Accidental death.
16 June.	Alex. Watt	Royal Standard Mine.	Stewart's Brook	Crushed in water-wheel while effecting repairs. Verdict: Accidental death; no blame attachable to anyone.
24 ,,	Aug. Stahlhut ...	Jury Gully	Uralla	Crushed by fall of earth. Verdict: Accidental death.
13 Aug..	Thos. Barry	Cobar Gold Mines	Cobar	Barring down stone after a blast in an open cut, when the lever he was using struck him on the head. Verdict: Accidental death; no blame.
14 ,, ...	Andrew Johnston	Prince of Wales Mine.	Gundagai	Manager of mine; fell down shaft owing to rope breaking. Verdict: Accidental; no blame attachable to anyone.
28 ,, ...	E. B. Cates	Alluvial Mine ...	Warrambucca...	Crushed by fall of earth.
28 ,, ...	G. P. L. Guthie..	The Lagoon.....	Near Bathurst..	} Explosion of boiler. Verdict: Accidental.
28 ,, ...	Wm. Rawson.....	„	„	
21 Oct...	Ed. Hughes	Mitchell's Creek	Daviesville	Struck by timber while riding in truck, contrary to the rules. Verdict: Accidental death; no one to blame.
27 ,, ..	Robt. Morley.....	Patron Mine ...	Wyalong	Whip-rope became detached from horse and Morley fell down the shaft. Verdict: Accidental; no one to blame.
10 Nov..	Archibald Frew...	Baker's Creek Mine.	Hillgrove	Fall of stone from face of stope. Verdict: Accidental death; no blame attachable to anyone.
11 ,, ...	A. E. Wedger ...	Alluvial Mine ...	Dog Trap	Fell off ladder; fractured skull; a fossicker; no inquest.
27 ,, ...	John Lonsdale ...	Star of Peace ...	Hawkins' Hill...	Fall of stone down pass. Verdict: Accidental; no one to blame.

13 Oct..	John Murray	Central	Attending machinery—crushed fingers.
29 „...	Wm. Walley	Block 10	Caught between buffers—bruised foot.
11 Nov..	Ed. Oatey	Proprietary	Opening hot water tap—scalded arm.

During the year I have made visits of inspection on official duties:—

West—To the Carcoar, Orange (twice), Forest Reefs, Nymagee, Overflow, Cobar, Newbridge, Parkes, Alextown, Peak Hill, Stuart Town, Macquarie River, Forbes, Condobolin, Blayney.

South—Murrumburrah (twice), Berthong, Young, Temora, Wyalong, Yalgogrin, Cootamundra, Wagga Wagga, Grong Grong, Cooma, Cowra Creek.

North—Uralla and Newcastle districts.

Nothing of any great importance has occurred during the year in connection with the metalliferous mines of the Colony as to any extensive new discoveries or other matters in connection with same, with the exception that a Royal Commission was appointed to inquire into and to suggest remedies in the alleged extraordinary frequency of accidents occurring in the Broken Hill mines. His Honor Judge Murray was appointed sole Commissioner, and, after searching inquiry, found that the accidents were not of a greater extent compared with former years, and that every possible precaution was taken by managers and the inspector of mines to as much as possible prevent accidents. His Honor Judge Murray has also recommended a number of valuable suggestions both in the altering of regulations and otherwise for the purpose of minimising the occurrence of accidents in the Broken Hill mines.

I have again to acknowledge with pleasure the great assistance given me in the multifarious duties of my office by the inspectors of mines and the clerks of my branch. They have taken a keen interest in everything appertaining to the duties in connection with said branch, and are always willing and ready to do the bidding of their superior officers in the interest of the whole department.

The inspection of mines as well as the clerical work of my branch has been on a steady increase for years past, and is still steadily increasing, as will be seen by the following:—

Papers registered, Chief Inspector of Mines and Diamond Drill Branch, for the year 1897, were no less than 4,090, as against 3,724 for 1896. Letters written, 2,410, which includes 731 for fossickers, in 1897, as against 1,898 in 1896.

The above is exclusive of telegrams and circulars.

In addition to the above, 1,284 papers on various subjects were received from the Records and 1,497 sent on to the Records, which were dealt with by me on various matters in connection with the department, and of which a skeleton register has to be kept to prevent miscarriage.

982 persons were recommended by me during the year to the Government Labour Bureau for railway passes to enable them to go fossicking for gold. This system has enabled many persons to earn a respectable livelihood on our gold-fields, and has, to some extent, eased the labour market of the metropolis. A fair percentage of those assisted have been able to return their railway fares, and have been able to make a home for themselves on our gold-fields, which, without the assistance given by Government, they would not have been able to accomplish. If more of our working population would settle on the gold-fields instead of in the larger towns, take advantage of the liberal laws by which any miner's right holder can take up a residence area (in addition to a claim) sufficiently large to grow all vegetables required, besides numerous other privileges which cannot be obtained on such easy terms in any town, it would be more beneficial, not only to the working men, but for the Colony at large.

The diamond-drill work for the year has been confined to Forest Reefs, Orange district; Junction Point, Mandurama district; Grassy Gully, Nowra district, and the Island of Funafuti.

At the Forest Reefs the depth bored during the year was 835 ft. 3 in., of which nearly 800 ft. was through hard basalt. At the Lyndhurst Gold-fields Company's property (Junction Point), 544 ft. 9 in. was bored through hard vertical slates, hard diorite and granite.

At Grassy Gully, 300 ft. were bored horizontally through a hill of hard felsite formation. At Funafuti boring operations were greatly retarded owing to the difficult strata the bore had to pass through. Of the 698 ft. reached by the drill; the strata consisted of honeycombed corals with sand mixed throughout. Professor David, when questioned on the subject of boring through the coral beds at Funafuti says, "It was by far the most difficult piece of work that our Government diamond drill branch has ever attempted. It was due principally to the constantly varying nature of the strata. For a few feet the drill would be in cavernous coral rock, the boring of which caused a violent jarring of the machinery, leading to frequent breakages and much splintering of diamonds; then it would suddenly pass into a bed of quicksand or coral rubble; and again without a moment's warning into a bed of rather dense limestone. On account of the numerous beds of loose quicksand and rubble, it was necessary to line the bore throughout with the best artesian iron tubing. It was impossible to drive the tubing down without first resorting to a process of under-reaming, which occupied fully twice as much time as the actual boring. After this had been done the artesian tubing had to be driven down with a heavy wooden "Monkey." I could dwell further on the difficulties the expedition had to contend against, but the above is sufficient to show that the depth of 698 ft. was reached under great difficulties.

Re the Funafuti expeditions, I drew special attention in my Annual Report of 1896 to the fact that as the expedition of that year had been a partial failure, it would be prudent not to drop such scientific enterprise, but to follow up the subject determinately, and bring it to a successful issue. This, I am pleased to state, has been done, and a second expedition, which started on the 2nd June last, has returned with very valuable scientific information. As stated above, 698 feet were bored through the coral beds. To the Royal Geographical Society of Australasia is due the outfit of the second expedition, although other kindred societies and private individuals assisted the enterprise. The leadership was given to T. W. E. David, Esq., B.A., &c., Professor of Geology, Sydney University, and was accompanied by his wife, who took a great interest in the work and ably assisted to bring the expedition to a successful issue. The Government of New South Wales lend the diamond drill machinery, which, with the six men who worked it, was selected by me. By knowledge gained from the first expedition, several items of new machinery were added to cope with the difficulties, the whole diamond drill plant weighing about 30 tons; and sufficient rods, &c., were taken to bore 1,200 feet.

There is no doubt whatever that notwithstanding the partial failure of last year's operations, the knowledge gained by the first expedition, under the leadership of Professor Sollas, F.R.S., LL.D., then of the Dublin University but now Professor of Geology, Oxford, has been such as to form a great guide for the second expedition, and I certainly think that although the greatest credit is due to Professor Anderson Stuart, who first, five years ago, mooted and urged the matter on the Government of New South Wales in connection with the loan of a diamond drill, and to Professor David, B.A., F.G.S., who so ably and successfully led the second expedition, none of those in Australia interested in the Funafuti boring operations have the slightest desire to lessen the great credit certainly due to the Royal Society, London, and to Professor Sollas, of the first expedition. Personally I have left no stone unturned, or an opportunity pass of furthering the objects of the expedition, by laying the case properly and in all its aspects before the Government, and by the selection of suitable machinery and men, or in any other way my services could be utilised, and generally to make the expedition a thorough success.

The first expedition under Professor Sollas ought not to be looked upon as a failure, but, rather, as a partial success, and the second expedition under Professor David, was a great success and improvement on the first, considering all the circumstances; nevertheless, the work was not thoroughly completed, inasmuch as the whole thickness of the coral beds have not been bored through, and the bed-rock has not been reached. Great satisfaction, however, remains in connection with the fact that the British, and not a foreign nation, has unravelled the principal portion of the interesting questions in connection with the creation and formation of the coral atolls. The inhabitants of New South Wales as a rule are in sentiment as British as the Britishers, hence the first expedition had as hearty wellwishers from this part of the globe as if it had been of an entirely Australian origin. As it is, this Colony has been honoured, and has been extensively advertised, not only by the Royal Society, London, and kindred societies, but by the whole scientific world, for the action of the Government of New South Wales, in the cause of science, by assisting the expedition with not only a diamond drill, but also other useful and valuable privileges.

I would very strongly recommend that still further assistance may be rendered, and another expedition started to complete the boring operations at the Island of Funafuti, through the whole depth of the coral bed, whatever depth that may be, and into the bed-rock.

Until this is accomplished, the object for which the former expeditions were formed has not obtained the fullest realisation, and the sooner this is accomplished the better, especially as the principal tubing has been left in the borehole, and it would cost less than any of the former expeditions, as only three (instead, as formerly, six) men would be required.

Herewith I also attach my reports (eight in number) of various districts, including reports on dredging the New South Wales rivers for gold, with illustrations of river dredge. Also, sections of diamond drill bores and the Inspectors' of Mines reports as appendices to my annual report.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines and Superintendent of Diamond Drills.

The Under Secretary for Mines and Agriculture.

TABLE A.

Showing Fatal, Serious, and Minor Accidents during 1897, which may be regarded as True Mining Accidents.

No	Date	Name of Mine	Locality	Person Killed	Person seriously Injured	Minor Accidents	Occupation	Nature and Cause of Injury or Death

Report on the Junction Point Reefs, known as the Lyndhurst Gold-fields Company (Limited).

Sir,

I have the honor to inform you that on my recent visit to the Mandurama district, on the 15th instant, I inspected the Junction Point Reefs, with the view of selecting sites for diamond drill boring purposes, to ascertain whether or not other undiscovered ore deposits occur at a lower depth.

Professor David, when Geological Surveyor of the Mines Department, and others versed in mining and geology, have already fully reported on the auriferous ore deposits of the Junction Point Reefs, now known as the Lyndhurst Gold-fields Company (Limited). Hence it is superfluous for me to again report on same, especially at the present juncture, when actual mining operations are being conducted on a small scale.

The ore obtained is at present being treated by that able and well-known metallurgist, Mr. Janitzki, under the Cyanide process, in addition to which he is carrying on various experiments to arrive at the best method of treatment for the class of ore occurring in these reefs.

Mr. Frederick Stahl, the Company's mining manager, is also very sanguine in his belief that he will in the near future be able to make the Junction Point Reefs mining operations a decided success.

The Company was formed with a capital of £400,000, and at present they are carrying on preliminary or prospecting operations only. Their greatest work consists of a dam across the Belubula River, and this is without doubt the greatest engineering work of the kind in connection with mining operations in any part of New South Wales, and is well worthy of inspection and deserving of public notice, as the following interesting particulars given me by the designer and supervising engineer, Oscar Schultz, C.E., will show:—"This dam has been built across the Belubula River, about half a mile above the old battery of the Junction Mine, now belonging to the Lyndhurst Company. Several waterfalls occur between the battery and dam, aggregating 150 feet in height. The dam is built in a narrow gorge, through which the river falls another 25 feet, and above which the valley widens out, the river flowing almost level through same for a considerable distance. The intention of the Company is the construction of a reservoir which will store up enough water to supply continuous working power to the battery during the driest seasons, which could be accomplished by building a dam 45 feet in height above the level of the old water-race. The particular site was chosen on account of the apparent good rock formation visible right across the gorge, and the foundation was laid into and across this bed-rock of solid diorite. Several perpendicular rock elevations running parallel with the water were made use of as foundations for buttresses, built to strengthen

strengthen the main wall, which thereby could be reduced in thickness. The foundations of the main wall and buttresses are carried up in concrete masonry to 12 feet above the water-race, or 10 feet above the outlet pipe, the front wall at this level being about 180 feet long and 14 feet wide, increasing in thickness downwards. The buttresses are six in number, 28 feet apart from centre to centre, each 40 feet long, 12 feet wide on top where they abut the inner wall, and narrowing to 6 feet wide at the outer end, thickening downwards, but carried up to the same level as the concrete formation of the main wall. The height of the foundation varies in accordance with the rugged nature of the bottom (bed-rock) from 1 to 30 feet. On the top of these foundations the buttresses are built up on brick masonry tapering from 8 to 4 feet thick, these are united by brick arches of elliptical shape, which decrease in thickness upwards from 4 to 2 feet, and are built at an inclination of 1 in 2, the spandrils between these arches are faced up flush, with concrete, thus on the water side forming a uniform face 36 feet high, with a batter of 1 in 2. On both sides of the central portion of the dam the ground rises and the wall is continued about 100 feet up and into the hill sides to firm rock faces, and concrete masonry with the same batter continued on the water side, but vertical at the back, the width on top being 2 feet. The whole length of the dam measures thus 340 feet, and shows a straight uniformly battered cemented face on the water side while the back is ribbed and shows five chambers under the overhanging arches between the huge buttresses. A bye-wash is constructed in the extension of the dam on the east side 65 feet wide, divided into five sluice openings with a wing wall built on the rock to lead the water clear of the dam. Allowance is also made for occasional extreme flood waters to run over the dam between the buttresses. The race which was left open during construction being arched over will serve permanently as an emergency outlet for which purpose a projection was built out from the main wall with a 5 feet well in it through which the reservoir can be emptied into the gorge. This well is usually closed by a wooden lid 12 inches in thickness, which can be raised by means of a hydraulic ram of 50 tons power, worked by a pump placed at the back of the wall. The service outlet is carried through the main wall by 24-inch cast-iron pipes the entrance of which being formed by a tapering and rising brick culvert, the vertical opening of which together with that of the emergency outlet and of two 6-inch flushing pipes are enclosed by a wooden grating built in the shape of a steep roof and surrounded by a sediment pit. The dam contains in its construction about 6,000 yards of concrete and 500,000 bricks, together with which 5,000 casks of Henmoor cement were used.

The water in the river will be backed up for a length of $1\frac{1}{4}$ mile and about 500,000,000 of gallons of water will be impounded, which with the fall of 225 feet made available by a conduit of 18-inch welded steel pipes will supply 200 h.p. for a term of three months, even if the river should stop running, which seldom, if ever, happens.

The total cost of the dam was about £9,000; it was built by day-labour under the personal supervision of the designer, the eminent and well known civil engineer, Mr. Oscar Schultz.

At the time of my inspection there were about forty men at work, and Mr. Schultz considered that the dam would be completed within a week.

When this is accomplished then the Lyndhurst Gold-fields Company (Limited) are likely to erect extensive crushing and gold-saving appliances, probably including chlorination works.

The present machinery is being driven by a 6 feet Pelton wheel, from which 200 h.p. can be obtained, but the machinery has been erected in a rather unsuitable site, being much cramped for space and it is difficult and costly to make additions. A splendid site is obtainable in the Company's property lower down the river, but within a few hundred yards of present machinery.

The Junction Point Reefs or Lyndhurst Goldfields Company (Limited) site is situated about 7 miles from Mandurama Railway Station.

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

Report on Gold-mining in the Yalgogrin District.

Sir,

Yalgogrin, 5 April, 1897.

I do myself the honor to inform you that I have completed my inquiries and inspection on various official matters in connection with the Yalgogrin district.

Owing principally to the almost unprecedented dry seasons, mining matters at Yalgogrin are somewhat retarded. Water for domestic purposes, and almost unfit for human consumption, has to be carted from a tank some 3 miles from the seat of population. Rain is very badly wanted, and to-day there are promising indications of a good downpour.

Another great drawback for the advancement of Yalgogrin is insufficient crushing and concentrating power. When this is supplied then the Yalgogrin district will be able to profitably support a mining population of at least several hundred persons.

The principal payable mines now at work are situated in what was formerly known as Robert Payne's selection, which was resumed for mining purposes in 1894.

The claim known as Mount Allen, George Mott and Party, is 100 feet in depth. Thickness of vein, from 5 to 12 inches. No crushing so far. Formation, granite.

The Autocrat, Foster, McMahan, and Party, 120 feet in depth. Still prospecting.

The Democrat, Thomson and Party, 126 feet in depth. Thickness of vein, 6 inches. The quartz looks promising; no crushing so far. Formation, granite.

The Picanini, Morris and Party. Present depth, 100 feet. Average thickness of vein, from 8 to 12 inches. Formation, granite. This party crushed 75 tons, yielding 150 oz. gold, and they had just completed the second crushing of 21 tons, yielding 103½ oz. of smelted gold, the concentrates of which assayed 6 oz. per ton. The quartz now being raised from the lowest level ought to yield fully 5 oz. of gold per ton.

The Hero Mine, north of the Picanini Claim, is prospecting, but so far unsuccessful.

The Black Ooon, on the same line of reef as the Picanini, under the able management of Mr. W. S. Bowman, has crushed during the last eight months:—

168 tons, yielding 3 oz. 7 dwt. per ton.

20 tons, yielding 2 oz. per ton.

The vertical depth is about 100 feet, but the reef lies very flat, with an E.N.E strike and southerly underlay. Formation, granite.

The

The Adelaide Mine, now known as the Mossgiel Syndicate, under the able management of Mr. Hector Huntley; depth 180 feet; 5 tons crushed from the 150 feet, yielded 7 oz. 3 dwt. per ton. The vein averages nearly 1 foot in thickness. Formation, granite.

There are several other parties prospecting in Payne's late selection, such as the True Blue, the Boomerang, the Defiance, and others, some of which have promising indications.

Jno. Meldrum C.P.—The principal mine at work is that of Cornelius Skelly and Party, who crushed at different times three parcels of quartz, 16 tons, yielding 3 oz. 17½ dwt. per ton; and 10 tons yielding 4 oz. 10 dwt. per ton. Mr. Skelly has, however, had possession of the land since August, 1893, when I first marked off the land for him, under application for permit under the 1889 Act. Others are prospecting under authority, but so far nothing payable has been discovered.

On Waldrum Conditional Lease only one mine is at work, that known as the Eureka, Waldrum and Party (now Waldrum and Foster). This claim was first marked out by me in August, 1893, before the discovery of the Wyalong Gold-field. It was first held under permit by Mr. W. Waldrum and another. The latter, however, left the field, and Mr. W. Waldrum, the owner of the conditional lease has had with him different parties to work the mine.

The following crushings have been taken out of the Eureka Mine since March, 1895:—

March 16, 1895	35 tons, yielded 80 oz.
June 8, 1895	11 " " 38 "
December, 14, 1895	40 " " 100 "
May 21, 1896	7 " " 28 "
January 23, 1897	20 " " 79 "
Total	113 tons, yielded 325 oz.

The quartz now at grass and on transit to Wyalong promises to give a greater yield than hitherto obtained. There are also other mines, such as the Southern Cross and Butler and Party's, within 4 miles of Yalgogrin. I am returning to Wyalong.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

Report on Fitzgerald Valley.

Sir,

13 May, 1897.

In accordance with your instructions I visited and inspected Fitzgerald Valley and its neighbourhood, in the Newbridge district, on the 7th instant, and do myself the honor to inform you that said valley is very extensive, receiving the drainage from well-known auriferous country such as Mount Willis, Sugarloaf, and other quartz veins, as well as from gullies which have yielded payable auriferous deposits.

There is no doubt in my mind that if the Fitzgerald Valley was Crown lands instead of freehold lands, so that prospectors could roam over same and sink wherever they pleased, perhaps a few hundred persons would find payable employment.

The geological formation is granite. The soil consists of rich agricultural land mostly under cultivation, and whatever gold may be found will no doubt be in patches, which in itself, and the large flow of underground water, will always be a great drawback in prospecting said valley. I would especially draw attention to the brow of Church Hill and the upper part of the valley as places worthy of a thorough prospecting. The last gold discovery, which for a time caused some excitement, was made in the bottom of the creek and in the lower portion of the valley, and was abandoned through the heavy flow of water. Had the upper part of the valley been thoroughly prospected the results might have been more favourable.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

Report on the recently discovered auriferous quartz-reefing district on the Moabala Run, near Condobolin.

Sir,

Condobolin, 20 July, 1897.

I do myself the honor to inform you that I have inspected the recently discovered auriferous quartz-reefing district, situated on the Moabala Run (Mr. Scott's), but which discoveries are partly on Samuel Seberry's conditional lease, and partly on Crown lands, about 14 miles north-westerly of Condobolin.

Owing to the late severe drought, and in consequence of the great scarcity of water and feed for horses, there are only about some seven or eight different parties at work at the reefs, or prospecting in the neighbourhood. But the principal discovery so far is that of Winter and Party, which is situated on Samuel Seberry's conditional lease. This party has exposed to view a well defined quartz vein averaging fully 2 feet in thickness, about 10 feet from surface, and the length opened is about 10 feet. Gold can be seen in the quartz, with the naked eye, across the thickness of the reef; but it appeared to me that the richest part is about 8 inches in thickness, nearest to the hanging wall. A prospect knocked out in my presence, and washed, yielded about ¼ dwt. of free gold, and several gold specimens. Present indications are such that, with economical and systematic workings, the reef ought to be made to yield good payable returns. The reef occurs between slate and sandstone, and as further developments takes place it will no doubt be found in lenticular blocks faulting into the footwall.

Westerly of Winter and Party's discovery, and on Crown lands, Auld and Party are at work. This Party has discovered several small quartz-veins, containing fair prospects of gold, but so far not of as great an importance as Winter and Party's. A proper system of prospecting, both by trenching across and along the veins, would very probably bring forth better results than the present system adopted by the party.

About

About $\frac{1}{2}$ mile north-westerly from Winter and Party's, Phifer and Party have about 30 tons of quartz at grass, estimated by them to yield about an oz. of gold per ton. Here the quartz-vein is very broken, of very erratic occurrence, in short shoots, and which are costly to follow. There are a few other claims at work, but so far without any promising results.

The auriferous area in the locality referred to is of considerable extent, and well worth the attention of the energetic, persevering gold-pro prospector, both for alluvial and quartz. The great drawback for thoroughly prospecting this locality is the scarcity of water even for domestic purposes, and the want of any kind of food for horses. The nearest place any provisions are obtainable is Condobolin. But a good wet season would alter these impediments to thorough prospecting very considerably.

The quartz reefs, such as Lady Julia, Reuben Sheppard and Party, Byron and Party, and others, are apparently idle, or doing very little work, notwithstanding which some of these mines contain fairly large bodies of low-class ores, some of which are somewhat refractory. Nevertheless, if a proper system of developing these deposits were adopted, under the guidance of practical and scientific knowledge, they would very probably yield payable returns for capital judiciously invested, although they may prove worthless in the hands of individual miners, or even by the aid of the ordinary quartz-crushing plant. It will only be a matter of time before a number of persons will be profitably employed on the above-mentioned reefs.

Copper deposits also occur on the stock route, within a short distance of the above-mentioned reefs, which is at present held by Mr. B. Roberts, of Condobolin. A shaft has been sunk about 28 feet in depth, the lode averaging from 6 to 12 inches in thickness, some of which is of high quality ore. Still, so far the lode is not sufficiently large to be payable, unless gold should be discovered, of which there appears to be very good indications.

Taking the district as a whole, the prospects of the mining industry are certainly brightening, and the town of Condobolin may yet rank as the centre of an industrious, well-to-do mining population.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

Report on the Mines at Uralla.

Sir,

Uralla, 25 August, 1897.

I do myself the honor to report that, during the limited time at my command, I inspected several mines in the Uralla District.

Mining, especially sluicing, has been greatly retarded of late owing to the severe drought. The principal mines at present at work are the Brown's Paddock Gold-mines (Limited), which is an hydraulic sluicing and dredging company; the Sydney Flat Gold-mining Company, which is a company working for alluvial under the basaltic formation; the John Brown, Kentucky Creek, Uralla, hydraulic sluicing, Cottie and Party, Little Grace Mine, which are quartz mines, and a few others. The John Brown is a sluicing claim worked by water from Kentucky Creek, which is about 2 miles distant from the mine; the water being raised to the head race by means of a large pump. The prospect of this mine is promising, and the yield is likely to give payable returns, as soon as an ample supply of water is obtained, by which constant sluicing can be carried on.

The Brown's Paddock Gold Mines Company (Limited), has lately put into operation a novel and cheap system of mining in alluvial.

The Uralla Creek which is the site of the operations, has for years past been the depository of the tailings from old Sydney Flat diggings which have filled the creek and adjoining flats several feet above their original level, and all of which carries more or less gold; in addition to which there is, below the sediment, an alluvial deposit resting on the bed rock from 10 to 20 feet in thickness containing gold. But to mine this profitably, the whole of this material on to the bed rock has to be removed and washed, and the debris raised to such a level to provide the necessary fall for sluice boxes, and carry it clear of the workings. In addition to which provision has to be made to ensure the safety of the plant in the event of a sudden flooding of the workings, and also to expeditiously shift the whole plant from point to point as the ground is being worked out, or circumstances demand such to be done. Hence to provide for such contingencies a system of dredging and hydraulic sluicing combined has been adopted. The whole plant is set on a pontoon of sufficient capacity to float easily. This barge or pontoon is of strong pine timber thoroughly secured, the seams and joints are caulked to make them water-tight. The plant consists of a vertical Tandem Compound Steam Engine of 75 h.p. (actual); steam being provided by a locomotive type of boiler working at a pressure of 100 lb. per square inch. The pump for raising the wash stuff and water is of the centrifugal type, 4 feet 6 inch diameter, lined inside with hard cast-iron renewable-liners, the runner is 3 feet 6 inch diameter, and S shaped and made in halves, bolted together to admit a lining of hard cast-iron or steel to take the wear.

The motion and delivery pipes are of steel 9 inches diameter, the suction pipe has a ball and socket with swivel joint, so that it can be raised on a level with the barge when floating.

Special arrangements have been made in the bearings of the pump to provide against excessive wear due to the pressure of sand and stones in the water, the bearings are fitted in a pocket which is kept filled with clean water at a pressure greater than the centrifugal pump is working to, and this water leaking through into the pump keeps back the sand which otherwise would grind out the bearings. Steam ejectors are fitted on the suction pipe for priming it in starting. The plant has a capacity to raise 60 cubic yards of ground or gravel and 150,000 gallons of water per hour. The pump raises all the wash dirt into sluice-boxes which stand on trestles at a convenient place close to the barge. These sluice-boxes are 4 feet wide and 120 feet in length, fitted for the whole length with coarse fibre matting and ripple plates acting as under currents.

The

— 10" CENTRIFUGAL DREDGING PLANT —
 referred to in the
CHIEF INSPECTOR OF MINES REPORT 1897.
 on the Uralla Mines.

SIDE ELEVATION

FRONT ELEVATION

BACK ELEVATION

The barge or pontoon also carries an electric light installation for the working of the machinery and mine during night-time. The plan herewith shows the arrangements and disposition of the machinery on the pontoon very clearly, whereas the two accompanying photographs show the plant in actual work, as well as the nature of the excavation and the mode of cleaning up the gold on the bed rock.

The above described system of gold-mining has been in use in Victoria for some time, and is said to be a great success. Reliable estimates of the work done show that the cost of mining has been as low as threepence (3d) per cubic yard dealt with, including all charges of management.

The above named company have so far spent about £4,000 in the erection of a large reservoir (known as Salisbury Lagoon), piping in connection with said reservoir and connecting the mine, and cost of machinery and its erection.

My thanks are due for the principal part of the above information to Mr. L. B. Mitchell, the general manager of the company, under whose able and energetic supervision the whole of these extensive mining operations have been carried on and brought to a successful issue.

The plant was constructed and erected by the Austral Otis Engineering Company (Limited).

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

Report on the new Gold Discoveries at Middle Flat, situated about 5 miles from Cooma.

Sir,

Cooma, 25 September, 1897.

I have the honor to inform you that, in company with Mr. Warden J. F. McKensy, P.M., of Cooma, I visited the new gold discoveries at Middle Flat, about 5 miles from Cooma, situated on the freehold of Messrs. Godwin, parish of Bunyan, and notwithstanding a heavy rainfall, a large number of interested persons had assembled to meet us. The discovery was made by Britton and Party in a diorite formation. A trial crushing taken out by them from near the surface averaged 1 oz. 8 dwt. of gold per ton. The quartz vein occurs in lenticular blocks, and although the strike of Britton's vein is N.E., indications are not wanting that discoveries will be made of quartz veins in the abovementioned diorite formation, whose strike will be towards nearly all points of the compass. In fact, it may be termed a network of quartz veins.

I again visited the locality on the 24th instant, after my return from Cowra Creek, but am unable to add anything to my first impressions. Whatever auriferous quartz veins will be discovered in the diorite formation, which stretches from Britton's Reef to within 1 mile of the town of Cooma, will occur in lenticular-shaped blocks, and very probably not one of these blocks will reach a continuous length or depth of, say, 100 feet; hence parties working on these veins must closely observe any faulting that has taken place. From my observation, faults are more likely to occur in the footwall. I would strongly advise prospectors in the abovenamed locality to do their work by trenching, and not sink until a shoot of gold has first been discovered. There may be many auriferous shoots in the quartz veins between Britton's claim and Cooma. Those on the slate formation, such as Stewart and Party, if they discovered payable gold, would be completely distinct from anything discovered in the diorite by Britton's Party.

Edward Perkins and Party are working near Bushy Hill, on the temporary common, in the porphyry formation, within $1\frac{1}{4}$ mile from Cooma, in a narrow quartz vein in which good gold can be seen with the naked eye. Although the vein is narrow, and the country rock very hard, it is, nevertheless, a promising prospecting venture, and if payable gold should be discovered, it is likely to be of a more permanent nature than the quartz veins near Middle Flat.

A syndicate, known as the Dartmoor, is also prospecting about $4\frac{1}{2}$ miles east of Cooma, in a locality known as the Green Hills. So far, the lode, consisting of silver and copper with a small percentage of gold, has been taken out from a width of two to six (2 to 6) feet and to a depth of 20 feet from the surface. The manager informed me that 12 tons of ore he forwarded to the Wallaroo Reduction Works yielded 9 per cent. of copper and 36 oz. of silver per ton; and 6 tons treated at Dapto yielded 14 per cent. of copper and 59 oz. of silver, also gold to the amount of slightly under 4 dwt. per ton. This lode is well worth thorough systematic prospecting.

Cowra Creek, about 25 miles from Cooma, was also visited by me. There are still five different quartz-crushing plants on this field, three of which were crushing. The number of miners has, however, been greatly reduced during the year, notwithstanding that payable gold is still being obtained by a few parties of miners, and further prospecting about the district may probably bring forth favourable results.

Taking the field as a whole, it is more likely to pay parties of miners than large companies.

I have, &c.,

W. H. J. SLEE.

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

Report on dredging for gold in some of the rivers of New South Wales.

Sir,

Sydney, 23 November, 1897.

I do myself the honor to draw public attention to a system of dredging for gold in the rivers of New South Wales. The question is frequently asked by our mining community whether dredging for gold in some of our rivers would yield payable returns for the capital required. So far very little advancement has been made to solve, by actual results, such a very important question.

In New Zealand, river dredging has, of late years, made great strides, and has become a very important industry, owing to the great improvement recently made in dredging and gold-saving machinery.

The first dredge in New Zealand was landed in the early sixties by Ben Knight and Party, which was of a very primitive design, known as the Spoon dredge, being only 45 feet in length, 16 feet beam, and had only one pontoon on which was a derrick and winch.

Some of the present dredges are over 100 feet in length, and worked by steam power, they show as much difference compared with Ben Knight's dredge as our mail steamers did of that date with those of the present time. One of the last and largest dredges built belongs to the Molyneux Hydraulic Dredge Company. Some of the very best steam dredges, with all necessary gold-saving appliances, as well as force-pumps, hydrants, &c., cost about £3,000; but there have been one or two instances where large dredges have been constructed at a higher cost; for instance, the dredge known as the "Dunedin" cost £6,000.

For some time past the Roxborough correspondent of the *Otago Witness* newspaper has given very valuable and interesting detailed information on the construction and working of the several dredges in said district. Time will not permit me to go into full details; suffice it to say that the gold-dredging industry in New Zealand, not only profitably employs a large number of persons on fair wages, but, with the exception of very few instances, the capital invested yields profitable returns.

This

This being so, the question naturally arises—are there no rivers in the Colony of New South Wales which traverse through extensive tracts of auriferous country worthy of a test for gold dredging purposes? There can be but one answer to such a question, which is that there are very favourable indications that some of our rivers will yield highly payable returns for any capital which may be invested for gold-dredging purposes. The tub, cradle, long tom, and even ground sluicers are fast disappearing on our rivers, notwithstanding thousands or even hundreds of thousand ounces of gold were won with these primitive appliances by the energetic and persevering gold-miner. But not only the individual miners, but also companies have always failed to follow the auriferous strata from the banks into the river owing to the flow of water. In some instances shafts have been sunk and drives constructed under the river, only to be swamped before the auriferous strata in the river-bed could be reached; hence dredging the river appears to be the only feasible method by which the gold known to exist there can be won.

Each dredge would cost about £3,000, and about ten persons are employed on one.

I have inquired into this important matter very considerably and have given the question of dredging on some of our rivers for gold-producing purposes very careful consideration, and feel confident that in the near future successful dredging for gold will be an accomplished fact, not only in the Macquarie and Shoalhaven Rivers, but also in other rivers in the north, south, and west.

There are large numbers of instances where a good deal of time and money has been spent to turn creeks and rivers from their natural course, but unsuccessfully, owing to the occurrence of floods, and it is in such parts where dredges could be introduced and successfully worked.

Objection may be raised by some persons unacquainted with river dredging, of the removal of bars in the shape of outcrop of rocks which occur in some parts across river-beds, and form the natural embankment of deep and extensive water-holes, and which water-holes are certainly very valuable especially during times of dry seasons. These objections may be answered by the fact that dredges are not capable of removing solid substances or solid rock such as would form the embankments of natural water-holes in our river-beds, and even if such bars could be removed by river dredges, provision could be made in leases, or even registration of claims, compelling intending dredgers not in any way to interfere with such bars.

Property holders along banks of rivers would naturally object, and in many instances with good valid reason, against intending dredgers of river-beds as that mode of producing gold would be quite a new feature. But I think that such objection may be easily overcome by mutual forbearance and consent of the owner by agreement of parties concerned as, in most instances, only the bed of the river would be required and the land-owners' consent to access for persons and machinery to and fro.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

Further report on Dredging for Gold in the Rivers of New South Wales (Appendix to his Report of 23rd November, 1897.)

Department of Mines and Agriculture, Chief Inspector of Mines Branch,

Sydney, 24th November, 1897.

Sir,

In submitting to you further detailed information in connection with dredging for gold in some of the rivers and creeks of New South Wales, I do myself the honor to add to my report of the 23rd instant, as an appendix, the following information on some of the dredges in use on the rivers and creeks of New Zealand, and other matters in connection with said dredging.

It must be borne in mind that dredging for gold in the rivers and creeks of New South Wales, will have more difficulties to contend against than the dredging on the more extensive rivers of New Zealand. As a rule, the rivers in New Zealand form a continuous water-shed for several miles in length, and in several instances of great breadth, whereas, the rivers in New South Wales (with the exception of the Clarence and Upper Murray, where successful dredging may also be carried on) are during the principal part of the year, and especially during dry seasons, nothing but mere chains of water-holes. Hence the erection, and moving of pontoon and dredges, is more difficult than the same work would be in New Zealand. Again, in New Zealand it has been proven by actual results, that dredging for gold is yielding payable returns, and therefore the industry is established on a sound foundation. Whereas, the pioneer prospectors who undertake to start the gold-dredging industry in New South Wales, will have for some time to come grope, as it were, in the dark; erect their dredges, and spend some thousands of pounds sterling, before they can actually start their prospecting dredging operations. This being so, the pioneer prospector of river or creek dredging in New South Wales, deserves (short of any Government subsidy) every possible justifiable encouragement.

A larger area (lease or claim) should also be allowed of the rivers or creek beds to the prospector, or others who follow in their wake, than the area which can be lawfully held in New Zealand, for reasons as above stated: namely, the contention of greater difficulties. If once the dredging industry has been fairly started and worked on a satisfactory basis, not only a large number will find profitable employment, but the rivers and creeks will rather be improved, than injured; and residents and property-owners on the banks of said rivers and creeks, will be greatly benefited.

Not only are some of the rivers in New Zealand yielding payable returns, but dredges are actually at work with payable results in some of the river tributaries, and creeks. What has been done in New Zealand can be done on some of the rivers and creeks of New South Wales; even if not on such an extensive scale as in New Zealand. But when it is considered that from 2 to 3 grains weight of gold per ton give profitable returns, then there can be but little, if any doubt, that a great deal of successful river-dredging will, in the near future, be carried on in this Colony.

To give the public a thorough knowledge of the plants used in New Zealand for gold-dredging purposes, I submit a drawing for publication with my Annual Report of one of the typical dredges at present in use namely, the "Mannorburn Dredge," which was lately built by Cutten Bros., Consulting Engineers, of Dunedin for Park Bros., and placed on the Manuherikia River, and is one of the best designed dredges in New Zealand, both for dredging and gold-saving purposes. There are, however, dredges in New Zealand nearly if not fully double the size of that mentioned above.

I herewith give Messrs. Cutten Bros', Consulting Engineers, own version as to river dredging in New Zealand:—

Dredging for gold in Otago has recently developed into a very important branch of the mining industry, and is with good and modern appliances extraordinarily profitable. There are at present forty-six bucket-dredges at work in Otago, and five more being built nearly completed, and the probability of twelve more during the next twelve months. The greater number of these dredges are working on the Clutha River and most of them are doing well, some have actually paid off their total cost of construction in a few months.

MANORBURN DREDGE.
The blocks for these illustrations were kindly lent by the proprietors of the Australian Mining Standard.

The "Manorburn Dredge," plan of which is published herewith, was designed by Messrs. Cutten Bros., and now working on the Manuherikia River, a tributary of the Clutha, at Alexandra. This dredge is doing very well, and is averaging about 25 ounces of gold per week, while the washing expenses are covered by 9 ounces per week. The work is for 144 hours, as the dredge runs night and day, except Sunday.

This dredge is 75 feet long by 24 feet wide, and 5 feet deep. It is built of Kauri throughout, with the exception of a few bluegum frames. The

The engine is a compound condensing one of 12 horse power nominal, capable of working up to about 48 horse power but only 30 horse power is required. The boiler is a 16 horse-power nominal, and is of the half Cornish multitubular type.

The buckets have each a capacity of 3 cubic feet and deliver at the rate of twelve buckets per minute, which would make 80 yards per hour but as it is impossible to keep the buckets always running full, the average will be brought down to about 60 cubic yards per hour, or 7,800 yards per week, of 130 hours being considered fair average dredging time for a week.

The buckets are made of steel and have hard steel connection-links, pin and cutting lip, and they are made of a peculiar shape to retain the dirt freely. The ladder in which the buckets work is made of steel, it is 45 feet long, and is capable of dredging to a depth of 25 feet below the water level.

The dredge is moved about while working and the ladder lifted or lowered by means of a special steam winch which has seven separate drums or barrels, with flexible steel wire rope attached; any single drum can be worked separately, or all seven simultaneously.

The gear is all made very accurately and strong, to meet the shocks, and strains, which come upon it, when the buckets come in contact with any very hard substance such as large stone, or rocky bottom.

The wash dirt after being raised is delivered into a large moving perforated steel cylinder, or screw, about 15 feet long, by 42 inches in diameter.

Through this cylinder, along the top, there is a perforated pipe, 8 inches in diameter, supplied with water from an 8 inch centrifugal pump. The water washes all the fine dust and gold through the perforations in the revolving cylinder on to a sieve of tables below, about 12 feet long and 12 feet wide, covered with cocoanut matting which catches the gold.

If there is any shotty or nuggetty gold it is advisable to put more iron ripples on the upper end of the matting where the gold falls. The coarser dirt or stone pass out of the lower end of the screen or cylinder down a short shoot into an elevator and are carried up dry and stacked to any height that may be found necessary. This elevator is not necessary in all cases. The above-named dredge cost, in thorough working order upon the claim, about £3,200. Another dredge of similar dimensions, but without an elevator, cost £2,900.

There are other dredges which cost £4,000, £5,000, and £6,000. The latter is the largest dredge built in New Zealand. It is to dredge 38 feet deep and elevate its tailings 40 feet above the water level behind it. It is to work a high beach on the banks of the Clutha River. The cost of a dredge to the site of dredging operations depends to a certain extent upon the locality, as the carriage of machinery and timber are very heavy items.

The working expenses of a dredge also depends upon the locality; for instance, fuel may be a very heavy item when it has to be carted a great distance. Again, if the claim is very rough the wear and tear to the buckets and machinery is considerable. In Otago some of the dredges pay their working expenses on an average of one grain of gold to the cubic yard of dirt lifted. The Jutland Flat dredge, for instance, working on the Waipiri River flat during the year obtained an average of 1.23 grains of gold to the yard of dirt lifted; and yet, on this small yield of gold dividends amounting to £1,230 were paid for the year. Again, in another year with the same dredge the average of gold obtained was 1.35 grains per cubic yard, and that year £1,100 odd was paid in dividends, in addition to £750 towards cost of litigation. In the case of this dredge coal is rather an expensive item and the dredge is not a modern one.

On the Clutha River, between Alexander and Clyde, there are at present ten large dredges working and without exception they are all doing well. The ground there is from 12 feet to 30 feet deep, which usually consists of from 4 to 6 feet of original washdirt covered with loose gravel, the latter of which contains little or no gold.

Higher up the river there is a dredge which was recently dredging to a depth of 42 feet below the water, lifting about 29 feet of gravel and only about 12 inches of auriferous wash. This wash was so rich that the dredge obtained in one week 177 ozs. of gold and over £2,000 worth of gold in thirteen weeks.

There is not the slightest difficulty in saving the gold as the dredges are now made with the most complete and efficient appliances, more so than any other class of alluvial mining machinery; consequently there is little or no gold lost.

Some dredges are paying handsomely, working in parts which have already been worked by hand.

The following may be taken as a fair average of the dredge workings in Otago, where fuel can be obtained at a reasonable price:—

				Wages.		
				£	s.	d.
Dredge-master and engineer combined	5	0	0
Three (3) firemen, £2 10s. each	7	10	0
Three winchmen, one at £3, two at £2 10s. each	8	0	0
Fuel, wear and tear of machinery, and other incidental expenses	20	0	0			

10½ ozs. of gold, at £3 17s. 6d. per oz. would cover all working expenditure.

I may here mention for public information that the Etrick dredge is a similar type and has done, and is doing, successful work. The length of this dredge is 90 ft., beam 20 ft., depth 4 ft., width of well 4 ft., length of ladder 60 ft., number of buckets 38, capacity of buckets 2½ cubic ft., speed per minute 12 buckets. It is estimated that 1,000 cubic feet of washdirt are lifted per hour, and reckoning that the cubic yard weighs about 1½ tons, the quantity lifted per hour is about 55 tons. The buckets are connected with single links, some are using double links.

The gold saving appliances are very good; the main run is 40 feet long and projects for some distance beyond the stern. The return boxes comprise the *save all* or *catch all*, 15 feet long. Plush is used in the top box of the main run, also in the "save all" or "catch all" and is taken up after every shift.

Cocoanut matting is used in major part of the boxes. Water for sluicing is supplied by a 9-inch centrifugal pump driven by belting. The average depth dredged from the water level is 30 feet.

The Dunedin dredge is one of the largest, if not the very largest, dredge in New Zealand; it cost £6,000. The dredge is 80 ft. long and consists of two pontoons, one 7 feet the other 14 feet in beam and 7 feet depth. In the body of the larger pontoon are placed the boiler and engine, and along the pontoon, to protect them, are placed two strong pieces of timber. The well is 5 ft. 6 in. broad. The ladder is 60 feet long, and there are thirty-two buckets, the capacity of each being 3 cubic feet. The gantry is of angle iron, which is also used for stays in the pontoon. The dredge is worked by steam power, and is

working at a depth of 32 feet, the washdirt as it comes up in the buckets falls into a hopper, thence into a revolving screen about 10 feet long. The stones and coarse shingle fall from the screen down a semi-circular iron shoot back into the river, the fine material from the screens falls on the tables, which are about 10 ft. in width, covered with cocoa-nut matting, having a small mesh-wire screen on top. Water for sluicing purposes is supplied by centrifugal pump, worked by sets of belting off the main shaft. Most of the water passes over the tables, and a perforated pipe runs through the screen. There is also an overflow channel, which washes away the material after passing over the tables which are placed at right angles to the screen.

Having gone fully into detail matters in connection with river and creek dredging in New Zealand, I trust that they will be found to be instructive and interesting to the mining community, and so become a guide to the successful river and creek dredging for gold in New South Wales.

So far only Messrs. Garland & Low, and a Mr. Parks, of New Zealand, have taken the initiative steps towards river dredging by taking up applied-for leases on the Macquarie River, a few miles from Stuart Town.

Inspector Milne's Annual Report.

Sydney, 20 January, 1898.

Sir,

I have the honor to submit my annual report for the year 1897.

The whole of my time has been spent in the Western District, where the following places have been inspected, some of them as often as four times:—

Bathurst, Blayney, Byng, Brown's Creek, Burruga, Black Springs, Burnt Yards, Binni Creek, Bobadah, Byrock, Burrendong, Burra Burra, Booramugga, Bunnamagoo, Capertee, Clear Creek, Cheshire Creek, Crudine, Caloola, Carcoar, Canowindra, Cowra, Cargo, Cobar, Euramby, Eurenderry, Flyer's Creek, Forest Reefs, Galley Swamp, Gilgunnia, Girilambone, Hill End, Hobby's Yards, Ilford, Junction Point, Lewis Ponds, Lucknow, Mudgee, Mullion Creek, Mitchell's Creek, Molong, Mandurama, Mount Allen, Mount McDonald, Mount Hope, Mount Drysdale, Mount Boppy, Mumbil, Macquarie River, Newbridge, Nymagee, Nangeribone, Oberon, O'Connell, Perth, Palmer's Oakey, Rock Forest, Rockley, Restdown, Sofala, Sunny Corner, Stuart Town, Tuena, Trunkey, Vermont Hill, Walli, Warne, Woodstock, Wellington, and Wattle Flat.

The total number of mines inspected is 482, of which some were inspected under application for aid out of the Prospecting Vote, in the execution of which I travelled 7,589 miles.

Cobar is the most active field, and the Great Cobar Copper Mine the most prosperous, although the average yield per ton is not so high as the previous year.

The increased tonnage of ore raised and smelted makes amends for the slight decrease in the returns.

Two blast-furnaces have been kept continuously at work on the mine reducing the ore, and a third is just completed, and will further increase the returns in the future.

Underground there is an abundance of ore showing, and the mine never looked so well for a permanent supply as at the present time.

The principal drawback being the want of a good main shaft for hauling purposes, which would greatly augment the output of ore, as those now in use are too small, and tend to hamper the general working of the mine both underground and on the surface.

The system of mining adopted is to back-stope and fill in with mullock, which, owing to the immense bodies of ore broken out, has to be sent from the surface. In stoping, so as to save time and economise, the stope is beaten out, and the ore allowed to remain for the men to stand on until a fair stope is beaten out (slightly arched for strength). It is then trucked out. When this is done the open space is timbered up with pig-styes or bulkheads and filled in, leaving one, or where the lode is very wide, two levels formed in the timber.

The mode of timbering is to lay long stringers on the bottom of the stope (for convenience of picking up the timber again from below), and on these timbers pig-styes are built, and filled in between, and levels constructed. Owing to the immense bodies of ore there must at times be a large amount of ground standing open.

When breaking the ore the miners can thoroughly examine the back of the stope, and as it is not allowed to stand for any length of time after the ore is trucked out before filling, there is very little chance of it "winding."

As an example of the method of stoping, suppose the level passes through a large body of ore, a main pass is sunk from the level above to connect, and a leading stope the full width of the ore is started, this stope is worked out gradually forward and upwards, the men standing on the broken ore, the full height of a stope usually being about 20 feet, this stope is carried on to the mullock pass or some distance ahead.

The timber is then put in, thus forming the levels, and sufficiently high for a strong foundation for filling, passes are also rearing up through the filling at convenient places; the filling is then run down the pass and spread over the top of the timber, filling up the open spaces and to within a few feet of the back of the stope. All the timber is scarfed out to prevent slipping. In the shallower workings they are working in and around old stopes where the nature of the ore bodies are more rotten.

In the olden times when these bodies of ore were worked they evidently followed only the richer bunches of ore which appear to have been principally in the centre of the formation, leaving large quantities of gossan ore on the sides and the centre filled with mullock, which has now to be run out and the flakes of ore broken down from the sides back to the walls which are hard. In working these stopes it is the practice to work up to the back of the stope for about 10 feet in height, then run the mullock and break down the ore.

This mine is in a very prosperous condition, and to all appearances likely to return handsome profits for sometime to come.

It has been proved beyond doubt that in depth all the large bodies of ore in this district will eventually be aurocupriferous formations, as has been proved by the Cobar Mining Company, which for years gave highly remunerative returns as a gold mine.

Amongst the gold mines at work the usual satisfactory returns have been obtained and a substantial increase in the erection of machinery on the field which can boast of being the first district in the Colony to have 100 stamps at work on one mine.

This plant is erected on the Cobar Mines Company (late Fort Bourke Mine), and consists of two separate plants of fifty head of stamps, parallel to each other under the same roof, which may be termed a twin battery, of American manufacture, the stamps weigh 800 lb. each, and are driven at the rate of 105 drops per minute with a 5 in. drop crushing 300 tons every twenty-four hours. They are driven by two separate horizontal engines, each of 150 h.p., made by Whitlock, with Scott and O'Neill's patent cut-off; steamed by four steel boilers set in furnaces, with two boilers in each furnace and return flues (150 in each boiler) to front of furnace, working at a pressure of 80 lb. per square inch. The ore is fed direct from the tunnel connecting with the open cutting to the battery first over grizzlies, all rock too large to pass through the grizzly is fed by hand through the rock-breaker falling into the hoppers from which it automatically passes through the challenge ore feeders to the mortars.

The machinery is substantially erected and works very smoothly.

There is one serious difficulty, that is the storing of the tailings which are to be cyanided later on.

The results from this mill will be watched with considerable interest, as there is diversity of opinion as to whether amalgamation and later on cyaniding or dry crushing, and direct cyanide treatment, will be the most economical for this district.

The

The success or otherwise of this plant will be a guide for others as to which is the better treatment of the low-grade ores of this district, which must be handled in large quantities on economical lines to give profitable returns.

There is up to the present only one cyanide plant on the field which has treated successfully some thousands of tons of tailings from the Fort Bourke Mine and others.

In the coming year there will be at least three others at work, one being now in course of erection and the other two started early in the year.

Along the whole line of lode are immense bodies of low-grade ore which will sooner or later be mined and treated with satisfactory returns. There is a very bright future for the Cobar District which will be one of the largest, if not the largest, mining district of the Colony.

There is at present at work in the district 195 head of stamps; four Huntingdon mills, each equal to five stamps; the total crushing capacity being about 500 tons per day. There are also three blast furnaces, two of 80 tons and one 40 tons capacity, on the field.

In the mines generally the timbering and securing is well done and every care taken for the protection of the men employed.

In most of the mines the country rock is good standing ground, being diagonal to the lode and banded with ironstone veins.

Boppy Mount.—Considerable energy is being shown in prospecting the Burra Burra Copper-mine.

The main shaft is sunk to the depth of 200 feet and crosscut west in lode formation some 70 feet, carrying bunches of sulphide ore which appears to be the back of a body of sulphide ore, to prove which it is intended to continue sinking the main shaft and crosscut at a deeper level. A small winding plant has recently been added to the mine.

Some 3 miles north-east of Burra Mine are the Florida Reefs, of which so far nothing can be said further than that it is a promising locality for prospecting.

Again south some 13 miles is another very promising locality for prospecting known as the Restdown Reefs, which occur in lenticular blocks in slate country. Some of these have been proved to carry payable gold, notably the Good Friday and Jeffery's Mine; from both of these crushings of 2 oz. and upwards per ton have been obtained.

The reefs are not large, being from 2 or 3 inches to 18 inches in thickness in soft country, easy to prospect, the only drawback being scarcity of water, which has to be carted a distance of about 4 miles.

In the Nymagee district a great improvement has been made on the Nymagee Mine, particularly on the surface, in the erection of blast furnaces to replace the old reverberatory furnaces; also tramway and hauling engine for the economical shifting of ore from the open roasting kilns to the blast furnaces, and an electric lighting plant and a thorough overhaul of all the old machinery has been made.

The results have not been as satisfactory as was expected. This is not in any way reflecting on the mine as an ore producer, but in the difficulty in keeping a stock of coke and firewood on the mine owing to the bad state of the roads in the wet season.

In the mine no new bodies of ore have been discovered, the principal work being the working out of bunches of ore left by the previous owners as too poor for the old reverberatory process.

There are still large bodies of sulphide ore in sight in the mine. This, with the amount of ore now being obtained from the old dumps, will no doubt give profitable returns for some time to come.

Bobadah.—The Overflow Mine, which is still in its infancy, will, when properly opened up, considerably add to the mineral output of this district.

On this mine it was originally proposed to erect blast furnaces for the treatment of the ore; but as there are large bodies of gossan in sight carrying gold, it has been decided to treat these bodies of ore by dry crushing and direct cyaniding, for which a Krupp ball mill and cyanide plant is now in course of erection.

A fair amount of prospecting is now being done in this district with every prospect of good results.

Mount Hope.—A considerable improvement in the output may be looked for from this district, particularly at the Great Central Mine, where a number of hands are now employed, and there is every appearance of this mine being a large producer for some time to come.

It is the intention to work largely on the open cut system, and a concentrating plant is in course of erection for the material raised from the cutting, which is a network of small veins of carbonate and grey ore intermixed with the country rock.

The Mount Hope Copper-mine is worked by a party of tributors in a very creditable manner considering the small margin of profit they have to work on, more especially when we see so many mines in the hands of tributors pig-rooted, gutted out, and mullocked up.

The same system is, however, adopted here as elsewhere. They naturally seek out the richer patches of ore which can be worked with a profit in the reverberatory furnaces, the poorer ore being left in the ends and sides of the stope, and filled up. In the future, when this district is within a reasonable distance of a railway, and more improved appliances for treatment of the ore, a large number of men will be employed with profitable results.

We may also look for some good return from the Girilambone District when the new concentrating plant (May Bros.) now in course of erection is completed.

There has been considerable activity shown during the year in developing the mine, and erecting machinery for the more economical treatment of the ore.

There is the same solid work being done in the Mitchell's Creek Mine as in previous years. This is one of the best opened-up mines in the colony, the only drawback being the hauling shafts, which are too small for the work required.

At Sunny Corner, Burnt Yards, Rockley, Cargo, Canowindra, and Mt. M'Donald, a considerable improvement of a permanent character has taken place, and in some of these places most extensive plants have been erected for the treatment of ore, which will materially add to the returns from these districts in the future.

Taking the Western District generally, there would have been a decided improvement in the mining industry, only for the severe drought that prevailed for a great portion of the year preventing alluvial miners from washing up, and the stoppage altogether of most of the sluicing claims.

On

On all mines where steam boilers are in use I have been particularly careful in seeing that the boilers have been subjected to hydraulic tests at least once in six months, such tests entered in a book kept on the mine, showing the date on which the test was made, the pressure to which the boiler was subjected, also the working pressure, and any faults that may have been noticed while under test. These entries are duly signed by the engineer and a witness, for the information of the visiting inspector.

During the year I have inquired into the cause of four fatal accidents:—

- 1st. At the Caloola Gold-mine, by a fall of earth in an excavation for a machinery site, the bank only being some 3 ft. 6 in. in height.
- 2nd. Two men killed by a boiler explosion on a sluicing claim, Campbell's River, caused by a want of water in the boiler, and the crown coming down and cold water suddenly fed into the boiler.
- 3rd. In the Star of Peace Mine, Hill End, by a stone falling down a pass.
- 4th. By a collapse of timber in an alluvial mine on the Macquarie River, owing to the leading set not being securely dogged.

In each case a verdict of accidental death was returned by the Coroner's jury.

All of these accidents were preventable, but are such as no inspector can prevent unless the men themselves assist by taking ordinary precautions for their own safety.

I have, &c.,

DAVID MILNE,
Inspector of Mines.

The Chief Inspector of Mines, Department of Mines, Sydney.

Inspector Hebbard's Annual Report for 1897.

Sir,

Broken Hill, 12 January, 1898.

I have the honor to present my Annual Report for the year 1897 as follows:—

The prosperity of the mining industry, indicated in my Annual Report for 1896, as resulting from the increased demand for the sulphide ores of the district, has been continued. The demand for the products of concentration has increased, and to meet this demand large additions have been made to the existing concentrating plants.

An entirely new plant, of 5,000 tons weekly capacity, has been erected on the Broken Hill Proprietary Mine; and new plants of large capacity are now in course of construction on the Junction and Junction North Mines.

As a consequence of the increased output of ore, the number of men employed has largely increased, the highest number recorded for the year being 6,473. These figures apply only to Broken Hill and its immediate neighbourhood at 1 August, 1897.

The prosperity of the industry as a whole has, however, received two severe checks—first, by the creep affecting the Junction and Junction North Mines, which occurred on the 16th April, 1897; and second, by the fire which broke out in Block 12 of the Broken Hill Proprietary Mine on the 12th September, 1897.

Regarding the first of these causes, the absolute necessity (if only on economical grounds) of filling up depleted stopes with mullock is now universally recognised.

The arrangements for the carrying out of this work in some of the mines has involved a large expenditure of both time and money, and though in this instance (Junction and Junction North) arrangements were in progress for the systematic filling of the stopes by a series of mullock passes from the surface to the 600 feet level, the work was not sufficiently advanced, and this cause, with perhaps a little too much eagerness to take out the ore, led to the creep.

However, it should, in justice to the management, be pointed out that the hanging wall of this place is of such a nature, and in such a position, that no timber would sustain it.

The immediate effect of the creep was to throw about 360 men out of employment, and almost completely stopped the production of ore.

At this date the mine is again producing ore in fairly large quantity and employing the usual number of men.

The second cause acting as a check on the prosperity was the Block 12 fire.

In the effort to locate its site, three men named William Knee, John Hude, and John William Mulcaster were suffocated in the fumes and smoke generated by the burning timber. Fortunately, within a few hours of its discovery, the efforts of those dealing with the fire were so successful in locating it that its spread was effectually checked—a work of very great danger and difficulty, considering that the perfect labyrinth formed by the workings of these mines was filled with smoke and gas from the fire.

There is no doubt that the self-sacrificing bravery of the men engaged in fighting the fire, and the officers of the Company who led them, by preventing its spread, averted what would have amounted to a national disaster, and preserved the livelihood of thousands of persons. Too much praise cannot be accorded to the officers and men, as they had to work amid great danger of suffocation from gas, and crushing timbers, &c.

In the early stages of the fire nothing at all could be accomplished without accepting extraordinary risk.

Every possible precaution was taken, but, notwithstanding, men were being constantly brought to the surface badly affected with gas and smoke, where they were attended to by the doctors in a temporary hospital hastily fixed up for the purpose.

The

The fire continues to burn, although, apparently, there is no actual flame; and the method adopted to quench the last remains of it is to put in a drive and crosscut over the affected portion, and allow water to percolate through the mullock in the hope of its reaching the smouldering timbers.

The fire had the effect of throwing about 1,000 men out of employment; but having been got under complete control, the bulk of these men have again been absorbed.

The disastrous consequences of fires in mines containing so much timber (as is necessary in any mine timbered on the square set system), has led managers to seriously consider the question of the advisability of continuing the system in its entirety. Numerous attempts have been made to modify it, with a view to minimising the risk of fire occurring, and in the case of partly worked out ground, to presenting to a possible fire sections of mullocked-up stopes containing no timber, and thus effectually preventing its spread. (In Block 12 fire, there seems no doubt that the fire has been gradually eating its way along the timber of the square sets, though entirely surrounded by mullock filling, and it is this fact apparently that up to the present time prevented the complete extinguishing of the fire.)

One of the many plans for the accomplishing of this object is a reversion to a very old plan. This is the drawing of the timbers after the depleted portions have been filled, and the timbers have served the purpose of temporarily securing the back and side of the stopes.

Another plan is to work the ore on a sloping face, using the mullock, which is at regular intervals put in, as a base of operations, and temporarily securing any weak portions with props, &c.

In very hard ground the ore is taken out to a sufficient height to allow of the level timbers and covering being put in, and then the stoping is done from the field in mullock as a base, all passes being reared through the mullock at regular intervals; meantime, pending the building of the level, the back or roof is secured by bulkhead or pig-stye stacks.

This plan also is a reversion to an old system.

In all these cases a permanent level is found with strong timber, especially strengthened with angle or mitre sets within the main timbers.

So far these plans have worked well, especially where the ore was of a very hard nature; and I am of opinion that one or other of these plans, with perhaps some modification to fit certain circumstances, will soon be adopted throughout the mines.

Boilers of all classes, there are now 104 in the district, aggregating 5,400 h.p., and supplying steam to engines totalling 3,600 h.p. These include the following types:—Cornish, Lancashire, Water Tube, Multitubular, Locomotive, and Vertical boilers.

The provisions for testing them under hydraulic pressure, as prescribed by the "Regulations for the Inspection and Regulations of Mines other than Coal and Shale Mines," have been carried into effect, every boiler having been tested within the six months' limit, providing it has been under steam.

In addition to the requirements of the Regulations, at every period of testing, an examination of the boiler is made, and necessary repairs effected. The boiler is then tested under hydraulic pressure at least one-third above the ordinary working pressure, and the safety valve set to blow off at that pressure.

A record of every test, signed by two witnesses, is kept on the mine, together with a note as to the repairs effected if necessary, and the general conditions of the boiler.

A monthly report of these tests is now being furnished by me.

Open Cuts.—The open-cut system is still in operation on the Broken Hill Proprietary Mine, and to a small extent on the Block 14 and Central Mines, but in the two last-named, only for the purpose of supplying mullock for the underground filling.

The quantity of material taken out of these open cuts during the year amounts to about half a million cubic yards.

The open cuts are being extended in depth, but the permanent batter is kept at a safe angle. A very large proportion of the waste material of the cuts is being sent as filling direct underground, as in the Broken Hill Proprietary Mine; and other mines, as Block 10 and Central, have made large contracts with the Proprietary Mine for supplies of mullock from their clumps for the same purpose.

The great bulk of the material is now raised from the cuts by means of inclined tram lines and waggons, these having almost entirely superseded the flying-fox and cranes.

At Tarrawingee the number of hands employed has been greatly reduced, owing to the gradual shutting-down of the local furnaces, and possibly in the near future the demand for flux will cease altogether, resulting in the stoppage of the quarries.

During the year 67,590 tons of flux have been raised, besides a large quantity of waste material.

Accidents.—The accidents for the year reported on by me number 62, including 16 fatal, 25 serious, and 21 minor accidents.

There have also been numerous casualties reported to me, which I have not thought of sufficient importance to call for further report.

The accidents recorded are the results of a great variety of causes; but it is a significant fact that only ten should be the results of falls of ground, showing that in operations of such magnitude great care is exercised in timbering and otherwise securing the grounds.

The bulk of the remainder of the accidents were of such a nature that no human foresight could have prevented them.

Numbers of men and work accomplished.—The highest number of men employed during the year is 6,473; and though this number, from causes before explained, has been reduced quite recently to 5,466, I have every reason to believe that, notwithstanding the cessation of smelting operations, the highest number recorded for 1897 will be exceeded in 1898. As instancing the amount of work accomplished by these men as a set-off against the accidents, the following figures (compiled from data furnished by the various companies) will be of interest:—

Ore extracted	1,165,234 tons.
Cubic yards filling put into depleted stopes	350,004
Lineal feet of work in way of cross-cuts, drives, winzes, rises, and shafts	20,670
Material moved from open cuts	500,000 cub. yds.

To accomplish this work has involved the use of 340,656 lb. of high explosive (including dynamite, gelegnite, gelatine, rack-a-rock, and roburite) and 343,275 detonators; besides these, 60,000 lb. of blasting powder have been used. The value of this lot of blasting material is given as £27,317.

The number of detonators used indicate pretty nearly the number of explosions required in breaking the grounds, the average per day being about 1,000; and a very limited number of injuries to workmen arising from explosives is significant of the general care exercised in handling explosive substances.

As respecting the progress of the industry, new machinery to the value of £111,192 has been erected on the mines, making the total value of machinery and plant in the district £546,351.

16,141,189 superficial feet of timber has been used in securing the main workings, and 350,000 cubic yards of mullock filling put into depleted stopes for their future security.

The total gross value of the output of the district is £3,620,611, based on the market value of the silver and lead contents, exclusive of zinc, which is not yet fully established as a marketable product.

However, about 30,000 tons of zinc-containing material, chiefly tailings, formerly regarded as worthless, has been sold from the various mines during the year, and there seems reasonable grounds for hoping that large quantities will be shipped during 1898, as a fair price was realised for that already sold.

Lead-poisoning.—With regard to the lead-poisoning regulations, I find that the majority of the managers are very willing to do all that is possible, in compliance with them, and that, on the whole, there is a desire to comply with the spirit of the regulations, having for their object the health and well-being of the men employed.

The principal difficulty apparent now is the scarcity of water at some of the mines.

I find that this is more generally caused by want of pressure in the mains, than by any disinclination on the part of the companies to supply the water.

During the year only 17 cases of lead-poisoning have been reported to me, as against 44 for the year 1896. Of these, 8 are uncertified and 9 certified.

This falling off is, I think, more largely to be attributed to the lesser quantity of carbonate ore extracted than to any other cause.

The rigid enforcing of clause 2 of this Act has brought under my notice several cases of hardship, where lads under the age of 16 have been the support of families. I may be allowed to express the opinion that, under the circumstances, viz. :—

- (1.) The decreased number of cases of lead-poisoning;
- (2.) That all the boy labour is absorbed in concentration works, blacksmith, fitting, and carpenters' shops;
- (3.) That the great bulk of the ore now being handled is sulphide;—

that there is now very little, if any, danger of the boys being lead-poisoned, and that, therefore, the rule might with very good reason be relaxed somewhat.

The whole of my time during the year has been occupied in the immediate vicinity, including visits to The Pinnacles, Balaclava, Rockwell, Angas, Thackaringa, Silvertown, Yuba, Pernamoota, Maybell, and Tarravungee.

In July, I attended all the sittings of the Royal Commission on Mining Accidents in the district, and accompanied the Commissioner, His Honor Judge Murray, in visits of inspection and investigation to the various mines of the district.

I also gave evidence before the Commission, as Inspector of Mines, general conditions of mines, and prospects of the industry generally.

The systematic filling of depleted stopes in the mines has added much to the stability and safety of the mines, and enabled portions of the lode to be worked, chiefly consisting of pillars formerly left standing as too poor to pay for the cost of treatment in the early days, which, in my opinion, could not now be worked at all if the mines had now to depend in the square-set system.

In fact, so firm is now the conviction as to the security obtained by the thorough filling of the stopes, that in many instances the square-set system is regarded as a temporary expedient pending the complete securing of the stopes by the mullock filling, and the adoption of this system has minimised the effect of creeps, as predicted in my report of last year's operations.

The prospects of a continuance of the prosperity of the mining industry are excellent, the payable ores when prospected for have been found to continue in depth, as instance the 700 feet level, Kelly's shaft, block 10; the 700 feet level at main shaft of Broken Hill South Mine; the deeper levels at M'Bryde's and other shafts at the Broken Hill Proprietary Mine; and the developments in the deep levels of the Junction, Junction North, and Broken Hill North mines.

The increasing efforts at improvement in concentrating machinery, put forth by the concentrating engineers, have also borne fruit, and the result is that gradually poorer ores are being brought within the limit of profitable treatment, thus largely increasing the quantity of payable ore in sight, until, notwithstanding the quantity extracted from the mines during the year, it may safely be said that the quantity of payable ore in the mine is larger than ever before in their history.

With immediate prospects of the zinc contents of the ore in the mines, also returning its share of the profits, the outlook can only be regarded as brilliant.

I have, &c.,

JAMES HEBBARD,
Inspector of Mines.

The Chief Inspector of Mines, Department of Mines, Sydney.

Inspector

Inspector Godfrey's Annual Report.

The Chief Inspector of Mines, Sydney,—
Sir,

Sydney, 1 January, 1898.

I have the honor to forward you my annual report for the year 1897.

The localities visited by me during the year are as follow :—

Northern District—Bingara, Bullahdelah, Copeland, Coolongolook, Crow Mountain, Hillgrove, Ironbarks (Wood's Reef), Moonanbrook, Paddy's Creek, Rawdon Vale, Stewart's Brook, Upper Gloucester, and Whispering Gully.

Western District—Cobar, Carlisle, Diejou, Eugowra, Forbes, Fifield and Platina, Gilgunnia, Girilambone, Gulgong and Cudgebegong, Mount Allen, Mount Drysdale, Mount Hope, Mount Boppy, Myall, Mudgee and its localities, Nymagee, Overflow, Peak Hill, Parkes, Pinnacles, Restdown, and the Rookery, Tomingley, and Windeyer.

South-western—Barmedman, Billy's Lookout, Buddigower, Grenfell (twice), Temora, Scrub Yards, Springdale, Wyalong (where I was constantly engaged for two months), and Yalgogrin.

Southern—Adelong, Braidwood, Bungonia, Corang, Gundagai, Jerralong, Nerriga, Quartzville, and Snowball.

During the year I inspected and reported upon 404 mines, including a considerable number for aid from the Prospecting Vote.

I served upwards of forty written notices, where such an action was rendered advisable by the defects in the mines.

I travelled upwards of 8,700 miles, made up as follows :—4,814 by train, and the remainder by vehicle and horse.

I was present at two inquests on accidents in mines during the year; these were—Albert Goodwin, who was killed in the Eleanora Mine, Hillgrove, owing to a skid board falling down the shaft; and Robert Morley, who was injured and subsequently died from falling down a shaft at the Patron Mine, Wyalong, owing to the hook of the whip rope on which he was riding becoming detached from the harness. Both these accidents should have been prevented.

The mining industry in the districts through which I have travelled shows a decided advance, both in the permanency of the work done, and in matters of safety, while there seems also to be more regard given to the future development of the mines.

The Wyalong field, since my last inspection, shows a marked improvement in the class of mining done. All the larger mines are constructing main working shafts, putting in permanent levels, and erecting winding plants. The following mines now have small winding plants capable of working to at least 500 feet in depth, *i.e.*, the Perseverance, the Junction, the True Blue, Neild's Prospecting, Bolte's Lucknow, the Curragong, and the Prince of Wales; the latter being a large and powerful engine. While the Rose and Shamrock has a small plant fit to work to 250 feet in depth.

The output of the field has maintained its previous promise, but owing to the refractory nature of the ore at deeper levels, the stone has, as a rule, to be subjected to special treatment which has caused a number of plants to be erected on the field.

The principal of these are—Cox's Huntingdon Mill, West's Battery, with Cottle's patent concentrators, Gough's battery and shaking tables, Channon's cyanide plant, Nicholas and Raymond's battery, vanners, and grinding and amalgamating pans. The Wyalong Chlorination Works, which have a large chlorination and cyanide plant, with revolving, drying, and roasting furnaces; and they have just erected a Krupp Ball Mill for dry crushing, which, so far, has given every satisfaction, both for speed and economy.

Messrs. Neild have a well-arranged and compact chlorination plant. At present they use rolls for crushing, but intend to erect a Krupp Ball Mill. Roasting is done in an inclined reverberatory hearth, and precipitation is effected by means of ferrous sulphate.

Up to a few months ago the bulk of the refractory ore was bagged up, and sent away for treatment; but since the above plants have been erected a considerable proportion of the ore is locally treated, and provided that reasonable and equitable charges are made, there is no reason why the local plants should not treat the whole of the stone.

Although the system of timbering and working at Wyalong has advanced, there is still room for considerable improvement in many of the mines.

At Adelong, the Gibraltar Consolidated Mine is being worked on a large scale, and has been very elaborately equipped since my last inspection.

The system of treatment includes crushing, concentration, chlorination, and cyanidation.

Crushing.—Is done by 30 head of stampers, each 10-head being driven independently. The stone is brought to the battery by a truck road which connects with ore bins corresponding to the several shafts (and which are filled from the shafts by inclined tram lines), the stone passes over grizzlies through rock-breakers, and is then fed automatically to the stampers by challenge ore-feeders.

The battery can be driven either by steam or water-power—the latter being only occasionally available when there is sufficient water to drive the turbines in the compressor sheds.

Concentration.—Is done upon frue vanners, of which there are twelve—ten of them being the 6-foot, and two of them 4-foot vanners.

Chlorination.—The concentrates thus obtained are subjected to chlorination.

The roasting furnace is known as Edwards' Patent, and consists of a rectangular iron frame about 55 feet long and 6 feet wide, lined with firebrick and swung on central pivots, so that it can be inclined at any angle. Rabbling is done by circular rabbles driven off a longitudinal counter-shaft by bevel wheels—every pair of rabbles revolve in opposite directions, and there are five pairs in all. There is an automatic feed and discharge.

The chlorination vats are small, with india-rubber luting, which enables them to use the gas under pressure, if necessary. Precipitation of the gold is done on charcoal.

Cyanide.—The tailings after concentration are subjected to cyanidation, which is done by the Siemens-Halské process, in which precipitation of the gold is effected on thin lead sheets by electrolysis. It is claimed for this process that weaker solutions can be used, and poorer ore treated profitably, than by other means.

The company has also a large air compressor shed containing also the two turbines mentioned above. The ventilation in the mines generally may be described as excellent, and all the larger mines have made provision for carrying down air as new levels and stopes are opened up.

The condition of shafts is as a rule good, miners being alive to the fact that the main shafts are the means of communication with the surface; one or two shafts, however, were found to be in a very bad condition.

I found that some of the indicators on the winding engines were very inaccurate owing to faulty construction; very few winding engines, even of modern design, have proper indicators attached. As a rule it is necessary to put a spindle in the end of the drum shaft and use sliding weights as indicators. In all winding engines with loose drums, the indicator should be designed to work direct off the drums themselves, so that in changing levels there should be no need to alter them.

Another bad practice—with loose-eccentric winding engines, especially—is to have the brake on the fly-wheel and none on the drums; or, if there are brakes on the drums, the levers for controlling them are placed in some position out of reach of the driver, unless he leave his engine.

Having the brake on the fly-wheel is defective for two reasons; firstly, because, if one of the drums slipped out of gear (owing, for instance, to the clutch slipping or breaking) the brake would be useless; and, secondly, because in the event of the engine getting a run on it and the cages getting away, the sudden application of the brake on the periphery of the fly-wheel would throw an enormous torsional strain on the shaft, and tend to break it.

When a brake is used on the fly-wheel, there should be brakes on each of the drums, and the levers of these placed close to the driver so as to be at once under control, should the necessity for using them arise.

The testing of boilers by hydraulic test is usually done as a matter of course. A few years ago considerable pressure had to be used to get mine-owners to comply with this rule, but they have gradually come to do it themselves at the half-yearly overhaul.

Records are kept showing date of test, pressure to which boiler was subjected, defects observable, &c.; and usually in large boilers an internal examination is also made. The above record is signed, witnessed, and counter-signed by the visiting inspector.

Many boilers are sent out with safety-valves attached which were made for some other boiler; the weights attached to the levers being so light as to load the valve down to about one-half the pressure to which the boiler could work with safety.

In one case the valve was so faulty in construction as to blow off at 15 lb. per square inch where the boiler was capable of working to 45 lb. In such cases it is absolutely necessary to load the valves, but this is usually done with pieces of angle-iron, old rails, hammer-heads, &c., put on anyhow, and anywhere, and without the men in charge knowing to what pressure they are loading the valve, except by the pressure gauge, which is often inaccurate. I therefore endeavoured to get them to put proper weights on, properly adjusted, for the pressure under which the boiler has to work (being, of course, below its safe working pressure), and so that the weights cannot be shifted at the caprice of any irresponsible person.

Wyalong, as already mentioned, shows a great improvement in the class of timbering done in the levels and stopes, it being better fitted, better put in, and stronger than it used to be.

A corresponding improvement is noticeable in other new fields, while the older ones are as a rule working with due regard to safety, as shown by the fact that nearly all the serious accidents for the year were due to causes other than any defects in the system adopted; and I think that this improvement is a proof that systematic inspection tends to keep the mine-owners up to the mark.

I have, &c.,

J. R. GODFREY,

Inspector of Mines.

The Chief Inspector of Mines, Department of Mines, Sydney.

Inspector Hooke's Annual Report.

Sir,

Sydney, 1 January, 1898.

I have the honor to submit my annual report on the working of the Regulations for the Inspection and Regulation of Mines other than Coal and Shale Mines in such districts as I have visited during 1897.

During the year I have visited the following localities, viz.:—Adelong, Armidale, Bago, Billapalula, Brungle, Barmedman, Bygalorie, Bringenbrong, Burrowa, Breakfast Creek, Coolongolook, Coolac, Combaning, Chandler River, Carabost, Cullinga, Craiglea, Demondrille, Dungog, Garangula, Gundagai, Gundaroo, Gooda Creek, Hillgrove, Harden, Humula, Junee Reefs, Moonan Brook, Murrumburrah, McMahon's Reef, Muttama, Metz, Melrose, Nanima, Nottingham Hill, Niangala, Nundle, Reefton, Rockvale, Rye Park, Stewart's Brook, Springdale, Stockinbingal, Sherwood, Sunnyside, Swamp Oak, Tumut, Toomoorooma, Temora, Tumberumba, Tia, Uralla, Ungarie, Wyalong, Walcha, Wee Jasper, Yass.

The total number of mines inspected was 344, of which some were in connection with the Prospecting Vote from which aid was being sought. The distance travelled amounted to 7,018 miles.

During the year, two inquests were attended by me; in each case, after close inquiry, the verdict of the coroner was "Accidental death, no blame attaching to any person."

Of these, one occurred in the Gundagai District, and was caused by the breaking of a winding-rope and the failure of the safety catches on the cage to operate. In this instance, the mine manager, himself, was killed; he was alone and, in contravention of the Regulations, was ascending in a loaded cage. This, I believe, was the only cage accident, through breakage of rope, recorded during the year; and

and although the use of safety appliances on cages is not compulsory in this Colony, yet in this instance the cage was so fitted, but, unfortunately, proved inefficient. This incident, however, indicates the usual absence, in this Colony, of accidents from this cause, which good result is due to the close examination of winding-ropes and attachments to which they are subjected by inspectors, who immediately cause to be thrown out of use any gear unduly worn or showing defects.

The other fatality happened at Hillgrove, and was occasioned by a fall of stone. It occurred in a mine under able management, but in accidents from this cause the safety of the miner, in a great measure, depends upon himself, and I am continually inculcating the need of frequent examination of working places by means of "sounding," &c., by the miners themselves.

No accident came under my notice during the year which occurred from any unusual cause, and of those (11 in number) recorded from the districts north of Sydney, 7 were from falls of stone or other material, mostly from stopes and other working places in which the injured person was working, and which accidents in several cases might have been averted by the exercise of more care. From the cause mentioned, 4 were killed and 3 injured.

Amongst other causes, 1 man was injured by falling down a shaft, 2 were injured by explosions, and 1 was killed through becoming entangled in machinery he was attending.

The general condition of the mines may be regarded as safe; the shafts, however, in several of our larger and older mines are not by any means in as satisfactory a condition as they might be, and although safe enough for working, they are only so through frequent examination and repairs, and hence are a continual source of anxiety to all concerned.

The travelling roads underground are generally well kept and in good order, and but little fault can be found in this respect.

In regard to removal of ore, stull stoping is generally resorted to, and as the filling of depleted stopes is insisted upon, the two combined render the workings very secure, and thus always permit of the deeper ground being opened without undue risk, even after long intervals of idleness.

The handling and use of explosives are not such fruitful sources of complaint as hitherto. This is due, to a great extent, to the better understanding of the risks to be guarded against by the miner, and although accidents do occur, they are now infrequent. Special storage of explosives is always insisted upon, and the larger mines are equipped with magazines of approved design, carefully attended, while for underground use suitable boxes are provided.

In regard to ventilation much improvement has been effected, mainly by causing the connection of various surface outlets, thus securing an adequate supply of air by natural means. In so far as the deeper mines are concerned, however, the absence of system is very apparent in regard to providing adequate and controllable ventilation, and it seems desirable that regulation should enforce the existence of two shafts or a series of winzes for this purpose. This would materially aid the operation of managers, who succeeding each other on any particular mine would then feel it incumbent to continue their predecessor's work towards this end, without re-arranging and repeating such work.

The machinery connected with the winding and pumping may be regarded as in good order, although much of it is of antiquated type, still insufficient attention is given this subject, and many of the plants are an eyesore so far as cleanliness, &c., is concerned. This is due to lack of ability on the part of attendants, and as no certificate of competency is required of engine-drivers by regulation, the removal of a proved incapable attendant is as often followed by the replacement of another. This defect has thrown considerable responsibility upon the inspectors in regard to the care of steam boilers, especially in the case of those mines in remote parts receiving but an occasional visit. The practice of the inspectors generally has always been to have a duly witnessed cleansing, examination, and hydrostatic test every six months, a signed record of which is entered in a book, stating particulars and defects in boiler, if any. A strict insistence upon such requirements has materially assisted in the prevention of accidents.

In regard to mine management there is a decided improvement, and it is a pleasing duty to record that as a rule managers do all in their power to obviate accidents, and in no instance have they declined to accept my suggestion for the further protection of their men. That the provisions of the Regulations are complied with is shown by the fact that managers' omissions in this respect have been so promptly made good, that no prosecutions have been deemed necessary.

In reviewing my work of the year, the district traversed has been practically the length of the Colony, hence my remarks in general will only apply to the northern portion which was twice visited by me.

The principal metalliferous mining centre in the Northern District is still at Hillgrove, the output of gold from which, during the year, approximates 32,000 oz.; this, however, is less than that of the preceding year, but is to some extent due to shortness of water supply during portion of the time. Other causes have also operated to lessen the output, notably the falling off in the yields of the Eleanora Mine, which at time of writing has partially suspended work underground; and also of the Sunlight, the output of stone from which being temporarily reduced.

Amongst the mines the Baker's Creek still holds the leading position, both in depth and otherwise, the deepest workings in which being about 900 feet below the Adit level. In the West Sunlight the deepest workings are at 800 feet, at which depth the developments have been very satisfactory. In both of these mines development work is kept well forward, thus enabling their batteries to be continually running, to which in a great measure their success is due.

In regard to other mines on this field, development work has been somewhat retarded, with consequent diminution of output of stone. This, however, is being speedily rectified, and they, in common with such new properties as the Hillgrove Proprietary and Cooney Creek Proprietary, will take their stand during the ensuing year as large producers, and as these latter properties possess the essentials of dividend paying concerns, it may be fairly asserted that the future of the field is not likely to be retrogressive for some time, and that the dull condition noticeable at the close of the year is only transient.

As indicating the activity generally displayed, it may be of interest to state that 160 stamps were falling during the year; some of these, however, are now idle.

In regard to battery practice upon this field, nothing new has been put into vogue during the time under review. An endeavour to treat the tailings by the cyanide process was, however, tried, but so far with indifferent success owing to the presence of minerals and metals inimical to the process, but this doubtless will be overcome in time.

During

During the year also an alteration of the fuel for steaming purposes from wood to coal was tested with a view to ascertaining actual difference in cost, with the result that the use of wood was reverted to.

Sundry improvements in detail have, however, been carried out with success, both financially and otherwise, as most of the mines now have their own electric lighting plants, and in one instance an electric deposition plant for re-silvering copper plates for amalgamating purposes. One mine also is about to instal an electric winding plant for its sinking operations, which will be the first application of electricity to this purpose in this colony.

It is, however, singular that the advantages of hydraulic motive power have not yet been utilised on this field, as unusual facilities for same exist, with consequent cheapening of cost of gold production.

No other metal than gold has been mined during the year, the antimony deposits remaining untouched owing to the low price of that metal.

Apart from the prospecting, inseparable from the particular operations of each mine, very little of such work has been done, which is to be regretted, as ample scope exists for systematic work in this regard.

In other districts than Hillgrove, extensions of the gold-mining enterprises have made a decided advance. Owing mainly to the sale of various properties to English and other buyers, due to which cause at Tia, Rockvale, Swamp Oak, Niangala, Hanging Rock, Drake, Coramba, Stewart's Brook, &c., mines of admitted value, are now being developed with bright prospects for the ensuing year.

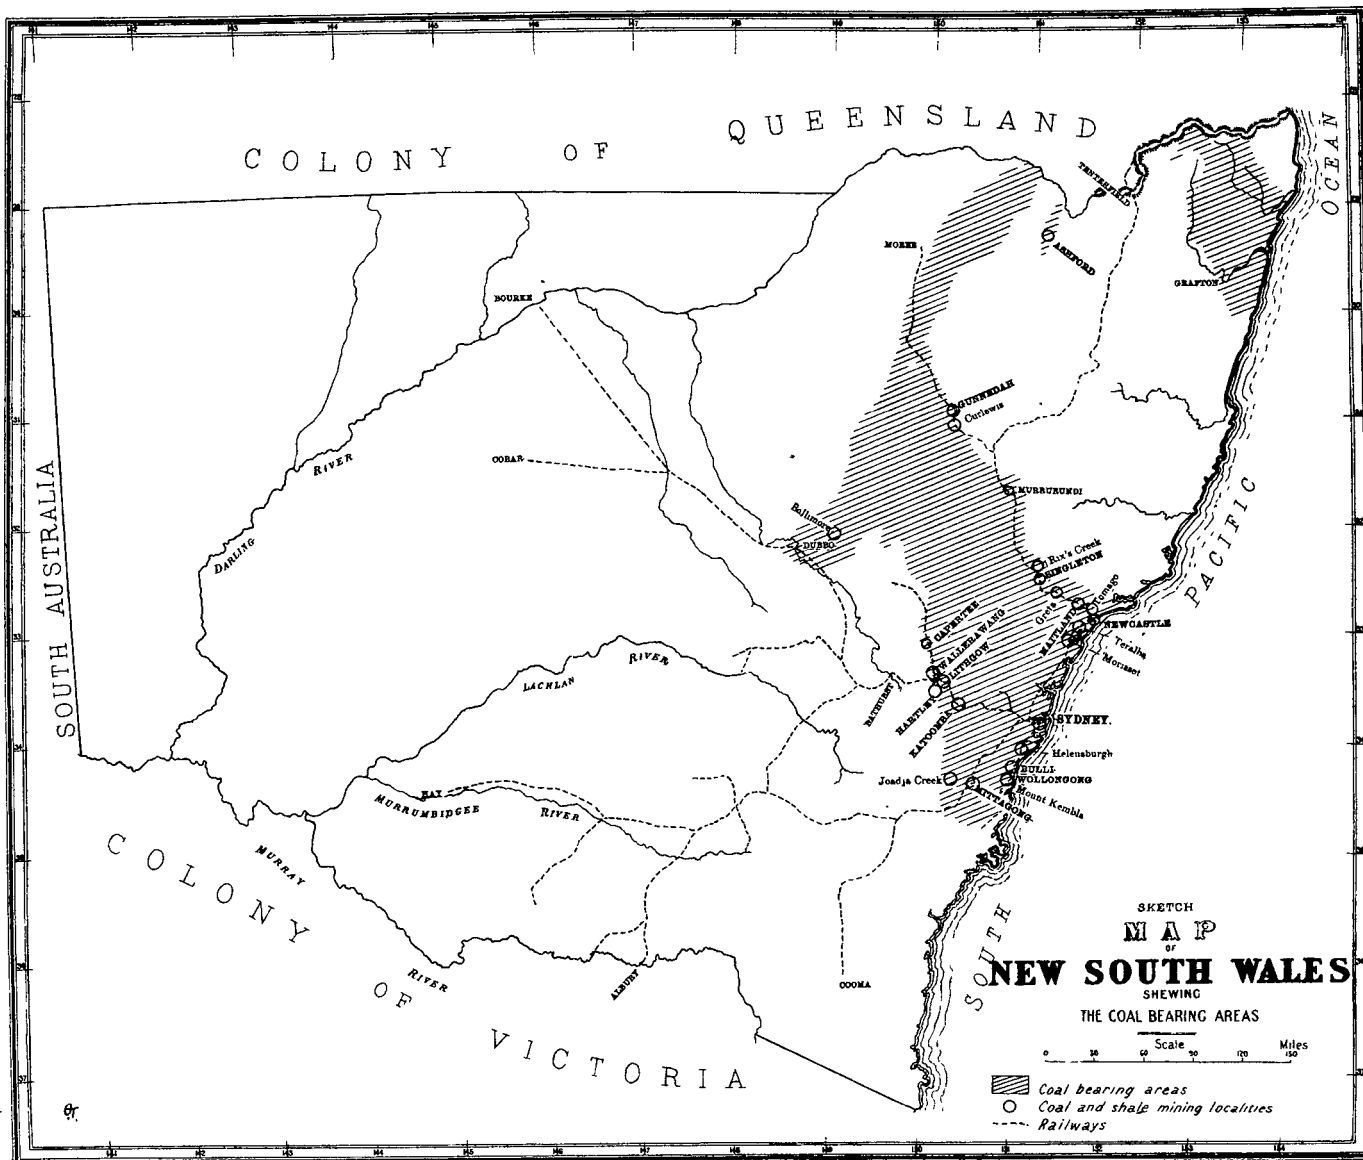

The application of improved processes to the treatment of the ores and tailings is receiving attention, and cyanide plants have been erected on various fields.

In the technical branch of mining also, the more recently formed companies who have mostly purchased properties prospected or worked out to shallow depths are devoting funds to the development of the deeper ground, in which respect important progress has been made towards pushing the industry beyond its infantile stage, and already improvements in the prospects of the mines are due to this fact.

Very little development has been made in regard to the mining of other metals than gold, mainly due to the low prices ruling for those metals, still prospecting in this direction has continued and with satisfactory results, so far as discovery is concerned.

I have, &c.,

HENRY HOOKE,
Inspector of Mines.

COAL AND OIL-SHALE MINES.

Report on the Inspection of Mines under the Coal Mines Regulation Act, in the Colony of New South Wales, for the year ending 31st December, 1897. By A. A. ATKINSON.

Sir,

Mines Department, Sydney, 31st January, 1898.

As required by section 21 of the Coal Mines Regulation Act, 1896, I have the honor to submit the following report of inspection, together with a detailed list of fatal and non-fatal accidents, and other tabulated statistical information relating to coal and shale mining generally.

The report is divided as follows:—

- Section I. Persons employed.
 „ II. Output and export of mineral.
 „ III. Accidents.
 „ IV. Prosecutions.
 „ V. General remarks.

The quantity of coal wrought during the year amounted to 4,383,591 tons, the quantities in each District being as follows, with the comparative figures for the year 1896:—

	1897.	1896.	Increase or Decrease.
	Tons.	Tons.	Tons.
Northern District	3,176,869	2,623,015	+ 553,854
Southern and South-Western Districts.....	918,862	1,008,376	— 89,514
Western District	287,860	278,124	+ 9,736
Totals.....	4,383,591	3,909,515	+ 474,076

The quantity of oil-shale wrought during the year amounted to 34,090 tons, the quantities in each District being as follows, with the comparative figures for the year 1896:—

	1897.	1896.	Increase or Decrease.
	Tons.	Tons.	Tons.
Northern District
Southern and South-Western Districts.....	5,486	2,995	+ 2,491
Western District	28,604	28,844	— 240
Totals.....	34,090	31,839	+ 2,251

SECTION I.
PERSONS EMPLOYED.

TABLE showing the number of persons employed in and about mines (Coal and Shale) under the Coal Mines Regulation Act, divided according to ages and occupation below or above ground, and in the several districts as tabulated below:—

Districts.	Number of Mines.	Below ground.			Above ground.				Total number of persons employed below ground and above ground.
		Ages.			Ages.				
		Boys under 16.	Males above 16.	Total below ground.	Boys under 14.	Boys of 14 and under 16.	Males above 16.	Total above ground.	
Northern	60	188	5,737	5,925	1	109	1,194	1,304	7,229
Southern and South-western	17	85	1,723	1,808	...	32	497	529	2,337
Western	15	4	340	344	...	8	61	69	413
Totals, 1897	92	277	7,800	8,077	1	149	1,752	1,902	9,979
Totals, 1896	101	Not returned.		7,699	Not returned.			1,761	9,460

These figures are obtained from the statutory return made by the mine owners under section 27 of the Coal Mines Regulation Act, 1896.

SECTION

SECTION II.
OUTPUT OF MINERALS.

TABLE showing the output of minerals (Coal and Shale) from mines under the Coal Mines Regulation Act, 1896, in the Colony of New South Wales, during the year 1897:—

Quantity of Mineral raised.

District	Coal.	Oil-Shale	Shale used for other purposes	Total.	Value.
Northern	3,176,869	3,176,869	£ 938,774 4 8
Southern and South-western	918,862	5,486	...	924,348	239,415 5 3
Western	287,860	28,604	316,464	92,463 6 2
Totals, 1897	4,383,591	34,090	..	4,417,681	£1,270,652 16 1
Totals, 1896	3,909,515	31,839		3,941,354	£1,159,482 0 0

TABLE showing the Output of Minerals (Coal and Shale) per person employed in Mines under the Coal-mines Regulation Act, 1896, in the Colony of New South Wales during the year 1897:—

Quantity of Mineral raised per person employed.

Districts.	Below-ground.	Below and Above ground.
Northern	Statute tons. 536	Statute tons. 439
Southern and South-western	511	395
Western	919	766
	} 546	} 442

The corresponding figures for 1896 were 522 tons per person employed below-ground, and 427 tons per person employed above and below-ground, whilst for the United Kingdom the figures were 374 tons per person employed under-ground, and 301 tons per person employed under-ground and above-ground. This comparison is favourable to the Colony.

Showing Coal and Shale separately, we obtain the following figures:—

Quantity of Coal and Shale raised per person employed.

Districts	Below ground		Below and Above ground	
	Coal	Shale	Coal	Shale
Northern	Statute tons. 536	Statute tons.	Statute tons. 439	Statute tons. ...
Southern and South-western	508	66	393	58
Western	836	175	697	110

COMPARATIVE Statement of Returns for 1896-7.

Increase in 1897	6	9	9,736	0 0	2,070	19 6

From these returns we find that in the Northern District, in the year under notice, there has been an increase of 288 persons employed in and about the collieries, and an increase of 553,854 tons of coal raised.

In the South and South-western Districts there has been an increase of 493 persons employed in and about the collieries, and a decrease of 89,514 tons of coal raised.

In the Western District there has been an increase of 15 persons employed in and about the collieries, and an increase of 9,736 tons of coal raised.

SECTION III.

ACCIDENTS.

The total number of accidents reported during the year 1897, including accidents on private branch railways, &c., was 76, the corresponding number for the previous year being 74. During 1897 there were 16 fatal accidents and 60 non-fatal, resulting in the deaths of 16 persons and injuries to 63 persons, the figures for the previous year being 24 deaths and 62 persons injured.

No accident has happened during the year which caused more than one death, and only three of the non-fatal accidents caused injury to more than one person.

SUMMARY of fatal and non-fatal accidents, classified according to place and cause.

Place and cause.	Fatal accidents.		Non-fatal accidents reported.	
	Number of separate fatal accidents.	Number of deaths.	Number of separate non-fatal accidents.	Number of persons injured, including those injured by accidents which proved fatal to their companions.

LIST of Fatal Accidents.

Date of Accident, 1897.	Name of Mine.	Situation of Mine.	Name, Age, and Occupation of Person killed.	Cause of Accident and Remarks.
22 Jan.	Gunnedah Colliery.	Gunnedah	Bernard McCosker, miner; age, 21.	Fatal injuries whilst wedging at the coal face by fall of coal and stone from the roof; a shot had been fired, which failed to bring the coal down, and deceased proceeded to wedge it, with fatal results.
22 Mar.	South Waratah Colliery.	Charlestown, Newcastle.	Alfred Frederick Foster, miner; age, 36.	Fatal injuries by fall of coal from the face; deceased was holing, and had one sprag set, which was deemed sufficient; but the fall occurred from a slippery facing.
25 "	Co operative Colliery.	Plattsburg, Newcastle.	John A. Thomas, Wheeler; age, 17½.	Killed by being crushed between tubs and a prop; deceased was riding without a light, on the buffer of the first of three tubs he was bringing out of a heading on to the going or main bord; part of his body projected beyond the corner of the tub, and, in passing round a curve, it was crushed between the tub and some props fixed on the outside of the curve to secure the roof; died in Wallsend hospital on following day.
22 April	Wickham and Bullock Island	Carrington, Newcastle.	Thomas Coxon, miner; age, 44.	Killed by a fall of coal; block of "little tops" coal fell upon him as he was working down some bottom coal, for the purpose of freeing a wedge he required to wedge down the coal that fell upon him.
19 July	Stockton	Stockton, Newcastle.	Charles Hansen Stormm, miner; age, 29.	Killed by fall of coal; large block of coal fell away from a sooty facing, twisting out a sprag he had fixed to it.
2 "	Do	do	William Hughes, stoneman; age, 31	Crushed to death by a baulk falling upon him. This accident is fully described in the report.
18 Aug.	Waratah	Charlestown, Newcastle.	Michael Sheedy, miner; age, 40.	Fatal injuries by fall of roof in an 8-yard bord; the stone came from a feather edge on two sides, and terminated at a clearly defined facing near the working face.
13 Sept.	Osborne-Wallsend.	Wollongong	Charles Benjamin Drew, shunter.	He was severely crushed between the waggon buffers whilst engaged in coupling them, and died a few hours afterwards.
27 "	Hetton	Carrington, Newcastle.	Hezekiah Wilhams, miner; age, 51.	Fatally injured by fall of coal; died, October 4th. Deceased and his mate worked in a bord getting bottom coal; they had worked away the lower coal, 4½ feet thick, leaving the "little top coal," 20 inches thick, secured with a prop; on wedging down a block of the bottom coal, it rolled over, and knocked out the prop; deceased evidently considered it unnecessary to refix it, as he resumed his work in the bottom coal; a few minutes only elapsed when a large portion of the "little tops" coal fell upon him, inflicting terrible injuries, from which he died.
29 "	Co operative Colliery.	Plattsburg, Newcastle.	Thomas McCroraly, miner; age, 68.	Killed by fall of coal. His son and mate had holed the "back end" coal, and had two sprags fixed under it; deceased took a pick and sounded it, saying it would not take much powder to bring it down; before he could step back a block of about 30 cwt. fell from between the wallside and one of the sprags, almost burying him; he died two hours afterwards.
11 Oct.	South Greta	Farley	Ernest Albert Moore, miner; age, 20.	Fatal injuries whilst riding on a train of loaded tubs (contrary to Special Rules), his head coming in contact with the roof.
15 "	Wallsend	Wallsend, Newcastle.	John Mawkes, Shiftman; age 51	Died on October 18th from injuries received. Mawkes and others were engaged in taking up the floor of one of the engine banks to reduce the gradient; a shot-hole was bored about 4 feet deep in hard post stone; a plug of compressed powder was put in this hole, and, whilst Mawkes was in the act of placing a second one with the rammer (which was copper), an explosion occurred, and he was severely burned on the face and chest, and his right hand and arm were shattered. It is difficult to say what caused this accident.
30 "	Stockton	Stockton, Newcastle.	David Wilhams, Wheeler; age, 20	Killed by kick from a horse. He was standing behind his horse, striking it with his whip; it lucked out, hitting him in the chest, killing him instantly.
11 Dec.	Newcastle Co's A Pit.	Newcastle	Wm. Thomas Skillings, miner; age, 21.	Killed by fall of coal in an 8-yard bord; seam, 6 ft. 7 in. thick. The coal was holed about 2 ft. 6 in deep; about 1 ton came away at a "grey back" or slip; there was one sprag in, 4 feet long, and plenty about.
14 "	Newcastle Co's B Pit.	do	William George, miner; age, 28.	Killed by fall of coal. The coal was spragged, and there was plenty of timber about; the coal knocked out a "soldier" or large sprag, which may also have struck deceased, who was said to be a very careful miner.
18 "	Vale of Clwydd Colliery.	Lithgow	Daniel Gendens, on-setter or hooker-on; age, 22.	Deceased was caught by descending cage when crossing the shaft bottom, causing fracture of the skull.

The following tables show the districts in which the accidents occurred:—

FATAL ACCIDENTS.

Districts.	Fatal accidents.						Deaths.

LIST of Non-fatal Accidents.

Date of Accident, 1897.	Name of Mine.	Situation of Mine.	Name and Occupation of Person Injured.	Cause of Accident and Remarks.
12 Jan. ..	East Greta	West Maitland	Henry Atkinson, miner	Injury to foot by fall of coal.
20 " ..	Co-operative ..	Plattsburg, Newcastle....	Robert Drysdale, miner.....	Thigh broken by fall of coal; coal broke over the sprag, and almost buried him.
21 " ..	Duckenfield ..	Minmi, Newcastle	Alexander Dobbie, miner	Injury to face by shot. Returned to shot which had "hung fire," when it went off.
2 Feb. ..	Wickham and Bullock Island	Carrington, Newcastle ..	Hugh Riddle, miner.....	Collar-bone broken by fall of "Morgan" stone.
24 " ..	Wallsend Main Tunnel.	Wallsend, Newcastle	James Craig, miner.....	Fracture of left leg by fall of coal.
25 " ..	Newcastle Coal Co., A Pit.	Merewether, Newcastle ..	John Morgan, screenman.....	Injury to foot whilst riding on empty coal wagons.
2 Mar. ..	Duckenfield ..	Minmi, Newcastle	William Price, checkweigher...	Broken ribs, collar-bone, and bruised hip, by falling off screen platform on to railway below.
10 " ..	Newcastle Coal Co., A Pit.	Merewether, Newcastle ..	Aquilla Pipe, miner.....	Severe flesh wound, caused by a falling pick whilst descending the mine in the cage.
25 " ..	South Waratah.	Charlestown, Newcastle ..	James Wilson, shunter	Fracture of leg.
26 " ..	Hetton.....	Carrington, Newcastle	George Wile, driver.....	Horse stepped on a loose rail, which struck the boy's leg and broke it.
3 April ..	Wallsend.....	Wallsend, Newcastle	Evan Jenkins, driver.....	Fracture of collar-bone. Crushed between his horse and a tub.
29 " ..	Metropolitan ..	Helensburgh.....	David Ridley, miner	Arm broken by a fall of coal.
8 May ..	South Bulli....	Bellambi	Richard Gibson, dayman.....	Leg broken by a fall of stone.
18 " ..	Burwood	Newcastle	Joseph Moss, miner	Leg fractured by a fall of coal whilst holing.
18 " ..	Zig-zag.....	Lithgow	William Dyer, miner	Head hurt by a fall of coal.
19 " ..	Dudley.....	Newcastle	Daniel Kelly, miner.....	Coal struck him when drawing a sprag. Shock to system—no bones broken.
20 " ..	Co-operative ..	Plattsburg, Newcastle....	Wm. Paviour, driver.....	Injury to head by falling on a rail when shunting a wagon.
20 " ..	Stockton	Newcastle	Albert Burt, driver.....	Arm broken by tubs.
25 " ..	Stockton	Newcastle	Thomas Desmond, miner	Leg broken by a fall of coal.
28 " ..	Co-operative ..	Plattsburg, Newcastle....	Alexander Marchem, endless-clip boy.	Thigh broken by a runaway tub.
2 June ..	Newcastle Co., B pit.	Merewether, Newcastle ..	James Banks, wheeler	Injury to both hips whilst attempting to jump into empty moving tub.
3 " ..	Dudley.....	Newcastle	John King, trapper	Flesh wound on leg by tubs when riding without a light.
15 " ..	Co-operative ..	Plattsburg, Newcastle....	Thomas Hepplewhite, miner....	Leg broken by piece of coal falling from face whilst filling coal.
15 " ..	South Bulli....	Bellambi	W. Metcalfe, clip boy	Arm broken by a skip.
16 " ..	Wallsend, No. 2 tunnel.	Wallsend, Newcastle	Anthony Bell, and Wm. Bell, miners.	Injured by fall of coal.
17 " ..	Burwood.....	Newcastle	J. Sutherland, miner	Injury to toes by fall of coal.

Date of Accident, 1897	Name of Mine.	Situation of Mine.	Name and Occupation of Person Injured	Cause of Accident and Remarks
23 June	Co operative	Plattsburg, Newcastle	Edward Coxon, miner	Severe injury to head by piece of coal from a shot which broke through the pillar between two bords
30 "	A A Co's, New Winning	Newcastle	Fred Brogen, engineman	Fracture of left arm by falling from a ladder on the surface
1 July	Burwood	Newcastle	Walter Grayson, screen boy	Left arm crushed in machinery, and had to be amputated
5 "	Co operative	Plattsburg, Newcastle	Christopher Goldie, shiftman	Eye destroyed by a piece of rust flying from a rail
13 "	Stockton	Stockton, Newcastle	Frederick Desmond, driver	Arm broken by kick from a horse
20 "	Wickham and Bullock Island	Carrington, Newcastle	Thomas Shakespere, miner	Collar bone broken by a fall of coal
20 "	East Greta	Maitland	James Ryan, miner	Severe injury to spine by fall of coal
23 "	Co operative	Plattsburg, Newcastle	Patrick White, endless rope boy	Injury to back and legs by being run over by tub
6 Aug	A A Cos, New Winning	Newcastle	Samuel Harris, miner	Severe powder burns on head, face and neck
9 "	Wickham and Bullock Island	Carrington, Newcastle	Thomas Screen, miner	Hand burnt by powder which exploded from a spark from the light on his cap
18 "	Duckenfield	Minmi, Newcastle	George Oliver, miner	Thigh broken by fall of coal
18 "	Seaham	West Wallsend, Newcastle	John Cotter, driver	Eye destroyed by iron sprag striking it, whilst attempting to use it from inside the tub, instead of from outside
19 "	Seaham	West Wallsend, Newcastle	John Parkes, driver	Leg broken by tub running over it

Fortunately there were not any accidents from explosions of fire-damp and coal-dust.

ACCIDENTS from Falls of Roof and Side, classified according to the place where they happened.

Place where the fall occurred.	No. of Fatal Accidents.	No. of Deaths.	No. of Non-fatal Accidents.	No. of Persons Injured.
At the working face	9	9	31	32
On roads while repairing or enlarging	2	2
On roads while otherwise working or passing
Total from falls underground	9	9	33	34

During 1897 there were reported 42 accidents due to falls, causing the death of 9 persons, and injuries to 34 persons, the corresponding figures for the previous year being 40 accidents, 7 deaths, and 33 persons injured.

Accidents by falls of roof and sides afford by far the most fruitful source of fatal results, this amounting in 1897 to 56.25 per cent. Eight of the deaths were caused by falls of coal, and one by a fall of stone; all the accidents taking place in the working face. All of them happened in the Northern or Newcastle district.

The Borehole seam, in which all these fatal accidents have occurred, varies from 5 to 14 feet in thickness, and contains many facings or slippery backs, which occur generally at regular intervals, and it is often that the accidents take place as these are reached in the holing, especially if the sprags or timber supports are not sufficient to hold the coal.

In such a thick seam it is advisable to use sprags under the holing as well as the longer or "soldier" sprags, which is the local name.

A very useful form of sprag for thick seams is that known as the "cockermeg," as shown on the sketch:—

The two thick props AB and BC are let into the roof and floor, and as the pressure increases at the point B these props become wedged more tightly.

This form of sprag is extensively used in the thicker seams in England, and if used in the Newcastle district might have the effect of preventing some of the accidents from falls of coal.

This matter is worthy of the attention of managers, officials, and miners, especially in the Newcastle seams.

It is satisfactory to note that in all the fatal accident inquiries there had always been sufficient timber of all descriptions ready for use and close at hand.

Greater immunity from this class of accidents can only be expected to result from more care on the part of the workmen, together with more diligent supervision by the officials, coupled with the punishment of miners who break the special rule with reference to the use of sprags.

The non-fatal accidents do not require any special remarks.

Shaft Accidents.—On the 18th December, Daniel Genders, onsetter at the Vale of Clwydd Colliery, was fatally injured by the cage at the bottom of the shaft. He had, evidently, been passing underneath one corner of the shaft when he was caught by the descending cage, causing a fracture of the skull, and almost instantaneous death. This was a breach of special rule 28, which states that "No person, while work is going on in the pit, shall be permitted to cross the bottom of the shaft."

Miscellaneous Underground Accidents.—In 1897, there were reported 5 fatal and 18 non-fatal accidents, resulting in the deaths of 5 persons, and injuries to 20 persons.

By Explosives.—There were 5 accidents from explosives, resulting in 1 death, and injuries to 5 persons.

ACCIDENTS with explosives, classified according to the nature of the explosive:—

The only fatal accident occurred at the Newcastle Wallsend Colliery, on 15th October, when John Mawkes, shiftman, lost his life. He and his mate were engaged in taking up the floor of one of the engine planes to reduce the gradient. A hole about 4 feet deep was bored, and a plug of compressed powder was put into it, and whilst Mawkes was in the act of placing a second one, and feeling with the rammer (which was a copper one) if it was touching the first, an explosion occurred, which caused his death on 18th October. John Conn, his mate, was also severely burned on the face and shoulders, by the premature explosion of the shot, and his eyesight was seriously endangered.

At the inquiry and inquest there was no evidence produced to account for this accident, the hole having been of sufficient size, well bored, and the tools used all in accordance with the Coal Mines Act.

Of the other accidents caused by explosives, one was in consequence of a spark getting on to the powder carried by a miner when in the token cabin; the powder was in a tin bottle, and the accident was unexplainable.

Another occurred at Minmi Colliery, where a miner returned too soon (in contravention of special rules) to a shot which had missed fire.

At the Co-operative Colliery a miner was injured on the head by a piece of coal from a shot, which broke through the pillar between two bords.

At the Wickham and Bullock Island Colliery a miner had his hand burnt by powder which exploded therein from a spark which fell from the lamp on his head. In this case the miner was prosecuted for a breach of special rule.

UNDERGROUND Haulage Accidents.*

* These include all accidents on inclined and engine planes, and by trams and tubs (see table headed, "Summary of Fatal and Non-fatal Accidents, classified according to Place and Cause").

On inclined and engine planes.—There was only 1 fatal and 1 non-fatal accident under this head, resulting in the death of 1 person and injury to 1.

The fatal accident occurred at South Greta Colliery to a miner named Ernest Albert Moore, aged 20 years. He was riding on a train of loaded tubs, when his head came in contact with the roof, causing fatal injuries. In riding on the tubs he was breaking one of the special rules in force at the colliery. The non-fatal accident does not require any remarks.

By trams and tubs.—One fatal and 12 non-fatal accidents, causing the death of 1 person and injuries to 12.

The fatal accident took place at the Co-operative Colliery, Plattsburg, to a wheeler named J. A. Thomas, aged 17½ years. Deceased was killed by being crushed between tubs and a prop. He was riding on the buffer of the first of three tubs, without a light, from a working place along a heading, and was coming out on to the "mothergate" or main bord. Part of his body projected beyond the corner of the tub, and in passing round a curve it was crushed between the tub and some props fixed on the outside of the curve to secure the roof. He died on the following day in Wallsend Hospital.

Although there is no special rule against working without a light, it is a reprehensible practice, and more especially when in charge of a horse and a train of tubs. It would have been much better had the deceased supplied himself with a light before commencing what unfortunately proved to be a fatal journey.

The non-fatal accidents, 12 in number, do not call for any particular comments, and were of the usual character, and may be divided about as follows:—Two were caused by persons attempting to get into tubs when in motion; 2 were jammed between horses and tubs, 4 were crushed between tubs when in motion, whilst 4 were run over by tubs.

By underground fires.—There were no accidents due to this cause.

Ropes and chains breaking.—There were no accidents due to this cause.

Sundries underground.—There were 2 fatal accidents and 1 non-fatal under this head, causing 2 deaths and injury to 1 person.

One death was due to a kick by a horse in the Stockton Colliery, when David Williams, wheeler, was killed. The horse had not the character of being particularly vicious or unmanageable.

The other fatal accident also occurred at Stockton, when William Hughes, stoneman, aged 31 years, was crushed to death by a baulk of timber falling upon him. He and his mate were driving a special place from the No. 3 shaft through a rise fault to connect with Ocean workings. Several baulks had been put in, one end being let into the wall side, whilst the other was supported by a prop. These baulks were covered with wood slabs, upon which was stowed a quantity of stone from the face. Deceased and his mate, thinking one of the props was loose and needed driving up, proceeded to do this, Hughes sitting under the baulk whilst his mate drove up the prop. Everything was wet, the wood was hard, and in consequence thereof, instead of the prop tightening with the blow, it flew out and let down the baulk upon Hughes, who was dead when he was got out. If a middle prop had been used, this accident, in all probability, would not have happened.

ACCIDENTS ON SURFACE—RAILWAYS OR TRAMWAYS.

Description.	No. of Fatal Accidents.	No. of Deaths.	No. of Non-fatal Accidents.	No. of Persons Injured.
While engaged in moving waggons	1	1
While engaged in coupling or uncoupling waggons	1	1
Run over while passing along or across railways or tramways.....
Crushed between waggons, or between waggons and structures.....	1	1
In other ways	2	2
Totals	1	1	4	4

Accidents on the Surface.—There was 1 fatal and 8 non-fatal accidents, resulting in 1 death and injuries to 8 persons.

The fatal accident happened to Charles Benjamin Drew, shunter on the Osborne-Wallsend Colliery branch, whilst engaged in coupling waggons, when he was severely crushed between the buffers, and died in a few hours afterwards.

Of the non-fatal accidents on the surface, the following are brief particulars:—

A screenman, named John Morgan, at the Newcastle Coal Company's "A" Pit, had his foot severely injured whilst riding on empty coal-waggons. In passing underneath the screens the foot was crushed between the wagon and the wooden uprights supporting the screens.

At South Waratah a shunter, named James Wilson, jumped off a moving train whilst shunting coal-waggons on a siding, and fell, with his leg doubled underneath him, causing a slight fracture.

John Stewart, locomotive engine-driver, at Greta Colliery, was scalded on the neck and shoulders by escape of steam and water, caused by the fracture of a bolt which secured the mud-hole cover of the boiler.

Fred. Brodgen, at the A.A. Company's New Winning, had his arm fractured. When attempting to hang up the key of the fan engine-house, standing on a ladder, he fell off, with the result above-named.

Walter Greyson, screenboy, at Burwood Colliery, had his arm caught in the cog-wheels of the machinery driving the belt, necessitating its amputation. The unfortunate boy was larking with a mate, and not at his place of work, and had often been warned about this before. He alone was to blame.

The remainder of the surface accidents do not call for particular remarks, and were of smaller importance.

SECTION V.

GENERAL REMARKS.

TRADE.

The coal trade in the Colony during the year 1897 has been in a depressed condition, especially at those collieries depending entirely upon foreign trade, and in consequence the pits, generally speaking, have worked very irregularly.

With a larger demand for coal, the powers of production are such that the output could be doubled in a few years.

The oil-shale industry has also experienced a year of depression, in consequence of which some of the thin shale in several places has been abandoned until trade improves.

LITHGOW VALLEY COLLIERY.

In the beginning of the month of October last that portion of the Lithgow Valley Colliery which had been sealed off since the fire which took place in March, 1886, resulting in the loss of eight lives, was re-opened. Owing to the carefully organised arrangements in doing this, made by Mr. Campbell, the manager, it was successfully performed—the foul gases being carried out by a return airway and over a furnace, which were independent of those required for the ordinary working of the mine.

This fire was caused by an underground boiler which ignited the coal-seam, and is another example of the inadvisability of placing boilers in the workings, which are always a source of danger.

STOCKTON COLLIERY.

The No. 3 district of the Stockton Colliery, which was closed off after the disaster in December, 1896, is at present giving no trouble.

Seeing, however, that many of the stoppings (about eighty altogether) enclosing the abandoned area, are along the side of the main intake and engine plane, it is necessary that the management of the colliery should have them constantly repaired to prevent, if possible, any of them collapsing, which would immediately result in some of the noxious enclosed gases mixing with the intake air current. As many of the stoppings are large in superficial area, and not correspondingly thick, they require particular attention.

SYDNEY HARBOUR COLLIERIES (LIMITED).

Two shafts were commenced by the above-named company in June last, on the Balmain side of the harbour, and within 100 yards of high-water mark. They have proceeded very satisfactorily up to the present, and, having regard to their proximity to the sea, are remarkably free from water. They are expected to reach coal at something under a depth of 3,000 feet.

GENERAL CONDITION OF MINES.

Having commenced my official duties on 13th September last, it has not yet been possible to thoroughly examine all the coal and shale mines in the Colony, although I have been in many of the most important mines in each district.

VENTILATION.

VENTILATION.

Generally speaking the ventilation of the mines will compare favourably with that obtaining in the mines of the United Kingdom, and seeing that very little fire-damp is generated, the miners are able to perform their work under good sanitary conditions.

As far as I have been able to observe, general rule (1) with respect to ventilation is attended to with care by the majority of the colliery managers, the air being judiciously divided into different splits, and conducted to the face of the working places by means of brattice cloth.

During the hot weather, such as was experienced during the month of November, the temperature of the air in the coal-mines of the Colony, which are comparatively shallow, was considerably less than the outside shade temperature. This was tested on several of the hottest days, and it was found that the temperature in the face, or working places, of several mines was 20 degrees Fahrenheit lower than the shade temperature at the time.

Fan versus furnace ventilation.—Both fans and furnaces are used for ventilating purposes, but generally speaking the best ventilated collieries are those where fans are in operation, and their more extended use in the future is to be desired.

Frequently colliery managers are disposed to ventilate by means of a furnace, as the first cost of erection is less than that of a fan, although taken over a period of years, having regard to the extra efficiency of the fan in these shallow mines, the latter is much cheaper than the furnace.

The presence of a large furnace fire in a mine has occasionally given rise to serious accidents by igniting the coal-seam in the vicinity, the most recent one having occurred at one of the collieries belonging to the Bridgewater Trustees in Lancashire, which caused the mine to suspend work for several months this year, and involved the owners in considerable financial loss.

The best fans in use in Great Britain are all adapted to exhaust the air from the mine, and are on the centrifugal principle. Amongst these may be mentioned the Waddle, Guibal, Schiele, Capell, and Walker, any of which will give good results.

The general tendency in England is to adopt fans in preference to furnaces. In fact, at many of the older collieries where the furnace was in use, it has been discarded in favour of the fan. This change has been going on to such an extent recently, that in South Yorkshire at the present time there is not a single large colliery where the furnace is in operation.

EXPLOSIVES.

The regulations with reference to the use of explosives are contained in general rule 12, which is the same as that in the Imperial Act of 1887. The latter, however, has been amended by a short Act which came into operation in 1896, a copy of which is given further on in this report.

Compressed blasting-powder is generally used at the collieries in the Colony, both for coal and stone, fuse being the medium employed to explode the charge.

At the Metropolitan Colliery, Helensburgh, no explosives are used in the coal, and only occasionally, by written authority of the manager, in the stone, special care being taken to comply with all the provisions of general rule 12, and in addition there are the following special rules:—

234. Where it is necessary for, or the manager has directed safety-lamps to be used, a competent person, called a shot-firer, shall be appointed by the manager for firing all charges of explosive substances or shots in the mine where blasting is allowed.

235. No shots shall be fired except by the shot-firer.

236. He shall, if a charge misses fire, immediately put up a signal or fence to prevent persons entering the place, and shall not remove the same for at least eight hours, unless the shot has been attempted to be fired by an electric apparatus, and he has disconnected the wires and removed the battery.

237. No accumulation of gas shall be removed in a district while shots are being fired therein.

238. He shall strictly observe the provision of general rule 12, subsections *a, b, c, d, e, f*, but in lieu of subsections *g, h, i* the following further precautions shall be enforced:—

- (1.) He shall not fire shots in any part of the mine without the authority of the manager in writing, called a "Firing Order," and when the work is completed, for which such specific instructions have been granted, the order must be returned immediately to the manager.
- (2.) He shall not fire a shot if there is any accumulation of gas, however small, within a radius of 50 yards, or if gas is being given off in dangerous quantities. He shall not fire a shot if there is in any place in the same ventilating district an accumulation of fire-damp sufficiently serious to prevent workmen entering or working therein with safety.
- (3.) He shall not fire a shot under any circumstances unless the place for a radius of 20 yards has been cleared of material accumulations of fine small coal or dust; the roof and sides and timber brushed clear of dust; all stringy or readily inflammable bark peeled from timber for 10 yards back from shot-hole; the roof, sides, and floor thoroughly saturated with water; the brattice-cloth damped for 5 yards back, and a wet cloth placed in a position to intercept the flame of a blown-out shot.
- (4.) If the shot is required on a haulage road worked by steam or other mechanical power, he shall remove from the mine all persons other than the men engaged in firing the shot, and such persons, not exceeding ten required for necessary work, as prescribed by general rule 12, subsection *i*.
- (5.) He shall not fire a shot if from any cause whatever he apprehends danger, and that thereby life or property would be in peril.
- (6.) He shall satisfy himself that the hole has been properly charged, and that only clay or other materials, approved by the manager, are used for stemming.
- (7.) He shall upon no account use, or permit to be used, gunpowder, and shall only use such other explosives as the manager may authorise.

239. He shall fire only one shot at a time, and before firing another shall return to the place and carefully examine it for fire-damp, and as to the security of the roof and sides, and shall not permit any person to enter therein (unless for repairs) until he has reported the same to be safe.

When an explosive is required, one of the permitted explosives under the Imperial Act is used.

At most of the collieries the miners use blasting-powder to assist them in getting down the coal in the whole mine, or first working, although it is seldom required in the removal of the pillars, which is called the "broken" or second working. Although

Although there are not many coal-mines in the Colony which would be described generally as very dusty, yet there is, in my opinion, sufficient dry coal-dust to be found on many of the main haulage roads to produce disastrous results under certain conditions.

The following explosions have taken place in England under the same stringent regulations as those contained in general rule 12, as the result of firing shots on dusty haulage roads:—

Camerton, 13th November, 1893	2 lives lost.
Timsbury, 6th February, 1895	7 „
Blackwell, 11th November, 1895	7 „
Brancepeth, 13th April, 1896	20 „

These collieries were practically free from fire-damp, being worked with naked lights, and were looked upon as particularly safe from explosions.

It is in some cases this false idea of safety, arising generally from an unbelief in the danger provided for, which produces indifference to regulations, and it is probable that the explosions named would not have occurred had the provisions of general rule 12 been carried out.

The dreadful explosion which took place at the Bulli Colliery on the 23rd March, 1887, resulting in the loss of eighty-two lives, which, according to the almost unanimous evidence given at the inquest, was caused initially by a gunpowder shot igniting fire-damp in the face of the headings, and was carried to the mouth of the tunnel by means of the fine dry coal-dust deposited on the main haulage road, and but for this latter element of danger the explosion would probably have been a local one, confined to the neighbourhood of the face of the headings.

In view of all these facts it is an important part of the duties of all colliery managers to impress upon all their officials and workmen the necessity for a strict observance of the regulations imposed by general rule 12. As an extra precaution they should not allow any gunpowder shots to be fired on main haulage roads without the written authority of the manager.

The short Act amending the use of explosives under the Imperial Act of 1887, which came into force on the 14th August, 1896, is as follows:—

In substitution for the Order dated 19th December, 1896.

ORDER made by the Secretary of State for the Home Department under Section 6 of the Coal Mines Regulation Act, 1896.

Whereas [by Section 6 of the Coal Mines Regulation Act, 1896, it is enacted that a Secretary of State, on being satisfied that any explosive is, or is likely to become, dangerous, may by order prohibit the use thereof in any mine or in any class of mines either absolutely or subject to conditions :

I hereby, in pursuance of the power conferred on me by the aforesaid section, make the following Order :—

Absolute prohibition of certain explosives in unsafe mines.

- 1.—(1) In all coal-mines in which inflammable gas has been found within the previous three months in such quantity as to be indicative of danger, the use of any explosive, other than a permitted explosive, as hereinafter defined, is absolutely prohibited in the seam or seams in which the gas has been found.
- (2) In all coal-mines which are not naturally wet throughout, the use of any explosive, other than a permitted explosive, as hereinafter defined, is absolutely prohibited in all roads, and in every dry and dusty part of the mine.

Conditional prohibition of other explosives in unsafe mines.

2. In all such coal-mines or parts thereof as aforesaid, the use of permitted explosives is prohibited unless the following conditions are observed :—

- (a) Every charge of the explosive shall be placed in a properly drilled shot hole and shall have sufficient stemming :
- (b) Every charge shall be fired by an efficient electrical apparatus, or by some other means equally secure against the ignition of coal-dust :
- (c) Every charge shall be fired by a competent person appointed in writing for this duty by the owner, agent, or manager of the mine, and not being a person whose wages depend on the amount of mineral to be gotten :
- (d) Each explosive shall be used in the manner and subject to the conditions prescribed in the Schedule hereto, or in any Schedule substituted therefor by any future Order :

Provided that nothing in this Order shall prohibit the use of a safety fuse in any mine in which inflammable gas has not been found within the previous three months in such quantity as to be indicative of danger.

Conditional prohibition of all explosives in main roads.

3. In every coal-mine the use of any explosive is prohibited in the main haulage roads and in the intakes unless all workmen have been removed from the seam in which the shot is to be fired, and from all seams communicating with the shaft on the same level, except the men engaged in firing the shot, and in addition such other persons, not exceeding ten in number, as are necessarily employed in attending to the ventilating furnaces, steam boilers, engines, machinery, winding apparatus, signals, or horses, or in inspecting the mine ; or unless a permitted explosive is used, and every part of the roof, floor, and sides of the main haulage road or intake, within a distance of 20 yards from the place where it is used, is, at the time of firing, thoroughly wet, either naturally or from the application of water thereto.

This section shall not apply to such portions of the main haulage roads and intakes as are within 100 yards of the coal face.

This section shall not authorise the use of any explosive in any case where the use of such explosive is prohibited by Section 1 or 2 of this Order.

Application of Order.

4. This Order shall not apply to mines of clay, or stratified or nodular ironstone, nor shall it apply to shafts in course of being sunk from the surface, or deepened, or to drifts and other outlets being driven from the surface, if such shafts, drifts, or outlets, are not ventilated by return air.

Where a mine contains several separate seams this Order shall apply to each seam as if it were a separate mine.

Definitions.

5. In this Order the term “permitted explosives” means such explosives as are named and defined in the Schedule hereto or in any Schedule substituted therefore by any future Order : provided that where the composition, quality or character of any explosive is defined in such Schedule, any article alleged to be such explosive which differs therefrom in composition, quality or character, whether by reason of deterioration or otherwise, shall not be deemed to be the explosive so defined : provided further that an owner, agent, or manager shall not be responsible for the composition, quality, or character of an explosive, if he shows that he has in good faith obtained a written certificate from the maker of the explosive that it complies with the terms of the Schedule, and that he has taken all reasonable means to prevent deterioration of the explosive while stored.

The

The term "road" includes all roads of any description extending from the shaft or outlet to within 10 yards of the coal face.

The term "main haulage road" means a road which has been, or for the time being is, in use for moving trams by gravity or by steam or other mechanical power.

Commencement.

6. This Order shall come into force on the first day of January, 1898.

Revocation of former Order.

7. The Explosive in Coal-mines Order, 1896, is hereby revoked from this date.

Citation.

8. This Order may be cited as the Explosives in Coal-mines Order, 1897.

M. W. RIDLEY,

One of Her Majesty's Principal Secretaries of State.

Home Office, Whitehall, 4th June, 1897.

*Schedule.—List of Permitted Explosives.**

Ammonite, consisting of Ammonium Nitrate not more than 89 parts and not less than 87 parts, uniformly incorporated with thoroughly purified di-nitro-naphthalene not more than 13 parts and not less than 11 parts, and with no other ingredient.

Provided that the explosive be used only in the form of blasting cartridges, not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case.

Provided also that the explosive be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 7 containing explosive of the Fifth (Fulminate) Class not less than 23 grains.

Ardeer Powder, consisting in every 100 parts of the finished explosive, of not more than 34 parts and not less than 31 parts of thoroughly purified nitro-glycerine with not more than 13 parts and not less than 11 parts of kieselguhr, with not more than 51 parts and not less than 49 parts of magnesium sulphate, and with not more than 6 parts and not less than 4 parts of potassium nitrate with or without the addition of not more than half a part of ammonium carbonate, and not more than half a part of calcium carbonate and with no other ingredient, the whole being uniformly incorporated and of such character and consistency as not to be liable to exudation.

Provided that the explosive shall be fired only by means of a detonator or electric detonator fuze, of not less strength than that known as No. 3 containing explosive of the Fifth (Fulminate) Class not less than 8 grains.

Provided also that the explosive shall not be fired in the frozen condition.

Bellite, No. 1, consisting of ammonium nitrate not more than 81 parts and not less than 79 parts, uniformly incorporated with thoroughly purified meta-di-nitro-benzol not more than 21 parts and not less than 19 parts, and with no other ingredient.

Provided that the explosive be used only in the form of blasting cartridges not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case or wrapper.

Provided also that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 7 containing explosive of the Fifth (Fulminate) Class not less than 23 grains.

Bellite, No. 3, consisting of ammonium nitrate not more than 94 parts, and not less than 92 parts uniformly incorporated with thoroughly purified meta-di-nitro-benzol not more than 8 parts and not less than 6 parts, and with no other ingredient.

Provided that the explosive be used only in the form of blasting cartridges not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case or wrapper.

Provided also that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 6, containing explosive of the Fifth (Fulminate) Class not less than 15 grains.

Carbonite, consisting in every 100 parts of the finished explosive, of not more than 27 parts and not less than 25 parts of thoroughly purified nitro-glycerine, with not more than 36 parts and not less than 30 parts of barium nitrate and potassium nitrate, or either of them, and with not more than 43 parts and not less than 37 parts of woodmeal, with or without not more than half a part of sulphuretted benzol, and not more than half a part of sodium carbonate and calcium carbonate, or either of them, and with no other ingredient, the whole being uniformly incorporated and of such character and consistency as not to be liable to exudation.

Provided that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 6 containing explosive of the Fifth (Fulminate) Class not less than 15 grains.

Provided also that the explosive shall not be fired in the frozen condition.

Dahmenite A, consisting in every 100 parts of the finished explosive, of not more than 93½ parts, and not less than 91 parts of ammonium nitrate, with not more than 6½ parts and not less than 4 parts of naphthalene, and with not more than 2½ parts and not less than 1 part of potassium bichromate, and with no other ingredient, the whole being uniformly incorporated.

Provided that the explosive be used only in the form of blasting cartridges not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case or wrapper.

Provided also that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 7 containing explosive of the Fifth (Fulminate) Class not less than 23 grains.

Electronite No. 2, consisting of ammonium nitrate not more than 91 parts and not less than 90 parts, uniformly incorporated with not more than ten parts and not less than 9 parts of woodmeal and starch, and with no other ingredient.

Provided that the explosive be used only in the form of blasting cartridges not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case or wrapper.

Provided also that the explosive be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 6 containing explosive of the Fifth (Fulminate) Class not less than 15 grains.

Kynite, consisting in every 100 parts of the finished explosive of not more than 27 parts and not less than 25 parts of thoroughly purified nitro-glycerine, with not more than 36 parts and not less than 30 parts of barium nitrate and potassium nitrate, or either of them, and with not more than 43 parts and not less than 37 parts of woodmeal, with or without not more than half a part of sulphuretted benzol and not more than half a part of sodium carbonate and calcium carbonate, or either of them, and with no other ingredient, the whole being uniformly incorporated, and of such character and consistency as not to be liable to exudation.

Provided that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 6, containing explosive of the Fifth (Fulminate) Class not less than 15 grains.

Provided also that the explosive shall not be fired in the frozen condition.

Roburite No. 3, consisting in every 100 parts of the finished explosive of not more than 89 parts and not less than 86 parts of ammonium nitrate, with not more than 13 parts and not less than 9 parts of thoroughly purified di-nitro-benzol, with or without not more than 2 parts of chloro-naphthalene containing of chlorine not more than 1 part, and with no other ingredient, the whole being uniformly incorporated.

Provided that the explosive be used only in the form of blasting cartridges not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case or wrapper.

Provided also that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 6, containing explosive of the Fifth (Fulminate) Class not less than 15 grains.

Westfalite, consisting of ammonium nitrate not more than 96 parts and not less than 94 parts, uniformly incorporated with gum-lac soluble in alcohol not more than 6 parts and not less than 4 parts, and with no other ingredient.

Provided that the explosive be used only in the form of blasting cartridges not containing their own means of ignition, and that every such cartridge be contained or enclosed in a thoroughly waterproof case or wrapper.

Provided

* This list remains unaltered. It is provisional only, and is subject to revision in accordance with the results of experiments which are to be made in the Government Testing Station now erected at Woolwich.

Provided also that the explosive shall be fired only by means of a detonator or electric detonator fuze of not less strength than that known as No. 8, containing of explosive of the Fifth (Fulminate) Class not less than 30 grains.

Provided that, in addition to the marking on the outer package containing any of the above explosives enjoined by an Order of the Secretary of State made under section 40 of the Explosives Act, 1875, and in force for the time being, such outer package shall bear the words "As defined in the List of Permitted explosives," together with the date of this Order. And further that each inner package shall be marked with the words "Permitted Explosive," and also with the name of the explosive, the date of manufacture, and the nature and proportion of the ingredients.

PLANS OF COLLIERY WORKINGS.

The regulations with reference to the keeping of plans showing the colliery workings are contained in section 28 of the Coal Mines Regulation Act, 1896.

This matter, in my opinion, does not receive the amount of attention it deserves from some owners and managers, and I have frequently had to point out the omission from the plans of details required by subsection (1), section 28.

It is advisable that the surveying and keeping of plans of colliery workings should be done only by efficient surveyors, who should have passed an examination and obtained a certificate approved of by the department. Until something of this nature is done it will be difficult to obtain the attention to this important matter which it deserves. At the same time I am pleased to say that at some collieries there are reliable and painstaking surveyors and well-kept plans.

There are many small coal-mines in the Colony which in times of depression in the coal trade are either permanently or temporarily abandoned, and I beg to call the attention of colliery owners and managers to the regulations on this matter contained in sections 30, 31, and 32 of the Coal Mines Act, 1896.

In some cases, where it is the intention only to temporarily abandon a mine, this, from unforeseen circumstances, may eventually prove to be a permanent abandonment; and the regulation contained in subsection (1) of section 32—which requires that "Where any mine or seam is abandoned the owner of the mine or seam at the time of its abandonment shall, within three months after the abandonment, send to the Minister an accurate plan showing the boundaries, the whole of the workings of the mine or seam up to the time of the abandonment, and the position of the workings with regard to the surface, and the general direction and rate of dip of the strata sunk through, or, if that is not reasonably practicable, a statement of the depth of the shaft, with a section of the seam; every such plan must be on a scale of not less than 2 chains to the inch, or on the same scale as the plan used at the mine at the time of its abandonment"—is apt to be lost sight of if not attended to at once.

The importance of the deposition of the plans of abandoned colliery workings has been forcibly impressed upon the mining community by an irruption of water into the workings of the Harvey seam of the East Hetton Colliery, in the county of Durham, England, on the 6th May last, from the workings in the same seam of the adjoining Cassop Colliery, when ten lives were lost. It appears from the evidence that the plan of the Harvey seam workings of the Cassop Colliery, abandoned about the year 1870, was not deposited at the Home Office, and it could not be traced by the manager of the East Hetton Colliery, who did all in his power to get a copy of it. If this plan had been available the serious accident referred to would not have taken place, but there was not any legal obligation to keep plans of colliery workings before the Coal Mines Act of 1872 in England.

METHODS OF WORKING COAL.

Broadly speaking, there are only two methods adopted for working coal, and these are:—

1. The bord and pillar or stoop and room system. This consists in forming galleries (variously called bords, rooms, walls, headways, headings, &c.) by excavating the coal and leaving rectangular blocks to support the roof, called pillars or stoops. This operation is technically called working the "whole" mine, whilst the operation of removing the pillars is called the "broken" or second working. Single and double stall are modifications of this system.
2. The longwall system consists in the entire removal of the coal in one operation, the roadways for haulage, ventilation, &c., being maintained through the waste goaf or gob. In this case the roof for the necessary roads is kept up by building solid stone packs by the side of them, whilst the remainder of the roof between these walls or stone packs is allowed to come down and close.

The system generally adopted in the Colony is that of the bord and pillar. In a few cases double stalls are being successfully worked.

The longwall system has been tried in a few cases, but has generally been abandoned.

When coal was first worked in the Colony it was obtained from the outcrops of the seams, where the amount of strata above the coal was inconsiderable.

In the course of time, as the coal near the outcrops became exhausted, deeper pits were sunk, and at the present time there are several collieries in the Newcastle district about 600 feet deep, whilst the Metropolitan Colliery, Helensburgh, is 1,100 feet deep; in fact some of the workings at the latter are 1,500 feet below the surface.

In the very shallow workings it was customary to get as much coal out as possible in the whole or first working, leaving only thin ribs of coal between the bords, and there was no intention, in most of these cases, to get any of the coal in these ribs by working the "broken."

As the deeper coal had to be worked, sufficient attention was not given to the additional amount of weight to be supported by the coal pillars, in consequence of the extra depth; and as the result of this the superincumbent strata crushed the pillars down, causing what is known in mining language as a "thrust" or "creep," by which all the old bords and walls which had been formed became closed up, and in some instances resulting in loss of life and property.

Frequently the bords were driven 8 yards wide, leaving from 4 to 6 yards of coal in the walls, and sometimes less than this, even in cases where there was 300 to 400 feet of strata above the coal.

In addition to the advisability of leaving larger pillars in order to prevent "thrusts" or "creeps," there are other reasons which might be urged in favour of large pillars as compared with small ones.

There are many natural conditions which require to be considered with reference to the methods of working coal, and the most suitable size of pillars to be left, but there are no peculiarities in the coal-fields of the Colony to prevent the pillars being left larger, and more especially in those cases when it is intended to remove them.

The

The following table, collected from various sources, shows the sizes of pillars left at various collieries in England and Scotland:—

Name of Colliery.	Seam.			Coal left in Yards.	Coal taken out.		Percentage of Coal.	
	Name.	Thickness.	Depth from Surface.		Bords.	Walls.	Taken.	Left.
Rainton, Alexandrina Pit	Low main	4 ft. 0 in.	240 to 420	20 x 15	5	2	32	68
Do Adventure do	do	3 " 9 "	300	60 x 40	5	2	14	86
Do Nicholson's do	do	3 " 9 "	450	22 x 12	5	2	36	64

Elemore	Hutton	4 " 6 "	570	28 x 12	5	2	35	65
Newbottle, Dorothea	Five Quarter	3 " to 3 ft. 8 in.	690	20 x 10	5	2½	41	59
Do do	do	3 " to 3 " 8 "	690	28 x 14	5	2½	32	68
Do do	do	3 ft. 4 in. to 3 ft. 8 in.	750	28 x 18	5	2½	28	72
Do Margaret	do	3 " 4 " to 3 " 8 "	750	28 x 16	5	2½	30	70
South Hetton	Hutton	5 ft. 0 in.	1,060	33 x 14	4	4	30	70
Marley Hill	Busty	5 " 0 "	432	50 x 20	5	3	21	79
Townley	Brockwell	2 " 10 "	504	30 x 12	5	2	27	73
Annfield Plain	Main coal	4 " 5 "	444	30 x 30	5	2	20	80
Killingworth	High main	6 ft. to 8 ft.	678	20 x 12	5	2	32	68
Allanshaw	do	7 ft. 0 in.	702	30 x 20	4	3	24	76
Wearmouth	Maudlin	6 " 10 "	1,620	40 x 40	4	3	16	84
Silksworth	do	5 " 8 "	1,620	50 x 50	4	2½	12	88
Garesfield	Brockwell	2 " 2 "	210	24 x 24	5	3	25	75
Castle Eden	Lowmain	3 " 0 "	900	33 x 22	5	3	26	74
Murton	Hutton	4 " 8 "	1,500	44 x 44	4	3	14	86
Eppleton	Main coal	6 " 6 "	1,038	33 x 44	5	2	16	84
Do	Hutton	3 " 6 "	1,350	66 x 33	3	5	15	85
Do	do	3 " 6 "	1,350	55 x 30	5	3	19	81
Do	Main coal	6 " 7 "	1,038	66 x 44	5	3	14	86
Clifton Hall	do	5 " 6 "	1,620	30 x 30	2½	2½	14	86

I am indebted to Bulman and Redmayne's "Colliery Management" and Pamey's "Handbook for Colliery Managers" for a portion of these particulars.

From an examination of this table it will be found that for depths up to 900 feet in the twenty-five examples given, the average depth is 518 feet, whilst the percentage of coal left in the pillars is 72·6, and that taken out in the whole mine is 27·4 per cent.

With pillars 31 yards by 8 yards, the bords being 8 yards wide, and the walls 2 yards wide, as is frequently left in the Colony, the percentage of coal taken in the whole mine is 53, whilst if the pillars are left 31 yards by 6 yards, which is not uncommon, the percentage of coal taken out in the whole is 60, thus leaving less than half the coal in both cases.

There are two or three instances in which larger pillars have been left, and it is to be hoped that there will be a greater tendency in this direction in the future.

On this matter the following references are made in the valuable report of the Court of Investigation appointed to inquire into the Stockton Colliery accidents. At the bottom of page 8 we find the following remarks:—"It has, however, been apparent that, apart from these difficulties imposed by nature, the colliery operations have been subject to serious interruptions, and the shareholders' interests have been sacrificed, by reason of a reckless and improvident system of mining, calculated to invite disaster. As early as 1889 (*vide* Mr. Humble), when the colliery was practically in its infancy, a crush took place, stopping work for some weeks; and similar trouble has been met with in later years. From an inspection of the plan, it is obvious that this trouble was due, not to unforeseen causes, but to the absence of adequate provision in the way of pillars to protect the working from the pressure of the superincumbent strata, known to consist largely of water-charged sandy alluvium, the security of the main shaft even being, from the same cause, not above suspicion. This absence of provision for the protection of ordinary working is regrettable enough; but, when roads have suffered from the same cause, and as operations have extended matters have not improved materially, one is astonished that the management of a large colliery, warned by costly experience, should not adopt a system of mining fairly certain to ensure safety, and ultimately to prove the more profitable. The absence of sufficient barriers, or pillars of coal, to support main roads, and isolate different districts, seriously increases the difficulty of sealing off this fire, and has certainly intensified the danger."

HAULAGE.

The haulage of the coal is performed principally by:—

- | | |
|----------------------------------|------------------------|
| 1. Horses. | } Actuated by engines. |
| 2. Main and tail rope | |
| 3. Endless rope | } Worked by gravity. |
| 4. Ordinary self-acting inclines | |
| 5. Endless " " " | |

On account of the thick and nearly level seams, large horses are extensively used, and they are frequently taken up to the working face to haul the coal. There

There are several collieries well fitted up with extensive main and tail rope and endless rope haulage worked with steam engines. In one or two instances auxiliary engines for secondary haulage are fixed at a considerable distance from the shafts, where the engines are worked by compressed air, which is taken down the mine in pipes from the air-compressing plant working on the surface.

There are more installations of the main and tail rope than of the endless rope system, although the tendency is to adopt the endless in preference to the former method of haulage; and having regard to its acknowledged superiority over the main and tail rope system, and the favourable conditions which exist for its more general adoption, it is probable that it will find more favour in the future.

Where the inclination of the seam is sufficient, and in favour of the full tub or towards the shaft, ordinary self-acting inclines are worked, and sometimes also self-acting endless inclines, both of which systems are economical and expeditious methods of haulage.

Where mechanical means are used for haulage, it is advisable, whenever this is possible, to provide a separate travelling road for the men, boys, and horses, in order to reduce the chances of accidents on the haulage roads. This is already done in many cases, and will probably be extended in the future, especially if managers, when laying out their workings, will take the precaution of providing for the separate travelling road being driven.

LIGHTING OF MINES UNDERGROUND.

The only colliery in the Colony where safety-lamps are entirely used for the underground workings is at the Metropolitan Colliery, Helensburgh, where a considerable quantity of fire-damp is regularly given off with the freshly-exposed surfaces of the coal.

Locked safety-lamps are also used for the purpose of examination before the miners commence work, in those mines where inflammable gas has been found within the preceding twelve months, in terms of general rule 4.

Where naked lights are used the Scotch miner's oil lamp is the usual one adopted, and these are hung by means of a hook to the miner's cap.

When the miners are engaged in charging or stemming their holes for blasting, it is a dangerous practice to allow this light to remain fixed on the cap, and the special rules forbid this being done as many accidents have resulted from sparks igniting the charge. In Scotland, where this light is in general use, it was found necessary to add a special rule to meet this contingency, in view of the regular accidents occurring from this cause.

In a few instances, the electric light has been applied for lighting the main roads about the shaft bottom, where it is found most useful and much safer than oil or paraffin lamps.

METHODS OF SIGNALLING.

In shafts, the ordinary wire and lever signal is generally used, although the electric signal has been adopted in a few instances. On engine planes the use of the electric signals is very common, and is found to be much quicker than the old-fashioned method named above, besides having the distinct advantage that a signal can be given from any point in the plane or haulage road, which cannot be done with the wire signal.

AMBULANCE.

With a view of affording working miners and others engaged in coal and shale mines an opportunity of obtaining such instruction as will enable them to render "First aid" to the injured, the Secretary for Mines and Agriculture appointed a committee under the name and style of the New South Wales Government Ambulance Corps.

The officers of this corps are:—Patron, The Honorable Sydney Smith, M.P.; President, Mr. D. C. McLachlan, J.P.; Committee, Dr. S. T. Knaggs, Dr. G. P. M. Woodward, Dr. W. L'Estrange Eames, Surgeon-Colonel W. L. Williams, P.M.O., Dr. Clifton Sturt, and Messrs. A. A. Atkinson, John Dixon, F.G.S., T. L. Bates, F.G.S., and W. Humble, F.G.S.; Secretary, Mr. H. Dalrymple Wood.

The committee arranges for the formation of classes, and, at the conclusion of the course of the instruction, for their examination.

To such members of these classes as attain the standard of proficiency prescribed by the committee, certificates are issued.

Each of the classes on its formation is provided with copies of the Ambulance Handbook issued by the authority of the Railway Commissioners and of Service Stretcher Drill, and with triangular bandages and blankets. If a class be put to the expense of hiring a hall for its use the corps shares with it the cost.

Already classes under the auspices of the corps have been established in connection with a number of the most important of the mines in the Northern district.

The following information in regard to these and other classes enjoying the benefits provided by the corps may be of interest:—

Name of Class.	Name of Surgeon-Instructor.	Number in attendance at class.	Number of Candidates who attended Examination.	Number of Candidates who obtained Certificates.	Name of Examining Officer.
Bulli	Surgeon-Captain Clifton Sturt, M.S.C.	38	20	20	Surgeon-Colonel W. L. Williams, P.M.O.
Burwood	Dr. Harwood	30	do do do
Lambton	Dr. Stapleton	34	17	17	do do do
Merewether.....	Dr. Wm. Clarke.....	30	30	30	Dr. G. P. M. Woodward, Railway Medical Officer.
Minmi (No. 1).....	Dr. A. Morton Gladden	27	24	22	do do do
Newcastle (Central)	Dr. W. L'Estrange Eames	36	16	16	do do do
Plattsburg	Dr. H. K. Bean	33	25	24	do do do
Stockton	Dr. J. W. Hester	33	11	11	Surgeon-Colonel W. L. Williams, P.M.O.
Wallsend	Dr. H. K. Bean	26	12	12	Dr. G. P. M. Woodward.
Do	Dr. J. B. Nash	24	16	16	Surgeon-Colonel W. L. Williams, P.M.O.
West Wallsend	Dr. J. Preston Hocken...	20	13	13	Dr. W. L'Estrange Eames.
Genowlan (Capertee)	Dr. C. W. Purdey.....	24	
Charlestown	Dr. Pearson.....	19	

The committee, during the past year, after considering the various designs of stretcher, has decided to recommend the regulation field stretcher, known as Mark V, and used by the Medical Staff Corps, as the most suitable for use in and about mines.

As the result of a paper read before the committee by Dr. W. L'Estrange Eames, a sub-committee was appointed to consider the advisableness of establishing life brigades at mines. The sub-committee (which consists of Dr. Eames, Mr. A. Filmer, Electrical Inspector (Railways) for the Northern district, the Inspectors stationed in the north, and myself) has had several meetings, besides having made some experiments and inquiries.

BOARD FOR EXAMINATION FOR CERTIFICATES.

The constitution of the Board is as follows:—

- | | | |
|--|---|-------------------|
| Jesse Gregson, Esq., J.P. (<i>Chairman</i>), Australian Agricultural Company, Newcastle. | } | Mine Owners. |
| Wm. Sandford, Esq., Eskbank Iron Works, Lithgow | | |
| Thomas Saywell, Esq., 16, York-street, Sydney | } | Mining Engineers. |
| D. A. W. Robertson, Esq., J.P., Metropolitan Colliery, Helensburgh | | |
| Richard Thomas, Esq., J.P., Brown's and Duckenfield Collieries, Minmi | } | Miners. |
| L. B. Blackwell, Esq., The Vale Colliery, Lithgow. | | |
| Adam Cook, Esq., Wallsend | } | |
| W. T. Philpot, Esq., Corrimal | | |
| David Leake, Esq., Lithgow | | |
| John Dixon, Esq., F.G.S. (<i>Vice-Chairman</i>), Inspector. | | |
| Secretary to the Board—H. D. Wood, Esq., B.A., LL.B., Mines Department, Sydney. | | |

The examiners appointed by the Board for conducting the examinations were:—Messrs. W. Humble, F.G.S., H. Osborne MacCabe, J.P., and T. Cater.

The first examinations under the Coal Mines Regulation Act, 1896, were held at Newcastle on the 27th, 28th, 29th, and 30th January, 1897, and at Sydney on the 10th, 11th, and 12th of March, with the following results:—

RESULT of the Examinations for Certificates.

	First-class Certificates.		Second-class Certificates.	
	Number of Candidates.	Number of Passes.	Number of Candidates.	Number of Passes.
Newcastle	22	12	14	9
Sydney	6	1	14	6
Total	28	13	28	15

By permission of the Board for appointing Examiners, the questions put at the Examinations in 1897 are given herewith:—

EXAMINATION FOR FIRST-CLASS CERTIFICATES OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.

Technical College, Newcastle. First Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks.

Arithmetic.

- 6 1. If the wages and stores bill on 1,000 tons of coal selling at 6s. per ton amounts to £250, what is the profit after a 5 per cent. advance in wages and stores, and a corresponding rise of 9d. per ton in the selling price?
- 7 2. If Jones does a piece of work in four days, Smith does it in five days, and Robinson does it in eight days, how long would it take if they all worked together?

Geology.

- 6 1. If, in working a seam of coal, you came upon a part, where, although the roof and floor were unbroken, the coal had been replaced by stone, what inference would you draw as to the origin of this phenomenon, and how would you proceed in searching for the coal?
- 5 { 2. (a) How do you account for the fact that at and about West Maitland and Greta the strata are highly inclined, more so than the same strata some distance away? Give in detail the probable cause thereof.
- (b) Describe briefly the principal seams worked in the Illawarra district, mentioning the chief dykes, faults, and rolls met with in working. What is your idea as to the origin of the latter?
- (c) Give a brief account of the principal coal-seams in the Western district, specifying thickness and character of coal, and the chief faults and dykes met with in working.

NOTE.—Either (a), (b), or (c) may be attempted, but not more than one of them.

Surveying.

- 8 1. Give a sketch of a few workings in a mine, and show how you would keep your surveying book with bearings, distances, dip, width of places, and thickness of coal entered.
- 5 2. If a seam dips south from the outcrop at the rate of 1 in 8, what would be the depth of a shaft sunk to it 1½ mile away in the direction of full dip, assuming the surface to be level?
- 6 3. How would you proceed to find the area of a triangle when the three sides are given? Supposing they are 65, 75, and 82 yards, what is the area in acres?

Ventilation and Mine Gases.

- 10 1. If in a far off district in a mine you found the ventilation insufficient, what would you do to increase it, assuming the available pressure was already at its maximum?
- 11 2. What is the composition of air, fire-damp, and black-damp? Under what conditions may a small amount of explosive gas render a mine exceedingly dangerous? State what you would do if these conditions existed?
- 12 3. If you were called upon to lead the rescue work after an explosion, what are the principal points to which you would direct your attention so as to carry out the work as safely as possible?
- 8 4. If 15,000 cubic feet of air per minute flow along a road 6 feet high and 10 feet wide, what quantity would you expect to find in a roadway of similar length, but 6 feet high and 7 feet wide? (Pressure the same in each case.)
- 9 5. How would you ventilate a large and deep sinking shaft?

EXAMINATION

EXAMINATION FOR FIRST-CLASS CERTIFICATES OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.
 Technical College, Newcastle. First Day—Afternoon: 2 p.m. to 5 p.m.

Marks. *Coal Mines Regulation Act, 1896.*

What are the requirements of the Act regarding—

- 7 1. Duties and responsibilities of certificated managers?
 7 2. Ventilation?
 7 3. Withdrawal of workmen in cases of danger?

NOTE.—Candidates are not required to give word for word from the Act, but are expected to give the gist, and, if possible, the number of each section and subsection containing the information asked for.

Winning and Working of Coal and Shale.

- 10 1. What size of shaft would you sink in order to wind 1,000 tons of coal per day of eight hours from a depth of 1,000 ft.? Give approximate size of cages, ropes, chains, &c., and describe generally the shaft-fittings.
 10 2. Give sketches, both in plan and section, showing how you would lay out a shaft-bottom for the output mentioned in the previous question, giving width and number of tram-roads.
 13 3. Sketch and describe the longwall method of working, showing the course of ventilation and timbering of working-face.
 8 4. Explain how you would erect an important air-door. Suppose the dimensions were 6 ft. by 4 ft., what would be the pressure thereon if a water-gauge read $2\frac{1}{10}$ in.? What do you understand by this pressure?
 8 5. What are the benefits derived from the mode of working known as "following the whole up with the broken"? Would this kind of work suit in all cases; if not, why?

Machinery, Boilers, Pumps, &c.

- 11 1. How many boilers, and what kind, would you provide for an engine winding 1,000 tons of coal per day of eight hours from a depth of 1,000 ft.? Enumerate the fittings of a Lancashire boiler, and give pressure of steam for a given thickness of plate and diameter.
 9 2. What pressure per square inch would you expect to find on a pump forcing water to a vertical height of 825 feet? If the ram be 10 inches in diameter, about what size must the steam-piston be?
 13 3. Sketch and describe the Waddle fan.
 7 4. A beam of timber, the sectional area of which is 10 in. by 14 in., is prepared as a cap-piece for securing the roof of a roadway, how would you fix it, and how much stronger would it be one way than another?

EXAMINATION FOR FIRST-CLASS CERTIFICATES OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.
 Technical College, Newcastle. Second Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks. *Arithmetic.*

- 6 1. How many tubs of stone are got out of a stone-drift 200 yards long, 8 feet wide, and 6 feet high, each tub carrying $12\frac{1}{2}$ cwt., and the S.G. of stone being twice that of water?
 6 2. A district of pillars measures 32 chains by 24 chains. How many tons of coal are contained if the seam be 6 feet high and 60 per cent. of the coal has been won? One cubic yard = 18 cwt.
 7 3. What would be the pressure in lb. per square inch on 6-yard pillars underlying 320 feet of strata, assuming that 8-yard bords have been wrought, and that the pressure is 1 lb. per square inch per foot of depth?

Geology.

- 7 1. What are the characteristics of (a) a good steam-coal, (b) a good gas-making coal? Give the approximate composition of each.
 7 2. Trace the gradation between bituminous, semi-bituminous, and anthracitic coal. What forces have operated in changing a bituminous coal into an anthracite?
 7 3. If in driving a level the coal is thrown out by a fault, which shows no definite indication of its being an upthrow or a downthrow, how would you proceed to search for the seam? Take the No. 6 (Borehole) seam as an example.

Surveying.

- 5 1. After surveying and chaining over undulating ground, what must be done before starting to plot? Show how it is done.
 7 2. What methods have been adopted to connect the surface and underground surveys, assuming you have only one shaft available for the purpose?
 5 3. What percentage of coal is left in pillars where bords 6 yards wide and headings 3 yards wide have been driven, the pillars being 30 yards long and 12 yards wide?

Ventilation and Mine Gases.

- 12 1. In a single heading, ventilated by brick brattice, a fall takes place, breaking the brattice and fouling with explosive gas 100 yards of the heading beyond the fall. Explain by a sketch how, after removing the fall, you would restore the ventilation, assuming that the strata were broken to a great height.
 11 2. What are the gases generated by spontaneous combustion in coal-mines. Give the composition and describe fully the properties and peculiarities of each gas.
 7 3. A fan 30 feet in diameter is running at 40 revolutions per minute, and producing 100,000 cubic feet of air. Find the theoretical water-gauge, the H.P. in the air, and the I.H.P. of the engine, assuming the percentage of useful effect is 62.

EXAMINATION FOR FIRST-CLASS CERTIFICATES OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.
 Technical College, Newcastle. Second Day—Afternoon: 2 p.m. to 5 p.m.

Marks. *Coal Mines Regulation Act, 1896.*

What does the Act require regarding—

- 6 1. Approaching old workings?
 8 2. The construction and use of safety-lamps?
 5 3. Employment of inexperienced men as coal getters?

NOTE.—Candidates are not required to give word for word from the Act, but are expected to give the gist, and, if possible, the number, of each section and subsection containing the information asked for.

Winning and Working of Coal and Shale.

- 10 1. A sinking shaft 15 feet in diameter, before reaching hard rock, must pass through (say) 100 feet of soft and jointy strata which must ultimately be walled: When and how would you do it?
 10 2. Assuming average conditions as regards strata, &c., what number of sinkers per shift would you employ in a shaft 13 feet in diameter? If the shaft be wet, what explosives would you use, and how would you fire them?
 14 3. Explain by the aid of sketches how you would proceed to repair the sides of a furnace shaft, assuming that the ventilation must not be materially retarded.
 8 4. Suppose there are two seams dipping south 1 in 9 and separated by 200 feet of strata, how would you proceed to win and work both at the same time, and so that the produce could be drawn from the bottom of one shaft?
 9 5. What is the principal danger to be guarded against in the extraction of small pillars overlaid by a hard and thick roof of sandstone? (The depth is about 200 feet, and the adjacent bords are twice the width of pillars.)

Machinery,

Machinery, Boilers, &c.

- 13 1. Give a brief description of a pit top arrangement for dealing with 1,000 tons of coal in eight hours with a minimum amount of manual labour.
- 10 2. What, in your opinion, is the best method of signalling in shafts and on engine planes?
- 8 3. With a mean pressure of 40 lb. per square inch., and a piston speed of 200 feet per minute, what size of cylinder is required to give 70 I.H.P.?
- 9 4. What direct weight would be required on a safety valve 4 inches in diameter to give a pressure of 80 lb. per square inch.?

EXAMINATION FOR SECOND-CLASS CERTIFICATES OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.

Technical College, Newcastle. First Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks.

Arithmetic.

- 5 1. If 240 tons of coal are hewn at 2s. 2d. per ton, 425 at 2s. 6d., and 300 at 2s. 7½d., what amount of money is paid for the total, and what is the average hewing rate?
- 6 2. If the wheeling of 800 tons of coal, in tubs carrying 12 cwt., amounts to £8 6s. 8d., what must be the scorage rate to amount to the same sum?

Winning and Working of Coal and Shale.

- 6 1. Enumerate the rules you consider necessary to control and regulate the sinking of a shaft.
- 6 2. What do you understand by the panel system of working coal? What are the advantages claimed for this system in a fiery mine?
- 6 3. Assuming a fairly good roof and clean seam, explain how you could apply a modification of the longwall system to the extraction of pillars. Make a sketch showing this, and how the face is timbered and secured.
- 8 4. Make a sketch and give dimensions of a large air-crossing.
- 8 5. Show by sketches how you would timber and secure a roadway the roof of which has broken away from a point 8 or 10 feet above the coal. Assume the seam to be giving off explosive gas.
- 6 6. With endless-rope haulage up a grade of 1 in 6, what precaution would you take to guard against accidents by slipping of clips, breaking of rope, &c.?

EXAMINATION FOR SECOND-CLASS CERTIFICATE OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.

Technical College, Newcastle. First Day—Afternoon: 2 p.m. to 5 p.m.

Marks.

Coal Mines Regulation Act, 1896.

What does the Act require as regards—

- 7 1. Inspection of working-places?
- 6 2. Refuge-holes on engine-planes and horse-roads?
- 6 3. Timbering?

NOTE.—Candidates are not required to give word for word from the Act, but are expected to give the gist, and if possible the number of each section and subsection containing the information asked for.

Ventilation and Mine Gases.

- 6 1. If the sectional area of an airway be reduced one-half, how does it affect the quantity of air passing? If there be 10,000 cubic feet per minute before the reduction, how much will pass afterwards?
- 6 2. If an accident happened during working-hours to a very important air-door, what would you do, assuming the mine to be constantly giving off gas? What provision could be made, generally, to minimise the consequences of such an accident?
- 6 3. What quantity of air passes in a shaft 15 feet in diameter, the velocity being 425 feet per minute?
- 6 4. Make a sketch of four or five bords showing how you would conduct a current of air to the face of each.
- 5 5. In a moderately fiery seam where shot-firing is permitted only after the miners leave the mine, how would you instruct the shot-firer to proceed with his work?

EXAMINATION OF SECOND-CLASS CERTIFICATES OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.

Technical College, Newcastle. Second Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks.

Arithmetic.

- 7 1. Divide £20 10s. 4d. among six men and three boys, each boy to have half of the sum given to each man.
- 6 2. How many bricks would it take to build a stopping 10 feet wide, 6 feet high, and 9 inches thick?

Winning and Working of Coal and Shale.

- 5 1. What are the duties of an Under Manager and a Deputy in a mine which gives off fire-damp freely?
- 6 2. What consequences are likely to arise from a blown-out shot? How would you guard against such an occurrence?
- 8 3. Show by sketches how you would fix chocks, props, and holing sprags in a seam with an inclination of one in four.
- 8 4. Sketch and describe a water-gauge and a regulator. If the latter be necessary in bord and pillar working, where would you fix it, and why?
- 7 5. Suppose a series of working-bords are approaching old workings containing noxious gas or water, what would you do? Explain fully the precautions you would take.
- 6 6. How is it water cannot be siphoned beyond a given height? What is that height, and what conditions must always be observed when fixing a siphon?

EXAMINATION FOR SECOND-CLASS CERTIFICATE OF COMPETENCY—27TH, 28TH, AND 29TH JANUARY, 1897.

Technical College, Newcastle. Second Day—Afternoon: 2 p.m. to 5 p.m.

Marks.

Coal Mines Regulation Act, 1896.

What does the Act require regarding—

- 5 1. Employment of boys?
- 8 2. Fencing off abandoned workings.

Ventilation and Mine Gases.

- 8 1. What is the composition of the gases met with in coal-mines? Give in detail all you know of the properties and dangerous character of each gas.
- 5 2. How is it that a furnace produces a current of air through the workings of a mine? Compare its action with that of a fan, and state which you prefer.
- 5 3. What is a dumb drift? Sketch and explain its advantages.
- 6 4. On entering abandoned workings situated on the rise side of a district your light is extinguished. What conclusion would you come to regarding the atmosphere you were in?
- 5 5. What is the principle of the safety-lamp?
- 6 6. In working longwall to the rise in a fiery seam, which part of a district would you keep in advance, having regard to the efficient ventilation of the face?

EXAMINATION.

EXAMINATION FOR FIRST-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. First Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks.

Arithmetic.

- 8 1. The headings of a new colliery are driven 7 feet high and 9 feet wide, their aggregate length being 2,000 yards, when a feeder of water is liberated which inundates the workings and rises 21 feet up the shaft, which is 14 feet in diameter: What is the quantity of water in the mine in—(1) tons? (2) gallons?
- 6 2. How many tons of coal are contained in a pillar 35 yards long, 8 yards wide, and 7 feet high, S.G. being 1.33? What would be the percentage of loss in tons, if in winning it you extracted 435 cubic yards?

Geology.

- 6 1. Give instances of dolerite intrusions. State their effect on our coal-seams.
- 5 2. Is geology of any service to a colliery manager? If so, what?

Surveying.

- 6 1. A survey has been made from A to B with a chain which on testing proved to be 2 inches over standard length—N. 50° E. 10 chains, S. 35° E. 5 chains, 90° E. 7 chains, N. 75° E. 15 chains: What would be the direction that you would lay out a straight tunnel from A and from B to meet? And what would be the length of line from A to B?
- 6 2. Detail the adjustments of the transit theodolite in the order in which you would make them.
- 6 3. Running a straight line for alignment of tunnel over steep ground, you come to a hill over which you can only get a short sight of 40 links in the line of tunnel: What means would you take to ensure your line being straight?

Ventilation and Mine Gases.

- 6 1. If, with a ventilating pressure of 3 lb. per square foot, you set in circulation 25,000 cubic feet of air per minute through an airway 6 ft. x 7 ft., what pressure would be required to produce double the quantity, other circumstances to remain the same?
- 10 2. Sketch the safest and best method of ventilating a mine, showing how you would lay out your workings so as to ensure the least damage in case of an explosion. (You may assume the extreme end of the workings to be not more than $\frac{1}{2}$ mile from the shaft.)
- 10 3. State the precautions you would take when putting in a furnace to prevent the surrounding strata taking fire. Illustrate your statement by sketches.
- 12 4. Give some of the leading features of some of the best ventilating fans, also their useful effect.
- 10 5. In a fiery mine, what lamps would you use—(1) for workmen? (2) for officials?—giving a description of each?

EXAMINATION FOR FIRST-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. First Day—Afternoon: 2 p.m. to 5 p.m.

Marks.

Coal Mines Regulation Act.

What are the requirements of the Act regarding—

- 8 1. Payment of persons employed in mines by weight?
- 6 2. Prohibition of single shafts?
- 6 3. Inspection of machinery?

Winning and Working of Coal and Shale.

- 10 1. What would be your first operation if you were directed to open a seam of coal:—
(i) Where outcrop is exposed?
(ii) Where outcrop does not come to surface?
In determining the site of your winning, to which would you give the greater weight—circumstances favouring surface arrangements, or circumstances favouring underground arrangements?
- 10 2. The direction of a full dip of a seam, dipping 1 in 3, is S. 35° E.: In what direction would you have to drive tunnels from each side of your down-cast shaft so as to rise 1 in 150?
- 10 3. A seam of coal 5 feet thick is dipping S. 45° E. 1 in 40, and the property is bounded by the following lines:—Commencing at N.E. corner, bounded on the north by line W. 80 chains; on the west by a line S. 160 chains; on the south by a line E. 80 chains; and on the east by line N. 160 chains: How would you open out and develop this property, the outcrop and outlet to market being on the northern boundary?
- 10 4. Describe the method of sinking and walling, and how a shaft in course of sinking is kept circular and vertical; and state if in sinking you met with a strong blower of gas, what steps you would take to make the shaft in a fit state for working?
- 10 5. Give your opinion as to the best method of sinking through a quick-sand. Should you favour tubbing, describe the method of putting it in, and say what thickness of metal you would use in a shaft 16 feet diameter, head of water 156 feet; also, what the effect of gas behind tubbing is, and how you would guard against it.

Machinery and Boilers.

- 10 1. Sketch and describe the detaching hook you would use, and its action.
- 10 2. State the various cage conductors used in winding shafts. Give sketch showing method of fixing those you prefer to use.
- 10 3. A road 1,500 yards long rises in-by 1 in 15: Which is the most economical system of getting out the coal in this case? Sketch the appliances you would fix, give the weight of rails you would lay, and state the size of rope you would use to get out 600 tons in 8 hours.
- 8 4. Show, by sketch, how you would fix a return wheel for the tail rope.

EXAMINATION FOR FIRST-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. Second Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks.

Arithmetic.

- 6 1. How many tons of coal are contained in 5 acres, if the seam is 8 ft. 6 in. thick with 9-inch band of dirt running through it? The seam has a slope of 1 in 5, specific gravity of coal being 1.28.
- 6 2. Find square root of 10125.716 to three places of decimals, and of .10125716 to four places of decimals.
- 6 3. What would be the income from £10,000 invested in 2 $\frac{3}{4}$ per cent. Consols at 102? What would be the gain or loss by transferring to 2 $\frac{1}{2}$ per cent. at 97?

Geology.

- 8 1. Were all rocks formed at one period of time? If not, name some of the recent periods as they apply to New South Wales, as well as the oldest rocks that have hitherto been determined here.
- 8 2. What is meant by the terms:—Amorphous, hade, dip, synclinal, outlier, siliceous, argillaceous, concretionary?
- 5 3. Detail, in the order of their occurrence, the seams found in—

- (i) The Newcastle District.
(ii) The Southern District.
(iii) The Western District.

NOTE.—Either (i), (ii), or (iii) may be attempted, but not more than one of them.

Surveying

Marks.

Surveying.

- 6 1. You have to make a new winning of a seam of coal on a property which has been partly worked. You are supplied with a tracing of old workings, upon which is shown two shafts half a mile apart connected with the old workings. How would you proceed to prepare your working plan in order to indicate thereon the proper position of the old workings?
- 6 2. You are driving two headings bearing due south and separated by a pillar of coal 2 chains wide. You wish to connect them by a cross-cut at two points 175 yards from each other measured on the meridian. What is the length of the cross-cut?
- 6 3. What is the diameter of the circle of which this is the segment?

*Ventilation and Mine Gases.*

- 12 1. Give the constituents and chemical symbol of—
Light carburetted hydrogen ;
Carbonic acid ;
Carbonic oxide ;
Sulphuretted hydrogen.
- 10 2. What are the gases evolved by explosion of—
(I) Gunpowder ?
(II) Dynamite ?
(III) Fire-damp ?
- 10 3. You are conducting the exploration of a mine which has been idle. The fan has not been working, and fire-damp is standing in the downcast shaft. How would you proceed ?

EXAMINATION FOR FIRST-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.
Technical College, Ultimo, Sydney. Second Day—Afternoon : 2 p.m. to 5 p.m.

Marks.

Coal Mines Regulation Act, 1896

What are the requirements of the Act regarding :—

- 5 1. Overwinding ?
6 2. (I) Boiler Fittings? (II) Fencing machinery ?
9 3. Use of Explosives below ground ?

Winning and Working of Coal and Shale.

- 10 1. Give a sketch of a shaft in which winding and pumping is carried on with cages, guide-ropes, &c., and, say, two columns of delivery pipes.
- 10 2. If your seam is highly inclined would you make any difference in the size of your shaft-pillars to the rise and dip? If so, on which side of the shaft would you leave the larger one?
- 10 3. Give a few practical remarks on the important question of timbering, and show by sketches :—
(I) How a bord should be timbered ?
(II) How coal should be spragged during the process of holing ?
(III) How a roadway 9 feet wide should be supported ?
(IV) How a wood chock should be built ?
- 10 4. What is your opinion with respect to coal-dust, does it form an important element in colliery explosions ; if so, in what way ?
- 10 5. If you were working a seam subject to sudden outbursts of gas, what precautions would you take in your leading headings to guard against such outbursts ?

Machinery, Boilers, &c.

- 10 1. Sketch in plan and section the arrangement of a sinking pit top, 16 feet in diameter, to comply with the Coal Mines Regulation Act, 1896 ?
- 10 2. A Lancashire boiler is 35 feet long, 7 feet diameter, and $\frac{1}{2}$ inch Lowmoor iron. What is the greatest pressure of steam that you would allow it to work at? Show your rule for determining this?
- 10 3. Describe the arrangement you would recommend for dealing with an output of 700 tons of coal per day, so as to market a clean coal; the seam being 6 feet high, and having three dirt bands in it, each of which averages 2 inches in thickness.
- 12 4. Explain Davy's differential gear as applied to pumps placed under ground. What are its advantages.

EXAMINATION FOR SECOND-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. First Day—Morning : 9:30 a.m. to 12:30 p.m.

Marks.

Arithmetic.

- 5 1. You have a circular air-way 4 feet in diameter : What is its area? Give the side of a square air-way three times the above area.
- 7 2. If your wages bill is £1,590 for an output of 7,500 tons of coal, and your timber, stores, &c., amounted to $7\frac{1}{2}$ per cent. of the wages account, what would be the cost per ton?

Winning and Working of Coal and Shale.

- 5 1. If you were working a thin seam of coal, how high would you make your travelling roads and horse roads? And why?
- 6 2. You have levels in process of driving : Describe how you would ventilate them, and how you would fix up brattice-cloth.
- 8 3. Is the longwall system of working advantageous? If so, under what conditions? In a seam 4 feet thick, what width of packwalls are necessary at a depth of 600 feet?
- 8 4. How would you timber and pack your working places, when there is not sufficient material to pack the roof tight along the face?
- 8 5. If you were working a fiery mine, what precaution would you take to guard against an explosion?
- 6 6. What is the benefit of splitting the air? And say whether, in your opinion, any one method of ventilation is applicable to all mines.

EXAMINATION

EXAMINATION FOR SECOND-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. First Day—Afternoon : 2 p.m. to 5 p.m.

Marks. *Coal Mines Regulation Act, 1896.*

- What does the Act require as regards—
- 5 1. Dimensions of travelling road?
 - 5 2. Securing of roof and sides?
 - 8 3. Periodical inspection on behalf of workmen?

Ventilation and Mine Gases.

- 5 1. What means, other than the anemometer, would you use to measure the quantity of air passing?
- 6 2. Sketch and describe the use of an air crossing. How does it enable you to reduce the number of doors in a mine? Also, state how you would take the air to the face of a bord or other working place.
- 5 3. You are driving a pair of headings on the level, one pair on the dip, and another pair on the rise; all are the same distance from the shaft: Which would be the most easily ventilated? And why?
- 5 4. A mine employs 200 men, 40 boys, and 35 horses in a shift; no inflammable gas is given off: How many cubic feet of air per minute would you supply?
- 6 5. The same number of men, boys, and horses as in previous question are employed in a mine giving off 3,000 cubic feet of light carburetted hydrogen per minute: How much air would you supply?

EXAMINATION FOR SECOND-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. Second Day—Morning: 9:30 a.m. to 12:30 p.m.

Marks. *Arithmetic.*

- 7 1. What is the value of 1,025 tons 2 cwt. 3 qr. 17 lb. at 5s. 11d. per. ton? What would be the price per ton if an 11% increase were charged? And how many tons, &c., would require to be sold to produce the same amount of money?
- 5 2. Express 5 cwt. 1 qr. 15 lb. in decimals of 1 ton of 2,240 lb. to four places of decimals.

Winning and Working of Coal and Shale.

- 8 1. If an explosion occurred at your mine while your pit was working, blocking the downcast shaft, and your return air passed over the furnace, what immediate steps would you take to get the men out of the mine?
- 3 2. If in driving a heading in the coal you met with a fault leaning back at the roof, where would you search for the coal?
- 9 3. Make sketches showing all parts of a self-acting incline in a seam inclined 1 in 12. Give gradients of the bank-head and bank-foot.
- 5 4. What gradients would you consider advisable on a horse-road, so that the haulage could be done most economically?
- 6 5. Sketch the best known method of spragging the coal to protect the workmen while holing, when the coal is worked longwall.
- 8 6. If you were in charge of a sinking shaft and had a walling crib to send down and lay, describe how you would perform the operations.

EXAMINATION FOR SECOND-CLASS CERTIFICATE OF COMPETENCY—10TH, 11TH, AND 12TH MARCH, 1897.

Technical College, Ultimo, Sydney. Second Day—Afternoon : 2 p.m. to 5 p.m.

Marks. *Coal Mines Regulation Act, 1896.*

- What does the Act require as regards—
- 8 1. Signalling and man-holes for travelling planes worked by machinery and animal power?
 - 6 2. Option of using downcast shaft?

Ventilation and Mine Gases.

- 5 1. What is the maximum and minimum rate per minute air should travel at in working places?
- 6 2. What are the causes of vitiation of air in coal-mines?
- 7 3. Of what material would you build main stoppings, and of what thickness? Give a sketch showing the form in which you would build stoppings alongside main roads where the sides are of friable coal; showing dimensions.
- 7 4. Describe how you would construct a main separation door. Give a sketch showing the frame, and how you would hang the door with relation to the direction of the air current.
- 6 5. Describe a box-door; the materials used; and the way to set it.
- 6 6. An air-course is 8 ft. x 7 ft. and 700 yards long. What pressure will be required to force 16,800 cubic feet per minute along it?

MINES temporarily abandoned.

LIST of Exemptions granted during the year 1897.

Date when Granted.	Name of Mine.	Description of Exemption.
1897. 1 January	Northumberland, Newcastle	From payment by weight. Expires 1st April, 1898.
1 March	Australian Kerosene Oil and Mineral Company's Mines at Katoomba, Joadja, and Capertee.	From provisions as to dimensions of communication between two shafts or outlets.
8 October	Morris's Colliery, Lambton	From provisions as to shafts or outlets, exempted until further notice.

COMPARISON OF IMPERIAL AND COLONIAL COAL-MINE ACTS.

As most of the coal-mine managers in the Colony, and many of the officials and miners, are conversant with the regulations of the Imperial Coal Mines Regulation Act, 1887, and seeing that the enactment in force in this Colony is constructed upon the latter as a basis, I have thought it advisable to point out how far the two differ, and the following is an account of the same.

1. *Certificated Managers and Under-managers.*

In this Colony, in the case of a mine in which not more than twenty persons are employed, it is not necessary to employ a manager provided with a certificate (see sub-section II, section 2) as it is sufficient for the manager to hold a permit from an inspector, such permit remaining in force for twelve months, which may be renewed at the option of the inspector.

In the United Kingdom a mine in which not more than thirty persons are employed below ground, may be exempt from having a manager, unless the inspector of the district notifies in writing that it should be under the control of a manager.

Certificates of service as managers may be granted in this Colony by the Minister under section 8 to every person who satisfies him either that before the commencement of this Act he was acting, and has since that date acted, or that he has at any time within five years before the commencement of this Act, for a period of not less than twelve months, acted in the capacity of an inspector or of a manager of a mine, or such part of a mine, as can under this Act be made a separate mine for the purposes of this Act. It must, however, be proved that during the twelve months there has been an average of not less than thirty miners employed below ground, under the control of the applicant for the said certificate—this is the same for under-managers.

Certificates of competency or of service granted under the Imperial Act are accepted as equivalent in all respects to a similar certificate granted under our Act, as also any others which may be approved by the examiners.

2. *Inspection.*

Our Act stipulates that every inspector shall hold a first-class certificate of competency or service, as provided in regard to managers, which condition is not attached to the Imperial Act. It has been argued strongly by mining engineers in England that inspectors should have held a manager's position for at least five years before being allowed to act as inspector.

The powers of inspectors are precisely the same under the two Acts, and are embraced under the following four heads:—

- (I.) To make such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine.
- (II.) To enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine.
- (III.) To examine into and make inquiry respecting the state and condition of any mine, or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine, or any mine contiguous thereto, or the care and treatment of the horses and other animals used in the mine.
- (IV.) To exercise such other powers as may be necessary for carrying this Act into effect.

Though an inspector may consider that workmen are in danger, he has no power under the Act in force here to withdraw workmen from a mine. To give them this power might possibly at some future time involve the Government in unnecessary responsibility and financial loss.

If the inspector, however, finds any defect or dangerous practice (see section 20) in connection with any mine, he may give notice in writing to the owner, agent, or manager to have the same remedied or discontinued. If the owner, agent, or manager objects to remedy the matter complained of in the notice, he may within ten days after the receipt of the notice, send his objections in writing to the Minister, after which the matter has to be determined by arbitration in the manner provided by section 25 of the Act.

In general rule 7 is explained the law with reference to the withdrawal of workmen in case of danger, this power being in the hands of "the person for the time being in charge of the mine," and this may be either the manager, under-manager, or deputy. The rule is as follows:—"If at any time it is found by the person for the time being in charge of the mine, or any part thereof, that by reason of inflammable gases prevailing in the mine, or any part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be withdrawn from the mine or part so found dangerous, and a competent person appointed for the purpose shall inspect the mine or part so found dangerous, and if the danger arises from inflammable gas, shall inspect the mine or part with a locked safety-lamp; and in every case shall make a true report of the condition of the mine or part; and a workman shall not, except in so far as is necessary for inquiring into the cause of danger or for the removal thereof, or for exploration, be readmitted into the mine, or part so found dangerous, until the same is stated by the person appointed as aforesaid not to be dangerous. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person who made the inspection."

The duties of withdrawal and inspection under this rule in ordinary circumstances will devolve upon the deputy, as he is generally the person in charge of the mine, or a part thereof, although in important or dangerous cases, it should be performed by the manager or under-manager, and does not come within the province of the duties devolving upon the inspector of mines.

After the fall of roof which took place in the Wickham and Bullock Island Colliery on the 1st October last, the workmen refused to resume work until a written report had been made by the inspector, although one had been made by the deputy in charge of the district in the mine when the fall had taken place.

This request seems to have been made under a misapprehension, the workmen possibly thinking that the duty of making the abovenamed report still rests with the inspector, as in subsection 5, section 12 of the Coal Mines Act, 1876.

Having regard to opinions expressed in conversation with mining engineers and miners in this Colony, with reference to the duties and powers of inspectors under the present Act, I have thought it advisable to enter somewhat fully into this matter.

Arbitration.

Arbitration.

There are no differences of any importance under this head between the two Acts.

Coroners.

In both Acts an inspector may only examine witnesses subject to the order of the coroner.

In subsection VIII, referring to any relative of any person whose death may have been caused by an explosion or an accident with respect to which an inquest is being held, under the Imperial Act he can only examine witnesses subject to the order of the coroner, whilst under our Act he can examine witnesses, but no reservation is made of being subject to the order of the coroner.

4. Returns, Plans, Notices, and Abandonment.

Returns by Owner, Agent, or Manager of Mine.—This is the same in both Acts.

Plan of Mine to be kept at Office.—The following words in subsection (r), section 28, of our Act, do not appear in the Imperial Act:—"And in addition to the above-named plan there shall also be provided a tracing of a surface-plan on the same scale, showing thereon all streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the said boundary."

Subsections (v) and (vi) of our Act are not included in the Imperial Act, and are as follows:—

"(v) Every copy as aforesaid shall be deposited in the principal office of the Department of Mines and Agriculture, and, except as evidence in a Court, no copy thereof shall be furnished, nor information in relation thereto given; but if, on the complaint of any owner or lessee of the surface, or the accredited officer of any municipality, that his or their rights or interests may be affected by the working of the mine, the Minister thinks fit so to direct, the inspector shall furnish a tracing of such part of the workings as are situated under the surface in respect of which complaint has been made.

"(vi) If any officer shall furnish any copy, tracing, or information, or shall allow any person to inspect any such plan or tracing, unless directed by the Minister as aforesaid, he shall be guilty of an offence against this Act."

Notice to be given of Accidents in Mines.—This is the same in both Acts.

Notice to be given of Opening and Abandonment of Mine.—The only difference under this head is that in subsection (iv), which requires notice to be sent to the inspector of the district of any change in the name of the mine, owner, agent, or manager, &c. In the Imperial Act two months are allowed, but only one month in our Act.

Fencing in case of Abandoned Mine.—This is the same in both Acts.

Plan of Abandoned Mine or Seam to be sent to Minister.—This is the same in both Acts.

Employment of Boys and Females.—In this Colony the Act stipulates that no female shall be employed in or about a mine, whilst according to the Imperial Act they may work on the surface, but not underground.

The limit of age of first employment of boys about a mine here is 14 years, whilst under the Imperial Act the age is 12 years.

Boys may not be employed here for more than nine hours for the first five days of the week, six hours on one Saturday, and eight hours on the next Saturday; whilst under the Imperial Act the regulation is that they shall not be employed for more than fifty-four hours in any one week, nor more than ten hours in one day. One hour for meals is allowed under our Act, whilst nothing is stated in the Imperial Act about this.

Wages.—The two Acts under this head are practically the same, the principal difference being that here power is given to any Justice or Clerk of Petty Sessions to summon an owner or agent of a coal-mine for recovery of wages due for labour done in the mine, provided that the sum does not exceed £50.

Single Shafts.—The only differences are that the local enactment requires that shafts shall not be sunk nearer to one another than 50 yards, whilst under the Imperial Act this distance is fixed at 15 yards; and the communication between the two shafts in the Colony shall not be less than 4 feet wide and 6 feet high, whilst the Imperial Act requires that it shall not be less than 4 feet wide and 3 feet high.

Division of mine into parts.—This is the same in both Acts.

Part II.—Rules.

9. General Rules.

Ventilation of Mines. Rule 1.—Whilst the provisions of the two Acts are similar in so far as they require that an adequate amount of ventilation shall be constantly produced, &c., in every mine, our Act, however, is more explicit, and further provides that "not less than 100 cubic feet per minute for each man, boy, and horse employed in the mine, which air (in that proportion but with as much more as the inspector shall direct) shall sweep along the airways and be forced as far as the face of and into each and every working place, where man, boy, or horse, is engaged or passing, main return airways only excepted."

That part of the second paragraph of rule 1 of our Act requiring the division of the air into splits of not more than seventy men in each, (except where longwall is worked) and that the intake air shall travel free from all stagnant water, stables, and old workings, does not appear in the Imperial Act.

Rules 2 and 3 are the same in both Acts—these refer to dumb drifts, and the position of a fan so as to insure its being uninjured by an explosion.

Stations and inspection of condition as to ventilation, &c., Rule 4.—The only difference is that in subsection (i) paragraph 4 of the rule under our Act are the words "the condition of the ventilation," which are not included in this rule in the Imperial Act.

Inspection of machinery, &c. Rule 5.—This is the same in both Acts.

Fencing of entrances.—This is the same in both Acts.

Withdrawal of workmen in case of danger.—This is the same in both Acts.

Use of safety-lamps in certain places.—This is the same in both Acts.

Construction of safety-lamps.—This is the same in both Acts.

Examination

Examination of safety-lamps and lamp stations.—These are the same in both Acts.

Use of explosives below ground.—The only differences in rule 12 under this head are as follows:—At the latter end of subsection (d) of our Act are the following words “nor in any mine or part of a mine in which safety-lamps are required by this Act to be used shall dry coal or coal-dust be used for tamping,” which in the Imperial Act reads “nor shall coal or coal-dust be used for tamping.”

At the latter part of subsection (e) are the words “Provided that in cases where a fuse is used no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge;” this does not appear in the Imperial Act, but is provided for in the special rules of each district.

Water and bore holes.—This is the same in both Acts.

Signalling and manholes for travelling planes worked by machinery.—Our Act stipulates that the places of refuge shall be at least 6 feet high, 3 feet wide, and 4 feet deep, whilst in the Imperial Act the size is not mentioned.

Manholes to be kept clear.

Dimensions of travelling roads.

Fencing of shafts.

Trolley over pit mouth.

Fencing of entrances to shafts.

} These are the same in both Acts.

Sinking Pit to be cleared of gas.—This clause of rule 21 does not appear in the Imperial Act.

Securing of roof and sides.—This is the same in both Acts.

Timbering.—This is the same in both Acts.

Option of using Downcast shaft.—This is the same in both Acts.

Attendance of engineman.

Means of signalling for working shafts.

Overwinding.

Cover overhead.

Chains.

Prevention of rope slipping on drum.

Brake and indicator.

Fencing machinery.

Safety-valves and gauges for boilers.

Barometer.

Stretchers.

Wilful damage.

Observance of directions.

Books and copies thereof.

Periodical inspection on behalf of workmen.

Person not to be employed in coal-getting without experience.

} The rules under these heads are the same in both Acts.

Penalty for interference with office of Check Inspector or Check Weigher.—This rule is not contained in the Imperial Act.

Penalty on non-compliance with rules.—The provisions are the same in both Acts.

Special Rules.—The only difference between the two Acts under this head is that in the Colonial Act the Governor (see rule 55, page 32) may make and publish a set of special rules which shall be deemed the special rules under the Act, so long as no other special rules have been framed in that mine.

Legal Proceedings.—In subsection (ii) section 59, five pounds is substituted for two pounds in the Imperial Act, for an offence committed after notice has been given by an inspector.

Miscellaneous.—After a sum not exceeding one hundred pounds has been deposited by the person laying the complaint, that an encroachment is suspected (see rule 73), gives power for the Minister for Mines to authorise an inspector together with a mining surveyor to inspect with a view to ascertain if such encroachment has been made, and the extent of it.

There is no such provision in the Imperial Act.

NOTICES RECEIVED DURING THE YEAR 1897.

The following notices were received during the year of new mines opening out or in course of development, mines reopened, sinking pits, driving tunnels, change of ownership, &c.:—

Bellambi Colliery.—Mr. George Cater, manager, notified on 6th January that Mr. Enoch Heath has been appointed under-manager.

Mount Pleasant Colliery.—Mr. Charles S. Byrnes, general manager, notified on 7th January of having appointed Mr. Thomas Cook manager of the colliery, in lieu of Mr. P. Lahiff, deceased.

Quarry Colliery, Waratah.—Mr. Benjamin Tonks notified on 3rd March that he had commenced to work J. Ruttley's colliery at Waratah, and requests permission to act as manager.

Durham Colliery, near Redhead.—Mr. Frank Croudace notified on 29th March having started four men to get fire-coal for the engines.

Hillside Colliery, Merewether.—Mr. William Leigh, on 31st March, notified having purchased the above colliery.

South Bowenfels Mine, near Lithgow.—Mr. Frank Burton, on the 10th April, notified having commenced prospecting for coal on his selection, 220, by driving a tunnel into the outcrop to good coal 2 ft. 10 in. in thickness.

Teralba Colliery, Teralba.—Mr. Andrew Sneddon notified on the 12th April of having commenced operations at the above colliery, with a view to work same.

Wallarah Colliery, Catherine Hill Bay.—Mr. Joseph Sperring notified on the 20th April that he had begun sinking a shaft on the company's estate near the jetty, for mining purposes.

New Anvil Creek Colliery, Greta.—Mr. Benjamin Yates notified on the 7th June of having started to drive the headings.

Sydney Harbour Collieries Company, Sydney.—Mr. J. L. C. Rae notified on the 17th June that his company had begun shaft-sinking operations on their ground at Long Cove, Balmain. On the 26th June also notifies that he is the company's manager.

The Pacific Co-operative Colliery, Teralba.—The colliery manager (Mr. J. A. Neilson) notifies on the 21st June his intention to reopen a shaft on the company's property during the week, known as shaft on the "Selections."

Northern Extended Colliery, Teralba.—Mr. William Sneddon, colliery manager, notified on 21st July that he had commenced sinking a shaft for the better ventilation of the colliery.

Coalcliff Colliery, Illawarra.—Mr. E. Vickery notified on 27th July that he was the owner of Coalcliff Colliery; also that he had appointed Mr. John McGeachie colliery manager.

Electric Colliery, North Lambton.—Mr. Wm. Holmes notified on 6th August that he had just cleaned out the shaft, with the intention of getting coal.

Cardiff Colliery, Cardiff.—On 3rd September Mr. Charles Horsefield notified that he had taken possession of Cardiff Colliery from the late proprietors, Campbell and Whitton, and will start to draw coal on the 6th or 7th instant.

New Lambton Colliery.—Mr. James Ruttley notifies that on 20th September Mr. Thomas would be the responsible manager of the mine.

South Wallsend Colliery, Cardiff.—Mr. George Leishman, manager of the Commercial Bank of Australia, notified on 21st September that he had appointed Mr. Geo. Leitch manager of the South Wallsend Colliery, in place of Mr. A. Gardiner.

New Anvil Creek, Greta.—Mr. Benjamin Yates on 4th October notified that he had resumed operations on the above date.

In conclusion, I wish to express my appreciation of the cordial and valuable assistance which I have at all times received from Mr. John Dixon, senior inspector of collieries, my predecessor in office, as well as of the manner in which my other colleagues, Messrs. Rowan, Bates, and Humble, have assisted me.

I am glad to say that the colliery managers and the miners generally have shown a disposition to co-operate in such a way as to ensure the carrying out of the Coal Mines Act, 1896.

I beg to send herewith the annual reports of the inspectors Dixon, Rowan, Bates, and Humble.

I have, &c.,

A. A. ATKINSON,
Chief Inspector of Coal and Shale Mines.

The Under Secretary for Mines and Agriculture.

Senior Inspector of Collieries' Report.

Merewether, 10 January, 1898.

To the Honorable Sydney Smith, Esq., M.P.,
Secretary for Mines and Agriculture, &c., &c.,—

Sir,

In compliance with the provisions of section 21 of the Coal Mines Regulation Act, 1896, 60 Vic., No. 12, I have the honor to submit my report for the year ending 31st December, 1897. From the commencement of the year till 13th September last, when the present Chief Inspector of Coal-mines, Mr. A. A. Atkinson, took charge of the Coal-fields Branch, I carried out the whole of the duties pertaining to that office, and also endeavoured to inspect as many collieries as possible, besides investigating several accidents.

During the term embraced by this report I made 146 colliery inspections, investigated 15 accidents, and travelled about 6,700 miles (exclusive of underground travelling).

The following is a list of the collieries usually inspected by me, also number of men, &c., employed underground, quantity of air, &c. :—

1. A.A. Co.'s New Winning, near Newcastle.—About 380 men, &c., are employed in this colliery, and the total quantity of air in circulation is about 90,000 cubic feet per minute.

2. A.A. Co.'s No. 2 Colliery.—About 97 men, &c., are employed in this colliery. Quantity of air per minute, about 40,000 cubic feet. The whole of the miners are engaged in pillar extraction, and the utmost care appears to be exercised by officials and workmen in the matter of safety to all concerned.

3. Newcastle Coal Co.'s A Pit Colliery.—About 300 men, &c., are employed in this colliery, and the total quantity of air in circulation is about 88,000 cubic feet per minute.

4. Newcastle Coal Co.'s B Pit Colliery.—About 309 men, &c., are employed in this colliery, and about 95,000 cubic feet of air per minute is circulated through the mine.

5. Burwood.—In this colliery about 286 men, &c., are employed, and the total quantity of air in circulation is about 52,000 cubic feet per minute.

6. Waratah.—About 190 men, &c., are employed in this colliery, and the total quantity of air in circulation is about 55,000 cubic feet per minute. Extensive improvements and alterations have recently been made at this colliery. A new iron pit-head frame has been erected at the A pit, which is the main winding shaft. This is a massive and graceful lattice iron frame 75 feet high to centre of pulleys; is strong and well braced, and is no doubt the heaviest frame of the kind in this district, or in the colonies. The pulleys are 15 feet diameter, and are set on springs (the bearings rest on strong springs) to save any jerk when the cage is being lifted from the pit bottom. The frame is set on concrete and brick foundations. Both winding ropes are fitted with detaching gear to prevent overwinding. The whole erection was completed while the mine was working and without the loss of an hour. An "Excelsior Schiele" fan for ventilating purposes has also been erected in connection with the B pit, upcast shaft. And at this shaft a new timber pit-head frame has been put up, and all requisite machinery is in readiness for raising or lowering persons when required. The endless-rope system of haulage will shortly be in use underground. When this is completed, the Waratah may truly be called a "modern colliery."

7. New Lambton.—About 29 men, &c. are at present employed in this colliery. The total quantity of air per minute is about 8,000 cubic feet.

8. Hillside, Merewether.—In this mine the No. 2 or Burwood coal-seam is worked; 6 men, &c., are employed below ground; and the total quantity of air is about 5,000 cubic feet per minute.

9. Ebbw Vale.—The No. 2 or Burwood seam is also worked in this colliery; about 23 men, &c., are employed below ground; and the total quantity of air is about 12,000 cubic feet per minute.

10. Durham.—Only two persons are employed at this colliery at the present time, keeping the mine free from accumulation of water.

11. Burwood Extended.—Operations ceased at this colliery in January, 1897, and the water has filled the whole of the workings, and also risen in both shafts. Both shafts are properly secured at surface.

12. Shortland's.—This is a new winning to work the No. 2 Burwood seam near New Lambton Colliery. An adit is being driven, but only one person is employed.

13. Side Colliery, Newcastle Pasturage Reserve, Waratah, 2 men employed.

14. Quarry Colliery, Newcastle Pasturage Reserve, Waratah, 2 men employed.

15. Wright's Colliery, Newcastle Pasturage Reserve, Waratah, 1 man employed.

16. Morris' Colliery, Newcastle Pasturage Reserve, Lambton, 2 men employed.

17. Bayley's Reward, private property, Lambton, 2 men employed.

18. Jenkins' Colliery, private property, Lambton, 1 man employed.

19. Mawk's Colliery, private property, Lambton, 1 man employed.

20. Rosehill Colliery, private property, North Lambton, 1 man employed.

21. Electric Colliery, private property, North Lambton, 1 man employed.

22. Sunnyside Colliery, Lambton.—Work at present suspended.

23. Ray's Colliery, Lambton, totally abandoned.

24. Meredith's Colliery, Lambton, totally abandoned.

25. Mason's Colliery, Newcastle Pasturage Reserve, Waratah, abandoned.

26. Kayuga Colliery, near Muswellbrook.—Only one person employed below ground.

27. Centenary Colliery, Curlewis.—About 36 men, &c. are employed below ground, and the total quantity of air is about 8,000 cubic feet per minute.

28. Gunnedah Colliery, Gunnedah.—About 14 men, &c. are employed in this mine, and supplied with about 4,000 cubic feet of air per minute.

29. Morley Colliery, near Gunnedah.—All work suspended at present.

30. Gladstone Colliery, near Gunnedah.—No work being done at present.

31. Harbour Collieries, Sydney.—A great deal of work has been done in connection with this new winning during the year in the matter of levelling the surface, and otherwise preparing for sinking operations. Two large shafts have been commenced, and first-class machinery is now being erected, and it is expected that very shortly sinking will be again resumed at both shafts. Everything about the colliery appears to be of the most substantial character, and reflects the utmost credit on manager, contractor, and all concerned in this great undertaking.

In concluding my report on the various collieries inspected by me during the past year, I may be allowed to state that, so far as I have been able to judge, I have found both managers, officials, and workmen actuated by a desire to fully carry out the provisions of the Coal Mines Regulation Act, so far as is reasonably practicable.

Accidents.

Of the 15 accidents investigated by me during the term under notice, 3 were fatal and 12 non-fatal.

Eight of the non-fatal accidents were caused by falls of coal, and resulted in injuries more or less severe. One was caused by being crushed between a skip and a roadside prop; 1 by machinery at the surface; 1 by falling down steps near a boiler-shed; and 1 by powder burns by the ignition of blasting-powder in a tin bottle.

Of the 3 fatal accidents, 1 was caused by a fall of stone (roof); 1 by a fall of coal direct; and 1 by a blow from a prop which was forced out by a fall of coal.

I attended the inquest in connection with each fatal accident, and fully agree with the verdict of accidental death, as returned by the jury in each case. Each accident was reported on at the time.

I have, &c.,

JOHN DIXON, F.G.S.

Senior Inspector of Collieries.

Colliery Inspector Humble's Annual Report for 1897.

Hamilton, 3rd January, 1898.

The Hon. Sydney Smith, Secretary for Mines and Agriculture,
Department of Mines, Sydney,—

Sir,

I have the honor to report that, in pursuance of section 21 of the Coal Mines Regulation Act, 1896, I have exercised the duties of an Inspector of Collieries in the Northern District during the twelve months ending 31st December, 1897.

In doing so, I have inspected the collieries set out in the following table, which shows also the approximate number of men and boys employed underground, and the number of days inspection given to each colliery.

No.	Name of Colliery.	Approximate number of men and boys underground.	Number of days inspection given to each.
1	Stockton	239	31
2	Hetton	370	25
3	Wickham and Bullock Island	278	24
4	Co-operative	230	16
5	Wallsend No. 2	66	6
6	Maryland.....	38	10
7	Brown's No. 4.....	234	7
8	Brown's No. 2.....	91	6
9	Duckenfield.....	260	13
10	Seaham	200	8
11	West Wallsend	265	12
12	Killingworth	6	3*
13	Dudley	180	3†
14	Wallahah	165	6
15	Morrisett	6	6
16	South Hetton	2	4
17	Thornley	10	5
18	Bloomfield	10	5
19	Marshall's	1	5
20	Louis Vale	2	3
21	Ingance	3	5
		2,776	203

* New mine opening out. Idle the first half of the year.

† Also inspected on four days by Mr. Dixon.

During the year I have investigated 7 fatal, and 39 non-fatal accidents. Three of the latter were, however, not serious, and are therefore not included in the tabulated list of accidents given to the Chief Inspector for his report.

I am sorry to say that this number of accidents is abnormally large. There appears to be no defect in the Act or special rules to which can be traced any of these accidents, neither is there any change for the worse in the physical conditions of the seams which would render coal-getting more hazardous than before; in fact, the opposite is the case, there being decided improvement in many of the conditions under which our miners now work.

I have not been able to trace any accident to defective plant or dangerous working place.

The majority of accidents have been caused by falls of coal and stone, the former being due to insufficient sprags when holing the coal.

The miscellaneous underground accidents have been caused principally by boys falling off or getting into tubs while in motion.

The great majority of accidents by falls of coal (nearly 50 per cent. of the whole) is not at all creditable to either miner or official.

Many of them are directly due to extreme carelessness and lack of ordinary forethought.

Men working day by day at the face evidently get so accustomed to the danger attending the holing of coal that they no longer look upon it as such, or, if they do, they treat it with contempt. Only by strict attention to, and enforcement of, the provisions of the Act and special rules relating to this matter can many of them be averted. It is not sufficient that officials provide timber and sprags; they must see that such are used as the requirements of the regulations and circumstances of each case demand. This is plainly their duty, and I have impressed it upon them very frequently of late.

At the time of last inspection each mine was in fair order and condition.

I am glad to be able to record that in addition to the many excellent fans at work in the district Messrs. J. and A. Brown, of Minmi, have during the year started a Schiele fan to ventilate their No. 2 and No. 4 Collieries, thereby doubling the volume of air in the workings; and that the Stockton Coal Company is now pushing forward the erection of a Waddle fan to supersede the very moderate furnace they have relied on for many years.

During the excessive hot weather, when the surface temperature often exceeds 100° F., and approximates closely to the temperature of the column of air in many furnace-shafts, the efficiency of the furnace is seriously impaired. It is to be hoped that when opening out and developing future mines of reasonable size or magnitude coal-owners will provide fans capable of producing large and constant currents of air in the mine instead of attempting to ventilate by furnace, which is, as I have said, of little use in hot weather, and, unless well built and provided with a dumb drift, sometimes a source of great danger in a coal-mine.

The new Act is, in my opinion, working very well and smoothly, and has not, I venture to say, been the bugbear, financially, that some predicted it would be. The provision in general rule 1, requiring ventilation to be carried to the face of each working-place, is of great benefit to the men, and in a lesser, but still important, degree to the owners also.

In

In obedience to directions from you, I proceeded against the owner of Marshall's Colliery for non-fencing the top of a shaft, and against a miner of W. B. Island Colliery for "carrying a naked light on his cap while handling explosives." In both cases the defendants were fined.

The Seaham Colliery Manager reported to me that in November last he proceeded against one of his miners on a double charge of passing a fence and using abusive and obscene language when remonstrated with. The Co-operative Colliery Manager also reports that in December last he proceeded against two of his miners on charges of passing a fence and in "charging a hole for blasting while carrying a naked light on his head." The three defendants all pleaded guilty, and a fine was imposed in each of the four cases.

In addition to the work of inspection I have been engaged in Coal-fields Office, writing reports, &c., on sixty days; in Courts of Inquiry, District and Police Courts, and at Inquests, on twenty-seven days.

In the latter part of the year 1896 the Board for appointing Examiners did me the honor of appointing me one of the examiners for certificates of competency under the Coal Mines Act. You were pleased to approve of the appointment, and I have therefore during the year been engaged in this work on nineteen days.

In the performance of my duties during the year I have travelled (exclusive of the distance underground) 3,790 miles by train, tram, boat, coach, and saddle; and I have had six days' sick leave.

I have, &c.,

WILLIAM HUMBLE, F.G.S.,
Inspector of Collieries.

Colliery Inspector Bates' Report.

Newcastle, 11 January, 1898.

To the Honorable Sydney Smith, Esq., M.P.,
Minister for Mines and Agriculture, &c., &c., &c.—

Sir,

Pursuant to section 21 of the Coal Mines Regulation Act, 1896, I do myself the honor to submit my first yearly report on the coal and shale mines inspected by me during the year ending 31 December, 1897.

In the year under notice I have inspected at frequent intervals twenty collieries in the Northern District of the Colony, also assisting Mr. Inspector Dixon with the following mines under his supervision, during the period he was carrying out the duties of Examiner of Coal Fields, viz., A.A. Co.'s No. 2 Pit and New Winning, Newcastle Co.'s A. and B. pits, South Waratah, New Lambton, Ebbw Vale, Gunnedah, Centenary and Kyuga Collieries, and have inspected in Mr. Inspector Rowan's absence the following coal and shale mines in the Southern and Western Districts of the Colony, viz., Mount Kembla, Osborne-Wallsend, Mount Pleasant, Corrimal, South Bulli, Bellambi, Bulli, South Clifton, Coal Cliff, Metropolitan, Collins, Vale of Clwydd, Lithgow Valley, Oakey Park, Vale, Zig Zag, Hermitage, Eskbank, and Retort Coal Mines, also Joadja Creek, Hartley Vale and Genowlan Shale Mines.

I have investigated 21 accidents in the Northern District during the year under notice. Of these, 4 proved fatal, 2 by falls of coal, 1 by riding on skips, and 1 by premature explosion of shot.

In the non-fatal accidents 4 occurred by falls of coal, 2 by skips, 1 by premature explosion of shot, and 1 by pick falling in shaft.

Surface Accidents.—Two non-fatal accidents occurred whilst shunting waggons, and 1 by escape of steam from locomotive boiler.

The remaining 6 accidents were not of a serious nature.

In the discharge of the duties above enumerated, I have made 177 inspections, dealt with 21 accidents, and travelled 6,045 miles to and from the various coal and shale mines, in addition to a very considerable amount of walking underground.

COLLIERIES.

Wallsend Colliery, Main Tunnel Workings.—There are 457 men and boys employed underground in this portion of Wallsend Colliery. The ventilation is produced by means of a Guibal fan and also a furnace, and the quantity circulating through the workings is about 100,000 cubic feet per minute.

Lambton Colliery.—About 176 men and boys are employed underground in this mine, and the quantity of air circulating through the workings is 26,000 cubic feet per minute.

Elemore Vale Colliery, Wallsend.—Work at this colliery has been very intermittent during the year. At the present time there are 29 men and boys employed underground. The quantity of air in circulation is 8,000 cubic feet per minute; steps are being taken to increase this amount.

Northumberland Colliery, Fassifern.—There are 14 men and boys employed in this mine, and supplied with 5,000 cubic feet of air per minute.

Pacific Colliery, Teralba.—There are 149 men and boys employed in this mine and the quantity of air circulating is about 28,000 cubic feet per minute. A communication has recently been made between the workings and an air-shaft sunk some years ago, which will materially assist the ventilation.

Northern Extended Colliery, Teralba.—Sixty-nine men and boys are employed in this mine, and supplied with 14,000 cubic feet of air per minute.

Teralba Colliery, Teralba.—Work was resumed at this sinking shaft during the year, for the purpose of taking out the water; after a few weeks operations all work was temporarily suspended.

South Wallsend Colliery, Cardiff.—Very little work has been done at this colliery during the year. On the last inspection 10 men were employed. The ventilation was in fair condition.

Cardiff Colliery, Cardiff.—There are 28 men usually employed in this mine. The ventilation was in a satisfactory condition.

Hartley Hill Colliery, Cardiff.—This mine was opened several years ago and abandoned. Work was resumed during the year, and 4 men employed; but at the present time all work is temporarily suspended.

East

East Greta Colliery, West Maitland.—A large amount of opening-out work has been done at this mine during the year. The coal is drawn from two tunnels, driven the full dip of the seam, which is 45 degrees. The mine is worked with two shifts of men, the total number of men and boys underground being 185, and the quantity of air circulating, 18,000 cubic feet per minute.

South Greta Colliery, Farley.—There are about 37 men and boys employed in this mine, and supplied with 6,000 cubic feet of air per minute.

Denton Park Colliery, West Maitland.—This colliery was at work up to March last, since then all work has been suspended.

New Anvil Creek Colliery, Greta.—Very little has been done at this mine during the year, the chief work being the driving of prospecting headings. Three men are employed in the mine, and the ventilation is satisfactory.

Greta Colliery, Greta.—At the present time there are about 153 men and boys employed underground in this mine. The ventilation is produced by a Guibal fan, and the quantity of air circulating through the workings is 31,000 cubic feet per minute.

New Park Colliery, Singleton.—At this colliery there are two hauling tunnels. Twenty-eight men and boys are employed underground, and supplied with about 14,000 cubic feet of air per minute.

Ellesmere Colliery, Singleton.—No coal has been drawn at this mine during the year, but the roads, &c., have been kept in repair for resumption of work.

Elliott's Colliery, Singleton.—Two men are employed in this mine. The ventilation is satisfactory.

Rosedale Colliery, Singleton.—There are 5 men employed in this mine. At the last inspection the workings and ventilation were in a satisfactory condition.

Oakvale Colliery, Singleton.—One man is occasionally employed in this mine, the ventilation of which was satisfactory at last inspection.

Dulwich Colliery, Singleton.—There are usually 9 men employed in this mine, and supplied with a satisfactory amount of ventilation.

I have, &c.,

THOS. L. BATES, F.G.S.,
Inspector of Collieries.

Colliery Inspector Rowan's Report.

Wollongong, 10 January, 1898.

To the Hon. Sydney Smith, Esq., M.P., &c., &c., Mines Department, Sydney,—

Sir,

In accordance with section 21 of the Coal Mines Act, 1896, I have the honor to present my first annual report of inspections for the collieries and shale mines in the Southern and Western Districts.

I am pleased to report that generally speaking the conditions imposed by the new Coal Mines Act are being fairly well carried out. At first there were a few misunderstandings as to the legal interpretations of certain sections, but with the exception of that referring to the weighing of the coal this has passed away, and the Act is becoming better understood and carried out.

During the year there were 2 fatal accidents, 1 occurring on the branch railway of the Osborne-Wallsend Coal Company when the shunter was killed by being crushed between the waggon buffers when in the act of coupling them. The other fatal accident happened at the Vale of Clwydd Colliery whereby the hanger-on (onsetter) at the shaft bottom lost his life. He was caught by the descending cage whilst attempting to cross the pit bottom. There were 7 non-fatal accidents which are included in the Chief Inspector's report.

During the month of December a large Waddle fan was started at the South Bulli Colliery, producing about 50,000 cubic feet of air per minute more than the quantity obtained from the two furnaces. This is a very satisfactory result, and it is to be hoped that the other colliery owners using furnaces will adopt fans in preference, especially in those cases where the prevailing winds have such adverse effects upon the ventilation.

I have made 180 underground inspections, besides having attended to official duties in connection with formation of special rules, applications for the right to mine, and other matters.

In consequence of illness I was unable to carry on my official duties for two months.

I have, &c.,

JAMES ROWAN,
Inspector of Collieries.

GEOLOGICAL SURVEY OF NEW SOUTH WALES.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

Sydney, 14 January, 1898.

I have the honor to submit my Report on the Geological Survey Branch for the year 1897:—

Owing to the fact that the geological surveyors have been required to perform a considerable amount of work in connection with the distribution of the Prospecting Vote, the time available for original work in the way of mapping the geological formations of the Colony has been very much restricted, and in fact, very little has been done in this direction during the year. I take this opportunity of urging that such arrangements be made as will allow of the officers of this branch devoting their time and energies to the important work for which they are specially qualified.

A large number of papers having reference to the contemplated cancellation or reduction of gold-field reserves, has been dealt with. These have necessitated the inspection of large areas which the Lands Department proposed to alienate or lease for settlement purposes.

During the earlier months of the year much of my time was taken up with the work of the "Royal Commission on the Spontaneous Combustion of Coal Cargoes," of which I was a member. The Commission issued its report on the 28th April, 1897, making a number of recommendations in regard to the manner of loading ships with coal, and thus minimising the dangers to which such ships are liable in warm latitudes. The Commission was subsequently reappointed to carry out some further experiments and to watch the results of their recommendations.

During the greater part of the months of February and March I was engaged in investigating and mapping the geology of the Gunnedah Coal-field; a considerable amount of work still requires to be done before a report on this district can be completed, and I propose to do this at intervals in my spare time.

During the period just mentioned, and again in the month of June, I assisted Professor David in a geological examination of a considerable area of the Moonbi ranges near Tamworth. It is important that the section of country between Tamworth and Gunnedah should be carefully studied with the object of establishing the relationship between our Palæozoic formations. The Devonian and the Carboniferous formations appear to be both represented in this tract of country, and when the relationship has been defined the key to the geology of a large portion of the Colony will be provided, and will facilitate the subsequent work of the geological surveyors.

Towards the end of the month of July I made an inspection of the Wentworth Mines at Lucknow, and gave evidence before the District Court at Bathurst in an alleged case of ore-stealing.

During the early part of the month of September, in company with Mr. J. W. Boulton, Superintendent of Public Watering Places, I visited Grenfell, and inspected some springs which were supposed to indicate the presence of artesian water. I found that the country consisted of granitic and Palæozoic rocks, and that the springs were merely of local origin. I then accompanied Mr. Boulton to Finlay, near Berrigan, where we selected a site for an experimental bore. This portion of Riverina is underlain by pleistocene, and possibly by tertiary rocks; and although the occurrence of artesian water in the district is by no means certain, I am of opinion that the experiment of a trial bore is warranted, more particularly as the experience gained by the Hay bore points to the probability of, at any rate, a sub-artesian supply being obtained.

On the 19th of September I left Sydney for Western Australia, and did not return until the 14th November. The object of this trip was primarily to examine the famous telluride deposits of Kalgoorlie, as it was considered probable that similar deposits may occur in New South Wales, and may have been overlooked by prospectors owing to their not being familiar with the rare but extremely valuable tellurides of gold, and to the fact that these ores can be easily mistaken for iron pyrites by the uninitiated. A description of the geology of those portions of Western Australia visited by me forms an appendix to this report, and, by the courtesy of the Hon. the Minister for Mines, I was permitted to read it before the Australasian Association for the Advancement of Science, at the Sydney Session, early in January, 1898.

Altogether I was occupied in field work for 120 days during the year.

I have recently received from Germany a book entitled "Australasian Gold-fields," by Carl Schmeisser, Chief Inspector of Mines at Clausthal. Attached to the book are a number of plates, and in several of these Mr. Schmeisser has reproduced mining and geological sections from the Annual Reports of the Department of Mines, N.S.W.; probably through an oversight, however, he has omitted to acknowledge the source from which he obtained them. In thus borrowing the work of some of our officers (*e.g.*, Geological Surveyors W. Anderson, J. E. Carne, and G. A. Stonier), there can, I think, be no doubt that Mr. Schmeisser has paid us, though perhaps unconsciously, a high compliment.

Mr. Geological Surveyor J. E. Carne was engaged for four months during the earlier part of the year in continuing the prospecting operations along the Victorian Border, between Cape Howe and the head of the Murray. The result of this exploration, so far as the discovery of payable mineral deposits is concerned, was entirely unsuccessful.

Mr. Carne also reported on the stability of the natural foundations of the proposed retaining-wall for the dam at Denman, in connection with the scheme for prevention of floods in the Hunter River.

Mr. Carne acted for me, in my official capacity, during my absence in Western Australia.

In addition to dealing with a number of applications for aid from the Prospecting Vote, Mr. Carne furnished the following reports:—

1. Notes on the Geology and Mineral Resources of the south-east border of New South Wales between Cape Howe and the head of the Murray.
2. Report on the "Luck of Roaring Camp" Reef, near Brown's Camp, Victorian Border.
3. Notes on the Geology and Auriferous Deposits of the Wolumla Gold-field.
4. Notes on the occurrence of Tungsten Ores in New South Wales; with a register of localities.
5. Notes on Chrome iron ore, its mode of occurrence, mining, dressing, uses, and value, with a register of New South Wales occurrences.

Mr.

Mr. Geological Surveyor J. B. Jaquet's time during the year has been mainly occupied in connection with applications for aid from the Prospecting Vote.

He has, in addition, dealt with a number of papers having reference to the proposed cancellation or modification of Gold-field reserves. He also furnished the following reports:—

1. On a supposed diamantiferous volcanic pipe at Bingara.
2. On Rigby's Reef, near Major's Creek.
3. On the Bundarra Copper Lode.
4. On the newly discovered deep tin lead, near Elsmore.
5. On a further examination of the ironstone deposit, near Seaham.
6. On the cobaltiferous deposit at Port Macquarie.

Early in the month of March, an addition was made to the staff of this Branch by the appointment of Mr. J. A. Watt, M.A., B.Sc., as third Geological Surveyor. Mr. Watt had a very successful career at the Sydney University, and subsequently was awarded a travelling science scholarship, tenable for two years. He came to us with a high recommendation from Professor David, under whom he received his geological training, and he has already given evidence of his qualifications, which enables me to report that the appointment is a very satisfactory one for the Department.

Mr. Watt was at first employed in conjunction with Mr. Jaquet in making a thorough examination of the Captain's Flat Mine, and these two gentlemen then furnished a joint report on the prospects of the district.

Mr. Watt in addition to dealing with a large number of applications for aid from the Prospecting Vote, supplied the following reports:—

1. On a supposed diamantiferous deposit on portion 292, Parish of Upper Tarlo, County of Argyle.
2. On the iron ore deposits of Carlo's Gap.
3. On Winter's Reef, Parish of Barratta, County of Cunningham.
4. On the Nanima Creek and Gooda Gold-fields.

Mr. E. C. Whittell, Field Assistant, has been occupied during the whole year in reporting upon applications for aid from the Prospecting Vote.

Mr. G. W. Card, Mineralogist and Curator of the Geological Museum, has examined and named a large number of rocks and minerals; he has given much information to the public through the inquiry office, and he has registered and sent on for assay 5,131 samples, besides conducting the correspondence in connection with the returns.

He has also completed in a very satisfactory manner, the registration, arrangement, and labelling of the rock and mineral collections of the Museum.

The Geological Museum now contains a very creditable collection, and will prove of great value to students and other persons who may be in search of reliable information in regard to the geology and mineral resources of this Colony.

Mr. W. S. Dun, Assistant Palæontologist and Librarian, besides attending to the Library (which entails much routine work), and determining a large number of fossils collected by the members of the field-staff, has edited Parts 2, 3, and 4 of Vol. V of the Geological Survey Records. He has also made a translation from the French of Professor de Koninck's work on the Palæozoic fossils of New South Wales which will shortly be issued as a memoir. Mr. Dun has also taken a considerable part in the Museum work, having classified and labelled the palæontological collection, besides preparing a systematic catalogue of the types and figured specimens in the collection of the Geological Survey.

Mr. O. Trickett, L.S., has made a number of surveys and plans of the limestone caves which will prove of considerable use to visitors. It is proposed to publish these plans in the Annual Report, as the want of some such information about these beautiful works of nature has long been felt by the public.

In addition to conducting all the correspondence with the caretakers, and submitting recommendations in regard to proposed improvements at the Caves, Mr. Trickett has performed all the geological charting in connection with this Branch. I would also like to specially allude to the important work performed by this officer in the preparation of an index to the known localities of the various mineral occurrences in the Colony. This index was commenced several years ago, and is continually being added to as new discoveries are recorded. It is of very great value for reference purposes, and will be largely used by the Geological Surveyors in preparing reports on our mineral resources.

The reports of the various officers of the staff are appended hereto, and it affords me much pleasure to be able to add, in conclusion, that these gentlemen have all, without exception, worked well and harmoniously.

I have, &c.,

EDWARD F. PITTMAN,

Government Geologist.

The Under Secretary for Mines and Agriculture.

APPENDIX I.

REPORT on Country between Gunnedah and Mullally.

Geological Survey Branch, Mines Department, Sydney, 9 March, 1897.

I HAVE the honor to report that I have made a geological examination of the road between Gunnedah and Mullally, with the object of ascertaining whether artesian water is likely to be obtained at the latter place.

The Permo-Carboniferous coal measures extend from Gunnedah in a westerly and south-westerly direction to the Black Jack Range. In this range several fine seams of coal occur, and one of them is being extensively worked in several collieries. Above these Permo-Carboniferous beds (which are probably the equivalents of the Newcastle or upper coal measures) a coarse conglomerate, formed largely of jasper pebbles, forms a noticeable feature near the top of the range. The conglomerate is overlaid by thick bedded greyish white sandstones, and these again are covered by coarsely crystalline basalt, which forms the cap of the Black Jack Range. Although I was unable to obtain any distinctive fossils in these upper rocks, I am strongly of opinion that they are the basal beds of the Ipswich coal measures or Triassic artesian water basin. These rocks are first seen on the Mullally Road, about 9 miles from Gunnedah, and they extend thence, with a westerly or south-westerly dip, continuously to Mullally, being covered, however, for a considerable distance by basalt, which is probably of no great thickness except on the hilltops.

I am of opinion that a bore in the neighbourhood of Mullally might be expected to strike artesian water at a comparatively shallow depth; but I would not advise the putting down of a bore at any great distance to the north-east of Mullally, as the eastern margin of the triassic basin is apparently about 9 miles south-west of Gunnedah.

Section along road from Gunnedah to Mullally, about 24 miles.

Mullally is about 200 feet higher than Gunnedah, and the highest point along the road between the two places is 470 feet above Gunnedah.

The Under Secretary for Mines and Agriculture.

E. F. PITTMAN,
Government Geologist.

APPENDIX 2.

REPORT on proposed Reservoir on the Namoi River.

Geological Survey Branch, Department of Mines and Agriculture, 23 August, 1897.

THE site of the proposed reservoir on the Namoi River (Parish of Keepit, County of Darling) was inspected by me in March last; and, on the accompanying diagrams, I have given a geological sketch, plan, and section, showing the formations at the point where, I understand, it is proposed to construct the retaining-wall. The rocks are all of Palæozoic (Carboniferous) age.

Plan.

Section.

About

About a quarter of a mile north-east of the proposed retaining-wall is a bed of blue oolitic limestone, which shows only about 10 feet wide at the outcrop, though it will probably be somewhat wider below. I have traced this bed for a distance of 15 or 20 miles, and, in places, it is fully 100 feet thick.

Towards the south-west the limestone is succeeded by beds of volcanic agglomerate or tuff, claystones, and coarse conglomerates, containing large granite pebbles up to 15 inches in diameter. The general strike of the sediments is N. 35 W., and the dip of the limestones, volcanic agglomerates, and claystones, as well as the adjoining beds of the conglomerate, is north-easterly (E. 35 N.), at an angle of about 40. Farther to the south-west, however, the conglomerates, as may be seen in the section, are thrown into folds, an anticline being succeeded by a syncline or trough.

I am of opinion that the fissures alluded to by Mr. McKinny are caused by the influence of the atmosphere, and are not likely to extend far below the surface. Judging by the age and general character of the rocks, I am of opinion that they would be impervious to water, except, perhaps, to some extent, along their bedding planes.

If it be possible therefore to construct the retaining-wall to the north-east of the anticlinal fold, shown on the accompanying section, I do not think there would be any reason to fear leakage from the reservoir.

The Under Secretary for Mines and Agriculture.

E. F. PITTMAN,

Government Geologist.

Report on an application by the Grenfell Progress Committee for an Artesian Bore, near some Springs on the Grenfell-Cowra Road.

15 September, 1897.

I HAVE made an inspection of the springs referred to by the Grenfell Progress Committee, and also of the country between Cowra and Grenfell. The prevailing rocks are palæozoic quartzites and slates, with intrusive rocks such as granites and diorites. There is no evidence of the existence of any extension in this direction of the artesian basin, and I am of opinion that the springs are purely local, and that no good purpose would be served by putting down a bore anywhere between Cowra and Grenfell.

E. F. PITTMAN,

The Under Secretary for Mines and Agriculture.

Government Geologist.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 6 Jan., 1898.

I have the honor to hand you herewith a report on the geology and mineral deposits of those portions of Western Australia recently visited by me, and to inform you that I have brought back and placed in the Geological Museum a number of typical specimens of the telluride ores of Kalgoorlie. These ores, which contain a large proportion of gold in combination with tellurium, differ so much in appearance from the auriferous ores hitherto worked in the eastern colonies that their exhibition here should be of benefit in the way of enabling mining men to recognise similar ores which may possibly have been overlooked in this Colony. Ores of telluride of gold having now been proved to exist in Western Australia and Queensland, there is no reason why they should not be found to occur in some of the mines of New South Wales.

I have, &c.,

EDWARD F. PITTMAN,

The Under Secretary for Mines and Agriculture.

Government Geologist.

APPENDIX 3.

Notes on the Geology and Mineral Deposits of portions of Western Australia, by E. F. Pittman, A.R.S.M., Government Geologist of New South Wales.

[Read, by permission of the Hon. the Minister for Mines, Mr. Sydney Smith, before the Australasian Association for the Advancement of Science, at the Sydney Meeting, January, 1898.]

Physiography and Geology.

THE south-western portion of Western Australia is composed mainly of an elevated table-land, the western escarpment of which is formed by the Darling Range. This table-land reaches an altitude of about 1,400 feet (at Coolgardie), and the rocks of which it is composed are chiefly granites and crystalline gneisses, with occasional belts of metamorphic schists and dykes of diorite or other hornblende rocks.

West of the Darling Range, which is composed of the rocks just mentioned, are patches of mesozoic sediments; but the coastal district, in the centre of which the city of Perth stands, consists of undulating country, formed of a calcareous sand-rock of undoubted Æolian origin. The surface of this country is almost everywhere covered with a considerable thickness of fine loose sand, while occasionally along the shore-line, as at Fremantle and other points to the north of it, and also at Subiaco, between Fremantle and Perth, the calcareous sand-rock may be seen outcropping. It consists of a very porous rock, composed of angular grains of sand and fragments of shells loosely cemented. In places, as at Subiaco, there may be seen imbedded in the sand-rock irregular-shaped masses of limestone, evidently produced by the action of rainwater, containing carbonic acid, which has dissolved the shell fragments and redeposited the carbonate of lime in segregated masses.

There are no traces of regular bedding visible in this deposit of sand-rock, but the natural sections which occur along the coast, as at Fremantle and in several railway cuttings, exhibit very characteristic false bedding, the grains of sand having been disposed along planes which clearly represent the "angle of repose" of mounds of loose sand, and which therefore point to its wind-blown origin.

This rock has been assigned a post tertiary age by West Australian geologists, because of its containing the remains of marine shells and crustaceans which are identical with existing species. As far as I could ascertain, however, these fossil remains have not been found anywhere except along the coast, where the rocks have been exposed to the sea; and I observed that many potholes in the rock along the shore-line had been filled with recent shells, which had evidently become cemented to the sides, and now form part of a solid deposit. It is just possible, therefore, that all the fossil remains hitherto noticed may have had a similar origin, and that this Æolian deposit may really be of tertiary age.

Along the coast, in some of the points to the north of Fremantle, and also in the banks of the Swan River, the weathered rock presents a very beautiful aspect. The carbonate of lime has here been deposited through it in pipes or stalactitic forms, and the weathering has resulted in the sand-grains being removed, leaving a fantastic network of calcareous stalactites, which cross and interpenetrate in all directions, causing the cliff to assume the appearance of being covered by the most beautiful lacework.

The

The calcareous sand-rock of the coastal district has been and is being extensively used for building purposes in Perth and Fremantle, and it is also utilised as a foundation for roads, being afterwards covered with ferruginous gravel. The rock is very soft when freshly quarried, but hardens on exposure, and appears to stand well in buildings. It has also been exclusively used in the construction of the large moles or breakwaters which form such a conspicuous feature in the Fremantle Harbour improvements now being carried out under the supervision of Mr. C. Y. O'Connor, Engineer-in-Chief for Western Australia. At first sight it would appear almost incredible that such porous rock would resist the action of the waves, but experience shows that it answers the purpose admirably.

The Perth Artesian Water Supply.

The chief interest, however, which attaches to this Æolian sandstone, from a geologist's point of view, is due to the fact that it yields a fine artesian water supply. The width of this coastal strip of artesian water-bearing rocks, in an east and west direction, is about 15 miles. It reaches from the flanks of the Darling Range, near the Midland Junction railway station, to the sea; and it is believed to extend along the coast, to the north and south, for many hundred miles, forming a belt of rather low undulating country, the surface of which is composed of sand-hills.

At Guildford, 3 miles to the west of Midland Junction, a plentiful supply of water under pressure was obtained at a depth of about 400 feet, while at Perth a supply of 500,000 gallons per day was struck at a depth of about 800 feet. The source of the supply is the rain-water (averaging between 30 and 40 inches per annum) which falls upon the western slopes of the Darling Range, and which is absorbed by the sands at its base and sinks into the underlying calcareous sand-rock. As showing the extremely porous nature of this country, it may be mentioned that many creeks issue from the foot of the Darling Range, carrying strong bodies of water, which completely disappear before reaching the coast, 15 miles to the west. Quite a number of bores are now being put down for the purpose of utilising this underground water supply.

The islands off the coast, such as Rottnest, Garden Island, &c., are said to be composed of the same Æolian rock, and it is therefore evident that there must be a leakage of the artesian water into the Indian Ocean. The altitude of Perth above sea-level is 38 feet; that of Midland Junction is but 44 feet; Bellevue, 3 miles further east, is 57 feet; while Swan View, which is only 3 miles eastward of the latter place, has an altitude of 268 feet. From Swan View the Darling Range, composed of granite and gneiss, rises rapidly to a height of 1,000 feet above sea-level. There is one noticeable feature in the Perth artesian water basin, if it may be so called, wherein it differs materially from the ideal artesian basin described in text-books. It lacks the overlying impervious beds which are so often quoted as necessary for keeping the underground water in a state of pressure and preventing its escape to the surface. It is true that around Perth there are patches of clay under the sandy soil in places, but these are of local occurrence, and there do not appear to be any continuous beds which can be regarded as impermeable. In an interesting paper, read before the Royal Society of New South Wales,* Professor David exhibited an experiment which illustrated the reason why, in a one-sided artesian basin having leakage to the sea (like that of Queensland and New South Wales), the water was under sufficient pressure to rise above the surface in bores. He proved that the resistance offered by the sands and gravels through which the water was obliged to percolate before it reached the sea was sufficient to maintain the pressure necessary to force the water to the surface when bores were put down.

It appears evident that the same principle can be extended to explain why the artesian water in the Perth basin, although not covered by any continuous impermeable stratum, occurs under sufficient pressure to enable it to rise above the surface in the bores. The water in this case has to meet not only the resistance offered by the sand-grains in its passage to the sea, but also the resistance offered to its upward ascent by the overlying beds of calcareous sand-rock. In short, if sand-rock, porous though it be, offer such resistance to the lateral flow of water, it will offer even greater resistance to its vertical ascent. It appears possible, therefore, to have a complete artesian basin without any impermeable covering stratum, provided the porous intake beds outcrop at a sufficient altitude above the site of the boreholes to supply the necessary "head."

The Collie Coal-field.

I was able to make only a brief inspection of the Collie Coal-field, which is situated in a valley in the Darling Range, about 110 miles to the south of Perth, and about 30 miles to the east of the seaport of Bunbury, with which it will shortly be connected by railway. The coal-field has an altitude of about 600 feet above sea-level. Unfortunately it does not offer many facilities, in the way of natural sections, to the geologist, for it consists of undulating country, the lower portions of which are for the most part covered by sand, while the hills are capped by a deposit of tufaceous conglomerate, which is a marked surface feature of the whole of the south-west portion of the Colony, and which may, probably, be of Pleistocene age. Along the banks of the Collie River conglomerates and sandstones are visible in a few places, but there does not appear to be any continuous section which would allow the sequence of the beds to be observed.

The coal measures evidently rest in a basin the floor of which is composed of granite, and the known coal seams have been discovered either by boring or by sinking near the northern margin of the field; for their outcrop is in every case hidden by the surface accumulations of sand, &c.

A coal seam of considerable thickness (12 or 13 feet I was informed) was opened in what is known as the Government Mine, and about 500 tons of coal have been extracted by an inclined shaft or tunnel following the dip of the seam, which is more or less in a southerly direction. These workings being now full of water could not be inspected. A second seam is visible in a shaft at a depth of about 70 feet in an adjoining property. This seam consists principally of carbonaceous shale in the midst of which is a small seam of coal not thick enough to be economically worked. A number of other seams are said to have been discovered by boring, but as the only evidence supplied was the material brought up, for the most part in a fine state of division, it is probable that some of these seams may have partly consisted like the one already mentioned, of carbonaceous shale.

There

* Journal Royal Society of New South Wales, 1893, Vol. xxvii, p. 428. "Notes on Artesian Water in New South Wales and Queensland," by T. W. E. David, B.A., F.G.S., Professor of Geology, Sydney University.

There appears to have been a considerable amount of controversy as to the quality and age of the Collie coal, some authorities having asserted that it is a true Palæozoic coal, while others have contended that it is a lignite. As a matter of fact it shows no ligneous or woody structure, but has all the appearance, as well as composition and other characters, of a coal of Mesozoic age. It is lustrous, bituminous, and fairly firm when newly won, but appears to become rather friable on exposure, owing, no doubt, to the amount of water it contains. It burns well, leaving a bulky ash, which, however, is very light. Its worst features are that it contains a high percentage of water, and that it does not form a coke.

The average of a number of analyses of this coal made by Mr. B. Woodward of the Perth Museum is as follows:—

Water	11.60
Volatile Hydrocarbons	32.10
Fixed Carbon	51.20
Ash	4.35
Sulphur90

Specific Gravity, 1.30.

One of the most unsatisfactory features of this coal-field from a mining point of view is the fact that the coal measures form an artesian water basin. All the bores that were put down in the deep ground, *i.e.*, towards the dip of the measures, struck artesian water which may still be seen rising above the surface under considerable pressure. While, therefore, it may be possible to extract a fair amount of coal from near the outcrops, it is manifest that the working of these seams in the deep ground, where a large supply of water exists under pressure, would not be practicable.

The occurrence of artesian water in these coal measures is further evidence in favour of their Mesozoic age, as it has not hitherto been met with in Palæozoic coal basins.

Although shales are abundant in the spoil heaps about the mines, they are singularly barren of fossil plant remains, and after a careful search I was only able to obtain two fragments of leaves. These appeared to have somewhat the outline of *Glossopteris*, though they were too imperfect for their shape to be definitely determined. The venation showed a few examples of anastomosis, but not nearly so many as *Glossopteris*, and the midrib was not by any means well defined. The specimens were submitted to Mr. Robert Etheridge, junior, of the Australian Museum, for his opinion, and he reported as follows:—“I do not think the fossils represent leaves of a *Glossopteris*, nor am I at all sure that they belong to the allied genus *Gangamopteris*, although the midrib, or what can be seen of it has some resemblance to that of the latter. There remains then, with us, the Mesozoic genus *Sagenopteris*, and to this I suggest the fossil may possibly belong.”

It will be seen, therefore, that the evidence of the fossil plant remains (imperfect though they are) is in favour of the Mesozoic age of the Collie coal-field, and thus supports the evidence which is supplied by the character of the coal itself, and the geological peculiarities of the basin.

In the Mining Handbook of Western Australia, by H. P. Woodward, Esq., late Government Geologist, it is stated that Mr. Robert Etheridge, senior, F.R.S., of London, reported having found portions of *Glossopteris* or *Næggerathia* in a sample of coal from the Collie field; and that on this evidence he assigned a Palæozoic age to the coal. Mr. Woodward also informed me that in a subsequent report Mr. Etheridge withdrew this statement. It is possible, therefore, that the fragment seen by Mr. Etheridge, senior, may have been a small portion of *Sagenopteris* showing some net venation, and that this characteristic may have led him to the erroneous conclusion that the plant was the Palæozoic one, *Glossopteris*.

In view of the somewhat inferior quality of the Collie coal, and in view also of the difficulties in the way of economic mining caused by the occurrence of artesian water in the coal basin, it is rather surprising that so much money has been spent on this field, while other districts along the coast to the north appear to be of greater promise. As an instance of this it may be stated that in the Perth Museum there is a collection of fossils which point to the existence of Permo-Carboniferous coal measures in the Gascoyne district, and there is, therefore, good reason for expecting that prospecting there would result in the discovery of coal similar to that of Newcastle.

Coolgardie Gold-field.

Coolgardie is situated about 350 miles to the east of Perth on the table-land previously mentioned, and has an altitude of about 1,400 feet above sea level. The railway from Perth crosses the Darling Range at an altitude of 1,000 feet, and then traverses a wide area consisting chiefly of granite, with occasional belts of metamorphic schists. At the town of Coolgardie the granite and quartz porphyry are seen to junction with hornblendic rocks, and there is a considerable development of amphibolites, hornblende schists, diorites, &c. Several important lodes, such as “Bayley’s” and “The Londonderry,” occur near this line of junction. They may be described as large bodies of white quartz in which gold has been found in phenomenally rich “chutes,” which were, however, of limited dimensions, and which were separated by barren or very low grade material. At The Londonderry Mine a coarse pegmatite occurs which very much resembles that found so commonly at Broken Hill, except that it contains a yellowish green variety of mica. About 3 miles west of The Londonderry Mine a rock of similar character contains large crystals up to 6 inches in diameter, of *Lepidolite* or lithia mica, which may prove to be of commercial value.

Many of the quartz reefs in the neighbourhood of Coolgardie stand up from the surface like walls of masonry 15 or 20 feet high, having resisted the denuding action of the atmosphere better than the enclosing country rocks. As a general rule the outcrops of such reefs have not proved payable, but experience has shown that on this field, as in so many others in the eastern colonies, the gold, for the most part, occurs in “chutes.” Over capitalisation of many mines appears to have been the outcome of the assumption that these rich chutes were of unlimited dimensions. There are a fair number of reefs on the Coolgardie gold-field which have yielded consistent returns, and many others have a promising appearance. Other auriferous deposits, locally known as “formations,” occur on this field. They consist of lenticular shaped lodes, or dykes, up to 10 feet in width at the surface, which thin out as they descend, and which consist of a very decomposed kaolinised material, intersected by quartz veins. The veins carry

coarse

coarse gold, while the kaolinised lodestuff contains the precious metal in a fine state of division. It is probable that they are dykes of quartz-felspar porphyry, though I was unable to see any of the undecomposed rock, owing to the fact that the workings have not been carried to a sufficient depth. The walls consist of actinolite rock. It is probable that if these deposits were explored to greater depths they would be found to increase in width again. In one instance I saw free gold in a rock which appears to be almost entirely composed of actinolite.

The hills about Coolgardie are capped by a thickness of from 10 to 15 feet of an agglomerate or gravel consisting for the most part of angular fragments of the surrounding rocks, but also containing some waterworn pebbles. In places this deposit becomes very ferruginous and passes into limonite. It may be of later Tertiary or Pleistocene age.

The valleys between the hills have received a material derived from the denudation of these gravels, as well as from the underlying rocks and quartz-reefs, and over a considerable area they have been proved to contain rich, but, for the most part, shallow auriferous alluvials, which have been worked several times over by the method known as dry-blowing, as water is too scarce to allow of any other process.

That these valleys have had, at one time, deep outlets, is proved by the fact that at a place known as Rollo's Bore, about 2 miles east of Coolgardie, a well has been sunk for a depth of 400 feet through alluvial clays. A thin bed of lignite was penetrated near the bottom, and this contained numerous impressions of the leaves of *Eucalyptus*, the appearance of which points to the probability of the valley having been filled up in Pleistocene times. There is reason for supposing, therefore, that this country enjoyed, during comparatively recent geological times, a much greater rainfall than it receives at the present day, and which is estimated at about 5 inches per annum. Moreover, it is only reasonable to suppose that the gold derived from the denudation of the reefs must have been carried into these deep drainage channels, none of which appears to have been prospected.

A very large amount of money has been fruitlessly expended at Coolgardie in the attempt to discover artesian water by boring with a diamond drill in solid granitic rocks. This undertaking was, I understand, carried out in opposition to the advice of all the geologists who were consulted, and it is needless to add that the result was unsuccessful. The bore was abandoned after a depth of 3,000 feet had been reached.

Auriferous Cement Deposits.

About 30 miles in a northerly direction from Coolgardie a number of mines have been worked in an auriferous deposit which is locally known as "cement." It consists of a loose white or greyish-white sandstone, cemented by kaolin in greater or less proportion, and containing subangular fragments of quartz, with occasional well-rounded quartz pebbles. Near the top of the deposit is a bed of kaolin about 6 inches thick, with a half-inch band of sand. The formation, which is horizontally bedded, is overlaid by ferruginous gravel, similar to that about Coolgardie, and it occurs as a capping (having a maximum thickness of about 15 feet) to a number of low granite hills. It contains angular fragments of free gold of varying size, some of them being microscopic, but is only payable along certain fairly-defined channels. The bed rock (granite) of these channels contains numerous pot-holes, showing that the "cement" was laid down on a denuded surface. I was informed that the richest deposits of gold are not, as a rule, found in the bottom of these holes, but around their margins, which appears remarkable. Some of the cement has proved remarkably rich, containing at the rate of 80 oz. to the ton; but this is, of course, exceptional, and the auriferous channels do not exceed 30 feet in their widest parts. The cement in places has been converted (possibly by hydro-thermal action) into a vitrified rock, which has very much the appearance of the well-known Desert Sandstone (Upper Cretaceous) of Queensland and New South Wales, in which the interstices between the grains of sand have been filled with secondary silica. Several hand specimens of this rock from Western Australia, which I had an opportunity of examining in Sydney two years ago, led me to express the opinion that it was really the Desert Sandstone. After an inspection of the deposit *in situ*, however, one can have no hesitation in recognising it as an alluvial deposit resulting from the disintegration of granite. The gold has evidently been derived from the denudation of quartz-reefs, several of which occur in the vicinity. The best of these reefs has a thickness of about 18 inches, and has yielded at the rate of about 10 oz. to the ton. The angular nature of the gold can be accounted for by the fact that it has had but a short distance to travel. No fossils have been found in the "cement," and it is therefore impossible to determine its age, but it is clearly older than the ferruginous gravels which occur about Coolgardie, and may therefore be provisionally put down as late Tertiary.

Kalgoorlie Gold-field.

The township of Kalgoorlie is situated about 25 miles in a north-easterly direction from Coolgardie, and is reached by the main line of railway from Perth, a distance of 374 miles. The name, Kalgoorlie, has already become famous by reason of the extraordinarily rich auriferous deposits which occur in its neighbourhood. Gold was first discovered by a prospector named Hannan, close to the present township of Kalgoorlie, and a very considerable area of surface or shallow alluvial deposits, derived from the denudation of quartz-reefs which intersect a low ridge in the vicinity, has been worked and reworked by "dry blowers." The principal interest, however, in the Kalgoorlie, or as it is officially termed the East Coolgardie Gold-field, centres in what are commonly known as the telluride deposits. These occur at a locality named the Boulder, distant about 4 or 5 miles in a S.S.E. direction from Kalgoorlie, and they form a series of low hills, which, in fact, are a continuation of the range previously alluded to as occurring in the vicinity of Kalgoorlie township. The country to the east, west, and south of this range consists of plains, the geological formation of which is obscured by superficial deposits of sand, gravel, and travertine, and which support a vegetation consisting of low scrub and stunted *Eucalyptus* trees. Of the latter two varieties are known locally as salmon gum and gimlet gum. About 4 miles south of the Boulder is situated "Hannan's Lake," a large depression or clay pan, in which no water is to be seen, except after a heavy rainfall, which is not a frequent occurrence. A considerable supply of extremely salt water, however, is conserved in the alluvial sands and clays which form the bed of the lake, and this is pumped to the Boulder through long lines of pipes, and is utilised for mining purposes. The bed of the lake glistens with crystals of gypsum and salt, and all the water in the district (with the exception of that obtained by distillation for domestic purposes) is extremely saline; it is, nevertheless, exclusively used for both battery work and wet extraction in the cyanide plants.

The

The Boulder Hills, where the telluride deposits occur, are covered at their summits with horizontal deposits of ironstone gravel, which passes in places into compact limonite. The Great Boulder Mine, which was the first established, received its name from the occurrence of large masses of this ironstone which stand out on the top of the hill, forming part of its surface. Immediately under this deposit the hills are composed of what at first sight appear to be bluish-grey micaceous or talcose schists, and these in places are intersected by dykes of diorite and also by irregular quartz-reefs. The "schistose" rocks, though having the appearance of what is generally known amongst mining men as "country rock," were found by the earlier miners to contain free gold, which in places was extremely rich. Some of the gold was fairly coarse, but much of it presented a very deceptive appearance, and could easily be mistaken for a coating of dull yellow clay. This is now known at the mines as "mustard gold." As these auriferous rocks were followed down and as the shafts were intersected by cross-cuts, it was noticed that the unproductive country at the sides was indistinguishable in character from the lodestuff, except in the matter of its unproductiveness. In short, there was always a difficulty in determining the limits of the so-called "lodes," and this could only be done, where free gold was not visible, by calling in the assistance of the assayer.

The zone of oxidation, within which the rocks have been subjected to more or less decomposition by the action of the atmosphere and by the percolation of water from the surface, extends in these hills to a depth varying from 80 to 200 feet. Below this zone iron pyrites appears in the rocks, and this is accompanied in a number of the principal mines by tellurides of gold and silver and mercury. Tellurides were, I believe, first recognised in the mine known as Block 45, but there appears to be a dispute as to whom the credit of the discovery is due. Ores of tellurium and gold are now also known to exist in the Great Boulder, the Boulder Main Reef, Lake View Consols, Ivanhoe, Australia, Boulder Perseverance, Kalgurli, Kalgurli North, Brookman's Boulder, and Golden Horseshoe Mines. The greatest depth attained in any of the mines up to the present is a little over 300 feet, and a careful examination of the workings from the surface down to this depth, leads one to the following conclusions:—(1) That the so-called lodes are in reality intrusive dykes, and (2) that the material of the walls, or "country," is of precisely similar origin, and differs merely in the proportion of its mineral contents and the amount of alteration it has undergone.

There is a gradual transition, downwards from the talcose schistose looking rocks of the surface, to the dense bluish-green rock which is found in the lower levels, and which has the appearance, to the naked eye, of a characteristic quartz felsite. It is thus evident that the surface rocks are merely the result of the oxidation of those below, just as the free gold contained in the former is the product of the decomposition of the pyrites and telluride minerals of the latter. I may state here that I collected a number of samples of so-called "lodestuff" and "country rock" from the principal Boulder Mines, and these have been examined in thin sections under the microscope, by Mr. G. W. Card, Mineralogist to the Geological Survey. He finds (as was indeed fairly evident to the naked eye) that "the evidence obtained by examining and comparing as many slides as possible, shows that the country rocks from the different mines on the field, differing as they do in colour, structure, &c., are one and the same rock; and further, that the lodestuff itself is nothing but an extremely altered form of the same."

Mr. Card further states that "the divisional planes exhibit a silvery sheen, due to the development of secondary mica. That this rock is of igneous origin is evident from its mineralogical constitution and structure. Quartz, felspar, ilmenite, and magnetite are among the original constituents, and that characteristically igneous structure, the micropegmatitic, so common among the acid eruptives, is sometimes well shown. The green colouration is due to chlorite, which acts as a pigment when finely disseminated, as it generally is. When chlorite is absent the rock is lighter in colour."

There is abundant evidence that these rocks in the Boulder Mines have been subjected to an enormous amount of crushing, which has induced in them a highly schistose structure. This is especially noticeable in the productive portions or "lodestuffs," which are in places quite fissile or foliated. Tellurides of gold, silver, and mercury are distributed through the lodestuff in veins, splashes, and pockets, and in the offices of the mine managers some very fine specimens are to be seen, containing solid masses of tellurides sometimes nearly an inch in thickness. As these minerals contain as much as 41 per cent. of gold, the presence of a small proportion of them has the effect of imparting a high assay value to the stone. Occasionally metallic gold is seen in conjunction with tellurides, and, in one instance, a vugh in the deposit was found to enclose large masses of beautiful sponge gold, probably derived from the decomposition of tellurides.

The productive dykes, or "lodes" as they are locally termed, are frequently intersected by irregular quartz-reefs. These reefs, in which the quartz is white and crystalline, sometimes follow the strike of the dykes, at other times cut across them, and occasionally enter the walls. They are not continuous for any distance, and their width varies very considerably. They sometimes, but not always, contain free gold.

It is probable that they represent fissures, which have been formed by the contraction of the dykes when cooling, and which have subsequently been filled in by ascending solutions of silica. The dykes are also characterised by numerous ironstone veins, consisting of specular iron and limonite, which branch off from the productive portions or "lodes" into the walls. These veins are probably the source of the ironstone gravel which forms such a noticeable feature on the surface of the Boulder Hills. The joints of the lodestuff in the lower levels are frequently coated with carbonates of lime and magnesia, while in the oxidised zone, their place is taken by gypsum. Among other minerals observed in the dykes may be mentioned magnetite in fairly large crystals, iron pyrites, and arsenical pyrites. Chloride of silver is stated to have been found in considerable quantity in one of the mines near the surface. In some places kaolinisation of the felspars in the lodestuff has taken place to a considerable extent. I was informed by Mr. T. A. Rickard, State Geologist of Colorado, that vanadium mica had been recognised in some of the rocks from the Boulder, and this statement is supported by the fact that Mr. J. C. H. Mingaye, Analyst to the Department of Mines, has detected vanadium in some of the material collected by me.

The area within which the productive dykes have, so far, been proved to exist is about three quarters of a mile wide, and its length is about a mile and a quarter. Fresh discoveries, however, continue to be made at intervals, and it is possible that they may be found to extend considerably beyond these limits.

Within

Within this area quite a number of more or less parallel lodes or productive belts occur, being separated by belts of unproductive rock of similar origin. The strike of the principal productive belts varies from N. 30° W. to N. 50° W; but these are in places cut off, and sometimes faulted by other dykes, of similar material, which cross them almost at right angles.

The productive portions of the dykes are nearly vertical; but, as a general rule, they have a slight underlay to the W.S.W., while occasionally the dip changes to E.N.E. for short distances.

Well-defined walls are not seen in these deposits, but, occasionally, on one or other side of an ore body there is a fairly smooth plane, which marks the limit of the productive stone. In the Boulder Main Reef Mine, between the ore body and what may be termed the hanging wall, there is a thickness of about 6 inches of what appears to the naked eye to be a brecciated rock. Mr. Card, however, after examining a thin section of this material under the microscope, reports that "it would appear as if the breccia-like appearance were delusive, and were due to the unequal distribution of the chlorite."

In some instances drives have been continued in payable ore for a distance of nearly half a mile along a dyke. The productive belts vary considerably in width, though they are rarely less than 1 foot. From 4 feet to 6 feet is not an uncommon width, and they increase from this to as much as 35 feet or more.

In one of the principal mines the following section was exposed in a cross-cut:—

	35 feet wide.	30 feet wide.	15 feet wide.	4 feet.	14 feet wide.	
West.	Average assay value, about 2 oz.	Barren.	Average assay value, 3-4 oz.	Barren.	Average assay value, 3-4 oz.	East.

So that in a total width of 98 feet, no less than 64 consisted of high-grade ore.

It has not yet been proved how far this extremely rich deposit continues in the direction of its strike, though one of the drives is at least 60 feet long. The newspapers record that a shipment of 1,000 tons of ore from this mine was recently treated for a yield of slightly over 4,000 oz. of gold.

So far as I could ascertain there has not been any notable decrease in the richness of the ore-bodies as they descend; on the contrary, in some mines the value of the ore appears to have increased in the lower levels. However, as the greatest depth hitherto attained is only a little over 300 feet, it would be risky to predict that no impoverishment will take place as the excavations are carried downwards; indeed, it would be more reasonable to expect that the auriferous ores will be found to occur in chutes, as is the case in so many true lodes.

A considerable amount of controversy was aroused, when the first traces of tellurides were discovered in Block 45, by a statement made by Mr. Maryanski, a mining engineer, to the effect that the permanence and richness of the Kalgoorlie lodes were now assured. This may perhaps appear to be a bold assumption when based on the mere presence of a small quantity of tellurium mineral. But when the mode of occurrence of the tellurides in the 300-foot levels is studied, when they are seen to be disseminated through dykes of igneous origin, there are, I think, reasonable grounds for expecting that the enrichment of the deposits by these minerals will continue, probably with intermissions, to very considerable depths. Should they prove to do so, and should their richness be maintained at anything like its present grade, the output from the Kalgoorlie mines, when efficient ore-reduction plants have been provided, should be something phenomenal, for one cannot avoid the conclusion that here there is an area of about 1 square mile, which, on present indications, promises to contain some of the richest gold deposits in the world.

The total output of gold from the Kalgoorlie Gold-field for the year 1895 is stated to have been 36,000 oz.; in 1896 it was about 100,000 oz., and for 1897 it rose to over 300,000 oz.

Another point about the productive belts in the Boulder dykes is that they occasionally split up or "fork," and the two branches, after diverging for some distance, again unite, enclosing a lens-shaped "horse" of unproductive material.

Along the western side of the Boulder field, and parallel to the dykes, there extends a narrow belt of jasperoid and chalcedonic rocks of varying colours, and in conjunction with this is a bed of black carbonaceous slate. These rocks are seen outcropping near Hannan's Lake, where they stand up from the surface like a wall. An examination of this outcrop shows that in places the slate is in process of replacement by white chalcedony. Neither the jaspers nor the slates are visible on the surface far north of Hannan's Lake, but they have been met with in shafts in several places along the west of the principal mines, thus proving the continuity of the beds for at least 4 miles. It seems probable that these jaspers, &c., mark a contraction fissure along the western boundary of the dykes, and that the silicification has been caused by the ascent of thermal solutions along the course of the fissure.

With regard to the genesis of the metalliferous deposits at the Boulder, there is much room for speculation, but in view of the limited extent of the present excavations, it is difficult to advance a perfectly satisfactory theory as to their origin. There is, however, little doubt that the productive belts have been subjected to a great deal of crushing, which has produced the schistose or foliated structure so characteristic of them, and it seems reasonable to suppose that the gold, silver, mercury, and other metals, together with the tellurium and sulphur, have been derived from solutions which deposited them between the folia of the shattered rock.

The question as to whether the deposition of the minerals has resulted from "lateral secretion" or from "ascension" of such solutions is one which will require more investigation than is possible at present; but in view of the dense character of the unproductive rocks adjoining the productive belts, I venture to think that if the ore deposits be due to lateral secretion, the leaching of the precious metals from the enclosing rocks must have taken place at a lower level than has yet been reached in the mine workings.

The surrounding district affords a fairly liberal supply of wood, suitable both for mine-timber and for fuel. Owing, however, to the difficulties of carriage, the mine managers, as a rule, prefer to employ imported coal for steam-raising.

Undoubtedly

Undoubtedly the most serious difficulty to be overcome in connection with the Kalgoorlie mines is the absence of a good supply of water. It has been already stated that the salt water obtained from the bed of Hannan's Lake is largely employed for mining purposes. The balance of the available supply is derived from the underground workings of the mines, and there seems to be little doubt that this will, at no distant date, prove inadequate. The source of mine waters is the rain which percolates through the more or less porous rocks within the zone of oxidation, and collects above the undecomposed rocks. As the workings progress in depth therefore, the supply of water must be expected to diminish in these mines, in accordance with the experience of other mining districts all over the world.

The water from the Boulder mines is said to contain free sulphuric acid (derived from the decomposition of pyrites), which necessitates the use of limestone to neutralise it before it can be employed in the cyanide vats. I was informed that about 7 lb. of limestone are used per ton of ore treated.

The Government having recognised the necessity for providing a water supply for these gold-fields, the Engineer-in-Chief, Mr. C. Y. O'Connor, has recommended a scheme for pumping 5,000,000 gallons per day from the Greenmount Ranges to a reservoir on the top of Mount Burgess, near Coolgardie, whence the water would flow by gravitation to the fields. The distance which the water would have to be pumped is 330 miles, and the vertical height which it would have to be raised is 1,350 feet. Nine pumping stations would be required, and the steel pipes would be laid on the surface of the ground, as the soil is so saturated with salts that they would be rapidly corroded if laid underground. The estimated capital cost of the scheme is £2,500,000, and the working expenses are set down at £320,000 per annum. It is also estimated that the scheme would allow of water being sold at the rate of 3s. 6d. per 1,000 gallons.

At present only the oxidised ores, in which the gold is free, are treated locally. These are, for the most part, reduced and amalgamated in stamper batteries, the tailings being subsequently treated by the cyanide process.

In the Australia Mine, however, the ore, after being crushed in rock-breakers, is heated to expel moisture, and then ground in Krupp mills. The greater part of the gold is then extracted in cyanide vats, and the tailings from these pass into Huntingdon mills, in which the coarser gold which remains (about 3 dwt. per ton) is obtained by amalgamation. A very good extraction is, it is claimed, obtained by this system.

At present the only mine which is provided with a reduction plant at all commensurate with its ore reserves is the Lake View Consols. This company has sixty head of stamps, forty of them being provided with the most modern accessories. The ore is conveyed by an elevated wire tramway to the battery, and the tailings are conveyed from the latter to a cyanide plant.

Many of the other mines will shortly be provided with modern reduction plants, so that a marked increase in the production of gold can be anticipated.

The telluride ores from the lower levels are at present sold, on the basis of their assay value, to the smelting works at Port Pirie, Dry Creek, and Lake Illawarra, where they are smelted with silver-lead ores, the resulting product being a bullion containing lead, gold, and silver. Experiments on the treatment of the telluride ores by roasting and cyaniding have been made at the mines, and it is stated that successful results have been obtained. It is probable that local works will be erected on these lines, though there is reason for supposing that the very rich concentrates will be more economically treated by smelting.

It is only natural to expect that in the neighbourhood of such rich auriferous matrices as those which occur in the Kalgoorlie field, alluvial deposits, resulting from the denudation of the lodes and dykes, should also occur. For a long time, however, it appears to have been thought that there were no ancient drainage channels of any depth, and that consequently no deep auriferous leads could exist. Until quite recently, therefore, alluvial mining was confined to the shallow or surface deposits, and these were worked with considerable profit by dry-blowing. These shallow deposits rest on a smooth floor of greyish-white travertine, which, for a long time, was regarded by the miners as "bed-rock." In September last, however, some more than usually enterprising prospectors at Kanowna, about 12 miles from Kalgoorlie, broke through the travertine, which proved to be only a thin stratum, and which was found to be underlaid by made ground, consisting of angular fragments of stone with a few rolled pebbles. By following this down an extremely rich gutter was discovered, resting upon a floor of decomposed quartz porphyry.

This lead was worked into deep ground, widening out as it was followed; and, at the time of my visit, had been proved payable at a depth of 50 feet, and was still going deeper. The gold is very angular, as a rule, indicating that it has not travelled far in contact with hard rocks; but the fact of its occupying an ancient drainage channel is undoubted.

The existence of the deep ancient valley, which was proved by Rollo's Well, near Coolgardie, and which I have already alluded to, is interesting in this connection; and I have very little doubt that deep leads, equally as rich as the one at Kanowna, will yet be found in the neighbourhood of the Boulder dykes. There is evidence of deep ground to the south-west of the mines, and a creek (dry, except in rainy weather) which trends towards Hannan's Lake, has cut its course through a fluviatile deposit of ironstone gravel some feet in thickness, which proves that a much greater rainfall occurred in former times. It can scarcely be doubted, therefore, that the denudation of these rich dykes has been followed by the concentration of the gold in alluvial gutters.

In conclusion, I may refer to the varieties of the telluride minerals hitherto found in the Boulder Mines.

In the Journal of the Chemical Society for November, 1897,* a reference is given to an analysis, by M. August Frenzel, of a mineral from Kalgoorlie, which he identified as sylvanite or graphic tellurium.

Two distinct minerals were fairly plentiful in the mines at the time of my visit. One of these was of a pale yellow colour, while the other was of an iron black. No crystal forms were observed, and it was a matter of some difficulty to obtain a sufficient supply of either variety, in a state of purity, to enable an analysis to be made. I am, however, indebted to Mr. W. F. Grace for a sample of the pale yellow mineral which has been analysed by Mr. J. C. H. Mingaye (Analyst to the Geological Survey of New South Wales), and has proved to be calaverite.

The

The analysis gave—

Te.	56.64
Au.	41.76
Ag.	80
									99.20
Sp. gr.	9.377.

With regard to the darker tellurides there may be more than one variety. M. T. A. Rickard, State Geologist of Colorado, informs me that he has recognised coloradoite—a telluride of mercury—at Kalgoorlie; and, quite recently, Mr. W. F. Grace forwarded me a sample of mineral, which proved to be a telluride of gold, silver, and mercury, with a trace of copper. Mr. J. C. H. Mingaye is making a quantitative analysis of this mineral, but it is not quite completed. There is very little doubt, however, that it is a new mineral species.

I was informed that telluride deposits had been found at Lake Lefroy, about 25 miles S.S.E. of the Boulder, and also near Broad Arrow, 25 miles to the N.N.W. It is significant that these two localities are on the line of strike of the Boulder dykes, and this would appear to indicate that the intrusions have taken place along a line of weakness, the extremities of which are at least 50 miles apart. It is quite probable, therefore, that other deposits of tellurides may be discovered along the course of this line.

I desire to record my thanks to a number of gentlemen in Western Australia for many courtesies, which greatly facilitated my work. Amongst these may be mentioned Mr. Wittenoom (Minister for Mines), Mr. Crockett (Acting Under Secretary), Mr. O'Connor (Engineer-in-Chief), Mr. H. P. Woodward, Mr. Maitland (Government Geologist), Messrs. Simpson, Blatchford, and Becher, of the Geological Survey, and the managers of the various mines.

APPENDIX 4.

Geological Survey Branch, Department of Mines and Agriculture,

2 January, 1898.

Sir,

I have the honor to briefly summarise the work performed by me during the past year.

On the 25th January I left Sydney to resume the Border prospecting work concurrently carried on by the Governments of this Colony and Victoria between Cape Howe and the head of the Murray River. Reaching Delegate on the 27th, I was engaged with the men under my supervision testing the rugged mountain country lying between Delegate and the Main Snowy Range, until the 27th of May, when it was officially approved that work should be suspended owing to the approach of winter which is too severe for the performance of efficient work in the open air in such elevated country.

Reaching Sydney on the 30th May I was engaged during June preparing my report on the geology and mineral resources of the Border country.

In July I visited the Upper Hunter River in company with Mr. Price, C.E., Engineer, Works Department, for the purpose of examining the strata at the site of the proposed flood-prevention dam near Denman, to determine the probability of a sound natural foundation being obtained at a moderate depth.

It is satisfactory to note that the opinion expressed in my report on the subject was confirmed later on in the practical tests recommended by you. The depth at which a solid conglomerate bed was reached being within 2 feet of the estimate. In August I dealt with a number of instructions and prospecting applications in the South Coast Districts as far south as Eden; and inspected and mapped the geological formations of the new gold-field of Wolumla, returning to Sydney in September.

During part of September, October, and part of November I was engaged in office as Acting Government Geologist during your absence in West Australia.

Later I visited the Gundagai and Wyalong Districts and dealt with certain areas on gold-field reserves.

Part of December I was also engaged acting in your absence from office.

I beg to hand you herewith copies of the following reports written during the year:—

1. Notes on the Geology and Mineral Resources of the South East Border of New South Wales between Cape Howe and the head of the Murray River.
2. Report on the natural foundations at the site of the proposed dam connected with the Hunter River Flood Prevention Scheme.
3. Report on the Luck of Roaring Camp Reef near Brown's Camp, Victorian Border.
4. Notes on the Geology and Auriferous Deposits of the Wolumla Gold-field.
5. Notes on the Occurrence of Tungsten Ores in New South Wales, with a register of localities.
6. Notes on Chrome Iron Ore, its Modes of Occurrence, Mining, Dressing, Uses, and Value, with a register of New South Wales Occurrences.

I have, &c.,

JOSEPH E. CARNE, C.E.,
Geological Surveyor.

The Government Geologist.

APPENDIX 5.

Notes on Chromic Iron Ore: Its Modes of Occurrence, Mining, Dressing, Uses, and Value; with a Register of New South Wales Localities.

Sir,

The chrome mining industry in New South Wales is of very recent date, though an abortive attempt was made to inaugurate it as early as 1882 in connection with deposits at Bowling Alley Point, Peel River. Trial parcels dispatched at that time, aggregating 100 tons, tested the market in Melbourne, Liverpool, and London. The highest realization, however—viz., 70s. per ton—was insufficient for profitable working under then existing conditions of land carriage, &c.

Attention

Attention was next directed to the chromite deposits of the Clarence River District; and, with a view of eliciting information as to the possibilities of the industry in that locality, Geological Surveyor (now Professor) David was instructed in 1891 to examine the outcrops. Extracts from his published report bearing on the mode of occurrence, quality, and probable extent of the ore bodies will be found under the head of "Gordonbrook" in the register of occurrences in these Notes. No practical attempt to test the market value of the ore, or the feasibility of profitable working, appears to have followed at that time.

In 1892, Mr. Wright, a chemist at Mittagong, interested himself in a group of chromite deposits on the east fall of Mooney Mooney Range, about 4 miles north-easterly from Coolac railway station. These eventually became the scene of the first practical mining operations, over 2,000 tons being dispatched from them during 1894 and 1895. The site, originally known as Wright's Mine, afterwards became the Vulcan Mine.

The opening of the Coolac Mine directed attention shortly afterwards to another group of deposits on the north and south falls of Mount Lightning, about 5 miles southerly along the same range, of which Mount Lightning is an isolated mass cut off by the intersecting channels of the Murrumbidgee River and Adjungbilly Creek, about 18 miles above the town of Gundagai (on the same river), the terminal railway station in that direction.

Several large ore-bodies occur on the flanks of the mountain, those on the north fall being designated Quilter's Mines, and those on the south Mount Mary Mine. Under this heading descriptions will be found in the Register. Practical mining and export began in this district in 1893, which caused not only local prospecting activity, but also general search throughout the Colony wherever serpentine was known to exist. Numerous discoveries of chromite followed, but only in the Gundagai-Tumut District did they become a source of profitable mining enterprise. In other localities, distance of land carriage in some instances, and inferior quality in others, retarded or altogether deterred extended prospecting.

The successful operations achieved in the Gundagai district stimulated further effort in that of the Clarence River, a fresh attempt being made in 1895 to turn those of Gordonbrook to account. A shipment of 30 tons was dispatched to test the market, with what financial result is not known; evidently, however, it was not sufficiently encouraging for continued effort. Lengthy land carriage and moderate quality combined are believed to have been serious obstacles to success in this instance—obstacles, however, capable of being modified or obviated in the future by improved roads and methods of ore dressing and concentration.

During 1894, 1895, and 1896 the chrome mining industry continued to flourish, the exports being 3,034, 4,299, and 3,851 tons respectively, but latterly it has languished and the output depreciated in consequence. The export for 1897 amounted to 3,379 tons, but a considerably less amount was actually mined during the year. The present is, therefore, an opportune time to review the situation and discuss the causes of fluctuation. A glance at the principal sources of the world's annual production of chromite may also be advantageously taken, especially for purposes of comparison of its chief modes of occurrence. It will also be useful to note its uses and value, and the latest methods of dressing and concentration of the crude ore for market.

Sources of Supply.

The principal supplies of chromite are drawn from Turkey, Russia, Greece, California, Canada, New Caledonia, and New South Wales. Of these countries, Turkey and Russia are reported to be the largest producers.

The following particulars are extracted from volumes ii and v of "Mineral Industry"*:—"The chrome deposits of Turkey, in the Province of Brousa, in Asia Minor, have for many years afforded the largest supply for the world's markets; but recent reports are to the effect that the supply is showing signs of exhaustion especially as regards the richer grades.

The Turkish ores are noted for their richness and freedom from silica, which is an objectionable ingredient equally in furnace lining and in the manufacture of bichromate salts.

From Macedonia the export is increasing, owing chiefly to the increased facilities of transport to seaboard. The best grades assay 55 per cent. chromium sesquioxide. The exports are reported to amount to 10,000 to 12,000 tons per annum.

For comparison, and as an index to values, the following analyses of Turkish ores are taken from Vol. v, page 155, of the work already quoted:—

	(1)	(2)	(3)
Sesquioxide of chromium	55·04	51·70	56·80
Protoxide of iron	12·63	14·20	12·06
Alumina.....	11·84	14·10	14·00
Magnesia	16·19	14·30	15·00
Silica	2·00	3·50	1·45
Lime	1·46	1·70	0·70
Water	0·40	0·30	0·15
	99·56	99·80	100·16

The value of the above ores is stated to have been (at the then ruling market rates, 1893), £5 10s. per ton in Europe for 50 per cent. chromium sesquioxide, with 5s. per unit additional for each unit above 50 per cent.†

The Russian chromite deposits occur in the Ural Mountains. Formerly the ore raised was exported, but the recent local establishment of bichromate manufactories absorbs almost the entire output, which amounts to about 2,000 tons annually.

The Grecian output is reported to be very irregular, ranging from 200 to 1,400 tons per annum.

Though previously mined in large quantities for a long period in Maryland and Pennsylvania, U.S., chromite is now practically only produced in California. The most important deposits occur in Sans Luis Obispo County, but the ore is reported to be too low grade and scattered to pay at present prices. The average grade of California ores, in fact, is low, ranging from 43 to 47 per cent. Under the head of concentration, further reference will be made to them.

The

* The Mineral Industry, its Statistics, Technology, and Trade, 1893, ii, p. 155. *Ibid.*, 1896, v, pp. 119-21. † Mineral Industry, 1893, ii, p. 155.

The production for 1895 amounted to 1,740 tons; and for 1896, 786 tons.

The production of chromite in Canada is of very recent date, the recorded output prior to 1894 only amounting to 50 tons. The output for 1895 was 3,177 tons; and for 1896, 2,362 tons.* The deposits occur irregularly and in small pockets in the serpentine belts of Quebec. The ore is of comparatively low grade, and is principally used for furnace lining in Pennsylvania. Large quantities of chromite are reported to be again coming forward from New Caledonia, where large and rich deposits occur on the seaboard. The following description is from "Mineral Industry" †:—"Chrome iron ore occurs in great abundance in New Caledonia, where it was first mined in 1875, the ore being a constant associate of the serpentine rock of which a great portion of the island is composed. The most important deposits are those of Mont d'Or, N'Go River, and Canoe Bay, which are near the sea, and are connected with the port of shipment by a short railway. The ore exported averages 50 per cent. Cr₂O₃. Alluvial ores are also met with at a great number of points in the south of the island, forming beds 30 inches in thickness. . . . There are also in New Caledonia large deposits of iron ore, containing 50 per cent. of iron and 2 to 5 per cent. of chromium sesquioxide. These occur in large masses of red clay in the serpentine country rock, which have been formed from the decomposition of the rock itself. This ore is low in phosphorus."

A similar iron ore is reported to occur in large quantity in Tasmania.

The chrome mining industry in New Caledonia is most advantageously circumstanced as regards proximity to seaboard, purity, and low-priced (convict and native) labour; hence it will always be a formidable rival to Australian chrome mining, where the conditions are not so favourable.

Detailed descriptions of the known New South Wales deposits will be found in the Register forming part of this paper.

From New Zealand, chromite was exported for a few years prior to 1866, but ceased in that year. At Dun Mountain, in the Nelson District, bands of the mineral 10 feet and 15 feet thick are reported. The Government Geologist, Mr. Alex. McKay, reports‡:—"Chrome ore occurs in New Zealand, chiefly in association with the magnesian rocks of the Dun Mountain mineral belt, in the Nelson provincial district. Associated with rocks of the same age and character, it also occurs in the mountainous district of North-west Otago and the southern parts of Westland.

"The chief developments of ore (in the Nelson District, J.E.C.) are found between the Upper Maitai Valley and the Lea River, a distance along the mineral belt of 12 miles. The ore occurs in elliptical masses, usually at a given distance from the north-west margin of the mineral belt. Some of these deposits are of considerable size, and the total of the ore exported from Nelson (5,666 tons, J.E.C.) was mainly from one outcrop supplemented by a lesser quantity from Little Ben Nevis."

Large chromite deposits have lately been discovered in Newfoundland, and are now being opened up. There are, in addition to the above, other less important sources of supply, which need not be mentioned here.

Modes of occurrence of Chromite.

Under this heading, attention will only be paid to occurrence in commercial quantity. The mode of occurrence of commercial chromic iron ore in all producing countries is characterised by uniformity of physical conditions. As a general rule, it forms "bunches" or "pockets" in serpentine, usually of comparatively small size; and occasionally in alluvial deposits resulting from weathering and denudation of the enclosing rock. A few notable exceptions to the general rule regarding size of chromite bunches occur in Turkey, and in Maryland, and Pennsylvania, in the United States; and, it is believed, also in New Caledonia. A few large deposits in Turkey, have for nearly fifty years, continued to afford the principal part of the World's supply. According to Dr. D. T. Day§, Reed's Mine, Harford County, Maryland, produced over 100,000 tons of ore before exhaustion. Another very notable exception was the Great Wood Pit, Lancaster, Pennsylvania, which, according to the same authority, was worked to a depth of 700 feet, and for forty or fifty years afforded the greatest part of the world's supply.

The following description of the occurrence of chromite covers the general run of chromite deposits, and is especially applicable to those of New South Wales so far discovered:—"The chrome mining industry in California has never been put upon a permanent basis, however, owing chiefly to the irregularity in the occurrence of the mineral and the peculiar local conditions. As elsewhere in the world, the chrome ore there is found in serpentine, whence it is easily mined, but it usually occurs in small pockets, which are soon exhausted; indeed, as a rule, the deposits are too small to warrant the outlay of much capital for their exploitation, and mining is consequently comparatively expensive."||

In Turkey, the ore forms irregular pockets and masses in serpentine, which are worked in open cut.

The Russian deposits are classified by Gustave Rose under three heads:—(1) Those which occur in large granular masses in serpentine; (2) those where the mineral is finely disseminated through the rock; and (3) in alluvial deposits.¶

In "A Treatise on Ore Deposits" by J. A. Phillips and Henry Louis, 1896, p. 182, the following extract is quoted from Vogt:—"Deposits of chromite all the world over are basic magmatic segregations from peridotite, occurring as lenticular masses of varying dimensions in peridotite or in serpentine, resulting from the alteration of the rock"; in other words, the chromite segregated into masses whilst the original matrix—peridotite—was in the condition of a pasty or viscid magma.

Professor Garrison describes different forms of chromite deposits thus**:—"They have no orderly mode of occurrence or of extension of figure. They are neither veins nor beds nor fissures, but are ore pockets, each of which must be considered as a complete unit, having no relation whatever to any other pocket in the region in which it may exist. So far as concerns chrome mines, it would be futile to argue the position of an unknown pocket from the basis of any known ore."

From the above extracts and quotations it will be seen that the discouraging features of New South Wales chrome mining are not peculiar to this country; moreover, they serve to emphasise the views expressed in my second report on the Gundagai-Tumut chrome field††:—"Chrome mining in the districts in

* The Statistical Year Book of Canada, 1896, p. 102.

† The Mineral Industry: its Statistics, Technology, and Trade, 1893, ii, p. 156.

‡ The New Zealand Record, 1897, i, No. 5, p. 229.

§ The Mineral Industry, 1893, ii.

|| *Ibid.*, pp. 151-2.

¶ *Ibid.*, 1893, ii, p. 153.

** Ann. Rept. U.S. Geol. Survey, 1895-96, xvii, pt. iii, pp. 261-272.

†† Ann. Rept. Dept. Mines and Agric., N.S. Wales, for 1895, p. 128.

in question has now been advanced to a stage which enables a fairly clear opinion to be formed of the nature and mode of occurrence of the deposits; and the experience of the past year teaches that they in no way differ from those of other countries which have been described as "pockety" and "bunchy," "irregular" and "uncertain." Therefore it seems imperative, if the chrome industry is to be advanced and maintained as a profitable commercial undertaking, that systematic prospecting must be kept well ahead, not only of actual winning, but also of actual discovery, so that new finds may be made available as the old give out, and thus prevent frequent cessation of work.

With resolute grasping of the fact of comparatively small but numerous and widespread deposits, coupled with systematic prospecting and proving, careful blending of ores and uniformity of grade, and by saving and concentration of smalls where practicable, there can be no doubt that the chrome industry of the Colony will be maintained on a vigorous and profitable scale.

In prospecting, it will be wise not to confine the search to surface outcrops of deposits, but to extend it to alluvial deposits; for, as already mentioned, commercial accumulations of chromite detritus are worked both in Russia and New Caledonia. In passing along the serpentine belt between Tumut and Mount Lightning, chromite rubble was frequently observed on grassless patches and in small rivulets on the slopes of the ridges. Advantage should be taken of these indications to trace by loaming—washing portions of soil—the source of the liberated particles; for though they may in some instances be derived from serpentine containing the mineral sparingly distributed through the mass (as chromite is always present in small proportion in serpentine), yet there is always reasonable prospect of it being shed from segregated masses, which at the present time are obscured by soil.

An instance of natural concentration of disseminated particles liberated by decomposition is furnished on a very small scale at Port Macquarie, where the now coherent grains form small patches assaying 48 per cent. of chromium sesquioxide.

Dressing and Concentration of Chromite.

The necessity of concentration is a question which is forcing itself on the attention of those interested in chrome mining. In California, where much of the ore at present accessible is of low grade, concentration has already been adopted; for, as pointed out in the valuable work already freely quoted ("Mineral Industry"), "the future of the chrome industry in California seems to depend upon more careful dressing of the ore, either by hand or mechanically." There can be no question that, apart from utilising deposits of low-grade ores in this way, the great market desideratum, viz., uniformity of grade, would be secured by dressing and concentration.

Where the ore is rich the usual practice of cobbing and hand-picking is sufficient to secure a high grade, but generally the richest ores are the most friable; hence considerable loss is entailed as smalls during the present process of mining and hand-dressing. The rich fragments which thus become mixed with the waste could be recovered by concentrating machinery. Hard, compact ore of low grade, in which the impurities are finely and intimately mixed, may not prove as amenable to concentrating treatment as comparatively lower-grade ores roughly mixed with serpentinous impurities. The latter, in cases where the serpentine has decomposed into magnesium clays, would probably afford special facilities for concentration. The hard ore in question might be utilised in two ways: after coarsely crushing and washing it might be mixed in carefully ascertained proportion with the rich concentrates to ensure an uniform grade of good quality; or it might be made available for furnace lining if the market rate afforded a margin of profit.

Touching the method of concentration, the following description of a plant running in California is valuable as a guide* :—"One of the chrome dressing works now in active operation in California is equipped as follows :—Rock-breaker, 6-ft. Huntingdon mill, and four Woodbury vanners with corrugated belts, together with settling tanks, drying floors, and the usual driving machinery, &c. The plant, which is capable of turning out from 20 to 25 tons of dry concentrates per twenty-four hours, cost about 12,000 dollars (£2,400). The process is carried out as follows :—The ore is crushed by the breaker and the Huntingdon mill so as to pass a 40-mesh sieve. The pulp is separated on the Woodbury vanners. The concentrates are collected in settling tanks, whence they are removed to the drying floors, and finally packed for shipment in strong jute bags."

The fuel used is wood. The crude ore does not cost more than 7 dollars (28s.) per ton for best grades, delivered at the mill.

The result of a month's run of the above mill is stated to have been 700 tons (2,000 lb. per ton) of 50 per cent. concentrates, which at the then market rates (1893) yielded a profit of 3 dollars (12s. 6d.) per ton, and 1 dollar (4s. 2d.) per ton for each 1 per cent. above 50 per cent. produced.

The following analyses give the results of the concentration of Californian crude ore† :—

	Crude Ore.	Concentrates.
Sesquioxide of chromium	43·70	52·86
Protoxide of iron	14·80	15·45
Alumina	15·96	11·59
Magnesia	16·49	16·28
Silica	7·96	3·00
Lime	·66	·76
Water	·49	·10
	100·06	100·02

Owing to the varying percentages of sesquioxide of chromium contained in chromite, it is recommended that preliminary panning or hand-jigging tests, with careful analysis of results, should first be made to ascertain the suitability of the various ores for treatment on a large scale of concentration.

With regard to concentration of New South Wales low-grade chromite and smalls resulting from mining and hand-dressing, both the Gundagai-Tumut and Clarence River deposits appear to offer fair fields for practical tests. At Mount Lightning, Adjungbilly, and Brungle Creeks, a plentiful water supply is available for such operations; but looking at the question in a larger light than individual interests, and having regard to the scattered occurrence of the deposits and the comparatively limited amounts of material available at any one mine or group of mines, there can be no question that the establishment of a central dressing and concentrating plant on the Murrumbidgee River—(say) at Gundagai, the present railway terminus in the district—would best serve the interests of the whole field. Low-grade ores, seconds, and smalls, could be disposed of to such an establishment on bulk assay values.

Uses

* Mineral Industry, 1893, ii, pp. 153-4.

† Mineral Industry, 1893, ii, p. 153.

Uses of Chromic Iron Ore.

Before discussing the uses of chromite it will be useful to briefly note its physical characteristics and chemical composition. The metal chromium (of which chromite is an oxide), according to R. A. Hadfield,* has an atomic weight of 52.40, and a specific gravity of 6.8–7.3, with a high melting point not yet determined.

Chromium is used in the metallic state only in making chrome steel, and even in this instance it is used as ferro-chromium. Quite recently M. Henri Moissan† has demonstrated the possibility of manufacturing pure chromium and tungsten in commercial quantities. His latest method is to take a carbon pipe filled with the metallic oxide mixed with carbon, inclining it, and subjecting it to the electric current; the metal contaminated with carbon readily flows off as a result of the reaction. Two carbides of chromium have been identified. The carbides are purified by remelting with lime.

Chrome steel is used chiefly in the manufacture of armour plates and armour-piercing projectiles, for shoes and dies in stamper batteries, and for burglar-proof safes and edge tools. Professor Garrison states that the "extreme hardness of the chromium steel face is dependent upon the content of carbon, whose action is intensified by the presence of the chromium, and is only developed after the steel has passed through a system of hardening. This tempering consists essentially in heating the plate to a red heat, and quenching it with sprays of ice water."‡ Sir Frederick A. Abel, in his presidential address before the British Association for the Advancement of Science, Leeds, 1890, stated that "chrome steel has for some time been a formidable rival of the very highest qualities of carbon steel produced for cutting tools, and of the valuable tungsten steel. The great hardness, high tenacity, and exceeding closeness of structure possessed by suitably tempered steel containing not more than from 0.8 to 1 per cent. of carbon, renders this material invaluable for war purposes. Cast projectiles, when suitably tempered, have penetrated compound steel and iron plates over 9 inches in thickness, such as are used upon armoured ships of war, without even sustaining an important change of form."

The presence of a small percentage of chromium in gun-metal is also likely to prove beneficial. Chromium is used in the production of first quality steel rails for railway purposes. Steel with 1 to 1.5 per cent. of carbon and from 2.5 to 4 per cent. of chromium is stated to be so hard that it cannot be worked with the ordinary hardened tools; consequently it has been called into requisition for the construction of burglar-proof safes. For this purpose it is welded and rolled with iron plates.

Chromite is the most common ore of chromium. Its composition, according to Dana, is—chromium sesquioxide, 68.0; iron protoxide, 32.0=100. Specific gravity, 4.32 to 4.57; hardness, 5.5; colour between iron-black and brownish-black, generally exhibiting emerald-green encrustations on smooth semi-conchoidal faces; lustre, sub-metallic to metallic, sometimes feebly magnetic.

Tests.—Before blowpipe in oxidising flame, infusible; in reducing flame, slightly rounded on the edges, and becomes magnetic.

With borax and salt of phosphorus, gives beads which while hot show only reaction for iron, but on cooling become chrome-green. Not acted on by acids, but decomposed by fusion with potassium or sodium bisulphate.

Chromite is reported as not uncommon in meteoric iron.

Other ores of chromium occur, the chief of which is crocoisite—chromate of lead—in which the metal was first discovered.

Serpentine, in which the chrome deposits occur, owes its colour to chromium salts. The beautiful colour of the emerald and of ouvarovite (chrome-garnet) is due to the presence of chromium, and probably also that of the ruby and sapphire; for it has been demonstrated that if the formation of crystallised alumina is accomplished in the presence of chromium compounds, crystals having the colours of ruby and sapphire, as well as their composition, may be produced.§

The other varieties of chromium ores are of mineralogical interest only, and call for no special mention in this paper, which is concerned with the economic ore alone.

Chromite, or chromic iron ore, is used in the arts for the manufacture of potassium and sodium bichromates, for the preparation of basic furnace hearths, and for reduction to ferro-chromium for the production of chrome steel. By far the most part of the mineral produced is employed for the first purpose, for which only that of high grade can be economically used; while for furnace hearths, and for manufacture of ferro-chromium, ore of lower grade suffices. ("Mineral Industry," vol. ii, 1893, p. 158.)

Chromite is coming largely into use as a refractory lining for basic furnaces. The latest particulars available of its use in this direction are given in the last volume of "Mineral Industry,"|| from which the following extracts are taken:—"At present the mineral is employed in reverberatory copper-smelting furnaces, and in open hearth steel furnaces, in both with very satisfactory results. Concerning the former, Herbert Lang writes¶: 'The Selby Smelting and Lead Company has used it quite extensively in the matting reverberatories at Vallejo Junction, California. The hearth is composed of large fragments of chrome ore, with the interstices well filled with smaller pieces, and the material is built up around the sides to the slag line. The protection is such that fettling is almost done away with; in fact, they have not to fettle but once a week or so. The chrome ore is acted on but slightly, if at all.'

Alfred von der Rupp, Superintendent of the Works, states** 'that the life of the furnace is more than doubled by the use of chromite.'

In the "Mineral Industry," 1893, vol. ii, it is stated that chromite has been used instead of magnesite and dolomite in basic furnace hearths, the method of preparation of which is given as follows:—"In preparing basic furnaces with chromite linings, all parts of the walls with which the metal bath and slags come in contact are laid with pieces of chromite, cemented with a mortar consisting of two parts (by volume) of finely ground chromite, and one part of lime, burned as free from silica as possible. The hearth is made of stamped chromite ore, mixed with same kind of mortar. The ore should be as rich as possible in chromic acid, containing from 40 to 45 per cent."

¶ Engineering and Mining Journal, January 23rd, 1897, p. 89.

** Mining and Scientific Press, Sept. 26th, 1896, p. 257.

In Vol. ii, 1895, p. 506, of the "Journal of the Iron and Steel Institute," reference is made to an article in "L'Echo des Mines," vol. xxi, page 548, as follows:—"According to P. Speier, chrome ore linings for reverberatory furnaces have been successfully adopted in French, German, and Russian steel works. The bottom and walls of the furnace are lined with chrome ore in large blocks, united by a cement formed by two parts of chrome ore finely ground, and one part of lime, as free from silica as possible. . . . The iron chromate is decomposed only under the influence exerted by the reagents and oxidising alkaline substances. Heat alone is insufficient to decompose chromate of iron, which may float in a bath of molten steel covered with basic slag without dissolving. One of the principal conditions of success in the employment of the chrome ore lining consists in carefully picking the pieces of ore used, which should be of uniform composition; and the best composition of ore used for lining reverberatory furnaces is found to be from 36 to 40 per cent. of chromic oxide, 18 to 22 per cent. of clay, 9 to 10 per cent. of magnesia, and at most 5 per cent. of silica."

Messrs. G. R. Blackwell, Sons, & Co., of Liverpool, England, are quoted for the statement that chrome ore had been used by steel manufacturers in Lancashire and Yorkshire for about fifteen years. They also remark that it is not necessary to make the chrome ore into bricks, a better method being to crush it to pea size, mix with tar, and line the furnace as if with mortar. The tar burns away, leaving a solid lining of chrome ore, which has been found to give satisfactory results.

The consumption of chrome ore in open hearth basic furnaces in the United States amounts to about 1,800 to 2,000 tons annually, according to the publication quoted ("Mineral Industry"), the Pittsburg supply being for the most part from the Province of Quebec. The requirement is for an ore of not less than 45 per cent. chromium sesquioxide, but the shipments are reported to rarely average so high. The ore is used in lump form for patching the sides of the basic lined furnaces, and is found far more convenient and durable than a slurry of dolomite.

According to the same authority, very hard and lasting chrome bricks are manufactured at Pittsburg for use as a neutral parting between the basic hearth and silica roof.

In connection with the rapidly increasing use of chromite as a refractory furnace lining, the comparatively low grade of material suitable for this purpose should have an important bearing in the near future on the local chrome mining industry, for increasing demand the natural correlative of increasing use is almost certain to give a remunerative value to ore at present below the minimum market grade, deposits of which are already known to exist in the local chrome fields.

Buyers still stipulate for high grades of 50 per cent., or more; probably 47 per cent. is about the lowest local grade for which a price would be quoted at the present time. It will, however, be noted in the quotations and extracts embodied in this paper that the stipulated grade of chrome ore for furnace lining at Pittsburg, U.S., is 45 per cent., and even this comparatively low grade percentage is reported to be rarely reached. The average percentage of chromic-acid in furnace lining may be taken as about 40 to 45. In chrome steel manufacture, or more correctly in the preparation of its preliminary stage of ferro-chromium, low grade ores of the above character are reported to be suitable.

Whilst fair supplies of rich ore are procurable from Asia Minor, Greece, and New Caledonia at about 75s. per ton (f.o.b.) for 50 per cent. ore, and 2s. per unit in excess, as has recently been quoted in a letter from Cologne to the Department of Mines and Agriculture in this Colony*, much lower than fairly proportional values will rule for low grades; still there is reasonable hope that increased consumption in the latest sphere of usefulness will correspondingly increase the value of lower grades, and thus render remunerative local deposits of this character known to exist within easy reach of railway carriage.

Railway concessions for transport of crude ores to seaboard have been steadily increasing until the rate per ton per mile has reached a nominal figure. Shipping freights can also be arranged for them at exceptionally low rates owing to the effective stiffening they afford to wool ships and other carriers of bulky cargo.

Attention is also directed to another bearing which the successful use of chromite as a refractory furnace lining may have on local industry, viz., the possibility of local consumption in connection with copper and matting furnaces, to say nothing of the iron smelting furnaces of the—it is hoped—near future. Doubling the life of a furnace and reducing fettling to a minimum—as proved in other countries—by the use of chromite lining, should induce practical tests in this Colony.

The chief use of chromite at the present time is in the preparation of chemical salts for use in the arts, in painting, calico printing, dyeing, and tanning. Chrome pigments embrace various shades of red, yellow, green, buff, and black. Green oxide of chromium is used extensively as an enamel colour for porcelain.

A new use for chromite is reported from France, where a compound known as *Silichromite* is manufactured. According to "Mineral Industry" (vol. v, 1896, p. 123) "it is an extremely hard, crystallized substance, but easy to pulverize, and is used for moulding and polishing purposes. It is prepared by treating chrome ore, sand, and coal, in an electric furnace, wherein a molten mass, in which chromium silicate predominates, is obtained."

REGISTER OF CHROMITE OCCURRENCES IN NEW SOUTH WALES, WITH NOTES AND DESCRIPTIONS.

Adjungbilly Creek, Parish Darbalara, County Buccleugh.†—On the south side of Mount Lightning, close to the Adjungbilly Creek, Messrs. Carroll and Gillespie were working on tribute an area on Mr. Quilter's property, known as the Mount Mary Mine. At the time of my inspection in 1895, about 400 tons had been despatched, averaging, according to the tributors' statement, from 48 to 49 per cent.

The main deposit was being worked by means of an open cut about 50 feet long, and 20 to 30 feet deep. The ore exposed under foot was solid, and about 7 feet in thickness, whilst a wedge of ore in the upper workings was left standing about 12 feet high and 10 feet thick.

Several smaller bunches were exposed by shallow cuts and trenches high up the slope of the mount.

The most important of the new finds was situated near the top of the mount, where a solid bunch about 10 feet by 4 feet outcropped above the soil.

On the south side of Adjungbilly Creek, on the continuation of the serpentine ridge, Welsh's mine is situated. The only known deposit in this mine was exhausted for a yield of about 220 tons.

Angular Creek, County Murchison.—Chrome has been reported from this locality, but no particulars are known.

Attunga

* From F. E. Clotten, 136, High-street, Cologne, Germany.

† J. E. Carne, Ann. Rept. Dept. Mines and Agric. for 1895, p. 126.

Attunga and Manilla—Between these localities a serpentine belt extends in N.N.W. direction. Several chrome deposits have been reported in it by Mr. C. S. M'Glew; but, so far as his prospecting extended, none were of sufficient size to induce mining for export.

Armidale—Samples submitted for assay in 1884 and 1886 from the Armidale district yielded 38.5 and 43 per cent. respectively.

Barraba—Chromite from this district, assayed in 1888 and 1895, yielded 40 to 44 per cent.

Bendemeer—Chromite, assaying 38.5, submitted in 1884.

Berthong Run, near Wallendbeen—Mr. Geological Surveyor Jaquet has described the Berthong chrome deposits as follows:—
“Chromite has recently been discovered upon Berthong Run, but nothing has yet been done in the way of proving the extent of the deposits. In the bed of Berthong Creek a shallow trench of 5 feet long and 2 feet broad has been cut through a mass of this mineral. Chrome ore has also been found in a shallow trench put down upon the banks of a tributary of Berthong Creek. In the vicinity of the discoveries, and over a large portion of the serpentine zone, the bed-rock is hidden by a shallow alluvial deposit, and it will be necessary for prospectors to find the ore bodies below.”*

Samples forwarded from the above-described deposits yielded from 39.5 to 54.04 per cent.

Bingara—Chromic iron deposits have been noted at Spring Creek, about 3 miles south-easterly from Bingara, by Geological Surveyor David, who reported that the serpentine in which they occur “forms an eruptive dyke from 3 to 5 chains wide, striking either north-westerly or northerly. Segregated masses of chrome iron are observable at intervals in the serpentine,”† and one bunch is stated to measure about 7 feet by 6 feet. Two assays are recorded from the Bingara district, viz., 40.87 and 41.21, the localities being 12 and 14 miles south of Bingara.

Bowling Alley Point, near Nundle, Peel River—As already mentioned the deposits of this locality were the first opened in the Colony—100 tons being mined in 1882.

The late Government Geologist, Mr. C. S. Wilkinson, F.G.S., &c., in one of his reports states that “on a high range about 1 mile north-east from Bowling Alley Point occurs a lode of almost pure chromite of variable thickness. In one place, at the junction of diorite and serpentine, it crops out on the surface 12 feet wide.”‡

Professor Liversidge states that “the outcrop from which this was taken—(samples of chrome under description J.E.C.)—is about 700 feet above Bowling Alley Point, and the apparent thickness of the vein is in one part some 40 odd feet; one huge block of the mineral lying loose on the surface measures 12 feet long by 6 feet high, and 5 feet wide.” A specimen from this locality is reported by the same author to have contained 64.72 per cent. chromium sesquioxide, and 21.11 per cent. iron protoxide.§ Other assays in 1892 are recorded varying from 37.42 to 43.50 per cent.

Brawlin, from foot of Cowong Range, 7 miles south-east—A sample forwarded for assay, bearing the above locality, yielded 31.13 per cent.

Brungle Creek, Parish Wyangle, County Buccleugh—||The Emu and Mount Miller Mines occur on either side of this creek, near the crossing of the Tumut-Tomorrowmah Road. The serpentine is here deeply intersected by the creek and its tributaries. The Emu Mine at the time of inspection consisted of two bunches of chromite, one rather superficial, the other of better promise as regards size, but not as regards quality. Abundant water supply in close proximity to both the mines mentioned should afford the best means of ensuring a high grade product for export.

Mount Miller Mine is situated high upon the range on the opposite side of the creek. The deposits here are very small at surface. A sample from the outcrop yielded 48.13 per cent.

Assays from this locality are recorded from 32.16 to 52.54 per cent.

Clarence District—See Gordonbrook.

Coolac—See Wrights and Vulcan Mine, Mooney Mooney.

Cootamundra—Assays are recorded of samples purporting to come from this locality—but which may be either Berthong or

Coolac—from 45.75 to 57.82 per cent.

Copmanhurst—Probably identical with Gordonbrook. Assays recorded from 40.71 to 45.45 per cent.

Darbalara Parish, County Buccleugh—See Quilters' Mines.

Emu Mine—See Brungle Creek.

Eurongilly—On Mr. Keogh's private land a small bunch of low grade chromite was noted, which had been broken from a loose block found in the soil which here is deep. The country consists of talcose slate. Assays are recorded from 40.9 to 41.38 per cent.

Gordonbrook, Clarence River—Mr. Geological Surveyor David reported on the occurrence of chromite in this locality in 1891. They occur in the parish of Pucka, about 30 miles north-west from Grafton, at Oaky and Fine Flour Creeks.

“The deposits of chromite in this neighbourhood form two principal groups. . . . They both occur in serpentine at a short distance from the edge of the Clarence Series. . . . Besides these two formations a third is developed, which may be described as a fine-grained, greenish-black rock, slightly crystalline, and, probably, a highly altered rock, which might be termed epidiorite. . . . This rock appears to have been intruded by the serpentine, and the deposits of chromite marked A on the plans herewith occur chiefly along the junction line of this rock with the serpentine.”¶

In connection with the first group (A) in Portion 7, Parish Pucka, Mr. David measured the two larger bunches as 12 feet x 12 feet and 24 feet x 18 feet. In the latter the chromite was a good deal mixed with serpentine, and would require dressing to render it marketable.

Deposit B is reported as forming a bluff on the left bank of Oaky Creek, about 2 miles north-westerly from the first group. The second group consists of two bunches—the main one about 90 feet x 36 feet at its maximum width. The quality is reported as superior to that of A group.

At the time of inspection the above deposits were not proved beyond a few feet except in the main deposit of the second group (B), of which a natural section is available down to 20 feet in the creek channel.

Mr. David regarded the deposits as lens-shaped bodies, the vertical extension of which, probably, equals the horizontal. Calculating on the basis of these dimensions, he estimated that the known Gordonbrook deposits would yield approximately about 20,000 tons of chrome ore to a depth of 90 feet from surface.

Samples selected at the time of inspection yielded from 40.25 to 55.27 per cent. Others by Mr. W. A. Dixon, F.C.S., F.I.C., were quoted in the report from 39.7 to 48.61 per cent. Earlier assays (in 1886) are from 28.44 to 47.70.

Two attempts to open these deposits have been made in 1891 and 1895, but so far unsuccessfully. Perhaps cost of carriage is one of the chief reasons for non-success. From the mines to Copmanhurst, the nearest point of available water carriage on the Clarence River, a distance of about 24 miles, has to be negotiated with teams, part of which is over a rough road.

Gundagai District—See Mooney Mooney, Vulcan, Quilter's Adjungbilly, and Kangaroo Mine.

Gwydir River—Chromite is reported from the Gwydir River and its tributaries (see Bingara).

Gulgong (?)—A sample of rich chromite is reported from this locality, but no analysis or particulars are given.**

Grenfell—From near Grenfell a sample yielding 43.22 per cent. is recorded.

Harden, County of—See Mooney Mooney.

Houlahan, Parish of, County Clarendon—Chromite from this locality yielded 40.71 per cent.

Ironbarks and Barraba—Chromite from the serpentine of this district has been assayed for a yield of 46.45 per cent.

Ironbarks, between Ironbarks and Mudgee—Chromite has been reported from between the places mentioned, but there are no particulars on record.

Kangaroo Mountain, Kangaroo Mine, †† Parish Wagara, County Buccleugh—The Kangaroo Mine is situated in portion 128. It was opened in 1894 by Mr. M. Constable, under agreement with owner of the land, Mr. Robert Owen.

This deposit constitutes one of the most important of the chrome-field, both as regards extent and quality. At the time of inspection in February, 1895, the output was averaging about 100 tons per week, about 1,200 tons having been dispatched to that date.

Down to 30 feet the main open workings averaged about 75 feet x 25 feet x 30 feet. At this point the dangerous open work system of mining was abandoned in favour of a safer method of shafts and levels.

For

* Ann. Rept. Dept. Mines and Agric. for 1895, pp. 179 and 180. † Ann. Rept. Dept. Mines and Agric. for 1891, p. 235.

‡ Ann. Rept. Dept. Mines for 1885, p. 135. § Liversidge, Minerals of New South Wales, 1888, p. 106.

¶ Ibid. || J. E. Carne, Ann. Rept. Dept. Mines and Agric. for 1895, p. 127.

** Ann. Rept. Dept. Mines for 1877, p. 211.

†† J. E. Carne, Ann. Rept. Dept. Mines and Agric. for 1895, p. 126.

For about 200 feet the ore body was exposed by open cuts. At surface the solid chromite was narrow, but opened to about 18 feet in the widest part. In the open workings, at 30 feet level, the chromite exposed measured about 54 feet by a width of 4 feet.

The quality of the ore proved consistently good, the lowest average in account sales of 1,230 tons dispatched to the date mentioned was 53 per cent., and the highest 57 per cent. of chromium sesquioxide.

In addition to the Kangaroo Mine, about twelve other smaller deposits were discovered which yielded about 75 tons of marketable ore. Other pockets were known at the same time, but had not been opened.

Keefe's Mine, between Brungle and Bumbolee Creeks, County Buccleugh.*—At the time of inspection (February, 1895), little work had been done at this site, which is on private property. A small chromite bunch or pocket, about 6 feet long by 2 ft. 6 in. wide, had been opened for a few feet only. Most of the ore was mixed with country, and required dressing. Other deposits were reported on this property, and latterly more attention has been given them. Distance of team carriage, however, is reported to have prevented profitable mining being maintained at the present time.

King, County of, near Fass.—Chromite has been noted in this county, but no particulars are available.

Manning River, Upper.—A sample purporting to come from this locality has been assayed in the Departmental Laboratory for a yield of 46·19 per cent.

M'Inerny's Mine,† near Bumbolee Creek, 8 miles from Tumut, situated near the south-west corner of Portion 351, Parish Mundongo, County Buccleugh.—This site was also inspected in February, 1895. A few small bunches were then being prospected, but the quality of the ore was inferior. This mine was the furthest southerly in the serpentine belt at the date mentioned, the distance from the Gundagai railway station being about 30 miles.

Molong, 15 miles west.—A sample of chromite bearing this inscription was assayed for 24·08 per cent.

Moonbi, 12 and 15 miles from.—Numerous samples have been forwarded from this District. Assays are recorded from 39·21 to 43·30 per cent.

Mooney Mooney.—See Wright's and Vulcan Mine.

Mount Lightning.—See Quilter's and Mount Mary Mines, and Adjungbilly.

Mount Mary Mine.—See Adjungbilly.

Mount Miller Mine.—See Brungle Creek.

Murrumburrah.—Chromite reported as coming from this district yielded 44·40 per cent.

Nundle.—See Bowling Alley Point.

Oaky Creek.—See Gordonbrook.

Paling Yard and Dry Diggings (between).—Chromite sent for assay from this locality yielded 40·67 per cent.

Port Macquarie.—From the serpentine of Port Macquarie samples of coherent chrome iron sand have been received recently, which yielded 48·24 per cent. chromium sesquioxides, and 1·29 per cent. of cobalt protoxide. No solid chromite pockets have yet been discovered in the neighbourhood, and the mode of occurrences of the compact sand points to the natural concentration of small disseminated particles of chromite liberated by weathering and decomposition of the serpentine. Magnetic iron oxide occurs at Port Macquarie under similar conditions.

Pucka.—See Gordonbrook.

Quilter's Mines.‡—Of the six deposits of chromite described in my first report,§, as occurring on Mr. John Quilter's property at Mount Lightning, three had been opened by the date of my second visit in February, 1895, and 1,100 tons of ore despatched mainly from two of the deposits. Both the latter presented very small outcrops. The open cut system had been adopted in winning the ore, but at 20 feet it had to be abandoned in favour of safer methods. Two of the largest deposits are unfortunately of very moderate grade, and hence have so far been little worked. No doubt, advantage will yet be taken of them when more systematic grading and dressing is adopted. Four consignments, aggregating 800 tons, from the deposits opened to the date above quoted, yielded from 49·8 to 56·5 per cent. of sesquioxide of chromium. By careful blending a considerable quantity of the abundant lower grade ore could be worked in with the first grade, and a uniform percentage of, say, 50 per cent. maintained.

The ore in this mine was conveyed by gravity from the mountain on a wire rope to the opposite side of the Murrumbidgee River, the bags of ore being suspended by hooks with running blocks.

Shoalhaven.—A sample of chromite, assaying 49·55 per cent., was received as coming from the above locality, but its correctness is very doubtful.

Stony Batta, County Hardinge.—Chromite reported. No particulars.

Tamworth District.—From 20 miles north, 26 miles north-west at Hall's Creek, and from Manilla Range, samples of chromite have been received, yielding from 40·41 to 46·59 per cent.

Tumut District.—See Darbalara, Wagara, Brungle, and Wiangle Parishes, County Buccleugh.

Uralla.—

Vulcan Mine§, Mooney Mooney Range, 4 miles north-easterly of Coolac Railway Station.—As already stated, the group of deposits at the site of this mine were the first opened in the Gundagai district under the name of Wright's Mine. At the time of my first inspection in 1892||, a little surface prospecting or uncovering had been done. The largest deposit thus exposed was about 63 feet by 12 feet at the greatest width, to a depth of 10 feet. The average width of chromite was about 7 feet. About 2 chains further down the slope of the hill another deposit, partly exposed by shallow openings, measured 45 feet by 5 feet. Selected samples from the two outcrops yielded 47·68 and 48·00 per cent. Cr₂O₃.

Estimates of the probable quantity of ore available in these deposits, based on the supposition that they were lens-shaped, and that the vertical extension might be assumed to be equal to about half the horizontal (owing to weathering of the exposed surface) tallied very closely with the actual amount won during mining operations. At the time of my second visit in February, 1895, about 1,200 tons had been raised and dispatched; and, judging from the appearance of the dangerous open workings—which were just then being abandoned on account of risk—the total output would be in the neighbourhood of the former estimate, viz., 2,250 tons.

Wagara Parish, County Buccleugh.—See Kangaroo Mine.

Walcha District.—A sample of chromite submitted from this district assayed 48·26 per cent.

Wallendbeen.—See Berthong.

Welch's Mine.¶—In Portion 173. On the west side of the continuation of the serpentine range, south of Adjungbilly Creek, Messrs. Welch and Springthorpe extracted 220 tons from a deposit, which gave out abruptly, and was abandoned.

Wright's Mine.—See Vulcan.

Wyalong (near).—A sample submitted for assay purported to be from this district, but the information is doubtful. It assayed 37·35 per cent.

Wyangle (Parish of).—See Brungle Creek.

Young District.—Chrome occurs about 20 miles from Young. A little attention has been given to it, and a number of assays made, ranging from 42·46 to 48·35 per cent.

Fulgilbar, Clarence River.—Chromite has been examined which was reported to have come from the ranges between Solferino and the local Cinnabar Mine; and as serpentine occurs in this locality, the report is probably correct.

APPENDIX 6.

Report on the Geology and Mineral Resources of the South-east Border of New South Wales between Cape Howe and the head of the Murray River.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

10 July, 1897.

I have the honor to submit the following notes on the geology and mineral resources of the south-east border of New South Wales between Cape Howe and the head of the Murray River.

About the end of 1895 the Ministers for Mines in New South Wales and Victoria decided upon simultaneous prospecting of the Border country between the points mentioned under the leadership of geological surveyors from their respective departments. The original intention of starting operations at Forest Hill on the Main Snowy Range and working towards the coast was frustrated by delays, arising, in the first instance, from the difficulty of arriving at a mutual agreement by the slow process of official communication, and afterwards by press of work accumulating in the interval. The New South Wales party was thus prevented from entering the field before the winter months, when work is not possible in such an elevated tract. The Victorian party began operations near Bendock some two months earlier, but removed to Cape Howe to meet the New South Wales contingent.

The distance between the points mentioned is about 112 miles, and the width of the strip to be tested was fixed at 1 mile on each side of the line, but this was subsequently doubled officially on the Victorian side. The actual width tested, however, in New South Wales became a variable quantity during the progress of the work, being regulated chiefly by the nature of the indications discovered, which frequently led some distance from the Border. The physical features of the country also further increased the area examined by forced detours for transport of the requisite plant and provisions, portions of the route, in fact, being only passable on foot.

In dealing with the geology of the Border country in this report a still wider range has been taken for the purpose of noting features at some distance bearing upon the question—features which special journeys or detours brought within the range of observation.

The boundaries of the geological formations shown on the accompanying map are fairly accurately defined within the prospected area; beyond it they have been sketched only from main points.*

Very interesting fields for detailed geological survey occur in the isolated patch of fossiliferous Upper Silurian strata at Quidong, and in the extensive developments of Devonian Estuarine and Marine beds typically represented in the Nungatta and Yambulla Ranges at the head of the Genoa River.

As the primary object of the joint project was gold discovery, public interests were protected by close reservation of the land within the areas agreed upon.

Previous Mention.

The Rev. W. B. Clarke appears to have been the only observer within the Colony to publish notes on the geology and physical features of the south-east Border country. In his "Southern Gold-fields, 1860" are recorded results of observations made as early as 1851, or twenty-three years prior to the commencement of the Border Survey. Being doubtful at the time of the actual position of the proposed line, definite suggestions were thrown out as to its most suitable termination westward. The actual bearing of the line subsequently surveyed is about 106 degrees magnetic from Cape Howe.

The difficulties still to be encountered along certain portions of the Border deeply impress later observers with a sense of the unbounded energy and enthusiasm of the above pioneer geologist, no less than his published reports testify to the keenness and cosmopolitan character of his observations. It is indeed remarkable how little escaped detection, considering the primitive condition of the country and the difficulties besetting the earliest geological investigation.

Mr. A. H. Howitt has elaborately described and discussed the physical, geological, and petrographical features of the country south of the Border in his report on the Devonian rocks of North Gippsland,† a work which naturally has an almost, if not entirely, equal bearing on corresponding adjacent features on the north side.

Physical Features.

The border country of New South Wales, between Cape Howe and the head of the Murray River, may be roughly divided into three main divisions:

- (a) The rugged, deeply-sculptured mountain region, extending eastwards from Forest Hill on the main Snowy Range to the Delegate River, a distance of about 40 miles.
- (b) The level table-land, stretching for about 24 miles from the Delegate River to the main coast range.
- (c) The country lying between the coast range and the seaboard, covering about 48 miles.

In the coastal division are the conspicuous Nungatta and Howe Ranges; the former was an original eastern escarpment of the table-land, but since separated from it by erosion of the Bondi or Genoa River Valley, which cuts deeply into the underlying granite.

The Howe Range lies close and parallel to the coast, with an elevation of about 1,350 feet.

The most conspicuous named peaks near the border are Mounts Carlisle, Buckle, Waalimma, Yambulla, Nungatta, Tennyson, Black Jack, and the Pilot, in New South Wales, and Mounts Howe, Merragunegin, Delegate, Tingaringi, and the Cobboras, in Victoria.

Forest "Hill," so called, is but an insignificant rise in a saddle of the main range between the elevated Pilot mountain and the Cobboras, which reach an altitude of over 6,000 feet, or about 1,350 feet above Forest Hill.

The drainage of the eastern division is south-easterly, into Mallacoota Lake in Victoria, the streams being the Timbilica or Wallagaraugh River, and the Bondi, White Rock, and Nungatta Creeks, which form the head of the Genoa River.

The streams of the table-land have a northerly flow into the sinuous Snowy River; they consist of the Quinburras, Bendoc or Little Plain River, Hayden's Bog, and the Delegate River.

In

* The topographical features along the Border are shown on the original Border Survey plans.—J.E.C.

† Progress Reports, Geological Surveys, Victoria, 1876-7.

In the mountain area the drainage is southerly, the channels crossing the border being the Snowy and Ingeegoodbee Rivers; Amboin, Jerry's Flat, Clarke's Cuttamurrah, and First and Second Creeks, all of which are tributaries of the Snowy River. Most of these streams flow in deep, precipitous gorges, between high narrow ranges; the magnificent valley of the Snowy lying nearly 3,000 feet below the summits of the bounding ranges.

The soil of the eastern division, with the exception of the Bondi and Nungatta Valleys and smaller areas on the Wallagaraugh and Boyd's Creek, is of poor quality, being loose and sandy. The table-land affords some excellent grazing land, whilst the mountain country is generally rocky, cold, and poor; the exceptions embracing small areas in the Snowy and Ingeegoodbee Valleys, and some of their tributaries.

On the crests of the highest range, on the east margin of the Snowy Valley, abundant wattle growth testifies to the excellence of the soil covering. It will be understood that the foregoing notes apply only to a narrow strip of border land.

The climate of the table-land is excellent, notwithstanding the duration of winter, the length or severity of which is less objectionable than unseasonable frosts, which frequently seriously interfere with the interests of farmers and fruit-growers.

The climatic conditions are admirably suited to the dairying industry, provided a proper system of winter feeding and shelter be substituted for the present shiftless method of summer abundance and winter starvation.

The climate of the mountain region is naturally very rigorous for several months of the year, with the exception of the valley of the Snowy, which lies far below the level of the table-land, and thus maintains a temperature that precludes snow lying within it. The very restricted area of the river flats, and general inaccessibility render the valley of no importance for settlement.

Geology.

The following formations are represented in the border country:—

Sedimentary and Organic	...	{	Tertiary and Recent.
		{	Devonian.
		{	Upper Silurian.
		{	Lower Silurian.
Igneous	{	Volcanic. Basalt.
		{	Intermediate. Diorite?
		{	Plutonic. Granite and Porphyry.

Discarding the Recent and Tertiary alluvial deposits, from Cape Howe westwards the geological formations occur in the following order:—From the coast to the Howe Range, Devonian, with granite outcropping on the west flank, thence Upper Silurian, with patches of Devonian, to about 120 chains west of Eden-Genoa Road, where granite is met and extends west to Yambula and Nungatta Ranges, which are formed of Devonian strata; west of them granite again reaches the surface in the Bondi Valley, and continues to the Main Coast Range. Lower Silurian rocks form the table-land, and extend, with two interruptions of granite at the Irondoon Range and west of Hayden's Bog, to the valley of the Snowy, which is excavated in granite. Between the granite of the Snowy and Ingeegoodbee Rivers, and between the latter and the porphyry at the head of the Murray River at Forest Hill, two thin belts of sedimentary rocks are interposed, probably, also, of Lower Silurian age. In parts gneissic and schistose characters are very pronounced, especially between the Ingeegoodbee and Snowy River granites in the vicinity of the Pinch River.

Marble limestone forms a small outcrop on the east side of Pilot Creek, which was the furthest point reached to the westward.

Lower Silurian.

Rocks of this age were first encountered on the Main Coast Range, on the west boundary of parish Bondi, county Auckland, where they constitute the eastern margin of the Monaro Table-land. At this point they reach the surface rarely from under a heavy covering of soil and conglomeratic debris, the latter marking the previous extension of the Devonian formation so massively developed in the Nungatta Range on the opposite side of the Bondi Valley. The country hereabouts is thickly covered with jungle extending westwards to near the Quinburra Bogs. Fortunately for the border prospecting operations, recent fires had cleared large areas of the undergrowth and fallen rubbish, rendering the surface visible.

Along the top of the coast range in the parish of Lawson, county Wellesley, the rocks are freely exposed, as they also are on the ridges at Mount Tennyson Trigonometrical Station. They consist of fissile slates, schists, and sandstones. Within the Bondi granite two narrow outcrops of sedimentary rocks occur. In that, farthest within the granite area, at Hopping Joe Swamp, gneissic character have been developed.

A special feature of the Coast Range outcrops is the abundance of quartz occurring in short, bunched veins, and reticulating threads, the debris of which strews the surface of the ridges. The quartz is apparently barren, though fine colours of gold are sparingly distributed in places on the bedrock under the alluvial flats.

About 3 miles within the eastern margin of the table-land, an outcrop of carbonaceous slate, a few square feet in area, was discovered, which yielded a suite of graptolites identified by Mr. W. S. Dun, Assistant Palæontologist, as undoubted lower Silurian types. Careful search failed to reveal any further outcrops in the neighbourhood containing recognisable fossils, owing to the extent to which weathering had bleached the slate and destroyed all traces of organic structure. Fortunately more extensive discoveries were subsequently made in the parishes of Currowang, Wollondibby, Tingaringi, and Alexander, in the county of Wellesley, which furnished additional evidence as to the age of the formation.

From a careful study of all the fossils collected, Mr. Dun is of opinion that the strata containing them may be approximately correlated with the graptolitic slates of north-eastern Gippsland, recently described by Mr. T. S. Hall.* The species also indicate that the strata are younger than the graptolite beds of Castlemaine and Bendigo.

The

The following forms were identified from the first discovery on the coast range:—*

- Dicranograptus furcatus. Hall.
 " (?)
 Didymograptus caduceus. Salter (?)
 Dicellograptus sp. ind.
 Diplograptus, cf. mucronatus. Hall.
 " cf. rectangularis.
 Phyllograptus.

Rocks of a slaty and schistose character persist westward to McLaughlan's Flat, parish Currowang, with frequent alternations of fine-grained sandstone. Considerable metamorphism is manifested near Delegate, arising from the granite intrusion, just west of Hayden's Bog. Delegate Hill in Victoria is distinguished by the metamorphic character of its rock structure, jasperoid cherts and quartzites being the prevailing types. Westward from the Delegate River arenaceous characters become more pronounced predominating over the argillaceous.

From Currowang Creek to Tingaringi Range, quartzites are largely developed in extensive foldings, so extensive in fact as to impart almost horizontality to the anticlinal layers forming the summit of the range in Victoria. Usually the quartzites are very massive but occasionally are finely laminated. Intercalated with the massive quartzites are argillaceous bands—frequently very ferruginous—destitute of apparent cleavage or bedding planes, instead of which irregular, semi-conchoidal division planes have been set up having marked slickensided faces. This structure is apparently identical with similar division planes in compact clays, serpentine, chromite, and Noumeaite, noted by Professor Liversidge, and for which he proposed the term "petaloidal" from the resemblance of the surfaces to the curved and fluted petals of an unopened flower-bud.†

The structure in the present instance has, no doubt, resulted from great folding stress acting on plastic material intercalated in massive, comparatively unyielding sandstone. An incipient stage was noticed in bands having rough cleavage.

At rarer intervals in the quartzitic areas extensive beds of highly cleavable black slate occur containing abundant remains of graptolites. Outcrops having considerable longitudinal extension were noted in the parishes of Currowang, Wollondibby, Tingaringi, and Alexander.

The second discovery of these fossils was made in the first-mentioned parish near the Border line on the old Brown's Camp, Gippsland track. Here the outcrop is much weathered, the surface being covered with loose shaly fragments of a bluish-grey colour, a sure indication of the graptolitic slate. About 2 miles south of the Border a creek-channel has been eroded in the unaltered slate, and organic remains are most abundant. Northerly the slate can be traced through Brown's Camp until it is lost in the granite of Wollondibby, a distance of several miles.

From the outcrop the following forms were identified by Mr. Dun:—

- Diplograptus cf. palmeus. Barrande.
 Dicranograptus sp.
 Dicellograptus.

These forms were represented in ferruginous lines on the bleached slate. On the unaltered slate the markings are milky-white or graphitic.

The third discovery of graptolites was in the parish of Tingaringi, and the fourth about 9 miles north-westerly in the parish of Alexander, at Stockyard Flat Creek. It is probable from the trend of the beds that these occurrences are points of a connected outcrop.

Later a fifth discovery was made in the parish of Wollondibby, a little east of Tingaringi Range.

At Stockyard Flat the unaltered slate exposed in the bed of the creek is highly fissile and capable of being split in large slabs. It is, however, too carbonaceous, and too liable to bleaching and rusty stainings on exposure to be of economic importance in the future. The lower beds of gravel and boulders in the creek have been converted into hard ferruginous cement, by the deposition of ferric oxide from the chalybeate waters escaping from the slate cleavages. The strata strike north 3° west, and dip west at 35°, but both strike and dip are subject to great local variation.

The distance between the first and fourth discovery is about 40 miles.

The following forms were identified from parish Tingaringi:—‡

- Diplograptus cf. palmeus. Barrande.
 Didymograptus sp.
 Dicranograptus furcatus. Hall.
 Dicellograptus sp.

From Stockyard Flat, parish Alexander:—

- Diplograptus cf. palmeus. Barrande.
 Diplograptus sp. (rectangularis McCoy?)
 Dicranograptus furcatus. Hall.
 Dicellograptus sp.
 Dicellograptus extensus. Hall.

Upper Silurian.

Prior to the discovery of graptolites all the sedimentary rocks of the border west of Nungatta were classified as Upper Silurian on Mr. Clarke's correlation of them with certain fossiliferous beds at Quidong, about 15 miles north from the Border, and 13 miles from Delegate. The latter consist of stratified limestones with intercalated mudstones and quartzitic sandstones, chiefly occupying a synclinal trough in the underlying massive quartzites and slates, which rise outside the margin of the limestone area

* Records Geol. Soc., N.S.Wales. Vol. V, Part III, p. 126. 1897. † Minerals of New South Wales, Liversidge, 1888, p. 106.
 ‡ Mr. Dun subsequently identified sponge remains amongst the fossils, which he referred to *Protospongia*, resembling *Protospongia cyathaformis*, Dawson and Hinde. See Proceedings Linnean Society, N.S.W., vol. 22, pt. 2, pp. 436-7.

area to considerable elevations especially to the south and west, imparting a basin-like appearance to the locality. The fossiliferous beds, however, are not confined to the trough, but ascend the opposite faces of the enclosing anticlines; conforming to the dips of the basal beds, a fact which points to conformable deposition prior to folding stress. Alternate banding or intercalation of quartzitic strata (similar to the underlying) in the lowest limestone beds also affords evidence of progressive sedimentation. The order being apparently deposition of immense thicknesses of clean sand now represented by the massive quartzite, then marine organic accumulations represented by the coral and shell limestones, which were several times interrupted by further inrushes of sand; finally muddy sediments mingled with the organic growths and gradually covering and destroying them.

The whole question of gradual and undisturbed passage from Lower to Upper Silurian conditions and life forms turns upon the identity of the lowest quartzite and slate beds of Quidong with those intercalated with the graptolite slates of the Border; definite settlement of this point is dependent upon more detail survey, but from observation extending over a large area of the lower rocks, and from lithological resemblance, I am of opinion that they are identical; and that between the graptolite slates and the Quidong beds will be found interposed a considerable thickness of quartzite.

Mr. Howitt's description of the Buchan and Bindi limestones of Gippsland tallies very closely with the physical features of Quidong, even to the metallic contents of iron, copper, lead, and silver, but he recognised a great break between the above limestones and the Lower Palæozoic (graptolite) rocks; the break being represented by the great thickness of Snowy River porphyries and their associated tuffs and agglomerates. Into New South Wales I believe these rocks do not extend for any distance, hence during the interval represented by the intrusion of the porphyries and subsequent volcanic activity represented by the tuffs and agglomerates, there may have been no corresponding break in the order of sedimentation at Quidong, though cessation may have occurred.

The crystalline limestone of Limestone Creek, on the west of the Main Range, containing *Palæopora*, is regarded by Mr. Howitt as probably of Upper Silurian age, and therefore older than those of Buchan and Bindi, which have been classed as Middle Devonian on Prof. Sir F. McCoy's identification of *Spirifera levicostata*, and the scale of a placodermatous fish.

A small outcrop of crystalline limestone adjoining the porphyry at Pilot Creek about $1\frac{1}{2}$ mile west of Forest Hill, coincides in its physical characteristics with the occurrence at Limestone Creek rather than with that of Quidong.

As regards the age of the Quidong beds, their very abundant fossil fauna possesses both Upper Silurian and Devonian facies. Prof. De Koninck, to whom Mr. Clarke submitted a number of Quidong fossils, divided them into Upper Silurian and Devonian according to their respective resemblance to well-known European types of either period. The classification was as follows:—*

		{	Campophyllum vermiculare. Goldf.
Devonian	...	{	Cyathophyllum Selwyni. De Kon.
		{	Alveolites obscurus. De Kon.
		{	Favosites fibrosa. Goldf.
		{	Syringopora serpens. (?) Linn.
Upper Silurian	...	{	Chonetes striatella. Dolman.
		{	Meristella tumida. (?) Dolman.
		{	Chromus Murchisoni. De Kon.

The following fossils from Quidong in the collections of the New South Wales Geological Survey were obtained by the Collector, Mr. C. Cullen:—

Chondrites.	Rhynchonella.
Mucophyllum crateroides Eth. fil.	Orthis elegntula, Dal.
Favosites.	Actinopteria.
Heliolites.	Pterinea.
Halysites catenularia.	Orthonota.
Vermipora.	Paracyclas.
Tryplasma Lonsdalei.	Mytilarca.
Amplexus.	Bellerophon.
Strophomena sp.	Holopea.
Spirifer Yassensis, De Kon.	Cyclonema.
Pentamerus Knightii.	Orthoceras.

From the occurrence of the above fossils the Quidong beds may probably be correlated with the fossiliferous strata at Yass, containing a similar blending of Upper Silurian and Devonian types.

The occurrence of a placodermatous fish plate at Buchan, in Gippsland, is paralleled at both Yass and Goodradigbee, where similar plates have been found.

The sub-order Placodermata is characteristic of the Devonian period in Europe, but is represented also in the Silurian.†

Devonian.—It is satisfactory to record that at last some palæontological evidence has been obtained whereby to fix the horizon of the great series of nearly horizontal strata, which attain their maximum development (approximating from 1,000 to 1,200 feet in thickness) in the Nungatta and Yambulla Ranges next the head of the Genoa River, and which occur in continuous beds and denuded patches along the coast from Cape Howe to north of Merimbula.

This formation consists of alternations of quartz-pebble conglomerates, grits, sandstones, and clay shales. The conglomerates are frequently very massive. The clay shales at the head of the Genoa are destitute of the rough cleavage which distinguishes those in the coast section at Eden and Pambula, which no doubt arose from the lateral pressure of the intrusive Pambula porphyry and felsite. In the Nungatta and Yambulla Ranges the shales which alternate with the arenaceous and conglomeratic beds, from their inferior resistance to weathering, undercut the harder strata which fall at vertical joint partings, and thus maintain the perpendicular cliff faces which characterise the scenery of these ranges.

From

* Remarks on the Sedimentary Formation of N.S.W. Rev. W. B. Clark, 1873, pp. 129-32.
† Manual of Palæontology, Nicholson and Lyddeker, p. 962.

From the abundant—though mostly ill-preserved—remains of land flora in the clay shales and finely laminated sandstones, it is evident that estuarine conditions prevailed during deposition of at least the major portion of the series. Recent discovery of shell impressions in the lowest division of the formation near Eden points to more marine conditions at the commencement. These fossils unfortunately are fragmentary, but one perfect valve impression has been identified by Mr. Dun as an undoubted coarse-ribbed variety of *Rhynchonella pleurodon*, a characteristic fossil of the Devonian marine beds of Sugarloaf, near the Clyde River, and Mt. Lambie near Rydal.

Mr. Clarke, on pages 166–9 of his "Southern Gold-fields," pointed out the previous wide range of this formation, which, in the absence of fossils, he described as of doubtful age, leaning, however, to the opinion that it probably belonged to the Carboniferous period. The discovery of fossil plants identical with forms previously determined from exactly similar beds at Iguana Creek and Mitchell River, in North Gippsland, described by Mr. Howitt,* removes any doubt as to the age of the formation in question. Mr. Howitt's description of the strata at the above-mentioned localities fits exactly those occurring on both sides of the border at the Genoa River. There is, in fact, abundant evidence of its previous wide extension, not only southerly into the neighbouring colony, but easterly to the coast and northerly to at least Wolumla in the coast country, and possibly Rock Flat, near Cooma, on the table-land. Mr. Clarke, indeed, was of opinion that it extended from the head of the Genoa to the head of the Shoalhaven (Southern Gold-fields, p. 167), and progress of the geological survey may yet confirm the correctness of his surmise.

The treeless, stony, hills east of the town of Bombala, and Bald Hill between that town and Bondi, are outliers of the same formation. It is also highly probably that the isolated masses of quartzitic conglomerate forming such conspicuous features in the landscape of the basalt downs at Rock Flat, and close to the town of Bombala on the south side, also formed part of the same strata. The intense silicification of these isolated masses may be due to the cementing action of siliceous springs, following the volcanic activity represented by the basalt out-flow, which covers the country in the localities mentioned, and forms the Downs, so characteristic of this portion of the table-land.

Mr. Clarke attributed the change to contact with the basaltic rocks, but evidence of considerable metamorphism of a similar character is afforded in the undoubted Devonian out-lier already mentioned at Bald Hills where the basalt flow has not reached.

In the clay shales, which are frequently strikingly red-coloured and ferruginous, abundant obscure impressions of plant remains occur both at Yambula Peak and further west on the Genoa River. In the greenish-grey arenaceous shales and finely laminated sandstones the impressions are better preserved. Amongst a number of specimens collected at the above localities, Mr. Dun was able to identify the following forms:—†

Archæopteris Howitti. McCoy.
Cordaites australis. McCoy.
Sphenopteris Carnei, sp. Nov.
Pecopteris (?) obscura, sp. Nov.

Igneous.

The granites and porphyries in the neighbourhood of the Border in the Snowy River Valley and Main Dividing Range have been exhaustively discussed, both physically and petrographically, by Mr. Howitt, in his important work on the Devonian rocks of North Gippsland;‡ reference to it will, therefore, be sufficient for description of the same rocks extending across the Border into New South Wales. Notice of the igneous rocks in this report will be confined to little more than mention of their distribution.

The main outcrop of granite occurring on the Border lies between the Nungatta Range and the Eden-Genoa Road; this mass represents the southern extension of the Bega, Wolumla, and Wyndham granite. It is intersected by numerous dioritic dykes, but these do not appear to have any appreciable influence on the local gold occurrences.

At the Irondoon Ranges, west of the Little Plains River, hornblendic granite occurs as a narrow intrusion, which pinches out about 1½ mile north of the Border. The granite occurring along the Delegate River, west of Delegate, has had a marked metamorphic action on the intruded sedimentary rocks, as already recorded.

The junction of the granite of the Snowy River Valley with the sedimentary rocks exhibits gradual and intimate blending, the line of contact being apparently entirely obliterated. Mr. Howitt records similar contact alteration in North Gippsland.

Of the granites of the Border it may be stated that they differ essentially from those of the auriferous areas at Braidwood, Adelong, Tumbarumba, Wyalong, and Uralla, and other localities where payable gold deposits occur.

The quartz and felspar porphyry at the head of the Murray River also differs essentially from the Eden porphyry, which has quartz crystals porphyritically developed, whilst the former has felspar in addition.

Volcanic rocks, as before stated, are extensively developed on the table-land about Cooma and Bombala, but do not reach the Border. As they have been described by Mr. Clarke in his "Southern Gold-fields," the only fact in connection with them that need be mentioned here is the occurrence of drift pebbles under the basalt sheet near Bombala. This circumstance naturally infers the existence of old drainage channels (leads), covered by the volcanic outflow, in which gold may be sought.

The presence of well-worn pebbles cannot, however, in this instance be always assumed to be evidence of leads, because of the one-time existence of the Devonian conglomerates over the locality prior to the basalt outflow. The weathering and denudation of the conglomerates would account for a drift-like sheet of pebble debris *in situ* on the level surfaces.

That earlier drainage channels or leads do actually occur under the basalt cover cannot be doubted, but their richness in gold would depend almost entirely upon the amount of it previously distributed through the conglomerates, which to judge from the priority of present streams traversing the undenuded areas at the back of the Genoa River, is infinitesimal.

Mineral

Mineral Resources.

As before stated, the chief object of the expedition was gold discovery; the result, however, is decidedly disappointing, being of negative value only, in proving the remote probability of any extensive auriferous deposits existing within the area tested. From the nature of the country and the well-known fact of new finds, even in old and well-trying fields, it will be unwise to regard the testing operations as exhaustive as regards reefing; within the gold-bearing belts it is, therefore, only reasonable to anticipate limited discoveries from time to time, especially in localities where the bed-rock is obscured by heavy burdens of soil, as at Brown's Camp.

As regards auriferous alluvial deposits, on the other hand, it may, with some confidence, be predicted that no important find will be made within the Border area.

Fine colours of gold were obtained at the head of Nadgee Creek on the east fall of the Howe Range. Lower down the channel gold has been won in small quantities at intervals, a small rush at one time ensuing, which, however, soon terminated, a few ounces only being obtained. About the commencement of the Border prospecting a well equipped party from Victoria was engaged on a further test of this locality, but the effort was fruitless.

About $2\frac{1}{2}$ miles from the Border, on the east fall of the same range, gold-bearing reef-stone in granite was discovered by Mr. Donnelly, of Wombeyan River, about eighteen months ago. Several shallow shafts and trenches have been opened on small veins, and a three-head stamper battery erected and worked by water power, the best results reported being about 5 dwt. per ton. Aid has recently been granted for the purpose of sinking on a larger adjacent reef.

West of the range very promising looking pyritous quartz reefs were prospected in slate country, but no gold could be obtained either by doling or assaying. A few colours, however, were found in some of the creeks traversing the slate, which afforded excellent bars or riffles for gold catchment.

On the bars and in the made banks of Royd's Creek—a tributary of the Wallagaraugh River—fine colours occur largely associated with black sand (chiefly ilmenite). Several shafts in the most favourable sites afforded no better results.

Near the crossing of this creek by Smellie's Track a small waterfall occurs over an outcrop of intrusive quartz felsite, which approximates in physical character to portions of the Pambula rock. Similar outcrops occur on the west bank of the creek and again on the east of the Wallagaraugh.

About 20 chains south of the Border a short gully running into the river, bears the name of "Golden" from the accidental discovery by an early settler of a small specimen of gold on a bar in its bed. Subsequent prospecting at intervals failed to discover any payable deposit, though a few ounces are reported to have been won. This site received special attention from the Victorian Border Party. Mention is made of it because of the local belief that gold exists in quantity in the vicinity.

Between the river and the Eden-Genoa road gold could not be found in the channels which deeply intersect the intervening country and lay bear the bed-rock in frequent bars.

About 1 mile west of the road a fine colour was obtained at a depth of 45 feet in loose sandy drift, heavy influx of water unfortunately prevented the bed-rock being reached, causing temporary abandonment to allow of the possibility of the ground draining on cessation of the rainy season, and provision being made for bailing and timbering. From this shaft also a few particles of ruby tin oxide were also obtained.

About two months later a second attempt was made to bottom, with the assistance of two of the Victorian party, in a larger shaft in which sinking and bailing could proceed concurrently; below 50 feet the ground became of the consistency of porridge, and oozed through the timbering. At 55 feet the pressure became so great that the timbering gave way bodily before the bottom was reached, fortunately without injury to the men engaged. Further test was abandoned in view of the exceedingly heavy and continuous rainfall, which, though not affecting the water-level in the drift by direct vertical soakage, was supplying it copiously at the intake on the flanks of the impervious high lands west and south. In a dry season, with proper bailing appliances and heavy timbering, the ground could be bottomed; but, judging from the poverty of the surrounding country, it is doubtful whether any large outlay would be justified.

An attempt made in a neighbouring flat some thirteen years prior to the Border Party's efforts was equally unsuccessful, though a greater depth—70 feet—is reported to have been reached.

The sinking in the latest trial shaft was through coarse, gritty sand, with pebbles of agate and chalcedony and fragments of rotten slate or shale. The agate and chalcedony are unlike any vein fillings in the surrounding watersheds, and evidently have been derived from the conglomerates which formerly covered the locality.

Other layers passed through at 55 feet consisted of loose, coarse quartz grains, with soft felspathic material between the particles, exactly similar to the coarse grits exposed in the coast section east of Eden. So closely, in fact, do the two occurrences coincide in the nature and mode of arrangement of the constituents that doubts were engendered as to whether the shaft was being sunk in a true drift channel or in decomposing beds of Devonian grits and conglomerates. The surrounding evidence of extensive denudation is, however, confirmatory of the drift supposition.

A short distance north from the trial shaft a small specimen of gold was found against a bar by a local resident in a small creek draining into the Wallagaraugh; the site was afterwards prospected, but a few small specks only rewarded the effort, as also that of the Border Party.

About half a mile west of the deep ground granite occurs, and forms the surface rock to the Nungatta Range, with the exception of a narrow belt of sedimentary rock running north from the Border to Mount Waalimma. It is intruded by numerous dioritic dykes on the east of Mount Buckle, but no reefs could be detected at or near the junctions, nor any gold in the intersecting channels.

About $1\frac{1}{2}$ mile north-west of Mount Buckle, near the Border, one of the party—E. Leonard—discovered gold in quartz veins in granite. On the surface the veinstuff consists of bunches and strings of quartz, with no defined walls, the main strike being apparently about N. 50° E. The visible gold occurs as extremely fine particles in cellular cavities after pyrites, also in the solid quartz. Pyrites, and rarely galena, and traces of manganese oxide, occur in the veins, portions of which have a very kindly, gossany appearance. A large selected sample of the most promising was assayed for a yield of 18 dwt. 12 grs. of gold, and 4 oz. 7 dwt. 2 grs. of silver per ton. The average yield would probably approximate to 5 or 6 dwt. of gold per ton.

As the discovery was worthy of further test, authority was obtained for directing local attention to it, which resulted in the ground being taken up under miners' rights.

The

The Timbilica Reefs, occurring under somewhat similar conditions, about 6 miles north-westerly, have already formed the subject of a separate report.*

From the Mount Buckle reef no further gold discoveries were made until the Main Coast Range was reached, where fine colours were found in numerous places on the bed rocks in shallow ground; nothing, however, of any importance could be traced. Several likely-looking pyritous reefs were opened, but yielded no prospects by loaming or dollying.

About 3 miles further west the main top of the Coast Range trends in a north and south direction; here the bed rocks—slates, schist, and sandstone—rise to the surface. Quartz is very abundant along the range, seldom, however, occurring in well-defined reefs, but chiefly in bunches and threads, the rubble from which covers the surface. It would appear from the Border Party's tests to be absolutely barren, though very fine and few colours of gold are obtainable on the bed rock in the neighbourhood.

At the head of Doogood's Bog, and along the Border towards the Quinburras, fine colours are met with in the alluvial. Along the latter, and the Bendoc or Little Plain River, shafts were sunk for the purpose of testing the correctness of the local belief that portion of the gold in the main channels had been derived from adjacent reefs and alluvial feeders; but neither in the quartz reefs nor in the flats leading into the auriferous channels could gold be obtained.

The evidence afforded by the nature and mode of occurrence of the gold within the present channels, and the terraces formed by their earlier levels, is conclusive as to its original source being high up in the flanks of the Coast Range in Victoria, in which these streams rise. The gold particles near the heads are coarse and frequently associated with quartz; down stream the size decreases proportionately with distance from the source until extreme fineness is met.

The Rev. W. B. Clarke reported gold in this locality as early as February, 1852, but it would appear from local report that little work was done prior to the advent of Chinese, who were driven by the Europeans from the Kiandra gold discovery of 1859.

A few Chinese yet eke out a living in the river beds, both in New South Wales and Victoria, and rich patches are still occasionally discovered by Europeans in the virgin ground near the source of the streams in the latter Colony.

The terraces formed of stranded drift at earlier and higher levels have received a little attention in places, but generally speaking these would only be remunerative on a large scale of gravity sluicing, which elevation and isolation render impracticable.

Lower down, one of the main channels—at Nelbothery—a large amount of capital has been fruitlessly expended in a powerful pumping plant for sluicing purposes, owing to the all-too-common cause in mining of insufficient preliminary testing prior to expenditure.

West of the Little Plain River a narrow intrusion of hornblende granite penetrates the lower Silurian slates and sandstones of the Irondoon Range for about $1\frac{1}{2}$ mile from the Border. A creek channel cutting across the intrusion affords an interesting section. No trace of quartz veins could be detected at or near the junction. A few fine colours of gold were found against the excellent bars in the creek bed below the granite.

In the southern extension of the Irondoon Range, about $1\frac{1}{2}$ mile south of the Border, gold occurs associated with mispickel in very thin quartz leaders in slate and schist, but no trace of a similar occurrence could be discovered north of the Border, though a few fine colours were found in the alluvium on the west fall of the range.

Large white quartz reefs are common between the Quinburra and the Delegate, but are entirely barren.

A few colours of gold are reported from Hayden's Bog, near Delegate, but there is little scope near the Border for anything important to occur, as the channel is shallow and rocky, and the made ground very limited. West of it is a high range of slate, sandstone, and granite, which has been cut through by the Delegate River, close to its junction with the Bog.

In the rocky road crossing at the junction a thin quartz reef carrying a large percentage of mispickel outcrops, but assay proved it barren.

Below the crossing of the Delegate at the Border, a little gold was obtained from terraces at some distance from and above the present channel level. The facts recorded of the Quinburras and Little Plain River apply also to this stream.

West of the Delegate River is an auriferous belt known locally as Brown's Camp, extending for about 4 miles along the Border to near Currowang Creek, and northerly for about an equal distance. In this area several short shoots were discovered and opened at various times, prior to the advent of the Border Prospecting Party, viz., the Concordia, Blue Bell, and Southern Cross. South of the Border numerous similar reefs occur in the direction of Bonang and Bendock, the nearest being the Coolgardie Pioneer and Bonanza, and the "Luck of Roaring Camp," recently discovered by the Victorian Border Party.

The most recent finds at Brown's Camp were Mead's, Latty's, and Parker's reefs, the two latter being discovered by the Border Party. Brief descriptions of the reefs mentioned will illustrate the nature of the local gold occurrences. "Concordia" reef, discovered about two years; situated in a low ridge, about 6 chains north of Border; strike N. 55 E.; tunnel from south side driven, under aid, 210 feet from end of open cut 14 feet in length; approaches reef at less than a right angle; abandoned before reaching it on refusal of further aid. Method of testing ill-advised, tunnel level being but 45 feet below cap of reef, and entrance distant 315 feet at a right angle. Later a shaft was sunk 75 feet on the reef, which is reported to have pinched out. Surface stone crushed 12 dwt. per ton, but the yield decreased with depth.

"Blue Bell" reef occurs in west end of Black Jack Range, about $3\frac{1}{2}$ miles north from Border. Consists of thin uncertain leaders in the cleavages of slate. Gold originally discovered at surface in rubble from the leaders. Aid was granted to sink, but for some unaccountable reason the shaft was carried down 75 feet in bank country, away from the auriferous leaders.

A short distance below the shaft down the northern slope of the ridge a block of auriferous quartz was found outcropping *in situ*, but the gold was not traced away from it in the shallow opening that was made. Lately a Mr. Brown has opened another small leader at the original discovery on the ridge. This site is worthy more systematic test than has hitherto been given it, though it is doubtful if the veins will converge or increase in thickness.

"Southern

* Ann. Rept. Dept. of Mines and Agriculture, 1896, pp. 122-5.

"Southern Cross" reef also occurs in the Black Jack Range, about $2\frac{1}{2}$ miles from the Border. It strikes N. 20° W., and dips N. 70° E. at 65° , and varies in thickness from 1 to 6 inches, averaging about 2 inches. Vertically and horizontally it did not exceed about 25 feet. Nine tons yielded 17 dwt. per ton, which exhausted the supply.

"Mead's" reefs are situated near Pipeclay Creek, about 50 chains from the Border. The north reef strikes about N. 60° E., and the south N. 27° E., at about 5 chains apart. Both reefs, so far as opened, appear to be lens-shaped. The north reef has pinched vertically at a few feet from surface, the other at 35 feet, though the quartz block is reported to be dipping north from the shaft. The greatest thickness of these reefs was about 2 feet, but their lengths do not appear to exceed 20 or 30 feet.

The first crushing of 10 tons yielded 32 oz., and the second of 14 tons yielded 14 oz.

Latty's reef was discovered on the 5th April, about 21 chains from the Border, in the direction of Mead's find. The surface prospects were excellent, but were not maintained with depth. The reef proved very short and erratic, as will be seen from the following plan:—

The south end was almost vertical to 9 feet, to which depth it was opened, but the gold was not going down. Trenching failed to reveal any further development of veinstone in the vicinity.

Two other reefs were opened between the above and Mead's reefs, one very pyritiferous. Neither yielded free gold in either loam or dolly tests, but on assay the pyritous stone yielded at the rate of 1 oz. 14 dwt. 20 grs. of gold per ton. The absence of free gold from the rubble and loam is rather peculiar, for it is invariably found in the waste of gold-bearing reefs, and such has been the experience of the Border party hitherto. Samples from a number of pyritous veins, from which no loam prospects could be obtained, were assayed in the departmental laboratory with confirmatory results.

Gold was traced by loaming up a ridge close to the border, west of Latty's reef to its source in the joints of sandstone country; a considerable amount of work proved that nothing workable or permanent existed.

On 17th May Parker's reef was struck about 7 chains east of the Brown's Camp, Gippsland track, and about 2 chains from the border. The rubble and loam prospects were exceedingly good, but, unfortunately, the gold was confined to a shoot not exceeding a foot in length. Trenching on the strike revealed a massive reef up to 2 feet in thickness, extending for some little distance, but no other gold-shoot could be detected. The site is now receiving local attention.

Several parallel reefs were opened close to the above, but proved barren.

Along the ridge followed by the Brown's Camp, Gippsland track, across the Border, for years past loam prospects have been obtained by prospectors, and aid was granted to sink and cross-cut in some ironstone veins in the sandstone country, which was erroneously regarded as the probable matrix of the gold in the loam.

About 25 chains south from the Border the Victorian party discovered two thin auriferous veins, but extensive costeening to bedrock along the Border failed to reveal their extension into this Colony. About 80 chains south of the Border the same party discovered a large reef—the "Luck of Roaring Camp"—rich stone was obtained in the cap of the reef, but little is yet known of the extent of the gold-shoot in the absence of any developmental operations.

In McLaughlan's Flat, which heads near the Border, close to the Gippsland track already mentioned, and falls gently northward, colours of gold are obtainable at a shallow depth on the bedrock. Near its head shafts have been sunk, some very recently, others evidently years ago; the latter extending for some feet into the bedrock.

Above these workings quartz is plentifully strewn on the surface, but apparently barren. Trenching to bedrock across this locality proved at least the non-existence of any extensive gold reefs.

In several additional instances loam trails were traced to their sources at Brown's Camp, which, however, were unworkable.

The experience of the Border party in this locality is in accord with that of earlier prospectors touching the unreliable nature of the gold occurrences. Not only are the gold-shoots extremely short and uncertain, but the quartz veins containing them are equally so. Apparently not more than one shoot occurs in each reef, at least, such has been the experience hitherto. In fact, the quartz veins are seldom more than a few feet in length, and the shoots rarely the length of the shaft, generally much less. The gold-bearing stone is frequently rich, yielding up to several ounces per ton, but a few tons usually exhausts the supply.

Numerous small finds will undoubtedly be made from time to time, but extensive ones can hardly be expected.

West of the Brown's Camp auriferous belt the country along the Border consists principally of massive quartzites with intercalated graptolite slates at intervals. Between Brown's Camp and Tingaringi Range no trace of either reef or alluvial gold was obtainable.

Between Tingaringi and the Snowy River, a distance of $16\frac{1}{2}$ miles, the only tests made were confined to a few trials of likely-looking bars in Amboin, and other creeks during a flying trip ahead; the results were very discouraging, not a colour being raised. Evidence of earlier prospecting was noted in a terrace of Jerry's Flat Creek in Graham Collins' Gap; the testimony of one of the prospectors—since met—was unfavourable.

From

From the Snowy River to Pilot Creek, west of the Main Range, prospecting operations were continued systematically; in this area also previous prospecting was manifested by numerous shallow shafts in the main flats and channels.

In the Snowy River gravels both at present and former levels a little fine gold is obtainable, but not in payable quantities.

In the Ingeegoodbee River and First Creek channels a few fine colours occur abundantly associated with black sand, chiefly ilmenite.

Fairly extensive drift-beds and terraces occur along Pilot Creek—one of the heads of the Murray River—but are almost barren.

To reach the Snowy River from Brown's Camp, with pack-horses, for the purpose of testing the most elevated tract before Winter, it was necessary to make a detour *via* Wollondibby, Merambalgo, and Byadbo, a distance of about 40 miles; the greatest distance from the Border being 10 miles.

At Wollondibby and Merambalgo granite occurs, the rest of the distance being over Lower Silurian sedimentary rocks until the Snowy Valley is reached, where granite again forms the surface rock.

Near Stockyard Flat Creek, between Byadbo and Merambalgo, a large, well-defined quartz reef occurs. Where it cuts the black graptolite slate of the creek, and of Little River, into which the latter flows, it is highly brecciated with slate fragments, resembling the Hillgrove stone. It is, moreover, exceedingly porous and gossany places, in others pyritiferous. The thickness varies from 4 to 20 feet, and the strike outcrop traceable for at least a mile. Numerous loam trials along the entire outcrop, and frequent dollings of most favourable-looking portions failed to reveal even a colour of gold; though a few were obtainable in the bed of the Little River, which the reef crosses, and in which huge boulders and smaller blocks of the reef-stone are strewn. Four or five dwt. of gold per ton in this huge reef would render it one of the most important in the Colony.

The above reef is very noticeable, because of the marked absence of quartz between Tingaringi and the Snowy.

The streams hereabouts fall northerly from the range forming the watershed of the Amboin, Jerry's Flat, and other creeks crossing the Border southerly already mentioned.

Copper.—A little copper ore was found in the Snowy River granite on a low spur opposite Mount Trooper, on the east bank of Sandy Creek, and in a small creek on the Border about half a mile east of the river; in the latter instance, however, the occurrence amounted to mere traces only of carbonates and isolated crystals of copper pyrites. Opposite Mount Trooper the indications were more pronounced and concentrated, but prospecting failed to reveal any workable deposit. An assay of a picked sample from a small concentrated bunch yielded 7·03 per cent. of copper, and 17 dwt. 9 grs. of silver per ton.

On the west end of Black Jack Range, in the parish of Currowang, a small copper lode was opened by Mr. H. T. Allen about sixteen years ago to a depth of about 30 feet. It is reported to have had a thickness of about 1 foot at surface; at 30 feet it consisted chiefly of clay, with grains of metallic copper. Two tons of ore dispatched to market at the time of working are reported to have yielded 10 per cent. of copper and a little gold.

Mention may here be made of the copper and silver-lead workings at Quidong. The copper prospecting operations preceded the silver-lead by several years. A large amount of work was done in sinking and driving on the east side of the Quidong River, in country revealing surface indications of copper and abundant oxide of iron, the latter resulting from oxidation of pyrites, which, in its unaltered condition, is very plentiful in the spoil from the deepest shafts.

Another source of the prevalent iron oxide which colours the rocks and soil of the neighbourhood, is the original precipitation of iron salts by the abundant organic remains in the strata, which have been converted into oxides, as weathering and denudation exposed the fossiliferous layers to atmospheric influences.

In some instances in the neighbourhood, Clarke's Rock, for example, the cellular, gossany appearance imparted to certain strata by the decomposition of the original organic remains, and the subsequent alteration of the investing iron salts into powdery oxides, gives rise to an erroneous impression that the "gossan" outcrops are caps of metallic lodes. A recent assay of a large average sample from the most favourable-looking of the outcrops yielded a trace of gold only.

Evidently in the early prospecting operations for copper ore nothing workable was discovered.

The most striking features in connection with the silver-lead workings and smelting plant, are the very meagre indications of ore and the inadequate prospecting, compared with the very evident heavy expenditure on crushing and smelting plant, which apparently was hardly ever used.

The ore consists of argentiferous galena in limestone, the largest vein at present visible not exceeding about 3 inches in thickness, and not solid.

Tin.—As before mentioned, a few specks of ruby tin oxide were obtained in the deep ground at Timbilica. Tin deposits were worked some years ago on the west fall of the Main Snowy Range, opposite the head of the Pinch River; but though careful search was made, no tinstone was detected in the neighbourhood of the Border near the above range.

Wolfram.—Wolfram occurs in very limited quantity in a quartz reef in Mr. Cochran's property near Mila, about 10 miles from the Border, but is of no importance.

Conclusion.

In conclusion, I desire to point out in connection with the strip of country along the Border between Tingaringi and the Snowy Valley—about 15 miles—yet remaining to be tested, that earlier prospecting and superficial tests made during a flying trip ahead were very discouraging; and further, that the channels falling northerly from ranges close to the Border were proved non-auriferous as already mentioned. In view of these facts, and the Minister's instruction to resume work next summer, I beg to strongly recommend an area—edged yellow on the accompanying map—west of the Main Snowy Range, in lieu of the Border land, as offering altogether stronger inducements for expenditure of public money. Within this area the main heads of the Murray and Tumut Rivers rise; large basalt plateaus exist, and reefs are plentiful in the narrow slate belts occurring in the granite and gneiss. Toolong, Grey Mare's Bogong, and Khancoban are gold workings discovered in this area within the past few years.

The great elevation renders prospecting a slow and difficult process, and only possible in summer months, hence little practical testing has yet been done.

If the proposal should be approved, the work would have to be carried out with the aid of pack-horses; a memorandum in connection therewith will be submitted separately.

Before closing, I desire to express my appreciation of the qualifications and good service of each of the members of the New South Wales Border Prospecting Party, viz., M. Keogh, H. Parker, J. Latty, E. Leonard, and A. Anderson.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,

Geological Surveyor.

The Government Geologist.

APPENDIX 7.

Report on the natural foundations at the site of the proposed dam connected with the Hunter River Flood Prevention scheme.

Sir, Geological Survey Branch, Department Mines and Agriculture, 27 July, 1897.

I have the honor to report that, in accordance with your instructions I visited the site of the proposed flood prevention dam at Woodlands on the Hunter River, in company with Mr. E. B. Price, C.E., Assistant Engineer, Works Department.

An examination was made of the physical and geological features of the locality, with a view of ascertaining the nature of the strata on which the foundation of the dam would be laid.

The valley of the Hunter has here been excavated in the Permo-Carboniferous Coal Measures, leaving on the south side a high range capped with massive sandstone, which presents characteristic vertical cliff faces to the valley. Below this well marked escarpment the position of the softer clay shales, sandy shales, and laminated sandstones is readily distinguishable from their mode of weathering, which imparts rounded and generally sloping contours to the foothills formed of these strata.

The general horizontality of the strata is rendered evident by well-marked zones of harder rock, which protrude on the slopes, and cap table-topped isolated hills.

As will be seen by the plan and section attached to Mr. Price's report, the dam would butt against a steep cliff at the south end, and ascend gradually up a low sloping ridge to the north.

In the accompanying sketch section—which follows the course of the dam—the nature of the strata is depicted. From the data obtained in the exposed cliffs at the north and south end of the section, supplemented by the evidence of the coal seams struck in the boring operations, the nature of the bedrock underlying the river drift and soil of the valley may be confidently assumed.

The general dip of the strata is south-easterly (across the river) at a low angle, amounting to about $5\frac{1}{2}^{\circ}$ in the coal seams struck in the bores. A dip taken in the south cliff face about 160 feet above the river level registered about $7\frac{3}{4}^{\circ}$.

At the north end of the section, which is about half a mile north of the north end of the dam, a dip of 20° was noted, the increase being due to a small anticlinal roll in the Measures which is exposed in the western escarpment.

The coal seams proved in the bores close to the river, outcrop about a mile north in the west escarpment of the ridge, and again on the south side of the river in a small creek bank about half a mile above the dam site.

Where the coal seams outcrop on the side of the ridge they occur in bluish grey shale intercalated between an underlying massive bed of pebble conglomerate and sandstone, and overlying laminated sandstones, sandy shales, and clay shales with ironstone bands and cherty layers.

The exposed thickness of conglomerate above the river flat is upwards of 90 feet. The coal seams occur within 10 or 15 feet of the top of the massive conglomerate. A sandstone capping on the latter reaches closer to the coal horizon.

Following the slope of the ridge towards the dam denudation has removed the overlying softer sandstones and shales, until probably beneath the surface drift at the north end of the dam the conglomerate will be found to be the bed-rock. At this point the anticlinal roll already indicated occurs, on the southern slope of which the overlying shales and coal seams have been preserved under the river drifts and alluvium, as proved by boring.

It will be noted that in the bore in the river bed—of which a detailed section (B) is given—a depth of 22 feet from the top of the upper coal seam has been pierced without reaching the conglomerate, whilst a thickness of about 15 feet only (17 feet in one instance) is shown in the ridge section (C). The discrepancy is due to the weathering and decomposition of the coal at the outcrops, which lets the roof down, thus pinching the soft perished material into thin layers.

If the gently inclined clay shales with coal seams be not deemed suitable for the dam foundation, I am of opinion that a few feet lower—probably less than 10—solid sandstone and conglomerate strata will be reached, unless there be abnormal thickening of the shales in the direction of dip, of which, however, there is no indication.

The additional depth required at the river to reach the more solid foundation will be compensated by the gradually lessening depth of the necessary excavation as the ridge is ascended.

The laminated sandstones and shales below the massive sandstone horizon in the South Cliff section, against which the dam will butt, are soft and weathered at the outcrop below the talus of slipped blocks and soil; the excavation will, therefore, require to be extended beyond the sphere of weathering, which, owing to the protection of the overlying massive sandstone, will probably not be far.

It is very likely that the coal seams already discovered in this locality will prove of economic importance in the future. If the flood prevention scheme should be adopted it must prove an important factor in connection with the extensive works to be carried out.

I have, &c.,

JOSEPH E. CARNE,

Geological Surveyor.

The Government Geologist.

APPENDIX 8.

Report on "The Luck of Roaring Camp" Reef, near Brown's Camp, Victorian Border.

Sir,

I have the honor to report, in accordance with your instructions received on papers 97-1,634 (Prospecting Board), that I have inspected the lines of reef recently discovered by the Victorian Border Prospecting Party, and since named the "Luck of Roaring Camp."

The discovery was made on the 19th February, close to the Gippsland to Brown's Camp track, about 1 mile from where it crosses the New South Wales border. At this point three parallel reefs occur, designated respectively "Main," "East," and "West" reefs; the three occur within a distance of about 5 chains.

The country consists of altered Lower Silurian sandstones and slates. The auriferous belt containing the reefs has been traced, so Mr. Hunter (leader of the party) informs me, for a distance of about 4 miles on the line of strike, which at the point of discovery is about N. 20 E. The underlay of the veins is hardly yet determinable in the absence of sinking, but is apparently easterly.

Gold-bearing veinstone has been proved to extend for about 2 miles by means of shallow surface exposures and outcrops, loam prospects, and loose specimens at intervals. The identity and continuity of the reefs and lengths of the gold shoots throughout, however, have yet to be proved, for the intervals between the provings are frequently extensive, especially northerly, and the exposures, with one exception, confined to a few feet of shallow trenching.

The most northern exposure of reefstone carrying gold occurs about 20 chains south of the New South Wales border, but "loam" prospects and loose specimens have been found within 13 chains. (The New South Wales party began prospecting on the border line yesterday for the purpose of tracing the reefs northerly; fine colours were obtained in loam tests).

The country has been pegged for about 1 mile northerly in New South Wales, in the direction of strike; prospecting within the Colony is, however, rendered far more difficult by the change in the physical conditions. South from the Border, the country consists of stony ridges deeply intersected by creeks and gullies; northerly, gently undulating, deeply-soiled flats cover whatever outcrops occur above bedrock.

The "Main" reef, at its principal outcrop—about 80 chains from the Border—has been exposed for about 30 feet by removal of the partial covering of soil; its thickness at this point averages about 2 feet. South from the opening, the outcrop is visible at intervals through the soil for about 40 feet to near a small creek, in the clean rock bed of which it pinches, and the gold ceases. On the opposite slope, however, gold is again obtainable in the solid reefstone. South from the latter occurrence, the reef has not been traced on its strike. Mr. Hunter (who kindly supplied the attached sketch plan of locality) informs me that the measured extent of the solid outcrop is about 15 chains, and that two known gold-shoots occur in it apparently separated by a blank. He also estimates the average value of the gold-bearing portions at 1 ounce per ton.

The gold occurs associated with arsenical and occasionally ordinary iron pyrites. The quartz matrix, as a rule, has a pronounced bluish tint; portions of the main reef possess a distinctive waxy or felspathic appearance, which so far has not been detected in the northern outcrops. A little galena was noted in one of the latter, associated with the gold and pyrites.

The "East" reef occurs 2 chains east, and the "West" reef 3 chains west of the "Main" reef, their thicknesses being respectively about 10 or 12 inches. Neither of these veins carry gold at the south end of the principal outcrops. Northerly about 60 chains towards the New South Wales border, however, gold occurs in three distinct lines of reef, which are regarded as identical with the southern outcrops because of their occurrence near the main line of strike, though the strikes of the individual reefs, so far as determinable from the single very limited exposure in each case, differ essentially from that of the main line. The thicknesses of the northern veins vary from 4 to 10 inches, and the underlay of one is apparently westerly.

If the discrepancy in the strikes be disregarded as a mere local variation, then the most favourable features of the discovery are the apparent longitudinal extension of the reefs, the number of the gold shoots, and the solidity of the main outcrop, features which form a marked distinction in the district, where, hitherto, the conditions have been exactly the reverse.

The ground was extensively pegged as leases by the members of the prospecting party, and subsequently jumped or repegged under miners' rights; but owing to the discovery being within the area specially reserved for Government Border prospecting operations (2 miles wide along the Border from Cape Howe to Forest Hill), no occupation or mining operation was possible until the veto was removed. Yesterday it became known that four of the leases pegged by the party (five 30-acre blocks) were refused, and one allotted them, and that the ground was gazetted open to lease at 5 p.m. the previous day; the balance of the leases were immediately repegged on behalf of others.

The Victorian party, I understand, will shortly leave the Border for some basalt country about 10 miles from the latter, near Bonang, which they have been instructed to prospect. The leader estimates that the winter will be occupied in the work, and the Border prospecting resumed in the summer.

As regards the time required to complete the Border work on the New South Wales side, an estimate is very difficult in view of the approach of winter months. I am of opinion that it will require about two months to properly test the gold belt between the Delegate River and Currowang Creek, if I am allowed discretion in following it northerly some distance from the Border, which is likely to be more profitable than continuing west on the line.

From Currowang Creek to near the Snowy River, the gap remaining to be tested is from 18 to 20 miles in length. It may be premature and risky to hazard an opinion of the latter country, but I am not favourably impressed with its prospects; some of the most promising localities were tested whilst journeying to and from the Snowy River and Forest Hill, without any favourable indications even. Between the Snowy River and the head of the Murray River, there is a marked difference in the rocks and their mode of occurrence compared with the conditions existing between Toolong, Bogong, and Kosciusko. Both east and west of the Snowy Range at Kosciusko gold occurs. From personal knowledge of some of the western side (Bogong and Toolong, etc.), I am of opinion that gold-bearing reefs and alluvial are likely to be found between the main range and the Murray and Tumut Rivers.

By the end of the period required for properly testing the Delegate-Currowang auriferous belt, it is highly probable that the rigorous climate of this elevated district will prevent effective work being carried on. Working mines from stationary habitations can be carried on regardless of weather; but constantly shifting prospecting operations under calico would be difficult as well as trying. Our present camp is strewn around with fallen and broken timber from last year's snow. I beg to recommend the discontinuance of work when the atmospheric conditions prevent it being carried on effectually, and resumption in the summer if deemed desirable.

I have, &c.,

JOSEPH E. CARNE,
Geological Surveyor.

The Government Geologist.

APPENDIX 9.

Notes on the Geology and Auriferous Deposits of the Wolumla Gold-field.

Sir, Geological Survey, Department of Mines and Agriculture, 30 October, 1897.

I have the honor to report that whilst recently in the South Coast districts I devoted several days to a preliminary examination of the Wolumla Gold-field with the object of mapping the geological features, and noting mining developments since my previous brief visit in August, 1896 (shortly after discovery), the result of which was published in the Annual Report of the Department for the same year, page 122. The following notes and attached geological sketch map embody the results of observations to date.

Discovery.

The credit of discovery belongs to Mr. C. Momsen, a local resident, who had previously discovered and prospected an auriferous felsite dyke east of the Black Range, about 3 miles north-east of Wolumla, without, however, success attending his efforts in the form of payable deposits.

About the middle of 1896 he directed his attention to the site of the present gold-field, and after considerable search succeeded in discovering on the west side of the hill now bearing his name a portion of the auriferous matrix which shed the gold previously known to exist in small quantities in the loam and small channels in the vicinity.

Situation.

The Wolumla Gold-mines are situated on the boundary dividing the parishes of Wolumla and Cobra, in the county of Auckland. The principal are within railway reserve No. 863, and C.P. 302 in the first-mentioned parish; the remaining two, Gahan and Party's and Schuback and Party's, are within C.P. 16, parish of Cobra.

The prospector's claim (M.T. 1) is situated about 1 mile S. 18° W. of the Wolumla Post Office. The nearest shipping port is Merimbula, distant about 7 miles E. 22° S., but further by road.

The nearest gold workings are those of Pambula and Jingera, distant about 10 miles S., 22° E., and 9 miles S., 27° W. respectively.

The gold finds are at present restricted to a rectangular area of about 75 acres extending N., 30° W.

Previous Mention.

The Rev. W. B. Clarke described the general geology of the Wolumla Range, and of the country lying between it and the coast, in his "Southern Gold-fields, 1861," p. 189.

Mr. Geological-Surveyor Anderson also briefly alluded to the locality in his report on the Pambula Gold-field in the Annual Report of this Department for 1890, p. 263.

Mention has already been made of my previous report on the field in 1896.

Physical Geology.

The principal physical feature of the Wolumla district is an extensive granite valley almost completely surrounded by an elevated rim formed by the Wolumla, Black, Mumla, Bemboka, and Tantawanglo Ranges. The high lands on the north and west, towards Cobargo and Tantawanglo are chiefly granite, while those on the south and east are mostly of sedimentary origin. The latter dip gently off, and away from the granite of the valley.

It would appear from existing phenomena that the granite originally rose to a considerable elevation over the site of the present valley, lifting a portion of the western edge of a great sheet of accumulated sediments from the coastal margin of the oceanic basin in which it had been deposited. During the uplift, which evidently was effected without any violent derangement of the strata, the basal bed (conglomerate) in contact with the granite was baked and hardened, quartzitic characters being developed in the sandy paste in which the pebbles are embedded. Extensive vertical joints in the conglomerate probably attest the strength of the tangential strain of the uplift, more than shrinkage caused by desiccation.

Where the gold deposits occur a section of the uplifted strata has been tilted to a high angle, and partially engulfed in the granite magma, portions of which have been squeezed upwards through numerous joints and fractures in the sedimentary rocks, crushing and saturating them. The dynamic energy of the intrusions has also left its impress on the extruded granite, for it presents a crushed and sheared appearance in the mass, and a waxy or chitinous aspect on closer view owing to the feldspars having been converted into a felspathic paste. These features have also been induced along the zone of main contact at Momsen's Hill.

Though apparently the granite originally formed a huge boss-like mass over the present Wolumla Valley, it was not isolated from the extensive outcrop trending southerly beyond the Victorian Border, and westerly to the Monaro tableland.

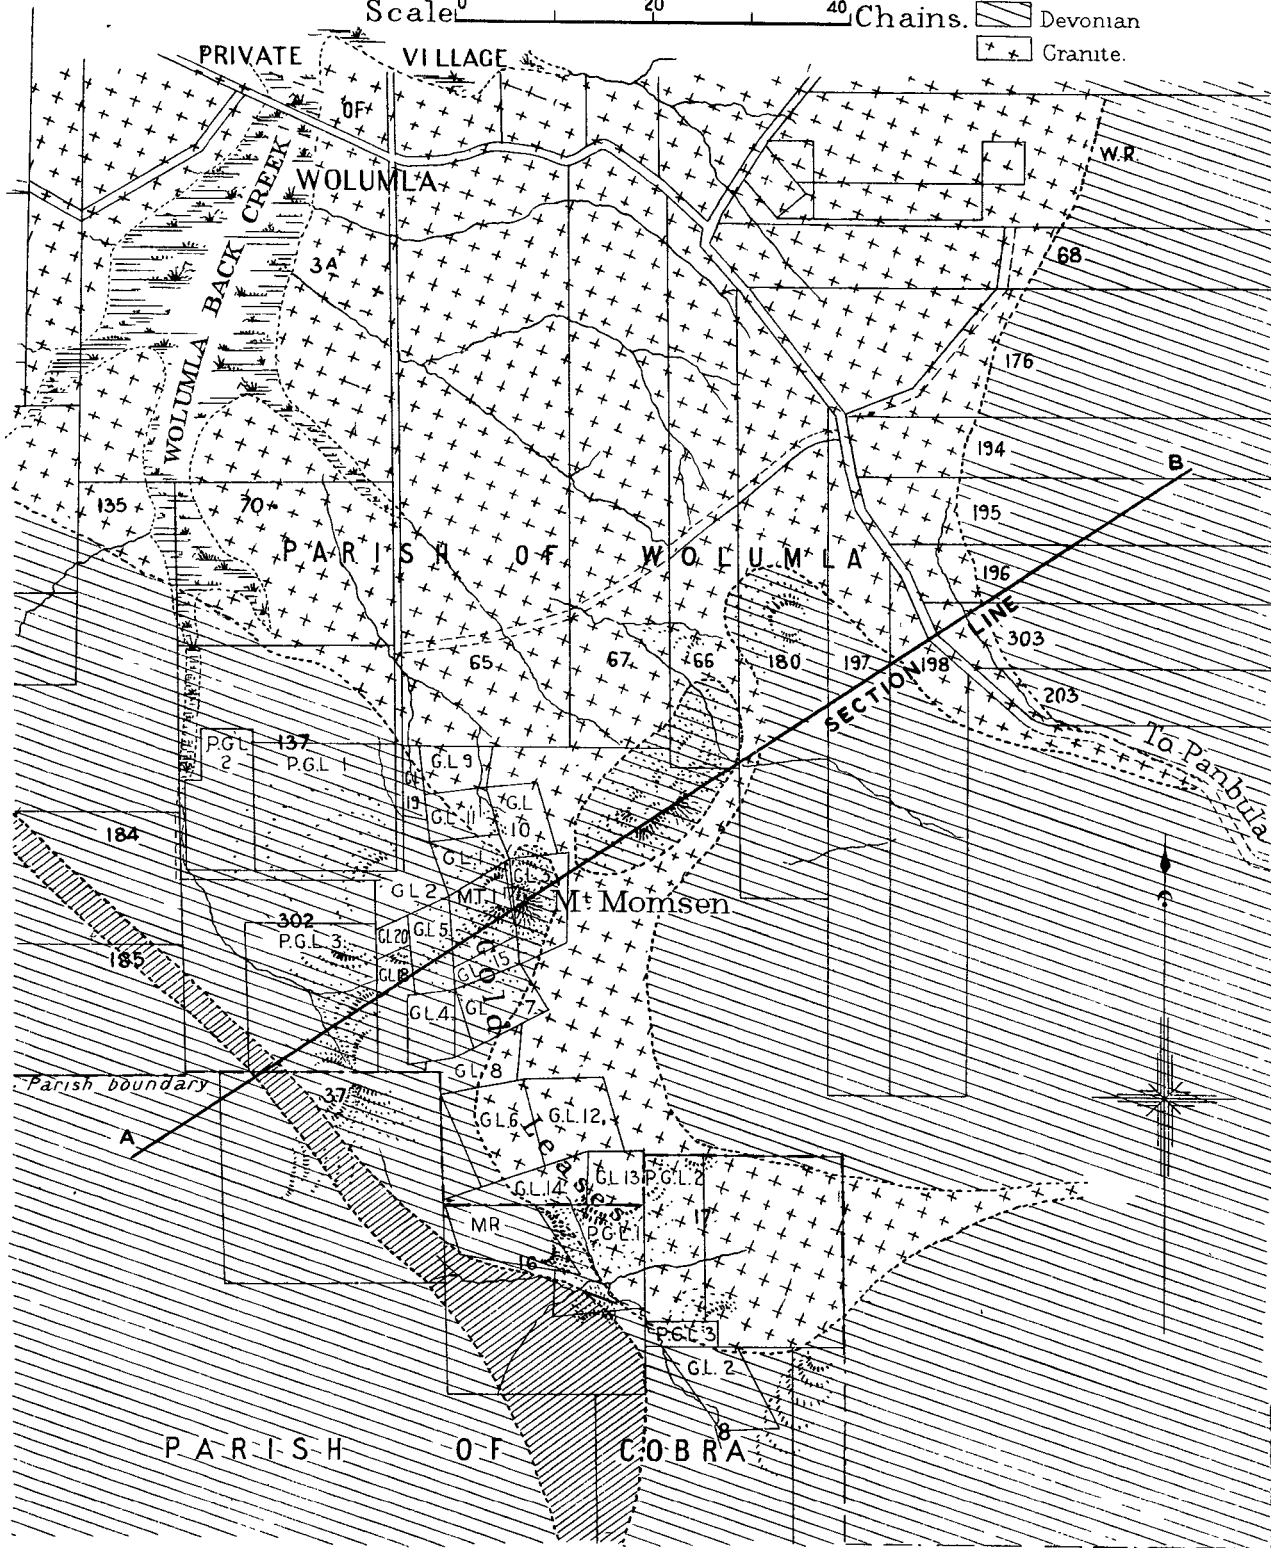

From

Geological Sketch Map of the WOLUMLA GOLD FIELD

County of Auckland.

Scale 0 20 40 Chains.

SECTION ON LINE --- A. B.

HORIZONTAL SCALE 0 10 20 CHAINS - VERTICAL SCALE 0 500 1000 FEET

From the relative positions of the granite and the sedimentary rocks between it and the coast, it would appear that the original line of weakness marked by the former was coincident or closely parallel with a shore line of a Devonian sea. The sedimentary rocks betray their shallow marginal origin by massive conglomerates and ripple-marked sandstones. An excellent instance of the latter is exposed at Bellbird Creek, close to the Eden-Pambula road, where marine worm tracks are also seen meandering over the rippled surfaces.

From the marked absence of any evidence of later marine deposits along this portion of the coast, it is reasonable to conjecture that it has not been depressed below sea-level since Devonian times, to which period the surface rocks belong.

Mention might be made of the absence of exposure of any sedimentary rocks older than Devonian along the margin of the granite in the neighbourhood of Wolumla, unless the highly schistose rock in Schuback's claim, in portion 16, parish of Cobra, can be regarded as evidence of such; certainly it differs materially in physical character from the slates of the Devonian series, but the crushing and shearing effects of the contiguous granite would account for the difference.

Reference might also be made to a fissile slate, outcropping at the head of a small creek on the east fall of the Black Range a few miles north-east of Wolumla, because of an attempt to turn it to economic account in 1885. An examination of the locality, prompted by the belief that earlier Palæozoic rocks were probably outcropping, revealed a granitic dyke about 4 feet thick, which had induced more pronounced cleavage for a few feet on either side in the slate which it intruded. At best, the cleavable material is very soft and inferior, and obliquely-jointed across the cleavage planes, hence quite incapable of splitting into a commercial article even if the quality was satisfactory. At a short distance on either side of the dyke, the fissility decreases rapidly until cleavage is impossible. The attempt to work such unkindly material inspires wonder at the credulity that prompted outlay. This slate also differs essentially from the Devonian slates in the neighbourhood, and as it lies close under the Black Range on the east flank of the granite, it may represent earlier strata brought up by the latter.

The series of alternating conglomerates, sandstones, and red slates described in my report on the Pambula Gold-field* as occurring along the coast between Eden and Pambula, have now been further traced to about 4 miles north-easterly from Wolumla, where they still continue northwards. At Wolumla, the western margin of the beds caps the ranges, and with the one exception of Momsen's Hill, the dip is at a low angle eastward and southerly off the granite, which outcrops on the western flanks and in the gaps and valleys between the ranges and peaks. At Momsen's Hill, where the exceptional dip occurs, the beds have been tilted to an angle approaching the vertical.

The lowest stratum of the series is a massive conglomerate; as before stated, evidence of the baking effect of contact with the granite is afforded by the hard quartzitic character of the sand in which the pebbles and boulders are embedded. The latter consist principally of quartzite with, occasionally, quartz and slate, and, more rarely, felsite resembling the Pambula rock. Boulders up to 9 inches or more in diameter have been noted.

This massive conglomerate has been observed extending from the Black Range, Wolumla, to west of Pambula, and probably may yet be traced with occasional gaps to the extensive—though finer—conglomerates of Nungatta, at the head of the Genoa River, near the Victorian Border.†

Above the basal conglomerate sandstones and roughly-cleaved red and purple slates alternate frequently, the cleavage of the latter being roughly at right angles to the bedding planes. The distinctive colouring of the slates forms a very marked feature of the local stratification, because of the contrast afforded by the lighter-coloured sandstones in which they occur. The colouring is most probably due to decomposition of the original constituents of the sediments, and the liberation and peroxidation of combined iron salts.

Mr. Clarke attributed the origin of the colouring‡ in members of the same series at the mouth of the Pambula River to deposition in ferruginous waters, but the characteristic alternate banding of highly coloured slates with sandstones, usually devoid of conspicuous colouring, cannot be accounted for in the way quoted.

In connection with these strata, it is interesting to note that among a number of fossils obtained, whilst in the district, from one of the lowest sandstones of the series at the only known fossiliferous site, viz., Bellbird Creek, 3 miles north of Eden, on the Pambula-road,§ Mr. W. S. Dun, Assistant Palæontologist, identified the following forms:—

1. *Rhynchonella pleurodon*, Phillips.
2. *Rhynchonella*.—Large species, with very strongly-marked ribs, but imperfectly preserved. This he regarded as *Rhynchonella cuboides*, Sowerby, a common Devonian species, but there is a probability of it being one of the extreme varieties of *pleurodon*.
3. *Atrypa* sp.—Very like some small varieties of *Atrypa reticularis*, Linn.
4. Small branching *polyzoa*.

The sand in which these fossils are embedded was originally deposited in shallow water, as ripple marks and marine worm tracks attest. Unfortunately for the cause of palæontology, the sand has since become so indurated as to form excellent road metal, for which purpose it is used.

The fossiliferous sandstone strikes about N. 29° W., and dips N. 60° E. at 15° from the horizontal.

Data collected in the Wolumla district not only confirm the previously expressed opinion in my Pambula report that the quartz-felsite and rhyolite of Eden and Pambula are partially intrusive in the overlying Devonian series, but also demonstrate that the granite is likewise younger and intimately connected with the abovementioned acid eruptives.

The

† Described in my report on the Border Prospecting Operations between Cape Howe and the head of the Murray River.—J.E.C.

‡ Southern Gold-fields, 1860, p. 193.

§ Since the above was written, Mr. G. D. Cavell, of Wolumla, has kindly informed me of the discovery of similar fossils in sandstone, about 1 mile from Wolumla.—J.E.C.

The abundance of fragmental felsitic material associated with the latter may, perhaps, be regarded as indicative of subaqueous intrusion.

The granite of the gold-field, as before mentioned, is much altered by crushing and shearing; away from these influences it is also much altered by weathering and decomposition. In parts it is rendered porphyritic by pink crystals of felspar. In the valley harder cores and dykes have resisted weathering more successfully, and stand above the general level as knolls and ridges.

Mount Misery, close to Wolumla, on the Candelo-road, is one of the former. In these occurrences felspar predominates until the mass approaches the character of an elvan dyke. Gold is associated with it in small quantity at Mount Misery.

The intimate association of gold with intrusive felsitic rocks is noticeable in several localities on the South Coast, particularly at Pambula, Wolumla, Wagonga, and Yalwal. At Pambula the gold is entirely confined to the felsites and rhyolites. At Wolumla it occurs with altered sedimentary rocks, crushed granite, and felsite.

At Wagonga, in addition to quartz-veins, it is connected with narrow felsite dykes traversing Silurian slates. At the recent rich discovery (Easdown's), on the north bank of the Wagonga River, the gold is present not only in quartz-veins at the junction of a felsite dyke, but also in the latter itself, for an assay of a clean selected sample yielded at the rate of 6 dwt. 12 gr. per ton in the Departmental laboratory.*

In several similar dykes at the head of the river, near the Bodalla-road, gold is present. Two of these have received attention—one under aid from the Prospecting Vote,—and at the present time a syndicate is engaged in reopening the most promising.

The gold of the felsites in this locality appears to be chiefly associated with pyrites. Near the surface oxidation of this mineral has liberated the gold in the free state; below the shallow oxidised zone, however, pyrites alone occurs, thinly distributed through the felsite.

At Yalwal the auriferous deposits occur in Silurian slates and sandstones, but some of the richest veins were associated with felsite, identical with the chitinous-looking variety of the Pambula Gold-field.

In three of the finds at Wolumla, viz., Cox and Party's G.L. 8, Brady and Party's G.L. 4, and Gahan and Party's P.G.L. 1, portion 16, the gold is associated with granite, which in the two former was much crushed and sheared.

The felsite dyke already mentioned as occurring about 3 miles north-easterly of Wolumla is identical in character with the auriferous felsite of Pambula. It intrudes Devonian sandstones and red slates in a N. 15° E. direction. In thickness it varies from 1 to 2 chains. A little fine gold is obtainable in the loam, resulting from its weathering, and in thin clayey joint fillings in the solid rock.

Basalt occurs as a large intrusive dyke in close proximity to the gold occurrences—in fact within 4 chains of Gahan and Party's shaft,—but it does not appear to have had any appreciable influence, for in no other instance along its course from Nethercote and beyond has gold been found near its line of junction with the intruded rock, not even when the latter itself is associated with gold, as at Pambula, where basalt at Indigo Gap in Mount Gahan ridge is intrusive in the auriferous felsite of the gold-field. At Wolumla it strikes in a north-westerly direction past the lower or southern end of the gold-field. Here it possesses the same distinctive amygdaloidal and epidotic characters as obtain in its southern outcrop in the vicinity of Pambula.

Dolerite dykes also occur at Wolumla; one in the village itself is quarried for road metal; a little further east on the west flank of the adjacent range is another outcrop. At Mount Misery, and at Schuback and Party's claim in P.G.L., in portion 16, ph. Cobra, decomposed dykes are exposed, which from their mode of occurrence probably may also be classed as dolerite.

M. Card, A.R.S.M., Curator, has kindly supplied the following petrological determinations of several specimens selected from the principal rock formations of the locality, and from four of the typical auriferous deposits:—

- No. 2590. Dolerite—Road Metal Quarry, Wolumla.
 No. 2592. Diabase—Mrs. Hill's property, south-west of Momsen's Hill.
 No. 2593. Quartz-felsite—Clynick and Naphthali's tunnel, G.L. 11.
 No. 2595. Crushed granitic rock—Cox and Party's tunnel, G.L. 8.
 No. 2599. Crushed granite, with included fragments of quartzite—Entrance to Murphy's tunnel, G.L. 5.
 No. 2601. Quartzite—Road near Momsen's hut, corner of G.L. 3.

The ore from Brady's and from Macdonal's No. 1 shaft, from near surface and from 60-foot level, consists of highly altered (crushed) acid rock, probably granite.—G. W. CARD.

Economic Geology.—The properties in which payable stone has been discovered to date are:—

Average yield { Gold, 5 oz. 10 dwt. 12 gr. per ton.
 { Silver, 12 oz. 17 dwt. 14 gr. per ton.

The above yields and average represent the output of picked first grade stone; the seconds still remain at the mines.

Momsen's Prospecting Claim is now held by a local syndicate under the title of Momsen's Hill Gold and Silver Mining Syndicate. Though over twelve months have elapsed since my former visit, little can be added to the previous report that the "gold occurs in altered slates, sandstones, and conglomerates, chiefly in small nests and veins in oxidised joints and cavities, which afford clear evidence of its pyritous origin. No defined body of gold-bearing stone has yet been determined, no walls or other guides being visible. The conditions point to an impregnation of the country, but to what extent prospecting alone can prove."

The main shaft was down 25 feet when the above extract was written, and an underlay shaft started towards it was down about 8 feet. The former has since been deepened to 70 feet, and two other shafts have been sunk 35 and 40 feet. A cross-cut tunnel from the site of the original rich surface bunch has been driven east 160 feet, under the cap of Momsen's Hill, the tunnel level being about 80 feet lower than the summit. From the cross-cut a level has been driven northerly in the direction of the country strike for about 70 feet; for a part of this distance auriferous stone has been followed.

The cross-cut tunnel affords an interesting section of the sedimentary rocks penetrated, the strike of which taken at the outcrop on the summit of Momsen's Hill is about N. 30° W.

Thin sandstone bands in the slates and conglomerates have been altered into quartzites, which simulate quartz-veins. These harder bands appear to have directed the course of the percolating solutions, for against them soft selvages occur which are usually richer than the harder portions. The slates have been bleached by the solutions leaching out the ferruginous colouring matter, and depositing and concentrating it as brown oxide of iron in joints and against the harder bands. In the workings the rocks are soft and weathered; on the summit of the hill they are flinty and quartzitic, but followed southerly they rapidly assume their normal condition, until pebbles, liberated by the weathering of the conglomerates, strew the surface, and the characteristic red slates outcrop. Momsen's Hill, therefore, affords conclusive evidence of the correlation of these strata with those capping the adjoining peaks and ridges.

The gold of Wolumla occurs largely associated with chloride of silver, which, in panning prospects, hangs back in the dish as a heavy green mineral that rapidly blackens on exposure. A small specimen from Momsen's Mine when broken revealed a cavernous centre, lined with chloride of silver and gold. The proportion of silver to gold in the stone treated has been about 4 to 1.

Practically the rich and workable stone in this mine so far has been confined to near the surface. The thickness of the rich veins averaged about 6 inches, though greater thicknesses were extracted when mining, from which the higher grade stone was sorted by hand picking.

With the exception of a small parcel recently sold to the Australian Smelting Works, Dapto, the stone from this mine has been treated by amalgamation and cyanide at the Mount Gahan Battery, Pipeclay, near Pambula; lately, however, a Huntingdon mill has been secured by the proprietors, who are erecting it on the main road about a mile from the mine by road.

Considering the large percentage of silver which is probably present in the stone, chiefly as an ore of the metal, it is exceedingly doubtful whether it can be efficiently treated in the machine adopted.

Brady and Party (G.L. 6) were working one of the three original finds mentioned in my previous report; little progress, however, has been made since that date, active work evidently having ceased for a long interval. Recently, owing to the stir occasioned by further finds, operations have been resumed, but so far the auriferous stone has only been sunk upon for a few feet, the shaft being in the zone of crushed and saturated rock at the junction of the granite and sedimentary. A few feet west of the shaft conglomerate and quartzite outcrop, in places much saturated with feldspathic material.

Of Gahan and Party's find in P.G.L. 1, portion 16, parish Cobra, nothing can be added to the previous report, as litigation has delayed development for nearly a year, and has only now ceased. The gold in this mine is in ferruginous joints and cavities of granite, which indicate that it was originally associated with pyrites. A depth of only 25 feet has yet been reached, but down to that level there was no appearance of any defined body of auriferous stone; several careful prospects from selected granite free from joints or cavities failed to reveal the presence of gold, from which it may be inferred that it is not indigenous in that rock, but has been introduced in solution along a system of joints, from which it has penetrated into small cracks and cavities.

Quartz-veins cut in the shaft are reported to be non-auriferous.

Macdonal

* Treated at the Mount Gahan Battery by amalgamation; tailings by cyanide.
 † Purchased by bulk sampling and assaying, Australian Smelting Works, Dapto.
 ‡ Bulk sampled and assayed at the Government Metallurgical Works, Clyde.

Macdonal and Party's finds in P.G.L. on the north end of portion 302, parish Wolumla, are, perhaps, the most promising of the later discoveries, but development has here also been retarded by litigation. Two shafts about $6\frac{1}{2}$ chains apart are on gold-bearing stone of excellent quality. No. 1 shaft at the time of inspection was down 60 feet, following the underlay of a body of crushed granitic rock striking N. 60° W., and underlying west at 21° from the vertical. In this shaft about 10 inches of rich stone is backed on the hanging wall side by about 3 or 4 feet of similar rock, but much harder and more pyritiferous; a selected sample of the latter yielded in the Departmental laboratory at the rate of 13 dwt. 1 gr. of gold, and 2 oz. 5 dwt. 17 grs. of silver per ton. One ton of the same material was purchased at the Australian Smelting Works, Dapto, at 17 dwt. of gold per ton, and another ton selected by Mr. Bensusan from the full width of auriferous stone at the 60-foot level was broken down and sampled at the Government Metallurgical Works, Clyde, for a return of 2 oz. 12 dwt. of gold per ton.

No. 2 shaft distant about $6\frac{1}{2}$ chains S. 62° E, is on a distinct strike of stone, viz., north and south, with a scarcely perceptible dip to the eastward. The auriferous stone in this shaft has a variable thickness up to 10 inches.

Gold has been found in five places on this lease, two or more small surface outcrops being close to, and apparently on the same strike as the auriferous shoot in No. 1 shaft. The richest stone is distinguished by a bluish tint which serves as a guide in selecting the best stone for despatch to the smelting works at Dapto.

Between Macdonal's find and the Momsen Proprietary Mine, Meaker and Party have recently discovered rich stone in their lease G.L. 2. Prior to this discovery a large amount of trenching was done by the party both north and west of the Proprietary Mine in the hope of picking up the run of auriferous stone from the latter, but the efforts were entirely unavailing.

The gold shoot in G.L. 2 is similar in character to those in the adjoining lease on the west—Macdonal's—at the surface it was but a foot in length and 2 inches thick, at 10 feet it had lengthened to 4 feet, and thickened to 9 inches. The shoot occurs on the east side of a harder band of rock about 18 inches thick. Assays of selected samples are reported to have yielded up to 10 oz. of gold per ton. From the west side of the hard band assays are also reported up to $1\frac{1}{2}$ oz. per ton. A bulk test was being prepared at the time of my visit for despatch to the works, but no particulars are available as to the result.

Cox and Party's find in G.L. 8 on the south-east fall of Momsen's Hill is one of the most recent and promising notwithstanding that the trial tests proved less remunerative than several others from the field. This party has driven a tunnel west into the southern slope of the Hill for about 176 feet through crushed granite and altered sedimentary rock. The upper surface of the granite is exposed gently undulating at the tunnel level as it rises and falls above or below the floor. Its upper surface at this point is about 380 feet below the summit of the Hill. Indications afforded by this tunnel, and an open cut in G.L. 17 on the northern fall, denote a shallow depth of sedimentary rocks above the granite east of a line connecting those points. Westward of it the main or lateral contact occurs between the two formations in this locality as is best explained in the following section:—

The section also illustrates the manner in which the sedimentary rocks have been intruded, crushed and shattered by numerous offshoots or dykes from the main mass of eruptive rock.

About 132 feet from the entrance of Cox and Party's tunnel a shoot of gold-bearing stone was struck having a western joint wall striking N. 15° E. The auriferous stone consists of crushed and sheared granite which has been impregnated by gold solutions percolating along the joint fissure, hence there is no defined boundary on the east to the gold stone. The western wall of the joint is non-auriferous; the tunnel continued into it for about 40 feet pierced a hard, compact, yet crushed granitic rock, highly charged with pyrites. The softer gold-bearing stone on the east of the joint is mined for about 3 feet in width, which pan prospects indicate is about the thickness of payable stone; the gold dies away, however, with distance from the joint.

Chloride of silver is present in the productive stone the proportion of metallic silver to gold being about 5 to 1.

Schafer and Party after sinking a shaft in G.L. 7 without result, have now commenced tunnelling for the purpose of endeavouring to cut the auriferous joint in Cox and Party's lease which they adjoin. The entrance to the tunnel is within G.L. 8, at the junction of granite and sedimentary rock, advantage being taken, by permission, of the natural configuration of the country.

Preston

Preston and Party, (G.L. 3) originally found gold on the face of a large block of quartzite outcropping at the site of their present shaft, which is close to the summit of Momsen's Hill, and near the east boundary of the prospector's claim.

The shaft was sunk in quartzite and quartz-felsite much jointed. Fair prospects were obtained at different levels, but nothing defined or payable was encountered. A cross-cut tunnel has now been started for the purpose of piercing the junction of the granite and sedimentary formations, which lies between the tunnel entrance and the shaft. Aid from the Prospecting Vote has been granted in this case, as also in G.L. 11 on the north fall of the Hill, where Messrs. Clynick and Naphali are also cross-cutting for a similar purpose. The face of the latter tunnel was at 132 feet from the entrance in quartz-felsite highly charged with pyrites. This rock corresponds with that at Preston and Party's shaft, and probably is just at the junction of the two principal formations.

The three tunnels last-mentioned are all cross-cutting the contact zone from the granite on the eastern side at levels varying from about 200 to 500 feet below the summit of Momsen's Hill.

On the west also three tunnels are entering the Hill in altered sedimentary rocks intruded by dykes of crushed granitic and felsitic rock. Momsen's tunnel already mentioned has been extended well under the cap of the Hill at about 80 feet below the summit. At about 120 feet lower in G.L. 5 a tunnel has been driven 100 ft., the last 20 feet in crushed granite with included fragments of quartzite. Nests of pyrites occur in the latter rock; an assay of a selected sample yielded a trace of gold only.

In the adjoining lease (G.L. 4) on the south another tunnel has been driven east for about 130 feet. At the entrance, crushed granite is exposed for a few feet, then slates and conglomerates. This tunnel is on a level, about 60 feet above that of G.L. 5.

From the end of the tunnel a large amount of trenching across the outcrop has been done, and a shaft sunk and driven without touching any auriferous deposit.

Schuback and party in P.G.L., adjoining Gahan and party's lease on the west in portion 16, parish Cobra, have performed a considerable amount of work. Three shafts have been sunk in a schistose slate close to the junction of the granite. Below the oxidised zone the slate is of a greenish tint and highly charged with pyrites. The latter is but slightly auriferous; a concentrated sample yielded only at the rate of 1 dwt. 2 gr. of gold per ton.

In the main shaft a decomposed dyke (probably dolerite) was cut; at the junction a thin but rich soft filling was followed down for some distance. Ten tons raised during operations was sold on assay to the Australian Smelting Works at 10 oz. of gold per ton. This shaft was driven 40 feet westerly and 34 feet southerly, and another shaft sunk on the southern extension; but the gold appeared to be confined to a short shoot in the main shaft.

In the adjoining lease on the north—G.L. 14—the same party has sunk 45 feet, and driven from that level N. 60° E. 45 feet, and 70 feet S. 60° W. In the southerly drive the junction of the granite and sedimentary was crossed without, however, discovering any auriferous stone.

Summary and conclusion.

Briefly summarised, the Wolumla gold deposits consist of impregnated patches of crushed granite and sedimentary rocks, usually destitute of defined walls or other guides pertaining to the ordinary or normal conditions of reef or lode mining. The deposits occur along a zone of crushing and fracturing at and near the junctions of the two formations mentioned, which probably offered free passage to percolating auriferous solutions. Why the deposition of the gold should have been confined to isolated patches in the crushed rocks may, perhaps, be attributed to the equally isolated occurrence of some precipitating medium at the points now marked by payable mines.

In addition to the occurrence of auriferous deposits in the crushed granite mass near the main junction, offshoots intruded as dykes in the sedimentary—as at Macdonal's and Meaker's, and probably Momsen's—are also auriferous, usually more richly so along a softer joint or crack.

From the nature of the gold occurrence at Wolumla there is every reason to anticipate its persistence to great depths, though it is unlikely that the individual shoots discovered near the surface will prove equally persistent.

Crushed and fractured rocks, either wholly eruptive or partly so in contact zones as payable mineral receptacles, form comparatively new features of mining development in the Colony, where chiefly fissures filled with distinctive gangues have occupied attention. The auriferous rocks at Pambula and Wolumla may be cited as excellent examples of the two forms of metalliferous crushed rock.

These new features widen immensely the scope of prospecting, by bringing under scrutiny rocks hitherto but little regarded. At the same time it must be clearly understood that mere identity or similarity with known metalliferous rocks does not of itself involve similarity—or even presence—of metallic contents. The containing rocks frequently may be the accidental, not the specific, cause of metalliferous deposition, marking as they do simply lines of least resistance to earth movements, along which mineral solutions subsequently followed, impregnating the crushed and shattered material resulting from dynamic movement along the planes of weakness.

In the case of isolated eruptive dykes, such as the auriferous felsites of Wagonga, there is on the other hand reason for regarding them as carriers of metallic elements to the surface from great depths.

The difficulties of development attendant upon the absence of any lithological distinction between the country and gangue, or more correctly perhaps between the metalliferous and non-metalliferous portions of crushed rock, have already been noted in my Pambula report.*

In connection with the subject, it is interesting to note that the rich gold and tellurium ores of Kalgoorlie, West Australia, belong to this class of deposits; for the Government Geologist—Mr. Pittman—in the field, and Mr. Card, Curator, in the petrological laboratory, have independently established the fact that these ores consist of impregnated, crushed eruptive rock—probably felsitic.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,
Geological Surveyor.

Notes

APPENDIX 10.

Notes on the Occurrence of Tungsten Ores in New South Wales, with a Register of Localities.

Sir,

Reviewing our knowledge of the local occurrences, it must be admitted that no payable deposits have yet been discovered, notwithstanding the stir caused by the sudden large advance in values of tungsten ores about the year 1890, although numerous fresh occurrences have been noted, and previously known ones more or less superficially explored.

Judging from the known deposits of tungsten ores in this Colony, and from the extremely limited outputs recorded in the statistical returns of countries producing them, notwithstanding the constant demand, it would appear that the ores of this metal are sparsely distributed in nature.

The chief supplies appear to be drawn from Cornwall (England), Austria-Hungary, Germany, and Saxony. Texas and Northern Mexico are reported this year to be offering unusually large quantities from recently-opened mines.*

The following outputs, recorded from the first-mentioned countries, are taken from "Mineral Industry," 1896 †:—

1891-5. United Kingdom	289 tons (returned marked <i>nil</i> for 1894-5).
1891-5. Austria-Hungary	247 "
1891-5. Saxony	226 "
1891-4. Germany	208 " (mixed Wolfram and Uranium ores).

In the "Mineral Industry of the United Kingdom, 1895, Second Annual Report," Portugal and Spain are also recorded as producers of tungsten ores to the extent of 19 tons and 14 tons, respectively, in 1894.

The above quotations serve to exemplify the very restricted world-production of tungsten ores, and explain the reason of rapid advance in value as fresh uses are discovered for the metal or its salts.

Prior to 1890 the market value of tungsten ores did not exceed about £12 per ton. In that year Messrs. Sternberg and Deutsch, of Martinikenfelde, *via* Berlin, made personal inquiry for wolfram in the New South Wales Court at the London Mining Exhibition, and offered £30 per ton for ore containing 70 per cent. tungstic acid, delivered in Berlin. This first intimation of rapid advance in value was announced in the Colony through the Department of Mines, and resulted in considerable activity in prospecting for this mineral. Prices have receded since that date. The present value for 70 per cent. ore may be accepted as about £20 per ton, bagged, free on board, at Sydney, with an advance of 5s. 3d. per unit above 70 per cent. These quotations are from Mr. Clotten's letter already referred to.

The English value for production in 1893 equalled about £19 per ton.

The high minimum market grade—*viz.*, 70 per cent. tungstic acid—requires ore entirely separated from gangue; indeed, some wolfram ore, to all appearances clean, falls below this standard. Dressing to standard by cobbing and hand-picking is not a difficult matter when the ore is in fairly large clean bunches; but in the case of small particles or crystals distributed through the gangue, which is usually quartz, separation would be almost economically impossible, under the local conditions of mining and dressing, owing to the heavy loss entailed by the brittleness of wolfram (which is the chief ore), arising from its facile cleavage into extremely fine plates. The reduction of the quartz gangue by stampers or rolls to the requisite fineness to free the ore particles would slime most of the wolfram and necessitate an extensive recovery plant. If lower grade ore was saleable, possibly miners could obtain more remunerative returns from proportionately lower selling values.

Until recent years the principal use of tungsten was in the preparation of acid salts for rendering coloured cotton goods "fast," or washable, and linen and cotton theatrical or other properties non-inflammable, and in the manufacture of stained and other papers, &c.

Its chief value, however, at the present time is as an alloy in the production of certain classes of steel for artillery and tool purposes. There is, however, considerable diversity of opinion amongst authorities as to the special qualities or merits of tungsten steel, some affirming and others denying its brittleness and hardness.

Professor F. L. Garrison discusses this question in an interesting article on "Alloys of Iron and Tungsten," ‡ and quotes Metcalf, from the "Transactions Am. Soc. C.E.," Vol. xxvii, pp. 394-5, and H. M. Howe's "Metallurgy of Steel," p. 82, for the following statements:—"It is popularly believed that tungsten renders iron very hard, and in support of this is the fact that there are many brands of so-called self-hardening steel on the market—that is, steel which does not require to be rapidly cooled in order to become hard. Nevertheless, this belief is erroneous; for if a steel be chosen not excessively rich in manganese and carbon, as all the self-hardening specimens are, then no amount of tungsten will make it file-hard if allowed to cool spontaneously in the air. The true function of this element is to delay the rate of change of carbon when either going in or out of solution. . . . Tungsten steel is neither so hard nor so strong as plain carbon steel; hence there is no advantage in using it except for certain purposes."

Professor Garrison remarks that Metcalf has also referred to tungsten in steel as acting merely as a vehicle in enabling the carbon to carry the "temper" or "hardness." He further observes that this peculiarity is only developed in the presence of manganese.

Howe states that "the hardness of tungsten steel is not impaired by heat, and as a consequence may be driven much faster than carbon steel when used as machine cutting tools."

"Tungsten steel appears chiefly adapted for cutting tools of lathers and planers."§

"When forged red-hot and slowly cooled, tungsten steel is reported to possess an extraordinary degree of hardness, which, however, gives way to softness when plunged red-hot into cold water, quite contrary to most other species of steel."||

E. Fuchs and L. De Launay state that "Tungsten has for some time been used to a considerable extent in the manufacture of steel, particularly for artillery, and this use is restricted only by the rarity of the metal itself."

 ‡ Ann. Rept. U. S. Geol. Survey, 1894-5, xvii, pt. 3, pp. 615-623.
 § H. M. Howe, Metallurgy of Steel, p. 82. || Trans., Am. Inst. M. Eng., xxii, p. 236-245.

"In a series of experiments made by Captain Caron, the addition of tungsten to cast-iron ($\frac{1}{8}$ to 1 per cent.) increased the hardness and the tenacity of the metal in proportion to the weight of the tungsten added. But it is especially in the case of steel that tungsten in very small proportions increases the hardness and tenacity."

"This influence of tungsten on steel and iron tends to prove that it neutralises the contained phosphorus, sulphur, and arsenic, combining with them chemically. In cast iron it is reduced at the expense of the carbon, and adds, more or less, to the metal the character of steel."*

Tungsten ores are most frequently associated with tin and bismuth ores, and, as before stated, the principal supplies are drawn from tin workings. In fact, in some countries and provinces—Saxony, for instance—the waste from ancient tin-dressing floors has been carefully worked over for the discarded wolfram of earlier mining days. In others wolfram has become the most important product of previous tin mines.

Intimate mixture with tinstone, either in the form of fine worn grains in alluvial drifts, or as finely comminuted particles in crushed lodestuff, necessarily depreciates the value of each mineral owing to the difficulty of separating, arising from practically equal specific gravities.

In tin smelting the presence of tungsten is objectionable in any proportion. Dr. G. Mackenzie, Manager of the Sydney Tin Smelting Works, informs me that the maximum quantity of tungsten ore which may be disregarded in tin smelting should not exceed 1 per cent.

The effect of tungsten in tin-smelting furnaces is to impede reduction and cause loss by scorification.

When possible separation of wolfram from tinstone is effected by cobbing and hand-picking; in finely comminuted material, however, fusion with common soda or sulphate is resorted to for the purpose of forming a soluble tungstate of soda which can afterwards be removed by washing.

Tungsten ores consist of compounds of tungstic acid with iron and manganese (wolfram, etc.), lime (scheelite), lime and copper (cupro-scheelite), and lead (stolzite). Of these wolfram and scheelite are the most common, and wolfram the most important commercially. In addition to the above are several alteration products of less importance.

The percentages of tungstic trioxide (tungstic acid), on which the market value depends, range up to about 77.5 in wolfram ores, and 80 in scheelite.

Tungsten ores have been recorded from the following localities within the Colony, many of which are known officially, others, however, are dependent upon the good faith of persons desiring assays made in the Departmental Laboratory.†

Register of Localities.

Adelong.—Professor Liversidge gives the following description of scheelite from this locality:—†
"A specimen from the Victoria Reef Gold Mine, Adelong, County Wynyard, was massive, but with a portion of a crystal showing on one side, of an amber colour, translucent, resinous lustre, brittle, splintery fracture. Hardness, 4.5; specific gravity, 6.097. Associated with a dark green chloritic veinstuff. The following analysis was kindly made for me by Dr. Helms:—

Loss at red-heat	25
Tungstic acid	79.53
Lime	19.14
Alumina58
Magnesia07

99.57

The above results correspond to the formula Ca. WO_4 ."

Armidale District.—From Gara Falls, about 12 miles from Armidale, a sample of scheelite was assayed in the Departmental Laboratory, in 1886, for a yield of 47.9 per cent. of tungstic acid. A sample in 1894, from the same district, yielded 66.29 per cent.

Berridale.—About 20 miles S.W. of Cooma.—Mr. Warden Love reported, in connection with the discovery of this locality, "A broken outcrop of quartz, containing wolfram, was traced for 100 yards, running east and west. An assay of a small sample yielded 69 per cent. of tungstic acid."§ (D.M.A., 1891.)|| Another assay was made in 1893, yielding 54.35 per cent. (D.M.A., 1893.)

Bingera.—Wolfram forwarded as coming from this locality yielded 72.46 per cent. tungstic acid. (D.M.A., 1893.)

Bundarra, 25 miles S.W. of Tingha, New England.—A sample received from this locality consisted of wolfram associated with arseniate and arsenide of iron in quartz, which yielded 44.94 per cent. of tungstic acid. (D.M.A., 1891.)

Burrowa District.—Both scheelite and wolfram occur in the neighbourhood of Frogmore, associated with both quartz and granite. Assays have yielded from 31.65 to 66.96 per cent. of tungstic acid. (D.M.A., 1891–2–3.) Prospecting failed, however, to discover any payable deposits.

Casino District, Richmond River.—From this district a sample of scheelite was assayed for a return of 75.30 per cent. of tungstic acid. (D.M.A., 1895.)

Clive County, Parish of Bengha.—Wolfram in a siliceous gangue, stained with arseniate of iron, forwarded from this locality yielded 42.55 per cent. of tungstic acid. (D.M.A., 1892.) It is also reported from Scrubby Rush, in the same County.

Cobar District.—Wolfram in quartz forwarded from this District yielded 53.70 per cent. of tungstic acid. (D.M.A., 1895.)

Cowra District.—Wolfram, yielding 67.80 per cent. tungstic acid, was forwarded for assay from this locality in 1893. (D.M.A., 1893.)

Cooma, 3 miles from.—Probably this locality should be Berridale. Wolfram reported as coming from near Cooma, yielded 54.95 per cent. tungstic acid. (D.M.A., 1891.)

Cordillera

* Trai et des Gites Mineraux et Metalliferes, ii, pp. 169 and 170.

† For many of these localities I am indebted to the valuable register compiled by Mr. Trickett, of this Branch.

‡ Minerals of New South Wales, 1888, p. 85.

§ Ann. Rept. Dept. Mines and Agric., for 1891.

|| NOTE.—Assays made in the Departmental Laboratory are marked (D.M.A.) with the year.

Cordillera Hill, Tuena District.—Scheelite, cupro-scheelite and stolzite were discovered when opening the Cordillera Hill Silver and Copper Mine in 1888, but, so far, the above minerals have not been systematically searched for.

The Government Analyst, Mr. W. H. Hamlet, F.C.S., &c., for this Department made the following analysis of a massive sample of a dark greenish colour* :—

Tungstic trioxide	69.31 per cent.
Lime	19.35 "
Silica	4.88 "
Copper oxide	4.05 "
Iron oxide	2.01 "
						99.60

Prior to this date, Mr. W. A. Dixon, F.I.C., F.C.S., detected the presence of stolzite (tungstate of lead) in this mine. Stolzite is also recorded from Broken Hill.†

Deepwater, New England.—Both wolfram and scheelite occur in the Bolivia district, the particular localities specified being Nine-mile, 10 miles east, and 20 miles from Deepwater, at Bald Rock; at the latter it occurs in quartz and felspar stained with arseniate of iron. At 10 miles east of Deepwater, ilmenite is associated with the wolfram in quartz. Assays from the above localities, made in the Departmental Laboratory in 1892-3-4, yielded from 47.02 to 73.10 per cent. of tungstic acid.

Ding Dong.—Between Deepwater and the Great Divide.—The late Government Geologist, Mr. C. S. Wilkinson, recorded the occurrence of wolfram at Ding Dong, where it is associated with tinstone in griesen.‡

Emmaville, New England.—Mr. T. W. E. David, B.A., F.G.S., thus refers to the occurrence of tungsten ores in this district:—"An important vein of wolfram occurs on the Mole tableland, 13½ miles north of Emmaville in a direct line, but 21 miles distant by road. The point, at which the reef was observed to be rich in wolfram, bears west 36° south from the south-west corner of portion 407, parish Rockvale, county Clive, a quarter of a mile distant, and lies just outside the boundary of this parish, in the north-east corner of parish Flagstone, county Gough. The vein is, in places, from 10 to 12 yards wide, though probably not metalliferous throughout its entire width. Owing to the reef being covered over with iron-stained sandy soil, it is impossible to ascertain, by mere inspection, the average width or length of its outcrop, though surface indications favour the supposition that the reef is a strong one. The strike is about N. 40° E. As far as I am aware, this reef has never been prospected, and it is situated partly on Crown lands.

"Wolfram also occurs at the Gulf main vein, Hall's Grampians, Lee's Gully, and the Planet Mine, near the head of the Nine-mile Creek, parish Wellington Vale, county Gough.

"Scheelite has been found in small quantities at McDonald's veins, on the Glen Creek. The mineral is honey-coloured and translucent."§

Though it is understood that no very large amount of prospecting has been done on the Mole Tableland lode, yet there is sufficient to reveal the fact that the wolfram is confined to comparatively small bunches in the reef, though at the same time larger than any other known deposits of clean ore. There is no record of any assays in the Department from this locality, but from physical appearance, the ore is of first quality.

An assay made, in 1892, of rubble wolfram in quartz and mispickel from the Emmaville district yielded 64.06 per cent. of tungstic acid.

Elsmore, near Inverell.—A sample of wolfram in quartz from this locality yielded 67.20 per cent. of tungstic acid. (D.M.A., 1895.)

Frogmore, Burrowa District.—See Burrowa.

Glen Innes.—Mr. C. S. Wilkinson recorded the occurrence of wolfram, associated with bismuth, molybdenite and arsenical pyrites, in Portion 25, about half a mile north-west of Kingsgate, in a large pipe vein, consisting of a very ferruginous mass of quartz.

About 12 miles north from Glen Innes at Hogue's Creek, about 1 mile from the Tenterfield Road, Mr. Wilkinson described a larger occurrence of wolfram associated with the minerals already mentioned as present in the Kingsgate ore. He described the mode of occurrence as follows :—

"They form irregular veins and masses of quartz traversing a fine-grained micaceous felsite rock, which is surrounded by altered sedimentary rocks. In one place this rock, for a length about 100 yards and a width of 15 yards, is traversed by a network of quartz veins. A small hole has been sunk here, and the stone taken from it contains bismuth ores, tin ore, molybdenite, arsenical pyrites, and wolfram.

In another place, about 100 yards from the last-named, a mass of hard crystalline quartz, in size at the surface about 40 feet by 20 feet, has been opened for a few feet in depth. It contained bismuth and tin ores, together with a large quantity of wolfram."||

Mr. Wilkinson did not consider that the lodestuff could be profitably worked for tin ore owing to the large proportion of wolfram.

Quite recently Mr. C. S. McGlew has been opening up this deposit of wolfram. A certain amount of clean wolfram is obtainable, but the bulk of the lodestuff, so far as operations have yet extended, is much below the minimum grade.

Gara Falls.—See Armidale.

Grampians (Hall's).—See Emmaville.

Gulf Mine.—See Emmaville.

Gundagai.—Wolfram in granite, forwarded from the Gundagai District, was assayed for a yield of 61.44 per cent. of tungstic acid. (D.M.A., 1892.)

Guyra.—Scheelite from this locality yielded 75.60 per cent. of tungstic acid.

Hillgrove,

* Ann. Rept. Dep. Mines for 1886, p. 41. † Records Geol. Survey N. S. Wales, 1896, v, pt. 1, p. 8.
‡ Ann. Rept. Dept. Mines for 1883, p. 151. § Geology of Vegetable Creek Tin-mining Field, 1887, pp. 161-2.
|| Ann. Rept. Dept. Mines and Agric. for 1883, p. 154.

Hillgrove, Armidale District.—Scheelite was noted at Hillgrove shortly after the gold discovery, because of its association with the gold and stibnite of the reefs. No appreciable quantity has, however, been exposed in the extensive workings and prospecting of the locality. Assays made of a number of samples during 1892, 1893, and 1894, yielded from 38·25 to 71·80 per cent. of tungstic acid. The gold and antimony reefs of Hillgrove occur principally in slate country close to the junction of granite, and to a lesser extent within the granite also.

Inverell.—Professor Liversidge gives the following description of a sample of wolfram from Inverell:—
“A specimen found in quartz veins with tinstone, Inverell, county Gough, of the usual bronzy black colour, sub-metallic lustre, opaque, lamellar structure, with only traces of crystal faces, had the following composition:—”

Tungstic acid	77·640
Iron protoxide	18·760
Manganese	4·121
								100·521*

Another sample recorded in the Departmental Assay Register as coming from 15 miles south of Inverell, yielded 73·40 per cent. of tungstic acid.

Jingellic, Upper Murray River.—Mr. E. F. Pittman recorded the presence of wolfram in the Jingellic tin lodes, which consist of quartz veins in granite. In No. 4 lode, which had been opened for 8 chains, the associated minerals were much arsenical pyrites, some wolfram and tourmaline, and a good percentage of tin ore.†

The tin lodes at Jingellic were abandoned shortly after Mr. Pittman's inspection owing (according to local report) to the failure to realise on some 9 tons of ore extracted, which may probably have been due to the presence of wolfram beyond the minimum limit of Australian smelters.

Mila, 14 miles south of Bombala, Monaro.—Wolfram occurs very sparingly distributed in a quartz reef in Mr. Cochrane's property, near Mila.

Mole Tableland.—See Emmaville.

Mount Hope.—North-west of Euabalong, Lachlan River.—Wolfram was discovered near Mount Hope by a Mr. Eason about the time of the gold discovery at Mount Allen in this neighbourhood. Several assays have been made which yielded from 62·57 to 72·2 per cent. of tungstic acid (D.M.A., 1892), but nothing is yet known of its mode of occurrence or probable quantity.

Mount Sutton, New England.—An assay sample from this locality yielded 71·22 per cent. of tungstic acid.

Nangeribone Run, via Nymagee.—Wolfram was detected in a sample of quartz from this locality, sent to the Department for examination.

New England.—Under this very broad definition of locality several samples of wolfram have been assayed in the Departmental Laboratory for yields from 56·50 to 70·75 per cent. of tungstic acid.

Newstead.—Wolfram from this locality has been noted, but nothing definite is known either of the exact locality or mode of occurrence.

Pulletop Station, County Mitchell, Wagga Wagga District.—Wolfram occurs in the vicinity of Pulletop Creek in the Parishes of Westby and Barrandana, associated with tinstone in quartz veins close to the junction of slate and granite, and in drift originating from denudation of the reefs. At the time of my inspection of this locality in 1894, about twenty loads of drift were run through a box-sluice for a yield of 5 or 6 cwt. of mixed wolfram and tinstone, an average assay of which yielded:—

	per cent.							
Metallic tin	27·72
Tungstic acid	28·82‡

A mixture of this character is unsaleable in the Colony, and owing to the practically equal specific gravities, the two minerals cannot be separated by mechanical appliances, though a large proportion of the wolfram could be removed by sieving; owing to the fact that all the larger fragments consist of that mineral, the tinstone being comparatively fine.

After considerable inquiry abroad, Messrs. Harrold Brothers, of 19, Bridge-street, Sydney, who were devoting considerable attention to the subject, ascertained that the mixture represented by the above assay had a prospective value in England of about £15 per ton, less about £3 cost of treatment.

Assays of other samples from Pulletop, made in 1894, yielded from 45·90 to 62·20 per cent. tungstic acid.

Purnamoota, Barrier Range.—A sample from this locality, received during the current year, was tested in the Departmental Laboratory for a return of 62·10 per cent. of tungstic acid.

Peelwood.—Scheelite has been reported from this locality. It is, however, more than probable that the occurrence recorded under this heading is identical with that of Cordillera Hill.

Severn River, near Emmaville.—Wolfram is recorded from this locality in 1886, which yielded, on assay, 74·41 per cent. of tungstic acid.

Tenterfield District.—Granular wolfram in clayey matrix, from this district, was assayed in 1893 for a return of 57·25 per cent. tungstic acid; and another sample, more specifically defined as coming from within 7 miles of Tenterfield, yielded 40·21 per cent.

The Gulf, New England.—See Emmaville.

Waukeroo, Barrier Range.—Wolfram is recorded from this locality, but no assays have been registered.

Wellington Vale.—Vegetable Creek or Emmaville district, which see.

Yeoval.—South-west of Wellington.—Cupro-scheelite was identified by Mr. G. W. Card, A.R.S.M., Curator, amongst specimens collected from Yeoval by Mr. E. C. Whittell, Field Assistant. §

I have, &c.,

JOSEPH E. CARNE,
Geological Surveyor.

The Government Geologist.

APPENDIX

APPENDIX 11.

Geological Survey Branch, Department of Mines and Agriculture,
New South Wales, 3 January, 1898.

Sir,
I now have the honor to forward you my progress report for the year ending 31st December, 1897.

The commencement of the year found me in the Orange district examining various mines in connection with applications for aid from the Prospecting Vote and attending to general geological work.

Upon the 18th January I left Sydney for Wyalong, and was engaged until the 7th March in the Southern district.

I left Sydney on 17th March for Captain's Flat, and was engaged for ten days with Mr. Geological Surveyor Watt, inspecting and sampling the Lake George Mines in connection with a proposal to extend the railway from Bungendore. We were afterwards engaged in the office for a fortnight, writing a joint report upon the Lake George Mines, preparing plans, &c.

Upon the 30th April, I left Sydney for Inverell, and was engaged in the Northern district until 12th June. I inspected the Bundarra Copper-field, the deep tin lead at Elsmore Valley, and a supposed diamond-bearing volcanic pipe near Bingara. I also made an examination of the ironstone bed near Seaham, and inspected the work which had been done upon the same since I last visited the district. During the remainder of the year I was engaged in the Northern district inspecting mines in connection with the Prospecting Vote, and dealing with proposals to modify the various gold-field reserves.

In September I examined the newly-discovered cobalt deposits at Point Macquarie. During the year I have contributed a paper to the Geological Survey Records—"Geological Notes upon a Trip to Kosciusko."

The Government Geologist.

I have, &c.,

JOHN B. JAQUET.

APPENDIX 12.

Minute on Mr. Jaquet's Report on supposed Volcanic "Pipe," at Bingara.

MR. JAQUET'S examination thoroughly bears out the opinion previously expressed by me, after inspecting samples of the rock forwarded by Mr. Wingate, the manager of the mine. This rock was stated to be volcanic breccia, such as occurs in volcanic pipes,—it proved, however, to be sedimentary rock, carboniferous claystone, which is the prevailing rock underlying the diamantiferous river drifts of Bingara.

I think it is probable that the diamonds occurring in these river drifts at Bingara, Cope's Creek, &c., will ultimately be traced to volcanic pipes, but there is reason to suppose that such pipes, if they do exist, will be found much farther to the eastward, viz., to the south-east of Inverell.

In the meantime there is no reason for amending the official statements already made as to the mode of occurrence of diamonds at Bingara.

E. F. PITTMAN,
Government Geologist.

Sir,
Geological Survey Branch, Department of Mines, N.S.W., 23 June, 1897.
I have the honor to inform you that in accordance with your instructions I have inspected the so-called "pipe," mentioned by the residents of Bingara in the attached petition, as occurring in the Australian Diamond Company's claim, which is situated about 6 miles from Bingara, in a south-westerly direction.

The mode of occurrence of the diamonds is shown in the above sketch. They occur, as they do elsewhere upon the field, in an ancient alluvial deposit which has been overlain and protected by a basalt sheet. The owners of the claim have sunk a shaft to a depth of 154 feet, which shaft has entered the claystones (bedrock) at a depth of 135 feet. There is nothing, in my opinion, to suggest the presence of a volcanic pipe upon the property.

I have, &c.,

JOHN B. JAQUET,
Geological Surveyor.

THE petition of the residents of Bingara asked for a specific report upon a volcanic pipe, which was said to have been discovered in the Australian Diamond Company's Mine, near Bingara. I did not make a general examination of the diamond-bearing country, but only obtained sufficient evidence from an inspection of the mine mentioned to satisfy myself that a mistake had been made.

I was shown the supposed pipe in the side of the mine workings. Sketch No. 1 represents what is to be seen according to the discoverers. Sketch No. 2 is the explanation which I have to offer concerning the phenomenon. The dotted line shows approximately the position of the bottom of the workings, and what occurs below this line is a matter of conjecture. The sketches are of course diagrammatic.

The so-called volcanic breccia or lava I found to be largely composed of waterworn pebbles and sand. I would suggest that the true character of the "pipe" could be quickly made evident by sinking down a few feet at its point of emergence.

As mentioned in the report above, a shaft was sunk to a depth of 154 feet upon the property, and upon a subsequent visit I inspected a drive which had been driven at a depth of 100 feet with a view of intercepting the supposed pipe. This drive throughout its whole length was in sedimentary rock (claystone), and no volcanic material of any kind had been encountered in it.

J.B.J.

APPENDIX 13.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

Sydney, N.S.W., 15 March, 1897.

In accordance with your instructions I have made an examination of Rigby's Reef, which is situated about $1\frac{1}{2}$ miles from Major's Creek township in a north-westerly direction.

The reef was first worked about twenty years ago by Rigby and party, who raised free milling gossans, and ceased operations on meeting the pyritous ore below. Eighteen months ago Messrs. Canning and party, having obtained an agreement from the owner of the land, commenced operations with a view of testing the pyrites below the old workings.

In April last year I inspected the reef in connection with an application for aid from the Prospecting Vote.

I found in the floor of the 52-foot level (E upon the plan) a well defined vein of pyrites about 1 foot 3 inches wide. I took samples across the vein, and these upon being assayed by Mr. J. C. H. Mingaye, Assayer and Analyst to the Mines Department, yielded as follows:—

Gold	1 oz. 13 dwt. 18 grs. per ton.
Silver	11 oz. per ton.

The Board considered the ore payable, and the application was refused.

The party then went to work and sunk the shaft to a depth of 64 feet, crosscutted to the reef, and then drove upon it 26 feet in an easterly direction. From between the two levels (52 feet and 64 feet) they raised 20 tons of ore, which upon being crushed at Major's Creek battery yielded 5 oz. of free gold and 6 tons of concentrates, which were bought by Messrs. Harrold Bros., as containing 3 oz. 18 dwt. of gold and 11 oz. of silver per ton; so there were recovered altogether 1 oz. 8 dwt. 10 grs. of gold, and 3 oz. 6 dwt. of silver per ton. A considerable amount of silver was probably lost.

The party next proceeded to drive westerly at the 64-foot level. I have been informed that at a point distant 40 feet from the shaft $2\frac{1}{2}$ cwt. of ore were taken and sent down to the Illawarra Works, and crushed, sampled, and assayed, and that it yielded as follows:—

Gold	19 dwt. per ton.
Silver	26 oz. "
Copper	14 $\frac{1}{2}$ per cent.
Antimony	5 "

Subsequently 30 tons of ore from the drive were sent to Illawarra Works for treatment, but upon being sampled and assayed the parcel was only found to contain as follows:—

Gold	4 dwt. per ton.
Silver	9 oz. 4 dwt. per ton.
Copper	3 per cent.

Whereupon the Smelting Company wrote that the ore sent down would not pay for smelting, and the mine was shut down in consequence.

When I recently revisited the mine it was full of water, and, being unable to proceed underground, I could only make an examination of the ore upon the surface. I found the unoxidised ore to consist essentially of iron pyrites, copper pyrites, and fahlertz, with a silicious gangue. There would appear to be two classes of ore in the mine: an ore adapted for treatment by milling, and a smelting ore.

Fahlertz is a mineral which may contain as much as 38 per cent. of copper, and the copper is sometimes almost entirely replaced with silver. Any ore which contains this mineral in abundance would be a valuable one for smelting purposes; and if the general ore won from the 64-foot level west resembled that which I examined upon the surface, as I believe to be the case, then, by a judicious process of selection, parcels of ore containing payable quantities of copper and silver could be obtained.

To profitably work the mine it will be necessary to have someone in charge who has had experience in the dressing of copper and silver ores. I may emphasise this fact by stating that hitherto ore coated with a film of iridescent iron-oxide has been much sought after as copper ore.

Judging by the old workings the reef would seem to extend for a distance of several chains upon either side of the shaft shown upon the accompanying sketch. The present party recently obtained 26 tons of gossan ore from a point distant 4 chains east of the shaft, where the reef had a width of from 1 ft. to 1 ft. 3 in.

This

This ore upon being treated at Major's Creek battery yielded as follows:—

9½ tons	16 dwt. of gold per ton.
16 "	9 " "

Having considered all the facts detailed above, I consider the vein to be a promising one, and would strongly recommend that a new shaft be sunk to a depth of 100 feet, and that levels be driven in either direction upon the vein for distances of 100 feet.

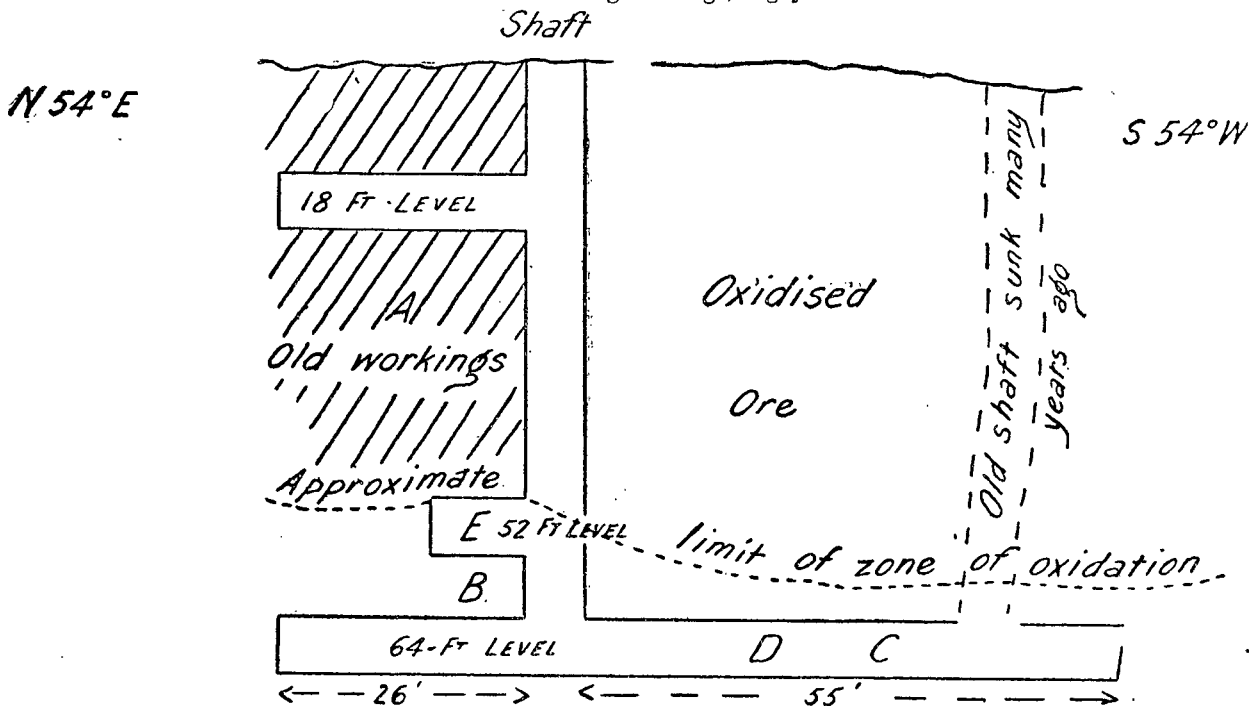

When this has been done it will be necessary, in order to determine the value of the property, that the vein be carefully sampled and tested by someone having an acquaintance, not only with gold ores, but also with copper and silver ores.

I have, &c.,

JOHN B. JAQUET,
Geological Surveyor.

The Government Geologist.

Sketch Section showing workings, Rigby's Reef.

- A. Gossan of a free milling character, raised from these slopes many years ago.
- B. 20 tons of ore were obtained from between these two levels by the present owners, from which 1 oz. 8 dwt. 10 grs. of gold and 3 oz. 6 dwt. of silver per ton were recovered.
- C. 2½ cwt. of pyritous ore taken from the face of this level at a point 40 feet from shaft yielded on assay: Gold, 10 dwt.; silver, 26 oz.; and copper, 14 per cent. per ton.
- D. 30 tons of ore taken from this drive, on being sampled and assayed, yielded: Gold, 4 dwt.; silver, 9 oz. 4 dwt.; and copper, 3 per cent. per ton.
- E. A sample which I took from across the face of the reef in this level yielded on assay: Gold, 1 oz. 13 dwt. 18 grs.; and silver, 9 oz. per ton. (J.B.J.)

Transverse Section.

APPENDIX 14.

Report on Copper Lode at Bundarra.

Sir,

Inverell, 22 May, 1897.

I have the honor to inform you that, in accordance with your instructions, I have made a geological examination of the copper lode which has been discovered about 3 miles south of Bundarra.

The geological formations consist of altered slates, claystones, &c., which are to a large extent impregnated with ironstone near the surface, while occasional bands of compact ironstone, associated with manganese, occur which dip downwards, and may proceed to great depths.

It is from one of these bands of ironstone that patches of rich copper ore have recently been obtained by Messrs. Russell and party.

This party having discovered traces of copper carbonate in the outcrop of a massive ironstone lode, have, by means of a shaft and short crosscuts, proved the same to a depth of 150 feet. Some rich ore has been obtained, but it occurs in patches, and no defined shoots have been discovered.

At a depth of 95 feet the lode is about 5 feet wide. A level has been driven along it for a length of 30 feet, and a small bunch of rich sulphide ore has been encountered. Parcels of this ore have been treated at the Newcastle Smelting Works, and yielded as follows:—

6 tons	33 per cent. copper.
18 "	"	"	"	"	6½ "

Copper pyrites can be seen in a crosscut at 130 feet. Upon the footwall side of the lode a shaft has been sunk to a depth of 84 feet in the country rock, which is here impregnated with copper carbonate with some black oxide of copper.

There are indications which lead me to think that the copper-bearing lode is short, and does not extend far in a longitudinal direction, but, having regard to the little prospecting that has been done, I should prefer not to express a definite opinion upon the subject. The owners of the mine are now asking for aid from the Prospecting Vote to continue prospecting operations on the score that the lode is not payable.

Numerous shafts are being sunk outside the prospectors' claim along an imaginary line of lode, and some of them are distant from it over 2 miles. In none of these shafts did I see any copper ore. Upon several occasions I was told that the rock was impregnated with copper stains, but in every instance upon examination I found these stains to consist of thin films of iridescent iron ore.

The general character of the country, and the fact that rich copper ore has been found upon the field, should encourage prospecting for metalliferous lodes, but the chances are greatly against such lodes being found by the system now in vogue, viz., sinking shafts along an imaginary line of lode where no indications of valuable metals are to be found upon the surface. In my opinion better results would be likely to be obtained if the energy now being directed to shaft-sinking were employed in napping and testing the outcrops, sinking being only resorted to after decided traces of copper, &c., had been obtained. Copper was first discovered in the prospectors' claim, not in the bottom of a deep shaft, but in the ironstone cropping out at the surface.

I have, &c.,

JOHN B. JAQUET,
Geologist Surveyor.

The Government Geologist.

APPENDIX 15.

Report upon Deep Tin Lead at Elsmore.

Geological Survey Office, Department of Mines,

New South Wales, 24 June, 1897.

Sir,

I have the honor to inform you that, in accordance with your instructions, I have made a geological examination of the deep tin lead which has been discovered upon the Elsmore Tin Mining Co.'s property near Elsmore.

A borehole was put down to prospect a wide flat about half a mile west of the old workings. It passed through the centre of a rich tin-bearing lead, and entered the bedrock at a depth of 205 feet. The position of the borehole and a section of the strata passed through is shown upon the geological map of the Elsmore and Tingha districts by the late Geological Surveyor-in-charge, Mr. C. S. Wilkinson, and Professor T. W. E. David, which was published under your direction in 1895. Two leads or beds of tin-bearing gravel were passed through—an upper bed, 10 feet thick, and a lower and richer bed, 3 feet thick.

A working shaft has been sunk upon the south-west side of the lead.

Section exposed in Shaft.

From the bottom of the shaft a level has been driven in a north-easterly direction, which has cut the lower lead at a distance of 76 feet. The lead has been proved by drives for a length of nearly 500 feet. It trends N. 53 W., falls towards the north, has an average width of about 40 feet, and a thickness of

of from 1 to 3 feet. The plant which the company are erecting for puddling and washing is not yet completed, and no bulk tests of the washdirt have been made, so I am unable to speak definitely as to the amount of tin which it contains. However, a general examination of the exposed faces has made me of opinion that the gravel is of a high-grade character, and will yield good returns. About 250 loads of washdirt are stacked at the surface awaiting treatment.

The upper gravel bed is much thicker (from 7 to 10 feet) than the lower one, and contains far less tin. It has been reached by a rise from the lower level, but, with the exception of one crosscut, no exploratory work has been carried out upon it.

I consider the discovery of these deep and promising-looking tin-leads of the greatest importance. There is a large area of basalt country forming Brodie's Plains towards which the leads are trending, and a consideration of all the circumstances has made me of opinion that under this ground, which has not yet been touched by the miner, valuable deposits of alluvial tin occur. The search for these deep leads would be facilitated in the event of a geological survey of the basalt being made.

I have, &c.,
JOHN B. JAQUET,
 Geological Surveyor.

The Government Geologist.

APPENDIX 16.

Report on Ironstone at Seaham.

Geological Survey Branch, Department of Mines,
 New South Wales, 29 June, 1897.

Sir,

I have the honor to inform you that, in accordance with your instructions, I have made a further examination of the ironstone discovered by Mr. Thomas Adams, sen., near Seaham.

With the aid of a grant from the Prospecting Vote Mr. Adams has put a series of deep trenches across the outcrop of the ironstone bed. Unfortunately, the workings were full of water at the time of my inspection, and I am unable to give a detailed section of the strata exposed in each cutting. I was able, however, to get a good general idea of the character of the deposit.

The compact ironstone of good quality occurs in the form of a series of disconnected masses, which taper out both along the line of strike and dip, and which succeed one another along a certain geological horizon, while the sandstone in the vicinity of these masses is in a greater or lesser degree charged with iron.

Diagrammatic section along bed.

The solid ironstone has a width of from 1 to 2 feet, and the average width of the iron-bearing bed is about 3 feet.

The outcrop of the bed has been traced by Mr. Adams for a distance of 2 miles in the vicinity of Seaham, and its position is correctly indicated upon the sketch which accompanied my preliminary report (*Vide Ann. Rept., Dept. Mines and Agric., N.S.W., 1896, p. 135*). After writing my former report I received the analysis of a series of samples which were obtained by me from various points along the outcrop. This analysis differed from any previously obtained in containing a small but appreciable amount (1.67 per cent.) of Titanic acid. In order to determine which portion of the bed contained the objectionable ingredient, I took three samples from places distant as far as possible apart from one another, and these were separately assayed for iron and titanium.

The results were as follows:—

	Metallic Iron.				Titanic Acid.			
A	49.22	per cent.	Trace,	less than .5 per cent.
B	43.22	"	"	"
C	41.67	"	"	"

Having regard to these results, and the fact that only in one instance has a sample yielded on analysis more than a trace of titanium, I think we may be justified in assuming that the Seaham portion of the bed contains only a small and harmless quantity of titanium. In this respect it differs altogether from the ore which occurs, in what is probably a continuation of the same bed, at Ironstone Mountain, and which was reported upon by Professor T. W. E. David in 1891. (*Vide Ann. Rept., Dept. Mines and Agric., 1891, p. 240.*) Again, the latter-mentioned ore contains only a trace of phosphorus, while that from Seaham contains an appreciable quantity of this element, a quantity which is sufficient to render the pig-iron produced from the ore unfit for the manufacture of steel by the ordinary Bessemer process.

Professor

Professor David, in the concluding portion of his report upon the Ironstone Mountain bed, says:—
 "It is doubtful probably also whether a comparatively thin bed like that at Ironstone Mountain can compete with the richer and more easily-worked iron deposits of Mittagong, Pieton, Rylstone, and other localities in the Western coal-field." These remarks are in a great measure applicable to the Seaham deposits.

Upon the left-hand side of the Seaham-Stroud Road, a few chains beyond the point where it crosses McManus Creek, Mr. Adams has discovered a deposit of brown ironstone. With the exception of a shallow trench, no prospecting work has been done.

An analysis of a sample of the ore by Mr. J. C. H. Mingay was as follows:—

Metallic iron...	49 65
Silica	8·25
Phosphoric acid	·41
Titanium	Trace.

A demand for ironstone flux has arisen in connection with smelting operations at Newcastle; and this ore, unlike the magnetite, would seem to be well adapted for this purpose.

I have, &c.,

JOHN B. JAQUET,
 Geological Surveyor.

The Government Geologist.

APPENDIX 17.

Report on Cobalt Deposits at Port Macquarie.

Sir,

Geological Survey of New South Wales, 26th December, 1897.

I have the honor to inform you that, in accordance with your instructions, I have made an examination of the deposits of cobalt ore which have recently been discovered in the town of Port Macquarie by Messrs. Wyborn and Tellefson.

The oxide of cobalt is chiefly used in the arts as a pigment. About 200 tons are annually absorbed by the world in this manner. Metallic cobalt is a bright metal which takes a polish and closely resembles nickel; indeed, were it not for its comparative high value, it might, like nickel, be used for plating purposes.

Other occurrences in New South Wales.

Cobalt has long been known to occur in New South Wales, and small quantities of the ores of this metal have from time to time been exported from the Colony.

The returns below have been extracted from the Annual Reports of the Department of Mines and Agriculture:—

Year.	Ore exported, in tons.	Value.
1887.....	640	£ s. d. 1,330 0 0
1891.....	115	470 0 0
1892.....	76	1,110 0 0
1893.....	26	305 0 0
1894.....	2·5	10 0 0
1895.....	5·5	26 0 0

The metal for the most part occurs as an hydrated oxide associated with wad in irregular superficial deposits, but also in true veins as Erythrine, Cobalite, and cobaltiferous pyrites.

Only in one locality, Carcoar, has a lode been worked exclusively for this metal. This deposit was reported upon in 1888 by Professor T. W. E. David, of Sydney University, then a geological surveyor in this Department.* He states that the ore contained Erythrine (cobalt bloom) and Glaucodot, a variety of cobaltiferous mispickel, and was associated with Annabergite (arseniate of nickel) and Molybdenite. It occurred in bunches along a line of fissure which for some distance followed a line of junction between slate and diorite. Professor David describes the ore as being exceptionally rich in cobalt, and states that when picked some of it would be worth £20 per ton. The greater portion of the ore mentioned in the above returns was probably derived from the Carcoar lode. The mine has now been closed down for some time, probably because after the richer ores had been worked out no fresh explorations were undertaken. Kupfermanganerz, containing cobalt, has also been mined in the Coombing Copper Mine near Carcoar.†

Cobaltiferous wad was worked a few years ago near Bungonia, and works were erected upon the mine to treat the ore locally. An examination of the specimens of this ore in the Survey Museum shows it to consist of a coarse grit, the component quartz grains being cemented together by manganese wad. No determined attempt to work the deposits appears to have been made, and little or no cobalt oxide was produced.

The analyses given below show it to be poorer than that occurring at Port Macquarie:—

Sample.	Description of Ore.	Cobalt Sesquioxide.	Nickel Protoxide.
1	Cobaltiferous wad	3·190
2	" "	2·65
3	" "	3·23	0·40
4	" "	2·61	0·35
5	" "	2·14	0 40
6	" "	3·50
7	" "	5·40

* Annual Report, Department of Mines and Agriculture, 1881, p. 176.

† Minerals of New South Wales, by Professor Liversidge, p. 110.

‡ These Returns are copied from the Annual Reports of the Department of Mines and Agriculture for the years 1883 to 1889.

Cobalt wad also occurs in the following localities, and assays of samples of the ore have been made from time to time in the Survey Laboratory as under:—

Locality.	Sesquioxide of Cobalt.	Protoxide of Nickel.
Mount Boppy (near Cobar).....	3.1
Maclean District	6.0
Nadgigomar (near Bungonia)	2.71	0.51
Taree	2.41	1.99
Tamworth District	5.20	3.70
"	Trace.	1.89
Sutton Forest.....	1.05
Barrier Ranges	1.95	3.05
Boro	2.10
Goulburn District (Bungonia ?).....	1.21	1.32
Capertree District	1.66	.35
Oberon	2.30

A very valuable sample of cobaltiferous pyrites was recently sent into the Department from the Nerriga district, which upon assay was found to contain as high as 9.15 per cent. of metallic cobalt. Unfortunately, no exact particulars are available as to the lode which yielded this specimen.

* Smaltine and Erythrine occur in considerable quantities in the Australian Broken Hill Consols Mine, Broken Hill, associated with Dyscrasite and other rich silver ores.

Traces of cobalt have been found in the tin-bearing cements obtained from the tertiary leads in the Inverell district, and some of the alluvial tin from Emmaville is known to contain small quantities of the metal.

Port Macquarie Deposits.

Cobalt appears to have been first found at Port Macquarie, about eleven years ago, by Mr. E. H. Becke. It was first of all worked upon the cliffs fronting the ocean a short distance south of Nobby's Point. What are probably the most promising deposits have been only recently discovered by Messrs. Tellefson and Wyborn. The site of these workings is in the town of Port Macquarie, about 250 yards from the Anglican Church, in a southerly direction.

Mode of Occurrence of the Ore.

Ideal Section, showing Mode of Occurrence of Cobalt Ore at Port Macquarie.

The sketch above represents an ideal geological section through Church Hill, and shows the position of the ore bodies. The formations consist of considerably altered fine grained sandstones and serpentine. I only made a cursory examination of the geological formations in the district, and my investigations are not sufficient to enable me to pronounce any definite opinion as to the probable origin of the serpentine. It appears, however, to have resulted from the alteration of a rock which at one time intruded the sandstone.

It is only in the serpentine and the clays which have resulted from its degradation that the cobalt is found. The ore occurs in nests or pockets which possess no defined form, and which are scattered in an irregular manner through the clays and decomposed serpentine. It is also found upon the cleavage planes and in the joints of the rocks. The most promising ore bodies have been discovered at the base of the red ferruginous clays, and in the upper layer of serpentine which is decomposing *in situ*.

Messrs. Tellefson and Wyborn have sunk a shaft to a depth of 20 feet, and from the bottom of the shaft they have driven several short levels into the decomposed rock, in all of which more or less cobalt ore can be seen. At the time of my inspection an inclined tunnel was being driven with a view of exploiting the deposits already discovered.

The ore consists of earthy cobaltiferous wad (Asbolite), an ore which, according to Dana, sometimes contains as much as 32 per cent. of metallic cobalt. It possesses a black or bluish-black colour. Generally speaking the bluer the ore the greater the quantity of cobalt which it contains. This characteristic has been used in classification. Being more or less spongy in texture, it includes within its cavities small quantities of red ferruginous clayey matter. Some specimens are rudely laminated, and others possess a botryoidal or reniform structure. The whole appearance of the ore would seem to suggest that it has had a concretionary origin.

An

* Transactions of the American Institute of Mining Engineers, Pittsburgh, February, 1896.
Annual Report, Department Mines and Agriculture, 1882, p. 29.
J. E. Carne, Geological Surveyor, Report Department Mines and Agriculture, 1896, p. 106.

An average sample taken by the writer from a few tons of picked ore, raised from a new find by Messrs. Wyborn and Tellefson, was analysed by Mr. J. C. H. Mingaye, Analyst to the Mines Department, with the following result:—

Chemical Composition.

Moisture, at 100 C.....	4.98
Combined water	12.21
Silica (Silicate O ₂)	8.06
Alumina (Al ₂ O ₃)	18.95
Ferric Oxide (Fe ₂ O ₃)	14.73
Manganese Binoxide (Mn O ₂)	31.05
Cobalt Oxide (Co O)	7.48
Nickel Oxide (Ni O)	1.36
Chromium Sesquioxide (Cr ₂ O ₃)41
Copper Oxide (Cu O)05
Lime (Ca O)05
Magnesia (Mg O)	trace
Phosphoric Acid (P ₂ O ₅)06
	99.44

A picked sample of the ore from the abandoned workings on the cliff south of Nobby's Head yielded, on being assayed by Mr. H. P. White, Assistant Analyst to the Mines Department, as follows:—

Chemical Composition.

Moisture, at 100 C.....	5.38
Combined water	12.24
Silica (Si O ₂)	6.40
Alumina (Al ₂ O ₃)	9.97
Ferric Oxide (Fe ₂ O ₃)	16.85
Manganese Binoxide (Mn O ₂)	36.50
Cobalt Oxide (Co O)	7.03
Nickel Oxide (Ni O)	2.39
Chromium Sesquioxide (Cr ₂ O ₃)40
Copper Oxide (Cu O)12
Lime (Ca O)	1.20
Magnesia (Mg O)83
Phosphoric Acid (P ₂ O ₅)14
Carbonic Acid (C O ₂)22
	99.67

Samples of the Port Macquarie ore have been assayed in the Survey Laboratory as under:—

Assay No.	Metallic Cobalt. per cent.	Metallic Nickel. per cent.
1394	1.34	1.70
3664	6.60	.77
3788	5.14
3823	4.36	1.77

A chrome iron ore, composed of small grains of chromite loosely cemented together, is associated with the wad in places. A sample of this ore, when assayed in the Survey Laboratory, yielded as follows:—

Chromic Oxide	48.24 per cent.
Cobalt	1.29 ..

It has not been found in sufficient quantity hitherto to permit of its being worked as a chrome ore. There are also found in the red clays masses of pisolitic ironstone, which, upon analysis, have been found to contain small quantities of cobalt.

The deposits which possess the greatest interest for the Port Macquarie cobalt miners, and those from which the greatest amount of information having a practical bearing upon the subject can be obtained, are found in New Caledonia. Both as regards the character of the ore and its mode of occurrence, there is a close resemblance between the two series of deposits. It is important to note that the New Caledonian ore is only found in the clays and decomposed rocks, and never in the unaltered serpentine. There are exported from New Caledonia from 2,500 to 4,000 tons of cobalt ore every year, which contains about 5 per cent. of metallic cobalt. Formerly the ore was only hand-picked before being bagged for export, but I have reason to believe that a considerable portion is now delivered of its associated red clay by a rude process of washing. The friable powdery character of the wad (and its consequent liability to "slime") must always render its concentration by the ordinary processes difficult. Unfortunately the efforts which I have made to obtain particulars of the system in vogue in New Caledonia have not been successful.

Treatment of the Ore.—The Port Macquarie deposits are handy to water carriage, and the ore could be cheaply shipped. Nevertheless the ore is, comparatively speaking, light and bulky, and would not be sought after by shippers for stiffening purposes, as is the case with chrome iron, and other heavy ores.

The late Mr. Cosmo Newbery suggested, in 1884, that the cobalt bearing wads of Victoria might possibly be treated at a profit in the Colony by a wet process which he outlines, and which he describes as one by which very poor ores may be treated at a profit.* The process would seem to be closely analogous to that in vogue at the Maletra Works, Rouen, France. Here the powdered ore is first treated in large vats, with a solution of protosulphate of iron, and as a result the manganese, cobalt, and nickel go into solution in the form of sulphates. The solution of sulphates is run into stone basins, and sodium sulphate is added in sufficient quantity to precipitate the nickel and cobalt as sulphides. A small quantity of manganese is also precipitated during this operation, but

but the greater portion of it remains in solution. The precipitate so obtained is washed, passed through a filter press, and then treated with perchloride of iron. As a result of this operation the manganese goes into solution partly as sulphate and partly as chloride, while a comparatively speaking pure residue of nickel and cobalt sulphides remains behind.

About 180 tons of ore per month, containing 3 per cent. cobalt (?) and $1\frac{1}{4}$ per cent. nickel are treated at the Malettra Works.

Price obtained for the Ore.

The prospectors have been offered £5 10s. per ton for ore containing 5 per cent. of cobalt oxide, delivered in Sydney. It would appear ("Mineral Industry, 1896," p. 247) that the value of a ton of cobalt oxide in the United States in 1896 was about £420, so the value per unit would be £4 4s., say £4. Upon this basis of calculation the actual value of the cobalt oxide contained in a ton of 5 per cent. ore would be £20.

It may seem somewhat extraordinary, having regard to the high intrinsic value, that buyers should refuse to quote prices for parcels containing less than 5 per cent. There is, however, only a limited demand for cobalt oxide—only about 200 tons are absorbed in the arts annually; and, upon inquiry, I have learnt that a sufficient quantity of asbolite ores, yielding 5 per cent. of oxide, can readily be obtained to meet the shortage in the world's supply from other sources. I have reason to believe that the market price of the manufactured product is controlled by a small ring of merchants.

General Remarks.

In my opinion the cobalt deposits of Port Macquarie and the surrounding district are well worthy of further attention on the part of the mining community. Prospecting operations have shown that bunches of payable ore exist, which is certainly as rich, if not richer, than that which at present is being profitably mined in New Caledonia. Exploratory work has not yet proceeded far enough to enable one to express any opinion as to the dimensions of the deposits or the quantity of ore which they are likely to yield.

I am of opinion that the chances are greatly against the ore being obtained in payable quantities at a depth in the unaltered rock; and I would advise prospectors to confine their attention to the clays, &c., and the upper decomposed portions of the serpentine. Fresh deposits of ore are likely to be found from time to time in the district, and I would particularly direct the attention of prospectors to the outcrop of serpentine, for the most part covered by red clays and ironstone pebbles, which crosses the Taree-Port Macquarie Road about 12 miles from the latter town.

All the facts seem to me to suggest that the cobaltiferous wad has segregated out from the serpentine which originally contained cobalt and nickel in a finely disseminated state, and that the process of segregation has been assisted by the decomposition of the serpentine.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

APPENDIX 18.

Progress Report for 1897 by Geological Surveyor J. A. Watt.

Sir,

I have the honor to furnish you with the following report of the work done since my appointment in March last.

On March 3rd I commenced my duties, and from that date till the 17th of the same month was engaged in making myself acquainted with matters in the office.

On March 17th I accompanied Mr. Geological Surveyor Jaquet to Captain's Flat and assisted him to examine and sample the Lake George mines, in connection with a proposal to construct a line of railway from some point in the neighbourhood of Bungendore on the Goulburn-Cooma Line to Captain's Flat.

I then made a short visit, lasting from 1st to 10th April, with Mr. Jaquet to the Parkes, Alectown, and Peak Hill Districts, where prospecting and lands papers were dealt with. From April 11th to the end of the month I was engaged at the office on the report on the Lake George mines and writing reports on applications for aid from the Prospecting Vote.

On May 3rd I left Sydney for Coolac, on the Gundagai Line, to examine a deposit of chrome—iron ore, consisting of loose masses of chromite embedded in the surface soil arising from the denudation of veins of chromite, which occur in serpentine higher up the slope of the hill.

During this trip the following places were visited, chiefly in connection with applications for aid from the Prospecting Vote, but in a few cases to examine portions of Mining Reserves proposed to be cancelled:—Young, Lyndhurst, Galley Swamp, Orange, Ophir, Byng, Lewis Ponds, Kerr's Creek, Warne, Stuartown, Wellington, Cargo, Mudgee, Gulgong, Home Rule, Windeyer, Capertree, and Glen Alice. In the vicinity of the last-named place, extensive reserves for shale-mining were recommended to be made.

Between May 31st and June 12th I was engaged at the office in writing reports.

On June 14th I left Sydney for Araluen, to make inquiries into the advisability of constructing the proposed drainage race in the Araluen Valley.

I again left Sydney on July 1st, and between that date and July 22nd, sites for prospecting aid were examined at Slippery Creek near Oberon, Mount David, Mount Werong, Porter's Retreat, Briar Park, and Back Creek near Rockley, Appletree Flat near Mudgee, Worobil Flat near Home Rule, Limburn, Canadian Lead, Windeyer, Clarke's Creek, Grattai, Gulgong, Tuclay Valley, Yamble, Cunningham's Hill, and Havilah. The following places were also visited in connection with proposals to alienate portions of Mining Reserves:—Native Dog Creek near Oberon, Wallbrook, Campbell's Creek near Windeyer, Gulgong, and Moglo Creek near Tuena.

Between 23rd and 30th July I was engaged at the office in writing reports.

On

On the latter date I left for Peak Hill to re-examine a portion of land on Burril Ceeek, near Mingelo, which Mr. Jaquet and myself had previously reported on.

Between 11th and 29th August, the following places were visited:—Araluen, Goulburn, Middle Arm (Upper Tarlo), Gundagai, Capertee, Carlo's Gap, and Parkes.

At Araluen the sites were chosen for a series of shafts which it was decided to put down to test an extensive and unprospected flat on the north-east side of Araluen Creek.

At Middle Arm, Upper Tarlo, the site of a reported discovery of a diamond was examined; my report on this forms Appendix 19. At Carlo's Gap, the iron-ore deposits were cursorily examined, and a fortnight later in greater detail, in connection with the suggested erection of iron-reduction works at that place. My report on these deposits forms Appendix 20.

On September 13th I left Sydney, and between that date and October 5th, the following places were visited:—Sunny Corner, Hargraves, Parkes, Forbes, The Pinnacle, Condobolin, Peak Hill, and McFail (Myall). An examination was made of an auriferous reef 18 miles north-west of Condobolin; as this was a new locality it was deemed advisable to make a report on it, this forms Appendix 21.

Between 6th and 27th October my time was occupied at the office in writing reports.

On October 28th I left for Goulburn and examined extensive mining reserves on the Abercrombie River; from there I went to Yass and made a geological examination of the new finds at Nanima Creek. My report on the Nanima and Gooda Creeks Gold-fields forms Appendix

The following places were then visited to inquire into applications for aid, and proposals to alienate portions of the Mining Reserves:—Young, Cowra, Woodstock, Mount McDonald, Mandurama, Blayney, Orange, Cargo, Ophir, Bathurst, Bumberry, and Stuartown.

On December 6th, I left for Araluen, to start the prospecting operations undertaken by the Prospecting Board, and then proceeded to Albury to make inquiries into the advisability of granting a lease of a large area of ground to one party to prospect for a deep lead. Several aid cases were also dealt with in this district.

I returned to Sydney on December 17th, and from that date, excepting the holidays, I was engaged at the office in writing reports.

A paper has also been contributed to the Records of the Geological Survey on the Hargraves Saddle-Reefs.

The Government Geologist.

I have, &c.,

J. ALEX. WATT, Geological Surveyor.

APPENDIX 19.

Report on discovery of Diamond at Upper Tarlo.

Sir,

Geological Branch, Mines Department, 6 September, 1897.

In accordance with your instructions I inspected the site of the reported discovery of a diamond on portion 292 (an additional conditional purchase of 50 acres held by Mr. Woodhouse) parish of Upper Tarlo, county of Argyle, and have the honor to report as follows:—

About five years ago, while Mr. Woodhouse was prospecting for gold on a basalt hill situated on portion 292, a stone was obtained during the washing of a dish of gravel, which attracted his attention at the time, and on subsequent examination proved to be a diamond. This led to further search being made, but up to the time of my visit, with unsuccessful results.

Locality.

The site of the discovery is a basalt-capped hill situated about 20 miles north of Goulburn, on portion 292, parish of Upper Tarlo, and about 4 miles south of the Main Dividing Range, which has there a nearly due east and west course.

General Geological Features.

The sedimentary strata in the neighbourhood consists principally of Silurian (?) slates, &c., highly disturbed, considerably altered, frequently intersected by quartz veins, and intruded by igneous masses of granite. Overlying the Silurian (?) rocks are small areas of sandstone of fresh-water origin, highly ferruginous in some parts, in others silicified by the deposition of silica between the grains of sand. These rocks were observed in two places on portion 142, about 1½ mile N.W. of the first locality. In the latter case they are found to contain fossil leaves of tertiary age, some of which Mr. Dun, Palæontologist to the Mines Department, considers resemble *Quercus Wilkinsoni*, Ett., from the Eocene beds of Vegetable Creek.

Of later age than the sandstone are the drifts underlying the basalt in many parts of this district, from which on portion 292 a diamond was said to have been obtained in addition to fair prospects of gold.

More recent still than the abovementioned drifts is the basalt, which occupies the surface of a large area of the Main Dividing Range in this district, and at one time covered much of the low lying land in the vicinity, from which it has since to some extent been denuded, leaving outliers similar to that on portion 292. The gullies heading from the basalt-capped hills and running into the Middle Arm of Tarlo Creek are occupied by recent deposits derived partly from the denudation of the basalt and underlying Tertiary deposits, and partly from the disintegration of the Silurian (?) strata and granite intrusions.

Description of the Deposits.

The basalt-capped hill on portion 292 is of irregular outline, of a maximum length of about 19 chains in a W.S.W. and E.N.E. direction, and a maximum width of about 10 chains. The surface of the hill is occupied entirely by basalt with the exception of a series of outcrops of ferruginous and silicified sandstone of probably tertiary age, and of similar origin and age to the sandstone with the fossil leaves occurring about 1½ mile to N.W.

These outcrops extend diagonally across the hill and appear to have formed the southern bank of the creek, which deposited the drift and was overwhelmed by the flow of basalt which took place probably in late tertiary times. Around the N., N.E., and N.W., margins of this hill water-worn pebbles appear

at

at the surface and mark the outcrop of the drift, while south of the abovementioned sandstone outcrops, which form the banks of the tertiary creek, no pebbles are visible; moreover, the few shafts sunk on the south side, including one 60 feet deep, have failed to prove the presence of the drift on this side. The basalt is nowhere of great thickness, and varies from a few feet to about 40 or 50 feet at the most.

Underlying the basalt are drift deposits consisting of sand above, sometimes white, at other times discoloured and cemented by oxide of iron liberated by the decomposition of the overlying basalt. The thickness of the sand varies from a few inches up to 6 feet or more. The junction between the sand and underlying gravel is not sharply defined and is of an undulatory character. The drift which underlies the sand rests on the denuded edges of Silurian (?) slates which form the bed-rock of the creek which deposited the drift. The thickness of the drift varies from a few inches to 4 feet, and consists largely of water-worn pebbles of quartz, quartzite, and slate, many of which are 6 or more inches in diameter, interspersed with fine gravel and sand. One block of quartz which was observed near the edge of the outcrop of the drift on the north side of the hill must be at least 4 or 5 cwt. The outer edge of the drift in many places, but especially at the entrance of the west tunnel, has been rendered intensely hard by the infiltration of water carrying iron in solution derived from the decomposition of iron bearing minerals in the overlying basalt.

It was from the bottom of a shaft sunk to the base of this gravel that this diamond was said to have been obtained. This is the only diamond yet found in this drift, although a large quantity has since been washed with the express object of searching for the gem.

Gold has been found in the form of fine flat grains in several parts of the drift, more especially in the workings on the eastern end of the hill, where (viz., in shaft No. 6) from 1 foot of wash no less than nine or ten colours of gold to the dish were obtained.

When the workings at the western end of the hill have been extended further into the hill it is highly probable that much better prospects of gold will be obtained; gold may yet prove a valuable constituent of the drift, and the search for it be attended with more profitable results than the prospecting for diamonds.

Description of the Workings.

Two tunnels have been driven into the wash under the basalt from the north slope of the hill, the eastern one to a distance of 70 feet, the western 50 feet. About a dozen shafts in all have been sunk on different parts of the hill to depths varying from 8 to 60 feet. Vertical sections through three of them are given to show relation of the strata.

Method adopted in testing the gravel for Diamonds.

The gravel is carted to a dam situated on a creek about 1 mile distant. There it is passed through a simple piece of apparatus, consisting of two sieves, one placed above the other, on the upper of which the gravel is placed, a stream of water made to play on it, and a horizontal movement given to the machine. By this means the fine material is washed completely through the two sieves. The pebbles, from one eighth of an inch to half an inch, pass through the upper sieve and accumulate on the lower; while pebbles larger than half an inch remain on the upper sieve.

The material on the upper sieve is shovelled away directly; that on the lower is removed and placed on a table, covered by sheets of iron, to be sorted.

Whatever gold is present passes with the fine material through the sieves and is practically lost, as the arrangements for saving it are quite inadequate; but for the object of enabling the gravel to be examined for diamonds, for which purpose the machine was designed, it is sufficiently efficient.

Summary.

According to instructions, advice was given to the gentlemen interested in the work. It was pointed out to them that the best results would be obtained by continuing the western tunnel further into the hill, as all the evidence pointed to the deepest part of the channel where the best prospects are likely to be obtained, being further south than the present workings.

Diamonds have been recorded in single specimens from many parts of New South Wales, so that the discovery of a diamond in this drift should not be taken to necessarily indicate the existence of a diamantiferous deposit of economic importance.

Judged from the standpoint of modern research it is morally certain that diamonds found in tertiary drifts underlying the basalt have not been formed where we now find them. They, like the pebbles of the drift, have had their origin elsewhere; have been set free by the denudation of older rocks, and owe their present position to the action of running water. Where the rock lies which shed this diamond, and possibly others, there is no evidence. Even in places like Bingara, Inverell, and Cudgegong River, where diamonds have been found in similar deposits, but in comparatively large numbers, the matrix of the gem has not yet been found.

The sporadic nature of the occurrence of diamonds in this Colony, their low commercial value, owing largely to their intense hardness, and consequent increased expense of cutting them, are facts which must tell very much against the success of diamond mining at Upper Tarlo.

The deposit, however, requires to be further prospected before one can speak more definitely. Even should no economically important discovery of diamonds be made there is some probability that prospecting operations will prove the existence of payable gold in the drift.

I have to thank Mr. Woodhouse for his kindness in furnishing me with valuable information.

APPENDIX 21.

Report on the Iron Ore Deposits at Carlo's Gap.

Sir,

Geological Survey, Mines Department, Sydney, 10 October, 1897.

In accordance with your instructions I visited Carlo's Gap, with a view of reporting on the extent and value of the iron-ore deposits in the vicinity. On August 24th a preliminary inspection was made, but as it was stated on my return that very important and extensive deposits existed on the summits of the mountains which had escaped my attention, it was deemed advisable that a second inspection should be made.

As a result of these two visits I have the honor to report as follows:—

THE IRON-ORE DEPOSITS AT CARLO'S GAP.

Carlo's Gap Platform, on the Wallerawang-Mudgee line, is distant 136 miles from Sydney and 31 from Wallerawang.

General Geological Features.

Between Capertee and Carlo's Gap the railway traverses conglomerates and mudstones of probably Upper Marine age, which overlie highly tilted and altered rocks of Silurian or Devonian age, and pass upward, without any apparent break in the conformity of the strata, into clay shales, mudstones, and sandstones of the upper coal measures.

Above the coal measures again are massive sandstones belonging to either the Hawkesbury or Narrabeen beds, and these are in turn capped by a varying thickness of basalt more or less weathered into clay.

The deposits of iron-ore occurring on the property lately held by the Carlo's Gap Coal-mining and Smelting Company are of two kinds:—

1. Bands of clay ironstone interbedded with the coal measures.
2. Irregular superficial deposits of limonite associated with decomposed basalt on the summit of the sandstone ranges.

1. Interstratified with the rocks of the coal measures, which consist mainly of clay shales, are thin bed-like deposits of clay ironstone. This ore consists essentially of carbonate of iron, with a greater or smaller admixture of clay and other impurities. Where these beds of ore come to the surface, and for varying distances from their outcrops, the original carbonate of iron has been converted by the action of atmospheric agencies into limonite, a hydrated oxide of iron. By the contraction in the volume of the ore, resulting from the chemical changes just referred to, jointing has been developed in a highly perfect degree at the outcrops, where the ore occurs in loose blocks of varying size and of rectangular shape. The economic value of these deposits is largely determined by the thickness of the bands of ore and their iron contents. With regard to the former, several bands were observed outcropping on the slope of the mountains, but none of them had a greater thickness than 1 foot, while the majority of them are less. These bands are, moreover, separated from one another by considerable thicknesses of clay shale, a circumstance that would prevent two or more of them being worked together. Nor, as far as I was able to ascertain, are there any beds of importance so situated that they could be worked with the coal.

The two seams of coal which have been worked on this property are separated by, at least 60 feet of clay shale. About midway between these two coal seams occurs one of the thickest of these bands, and another is situated about 100 feet above the upper seam.

With regard to the iron contents of this ore, a fairly average sample was obtained from a limonite outcrop of one of the largest of the bands, and this was analysed in the departmental laboratory. The result of the analysis given below may, I think, be taken to fairly represent the average composition of the altered portions of this ore:—

Analysis.	Per Cent.
Moisture at 100 C.	1.40
Combined Water	11.75
Silica (Si O ₂).....	15.55
Alumina (Al ₂ O ₃)	7.53
Ferric Oxide (Fe ₂ O ₃)	60.47
Manganese Bin oxide (Mn O ₂)	1.73
Lime (Ca O).....	0.70
Magnesia (Mg O).....	0.25
Sulphur Trioxide (S O ₃).....	0.24
Phosphoric Acid (P ₂ O ₅) minute trace (less than).....	0.01
Organic Matter.....	0.55
Metallic Iron, 42.33 per cent.	100.17

It was not found possible to obtain a sample of the unaltered ironstone, as these bands have nowhere been driven on further than 5 or 6 feet, which is not far enough to reach the unaltered ore. Experience indeed goes to show that, as a general rule, such ores in their unaltered portions are more uniform as regards their iron contents, but somewhat lower in value, than their limonite outcrops.

The unaltered ironstone might, therefore, be expected to yield from 35 to 40 per cent. of metallic iron.

In the absence of direct evidence it is impossible to definitely state how far in from the outcrops the zone of alteration will have extended; but, taking into consideration the steep slope of the mountains and the therefore rapidly increasing thickness of the strata above them, it cannot be expected to extend more than 30 or 40 feet, perhaps not so far.

From the foregoing remarks it will be understood the great drawback to the successful utilisation of these deposits lies in the fact that the expenses incurred in winning the ore would be too heavy. The beds are thin and so separated from one another that it would be possible to work but one bed at a time, whereas a very large amount of clay shale would have to be removed at the same time.

The ore is of fair quality, and a few hundred tons might be easily and cheaply obtained.

2. The other variety of iron ore is a limonite occurring on the summit of the sandstone ranges, and owing its origin to the decomposition of basalt. The iron thus set free has penetrated to a considerable depth along the joint planes of the sandstone, impregnating the rocks for some distance on each side.

This

This has produced bands of ferruginous sandstone, several feet wide in places, which become prominent owing to the denudation of the surrounding softer sandstone; but on account of their highly siliceous character they are valueless as ores of iron.

The decomposition of the basalt has given rise to another kind of deposit consisting of concretionary masses of limonite covering more or less completely the surface of the deposits of ferruginous clays of very limited extent, which have accumulated in the shallow inequalities on the surface of the sandstone. These deposits have a very limited superficial extent and reach vertically not more than 6 to 9 inches below the surface. Beneath these thin layers of iron ore are variously coloured clays through which are interspersed small concretionary lumps of limonite.

A sample collected from the superficial layer of limonite was analysed in the departmental laboratory with the following results —

Analysis	Per cent
Moisture at 100 C	2 82
Combined water	12 28
Silica (Si O ₂)	16 40
Ferric Oxide (Fe ₂ O ₃)	53 51
Ferrous Oxide (Fe O)	0 20
Manganous Oxide (Mn O)	trace
Alumina (Al ₂ O ₃)	14 06
Lime (Ca O)	0 20
Magnesia (Mg O)	0 18
Sulphur Trioxide (S O ₃)	trace.
Phosphoric Acid (P ₂ O ₅)	0 61
Organic Matter	trace
Metallic Iron, 37 53 per cent	100 26

These deposits are so extremely limited in extent that they can have but little economic value, and, moreover, the comparatively large percentage of phosphoric acid present detracts greatly from the value of the ore.

In conclusion, the fact must be recognised that no deposits of a workable nature have yet been proved to exist in the immediate vicinity of Carlo's Gap, and, as a consequence, there is nothing to justify at the present time the expenditure of any money in the erection there of iron reduction works.

I have, &c,

J. ALEX. WATT,
Geological Surveyor.

APPENDIX 20.

Report on Winters' Reef, near Condobolin.

Department of Mines, Geological Branch, 15 October, 1897.

Sir, I have the honor to report that in accordance with your instructions I made an examination of Mr. Winters' reef, and beg to furnish you with the following particulars —

Situation.

The site of Mr Winters' workings is near the north-west corner of portion 7. parish of Barratta, county of Cunningham, and distant about 18 miles in a north-westerly direction from Condobolin.

Mr. Winters, by virtue of an agreement with Mr Seberry, the owner of the land, holds 15 acres for mining purposes.

General Geological Features

In travelling west from Parkes little is seen of the older rocks, the surface of the country becomes very flat, and, with the exception of a few isolated and comparatively low hills, is concealed beneath a covering of varying thickness of red sandy clay.

In the vicinity of Winters' Reef the bed-rock comes to the surface, and is there seen to consist of greatly disturbed and highly contorted slates, apparently inclined at high angles.

The age of the gold-bearing rocks is probably Upper Silurian, although some portions at least may possibly be Lower Silurian.

Discovery

Mr Sam Seberry was the first who did any work on the site. About two years ago a shallow pit was dug and a few pieces of quartz carrying arsenical pyrites were sent by him to Mr Scott, of Mowabla Station.

This stone, however, was not known to be gold-bearing until eleven months ago, when Mr Winters crushed several pieces of stone from the same place and found gold in them. Seven months elapsed before a lease was obtained, and in June last mining operations were commenced.

Workings on Crown Lands

Before describing the work done by Mr Winters on his lease, and the results obtained, brief mention will be made of the workings in the immediate neighbourhood.

Just outside of Mr Seberry's land, and situated on Crown land, about 100 yards distant to the north-west of Winters' shaft, Mr Auhl holds a prospecting protection area, on which a fair amount of work has been done. A shaft has been sunk to the depth of 22 feet on a couple of small quartz leaders, one of them, that on the west, varies from 2 to 4 inches in width, and is said to prospect up to an ounce of gold per ton. From 40 to 60 feet north-east of the shaft a trench 10 feet in depth has been dug, in which a leader from 4 to 6 inches in width was cut; this carries small quantities of gold. Mr. Auhl has not succeeded in finding anything larger than these two leaders.

Further workings have taken place on Crown land 8 chains west of the north-western corner of portion 7. A vertical opening, so irregular that it can scarcely be called a shaft, has been made to a depth of 40 feet. Contorted and partly crushed siliceous slates were passed through, in which no defined reef was met with, but merely irregular masses of quartz and small leaders, some of which carry fair gold. Two tons 8 cwt. of stone from these workings were treated for a yield of 7 dwts per ton.

Working

Workings on Mr. Winters' Lease.

Comparatively little work has been done on this lease. Three shallow pits, varying from 2 ft. 6 in. to 6 feet in depth, and a shaft 22 feet have been sunk. At the bottom of the shaft the reef has been opened up for a length of about 13 feet. A trench 5 feet wide and 2 ft. 6 in. in depth, extends from the shaft towards pit A (*vide plan*), which is 10 feet by 7 feet, and 6 feet deep. From 100 to 120 feet north of the shaft a narrow trench has been dug, in which nothing but small leaders were cut.

Plan of workings on Winters' Reef.

Vertical section through shaft

Note Ore body (quartz) shown thus

Lastly, Waite and party have trenched the ground about 130 yards south of Winters' Shaft for a length of 200 to 250 feet, and a depth at times of 10 feet or more, without cutting any body of quartz.

Gold-bearing Material.

Prospecting operations have not been carried out far enough to allow of the form of the ore bodies on Winters' Lease being distinctly made out. In the pits irregular masses of quartz 4 to 5 feet in width are to be seen, but whether these form portions of reefs well defined, but of a somewhat broken character, or are merely isolated masses of indefinite form, filling up irregular openings produced during the crumpling of the slates, it is impossible to say. In the present state of their development they appear to possess the latter character. The reef-like body of quartz followed down in the shaft suddenly ceases at a depth of 22 feet from the surface (*vide section*). This may be due to the presence of a fault which has separated it from the main body, or, which seems just as probable, it may illustrate the real character of these deposits.

The quartz contains, in addition to free gold, arsenical pyrites, zincblende, and galena. The three latter are present in some portions of the quartz in an unaltered state even in close proximity to the surface.

Two parcels of stone raised from Mr. Winters' Shaft have been treated:—

- (1.) Ten tons sent to Pooler's battery, at Cugong, yielded a little over 28 oz., or 2 oz. 16 dwts. per ton.
- (2.) Ten tons sent to Clyde yielded 2 oz. 2 dwts. per ton.

Five samples were collected by me from the workings on Mr. Winters' Lease, and assayed in the departmental laboratory, with the following results:—

Sample 1 (S. 1) from pit A.				
Gold	1 oz. 11 dwts. 14 grs. per ton.
Silver	3 dwts. 6 grs. per ton.
Sample 2 (S. 2) from shaft—north end.				
Gold	15 dwts. 6 grs. per ton.
Silver	4 " 8 " "
Sample 3 (S. 3) from shaft—south end.				
Gold	13 oz. 16 dwts. 14 grs. per ton.
Silver	9 dwts. 19 grs. per ton.
Sample 4 (S. 4) from pit C.				
Gold	Trace (under 2 dwts.) per ton.
Silver	" " "
Sample 5 (S. 5) from pit B.				
Gold	Trace (under 2 dwts.) per ton.
Silver	" " "

* 9—2 A

On

On Mr. Winters' Lease the prospects are decidedly encouraging, for the results of the assays, as well as the yields of the 20 tons of stone already treated, prove conclusively that rich ore exists in the bottom of pit A, and in the shaft. How far, laterally and vertically, this ore will extend prospecting alone can prove; and in carrying out this work considerable judgment will be necessary, for the "country" exhibits evidence of considerable disturbance.

My thanks are due to Mr. Scott, of Mowabla Station, for his kindness in conducting me over the ground.

I have, &c.,

J. ALEX. WATT,
Geological Surveyor.

The Government Geologist.

APPENDIX 21.

Report on the Nanima Creek and Gooda Gold-fields.

Sir, Geological Survey Branch, Department of Mines, Sydney, 1 December, 1897.

At the beginning of last month I paid a visit, in accordance with your instructions, to the above gold-fields, and now beg to furnish you with the following report on them:—

Nanima Creek Gold-field.

The locality where rich gold-bearing stone has recently been discovered is situated about 3 miles east of Murrumbateman, close to, and on the west side of, Nanima Creek, in the parish of Nanima, county of Murray.

This site is about $2\frac{1}{2}$ to 3 miles west of the old gold-field of Nanima, where well-defined auriferous quartz reefs have long been known to exist. Many years ago they were worked for a time, and afterwards abandoned, in which state they remained until quite recently, when, owing to the important discovery at the new site, on the west side of Nanima Creek, and the erection of a battery on the creek, several of them were again taken up. Bismuth is present in some of these reefs on the old Nanima Gold-field.

The quartz-felsite, which occupies almost the whole surface between Yass and Murrumbateman, extends to within a quarter of a mile westerly of the prospector's and Croker's claims, which lie just within the highly disturbed and considerably altered zone of Silurian rocks in contact with the eruptive mass.

To Mr. James Remington I believe is due the discovery of gold on the present Namina Creek Gold-field, as a result of about five weeks spent in prospecting in the neighbourhood. Good prospects were obtained by the dish in the "rubble" at the surface, about 50 yards below the outcrop of the gold-bearing stone. From this point gold was traced up the hill to the outcrop, where big masses of ironstone and quartz showing free gold were obtained. Some of the surface material was very rich. One piece of stone about 2 lb. in weight yielded $1\frac{1}{2}$ oz. of gold, while some portions of the soil and subsoil gave as much as 1 oz. of gold to the dish.

Almost simultaneously with Mr. Remington's discovery, or possibly a little later, another important find was made by Messrs. Butts and Cooper, at a point about 25 chains south of the first discovery.

Here the outcrop, which consisted of gossanous slate carrying gold visible to the naked eye, was concealed by about 9 inches of subsoil. This "rubble," as it is called, as in the case of Remington's, discovery gave good prospects with the dish, some portions of it containing as much as $1\frac{1}{2}$ to 2 dwts. of gold to the dish.

Work has been carried on by the parties holding the claims on which the discoveries were made, and the ground has been taken up on all sides of these claims, and is now being vigorously prospected, but, up to the present, without success.

Remington and Jordan's Claim.

This is known as the "Prospector's Claim," and comprises an area of 19 acres. Two shafts, where the first discovery was made, have been sunk on this ground—one, the most southern, to a depth of 130 feet, and the other, 20 feet to the north of the former, to a depth of 30 feet. The former shaft has been sunk on the gold-bearing deposit, which lies within a crushed zone on the Silurian (?) rocks, and which consists of fragments of crushed slate and silicified sandstone, and of more or less irregular veins of quartz of small size. The gold-bearing shoot of this crushed zone varies from 6 inches to 2 feet in width, underlies to the east at an angle of about 75 degrees, and pitches to the south at about 45 degrees. It has been followed down to a depth of 130 feet both on the underlay and on the pitch, making the further sinking of the shaft an almost impossible operation. Preparations were being made at the time of my visit to drive along the mineralized zone to determine its lateral extension.

Of the material obtained during the sinking of the 130-foot shaft, a first parcel of 10 tons of loam and rubble was sent about July last to Sutton, near Bywong, a distance of about 23 miles, and yielded 2 oz. 5 dwt. of gold per ton. A second parcel of 7 tons of the best of the gold-bearing material taken out, for about an average width of 1 foot, from the surface to depth of 60 feet, yielded 20 oz. of gold per ton. Four tons of tailings resulting from the treatment of the last parcel were sampled, and found on assay to contain 2 oz. of gold per ton. In addition to the above there were about 150 tons of stone stacked at the mine, which, it is expected, will yield from 8 dwts. to $\frac{1}{2}$ oz. of gold per ton.

The gold in the stone is, as a rule, in a very fine state of division, but occasionally pieces up to 2 grains in weight are noticed.

A little iron pyrites has been observed in the material already removed. This is an ingredient that may be expected to considerably increase in amount after the water-level has been passed.

Croker and Butts' Claim.

This claim includes an area of 50 acres. The circumstances of the discovery of gold in the claim have already been detailed. Three shafts have been sunk, one 40 feet deep, another 15 feet north of the first, to a depth of 25 feet, and the third 1 chain north of the last mentioned shaft, to a depth of 80 feet. From the bottom of the 80 feet shaft a drive to the north 20 feet in length, and another to the south of a similar length have been put in along the deposit. The gold-bearing material consists of a zone of crushed slate 4 to 5 feet in width, through which runs a quartz vein of much richer nature, and varying from 5 to 15 inches in width.

Transverse

Transverse Section across Crocker's Reef (in the southern part of the mine).

Scale, 40 feet to One Inch

- a. Subsoil, 9 inches thick, carrying gold up to $1\frac{1}{2}$ dwt. to the dish.
 b. Rich quartz vein, 5 to 15 inches in width, carrying gold up to 30 oz. or more per ton.
 c. Crushed slate on west wall } Expected to
 d. Crushed slate on east wall } carry 1 oz. gold
 e. "Country" Silurian (?) slate. per ton.

The width of the gold-bearing portion is at least 4 or 5 feet, and may be much more. It extends down nearly vertically, underlying slightly to the west in the southern portion of the mine, but in a much more pronounced manner in the northern portion, where the crushing of the country becomes less evident and the gold-bearing material consists only of a vein a few inches in width lying apparently parallel with the bedding planes of the slate. The country strikes nearly north and south and underlies to the west, and is somewhat obliquely intersected by the impregnated and crushed zone.

Nine tons of the stone raised during the sinking of the 80 feet shaft were treated at Sutton, near Bywong, for a yield of 30 oz. 7 dwts. per ton, and 5 tons taken from the drives yielded $1\frac{1}{2}$ oz. per ton. An assay of a fair sample of the $4\frac{1}{2}$ tons of tailings resulting from the crushing of the first parcel of stone gave a return of 7 oz. 16 dwts. 19 grs. of gold per ton.

Without making any allowance for the loss of gold, "float" or other, incurred in the operation, the original contents of the ore as it went to the battery could not have been less than 34 oz. of gold to the ton.

The gold seems to be in such a fine state of division that, although the tailings assayed as above, it was found impossible with the dish to obtain a prospect from them until the particles had been further reduced in size.

There are about 20 tons of ore at grass, of which 8 tons are expected to yield 7 oz., and the remainder from $\frac{1}{2}$ to 1 oz. of gold per ton.

The richest stone has been obtained from the western wall of the deposit, and in the vicinity of the bottom of the shaft.

General Remarks.

In the case of both the prospectors' (Remington and Jordan's) and Crocker and Butts' claims, the gold-bearing material does not occur as an ordinary quartz reef; but in both cases it appears to consist of a zone of crushed "country" which has become impregnated by the passage through it of gold-bearing solutions.

The very fine state of division of the gold in the material treated from these claims makes it highly probable that when the water-level is reached pyrites will appear, and will be found to carry a large proportion of the gold.

So little developmental work has been done, that it would be extremely hazardous to express an opinion as to the probable extent, lateral or vertical, which these impregnated zones will be found to attain.

There is apparently no connection between the deposits on the two above-described claims; and although they are very similar in character, and are probably of similar and perhaps synchronous origin, they would seem to mark the sites of independent vents for the former passage of the gold-bearing solutions.

The deposit in the Prospectors' Claim has not been traced laterally for any distance from the 130 feet shaft, even within their own ground; while in Crocker and Butts' Claim the deposit, which is more than $\frac{1}{4}$ of a mile to the south of that in the prospectors', had run out in the north end of the mine, not more than 20 feet from the shaft, to a thin vein of quartz carrying a little gold, and was apparently cut out by a band of quartzite in the face of the S. drive, 20 feet from the shaft. On further development it may, of course, be found to pass through the quartzite, or to have been faulted against it.

Outside these two areas nothing of any value has as yet been found; in one or two cases only a little gold has been detected in the rubble or in narrow leaders. Ten samples, however, taken from likely-looking outcrops in the vicinity of the two rich mines were assayed in the departmental laboratory, with the result that neither gold nor silver was found in any of them.

Goda Creek Gold-field.

The auriferous deposits, which are situated on portion 180, parish of Jeir, county Murray, distant about 14 miles S.E. of Yass, and $\frac{3}{4}$ of a mile E. of the Queanbeyan Road, have already been reported on by Mr. Geological Surveyor Jaquet (*vide* Annual Report of Dept. Mines, 1896, p. 138); but as twelve months have elapsed since his examination, the following particulars, brought to light in the development of the mine during that interval, may be of interest.

The

The first indication of the existence of gold in the vicinity was obtained by Mr. Wilson, who washed a few dishes of material removed in the digging of a small water-hole, about 60 yards to the west of the spot where the outcrop was afterwards found, from which good prospects of gold were obtained. Later, in about July, 1896, Mr. Jordan followed up the discovery made by Mr. Wilson, by "loaming" (testing the surface material, soil, and "rubble" by washing), and finally succeeded in tracing the gold to its source.

No prominent outcrop marked the position of the deposit, for directly over it, where a shaft was afterwards sunk, the soil and subsoil were 3 feet deep, the lower 12 inches of which yielded as much as 1 to $1\frac{1}{2}$ dwt. of gold to the dish.

A prospecting protection area was applied for by Messrs. Jordan and O'Rourke; and later, in about March, 1897, a syndicate, consisting of the above and Messrs. Buckmaster and W. B. Anderson, and known as the Gooda Creek Prospecting Company, obtained a lease of 17 acres from the owner of the land.

Partly surrounding the Gooda Creek Prospecting Company's ground on the west, north, and east sides is the lease of 20 acres held by the Yass Syndicate. They have been at work over twelve months, but up to the time of my visit had found nothing. Work has been carried on within a few feet of the west boundary of the Gooda Creek Prospecting Company's lease, including the sinking of four shafts, ranging from 15 to 71 feet in depth.

On the south-east side of the Gooda Creek Prospecting Company Mr. W. Ratchford has taken up an area of about 6 acres, which was held previously by another party, but abandoned after some trenching on the surface had been done. No work, I believe, has yet been done by the present holder of the land.

Eleven acres were held by O'Rourke and party on portion 187. This was taken up in August, 1897, and abandoned in October of the same year, after a shaft 20 feet in depth had been sunk on a small vein carrying auriferous quartz, and averaging 3 inches in thickness. Good prospects were obtained from this small reef near the surface, but at the bottom of the shaft the gold disappeared, the reef consisting of ferruginous quartz, with no gold or copper. A little trenching was also done on this ground.

Mr. T. Glasscock holds a portion of the road between portions 187 and 180, but no work has yet been done on it.

Gooda Creek Prospecting Company.

The gold-bearing deposits at Gooda Creek consist essentially of thin irregular veins of copper and iron pyrites rich in gold, and filling narrow cracks in the quartz felsite, which forms the prevailing rock in this neighbourhood.

These veins of ore, which are exceedingly rich in gold, do not comprise the whole of the gold-bearing material, for the country, the quartz-felsite, sometimes on only one side of the crack, but usually on both sides, has been impregnated to varying distances into its substance, in all probability by the ascending mineral-bearing solutions, which at the same time deposited the ore in the cracks themselves.

These mineralised portions of the country are, as one might expect, poorer than the solid ore in the veins; but, especially in the upper portions of the deposits, where, owing to the rapid decomposition of the pyritous material in them, and consequent disintegration of such impregnated country, separation of them from the mass of the quartz-felsite becomes easy, they are of sufficient value to save, as they carry from 2 to 3 oz. of gold per ton.

Sketch Plan, showing Workings on the Yass Syndicate and Gooda Creek Prospecting Company's Leases.

The existence of several more or less parallel veins has been proved by the present workings, as indicated on the accompanying plan.

The veins strike between N. 60° W., and N. 30° W., and underlie south-westerly at angles varying from 85 to about 65.

The

The accompanying sketch sections represent the structure of the deposits as seen in some of the shafts. In No. 1 shaft, which is 13 feet in depth, there is a small vein 2 inches in width accompanied on its hanging wall side by 4 inches of impregnated "country," which, in addition to the 2 inches of vein material, is being saved for treatment.

Sketch Sections of the Deposit as seen in Shafts Nos. 1, 2, and 3.

In No. 2 shaft, 20 feet in depth, there are two thin veins about 3 inches thick, carrying 10 oz. of gold per ton, and enclosing a foot of impregnated "country," which gives fair prospects. These were followed down, and found to unite near the bottom of the shaft into a vein 8 or 9 inches in width, which has yielded good ore.

In No. 3 shaft, 80 feet in depth, where most work has been done, some very good patches of ore have been obtained. The solid body of ore varied from 1 inch or less up to 15 inches in width, the widest portion occurring about 20 feet from the surface. At the surface, the vein was concealed by 3 feet of soil and subsoil, from the lower portions of which very good prospects were obtained by the dish.

The upper portions of the ore in the veins have been changed by the action of meteoric waters, copper carbonates, and oxide being produced, and a good deal of fine gold set free. A small quantity of black mineral, chiefly black oxide of copper, taken from the vein about 12 feet from the surface, and washed in my presence, gave an excellent prospect of very fine gold.

The general underlay of the vein in this shaft is about 65° to S.W. The "country" on both sides of the vein has been impregnated by gold-bearing copper pyrites, the decomposition of which in the upper part of the mine has accelerated the disintegration of the quartz-felsite.

Now that the shaft, however, has about reached the limit to which surface action has extended, the impregnated "country" presents an appearance not dissimilar to the unimpregnated "country," and great difficulty is being encountered in following down the vein, which difficulty, it may be expected, will not decrease as the mine increases in depth, especially where the vein pinches.

Small cross-veins occur in several places, but these have proved non-auriferous.

The ore, fortunately, is rich in gold, otherwise it would have been found impossible to work such narrow veins. Experience shows that the richest ore occurs in the upper portion of the mine, a phenomenon due, no doubt, to the chemical action of surface water; below the water level it may be expected that the value will be found to be lower, but more uniform.

Since the commencement of operations at Gooda Creek, eight parcels of ore have been despatched from this mine, of which number the former half went to Clyde and the latter to Dapto. The returns obtained from each are given; a glance at these will show the justification for the above statement as to the greater value of the ore in the upper portions of the mine:—

Date	Quantity	Destination	Value	oz. gold per ton
October, 1896.	2 tons	sent to Clyde Works	22	11
" 1896.	6 "	" " "	11	" "
January, 1897.	10 "	" " "	10½	" "
" 1897.	5 "	" " "	5½	" "
March, 1897.	9 "	sent to Dapto Works	5½	" "
May, 1897.	21 "	" " "	3½	" "
June, 1897.	6 "	" " "	4½	" "
" 1897.	8 "	" " "	3	" "

Thus, the 67 tons of ore sent away for treatment contained in the aggregate 412 oz. of gold, or an average of more than 6 oz. per ton.

In addition to the above, 10 tons of ore were bagged at the mine, and awaiting treatment.

It may be pointed out that the prospects at Gooda Creek are very encouraging, but as greater depths are reached, and where the veins pinch, it will not be an easy matter to follow them. Moreover, the expenses incurred in sinking in the hard country will be very heavy.

My thanks are due to Mr. James Buckmaster, who very kindly conducted me over the workings, and gave me much information.

The Government Geologist.

I have, &c.,
J. ALEX. WATT,
Geological Surveyor.

Sir,

31 December, 1897.

I have the honor to present my Progress Report for the past year.

The removal of the offices of the Branch at the close of 1896 to the Lands building, while conducing much to increased efficiency of work and economy of time, has led to a decided falling off in the numbers of persons calling for information. It may be partly to this reason that the number of samples left for examination has not reached the record put up in 1896. Of these, 5,131 have been sent to the laboratory to be assayed for one or more metals—about the same number as in 1895. It has, in consequence, been possible to push on vigorously with the museum work, and after five years' labour, the registration and arrangement of the collections under my care is practically completed. The whole has been arranged and labelled on a plan that has met with great success, and has largely added to the usefulness of the museum. The preparation of a popular handbook has already been commenced. The completion of so much dead work should enable a forward policy to be pursued in the near future, but as the museum has been dealt with at length in a special report (*Appendix 26*), no further reference to this is now necessary.

Twenty-two collections of ores, &c., were prepared during the year for various institutions, and will be found detailed in an Appendix.

The number of letters written during the year was about 4,000.

The museum has lately been opened on Saturday afternoons and public holidays with a result that has been on the whole most satisfactory; indeed, the interest taken in the collections by visitors, including the Federal Convention Delegates, and the opinions expressed, have been most gratifying.

Early in the year two boxes containing small Australian diamonds were stolen by some one in possession of a duplicate key. The appointment of G. Baker as day caretaker has enabled arrangements to be made which will, it is hoped, render such an occurrence impossible in the future.

A special collection of typical minerals, rocks, and fossils has been prepared for the use of students, and has been highly appreciated. The minerals illustrate Rutley's text-book, and the rocks and fossils are those referred to in general treatises on geology. On application *bonâ fide* students are allowed to handle the specimens freely. It is to be hoped that the new ground thus broken may be further worked, and the Mining museum made an active centre of educational work.

Among the additions made to the collections during the year may be noted the two Mungindi meteorites procured by the untiring efforts of Mr. E. C. Whittell, and the collection of marbles from Bathurst, Molong, and other districts, presented by the Government Architect. The Mungindi meteorites together originally weighed about 1 cwt. They have been cut by Professor Ward, of Rochester, U.S.A., and now form an attractive exhibit in a special case. The marbles have been repolished by Mr. Gilding, and are mounted on the south wall of the museum.

Mr. Edgar Hall, of Rivertree, presented, through Mr. Jaquet, a very fine specimen of pale green fluorite, associated with native copper, from Bald Nob, Armidale.

During the year I have examined more than 300 thin sections of rocks. The petrographical work has been much facilitated by the substitution of a small diamond-cutting lathe in place of the emery wheel formerly in use. The determinations are far too numerous to be detailed here. Two special reports were made on rocks collected by the Government Geologist from Gunnedah District and West Australia respectively. The results obtained from the specimens of country rocks available from the Kalgoorlie Gold-field were of an interesting and important character, and it is hoped to pursue this matter further. A series of rocks collected by Mr. Carne from the Snowy River illustrated in a most interesting manner the progressive stages in the crushing of an intrusive granite, it passing into a gneiss. Tuffs were recognised among the andesitic country rocks of the Bushman's Mine, Parkes, and in the Post-office mine, Stuarttown. This is interesting, as indicating that normal volcanic phenomena were manifested here in early Palæozoic. Several of the remarkable obsidian bombs, now well-known as occurring scattered over Australia, were received from Thackaringa, Cobar (?), Tumbarumba, and Uralla Districts. From Uralla several were obtained by the Mining Registrar, Mr. Roman, who kindly supplied an interesting note on their mode of occurrence there. An analysis of one of these was made by Mr. Mingaye, was of considerable interest. It is hoped that some more work may be done on these bombs very shortly. The detection (by Mr. Mingaye) of vanadium in a green clay from the Tomingley Mine, and of a good percentage of strontium in an earthy galena-bearing barytes (locality uncertain), were noteworthy. Crystallised pyromorphite was recognised from the Wallah Wallah Silver Mine, Rye Park, and a quantity obtained by the courtesy of Mr. T. S. Huntley and the manager.

Many inquiries have been made about tellurides, but no further discoveries are known. Tellurium, in combination with bismuth, has been found at the following localities:—Captain's Flat; Moor Creek, Tamworth; Saw-pit Gully, Tamworth; Kentucky; Slippery Creek, Tarana; and (in alluvial) near Glen Innes. An interesting letter dealing with the Undercliff deposits of plumbago was received from the Springfield Facing Co., Chicago, in which they say: "We are positive it would have made a good facing and could be used to advantage wherever German lead is used in the manufacture of foundry facing. It is true that it would probably be impossible to ship it to this country at the price.

On any work in the foundry where the facing is used wet, such as dry sand or cores, it would be a very good article indeed." But few remarks are necessary upon the results of the assays. Some of the more important are tabulated in Appendix 25. The whole of these were made in the departmental chemical laboratory at Clyde, under the direction of Mr. Mingaye.

Gold.—Concentrates and tailings are now never assayed, except by direction of the Minister on special reason being shown, and on no account whatever are samples assayed in which an appreciable quantity of free gold is visible. Very many of the samples were from districts in which auriferous reefs are known to occur, and their publication would serve no useful purpose. In the Appendix are tabulated some results from localities not so well known or that are otherwise interesting. In all cases the assay results are given in round numbers.

Silver.—Numerous rich silver ores have again been received from the Rockvale and Armidale Districts. A gossan (1327) from the former place assayed 460 oz. of silver. Generally speaking these samples consisted of quartz with arsenical pyrites and ruby silver ore disseminated through it. Sample 1380 was peculiar in consisting of an iron-stained calcareous rock apparently of granitic origin. It contained pyrargyrite and assayed—gold, 4 dwt.; silver, 421 oz. Samples 157 and 1382 contained 13 dwt. and 6 dwt. of gold respectively. From Rocky Creek, Swanvale, pyritous ores assaying up to 90 oz

of

of silver, and numerous samples of mixed sulphide ore from Drake assaying up to 100 or more oz., were received. Prospecting in the Burragorang District has been continued; samples of quartz, ironstone, and galena assaying up to 250 oz. and cerussite nearly 500 oz. to the ton. The prospecting being carried on in the Kanimbla Valley District has brought to light some rich ores of both gold and silver. The silver occurrence is noteworthy, inasmuch as it appears to be sometimes contained by coarsely-crystallized galena, a somewhat unusual thing.

Copper.—The feature of the present year's work has undoubtedly been the activity in prospecting for copper, consequent on the improved condition of that metal in the market. Very many samples have been examined and numerous assays made. These latter are perhaps more misleading than most, inasmuch as picked samples of copper ore are so readily obtained in many mining districts, and this fact must always be borne in mind when noting the results of assays of copper ores.

Many samples came to hand from the important find of massive copper-pyrites and bornite from Bundarra, in the Inverell District. As this field is referred to in detail in a report by Mr. J. B. Jaquet, it is sufficient to state that a number of samples of ironstone not in the least resembling copper ore have come to hand from time to time. The Bundarra ore is somewhat misleading in appearance. For instance, an assay of 25 per cent. being obtained once when one considerably higher had been anticipated. Judging from the samples, some important finds have been made in the Cooma District. Assay results will be found detailed in the Appendix. Some of these ores, also, are very misleading, their copper (and lead) contents being sometimes very much higher than one would expect from the ferruginous appearance of the stone. While the silver contents of these Cooma ores may amount to 30 oz., gold is rarely present in appreciable quantity.

Good results have been obtained from ores from Bunnamagoo, near Rockley: a copper gossan (2375) containing 32 per cent. of metal; copper pyrites (2370), 19 per cent.; and a siliceous carbonate ore (2805), 33 per cent. Small quantities of silver were sometimes detected. Details of some of the more important results will be found in the appendix.

Wolfram and Scheelite.—No samples of scheelite have been received, and but few of wolfram. A peculiar specimen of the latter, containing 62 per cent. of tungstic trioxide, came from near Purnamoota.

Antimony.—Very few specimens of antimony ore were received, and only two or three of these appeared to be of any importance. From Ulmarra, Clarence River, an interesting specimen showed acicular radiating crystals of antimony oxide with pulverulent yellow material, and contained 63 per cent. of antimony, 2 dwt. gold, 1½ oz. silver.

Cobalt.—Cobalt has been detected in a number of ores, but none appear likely to be of any importance except that from Port Macquarie. This latter is dealt with in a report by Mr. Jaquet, in which will be found complete analyses both of the new discovery and of the ore from the old workings.

Manganese.—Many samples of black oxide were examined, but very few were worth assaying.

Iron.—Partial analyses were made of further discoveries of granular magnetic iron ore from the Raymond Terrace District. These ores, which are of importance from the small amount of titaniferous iron present, have been described by Mr. Jaquet.

Ochre.—A few ochres were examined, but only one or two gave favourable results. A hard, yellow material (571) from Dubbo contained 65 per cent. of ferric oxide and only 5.33 per cent. of grit. An ochre (2,022) from the Wingello District contained 68 per cent. of ferric oxide.

Limestone.—The newly-established smelting-works have occasioned a demand for limestone flux. Numerous samples of calcareous tuffs (volcanic rocks) were brought from the Illawarra District. These were of no value in themselves, nor can they be regarded as being in any way indications of limestone. A crystalline limestone (1459) from Gloucester was found to contain 89 per cent. of carbonate of lime.

Refractory material.—Several samples of clay and disintegrating granite (2262, 2263) from Goulburn District, Parish Towrang, were analysed and tested. Mr. Mingaye reported that the test bricks stood the tests well, showing no signs of fusion. From the analyses which are given in Appendix 26, it will be seen that the alkali percentage is much higher than it should be theoretically. A white clay (2344) from the Lower Clarence River was practically tested, with the result that the bricks showed no sign of fusion.

Mr. Harper has this year been wholly occupied at the Head Office in dealing with the assay and similar work. His assistance in examining the samples is of the greatest value. He also assists the Librarian with his routine work. Mr. Morrison has prepared the collections of minerals for public schools and other institutions, attended to the registration of specimens, and given information to visitors at the museum. Mr. Dobson has rendered general assistance, more particularly in the rearrangement of the museum collections.

My thanks are especially due to my colleague, Mr. W. S. Dun, the Palæontologist and Librarian, for the trouble he has taken in arranging the fossil collection. Much interest has been taken in the mounting, under Mr. Dun's superintendence, of the limb bones of *Diprotodon* in an erect position, a much clearer idea being thus conveyed of the size of the animal.

During the year I have contributed several papers to the Geological Survey Records, one, written in conjunction with Mr. Dun, dealing at some length with the diatomaceous earth deposits of New South Wales.

As Appendices will be found the following:—

- Report on the country rock of the Kalgoorlie Gold-field, Western Australia.
- List of donations to the Mining museum.
- List of institutions to which collections have been sent.
- A tabulated statement of the more important analytical results and assays.
- Special report on the Mining and Geological Museum.

I have, &c.,

The Government Geologist.

GEORGE W. CARD.

APPENDIX 23.

Report on some West Australian Rocks.

Sir,

I have the honor to report as follows regarding the rocks collected by yourself from certain West Australian Gold-fields:—The work has involved the examination of many thin sections, and the results are of considerable importance, particularly so in the case of the Kalgoorlie rocks. These latter form a group by themselves, and I propose at present to deal with them as such, postponing their detailed examination till later. The microscope slides have been expeditiously prepared by Mr. C. Murton, and, in addition to other assistance, the specific gravities of the whole series have been determined by Mr. M. Morrison.

I have, &c.,

GEORGE W. CARD,

Curator.

The Government Geologist.

Kalgoorlie.

In addition to the specimens collected by the Government Geologist, I have had the advantage of a small series, kindly presented by Mr. W. Frecheville, A.R.S.M., F.G.S., and further, of a copy of analyses made for that gentleman by Dr. Helms of ore and country rock respectively.

The evidence obtained by examining and comparing as many slides as possible shows that the country rocks from the different mines on the field, differing as they do in colour, structure, &c., are one and the same rock; and further, that the lodestuff itself is nothing but an extremely altered form of the same.

The country rock is generally soft, of a green colour, and has a schistose structure, which sometimes occasions a considerable amount of fissility. The divisional planes exhibit a silvery sheen, due to the development of secondary mica.

That this rock is of igneous origin is evident from its mineralogical constitution and structure. Quartz, feldspar, ilmenite, and magnetite are among the original constituents, and that characteristically igneous structure, the micro-pegmatitic, so common among the acid eruptives, is sometimes well shown (*e.g.*, the Australia and Ivanhoe country rocks). The green colouration is due to chlorite, which acts as a pigment when finely disseminated as it generally is. When chlorite is absent the rock is generally lighter in colour. Carbonates of lime and magnesia are abundantly present, occurring either as veins or disseminated through the rock mass. Ilmenite, with the characteristic leucoxene alteration product beautifully shown, is commonly present, more especially in the country rock but also in the lodestuff. Magnetite in small crystals readily picked out from the powdered rock is fairly common, being frequently intimately associated with the ilmenite. Pyrites is abundant in the lodestuff, occurring in the form of minute crystals disseminated through it, or arranged in strings. Chlorite is generally present, usually in a fine, scaly condition. It is generally scattered through the rock, but occasionally appears to form pseudomorphous replacements. Primary quartz is seldom, if ever, entirely absent. In the country rock it is abundant, and occurs in larger or smaller pieces, always giving more or less evidence of the stresses undergone. Secondary quartz is common in the lodestuff. Feldspar is seldom present in recognisable crystals, although distinctly so in the country rock of the Australia East Lease (140-foot level). Its original presence can, however, be frequently inferred.

The specimens from the Boulder Main Reef may be specifically referred to for the purpose of further exemplifying the nature of the rock. The hanging-wall rock contains quartz in distinct areas and fairly large fragments, ilmenite, magnetite, and chlorite in more or less well-defined areas (apparently pseudomorphously replacing feldspar). The foot-wall rock is very similar. Between the true hanging-wall rock and the lode is a breccia-like material (8448) which has essentially the same composition, but the chlorite is more diffused while at the same time being almost absent from certain areas. Carbonates are abundant, especially in the areas just referred to as being poor in chlorite. It would appear as if the breccia-like appearance were delusive, and were due to the unequal distribution of the chlorite. In immediate juxtaposition with the lode on the hanging-wall side is a material traversed by veins of carbonates and of secondary quartz. It is of a much more streaky character, and is, to some extent, made up of lenticular areas. Much pyrites is present. The lodestuff from the Great Boulder Mine, which may be referred to here by way of comparison, is highly pyritous and calcareous and contains chlorite; quartz is present in smaller grains than in the country rocks. The only rock specimen available that differs slightly from the rest of the series is that from Lake View and Boulder Junction. This does not show quartz, and has a crypto-crystalline ground mass in which the outlines of dimly polarising feldspars may be seen. This may be only a local variation. The lodestuff (8471) from the Ivanhoe may be described as indicating the operations that have gone on. Very much pyrites is present in small crystals scattered through the mass. A little ilmenite (with leucoxene) is present. Veins of carbonates occur which traverse crystals of primary quartz without interrupting the optical continuity of the several portions. The carbonate-veins are intersected and partially replaced by secondary quartz. The whole is traversed by a line of shearing which shifts the secondary quartz-veins; consequently it is of later date than these. Of the original rock there is little identifiable left beyond areas of quartz with indefinable boundaries.

Conclusions.—The specimens examined comprise lodestuff and country rocks in the immediate vicinity of the lodes from the following mines:—

Boulder Perseverance.	Lake View Consols.
Great Boulder.	Australia.
Boulder Junction.	Australia East Lease.
Boulder Main Reef.	Kalgurli.
Lake View.	

1. The country rock on the hanging and footwall sides of the deposit is one and the same.
2. The country rock is of igneous origin and belongs to the acid group; in all probability it is a quartz-feldspar porphyry, but may approximate to a granite in places.
3. The country rock has undergone great alteration, both chemical and mechanical. It would appear probable that deep-seated alteration occurred prior to the lateral crushing that imparted to the rock its fissility.

fissility and schistose structure. Subsequently, solutions containing metallic salts, silica, carbonates of lime and magnesia, and possibly alumina, permeated the rocks, depositing their contents in the spaces resulting from the crushing just referred to and by pseudomorphous replacement.

4. The "lodes" represent belts along which the crushing effects have been most severe, and the deposition of secondary material more abundant. They are, in fact, more highly altered portions of the country rock.

5. The terms "slate," "talc-schist," "schist," etc., that one sometimes sees applied, would appear to be unwarranted and indeed absolutely incorrect. "Talcose" may, perhaps, be admissible as an adjective, but there is apparently no reason for suspecting the presence of talc at all.

GEORGE W. CARD.

APPENDIX 24.

INSTITUTIONS and Individuals to whom Collections of Minerals have been sent during the year:—

Balmain—	Pyrmont—Superior Public School.
Canowindra—School of Arts.	*San Francisco—State Museum.
*Emmaville—O'Donnell, M. J.	Strathfield—Dominican Nuns.
* " " Chandler, —	Sydney—Furber, T. F.
*Freiburg (Saxony)—Imperial Bergakademie.	" " St. Joseph's College.
Helensburgh—Sellers, H. E. O.	" " Marist Brothers' College.
Hillgrove—Public School.	" " Kirkpatrick, F.
London—Imperial Institute.	Tumut—School of Arts.
Maitland—Dominican Nuns.	Victoria—Green Wills School of Mines.
Menangle—School of Arts.	Tacoma (U.S.A.)—Hewitt, H.
North Sydney—Church of England Grammar School.	Yass—The Warden.

* Those marked with an asterisk were in exchange.

APPENDIX 25.

Gold.

25. Bonanza Mine, 6 miles west of Uralla—Arsenical pyrites	Gold, 1½ oz.
40. Bongongolong—Quartz—Felspar porphyry partially silicified and traversed by veins of pyritous white quartz	" 7 dwt.
398. Raglan (Bathurst)—Quartz with iron and arsenical pyrites	" 16½ oz.
NOTE.—Other assays were subsequently made of this stone, with very much lower results.	
430. Cugong—Iron-stained quartz	" 23½ "
466. Byng—Copper-stained quartz	" 5 "
509. Forty miles west of Eden—Rotten granite with quartz	" 1½ "
513. Corinda Creek, Woolgoolga—Quartz, with carbonaceous clay	" 5½ "
531. Mount Boppy—Siliceous ironstone	" 4 " Silver, 15 oz.
533. The Peak—Siliceous slate	" 2 "
2277. The Peak, Cobar—Ferruginous quartz	" 17 dwt.
549. Molong District—Light-coloured garnet rock	" 1½ oz.
932. Green Swamp, Mudgee—Quartz and fahlore	" 39 "
1076. Wiseman's Creek—Cellular quartz	" 13¾ " " 11 "
1091. Bowman River—Banded quartz	" 3 "
1163. Harden—Clay slate	" 5½ "
1210. Red Range, Glen Innes—Sulphide of bismuth (bismuth, 27 per cent.)	" 1½ " " 10 "
1376. Cunnigar—White quartz, heavily charged with sulphides	" 4¾ " "
1496. Salvation Hill, Gulgong—Quartz highly charged with arsenical and iron pyrites (by amalgamation gold, 10½ dwt.)	" 2 "
1525. Werris Creek—Quartz and lodestuff	" 4½ "
1720. West Wyalong—Jasperoid quartz, with a crust of sintery material	" 57 " Silver, 9 oz.
1753. Mayday Mine, Gilgunnia—Copper and iron stained slate passing into ironstone (lead, 3 per cent.; copper, 4 per cent.)	" 1 " " 86 "
2192. Burragate (Naden's Claim, depth, 65 ft.)—Ferruginous siliceous material	" 1½ "
2194. " (Key's Claim, depth, 12 ft.)—Ferruginous quartz	" 18 "
2231. Forest Reefs, Ballarat Company's No. 5 Bore—Crushed material	" 2 oz. 12 dwt. 23 gr.
2232. " " " Pebbly wash	" 12 dwt. 9 grs.
2233. " " " Wash	" 3 " 14 "
2236. Bulladelah—Quartz and calcite with finely disseminated pyrites	" 3½ oz.
2286. Girilambone—Quartz	" 4 "
2420. Pye's Creek—Crushed quartz (copper, 9.6 per cent.; bismuth, 2½ per cent.)	" 2½ " Silver, 21 oz.
2459. Carcoar—Pyritous decomposed material	" 42 "
2527. Wyndham—Pyritous stone	" 1½ "
(Concentrates, 6.3 per cent., assaying	" 18 " " 10 ")
2564. Clifton Three Hills, Rye Park—Glassy quartz with iron and copper pyrites	" 16 "
2747. Bungonia, 7 miles east of—Cellular quartz	" 24½ "
2837. Restdown—Quartz	" 7½ " " 2 "
3151. Binalong (Kangaroo Reef)—Iron-stained quartz with galena and pyrites	" 1½ "
3156. Sofala (Wood's Reef)—Decomposed felspathic rock	" 17½ dwt.
3411. Towamba—Iron-stained quartz	" 5½ oz. " 2½ "
3422. Jingera (Robertson's)—Pyritous quartz	" 14½ " " 17 "
3672-79. Cobar District—Quartz	" from 3 dwt. up to 2½ oz.
3807. Mount Werong—Quartz with galena	" 18 oz. Silver, 7 oz.
4010. Oakey Creek, Capertee—Quartz with coarsely crystallised galena	" 5 " " 4½ "
4198. Florida (Cobar)—Slate, ferruginous quartz, &c.	" 19½ " " 6 "
4298. Eurongilly—Quartz with a little copper pyrites	" 3 "
4417. Tooloom—Quartz with greenish clay	" 2½ "
4521. Overflow—Ironstone and quartz	" 2 "
4834. Timbilica—Ferruginous cavernous quartz	" 9½ "
4875. Rocky Hall, Monaro—Iron-stained cellular quartz	" 2½ "
4890. Dry Creek—Iron-stained quartz and calcite	" 21½ "
4919. Forest Reefs—Siliceous pyrites ore (copper, 1.6 per cent.)	" 64½ " " 17½ "
4956. Palmer's Oakey—Quartz, calcite, &c.	" 13½ "
5025. Mount Dawson—Pyritous quartz	" 12½ "
5046. Moonan Brook, Collett's Reef—Quartz and calcite with carbonaceous partings and a little pyrites	" 34½ "
4983-90. Frogmore—Schists	" a few dwt. up to 10 oz.

2235.	Little Hartley—Ironstone gossan with a little galena	Silver, 41 oz.
3844.	Hartley—Ironstone	Gold, 11 dwt.
3845.	"	" 3 oz.
3847.	" Decomposed stock	" 16 dwt.
3848.	" Crushed quartz	" 6 oz. Silver, 3 cz.

3960.	" Ferruginous quartz	" 1 oz 17 dwt. Silver, 29 oz.
3961.	" Ferruginous pyritous quartz	" 2 1/2 oz. Silver, 4 oz.
4622.	" Crushed pyritous quartz	" 7 " " 6 1/2 "
3216.	Duddevarra—Somewhat pyritous quartz	" 15 dwt. " 4 "
3217.	" Coarsely crystallised galena with quartz (lead, 41 per cent.)	" 11 " " "
3265.	" Ironstone	" 6 1/2 " " 6S 1/2 "
		" 1 oz.

Silver.

4544.	Hampton—Earthy copper-stained carbonate of lead	Silver, 63 oz.
85.	Bee Mountain, Cobar District—Iron stained slate	Gold, 17 dwt. Silver, 72 oz.
110.	Near Singleton—Quartz with pyrites and blende (very small sample)	" 2 1/2 oz. " 369 "
162.	Dorah Creek—Quartz with ochreous material	Silver, 143 oz.
532.	Near Mount Boppy—Slate	" 94 "
534.	The Peak—Slate	" 70 "
801.	Rigby's Reef, Major's Creek—Pyrites, fahlerz, and ironstone (copper, 8 per cent)	" 45 "
855.	Wollomombi—White quartz with arsenical pyrites	" 1,327 "
994.	Quealy's Mine, Rivertree—Mixed sulphide ore	" 73 "
1041.	Rivertree—Ferruginous cellular quartz	" 238 "
1050.	Near Tingha—Ferruginous copper stained granitic rock (copper, 16 per cent.)	" 65 "
1332.	Tinda Tank—Galena	" 39 "
1568.	Piccaninny Claim, Yalgogrim—Galena and cerussite (lead, 34 1/2 per cent.)	" 57 " Gold, 6 oz.
1934.	Restdown, Nyngan—Massive cerussite (lead, 39 1/2 per cent)	" 67 "
2014.	Near Gilgunnia—Ferruginous pyritous material	" 58 "
2015.	" Slate, containing green carbonate of copper (copper, 11 per cent.)	" 76 "
2050.	Mount Sperraby, Bolivia—Galena with iron and copper pyrites	" 193 "
2553.	Near Mudgee—Galena and cerussite	" 80 "
3163.	Cooma—See Copper.	
3181.	Carcoar—See Copper.	
3371.	Wallah Wallah Mine, Rye Park—Galena with pyromorphite (lead, 44 per cent)	" 58 1/2 "
3424.	Black Range, Wolumla—Ironstone	" 116 "
3457.	Cooma—Carbonate of lead (lead, 39 1/2 per cent.; copper, 1 per cent.)	" 57 1/2 "
4077.	Twenty miles north-west of Tingha—Arsenical pyrites	" 351 "
4334.	Waverley Mine, Murrurundi—Quartz	" 96 1/2 "
4387.	Mount Bullen, Queanbeyan—Zinc blende	" 93 " Gold, 6 1/2 dwt.
4709.	Tibuster Creek—Blende and galena	" 173 " " 10 "
4780.	Boro—Carbonate of lead (lead, 55 per cent.)	" 48 1/2 "
5111.	Upper Burragorang—Galena with quartz	" 115 "
5112.	" Cerussite with galena and quartz	" 557 "

Copper.

4446.	Cooma, Bushy Hill—Oxide, sulphide, and carbonate	Metallic copper, 30 per cent.
15.	" Middle Flat—Copper gossan	" 20 " Silver, 7 1/2 oz.
225.	" 5 miles north of—Copper gossan	" 35 "
2691.	" 5 " from—	" 42 " " 28 "
2695.	" 5 " " Galena and copper pyrites (siliceous ore)	" 18 " " 26 "
2697.	" 5 " " Copper glance	" 41 " " 28 "
3633.	" Dartmoor—Copper lead gossan (lead, 12 per cent.)	" 24 " " 51 "
1458.	Jindabyne—Copper pyrites	" 49 "
4407.	Adaminaby—Copper pyrites in quartz	" 24 "
4216.	Barraba—Green carbonate ore	" 44 " " 11 "
1245.	Upper Bingera—Copper pyrites	" 65 "
55.	Tarago—Siliceous copper gossan	" 34 " " 21 "
142.	Shooter's Hill—Siliceous oxide and carbonate	" 19 "
304.	Near Kempfield (Trunkey)—Copper pyrites and carbonate (siliceous)	" 27 " " 4 "
594.	Gloucester (Hook's Reef)—Copper gossan	" 11 " " 10 "
596.	Scone (Watson's Reef)—	" 9 " " 8 "
598.	Walcha (Jones' Reef)—	" 11 " " 13 "
671.	Quedong—Galena, quartz, calcite, barytes, and copper pyrites	" 21 "
688.	Abercrombie—Siliceous carbonate ore (gold, 2 dwt)	" 15 "
976.	1 1/2 mile from Luc Station—Ferruginous quartz and slate with copper carbonate	" 24 " " 9 "
1187.	Jacqua Creek, Shoalhaven—Copper pyrites (siliceous)	" 12 "
1189.	10 miles from Marulan—Copper pyrites and blende	" 23 "
1193.	4 1/2 miles west of Capertee—Copper pyrites with quartz, calcite, &c.	" 19 "
1244.	Bombole, Tumut—Ferruginous carbonate ore	" 45 "
1442.	Nangerbone Run, Nymagee—Copper gossan	" 17 " " 7 "
1493.	Cobborah—Siliceous carbonate ore (gold, 2 oz. 16 dwt.)	" 20 " " 8 "
1521.	Armidale—Copper pyrites and carbonate ore (siliceous and calcareous)	" 14 " " 11 "
1534.	Fourteen miles east of Black Range (Overflow District)—Copper pyrites and carbonate (siliceous)	" 42 "
1763.	Yulgilbar—Copper gossan	" 16 " " 15 "
1864.	Davisville—Copper pyrites	" 26 "
1886.	Binalong—Copper gossan in slate	" 12 "
1917.	Stuart Town—Ferruginous calcareous ore	" 11 "
1993.	Grafton—Siliceous brown limestone containing native copper and cuprite	" 5 "
2495.	One mile from Carcoar—Copper gossan	" 23 "
2902.	Junea Reefs—Siliceous carbonate ore (gold, 13 dwt.)	" 13 "
2966.	Gundagai—Carbonate ore	" 19 "
3090.	Glanmire—Copper pyrites (siliceous and ferruginous)	" 14 "
3125.	Tuglow—Carbonate and sulphide ore (siliceous)	" 29 " " 11 "
3152.	Mount Werong—Siliceous ore (native, red oxide, &c)	" 18 "
3178.	Grassmere—Carbonate	" 14 " " 25 "
3181.	Carcoar—	" 24 " " 61 "
3247.	Boro—Oxide and carbonate with ferruginous slate (gold, 9 dwt.)	" 32 " " 2 "
3522.	Clefdon (County Bathurst)—Carbonate and sulphide (siliceous)	" 17 "
3618.	Molong—Siliceous copper gossan	" 14 " " 28 "
3640.	Five miles from Adelong—Slate impregnated with carbonate of copper (gold, 2 dwt.)	" 15 "

3742. Gundagai, 10 miles south of—Copper-bearing ironstone (gold, 6 dwt.)	Metallie copper, 11 per cent.
3860. Bredbo—Copper gossan	" " 37 "
4094. Sunny Corner—Cuprite, carbonate, &c.	" " 59 " Silver, 3 oz.
4124. Deepwater—Copper pyrites and carbonate with fluor spar (siliceous).....	" " 18 " " 32 "
4159. South-east from Jervis Bay—Siliceous ore (carbonate, oxide, sulphide)	" " 30 " " "
4177. Lowther—Siliceous ore (carbonate, sulphide)	" " 39 " " 15 "
4307. Frogmore—Carbonate	" " 36 " " 6 "
4355. Mount Werong—Copper glance	" " 51 " " 3 "
4728. Bark Hut, Monaro—Copper pyrites and carbonate (siliceous)	" " 17 " " "
4735. Bucca Creek—Carbonate.....	" " 43 " " 5 "
4747. Swamp Oak—Siliceous ore	" " 23 " " "
4762. Cudjegang—Copper pyrites, &c. (siliceous).....	" " 30 " " 6 "
4804. Glenborne, O'Connell—Crushed carbonate ore	" " 39 " " 3 "
5024. Hillman's Tank, Nymagee—Red oxide and carbonate	" " 24.7 " " "
4960-3. Mountain Run, Rockley—Ironstone, mica schist, &c., with sulphides and carbonates	" " 12-17 "

Tin.

178. Cobar District—Tinstone in quartz	Metallie tin, 22 per cent.
2237-43. " " with greenish clay	" " 18 to 32½ per cent.
1856. Mount Hope District—Siliceous ironstone (silver, 6 oz.)	" " 3 per cent.
1857. " " Quartz, showing tinstone	" " 8½ "
1858. " " Very ferruginous quartz (silver, 6 oz.)	" " 4½ "
2367. Black Mountains, 15 miles east of—Black sand	" " 45½ "
2549. Armidale, near—Black sand	" " 14½ "
3068. Orange, near—Ferruginous copper-stained rock with garnet (silver, 10 oz.)	" " 12 "
3176. Molong—Siliceous magnetic iron ore	" " 0.8 "
3210. " Greenish garnet rock (silver, 3 cz.)	" " 5 "
3270. Port Macquarie—Decomposed rock	" " 19½ "
4770. " 30 miles from—Decomposed granite rock with disseminated tinstone...	" " 17½ "
4610. Smoky Cape, 16 miles from—Lode tin ore	" " 16½ "
3775. Rockvale—Ferruginous stone with crystallised tinstone	" " 23 "

Bismuth.

24. Tent Hill—Decomposed micaceous rock	Metallie bismuth, 3.46
82. Glen Creek, Emmaville—Carbonate and sulphide ore	" " 2.77
1082. " " Arsenical pyrites with clay containing minute crystals of tourmaline	" " 0.96
1210. Red Range, Glen Innes—See Gold	" " 26.85
1606. " " Granitic rock heavily charged with sulphide of bismuth (gold, 17 dwt.)	" " 12.95
3109. Pambula—Traces of bismuth in arsenical pyrites and quartz.	
3280. Yarrow Creek, Red Range—Bright yellow pulverulent material.....	" " 3.67
4059. Dundee—Quartz, wolfram, and carbonate of bismuth	" " 1.42

Antimony.

62. Sulphide and oxide—Barraba, 18 miles north-west of	Metallie antimony, 55 per cent.
413. " Glen Innes District.....	" " 64½ "
485. " Barraba, 17 miles north of—(siliceous)	" " 59½ "
958. " Armidale, 8 miles north-west of	" " 64½ "
2662. " Duval	" " 60 "
4732. " Bucca Creek—(siliceous)	" " 42 "

Cobalt.

540. Burnt Yard Creek—Iron and arsenical pyrites	Metallie cobalt, 1.75 per cent.
566. Fernbank, Shoalhaven River—Ferruginous quartz with wnd	" " 1.31 "
2333. Mount Boppy, Cobar District—Siliceous black oxide of manganese.....	" " 2.23 "
3249. Temora—Siliceous black oxide of manganese	" " 0.53 "

(See also Reports by Mr. Geological-Surveyor Jaquet).

Manganese.

80. Five miles east of Peak Hill—Pyrolusite (silica, 4.3 per cent.; iron, 10 per cent.; phosphoric acid, 0.473 per cent.)	Metallie manganese, 48 per cent.
1660. Tamworth—Black oxide	" " 47½ "
1823. Queanbeyan—Black oxide with ferruginous clay	" " 45 "
3124. Mudgee—Black oxide	" " 41½ "
3372. Bodangora, Wellington—Black oxide (gold, 2 dwt. per ton)	" " 35 "
3472. Barlow's Hill, Mandurama—Calcareous ore, probably carbonate in part	" " 31 "
3791. Flyer's Creek, Burnt Yards—Black oxide	" " 49 "
4385. Ten miles from Moonbi— "	" " 52 "

Iron.

1449. Bog iron ore from Jervis Bay.
3688. Concretionary brown iron ore from Carlo's Gap, near Capertee.

	1449	3688
Moisture at 100° C.	2.41	2.82
Combined water.....	8.65	12.28
Ferric oxide (Fe ₂ O ₃)	59.91 (= 41.94 metallie iron).	53.51 (= 37.59 metallie iron).
Ferrous oxide (FeO).....	nil	0.20
Manganous oxide (MnO).....	trace	trace.
Alumina (Al ₂ O ₃)	3.45	14.06
Silica (SiO ₂)	24.63	16.40
Lime (CaO)	0.29	0.20
Magnesia (MgO)	0.23	0.18
Phosphoric anhydride (P ₂ O ₅)	0.32	0.61
Sulphuric " (SO ₃)	0.47	trace.
	100.36	100.26

1591. Clyde River, somewhat spongy siliceous brown iron ore	Metallic iron, 41·7 per cent.
2675. Parkes, stratified magnetic iron ore	" 45 "
2803. Braidwood, ironstone	" 59 "
2855. Mount Keira, ironstone	" 54 "
3358. Yalwal, ironstone (silica, 18·0 per cent.)	" 43 "
3409. Mount Kembla, brown iron ore	" 40 "
3814. Wingello (Ph. Berrima), siliceous brown iron ore	" 58 "
3878. Tarana (2 miles from), magnetite	" 60 "
4015. Penrose, brown iron ore	" 53 "
4039. Shoalhaven District, brown iron ore	" 46 "

(See also Reports by Mr. Geological Surveyor Jaquet.)

Coal, &c.

	Locality.	Substance.	Hygroscopic moisture.	Volatile hydrocarbons.	Fixed carbon.	Ash.	Sulphur.	Specific gravity.	Calorific power.	Notes.

772—Substance found in the Grotto Cave, Jenolan :—

Water	16·82
Lime (CaO)	22·66
Magnesia (MgO)	0·32
Alumina (Al ₂ O ₃)	0·64
Ferric oxide (Fe ₂ O ₃)	trace.
Potash (K ₂ O)	0·11
Silica (SiO ₂)	37·82
Phosphoric anhydride (P ₂ O ₅)	15·71
Sulphuric anhydride (SO ₃)	5·39
Carbonic anhydride (CO ₂)	0·24
	<hr/>
	99·71

A minute trace of Chlorine; no fluorine.

810—Clay from Riverstone :—

Moisture at 100° C.	2·20
Combined water	7·50
Silica (SiO ₂)	64·20
Alumina (Al ₂ O ₃)	20·18
Ferric oxide (Fe ₂ O ₃)	1·84
Ferrous oxide (FeO)	1·86
Manganous oxide (MnO)	trace.
Lime (CaO)	trace.
Magnesia (MgO)	0·86
Potash (K ₂ O)	1·79
Soda (Na ₂ O)	0·02
	<hr/>
	100·45

1348—Olivine from an olivine basalt, 8 miles from Walcha, towards Swamp Oak :—

Moisture at 100° C.	0·20
Combined water	0·44
Silica (SiO ₂)	45·60
Ferric oxide (Fe ₂ O ₃)	3·18
Ferrous oxide (FeO)	6·49
Nickel and manganese oxides	traces.
Alumina (Al ₂ O ₃)	5·79
Lime (CaO)	3·40
Magnesia (MgO)	34·22
Potash (K ₂ O)	0·42
Soda (Na ₂ O)	0·28
Phosphoric anhydride (P ₂ O ₅)	trace.
	<hr/>
	100·02

A minute trace of a rare element, probably vanadium.

1523—White saccharoid substance (associated with galena) from Gundagai (?) :—

Water	1·50
Silica (SiO ₂)	61·39
Ferric oxide (Fe ₂ O ₃)	0·39
Manganous oxide (MnO)	trace.
Barium sulphate (BaSO ₄)	26·50
Strontium sulphate (SrSO ₄)	9·84
Magnesia (MgO)	0·14
	<hr/>
	99·76

The interesting feature of this analysis is the presence of strontium sulphate.

2132—Epidote from Braidwood :—

Water	0·70
Silica (SiO ₂)	40·70
Alumina (Al ₂ O ₃)	24·13
Ferric oxide (Fe ₂ O ₃)	12·07
Manganous oxide (MnO)	trace.
Lime (CaO)	22·60
Magnesia (MgO)	0·30
	<hr/>
	100·50

3739—Alumina silicate, cyanite (?), from Cooma :—

Water	0·28
Silica (SiO ₂)	44·33
Alumina (Al ₂ O ₃)	53·44
Ferric oxide (Fe ₂ O ₃)	0·54
Manganous oxide (MnO)	trace.
Lime (CaO)	0·44
Magnesia (MgO)	0·03
Potash (K ₂ O)	1·28
Soda (Na ₂ O)	0·23
Phosphoric anhydride (P ₂ O ₅)	0·02
	<hr/>
	100·59

2738—Saline material from near Broken Hill :—

Water	19·20
Lime (CaO)	31·50
Magnesia (MgO)	1·06
Strontia (SrO)	trace.
Silica (SiO ₂)	1·25
Alumina (Al ₂ O ₃)	0·11
Ferric oxide (Fe ₂ O ₃)	0·49
Sodium chloride (NaCl)	2·05
Sulphuric anhydride (SO ₃)	43·46
Carbonic anhydride (CO ₂)	1·15
	<hr/>
	100·27

3443—Obsidian bomb from Uralla:—		380—Light grey fluffy substance from Jenolan Caves:—			
Silica (SiO ₂)	64.68	Moisture and combined water	2.48	2.88	} Soluble in acid.
Ferric oxide (Fe ₂ O ₃)	6.57	Carbonate of lime	72.57	76.03	
Ferrous oxide (FeO)	1.01	Carbonate of magnesia	5.28	6.12	
Manganous oxide (MnO)	0.20	Alumina and ferric oxide	0.58	1.46	
Alumina (Al ₂ O ₃)	16.80	Phosphoric anhydride	trace.	0.28	
Lime (CaO)	3.88	Silica	17.26	18.22	
Magnesia (MgO)	2.50	Magnesia	0.07	...

Gold, 2 oz. 15 dwt. 12 grs. per ton.					
Silver, 10 oz. 5 dwt. 19 grs. per ton.					
1261—Spring water from Werong:—					
	gr. per gal.	From Goulburn District:—	2262	2263	
Silica and silicates	3.444	White clay		Disintegrating granite.	
Bicarbonate of soda	49.106	Moisture at 100° C	0.82	0.42	
Bicarbonate of potash	3.690	Combined water	3.30	1.64	
Bicarbonate of lime	40.256	Silica (SiO ₂)	71.90	73.40	
Bicarbonate of magnesia	34.437	Alumina (Al ₂ O ₃)	16.15	14.60	
Bicarbonate of strontia	trace.	Ferric oxide (Fe ₂ O ₃)	1.45	1.10	
Sulphate of potash	.585	Manganous oxide (MnO)	trace.	trace.	
Sodium chloride	.659	Lime (CaO)	trace.	trace.	
Ferric oxide	trace.	Magnesia (MgO)	0.50	1.40	
		Potash (K ₂ O)	4.77	4.43	
		Soda (Na ₂ O)	0.57	2.74	
		Phosphoric acid (P ₂ O ₅)	trace.	trace.	
Total solid matter	132.177		99.46	99.73	

A trace of chlorine; no fluorine.

APPENDIX 26.

The Mining and Geological Museum.

The Government Geologist,—
Sir,

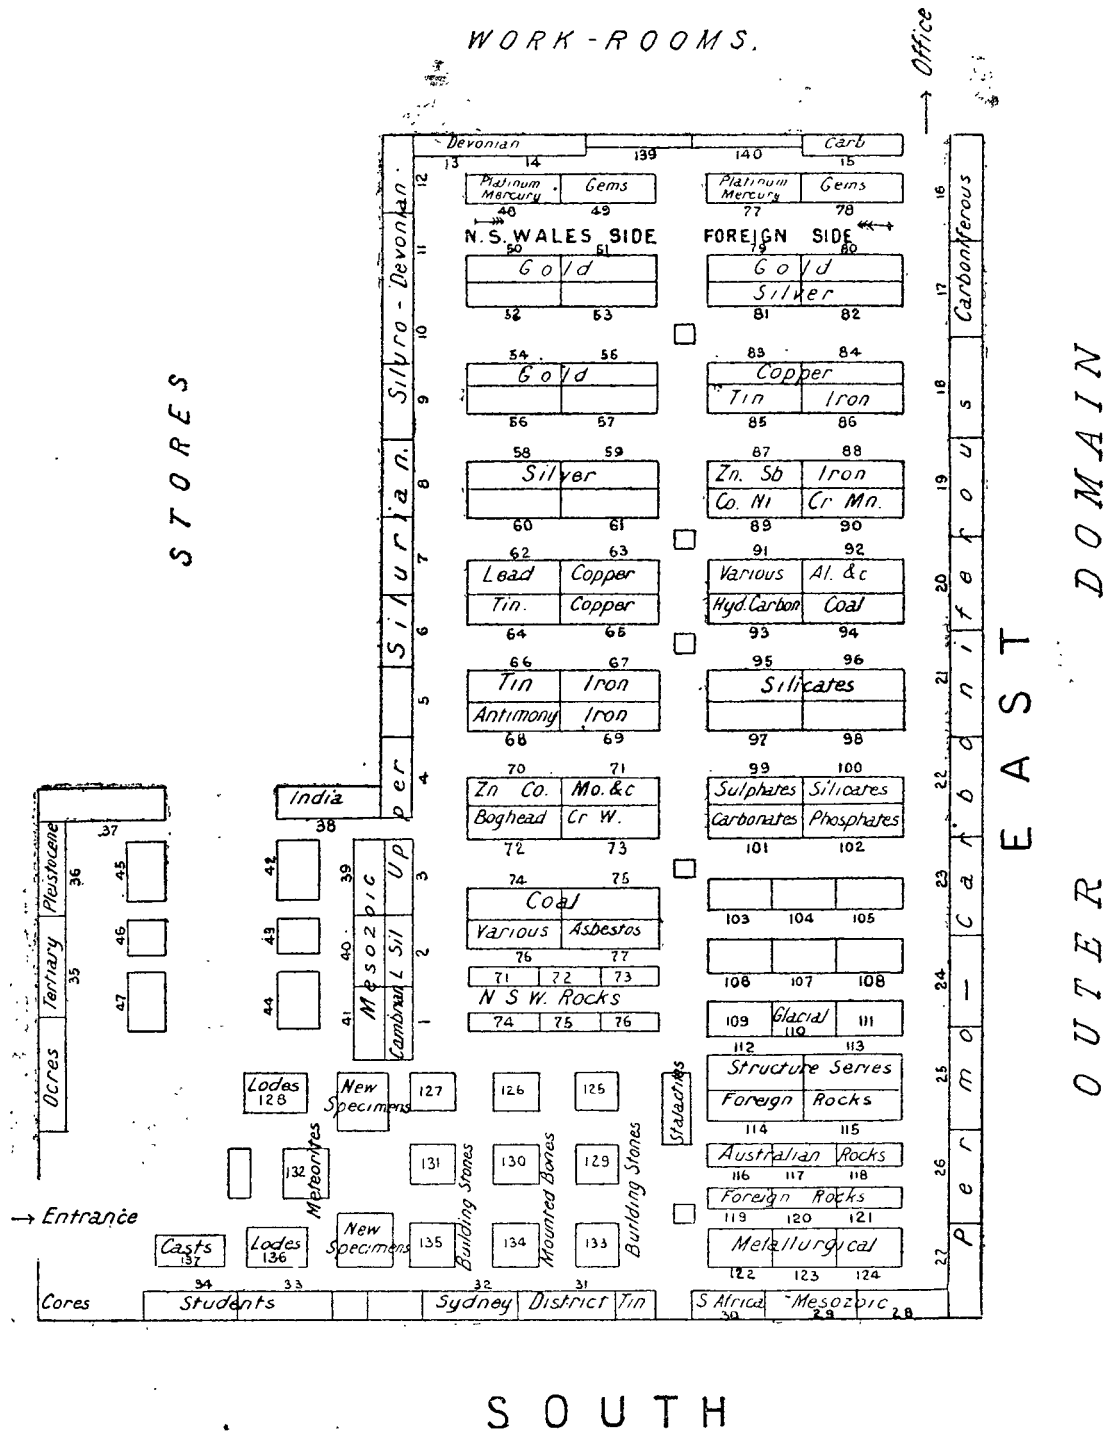

The Mining Museum, 31 December, 1897.

I have the honor to make a special report on the Museum; the practical completion of the work of registering and arranging the mineralogical and rock collections, on which I have been engaged for the last five years, rendering the opportunity a favourable one.

The Mining and Geological Museum has been practically co-existent with the Department of Mines. It resembles in its functions such institutions as the Museum of Practical Geology, London; the Museum of the Mining Bureau of California, San Francisco; the Geological Museum, Calcutta; the Geological Museum, Ottawa. Museums are attached to most Geological Surveys, and the Johannesburg Chamber of Mines and the Transvaal Republic are now actively engaged in establishing mining collections. The Museum at first occupied premises in Bridge-street, and was opened to the public on March 6, 1876. In 1881 the collections were removed to Exhibition Buildings in the Inner Domain, and were lost in the fire that destroyed the Garden Palace in September, 1882. Some 50,000 specimens, including much of the Rev. W. B. Clarke's invaluable collections and MSS., were lost. A small temporary iron structure having been erected at the back of the Geological Survey Offices, at 233, Macquarie-street, the nucleus of a new collection was got together and opened in 1886. In 1893 an opportunity of acquiring larger space was afforded by the removal of the Technological Museum to Harris-street. The ancient Exhibition Building in the Domain, at the back of the Sydney Hospital, formerly occupied by the technological collections, was acquired, and the collections and workrooms of the survey were removed there. Since then the whole of the collections have been overhauled, reregistered, rearranged, and relabelled. About 15,000 mineral and rock specimens have been registered, the great majority of these being New South Wales ores. The very fine collection of fossils, exemplifying the stratigraphy of New South Wales, has been tableted and arranged stratigraphically in cases round the walls in ascending geological order by the palæontologist, Mr. W. S. Dun. Of the central floor space, one-half is occupied by colonial ores and substances of economic value, and the other half by the rock-forming minerals and a number of foreign ores. In every respect the strictly scientific aspect has been subordinated to that which is commercial and practical, and no attempt is made to make a general collection of minerals.

The object of the Museum is to illustrate the geology, and more particularly the mining geology, of New South Wales; this being supplemented, so far as space will permit, by carefully chosen specimens from foreign mining districts. The guiding principle in the arrangement of the mining exhibits, which constitute by far the most prominent section, is to illustrate the occurrence of the mineral deposits by representative

representative specimens of ore, country rock, associated minerals, &c. All the ores of a given metal are placed near one another, and arranged geographically. Thus, a visitor consulting the foreign copper series will find each important copper-mining centre in the world illustrated in the manner just referred to, the ores of each district being placed together, irrespective of their nature. I am not aware that this plan has been carried out elsewhere. Even in its present condition, incomplete as it is from the existence of numerous gaps in the series and the absence of descriptive headings, this plan has proved a complete success. The preparation of a descriptive handbook has already been commenced.

While it is always the case that a specimen loses much of its value if incompletely localised, it is peculiarly so in a Museum such as this. Very many of the specimens—and this is especially the case with a large part of the rock collection, small as it is—are of little or no value from the absence of carefully stated localities.

The foundation having been laid, it now remains to consolidate and build up upon it. The difficulty lies in the acquisition of suitable specimens. It was at first a great disappointment to me to receive but little assistance from the numerous officers of the Department, who have personally to do with

with the mines. On considering, however, that the modern idea of what the true functions of a museum are is of comparatively recent origin, and that the duties of a curator as now understood require preliminary training and much careful thought like any other profession, I can see that it is unreasonable to expect another person to realise what is required. It is almost impossible to make it clear that one does not want specimens because they are curious or exceptionally rich, but because they have a definite educational value. You may ask for a piece of country rock or an average specimen of ore, but you cannot make it plain that you really want such useless stuff. It is very difficult to get representative specimens of ore from the deeper levels of a mine; of those now in the Museum, by far the larger part are surface samples only. I am confident that if a satisfactory method of acquiring the necessary specimens could be consistently followed, a collection would in time be built up that would be of the very greatest educational value to mining men, and would furnish a mass of accumulated evidence that might be expected to throw much light on the origin of ore deposits. It is my desire to study the country rocks of as many well-defined mining centres as possible, and to utilise the results in successive editions of a hand-book.

Another object at present in view is the adequate illustration of the geology of the Sydney District. A check was met with at the outset by finding that, with one or two exceptions, there were no specimens whatever available. For the purposes of exhibition a few have now been secured by the kind aid of one or two of my colleagues who have given up some of their leave of absence in procuring them. I am very hopeful of obtaining your approval to a scheme whereby the Sydney District may be systematically worked by the assistants and myself. Two or three show-cases are already reserved for the display of minerals, rocks, and fossils found in the Sydney District. By a series of day visits the various quarries, &c., would be photographed and examined by us. The dyke and other rocks would be studied petrographically, and the results published in the Geological Survey Records. Important material would thus be accumulated towards the elucidation of the geology of this part of the Colony.

The mention of photography leads to my final point. I should very much like to systematically collect photographs of geological or mining interest. These would be kept indexed for convenient reference, and enlargements of selected negatives could be prepared for framing as wall diagrams. Mine managers and others could be solicited to present to the Museum copies of any photographs they might have taken of their mines, and persons having negatives of geological phenomena would no doubt lend them for the purpose of taking prints.

I have, &c.,
 GEORGE W. CARD,
 Curator.

APPENDIX 27.

DONATIONS to the Mining and Geological Museum.

Donor.	Donation.
Allworth, F. C.	Crystals of tin in matrix.
Baker Bros. and Wade.....	A quantity of rich silver ore, native silver, pyrrargyrite, &c.
Bartlett, J. V.	Argentiferous quartz with sulphides of iron, lead, &c.
Bensusan, A. J.	Country rock (indurated slate), rich auriferous pyritous ore.
Bensusan, S. L.	Pyrrargyrite in lodestuff, argentite on quartz, compacted guano, and mica.
Blakemore, J. H.	Rock containing native copper.
Brice, W. S.	Quantity of basalt.
Brown, T. (M.P.)	Quartz showing free gold.
Californian State Museum	Collection of mineral and rocks, &c.
Calman, J.	Auriferous ores.
Card, G. W.	Soft slickensided coal, coal, pyrromalite with magnetite, various country rocks, and auriferous specimens.
Chandler, —	A quantity of tin ore.
Clark, D.	Monazite sand.
Coal Cliff Coal Company	Coal.
Collins, H. F.	Section across a reef showing a "turn," various country rocks, auriferous specimens, sulphide ore, and stibnite in quartz.
Collins, J.	Quartz showing free gold.
Conway, —	Quartz containing molybdate of lead.
Cotton, F. (M.P.)	Copper and lead ores.
Cruickshank, G.	Crystals of gypsum.
Curlewis Coal Co. (the Manager) ...	Naturally coked coal.
Davies, J. E.	Calcite.
Dixson, Inspector	Coal from various collieries.
Dobson, J. E.	Copper ores, alluvial gold, silver ores (native silver, &c.), barytes with galena, auriferous pyrites in calcite, auriferous blende and pyrites in quartz, and various rock specimens, &c.
Duncan, A.	Quartz showing free gold.
Finselbeck, Dr.	Contorted slate—the contortions being indicated by iron pyrites.
Fitton, J.	Alluvial gold, and a specimen of the wash from which the gold is obtained.
Frecheville, W.	Schist coloured by vanadium and country rocks from Kalgoorlie.
Garvan and Coward	Quartz showing free gold.
Hammond, H. R.	Platinum concentrated.
Hall, E.	Native copper in fluor spar.
Harper, L. F.	Rock specimens, &c.
Hasenkan and Party.....	Quartz showing coarse free gold.
Hibbert, —	A quantity of topaz and crystals of tin and tourmaline.
Hedges, J.	Lead ore—galena in fluor spar and calcite—from Derbyshire.
Huntley, T. S.	Pyromorphite and silver ore.
Huntley and Masey	A quantity of crystallised pyromorphite.
Jaubard, J.	A fire-brick made at Bulli of tripolite and fireclay.

Donor.	Donation.
Jermyn, R.	Asbestos.
Josephson, —	Tripolite and aragonite lining the interior of hollow geodes.
Lamb, S.	Serpentine with asbestos and soapstone.
Lane, Dr. W. H. H.	Tripoli and articles manufactured from same.
Litchfield, G. F.	A collection of rocks, &c.
Mackenzie, Dr.	Conichalcite (argentiferous) and ferberite.
Madson, H. F.	Limestone showing concretionary structure.
Margoschis, —	Auriferous stone.
McGlew, C. S.	Wolfram.
Meldrum, J.	Stream tin ore, alluvial gold, kyanite, bone breccia, and various rock specimens.
Metropolitan Coal Company	Coal.
Miller, R.	Slate, &c., showing paint gold and chloro-bromide of silver.
Mitchell, J.	Concretionary ironstone with calcite.
Mooney, Jas.	Quartz showing free gold, &c.
Mt. Pleasant Coal Company	Coal.
Mt. Kembla Coal Company	Coal.
Oakley, W. A.	Non plastic white clay and felspathic granite fireclays.
O'Donnell, M. J. (per E. C. Whittell)	Fine specimens of quartz crystals, &c.
Overflow S.M. Co. (the Director)	A collection of argentiferous and cupriferous ores.
Pender Miss	Bismuth ore.
Pith, J. (per Warden's Clerk, Rockley)	A quantity of epidote with felspar.
Power, W.	Copper ore.
Power, F. D.	Numerous rock specimens, auriferous slate, pyromorphite, Lower Silurian graptolite slate, tripolite, common opal, tin-bearing wash-dirt, calcareous material found in cylindrical masses in the Cooma tripolite, calaverite in calcite from Kalgoorlie.
Pryce, J.	Stalactitic quartz.
Public Works Department	Ninety-six pieces of polished marble.
Ramsay, S. F.	Tourmaline, a quantity of andalusite, magnetite in quartz, zircon-sapphire—sand, talc.
Rantzon, L. V.	Auriferous and argentiferous specimens.
Reid, M.	Crystallised barytes, and quartz showing gold freely.
Robinson, Rev. J.	Oilvine, and oilvine basalt.
Roman, H.	Specimen illustrating weathering, volcanic bombs.
Sellers, H. E. O.	Slickensided shale.
South Clifton Coal and Coke Co.	Coal and coke.
Southern Coal Company	Coal.
Stokes, H. G.	A collection of silver ores from the Silver Spur mine.
Strange — (per E. C. Whittell)	A quantity of topaz and sapphire.
Stribly, T.	Auriferous quartz.
Thomas — (per E. C. Whittell)	A quantity of tin ore.
Throsby —	Tin ore, &c.
Tomingley, G. M. (the Manager)	Vanadium-bearing clay.
Van Weenan	Specimen illustrating weathering.
Warden's Clerk, Yalgogrin	Auriferous ore.
Warden, Braidwood	Pyromorphite.
Warden, Junee	Auriferous ore.
Warden, Queanbeyan	Free gold in ferruginous material.
Warden, Wolumba	A collection of auriferous sulphides from deep levels in the various Wyalong mines.
Warden, Wyalong	Pyromorphite.
Warden, Yass	Volcanic bombs.
Watt, J. A.	Deposit in pipe.
Welch, H. P.	Rock specimens and gypsum.
Wiburd, J. C.	Arsenical pyrites.
Wooller, Chas.	

APPENDIX 28.

Annual Report of the Assistant Palæontologist and Librarian for the Year 1897.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 13 January, 1898.

I have the honor to submit to you the following summary of the Palæontological work and work connected with the Library performed by me during the past year:—

Records and Memoirs.—Vol. V, Parts 2 and 3, of the *Records* have been published, and Part 4 is now going through the press and will be issued during February. A translation of the late Professor De Koninck's "Recherches sur les Fossiles Palæozoïques de la Nouvelle Galles du Sud" is now going through the press. This will form Memoir No. 7 of the Palæontological Series, and should be issued during the first half of this year. No Memoir was published during 1897.

Miscellaneous Determinations.—These determinations were made chiefly in connection with the field work performed by officers of the staff. The principal ones are:—

1. Post-Tertiary Estuarine Fossils from the Northern Territory:—*Cerithium Kieneri*, Homb. and Jacq.; *Potamides fuscum*, Schum; *Kuphus*, sp. ind.
2. Tertiary Leaves from the Elsmore Tin-mining Company's Mine, 220 feet level, collected by Mr. E. C. Whittell, comprising:—*Malpighiastrum Babbagei*, Ett.; *Cinnamomum Leichhardtii*, Ett.; *Apocynophyllum Kingi*, Ett.; and *Myrsine Stokesii*, Ett. (?)
3. Lower Silurian Graptolites from county Wellesley, collected by J. E. Carne, vide *Records*, 1897, V, Pt. 3, pp. 124-127.
4. Carboniferous Fossils, collected by yourself in the Somerton District:—
 - (a) From Oolitic Limestone, Por. 100, Parish Tulcumbah.—*Zaphrentis*, *Spirifera*, *Dielasma hastata*, Sby., *Edmondia*, *Loxonema*, *Pleurotomaria*, *Entolium*, *Conularia*.
 - (b) Por. 2, parish Rangira, county Nandewar.—These are ill-preserved, and comprise Crinoid stem-ossicles, *Rhynchonella* (?) *Cyrtoceras* (?)
 - (c) From 1 mile east of J. Swain's house.—*Productus*, *Otenodonta*, *Bellerophon*, *Murchisonia*, *Worthenia*, *Euomphalus*, *Hyolithes* (?)
 - (d)

- (d) Por. 23, Parish Wilura, County Nandewar.—*Spirifera*, *Michelinia*.
- (e) "Whales' Egg" Limestone, 5 miles S.E. of Somerton.—*Zaphrentis sumphiensis*, Eth. fil.; *Zaphrentis*, sp.; *Dielasma hastata*, J. de C. Sby; *Productus semireticulatus*, Martin; *P. giganteus*, Martin (?); *P. cf. muricatus*, Phill.; *Orthis australis*, McCoy; *O. resupinata*, Martin, *Spirifera cf. bisulcata*, Sby., *S. striata*, Martin, *S. cf. humerosa*, Phill.
5. Upper Silurian fossils from near Young, collected by Mr. H. F. Marsden:—*Cucullæa*, *Orthonota*, *Spirifera*.
6. Upper Silurian fossils from Quedong, collected by Mr. J. E. Carne:—*Favosites gothlandica*, Lam. (small-pored variety); *Heliolites cf. interstincta*, Linn.; *Pentamerus Knightii*, Sby.; *Leptæna rhomboidalis*, Wilck.; *Atrypa reticularis*, Linn.; *Rhynchonella, cf. borealis*, Schl., var.; *Rhynchonella*, sp.; *Orthis*; *Paracyclas*; *Pleurotomaria*.
7. Fossils collected by Mr. J. H. Watt from—
- (a). Five and a half miles north-west of Kerr's Creek Platform:—*Favosites gothlandica*, Lam.; crinoid stems.
- (b) Crown Station, Capertee Valley, 15 miles from Capertee:—*Spirifera disjuncta*, Sby.
- (c) One and a half miles from Mudgee, northern side of Lawson's Creek (in chest):—*Favosites*, Stromatoporoid (*Actinostroma*?), and numerous crinoid stem and arm ossicles and fragments of organisms replaced by silica.
- (d) Underlying basalt, half a mile north of Mount David, at Baker's claim, Parish of Mount Lawson, County of Georgiana:—Indeterminate fragments of Brachiopods and portion of the pygidium of *Phacops*?
- (e) Buckeroo, near Mudgee:—*Spirifera cf. multiplicatus*, Dekon.; *Meristella*?
- (f) Tertiary leaves from Portion 142, Parish of Tarlo, County of Argyle, very like *Quercus Wilkinsoni*, Ett., from the eocene of Vegetable Creek.
8. From the "New Cave," Jenolan Caves, collected by Mr. F. J. Wilson:—*Favosites gothlandica*, Lam.; *Pentamerus Knightii*, Sby.
9. Devonian fossils from Bell Bird Creek, near Eden:—*Rhynchonella pleurodon*, Phill.; *R. cuboides*? *Atrypa*.—*Vide Records*, V., pt. 4, p.
10. From the Yarrangobilly Caves, collected by Mr. H. Bradley, keeper:—*Pentamerus Knightii*, Sby.; *Pleurotomaria*; *Orthoceras*.

During the year large collections of fossils from the Yass and Murrumbidgee Districts were made by Mr. C. Cullen. These collections contain much new material. They have been registered, and it is hoped that the examination of, at any rate, the Mollusca will be completed by the end of the year. Mr. Cullen also made a small collection of fossil plants from the Narrabeen beds of Turrimetta Head.

For some years past Mr. B. Dunstan, F.G.S., formerly Lecturer in Geology to the Technical College, Sydney, and now of the Geological Survey of Queensland, has been getting together a large collection of fossil fish from the Wianamatta Shales of St. Peters. Under certain conditions this collection has been presented to our Museum, and the fish are now in the hands of Mr. A. Smith Woodward, Department of Geology, British Museum (Natural History), who is describing them. It is hoped that his descriptions will be available for publication during this year.

Through the generosity of Mr. F. Danvers Power, F.G.S., our Museum has been enriched by a collection of Lower Silurian graptolites from Myall Reefs, near Tomingley. This is, I believe, the first occasion on which graptolites have been collected in this part of the Colony, and their discovery is of the highest importance from a stratigraphical point of view.

Museum.—During the year considerable time has been given to Museum work—registration and sorting of specimens, label writing, and tableting. The space available for the display of the fossil collection is inadequate. Of Australian specimens, the Carboniferous and Permo-Carboniferous Polyzoa, a considerable amount of Silurian and Siluro-Devonian material, the Marine Tertiary Mollusca and the greater part of the Post-Tertiary Marsupial bones are not exhibited. As well as this we have large and good collections of fossils from other parts of the World, which, with the exception of a few odd specimens, are kept packed away. Five small named collections were prepared for distribution.

The following papers and reports were prepared or published during the year:—

1. Annual Report for the year 1896.
2. Additions to the Permo-Carboniferous Flora of New South Wales. *Records*, 1897, V, pt. 2, pp. 64, 65, pt. 9.
3. On the Occurrence of Devonian Plant-bearing beds on the Genoa River, County of Auckland. *Records*, 1897, V, pt. 3, pp. 117–121, pls. 10, 11.
4. The Occurrence of Lower Silurian Graptolites in New South Wales. *Records*, 1897, V, pt. 3, pp. 124–128.
5. Note on the Occurrence of Sponge Remains in the Lower Silurian of New South Wales. *Procs. Linn. Soc. N. S. Wales*, 1897, pp. 436, 437.
6. With R. Etheridge, *Junnr.* The Australian Geological Record for the year 1895, with addenda for the years 1891–1894. *Records*, 1897, V, pt. 2, pp. 87–111.
7. With R. Etheridge, *Junnr.* The Australian Geological Record for the year 1896. *Records*, 1896, V, pt. 4, pp. 183–203. (In the Press.)
8. With G. W. Card. Diatomaceous Earth Deposits of New South Wales. *Records*, 1897, V, pt. 3, pp. 128–148, pls. 12–15.
9. Notes on the Fauna of the Devonian Boulders occurring at the White Cliffs Opal-fields. *Records*, 1898, V, pt. 4, pp. 153–175, pls. 17–18. (In the Press.)
10. Stratigraphical and Palæontological Notes, No. 1. *Records*, V, pt. 4, pp. 180–184. (In the Press.)

I have also prepared a full "Systematic Catalogue of the Types and Figured Specimens in the Collections of the Geological Survey," which will shortly be published.

Library.—During the year 1,682 publications have been registered and placed in the Departmental Library, consisting of Societies' Transactions, Reports of State Departments, serials and separate works and pamphlets. This total is made up of 1,436 volumes or parts of volumes and pamphlets that have been presented or sent in exchange, and 246 that have been purchased.

The Library is now in correspondence with 209 Institutions and State Departments, from which exchanges are regularly received, and there are also numerous personal exchanges.

The principal additions to the exchange list are:—

American Philosophical Society, Philadelphia.
 Institute of Mining and Metallurgy, London.
 K. K. Geologischen Reichsanstalt, Vienna.
 Gesellschaft für Natur und Heilkunde, Giessen.
 Kansas Academy of Science.
 Chicago Academy of Science.
 Chemnitz—Naturwissen. Gesellschaft.
 Frakfort-on-Maine—Senckenbergische Gesellschaft Naturforschender.
 Vienna—K. Akademie de Wissenschaften.
 Havre—Société Géologique Normandie.
 Mexico—Comité Geologique.
 University of Wisconsin.
 Annuaire Geologique de Russie.
 State Geologist, South African Republic.
 Geological Survey of Western Australia.
 Rome—Accademia Lincei.

The following publications have been distributed to correspondents:—

- (1) Records, Geological Survey, V, Part 2.
- (2) " " " " " 3.
- (3) Annual Report for 1896, to Institutions.
- (4) Special Editions Australian Mining Standard.
- (5) Numerous miscellaneous lots.

During the second half of the year the registration and acknowledgment of donations was performed by Mr. L. F. Harper, and this assistance was a great help to me.

The registration, catalogue, &c., has been kept up to date.

I have, &c.,
 W. S. DUN,
 Assistant Palæontologist.

APPENDIX 29.

CAVES.

PROGRESS and other Reports on the Limestone Caves for the year 1897, by O. Trickett, C.S., M.S., Vict., L.S., N.S.W.

During the year the following improvements have been effected.

Jenolan Caves.—Improvements of the northern branches of the Right Imperial Cave. Such branches have been named the "Jubilee Cave."

Construction of a new entrance to the Lucas Cave from the Grand Archway. Visitors will be enabled to reach the Lucas Cave without the necessity of climbing over the ridge in which this cave is situated.

In connection with these improvements I desire to refer to the care Mr. F. J. Wilson, Caretaker, has taken to give the concrete and other steps a uniform grade, and generally to second my efforts to obtain the exact cost of material or labour in the different items of improvement work.

The new Caves House designed by the Government Architect for the convenience of visitors is nearing completion.

Yarrangobilly Caves.—The Thermal Spring has been improved for the use of visitors by the excavation and timbering of a bathing-place (*see plan*). The waters of this spring are said to have curative properties.

Credit is due to the caretaker, H. Bradley, for the manner in which this work has been carried out.

He has also erected a substantial washhouse and forge-shed, partly with material supplied by the Government.

Bungonia Caves.—A cottage for the use of the caretaker has been erected, and the access to the ladders in the Main Cave has been improved.

Bendithera Caves.—The old wooden ladders have been replaced by new ones, which are further improved by the erection of standards with wire rope where required.

Wellington Caves.—The "Altar" in the Main Cave has been protected by the erection of standards and wire netting.

A new chimney at the visitors' shed is nearly completed. The caretaker is putting up this chimney with material supplied by the Department.

Abercrombie Caves.—The tracks have been improved, and one of the iron ladders re-erected.

Wombeyan Caves.—The entrances to two new caves up the Mares Forest Creek have been made accessible by the erection of wooden ladders, while one of these caves has been improved by the fixing of a door and some wire rope.

The following improvements have been authorised to be effected as opportunity offers:—

Jenolan Caves.—Placing of garden seats in suitable positions, improvement of track to bathing-place, construction of a new entrance to the Imperial Caves, improvement of the Gem of Jenolan Cave, improvement new cave, improvement engine-driver's cottage (painting), erection of cottage for caretaker.

Yarrangobilly Caves.—Erection of kitchen and chimneys.

Abercrombie Caves.—Erection of horse-paddock fence.

Wellington Caves.—Painting caretaker's cottage.

Wombeyan Caves.—Improvement of the Wollondilly Cave.

Bungonia Caves.—Improvement of the Main Cave.

Discovery

Discovery of New Caves.

On the 10th November, 1897, the Caretaker (F. J. Wilson) reported that he discovered a new cave equal to any of the other caves at Jenolan. (Report of inspection attached.)

Mr. Jeremiah Wilson, Explorer at Jenolan Caves, reports that he has discovered several new branches of the caves, and a new cave 1 mile north of the Accommodation House. Some of the chambers he reports to be of considerable beauty.

He was employed to relieve the caretaker at the Abercrombie Caves during the months of July and August. While there he discovered what has been named "The Grove Cave." (See report attached.)

The caretaker of the Bungonia Caves has reported the discovery of new and good caves.

The caretaker of the Bendithera Caves reports the discovery of new caves. These are, probably, of little importance.

I visited the Tuglow Caves during the year. (Report attached.)

Number of Visitors for Year 1897.

Abercrombie Caves	904	visitors.
Bendithera Caves	53	"
Bungonia Caves	627	"
Jenolan Caves	2,247	" (who paid 6,135 visits).
Wellington Caves	1,129	"
Wombeyan Caves	335	" (who paid 515 visits).
Yarrangobilly Caves	474	" (who paid 1,028 visits).
Total	5,434	

Magnesium Ribbon used.

Ribbon issued to caretakers, 627 oz., cost £107 9s. 6d.; ribbon used by guides and caretakers, 544 oz.; amount collected for use of ribbon, £227 12s. 10d.

Survey of Caves.

I have realised that it would be a benefit to the caretakers at the various caves if they had a better idea of the direction of the underground channels and caverns as an aid to future exploration, and to enable the guides to answer questions which are frequently put by visitors.

I have commenced to define these channels, with the assistance of Mr. Harper, Field Assistant, by making a compass survey of part of the Jenolan Caves, as indicated on plans herewith.

I would have preferred to make a theodolite survey, to avoid errors of magnetic variation arising from the presence of the protecting ironwork and netting, but I should have required more time than I had at my disposal, and extra assistance.

Reports on Caves.

For the purpose of reference I have furnished general reports on each of the caves, which include such information as I thought might be of interest.

To illustrate these reports I made compass and pace surveys of the surface features and improvements at the different caves, which are shown on accompanying plans.

The following are extracts from the information collected:—

The Limestone Caves of New South Wales.

THE control of the caves was transferred from the Lands Department to the Mines Department in 1879 (M. 79/8,989). Between 1st January, 1883, and July, 1897, the sum of £23,131 had been expended on the care and improvement of the caves. Particulars of earlier expenditure are not readily available.

Probably as much more has been expended on the roads to the Jenolan, Yarrangobilly, and Wombeyan Caves.

The Jenolan and Yarrangobilly Caves have telegraphic communication.

There is a post office at Jenolan and a postal receiving office at Wombeyan.

The eastern portion of the Colony contains numerous deposits of limestone, many of which are unexplored. Wherever the limestone occurs in mountainous or rugged country it has been found to contain caverns, which, from their grandeur and the richness and delicacy of their ornamentation, have been termed the "Australian Fairy Land."

The causes which have led to the formation of the caves have been explained by the late C. S. Wilkinson, Geological Surveyor in Charge, in a paper published in the Railway Guide, 1886, and by Professor T. W. E. David in his report on the Wombeyan Caves, 22/6/85.

The limestone in which most of the caves are situated is of Upper Silurian or Lower Devonian age; but I am informed by Mr. W. S. Dun, Assistant Palæontologist, that the Yessabah Caves are probably in limestone of Permo-Carboniferous age, while the Isis River Caves may be in Carboniferous rocks.

The caves have been the subject of the following descriptions and reports:—

JENOLAN CAVES. (Originally known as the Fish River or Binda Caves. Name altered to Jenolan by *Gazette Notice*, 19th August, 1884.)

Sydney Morning Herald, 5th June, 1863.

J. E. Richter, *Scientific American*, 1884, No. 15.

Sydney Morning Herald, a series of articles published in 1886.

S. Cook, *The Jenolan Caves, an Excursion in Australian Wonderland*, 1889.

At 4 miles south-south-east of Cudgegong.

And at 6 or 7 miles from O'Connell, Bathurst District.

It may be added that the picturesque scenery of the Kanangra (Kowmung) Walls, near Jenolan, is the subject of a report by W. S. Leigh, 24th October, 1889, Annual Report, Department of Mines for 1889, p. 252.

APPENDIX 30.

The Grove Cave (Abercrombie Caves).

Sir,

25 September, 1897.

I have the honor to report on my visit to the caves at the Grove Creek, near Trunkey, discovered by Mr. Jeremiah Wilson, during the months of July and August last.

One of them, situate S.W. of the Arch, is of interest. Its mouth was found blocked up. It had apparently been used as a hiding-place—presumably by bushrangers—many years ago. Only one of the others is of any importance. It has been named the Grove Cave. It is entered from the face of a limestone bluff, at about 50 feet above the Grove Creek, and about 1½ chain S.E. of the Abercrombie Arch. Its position is indicated on accompanying maps. Two photographs of this cave have been kindly supplied by Mr. T. W. Seaver, of the Water Conservation Branch of the Public Works Department.

The Grove Cave is mostly dry, and appears to have been so for a very long time, consequently for the greater part of its course, it has comparatively little beauty; but a small portion of it, 7 feet x 10 feet, contains one very fine column, something after the style of the Alabaster Column at Jenolan, a smaller column, and a few shawls and stalactites. On the north side of this chamber there is no drip, and the formations have lost most of their beauty; but on the southern side the shawls and stalactites are in course of formation.

This would not be considered a particularly beautiful chamber at, say, Jenolan, but it is distinct from anything else at the Grove Creek, and is a valuable addition to the attractions furnished by the beautiful Abercrombie Arch.

The Government Geologist.

I have, &c.,

O. TRICKETT, L.S.

APPENDIX 31.

Tuglow Caves, Tuglow River.

Sir,

29 October, 1897.

I have the honor to report on my visit to the caves at the Tuglow River, a tributary of the Kowmung River, 10 miles south of the Jenolan Caves.

The discovery of caves at Tuglow by Messrs. H. and C. Wilcox, selectors in the vicinity, was reported to the Department in 1884. On the 13th February, 1897, the Rev. J. W. Harrison, of Oberon, requested that some steps should be taken to preserve them.

From the Jenolan Caves southerly, as far as the Wombeyan Caves, a distance of 35 miles, there are numerous outcrops of limestone. On the accompanying plan I have indicated the position of some of these outcrops in the vicinity of the Tuglow River. They are all more or less honeycombed by caves.

The most important cave, as far as known, is the one more particularly referred to by Mr. Harrison.

It is situated in a limestone bluff overlooking the Tuglow River, at an altitude of 3,200 feet above sea level, N.E. of portion 18, parish of Banshea, county of Westmoreland.

There are two openings from the surface to this cave. One represents a perpendicular drop of, perhaps, 100 feet. The other, a few feet distant, reaches the same point by a descent which is easier, but requires the use of rope.

Still

Still descending, a massive "curtain," some 25 feet long, decorated with calcite crystals, is passed, and the main cavern is reached at 280 feet from the surface, probably representing a fall of 200 feet.

Part only of this cavern was examined. A channel in its floor is the waterway for a considerable body of water, which, if confined to the surface, would apparently run down the Horse Gully Creek, but now finds its way easterly, by a shorter route underground, to the Tuglow River.

Passing down the cavern one is faced by a massive terrace, similar to the formation known as "the diamond walls," at Jenolan. Further on (330 feet to 360 feet from surface), on the right-hand side of the cavern, is a grand collection of stalactites, "draperies," and "shawls." One of the latter is some 6 feet long by $2\frac{1}{2}$ feet wide at its base. It is unusually thin for such great width, which adds to its beauty.

A photograph was taken of this part of the chamber with a camera kindly lent to me by Mr. Rowe, of Jenolan.

Beyond this chamber to the left (370 feet) the water passes over a cascade formed of "basins," similar to those in the Wombeyan Caves, described by Professor T. W. E. David (Annual Report, Department of Mines and Agriculture for 1896, page 151). The sound of the falling water is heard a considerable distance away.

Turning to the right and rising about 20 feet over a heavy deposit of bat guano, a collection of columns of a reddish tinge is reached. They resemble formations which have been likened to organ-pipes in other caves. From thence, running north-easterly, is a passage from $2\frac{1}{2}$ feet to 5 feet high and 7 feet broad, which (500 feet from the surface) ultimately becomes too small to follow without excavation.

The floor of this chamber is ripple-marked in places. On its left-hand side (410 feet to 440 feet) are a series of grottoes, which contain a varied and beautiful collection of stalactites, from the miniature pencil forms, to snowy-white groups of larger size. One of these groups is fringed by a reddish drapery, which gives a pleasing effect to the white formations.

Exploration would doubtless disclose many other interesting chambers, which, added to the present attractions of the Tuglow Caves, may render them, in the future, as important as some of the better known caves.

Mr. Harper, Field Assistant, collected fossils from several of the limestone outcrops, which show the rock to be of the same age as the Jenolan limestone.

In concluding this report, I desire to thank Messrs. Brennan, J.P., Luther, and Bouchier, local residents, for the assistance given to me during my inspection of the caves.

The Government Geologist.

I have, &c..
O. TRICKETT.

APPENDIX 32.

New Cave, Jenolan Caves.

Sir,

Geological Branch, 6 December, 1897.

I have the honor to report on the new cave discovered by Mr. F. J. Wilson, caretaker at the Jenolan Caves, on the 10th November, 1897.

It is situated at the foot of a cliff 3 chains west of McKeown's Creek, 2 chains southerly from the Glass Cave, and 30 chains north of the Grand Archway.

The caretaker was induced to search hereabouts from the information I had supplied him with respect to the position of the "Lily of the Valley," fixed by my survey of the Imperial and Jubilee Caves.

At about 130 feet above McKeown's Creek, the entrance is found in a hole barely large enough to squeeze through. Thence scrambling along a passage westerly and south-westerly for about 150 feet, the cave is reached at a depth which is apparently some 50 feet above the dry bed of the creek.

There are two chambers. From the northern one the Caretaker obtained some fossil bones beautifully encrusted with crystals of calcite. He at once forwarded these to the Department, and they are now on view at the Museum, in the Domain.

This northern chamber is very attractive. It is some 20 ft. x 30 ft. x 30 ft. in size. I propose to describe the southern chamber only.

I have previously reported that the "Gem of Jenolan," a branch of the Jubilee Cave (not yet opened for the inspection of visitors), was superior to any other chamber then known at Jenolan.

The southern chamber of the cave now under notice, however, I consider to be unrivalled for the beauty and wealth of its ornamentation. It sparkles with calcite crystals, which give effect to the waterfall and drapery formations which grace its walls. On one hand are reddish-tinted coral-like bunches of crystals, on another forests of diminutive stalactites, with groups of larger ones, some reddish, others snowy white or semi-transparent. This chamber is about 20 ft. x $2\frac{3}{4}$ ft. x 30 ft. A grotto 15 ft. x 10 ft. x 5 ft. is seen on its south-western side. This is separated from the main chamber by numerous semi-transparent columns and a fringe of stalactites, which remind the spectator of Nellie's Grotto in the Imperial Cave. The beauty of these columns is enhanced by the remains of an older column which lie in ruins at their base. Through these columns is seen a fairy-like grotto, with a peculiarly beautiful reddish crystalline and rippled floor, the whole making a picture which must fascinate even those who are not ordinarily moved by the beauty of Nature's handiwork.

It will be difficult to give easy access to this cave, as the two chambers lie at the end of a fissure 40 ft. x 40 ft. x 2 ft., dipping at a steep angle. The bedding plane forming the roof is of smooth and hard rock, while the floor is also hard. The latter has, however, a sufficiently roughened surface to render descent comparatively safe and easy.

It seems a pity to close to those of the public, who are not inconvenienced by a scramble, such a magnificent cave.

At the same time it would severely tax the energies of the guides if this cave were included in their daily routine of work. I therefore think some means of limiting the number of visitors to it should be adopted, if it be deemed advisable to render the cave accessible for inspection.

I have, &c..
O. TRICKETT, L.S.

The

APPENDIX 33.

Mutilation of the Copper Mine Cave, Yarrangobilly.

Sir, Geological Branch, 20 December, 1897.

I have the honor to report on the mutilation of the Copper Mine Cave, Yarrangobilly.

The necessity for protecting this cave forms the subject of letters from Trevor Jones, Esq., M.P., and J. S. Taylor, Esq.

The Copper Mine Cave is situated near the northern end of a large body of limestone, from $\frac{1}{2}$ to 1 mile wide, and 6 miles long. Near the southern end of this limestone are the caves rendered available for access to visitors. (*See plan.*)

The limestone is flanked on its western side by precipitous and picturesque cliffs, rising 300 to 400 feet above the Yarrangobilly River. It is honeycombed by caves, some at present forming the channels of permanent running streams, while others are at a higher level. For the greater part they are unexplored.

The waters which have formed the Copper Mine Cave enter the limestone in three places, near the "Yarrangobilly Hotel," 4 miles as the crow flies north of the caretaker's residence and accommodation cottages. The water descends rapidly after passing through these openings by channels which may be followed for some distance.

One mile south-westerly the waters have their exit. From inlets to outlet, therefore, there is a mile of main cavern, in addition to branches.

Following the underground stream up from its exit for 500 feet, wading through icy cold water on the way in places, and then rising about 30 feet, the remains of what has been a magnificently ornamented cave is reached, about 300 feet long as far as explored.

Axes, crowbars, chisels, and cartridges, have been used to demolish or remove the beautiful formations in this part of the cave.

Nothing appears to have been too large to destroy, for in one place the remains of a fine column over 6 inches in diameter, are lying on the floor. Fragments of semi-transparent "shawls" lie among the debris of broken stalactites, stalagmites and crystals of calcite. To secure the last-named, appears to have been the main object of the miscreants, who have destroyed as much as they could get access to, for the crystals have been carefully chiselled out. There can, however, have been no object other than destruction in breaking the "shawls," which come away in pieces, and have no beauty when removed.

The cave is still worth preserving, for the portion damaged probably represents a very small part of the attractive chambers which may be found in the future along the underground water way.

It is important that the destruction of any of the caves at Yarrangobilly should be prevented, for it is not unreasonable to suppose that the impressive scenery, the number and extent of the caves, and the cool climate of this locality, will render it in the future one of the most popular resorts of tourists in the Colony.

I have, &c.,

O. TRICKETT.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

DEPARTMENT OF MINES AND AGRICULTURE.

(ANNUAL REPORT OF THE STOCK AND BRANDS BRANCH FOR THE YEAR 1897.)

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

The Under Secretary for Mines and Agriculture to The Minister for Mines and Agriculture.

Sir,

I have the honor to submit the report of the Chief Inspector of Stock for the year 1897, which shows a decrease in both horses, cattle, and sheep, owing to the severe drought.

Inspectors' Work.

The inspections made by the staff number 45,116, exclusive of the inspections of Queensland cattle on the Border—rather more than usual—which include horses, cattle, sheep, dogs, pigs, and inspections of pounds, commons, &c., and in this work Inspectors travelled an average of 4,158 miles each. Nearly 300 prosecutions took place under the different Acts, and 258 convictions were obtained.

Horses.

The number of horses in the Colony at 31st December last, was 466,813, being a decrease of 17,215 on the previous year.

No serious outbreaks of disease have taken place. Blindness in horses again made its appearance in a few districts.

Cattle.

The cattle decreased during the year to the extent of 76,978, and now stand at 1,966,729.

Several districts report pleuro-pneumonia, and cases of tuberculosis have been met with in almost every district, and the cattle have been destroyed.

Tick Plague.

Unfortunately Ticks are making progress towards our Border, having recently been discovered at Brisbane. Every effort is being made to protect our Colony.

Sheep.

The returns show a decrease of 4,365,893 over the previous year.

The large decrease is of course due to the drought, as already stated.

* 57—A

[2,025 copies—Approximate Cost of Printing (labour and material), £47 16s.]

A

A careful classification made of the different breeds shows the total number of merino to be 40,065,936, comprising 29,011,805 combing, and 11,054,131 clothing; long-woolled sheep number 1,223,580; while the total of English sheep and cross-breeds is put down at 3,886,961.

Of all descriptions, the grand total at 31st December last, was 43,952,897.

During the year 136 stud rams and ewes were imported from America and Germany, and passed the prescribed quarantine.

It will be seen that nearly the whole of the sheep are now paddocked, and that their condition is generally reported as improving.

The Lambing.

The actual lambing for the whole Colony is estimated at $43\frac{1}{2}$ per cent. The spring lambing gave $67\frac{1}{2}$ per cent., and the autumn and winter lambing $35\frac{1}{2}$ and 49 respectively.

The Clip.

3,725,278 lambs were shorn in the grease, and 192,224 washed; while 36,206,151 sheep were shorn in the grease. The wool of 2,306,097 was scoured.

The average weights of the clip are estimated as follows:—

							Lambs.	Sheep.
							lb. oz.	lb. oz.
Grease	1 15	5 12 $\frac{1}{2}$
Scoured	1 5	3 4

The total clip for the Colony is estimated at 224,281,646 lb.; being a decrease of 30,594,536 lb. on the year 1896.

Of the total mentioned, 186,407,749 lb. are estimated to have been sent to Sydney, 29,760,856 lb. to Melbourne, 7,957,082 lb. to Adelaide, and 155,959 lb. to Brisbane.

The sheep were comparatively very free from disease during the year. Outbreaks of anthrax still occur in several districts, but owners are inoculating with decided success, and the deaths from this deadly disease are decreasing.

It is very satisfactory to report that the whole of the Colonies, including Tasmania and New Zealand, are now free from scab in sheep, Western Australia being the last to be free from that pest, and it is expected to be officially declared so at once.

Pigs.

The number of pigs in the Colony is 207,738, a number very far short of what there ought to be.

Dogs.

Sixty dogs were quarantined during the year, but of these thirty-six were "ships' dogs," and only remained in quarantine until the ships to which they belonged left the port.

Travelling Stock Reserves.

Owing to the dry season many of these reserves were quite bare of grass, and as the drought assumed serious proportions, travelling in many cases became impossible, and the sheep have perished.

The advisability of withdrawing the principal travelling stock reserves from lease is every day more apparent, and is a subject demanding early and serious consideration.

Registration of Horse and Cattle Brands.

About the average number of brands were registered during the year, and the total number registered since the Act came into force up to 31st December last, was 78,203, and the number of sheep brands were as follows:—Fire-brands, 5,539; tar-brands, 21,099; and ear-marks, 12,583.

Public Pounds.

There are 265 pounds now open, and these are periodically inspected.

Noxious

Noxious Animals.

The receipts under the Pastures and Stock Protection Acts during 1897 reached £35,235 3s. 8d. while the amounts expended by the different Boards in the Colony for scalps of animals destroyed, and other expenses, amounted to £40,340 13s. 11d.

In only three districts were the full rates of assessment levied.

The number of the different animals destroyed, and paid for, is shown in Appendix M to this Report

The Boards are still urging amendments in the Sheep, the Pastures and Stock Protection, and other Acts.

Among the Appendices, some interesting information is given by the Chief Inspector with regard to the Export Trade in Australian Mutton, Experiments in Cross-breeding, Defrosting of Meat, and the provisions of the proposed Amended Brands Bill are fully explained.

A large, elegant handwritten signature in cursive script, reading "W. C. L. Sacklow". The signature is written in dark ink and features a prominent, sweeping underline that extends to the left and then curves back under the main body of the signature.

Under Secretary, Department of Mines and Agriculture.

The Chief Inspector of Stock to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines and Agriculture, Stock and Brands, Sydney, 1st June, 1898.

On the 2nd February last I submitted a Progress Report for the year ending 31st December, 1897, giving the approximate number of the horses, cattle, and sheep then in the Colony; and I have now the honor to submit for your consideration my complete Report for that year on the working of this Branch, which is, as usual, based very much upon Inspectors' estimates, owners still showing very little inclination to furnish data. It will be seen that there is a very large decrease in the number of and descriptions of stock. This, of course, is attributable to the excessively severe drought from which almost every portion of the Colony suffered. There has been no such general drought for more than fifty years. With the exception of a comparatively small part of the north-eastern and north-western portions of the Colony and some portions of Monaro, no part of the Colony escaped. In the Eastern Land Division of the Colony the losses were greatest in the middle portion. In the Central Division, the losses were very heavy, and they were greatest in the southern portion. In the Western Division, the losses were very light in the northern portion, not very heavy in the middle, but very heavy in the southern.

I have, &c.,

ALEX. BRUCE,

Chief Inspector of Stock.

INSPECTION OF OFFICES.

During the year the Office of the Inspector of Stock at Gundagai was visited, and the books, &c., inspected.

Bi-monthly inspections were made by the District Inspectors along the Queensland Border where there are Acting Inspectors.

INSPECTORS' WORK.

The Colony is now divided into sixty-five Sheep Districts, and there are fifty-two Staff Inspectors employed, who have made the following inspections during the year 1897:—

Stock, including horses, cattle, and sheep	24,659	inspections.
Reserves	5,778	„
Public Pounds	483	„
Commons	925	„
Dogs	898	„
Pigs	2,372	„
Under Pastures and Stock Protection Act	6,839	„
Under Public Watering-places Act	1,667	„
Under Diseased Animals and Meat Act	1,495	„
Total	45,116	„

being an average of 867 inspections by each Inspector.

The total number of stock inspected was,—111,738 horses, 852,721 cattle, and 23,877,231 sheep. This shows a decrease of 13,220 horses and 156,803 cattle, and of 259,606 sheep inspected during 1897, as compared with the previous year. This is exclusive of the inspections made by the Inspectors stationed along the Queensland Border.

Homebush Sale-yards.

As usual, the whole of the stock arriving at these yards were carefully inspected on each sale-day by an Officer of the Board of Health and an Inspector of Stock, and a considerable number were condemned as unfit for human consumption. The numbers of stock submitted to auction were as follows:—

Cattle, 112,338 head.

Sheep, 2,574,718 head,—

a weekly average of 2,160 cattle and 49,514 sheep. Compared with 1896, this is an increase of 23 cattle and a decrease of 2,185 sheep per week. These inspections occasionally lead to the detection of stolen stock, as the Inspector's duty requires him to compare the brands and marks on the stock with those in the permits and travelling-statements accompanying them, which are filed in this office for reference by persons inquiring about stock supposed to have been stolen, and the identification of the owners of animals condemned at the abattoirs. Some of the permits and travelling statements collected by the Inspector at Flemington are still imperfect, especially as regards the brands and marks, and are useless in tracing stock or for production in a court of law. If, therefore, this continues, the Inspector will prosecute for non-compliance with the Act and Regulations.

Inspectors' Mileage.

During the past year the staff travelled over a distance of 216,210 miles while on duty, an average of 4,158 each per annum.

Prosecutions

Prosecutions and Convictions obtained.

Under what Act.	No. of Prosecutions.	No. of Convictions.
Diseases in Sheep Acts	60	54
Imported Stock Acts... ..	1	...
Registration of Brands Acts	6	6
Pastures and Stock Protection Acts	174	163
Public Watering-places Act... ..	20	18
Impounding Acts	1	...
Diseased Animals and Meat Act	17	17
Total	279	258

Attention is again called to the neglect on the part of the Pastures Boards to compel defaulting owners to destroy the noxious animals on their holdings. If compulsion after caution was brought to bear on defaulters to a moderate extent by the Boards—and moderate compulsion can hurt no one seriously—simultaneous action would be brought about, and something like value for the money now expended would then be obtained, while the pest would, year by year, be reduced.

HORSES.

The number of horses in the Colony during the thirty-seven years previous to and including 1897 was as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	251,497	1874	334,462	1887	390,609
1862	233,220	1875	357,697	1888	411,368
1863	273,389	1876	366,703	1889	430,777
1864	262,554	1877	328,150	1890	444,163
1865	284,567	1878	336,468	1891	459,755
1866	282,587	1879	360,038	1892	481,416
1867	278,437	1880	395,984	1893	481,399
1868	280,201	1881	398,577	1894	500,068
1869	280,818	1882	328,026	1895	482,459
1870	280,304	1883	326,964	1896	484,028
1871	337,597	1884	337,172	1897	466,813
1872	304,100	1885	344,697		
1873	328,408	1886	361,663		

being a decrease of 17,215 horses on the number returned for the previous year, which is accounted for by the severe drought which prevailed nearly over the whole Colony, less breeding, consequent on low prices, and use of bicycles.

The number of horses as returned in each Sheep District of the Colony will be found in Appendix A, as also the number of cattle, sheep, and pigs.

Breed of Horses.

Under this head the Inspectors' returns give the different breeds of horses as follows:—

	Ordinary.	Thoroughbred.	Total.
Draught	125,234	18,473	143,707
Light harness	108,308	13,758	122,066
Saddle	174,702	26,338	201,040
Grand Total			466,813

Australian and Foreign Horses Introduced and Imported.

Australian Horses—From other Australian Colonies.—By sea: 3 stud horses and 249 other horses. Overland: 25 stud horses, 21 stud mares, and 7,574 ordinary horses; total, 7,872.

Foreign Horses—From Foreign Countries (including Great Britain and Ireland).—During the year 13 horses were imported from England and other countries, and were subjected to the prescribed quarantine of fourteen days in Sydney (except in the case of two lots which arrived without complete certificates,

certificates, when an additional term of fourteen days was imposed, in accordance with Sub-Clause 3 of Regulation No. 33 under Imported Stock Acts) before being allowed to go inland. Particulars as to number and breed of these horses are as follows:—

Name of Importer.	Address.	Where Imported from.	Breeds.

Horses fit for Sale, number Exported, Improvement, &c.

In the several districts of the Colony, Inspectors' reports show that there are 21,948 draught, 21,052 light harness, and 34,238 saddle horses fit for market, while of this number 19,612 are considered suitable for requirements of India and China.

During the year 8,819 horses were exported, principally to India, Victoria, Queensland, New Zealand, Western Australia, Fiji, Java, and the Straits Settlements.

Reports from forty districts say that the horses are improving.

In sixteen districts there is no improvement, while in nine districts they are reported as deteriorating.

Tax on Stallions.

A tax on stallions is still asked for by owners, and in the interest of horse-breeding generally, is I think highly desirable. Stallions should be registered and certified by a Veterinary Surgeon as sound.

DISEASES AND AILMENTS OF HORSES.

Blindness in Horses.

From five districts horses to the number of 500 are reported as having been affected with blindness.

Mr. Veterinary-Surgeon Robinson, after investigating this ailment, came to the conclusion that it was caused by parasites, and prescribed accordingly. His prescriptions, when properly administered, proved successful, and as there has been a recurrence of the disease his prescriptions are given again.

Vermifuge.

Arsenic—5 grains, carefully mixed in (say) 3 lb. bran, and give three doses to each horse at intervals of one week between each dose—each horse to receive 5 grains in each dose; or

Turps and { 3 draughts for each horse at intervals of one week between } 1 pint linseed oil.
Linseed Oil { each draught. } 2 oz. turps.

Tonic.

To follow the vermifuge if the disease has been allowed to make considerable progress:—

Black antimony	2 drams	} 1 dose.
Tartar emetic	1 dram	
Sulphate of iron	3 drams	
Common salt	$\frac{1}{2}$ oz.	
Powdered sulphur	$\frac{1}{2}$ "	

Dose to each horse at intervals of three days for three weeks, to be given in chaff or bran damped.

In the localities in which the horses are attacked, licks of salt and sulphur should be provided for them in troughs in the paddocks, and the horses could be enticed to the licks by a little bran and chaff.

Australian String-halt in Horses.

The horses in seven districts are reported as having been affected with this ailment during the year.

The majority of the horses, however, recovered when the spring set in.

Mr. Chief Veterinary-Inspector Stanley considers this a parasitical disease and is of opinion that the curative treatment is to expel the parasites by the administration of anthelmintics, and dose after dose may be required for this purpose. It is necessary to remember that brood after brood have to be poisoned; and that when they are ensconced in a living being, whose tissues are also liable to suffer from the introduction of drastic drugs, it is impossible to effect our object without perseverance; and to prevent reinfection it is advisable to move the patients to a sound paddock or, better still, into a yard or stable, to feed liberally, and also constantly supply salt with their food.

Preventive measures are very important. With this object, avoid putting an affected animal into a paddock at all favourable for the development of worms. Infected paddocks should not be used by horses, even temporarily; half an hour's grazing may effect them, especially during the spring and autumn. The first grass after summer will scour animals, and has been known to cure them, because at that season the parasites are prepared for exit. Microscopical examination shows one affected animal introduced, though he may be eventually cured, means later on (all circumstances being favourable) a hot-bed of infection or future tenants of the paddock.

Mr.

Mr. Veterinary-Surgeon Robinson is of the same opinion as to the nature of the disease, and prescribes as an anthelmintic and tonic the following mixture viz:—

Common salt	2 lb.
Powdered sulphur	2 „
Black antimony	1 „
Tartar emetic	$\frac{1}{2}$ „
Sulphate of iron	1 „

Doses, divided into ounce-doses and given in the feed, which may be varied by the administration of a draught every alternate day, composed of linseed oil (raw) 1 pint and spirits of turpentine 2 oz.

Influenza.

This disease is reported to have affected the horses in two districts. For its character, symptoms, and treatment see Appendix B.

Ophthalmia.

This disease is only reported from one district during the year. Its nature, and treatment recommended by Mr. Chief Veterinary-Inspector Stanley, is described in Appendix C, and is applicable to all stock.

The Skin disease (*prurigo*) is reported from one district; anthrax from one district; the Bot Fly from one district; ophthalmia from one district.

With the exception of the above ailments the horses throughout the Colony have been exceptionally free from disease during the year.

Owners are cautioned, where their stock are not removed from the paddocks where poisoned pollard is laid for rabbits, that they should see that the pollard pellets are small, as both horses and sheep are liable to pick them up when laid large or in lumps.

The estimated losses in horses during the year from various causes, principally through drought, amount to 25,258.

CATTLE.

The returns of cattle in the Colony during the thirty-seven years ending 31st December, 1897, stand as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	2,271,923	1874	2,856,699	1887	1,575,487
1862	2,620,383	1875	3,134,086	1888	1,622,907
1863	2,032,522	1876	3,131,013	1889	1,741,592
1864	1,924,119	1877	2,746,385	1890	1,909,009
1865	1,961,905	1878	2,771,583	1891	2,046,347
1866	1,771,809	1879	2,914,210	1892	2,147,074
1867	1,728,427	1880	2,580,040	1893	2,155,500
1868	1,761,411	1881	2,597,348	1894	2,290,112
1869	1,795,904	1882	1,859,985	1895	2,023,768
1870	2,195,096	1883	1,640,753	1896	2,043,707
1871	2,014,888	1884	1,425,130	1897	1,966,729
1872	2,287,660	1885	1,317,315		
1873	3,794,327	1886	1,367,844		

From the above it will be seen there was a decrease caused by the great drought of 76,978 cattle during the year 1897, and an increase of 391,242, as against the decennial year 1887.

The number of cattle in each of the Sheep Districts of the Colony will be found in Appendix A.

155,112 cattle were introduced from other Colonies during the year, and 57,782 exported, being an increase in the number introduced over the number exported of 97,330.

Breeds of Cattle.

	Pure and Stud.	Ordinary.	Total.
Shorthorns	49,922	639,758	689,680
Hereford	27,907	182,416	210,323
Devon	10,351	60,115	70,466
Black-polled	1,055	6,000	7,055
Red-polled	58	1	59
Ayrshire	4,937	30,425	35,362
Alderneys	1,544	5,437	6,981
Holstein	93	376	469
Jersey	2,176	9,538	11,714
Crosses (first crosses)	934,620	934,620
Grand Total	1,966,729

The crosses are estimated as follows:—

Shorthorn and Hereford	293,020
Shorthorn and Devon	139,300
Hereford and Devon	59,577
Shorthorn and Black-polled	19,040
Ayrshire and Shorthorn	56,966
Alderney and Shorthorn	582
Jersey and Shorthorn	2,414
Unrecognisable	363,721
Total	934,620

Australian and Foreign Cattle Introduced and Imported.

AUSTRALIAN CATTLE.—*Overland*—151 stud bulls, 33 stud cows, 154,881 ordinary cattle; total, 155,065.

By Sea—47 stud bulls and cows.

FOREIGN CATTLE.—During the year, two shorthorn bulls were imported from England by A. A. Dangar, of Barooka, Whittingham, and passed through the prescribed quarantine of sixty days in Sydney, before being removed inland. The term of quarantine for cattle from England has since been reduced from sixty to forty days.

Increase and Decrease of Cattle in the several Districts.

On reference to the number of cattle returned for each district as given in Appendix A hereto, it will be seen that there is an increase in eighteen districts, which is attributed to the extension of the dairying industry, additional settlement, increased breeding, large numbers introduced from Queensland, and more complete returns.

In the remaining forty-seven districts they have decreased, in some to a very slight extent and others very considerably, through losses by drought and less breeding.

The "Cast" of Fat and Store Cattle.

The estimated "cast" of fat cattle for market during the coming year is 257,366, and store cattle, 229,592. From fourteen districts the fat cattle are principally sent to Victoria; from three districts they are principally sent to South Australia and Tasmania; and the remaining districts supply the markets of Sydney, Maitland, Mudgee, Bathurst, Orange, Goulburn, Tamworth, Albury, Western Australia, and New Caledonia. The principal markets for store cattle are Muswellbrook, Maitland, Goulburn, and Wagga Wagga.

How kept.

The number of cattle kept wholly in paddocks is returned as 1,605,184; on open runs, 226,046; and the balance, 135,499, are depastured both ways.

Improvement and Deterioration.

In forty-two districts the cattle are said to be improving; in nineteen districts they are stationary; and in four districts deteriorating. The principal reasons given for the improvement are—introduction of good stud stock; more attention and care in selection and breeding of stock, more particularly those for dairying purposes; also closer culling and keeping in paddocks. The reason given for deterioration is inattention to breeding, some owners breeding from all sorts without respect to breed or quality, and using the same blood for years.

Their Diseases and Ailments.

Pleuro-pneumonia—Inspectors' reports show that this disease existed in twenty-two districts and that the cattle on 78 runs were affected; while the other districts are reported to be free from the disease. Inoculation was practised on 134 holdings as a preventive with good results in each case.

Cumberland Disease.—From ten districts the number of cattle reported to have died from this form of anthrax is 867.

Symptomatic Anthrax or Blackleg is reported to have carried off 315 head in seven districts.

Cancer and Actinomycosis.—1,606 cattle are reported to have died in forty districts from these diseases.

Tuberculosis.—Cattle to the number of 5,789, suffering from this disease, are reported from forty-two districts as having died or were killed and boiled down.

Red Water.—From one district eighteen deaths are recorded. The disease is prevalent in certain localities in the coast country at particular seasons, more so in spring.

Ophthalmia occasionally assumes an epidemic form, and the number of cattle attacked is in some cases considerable, causing much temporary inconvenience to stock from blindness. Outbreaks have been reported from twelve districts, and the deaths numbered 697. For treatment, see Appendix C.

Poisonous Plants.—From nine districts deaths to the number of 1,440 are reported through eating supposed poisonous plants, but they were, it is believed, due in most cases to hoven, arising from starving cattle gorging themselves with indigestible vegetation.

Tick-fever.—For statement with reference to the steps taken in this Colony to prevent the introduction of Tick-fever, and the progress and treatment of the disease in Queensland, see Appendix D.

Diseased Animals and Meat Act.

The number of cattle condemned under this Act are given in Appendix E, kindly furnished by the Board of Health.

SHEEP.

SHEEP.

The number of sheep in the Colony during the thirty-seven years ending 31st December, 1897, stands as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	6,119,169	1874	22,797,416	1887	46,965,152
1862	6,558,896	1875	25,353,924	1888	46,503,469
1863	7,169,126	1876	25,269,755	1889	50,106,768
1864	9,082,463	1877	21,521,662	1890	55,986,431
1865	9,650,106	1878	25,479,484	1891	61,831,416
1866	11,644,593	1879	30,062,910	1892	58,080,114
1867	15,066,377	1880	35,398,121	1893	56,980,688
1868	16,000,090	1881	36,591,946	1894	56,977,270
1869	16,848,217	1882	36,114,814	1895	47,617,687
1870	16,218,825	1883	37,915,510	1896	48,318,790
1871	16,766,012	1884	31,660,321	1897	43,952,897
1872	17,873,696	1885	37,820,906		
1873	18,990,595	1886	39,169,304		

For number of sheep in the several Sheep Districts, see Appendix A, and Appendix F for different classes of owners and the sheep they own.

Increase and Decrease.

This shows a decrease for the whole Colony of 4,365,893, occasioned by the prolonged drought.

The number of sheep imported during the year was 1,171,794, and the number exported 1,022,295, an increase in the imports over the exports of 149,499 sheep.

In Appendix G there is a statement kindly furnished by the Government Statistician, which accounts for this decrease.

Australian and Foreign Sheep Introduced and Imported.

Australian Sheep Overland from other Colonies.—Stud sheep, 3,288; ordinary, 1,165,859; total, 1,169,147.

By Sea from other Colonies.—2,509 stud sheep were introduced from the other Australian Colonies by sea; particulars of those sold at the annual stud sales are given in Appendix H.

The prohibition against the introduction of stock from Western Australia is now in force only so far as relates to sheep, but it is expected to be shortly withdrawn against them, as that Colony is now said to be free from scab, though not officially declared

Foreign

Foreign Sheep.

During the year, 136 stud rams and ewes were imported from America and Germany, and passed through the prescribed quarantine of sixty days in Sydney, before being allowed to be removed inland.

Particulars as to number and breed of Foreign Imported Sheep are as follows:—

Name of Importer.	Address.	Imported from—	Merino.					
			German.		American.		Total.

The "Cast" of Fat and Store Sheep.

The annual "cast" of fat sheep for the ensuing season is estimated at 4,811,946, and store sheep, 4,587,021.

How Sheep are kept.

Paddocked	43,198,554
Shepherded	195,160
Both ways	559,183
							43,952,897

Condition of the Flocks.

In forty districts the sheep are said to be improving, the principal reasons given being more attention to breeding, paddocking, introduction of high-class rams and ewes, more careful classing and culling.

In seventeen districts they are said to be stationary, and in eight districts they are deteriorating.

Lambing.

From a return of the autumn, winter, and spring lambings obtained from the Inspector for each Sheep District, the average percentage of lambing for the whole Colony is estimated at $42\frac{2}{3}$ per cent., *i.e.*, calculating the number of lambs marked on the number of ewes put to the rams. The spring lambing was the highest, averaging $67\frac{1}{3}$ per cent., while the autumn and winter lambings averaged $35\frac{1}{2}$ and 49 per cent. respectively. The estimated number of ewes put to the ram during the year was 14,782,469, and the number of lambs returned as marked during the autumn, winter, and spring lambings was 6,229,603. The total number of lambs returned on 31st December was 6,379,301, giving an actual percentage of $43\frac{1}{3}$.

*The Clip.**Average per Sheep.*

Lambs.—The number of lambs shorn in the grease was 3,725,278; the number washed, 192,224; total lambs shorn, 3,917,502.

Sheep.—The number of sheep shorn in the grease was 36,206,151; and scoured, 2,306,097; total sheep shorn, 38,512,248.

The average weights of the clip are estimated as follows:—

		<i>Lambs.</i>	<i>Sheep.</i>
		lb. oz.	lb. oz.
Grease	1 15	5 12 $\frac{1}{2}$
Scoured	1 5	3 4

Total Clip.

Total clip in the Colony for the year 1897, according to the number of sheep, would be:—

36,206,151 sheep shorn in the grease; average clip, 5 lb. 12 $\frac{1}{2}$ oz. per sheep	=	209,316,811 lb.
2,306,097 „ scoured „ 3 „ 4 „ „	=	7,494,815 „
3,725,278 lambs shorn in the grease „ 1 „ 15 „ per lamb	=	7,217,726 „
192,224 „ scoured „ 1 „ 5 „ „	=	252,294 „
		224,281,646 lb.

The estimated total weight of the clip as shown above is below that of the previous year by 30,594,536 lb., owing principally to the large decrease in the number of sheep and lambs shorn. This, again, was occasioned by the exceedingly severe drought which affected the greater portion of the Colony. For the same reason the average clip per fleece in grease for sheep and lambs is $7\frac{1}{2}$ oz. lower than in 1896.

Condition

Condition of Clip.

In seven districts the clip is reported as entirely sound; in fourteen districts, from 90 to 98 per cent. is sound; in fifteen districts, from 75 to 90 per cent. is sound; and in remaining districts weak. In a few districts only is the yolk reported to be well up. Although the clip is reported as being very free from burrs and grass-seeds, it suffered to a much greater extent from dust than in the previous year.

Exportation of Clip.

The clip grown in the Colony of New South Wales is shipped principally to England, America, France, Germany, and Japan, and considerable portions of it is so from the ports of the three neighbouring Colonies, as well as from Sydney and Newcastle. The portions of our clip thus shipped from the other Colonies is often mistaken as the produce of those Colonies, more particularly for that of Victoria and South Australia.

The following is an estimate of the clip sent to Sydney, and also the proportion sent across the Border to Melbourne, Adelaide, and Brisbane for the years 1896 and 1897:—

Port of Shipment.	1896.			1897.		
	Greasy.	Washed.	Total.	Greasy.	Washed.	Total.
	lb.	lb.	lb.	lb.	lb.	lb.
Sydney	199,346,896	5,685,757	205,032,653	180,329,890	6,077,859	186,407,749
Melbourne	38,280,139	301,707	38,581,846	28,841,536	919,320	29,760,856
Adelaide	9,220,519	1,901,509	11,122,028	7,207,152	749,930	7,957,082
Brisbane	139,655	139,655	155,959	155,959
	246,987,209	7,888,973	254,876,182	216,534,537	7,747,109	224,281,646

This shows a decrease in the quantity of wool shipped during the year from the Ports of Sydney and Newcastle of 18,624,904 lb., as compared with that shipped in 1896, but the decrease in the quantity of New South Wales wool shipped from Melbourne is proportionately larger.

Classing of Clip.

In forty districts the clip is reported as having been fairly to well classed. In the other districts it is not considered to have been so, the reasons given being, owners consider that it does not pay, that prices obtained are no better, also want of convenience, clips not large enough to warrant expense, and the difficulty of obtaining competent wool-classers.

Wool-presses.

A great number of different kinds of presses are used; those most in favour are Ferrier's Patent, and Williams', and Robinson's; rack screw and pinion presses are used. There is still room for improvement in the mode of pressing, especially by the owners of small clips.

Woolpacks.

The woolpacks used are mostly Calcutta and Dundee, of various sizes, from 4 ft. 6 in. x 2 ft. 2 in. to 5 ft. 3 in., and the weight from 10 to 12 lb.

On fifty-three holdings the wool is dumped before leaving.

Sheep-brands and Marks.

During the year 1897 the number of Sheep Brands and Ear-marks recorded, transferred, and cancelled were as follows:—

Recorded.	Transferred.	Cancelled.	Total Registered.
Fire Brands ... 169	Fire Brands ... 70	Fire Brands ... 70	5,539
Tar do ... 1,051	Tar do ... 169	Tar do ... 163	21,099
Ear-marks ... 751	Ear-marks ... 153	Ear-marks ... 140	12,583
Total ... 1,971	Total ... 392	Total ... 373	Total 39,221

Ear-marking and Tattoo-marking.

In all districts the system of ear-marking sheep is now generally carried out, and the system of tattoo-marking is mostly used by owners of stud-sheep, not as yet to any great extent in the case of ordinary flock sheep, but where tried it has been found to be a good preventive of sheep-stealing.

Destruction of Wool by Tar and Paint Brands.

Buyers still complain of the destruction to wool by the use of the above materials for branding purposes; but as yet it has been found impossible to find any pigment or other material for branding sheep which will be sufficiently legible and lasting and not damage the wool. As this is the case, the only course for owners to adopt is to put as few paint brands as possible on their sheep, and see that the branding is carefully done.

DISEASES

DISEASES IN SHEEP.

Scab.—The flocks in this Colony and in the Colonies of Queensland, Victoria, South Australia, New Zealand, and Tasmania are free from scab; and Western Australia may now also be considered clean, as no case of scab has been met with in that Colony since May, 1895, and it is expected to be soon officially declared clean.

Anthrax.—This disease appears to be increasing, and owners are now availing themselves of the facilities offered for vaccinating their sheep, which has been the means of lessening the great mortality previously suffered by them. A statement (Appendix I) is attached showing the vaccinations made and the results.

At the request of the Council of Advice inquiries have been made with a view to purchase the secret of preparing Anthrax Vaccine, and placing it at the disposal of owners at a very reasonable cost, but so far the negotiations which have been renewed have not been successful.

The Minister has also under consideration the expediency of placing a sum on the next estimates to provide the necessary salary for a bacteriologist for the department, who, in addition to preparing the virus of pleuro-pneumonia and the vaccine of anthrax and other diseases, would be prepared to investigate and report on outbreaks of diseases in cases where the veterinary authorities were in doubt.

Foot-rot.—Five districts report foot-rot among the sheep, but only to a slight extent, the past season not being favourable to its spread. Remedies for foot-rot will be found as Appendix J.

Fluke.—Owing to the dry season this disease also has been less prevalent than in previous years. The losses from fluke reported from thirteen districts amount to 44,300.

To prevent its spread, owners are again urged to free their land from surface water by running plough furrows where practicable and helping them with the spade. The preventives used by owners were salt, tar, and turps, sulphate of iron and Liverpool salt, and salt and sulphur.

Parasitic Worms.—Twelve districts report the sheep as having been infested with worms to the extent of about $\frac{1}{2}$ per cent.; in seven districts the sheep were infested with stomach, lung, and tape worms; five districts with stomach and tape worms; in one district with stomach and lung worms; and in two districts with stomach-worms only.

The following results have been gathered regarding the efficacy of the various drenches and licks used for sheep for worms:—

Drenches.

Arsenic.—For the stomach and tape worms the arsenic and soda drench is still reported as the most effective, and has been by far the most generally used. It has, however, been recommended that potash, as being less severe on the lining of the stomach, should be substituted for soda in its preparation. The arsenic and soda drench is reported by several of the Inspectors as having been also efficacious for lung-worms. No authenticated information has been received of this drench affecting the health of the sheep or injuring the wool.

Turpentine.—Turpentine, with various mediums, has been very generally given for stomach, tape, and lung worms, with good results, when repeated.

Hayward's Specific is reported as having given satisfactory results where used.

Pottie's, Weaver's, and Walsh Bros.' Drenches are reported to have been used in a few districts with fairly satisfactory results.

H. C. Suttor's Drench is said to be, by persons using it, very good.

While it can be said that a decided improvement follows the administration of most of the drenches generally used, it is a fact that even in the case of the most effective the *post-mortem* examinations disclose that generally where the sheep are at all badly infested some worms are still alive; and this again, it is believed, arises from the owners delaying too long in drenching, and allowing the worms to have too great a hold on the sheep before they are drenched. The consequence is that some worms are left, which keep the sheep from thriving, and, with the introduction of fresh eggs from the water and pasture—if the weather is at all favourable for the development of the worms—in the course of a few months the sheep are as bad as they were before they were drenched. To make the cure effective, therefore, sheep which have been badly infested should, on receiving one drench, be kept as near the drenching yards as possible, and receive a second drench in the course of twelve or fourteen days after the first.

But, while licks and drenches should be provided and given at as early a date and as often as required, owners should give their earnest attention to the removal of what may be termed the contributing causes of the pest by avoiding overstocking, attending to the proper nourishment of the lambs and weaners, burning off old pasture, and getting rid by draining of surface and stagnant water, as suggested in Vol. II, part 2, of the *Agricultural Gazette*.

A specific supplied by Mr. L. G. Jones for fluke and worms, strongly recommended by several owners, was carefully tested at Sutton Forest last year, but proved to be ineffective.

Licks.

It is reported that the following licks have been used with good results:—

Salt and sulphur.	Salt, sulphate of iron, and Hayward's Specific.
Salt and sulphate of iron.	Salt, tar, and turpentine.
Salt and turpentine.	Pottie's Preventive Lick.
Salt, sulphate of iron, and turpentine.	Salt and lime.
Salt, sulphur, and sulphate of iron.	Salt, sulphur, and lime.

It is scarcely necessary to point out that a lick, if it is efficacious in warding off an attack of worms, is far preferable to a drench; and as owners in all but the true saltbush country are now aware that it pays them well to give their sheep a liberal supply of salt, it would add very little to the trouble or expense to give once a month with the salt some of the other ingredients here mentioned which they found from experience was to any extent effective in protecting their sheep from the worm-pest.

The following further progress report of his investigations in regard to fluke and worms in sheep has been received from Dr. Cobb:—

Department of Mines and Agriculture, Sydney, 23rd April, 1898.
THE results of the work in connection with the parasites of stock upon which I have been engaged in years past, and to which reference has previously been made in the Annual Reports of the Stock Branch, are now in course of publication in the *Agricultural Gazette* of New South Wales. About one hundred pages, with several hundred illustrations, having already appeared. I am sorry to say that some of the matter, which is of much practical interest, will have to suffer some further delay in order to put the result on a sound scientific basis, but this delay will not be protracted a day longer than necessary.

There is a good demand for the opening part of the chapter on the Sheep Fluke, which appeared in the *Gazette* for the month of March. It has been favourably received in many parts of the world.

The chapter on round-worms appeared in the *Gazette* for April, and has been issued in the hope of inaugurating an Australian school of experts in this important group of parasites.

N. A. COBB.

Sheath Disease in Wethers.

A considerable number of fresh outbreaks of this disease have been reported during the year.

Full particulars as to the nature of the disease, its treatment, and prevention, as furnished by Mr. Veterinary-Surgeon W. Scott, will be found in my Annual Report for 1895, as Appendix H.

PIGS.

On 31st December, 1897, the number of pigs in the Colony stood at 207,738, being a decrease of 6,852 on the returns for the previous year.

Five thousand two hundred pigs were introduced by sea and land from the other Australian Colonies and England.

Six thousand three hundred and ninety-two pigs were exported during the year.

Twenty-two ships' pigs were killed on board, as the owners would not quarantine them.

The latest reports with respect to swine fever shows that there has been a decrease in the number of outbreaks in Great Britain and Ireland during the year 1897 as compared with previous years.

DOGS.

Twenty-four dogs which arrived from England and other places outside the Australian Colonies passed through quarantine during the year.

Thirty-six "ships' dogs" were quarantined during the stay of vessels in port, and seven "ships' dogs" were destroyed.

All "ships' dogs" and other stock on board foreign vessels for the use of the passengers and crew are now quarantined during the stay of the vessel to which they belong in port, whether in Sydney or at Newcastle.

Four hundred and two Colonial dogs were introduced at the Port of Sydney from the other Colonies, and 304 dogs were inspected prior to exportation.

Diseases in Dogs.

Although rabies is reported as having decreased in the United Kingdom during the past year, the returns for that period are considered as anything but satisfactory.

TRAVELLING STOCK (*Reserves, Roads, Tanks, Wells, &c.*).

Trespass on Reserves.

In thirty-two districts the travelling stock and camping reserves are reported as having been trespassed upon, generally only to a slight extent, and in thirty-three districts they are reported as being free from trespass.

From thirty-six districts it is reported that 2,517,641 sheep have travelled through during the year in search of grass and water. From twelve districts the number of loafing sheep is given at 156,296.

Owing to the continued drought the number of sheep on the road were more than double that during the previous year, and the reserves, where leased to adjoining holders, have been found quite inadequate for this extra traffic, owing to the lessees constantly feeding their stock on them.

The remedy for this would be to set apart, say 8-chain wide, droving roads, with areas at certain distances, solely for travelling stock, and to have them securely enclosed and placed under caretakers. To meet the expense attached to such a proposal a small charge could be made on all stock using these reserves—the stock in the outlying districts being charged at a reduced rate.

The Stock Boards Council of Advice have taken up this matter with a view to the stock traffic and the reserves being placed on a more satisfactory footing.

Marking

Marking of Travelling Stock and Camping Reserves.

Fair progress has been made with regard to the marking of travelling-stock and camping reserves, the system of which is shown as Appendix K, there being at present about 1,380 miles surveyed and about 100 miles in course of survey. The routes marked are:—

1. From Boggabilla, *via* Yetman, Warialda, and Cobbadah, to Breeza.
2. From Moree, *via* Millie, Narrabri, Boggabri, Breeza, and the Liverpool Range, to the Bulga Mountains.
3. From Walgett, *via* Coonamble and Mendooran, to Uarbry.
4. From Coolah, *via* Uarbry, to Rylstone.
5. That portion passing through Terry-hie-hie Holding.
6. From Boggabri, *via* Turrabeile or Cox's Creek, to Coolah.
7. Mungundi to Moree.
8. Along the Mara Creek from the Barwon River upwards.
9. Along the Bogan to travelling stock reserve on the Murda Creek.
10. From Breealong to Dubbo.

In course of marking:—

That from Jennings to Tamworth.

With a view of making these surveys of practical benefit to drovers, stock-owners, and others, lithographs are being prepared showing sections of the roads in lengths of between 20 and 30 miles.

Lithographs of the roads, Boggabilla to Cobbadah, in six (6) sections; Moree to Cobbadah, *via* Gurley Holding, in one (1) section; Walgett to Uarbry, in five (5) sections; and Liverpool Range to Putty, in five (5) sections, are now on sale at the Head Office, and also at the local Stock Offices, at 2s. per section. These Lithos can be obtained at the Lands Office, Sydney.

New Stock Roads required.

In fourteen districts new roads are required for travelling stock, and to obtain these action has been already taken in five districts.

New Stock Reserves required.

In thirteen districts new reserves and alterations of existing ones for travelling stock are required. In fifty-two districts there are sufficient reserves; but in a great many cases the reserves are under annual lease, and are, therefore, kept very bare of feed.

New Wells, Tanks, or Dams.

In twenty-two districts the inspectors report that new wells, tanks, or dams should be constructed by the Government at places which they indicate.

REGISTRATION OF HORSE AND CATTLE BRANDS.

Brands registered.

The number of horse and cattle brands registered up to 31st December, 1897, was 78,203. The number of brands registered during the year 1897 was—Horse brands (alone), 194; cattle brands (alone), 385; and horse and cattle brands, 940; making a total of 1,519.

This shows a decrease of 67 in the total number of brands registered during the year as compared with 1896. There is also a decrease in the number of brands transferred and cancelled.

Brands transferred.

The brands registered during the year 1897 as transferred were—Horse brands, 18; cattle brands, 27; horse and cattle brands, 90; total, 135—being a decrease of 8 on previous year.

Brands cancelled.

The brands cancelled (horse and cattle) in 1897 were 165.

Addresses changed.

The number of addresses of owners changed in 1897 was 75.

Compliance with the Act.

In all the districts the provisions relating to registration and the other requirements of the Act are reported as being fairly carried out.

Benefits of the Act.

The inspectors, in alluding to the benefits of the Act, report that it prevents duffing, stock-stealing, facilitates identification, assists in recovering lost stock, and otherwise is a great convenience and protection to stock-owners.

In accordance with the arrangement come to by the Ministers of Agriculture for the several Colonies, the draft of a Registration of Brands Bill has now been framed, and copies have been forwarded to the other Colonies for consideration; copies have also been submitted to the Council of Advice, and to the Pastures Boards for any remarks they have to make. Explanations of the provisions of the Bill will be found under Appendix K.

POUNDS.

POUNDS.

Number and Inspection.

At the end of the year there were 265 pounds in operation in the Colony, 35 have been closed for want of poundkeepers, and there are sites set aside for the establishment of 174 more as occasion requires. The whole of the pounds are inspected periodically by the Stock Inspectors.

State of Yards.

Forty-three of the pound-yards are reported to be old; some require renewing, being unfit for the safe custody of stock; while others need repairs. The remainder are said to be in a fair and good condition.

Keeping and Depasturing Pound Stock.

The provision for the proper sustenance of impounded stock, which has to be made by the Poundkeeper at his own expense, according to the reports received, is satisfactory. As a rule, poundkeepers have now paddocks for the stock.

Management of Pounds.

The poundkeepers are reported to be performing their duties, upon the whole, in a satisfactory manner, and the appointment of inspectors of stock as inspectors of pounds has had a very beneficial effect.

NOXIOUS ANIMALS.

The Districts in which the Pastures and Stock Protection Act is in force.

The Act has been brought into operation in all the districts, and during the year work has been done to the extent shown in Appendices L and M.

Receipts and Expenditure under the Act.

The amount of assessment paid by stock-owners in 1897 was £35,235 3s. 8d.; and the amount expended £40,340 13s. 11d. Seven districts are reported to be in debt to the amount of £635 8s. 10d.

In four districts full rates were levied, in fifty-seven districts less than full rates, while in four districts no rates whatever were levied.

During the year the bonuses paid by the Boards for scalps ranged as follows:—For kangaroos, from 1½d. to 6d.; kangaroo rats, ½d. to 3d.; wombats, 6d.; wallaby, from 1d. to 3d.; paddymelon, from 1d. to 3d.; bandicoot, ¼d. to 3d.; hares, from 1d. to 6d.; native dogs, from 5s. to 40s.; pups, 2s. 6d. to 15s.; opossums, ¼d.; wild pigs, 3d. to 6d.; eagle-hawks, 2d. to 2s. 6d.; emus, 6d.; crows, ½d. to 6d.; foxes, 5s. and 30s.; and flying-foxes, 1d.

Increase and Decrease.

Kangaroos are reported to be increasing in eleven districts, wallabies in fifteen districts, native dogs in fourteen districts, hares in fourteen districts, and wild pigs in six districts. In twenty-five districts kangaroos are reported to be decreasing, wallabies in twenty districts, native dogs in seventeen districts, hares in fifteen districts, and wild pigs in six districts.

Number destroyed.

The number of kangaroos destroyed during the past year was 27,422; of kangaroo rats, 238,822; of wallabies, 1,118,473; of wombats, 318; of bandicoots, 800; of paddymelons, 198,043; of wild pigs, 9,524; of hares, 599,595; of foxes, 532; of native dogs, 13,264; of opossums, 3,702; of eagle-hawks, 6,502; of crows, 52,682; of emus, 1,575.

Steps taken for their destruction.

In the majority of the districts, hunting with dogs, drives, shooting, trapping, and poison have been adopted with satisfactory results. In forty-two districts poison has been used, mostly for dogs, with fair to best results, and from eight districts it is reported that the results have not been satisfactory, the dogs being too cunning to take baits.

AMENDMENTS SUGGESTED IN THE ACT BY THE BOARDS.

The agitation for the passing of the Stock and Pastures Bill still continues, and among other amendments in the law asked for it is suggested that uniform rates of assessment and bonuses should be fixed; that bonus be paid for rabbit scalps; that all assessment be paid into a general fund; that the Government should contribute a higher rate of subsidy to the funds of the Boards; that Section 6 of the Pastures and Stock Protection Act Amendment Act of 1881 be amended; that rabbits be declared noxious animals; that the Boards should have the administration of the Rabbit Act; and that a measure should be passed dealing with noxious weeds and plants. Owners should be compelled to lay poison for noxious animals; triennial elections of directors; compulsory bonus for all noxious animals.

LOSSES FROM NATIVE AND TAME DOGS.

The losses through native dogs for the year are estimated at 172,571 sheep, valued at £39,164; and from tame dogs 78,901 sheep, valued at £18,503; making a total loss of £57,667. A stricter enforcement of the law with respect to stray dogs, and the registration of dogs, are urgently required.

COMMONS.

COMMONS.

There are now 353 Commons in the Colony, the average acreage of which is about 4,000 each.

Number of Commoners, Stock, &c.

The average number of Commoners to each Common is estimated at ninety, and the average number of stock kept on each Common at 150.

Many of the Commons are unfenced, consequently are trespassed upon by travelling and other stock.

MISCELLANEOUS.

Cultivated Grasses.

In thirty-two districts cultivated grasses have been sown for pasture during the year, the most successful being lucerne, prairie, rye grass, and Burnett grass.

Number and Division of Runs.

The number of open or unenclosed runs in the Colony is 3,848; the number enclosed is 39,817; the number partially sub-divided is 15,359; and the number properly sub-divided is 22,767.

Improvements, Fencing, Dams, Tanks, and Wells.

The number of miles of fencing throughout the Colony is estimated as follows:—728,925 miles without wire netting, at an average cost of (say) £37 6s. per mile, amounting to £27,194,652, and 44,868 miles with wire netting, average cost at (say) £66 7s. per mile, amounting to (say) £2,977,150.

The number of dams used for stock purposes is estimated at 52,919, at an average cost of (say) £49 19s. 6d.; number of tanks, 50,105, at an average cost of £152 11s. 6d. each; and the number of wells used is estimated at 8,885, at an average cost of £105 7s. 6d. each.

Cost of fencing, £30,171,802; cost of dams, £2,644,637; cost of tanks, £7,644,641; cost of wells, £936,244; making a total of £41,397,324, as representing the amount expended by way of improvements, &c.

Plants and Weeds.

Prevalence.

In eleven districts *trefoil burr* grows to a very large extent; in nine districts, to a considerable extent; in twenty-two districts, to a slight extent; and in twenty-three districts there is none reported.

In thirty-four districts *variegated thistle* is reported to a slight extent; in nine, to a considerable extent; in four, to a very large extent; and eighteen districts are reported as free from it.

In thirty-one districts *black thistle* is reported to a slight extent; in eleven, to a considerable extent; in four districts, to a very large extent; and nineteen districts are reported to be free from it.

In five districts the land is reported as being infested to a very large extent with *Bathurst burr*; in fifteen districts, to a considerable extent; in thirty-four districts, to a slight extent; and in eleven districts the land is not infested.

In twenty-seven districts other noxious weeds grow to a slight extent; in eleven districts, to a considerable extent; in eleven districts, to a very large extent; and in sixteen districts there is none reported.

Legislation for Noxious Weeds.

Legislation is urgently required for dealing with noxious weeds and plants, more especially the *Bathurst burr*, the prevalence of which is inflicting very serious loss on travelling stock. A Bill has been prepared by the Minister for Lands to deal with the matter.

Cost of clearing Commons, Reserves, &c., of Weeds.

The cost of clearing the Commons of noxious weeds throughout the Colony is estimated by inspectors at £23,830; the police paddocks, £2,022; the travelling stock reserves and driving roads at £117,226; amounting in all to (say) £143,077.

PREVENTION OF SCAB IN SHEEP ACCOUNT.

A detailed statement of receipts and expenditure by the Department in connection with the above Fund for year 1897 will be found in Appendix N hereto, and will be published annually in the same form.

For statement of the salaries paid to the different inspectors from the above account see Appendix O.

DISEASES IN STOCK IN THE UNITED KINGDOM.

It will be seen by tabulated statement under Appendix P that there was a very considerable decrease during the year in infectious and contagious diseases in Great Britain and Ireland.

The following is a Statement of the Boiling-down, Chilling, Freezing, and Preserving Works in the Colony and of their Capacity, and the Work done during 1897.

THE LIVE STOCK EXPORT TRADE.

There appears no prospect of a revival of the live stock trade at the present prices at Home, on account of the heavy expense of freight and forage, and the risk of loss on the voyage.

EXPORT OF CHILLED MEAT TO LONDON.

Some further attempts have been made during the year to send meat in a chilled state to England, but I regret to say that none of them have been attended with success.

DEFROSTING OF MEAT.

While this process is still carried on, and, apparently, with good results where the meat is prime, the practice does not seem to be extending.

This is one of the matters which the Export Board should, it is thought, take up, now that they have command of Refrigeration, with the view to ascertain how defrosting can be best and most economically carried out, and whether it would pay to defrost our meat before placing it on the London and other markets.

THE EXPORT TRADE IN AUSTRALIAN FROZEN MUTTON.

Our export trade in frozen mutton in 1897 has again been anything but a profitable one.

This has arisen from several causes:—

- (1.) The continued increase in the quantity of frozen mutton placed on the markets of the United Kingdom. The number of carcasses imported in 1896 was 5,647,418, while in 1897 there were landed 6,184,964, being an increase of some 550,000 carcasses, and causing glutted markets and low prices. This increase came from New Zealand, to the extent of about 500,000 carcasses, and from South America of, say, 300,000, while there were 250,000 less from Australia.
- (2.) The effect of the engineers' and other strikes in Great Britain and Ireland.
- (3.) The effect of the drought in the Australian Colonies on the quality of the mutton.
- (4.) The damaged condition in which the mutton frequently arrived.
- (5.) The fall in the price of second-class New Zealand mutton.

While, again, this is the case, the disheartening difference between the prices of Australian mutton and New Zealand still continues, as will be gathered from the following statements of the average annual prices of the two descriptions of mutton, compiled from the figures appearing in Messrs. W. Wedell & Coy.'s last annual review of the frozen meat trade:—

1895, January.—	New Zealand mutton,	3 $\frac{7}{8}$ d.	;	Australian,	2 $\frac{3}{8}$ d.	;	difference per lb.,	1 $\frac{1}{2}$ d.
1896, " "	" "	4 $\frac{3}{8}$ d.	;	" "	2 $\frac{3}{8}$ d.	;	" "	2d.
1897, " "	" "	3 $\frac{7}{8}$ d.	;	" "	2 $\frac{3}{8}$ d.	;	" "	1 $\frac{1}{2}$ d.
1897, December.—	" "	3 $\frac{3}{8}$ d.	;	" "	2 $\frac{3}{8}$ d.	;	" "	$\frac{7}{8}$ d.

These figures show that, taking the average annual prices of New Zealand and Australian mutton, there is more than 1 $\frac{1}{2}$ d. per lb. difference in favour of the New Zealand; and recent London cable quotations in the daily press give Canterbury cross-breds as worth 3 $\frac{1}{8}$ d. per lb.; Dunedin and Southlands, 3 $\frac{3}{8}$ d.; and North Island, 3d.; while Australian mutton (cross-bred or Merino wethers) is quoted at 2 $\frac{3}{8}$ d. per lb. for heavy (over 50 lb.), and the same price is quoted for light (under 50 lb.).

Some years back there was perhaps reason for this great difference, as the Australian sheep were then almost wholly merinos; but as there is now a great deal of cross-bred mutton shipped from this Colony and Victoria, the same difference ought not to exist.

It still, however, does so; and this is only what is to be expected so long as our cross-breds are mixed and sold with the merinos in the London and other markets. While they are dealt with in this way, and no separate quotation given of the prices made by our cross-breds in these markets, there is nothing to show our owners that they do any better in breeding cross-breds than merinos; and all the time the New Zealand breeders are making 1d. per lb. more for their sheep (which are, as a rule, cross-breds) than we are.

As this is the case, it is most essential that our sheepowners who are breeding or intend breeding cross-breds should learn the reason why the difference exists; and this, again, they can never really do unless the Australian cross-breds are sold as such by themselves, and their defects, as compared with the New Zealand sheep, clearly pointed out.

I would, therefore, suggest that the attention of the companies now freezing and shipping on owners' account should be called to the matter, and that they be invited, in the interest of our owners who are breeding cross-breds, and of that of the Colony generally, to put the cross-breds on the market as such, get a report in what way they are defective, and thus obtain the information which our breeders of cross-breds so urgently require to enable them to compete successfully with New Zealand

Although there is little prospect of any decrease in the importation of frozen mutton into the United Kingdom, and of relief coming to our sheepowners in that way, still it is believed that, with greater care in breeding, fattening, and slaughtering our sheep, and especially in breeding a larger number of

of cross-breds where the country and circumstances are at all suitable, and making them really prime at an early age, better prices will be obtained, and that our trade in frozen meat will increase and extend. The fact that an increased percentage of Australian mutton is now disposed of in the provinces without passing through the Smithfield market is also encouraging.

The following *pro formá* account sales of a prime fat 20 months old wether and a prime 4½ months old milk cross-bred lamb is published for the information of our breeders of cross-breds:—

Cross-bred Wether.

	£	s.	d.

Notes by the Chief Inspector of Stock on the Report by Messrs. Wedell & Co., London, on the Sheep exhibited at Sheep Breeders' Association Show in July, 1897, for the Export Prize, and consigned to them through the Pastoral Finance Company of Sydney.

This report practically confirms that kindly obtained by the Colonial Consignment and Distributing Company on the sheep exhibited at the Metropolitan Show of 1897, so far as regards the most desirable weights of sheep for the London market, *i.e.*, that the sheep exhibited at our shows for export are a good deal too heavy, and some of them too fat; and if it had not been for the course adopted by Messrs. Wedell & Co. with the sheep, of storing them for about four months, till Christmas, when big, over-fat sheep are in demand for display in the butchers' shops, the prices realised would not have been nearly so good as they were.

While, however, the agents thus looked well after their constituents' interest in taking that course, they, to a considerable extent, defeated the object for which the prizes were offered, and prevented the test from being carried out as intended through not disposing of the sheep on arrival in the ordinary market, and keeping them for a market which only occurs once in twelve months.

As they felt called upon to deal with the sheep in that way, Messrs. Wedell & Co., with the view to our owners not being misled as to the proper class of sheep to ship for the London market, have taken the trouble to give a double quotation—that of the special price they realised in the Christmas market, and the price which they would have brought had they been offered at any other time than at Christmas, *i.e.*, their intrinsic value.

The accompanying tabulated statements, A, B, C, show how this stands, and the substance of Messrs. Wedell & Co.'s remarks on the several lots given in these statements show also how far the sheep are suitable for the Home markets, and the reasons why they are so. They omit, however, two very material pieces of information, so far as the Breeder is concerned—*i.e.*, the most saleable age and most saleable weight at which the sheep should be put on the market. No doubt it can be gathered from the Messrs. Wedell & Co.'s remarks generally, and particularly on lots 15 and 16 of the cross-breds (which averaged more than 70 lb.), that when sheep exceed a certain weight and fatness, their doing so entails a reduction in the price per pound; but their remarks convey no definite instructions on these important points, such as were given in the elaborate and valuable report furnished by the Colonial Consignment and Distributing Company, and since published and distributed throughout the Colony on the sheep shown at the last Metropolitan Exhibition, including those from the Experimental Farm, Bathurst. That report, which conveys the opinions of six leading meat experts in London, gives very pointed directions in regard to these matters, and shows owners how very important it is that they put their cross-breds on the market at the right age and weight, as well as in prime condition. In order to still further impress on owners the necessity for attending to the instructions given by these experts, backed as they are by the report here under consideration from Messrs. Wedell & Co., the following comparative statements of the average intrinsic value of the five different crosses from the Bathurst Farm exhibited at the Metropolitan Show of 1897, and of the sheep from the Sheepbreeders' Show referred to in that report are here given.

---	----------------	----	------	-------	----------	-------	----	-------	-----	-------	-------	-----	---

Cross-breeds from Bathurst Farm and from Sheep-breeders' Show compared.

Bathurst Farm Cross-breeds.—These sheep were 17 months old, and averaged 59 lb. 9 oz. Their average intrinsic value, according to the London experts, was 3½d. per lb., or per sheep, 12s. 11¼d.

Cross-breeds from Sheepbreeders' Show.—These sheep, which were, it is believed with one exception, Lincoln and Merino crosses, were from 2 years to 2 years and 3 months old, and averaged 61 lb. 5½ oz., while their average intrinsic value, according to Messrs. Wedell & Co., was 2¾d. per lb., or per sheep, 9s. 11d.; *showing a difference in favour of Bathurst Farm sheep of 3s.*

This shows that the Bathurst Farm sheep were very much more suitable for the London market than those exhibited at the Sheepbreeders' Association Show, and they were so for the following reasons:—(1) They were younger sheep; (2) they were more suitable weights; (3) they were better shapes; (4) they were better quality of mutton.

(1.) *The Age.*—In the London market the younger the mutton is, provided it is in prime condition, and not too fat, the better price it brings, because it is tender and juicy. In confirmation of this, Mr. J. G. Gray, Kentucky, Corowa, last year netted 10s. 2d. for 12 to 13 months old cross-bred Tegs, averaging 41½ lb., which were slaughtered and frozen at Deniliquin, and shipped to London on his own account. They made 3'98d. per lb. in the market.

(2.) *The Weight.*—What purchasers in the Flemington market, as a rule, mainly look for is plenty of weight, and at the price they usually pay, the larger and fatter the sheep, the better it suits them. It is different in the London market; there the shapes of the sheep and the quality of the mutton are everything. Although the average weight of the Bathurst Farm sheep was a moderate one, some of them were considerably over that weight, and in that way made the intrinsic value less than it would otherwise have been, especially as the majority of the London experts stated that they preferred an average of 55 lb.; that is, sheep from 52 to 58 lb.

(3.) *The Shapes.*—The fact that two out of the five crosses were by South and Shropshire Down rams, and the three by a Cheviot, which are the very best shaped mutton sheep, accounts for the superiority of their shapes. But, so far as regards shapes, there is no doubt the second cross, provided that the ram put to the first cross is one of the breeds here mentioned, would produce the best shaped sheep for the London market, as well as a high quality of mutton.

The continued cry with the London salesmen is to get rid of the sharp shoulder, narrow, poorly-covered loins, and scraggy leg of the merino.

This is all right, but, of course, the question of how far this would suit the wool, has to be worked out and considered.

(4.) *The Quality of the Mutton.*—There can be no question but the quality of the majority of the Bathurst Farm crosses was much higher than that of the sheep exhibited at the last Sheep-breeder's Association Show.

Next, perhaps, to Welsh mutton, the Cheviot brings the highest price in the London market; the Southdown the next; and the Shropshire the next; while the Romney Marsh was also fairly appreciated. The Lincoln cross (of which the sheep from the sheep-breeders' Show almost wholly consisted) was the least appreciated of any of the crosses.

CROSS-BREDS ON THE BATHURST EXPERIMENTAL FARM.

An exhibit of eighty lambs from these cross-breeds was shown at the Metropolitan Exhibition as non-competitive made up of eight different crosses, viz., Southdown, Shropshire, Border Leicester, Romney Marsh, Dorset Horn, English Leicester, Lincoln, and Cheviot, from Merino ewes, and were between 4 and 5 months old. They were shown at a disadvantage; for, through alterations which were being carried out at the Farm, the ewes had to be sent away for pasture which latterly failed, and the lambs were not in a condition to ship. Still, they have, even in this state, done a good deal towards the settlement of one of the principal questions for which these experiments were initiated—which is the best cross for the production of fat lambs for export—for it has shown which was the best breed under an unintentionally severe test. Two lambs were selected from each of the different crosses and killed, and the average weight of the two lambs of each cross will be found in the appended statement. It will be seen from this statement that the Shropshire and Southdown crosses make the best shaped, best fleshed, and earliest maturing lambs. While this is the case there is no question as regards quality of meat and the value of the lambs in the London market. These "Down" crosses stand highest, and will bring the best prices both in the city and provinces. Lambs in the English markets must be milk lambs, not more than 5 months old, and from 32 lb. to 38 lb., or perhaps 40 lb. These conditions, well-bred Southdowns and Shropshire cross lambs would on good feed readily fulfil, and if the natural pasture is supplemented by giving the ewes a run now and then on lucerne or some other cultivated food, the lambs of these crosses would be prime at 4 months, and of the weights mentioned.

Statement of average weight of crosses:—

	lb.	oz.
Southdown and Merino	35	0
Shropshire Down and Merino	33	8
Border Leicester and Merino	31	4
Romney Marsh and Merino	30	8
Dorset Horn and Merino... ..	30	0
English Leicester and Merino	29	12
Lincoln and Merino	29	4
Cheviot and Merino	26	12

THE STOCK BOARDS COUNCIL OF ADVICE.

This council which consists of nine members, three of which are selected from each of the land divisions of the colony, is doing useful work. It has had under consideration many very important matters, and although not much progress has been made in obtaining the amendment of the Acts which they have been urging on the Government, the opinions of the Boards on these questions have been ascertained and a great deal of valuable materials have been collected which will be turned to account in preparing the measures which are being framed to carry out these amendments, and will be ready to be submitted to Parliament when the opportunity occurs; and there is no doubt that the experience and advice of its members will be of much assistance to the Department and the Minister.

The following are some of the matters which the Council of Advice have had under consideration:—

- (1.) The framing of rules for the guidance of the Council of Advice.
- (2.) The regulation and supervision of travelling stock and the imposition of travelling charges to be paid by the drover.
- (3.) The notification, management, and cancellation of travelling stock reserves, and placing them under the supervision of the Stock Boards.
- (4.) The notification and management of Public Watering Places.
- (5.) Amendment of the Sheep Acts, including assessment on large stock, eliminating the 40-mile limit, providing for bond for travelling charges, &c., &c.
- (6.) The amendment of the Pastures Act.
- (7.) The payment of a reasonable subsidy by the Government for the destruction of noxious animals.
- (8.) The prevention of stock stealing.
- (9.) The stricter enforcement of the Dog Act.
- (10.) Additional legislation for preventing the introduction of tick fever.
- (11.) The purchase of the secret of production of reliable vaccine of anthrax.
- (12.) The payment of 1s. per head on cattle sold at Homebush, to provide funds for compensating purchasers of stock which were found when slaughtered to be diseased.
- (13.) The disease and extent of disease which should make an animal or carcase liable to be condemned.
- (14.) The formation of the Stock Board Convention.

In addition to the advantages arising from the action of the Council in regard to the matters here alluded to, another most important benefit is accruing from these annual meetings of delegates and the election of the Council of Advice. Stockowners as a class are drawing closer together, and a spirit of union and co-operation is being fostered among them, which must result in their advantage and the good of the Colony; and if the proposed Stock Board Convention is formed, as it is believed it will be, these advantages will be still further increased and confirmed.

APPENDIX A.
RETURN of Stock in the several Sheep Districts.

Districts.	Year 1896.					Year 1897.

APPENDIX B.
INFLUENZA IN HORSES.

(By E. Stanley, F.R.C.V.S., Government Veterinarian.)

Character.

It is a contagious equine fever, due to germinal matter invading the system, producing disastrous changes in the blood, which interfere with nutrition, excite congestion, and occasionally inflammation of important organs or tissues.

The germs of this disease are always lurking about, and epidemics are due to exceptional climatic changes that have a lowering effect on the health of horses, and at the same time favour the vitality of the disease germs.

The worst cases are amongst hard-working horses in overcrowded sheds, with bad sanitary surroundings; next come fat horses; and the least susceptible are horses that are in good working condition, cleanly kept, and well cared for. If such have the disease at all, it is in a mild form, and they speedily recover.

Symptoms.

Symptoms.

In the onset, loss of appetite, drowsy headache, pain in the limbs, general weakness; in many cases the eyelids are swollen, tears trickle down the face; there may be discharge from the nostrils, and occasionally coughing; the eye will be found scarlet and orange colour, the tongue furred, breath offensive, the heart beats feebly but quick, the pulse is small and weak, the dung is soft, and the urine high-coloured; there is a general rise of the bodily temperature.

As the disease progresses the symptoms will depend on its course, which is very variable, as the numerous names given to the disease indicate. The vital forces in many cases overcome the toxic effects and excrete the poison from the system. It is to assist this process that we have recourse to treatment.

The Treatment.

This should consist of rest, pure air, shelter from sun, rain, or wind, bran mashes, and cut green food with drachm doses of chlorate of potash, carbonate of ammonia, or nitrate of potash given in the drinking water. If the case has been taken early enough, and the surroundings are good, the fever will abate, and recovery be complete in a very few days.

Unfortunately many horses are worked at the commencement of the illness; then they are completely knocked up, and they present a variety of bad symptoms, owing to the mischief being located in individual organs, such as those of respiration, or the bowels, liver, spleen, lymphatic glands, or cerebro-spinal system. The location can only be diagnosed by the educated veterinarian, and every case should be treated to suit the nature and stage of the illness. Dropsical swellings are a favourable indication, but time and patience must be allowed for recovery. No case is cured until the horse is playful at exercise.

APPENDIX C.

EPIZOOTIC OPHTHALMIA.

Nature and Treatment.

This affection is usually seen in several cattle or sheep about the same time in various paddocks in the same district. However, as the majority recover, little notice is taken of the disease in the early stages; but that is just the time when proper treatment (if it were possible to apply it) would be of the greatest benefit.

It is in the acute stage, when the inflammation is severe, the animal being almost blind, that treatment is attempted. Now, at this particular stage, much harm is done by injudicious treatment. Even yarding animals, unless done very carefully, will do more harm than good.

The eye is a very delicate, sensitive organ to deal with; therefore, nature is frequently the best restorer. She can be assisted by attending the animals' comfort, having food and water accessible to the nearly blind animals, keeping them perfectly undisturbed and in shady places.

It may happen that the animal becomes nearly blind in one eye, the other recovering. In such cases the disease becomes chronic, the cornea covering the eye remains a milky-white colour. Proper treatment in this form is sometimes beneficial in clearing the eye.

For animals that can be handled, the following applications are recommended for the eyes:—

For the first stage of the disease, 1 oz. of tincture of opium, 1 pint of water; or 1 oz. of liquor plumbi subacetate, 1 oz. tincture of opium, 2 pints of water. These may be applied two or three times daily.

For the second stage after the acute inflammation has subsided, 1 part of boracic acid, 60 parts of water; or 40 grains of nitrate of silver, 1 pint of water. These may be applied two or three times a week.

In the chronic stages, finely powdered burnt alum may be blown on the eye once a week.

APPENDIX D.

THE TICK PEST IN QUEENSLAND.

Until comparatively recently it was believed that the tick pest was being kept well in check by the Queensland Government, and it was hoped that its progress towards the southern portions of Queensland and this Colony would be long retarded if not completely stopped. Unfortunately this has not been the case, and the disease instead of being confined to the country around Rockhampton, which is some 350 miles from our border, has made its appearance in a slaughter-house near the sale-yards in the neighbourhood of Brisbane, and again at Redbank Meat-works, some 5 miles east of Ipswich, which, in a direct line, are not more than 60 or 70 miles from our border.

On the discovery of the disease the Chief Inspector visited Brisbane with a view to the notification of the necessary quarantines, and the adoption of such other measures as were calculated to prevent the further progress of the disease; but he failed to come to an agreement with the Stock Department there as to the steps which should be adopted, and a like result has attended an Intercolonial Conference held recently at Brisbane by the Ministers for Agriculture of this Colony, Victoria, and Queensland.

Negotiations are still proceeding, and it is hoped an arrangement will be arrived at under which the progress of the disease will be checked.

In view of the serious risk which the north-eastern portion of this Colony is now running of the introduction of the disease, the following precautions have been taken by the Department:—

1. All stock except horses in actual work and sheep have since been prohibited from entering this Colony from that portion of Queensland lying north of the border from Tweed Heads to the 148th meridian and south of the Conference line as altered by the Queensland proclamation of 29th April last.

2. Additional inspectors have been appointed, and are patrolling the border where the risk is greatest.

3.

3. Boundary riders have been engaged to assist the border inspectors from Tweed Heads to the 148th meridian.

4. Contracts have been entered into, or called for the fencing of the border from White Swamp to Tweed Heads, a distance of 70 miles, and the necessary particulars in regard to the fencing of the border from White Swamp to Wallangarra are being obtained.

5. The erection of a double fence and buffer area is under consideration, but what is most urgent now is to get such a fence erected as will prevent stray stock from crossing the border and assist the patrol in thoroughly maintaining the prohibition against Queensland stock. Should the pest unfortunately spread south of Brisbane the second fence will be at once erected in the more dangerous portions of the border.

6. The district inspectors, as well as those appointed for the border duty, have been instructed to devote all the time they can to its protection and to assist the border inspectors in their work.

7. The Inspector-General of Police has also issued instructions to the Force to assist in the enforcement of our proclamation.

Dipping.

Dipping for ticks in Queensland does not seem to have been so successful as it was at first thought it would be. To be effective—as dipping is with sheep scab—the medicaments used must contain some preventive agent to protect the cattle from reinfestation for a period exceeding the life of the larval ticks on the pastures, and such an agent has not yet been discovered. Still, it is said that dipping has been fairly successfully carried out by some owners in the St. Lawrence and Mackay districts.

Inoculation.

It is gratifying to note that the experiments with inoculation, conducted by Dr. Hunt in the north, and Mr. Pound in the south, of Queensland, have been productive of good results. It is claimed for inoculation that it has placed beyond doubt the fact that the injection of blood from a recovered animal into susceptible, healthy cattle, effectually protects them from the fever when placed in contact with infection; and this is confirmed by reports recently received of the result of inoculation. It has been performed on a good many thousands of cattle in the Hughenden, Mackay, and Rockhampton districts, and not only are the results very encouraging as to the protection of the cattle, but with extended experience the losses from the operation have greatly diminished.

While, however, this is the case, the question as to the effect, if any, of inoculation on the quantity and quality of the milk of dairy cattle which has been inoculated, or on the quality and keeping properties of butter and cheese, has not been thoroughly and scientifically tested, as it was agreed at the Intercolonial Stock Conference it should be. The test is now, however, being carried out by Mr. Pound, at Brisbane, and the question will now soon be settled.

APPENDIX E.

TABLE 1.

RETURN prepared by the Board of Health showing the number and proportion of Cattle condemned out of all those slaughtered at the Abattoir, Sydney, 1897.

Description of animals.	Number slaughtered.	Condemned diseased.		Condemned or bruised or unfit for food.	
		Number.	Percentage.	Number.	Percentage.
Bulls	54	5	9·6	Nil.
Bullocks	58,557	706	1·2	2	·003
Calves	11,810	5	·04	2,301	19·4
Cows	13,965	295	2·11	18	·12
Pigs	56,568	2,272	4·01	7	·01
Sheep	1,129,701	390	·03	22	·00001
	1,270,655	3,673	2,350

Quarters condemned as bruised or unfit for food, 12.

"Cattle" means all kinds of animals killed for food.

TABLE 2.

SHOWING the total number of Cattle condemned under the Diseased Animals and Meat Act, and the Noxious Trades and Cattle-slaughtering Act, at various Slaughter-yards, and for the Colony of New South Wales generally, 1897.

Abattoir.....	6,023
Flemington	260
Other Sale-yards and places (dairies included)	30,409
	<u>36,692</u>

"Cattle" means all kinds of animals killed for food.

APPENDIX F.

NUMBER of Owners of different classes in the several Sheep Districts and the Sheep they respectively own.

District.	1 to 500 Sheep.		501 to 1,000 Sheep.		1,001 to 2,000 Sheep.		2,001 to 5,000 Sheep.		5,001 to 10,000 Sheep.		10,001 to 20,000 Sheep.		20,001 to 50,000 Sheep.		50,001 to 100,000 Sheep.		100,001 and over.

APPENDIX J.

FOOT-ROT.

DRESSINGS recommended by Mr. E. Stanley, Government Veterinarian. (For further details see *Agricultural Gazette*, July, 1891):—

Arsenic Dressing.

Arsenic, from 1 to 2 oz. ; potash, from 2 to 4 oz. ; water, 1 gallon.

To be used in troughs for the sheep to walk through. The mixture to be boiled slowly for half-an-hour at least, till the arsenic is thoroughly dissolved.

Sulphate of Copper (Bluestone) Dressing.

Sulphate of copper, from $\frac{1}{2}$ lb. to 1 lb., dissolved in a gallon of water, may be used instead of arsenic.

The following healing dressings may be used by hand after the above caustic applications:—

Tar Dressings.

Stockholm tar, 20 parts ; carbolic acid, 1 part ; or, Stockholm tar, 8 parts ; bluestone in powder, 1 part ; or, oil of tar, 10 parts ; carbolic acid, 1 part ; olive oil, 1 part.

Lime Dressing.

Quick-lime, sprinkled on a dry surface, and the sheep walked through it frequently, will be found very beneficial. Before any dressings are used, the whole of the loose horn should be pared carefully from the diseased feet. It is of the greatest importance that the sheep's feet should, on the dressing being applied, be kept thoroughly clean and dry for at least three hours afterwards. They should, therefore, on leaving the troughs, or being dressed, be passed directly on to a battened or wooden floor, if it can be got ; and where neither of these is obtainable, they should be passed into a dry yard, in which there is a good coating of straw, cut grass, or dry bark taken from trees which have been rung, or, in fact, any other thing which will keep their feet clean and dry.

The following are the remedies reported by the Inspectors to have been used and the results:—

Application.	Result.	Application.	Result.
Arsenic in troughs	Good.	Corrosive sublimate and bluestone	Good.
„ bluestone and carbolic acid	Not given.	Carbolic acid	Good.
„ and bluestone	Good.	„ and oil and butyr of antimony	Good.
„ and lime	Fair.	„ acid, bluestone, and arsenic	Not given.
„ and saltpetre	Not given.	Kerosene	Good.
Bluestone and corrosive sublimate	Satisfactory.	„ and bluestone	Good.
„ and arsenic	Good.	Lime and tar	Not given.
„ and kerosene	Good.	„ and arsenic	Not given.
„ and lime	Good.	Sulphur and bluestone	Good.
„ and sulphur	Good.	Saltpetre and arsenic	Not given.
„ arsenic and carbolic acid	Good.	Tar and turpentine	Not given.
Butyr of antimony	Good.	„ and quick-lime	Good.
„ „ carbolic acid and oil	Satisfactory.	„ and bluestone	Good.
Corrosive sublimate	Not given.		
<i>Specifics.</i>			
Cooper's Dip	Satisfactory.	Quibell's Foot-rot Cure	Good.
Hayward's Dip	In some cases.	Graham's Foot-rot Powder	Not very satisfactory.
Little's Dip	Satisfactory.	Payton's Foot-rot Specific	Very satisfactory.
Pottier's Specific	Not stated.		

APPENDIX K.

AMENDED BRANDS BILL.

The Intercolonial Trade in Stock must be kept in view in framing a Brands Act.

THIS is necessary because, as there is a frequent interchange of stock from one colony to another, the registration in all the colonies would to a large extent be nullified if, as it is now proposed, the same form of brands (one and two piece brands) is adopted in all the colonies. At present that system is only in use in this Colony. In Queensland all the brands consist of two letters or signs and one numeral, while in South Australia they consist of two numerals and one letter; and in this way stock bred in the several colonies are now readily recognised. As, therefore, these two colonies proposed to adopt the same system as this Colony it became necessary to fix upon a brand to indicate the colony in which the first brand was imprinted on the stock; and the Registrars for the three colonies and the Chief Inspector of Stock for Victoria under instructions from their respective Ministers met in conference at Brisbane in 1895, and proposed that a small dot—or any legible brand—should be attached to the brands used in each of the four Australian colonies, but in different positions, which would indicate the several colonies in which the breeders brand was branded without interfering with his brand. No alteration would, however, be made in the brands of this Colony, as it is our system which the other colonies propose to adopt.

The matter again was brought up at an Intercolonial Stock Conference held in Sydney in August, 1896, when the Minister for Mines and Agriculture for this Colony was requested to have a Draft Bill prepared, which, while its general provisions were such as could be adopted by all the colonies, such forms of brands would be adopted by the several colonies as would indicate the colony in which it was used.

With the view to comply with this request, and to consolidate and amend the law relating to the registration of brands and marks on stock as it exists in this Colony, this Draft Bill has been framed.

Our Brands Act, which was the first passed in any of the colonies, is defective in many respects, and its provisions tedious and expensive to carry out.

The following may be specified as some of the more important amendments which it is proposed to make, and the reasons for making them :—

1. Several new branding portions are added to those in the Schedules now in force, and they are, as far as horses are concerned, to allow owners who breed for the Indian, China, and English markets, to brand on less prominent positions, and as regards cattle to give owners if they choose the option to brand on less valuable portions of the hide. It is estimated that by adopting this plan and using smaller brands a sum of £300,000 a year might be saved to the colonies.

2. The ear-marks of cattle will be registered with the view to make ear-marks of cattle as much proof of ownership as sheep ear-marks are of sheep. As it now is, eight or ten owners in the same district may have the same ear-mark; and as it now is, an ear-mark in cattle is of little or no value as proof of ownership. But this will be altered by their registration, after which no two owners in the Colony will have the same brand and ear-mark. Not only will ear-marks then be additional valuable links of evidence, but they will be a great convenience, in so far as the drafting will then be almost entirely done by the ear-mark, as it is in the case of sheep.

The drafting of cattle in Queensland is now principally done by the ear-mark, and it will be entirely when the system of registration of marks is amended.

3. The size of the brand will be considerably reduced; for with a good plain full-sized ear-mark made with a pliers there will then be no necessity for the large flaring brands which are now put on stock by their owners to enable them to pick out their stock at a long distance. He will then do so very much more readily by their ear-mark, which is the first thing to attract attention, and can as a rule be seen from any position.

4. The store brands will enable owners who have two and three piece owners' brands to register a single-piece brand which will be quickly and easily branded on any of the store portions, but especially on either loin. It is almost impossible to brand some owners' brands on store cattle without putting them in bails or throwing them.

5. The working of the Act will be greatly simplified, and the proposal to carry out the details by regulations will render the measure very much more complete. By-gone experience as regards legislation in pastoral matters has shown that it is seldom obtained when wanted, even with respect to mere matters of detail, whereas a regulation by the Governor and Executive can be made out and issued in a fortnight. And there can be no danger in adopting this course, for it will be seen that there is a provision in the bill which empowers Parliament, by mere resolution, to cancel or alter any regulation which may be made and found to be unworkable or oppressive, so that there can be no risk whatever in entrusting the Governor and Council with the power here proposed to be conferred. There is still another reason why there can be no risk, now that the Council of Advice has been elected and recognised by the Minister. It may be taken for granted that no matter of practical detail calling for the issue of regulations will be dealt with until the opinion of the Council has been obtained.

6. The provisions for the prevention of stock-stealing will be enlarged in regard to all descriptoin of stock, and made more effective by putting them on the same footing as regards large stock as they are now under the Sheep Act of 1878 with respect to sheep.

7. As to registration of store brands on the hoofs of broken-in horses, this will be a real boon to owners residing in towns who turn their horses out to grass for a spell, but who now run the risk of losing them, should they stray, rather than re-brand them. Hoof brands on broken-in horses are thoroughly legible. They are so on cavalry horses, and poundkeepers and others would be bound to take notice of them, while they can readily be renewed.

8. No alteration is proposed in the existing system of the sheep brands and marks or their registration, although, through a mistake in the wording of the heading of some of the schedules to the bill which relates to the sheep brands and marks, it would appear that an alteration was intended.

APPENDIX L.

STATEMENT of the number of the different kinds of noxious animals killed during years from 1881 to 1897; the amount of assessment collected, the amount of Government subsidy paid; and the total expenditure for each of these years.

Table with 8 columns: Year, Kangaroos killed, Wallabies killed, Native Dogs killed, Hares killed, Wild Pigs killed, Amount of Assessment collected (£ s d), Amount of Government subsidy paid (£ s d), and Amount of Expenditure (£ s d). Rows list years from 1881 to 1897, plus a total row.

* N B -Subsidy on account of assessment collected during year 1896-7 will be paid during half year January to June, 1898
† Includes kangaroo Rats

APPENDIX M.

STATEMENT of the Operations of the Pastures and Stock Protection Boards during the year 1897.

Table with 17 columns: Location, Amount of Assessment collected (£ s d), Amount Expended (£ s d), Kangaroo, Kangaroo Rats, Wallabies, Wombats, Paddamelon, Bandicoots, Native Dogs, Hares, Opossums, Pigs, Eagle Hawks, Crows, Emus, and Foxes. Rows list various locations like Albury, Armidale, Balranald, etc., plus a total row.

1898.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

AGRICULTURE AND FORESTRY.

(REPORT ON, TO 31st DECEMBER, 1897.)

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

The Under Secretary for Mines and Agriculture to The Honorable the Secretary for
Mines and Agriculture.

Sir,

In presenting the reports concerning the various branches of the Department of Agriculture, it is my pleasing duty to say that the efforts of the Department to advance the agricultural interests have met with a full measure of success, and that at no time in the history of the Colony have the prospects of the industries allied to agriculture been so promising. Despite the fact that the two seasons covered by the period of this report were among the most disastrous ever experienced in the Colony, the output of farm and orchard products has been unprecedented; and this pleasing circumstance can, I think, be logically regarded as a result of the adoption of better and more effective methods promulgated by the Department, which place the producer at more advantage in combating adversity of season.

The wheat experimentation at Wagga has been continued, and Dr. Cobb has added to his already large contributions to the knowledge of the staple cereal much that is of interest and value. A number of diseases of plants have also been investigated, and the results of this work have been published from time to time in the *Agricultural Gazette*.

Special attention is directed to the report of the chemist. With the co-operation of Mr. W. Farrer, of Queanbeyan, to whom the thanks of the Department are due, Mr. Guthrie has conducted a series of investigations to determine the milling qualities of wheats and the nutritive value of flours. As the immediate result of this work, the Department is in a position to pronounce definitely upon the milling quality of any variety of grain. Many of the leading millers of this and the other colonies have taken great interest in the experiments, some having sent representatives to study the methods. In conjunction with the purely experimental work the chemist has been enabled to demonstrate the practicability of adjudicating upon wheats entered in prize competition on the basis of their flour product. The Agricultural Societies in the wheat districts have been so favourably impressed with the utility of the system that it is now customary for wheats recommended by the judges employing ordinary methods, to be submitted to the milling test before the awards are made.

Much valuable work in the analysis of soils, fertilisers, wines, water, and other matters has also been done, and it is a matter for congratulation that the farmers and orchardists of this Colony have as many opportunities for sound guidance in the purchase of pure fertilisers as they could possibly desire.

The investigations of the Scientific Staff in the life-history and treatment of the numerous pests and diseases of fruit, farm crops, and stock have enabled the Department to disseminate advice as to the most effective and economical means of mitigating the ravages and checking the spread of the vast army of pests that, unmolested, would soon devastate our orchards and farms. Judging by the success that has attended the methods of treatment adopted for several of the more serious diseases, there is in my mind

*82—A

not

[1,435 copies—Approximate Cost of Printing S.L. (labour and material), £26 15s. Od.]

not the slightest doubt that if some alteration could be made in the present state of affairs, under which the efforts of the careful agriculturist to rid his place of pests are nullified by the inertness of a neighbour, whose neglect affords the pests a safe refuge and breeding-ground, this Colony would soon enjoy immunity from some of the parasites that are a source of constant trouble and apprehension. The legislative machinery which it is hoped will shortly be provided will do much to strengthen the hands of the Department and the agricultural community in coping with pests; and it is also satisfactory to be able to say that throughout the Colony there is evidence of a widespread and rapidly increasing desire for information, and a determination to take active steps to exterminate the evils. The growers are also beginning to realise the advantages that accrue from deeper and more systematic cultivation with application of manures, and there can be no question that ere long the pests may be kept well under control.

In addition to the Hawkesbury Agricultural College a limited number of students are received at the Wagga and Bathurst Farms, where the curriculum is of an essentially practical nature. Instead of the alternation of days in the class-room and field, every day is devoted to field work, and in the evening the manager, and, as opportunity occurs, one of the specialists of the Department, deliver lectures on subjects for examination. The class of lads admitted are of a good stamp, and already several of them have begun the practice of their calling either on holdings of their own or the properties of their parents.

The area under cultivation at each of the farms has been gradually extended, and, as funds became available, buildings, stock, and implements have been added to, until now in these estates the Government possesses most valuable assets. The interest taken by agriculturists in the experimental work does not abate. Indeed the farming community place so high a value on the object lessons the farms afford that it is now the practice to organise parties periodically to visit the farms and spend the day inspecting the crops and questioning the experts.

The introduction of new crops and methods into remote districts has been further promoted by the exhibition at Agricultural Societies' shows of produce from the various farms. Such exhibits are generally the most attractive object of the show, and the officer in charge is kept busy answering enquiries and distributing seed for trial. The orchards connected with the College and the different farms are in a flourishing condition, and reflect credit on the fruit expert and the orchard managers. At Wagga the area under trees has been considerably extended, and during the present season a large quantity of fruit will be available for the purpose of drying and preserving in other ways. In all operations the students assist the manager, who is thus enabled to give the lads a thorough grounding in cultivation, pruning, harvesting, and other operations necessary to secure success in orchard-keeping. During last year several important changes have been made in the personnel of the College and farm staffs. The transfer of Mr. J. L. Thompson from the position of Principal of Hawkesbury Agricultural College to that of Travelling Instructor in Agriculture, has afforded a means whereby the agriculturists in the more remote districts can receive the benefit of the personal advice and practical demonstrations Mr. Thompson is so eminently qualified to give.

There is no industry that has advanced with such rapid strides during the past few years as dairying. The introduction of the factory system and creameries in the North-Coast and other comparatively new districts marked a new era in the butter production of the Colony, and created a desire for expert advice that could only be met by the appointment of a specialist trained in the modern dairy schools of the countries with which our producers must compete. Since his appointment the greater part of the Dairy Expert's time has been occupied in visiting districts to advise the farmers as to the arrangement and equipment of factories and creameries, and how to improve and increase the productiveness of their herds.

In order to afford those interested in the dairy industry an opportunity of interchanging ideas and discussing problems of vital concern to the future trade of the Colony, a conference was convened in July last. About 150 representatives nominated by the Agricultural Societies assembled, and the results of their deliberations are embodied in a report in pamphlet form, which has been distributed throughout the Colony.

The progress of the dairy industry is assured, and with the skill and enterprise that is being every day brought to bear upon it, but little time will elapse before the butter and cheese of New South Wales will take high rank in the markets of the world, not only as to quality but in volume.

Another industry which promises shortly to attain large proportions is viticulture. The area in this Colony suitable for the production of grapes for wines of all types is practically unlimited; and it is gradually becoming recognised that the pure wines of New South Wales have a delicacy of flavour and sound wholesomeness that must inevitably secure for them due recognition.

The appointment of a graduate of one of the large viticultural colleges in Europe to advise the vignerons as to the cultivation of the vine and the application of more scientific methods of wine-production has been much appreciated by those engaged in the industry. The phylloxera pest, which proved so disastrous a few years ago in Europe, and, unfortunately, appeared in this Colony also, has received unremitting attention; and in the few places in which the insect has been discovered in the counties of Cumberland and Camden (to which it is almost certain the pest is confined) the vineyards have been treated with carbon-bisulphide and rigorously uprooted. Three inspectors, under the immediate direction of the viticulturist, are constantly engaged in the examination of vineyards in the infected counties; and as the Vine Disease Act prohibits the introduction of diseased vines from abroad, it is confidently hoped that the disease will soon be exterminated. As a practical measure of protection against the inroads of this pest, the Department has secured from France half a million cuttings of phylloxera-resistant varieties for use as stocks in the planting of new vineyards.

It had long been felt that the subsidies granted to agricultural societies were not being employed in all cases exactly in the way it was originally intended such funds should be used. In order to hear all that could be said on the matter by those most prominently identified with the management of societies and the disposal of subsidies, in July last a conference of representatives met at the Hawkesbury Agricultural College. About 135 delegates were present, and, in addition to the settlement on a new and more satisfactory basis—subsidy to be paid on amount actually devoted to prizes for the encouragement of agricultural, horticultural, and pastoral enterprise—opportunity was taken to discuss a variety of topics of agricultural interest. A full report of the proceedings was also prepared and distributed.

During the year the Board for Exports was transferred to this Department, and has done much to promote the export trade in several important lines. The shipment of fruit despatched in cool chambers was eminently successful, but the Board last season, I regret to say, experienced failure in the effort to demonstrate the practicability of shipping in the ordinary hold of the vessel.

The possibilities of the export trade of this Colony are inconceivable, and with the facilities the Board provide there is every reason to predict that, at no distant date, their efforts will be rewarded by this Colony assuming the leading position in the export of Colonial produce.

The business transacted in connection with the packing and shipment of hares, rabbits, and poultry has already been sufficient to recoup expenses to the Department, so that it can readily be seen that under the present system the producers of the Colony will be enabled to enjoy all the privileges and advantages of export supervision and handling of produce without the general community having to contribute to it.

The *Agricultural Gazette* has maintained its position as the principal channel through which the results of the investigations of the scientific staff and experimenters are conveyed to the agricultural community, and the demand for it is steadily increasing. In the issue of agricultural literature the Department now enjoys an unrivalled place in these Colonies, and that the people for whom the work is prepared are with the Department in the publication of it is instanced by the remarkable sales of the handbook on farming and fruit-growing issued early last year.

In conclusion, I may say that the efficiency of the Department is all that can be desired, and on all sides there is evidence of the good results that are following the efforts of the capable and energetic officers with whom it is my privilege to be associated in the promotion of the agricultural interests of the Colony.

I have the honor to be,

Sir,

Your obedient servant,

D. C. McLACHLAN,

Under Secretary for Mines and Agriculture.

Report of the Chief Inspector of Agriculture to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines and Agriculture, 31 December, 1897.

In submitting the accompanying reports of the officers connected with the Department, I have no hesitation in saying that the progress made in all branches has been satisfactory, and that each officer has performed his duties with zeal and enthusiasm, that the work has done much for the benefit of those engaged in agricultural and horticultural pursuits, and I have reason to think that this is appreciated by most of those persons who come into contact with the several members of the Agricultural Department.

The Experimental and Demonstrating Farms which have been established, although comparatively but recently, are becoming of more and more importance and benefit, not only to the districts in which they are situated, but to districts quite remote. The practical lessons taught by improved systems of farming and horticultural practice, the experiments made with various crops, the uses of new implements, and other matters which are carried out are watched keenly, and the information supplied to all who desire to seek it, is gladly welcomed, and will, I have no doubt, be made good use of; indeed, I may say that already changes in old practices are noticeable in many places.

I may state, with a considerable amount of satisfaction, that it has become evident to me that the Agricultural Department is now looked upon as the great centre or bureau for the dissemination of valuable information on all matters pertaining to the various branches of agriculture and horticulture, scientific or practical. Such information would be difficult to obtain without this agency.

In the course of my work it has been my duty, I may say privilege, to meet numbers of persons seeking information in connection with agriculture and horticulture and allied subjects, and it is quite clear that there is a growing desire, and a general feeling that it is becoming more and more necessary to keep up to date with the world's progress in the economy of general farming, dairying, fruit production and its preservation, and vegetable growing. This necessity is becoming more and more forced upon all who are engaged in rural pursuits, the more they are realising that much of their produce must compete, in markets outside the Colony, with the products of other countries, raised with great skill and intelligence. Hence it follows that it is incumbent on the officers connected with the Department to be fully alive to the progress made in the various producing countries in the world, and become thoroughly acquainted with all improved methods suggested or carried out by the vast body of workers, both scientific and practical, who are engaged on problems which from time to time are gradually revolutionising old methods and practices for work which to-day is managed by rule of thumb, guided by traditional knowledge, with chances of frequent failure and loss, may to-morrow, perhaps, through the aid of scientific research, be carried out on sound principles with every chance of success.

The results of observations and experiments made in other countries are doubtless of immense value to us, and can be followed in many instances; but our conditions, climates, and soils are so dissimilar to those in Northern countries, that it is necessary to carry out many experiments under our own conditions, and the results of these, when completed at the experimental farms, should prove of great service to the various districts within which these farms are established.

It is noticeable here as elsewhere that there is a certain amount of impatience for results of experiments on the part of those seeking for information, who seem to be unaware of the difficulties to be met or length of time needed to arrive at correct determinations.

There seems to be every indication, from the progress made in farming, in the increasing area of land put under cultivation, and from the large number of young men who seek admission to the Agricultural College and experimental farm schools, that in the course of a short time there will be a considerable increase in our productions, and I beg to submit that there is every indication of an enormous increase in the productions of other new countries, which must come into direct competition with the surplus productions of the Australasian colonies. The countries I particularly refer to are South American and South African. During the last few years great efforts have been made towards improvements in agriculture and improvements in stock in the Argentine Republic and also at the Cape. To the former we must look to a very important competitor, not only in meat, grain, and wool, but in dairy produce, which, I believe, is largely on the increase; and in the latter country it seems not improbable that fruit-growing for export to Great Britain will become a large industry. These two countries have a considerable advantage over the Australasian colonies in their comparatively short distances from the world's great market.

In Canada, such improvements and advances are being made in the dairying industry that, although I believe cattle require to be hand-fed and housed for several months during the winter, it seems probable that butter and cheesewill be made for export throughout the year.

No efforts and no expense are being spared by the Governments of the world to further improvements and education in rural industries; but I think that the work carried out by the Agricultural Department of New South Wales during the past eighteen months will compare favourably with that effected in other countries.

I have every reason to think that the information diffused through the medium of the Departmental publications—the *Agricultural Gazette*, the various pamphlets issued, and the *New South Wales Farmers and Fruit-growers' Guide* has proved most useful to the readers. The *Agricultural Gazette* has maintained its high standard both for its scientific and practical papers; and it is pleasing to know that many of the articles have been republished, not only in Australasian, but in the papers and periodicals of other countries.

The

The lectures and demonstrations given in the country by those officers who are skilled in particular branches of science or practice connected with agriculture and horticulture, have been very favourably received. Practical demonstrations are evidently the most popular form of lectures, and are preferred to simply oral lectures.

The work in the Forestry Branch, which has been chiefly of a routine character, has been carried on satisfactorily. Mr. Hay has effected many improvements in the clerical work to facilitate matters, and doing away with the necessity to retain any more old papers that can possibly be avoided.

With respect to the field work, I may say that forestry, in the proper meaning of the term, cannot be carried out, with any prospect of success, in a systematic manner until timber reserves are conserved and set apart absolutely. At the present time, forest reserves are liable to be revoked at any time, so that any attempt made to work a forest on proper forestry principles may be rendered useless.

During the past year there has been some revival in the timber trade, and there seems to be every prospect of a large trade arising with Great Britain and other European countries, and, perhaps, with the United States and Africa; but, if so, in my opinion, in a very few years all timber of any value will be cleared off. The quantity of really good, sound, hardwood timber available in the Colony is generally very much over estimated. Immense damage has been caused, from time to time, to standing timber by bush fires. Such damage is not always apparent at first glance or until the trees are carefully examined.

The supply of timber inland, in the western part of the Colony, is becoming more and more scarce as settlement extends; and but little, if any, idea of preserving sheltered belts or timbered areas for future building, fencing, fuel, or other purposes seem to obtain amongst the settlers.

I have noticed the evil effects of injudicious clearing away timber in various districts in this Colony, and, I think, every effort should be made to prevent the wholesale denudation of large areas, even by legislation, if this cannot be effected otherwise.

I have the honor to be,

Sir,

Your obedient Servant,

WALTER S. CAMPBELL.

The Under Secretary.

Report of the Pathologist..

I beg to state that the work of my branch of the Department of Agriculture has progressed steadily at the special laboratories which have from time to time in past years with your approval been established under my direction. These laboratories are located in different parts of the Colony, as follows :—

- | | |
|--------------|---------------|
| 1. Sydney, | 4. Pymble, |
| 2. Bathurst, | 5. Bong Bong, |
| 3. Wagga, | |

and are devoted to various purposes, according to their locality. Some of the work in each has, during the time since my last annual report, become sufficiently advanced to warrant the publication of the results, and accordingly articles setting forth the results of my investigations have from time to time been inserted in the *Agricultural Gazette of New South Wales*.

Without going into details it will suffice to say that these original articles cover a wide range of subjects, and fill nearly 200 pages of the above publication, and are illustrated by over 300 original illustrations and several plates, one of the latter coloured.

The following is a partial list :—

- The Hardness of the Grain in the principal varieties of Wheat. 22 pages, with 28 illustrations. *Agricultural Gazette*, Sydney, 1896.
- The Relative Hardness of Australian and American Fife Wheats. 8 pages, and 28 original illustrations in the text. *Agricultural Gazette*, Sydney, 1896.
- Notes on the Colour of the Grain in different varieties of Wheat. 4 pages, no illustrations. *Agricultural Gazette*, 1896.
- The Common Crow. 14 pages, with one original illustration in the text. *Agricultural Gazette*, Sydney, 1896.
- Experiment Work in Agriculture. 25 pages, with 49 original illustrations in the text. *Agricultural Gazette*, Sydney, 1896.
- Cause of an important Apple Disease. 2 pages, with 1 original figure in the text, and 1 original plate. *Agricultural Gazette*, Sydney, 1897.
- Some useful Observations on Germinating Wheat. 3 pages, with 1 original coloured plate. *Agricultural Gazette*, Sydney, 1897.
- A Method of Using the Microscope. 5 pages, with 3 original illustrations in the text. *Agricultural Gazette*, Sydney, 1897.
- Letters on the Diseases of Plants. 54 pages, with nearly 100 original illustrations in the text, and 1 original plate. Disease of wheat, maize, plum, apple, potato, citrus fruits, peach, nectarine, grape, onion, timber, with an account of root-gall, and an improved method of preparing Bordeaux mixture. *Agricultural Gazette*, Sydney, 1897.
- Abandoned Orchards of Cumberland County. 7 pages, with about 40 original illustrations. *Agricultural Gazette*, Sydney, 1897.
- The Sheep-fluke. 40 pages, with 1 plate and about 30 original illustrations in the text. *Agricultural Gazette*, Sydney, 1897.
- The "Brush" in different varieties of Wheat. 5 pages, with 28 original illustrations in the text. *Agricultural Gazette*, Sydney, 1897.
- The Grading of Wheat. 8 pages, with 33 original illustrations in the text. *Agricultural Gazette*, Sydney, 1897.

About half the illustrations were drawn or otherwise prepared by myself, and nearly all the rest by Mr. E. M. Grossé, under my direction.

Sydney

Sydney Laboratory.

The chief laboratory is located in Sydney, and all the others are worked from it as a centre. This is a natural and satisfactory arrangement. The central laboratory, in addition to its own special work, takes over from the branches the publication of all results of investigation. It also serves as a receiver of all work that can be conveniently transferred from the branch laboratories. Most of my correspondence is conducted from this Sydney laboratory. The nature of this correspondence is fairly well indicated in the above pamphlet, entitled, "Letters on the Diseases of Plants," the same being, in reality, largely a compilation from my letters to correspondents in various parts of Australia. The number of letters and reports is not far from one thousand, and the official papers otherwise dealt with number also toward one thousand.

Wagga Laboratory.

This is a more commodious brick building, which has been constructed in an economical and substantial manner, and is generally admired, particularly on account of its beautiful, comfortable, and commanding location. It is practically fire-proof, and consists of eight rooms each a 15-foot cube. There is a cellar of similar dimensions. The top is surrounded by a parapet 4 feet high, and as the roof is of concrete and flat, it affords a fine working space, which is reached by stairs, and also by a block and tackle for conveniently and quickly hoisting any desired loads. The whole is surrounded on all sides by a commodious verandah and balcony. The rooms have been designed for their special purposes, as, for instance, that devoted to microscopy being carefully lighted and supplied with steel pillars to carry the instruments, these pillars being set in cement free of the building, so as to avoid tremor. The work carried out at Wagga is mainly in connection with wheat, and the publications in the above list, which have issued from this laboratory, are the result of years of systematic experiments on consecutive crops. Numerous investigations of an important nature are in progress at the Wagga Experiment Farm, which will yield the results in due course; in fact some are even now on the verge of completion, such as the relative value of large and small seed, the average weight per bushel of the various kinds of wheat as grown at Wagga, &c., &c., &c. Various experiments with manure are also yielding results of great economical importance to Australian wheat-growers.

Bathurst Laboratory.

This laboratory, located near the Bathurst Experiment Farm, is now in working order, and already some very interesting results have been obtained here as announced in my pamphlet on the sheep-fluke mentioned above. In the near future, no doubt, other results of investigations which have been recently inaugurated at Bathurst will amply justify the founding of this particular experiment farm. So far as my branch of the Department's work is concerned these investigations will be directed towards the solution of various problems connected with the diseases of stock, though a number of other lines of experiment will also be undertaken. Soon "Logan Brae," the building in which the laboratory is located, will be heard from to good purpose.

Bong Bong Laboratory.

This laboratory has now been practically dismantled, and the sheep-fluke and other investigations will in future be conducted at Bathurst.

Pymble Laboratory.

This is located in my residence, and with your special permission for the time being, regarded as a departmental laboratory, which, however, I would like to add, costs the Government nothing. Its function as a temporary laboratory is to make inquiry into the diseases of citrus fruits, and its voice has been heard to some purpose, I am credibly informed, in "The Abandoned Orchards of Cumberland County," and the pages devoted to the diseases of citrus fruits in my "Letters on the Diseases of Plants." From it, as headquarters, also were conducted the signally successful experiments on curing two important citrus diseases, carried out under my direction by Mr. W. C. M. Owen, of Pennant Hills, and described by him in the *Agricultural Gazette*.

APPENDIX.

Experiment Work on the Sheep Fluke.

The work conducted by me having for its object the mitigation of the losses due to the sheep fluke has been vigorously carried on during the last half of the year 1897, at these places,—Sydney, Bathurst, and Moss Vale. The Sydney work has been mainly literary and artistic, and the extent and nature of the same may be fairly gauged by the publication entitled "The Sheep Fluke," consisting of thirty-two pages, with twenty-nine original illustrations in the text and one original plate. This is to be continued. This pamphlet though only recently published and not yet complete has been already extensively reviewed and quoted in various parts of the world, owing no doubt to the fact that the recommendations for the prevention of the disease are clear and reasonable, and to some extent quite novel. The succeeding parts of this treatise yet to be published have the same characteristics. The writing, proof-reading, designing of blocks and supervision of the artistic work connected with this article occupied about two weeks out of last half-year, though the facts presented are the accumulations of years. Contrary to what is usually the case none of the drawings for this article were prepared by myself; they were all drawn by the hand of Mr. E. M. Grosse for the most part from my designs or photographs, and under my constant personal supervision. The high quality of Mr. Grosse's work is well shown in these illustrations.

The work done at Bathurst though brief and occupying only about a week has been productive of very useful and striking results, showing the symptomatic value of the eggs of fluke as found in dung, and I confidently expect to use the facts disclosed by the Bathurst examinations to great advantage in diagnosing the disease in ordinary flocks, and especially in stud sheep. The sheep sent to the Bathurst Experiment Farm from Cobarr for the purpose of this examination proved to be very suitable indeed. I have to acknowledge the assistance of Mr. E. M. Grosse also in this work.

The

The Moss Vale experiment is one to determine the utility or otherwise of a certain alleged cure for fluke, and has occupied over a week of my time during the last six months, having cost me also five special journeys to Moss Vale and back from Wagga. The work is not yet completed; I doubt if it was wise to employ my services in this connection. As I pointed out at the outset, in the light of past experience the result was almost a foregone conclusion. Had not Mr. Bruce been disabled so as to be unable to be present at some of the tests, I should certainly have absented myself. As it is, I have attended all the meetings and made myself responsible for checking the main system, viz., the presence and quantity of fluke in the treated and untreated sheep, having so far personally removed and noted each parasite from each diseased liver. Again, I have given personal attention to the condition of the experiment paddocks used, in order to settle definitely the matter of infection during the progress of the experiment, with the result of proving that all stages of the fluke are present in both paddocks. I have proved the snails of both paddocks to be infested with the intermediate stages of the fluke, having incidentally had the pleasure of exhibiting these interesting creatures to yourself and others.

It was the discovery of these intermediate forms in a species of Australian snail made by me some years ago that gave the first clue to the actual life history of the sheep fluke in Australia, and thus enabled me to formulate definite and useful recommendations for the prevention of fluke having a scientific basis.

Diseases of the Citrus Tribe.

Some months ago by your sanction my private laboratory at Pymble was converted to Departmental use for the purpose of investigating the diseases of the citrus tribe. During the last six months those investigations have been prosecuted, and about two weeks of my time has been thus spent. Evidence of the success of this work may be obtained by consulting the article on "Melanose, a Disease of the Orange," written by Mr. Owen, J.P., of Pennant Hills, which gives an account of his signal success in economically curing this disease under my directions. I visited Mr. Owen's orchard and drew up a plan of procedure, showed him my methods of preparing Bordeaux mixture, and from time to time spent a day at his orchard when the spraying was going on, and also inspected the result of his work. He also submitted his proof to me, but I did not think best to alter anything he said. I contented myself with preparing the illustrations, to which I beg to respectfully call your particular attention, as giving another signal illustration of the value to the producers of the Colony of reliable advice based upon scientific research. When the orange growers first called my attention to their losses from this disease its nature was wholly unknown, and, what is worse, was supposed to proceed from a cause altogether different to that which my examinations revealed. The result of my examinations is given briefly in the pamphlet entitled "Letters on the Diseases of Plants."

Weight per Bushel of the Grains of different Varieties of Wheat.

This subject has formed matter for special attention during the last six months, more especially because the accumulated observations of four years at Wagga have now enabled me to give reliable averages. The observations extend over such a number of years and variety of seasons as to give them trustworthiness, and when it is remembered that the weight per bushel is one of the principal items in determining the worth of a sample of wheat, the value of these results will be duly appreciated.

In many cases, in fact I believe in most cases, the final decision of the wheat judges at our agricultural shows is determined, at any rate where the competition is close, by the weight per bushel, the highest award being assigned to the sample that "goes the most" to the bushel. It is well known that these heavy samples are good flour producers, and they are much sought after by millers, who, as a rule, avoid light and shrivelled samples. It is, therefore, important to farmers to know what varieties of wheat, during a succession of seasons, will give the heaviest samples. As my results are obtained from samples specially grown for the purpose under scientific control in the principal wheat district of the colony they have additional value for that reason. These results are now almost ready for publication. The time occupied in this connection during the last six months was about one week.

The brush of Wheat Grains.

This minor article occupied about a week of my time owing to the large number of measurements which were necessary previous to the construction of its tables. It consists of four pages and contains twenty original illustrations.

The grading of Wheats.

This minor article containing five pages and many original illustrations on six plates, also occupied about one week's time. The results published are by no means so unimportant as might be thought. Not that farmers and millers will give them very much attention (though I find the latter to be already considerably interested) but the graphic way in which the results are presented have given food for thought among those who are making a special study of wheat. The variation in the size of the grains in samples of wheat has been too much disregarded, not only by growers in their seed, but also by analysts and others in their experiments, for not only are the small grains poorer as seed, but they are also poorer in many other ways that effect the experimenters' results. In future I hope to see much more attention given to this matter. The sieves which have rendered me such yeoman service in my experiments, should, I am convinced, be found and used everywhere that wheat is experimented on. When this is the case, and not till it is the case, will the results of experiments cease to be rendered uncertain by lack of an obvious precaution. Not until we know what proportion of the grains of treated samples are small and what proportion large shall we be able to accurately compare the results. In consequence of the growing importance of this matter, larger and more accurate sieves have recently been made at the Wagga laboratory under my supervision. I might add that during the last five years no instruments in the Wagga farm have been in such constant use as these sieves, and it is with great pleasure that I can now say that similar sieves are being used elsewhere in consequence of the publication of the results of the Wagga Farm experiments.

Large and Small Seeds.

For four years experiments on a large and most accurate scale have been conducted at the Wagga Experimental Farm on the relative value of large plump seed as opposed to small or shrivelled seed. Where rust shrivelled seed could be procured it was given preference over the small pinched seed, but some years it has not been possible to secure small and shrivelled seed that I could be sure was such owing to the attacks of rust. Under such circumstances, seed, small or shrivelled from other causes, was used. It is needless to say that all these experiments have been conducted in the careful manner described in my pamphlet on "Agricultural Experiment Work," which has now become so well known through reviews in leading journals in various parts of the world.

During the last six months I have spent about three weeks in this connection. The experiments have been continued with striking results, and the same are now being prepared for publication. The number of weighings, gradings, and calculations in connection with these experiments is enormous, and much delays the publication. But as the results are now assured, I am very glad to be able to express the opinion that the Department will be soon in a position to deliver a death-blow to the hoary fallacy that small and shrivelled seed is as good as any—a fallacy which still finds advocates in places where it is astonishing to see them. More than this, the Department will, as the result of these experiments, be able to say definitely how much can be profitably spent in improving a given sample for purposes of seed. It will be at once seen that this latter information will be of great practical value.

In connection with these experiments you caused to be collected from all parts of the Colony, at my request, samples of wheat as they were being sown in 1897. During the last six months these have been graded and weighed and otherwise examined, and in this connection some days of my time have been consumed. The results will be of great interest when compared with those of the large and small seed experiments, as I shall be able to say, concerning the seed of each district of the Colony, how much ought to have been sieved out and rejected as such.

Manure Experiments.

These experiments, begun four years ago, have been continued in full during the last six months and the operations of the season have been brought to a most successful close, altogether about three weeks being so occupied. The results of these years of experiments are now assured. It only remains to tabulate and arrange them, and prepare the necessary illustrations. The results are very striking, and will prove most useful to the farmers of the country. No experiments at the Wagga Experiment Farm have attracted so marked attention as these, and this attention has increased from season to season.

Nomenclature Plots.

This plot has been continued this season and has proved itself even more valuable than heretofore. Improving this plot and preparing from it a set of samples for the Indian Government occupied my time for the best part of a week during the last half-year.

Age of Seed Experiments.

These experiments have occupied my time for the better part of a week. They arose from the fact that upon inquiry I could get no satisfactory evidence of the rate at which wheat deteriorates in value as seed. Opinion varies all the way from belief in the vitality of seed found in Egyptian mummies to doubt as to the value of seed grown year before last. As I have saved seed each year for some years I determined the vitality of the samples by the row system. My seed having been kept in a uniform manner was eminently suitable material for this experiment. Of course this year's work only constitutes a beginning. I may say, however, that the results of this season alone show that if seed wheat be kept in a warm, dry place it deteriorates in value very little in five years. This suggests the feasibility of keeping good seed over from season to season so as to have a supply on hand against a season when all the wheat, being ill-grown, is inferior for seed. The cost of storing and the interest on the value of the stored seed would be less than the additional value of extra good seed in a season when all other seed is inferior, at least within certain limits. I may adduce, as an illustration of this, that it would have been advantageous if the seed at Wagga in 1894-5 had been reserved for 1895-6-7. If in reply it be asked, "Why not procure seed from another district?" My reply would be that I now have fairly satisfactory evidence that seed from another district is not likely to be advantageous unless in addition to the seed being very well grown the seed supplying district be also similar in soil and climate, and that these facts increase the difficulty and cost of getting such seed.

Meetings, &c.

About a week of my time during the last six months has been consumed in attendance at meetings called at the instance of the Minister or yourself.

Correspondence.

The number of letters that have come to me for official attention during the last part of 1897 is considerable, and oftentimes the replies have cost a lengthy examination into some obscure matter. I presume the time thus spent (I do not include here Wagga Farm correspondence or inter-departmental correspondence, but only such as required my attention as an attaché of the Sydney office) would total several weeks. Though the majority of these letters relate to pests and to wheat, others are very miscellaneous and cover a wide field.

Wagga Experimental Farm.

In June, 1897, I received notice from you that as owing to the reorganisation of the Department it was necessary to temporarily transfer Mr. Valder to the Hawkesbury Agricultural College the Minister wished me to take charge of the Wagga Experimental Farm in addition to my other duties there. Hence, as it turned out, during the last six months of the year 1897, in addition to my other duties, the management of the Wagga Experimental Farm and School has fallen to my lot. It will be seen from the foregoing pages that my regular work has proceeded as usual during that time, and that in accordance with

with the Minister's wishes I have taken the management of the farm, &c., as an extra. This has been done by arduous overtime work, involving daily duty from 5 a.m. or 5:30 a.m. to late in the evening or night, and involving also spending on the railway train during six months more than fifty nights, and the travelling of over 12,000 miles by rail.

Concerning the work accomplished at the Wagga Experimental Farm during the abovementioned six months I have to report as follows:—

With your approval Registrar M'Donald was appointed as follows: After a full explanation of the circumstances of the case, with your approval and that of the Civil Service Board I had an interview with the Under-Secretary for Education, who agreed to name from his Department a successful teacher whom he thought qualified to fill the position, as described by me. As a result, Mr. L. M'Donald was selected by the Under-Secretary for Education. After an interview with Mr. M'Donald I reported favourably to his appointment on trial, and this report met your approval. Mr. M'Donald accordingly assumed his duties in August.

One of the first duties assigned to him was the preparation of a complete inventory and valuation of the farm, including all real estate and other property whatsoever. This inventory is now in a forward state, and will, I believe, soon be completed by the new manager, Mr. Valder's successor, without any outside assistance. When complete it will be the first definition of the capital represented by the Wagga Farm and its appurtenances.

The duty second in importance assigned to Mr. M'Donald was the opening of proper ledger accounts against all branches of the farm, such as separate crops, buildings, experiments, &c.

These duties and many others have kept Mr. M'Donald very busy, and it has been only by long hours and very faithful work that he has been able to cope with his duties. I beg to recommend this fact to your attention.

I consider that a fair beginning has been made during my incumbency on a proper system of accounts, but only a beginning. The ordinary work of the farm has been prosecuted with vigour, and this fact has involved such an amount of routine work that the establishment of good accounts has gone on very much more slowly than would otherwise have been the case.

Orchardist.

It was evident that certain changes ought to be made in the orchard, and it was also evident that during my necessary absences from the farm someone should be there who could step at once into my place. Mr. Allen, Fruit Expert to the Department, was therefore appointed to take charge of the orchard and act during my absences. It soon became evident, however, that Mr. Allen's absences on duty were so long and frequent as to leave him little opportunity to relieve me, and this part of the arrangement therefore, practically speaking, fell through. Mr. Allen, however, took charge of the orchard, greatly to its advantage. At my request he made a statement regarding Mr. Alford, recommending him for the position, and this I had the honor to recommend for your favourable consideration, and, with your approval and that of the Civil Service Board, Mr. Alford's services were secured.

Mr. Alford has performed his duties in a very satisfactory manner, and the orchard under his immediate supervision now looks better than it has ever before done.

The students as a body worked industriously as soon as they became used to the earlier hours appointed for work in August, and thenceforth as a rule did themselves credit, and in their final marks satisfied the requirements of the Board of Control as well as could have been expected.

Board of Control.

As soon as Messrs. Allen, M'Donald, and Alford had been appointed I asked Messrs. Allen, M'Donald, Alford, and Mr. Fuller, farm foreman, to act with me as a Board of Control. The Board met each Monday at 7 p.m., I myself acted as Chairman, and Mr. M'Donald acted as Secretary. A record of each meeting was kept by the Secretary. At each meeting the progress of each student was considered and such action was taken as was necessary. Other matters relating to the management of the farm were discussed and acted on by the Board. On all occasions the Board acted conscientiously and harmoniously and, I believe, wisely, and practically no important action due to its voice was taken without a unanimous vote.

Students' Marks.

The students' marks were given as follows:—For outside work they were marked each day on a scale of one to five by the farm employee under whom they were working. Their conduct was also recorded as was also their attendance. Lecture marks were decided on the result of examinations both oral and written. The final mark was ascertained by reckoning the outside mark twice to the lecture mark once. Thus a premium was put upon faithful outside work every day. No amount of spurring in examination work could make up for a low outside mark in field work. Each student was given at the outset twenty conduct marks. So long as he kept the whole twenty his conduct was perfect. One mark was deducted for an unexcused tardiness, two for an unexcused half-day's absence, three for an unexcused whole day's absence. Other marks might be removed for infringement of the single rule. Students are expected to be punctual and diligent, and to behave themselves at all times in a gentlemanly manner.

The Course of Study.

In securing Mr. M'Donald as registrar, an eye was had to his capabilities as a teacher, and when the proper time arrives his acquirements in this line should be utilized. So, also, the preparation of a schoolroom equipped with blackboards and the purchase of microscopes has all looked in the same direction. Inasmuch as the students had hitherto been admitted at irregular intervals and without examination, and were, therefore, a most heterogeneous lot, I concluded that it would be best to put off the establishment of a definite course until at least January, 1898, and all my plans were made to this end. It is my opinion now that no time should be lost in deciding on a definite course of study for the Wagga Farm School which, though short and elementary, shall be suitable to the requirements of the pupils and definitely allotted to the care of certain instructors at definite dates and hours.

The Men.

The farm employees are an excellent set of men. I have found it necessary to make numerous changes only in one department. Although a number of discharges have taken place the number of employees has remained about the same.

Visitors.

At no time during the history of the farm has it had so many visitors during the same length of time as during the last 6 months, over 700 visitors having been received. Of these fully 75 per cent. were farmers. Nearly all these visitors came at their own expense, and often from very long distances. About half came in small parties unexpectedly, though they were none the less welcome on that account, the others came by invitation. Of the whole number about 80 were driven from Wagga to the farm at the expense of the farm. The total cost of catering for these visitors I estimate at about £25—a very small sum of money when the result is considered—for there can be no question that this is one of the ways in which the Wagga Experimental Farm does the most good.

Stock.

During my administration the horses have increased by 2, the cows by 3, the calves by 5, the pigs by 50, the poultry by 15. All the horses and cattle have been branded and registered, so that I was able to hand over to Mr. Valder's successor a full and exact list of all the stock on the place.

Building.

The last half-year has seen the elevator carried on and completed; the new laboratory carried on and completed; the dairy commenced and completed; a school-room, so far as concerns forms, blackboards, platforms, &c., nearly completed; increased shop-room provided for; stairs for barn put under way; fruit-drying plant erected; additions to foreman's cottage made; housekeeper's bath-room and cupboards provided; students' bath-room re-made and placed in a sanitary condition; the old laboratory moved a mile and re-set. The oversight of all this and other construction work of a similar character has consumed a good deal of my time.

Land.

Eight hundred acres of land have been arranged to be dedicated to the farm. Part of this has been fenced. Much fencing has been pulled down, because it was in the way, and placed elsewhere.

Fifteen hundred acres have been ringbarked. This, in my opinion, should have been done several years ago. Most of this was done at about 6d. an acre by our own men.

The new vineyard of 30 acres has been surveyed, fenced, cleared, ploughed one foot deep, and sowed with cow-peas. About a dozen necessary new gates have been provided.

One of the 90-acre paddocks has been wire-netted. A tennis-court has been erected, and a cricket-ground prepared.

About 50 acres of the home paddock have been thinned out and stumped. This long talked of work should be continued.

Ornamental Trees, &c.

Besides several hundred fruit trees already mentioned as added to the orchards, over 2,000 ornamental trees were planted out.

A number of additions have been made to the plans of the farm prepared from Mr. Dimelow's surveys.

Roads.

The larger half of the main road through the farm has been contracted for and finished during the preceding six months. The elevator road has been surveyed by myself and contracted for and finished during the same time. Two much needed culverts, both near the home paddock tank, have also been constructed by our own labour. The arrangement of the various culvert and water channels so as to bring the storm waters as well as possible into the six million gallon irrigation tank, has cost me considerable thought. Some of these water channels will have to be paved in the near future.

Students' Quarters.

The students at this farm have always had my sympathy on the ground of the uncomfortableness of their quarters, and I have done what I could to render them more comfortable. The colour has been altered from red to a light green, nearly white. The roof has been whitened with so-called refrigerating paint. This is admitted on all hands to have afforded considerable relief during the hot weather. I have placed chairs at the dining tables instead of the old and very inconvenient and uncomfortable forms. The bath-room has been lined with metal and ten showers placed instead of three tubs. This improvement has been much appreciated, and in fact the old arrangement, as I found it, was a menace to health, malodorous, and badly drained. Wire screens have been placed on the kitchen, scullery, and dining-room, to mitigate the fly nuisance. A filter-bed has been arranged for, so that water from the home paddock tank may be used for domestic purposes with comfort and without risk. The bath-room has been connected with the home paddock tank instead of with the underground tank, which was an extravagant arrangement so far as water was concerned. I have made an effort to improve the food and cookery supplied to the students, and, according to my own belief and to the testimony of the housekeeper and other officers, have succeeded. The table-waiting at present is also much improved on that of July last. This has been done through numerous changes in the servants, but fortunately each change has been for the better; much improvement could yet be made.

I believe all these improvements have been duly appreciated by the students, as they certainly have by the officers.

Apparatus

Apparatus and Books.

£50 worth of books have been added to the farm equipment, and I hope this nucleus will be quickly added to, as the distance from town is so great as to preclude the use of the local School of Arts. Good books exert a great influence in the right direction.

Twenty-five microscopes have been added to the teaching outfit for the use of the experts in instructing the students. Similarly an enlarging lantern has been purchased. Four telephones have been added and erected. These have been an immense saving in time. Fire buckets have been provided and a fire drill partly devised; this should be completed. A theodolite and levelling staff have also been added to the equipment of the laboratory.

Water.

Besides various improvements mentioned above in connection with the water supply, I have had the pleasure of making the following improvements:—

1. Fenced and wire-netted the home paddock dam, so that stock cannot wade in it.
2. An effective water supply has been laid on to the new dairy.
3. An effective water supply has been given to the piggeries in place of that formerly laid down, which would not work.
4. Aforementioned filter-bed, in place of that formerly constructed, and which was useless.
5. Starting the fixing of two 25,000-gallon iron tanks on the east Sister Hill.

Machinery.

With your approval I have purchased the following machinery:—

1. One M'Cormick right hand binder, another binder (Massey Harris) will be needed next year, if the area under wheat is increased as it should be.
2. Two one-horse hoe.
3. One hand drill.
4. One chaff cutter which with four men will cut 20 tons a day where that formerly employed with six men would cut two tons.
5. One winnower.
6. A disc header, worth £24, has been secured.
7. One horse rake.
8. One oat crusher.
9. Numerous necessary tools.

The various tools on the farm are now branded and numbered, and there are fewer losses than formerly. I venture to express the opinion that all the above are such as to bring credit to the farm.

Provender.

Since August all the meat, milk, bran, chaff, grain, &c., have been delivered or fed out by weight, and all are booked by the registrar.

Shows.

I had the honor to send exhibits to the following shows:—Wagga, Corowa, Albury, Junee, Moree. I am afraid that except at Wagga where the exhibit was under my own supervision the display did not do the farm any good. There was not much produce to display, as the crops had failed. The crops were almost a total failure. Consequently (and this could be done well only at Wagga) other things had to be exhibited. This was so well done at Wagga (*vide* my photographs sent at the time) that about 200 visitors flocked to see the farm that could produce such an exhibit.

Signs.

I have pushed on the matter of signs for our main crops. The new signs which I have had prepared relate principally to the orchard and are a very striking and useful feature of the place, and are the only large crop signs added since those painted for the experiment wheat-plots.

Crops.

In addition to innumerable experiment plots, I have directed the preparation of the ground and the sowing of

150	"	wheat.
150	"	barley.
50	"	sorghum for ensilage.
50	"	cow pea for cow feed and sea.
5	"	miscellaneous garden produce.

and the entire harvest of 1897.

Grain Harvest.

In spite of the fact that the grain harvest of this year was nearly half as large again as it ever was before, it has been entirely removed from the paddocks (never done before and entailing much more labour) and placed in a safe position near the quarters, in scarcely more than half the time hitherto taken. This was done by sharp work over-time for which the men were afterwards given full allowance. This is the way the harvest should always be conducted.

By this enumeration of the various works undertaken during the last half of 1897 at the Wagga Experiment Farm it will be seen that progress has been the watchword; in fact, it is my opinion, and I do not venture to state it without first ascertaining that it coincides with that of those well qualified to judge, that during no period of its history of similar length has the farm done such good work or made so much progress.

Other

Other Work.

In addition to the above-mentioned technical work, I must mention that you yourself and the Honorable Minister for Agriculture, have, on numerous occasions, commissioned me to report specially upon a variety of matters, and to attend and take part in a number of conferences and committees, and these duties have absorbed a considerable amount of my time and thought.

Again, the planning of several of the special buildings erected, or proposed to be erected, on the Wagga Wagga and Bathurst Experiment Farms, has been entrusted to me, and though some of these are in abeyance, because I could not see my way to recommend for these farms any further small make-shift, non-permanent, buildings, yet some of them have taken shape, and I feel confident will meet with general approval. In this connection I would respectfully point out that experiment farms are no longer an experiment in this country. They have justly won popular favour, and have come to stay. In view of this fact, I think that in future all buildings on these farms should be of a permanent character and on a sufficiently liberal scale to accommodate the inevitable growth. Let the housing of valuable officers and materials in tents and shanties become a thing of the past.

The Outlook.

The outlook for useful scientific work for the benefit of agriculture in this country was never before so bright. May the faithfulness with which such work is done be such as to meet the high expectations which have been raised by the great achievements of science in the past.

I cannot close this report without tendering you my congratulations on the high repute your Department has achieved, not only in this Colony, but throughout the world; nor without acknowledging the many official courtesies I have received at your hands, and those of my brother officers of the clerical staff, and of the scientific staff. I am particularly indebted to those officers who have assisted me in my own particular investigations, of whom I may mention Messrs. E. M. Grosse, H. S. Burton, and W. Chambers. The Department is to be congratulated in retaining such talented and faithful officers as these.

My thanks are also specially due to the various managers of the Experiment Farms and their assistants for numerous favours and courtesies, always cheerfully rendered.

Yours, &c.,
N. A. COBB.

Report of the Chemist.

I HAVE the honor to submit herewith a short report of the work done in the Chemical Laboratory of the Department of Agriculture during the years July, 1895, to July, 1896, July, 1896, to July, 1897, respectively, and the half-year July-December, 1897.

The routine analytical work include the following :—

Soils.....	195
Fertilisers	135
Beet-roots	126
Waters	47
Wheats and flours.....	107

The routine work also includes a large number of miscellaneous analyses of agricultural produce, such as dairy produce (milk, butter, cheese), fodders, wines, tobaccos, ashes of timbers, preservatives and insecticides, barks for tannin, &c., &c. Also a large amount of unrecorded work, such as replies to questions, personal interviews, and advice, &c. The number of papers dealt with by the Chemical Branch amounted in 1895-96 to 283; during 1896-97 to 447; and from July to 31st December, 1897, 273.

Early in November, 1896, the premises hitherto occupied by the Department in Macquarie-street were evacuated. The Chemical Laboratory was, consequently, moved to its present quarters in the old Naval Stores Depôt in Lower George-street.

It was not until January, 1897, that the necessary fittings and alterations were completed so that work could be resumed, involving a delay of over two months.

SOIL ANALYSES.

Of the 195 soils examined, 182 were complete analyses involving 15 or 16 separate determinations in each case, the remaining 13 being only partial analyses.

In all cases the farmer is furnished with the result of the analysis together with a report based upon the chemical examination, explaining technicalities and advising as far as possible the best treatment for the crops which it is intended to grow, suggesting appropriate manuring, and replying to any special points about which information may be desired.

The work of tabulating the results of the analyses, hitherto made, in such a way as to show the general characteristics of the soils in the various districts is not being lost sight of.

Owing to the immense area from which the soils come, and the haphazard way in which they are selected, the number of representative soils analysed from any particular district is as yet hardly sufficient to justify any definite conclusion in most districts.

It is hoped, however, that a general description of the soils in the neighbourhood of Sydney, in the counties of Cumberland and Camden will be prepared shortly.

FERTILIZER ANALYSES.

Analyses of fertilisers were undertaken as in previous years for farmers.

These include both examinations of manures on the market, as well as analyses of waste-products regarding which information is sought as to their manurial value.

In July, 1895, a list was published giving the composition of the fertilisers obtainable in New South Wales, together with the price asked for them. This list was revised in May, 1897, and brought up to date.

This table is compiled from analyses made in the departmental laboratory and enables farmers to compare the nature and composition of any particular fertiliser they contemplate purchasing, and affords them some guarantee of their value and purity.

REPORT ON THE WORK DONE IN EXAMINING THE MILLING QUALITIES OF WHEATS.

A considerable amount of work was been done in the examination of wheats, more particularly as to the milling qualities of the different varieties of grain. The following is a short account of this work:—

Historical.

In 1894 Mr. Farrer of Queanbeyan asked me to determine the gluten-contents of certain wheats with which he was experimenting. Mr. Farrer has been engaged for a number of years in cross-breeding and selecting wheats with the object of improving the grain locally grown, and providing one or more varieties of wheat suitable to the different districts of the Colony.

The first batch of samples received from him were simply ground to a meal, and the gluten determined. It was soon apparent that to be of any real value the determinations would have to be made on the flour, and further, that if it were possible to produce on the small scale flour of a quality approaching that turned out by the millers we should be able to determine a number of other points, and, in fact, determine the milling qualities of any wheat with some approach to accuracy.

After some delay a pair of small hand-roller mills were obtained through the Austral-Otis Engineering Company of Melbourne, manufactured by Ganz and Company of Buda Pesth.

In devising and perfecting a system of milling suitable to our small mills, I am greatly indebted to Messrs. Brunton and Gillespie, of Sydney, both for their own help and their permission to their millers to give me their assistance. With their aid a system was devised which enabled us to produce a flour in all respects identical with that obtained in the large mills.

We are now in a position to pronounce definitely upon the milling quality of any variety of grain, no matter how small the amount, as we can mill as little as 12 oz. with accuracy. The flour produced is further examined for colour, strength, gluten-content, and, if necessary, baked into small loaves.

Milling Experimental Wheats.

The experimental wheats harvested by Mr. Farrer early in 1894 were then attacked, and the results, seventy-five in number, were published in the *Agricultural Gazette* for March, 1895.

This batch included a large number of locally-grown wheats, as well as bread-wheats of foreign countries, and some unsuited for bread-making.

These results were, as I had anticipated, of considerable service to Mr. Farrer, as they enabled him to reject many varieties less suitable for milling purposes, and gave him information as to the milling qualities of the grain which he could not otherwise have obtained.

Another batch of about thirty different varieties was put through in 1895—the result of the harvest of that year, and the results published in the *Gazette* of February, 1896.

A third batch selected by Mr. Farrer from his harvest of the present year are now being dealt with, and will be ready for publication in a short time.

As the wheats thus examined include typical grain of the different varieties of bread-wheats, and as these are all of pure strains, and true to name, we have been able to determine, once and for all, the milling qualities of these different groups of wheat when grown locally.

A large number were the product of cross-breeding and selection, and our results show to what extent cross-breeding influences the milling qualities of the grain.

Reason of the "Strength" of Flour.

A number of interesting questions naturally cropped up in the course of this work, one of which, as it was of immediate practical importance, was followed up more particularly. This relates to the "strength" of the flour or its water-absorbing power. This point is of even greater importance than the gluten-content, because a strong flour produces a more voluminous and easily digestible and more nutritious loaf than a weak. Hitherto it was generally assumed that the strength of a flour depended upon the quantity of gluten. The result of our investigations has been to establish the fact that the strength of the flour depends upon the chemical composition of the gluten rather than its amount, those flours being strong which contain a large proportion of the proteid substance glutenin, whereas weak flours contain always an excessive proportion of gliadin, the second proteid of gluten.

The result of this investigation was published by the Royal Society of New South Wales in 1896.

Further experiments have shown that this is also the reason of the greater strength of the so-called patent flour compared with flour obtained by milling closer to the bran, although the amount of gluten in the patent flour is very much lower. In other words, the gluten-cells are richer in gliadin in the neighbourhood of the bran, and of glutenin towards the centre of the grain.

In addition to Mr. Farrer's wheats, a number of wheats have been examined for farmers and others desiring an opinion as to the milling qualities of small samples.

Judging

Judging Wheats competing for Prizes at Shows.

The system has also been called into requisition in assisting in judging prize wheats at shows. At the shows held by the Grenfell P. A. and H. Society in particular a number of samples have been forwarded each year for the past three years to the Department.

These samples have been milled and marks awarded for such points as weight, ease of milling, and colour, strength and gluten of the flour. It is satisfactory to say that in two cases out of the three the independent judgment of the millers and our own judgment coincided in every particular; in the third case the differences were not great.

In other cases of wheat-judging the results have been equally satisfactory, and the method has this advantage over expert judging, that the reasons for the decision can be expressed on a numerical basis, and the personal factor is eliminated.

The question of the suitability of Hard Grain for Milling.

A further point of interest to wheat-growers in New South Wales has been that we have been able to show that certain wheats which were not considered suitable by our millers are nevertheless excellent wheats for blending purposes, and they have the additional advantage that they can be grown in parts of the Colony unsuited to the softer grain to which we are accustomed.

Since I first drew attention to this point our local millers, on account of the small wheat harvest of 1896, have been compelled to import a quantity of wheat to make up the deficiency, and the grain they have imported is exactly this hard American wheat to which I had drawn attention.

They are now prepared to take this kind of wheat for blending purposes, and are distributing it themselves to farmers in districts suitable to its growth.

Improvement in our Local Flour.

That the introduction of this grain has not been detrimental, but the reverse, to the quality of our flour is proved by the fact that whereas our flour used to contain on the average about $8\frac{1}{2}$ per cent. gluten only, with a strength represented by 50 quarts of water to the sack, the flour at present in the market containing this blended American wheat has a gluten content of $9\frac{1}{2}$ per cent. in the average, and a strength as high as 55.

I cannot close this report without expressing my high appreciation of the value of the services of Mr. E. H. Gurney, my assistant, in this work. Since the scheme of milling which he assisted in perfecting was finally adopted, he has milled every sample of wheat examined, work requiring skill and care of no mean order.

Co-operation of Practical Millers.

As an instance of the appreciation of practical millers of our work, I may mention that in August, 1897, two South Australian millers—the head miller of the Adelaide Milling Company in Adelaide, and the head miller of the Port Pirie mill of the same Company—spent a fortnight in the laboratory learning the details of our method and testing wheats. I am indebted to these gentlemen for much valuable information, and they propose to introduce similar work into South Australia.

It is proposed to replace the hand power hitherto used by a small gas engine, by which the amount of work done can be considerably increased. The mills will then be available for commercial testing of samples as well as experimental work, for which they have been hitherto utilised.

WINES.

The study of the chemical nature of the wines of the Colony has been commenced by the examination of the product of several of the northern river vineyards.

The result shows that the pure wines of New South Wales are very similar in composition to those of the best European vintages, the amount of acidity, sugar, and tannin comparing favourably with European wines.

As the value of a wine depends more particularly upon qualities, such as bouquet or aroma, which are indistinguishable by chemical methods known at present, these analyses are chiefly of value in showing that the wines examined are pure, unfortified, and well fermented wines, and consequently a high-class and perfectly harmless product.

SOIL-BACTERIA.

Early in 1896 I obtained the assistance of Mr. R. Helms, to investigate the conditions of nitrification in the different soils of the Colony.

It was hoped that, in addition to the information usually given in connection with the analysis of soils, it would be possible to express an opinion as to the nitrifying power of the different soils, besides being able to contribute something towards our knowledge of their important organisms.

Unfortunately Mr. Helms accepted an offer made to him by the West Australian Government within six weeks of his commencing this work. We were, consequently, unable to obtain any results, except to collate the literature bearing on this subject, and to follow the course of nitrification in several typical cases.

In view of the great importance of this subject, and the practical nature of the results to be derived from a proper investigation into this subject and the kindred one of nodule-bacteria in leguminous plants, I would like to point out the desirability of engaging someone who could devote his time to the bacteriological aspect of the question, which requires a closer and more continuous attention than I am able to give it.

Work of this nature could be very well carried out at Bathurst or Wagga, in connection with other lines of research work, such as systematic manuring experiments, pot experiments, and a number of investigations of a similar nature, which cannot well be carried out in a laboratory where everything has to give place to routine analytical work.

PUBLICATIONS.

The following is a list of the articles dealing with chemical matters published in the *Agricultural Gazette* from July, 1895, to July, 1896 :—

"Table of Analyses of Commercial Fertilisers".....	July, 1895.
"Chemical nature of the Wines of N.S.W." Part I.....	Dec., 1895.
"Soil analysis".....	Jan., 1896.
"Further notes on the Milling Qualities of different varieties of Wheat".....	Feb., 1896.
"Analysis of Hay of <i>Paspalum dilatatum</i> ".....	May, 1896.
"Chemical nature of Wines of N.S.W." (continued).....	June, 1896.
"Note on imported Flours and Wheats".....	Sept., 1896.
"On the absorption of water by the gluten of different varieties of Wheat".....	Sept., 1896.
"On the inoculation of the Soil for leguminous crops".....	Oct., 1896.
"Value of the Phosphate of Lime in Bone-dust".....	April, 1897.
"Table of analyses of Commercial Fertilisers".....	May, 1897.
"Objects and methods of Soil analysis".....	June, 1897.
"Note on the Analysis of Fertilizers".....	July, 1897.
"The Fodder Value of Salt-bush".....	Aug., 1897.
"Agricultural Education".....	Sept., 1897.
"Some Chemical Points in the Preparation of Insecticides, &c.".....	Sept., 1897.
"Chemical notes"—being short analytical and miscellaneous notes on a variety of subjects in October and November, 1895; November, 1896; and June, 1897.	Oct., 1897.

Also, in conjunction with Mr. E. H. Gurney :—

"Further Notes on the Milling Qualities of different varieties of wheat".....	Nov., 1897.
"Judging the Milling Qualities of Prize Wheats at Shows, &c.".....	Dec., 1897.

In addition to the above, a chapter on "The Soil" and another on "Manures and Manuring" were contributed to the *Farmers and Fruit-growers' Guide*, which appeared in January, 1897.

In conclusion, I wish to express my high sense of the value of the help given me by my assistants, Mr. E. H. Gurney and Mr. C. R. Barker.

F. B. GUTHRIE.

Report of the Entomologist.

I HAVE the honor to submit the following annual report of the Entomological Branch.

I took charge on the 1st of October, and have gone through the whole collection of specimens, named and arranged the lepidoptera, hemiptera, some of the orthoptera and coleoptera, and with specimens from my own collections, set out the finest named collection of scale insects (Coccidæ) in Australia. A large number of specimens of economic value have been received in the course of the year, which have been labelled and put away. With the assistance of the Chief Inspector of Stock, I prepared about 100 postal blocks containing glass tubes, one being sent to each district inspector; by this means we have obtained a fine collection of external parasites, ticks, lice, acaria, &c., many of which having been prepared and mounted by me, for microscopical observation, now form a valuable adjunct to our insect collections, and have been examined by the Inspectors of Stock when wanting information.

At the request of the Secretary of the Department of Agriculture of New Zealand, a collection of live larvæ of the friendly lady-bird beetle (*Cryptolæmus montrouzuri*) were obtained and shipped to that colony, where they arrived in good condition on the 21st of January.

In January, I visited the vineyards of Messrs. Adams, Murray, and Fincham to examine the phylloxera, and during the three following months was engaged for three days every week in the Minto district vine inspecting. I also visited and reported upon white ants (*Termes lactis*) attacking potatoes at Colo Vale; Gosford, to investigate the attacks of "black fly" (a small hemipterous insect) upon peaches and other fruit; Orange, to examine an obscure disease attacking apples; and various gardens in the immediate vicinity of Sydney.

In the latter part of May, the Tweed River was visited in reference to "maize blight" and numbers of insects, many in the larval state, were collected there, and at the Wollinbar Experimental Farm, whose life histories have been worked out under observation in the office.

During the half-year ending 31st December, 1897, I have visited the following places lecturing, and inspecting farms and orchards for insect pests.

Addresses have been delivered by me at Ermington, Corowa, Albury, Thurlgoona, Glen Innes, Tenterfield, Inverell, Armidale, Bathurst, Tamworth, Maitland, Thornleigh, Dundas, and Liberty Plains.

Early in July specimens of the San Jose Scale were sent into the office from Tamworth, which led to me going to Woolomin and spraying the infested trees. I afterwards found this destructive pest at Tenterfield and Glen Innes, later on at Maitland, Berowra, and Gosford. I therefore, under instructions, visited most of the leading nurserymen in the county of Cumberland, and inspected their places, with their permission, but found this dreaded scale in one nursery only.

I am carrying on some experiments with potatoes treated with different chemicals to protect them against the attacks of the potato moth (*Lita solanella*) and have two plots planted—one at Colo Vale and the other at Macquarie Fields.

Since the middle of November I have been acting as Vine Inspector in the Ryde district, as weather permitted, for two days of each week.

A large amount of clerical work has been necessary in reporting upon entomological questions, their identification, life histories, habits, and the best methods of destroying injurious ones.

I have contributed the following papers, compiled from original notes and observations, to the *Agricultural Gazette of New South Wales*, "Forest Moths, that have become Orchard and Garden Pests," Nos. I., II., III., and IV.; "Entomological Notes" (No. 136); "White Ants" (No. 155); the "Fruit-maggot Fly" (*Tephritis tryoni*) No. 163; and carefully compared the drawings of the artist with the specimens.

In conclusion, I would beg to call attention to the serious disadvantage I labour under in the want of room at my disposal for the breeding and observation of insects in their immature stages; an insectarium is a most important adjunct to an economic entomologist's office, and much valuable information is lost through the want of proper equipment.

I have, &c.,

WALTER W. FROGGATT.

Report

Report of the Fruit Expert.

I HAVE the honor to report that I proceeded to Bathurst on the 10th of March last under instructions to take over temporarily the management of the Bathurst Experiment Farm.

Before my arrival, all the crops, with the exception of the maize, had been harvested, and owing to the extremely dry weather which prevailed at the time, anything in the way of experiments was quite out of the question.

Notwithstanding the dry weather, ploughing was pushed forward as quickly as possible under the existing circumstances, and by the middle of May, with the exception of a few acres, all the crops were in.

Certain works and improvements which were in progress or had been approved of were completed during my management, notably :—

Laying earthenware pipes across orchard for purpose of carrying water from the bush paddock to the new tank.

Putting wire netting around orchard fence.

My management of this farm expired on 16th June last, when same was handed over to Mr. A. A. Dunningcliff.

Immediately after giving up the management of the Bathurst Farm I proceeded to the Wagga Farm in the first week of July, and was engaged from then up to the 24th of August, attending to the pruning of the 80 acres of orchard there; giving the students a thorough course in pruning, spraying, and the winter cultivation of orchards, and twice a week for these eight weeks lecturing to them in the evenings on all matters pertaining to orchard work. At the end of this period I examined them, and found on the whole that they had a very fair grasp of this particular branch of the work. During this time also I filled many orders for cuttings and scions from all over the country—the cuttings and scions from each particular variety of vine or tree having to be tied in separate bundles and carefully labelled—entailing a great amount of careful work. At this time also, at the request of Dr. Cobb, and with the assistance of students for staking out, I laid out and attended to the planting of 5 acres of saltbush, since which this work has been carried on by the farm manager, as also the avenue of plane trees from the main entrance to the granary, which were planted by myself and students.

On the 28th July, I was summoned by wire to Sydney, to wait upon the Minister in reference to proposed nurseries, and on my return home the following day, I prepared and submitted a list of the stocks required for starting nurseries on the different farms. On the 6th August, acting on verbal instructions received from the Minister, I wired to Mildura for six bags each of peach and apricot pits, but it was the middle of September before these arrived, owing to delays in transit, so that by the time these pits were in, the season was rather far advanced, and being an exceptionally dry season, a very small percentage only germinated; in fact none of the peach pits planted on any of the farms will come on until next spring. At the Hawkesbury Orchard the apricot pits have come on very well, those at the Wagga Farm which did come up were scorched and killed by the hot winds and want of an adequate water supply. The almonds here have done fairly well, this being the only orchard at which any of the nuts have so far germinated. Only a small supply (about a pint) of orange pips were planted in seed-beds at the Wagga Orchard, but these have come on very well owing to the efforts of Mr. Alford, who carted and carried water to the seed-bed. These will be ready for planting in nursery rows this coming spring.

Trellising Vineyard.—About the middle of September the contract for trellising a portion (about 6½ acres) of the vineyard was let to Mr. Paterson, two systems being adopted, viz., that of Prof. Blunno being the system followed for vine grapes, and my own system being that followed for sultanas and zante currants. The work has been done in a careful and substantial manner, and is a good object lesson for those engaged or wishing to engage in raising grapes of these kinds.

With the approach of the fruit season it became necessary to erect a fumigator for the sulphuring of the dried fruits, and also to purchase the proper trays and boxes for handling the fruit. Notwithstanding certain difficulties no fruit was lost and a very creditable sample of dried fruit has been turned out—the weather being so exceedingly hot and dry that fruit was dried in two days—instead of three and four days, which is the usual time occupied. Besides this about eighty-two quart bottles of apricots have been put down and a few bottles of cherries, the crop being practically nothing this year. I am pleased to have been able to secure such a fair sample of fruit from this dry district during such an exceptionally dry season.

Great interest has been evinced in the system followed and condition of this orchard by all visitors, who receive every attention and information desired.

Hawkesbury Orchard and Nursery.

Four bags of peach and three bags of apricot pits and 50 lb. of almonds were planted here, as well as about 2½ gallons of orange pits. The apricots here have come on exceedingly well considering the season, as also the orange pips; the former will be ready to bud this fall, and the latter to be planted in nursery rows next spring.

The peach pits and almonds have not come up, but will come up in the following spring.

The orchard received a rather severe pruning during the winter, which was necessary, as the branches had been allowed to grow rather wide and spreading. The peach and apricot crop is very light, and no apricots will be available for drying, and but few, if any, peaches. Plums will be a fairly good crop, and drying varieties will be dried, and samples of the various kinds canned. The vineyard here is in very good condition, and a good crop of grapes may be expected. The citrus trees are in much cleaner and better condition than they were six months ago, owing to the improved cultivation and spraying, but little, if any, fruit can be expected this year. Pears have made a fair growth, but as the trees are young, these will also be a light crop. Apples, on this light soil, are not doing as well as if planted in heavier soil, but there will be samples of different varieties. Generally speaking, the orchard is in very fair condition, there being still a little couch grass, which Mr. Waters is trying to eradicate.

Bathurst Orchard.

After finishing the pruning at Wagga I proceeded to Bathurst, and with the assistance of the students there pruned this 30 acres of orchard. I also planted about 250 trees required to be planted to complete the orchard as at present laid out. No attempt has as yet been made to raise nursery stock here, but if water could be guaranteed I think that this district should be specially adapted for growing some of the apple, pear, plum, and cherry stocks recently ordered from France.

This orchard has received as good attention as could be expected from one not under the constant supervision of an experienced orchardist, but this work can receive more attention since my removal here. The trees, however, have made very fair growth, but are too young to produce any fruit this season.

Pera Bore Orchard and Nursery.

The pruning here has been well carried out, and the trees at the time of my last visit (about 1st December) were putting on good growth, excepting the prune trees, which are not doing quite as well as they should. This is partly due to the climate, which is, I fear, rather too warm, and partly to the severe check received in transit from California.

A bag each of peach and apricot pits, and about 30 lb. of almonds were also sent to this orchard for nursery purposes, none of which have germinated owing to the lateness of planting, but these should come up next spring. About a pint of orange pips, sent at the same time and planted in the seed-bed, have come on exceedingly well, and will be ready to plant in nursery rows next spring.

Six hundred orange trees, which were sent on for planting at the Walkden's Bore, I found, on my last visit, to be mostly all dead. Mr. Gorman has no doubt reported on this matter before now. No fruit can be expected this year owing to the trees being too young.

Wollongbar.

About a quart of orange pips were forwarded to Mr. M'Keown, with instructions as to the preparation of seed-bed and planting, and I have Mr. M'Keown's verbal assurance that these have come on very well. As yet I have not paid a visit to this district, but have written Mr. Jackson of my intention to do so the last week of January.

Trip to Mildura.

On the 5th November I started, under instruction, for Mildura, to arrange about securing a supply of buds and scions true to name, for use in budding in the different nurseries this coming fall and spring, and I hope by this means to introduce into this Colony a plentiful supply of those varieties of fruits which are of the highest value commercially, and such as can compete with the fruits of Southern California and Mildura. A detailed report of this visit was furnished on the 22nd of November.

Since the 24th of August last much of my time has been taken up in visiting different districts in order to give practical demonstrations in orchard work, as well as all other information in connection with fruit-growing, detailed reports of these visits having been furnished from week to week. I may mention that wherever I have been great interest was shown in the work, and those interested were of the opinion that as far as this branch of the work was concerned that this was by far the best and most practical means of helping the fruit-grower.

Besides my other duties I have contributed during the last six months, to the *Agricultural Gazette*, several articles, as well as many answers to inquiries—the article on "Fruit Drying," published in the November *Gazette*, being the only reliable one in every detail which I have yet seen published—this having been an especial feature of my work during the past seventeen years.

Before the Christmas breaking-up I prepared a list of questions on orchard work for Dr. Cobb, who was examining the students, and on a revision of their replies I found that most of those who went in for the examination did fairly well.

I examined, at the Hawkesbury College, on the 21st ultimo, eighteen students, and found that most of these also had a fair grasp of the subject.

I have, &c.,
W. J. ALLEN.

Report of the Viticultural Expert.

I HAVE the honor to report on the work accomplished since my appointment in September, 1896, to 31st December, 1897.

My first thoughts were directed to bringing the inspection of the vineyards and the precautionary measures for the eradication of the phylloxera in accord with a proper system, and instructing the inspectors accordingly. This was done through the "Hints for the Inspection of Vineyards," in which is to be found all information that one needs to have in such responsible and important work. The system is becoming every day more efficient, and is inspiring more confidence in the vignerons.

The assignment of a head-quarters to each inspector, so letting each work within a determined zone, makes those officers feel more responsible, and also enables the Department to economise on the service.

Four infected vineyards were detected last year, which were treated with strong doses of bi-sulphide of carbon, after all the growth above ground had been burnt. The insecticide was applied at intervals of three or four days, following special places for the injection, so as to have the ground thoroughly disinfected. The effect of such treatment was most satisfactory. I may say, however, that the second and third infections were amongst the worst I had ever seen before, hence the further precautionary measure of trenching adopted in the three first cases, all the roots being collected and destroyed by fire.

In the fourth vineyard the infection was only slight, and it was treated exactly in the same way as the previous ones, but the trenching of the ground being a costly operation was omitted. Instead, the vines were carefully dug round, all the stumps pulled out, also as many main roots as possible were collected and destroyed by fire.

The stamping out of this pest in Australia may hardly be expected, and the chief fault lies not so much in the insect life itself as in the possibility of inadvertent assistance the spread of the insect may receive through lack of care or knowledge.

Here

Here the pest is more easily controlled than has been possible in Europe. The outlook, however, being uncertain, I strongly advocated the import of cuttings of phylloxera-resistant stocks. A hundred thousand of these will arrive from France next March, when they will be planted in quarantine at the Department's experimental vineyards.

We have a long and interesting study before us concerning their suitability to the different kinds of soils, every true species and every hybrid having some characteristic requirements of its own. Their more or less affinity in getting grafted with our local varieties, their sensitiveness to the presence of a varying percentage of lime in the soil, their exigencies as for depth and physical composition of the ground, &c., &c., are all questions which make this new branch of viticulture a complicated subject, wanting the attention of several years to ascertain to what extent the information that we have got from other countries is of use in ours.

Being well aware of this, I thought that the sooner we started the better, so as to be able to give the vigneron reliable information when a sudden spreading of the phylloxera, which is not beyond possibility, might alarm them.

We may also congratulate ourselves to see the Department of Agriculture of Victoria following our steps and joining us in the import of these vine-cuttings.

When first I was appointed temporarily I went to the Southern districts, thence I proceeded to the Hunter River. A report on this trip sent to the Department appeared in the January *Agricultural Gazette*, referring to my impressions about the quality of the wines, and several objections were pointed out.

The land is too shallowly worked in the Albury and Corowa districts before and after planting, and this is one of the main reasons to which is due the low average yield. In similar climates, hot and dry as that of the Southern districts, and for vines planted so far apart, the soil is always disturbed much deeper, so as to allow the roots to live in a fresher and cooler environment.

It also surprised me to see vines only 15 years old looking as if they were 35, and those of 35 quite exhausted. I thought that it was a question of pruning as well, and at the first occasion I delivered in both districts a lecture on this subject, and gave a practical demonstration in the vineyard.

The lecture began with some general hints on pruning the vine, then four principal systems were illustrated, viz. :—

- 1st. The common gooseberry bush method.
- 2nd. The system named after Dr. Guyot, on single or double cane.
- 3rd. The system named after M. Royat, also on single and double arm.
- 4th. The method Cazenave, modified by Guyot.

The lecture was printed in the June *Gazette*, and entirely reported by some weekly papers of Melbourne.

In November last, I assisted at a quarterly meeting of the Albury Vine and Fruitgrowers' Association. There I was called to answer many questions on vinegrowing and vine diseases, on wine making and sickness of vines. Thence I went for a visit to the Bendigo district, which is the worst seat of infection of phylloxera of Australia. It was necessary for me to go there to see how things were proceeding, in order to be able to take the necessary steps in our Colony accordingly.

During vintage time I was particularly engaged in some cellars of the Hunter River and of the Albury districts for experiment purposes, and on that occasion the *levures pures* received a trial.

The result of the experiments was a new proof added to hundreds more which the European vinegrowers are used to. The *levures pures*, where the vintage is good, and grapes are sound and clean, are of questionable importance; with musts of inferior quality, this pure yeast will cause a purer fermentation, but this fact could not be confirmed last vintage, on account of the season being so favourable for the vintage, throughout which with dry weather prevailed.

In all cases these *levures* answer only to part of the wonderful claimed advantage—I mean to say, that the *levures pures* of a *Château Yquem*, for instance, will make this sort of wine at *Château Yquem*, and only there.

For detailed information on the argument of the selected *levures*, I would direct attention to a special chapter of my "Notes on Wine-making," which appeared in *March Gazette*.

In these same notes the principal arguments are the influence of temperature on the fermentation and precautions to control it; the aeration of the must; the systems of properly making red and white wines and Muscats are separately dealt with in special chapters; also is given a formula of calculation for fortifying sweet wines, besides other general hints.

These notes being quite new, were highly appreciated, and reproduced by some weekly papers of this and the other colonies.

I paid several visits to the different vine districts. I went once to Tamworth and to various other places—on nearly every case at the special invitation of vigneron.

I have not kept record of the papers sent to me from the Head Office, or of the letters addressed to me individually, being from vigneron seeking technical advice, because having been appointed permanently only since May last my office is yet in a way of formation, but I may say that they were many.

During the last six months several important matters have engaged my attention. In fulfilling the appointment of judge in the wine section at the Corowa Show, I had opportunity to note the inconvenience, common to such competitions, resulting from incorrect classification of the different types of wines. This not only detracts from the educational influence of the exhibition, but renders it almost impossible to adjudicate and award prizes. I brought the matter under the notice of the Viticultural Board of Advice, and laid before the Board a report as to the best means of remedying the matter. They concurred with my views, and I am now drafting a wine schedule to provide for a proper classification of wines at the various Shows.

At both the Albury and Wagga Wagga Societies' Shows, I am sorry to say, I detected, by means of chemical test, two prize sweet wines containing salicylic acid, which is not a natural component of wine. Under the circumstances I recommended the refusal of awards. It is gratifying to be able to report, however, that these unsatisfactory exhibits were not the produce of this Colony.

I consider that it is essential, in the interests of consumers, to establish the limits within which the treatment of wines is to be considered legitimate, and, for the guidance of those interested, to draw up and publish a list of the substances which, being most commonly used to adulterate wines, are to be sought and guarded against. Subject to the approval of the Board of Health—the responsible authority in the matter—no time should be lost in giving effect to such a regulation, and so put an end to the uncertainty that exists as to what is to be deemed fair in the treatment of wines. I am doing my best to carry out the scheme, but do not consider it advisable to submit it for approval until my laboratory is set up and I am able to undertake an exhaustive chemical study of the wines of the various districts of New South Wales.

With regard to the Phylloxera service, I am glad to say that during this period no further discovery has been reported, notwithstanding the fact that inspection has proceeded with the utmost care. Of the four inspectors, two have been occupied in examining the vineyards nearest to the recently diseased area, but no trace of further infection has been found. This circumstance does not, of course, absolutely set at rest the question as to the existence of the pest in such vineyards, because it may be in its earliest stages when detection is exceedingly difficult. But I am quite satisfied that in time we shall succeed in eradicating this disease from the Colony, or at all events so localise it as to effectively safeguard the vinegrowing industry.

The question of the establishment of a viticultural college has evoked considerable discussion among those interested in viticulture. Vignerons themselves and those anxious to engage in the industry advocate the movement, which is, of course, natural in a country so well adapted as this for a large progressive viticultural interest.

I reiterate my impressions about the future of vinegrowing of this Colony, and I consider it most promising.

It is a fact that foreign connoisseurs cannot but acknowledge the good quality of the New South Wales wines, or at least of those wines well made and well looked after.

Technical knowledge is generally lacking amongst vigneron, but I may say they are very anxious to follow proper systems when they know how to do so.

The natural factors deserve the most credit for the actual quality of the wines, but, if I may judge by the earnestness of the generality of the vine-growers, skill will before long join nature.

I have, &c.,
M. BLUNNO

Report of the Dairy Expert.

I took up my duties in the Colony on March the 25th, visiting on that day the Hawkesbury Agricultural College. My report on the dairy part of that institution was furnished in due course, and I have now to point out what I did then—that whereas students can get a very fair knowledge of dairy-farming and a sound knowledge of butter and cheese making, the quantity of milk dealt with is not sufficiently large to enable students to get an experience of large quantities of butter or cheese, or, in other words, to fit them to take charge of a factory immediately they leave the College. If, however, the students put in a short course in a factory as assistant managers or some such position, they should then be capable of managing successfully a butter or cheese factory or dairy farm. It is my opinion, however, that as the Government goes part of the way they ought to complete the education of pupils desirous of becoming capable of taking full charge of a factory, and with this end in view I have recommended the establishment of a Government factory dairy in some good dairying centre. This should be self-supporting. Such an institution would also enable the Government to receive all the pupils who apply for a dairying education; at present we are not able to accommodate all the students applying, and considering the great strides dairying is making in this Colony, I consider it a disadvantage to the Colony that there is not a dairy school or schools capable of receiving all that apply. The butter and cheese made at the college are very good, especially when it is borne in mind that various students partake in the manufacture of these articles.

Wagga Experimental Farm.

I have to report visiting this farm with a view to establishing a small dairy there. The construction of this dairy is now complete, and in a short time pupils will be afforded instruction there in butter and cheese making. Experiments in the feeding and breeding of dairy cattle are now being carried out at the Hawkesbury Agricultural College, and it is my intention to do similar work though on a smaller scale at Wagga Farm. The students have also been shown an improved and simple method of analysing milk for butter fat.

It has now been arranged that I shall hold quarterly examinations for dairy students at the Hawkesbury Agricultural College, and that outsiders may enter for such examinations with a view to obtaining certificates of proficiency in dairying.

It has also been arranged that intercolonial examinations shall be held at which successful students will obtain certificates in dairy management which will give their bearers a status of proficiency in any of the Australian Colonies. This is a step in the right direction, as the owners of factories will then be able to see by reference to the examiners' reports of these examinations where to get a reliable manager, and it will also enable managers leaving one Colony to reside in another to obtain employment in the latter. These examinations should also create a healthy rivalry between the managers in the different colonies, and in this way would tend to the advancement of dairying.

I have visited various creameries and central factories in the Colony, on all of which I have submitted reports. The central factories are, as a rule, well managed and turn out good work, but the bulk of the creameries or separating stations which I have seen require some improving.

Improvement is most needed in the handling and treating of the cream before it is despatched to the central factory. The cream requires immediate cooling after it is separated, and this is a point generally neglected. Another point requiring much more attention is cleanliness, and more particularly in dealing with the separated milk. To prevent the propagation of disease, as well as to improve the milk as a calf food, I have strongly recommended that the separated milk tanks or cisterns be scalded and cleaned daily, and also that the separated milk be heated from 185° to 195° F. where possible before it leaves the creamery.

Cattle.

Cattle.

The dairy cattle of the Colony are generally admitted to be in some respects inferior, and with a view to improvement I have suggested that some cattle be imported by the Government. The best dairy farmers on the South Coast have some good herds of milking Durhams, and with a view to breeding from this strain, about twenty-five have recently been purchased. It is intended to put an Ayrshire bull to some of these, and a Durham bull of a milking strain to the others. It is well known that the Durham breed will cross well with almost any other cattle, and it would be well for dairy farmers wishing to improve their cattle to bear this in mind.

I have attended some of the Agricultural Shows in the Colony, including the last Sydney show. The dairy produce exhibited at the country shows I have seen has not been of much moment, but there have been some good individual specimens of dairy cows shown. The Sydney show had a fine exhibit of butter, especially in the export class, and I hope to see this class repeated at future shows. The cheese shown was not of so high a character. Generally speaking, the dairy industry of the Colony seems to be progressing, and there appears a strong desire on behalf of farmers and landowners to further participate in this industry, and for those who select suitable districts, as along the coast, I expect a profitable return.

The greater portion of my time during the half year ending 31st December, 1897, has been taken up in visiting the various dairying centres in the Colony, so that I should be able to see the condition of things, and advise and report thereon. In all cases a detailed report has been submitted to the Department dealing with the cattle, pastures, methods of dairy farming, condition and working of the various creameries and factories, as well as suggestions for the improvement of dairying in each individual case or district.

The following are some of the districts visited :—

Tumut and Adelong, where it was thought it might be advisable to erect a butter factory. Two meetings were held and addresses delivered. Plans were supplied to a Mr. O'Brien suitable for a small butter factory, and I understand one has been erected.

Blayney was visited, the principal object being to advise the formers as to the most suitable building, plant, &c., for a medium-sized factory. Much benefit was derived from the advice given, and the Company were guided as to the best machinery, &c., with the result that a considerable sum of money was saved.

Brisbane was visited for the purpose of judging Ayrshire and Jersey cattle at the International Exhibition. This enabled me to see what some of the Queensland dairy cattle were like. A herd of pure-bred Ayrshires, Jerseys, and South Coast Durhams is being formed at Gatton College, near Brisbane, and I think this is a step in the right direction. No cattle are kept on the farm whose breeding is not known, and by this means the results of careful breeding and cross-breeding can be observed, and much benefit to the state derived therefrom.

The following districts also were visited, in some cases lectures were delivered, and in others advice was given regarding the erection or improvement of creameries or dairies :—Narrabri, Singleton, Albury, Camden, Hay, Grafton, Ulmarra, Maclean, Chatsworth, Lismore, Altonville, Coraki, and many other centres on the Richmond River, Wyong, Nowra, Berry, Quirindi, Wallabadah, Muswellbrook and district, and the lower Hunter River District.

A considerable amount of time has also been devoted to the delivery of lectures to the dairy students at the Hawkesbury Agricultural College, and to the setting of papers for the quarterly examinations. The general condition of dairying at the College has also had some attention, though I have not been able to devote as much time to this, or to make as many improvements, as I should like. I have introduced the tuberculin test into the College course, and every student has had ample opportunity of learning how to conduct these tests, a point which I consider of much importance to the dairying, as well as to the cattle-raising industry of the Colony.

The pasteurising of milk and cream for butter-making has been started. A pasteurising plant for purposes of demonstration has been placed at my disposal, and already a series of demonstrations has been begun, in connection with the separating stations on the Berry Estate, which promise to be of very great service to the farmers of that district, as by means of pasteurising the cream is brought under control of the creameries, and thus reaches the central factory in a much improved condition when compared with cream handled in the ordinary fashion; also, if the milk be pasteurised the separated milk is rendered a safer, and by being kept fairly sweet, a better food for calves. I have also given some time to writing articles for the *Agricultural Gazette*, which, I have every reason to believe, have been of considerable use in causing farmers to give more attention to some of the important details of dairying, and to prepare their minds for the reception of scientific information, such as the pasteurising of milk and cream, the cause of sourness in milk, and the physical means that may be adopted for retarding or controlling rancidity, whether in milk, cream, butter, or cheese. The question of tuberculosis in our stock has always been dealt with in my lectures, and many farmers now heat the separated milk to a high temperature before feeding it to pigs and calves.

A new departure has been taken in placing the services of pure-bred bulls at the disposal of farmers for a merely nominal fee, and it is to be hoped this will be extended, for I see no greater need for improvement in any department of dairying than in the average dairy cow of the Colony. In my wanderings through the Colony I have noticed on numerous occasions some excellent milkers, traceable to crossing the ordinary cow of the Durham strain with a pure-bred Ayrshire bull (this also agrees with my experience of this cross in the Old World), so that I expect some very good results from the use of the two Ayrshire bulls recently imported by this Department, and placed at the disposal of the farmers.

Complaints are still being received of the treatment which New South Wales butter receives in transit to London, the latest trouble being that the butter exported from Melbourne is delivered to customers in London two days before the shipment, in the same boat, from Sydney. This is a serious question from many points of view. Firstly, it gives the brokers of Victorian butter a handicap over the merchants who handle the New South Wales product. This might cause some of the English importers of New South Wales butter to lose their best orders and customers, and this would result in the importers themselves giving up dealing in an article that loses them trade, and turning their whole attention to goods that do not cause them any such worries or losses. This would have the effect of checking the progress of dairying in this Colony, and would be a general loss to our farmers. There is also the fact that factories situated anywhere near the

Victorian

Victorian border would favour Melbourne as a port of despatch, for they would have the certainty of a prompt delivery on arrival in London. Needless to say, this would react on the Railway Department of this Government. The Victorians have a Commissioner in London to look after their exports, and it is my opinion this Colony should have like representation. If the Government does nothing in this way, the merchants will be bound to unite, and provide such representation, in order to protect their interests and their industry. Hoping that this whole question of transit and delivery will receive more consideration during 1898.

M. A. O'CALLAGHAN.

Report of the Editor, *Agricultural Gazette*.

In addition to the information that our experts are enabled to supply as to the results of their investigations for dissemination by means of the *Agricultural Gazette*, care is taken to keep the farmers in touch with what is being done to advance agriculture in other countries. In exchange for the journal there are received by each mail from England, America, France, Canada, Germany, Denmark, Italy, Russia, and other countries of agricultural importance, bulletins and reports of the latest discoveries and methods that have been successfully adopted for the advancement of any particular branch of agriculture. This information is published in the *Agricultural Gazette*, so that farmers and others may see for themselves the road to take in preparing for competition with other countries. The *Gazette* is distributed free to 4,400 agriculturists, and is sent to all agricultural societies, Schools of Arts, libraries, and similar institutions throughout the Colony, where it is available for perusal by those in need of information. Some subjects dealt with during the period of this report were the cultivation of fruit for export purposes; treatment of noxious weeds; illustration and description of grasses; economic plants and timbers; treatment and illustration of diseases of crops and animals; trial of various crops and methods of culture under varied conditions at the Experimental Farms; and many other topics applicable to the needs of agriculturists. The monthly notes on vegetable growing and orchard culture have been continued and form an attractive feature of the publication. In all 280 articles—most of them illustrated, and a large number of general notes on subjects of importance that have from time to time come under observation, have appeared. Reprints of any articles which have met with a greater demand than could be supplied by means of the limited issue of the publication have been prepared; and these pamphlets have done much to lessen the work of correspondence upon subjects with which they deal.

In January a circular was addressed to recipients of the publication, who were asked to suggest subjects for treatment. Over 3,000 replies of an appreciative nature were received, and the questions asked were so numerous that an additional heading, "Replies to Correspondents," was opened. Since this departure, each month a large batch of inquiries on matters of agricultural interest are dealt with.

The thanks of the Department are due to the gentlemen who are good enough to contribute voluntarily the valuable articles that have been published, and the zeal and enthusiasm of the officers who devote much of their leisure to this work are worthy of commendation. Not only do the agriculturists express their appreciation of the *Agricultural Gazette*, but it is gratifying to note that newspapers and leading agricultural journals of America, Cape Colony, Victoria, Queensland, South Australia, and New Zealand, as well as our own Colony, avail themselves of the privilege of reproducing articles. The process blocks used in the illustration of the articles are also largely availed of, and during the past year over 200 of these blocks have been borrowed for this purpose.

The Farmers' and Fruit-growers' Guide, issued in January last, has been generally appreciated, and two editions have been disposed of.

I have, &c.,

W. H. CLARKE.

Report of the Tobacco Plantations.

The Nemingha Tobacco Experiments.

In July, 1895, Forest Reserve 20636, comprising 15 acres, situated on the eastern bank of the Cockburn River, was placed at the disposal of Mr. Lamb for experimental purposes. It was then a thickly-timbered unenclosed apple-tree flat, densely overgrown with the usual noxious weeds. Contracts for clearing, fencing, and first ploughing were sanctioned 8th August, and the contracts were concluded 12th October.

Trial plantings were made with every sort of tobacco of which seed could be procured. Many difficulties were encountered from the foulness of the ground, the rank growth of weeds, the ravages of insect and fungus pests, imperfect equipment, want of skilled labour, and, more especially, from the memorable heat wave which passed over the colony about midsummer. Nevertheless, about a ton of leaf was cured and bulked, comprising about sixteen varieties. This tobacco is now placed in the cool building recently erected, and will be packed as opportunity serves. It shows, as might be expected from the number of sorts grown, many varieties of form, colour, and texture, which have all, however, one characteristic in common, viz., it is all powerful tobacco. Samples were submitted to the trade in Sydney on 9th September, and some of them obtained high commendation; but the parcel, containing as it does so many sorts, is not readily salable, except in a brisk market. Several of the leading firms dealing in tobacco report that at present there is no sale for tobacco-leaf in Sydney. Mr. Lamb, therefore, proposes to pack each kind separately, and keep it in cool storage until the market shall be somewhat relieved of its present glut.

Mr. Lamb has, from the date of his first appointment, condemned the rich river flats so much favoured by tobacco-growers in this Colony, as being unfitted to produce any but the coarsest and commonest quality of tobacco-leaf, and has quoted the Custom House returns showing the great increase in our importations of foreign manufactured tobacco, as supporting his contention. On 6th May, 1896, he reported to the Department that he would rather abandon the Nemingha experiments except for the consideration

consideration that our tobacco-growers were so wedded to alluvial flats for the crop that it would be impossible to convince them of their error, and that he thought he could, by adopting a different system of cultivation and a different variety of seed, produce even on this alluvial a price worthy tobacco, *i.e.*, one suitable for the export trade.

In the past season (1896-7) the experiments have been continued, with a view to producing such a style of leaf, with what success it is yet too early to say with any certainty. The crop is now hanging on the poles in the sheds, waiting suitable weather for striking, handling, and bulking it, and it will require at least six months in the bulk to mature and develop its ultimate character. The severe and long-continued drought has been very detrimental, but a partially-cured sample of a new variety, produced by cross fertilisation and irrigated during its growth, which was harvested on the single-leaf system, has been very favourably reported upon by Hugh Dixon, Esq., and certainly shows great promise. It has been named Golden Fleece

Five acres are to be planted in the coming season of this variety, the plants for which are already in a forward condition.

Mr. Lamb reports that, amongst other tobacco experiments which he has tried at Nemingha, he has endeavoured to bring into cultivation the native tobacco, *Meotania huaveolens*, which is common on the banks of the Cockburn River, but so far with indifferent results.

Thirty-five crops other than tobacco have been experimented with at Nemingha, in addition to the twenty-one sorts of tobacco sown; but it should not be overlooked that the season was of so exceptional a character that any conclusions drawn from the results obtained may probably require to be much modified in the light of experience obtained in a normal season.

The Moonbi Tobacco Experiments.

In 1893, Mr. Lamb was employed in visiting and reporting upon the tobacco-growing districts in the northern parts of the Colony, lecturing on tobacco cultivation and curing in centres where lectures were desired, and in giving practical lessons to individual growers who had applied to the Department for his services.

In September of that year, returning from Bendemeer, having some hours to wait at Moonbi for a train, he visited the site at Moonbi then being prepared for a forestry plantation, and being much impressed with the suitability of parts of its soil for the growth of a superior class of tobacco, he sowed a small seed plot there, and reported the circumstance to the Department. In November, the young seedlings having made good growth, the Assistant Forester in charge planted out about 400 of them. They had but scant attention until April, when Mr. Lamb revisited the place and found them growing almost wild, many gone to seed, and many infested with *Peronospora*. He attended to them, harvesting such as were fit, hanging the plants in a temporary shed hastily constructed for the purpose. In the following winter Mr. Lamb made some cigars and cigarettes from this tobacco, which proved of good quality. Small sowings were made next spring with equally good results, and in 1895 Mr. Lamb obtained permission to plant 2 acres of the plantation with tobacco. Adverse conditions worked against this planting, which included about twenty varieties, the object being to find out what variety of the tobacco plant would yield the best results in this soil. Nevertheless, the crop, although small, was throughout of excellent quality. Amongst it was found some cigar leaf and some bright pipe tobacco, but the bulk of it was cigarette tobacco pure and simple.

About 10,000 cigarettes made from it have been distributed, and the reports received concerning them have been, almost without exception, highly appreciative. Both the trade and connoisseurs describe them as far superior to the usual cigarettes purchasable in the shops, and as bearing a striking resemblance to the best grades of Turkish and Egyptian cigarettes.

An exhibit, comprising many varieties of leaf grown from seed obtained from Europe, Asia, America, and the Southern Pacific, was prepared and is now on view at the Museum of Agriculture and Forestry in the Domain. It is probably the finest collection of Australian-grown tobacco ever gathered together.

Samples of this crop of tobacco were submitted to the leading tobacco manufacturers in Sydney, and they were valued at 8d. per lb. all round, the current price for New South Wales leaf at the time being 4d. per lb.

One of these samples impressed one of the leading Sydney tobacco manufacturers so strongly that he authorised Mr. Lamb to endeavour to induce the farmers of the Moonbi district (who had suitable land) to plant 20 acres of that variety, he agreeing to purchase the resulting crop at 1s. per lb. for first quality and a proportionate price for second and third qualities.

Mr. Lamb spent some weeks in endeavouring to induce the farmers to take up this contract, but did not succeed, the chief difficulty being the cost of the sheds necessary to cure out the leaf the required colour. After mature consideration, in order that so great an opportunity should not be lost to the Colony, the Department accepted the contract, and preparations for growing and curing the crop are now in progress. The seed plots have been sown and the young seedlings are so far advanced that it is probable that (with favourable weather) the planting will commence before the end of October.

The first and second grades of this crop, 1895-6, are now in the hands of an eminent Sydney firm who are experimenting with and will report upon them as to their suitability for Sydney trade purposes. Mr. Lamb anticipates that these Moonbi tobaccos will, most of them, prove to bear too close a resemblance to the higher grades of Turkish tobacco to allow of its being mixed with, or sold as American, and he hopes that such will be the case, seeing that fine Turkish tobacco sells in European markets at three times the price obtainable for the finest American leaf.

Mr. Lamb is of opinion that it will be for the best interests of this Colony that the Moonbi tobacco should be sold in its own name and stand on its own merits, to make a place for itself in the tobacco markets of the world.

It was intended to have made much larger plantings at Moonbi in the last season, but the drought was so severe and so persistent that, in the absence of any provision for irrigation, the crop was small and light. It has not yet been handled, and cannot be until a spell of moist weather renders it possible to take it down from the poles where it now hangs, but it gives promise of fine colour and quality, and is described by Mr. Howell in his report as comparing favourably with the best products of North Carolina, and valued by him at 30 cents per lb. all round, and its first grades as worth 50 cents. per lb. in any tobacco market in the United States of America.

Of the twenty varieties sown, only fourteen grew, the best of these, as far as our present experience has shown, are Fly River, Persian, Hongroi de brok, Aya Soulouk, and Kei Basma, but it is probable that in a different season different results would accrue.

A considerable quantity of tobacco seed has been saved, and distributed to growers in various parts of the Colony.

The crops other than tobacco which have been grown at Moonbi have been wheat (five varieties), barley, oats, rye, millet, kaffir corn, cow-peas, pumpkins, potatoes, lucerne, turnips, rape, cabbage, beans, peas, and onions, but all these, except the wheat, barley, and rye, suffered so very greatly from the drought that no trustworthy conclusion can be drawn from their results, except that it has been fully demonstrated that the so-called poor land forming the foothills of the granite ranges, which has hitherto been valued at from 1½d to 3d. per acre per annum as sheep pasture only, is capable of producing a very high grade of tobacco leaf for cigarette purposes, and also some other crops, notably wheat and barley, of fine quality.

As there is a vast area of this class of land scattered throughout the entire length of the Colony from south to north this demonstration of its value is of the utmost importance, and the Moonbi experiments may justly be regarded as a great success.

Report of the Officer in charge of Museum.

THE Agricultural Museum was opened to the public by the Minister in February of this year. A fair amount of attention has been shown by the public in visiting the Museum daily, more especially farmers from the country when in the city, and those interested in agriculture.

A great deal of my time this year has been occupied in attending the principal Agricultural Shows held in the Colony with the Departmental exhibit. I visited Bathurst, Wellington, Dubbo, Bourke, Nyngan, Condobolin, Forbes, Parkes, Singleton, Albury, Junee, Cowra, and Moama. Judging from the amount of interest shown by the farmers and the general public in the exhibits, and the information asked for respecting the cultivation and uses of the numerous products displayed, it is needless to say that the showing of the exhibits have done an extensive amount of good by encouraging the farmers to turn their attention to cultivating better class of stuff and different kinds hitherto unknown to them.

The work done in the Experimental seed Distributing Branch is shown by the attached schedule.

SEEDS distributed from the Agricultural Museum during years 1896 and part of 1897.

Seeds.	No. of Applications.	No. of Packets sent out.

I have, &c.,
J. MARTIN, JUN.

Report of the Experimental Farm, Wollongbar, Richmond River.

DURING the past year, although the rainfall has been lighter than usual, it has been only during a limited period that crops have suffered severely from insufficient moisture.

In some instances, however, the drought was sufficiently prolonged to cause the loss of several crops, and to greatly diminish the yields of others.

Fruit-trees and sugar-cane, however, did not suffer to the same extent as recently-sown crops, the growth during the year having been considerable.

Large collections of produce were exhibited at the following places, viz. :—The Royal Agricultural Societies' Show in Sydney, and at Lismore, Grafton, Casino, and Alstonville.

Two collections of exhibits were also sent to the Departmental Museum in Sydney, and at the Spring Show of the Lismore Agricultural Society, held in October last, over 100 varieties of produce were exhibited, consisting chiefly of vegetables and fodders.

At all of these shows the exhibits attracted much favourable criticism, and much information was supplied to inquirers as to methods of culture, &c.

The area of land under cultivation, including ornamental grounds and nursery, is 17½ acres; but, as contracts for clearing are now in hand, in a few months this will be increased to nearly 50 acres.

About

About 20 acres have recently been cleared and ploughed, and sown with grasses of the most approved varieties, in separate paddocks of 5 acres each, for the purpose of testing their relative value for dairying purposes.

About 60 acres have been felled and fired, and now await the complete drying of the roots prior to being cleared for future operations.

The improved area now stands thus :—

Existing plantation	17½ acres.
Old grass paddock	7 "
New	20 "
In course of stumping	37 "
Felled and fired	106 "

Additions to the manager's residence have been made, and a substantial seed and implement shed has been erected. The latter building has proved a great convenience ; but, with the increase of cultivation area, increased accommodation of this kind will become necessary.

A well has been sunk, which now affords a permanent supply of water for stock ; and additional tanks have been supplied to the buildings, thus greatly improving the water supply, which was previously very precarious. As it will shortly be possible to clear the land lying between the present plantation and Merom Creek, to which the farm has a frontage of about half a mile, a large and permanent supply of water will become available from that source

Subtropical Crops.

Coffee (Coffea arabica).—The small number of trees planted upwards of two years ago are still thriving, some of them showing promise of an early crop of berries. Some of them during last winter were somewhat injured by frost, but protection will this season be afforded them. It is intended to plant an acre at least to coffee-trees when the land is ready for the purpose.

Turmeric (Curcuma longa).—This crop has so far proved successful, the plot harvested since last report having yielded green roots at the rate of 4 tons per acre, valued at £7 per ton. The growing crop now approaching maturity will, in all probability, give an improved return.

Ginger (Zingiber officinale).—The last season's crop proved a comparative failure, but owing to better soil being available the plot now growing promises payable results.

Arrowroot.—A heavy crop of the purple variety (*Canna edulis*) is almost ready for harvest, while a fair yield should be obtained from a plot of the Bermuda or White Arrowroot (*Maranta arundinacea*). Both of these products will be prepared at a local mill, as the process of preparation with the appliances available at the farm is tedious and expensive. Samples and further reports will be furnished later.

Cassava.—The sweet variety (*Manitrot Aipi*) only is cultivated, the yield of tubers being over 10 tons per acre. *Manitrot utililissima* was applied for from Fiji, but *M. Aipi*, which had previously been in cultivation here, was forwarded in error.

Rice.—One variety (Japanese) has been grown this season, but owing to lack of moisture and the attacks of rust it has proved a complete failure.

Onions.

Eighteen varieties have been tested, viz. :—Brown Spanish, Hunter Globe, Giant Rocca, White Tripoli, Straw-coloured Spanish, Brown Globe, Extra Early Globe, Early Flat Red, James' Keeping, Potato, Tree Barletta, Silverskin, Silver King, Wethersfield, Golden Ball, Market Model, and New Queen.

The pickling varieties, viz., Barletta and Silverskin, were fairly successful, but with the exception of the Giant Rocca no other variety of which unacclimatised seed was sown could be regarded otherwise than as failures. They failed to "bottom" well, the product being in almost all cases inferior, ripening irregularly, and rotting almost as soon as harvested.

The Brown Spanish and Hunter Globe, from seed grown on the Hunter River, yielded onions of high quality at the rate of 5 tons 2 cwt. per acre, which were sold locally at £10 per ton, showing a profit of £40 per acre.

Further tests are being made this season with seed locally grown as well as from England, America, Victoria, and the Hunter River.

Potatoes.

Fourteen varieties have been tested under the following conditions and with the following results :—

Variety.	Manured with Colonial Sugar Co.'s No. 6 (7% potash), 4 cwt. per acre, value £1 6s. per acre.				Unmanured, per acre.			
	t.	c.	q.	lb.	t.	c.	q.	lb.
Imperator	12	11	1	20	10	10	3	4
Breese's Peerless	11	7	3	12	Not tried.			
Imperial Blue	10	12	0	16	7	10	0	0
The Dean	8	12	3	12	7	19	0	20
Early Rose	7	19	0	20	5	2	0	16
Irish Flounder	7	1	1	20	4	14	0	0
Satisfaction	6	13	2	8	5	17	3	12
Brownell's Beauty	6	11	2	12	5	6	3	24
Reading Russet	6	9	2	16	5	2	0	16
Early Puritan	5	17	3	12	5	11	3	24
Early Vermont	5	10	0	0	4	6	1	20
Bliss' Triumph	4	18	0	2	3	10	1	14
Federation	4	16	1	0	3	2	3	12
Robin Adair	2	5	0	17	1	17	1	8

The same varieties have again been planted for a test of their value as a winter crop, but owing to the prolonged dry weather nominal results only may be expected.

Turnips.

Turnips.

The following trials were made in a very poor plot of land, about the worst on the farm, the result clearly proving the value of manures. The manure used was the Colonial Sugar Company's No. 4, which was applied at the rate of 4 cwt. per acre, the cost being £1 9s. :—

Variety.	Yield per Acre.			
	Manured.		Unmanured.	
	tns.	cwt. qr. lb.	tns.	cwt. qr. lb.
Skirving's Purple Top Swede...	13	2 0 16	9	18 1 16
Anderson's Imperial Purple Top	9	15 1 22	5	6 0 8

The following results were obtained in land of better quality than the above, and which had become sweetened by longer cultivation. Swedes were planted 3 feet by 1 foot 3 inches apart in the drills, the other varieties 3 feet by 9 inches :—

Variety.	Yield per Acre.			
	tns.	cwt.	qr.	lb.
Skirving's Purple Top	14	18	2	8
Anderson's Imperial Purple Top	13	10	0	10
Sutton's Champion	11	13	3	0
Emperor Green Top	11	7	3	12
Green Top Aberdeen	11	15	2	24
Purple Top	10	4	1	4
Anderson's Model	17	13	2	8
Red Top American	14	8	3	0
Long White	11	15	2	24
Orange Jelly	8	16	3	4

Mangels.

Excellent results were obtained from this crop, the long red variety yielding upwards of 40 tons per acre. A number of roots weighed upwards of 20 lb. each.

Oil Crops.

Peanuts (Arachis hypogea).—Three varieties have been cultivated, one of which this season has proved a comparative failure. The large cluster variety, recently introduced from America, yielded at the rate of 19 cwt., and the large old kind 1 ton 6 cwt., per acre, valued at 2½d. to 3d. per lb.

Till or Gingelly (Sesamum indicum).—Has yielded light crops.

Castor Oil (Ricinus communis).—Has shown better results than usual owing to the season having proved drier than usual. The crop, however, is a precarious one, being liable to damage in wet weather.

Sunflower (Helianthus).—Three varieties, viz., grey, black, and white, have been grown with fair results.

Linseed (Linum usitatissimum).—A small area was sown, which produced seed at the rate of 800 lb per acre. A considerable quantity in excess of this had to be sacrificed owing to irregular ripening.

Tans.

Canaigré.—Has not yielded a payable crop, the result being at the rate of 3 tons per acre.

Specimen trees of the following are growing, viz. :—Acacia catechu, Acacia pycnantha, Terminalia bellerica, Rhus coriaria, and Rhus cotinus.

Fibres.

Ramie (Boehmeria nivea).—This crop has again made good growth, the plants apparently retaining full vigour. Samples have been sent to London fibre merchants for report as to its market value, in the "ribbon" form. While awaiting report, however, fibre of good length and excellent quality has been prepared by Mr. Guthrie, chemist to the Department, from ribbon grown on the farm. As more land will shortly be available, a larger area will be placed under this crop.

Sisal Hemp (Agave rigida var. sisatano).—Still shows vigorous growth, but the plants are still too young to test the value of the fibre.

Manilla Hemp (Musa textilis).—A considerable number of plants area vailable for extended cultivation, when tests of fibre value will be made.

The following varieties have recently been introduced from Ceylon :—Fourcroya gigantea, Sansevieria Zeylanica, and Sansevieria Guineensis.

Cotton.—Several varieties have been grown with the usual results ; the greater part of the crop has been destroyed by rain, which usually sets in about ripening season.

Fruits.

Almost all of the fruit-trees planted at various periods since the inception of the farm are thriving remarkably well. Some loss of trees, however, has occurred, partly owing to the excessive rains of last November, and to the prevalence of root fungus in one portion of the orchard, the latter being due to the difficulty of removing the whole of the roots of black bean (*Castanospermum australe*). The land has been stumped to 2 feet, but where any portion of the root is left, fruit-trees in the vicinity are liable to contract this disease, to counteract which we are using lime.

The following varieties have during this season borne their first fruits, viz. :—Citron—Lisbon Lemon, Sweet Lemon, Shaddock, Sicilian Lemon, Nelair Lemon. Kumquat Limes—West India and Tahitian. Oranges—Queen, Siletta, Parramatta, Satsuma, Seville, Mediterranean Sweet, Poor Man's, Myrtifolia. Mandarin—Oonshin, Emperor, Canton, Thorny. Grapes—Elsingburgh, Rebecca, Catawba, Anna Wilder. Chasselas, Royal Ascot, Black Damascus, Bell's Seedling, Isabella, and Madeleine Royal.

In almost all varieties the fruit has been of excellent quality, and the suitability of the district for their production has so far been demonstrated.

Sugar-cane.

About 100 varieties are now in cultivation on the farm, a number of which have thus far proved themselves well suited to the soil and climate of this district.

Of the older varieties, the Tannas (black, striped, and green), Louzier, Cheribon, and Mahoam are still giving satisfactory results.

A number of those received from New Guinea early in last year have in the "plant" stage made wonderful growth, and should they produce proportionate ratoon crops, they will prove most valuable additions to our stock.

The varieties most worthy of mention are, Nohona, Baruma Hota, Topuaka, Geboa, Porai, Uredi, Monoa, Baruma Be Ru Ru, Waki Aua, Yekarewa, Baruma, and Tututabuna, all of which are far above the average.

The most vigorous kinds will shortly be submitted for analysis, to ascertain their sugar contents.

The whole of the cane on the farm is in a very healthy condition, a few varieties being slightly affected by rust, but none showing symptoms of gumming.

The offer of plants to such persons as would take delivery of them was not very freely responded to, about 15,000 plants having been distributed.

The remainder of the cane was sold to the Rous Mill for crushing.

Tomatoes.

Tomatoes during the past season have not proved a satisfactory crop, all but a few varieties having suffered from disease, which greatly curtailed the bearing season.

The following varieties were tested:—Lemon Blush, Golden Queen, Imperial, Optimus, Peach, Ignotum, Beauty, Extra Early Advance, Sutton's Perfection, Buckley's State, Dwarf Aristocrat, Trucker's Favourite, Golden Perfection, Trophy, Long Keeper, and Fordhook, and Fordhook Early.

The most successful varieties, and those which best resisted disease, were—Imperial, Beauty, Sutton's Perfection, Long Keeper, and Fordhook Early.

Cucumbers.

The non-retentive nature of the soil, and the liability of cucurbitaceous plants to the attacks of aphides and oidium, render this at almost all times a precarious crop, and the past season has not proved an exception.

The following varieties were grown, viz.:—Japanese Climbing, Large Japanese, Apple, Long Green, Giant Pera, Richmond, Telegraph, Prescott Wonder, Short White, and West India Gherkin.

The only varieties that were even fairly successful were Large Japanese, Short White, and Gherkin

Pumpkins and Squashes.

Throughout the district this crop has been a comparative failure, owing chiefly to the attacks of mildew, and this farm has not proved an exception.

In the early stages of growth the application of sulphur by means of a vine-bellows is comparatively easy, but after the vines have grown their successful treatment is impracticable.

Unlike the previous season, very little trouble was experienced from the pumpkin beetle (*Aulacophora hilaris*).

The vines died almost to the roots after the heavy rainfall which occurred in November, and all early pumpkins rotted. A fresh growth, however, set in, which bore a light crop.

The following varieties were grown, viz.:—

Pumpkins—

Early Orange Sugar.
I.X.L.
Turk's Head.
Button.
Ironbark.

Gramma (4).
Cheese.
Japanese.
Connecticut.
Crown.

Cattle.

Butman.
Chili.
Cocoanut.
Japanese.

Marrows—

Prolific.
Long White.

Long Bush.
Long Green.

Rice.

Melons.

The following varieties have been grown on a small scale, the most successful having been those sown on 10th November, which were treated with Colonial Sugar Co.'s manure, No. 6, at the rate of 4 cwt. per acre.

A limited number of large fruits was obtained from Mammoth Ironclad, Seminole, Dixie Grey Monarch, Fordhook First, and McIvor.

The following varieties were also grown, viz.:—Orange, Egyptian, American Champion, Gragg Delaware, Green and Gold, Cole's Early, and White Gem.

Preserving varieties, as usual, gave good yields of the following kinds, viz.:—Citron, Japanese, and Lemon Jam.

Rock Melons.

Like all other plants of this class, rock melons may be classed as a failure. Less than half a dozen fruits matured on thirty-six hills, of the following varieties:—Scarlet Perfection, Columbus, Washington Market, Perfection Vatted Gem, Bakhliiri, Melrose, Reid's Scarlet Flesh, Cassaba, Banana.

Tobacco.

The following varieties have been grown, their success in point of growth being in the order of the names, viz.:—Persian, Virginia, Fly River, Kir Basma, Ghinbeck di Zanthi, Raseibali de Persoccian, Vuelti di Abajo.

As previously reported, climatic conditions are wholly opposed to the successful curing of tobacco leaf in this locality, without properly constructed drying houses, which are not yet available.

Meteorological Report.

Maize.

Early-sown crops gave fair results, as the plants had the advantage of good rains in November and December; but a plot sown in the former month proved a comparative failure, as hot, dry weather set in at the flowering period, and, continuing for some weeks, destroyed the crop, which had given promise of a good yield.

Appended is a table showing yield of varieties sown in subsoiled land without manure:—

Variety.	Yield per acre.
	bsh. lb.
Leaming	30 48
Hickory King	33 2
Yellow Flint	47 8
American White	40 0
Golden King	50 0
Large Yellow..	51 24
Giant Caragna	54 48
Yellow Hogan	59 20
Mastodon	59 20

With the Hickory King variety a test of the value of seed selection was made with the result that large seed yielded $3\frac{1}{2}$ bushels more than seed of medium size.

Pulses.

A considerable number of varieties of table peas were sown, comprising Daisy, Stanley, Heroine, Telephone, Duke of Albany, Bedman's Blue, Carter's First Crop, Stratagem, Sangster's No. 1, and Sugar. All these varieties were exhibited green at the Lismore Show in October. The only varieties harvested entirely dry were Sangster's No. 1, yielding 10 bushels, and Bedman's Blue, yielding 9 bushels, of pulse per acre.

The varieties yielding the best crops for quantity and quality combined were Daisy, Heroine, and Duke of Albany.

For green manures the following were sown, viz.:—Black Cow Pea, Clay-coloured Cow Pea, and vetches, which have been ploughed in. Among citrus fruit-trees the cow-peas have been allowed to die on the surface.

A large portion of one of the bean-plots was washed away by the excessive rainfall of November, therefore dried pulse yields of the following varieties was not recorded:—Chevrier, Davis, Giant Round-pod, White Giant, White Wonder.

Pulses—

Pulses—Beans.

The following yields of dried pulse have been recorded, viz. :—

	per acre.
	bsh. lb.
Sensation	5 14
Surprise	5 38
Horticultural	5 40
Negro Longpod	7 16
Broad Windsor	7 20
Pale Dun	8 4
Haricot	9 30
Canadian Wonder	9 46
Broad Longpod	11 0
Startler	11 0
Field	14 0
Governor Denison	14 0
Soy	23 30

Wheat.

Three varieties were grown for grain for chick-feed, viz., Poland, Algerian, and Mummy. All were affected by rust, especially the two former varieties, which had to be cut for hay, the Poland yielding 17½ cwt. per acre, and the Algerian 1 ton 6 cwt. per acre.

The Mummy variety yielded grain at the rate of 10 bushels per acre, but a considerable quantity had been destroyed by birds.

A plot of Poland sown for hay returned at the rate of 2 tons 19 cwt. per acre.

Rye.

This cereal was successfully grown both for hay and grain, in all cases making good growth, and being free from rust.

Sown for grain and straw, the results were—straw, 3 tons 2 cwt., valued at £4 per ton, and 22 bushels of grain per acre. The actual yield of grain should have been about 30 bushels per acre, but owing to destructive birds much of it was lost.

A plot sown for hay, and cut before the awns stiffened, gave a return of 2 tons 3 cwt. of chaff per acre.

Pasture Grasses.

Over a hundred kinds of grasses, most of them new to the district, were received late in last spring, from the Director of the Sydney Botanic Gardens, and from the Queensland Government Botanist. The weather proving dry, sowing was deferred till autumn, and now about a third of the varieties are above ground. Others may germinate in the spring.

The newly ploughed area for grasses has been sown as follows, viz. :—5 acres Cocksfoot, 5 acres Paspalum, 5 acres Kentucky Blue Grass, and 5 acres Prairie Grass and Clovers. These paddocks will be separated by fences, and the respective values of the grasses for milk production may thus be thoroughly tested when dairying operations are commenced.

The established experimental plots consist of Clovers, Perennial Red, Alsike, Crimson, Dutch and Japanese. Grasses : Meadow Foxtail, Meadow Fescue, Cheewing's Fescue, Prairie, Paspalum dilatatum, Paspalum galmarra, Paspalum conjugatum, Trefoil, Panicum spectabile, Timothy Natal Redtop, Poa trivialis, Kentucky Bluegrass, Panicum plicatum, and Panicum maximum (Guinea grass). The last-named variety should prove invaluable for ensilage, a recent cutting from 9 months old plants having yielded at the rate of 25 tons per acre.

Fodders.

Lathyrus silvestrus.—Has proved a failure, the plants having remained stationary during the past year.

Hungarian Millet.—Has again proved a successful fodder crop, chaff of excellent quality having been made at the rate of 2 tons per acre.

Bokhara Clover.—Has made luxuriant growth, but is too woody for useful fodder.

Sulla.—Has only made moderate growth, the climate not being suitable.

Ensilage.

A small open stack has been made for the purpose of saving the crops, resulting from trial plots, and at the same time demonstrating in a small way the process of ensilage.

Specimens were exhibited at the Casino Show and in the town of Lismore, and portions were given to dairy farmers who applied for it for the purpose of trying their stock with it, in all cases the results being satisfactory.

As in the coming season a larger area will be available for growing fodder, it is intended, if funds will allow, to erect an enclosed silo so that operations may be more satisfactorily carried out by conserving a large quantity of fodder.

Fodder Plants.

Oats.—Forty-seven varieties are now being tested, most of the seed having been received from Vancouver. Most of them are making luxuriant growth, and only one variety has yet shown signs of rust.

Sorghums.—A limited area only was sown with the following varieties, viz. :—Amber Cane, Black, White Kaffir, Brown Dhoura, and Planter's Friend, all of which made fair growth.

Barley.—The following varieties are growing, viz. :—Cape, English, Skinless, and Algerian.

Tagosaste.—After growing freely for two years has died out, the climate apparently being unsuitable.

APPENDIX.

During the half year commencing 1st July, the following operations were carried on at the Wollongbar Experimental Farm. The work of stumping two portions of land containing respectively 24½ acres and 6½ acres was on the eve of completion at the date of my leaving Wollongbar, the 19th November.

The 6½-acre portion was first completed and was sown to maize, potatoes, and pumpkins which gave promise of a fair yield. The crops, however, were checked at a critical period by lack of moisture, and, therefore, the yields will not be far, if at all, above the average.

The larger portion is intended for the planting of commercial areas of the crops, &c., which have proved the most successful in the experiment plots.

About

About 2 acres was being prepared for pineapples, and the plants of the most approved varieties which were purchased in Brisbane were then arriving.

It was arranged that this area should be planted according to the method which has proved most successful in Queensland, and it is anticipated that a good return will be obtained from the fruit within two years.

One acre was set apart for a trial coffee plantation, and 2 or 3 acres will be devoted to the culture of ramie, so that demonstrations in the cultivation of these crops, from a commercial point of view, might be made.

Hitherto the results of experiment plots have been of a promising nature, especially so in the case of the ramie.

Space was also allotted for planting bananas, which will serve the double purposes of wind-breaks and fruit-producers; and an area was set apart at the principal entrance for the growth of shrubs, specimens of ornamental and timber trees, and economic plants. A portion of the latter area had been planted.

A nomenclature plot of sugar-cane was also established comprising a few plants of each of the most useful kinds, numbering about ninety varieties. The planting of cane has for this season been limited to this area.

The rest of the newly-cleared land was to be used at once for raising pulses, &c., for seed, forage crops for hay and ensilage, and a portion was to be devoted to nursery work pending the preparation of the land on the bank of Merom Creek, where a good supply of water will be available.

The contract of C. Leeson for stumping and ploughing about 25 acres was also completed in July. Of this area about an acre and a-half was planted to beans, comprising over forty varieties, a number of which were recently received from America.

It was intended on the maturity of this crop to plant a larger area with the seed thus raised, with a view to selling the surplus to Sydney seedsmen and others, from whom last year there was considerable enquiry for pulses.

The whole area was enclosed with substantial vermin-proof fencing, and gates were erected where required.

About 22 acres was sown to the grasses which had proved most successful in the experiment plots, each variety having an area of 5 acres, except in the case of some of the heavier tropical grasses.

It is intended, when they are established, to make a thorough test of the value of these grasses for milk and butter production.

The area now under grass is about 30 acres, which, when ready for grazing, is expected to carry a larger number of stock than is possible on pastures laid down in the usual way, without ploughing.

This land was stumped and broken to a depth of 1 foot, by ploughing and subsoiling, at a cost of £4 15s. per acre, and the result of the experiment in laying down pasture and in the feeding value of the various grasses will be of great interest to the dairy farmers of the Richmond River.

The clearing of more land on the farm is essential to allow of its full value being realised, as hitherto its operations have of necessity been limited to a small area.

At the time of my leaving Wollongbar the land stood thus, viz. :—

Area under orchard crops and experiment plots...	27 $\frac{1}{2}$ acres.
Grass paddocks (new)	23 "
" (old)	7 "
Felled and fired once	108 $\frac{3}{4}$ "
Newly cleared	24 $\frac{1}{2}$ "
Standing scrub	72 $\frac{1}{2}$ "

263 acres.

Tenders were being called for stumping and ploughing a further area of 45 acres, which, when cleared, will render accessible the permanent supply of water in Merom Creek, on the western boundary of the farm, which hitherto has not been available, owing to the logs and stumps occupying the intervening land, and which could not be removed till sufficiently decayed to admit of its being cleared at the lowest rates.

During the first three months of the period referred to, about 300 persons visited the farm, on one occasion upwards of sixty attending to witness demonstrations in budding and grafting.

Upwards of 40,000 plants, consisting chiefly of grasses, sugar-cane, ramie, and other economic plants, were distributed free of charge.

The cane plants secured from New Guinea in the early part of 1895 reached maturity early in the half-year and were cut in October, plants being distributed without charge to applicants, and the remaining cane was sold to the proprietors of the Rous Mill.

A detailed report on these canes will be supplied to the *Agricultural Gazette*, embodying a favourable report from the Colonial Sugar Refining Company as to the sugar contents of the majority, and as to the growth of about one-third of the surviving varieties.

Experiments were about to be commenced in the treatment of cane with manures, and these will now be carried out by Mr. Jackson.

During the month of August I visited Brisbane, and while there inspected all local centres of interest to agriculturists and obtained a number of ornamental and economic plants, which were generously supplied by the Secretary of the Acclimatization Society and the Curator of the Botanic Gardens.

I also visited the leading pine-apple and banana plantations; obtained information as to the best methods of planting and cultivating the former; and arranged for the purchase of plants for Wollongbar.

Under notification of my appointment to the Bomen Experiment Farm, I left Wollongbar on 19th November, and arrived here on 26th November.

During the period to 21st December, with the exception of two intervals occupied respectively in attending the Officers' Conference at Bathurst and in bringing my family from Sydney, I remained here gaining information as to the work carried on at the farm, and on the 22nd December I assumed the directing of operations.

The work, since my arrival here, has consisted mainly of harvesting wheat, in the farming department, and in the orchard the keeping in check of a plague of grasshoppers by spraying, the usual tillage, and more lately the bottling and drying of fruits.

I have, &c.,
G. M. McKEOWN.
FORESTRY.

FORESTRY.

THE efforts made by this Department have been in continuance of the former policy adopted for conserving our timbers; and, whilst controlling destruction and waste of timber by regulations restricting operations, the conditions attached have not debarred the working of our forests at reasonable rates. During the period a demand for timber products for export has been steadily growing, and throughout the coastal districts mills are everywhere in full swing, providing employment for many hands who were idle during the prior years of depression in trade; and in some instances it is known that mills at the present time hold more orders for timbers for export than they can fulfil with the plants at command. The wisdom of the policy of distribution of samples and information regarding the value and uses of our hardwoods which has been exercised during the past five years is now being evidenced, and in many parts of Europe shipments of these timbers have been introduced, and used for street-paving, wharfage, carriage-building, and other manufactures, with results that should ensure a continued demand for them. Whilst seeking fresh markets for this product, the fact that our supplies are not illimitable has not been overlooked, and the Department, whilst being assured that a fair margin for export existed beyond local demands, has strenuously endeavoured to further the policy of reservation of usefully-timbered lands. In the formation and maintenance of plantations little work has been effected, although the importance of this work has not been overlooked, and its practical application on a large scale in the western portions of the Colony is a problem which must eventually be faced; but attention for the period has chiefly been directed to the improvement of existing forests by thinning out superabundant growth, and assisting the maturity of those allowed to remain. This class of work has been effected principally in the Murray River red gum forest, and in the pine areas surrounding Narrandera, particulars of its extent and cost being furnished under tables.

In carrying out these improvements employment has been afforded to a number of men at a time of great depression; but, apart from its economic aspect, large returns in revenue from timber sales will eventually follow as a result of the expenditure. In principles of general working no great departure from ordinary routine has taken place, nor have the dues for operation been raised with the increased demand for timber. As a result, however, of the recent investigation by the Public Service Board, a very startling change in the constitution of the field staff has been effected, the office of forester pure and simple being abolished, and the duties applying to that office being amalgamated with those of Conditional Purchase Inspector. The services of mounted police throughout the Colony were obtained, through the direction of the Inspector-General of Police, and already plans and information relating to forest lands in the vicinities of their stations have been supplied to about 300 of these officials, with results that prove beyond doubt how necessary the additional aid was in effecting a complete and practical system of supervision, and in continuance of this scheme a net-work of additional patrol within districts is gradually being extended throughout the whole of the Colony. In administration much attention has also been given to the dissemination of information relating to classification and rates for operation attached to the differently classed lands, and great facilities have been afforded the public to obtain this knowledge locally instead of by application to head quarters. In prosecutions for illegal offences and acts, little reduction in number is evidenced by the returns in comparison with those of former years, and whilst on this subject it might be again urged that an alteration of the law relating to offences is urgently needed. As now existing the section is not sufficiently comprehensive or forceful to act as a deterrent to persons wilfully committing offences against the regulations, and the matter is an important one in a country situated as this is, the areas to be supervised being scattered over large districts with the opportunities for visiting them curtailed by a limited staff. In distribution of plants to public bodies and trusts for the improvement of parks, show-grounds, cemeteries, &c., the work has been particularly heavy, and in supplying requirements has taxed the resources of the central nursery at Gosford, which is now worked with a limited staff. The extent of work in eradication of prickly-pear on the public estate has been very small, as no funds were provided by Parliament for effecting it, but the limits of the Act have been taken full advantage of in enforcing eradication on private lands and in leasing Crown lands with reasonable rentals and stringent conditions attached for destruction of the pest.

The question of permanency of forest lands, which is so vital a one in the maintenance of a scheme of conservation, has unfortunately not advanced any stages since the publication of last report, and in the interim much land valuable for the timbers thereon has been withdrawn from reservation and alienated. The importance of this matter cannot be overlooked, for the present area set apart for forestry is not of sufficient extent to admit of its reduction, and in comparison with the area of the Colony is very limited. With the advent of increased population the question of timber supply will, in many parts, become a burning one, for profitable occupation of the country is practically dependent upon facilities for obtaining timber for fencing, building, and domestic purposes, and the neglect to now make a liberal provision of lands for the growth of timber will necessitate in the future costly resumption, and delays in settlement whilst the natural growths are being artificially reproduced.

The extent of timber destruction effected by ringbarking in pastoral districts has been enormous, and whilst conditions are usually attached to permissions granted by the Lands Department providing for the preservation of stated proportions or certain species of timber, it is doubtful whether the supervision available has in all cases been sufficient to enforce the observance of such. Another medium for the destruction of a highly valuable timber has been that regulation under the Crown Lands Act which authorises the destruction of Cypress pine as scrub without permission at a girth of 1 foot in diameter, a dimension it may be remarked at which this particular timber, under the Forest regulations, is considered as marketable timber. It may be worthy of mention that whereas in all the leading countries of the world the subject of forestry is treated as one of national importance, calling for stringent laws and careful management in order to provide for its maintenance, not one of the colonies of Australia possesses even a definite system of conservation placed beyond the reach of interference by persons desirous of exploiting the timbers.

Office Work and Records.

The administration work has been carried out efficiently by the staff which comprises 1 senior and 2 assistant clerks, with a clerk for Records and Correspondence, and when it is considered that the outside staff associated with Forestry comprises 39 foresters, 5 acting foresters, and about 300 assistant foresters in the ranks of the Mounted Police, it is creditable to be able to report there are no arrears of office work. Several reforms in the system of working have been inaugurated, simplifying processes and curtailing methods, and amongst other items it may be mentioned that the whole subject of royalty rates has been revised and a scheme for allotting them has been completed, which aims at placing these charges on a basis devised to afford uniformity in operation and to place operators throughout the Colony upon a more equal footing. Fresh reports upon the status of every forest area have also been obtained and filed, and the information comprised therein carefully noted for reference in working, and under this section it may be mentioned that a considerable area of land resumed, but found to be unsuitable for forestry, will shortly be released for disposal in other directions. The following is a statement of office records for the period under report.

Number of papers registered, 1st July, 1895, to 30th June, 1896	9,480
" " " 1st July, 1896, to 30th June, 1897	6,500
Total			15,980

Number of letters issued, irrespective of circulars and B6 communications,			
1st July, 1895, to 30th June, 1896	3,050
1st July, 1896, to 30th June, 1897	2,600
Total			5,650

Carpentry and Museum.

The distribution of samples in advertisement of our timbers has been considerable for the period; but for educational purposes there has been a constant demand by trustees of Schools of Arts, Mechanics' Institutes, and other educational establishments. In addition to the proportion of these woods, the museum has been literally stocked with bulk samples of every indigenous timber of known commercial value, and, with many others, the value of which for carpentry and decorative arts have yet to be tested. The work of sawing, cleaning, and fixing these has provided full employment for the staff engaged, and at the present time this exhibit of our forest wealth embraces a fairly representative collection of timbers, besides many practical illustrations of their enduring qualities and capabilities of usage. The museum was opened to the public on the 17th of February, 1897.

The following table indicates the distribution and variety of samples issued for the period:—

Samples.	Great Britain.		America.		Germany.		Africa.		India.		The Timber and Trades Journal.		Imperial Institute.		Local Distribution.		Totals.

Forest Improvement.

Planting and Thinning Operations.—As stated in the introductory report, the extent of planting operations has been extremely limited, the work under this heading being principally confined to thinning operations, details of the extent and cost of which for the period are given in the following table. It will be observed that the cost of red gum thinning throughout is greater than for pine, the work being much heavier in the direction of ringbarking over mature trees, and in actual thinning. The habit of this species requires that saplings to be destroyed must be taken out below the bulb, otherwise a fresh growth will ensue.

ensue. The total expenditure under Loan Votes for forest thinning, during the whole period covered by this report, amounts to £37,626 3s. 5d. for the year ending 30th June, 1896, and £11,229 17s. 6d. for the year ending 30th June, 1897 :—

Gosford State Forest Nursery.

The usual nursery operations have been carried out with marked success, and improvements to the area generally have been effected. The work of clearing the remaining uncultivated area has been completed; this portion has been subdivided with wire fences, in order to protect any trees that may ultimately be planted. A further area has been put under fruit-trees of named varieties, in order that the Department may be able to have a supply of such fruit-trees for the various Farms and Experimental Stations, Artesian Bores, &c.

Three varieties of Turkish tobacco were raised, from which a fair quantity of seed was obtained and sent to the Department. It was a particularly unfavourable season for tobacco-rearing in consequence of the virility of plant pests, due, no doubt, to the drought, the dry weather favouring their natural increase.

Some of the coniferous trees permanently established in the grounds of the nursery having come into seed bearing, after being properly treated, the seed was sown, and produced very fair results. Next season the seed should be stronger and in sufficient quantity to more than meet the nursery requirements. Some of the American ash-trees also bore seed, which proved fertile.

Imported seed of carya species, American hickory nuts, Saxodium species, American red woods, Accs Negundo, American box elder, &c., was sown, with good results.

Erythrina Caffra, Mulletia Caffra, and Odina Caffra trees were raised from seed received from the Forest Conservator, Natal, South Africa.

The fodder plant called "Siberian Persicary," mentioned in last report, known in botany as Polygonum Sachalnieuse, grew exceedingly well where planted out, but there is not yet sufficient quantity to estimate its usefulness on an extensive scale. Horses show a disposition to eat it with avidity. The plant dies down late in autumn, the stool sending forth shoots again in the following spring.

Varieties of salt-bush were successfully raised from seed, the whole of the plants being distributed in season.

The most important of our indigenous timber trees were raised from seed, iron-bark, tallow-wood, blue gum, terpine, cypress pine, brown pine, beach, black bean, and red cedar, &c.

Imported seedlings were received of Spanish Chestnut, common maple, ash, Norway maple, Linden, and horse chestnuts. These will be ready for transplanting to suitable districts on the higher table-lands in due season.

During the year ending 30th June, 1896, some 25,000 plants were potted and 400 seed boxes sown; seed beds were formed and sown; a large quantity of cuttings were also sowed out in suitable light soil.

During the year ending 30th June, 1897, some slight changes have been made in the working of the forest nursery at Gosford. The working staff was materially reduced at the end of August, 1896, thereby considerably reducing the expense of the establishment. The manager was transferred to the head office, Department of Mines, in June, 1897, where other duties have been assigned to him besides that of still managing the nursery work at Gosford. So far as the actual nursery work is concerned, the raising of plants and supervision of the large stock held at this establishment has not been materially affected, the reduction of labourers simply causing a cessation of work in the opening up and bringing into some sort of order and possible future cultivation the balance of the area not in use.

The plants reared and distributed during the 1896-97 season were of excellent growth and well rooted, and the Entomologist to the Department, after a visit of inspection, reports most favourably on the absence of plant diseases and scales.

The

The distribution of trees for the period under report was as follows:—

	1895-6.	1896-7.	Total.
To plantations, Artesian Bores, and Experimental Farms	11,790	7,850	19,640
To public Bodies, Charitable Institutions, &c.	10,137	11,176	21,313
To Farmers, Settlers, &c., for sericulture, shade and shelter, and other purposes	7,356	Discontinued	7,356
Grand Total			48,309

The wages, salaries, and incidental expenses in connection with the actual nursery work for the period was as follows:—

	£	s.	d.
1895-6	1,166	13	1
1896-7	492	1	8
	£1,658	14	9

It will be noted that owing to curtailment of staff and the practice of economies that a reduction in expenditure amounting to £674 11s. 5d. was effected in the latter period.

The stock has been fairly well kept up to the usual quantities held, and gratifying acknowledgments have from time to time been received respecting the excellence of the plants reared and the satisfactory mode of packing them.

Class and area of Forest Reserves.

On the 30th of June, 1897, the total area of reserved forest lands was 5,596,521 acres. These reserves are divided into three classes, viz., A, B, and C; the latter being under license fee and royalty, whilst the two former are under license only. The totals of the areas under each class are as follows:— Class A, 2,913,061 acres; class B, 128,995 acres; class C, 2,554,465 acres. In addition to the above, an area of 2,265 acres stand reserved for forest plantation.

On the same date the areas exempted from operation of licenses were as follows:—

- (1.) From the operation of ordinary licenses 192,000 acres of Crown land not embraced within forest reserves.
- (2.) From the operation of all licenses and permits (closed areas) 41,084 acres, being principally special areas comprised within forest and other reserves.

In the introduction to this report it was mentioned as a matter for regret that many usefully timbered areas had been withdrawn from reservation and alienated; the extent of area withdrawn, by comparing the total area of reserved land given in last report with that shown above, is found to be nearly 50,000 acres, the correct figures being 44,757 acres.

Prickly-pear Extermination.

During the past two years a considerable amount of work has been done in eradicating prickly-pear from both Crown and private lands throughout the Colony, the following being a brief *resumé* of the work accomplished.

Tenders for leases were invited for 67 portions, embracing an area of about 37,000 acres; of these 36 lots, embracing 11,905 acres, let for terms varying from 1 to 21 years producing an annual rental of £169 ls. 6d.

During the period under review a number of leases expired or were cancelled for non-compliance with conditions; but the total area of Crown lands to date held as leases under this Act is 29,931 acres, yielding an annual rental of £426 15s. 1d.

Upon private owners a great number of notices were served resulting, in a large number of cases, in the complete eradication, and in the remainder (with few exceptions) in satisfactory endeavours to cope with the pest.

It is plainly evident from reports received that prickly-pear is spreading on the Crown estate, the evil chiefly occurring on travelling stock and camping reserves, from which it is carried to adjoining lands. As great objection exists to leasing these areas, and funds are not available for eradication purposes, the pest was of necessity allowed to grow unchecked; but it is hoped that in the near future the seriousness of this matter will not escape notice, and funds sufficiently large to curtail this expansion and in time effect a permanent eradication will be voted for the purpose.

Forestry

Forestry Prospects.

In forestry, the fact that timber-falling operations are being conducted on a large scale is looked upon by the public as a sign of prosperity; and to a certain extent it undoubtedly is, for employment is afforded thereby to a large number of persons. The impetus that has been given to the timber trades by an export demand, after a long period of depression, comes as a fortunate circumstance to the many who are dependent on this industry for a living; but there are other aspects to be considered before congratulation is too freely indulged in, and these are as to whether our resources are capable of supplying an export demand for any period, and also, secondly, as to whether our timbers are not being parted with too cheaply. On the question of cheapness there is, of course, much to be credited in the argument that we are at this stage creating a market, and must move slowly until such is established; but if any comparison can be drawn from the small dues collected by the State for royalties and rights to cut timber, and which, whilst being so low as to prohibit sufficient return to pay cost of working and supervision, are the cause of constant complaint and agitation for reduction on the side of operators, it would seem that neither the State or the public are profiting from the industry. The question of maintaining an export trade is one depending largely upon the policy that is to be followed in regard to our forest tracts and their working. Under present conditions, with laws not sufficiently forceful to aid supervision or check waste and destruction, and with lands so indefinitely set apart that they are liable to withdrawal for sale at any time, heedless of their more lasting value for timber production, it may be at once set down that, apart from legitimate operation, we are burning the candle at both ends, and will soon exhaust our resources. It is frequently asserted that insufficient provision for future supply is being made in the direction of planting operations; but in the bulk of our commercial hardwoods, replanting will never be a necessity, for natural reproduction follows rapidly upon depletion, and the problem of their supply depends principally upon stringent laws against immature operation, and sufficient provision of suitable land for them to reproduce upon. Forest planting is a costly operation, and would not repay the State on the basis of present rates paid by operators for the right to cut timber. Our red-gum forests on the Murray give, perhaps, a brighter promise than any others we possess, for they are situated on land which is subject to inundation, and therefore unsuitable for settlement, and as the timbers obtained therefrom are principally for Victorian markets, the difficulty of obtaining fair rates for operation is never likely to arise. These areas are, further, not to any extent cut into by settlement, and being distant from population are more easily supervised. In speaking of forestry prospects, mention may also be made of our Western pine, a highly valuable timber, and in great demand. In some parts of the west this timber is becoming very scarce, and as it mostly occurs upon land suitable for wheat-growing, there will always be a danger, under existing conditions, of insufficient land being left for the production of this species. Some idea of the value of this pine may be gathered from the fact that a cargo was recently trucked from the Narrandera District for shipment to Port Darwin, it being highly esteemed there for its white ant-resisting properties.

Report of the Government Botanist.

THE work of the Botanist for the period was heavy, and included services for the Department of Agriculture, as well as botanical and other work associated with forestry. In face of his other duties, Mr. Maiden is assiduous in undertaking investigations, which in the course of a year include a variety of subjects. Apart from many memoranda of a brief character which were not pressed, the number of reports of varying length and importance presented to the Department for the period 1st July, 1895, to 30th June, 1897, was 577, the work consisting in the naming of any plants submitted, whether indigenous or exotic, or whether useful, noxious, or simply of botanical interest; also in the examination of plant products, the following being a brief *resumé* of his operations:—

Agricultural.

Weeds.—The naming of weeds, and making suggestions in regard to their destruction or utilisation. Reports in regard to coping with the prickly-pear pest, and the eradication of scrub.

Plants reputed Poisonous to Stock.—Identification and reporting upon indigenous and other plants reputed to be poisonous to stock, with suggestions in regard to the collection of evidence or dealing with the plants themselves.

Fodder-plants.—Reports on indigenous and exotic fodder-plants, particularly salt-bushes.

Grasses.—The naming of indigenous and exotic grasses, and making recommendations with the view to the conservation and propagation of desirable ones, particularly the indigenous species.

Bee-plants.—The naming of plants reputed to be useful to the bee-keeper, with suggestions for the dissemination of such plants.

Drugs.—Reports on indigenous plant-products reputed to possess medicinal properties.

Fibres.—Reports on indigenous and exotic fibres, and suggestions as to the desirability of cultivating or conserving the plants. Note on the utilisation of *melaleuca* bark for fruit-packing.

Experimental Cultivation.—Reports on the cultivation of the golden osier, sugar-cane, indigenous grape-vines for stocks, barob, cork-oak, &c. The testing of various seeds as to their germinating power.

Forestry.

Timbers.—The diagnosis of timbers; the identification of herbarium specimens of timber-trees; reports on various questions connected with the conservation of timber-trees, and forestry in general; reports on the utilization of Colonial timbers for various purposes, and specifically for wood-paving; engraving; wood-pulp; wine-casks; the seasoning of timber by rapid methods.

Gums, Resins, &c.—Reports on plants yielding gums and resins, especially grass-trees, wattles, and the indigenous Cypress-pines (*Callitris*); furnishing information in regard to the distribution of the plants, and the commercial possibilities of the products.

Kinos, Rubbers, &c.—Reports on the various eucalypts (and their distribution) producing kinos which are merchantable; reports on the kinos themselves; reports on indigenous plants containing rubber, and on the possibilities of the successful cultivation of India-rubber and gutta-percha plants in the Colony.

Tans.—Reports on the introduction of sumach to the Colony, also on canaigre, wattle bark, &c.

Dyes.—Reports on some indigenous products suggested as useful for dyeing purposes; also on some materials suggested as useful for marking stock.

Miscellaneous.

Miscellaneous.—In addition to the foregoing, miscellaneous subjects were treated of, such as—Identification of Mangroves used by Oyster Lessees for Spat; Report on the effects on the Indigenous Vegetation of the severe winter of 1895; Correspondence on the Saps of the Silky Oak (*Grevillea robusta*) and Brush Box (*Tristania conferta*); Naming and Reporting on Fungi, &c.; and, for the period under review, Mr. Maiden contributed much valuable matter to the pages of the *Agricultural Gazette*, the work performed including—26 illustrations of plants, comprising 6 weeds, 10 indigenous grasses, 3 salt-bushes, 1 other fodder-plant, 6 timber-trees; 48 articles of varying length on the following subjects—Weeds (10), Poison-plants (4), Prickly-pear (1), Salt-bush (3), A. Medick (1), Grasses (10), Timber-trees (8), the Cultivation of Indigenous Plants (1), Botanical Notes, or series of Notes (5), Descriptions of Botanical Tours (2), and Resins (2).

In concluding this section, mention may also be made of the publication "Notes on Commercial Timbers of N.S.W.," compiled by Mr. Maiden at the request of the Department, and which has since been distributed as a text-book of reference in brief on the principal timber, their localities and uses, and also of the report of the Spotted Gum Committee, of which Mr. Maiden was a member, and the quarterly publication, "Flowering Plants and Ferns of N.S.W.," with which Mr. Maiden is associated as author

I have, &c.,
R. D. HAY.

THE BOARD FOR EXPORTS.

The Board began its existence on the 7th November, 1895; but as the first twelve months or more were chiefly occupied in work of a tentative and preparatory nature, it may fairly be claimed that active operations date only from the beginning of the current year, from which date the cold stores at present utilised were rented from the lessees of the Government Meat Markets.

It may be well to recapitulate briefly the history of the Board from its inception. In 1895 the Hon. G. H. Reid, in his position as Premier and Colonial Treasurer, recognising the fact that upon finding markets for our surplus products, and assisting the producers of the Colony to get more closely into touch with consumers, rested in a great measure the future prosperity of a Colony so eminently suitable for the growth of crops and stock, recommended the appointment of the Board, which was thereupon selected and called into existence under the following Patent, issued under the hand and seal of the Lieutenant-Governor of the Colony, on the 29th October, 1895, and recorded in the Register of Patents 4th November, 1895:—

By His Excellency the Honorable Sir FREDERICK MATTHEW DARLEY, Knight, Lieutenant-Governor of the Colony of New South Wales and its Dependencies.

To:—

GEORGE SKELTON YUILL, Esquire, Chairman;	THOMAS JESSEP, Esquire;
The Honorable ALEXANDER KETHEL, M.L.C.;	JOHN WILDRIDGE, Esquire;
GEORGE MAIDEN, Esquire;	THOMAS C. WORBOYS, Esquire; and
HENRY LEE, Esquire;	JOHN LOW THOMPSON, Esquire,—
CHARLES FREDERICK LINDEMAN, Esquire;	

Greeting:—

Whereas it has been determined to appoint a Board of Advice to assist the Government of the Colony of New South Wales in promoting the interests of the producers of the said Colony in British, Colonial, and Foreign Markets: Now, therefore, I, Sir Frederick Matthew Darley, the Lieutenant-Governor aforesaid, do, with the advice of the Executive Council, hereby appoint you, the said George Skelton Yuill, the Honorable Alexander Kethel, George Maiden, Henry Lee, Charles Frederick Lindeman, Thomas Jessep, John Wildridge, Thomas C. Warboys, and John Low Thompson, to be members of such Board of Advice accordingly, and you, the said George Skelton Yuill, to be Chairman thereof.

Given under my hand and the Seal of the Colony, at Government House, Sydney, in New South Wales aforesaid, this twenty-ninth day of October, one thousand eight hundred and ninety-five.

(L.S.)

FREDK. M. DARLEY,
Lieutenant-Governor.

By His Excellency's command,
G. H. REID.

Entered on record by me, in Register of Patents No. 17, page 148, this fourth day of November, one thousand eight hundred and ninety-five.

For the Colonial Secretary and Registrar of Records,—

CRITCHETT WALKER,
Principal Under Secretary

In the above selection, it will be noticed that care was taken to appoint a number of practical men of known business capacity, whose long experience and close association with the various products of the Colony were calculated to make their advice of material service in inaugurating any system having for its object the advancement of the growers' interests. Representing agricultural, pastoral, dairy, vineyard and orchard produce, timber, meat refrigeration, and shipping, it was anticipated that their advice would be of a thoroughly practical nature, and their recommendations such as would secure adoption by the Government and be of immediate service to the producers.

The Board, at its first sitting, recommended the appointment of Mr. Jas. Stephenson, late of the Department of Agriculture, as Secretary *pro tem*, a position which was afterwards confirmed to him, by advice of the Executive Council, under the hand of His Excellency the Governor, early in 1896.

From the first, the Board fully recognised that, in order to secure to New South Wales a fair share of the world's markets, and place our producers on as good a footing as those of other British colonies and foreign nations, some immediate steps were necessary; and, as the interests of the producers were likely to be best consulted by taking them into confidence, a series of meetings was arranged for, the dairying, timber, meat, wool, and wine industries being among the first to receive attention.

In

In regard to the dairying industry, it was at once found that an apparent conflict of interests, and some misunderstanding of the Board's recommendations by some of the Sydney manufacturing and export firms, tended to retard any movement the Government might be advised to make in the direction of simplifying for the producer the marketing of his goods to best advantage. A large and representative conference of country producers, however, met and discussed the question of Government supervision and assistance, finally deciding in favour of Government inspection and grading, the establishment of a representative in London to look after produce, the giving of prizes to export factories, Government assistance in obtaining reductions in freight and facilities of transport, the encouragement of small producers' factories, with proper diffusion of scientific information, &c., &c.

The resolutions adopted by the Conference being in accord with the opinions of the Board, the Government was advised to take steps to carry out a comprehensive scheme to further the industry by establishing cold stores, appointing qualified officers for grading, &c. A set of regulations was also directed to be drawn up (*Appendix* p. 37) and submitted to the Government for approval.

Having been approved, the Regulations were printed in anticipation of the coming season; but before any further steps had been taken, an influential deputation waited upon the Premier to represent that, instead of wishing the Government to assist them in any way, the producers were perfectly satisfied with the way in which they were being treated by the companies and agents, and that, as the latter had provided all necessary facilities and largely invested capital, any interference would be both uncalled for and injurious.

Meantime a meeting of representative saw-millers, timber merchants, and others was convened, and resolutions were passed in favour of Government grading and branding, also of the establishment of an officer in London to watch markets and influence the trade to this Colony. The report of the meeting was handed to the Honorable A. Kethel, M.L.C., for consideration and report.

A conference of those interested in the export of meat sat on several occasions, and finally arrived at the conclusion that proper supervision of all meat for export, the issuing of certificates as to condition, the absolute prohibition of export of any meat without such certificate, and sundry modifications as to freights, dues, &c., were proper questions to be dealt with by the Government. [*Appendix* p. 38.]

Those interested in wool were asked to confer and say whether Government assistance would be of any value in furthering the interests of the pastoralists. The reply of the Wool Brokers' Association was in the negative; and the Board contemplated calling a conference of pastoralists themselves, but this was afterwards abandoned.

The bacon-curers and others interested in that trade were called together, and reported that the Government could best benefit the industry by procuring for the use of farmers in the various districts stud boars of recognised merit, and sending lecturers round to instruct growers in the proper methods of breeding, feeding, &c. [*Appendix* p. 39.]

In July, 1896, the first practical work of export was undertaken by the Board, when the question of exporting a trial shipment of oranges to London was dealt with. As will be seen by the report (*Appendix*, p. 39), the growers themselves gave scarcely any assistance; but, notwithstanding this drawback, the experiment conclusively established the fact that, at the time of our greatest plethora of supplies, the British market was so bare that exporters might reasonably expect to realise about 100 per cent. more for their produce than Sydney prices.

In August, 1896, the Premier decided to place the Board under the Minister for Mines and Agriculture, who met the members and discussed their various recommendations.

The general scheme advocated by the Board was found to correspond closely with the Minister's views, and proceedings were at once taken to carry out the various proposals.

The metropolitan butter exporters again came forward to urge a policy of non-interference, and assured the Minister that Government supervision was utterly uncalled for and unnecessary. The Minister promised to make full inquiries, but maintained that, as it was not proposed to make supervision compulsory, no injury to vested or other interests could result.

The Board having recommended the establishment of an export scheme in connection with the hare and rabbit pest, and the same being approved by the Government, an expert grader and packer became necessary; and, after careful inquiries, the services of Mr. George Bradshaw, assistant grader at the Victorian Export Depôt, were secured.

To make the export scheme known in the infested districts, public meetings were called at Bathurst, Goulburn, and Carcoar, and the scheme explained by the Secretary. The Melbourne exporters at once took the matter up and sent buyers into the various districts, with the result that an export trade was immediately established, leading, during the first four months, to the destruction of over 56,000 hares. Owing to the drought and the comparatively low prices in London, rabbits were not handled in large quantities, but everything points to an enormous trade in these during the coming winter.

The offering of a £50 prize at the Easter Show of the Royal Agricultural Society in 1896 for the best five boxes of butter, packed for export and stored for six weeks, having created a great amount of interest and led to a spirited contest among the producers of all the Colonies, it was decided to offer this season prizes for other export produce at the same show, and a special list was prepared (*see Appendix* p. 43), comprising butter, poultry, sheep, wheat, barley, bacon, meats and soups, dried and preserved fruits, rabbits and hares prepared and packed for export. The total list of prizes offered amounted to £280; but, except in butter, which again brought forward a large entry, the exhibits were so few, and in some cases so indifferent in quality, that only £175 were finally awarded by the judges.

This result may be regarded as somewhat disappointing; but even the negative results were such as to encourage the belief that similar measures next year will meet with much greater success. It was conclusively shown that, before we can expect to capture even a share of British and Foreign trade in most of our exportable products, we have much to learn in producing and preparing; and one of the chief duties of the Board will be, by means of object lessons and experiments, to show producers what to grow, how to grow, and how to prepare for the various markets.

In March of this year Mr. Lindeman submitted his report (*Appendix* p. 44) on the wine industry of the Colony, giving at length the opinions of the leading vignerons and manufacturers, the general opinion being in favour of an alteration in the excise on distillation by reducing same from 14s. to 9s. for spirit distilled

distilled from N.S.W. grapes—this being the difference already established in South Australia. This lower excise would, in the growers' opinion, lead to much more extensive areas of land being placed under vines, with a consequently larger supply and a certainty of remunerative prices all round.

The Hon. A. Kethel submitted his report on the question of timber export (*Appendix* p. 46), which generally endorsed the views of the Saw-millers' Conference held in February, 1896. The Board commended the report to the favourable consideration of the Government.

With last year's orange shipment such a pronounced success, the Board anticipated that growers would ship largely on their own account during the current season; but it was found that, with rare exceptions, they did not respond. A sufficient quantity was therefore purchased to test the possibility of shipping large lots as ordinary cargo. In all 1,154 cases were shipped, and, although many arrived in good condition and sold up to 16s. and 17s. per case, there was a great deal of waste in the lower grade fruit, and the experiment was not a commercial success. The London salesmen strongly advise all citrus fruit to be shipped in cool storage in future, as the extra cost is much more than compensated for by the certainty of landing the fruit in prime condition. A full report of this shipment is now in preparation.

In July, at Hawkesbury College, was held a conference of dairymen and others interested in the dairying industry and the export of butter. Among other questions discussed, that of Government supervision occupied a prominent place, and it was found that the representations made to the Government against interference had not the support of the producers. On the matter being put to a vote, a majority of 82 to 7 declared in favour of Government supervision of all butter intended for export. A general vote of agriculturists in conference at the College was unanimously in favour of increased activity in regard to placing our export produce properly on the markets of the world, and generally endorsed the policy of the Board.

From November, 1895, to 1st September, 1897, the Board has sat as follows:—

Total number of meetings	70
G. S. Yuill, Esq., attended	28
Hon. A. Kethel attended	47
Thos. Jessep, Esq., M.L.A., attended	55
J. L. Thompson, Esq., attended	53
C. F. Lindeman, Esq., attended	40
Geo. Maiden, Esq., attended	55
T. C. Worboys, Esq., attended	19
H. W. Lee, Esq., attended	31
John Wildridge, Esq., attended	43
Secretary attended	70

The members have undertaken the following duties on behalf of the Board:—

G. S. Yuill, Esq., Chairman.—Various conferences. Is now, for the second time, on a visit to Britain, where he will combine with his own affairs such inquiries as may be of benefit to the Board in its deliberations.

Hon. A. Kethel, M.L.C., Vice-Chairman.—Various conferences. Visited Victoria and Tasmania in the interests of the timber trade. Is now in Britain on private business, combined with inquiries *re* export of timber and other commodities.

C. F. Lindeman, Esq.—Travelled throughout the colonies, prosecuting inquiries as to the best means of furthering the interests of viculturists in New South Wales. Conferred with the vigneron and reported at length.

John Wildridge, Esq.—In a series of conferences with producers and shippers, acquired much valuable information *re* export of meat, and embodied same in a report. Is now in Britain on private business, and intends to give the Board the benefit of any information acquired touching the export of perishable produce.

Thos. Jessep, Esq., M.L.A., Acting Chairman.—Attended various conferences. Has made exhaustive inquiries, in this and adjoining colonies, touching the export of fruit, &c.

The other members have at all times given great care and attention to the producers' interests, and have devoted much valuable time to the deliberations of the Board, contributing at the same time much information of value to the producing interests of the Colony.

The Secretary has visited Victoria, prosecuting inquiries as to Government supervision of perishable produce there, and has addressed public meetings and attended agricultural shows at the following places:—Bathurst, Carcoar, Goulburn, Inverell, St. Ives, Thornleigh, Dundas, Parramatta, Dural, Wollongong, &c.; has furnished many reports on a variety of subjects, and generally controls the working of the Government Export Depot.

Among many other schemes which have engaged the attention of the Board, and which form a part of its programme, may be mentioned the following:—

- (1.) Increased facilities in railway and steamship carriage for perishable products, more careful supervision of same in transit, and adjustment and reduction of freight.
- (2.) Rigid and impartial inspection of all export food supplies, with Government certificates of quality, and, where necessary, prohibition of the export of any produce unfit for human food, or otherwise likely to damage the reputation of New South Wales products.
- (3.) The establishment at ports of discharge of such a system of supervision as may conduce to greater care in handling and better systems of marketing our produce.
- (4.) Creating, as an important branch of the Board's functions, a bureau of information on all matters connected with British and foreign markets, and the dissemination of useful information to producers and merchants by means of paragraphs, pamphlets, &c., along with the publication of cable and other news of value to shippers.
- (5.) Procuring reliable information as to proper methods of preparing, packing, and shipping produce to suit the various markets, and, where necessary, experimenting on a commercial scale with the shipment of various products to such markets as may be available.

The

The following financial statement shows exactly what the Board is costing the country:—

Amount expended, November, 1895, to June 30th, 1896—	£	s.	d.
Working expenses, furniture, stationery, prizes, and sitting fees	254	0	10
Secretary's salary	163	11	7
Total	417	12	5
Amount expended, July 1st, 1896, to June 30th, 1897—			
Working expenses, purchase of fruit, prizes, sitting fees, &c., &c.	1,763	10	11
Secretary's salary	250	0	0
By returns received for oranges sold in London, &c.	1,143	6	6
Total cost to June 30th, including all prize moneys, fees, salaries, travelling and other expenses, cold store rent, &c.....	1,287	16	10

It may be added that from 30th June the receipts from the cold stores for freezing, grading, &c., practically cover the expenditure, and should the producers take advantage to the anticipated extent of the export facilities offered, the whole of the Vote for 1897-8 will be available for experiments, prizes for exportable produce, and the general encouragement of production for export purposes.

When it is considered that other colonies have for years past been spending lavishly to encourage an export trade, the results obtained from such a small expenditure here cannot but be gratifying, and, as will be seen from the Regulations governing the various classes of produce (*Appendix*), the charges made are expected to make the general scheme—apart from experimental work—entirely self-supporting.

As to the experiments, the small amounts required, and the probability of returns nearly or altogether equal to cost, lead to the conclusion that the benefits derived from the Board's efforts will be obtained at little or no cost to the Colony.

Should this end be achieved, the labours of the Board as a body, and the sacrifice of time on the part of its members, will not have been thrown away, but will doubtless meet with the approval of the producers, in whose interests it was originally established.

Appendix.

I.—BUTTER.

REPORT of Conference of Country Butter Producers.

RESOLVED:—

1. That, in the opinion of this Conference, all butter for export should be examined, graded and branded, by a Government expert before shipment; if possible, at a common centre.
2. That, in the opinion of this Conference, a Government official, properly qualified, should be appointed in London to watch the interests of produce shipped under Government auspices.
3. That this Conference affirms the principle of holding exhibitions and granting substantial prizes to factories and others producing butter for export under conditions adapted from those obtaining in Denmark and elsewhere.
4. That, in the opinion of this Conference, the Government should at once proceed to arrange with shipping companies for lower rates of freight, and should endeavour to obtain a rate of (say) a half-penny per pound, subsidising or otherwise arranging with the various Companies.
5. It was suggested that any efforts made by the Government through the Board towards encouraging the smaller farmers to produce superior butter, by such means as local creameries, new methods, improvement of herds, &c., would go far towards making the export of butter the success it should be.
6. That, the Government be requested to arrange for large storage accommodation in Sydney with facilities for packing, grading, freezing, branding, &c., and that refrigerating cars be made available for conveying butter to such stores direct, for handling and shipment under Government auspices.

II.—BUTTER AND CHEESE.

SHIPPING Regulations (Butter and Cheese).

Treasury Department, Board for Exports, Sydney, 2nd January, 1896.

THE following arrangements, having been made by this Board for the shipment of butter and cheese to London during the season 1896, are published for the information of intending shippers. Preliminary estimates of probable space requirements should in all cases be sent to the Board at least one month prior to date of intended shipments:—

Applications for Space.

1. As the Board is held liable for the freight on all space engaged, no application for space will be entertained unless made on the form marked A, which renders persons applying for space liable for the freight due on same, or on any portion of same which may be allotted to them.
2. Persons acting as agents must apply on form B, and an authority on Form C from the person for whom they are acting must accompany their application.
3. A separate application must be made by agents in respect of each person for whom they may be applying for space.
4. The necessary application forms are supplied by the Board; and, in the event of the total space applied for exceeding that available, a *pro rata* distribution will be made amongst the various applicants.
5. Notice of the space required must be given to the Shipping Companies by the Board at least ten days prior to the sailing of the vessels from Sydney, and only such space will be secured as the Board may receive applications for at least twelve days prior to the dates mentioned.

Butter and Cheese Cases.

6. With a view to economising space in transit it is specially desirable that packages of a uniform size should be adopted. Sample cases most in favour with buyers can be seen at the depot. The inside measurements are:

Butter Cases.—12 inches by 12 inches, and 12 inches deep, weighing not more than 11½ lb.

Cheese Cases.—Length, 22½ inches; diameter, 13 inches; weighing 19 to 20 lb.; ends, 1 inch thick; centre boards, ½ inch thick; sides, ⅓ inch thick.

7. It is specially desirable that only well-seasoned timber be used for butter cases, as mildew rapidly affects the butter where imperfectly seasoned timber has been used in the manufacture of the boxes. Badly-nailed, indistinctly-branded, second-hand, or soiled boxes will not be shipped.

The timber to be used for butter and cheese cases is to be New Zealand white pine, or other timber approved by the Board.

Packing

Packing of Butter and Cheese.

8. The butter cases must be new, and lined with the best waterproof butter paper, put in the box in two strips only, so that the solid square of butter may be shaken out with the paper adhering to it.
Each case should contain 57 lb. of butter, which would allow for shrinkage of 1 lb. during voyage.
Cheese cases should contain two cheeses, of not less than 56 lb. each, or four of 28 lb. each.

Branding of Butter and Cheese Cases.

9. Both ends of each case must be legibly branded with the name of the factory at which the butter or cheese is manufactured. Dark colours only must be used, and the letters should not be less than $1\frac{1}{2}$ inch in length (red, pale blue, pale green, and similar colours are forbidden). The net weights of butter and cheese should also be branded on the boxes.
In the case of mixed or blended butters, shippers will only be permitted to brand their boxes with letters or figures not exceeding three in number, and not less than 4 inches in length.

Despatching of Butter and Cheese.

10. In despatching butter and cheese, care should be taken to see that each package is securely nailed with $2\frac{1}{4}$ -inch barbed nails, and properly branded; and also that a way-bill, giving full particulars of the consignment (numbers, brands, weights, &c.), accompanies it, addressed to the Government Butter Expert, Refrigerating Works, Sydney.

11. Butter and cheese for shipment by any of the vessels named from time to time must reach the Refrigerating Works at least seven clear days prior to the sailing from Sydney of the vessel by which it is intended to ship it, when the Board will undertake to carry out all arrangements connected with the receiving, chilling, examining, branding, and shipping of same at a cost of 3d. per box.

12. All butter and cheese prior to shipment will require to be examined and approved by some person or persons appointed for that purpose by the Board for Exports.

13. Any person forwarding inferior butter or cheese will be debarred from shipping during the remainder of the season, and all rejected butter and cheese must be removed by the owner thereof or his agent immediately upon receiving notification of its rejection, otherwise it is liable to be sold at owner's risk.

Suggestions.

Directors of factories where cheese is made should bear in mind that the butter made during the months of December and January usually arrives in London to meet a falling market; and that consequently cheese-making might with advantage be started during those months, as on arrival in London it would be most likely to command a good price. Any factory having a good cheesemaker under the Canadian system would do well to make at least a portion of its milk at the period named into cheese, for the reason that unless the Board can gather consignments of at least 50 or 60 tons a difficulty arises in securing a ship's chamber, as no other produce may be carried together with cheese in the same chamber. Combined action in this respect by the factories would insure cheese of a uniform age—a result absolutely necessary where good prices are desired.

A.

Application for Space for Shipment of Butter and Cheese to London when services of an Agent are not employed.

Sir,

I have the honor to apply for space in the _____, sailing on the _____, for _____ tons gross weight of _____, for shipment to London; and I hereby guarantee to pay the full freight, viz., $\frac{3}{8}$ of one penny per lb. on this space if same be allotted to me or upon any portion of same which may be allotted to me.
I also guarantee that this _____ is the produce of the Colony of New South Wales.

I have the honor to be, Sir,
Your obedient Servant,

To the Secretary, Board for Exports, Sydney.

B.

Application from Agent for Space for Shipment of Butter or Cheese to London.

Sir,

I have the honor to apply, on behalf of _____, for _____, for space in the _____, sailing on the _____, for shipment to London; and I hereby guarantee to pay the full freight, viz., $\frac{3}{8}$ of one penny per lb. on this space if same be allotted to me, or upon any portion of same which may be allotted to me.

Attached is authority from _____
I also guarantee that this _____

_____ for me to act as his agent.
is the produce of the Colony of New South Wales.
I have the honor to be, Sir,
Your obedient Servant,

To the Secretary, Board for Exports, Sydney.

III.—MEAT.

REPORT of Final Meeting of those interested in Meat Exports.

11 February, 1896.

AFTER several meetings were held, in response to the invitation of the Board of Advice, the following minute was agreed to by those present:—

The following are the means by which, in the opinion of the meeting, assistance to the trade could be rendered by the Government, the object of the suggestions being more the extension and improvement of the various services now carried on under State supervision, than any further enlargement of its powers in the control of private industry:—

1. Reduction of railway freights on live and dead stock for export, with increased facilities for rapid transit.
2. Special legislation annulling the power of the Sydney Municipal Council to claim dues on stock intended for slaughter for export.
3. Supervision, under the direction of the Board of Health, of all meat for export at the place of slaughtering, including a certificate testifying to its fit condition for human consumption, and absolute prohibition of export of any meat without such certificate.

The Secretary Board for Exports, Sydney.

WM. McMILLAN,
Chairman.

(See also folio 37.)

IV.—BACON.

REPORT of Bacon-curers Conference.

Sydney, 12 February, 1896.

A CONFERENCE of bacon-curers and others interested in the trade was held under the auspices of the Board in the Secretary's room this day at 11:30 a.m. Present:—Messrs. G. Murphy (in the Chair), J. McLean, H. Joyce, A. C. Fletcher, S. Wansey, and J. Wansey.

Mr. Principal Thompson represented the Board, and briefly introduced the subject under consideration. He pointed out that with an enormous territory, our climate, and the immense amount of pig-food we could produce, how absurd it seemed that we went on importing ham, bacon, salt pork, and even live pigs from year to year. He hoped this Conference could suggest some measures whereby we could, at an early date, become large exporters instead of importers, and promised that the Government, through the Board, would give effect to any reasonable suggestions that might be made.

Mr. G. Murphy, Leichhardt, was moved to the Chair, and opened the proceedings.

He remarked that in this, as any other reform, we must begin at the beginning, and the first point was the improvement of the breed of pigs.

The members of the Conference, at some length, discussed this aspect of the question, and it was finally resolved:—That the Government should be asked to supply, for the use of the pig-breeders, boars of recognised breeds, and that same should be placed in the hands of intelligent farmers in the various districts for general service; the Board to frame the necessary regulations, and exercise control over the boars so supplied.

It being recognised by the Conference that a great amount of ignorance exists among farmers as to the proper treatment of pigs, it was resolved:—“That the Government should be asked to appoint experts to travel in the Colony and lecture on the breeding and feeding of pigs, suitable weights for markets, and cognate subjects.” The lecturers should be capable of instructing farmers and others in all branches of pig-breeding, the best breeds, age of maturity, feeding, topping, and marketing. A consensus of opinion on the part of the Conference favoured the “Improved Berkshire” as the model bacon pig of the present day.

Although Mr. Thompson had stated that the Board could not touch upon any question relating to the fiscal policy of the Colony, it was thought advisable to put on record the opinion of the Conference, as follows:—Resolved,—“That the Bacon-curers Conference, here assembled, desires to enter a protest against the removal of duties from bacon and hams.” It was pointed out, in this connection, that in ordinary seasons the adjoining Colonies have better facilities for pig-breeding than this Colony possesses, and can flood the market with live pork whenever there is a margin of profit, the cheap intercolonial freight being also against our farmers. It was not thought that any immediate prospect existed for this Colony to export at a profit its pork supplies, which are not equal to our own necessities; but the Conference was of opinion that when the time comes, any concessions in freight the Government can arrange would be of great importance in encouraging the export of pork, ham, and bacon.

The Secretary was asked to embody above recommendations in a report, and submit same to the Board, with the signature of the Chairman.

JAS. STEPHENSON, Secretary.
February 12th, 1896.

Approved as correct,
GEO. MURPHY,
Chairman.

V.—ORANGES.

Experiment in Orange Shipping by the Board for Exports.

(Jas. Stephenson, Secretary.)

PART I.

It has long been recognised that, with the constantly increasing area of orangeries, and the coming into bearing of those planted in boom times, our small population is quite inadequate for the consumption of all, or even a large proportion, of the fruit grown. Spasmodic attempts have from time to time been made to find permanent markets outside the Colony for this class of produce, and some enthusiastic gentlemen, notably C. B. Cairnes, Esq., of Parramatta, have experimented extensively and with a fair amount of success.

The great majority of our growers, however, have shown an amount of apathy in looking after their own interests as remarkable as it is regrettable.

Being reasonably satisfied that, under proper conditions of preparation and transit, a market for our surplus for years to come would be found in Britain, the Board, with the sanction of the Government, decided to arrange for a representative shipment being sent to London as an experiment in cool storage, and with this end in view, called a conference of fruit growers and others interested in the matter early in July. The meeting, although fully advertised in the leading newspapers, was attended by only *three growers*. Failing to get the growers interested in the matter, it was decided to purchase from them a sufficient quantity to fill a small insulated chamber on one of the mail steamers, and a sub-committee, consisting of Thos. Jessep, Esq., M.L.A.; Mr. Principal Thompson, Hawkesbury College; C. B. Cairnes, Esq., of Parramatta; and Mr. Jas. Stephenson, Secretary to the Board, was appointed to carry out the shipment.

Messrs. Jessep and Stephenson visited the principal orchards in the Parramatta, Dural, Galston, and Castle Hill districts, while Mr. Thompson undertook Kurrajong and neighbourhood. In the latter district considerable success was achieved; but the Sherwood growers were not only reluctant to risk small quantities, but in some cases would sell only at exorbitant rates or not at all. Besides this, the condition of the fruit, owing to insect and fungous pests, was not at all what could be desired. The orchards in many cases were simply smothered with scale, Maori, aphid, and other parasites, and showed evidence of great carelessness in cultivation.

It was found that many of the best orchards had been sold for the season to fruit merchants in Sydney and elsewhere and the sub-committee, in order to secure the necessary quantity in the limited time at its disposal, turned its attention to the firms which had purchased the season's crop from the growers. Here more of a business spirit was shown, and in a short time all necessary arrangements were made.

To get the necessary grading and packing done under proper conditions was the next difficulty, and it was recognised that to have this part of the work performed in a perfunctory manner was to court disaster. It was, therefore, decided that all fruit should be subject to the following conditions, which were furnished to the growers and others concerned, and that the packing be done in Sydney under proper supervision:—

1. All fruit must be carefully *cut* from the trees; on no account pulled.
2. The fruit must be handled with the greatest care, so as to avoid bruising.
3. When cut, the fruit must be placed in trays or open boxes, and exposed freely to the air (under cover) for at least five days, if dry weather, or seven days if moist.
4. The fruit must then be packed in gin-case boxes, and carefully handled in transit.
5. The fruit must be perfectly clean, thin-skinned, and free from blight, scale, or frost-bite, and must be of an average size of 3 inches diameter.
6. The fruit must be delivered at a place in Sydney, to be afterwards named, on or before Tuesday, the 4th August, the cases to be returned to the growers.
7. The fruit shall be submitted to the inspection of an Expert provided by the Board, who shall reject any fruit unsuitable for export, and whose decision shall be final.

NOTE.—The fruit must on no account be cut in wet weather, or when the dew is on it.

Mr. Geo. Maiden, a member of the Board, kindly placed the necessary space at its disposal in the conveniently-situated stores of Messrs. Goldsbrough, Mort, & Co., at Circular Quay, where a staff of packers graded, culled, and packed the fruit under the directions and supervision of Mr. A. H. Benson, Fruit Expert to the Department of Agriculture.

The

The total number of cases purchased was 2,076, which after culling and grading, resulted as follows:—

First grade	55 cases.
Second „	987 „
Third „	698 „
Culls	245 „
Used to make up difference in capacity of cases	91 „
	2,076 „

In packing, a specially-prepared paper, glazed on one side, was used, the cost being 3s. 3d. per ream of 2,840 wrappers. The fruit was carefully wrapped, the thickest folds of the paper covering the stem end so as to prevent punctures in the adjoining fruit.

The cases used were of the following dimensions:—28 inches x 14 inches x 8 inches inside measurement; tops, bottoms, and sides $\frac{3}{4}$ inch thick; ends and partitions, $\frac{1}{2}$ inch thick—one partition to each case.

Three laths, $\frac{1}{2}$ inch thick, were nailed on one side of each case to provide ventilation, and the joints of cases were open, $\frac{3}{4}$ inch. It was stipulated that only Colonial pine or other flavourless wood should be used, and that it should be thoroughly seasoned.

It was found that these cases held about 5 per cent. more than the ordinary gin-case.

The fruit was packed the deep way of the case, in rows of three, and, when the case was completed, projected a full inch or more above the top. The lids were then adjusted, and, under a firm pressure, nailed in their places, thus ensuring that no reasonable amount of handling would cause the fruit to get loose and knock about. The “sweating” or toughening process adopted in the orchard was meant to allow of firm packing being done; newly-gathered fruit would spoil under such treatment.

The cases were branded with the names of the producing districts, the grade of fruit, and a registered initial whereby each separate lot will be identified when the returns and report of the London salesmen come to hand.

The insulated storage on the steamer was arranged to be kept at a temperature of from 45 to 52 degrees Fahrenheit, which has been found to be most suitable for fruit.

The shipment being an experiment, it was to be expected that the expenses would be somewhat heavy, and this was found to be so. The principal item of expenditure was, of course, freight, which for 1,740 cases amounted to £343 13s. 4d., with insurance £2 7s. There is every reason to believe that, when the trade in fruit is properly established, this item will be reduced to the equivalent of meat freight, or something like 50 per cent. under that now charged.

The cost of packing can also be much reduced when the growers are taught the proper method, and can have grading and packing done in the orchard. This must be attended to with scrupulous care, and to ensure success of future shipments it is strongly insisted on that no fruit should be allowed to leave the Colony without special inspection before shipment, and the “approved” brand of the Board for Exports affixed.

A cable message from the Hon. the Agent-General reports the sale of the fruit, which arrived in splendid condition, and realised prices which fully demonstrate the important fact that we have in London a market at highly remunerative rates for all our medium grade fruit. It is no exaggeration to say that the success of this experiment means to our orange-growers an increased income totalling something like £30,000 per annum, the only stipulation being that regularity of quality and constancy of supply be maintained throughout the season.

The following is an approximately correct return of the shipment so far as present information goes:—

	£	s.	d.	s.	d.
Total cost of 2,076 cases	487	10	6	=	4 8 3 per case.
Freight on 1,740 cases	343	13	4	=	3 10 8 „
Cases, wrapping-paper, rail freight, wharfage, and charges.....	104	2	1	=	1 2 3 „
Cartage, wrapping, packing, and expenses	64	10	0	=	0 8 9 „
Total cost.....	£999	15	11		
By a/c. sales, London.....	1,100	0	0	=	12 7 7 „
To gross cost cif., London.....	£999	15	11		
Less returns, culls, &c.	31	11	4		
				=	968 4 7 = 11 1 5 „
Net profit.....	£131	15	5	=	1 6 17 „

It will thus be seen that, despite the extra expenses unavoidable in such an experiment, a handsome profit has been realised. When full details come to hand it is intended to publish an accurate and comprehensive statement, showing exact returns from each individual lot.

With an open and favourable market as an incentive, our fruit-growers should be stimulated to further efforts on more scientific lines; and it is confidently anticipated that in a few seasons our orange crop will be deemed of sufficient importance to warrant British fruiterers making extensive arrangements to purchase in advance direct from the growers.

No effort must be spared, however, to ensure gradual and consistent improvement in quality, as the price obtainable for top grades will more than pay for additional care and attention. I would also again strongly insist on efficient supervision of future shipments, and the securing by the Board of all necessary insulated freight space, as a few carelessly-packed consignments would strangle in its infancy this promising and remunerative industry.

PART II.

THE following correspondence, relating to the experimental shipment of oranges, will be seen to fully bear out the theory of the Board as to the possibility of our supplying the British markets throughout our flush season, thereby relieving the surplus stocks and securing better returns to the growers.

The full returns, now to hand, show even a better result than the cablegrams led us to suppose, and the general statement attached hereto gives a full account of the various lots and actual results from each.

Briefly summed up, the necessary precautions to be observed to insure success are to be found in the previous notice on the subject, at page 716 of the October *Gazette*, and, as there explained, the whole of the work of grading and packing could, with care, be done in the orchard.

The fruit should be cut when fully matured and coloured, but not over-ripe, and the greatest care must be exercised in culling and grading, so that every case will contain exactly the same sized and equally coloured fruit. Two grades might with advantage be made, *i.e.*, 3-inch and 2 $\frac{3}{4}$ -inch diameters. Nothing under the latter size should be packed. Fruit in any way damaged by parasites, thorn-pricks, frost-bite, or otherwise, must be rigidly excluded, as well as any which have been in the least degree bruised. A fall of even 2 feet will render an orange quite unfit for packing.

The sweating process is also imperatively necessary to prevent damage in packing, by giving the necessary toughness and elasticity to the skin.

The

The same necessity exists for tight packing, and no injury will result from a good steady squeeze after the fruit is properly matured. A perfectly safe limit is to allow half the diameter of the top layer of fruit to project over the top of the case; then leave the case open for an hour or two, and press the lid firmly and steadily into position when nailing on. Loose packing, by allowing the fruit to shake about, is responsible for most of the damage occurring in transit.

The system of cool storage adopted in this instance solves at once the difficulty of long-distance shipping, and, as will be seen from the letters of the Agent-General and the salesmen, we have the British market practically to ourselves from August to October; so that oranges sent from here under proper conditions between the middle of June and the beginning of September are likely to meet a ready and remunerative sale.

The Board, with the sanction of the Government, hopes to have such freight arrangements made for the coming season as will allow a weekly despatch of from 2,000 to 5,000 cases, according to requirements. Orange growers should bear this in mind for next season, and notify the Board of their probable shipments in good time to allow all preparations to be made.

It is difficult to arrive at any correct estimate as to the actual returns from our orangeries, as only the fruit known to be marketed seems to have been included in our statistics. However, it may perhaps be within the mark to estimate that, from an orchard in good bearing, an average of two and a half cases per tree per annum should be obtained, and that ninety trees per acre will represent the average plantation.

Allowing twenty-five cases per acre for the extra culling required for this purpose, we have (say) 200 cases per acre fit for export. Even should the net returns equal only 5s. per case—and there is no reason why this should not be exceeded—the returns from an acre would be, in round figures, £50 sterling per annum. This estimate, which may look too good to be true, is by no means an exaggerated one, but it must be borne in mind that to attain to such returns there must be no slipshod cultivation allowed. The trees must be treated with something like generosity in the matter of cultivation and manuring, and not left, like milestones, to look after themselves after they are once planted. Insect and fungus pests must be exterminated, and the trees must be kept in vigorous health, and fed with as much care as you would feed a milch cow, which no one would expect to give a good return if left in a stall all the year round and given nothing to eat.

The northern districts, of the Colony especially, where oranges thrive like weeds, have before them a splendid future, if people would look on fruit-growing as a business, and give the same attention to it as they would bestow on any other industry.

The Government has now shown what can be done under proper conditions, and it rests with the growers themselves to take advantage of the object-lesson.

[Copy of letter from Agent-General.]

Westminster Chambers, 9, Victoria-street, Westminster, S.W.,

2 October, 1896.

Sir,

I have the honor to inform you, in reference to your letter of 17th August last, advising me of the transmission to London per s.s. "Ophir" of 1,740 cases of oranges, that the consignment duly arrived, and the oranges were sold at Monument Yard, London Bridge, on Wednesday last, the 30th ultimo.

I obtained the insertion in the newspapers of notices regarding this experimental shipment, which I placed for sale in the hands of Messrs. Keeling and Hunt, leading fruitbrokers in London, having previously had a knowledge of these gentlemen, as in 1886 they kindly furnished me with a full report of the orange trade for the information of your Government, and gave me three cases of Valencia oranges to send to the Colony as a guide to the mode of packing the fruit. The sale was considered a great success, and, as I informed you in my telegram of the 30th ultimo, realised an average price of about 14s. per case.

The fruit arrived in excellent condition, and the No. 1 grade was much approved, and considered equal to any oranges coming to this market. The letter I enclose from Messrs. Keeling and Hunt will give full particulars as to the condition of the fruit on its arrival, and their opinion with regard to the packing, &c.; and I beg to direct your special attention to their practical suggestions in this regard for future guidance.

I am pleased to say that a considerable amount of interest has been evinced in regard to this shipment. Arriving, as it did, at a time when the English market is very barely supplied with such fruit from any other country, the sale, on the whole, has been particularly satisfactory.

I have little doubt that a good market can be secured at this period of the year if the fruit offered is of good quality.

One fault of this shipment was its unevenness. Care should be taken, if possible, in large shipments, to have the fruit of the very best quality; the mixture of inferior sorts tends to lessen competition and injures the market.

I enclose for your information some of the newspaper comments which have appeared, together with fifty copies of the auction sale, giving the prices realised for each kind of orange.

I have just received from Messrs. Keeling and Hunt the account sales, which I enclose herein, showing net proceeds of £1,111 15s. 2d., for which I have their cheque, which I will pay to the credit of the public account of the Government at the London and Westminster Bank.

The Hon. the Minister for Mines and Agriculture, Sydney.

I have, &c.,

SAUL SAMUEL.

[Copy of letter from Messrs. Keeling and Hunt.]

Monument Buildings, Monument-square, London, E.C., 1 October, 1896.

The Hon. Sir Saul Samuel, K.C.M.G., C.B., Agent-General for New South Wales.

Dear Sir,

We beg to inform you that we landed the oranges ex "Ophir" in very good condition with very few exceptions.

The fruit carried in the refrigerators was fresh and full, some rather cold, with here and there a little waste.

Fifteen boxes were brought over in the hold. The five boxes marked "S. M. Cay," were fairly fresh; five marked "Parker" were rather stale, spotted, and flabby; and five marked "Pumice" were very stale, flabby, and bad. We condemn this style of packing.

Quality.—Good, especially the No. 1, which were excellent. The Nos. 2 and 3 of each mark showed very little difference. The prices realised give the best idea of our buyers' appreciation of the fruit.

Packing.—Good generally. We always recommend the use of tissue paper only, avoiding any soft shavings, sand, pumice dust, or other packing. Those that were well and firmly packed in the white paper only looked very nice when opened; any addition spoils their appearance.

Boxes are very good, allowing a free circulation of air.

Freight is very high, viz. :—4s. 1d. per box, as compared with an average of 1s. 8d., sometimes 1s. 6d. per case for Valencia oranges. These latter cases are nearly three times the size of the Australians, and weigh from 1 cwt. 1 qr. to 1 cwt. 2 qr. gross.

The voyage from Valencia occupies from nine to ten days, and the oranges are loaded in ordinary steamers as general cargo.

Time.—In our opinion, the best time for Australian oranges to come upon this market is from the beginning of August to the middle of October, when supplies from other sources are scarce.

Denia and Valencia oranges form our chief supply, commencing end of October and lasting till end of June, sometimes going into July. Last season from this district, London received 888,725 cases.*

The result of the sale of the 1,740 boxes ex "Ophir" is generally looked upon as very satisfactory.

Yours, &c.,

KEELING AND HUNT.

(F. KNOTT.)

SHIPMENT

* Equal to about 2,300,000 of our export cases.—J.S.

VI.—SMALL GOODS.

SHIPPING Regulations (Hares, Rabbits, Poultry, &c.)

Department of Mines and Agriculture, Board for Exports, 40, Young-street, Sydney, March, 1897.

THE following arrangements, having been made for the handling and shipping of hares, rabbits, &c., are published for the information of shippers. Preliminary estimates of probable numbers designed for shipment should be furnished in all cases at least three weeks prior to date of intended shipments.

Hares.

Should be trapped or snared (not shot), killed, but not gutted. Care should be taken to keep the fur clean, as blood or any other disfigurement of the skin militates against their satisfactory sale.

The carcasses, immediately on being killed, must be forwarded to the Government Export Depot by quick train, and advised by letter or wire on despatch.

The Government Expert will receive, grade, pack, and brand the cases, which will be supplied by the Board for Exports. The charge for handling, freezing, and shipping has been fixed at 2d. each, including cases. (This includes all expenses from railway station to shipboard.)

Rabbits.

Should be trapped or snared, killed, gutted, and bled; the liver and kidneys must be left in the carcass. Care should be taken to keep the fur as clean as possible; this can be attained by hanging over rails in pairs. Cases with a rail from end to end, and holding about fifteen to twenty pairs, are best for this purpose. The carcasses, immediately on being killed, must be forwarded to the Export Depot by quick train.

The Government Expert will receive, grade, pack, and brand them, the charge for handling, freezing, and shipping being 1½d. per pair, cases included. All sweated, damaged, or unsightly carcasses will be rejected, and must be immediately removed by the owner or his agent.

Poultry.

Must be young. Fowls from three to five months old, well-fed, and not under 3½ lb. each, live weight. Older birds, or those in poor condition, will be rejected by the grader.

Ducklings should be from ten weeks to five months old, weighing not under 4 lb. each, live weight. The younger birds give the better prices. White ducklings are most admired in the English market. Old birds will be rejected.

Goslings should not be over six months old, and should weigh not under 10 lb. live weight.

Turkeys.—Gobblers must not be over ten months old, and should weigh not less than 13 lb.; hens not under 9 lb. live weight. If young, the heavier the bird is the better price can be got in proportion.

All fowls must be sent alive to the Export Depot, where the Expert will receive, grade, kill, pluck, prepare, and pack them. The Board will find the cases, freeze and ship the birds at the following uniform rates, which must be paid by the owner or his agent before shipment:—

Fowls and Ducklings 6d. per pair.
Geese and Turkeys..... 1s. „

This covers all expenses except railway freight.

Game.

Any kind of game, such as black ducks, teal, quail, &c., will be received for export when in season, the Expert having the right to reject any over-shot or stale carcasses. Charges will range from 1d. each, including cases, freezing, &c. Live game will be treated as fowl.

Eggs.

In ordinary seasons these can be profitably shipped in cool storage from September to January, and will be received, graded, and packed at a uniform charge of 1½d. per dozen, cases included. Eggs for this purpose should be absolutely new laid. Any suspicious samples will be rigidly excluded.

Best time for Shipping.

Hares and Rabbits.—All the year.

Fowls and Ducklings.—December to April.

Goslings.—December to April.

Turkeys.—September to 1st November (to reach London for Christmas markets).

Eggs.—September to January.

Game.—When in season.

Quantities

Quantities.

The following are the numbers usually packed in cases for export, and shippers would do well to regulate their consignments accordingly:—

Fowls and Ducklings	20 in a crate.
Goslings'	10 "
Turkeys	8 "
Hares	20 "
Rabbits	24 "
Eggs	20 dozen in a box.

The following particulars represent present arrangements for carriage by railway. All railway charges must be paid in advance by the owner:—

Poultry will be conveyed in Railway Commissioners' coops at the following rates:—

For each small coop capable of holding about 12 pairs of fowls or ducks.		For each large coop capable of holding about 8 pairs of turkeys or geese.	
	Rate. s. d.		Rate. s. d.
Up to 50 miles.....	2 6	Up to 50 miles.....	3 2
51 to 75 "	3 6	51 to 75 "	4 5
76 to 100 "	4 6	76 to 100 "	5 8
101 to 125 "	5 0	101 to 125 "	6 4
126 to 150 "	5 6	126 to 150 "	7 0
151 to 175 "	6 0	151 to 175 "	7 8
176 to 200 "	6 6	176 to 200 "	8 4
201 to 250 "	7 0	201 to 250 "	9 0
251 to 300 "	7 6	251 to 300 "	9 9
301 to 350 "	8 0	301 to 350 "	10 5
351 to 400 "	8 6	351 to 400 "	11 8
And 6d. per coop for every additional 50 miles or part thereof.		And 8d. per coop for every additional 50 miles or part thereof.	

The through mileage distance charged when from or to Branch Line stations.

Coops not to leave Railway premises, but if permitted, and their return is delayed, a demurrage charge of 2s. 6d. per coop per day will be made when delayed over three days.

The owner or his agent must in all cases undertake the procuring of shipping documents, payment of freight and all charges before shipment, also the receiving and disposal of all rejected carcasses, which must be immediately removed from the Depôt.

The Board for Exports will not undertake shipment to any particular salesman or firm, but will furnish any desired information as to probable markets and reliable agents for the sale of produce exported under its auspices.

By order of the Board,

JAS. STEPHENSON,
Secretary.

40, Young-street, Sydney.

It may be mentioned that under the foregoing regulations, during the months of May-September, the following number of hares were destroyed:—

Actual number exported	40,560
Rejected, unfit for export	16,000
	<hr/>
	56,560

The hares were sold in London market at an average price of 2s. 6d. each, representing over £5,000 sterling, of which £1,000 goes as freight, £235 to the railways, £346 for cold store rent, case-making, &c., and the remaining £3,000 odd is distributed among trappers, buyers, exporters, and others. The balance-sheet, including returns in cash, saving on scalp-money and pasture, &c., shows a net gain to the Colony of over £5,700. The prospective shipments for next year, commencing in March, are estimated at 200,000 hares and 300,000 rabbits, representing, commercially, about £35,000, besides doing much to exterminate pests which have, in past years, cost many thousands of pounds, and which can now be dealt with at a substantial profit.

VII.—SCHEDULE OF PRIZES, ROYAL AGRICULTURAL SOCIETY'S SHOW, EASTER, 1897.

GOVERNMENT Board of Exports Prizes, £280.

(Open to all the Australasian Colonies).

Class A.—Butter for Export, £50. Best exhibit of 5 boxes of butter suitable for export.

Conditions of Competition.

- I.—Each exhibit shall consist of 5 boxes of butter, each of 56½ lb. net weight.
 - II.—No exhibitor shall compete with more than one exhibit.
 - III.—The boxes must be of the latest type of export box (see end of schedule).
 - IV.—The boxes must not bear any distinguishing brand or mark; the necessary labels may be procured on application to the secretary of the society, Sydney.
 - V.—All exhibits competing in this section must be stored in the Government Refrigerating Depôt, Sydney, on or before Wednesday, 24th February, 1897.
 - VI.—Each exhibit shall be sealed by the official in charge of the depôt, and the seals shall be broken by the judges at the time and place of judging. In all other particulars the exhibits shall be subject to the by-laws and regulations of the Society's exhibition.
- Entries close 20th February, 1897.

Class B.—Poultry for Export. First prize, £10; second prize, £5. Best exhibit of 2 cases each ducks and fowls suitable for export (20 birds in each case), packed for export.

Conditions of Competition.

The birds must be killed, dressed, wrapped and packed, and must be stored in the Government Refrigerating Depôt on or before Wednesday, 24th February, 1897.
Particulars as to dimensions, &c., of cases may be had on application to the secretary.
Entries close 20th February, 1897.

SHEEP

SHEEP FOR EXPORT.

- Class C.—First prize, £20; second prize, £5. Best exhibit of 25 Merino Wethers, not exceeding 6-tooth.
 Class D.—First prize, £20; second prize, £5. Best exhibit of 25 Cross-bred Wethers, not exceeding 4-tooth.
 Class E.—First prize, £15; second prize, £5. Best exhibit of 25 Merino Lambs (suckers), not exceeding 5 months.
 Class F.—First prize, £15; second prize, £5. Best exhibit of 25 Cross-bred Lambs (suckers), not exceeding 4 months.

Conditions of Competition.

- I.—All exhibits in this section must be the bonâ-fide property of exhibitor at time of show, and for twelve month previously in case of sheep. Lambs must be bred by exhibitor.
 II.—No exhibitor shall compete with more than one exhibit in each class.
 III.—The sheep shall be judged alive by points, and on the third day of show slaughtered and judged in carcase (two sheep from each pen shall be slaughtered on second day of show and exhibited in pen).
 IV.—The exhibit getting the highest aggregate number of points to be declared the winner.
 V.—The judges shall take into consideration the quality and weight of carcase best suited for export; but in the case of a tie, then the value of skin and fat shall be taken to decide the tie.
 VI.—In case of absolute equality then the preference to be given to the youngest sheep.
 VII.—Evenness of quality and weight shall be considered in awarding the prizes, the range suggested being as follows:—
 For Merinos—52 lb. to 58 lb.; average 54 lb.
 or small do —47 lb. to 52 lb.; „ 49 lb.
 Crossbreds—55 lb. to 65 lb.; „ 58 lb.
 Net freezing weight.
 VIII.—Exhibitors shall declare on entry form that the sheep have been grass-fed.
 IX.—All exhibits considered fit for export shall be killed, frozen, and shipped to London, under the supervision of an expert appointed by the Board for Exports, and there sold by public auction, and reported on by qualified experts. The net proceeds of sale, after deducting expenses, to be the property of the exhibitor.
 Entries close 15th March, 1897.

WHEAT FOR EXPORT.

- Class G.—First prize, £15; second prize, £10. Best exhibit of wheat, 4-bushel sack, representing a bulk of not less than 100 sacks, suitable for export. Grower to sell 100 sacks equal to exhibit by public auction during show if called on to do so by written notice, delivered through the secretary, and failing to supply such quantity of equal sample, to forfeit any prize which may have been awarded.
 Entries close 15th March, 1897.

BARLEY.

- Class H.—First prize, £15; second prize, £10. Best exhibit of barley, suitable for malting, 4-bushel sack, representing a bulk of not less than 50 sacks, suitable for export. (Conditions same as those for wheat.)
 Entries close 15th March, 1897.

BACON AND HAMS FOR EXPORT.

- Class J.—First prize, £10; second prize, £5. Best exhibit of 20 hams and 12 sides of bacon, suitable for export.

Conditions of Competition.

- I.—The hams to be cured, smoked, wrapped, and packed in suitable case for export. Bacon to be green, cured, and packed in suitable case for export (see end of schedule).
 II.—All exhibits to be stored at even temperature, under direction of the Board of Exports, on or before the 24th day of February, 1897. Cases to be sealed by the official in charge of the depôt.
 Entries close 20th February, 1897.

MEATS AND SOUPS FOR EXPORT.

- Class K.—First prize, £10; second prize, £5. Best exhibit of 6 dozen tins colonial meats and Soups, suitable for export, assorted.
 Entries close 15th March, 1897.

FRUIT FOR EXPORT.

- Class L.—Dried Fruits. First prize, £10; second prize, £5. Best exhibit of not less than 10 distinct varieties of dried fruits suitable for export, packed in cases of not less than 28 lbs. each.
 Class M.—Preserved Fruits. First prize, £10; second prize, £5. Best exhibit of not less than 24 varieties preserved fruits (in syrup), suitable for export, packed in glass jars of not less than two quarts capacity each.
 Entries close 15th March, 1897.
 Class N.—Rabbits and Hares for export. First prize, £10; second prize, £5. (For New South Wales produce only). Best exhibit of 24 rabbits and 20 hares, packed for export.

Conditions of Competition.

- The animals must be packed in proper export cases (see end of schedule), particulars of which may be obtained from the secretary, and lodged in the Government Refrigerating Depôt on or before Wednesday, 24th February, 1897. To be placed under seal by the official in charge of the depôt.
 Entries close 20th February, 1897.

NOTE.—In all the foregoing classes no prizes are to be awarded to exhibits which are not, in the opinion of the Judges, suitable for export, as fairly representing what the Colony can produce.

All exhibits of butter, poultry, hares and rabbits, shall be sold by public auction during the show, and the proceeds, after deducting expenses, handed to exhibitor.

VIII.—WINES.

THE WINE INDUSTRY.

(C. F. Lindeman.)

I HAVE now the honor to submit my report dealing with the Wine Industry, and in view of the approaching planting season to suggest that the question be dealt with by the Board, and that a resolution embodying the suggestions therein contained be forwarded to the Honorable the Minister, together with a request that the same may be laid before his colleagues at an early date for approval.
 I have, &c.,
 C. F. LINDEMAN.

First Report, submitted to the Board for Exports, February, 1896.

As a member of the Board for Exports, I have visited South Australia and Victoria with a view to, if possible, further the interests of the wine-producing industry in New South Wales, and my experience is that wherever the State has attempted to directly assist the industry it has been a lamentable failure.

The Victorian Government, some few years ago, in order to stimulate viticulture, offered £2 per acre for all vines that should be planted after a certain date, and the consequence was that people rushed blindfold into the planting of vines, using inferior stocks and indiscriminately planting on any sort of soil, the result being an overproduction of inferior wines unsaleable at any price. The Government now propose, in order to get rid of surplus stocks, to give 3d. per gallon on all wines exported.

This

This will not benefit the grower, as he will get no better price for his wine, but the large shipping merchants will receive any benefit accruing; it may indirectly stimulate trade a little by increasing sales. The shipper—two wines from different colonies being equal—would prefer buying in Victoria in order to get the bonus, but I do not see that it will do much good, as only inferior wines are held, and these cannot be disposed of except for distilling.

Local Central Stores have been advised, but the scheme would be hard to work, as there would be so many different interests; and, unless the Government were to buy outright (a form of State Socialism I do not approve) and blend to make a standard wine, the complications arising would be too many, at all events in the present state of the wine industry of this Colony; we are not yet ripe for it, as we have not over-produced—there are no old stocks of good wines in New South Wales, except in the hands of a very few, who want every drop they have for local consumption.

I cannot too strongly urge upon our Government the necessity of our distillation laws being altered. If they would give encouragement to the production of good spirit, by reducing the excise on all spirit made in the Colony, the people of New South Wales would, in a short time, be supplied with a good, wholesome, *pure* spirit; it is in this direction they can assist the wine industry at the present stage better than any other, as all unsaleable stocks could immediately be turned into the best of brandy, and people who do not now care to plant vineyards on account of the danger of making inferior wines in bad seasons would see that a profit could be made even in these years by distilling their produce, while in good seasons the wines could be sold to the merchant for maturing.

It is a daily occurrence to see publicans brought into the Police Courts for selling spirit which is not only unwholesome but absolutely poisonous. Vine-growers cannot compete on even terms with these poisons, made of no one knows what; but were a moderate excise charged there would soon be a different tale to tell in the increase of the area under vines and the health of the people generally.

Subjoined is a practical letter from Mr. T. Hardy, of Adelaide, bearing on the subject:—

Exchange, Sydney.

I remain, &c.,
C. F. LINDEMAN.

Adelaide, 20 January, 1896.

Dear Sir,

You ask my opinion on the question of what the Government of New South Wales can do to further the wine-growing industry in your Colony.

The success of the experiment by the South Australian Government establishing a *depôt* for wine in London is not yet assured, and cannot therefore be recommended.

The proposal for a national wine cellar in Melbourne appears feasible, but the difficulty would be in carrying it out. If each small grower's wine has to be kept separate and shipped away, it will only increase the present difficulty of placing on the English market a uniform quality of wine in large quantities from year to year. No doubt the wine could be much better cared for than by many of the growers themselves, and if merchants could be allowed to purchase and blend in the cellar it may answer; but if the small lots of different growers are blended by the Government, trouble would arise, as some would say that their good wine would be used to bring up the quality of inferior lots, and it would be nearly impossible to make up blends of uniform quality, as the material to work on would be uncertain, both in quantity and quality, from year to year.

The plan adopted by the Victorian Government of stimulating planting by giving bonuses of so much per acre has proved to be most disastrous to many, and is most unfair to those who planted before the bonus system came into operation, and the effect has been to greatly increase production before an assured market is found for the produce; and now further assistance is urgently demanded.

The proposal to give a bonus of 3d. per gallon on wine exported would benefit the large shippers, but be of very little good to the small grower.

What is wanted here—and no doubt with you, in a less degree—is an outlet for inferior wines. It will not pay to send them to England, and they are not saleable in the Colonies. Our working-men would not look at the poor wines used by the same class in wine-growing countries. A bonus of 1s. 3d. per gallon proof on all brandy exported would do far more good than a bonus on wine.

Another help to your producers would be a differential excise duty on all brandy made in New South Wales, similar to what we have in South Australia, that is, 9s. on our manufacture, against 14s. on the imported. This would, in time, give an opening for the colonial-made brandy to successfully compete with the imported.

Greater facilities should also be given to the makers of sweet wines to obtain spirit made in the Colony, free of duty, for fortifying—a privilege we have always had in South Australia, on payment of a fee of 6d. per gallon proof,—which is levied to pay for the attendance of officers to see the spirit used.

The distillation laws of South Australia have always been fairly liberal and carried out in a way to give as little trouble to the winemaker as possible. We pay £50 per annum for a distiller's license which enables the distiller to use any material and to sell in any quantity. A winemaker's distillery license costs £5 per annum, and under it a winemaker can distil his own lees and inferior wine, or can take his neighbour's, but he must use it fortifying his wine, and if he has any surplus he can sell it in one lot once a year, which very few ever require to do; they can also purchase spirit and use for fortifying.

A great help to growers, both large and small ones, would be a thoroughly competent man to visit the vineyards and cellars and advise on the best methods of winemaking, and point out any defects in practice, and there is plenty of room for the latter. Great carelessness in the management of casks and vats, want of cleanliness generally, allowing grape-skins to lie about the cellars, and overheating in fermentation are the causes of much bad wine being made, and until these defects are remedied merchants will not risk the chances of buying the wines of small growers, because one lot of badly made wine, the fault of which may not be detected at the time, may injure a large blend later on and cause great loss to the merchant.

C. Lindeman, Esq.

THOS. HARDY.

Copy of Letter to The Hon. the Premier, April, 1896.

The Hon. G. H. Reid,—As you are aware I was appointed to the Board for Exports solely in the interest of the wine industry, and in order to help the Board in its deliberations on this question, I visited the neighbouring colonies—Victoria and South Australia. In both these colonies they have far outstripped us in the area they have under vines. There is no doubt they have over-produced for their local consumption, and have to find an outlet for their surplus in some shape, and it is my opinion that the greater portion of their wines will have to be turned into brandy and exported or consumed in that form, as, certainly, thousands of gallons are not fit to be sold as wine, and to endeavour to make a trade in London with immature, badly-fermented stuff, that in many cases has been shipped, will only give Australian wine an unenviable reputation; but if these inferior wines were converted into grape spirit, and shipped under Government guarantee as being pure, unsophisticated natural grape brandy, a large export trade would result, and spirit when once made does not deteriorate. Wine is different; it may be chemically tested in Australia, and pass as pure wine, but if not properly fermented and matured, may, *en route*, undergo a secondary fermentation, and arrive at its destination in bad condition and quite unsaleable. I don't mean for one minute to say that there is not a trade to be done in England if good, well-matured, and well-fermented wine were sent; but I am afraid the greater bulk that has been shipped has been immature, and already Australia, from what I can learn, has a name for crude, coarse, and consequently cheap wines. It will be an uphill fight to get Australian wine introduced into the upper circles, even if the very best wines were now sent.

Whenever the Government have attempted to directly assist the wine industry by the bonus system, it has, I think, resulted in complete failure. The Victorian Government some time back offered £2 per acre bonus for all new vineyards planted. The consequence was inexperienced people rushed in blindfold and planted indiscriminately, both as to the quality of the vine and soil, the result being over-production of inferior wine, quite unsaleable in the local or home markets. The Victorian Government now propose to give 3d. per gallon bonus for all wines exported. This, again, can lead to no good, as it will be an incentive (unless under very stringent supervision) for people to ship young, inferior wines, in order to get the bonus. It would be far better to offer a bonus on all brandy exported, as pure, natural, grape brandy would improve by age, whereas a wine badly fermented would only deteriorate.

There is no doubt that the wine industry in this colony can be materially assisted by having our Distillation Act amended, and allowing a concession in the excise on all pure spirit made in the colony. People would at once go in for planting more vines, especially in the prolific soils of the Hunter and northern rivers. They are deterred from doing so now, as in wet years their crops are utterly lost or else sold to such men as lately appeared in the police court for selling

selling poison under the name of Australian wine, and rightly fined £30, although that sum was, in my opinion, quite inadequate to the enormity of the offence. I say emphatically that anyone convicted of selling decoctions under the name of Australian wine should have their whole stock confiscated and be debarred from ever selling wines again.

We should watch with jealous care, at all events, the purity of Australian wine. It will be seen by the analysis that this so-called wine contained 25 per cent. of grape juice, the balance being made up with white spirit and chemicals. How far better if the grower could depend upon getting a fair price for his inferior wines from a good distillery company. It would not pay to convert these inferior wines into brandy under the present Act, as it has to compete on even terms with the poisons that are now introduced into the colony and sold under the name of spirit. Our capitalists will not go in for large distilleries, depending solely on the export trade; but, had we a moderate excise, we could in a few years' time supply a portion of our own demand, and if a surplus were created, we could assuredly find an outside market for it. I had a long conversation with a Mr. Muir this week. He is Commissioner-General for Canada, Montreal Exposition, and he tells me that the consumption of Australian brandy in Canada is increasing at a marvellous rate, and says he would be quite content to leave everything else alone if he could get an agency for good Australian brandy, he being so satisfied of its future. Herewith I beg to hand you his letter upon the subject.

The convictions in the last year for selling poisons under the name of spirits have been numerous, and respectable publicans have sworn most positively that these poisons were supplied to them by their wine and spirit merchants. Someone, at all events, must import these decoctions designated as poisons by our Government Analytical Chemist, and valued by him at, I think, 2d. per bottle. Had we a moderate excise there would be no incentive for the merchant to import these decoctions, but by giving a fair price for good, pure local spirit, he could afford to sell to the publican at the same price that he now sells poisons. I feel sure, were our Distillation Act altered to the same as they have in South Australia, namely, 9s. excise, it would be the means of settling hundreds of families on the land. People are constantly coming and writing to me about planting vineyards, and I tell them that under present circumstances I would not advise my worst enemy to plant vines; but, could we get our Distillation Act altered, I myself would plant all the suitable soil at Cawarra with vines, and I am sure others would follow suit. I feel certain that the area under vines would double in the next three to five years, and, were our Agricultural Department to appoint an expert simultaneously with the alteration of the Distilleries Act, who could advise as to the soils and kind of vines most suitable, we would evade the errors made both in South Australia and Victoria, viz., that of planting inferior varieties of vines and choosing unsuitable soils. It is interesting to see how the Act has worked in Victoria and South Australia. The former colony in 1895 produced 306,000 gallons of spirit, South Australia 147,093, against New South Wales' 6,000.

Trusting you will give this matter your earnest consideration, as I feel confident that it will be the means of stimulating a most important industry.—I am, yours faithfully,

March 2nd, 1896.

C. F. LINDEMAN.

P.S.—In 1895, 1,017,749 gallons of spirits were imported into New South Wales.

Exchange Cellars, Sydney, February 12, 1896.

Mr. H. J. Lindeman, Sydney, N.S.W.,—

Dear Sir,—

I take pleasure in stating that the sale of Australian brandy in Canada is very large, and is increasing, especially in the provinces of Quebec, Ontario, and Nova-Scotia.

Australian brandy has only been introduced into Canada some eighteen months, and has become a very popular drink,—Yours truly,

(Signed) J. SKEE-MUIR,

Commissioner-General for Canada, Montreal Exposition, 1896.

In view of the above facts, and with the concurrence of all those interested, I beg to propose that this Board pass a resolution asking the Government to reduce the excise on spirit made from grapes grown in the Colony of New South Wales from 14s. to 9s. per proof gallon, feeling sure that were this concession made that many acres would be planted with vines that are now lying idle, which would give employment to many families. Farmers and vinegrowers will not, under the present law, plant or increase their vineyards, as in bad years their labours are entirely lost as they cannot profitably convert their grape-juice or waste products into brandy and compete with the chemical compounds now introduced into the Colony under the name of German Spirit, which is sold at about 2s. per gallon in bond. If this concession were made, I feel sure that the vine-growing industry would receive an impetus unknown in the history of the Colony, the health of the people would benefit, and there would not be such an incentive for illicit distillation, and in time the vineyards would so increase that sufficient good wine would be grown to do a large export trade, whereas at present there is barely sufficient to supply our own local market.

IX.—TIMBER.

EXPORT OF NEW SOUTH WALES TIMBERS.

(By the Hon. A. Kethel, M.L.C.)

To the Board for Exports,—

At the request of the Board, the Secretary summoned a conference of the Saw-millers and Timber Merchants of Sydney and the coastal districts of the Colony, to consider in what manner the Board could best promote and encourage the export of our indigenous timbers, and assist those engaged in the production and distribution of the same.

The Conference met at the Board-room of the Colonial Secretary's office on 3rd January, 1896, and was attended by representatives from nineteen firms engaged in the saw-milling business, and also by Mr. De Coque, timber surveyor and expert to the Department of Works. The Vice-Chairman and Secretary to the Board for Exports were also in attendance.

The proceedings were commenced by the reading of a paper on the "Export of Hardwood Timbers of New South Wales" by Mr. De Coque.

The Conference then proceeded to discuss the various matters relating to the trade, and recorded their opinions thereon by unanimously passing the following resolutions:—

1. That this Conference respectfully recommends the Honorable the Premier and Colonial Treasurer to appoint an expert officer to inspect, classify, grade, and, if desired, measure all timbers intended for export; such officer to be selected by the Board for Exports.
2. This Conference suggests that the Board for Exports shall, when requested, use all possible means to obtain cheap and convenient freight for the export of timber.
3. This Conference recommends that the Board for Exports should endeavour to get an expert appointed in London to promote the interests of the export trade in native timbers and their extended use in the manufacturing industries of Great Britain.
4. That the Government be recommended to establish a small depôt in London for the exhibition of New South Wales timbers and extending a greater knowledge of their various qualities.

These resolutions were formally presented to the Board by the Chairman of the Conference, Mr. W. Langley, attended by Messrs. Clarke and Scott, two members of the Conference. The Chairman in presenting the report and resolutions, made, *inter alia*, the following remarks:—"I feel certain that if your Board can put into force the resolutions presented by us to-day, the expenditure incurred in doing so will so much facilitate our timbers being placed on the markets of the world that you will never regret having recommended the same."

The Conference were unanimous in declaring their willingness to pay a small fee for the services of the timber expert, when required, for inspecting, grading, and branding. On receiving this report the Board considered that it would be desirable to ascertain what was being done in the other colonies to encourage and assist in the export of hardwoods before making

making any recommendations to the Government in the matter, and accordingly instructed me, with the approval of the Honorable the Premier, to proceed to Victoria and Tasmania and inquire into the conditions under which the export timber trade was being conducted in those colonies.

In accordance with that resolution I left Sydney on February 5th, 1896, for Melbourne, and from thence, *via* Launceston, to Hobart, returning after a few days by the same route to Melbourne. I made extensive inquiries in both colonies, as well in the several Government departments as among the saw-millers and local traders and exporters in Hobart and Melbourne, especially as to the amount and value of the assistance given by the Governments to those engaged in the export timber trade, and I found that the Government of Tasmania, some time since, recognising the necessity for encouraging the saw-millers in the export of their timbers to Europe, decided to assist them by guaranteeing to the ship due payment of the freight; they also made the shippers a cash advance on account of the cargo, repayment of same to be a first charge on the proceeds of the sale of timber. This was done, the timber was landed in London and sold under Government supervision, freight and advances reimbursed, and the net balance of proceeds handed to the shippers, the whole transaction being satisfactory and profitable to all concerned. "All the timber was inspected, graded, and branded previous to shipment."

In course of time another Government came into power. The new Ministry reversed the policy of their predecessors, withdrew all promise of support to the timber trade, and declined to assist producers in any way whatever.

The system now in existence in Hobart is this: the Government appoint an expert at £240 per annum to inspect, grade, and brand all timber entered for export, but his salary is paid by the associated timber merchants of Hobart.

The timber merchants of Tasmania were unanimous in the opinion that the presence of a timber expert in London would greatly promote and extend the use of Australian timbers in Great Britain, and that all timber intended for shipment to Europe should be inspected prior to shipment and receive the Government brand.

The Melbourne timber people also concurred in this opinion.

Victoria has a very limited quantity of hardwood suitable for export; the small parcels hitherto shipped have not been sufficient to justify the appointment of an inspector, but have been inspected and branded by the Conservator of Forests, who issues a certificate in triplicate.

In view of these facts and the information gathered by me, and of the result of my own experience, I recommend the Board to comply with the resolutions of the Timber Merchants' Conference of January, 1896, and that the Government be requested to appoint an expert in Australian timbers to inspect, measure, brand, and certify to the description, size, and quality of all indigenous timbers intended for export, at a salary of not less than £200 per annum, and that a scale of fees be charged to the shipper of said timber for the services of such expert.

It is anticipated that during the present year of 1896 there will be not less than 4,000,000 feet of timber exported from New South Wales to Europe, and a charge of 1s. per 1,000 feet for inspection and branding would pay the salary of an expert inspector, so that the Government would not be anything out of pocket.

As to the 2nd resolution of the Conference, *re* the matter of freight, the Board, with the approval of the Government, will certainly be ready and willing to render all possible assistance whenever requested to do so.

With regard to the 3rd and 4th resolutions of the Conference, recommending the appointment of a timber expert agent in London to push the use of our timbers in the industries of Britain, and supply all needful information concerning the same; and the establishment of a sample depôt—such arrangement would, in my opinion, be productive of excellent results.

Every mail brings letters of inquiry from Europe or America, asking for information as to the nature, qualities, and description of our native timbers, and the uses for which they are suitable. The establishment of a depôt in London in charge of an intelligent man, thoroughly conversant with our native timbers, would facilitate the supply of all information required, and where necessary provide for the distribution of samples of the different timbers, for the purpose of giving practical tests of their suitability for many of the manufacturing industries of Europe.

As this would be a tentative or experimental proceeding, the appointment may be made for one year; the value of the experiment could then be judged by its results.

After careful consideration of the whole matter I would ask the Board for Exports to submit these proposals to the ministerial head of the Department of Agriculture, recommending the carrying into effect the recommendations of the Saw-millers' Conference.

A. KETHEL.

X.—MEAT.

MEAT EXPORT TRADE.

(By John Wildridge.)

A FULL report on the export of meats would entail more time than I could spare, or you afford for consideration. I will, therefore, with your permission, only deal with the matter in the way of most interest to us as an Export Board, in anticipation of recommendations from the Conference of Meat Exporters, and after which we may be able to advise the Government how the industry could be best assisted. At present we have to deal with the article frozen and preserved in tins, but hope that ere long the export of chilled meat will be prominently to the front. Since the first trial shipment of frozen mutton left Sydney, up to the end of 1895, the progress has been indifferent as compared with New Zealand.

The yearly totals of frozen meat exported from the Colony of New South Wales during the last seven years being as follows, taking weight per carcase of mutton at 45 lb. :—

	cwt.	Sheep.		cwt.	Sheep.
1889	37,868	=	94,249	1893.....	220,584 = 549,009
1890	72,304	=	179,956	1894.....	329,404 = 844,738
1891	105,013	=	261,365	1895*	455,674 = 1,134,122
1892	223,074	=	555,206		

* Also, 152,144 cwt. beef.

This last year a marked improvement has taken place, and in comparison with the years before, the results are such that if we can only add a small margin of profit to the grower, New South Wales should at an early date head the export countries for mutton, and there is no reason why beef should not also maintain a good place.

Without dealing with the quality now exported, there are other important points which can well be discussed as bearing on the export trade :—

- 1st. Competition with other countries.
- 2nd. Freight charges and regular shipments.
- 3rd. Cold storage in London or elsewhere, and distribution.

Our greatest competitor, so far as flocks are concerned, is the Argentine Republic with 81,500,000 sheep, as against 57,000,000 in this Colony; and, as showing how the exporters from that country are awakening to the possibilities of more serious competition, we have lately had information that they will reduce their sale prices and open retail establishments all over Great Britain. This we may fully expect, and with our mutton selling, as at present, for 2½d. per lb. in London, under existing charges it would be impossible for us to compete against them successfully; and the freezing establishments now in existence here would find they have works but no mutton to freeze, as graziers would have more profit out of boiling down for tallow only. The freezing companies have already reduced their charges from ¾d. to ½d., and lately have instituted a further reduction by including the chilling works charges in their ¾d. With an increased business they may be able to reduce another ¼d., or ½d. per lb. for receiving, freezing, bagging, and delivery—only double the London charges for receiving and storing for four weeks. When we consider that freezing costs three times as much as storing, you will readily recognise that operations here are economically carried on, requiring close supervision to leave a margin of profit. That other charges will have to be modified to meet the demand for reduced consolidated charges is apparent, the principal item being that of freight, both in railway haulage and steamer.

Railway

Railway haulage for a distance of 350 miles costs 202d., or slightly under ½d. per lb., and the average steamer freight is ¼d. per lb. Double our present export, and, like the freezing works, the Railway Commissioners should be able to lower their charges (say) an ¼d., and the steamers an ¼d., as, in the latter case, owners will not require to go seeking for cargoes. The saving of time, port dues, and coal would make up the difference in present rates.

London charges are composed of—1st. Storage charges average ¾d. 2nd. Agency charges average ½d. full, or total, 28.

The first appears excessive as compared with our freezing rates here for the accommodation provided, as the stores are frequently blocked and the frozen meat has to be sacrificed. To meet this I would suggest that the Government of this Colony erect cold storage premises in London of a capacity equal to holding 500,000 carcasses of mutton. The cost of such a work would be about £120,000, including buildings, machinery, and land, and the working expenses, including interest on capital and depreciation, would be about £23,600 per annum. At a charge of one-half present London rates, or ¼d. per lb., on an export of 3,000,000 sheep per annum, the Government would have a revenue of £35,000. (See calculations attached.)

We cannot very well deal with the agencies for the selling of the meat, but with a combination on the part of exporters, these charges should without doubt also be considerably reduced. On the basis of an export of 3,000,000 sheep per annum charges should be:

1st. Killing, Chilling, Freezing, and delivery	312
2nd. Railway haulage	125
3rd. Freight	687
4th. Insurance	070
5th. Storage	032
6th. Agency sales	125
7th. Cost of mutton (for merinos)	750
	2101
For cross-breds 50 per cent. more, or	2476

This would place us in a position to compete against any other countries. The foregoing would be about the lowest price obtainable in London, and would ensure a small profit to all concerned. With higher prices it is possible that the several contracting parties should also receive a *pro rata* benefit. My suggestions would be, therefore, as follows:—

- 1st. Assist the export from this Colony to an output of not less than 3,000,000 sheep per annum, or the equivalent, including beef. Arrange for grading and supervision of shipments.
- 2nd. Reduction of railway haulage and freezing charges.
- 3rd. Arrange shipping to sail from this port at regular intervals, *via* Australian ports only.
- 4th. Erection of cold storage in London.

In the foregoing suggestions there are no insuperable difficulties, and indeed if we do not adopt some such ideas, we will find other colonies ahead of us, notably Queensland, as my firm is in possession of information that the latter intends proceeding somewhat on the foregoing lines.

It may not be out of place to remark that the system of refrigeration on board steamers is not all which is required. Allowing that we take every care in the manipulation of the dead meat before being put on board ship, the machines on the steamers are not all suitable for other requirements. The principle of the compressed air machines being such as to require a large amount of hydro-carbon oils being injected into the compressing cylinders to keep them working smoothly, this oil is volatilised and passed over into the holds and distributed with the cold air: frozen meat will not suffer much on this account; but for butter, cheese, or fruit the subject is one which in a contract made by the Government should receive careful consideration. With the view of inducing shipowners and those likely to cater for the carrying of our produce, regulations should be adopted which would require steamers to be fitted with refrigerating machinery capable of dealing satisfactorily with the several products to be carried.

Chilled meat in place of frozen will shortly without doubt prove a step in advance of the frozen by enhancing values in London, and will compete directly with the American. In this direction my firm has been making a series of experiments in conjunction with one of our large shippers, at considerable expense, how long meat will actually keep in good condition, with the result that we have sent chilled meat from here to Queensland carried as ordinary goods in the guard's van during the present exceptional hot weather after fifty-five days hanging, and then eaten with relish, being both sound and sweet. This would be a sufficient assurance that it could also be delivered on the London market, but as it will take more space on board ship, more care in transit, and special arrangements for automatically regulating the temperature not to vary more than 1 degree during the whole voyage, the cost of a trial shipment by a single company would be considerable, but, as it would be to the benefit of all, probably the Government might consider such a shipment as a national one, and be at the expense of same, excluding cost of meat. I append copy of letter received from Mr. R. Ferguson, expert surveyor to Queensland Government, in reference to chilled meat.

To fully realise all the profits which should accrue in the exportation of meats, greater enterprise, and a thorough knowledge of every means which can be adopted in the preserving of meats by tinning, and the treatment of by-products, &c., as is carried out in America, would prove of immense value. This comprehensive information would take months of close study, close inspection of the several processes to be undergone, and a thorough knowledge of the many mechanical applications used in reducing to healthful and profitable products, what are to us at present sanitary nuisances, and no better opportunity could offer for the Government to assist in this development than in connection with any proposed new abattoirs. Although we have already in existence the following inland chilling works:—Bourke, Nyngan, Dubbo, Forbes, Carrathool, Narrandera, Young, Narrabri, Gunnedah, Werris Creek, and Tenterfield, also Deniliquin and Aberdeen Freezing Works—a local slaughtering establishment we may deem as indispensable, and where, as already mentioned, a complete plant to deal with all by-products would not only prove a profitable investment, but could also be the ensample necessary for the inland works, which at present cannot afford to experiment.

In conclusion, I would add, the foregoing is only a brief summary of this very important business, one in which my firm has taken a very deep interest, and hope to see it second only to that of wool, while the two scientifically combined would materially enhance our land values and open resources in which our surplus labour could be profitably employed.

Yours obediently,

JOHN WILDRIDGE.

Messrs. J. Wildridge and Sinclair, Consulting Engineers, Sydney,—Brisbane, 30th December, 1895.

Dear Sirs,

The piece of chilled meat kindly forwarded to me by mail came to hand on the night of the 23rd instant, in splendid condition, and was of prime quality when eaten at my table on Christmas Day, the marbled undercut being generally appreciated.

I have been agreeably surprised at the sound condition of the meat upon arrival at Brisbane, temperature and weather being considered, but more so on its keeping sound after being cooked up to date, as I had some of it for breakfast this morning, enjoying it very much.

I thank you very sincerely for sending me this Christmas treat, as beyond the actual enjoyment of eating it, the test of carrying chilled meat for such a distance, exposed to atmospheric influences at this season of the year, is most interesting.

I am, yours sincerely,

(Signed)

ROBT. FERGUSON.

COST OF INSULATED CHAMBERS.

XI.—REPORT SENT IN ANSWER TO AN INQUIRY FROM THE HON. THE SECRETARY OF STATE FOR THE COLONIES, 1896.

NEGLECTED EXPORTS.

SECRETARY'S REPORT.

WITH reference to a communication from the Hon. the Agent-General touching the possibilities of extended trade between the colonies and the United Kingdom, I have the honor to submit the following particulars, which may be of some use in determining the nature of despatch necessary to cover returns of our leading products.

I have confined my remarks to general terms, as any necessary statistics can be submitted in the returns called for.

Some of the principal products which this Colony can now or will in the immediate future be able to produce, and which have not yet found sufficiently satisfactory markets in the United Kingdom, are the following:—

GROUP I.—Pastoral Products.

Wool.—In those it may be asserted that we have taken premier position as far as wool is concerned, and probably at the present stage any interference, even in the direction of improving the position of the industry in the United Kingdom, would be more likely to be resented than appreciated by the pastoralists, who certainly deserve credit for the earnest zeal which has overcome so many difficulties, and placed our wool trade in such an enviable position.

Pastoral By-products.—Wool production cannot, therefore, be classed among our neglected industries; but such by-products as hides, skins, bones, horns, hoofs, tallow, lard, &c., of which we are large exporters, might well repay some additional amount of attention being called to them.

GROUP II.—Dairy Products.

Although we have already had a fair amount of success in placing our dairy produce on the markets of the United Kingdom, much remains to be done to popularise them, especially in the provinces. Up to the present the London market has almost monopolised our output, and although a fair market has always been found there, the necessity of getting into closer touch with the multitude of consumers in such centres as Manchester, Glasgow, Liverpool, &c., is every day more apparent. That we are destined to take a large part in this class of trade seems inevitable, and it is considered necessary to make some decided move during the coming season, so as to keep well to the front in securing a share of the markets.

Butter.—Our butter at present compares favourably with that of Denmark, and the rapid adoption of the latest and most approved appliances, together with the excellence of our stocks and pastures, and the fact that our flush season meets the scarce supply of winter in Britain, fully justify active measures being taken to secure a premier position throughout the United Kingdom.

Cheese.—Of cheese we have exported but little, although there is a prospect of greatly increased supplies soon, especially as the scientific methods of the present day are gradually replacing the admittedly indifferent systems of the past.

Condensed Milk.—Several schemes for utilising a portion of our skimmed milk by condensation are being tried, and there is some hope that we will soon be able to supply a superior article of food from this source.

GROUP

GROUP III.—Meat.

The trade in this product is but in its vigorous infancy, although for years past capital and energy have gained for us a foothold in the markets of Britain. There is almost unlimited scope for the Colony's surplus supplies, notwithstanding the competition of America, North and South, and other nations.

One of the essentials of success lies in our meat being fairly represented on the market, and this, it is to be feared, is not always done. It is an undoubted fact that many interested butchers are in the habit of selling our primest meats as native reared, and ticketing only the culls as "New South Wales," or "Australian," much to the prejudice of our suppliers. Canada and America have already gone directly into the British market, and it is quite evident that we must adopt similar means of selling our best stocks if we wish to avoid having our name discredited with the consumers.

Live Cattle.—Although our supplies of horned cattle are considerably below those of Queensland, we have still a substantial margin to export, and although experiments in shipping cattle alive must be admitted a partial failure, so far as it has gone, we should have no difficulty in finding ready sale for larger quantities of beef, chilled or frozen, than we are at present sending.

Beef.—Any action, therefore, which would place fairly before the consumers the excellent quality of our beef, must have a decided effect in increasing this important trade.

Mutton.—In mutton we have made substantial progress, but there is scope for large improvement, especially in the direction of providing efficient inspection of cargoes at port of discharge and supervision of the methods of handling, care during transit, and other matters which may affect the quality or appearance of the carcases.

The complaint of misrepresenting our mutton as Scotch, Welsh, &c., is frequent, and prevents the consumer appreciating the best qualities of our meat. This, in justice to the Colony, should be stopped, even if it can only be done by branding the meat before shipment or coming on the market as retailers.

Pork, Bacon, &c.—Very little has been attempted in the export of pork, either fresh or as hams and bacon, but with the rapidly increasing number of our dairy herds and the large quantities of milk, &c., available for pig feed, besides the cheapness of other classes of food and the suitability of our climate, there must soon be a surplus for other markets. Meantime we consume more than we produce.

Preserved Meats, Soups, &c.—In the packing and preparation of preserved meats, soups, &c., a considerable amount of intelligent energy has of late been displayed, and there can be no doubt that, with a proper system of placing these before the consumers, a large share of business would come to the Colony which at present, on account of inadequate representation, goes elsewhere.

The quality of these meats, soups, and extracts is quite up to the highest standard of excellence, and simply needs to be made better known; much good to the Colony would result.

GROUP IV.—Small Goods.

Poultry, Rabbits, Game, Eggs, Fish, &c.—These, which may be classed generally as "small goods," have, up to the present, hardly passed the experimental stage of exporting, but an intelligent amount of interest is now being drawn to them, with the probable result that in future seasons we will become large exporters. At this stage it is unnecessary to particularise these products, but there is no doubt that an active campaign among British consumers would soon lead to extensive arrangements being made for shipments. The success of the adjoining colonies will no doubt be a further incentive to our producers.

GROUP V.—Cereals, &c.

As yet this Colony has not made any figure as an exporter of grain, and the production of cereal crops has been subordinated to the staple product, wool. There are evidences, however, that agriculture will in the near future, when closer settlement and increasing population warrant its extension, occupy a large place in the economy of the Colony, and become a feature to be reckoned with in our list of exports.

Wheat.—In wheat it is probable that next season will see us supplying all our own requirements, and our surplus then must abide by the natural law of trade and follow the fluctuations of the world's market—Mark Lane. We have millions of acres of magnificent wheat lands, which have in the past supported an average of about half a sheep per acre, but which are now found to be capable of producing an average of 20 to 25 bushels of wheat.

That they are destined to this class of cultivation ultimately cannot be doubted, and arrangements should not be delayed to enable us to take fullest advantage of the European market when the time comes, especially as our staple grain is of the highest possible grade as regards the milling and baking qualities.

Barley.—Barley for malting stands next in importance as a possible source of export trade, and from the excellence of our samples, I anticipate a very large business in this cereal as soon as British brewers turn their attention in our direction.

Other Cereals.—Oats, peas, beans, maize, &c., have not up to the present occupied a large share of our attention, but may in future form a part of our available exports.

GROUP VI.—Fruits.

Taking into consideration the variety of soils and climates of this Colony adapted to the cultivation of fruits ranging from semi-tropical to low temperature classes, it is important that the possibilities of our fruit trade should be prominently brought before the British consumers. So far we have but experimented in exports, but from the acreage of new orchards, &c., just coming into bearing, we must soon find markets for our surplusage.

Citrus Fruits.—Citrus fruits can be grown throughout a wide range of country; therefore we should be able to supply extensive quantities of oranges, lemons, citrons, &c., of a very high quality.

Other Fruits.—Peaches, apricots, pears, apples, and a great variety of other fruits can be grown to perfection, and scientific and skilful improvements in cultivation, &c., promise an early and large supply.

Preserved Fruits.—Preserving and canning are being entered into by several enterprising firms, and we anticipate that, with the double advantages of producing our own sugar, and being so favoured in climate and soil for the growth of a superior quality of fruit, a large export business in these is only the question of a year or two.

Dried Fruits.—For reasons given above, dried fruits must also soon form a large source of export business.

GROUP VII.—Metals and Minerals.

It is only necessary to mention the noble metals, with copper, lead, and tin, as all these are already fairly before the markets of the world, but for the development of trade in any of the undermentioned, much remains to be done in encouraging the attention of the British public.

Iron.—As has been often pointed out, iron must ultimately be produced from its ores in immense quantities, all the conditions, such as the proximity of the iron deposits to unlimited supplies of lime, coal, manganese, wolfram, &c., pointing to profitable returns as soon as the conditions of population and the labour market warrant the investment of capital.

Other Metals, &c.—Then we have extensive deposits of mercury, titanium, molybdenum, zinc, cobalt, chrome, sulphur, antimony, arsenic, bismuth, graphite, lignite, anthracite, &c., almost entirely undeveloped.

Coal.—Coal is the most important of our earthy minerals, but this market is already being exploited with considerable ability, although the unfortunate friction between labour and what is represented as "capital" has led to our losing some important outlets for our supplies. We have still, however, a fair share of markets in the United Kingdom dependencies and other nations.

Diamonds.—Other Gems.—Gems of the corundum and crystalline series occur in various parts of the Colony, and the development of mining for these may soon lead to a considerable business with British markets, especially in our diamonds, which are said to be equal in colour and lustre to the best Brazilian gems. Rubies, emeralds, and opals are the other more important gems found in the Colony, and but little has been done towards developing these sources of wealth.

GROUP VIII.—Wines and Brandies.

Wines.—Considering the possibilities of viticulture in this Colony, and the magnitude of the demand for these throughout the world, the trade in wines and brandy is likely to assume a most important position in our list of exports. Attention has already been drawn to the superior quality of our best wines, which have met with the appreciation of connoisseurs of European reputation. There is sufficient demand already for our best wines to warrant the investment of more capital in wine-growing and manufacture, with the prospect of an assured market.

Brandy.

Brandy.—Brandy of excellent quality has been made in the Colony, and the increasing demand is the best evidence that we are on sound ground in increasing our supply.

Some slight modification of our Distillation Act will enable distillers to operate on a large scale, and meantime the British public should be kept well advised of the superior character of our brandy when compared with the chemically-disguised white spirit which is often foisted on them by unscrupulous traders.

Both in wines and brandies it is always to be feared that our interests may be sacrificed to those of known wine-producing countries, by our best samples being credited to them, and the inferior only sold as Australian; great care will require to be exercised in preventing such being done.

GROUP IX.—*Timbers.*

Timbers.—Although for many years the high quality and durability of our native hardwoods have been well known to experts in timber, we have never more than dabbled with the European markets, chiefly for want of enterprise, and because the value of our timbers has never been properly represented to the general public.

At the present juncture, when the wood-paving of streets is beginning to assume national importance in Great Britain, it is imperative that the superiority of our timber for such purposes should be conspicuously presented to the proper authorities, so that a fair share of the trade can be secured by New South Wales.

It is of the utmost importance also, that demonstration be made of the other uses to which our hardwoods can be put, such as railway-sleepers, manufacture of rolling stock, waggon-building, wheelwrights' work, and, for our ornamental timbers, cabinet-making, decorative panelling, &c., &c.

This industry may fairly claim to be one of the most neglected of any, and no time should be lost in presenting our claims and pressing our goods on the markets of the United Kingdom. Such measures, therefore, as may be necessary to fully exploit the markets of the United Kingdom are urgent and imperative necessities.

Tobacco.

Tobacco may be also mentioned as a probable source of trade, our climatic conditions favouring the growth of nearly all varieties. Some time will probably elapse before we can produce sufficient quantities of suitable quality, but every year will improve our prospects, and no element of success seems wanting beyond the necessary skill, which is being rapidly attained.

From the foregoing list it will be noticed that only products which can be easily prepared for export, and which have been neglected in the past, are taken into consideration. Enough has probably been said to emphasise the necessity of closer relations between this Colony and the parent nation, equally in the interests of both. Nothing is wanting but application of the business acumen and readiness to invest capital in profitable enterprises, so characteristic of our race, to make the next decade a season of such prosperity for New South Wales as the most sanguine could hope for.

I have, &c.,

JAS. STEPHENSON,
Secretary, Board for Exports.

Sydney, June 26th, 1896.

XII.—OPINIONS OF VISITORS.

EXPORT OF PRODUCE.

Jas. Stephenson, Secretary, Board for Exports.

VISIT OF CO-OPERATIVE DELEGATES.

ON the arrival of these gentlemen—Messrs. Clay, Stoker, and Jones—representing the Co-operative Wholesale Society of England, arrangements were made by the Board for Exports, under instructions from the Honorable the Premier, to show them round the various producing districts and other places likely to interest them from a business point of view.

The general result of the visit may be described as highly satisfactory, and likely to lead to very considerable business relations between their society and our producers.

Their mission being only one of inquiry, there was no actual business done during the tour; but several arrangements were made for sample consignments of butter, tallow, leather, honey, &c., and they spoke with all confidence of the probability of much of the British supplies being in future drawn from these colonies.

It is unnecessary to enumerate all the factories, &c., visited, as the same details would apply to many examples, but it is well to remark that no important interest was overlooked in making the arrangements, which were carried out without a hitch.

Sydney and suburbs naturally formed the first part of the programme, and several butter factories in the city were visited on the first day, at all of which the modern character of appliances, cleanliness of manipulation, and quality of output were favourably commented on by the visitors.

The Botany tanneries and boiling-down establishments were next visited, where samples of leather and tallow were arranged for with several of the producers. The bulk of the leather generally was said to be inferior in quality and finish to average British samples, but large quantities of our 18–20-lb. sides were likely to be required for sole-leather.

In tallow a very extensive market was expected for soap-making, which was declared to be the future principal outlet for our class of tallow, candle-making consuming less year by year.

The works of the Sydney Meat Preserving Company were visited, and called forth highly favourable remarks. In this direction a strong opinion was expressed as to probable large and satisfactory business, and Mr. Alban Gee, the manager, was complimented in high terms on his perfect system of sanitary arrangements.

Hawkesbury Agricultural College and the Kurrajong were next visited, and the delegates highly approved of the work being carried out by the students under the tuition of Mr. Principal Thompson. The weather, unfortunately, was inclement, and the orangeries were seen under adverse conditions, but a favourable opinion was expressed as to the probability of our attaining a share of British trade in fruits generally.

The delegates then left for Newcastle, where they were received by H. W. Lee, Esq., of the Board for Exports, and the local Chamber of Commerce. A quick run through Aberdeen, Singleton, and Maitland districts enabled them to form some idea of Upper Hunter valley, which was favourably spoken of as a producing centre.

An extended trip throughout the South Coast dairying districts followed, where the visitors were accompanied or met by the local M's.L.A. and all the principal producers. Throughout this visit the Honorable A. Kethel, M.L.C., Vice-Chairman of the Board for Exports, travelled with the party, and his extensive knowledge of the country proved of great service in making the trip a success.

The extreme hospitality of the farmers and others, and the sympathy with the objects of the Co-operative Society so generally expressed, were highly appreciated by the delegates, who, as they said themselves, were received more like ambassadors than plain business men.

Some of the samples of butter seen on this visit were as near perfection as might be, and the delegates spoke in no uncertain terms of the prospect of our very soon taking a still higher place in the British markets.

On the invitation of John See, Esq., M.L.A., manager of the North Coast S.S. Co., the visitors were taken through the North Coast Districts, including the Clarence, Richmond, and Tweed Rivers, Byron Bay, &c., and were heartily welcomed and entertained by the settlers. They afterwards made a tour through Queensland, and left, *via* Sydney, for New Zealand, on their homeward route.

In course of conversation with Mr. B. Jones, the London manager of the society, the following facts and opinions were elicited. Coming, as they do, from a responsible and authoritative source, these remarks should be laid to heart by our producers, and acted upon as far as possible:—

Butter.

Speaking generally, we are on the right lines, and may safely go on, taking care, however, to be content with nothing short of perfection in quality and manipulation.

Qualities

Qualities necessary.—Butter for export must possess the following qualities :—

1. Good, strong body, with under 10 per cent. moisture.
2. Good keeping quality.
3. Fragrant flavour.
4. Bright, uniform colour.
5. Should, when worked, carry not more than 2 per cent. salt and $\frac{1}{2}$ per cent. preservitas.

As to the time for shipping, our present season—from September onwards—suits the London market well; but in order to keep customers together we will probably in future require to have our butter on the market all the year round. This would involve storing on this side from season to season, but not necessarily at a loss, as home buyers will pay a good price to secure an article they are accustomed to. This, of course, would apply only to comparatively small quantities.

Mr. Jones is of opinion that cold storage is no drawback, if the butter be good to begin with, the only objection being the cost of storage—not a very heavy item.

Grading and Branding.—The delegates hold the strongest views on the necessity of establishing standard grades, and working up to the best. They also favour the adoption of more than one grade, and generally give their adherence to the following plan as formulated by the writer from personal experience and acquired information :—

Butter-making for Export.

“Institute a thorough system of inspection of all stock, dairies, factories, and means of conveyance, giving extended powers to the inspectors, to enable them to efficiently carry out their duties.

“Give assistance to producers in obtaining for them the cheapest and best means of transit.

“Offer the certificate of the Government to all producers of a good article, and carry out a rigid system of inspection to prevent any adulterated samples being exported, or inferior stuff being falsely represented in any way likely to cause injury to legitimate producers or merchants.

“Distinguish the various grades under the following headings :—

Brand.	
CHOICEST	To include the highest grades of creamery and factory butter; to be attached only after careful inspection of each separate shipment.
PRIME	To include all well-made and sound samples of creamery and factory butter fit for table use, and calculated to arrive in prime condition.
No brand	Second-class factory, dairy, separator, and mixed butters, fit for table, but not up to prime standard.
PASTRY	All butter calculated to reach market in a condition unfit for table use.
(Fire Brand.)	

“In case of any factory or supplier habitually failing to produce good butter, offer any advice or instruction required to remove the difficulty, charging only actual expenses in case of a visit of the expert being necessary.

“Institute a system of conferences from time to time in producing centres, and encourage the interchange of ideas among producers.

“Encourage the utilising of all offal, and urge the immense loss involved in allowing any waste.”

Packing.

Our present system of packing has “caught on” with the trade in Britain, and cannot be improved on, except that a slight taper might be given towards the bottom of the case inside (say, $\frac{1}{8}$ inch on all sides), so as to facilitate getting the butter out. This could be done without interfering with the symmetry of the case outwardly.

“Fishy” Flavour.

Questioned about this taint, which has been variously attributed to rank grasses, weeds in pasture, insufficient extraction of butter-milk, &c., Mr. Jones suggests that the inclusion of too new milk after calving (beestings), may have something to do with it, and endorses the general opinion that no milk from newly-calved cows should be allowed to be used, under heavy penalties. The notable presence of “fishiness” in butter about the opening of our flush season seems to favour this hypothesis, and I would strongly recommend exhaustive experiments being made to prove or disprove it. Nothing should be left undone to keep up the character of our supplies.

Pasteurising.

This system of treatment being still in its infancy, Mr. Jones speaks with caution about it, although he admits that, if by the introduction of pure cultures of lactic-acid-forming bacteria, the results claimed can be uniformly obtained, a great point will have been gained.

Butter production generally.

One good result of the delegates’ visit has been to dispel the fear that we are on the way to over-production, and consequent stagnation. We are assured that no such stage is likely to be reached for the next twenty years. By closely following the best and most modern scientific methods, and keeping up the standard of quality, there is an almost unlimited market for us in the United Kingdom.

The district of the Colony which most impressed the visitors was that of the Richmond-Tweed. As Mr. Jones expressed it, “Other districts are good, but the Richmond-Tweed scrub lands are super-excellent.” He considers that even should sugar, maize, and potato growing equally cease to interest the Northern farmers, the butter-producing prospects are such as to warrant the utmost confidence in the future. Some improvement in stock is necessary, the cattle generally being hardly up to South Coast standard, but no doubt this will have attention as the area of grazing extends.
