 788. What are you paying for your special area? It was appraised at first at £2, but I got it reduced to 21s.
 789. On what ground did you get it reduced? On the ground that the price was excessive.
 790. Was it on the ground that the land was not so good as you anticipated? Yes.
 791. Or was it on the ground that the "white line" had not been constructed? That ground was not brought forward at the reappraisalment.
 792. Then on what ground did you get the reduction? On account of it being such a distance from railway communication and from a market.
 793. Where do you get your supplies from? From Young.
 794. Will you continue to get them from Young, whether the line is or is not constructed from Koorawatha to Grenfell? I would not say that. The line would bring me nearer the town of Grenfell.
 795. In that case would you go to Grenfell, it being the nearest point? Yes.

H. Doherty.
 25 Feb., 1898.

Thomas Joyce, farmer, Park View, Burrangong, sworn, and examined:—

796. *Chairman.*] Where is your holding? Three miles from Bulla Creek, towards Young.
 797. What area have you? I and my sons own 440 acres of land, which we farm.
 798. How much are you farming? We had about 150 acres of wheat under crop last season, which we sent to Young. We also get our stores from Young.
 799. Would the "white line," if constructed, run near to your holding? Yes; within 200 yards of the place.
 800. Would a line from Koorawatha to Grenfell be of any use to you? No; I am so near to Young that it would be useless to think of coming to Grenfell. I consider that if the "white line" is constructed it will do a great deal of good to the country.
 801. Do you think there would be much trade from the Bland to the railway? I think a good deal of traffic would come in from there. All the wool comes in from there now.
 802. Are you farming on the halves system anywhere? We have put in a little on the halves system this year.
 803. Are you prepared to say anything about it? Last year my sons had some wheat on Mr. Massey's land on the halves system, but the season was not a very good one. We intend to try again this year with 200 acres.

T. Joyce.
 25 Feb., 1898.

SATURDAY, 26 FEBRUARY, 1898.

[The Sectional Committee met at the Court-house, Young, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed railway from Koorawatha to Grenfell.

Edward Taylor, Chairman of the Railway League, Young, sworn, and examined:—

804. *Chairman.*] Do you desire to make a statement? Yes. I desire to place before you a statement which the Railway League has drawn up, as follows:—

E. Taylor.
 26 Feb., 1898.

The Minister for Works having promised Grenfell and Wyalong a railway, and the Chairman of the Public Works Sectional Committee having promised the Committee's support for a railway to Hillston, and the Sectional Committee having reported on the proposed Condobolin-Euabalong line that "a permanent survey be at once undertaken of the explored route from Koorawatha to Hillston, with a view of its consideration in conjunction with existing surveys, and also with a view to the early consideration by Parliament of the expediency of extending railway communication to the several important centres of population affected, and to the reclamation and settlement of a valuable tract of land now in course of abandonment," and the Minister having accordingly stated his intention to meet all these demands by a line from Koorawatha to Grenfell, to be extended to Wyalong and Hillston, the proposed Koorawatha-Grenfell railway assumes corresponding importance, and must be considered from a wide standpoint.

* 3 (a)—E

The

E. Taylor.
23 Feb., 1898.

The Blayney-Harden line, Parkes-Forbes line, and Cootamundra-Temora line are all involved, as well as the proposed Temora-Wyalong route, and the long advocated "white line" route from Young to Grenfell. Consideration of the whole matter involves inquiry into the following questions:—

1. The proposed line from Koorawatha to Grenfell.
2. The proposed extension from Grenfell to Wyalong and Hillston.
3. The proposed line from Young to Grenfell.
4. The proposed direct Federal line from Werris Creek to Demondrille.
5. The proposed Federal and commercial line from Temora to Wyalong, Hillston, Broken Hill, and Adelaide; in conjunction with
6. The proposed line from the vicinity of Moss Vale or Exeter to the Illawarra district.

1. *The proposed line from Koorawatha to Grenfell.*

This line would principally traverse the estates of three landholders—one of whom already has a line through his land, and another of whom would be equally well served by the line from Young to Grenfell—who at present are large wheat-growers on the "halves" system, but who will doubtless revert to grazing after the lands cleared for agriculture have produced a certain number of crops, as lucerne paddocks carrying five sheep to the acre are more profitable than wheat-growing.

The electoral statistics reveal the scarcity of population on this route.

One of the said land-holders offers land free, anticipating to derive substantial benefits from the closing of roads, and unearned increment consequent upon the approach of a railway; and as the Railway Commissioners, after going 30 miles west of Grenfell and southerly well into the Young district for statistics, estimate the loss of £1,949 annually upon the venture—excluding interest on cost of land resumption from the annual charge—the land-holders' gains and convenience would be the general tax-payers' loss and detriment.

Owing to the scarcity of population, the only time when there would be any substantial traffic on the line would be after shearing and harvest, consequently the line would scarcely be utilised for about nine months of the year.

The Grenfell people would be almost as well served by communication with Young, and as live stock trucked at Koorawatha for Sydney are carried at the Western and cheaper tariff, yet frequently reach the metropolis *via* the Southern line, there would be a corresponding loss to the revenue.

2. *The proposed extension from Grenfell to Wyalong and Hillston.*

The extension to Wyalong would principally serve a few land-holders on the Bland country, who are at present served by the railway at Forbes, Young, and Temora.

A map of the Bland country, showing the distance of each homestead from Forbes, Young, and Temora, would show that very few of the land-holders would derive any great benefit from the Koorawatha-Wyalong line.

Some of the holders desire an extension *via* Bimbi, but the Government Engineer considers the Piney Range route would be less costly.

In any case the engineering difficulties on a considerable part of the Bland country are very great, owing to the liability of floods from the overflowing of the Bland Creek and Back Creek.

Much of the Bland country is unsuitable for wheat-growing, so "the reclamation and settlement of a valuable tract of land now in course of abandonment" by constructing the Koorawatha-Wyalong line is very improbable.

The Wyalong people would sooner be connected with Temora. Connection of Wyalong with Lithgow is no desideratum, as the wood fuel around Wyalong is sufficient for many years, and when that gives out coal would be equally required for mining purposes in the district between Temora and Wyalong. A considerable portion of Wyalong ores now travel *via* Temora and the Southern line for treatment at Dapto.

There is no indication of mining between Wyalong and Koorawatha. The Western line has nearly all the traffic it can carry, and will be still more heavily taxed by the fast-approaching mining developments between Lithgow and Cobar, until partly relieved by the proposed direct Federal line from Werris Creek to Demondrille, sections of which are already constructed.

Hillston is doubtless entitled to a railway, and land on the proposed route is already being taken up and inquired for. In view of the cost and difficulty of locking the river, the railway would probably hold its own, if the line passed through the immense tract of country rich in mining, agricultural, and pastoral resources, represented by the centres of Wyalong, Barmedman, and Temora.

Connection with the Great Southern line at Cootamundra would give pastoralists and others the advantage of access to the important markets at Wagga Wagga and Albury, as well as a more generally convenient route to Sydney than a junction with a loop-line at Koorawatha would afford; which latter advantage is fully recognised by commercial travellers, whom it would suit better to travel to Carrathool, and journey thence to Hillston 80 or 90 miles by coach, than to go to Koorawatha to get the train to Hillston. But a line from Hillston to the main line at Cootamundra, *via* Wyalong and Temora, would be of great benefit to them.

3. *The proposed line from Young to Grenfell.*

A former Government promised this line, which is permanently surveyed, the land 40 chains on either side of the line being within a railway reserve since 1883. The Lands Department have set a special value on the Crown lands adjacent, because of this promised railway construction, and the promise has induced close settlement, but the Government promise has not been fulfilled.

Construction of the line is warranted by the close settlement and trade along the route. Starting about 3 or 4 miles out, near the Meat-chilling Works, the route between Young and Grenfell and adjacent holdings includes sixty-nine holdings, representing an area of 115,710 acres. Sixty-seven of the holders desire the line; five holders, representing 27,400 acres, are willing to give land; two others representing 1,020 acres, are willing to make concessions; one other holder will probably make a concession; three others are undecided at present. 10,880 acres of the total area are under permanent farm crop, 90 acres are under cultivation temporarily; thirteen holders are increasing their cultivation areas by 5,443 acres, and thirty others are also increasing their cultivation areas.

The annual sales off these holdings are as follows:—

Wool clip.....	1,813 bales.
Wheat, about.....	117,000 bushels.
Stock sales—Sheep.....	34,190)
Cattle.....	122)
	34,312
Hay, about.....	454 tons.
Corn, about.....	886 bags.
Number of stock at present on said holdings—	
Sheep.....	111,050
Cattle.....	1,203
Horses, about.....	100

The present population on the same holdings is 511. A good guide to the population on the line of route is furnished by the enrolments at public schools taken from the last quarterly returns—Burrangong, near Meat-chilling Works, 46 pupils; McHenry's Creek, on main road, 44 pupils; Bulla Creek, on main road, 30 pupils; Tyagong, about a mile from main road, 33 pupils (mining developments are probable here in the near future); Weddin, on main road, 42 pupils. In addition there are—Kikiamah Provisional School, 6 miles west of main road, 18 pupils; Arramagong Public, 3 or 4 miles west of main road, 21 pupils; Thuddungra, 10 miles west of main road. Total, 263.

The only school close to a direct line from Grenfell to Koorawatha is Mitten's Creek Public, enrolment 26. Of the other schools, the Tyagong Public would be the nearest to such line.

The present parcels and passenger traffic per coach exceeds £600 per annum. In addition, the Grenfell goods traffic would swell the returns. There would also be revenue from mails by saving cost of existing contracts; and owing to the diminution of the very heavy traffic on the roads, the cost of road maintenance between Young and Grenfell would be somewhat reduced. The volume of goods traffic can be estimated from the returns of the holdings on the route, above detailed, to which would have to be added the traffic from the Bimbi, Bland, Thuddungra, and other adjacent districts.

The

The rainfall immediately along the route is as follows :—Young, average for twenty-four years, 27 inches 95 points ; Nestle Brae, average for eight years, 27 inches 74 points ; Iandra, average for six years, 25 inches 82 points ; Kokedahl, average for five years, 23 inches 30 points ; Brundah, average for twelve years, 26 inches 35 points ; Bogolong, average for ten years, 26 inches 52 points ; Bald Hills, average for nine years, 24 inches 17 points ; Grenfell, average for eleven years, 29 inches 93 points.

The main construction arguments are—Country easily cleared at low cost ; ironbark timber for sleepers in the Weddin Ranges, 10 miles west of Grenfell ; good box and pine timber near Bimbi ; ballast at suitable points ; clay for bricks along route ; plenty of water for locomotive purposes at Bulla Creek, Tyagong Creek, and Burrangong Creek.

The length of the line is 32 miles, of which 3 miles 31 chains are completed.

The line would pass through splendid agricultural land, on which there are probably more farmers than on any 30-mile track anywhere in or around the district of either Young or Grenfell.

4. *The proposed direct Federal line from Werris Creek to Demondrille Junction.*

It is of national importance that the line from Grenfell should be a section of the direct Federal route from Young to Werris Creek, viz. : Young to Grenfell, 32 miles (3 miles 31 chains laid) ; Grenfell to Forbes, 34 miles ; Forbes to Parkes, 21 miles (already laid) ; thence northerly to Aleetown ; Peak Hill and Dubbo, 74 miles ; thence to the junction of the north and north-western systems at Werris Creek, about 154 miles.

The Harden-Blayney line shortened the distance between places west of Blayney and the Victorian capital by 375 miles ; also, by connecting the Southern and Western lines, it enables residents of the Western districts to travel south, and residents of the Southern districts to travel west, without crossing the mountains or going through the metropolis, thus shortening the journey, in either case, by 115 miles. In the same way, the Federal line will shorten the distance between Werris Creek and Demondrille Junction by no less than 150 miles.

This Federal line, over 42 miles of which are already laid, will further not only the respective local interests, but also those affecting the Colony, and, by connecting the three great colonies, will be of advantage to Australia.

The section starting northerly from Young would, for about 40 miles, traverse a gently-undulating red-soil country, presenting no engineering difficulties, and eminently adapted for agriculture, viticulture, fruit-growing, and the production of high-class wools. A large area of this district has already been brought under the plough, and the whole of it is auriferous.

Thirty-two miles north from Young, Grenfell would be taken in the line of route, with its gold-bearing quartz-reefs and alluvial deposits, capable of great development.

Continuing northerly to Forbes, the last part of the section would be constructed over country of the best pastoral description, extending westerly to the plains of the Bland Creek, and bounded on the east by low ridges, the slopes of which are all adapted for farming.

The construction of this first section would largely develop the pastoral, agricultural, and mining interests, and be certain to carry a heavy traffic of fat stock, wool, wheat, &c.

The section from Forbes to Parkes is already open ; both towns are the centres of splendid grazing, farming, dairying, and mining districts.

The first 50 miles north of Parkes would be made through chocolate soil flats and slopes, of great depth and strength of soil, which, although chiefly used for grazing purposes, are already occupied by many extensive farms.

All this country is highly auriferous, important mining centres having been developed at Aleetown, Mingelo, Peak Hill, Myalls, and Tomingley ; Peak Hill Municipality having a population of over 1,500. Many of the reefs in these localities are heavily charged with pyrites, as depth is obtained, necessitating their ultimate profitable treatment at one of the coal-fields of the Colony.

The northern 24 miles of this section—although not passing through such rich land as the southern end—is chiefly adapted for farming purposes, and the whole section is bounded on the west by the fattening pastoral country of the Bogan River, and the agricultural lands abutting on to the edge of its plains, and when Dubbo is reached communication is effected with Bourke and the Western districts.

Upon this section a heavy traffic of minerals, wheat, wool, and other products would be a certainty.

The section from Dubbo to Werris Creek Junction, after following the alluvial flats of the Talbragar River and the high lands at the head of the Castlereagh, of which large areas are suitable for farming, would traverse what is probably the richest fattening district of New South Wales, at present almost devoid of railway communication, viz., the magnificent pastoral district of the Liverpool Plains.

This section has been estimated to cost £505,600, but the average estimate of £3,200 per mile seems heavy.

The Minister for Works recently stated at Dubbo that it would be necessary to have a fresh survey and estimate made, and that, though it would be impossible to deal with the matter this Session, he would inquire into it without delay.

The momentous advantage of being able to save their stock in times of drought by speedily removing them to the New England district or elsewhere would alone justify the landholders and people of this district in advocating the line from Young to Grenfell, and the conveyance of fat and store stock from Southern Queensland and Western New South Wales to the Wagga, Albury, and Victorian markets are obvious advantages to the Colony.

The Koorawatha-Grenfell route would not connect Young or the Bland districts with the New England district.

This Federal scheme has the support of the Werris Creek, Dubbo, Peak Hill, Parkes, Forbes, Barmedman, Temora, and Cootamundra people. The Parkes League thus conclude their arguments for the construction of the Federal line from Young to Werris Creek :—“To the Australian Colonies as a whole this enormous advantage is presented, namely, a second route between Melbourne and Brisbane, well away from the seaboard, for the conveyance of troops in case of war. As things stand at present, an enemy holding possession of Sydney, Newcastle, or even Broken Bay, could completely sever our lines of railway communication and prevent all movements of troops between Victoria and Queensland, and even from Northern to Southern New South Wales. Queensland and Victoria would also be greatly benefited by the construction of a comparatively straight line of railway built at a low cost per mile, and consequently largely reducing the present expenses of carrying both fat and store stock to their respective markets.” The Cootamundra District Council passed the following resolution held at a meeting held in November last :—“That the Cootamundra District Council heartily approves of the exertions of the citizens of Young in advocating railway extension from Young to Grenfell, thence to Forbes, Parkes, Dubbo, and Werris Creek, thus connecting Brisbane and Melbourne, which would be a national line, and help to strengthen the federal spirit.”

5. *The proposed Federal and commercial line from Temora to Wyalong, Hillston, Broken Hill, and Adelaide ; in conjunction with—6. The proposed line from the vicinity of Moss Vale or Exeter to the Illawarra district.*

The better route to Wyalong is from Temora, through Barmedman.

The Koorawatha-Wyalong route would not suitably serve the Barmedman district, and would seriously reduce the earnings of the Cootamundra to Temora line, drawing the trade of the Temora back district to a branch line at Koorawatha instead of the main line at Cootamundra.

The Bland trade would be diverted from Young.

The Temora-Wyalong route is already permanently surveyed, and would be the shortest line to construct, and could be probably completed in a year and a half—which would be an immense benefit to Wyalong—as there would be no cuttings or bridges to speak of, whereas bridges and viaducts would be necessary on the Bland country.

Temora Station is one of the best sources of supply on the Southern line for the ironbark required for sleepers, girders, &c.

From Temora to Wyalong the route follows the road, and there are a considerable number of selectors engaged in agriculture.

In addition to the ordinary passenger and merchandise traffic, there will be large supplies of firewood required by the numerous chlorination works and batteries, besides timber for mining purposes at Wyalong, where there are five saw-mills whose proprietors would become customers.

The population of Wyalong is estimated at between 4,000 and 5,000, not including the growing township of Yalgogrin.

The Temora-Wyalong route would mean to the Barmedman and Wyalong districts more settlement, more cultivation, and fewer rabbits.

Temora

E. Taylor,
26 Feb., 1898.

E. Taylor.
26 Feb., 1898.

Temora to Wyalong, through Barmedman, is 40 miles; Young to Grenfell, 29 miles; total, 69 miles.
Koorawatha to Wyalong, via Grenfell, is over 87 miles, with Temora, Barmedman, and Young left out of consideration.

In reference to the Public Works Sectional Committee's recommendation of the Koorawatha-Wyalong line, "For the reclamation and settlement of a valuable tract of land now in course of abandonment," the League desire to point out that there is plenty of room for a greater development and settlement on vast areas of Crown lands between Cootamundra and the western rivers, and that the Temora-Wyalong railway would mostly traverse Crown lands, large tracts of which are periodically thrown open for settlement.

The ores from Cobar (where is erected the largest stamper mill in the Colony, and where water-jacket furnaces reduce ores for final treatment at Lithgow or Dapto or Cockle Creek), Nymagee (where there are 100,000 tons of ore ready for treatment by cyanide process), Dubbo (where a plant is being erected to treat 25,000 tons of tailings from Stuart Town), Peak Hill, Parkes, Carcoar, Blayney, Orange, and Hill End, reach the coal per the Western line.

Also ores from Wyalong, Temora, Gundagai, Adelong, and other mining towns reach the coal per Southern line, and will do so to a much greater extent when the Southern line is connected with the coast line from Exeter or Moss Vale, only about 30 miles off.

The ore at these places should be readily accessible to the coal (and *vice versa*, the coal to the ores), at Berrima (7 miles from Moss Vale), or at Illawarra (where are situate the finest smelting works in Australia), or Wollongong, and to the deep water at Kiama, or Port Kembla—when the present scheme for a harbour there is accomplished.

The Minister and the Public Works Committee have promised Hillston a railway for its grain.

Then why not Broken Hill *via* Menindie for its ores, to further support the proposed line or lines?

The regular despatch of sulphides from Broken Hill to Port Pirie for shipment to Europe is well known, but with the existence of such works as the Smelting Company of Australia at Dapto, and the Sulphide Corporation Works at Cockle Creek, this course should become unnecessary.

These works are making their existence felt, heavy consignments of ore being regularly received from all parts of Australia and Tasmania. Ores and concentrates are being carried by rail from Broken Hill to Port Augusta, Port Pirie, or Port Adelaide for shipment to Dapto or Newcastle.

It may be said that the railway cannot compete with water carriage, but it may be that with the line at Hillston (and the factors of rail freight from Broken Hill to the South Australian coast, the cost of handling the bags or ores off trucks and loading them on board ship, the cost of marine insurance and shipping freight and charges, and the saving of time by rail transit), the possibility of carrying the ores from Broken Hill to Illawarra *via* Exeter or Moss Vale by rail may be brought about.

Altogether it is not apparent that the Koorawatha-Grenfell-Hillston route would be as advantageous to the whole Colony as the line from Werris Creek to Demondrille (part already constructed), and the line from Temora to Wyalong and Hillston.

The Young Railway League look for the time when Young will be on a main trunk line from Brisbane to Melbourne, and when Temora, Wyalong, and Hillston will be towns on a main trunk line to Broken Hill and Adelaide, traversing an immense tract of country rich in mining, agricultural, and pastoral resources.

Submitted with this statement is an Appendix containing further information and statistics.

The returns with regard to population do not include anyone closer to Young than 3 miles. In other words, the returns start 3 miles from Young. Thence we follow the "white line" to Grenfell. Most of the holdings on the east about on the line. On the west, the nearest boundary to the line is not more than 15 miles from it. We have purposely taken a narrow strip of country. I desire to attach the following appendix to my evidence:—

Table of Distances.

I.		miles.
Koorawatha to Grenfell	29 $\frac{3}{4}$	
Young to Grenfell, 32 miles, less constructed 3 $\frac{1}{2}$	28 $\frac{3}{4}$	
Difference in construction in favour of route from Young	1	
II.		
Koorawatha to Wyalong, <i>via</i> Grenfell (approximate)	87 $\frac{1}{2}$	
Temora to Wyalong, <i>via</i> Barmedman	40 miles	
Young to Grenfell	28 $\frac{3}{4}$ "	
	68 $\frac{1}{2}$	
Difference in construction in favour of Young to Grenfell, and Temora to Wyalong.....	19	
III.		
Sydney to Grenfell, <i>via</i> Koorawatha, Western route (approximate)	265 $\frac{3}{4}$	
Sydney to Grenfell, <i>via</i> Young, Southern route (approximate)	277 $\frac{3}{4}$	
Difference in distance in favour of western route	12	
IV.		
Sydney to Wyalong, <i>via</i> Koorawatha, Western route (approximate)	323 $\frac{3}{4}$	
Sydney to Wyalong, <i>via</i> Temora, Southern route (approximate) ..	330 $\frac{1}{2}$	
Difference in distance in favour of Western route	6 $\frac{3}{4}$	
V.		
Sydney to Hillston, <i>via</i> Koorawatha, Western route (approximate).....	435 $\frac{3}{4}$	
Sydney to Hillston, <i>via</i> Cootamundra and Temora, Southern route (approximate) ..	442 $\frac{1}{2}$	
Difference in distance in favour of Western route	6 $\frac{3}{4}$	
VI.		
Wyalong to Lithgow, <i>via</i> Koorawatha (approximate)	228	
Wyalong to Berrima (or Mittagong), <i>via</i> Cootamundra and Temora (approximate)	252	
Difference	24	
VII.		
Werris Creek to Demondrille Junction, <i>via</i> Sydney	485	
Werris Creek to Demondrille Junction, <i>via</i> proposed Federal route	385	
Saving in distance by Federal route	150	

Mr. Coghlan, in his statement showing the area under wheat in New South Wales in 1896, said, "The increased area of wheat for grain on the Southern tableland is over 38,000 acres, the increase being general, the largest extension of cultivation being in the Grenfell and Young districts."

In the Police District of Young, within counties of Monteagle and Bland, excluding rented Crown lands, there are 26 holdings, ranging from 1 acre to 23,200 acres (Memagong). Over 14,200 acres on these holdings were under wheat in 1896, the average yield per acre being 9.44 bushels.

Wheat

Wheat Yield, 1897-98.

	acres.	bushels.
County Bland.....	4,113	32,890
County Monteagle.....	11,771	97,170
	15,884	130,060

E. Taylor.
26 Feb., 1898.

(The price at Mark Lane, London, for British wheat ranged from 4s. 7½d. per bushel in 1891 to 2s. 10¼d. in 1894. Imported wheat at same market ranged from 4s. 9½d. in 1891 to 2s. 10¾d. in 1894.)

Town and District of Young.

Flour-mill.—The number of bushels received at the local flour-mill for the years 1894-98 was as follows :—

1894-95, 5th year	206,000 bushels.
1895-96, 6th year	215,000 „
1896-97, 7th year	261,855 „
1897-98, 8th year	318,727 „

Butter Factory.—For the year ending 31st August, 1897 :—

Milk received.....	107,550 gallons.
Cream	72,019 lb.
Total output of butter	77,252 lb.
Average price paid for milk	4d. per gallon.

Meat Works.—Three miles north-west of the town of Young, established in 1893, costing over £12,000. They were built with a view of tapping the large fattening and wool-growing district of the Bland Plains. The plant contains a complete modern boiling, chilling, freezing, and manure plant. The works are capable of treating 2,000 sheep a day. The Pastoral Finance Association (Limited) took over these works in December, 1896, and during three months' operations treated 27,000 sheep—nearly all being chilled for export. It is near these works that the proposed Young-Grenfell line would commence, the advantages of which are obvious.

Postal Revenue.—The postal statistics for the year 1896 are—

	Receipts.	£	s.	d.
Postal Revenue		2,085	0	0
Telegraphic Revenue		613	0	0
Money Order, &c., Revenue		115	0	0

Expenditure for same year

£2,813 0 0
1,225 0 0

Customs Revenue.—The revenue derived from this source for the year 1896 was £564 ls. 6d., being excise duty on 45,126 gallons of beer:

Land Revenue.—1897—£28,708.

Gold raised.—1897—£8,375 (2,134 oz.)

Population of Young.—1896—5,111 ; 1897—5,436 ; 1898—5,658.

Extract from *Sydney Morning Herald*, of 19th November, 1897 :—“ Since the commencement of smelting operations at the Australian Smelting Company's works at Dapto, the railway traffic in connection with the works has averaged 4,000 tons per month. Ores and fluxes are received from as far north as Tenterfield, as far west as Orange, and from near Albury on the south. Consignments also come by steamer from southern parts of the Colony. About 50 per cent. of the whole, however, comes from Broken Hill. The company has shipped, so far, 250 tons of bullion, containing gold, silver, and lead, the percentage of gold ranging from 6 oz. to 20 oz. per ton. The bullion is at present being sent to England for final treatment, but on the completion of the refining plant, which is now nearly ready, all the metals will be separated by the company at Dapto.”

Specimen of Statistical Sheet used for “white line” :—Name of Holding. Area. Area under crop.
Stock. Sheep. Cattle. Annual wool clip. Annual sales of stock. Sheep. Cattle.
Annual sales of produce. For or against line. Total population on holding. Distance of nearest boundary from line. Remarks.

I have some statistics relating to the various holders on the “white line” furnished by the holders themselves, as follows :—

Name.	Holding.	Area.	Under Crop.		Stock.		Wool.	Sales.		For the 'white line.'	Land given.	Population residing on Holding.	Remarks.
			Per.	Tem.	Sheep.	Cattle.		Stock.	Produce.				
George Dooley.....	Stone Cottage..	acres. 121	acres. 60	acres. 20	10	15 cattle.	200 bags wheat.	Yes.	7	
John Anderson	Arramagong Farm	233	50	40	12 cattle.	150	Yes.	4	Increase next year.
A. Aston	Arramagong East	7,000	400	9 corn.	8,000	50	120	2,000 sheep.	900	Yes.	Undecided.	15	Expect to cultivate 3,000 acres next year.

I also hand in a petition in favour of the construction of the "white line" from Young to Grenfell, signed by 343 persons. It is as follows:—

KOORAWATHA-GRENFELL RAILWAY—THE "WHITE LINE"—YOUNG TO GRENFELL.

To the Chairman, Sectional Committee, Parliamentary Standing Committee on Public Works,—

Sir,

The Petition of the undersigned residents of the town and district of Young humbly sheweth—

That a great necessity exists for railway communication between the towns of Young and Grenfell, such necessity being based on the following facts:—

A former Government promised a line from Young to Grenfell, which is permanently surveyed, the land 40 chains on either side being within a railway reserve since 1883, present settlement along the line being largely due to this promise.

The present Minister for Works has stated that Grenfell is entitled to connection with the present railway system.

The districts of Young and Grenfell are well established as wool and wheat-growing centres.

The line from Young to Grenfell will pass through splendid agricultural land, on which there are probably more farmers than on any 30-mile track anywhere in or around the districts of Young or Grenfell.

Out of sixty-nine land-holders immediately on the surveyed line of route, or immediately adjacent thereto, representing 115,710 acres, five holders, representing 27,400 acres, have volunteered to give land for railway purposes; two, representing 1,020 acres, will make concessions, and one will probably do the same. 10,850 acres of the said sixty-nine holdings are under permanent cultivation; thirteen holders are increasing their areas by 5,443 acres, and thirty others are also increasing their areas.

The annual sales from the said holdings are—Wool clip, 1,813 bales; wheat sales, about 17,000 bushels; stock sales 34,090 sheep, 122 cattle.

The present population on the said holdings is 511. There are five public schools on the line of route, and three a few miles from it. (These figures would be very much increased by taking a radius of 10, 20, or 30 miles from the line of route.)

The country on the line of route can be easily cleared at a low cost. There is ironbark timber for sleepers in the Weddin Ranges, 10 miles west of Grenfell; also good box and pine timber near Bimbi; also ballast, and clay for bricks, at suitable points along route; also plenty of water for locomotive purposes at Bulla Creek, Tyagong Creek, and Burrangong Creek. Three miles 31 chains of the line are already constructed.

The line from Young to Grenfell would form a section of the Federal route from Young to Werris Creek, of which 24 miles (Parkes to Forbes) and 21 miles 31 chains (Young to Demondrille Junction) are already laid. This Federal line would shorten the distance between Werris Creek and Demondrille Junction by 150 miles, and would greatly facilitate the transit of passengers and mails between Brisbane and Melbourne. At present the Queensland English mails are detained in Sydney eight and a quarter hours. The sphere of usefulness of that part of the Harden-Blayne line between Young and Demondrille will not be complete until it is part of the Federal line, connecting Queensland and Victoria, which will further not only various local interests, but also those affecting the Colony, and by connecting the three great colonies will be an advantage to Australia.

The conveyance of fat stock from Southern Queensland and Western New South Wales to Wagga, Albury, and Victorian markets are obvious advantages to the Colony, but the momentous advantage of being able to save their stock in times of drought by speedily removing them to the New England district or elsewhere would alone justify the people of the town and district of Young in urging their humble Petition.

That, in consideration of the foregoing, your Petitioners pray that you will cause full inquiries to be made as to the just claims of the important town and district of Young before deciding on the construction of any line of railway communication connecting the town of Grenfell with the present system.

And your Petitioners, as in duty bound, will ever pray.

805. The people who have signed this petition may reasonably be presumed to be interested in the "white line"? I think they are all interested in it.

806. With regard to the traffic coming into Young—has the Marsden traffic come to Young in the past? Yes.

807. Do you think that in the future the export from Australia will be in flour or in wheat? If my ideas are carried out, it will be in flour. I think every district like Young, where wheat is grown, should erect

E. Taylor. erect sufficient mills to grind the wheat into flour, and should send the article in its matured state to the markets—wherever they are—whether to the seaboard, Sydney, or otherwise.
26 Feb., 1898. 808. How does the wheat reach England, as a rule—as wheat or flour? I think a great deal of it goes there as wheat.

809. Is it a mixed trade? I think it goes chiefly as wheat.

810. Then that would be against you, so far? It is, so far.

811. What brings you to the conclusion that it is going to pay you better to make the flour in Young, and to export it? We grow the wheat here, we grind the flour here, and we employ the labour and circulate the wages in our own town, and they stop in our own district. Then there is the offal from the wheat. Of course everything is turned into money. Apart from that there will be less carriage to Sydney.

812. Have you anything to prove that a better price will be obtained for the flour ground in Young than for the exported wheat? I believe our flour in many instances brings as much as 10s. a ton more than other flours. The flour ground in Young is as high as or higher than that ground in any other part of New South Wales.

813. Is it probable that flour does not carry so well as wheat, and may deteriorate in carriage? There may be something in that.

814. I notice from the Appendix you have handed in that last year 319,000 bushels of wheat were received at the local flour-mill? That is so.

815. Divide 319,000 by 14 bushels to the acre, and it appears that the mill in Young crushes the produce from 22,000 to 23,000 acres of wheat land? That is so.

816. Is the co-operative flour-mill the only one in Young at present? Yes.

817. Inasmuch as there is an area around Young for growing wheat very much greater than 23,000 acres, it stands to reason that if you are going to crush in Young anything like the quantity of wheat which geographically belongs to it there will require to be a good many flour-mills. If the wheat grown around here is exported as wheat, you will not want any more flour-mills? That is so.

818. The question is really whether you will crush the wheat in Young, or whether it will pass by on the railway to the seaboard? All I can say is that, if my advice is taken, it will all be ground in Young. The mill here has given, on an average, from 1d. to 3d. per bushel more for the wheat than the farmers would have got if the mill had not been here. I told Mr. Greene, this year, when he asked me what we were going to give for wheat, that we were going to give as high as anyone else. He replied, "That is not much." I answered, "We will give you 1d. a bushel more for your wheat than you can get for the same wheat in Sydney, less the carriage." I am able to make a statement as to the amount of land through which the "white line" would pass, which would be given to the Government if that line were constructed. Through Simpson's property it would pass a distance of 1 mile; through Aston's, a distance of 3 miles; through Thackeray's, a distance of 1 mile 32 chains; through Baker's, a distance of 3 miles; through A. Taylor's, a distance of 63 chains; giving a total, approximately, of 9 miles. It would also pass through Crown lands a distance of 7 miles, giving, therefore, a total of free land of 16 miles. In addition, Mr. Cramb has made a verbal promise that he will give the land required, and there are a number of others who say they will make concessions. I produce a letter from the Pastoral Finance Company, giving particulars of the Chilling Works at Young, as follows:—

The Pastoral Finance Association, Limited, Sydney, 9th November, 1897.

The Hon. Secretary, Young Railway League,—

Dear Sir,

Replying to your favour, 5th instant, we beg to state that our statistics of the operations of Young Works do not go back further than the date of our starting there, which was in the beginning of December, 1896; and during three months' operations we treated 27,000 sheep, nearly the whole of that number being chilled for export.

Yours faithfully,

The Pastoral Finance Association, Limited,

W. TYSON, Joint Manager.

John Adolf Rossbach, District Engineer, Young Road District, sworn, and examined:—

J. A. Rossbach. 819. *Chairman.*] What are the limits of your district? The north-western corner of my district is approximately a little west from Marsden; thence I come almost direct to Temora; thence easterly, keeping a direct line to Stockinbingal. There the district boundary makes a little north to a little south from Deep Creek. Then the southern boundary follows a fairly easterly course to a little north from Wallendbeen. The southern boundary still continues easterly through Nubba, Murrumburrah, and Galong; a few miles east from which latter place it turns north-easterly, and passes through Burrowa, close to Rugby, to Narrawa bridge; thence along the Lachlan to Reid's Flat; thence the northern boundary is an approximate westerly line, with such deviations as bring it through Kenyu, Koorawatha, Brundah, Grenfell, Barbingal, and to Marsden. Of course these boundaries are not absolutely right lines, but they will convey to your minds the area of my district.

820. *Mr. Clarke.*] Are you acquainted with the route of the proposed railway from Koorawatha to Grenfell? I do not know it very intimately; I have not been very much over that part of the country. The roads there are not numerous. Although I have driven from Grenfell to Iandra, I do not know the position of the proposed line. It has been surveyed since I have been through there. I know the route of the "white line" better.

821. Which route do you consider best both in the interest of Grenfell and Young? I think the "white line" would benefit the greater number, and that it would be easier to construct. I can only speak generally of the other line, as I do not know its exact position, but it seems to me to cross a little more hilly country, and would be more costly in construction. There is more roll in the country between Grenfell and Koorawatha than there is between Grenfell and Young, and that means a little more earthwork.

822. In the event of either line being constructed, in what way would the road traffic be reduced? The road from Young to Grenfell gets a yearly grant of £600, and I think the traffic between Bulla Creek and Young would be considerably reduced, but between Bulla Creek and Grenfell there would still be a large amount from the farmers resident there which would come to a station at Burrumunda or to Grenfell. For 15 miles the traffic would be very much reduced. The "white line" would also affect the Burrangong and Emu Creek Road, as also the road from Grenfell, *via* Bimbi, to Williams' Crossing on the Bland.

J. A.
Rossbach.
26 Feb., 1898.

S23. How would it affect these roads? I consider that on the Young to Grenfell road the present expenditure of £600 per annum might be reduced by £225. There would be less expenditure on the 15 miles nearer to Young. In the other case—Grenfell to Williams' Crossing—the 8 miles nearest Grenfell would run quite parallel with the railway, and the traffic would be reduced on that portion. I estimate that there would be an increase of traffic from Bimbi, past Arramagong. It would meet at a proposed station at Tyagong Creek. Therefore that road, which is now granted about £150 per annum for 50 miles, should, I think, be granted about £300. Another road—Burrangong to Emu Creek—appears on the schedule for the first time this year, and gets £260 per annum; but I think the expenditure might be considerably reduced, and the "white line" approached by a shorter road, which would bring the traffic to a proposed station at Burrumunda. The saving on that road would be £160. The next road which would be affected would be Clifton, *via* Bimbi, to Caragabal, 42 miles, and it receives £420 per annum. The "white line" would reduce the traffic between Clifton and Thuddungra, assuming that a road were made from Thuddungra to Burrumunda. I would also point out that I have in view extensive repairs between Clifton and Thuddungra, which would be abandoned were the "white line" adopted. At the present time £715 is available on the Loan Estimates for the bridge over Burrangong Creek, at Clifton, but were the "white line" constructed, that bridge might be made on the proposed road between Burrumunda and Thuddungra over the same creek.

S24. What would be the saving on the whole of the line? Whilst there would be reductions on some of the roads, the railway would necessitate the opening up of new ones, so that I think things will be counterbalanced.

S25. In the event of the railway not being constructed between Koorawatha and Grenfell, have you taken into consideration the desirability of constructing a road from Grenfell to Koorawatha? There is at present an unclassified road, which is in the district under the officer at Cowra, which leaves Koorawatha, and comes out at Kelly's Creek. The officer at Cowra has told me he thinks that will be a very desirable road. He anticipates a very heavy traffic upon it.

S26. Have you any idea of the cost of the construction of that road? No.

S27. We have had evidence to the effect that it would cost about £14,000? Of course, it would be a macadamised road for that. It might be cleared and made suitable for traffic for a smaller sum.

S28. In the event of either one line or the other being constructed, a road would still be necessary to enable farmers to bring their produce to market? Yes, to a greater extent than at present. In the event of the "white line" being constructed, and a station established at Bulla Creek, a road is feasible, and I think would be easily constructed from Burrumunda to Jerrybang, which would intercept a road running from Brundah to Jerrybang or Brundah to Monteagle. It might further be extended to landra and catch the traffic on the road from Young to Bumbaldry. Between Bumbaldry and Monteagle the road is not good, and is not vitally affected by the construction of the line. If the country is going to be developed by a railway, the design of the roads ought to fit into it. Instead of running parallel to the railway they should be made feeders to it.

S29. *Mr. O'Connor.*] Do you know the Bland country? Yes; it is extremely flat, with sticky soil, and is subject to floods. I have been from Williams' Crossing to Wyalong. From information I have gathered the country about Williams' Crossing is subject to inundation in wet weather.

S30. *Chairman.*] Do you know the trend of the traffic in the district? Yes, fairly well. In laying down lines to define the traffic which Young gets to the north and the west, I should say that the road from Stockinbingal, passing down the Bland to Marsden, would fairly well be the western limit of that traffic. The northern limit of the Young traffic would, in my opinion, be extended far enough north by taking the road from Grenfell to Marsden. These are the utmost limits of the Young traffic. The railway station at Cowra, and the line from Cowra to Young, furnish the competition in the northern and north-eastern portion of the Young district. The trade of the country lying immediately west from Grenfell, and possibly some distance south from Grenfell, might reach Cowra instead of Young. It is clear that Koorawatha and Monteagle, and such places, by their contiguity, would also eat into the trade. Of course, the importance of a town with regard to trade is always felt. People very frequently deliver goods in centres of population which furnish them with opportunities of getting return goods, and for other incidental reasons which must be known to everybody.

S31. If a railway reaches Grenfell from any direction, what will be the limits of the Young trade? In my opinion, taking into consideration the rates of carriage, the traffic would split between Bulla Creek and the Tyagong.

S32. If a railway is built to Grenfell, will the Bimbi traffic go to Grenfell or to Young? I think it will go to Grenfell, because it is a better road.

S33. What is the distance from Bimbi to Grenfell? Twenty-four or 25 miles.

S34. What is the distance from Bimbi to Young? About 32 miles.

S35. If a railway be in Grenfell and a railway in Young, would the Bimbi traffic make Grenfell or Young? It would make Grenfell, I think.

S36. Do you take into consideration the fact that, once in Young, goods are carried cheaper to Sydney than from Grenfell? Of course, the railway carriage will be greater from Grenfell.

S37. Then the Bimbi traffic becomes doubtful, anyhow? It does.

S38. North of Bimbi the traffic would go to Grenfell? Yes; if a railway be in Grenfell, it appears reasonable to suppose that a line going east from Bimbi, and following along the watershed between Bulla and Tyagong Creeks, would be about the division of the traffic north and south. With regard to the western portion of the district, if a line were taken fairly well direct from Bimbi to West Bland, including Marsden, it is probable that the Marsden traffic would reach Grenfell rather than Stockinbingal. I have already explained that the "white line," inasmuch as it would save carriage to the large bulk of the western trade, would be the best line to construct.

G. Edmund Spark, Young, sworn, and examined:—

S39. *Mr. Fegan.*] I believe you represent Mr. W. S. Millard, saw-mill proprietor and general merchant? Yes.

S40. How long has Mr. Millard been here? Twenty-five years.

S41. Will you give us an idea as to the direction of your trade? We trade right round the district—right on to the Bland.

* 3 (a)—F

- G. E. Spark.
26 Feb., 1898.
842. Where do you get your pine timber from? We get it drawn from Bimbi. For some years past we have had considerable difficulty in getting logs to saw. We have a very large plant for sawing logs. Owing to the dryness of the weather and the state of the roads we have not been able to get logs to keep our machinery fully going. That is due to the distance we are from the timber. If a line were constructed from Young to Grenfell we should be able to get logs from both sides of it, and that would enable us to keep the plant going.
843. Have you any idea what your timber last year amounted to? The sales were about 200,000 feet superficial. If we could get the logs brought from either side of the line we could do with 500,000 or 750,000 feet superficial.
844. In other words, your plant can do three or four times more than it is doing at present? Yes, more than that.
845. I understand that you not only manufacture furniture but that you go in for the building trade? Yes.
846. Does your furniture timber come from Sydney? Yes.
847. What is the freight? If we get it in large quantities—10 or 12 tons—it comes at the miscellaneous truck rate—the rate for building girders—a rate plus 50 % and minus 10 % for furniture timber.
848. What is the cartage for timber from Bimbi to Young? The cartage of sawn timber is sometimes 3s. and sometimes 3s. 6d. per 100 feet. That is what we pay on top of the mill price.
849. Railway communication with Grenfell *via* Young would, I presume, materially assist your establishment as well as give employment to a large number of hands? Yes; and it would also put us in a position to supply timber between Young and Harden.

Reverend William McGrath, Young, sworn, and examined:—

- Rev.
W. McGrath.
26 Feb., 1898.
850. *Chairman.*] I believe you are a priest in holy orders in the Roman Catholic Church? Yes. I have resided in Young for eighteen years, and have a full knowledge of this district, and of Grenfell as well. I had charge of Grenfell for four years. I desire to submit reasons in favour of a direct line from Young to Grenfell. One of the principal reasons for the construction of the loop line from Harden to Blayney was that it might be the means of relieving or lessening the traffic over the Blue Mountains. As a matter of fact, since this loop line has been constructed, coal from Lithgow has been sent to the Demondrille Junction by this line, and on to Victoria. Passengers also from Orange, Molong, Parkes, Forbes, Wellington, Dubbo, and Bourke, travel by this line when going to Victoria. If a line were constructed from Koorawatha to Grenfell and Wyalong all the passengers and traffic would come by that line over the Blue Mountains, thus defeating the principal object in view in making the loop line from Harden to Blayney. There is no population between Koorawatha and Grenfell, excepting three squatters, a boundary rider, and one farmer named Barr. The "white line," on the contrary, would pass through a populous district, and would run within 9 or 10 miles of Thuddingra and Bimbi; consequently it would benefit a very much larger number of people than a line from Koorawatha. In my opinion a line from Koorawatha to Grenfell would not pay expenses, and the "white line" in all probability would.
851. Are there any selectors between Brundah and Grenfell? There are a few, but the area to which I have referred is east from Grenfell. From Brundah going west to Grenfell there is a farming population.
852. You think that the Grenfell traffic should go by the Southern Line, and not by the Western Line? Yes.
853. You contend that the route from Young to Grenfell is well populated, and that the route from Koorawatha to Grenfell, excepting for the first few miles, is not so well populated? That is so.
854. Do you think that is a fair statement of the case? There are a few men on the halves system on Mr. Greene's run, but they may be there to-day and gone to-morrow.
855. Is there not a considerable amount of labour expended on cultivation between Koorawatha and Grenfell? There is.
856. Considerable work has been done there? Yes, on Mr. Greene's station.
857. Do you believe the halves system is likely to be permanent? I do not think so, from what I have heard.
858. Would you make a definite statement about it? I could not be certain; but the report is that the country will be turned into a sheep-walk.
859. Can you show logically why it should be? Yes, if it paid better.
860. Do you think it will pay better to let the country revert to pastoral occupation than to go on with agricultural settlement? I could not give a direct answer to that question. In my opinion, the smaller settlement, in the absolute ownership of selectors, is a more wholesome settlement than any that obtains under the halves system. I base my opinion with regard to a Koorawatha-Grenfell line not paying on an intimate knowledge of the district.

Arthur James Taylor, farmer and saw-mill proprietor, Burrangong, sworn, and examined:—

- A. J. Taylor.
26 Feb., 1898.
861. *Mr Clarke.*] What is the extent of your holding? Six hundred acres.
862. What area have you under crop? I have 550 acres under wheat.
863. How far do you reside from Young? Ten miles on the Grenfell road.
864. Where do you find your market? Young.
865. If a line were constructed from Grenfell to Young, would there be a general increase of land under cultivation? Undoubtedly there would. Wheat growing is only in its infancy at present; there is a good deal of clearing now going on, and we have suitable soil for cultivation.
866. Is the quality of the soil on the "white line" very good? Yes. Three parts of the "white line"—from Young to Grenfell—are very suitable for cultivation.
867. Have you any idea of the character of the land on the proposed line? Yes, I have been through that country. Some of it is very good, and some of it is very bad. The land lying close to the Tyagong Creek is of a very sandy nature and has no body in it. On the hills about the same country the soil is very good.

868. Is there a larger area of good land on the Koorawatha line than on the "white line"? There is a A. J. Taylor. larger area of better soil for cultivation on the "white line."
869. What are the prospects of either of the two lines paying? My idea is that the "white line" would pay far better than the Koorawatha line. 26 Feb., 1898.
870. Why do you think so? The holdings on the "white line" are substantial. They are owned by the farmers. The holdings on the other line are temporary. A man who has settled on the land has his money and interest in it for years to come, whereas people on the halves system only make agreement in the first instance for three years.
871. Do you consider the halves system is not likely to continue? I could not say that; but it has not as good a show of lasting as has permanent settlement.
872. Would the construction of the "white line" have any effect on the Bland trade? Very much so.
873. Where would the Bland traffic go? The Bland traffic would certainly come to Young if a railway were constructed. Most of it comes to Young at the present time, there being no suitable market at Grenfell, and no markets behind.
874. If a railway were constructed from Koorawatha to Grenfell, would it capture the Bland trade? I do not think so. The haulage to Sydney would be so much further and so much more expensive.
875. What do you consider the lowest possible price at which wheat would pay per bushel? It depends entirely on the crop you get. For instance, if I put in 100 acres and get an average of 20 bushels to the acre, which is possible, it could be made to pay at 1s. 6d. per bushel at market.
876. What is the average yield, taking one year with another? Twelve to fourteen bushels.
877. Taking that as an average, would it pay at the price you have mentioned? It would in preference to sheep growing.
878. How do you work it out? My experience is that with careful farming with sheep a good return is 5s. an acre. The other return would be nearly three times that amount.
879. But have you not a great deal more labour in the cultivation of wheat than in looking after sheep? Yes, a little more, but that is not a very great consideration.
880. How much would it cost to cultivate an acre, independent of clearing? It can be done, including ploughing, finding the seed, putting it on, and getting it into the bags, for about 10s. an acre.
881. That means that you will have 10s. an acre to the good? Yes.
882. The difference between 8s. an acre for wheat-growing and 5s. an acre for sheep-rearing is 3s.? That is so.
883. Are you sure that your figures are correct? Yes, I may say that instead of reaping we strip. It is the cheaper way of taking it off. Of course, we lose the straw, but under present conditions it is not valuable to us. If we had a line close to us, and could send the straw to Sydney, no doubt we should cut with binders and save the straw.
884. And that would entail further expense? Yes, a little more.
885. You are perfectly sure that 10s. an acre would cover all expenses from the time the wheat was put into the ground? Yes.
886. Does the 10s. include the cost of seed? Yes; and ploughing, harrowing, taking off, and putting into the bags.
887. Are you the proprietor of a sawmill? Yes.
888. From where do you get your timber? Bimbi and Grenfell.
889. What description of timber do you get? Pine, ironbark, hardwood, and white box.
890. What is your experience of the cost of getting the timber? Sometimes we get the logs reasonably; at other times we cannot get them at all. It depends entirely on the weather. If it is a dry year the teams have to carry feed with them, and we have to go short of logs. If we had a line we could have a constant supply, and could get our supply from a longer distance.
891. Are the supplies about Bimbi likely to prove permanent? Yes; there are some very good forests which are likely to last for a considerable number of years.
892. Do you supply other portions of the Colony than Young with timber? Not at present, but if we had a railway I should have an opportunity of sending it to other parts.
893. Would the "white line" be more suitable than the other? Much more so.
894. Do you think the halves system is likely to remain permanent? Under the present state of affairs I do.
895. What do you mean by the present state of affairs? The working class seem to be more occupied in wheat-growing at the present time than anything else.
896. I suppose that so long as it pays the people who are working at it they will continue at it? I should think so.
897. Do you think the system is likely to exist only for a few years, and then for the farmers to go into grass again? No; I think it is likely to be one of the biggest farming centres of New South Wales, and the system is likely to be permanent so long as the conditions are fair.
898. Do you think the halves system is better than the system of farmers working the land on their own account? I do not know, but it suits the people who do it, because they have not the money with which to take up land for themselves. Most of the land is already taken up, and people who take it on the halves system have not the chance to do otherwise. There is no doubt that the man who is able to work land on his own account gains the most.
899. Do you think those who have worked on the halves system have made money out of it? Yes; I can say they have done very well up to the present out of it.
900. Then you do not agree with the opinion that the system is likely to be only temporary? I could not say. It depends entirely on the affairs of the country in general. I think it is quite likely under the present circumstances to be lasting.
901. How long will the lands under cultivation of wheat continue without being rested or lying fallow? It depends on the nature of the soil. The soil I occupy and work will go for six years without any spell or manuring.
902. What do you propose to do at the end of the six years? To spell it for twelve months or two years, and run sheep on it.
903. Would the natural grass come up again? Yes; as soon as you stopped ploughing the land it would. It would increase in growth year by year.

- A. J. Taylor. 904. Is it not the practice in some parts of the district to sow lucerne? Yes; it pays anyone who can afford it to put down lucerne. It seems to be very profitable.
- 26 Feb., 1898. 905. If the land remained for a few years under lucerne and was then ploughed up again, would it be fit for wheat? Yes.
906. How many years would it go then? It would go then for another five years with wheat.
907. Then under that system the land would be likely to remain in good condition for almost any length of time? Yes; provided the soil is good.
908. *Chairman.*] Did you hear the evidence of Mr. Rossback with regard to the traffic which comes to Young? Yes; three parts of the traffic comes to Young at the present time, and that same traffic would be continued and greatly increased.
909. Then the statement Mr. Rossback made with regard to the traffic coming within certain boundaries to Young is correct? It is.
910. Do you know the various parts of the district from which the wheat comes to Young? Yes.
911. Why does the wheat come to Young? It is the best market at the present time. It comes partly to be milled and partly to be sent out of the district as flour.
912. Does it all go out as flour? It has not done so this year, but in other years it has done so.
913. Would it all go out as flour if you had a sufficiently strong milling-plant? That I could not say. If there were two more mills here, there would be sufficient wheat to keep them going.
914. Do you know the various localities from which the wheat comes? Yes, most of them.
915. Is there a very considerable area of land fit for growing wheat yet uncultivated? There is.
916. Therefore the possibilities of the development of the Young district are considerable? Yes; I may say that farming along the "white line" is only in its infancy at present. A number of people have settled on the land in the expectation of the "white line" being constructed? When it is constructed, three parts of the country will be opened up.
917. Have you anything further to say? I should very much like to see the "white line" constructed. I only work half my time as a sawmiller, and if we had a railway it would enable me to keep my plant going the whole of my time.

James Woodridge, carrier, Young, sworn, and examined:—

- J. Woolridge. 918. *Mr. Tegan.*] How long have you been in this district? About thirty-four years.
- 26 Feb., 1898. 919. Do you own any land? No, but I have been a land holder for fifteen years.
920. What was your area? About 300 acres or 400 acres 6 miles from Young.
921. Did you use it for cultivation? Yes, I grew wheat.
922. What were the conditions of your holding? Conditional purchase.
923. Why did you give it up? I sold out to go into business in town and thought it would be more profitable to do so.
924. Have you been a carrier since then? Yes.
925. How far does your trade extend? It depends; sometimes out on the Bland; also to Lake Cowal, about Bimbi, and elsewhere. The principal trade is on the Bland.
926. What do you principally carry on the Bland? Wool, wheat, and timber. I draw a good deal of timber from Bimbi.
927. Do you draw more timber than wheat or wool? Yes.
928. How far is it from here to the Bland? To the edge of the Bland it is about 22 miles.
929. Has the trade fallen off principally on account of the great distance you have to travel to obtain the timber? It has fallen off a good deal for want of rain. If we had a better rainfall we should have more grass and water. Of course the roads might be heavier, but we can do with that better than we can with a drought.
930. I suppose that whilst the seasons are so dry, carrying does not pay you so well on account of having to buy forage? That is so.
931. What do you charge for carriage from Bimbi? Three shillings and sixpence and 3s. per 100 feet, superficial. Wheat, of course, we draw by the bag.
932. I suppose you bring wheat to Young? Yes. The furthest point from which we draw wheat is 40 miles—around Bimbi.
933. Do you think if a railway were constructed to Grenfell by either route, you would draw wheat from Bimbi? No.
934. Where would you draw it to? It would be carried to somewhere between Young and Grenfell—it depends on where the platform station is.
935. Then there would not be much coming to Young from Grenfell? Not a great deal.
936. How much a bag do you get for wheat from Bimbi? Sometimes 1s. 3d. and sometimes 1s. 4d.
937. Making wheat almost impossible to grow? That is so.
938. A farmer would not get much out of it at that rate? No.
939. Do you carry any wheat from Bulla Creek? Yes.
940. What is the charge? Some give 7d., and some 8d. a bag. The charge about Tyagong is 8d. a bag; from Burrangong Creek, 6d. a bag; and a little further towards Young, 4d. a bag. It depends on the distance.
941. What sort of land did you hold? Very good land.
942. What did you grow? Wheat, principally.
943. What did you get from the land? I have had as much as 20 bushels per acre from it. The average would be about 15 bushels.
944. Can you tell us what it would pay a farmer to grow his wheat profitably? It would depend on the crop. I reckon that if a man can get 15, 16, or 20 bushels per acre it would pay him well at 3s. per bushel.
945. Would it not pay him if wheat went lower than that? He might make a living from it. I consider 3s. a bushel to be a fair thing.
946. You would not like to farm it at 2s. 6d. a bushel? I might if I had plenty of land under cultivation. The more land you have the less price you can charge.
947. What is your opinion, as to where the better land lies? There is no doubt there is good land at Koorawatha, but there is also some bad land.

948. Do you think it is to be compared with any in Grenfell? No; it is nothing like the same country. J. Woodridge.
949. Do you know the district from Young to Grenfell? Yes, it is as good cultivation land as any you can find in the Colony, so long as it gets a fair amount of rain. The country from Koorawatha to Grenfell cannot be compared with the country from Young to Grenfell. 26 Feb., 1898.
950. What kind of grazing country is it between Young and Grenfell? As good as you can find anywhere with regular rain.
951. How long is it since you were at Koorawatha? Two or three years; but I am often backwards and forwards from there.
952. Have the features of the country changed within the last three or four years? Yes; it seems to have gone down altogether for feed. It is worse than it was four or five years ago, and is less productive. This year the wheat was very good, but there has been no wheat there during the last two or three seasons.
953. Has the country between Young and Grenfell improved? It is not improved in one sense, because of the want of rain, but there is more agriculture between Young and Grenfell than there was three or four years ago. More land has been cleared, and more wheat has been grown. Thousands of additional acres are being put under cultivation every year.
954. Do you do much carrying between Koorawatha and Grenfell? Not now; I have not been on that route for years.
955. Then you will not give an opinion as to the grass there? No.
956. Is there not very little grass at present between Young and Grenfell? Yes, there is very little grass at present.

James William Slatyer, coach proprietor and carrier, Young, sworn, and examined:—

957. *Mr. Clarke.*] Have you any idea as to the value of the land on the route from Grenfell to Young, and on the route from Grenfell to Koorawatha? I cannot give you the value as a speculator or valuator, but, as far as appearances are concerned, the "white line" is in the midst of the best land on this side of the Lachlan and of the Temora line. J. W. Slatyer. 26 Feb., 1898.
958. Is the land on the "white line" better than that on the proposed line? Yes; when you come from the Lachlan River in this direction and get on to the Koorawatha route—Iandra and thereabouts—you commence to get into what you may call fairly good country. The further you come this way, whether it be southerly or south-westerly, you get into more good country. It is the good country which the "white line" runs through. I have been travelling about these parts since 1862.
959. Do you know anything as to the population on both routes, excluding the towns of Grenfell and Young? The population on the "white line," both right and left, is far greater than on the Koorawatha route. I have been out to Iandra, and, from what I know of it, there is a population there of men in the ploughing season, but after the ploughing season is over they return to their homes. They are not stationary. They are not the same as the population on the "white line" who are established there.
960. Do you consider there is likely to be less permanent settlement on the proposed line than on the "white line"? Yes.
961. What is the prospect of trade on the "white line" so far as the Bland district is concerned;—do you think it would still come to Young if the other line were constructed? The Bland trade out as far as Curraburrama would come to Young. No doubt the Koorawatha and Grenfell line would tap some of the Bland trade, but it could not interfere with it anything like 30 miles out in a westerly direction. Of course, anything north-west from that the Grenfell route would get.
962. Is it doubtful whether the Curraburrama trade would come to Stockinbingal or Young? It would depend on the state of the roads.
963. Have you any further statement to make? I have read some of the Koorawatha evidence and should like to rebut it. Mr. Wood infers that if a line were made between Young and Grenfell the Grenfell people would get their goods *via* the west to Cowra. He quotes the trainage of the first, second, and third class goods correctly. He says nothing about the special classes. In addition to that, he puts on £1, carriage from Cowra. In the third-class goods he shows that by carrying by teams from Cowra, and getting the goods from Sydney, there would be something like 6s. a ton saved in the transaction. As a matter of fact, that price per ton for carriage really refers to what teamsters called "back carriage" in the wool season. When teams come in from the back country they are glad to take anything rather than go back empty. It is not the standard carriage. I understand Mr. Wood to infer that if the line is made from Young to Grenfell the Grenfell people will, to save their pockets, get their goods to Grenfell with teams from Cowra, as usual. If that is what he means he is quite wrong, because the land-carriage would swamp the whole, as the trainage from Sydney, *via* the South, would be a considerable amount under it. It is all very well to quote these high-classed goods, and not quote the special classes.
964. Have you heard Mr. Taylor's statement as to the advisability of milling as against exporting wheat? Yes; I concur in his opinion. The local manufacture of the article gives a great impetus to labour in the district. Even if the flour has to go across the water there is less risk in carrying flour than in carrying wheat. If you put a bag of flour into the sea you have a better chance of getting something from it than you would have if you put a bag of wheat into the sea, because the whole of the bag of wheat would be destroyed.
965. Did you ever carry on the road from Cowra to Grenfell? I have taken families along there.
966. How did you gain an intimate knowledge of the routes? I have been connected with road carriage for a number of years, and I have watched these matters. Of late the goods have gone principally to Cowra. Occasionally a load comes to Young for Grenfell. I know from the carriers that the rates between Cowra and Young are no different from what they were between Young and Grenfell. I may state that the Cowra to Grenfell road is the worse road of the two.
967. How long ago did you carry from Young to Grenfell? I suppose it is two years since there was any amount of it, but every month or so there is a load going from here to Grenfell.
968. Do you refer to store goods going from Cowra to Grenfell, or to wheat or wool coming from Grenfell to Cowra? No; wheat and those things are lower as a rule, because they are taken as return carriage.
969. Can you say what is the rate for the carriage of wheat and wool for 30 miles? I know what used to be the return carriage from here to Harden, 20 miles, and that is 10s. a ton for flour. Things have been cut down since then, and I presume it would not be less than that now for a distance of 30 miles.

Alfred Aston, farmer and grazier, Arramagong East, sworn, and examined:—

- A. Aston. 970. *Chairman.*] Where is your holding? About 13 miles from Grenfell, and about 22 miles from Young.
971. *Mr. Fegan.*] What is the total area of your holding? About 7,000 acres.
- 26 Feb., 1898. 972. How much have you under cultivation? I had about 400 acres last year.
973. With what result? The wheat went three bags to the acre, and the hay one ton to the acre.
974. Was that a good crop considering the state of the season? Yes, it was a fair crop. I may state that we have had about three and a half years' drought.
975. How long have you been cultivating your land? Eight or nine years.
976. Have you allowed it to rest during that time? I may state that the land the Committee went over yesterday is equal to any in the Colony, and gives as good results.
977. Are you in favour of the construction of the "white line"? Considering that the line would come within 3 miles of my place I ought to be. It would cut through two of my paddocks, and instead of having my property in three pieces I would have it in six.
978. If the "white line" were constructed, would you put more than 400 acres under wheat? Yes; I have 1,000 acres ready for wheat now.
979. Do you know of anyone who would follow your example? I think the Bank of New South Wales at the Kikiamah Station, and the Union Bank, which holds about 30,000 acres, would do the same. They have a lot of land cleared this year.
980. Would that land compare favourably with yours? There is only the Tyagong Creek between us, and I do not see how it can vary very much.
981. Where do you send your wheat? To Young, when I can.
982. Where did you send it last season? To the mill, at Young.
983. What did it cost you to bring it here? One shilling per bag.
984. How many acres will you have under crop next year? 400 acres in one paddock, and a little over 500 acres in another. Then there is another paddock of 48 acres. That makes close on 1,000 acres.
985. Do you know anything about the mining development of the district? I am only sorry to see the country lying dormant, as it is.
986. Do you think the country is a good one for mineral development? I am sure of it. There is stuff here which, I think, will go half an oz. to the ton.
987. Do you think the construction of a railway will give an impetus to the mining industry? I think it will.
988. Do you know anything about the Goulburn valley? I have seen a little of it.
989. Have you worked in it? No; but I have crossed it with cattle.
990. Do you think that you can compare your land, and that surrounding your holding, with the Goulburn valley? Yes, for a distance of 20 miles. In the flat country to Thuddungra, and to the Weddin Mountains, as far as you can get, the land is not to be surpassed.
991. Taking all things into consideration, you think the "white line" would materially assist the prosperity of the district? Yes.
992. How far have you to sink for water on your estate? We have three wells averaging 8 to 9 feet deep—that is on the Burrangong Creek. I reckon that we can supply all the stock in the country. The well you saw yesterday, at one time watered about 2,600 sheep; but this year it will only water about 1,200 or 1,400 sheep. It has gone back a bit.

William James Hills, grazier, Young, sworn, and examined:—

- W. J. Hills. 993. *Chairman.*] Where is your estate? East and west of Young.
- 26 Feb., 1898. 994. What area have you adjacent to Young? 2,200 acres within 4 or 5 miles east of Monteagle platform. I have also 780 acres, 5 miles from Thuddungra, on the west of the "white line."
995. How far are you from Young? 25 or 26 miles.
996. Supposing the "white line" is constructed, how far will you be from it? 14 or 15 miles.
997. Therefore, it would save you about 11 miles carriage each way? Yes. I may say that if the line is constructed, I shall be able to put a larger portion of my land under wheat, as the carriage will be cheaper. I have been in communication with a number of farmers about Thuddungra, and I can state that they will do the same.
998. Do you prefer the "white line" country to the other? Yes; it is far superior. Running north of the proposed line there is a lot of No. 10 wire-grass, and the only way to get rid of it is to plough it up. Country has been offered to me in that direction at about 6s. per acre.

Herbert George Makepeace Thackeray, farmer and grazier, Clifton, sworn, and examined:—

- H. G. M. 999. *Mr. Clarke.*] How far is Clifton from Young? Seven miles, on the "white line."
- Thackeray. 1000. What area do you hold? 11,200 acres.
- 26 Feb., 1898. 1001. How many acres have you under cultivation? I had 1,000 acres last season.
1002. Do you farm on your own or on shares? Principally on shares.
1003. If the "white line" were constructed, would you increase your area under cultivation? Yes, by 1,000 acres.
1004. Would the line from Koorawatha to Grenfell be of any use to you? No, I am too far away from it.
1005. What is your average yield per acre? Last year, which was a bad one, I averaged 18 bushels. I should say that the general average would be from 8 to 10 bushels, taking good and bad seasons together.
1006. What is your opinion of the halves system? I think it is good for both sides. It is good for us. We clear the land, and the farmers repay us in wheat for the clearing. When the land is played out we can lay it down in grass—principally in lucerne and burnet. As long as the lucerne and burnet lasted we should graze, and when that was played out we should put the land under wheat again.
1007. Is the halves system likely to be permanent? I think not. I have 10,000 acres. As long as I can keep going I shall give my farmers fresh lands as theirs become worn out. If, at the end of a certain time, I have exhausted my land and the lucerne is growing sufficiently well I should not think of breaking it up again. If the lucerne and burnet deteriorated I should turn it over again.

1008. Is a good farmer likely to let the land run out? No. It is different with a farmer working on his own land, where he has to do it, and where we have a quantity. It would pay us to get the land cleared. We could make almost as much per acre if we got the lucerne to take well, and we should not have the worry and bother of farmers.

H. G. M.
Thackeray.

26 Feb., 1898.

1009. Then you would let it go back to grazing? Yes.

1010. Would that pay you as well as growing wheat? Yes, provided the country were suitable for lucerne. If not, of course we should have to manure it.

1011. How long would lucerne and burnet grass last? The lucerne would last about seven years with us.

1012. And then you would have to re-plough it and re-plant it? Yes, or put it in with wheat, and then put it under lucerne again.

1013. In the event of the "white line" being constructed, would the trade of the Bland district come to Young? Yes; if the other line were constructed it would go to Bimbi.

1014. Where does the trade of the Bland country come now? Through Thuddungra into Young.

1015. Would the Koorawatha line serve the Bland better than the "white line"? I think not. I think the whole of the fat stock from the Bland would be trucked on the "white line" if it were constructed.

1016. Do you think the evidence you have given as to the land going back into the hands of the pastoralists in a few years would apply to some of the large areas in the Koorawatha district? I think so; in fact, Mr. Greene is the father of the business.

1017. I suppose that whatever proved the most profitable would be followed? Yes.

1018. Whilst some of the people might think that the land should be continually kept under wheat, with rotation of crops, you are of a contrary opinion, and think it would go back to the owners of the land for grazing purposes? Yes, provided the grasses are a success. We should make almost as much from it, and should have no worry whatever.

1019. Still, you would not employ so many people in connection with grazing as you would in connection with wheat? No.

1020. What would be the difference in number? About 20 to 1.

1021. Do you think it possible or probable that those who have large areas of land on the shares system might ultimately sell to the small farmers at a fair price? I think some of them would be only too glad.

1022. I suppose you would be glad to do it? No. I would not care to part with any, but if I had a large holding I think I should.

1023. In that case it would put a good many people on the land? Whilst men can get virgin soil on the halves system they will not buy parts of estates which are worn out or dirtied.

1024. Can you say how far the land, fit for cultivation, west of the "white line" extends towards the Bland? It would take in nearly to the east bank of the Bland, as far as Curraburrama boundary.

1025. Where would the produce of that district go to? To Young.

1026. What is the distance? Thirty miles.

1027. *Chairman.*] You use your land to get the most out of it? Yes.

1028. That is why you are letting it on the halves system? Yes.

1029. How many years do you think you will run it under wheat? As long as I can keep on giving the men new land. They will get about four crops off the land they have at present in about four years.

1030. Would it be dirty or exhausted at the end of four years? It would be dirty.

1031. Then you are going to put lucerne in, and have it under lucerne for a period? As long as the lucerne continues to flourish.

1032. Which you hope will be seven years? I hope it will be fourteen years. I will not break it up if the lucerne succeeds.

1033. Putting it under lucerne is essential to good farming? It is.

1034. If you can see 5s. an acre more by putting it under wheat will you leave it under lucerne? No, I will put it under wheat again.

1035. *Mr. Fegan.*] If the ground is good will it not give more than four crops to wheat? Yes.

Job Fowler, farmer and grazier, Coolagong, near Monteagle, sworn, and examined:—

1036. *Chairman.*] How far are you from Monteagle platform? 6 miles.

1037. How far are you from the "white line"? It runs through one of my paddocks.

1038. What is your total area? 10,000 acres.

1039. What have you under crop? 1,500 acres.

1040. If the "white line" is constructed will you increase your area under crop? Yes; if the "white line" were constructed, and a siding were built it would suit me better for what is grown near to it. Of course, where I live I should not use the "white line."

1041. Are you giving your land for the construction of the "white line"? No, but I will exchange for any Government land. On my place there is a small block which could be exchanged for an equal area. I would accept any access road in exchange.

1042. How far does the line go through your property? $1\frac{1}{4}$ miles.

1043. How long have you been growing wheat? For many years.

1044. Do you regard this as a good country for the production of wheat? Yes; extraordinarily good country.

1045. How long can you cultivate your land from its virgin state until you let it lie fallow? Personally, I do not care to take more than three crops off. Then I would let the sheep run on it for four or five years. After that I would plough it again, and then grow crops.

1046. Your reference to the giving of land was not contained in the statement made by the Railway League? No.

1047. Therefore we must add $1\frac{1}{4}$ miles to the length of the land mentioned by the League? Yes.

J. Fowler.

26 Feb., 1898.

MONDAY, 28 FEBRUARY, 1898.

[The Sectional Committee met at the Court-house, Young, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Koorawatha to Grenfell.

Sydney Bell, stock and station agent, Young, sworn, and examined:—

- S. Bell. 1048. *Chairman.*] Have you had any experience here in connection with bank matters? Yes, extending back to 1863.
- 28 Feb., 1898. 1049. Are you acquainted with the country between Young and Grenfell, and also with the country between Koorawatha and Grenfell? Yes. I understand that the proposed line starts a short distance from the township of Koorawatha, crossing Crowther Creek through Warrangong and Mr. Kinleside's property, and into Iandra; then crossing the Tyagong Creek to Grenfell. A portion of the country there, especially Warrangong and Kinleside's property, is, in my opinion, far better agricultural land than any other portion through which the line will pass.
1050. Going west from Koorawatha, through Warrangong, Kinleside's, and Iandra, the country is good? The best land is through Warrangong and Kinleside's property. I do not think the land is as good for agriculture after you leave Kinleside's. Again, north and north-west of the line the country is much more broken, and there is less agricultural land there than there is on the south side. Mr. Geisow, who surveyed the line from Demondrillo, after finishing the survey, came to me and asked me to give him an idea as to the route he should adopt from Young to Forbes. He brought the maps to me and I pencilled out what I thought was the most practicable route for the railway. On his return from Forbes he said I had reduced the work for him by at least three months, as he had been able to follow my suggestions very closely. In only one instance had he occasion to deviate from the line I had marked out.
1051. That is the "white line"? No, almost the same as the "white line." There is a little deviation from the Tyagong into Grenfell. I have been through that country before there was any fencing or improvements on it, and am very well acquainted with the country from here as far as Lake Cargollico. From the junction of the line to Grenfell from Young—if carried out—about Queen's Crossing, 5 miles from here, the line passes down the valley of the Burrangong Creek, and I am told by some of the old farmers from Victoria that the land in the valley there is quite equal to the land in the Goulburn Valley. As regards the Young to Grenfell route, there are very few acres between here and Grenfell which are not fit for the plough.
1052. Can you make a comparison between the Koorawatha and Grenfell route and the Young and Grenfell route in regard to the agriculture of to-day? There is no question that on Koorawatha, Iandra, and Brundah there is a larger extent under cultivation at the present time. Preparations are being made for a considerable extent of agriculture on the "white line," and to the westward. Again to the westward, on the stations owned by Mr. Burrett, and some others, there is a very large tract of first-class agricultural land—as good as you will find anywhere in the district. It is Crown lands, and it will, before many years have passed, be thrown open for selection. It is country which is intersected by the Burrangong Creek. One reason why more land has not been put under cultivation on the "white line" is that the roads leading into Young have not been as good as in other parts of the district.
1053. What is the population on the two routes? The population on the "white line" is larger than that on the proposed line, but at times—such as harvest times—the population on the proposed line would be a little greater. It is, however, of a migratory nature. I may say I am thoroughly acquainted with all the country on this side of the Lachlan, and I think the views of the District Engineer for Roads as to the Bland country are fairly accurate.

Thomas Chapman, manager, Co-operative Flour-mill, Young, sworn, and examined:—

- T. Chapman. 1054. *Chairman.*] Have you seen the Appendix to the statement of the Chairman of the Railway League? Yes.
- 23 Feb., 1898. 1055. Would 319,000 bushels of wheat come off 22,000 acres of land, or an average of 14 bushels to the acre? I believe the area would be larger. I would give the average at 12 bushels. That would make the acreage 25,000 acres.
1056. *Mr. O'Connor.*] How long have you been in Young? Since 1880.
1057. Do you buy wheat very largely? Yes; we have bought the chief part of the wheat which has been sold during the last eight years.
1058. Do you buy wheat from Grenfell? Yes; the Grenfell trade is a very considerable item. In fact, some of the best farmers live at Grenfell, and we have a preference for the carefully-grown wheat of Grenfell as distinguished from the halves wheat.
1059. Have you bought wheat from the growers on the "white line," excluding the large estates? Yes; we have reckoned up 2,500 tons from there last year. Since the mill has been established it has increased its customers, and last year was a record for the district, namely, 2,500 tons exclusively from the settlers along the "white line" and the Bland.
1060. What is the capacity of your mill? The capacity for grinding is 320,000 bushels per annum, or a ton an hour.
1061. Do you think there would be room for another mill or two here? According to the amount of wheat grown last year and this year there is plenty of room for extension.
1062. Have you any preference for different wheats? Yes; a decided preference for three classes of wheat which I encourage the farmers to grow with all the persuasion of which I am capable, namely, the Purple Straw, the Tuscan, or the White Lammas.
1063. Is there any difference in the production of the man who owns the land himself, and who employs labour, and the man who works on the half-share system? There is a marked difference. The wheat grown on the halves system generally shows signs of careless cleaning, careless reaping, and careless bagging. I have a decided preference for the wheat that comes from the owner who cultivates the ground himself. Our books show the treatment of the wheat grown on the halves system to be more severe than the treatment of the wheat purchased from the working owners.
- 1064.

1064. Would not that be removed by greater diligence on the part of the men? Yes; but the lower prices offered for the halves wheat do not seem to increase the spirit of improvement as they should do.
1065. As a matter of fact, then, they have to pay the penalty by taking a lesser price? Yes; there is a penalty, either in less price or deductions per bushel.
1066. What have you paid for wheat during the last twelve months? 4s. 6d. to 3s. per bushel. The minimum was 3s. per bushel.
1067. What is the price at the present time? It is for sale at 3s. 6d. in the town now.
1068. Is that clear cash? Yes.
1069. What was the price on the 1st January last? 3s. 9d. per bushel. Our chief stock was purchased at that price.
1070. *Chairman.*] What is the rate of railway carriage from Koorawatha to Young? Three shillings a ton, or about 1d. per bushel.
1071. How much more could your mill crush at present? It would have to be enlarged to do more. The sellers of wheat who come to me to make their sales—chiefly from the Bland—say they are too far away when wheat is cheap to cultivate at a profit, and their exertions are weakened by the lack of cheap carriage to market. That is the complaint of the Bland people. If the "white line" is constructed, I feel sure that the wheat from the large estates will come down the "white line." The townspeople of Young have endeavoured to make the buying capacity of the mill large enough for the district; but the development of cultivation has overreached that for the moment, and something will have to be done to meet the case. Any wheat grown on landra would find its way down the "white line," because of its close proximity to the railway siding. The Grenfell trade to us is about 300 tons of flour; we sent that from here to there last year; and the Grenfell trade is an item in our business worth considering. The old line would bring them to their natural market, which the people have tried to cultivate, and would place within reach of the Grenfell and Bland people the markets of Young, Murrumburrah, and the market of Goulburn, which is almost as large as the two towns put together, whilst on the other line there is only one market worth considering, and that is Bathurst. The amount of trade, or the amount of nearness to the selector, would be increased by a line going from Young to Grenfell to a greater extent than it would be if the proposed line were constructed. It would bring more settlers under its influence, enable them to cultivate more largely than they do, and bring the land suitable for wheat-growing under cultivation.
1072. What is the cost of taking a ton of flour from Young to Grenfell? Fifteen shillings.
1073. What is the cost of taking a ton of flour from Young to Koorawatha by rail? Five shillings—that is within a copper or two.
1074. Will the future export trade from Australia be done in wheat or flour? Can you name the country to which it will be exported?
1075. Say England? It would be better to export wheat there on account of the long journey and the close confinement of the produce when it is stored away.
1076. Does wheat carry better than flour? Yes, because of the fibre covering the kernel. The flour would absorb any odour that was near to it.
1077. Do they export the grain in countries which do their exporting mostly by sea? Yes; the Southern States of America and California, for instance. The flour from California is put into wood, and that protects it from odours in the holds of the ships; but the chief thing which is encouraged in the old country is the importation of wheat. There are wheats from different countries—India, Russia, River Plate, Manitoba, and San Francisco—which are of different classes—different in gluten and strength, and they use them to blend to make flour suitable for different districts. There is one class of grain which finds its way into Liverpool, and a different kind of grain which finds its way into London. The supply is affected by the question of taste and closeness to markets.
1078. If Australia exports eventually to countries which can only be reached by a long sea voyage, will that export be mostly in grain? I think so. I may say that Australia could not adopt the same means of exporting flour that America adopts. They have not the material and the timber with which to cover it so as to insulate it from the odours in ships' holds.
1079. How long would wheat retain its strength? If it were stored under the same conditions that animal life would be stored, it might last for an indefinite length of time. It would require clear ventilation. Otherwise it would breed insects and weevils to such an extent that in a year or two only the bran would be left.
1080. Would it last five weeks? You can store wheat in a healthy locality for five years. I once had charge of a mill which produced sixty bags an hour, and we ground many cargoes of wheat which had come long journeys—some from India and some from the River Plate—and in all cases, when investigation took place, the faults which existed all pointed to damp shipping. If wheat is shipped dry it will keep for an indefinite period, but if it is shipped with more moisture than its surroundings contain it will go bad.

William McIntosh, railway station-master, Young, sworn, and examined:—

1081. *Chairman.*] How long have you been at Young? About four years.

1082. Have you any returns to present? Yes, as follows:—

YEARLY Return of Traffic at Stations.

Date.	Goods Traffic.			Live-stock Traffic.								Wheat— No. of Bags outwards.	Wool— No. of Bales.		Coaching.		
	Inwards.	Outwards.	Revenue.	Inwards.				Outwards.					Revenue.	In.	Out.	No. of Passengers.	Revenue.
				Horses.	Cattle.	Sheep.	Pigs.	Horses.	Cattle.	Sheep.	Pigs.

* 3 (a)—G

W. McIntosh.
28 Feb., 1898.

- W. McIntosh. 1083. Has there been some live stock trucked for Sydney from Koorawatha by the Southern line instead of going by the Western line? Yes.
- 28 Feb., 1898. 1084. What is the reason of that? It is much more convenient for the Department to carry it *via* the south, for this reason: If the Railway Department compelled the owners to truck at Koorawatha in the morning for the morning train, the stock would have to stand in Cowra the whole of the day until the evening train, as there is no corresponding train to run west. In the case of stock loading at Koorawatha, of late, specials have had to be put on to carry it. This has simply been done because it has been more convenient for the Department to carry it that route.
1085. Have the grades anything to do with it? That is not the objection. It is simply to prevent the inconvenience of the stock standing at Cowra all day.
1086. Do you know what rates are charged? All traffic from branch lines is charged as if coming by the shortest route, independent of which way it comes.
1087. Do you know the district? I know there is a good deal of wheat coming in from the district through which the Young to Grenfell survey passes.
1088. What traffic does the Monteagle station obtain? Generally Darling Harbour. It depends on what convenience Darling Harbour has for dispatch.
1089. It is not a question of preference to south or west? No, it is a question of convenience at Darling Harbour.
1090. Do you know of any goods consigned to Young, *via* the Western line, from Darling Harbour? No. Even traffic from Richmond, though it is a mile or two shorter *via* the west, has on several occasions come by the Southern line. The general traffic from suburban stations and Darling Harbour comes by the Southern line.
1091. Last year you sent away 5,050 bags of wheat or flour from the railway station? Yes, of wheat.
1092. That means that 20,000 bushels of wheat which reached Young went away from Young without being ground? Yes, it was despatched by train.

Donald McKenzie, butcher, Young, sworn, and examined :—

D. McKenzie. 1093. *Chairman.*] Have you had much experience of the district of Young? Yes, for over thirty years. Formerly, I was a pastoralist.

28 Feb., 1898. 1094. Have you any statement to make? I cannot say that I know a great deal about the Koorawatha line, but I am acquainted with the "white line." I hand in a list of residents who will be benefited by the "white line." The list shows the distance they reside from the line :—

Anderson John	1½ mile.	Hooper Jas.	on line.	Rumble W.	1 mile.
Aston A.	on line.	Hargrave F.	close to line.	Shannon M.	close to line.
Anderson D.	1½ mile.	French Thos.	on line.	Simpson John	on line.
Baker W. and R.	on line.	Hunter Wm.	close to line.	Simpson Jas.	on line.
Baker John	1 mile.	Hughes Thos.	close to line.	Singleton T. S.	1½ mile.
Barr Wm.	on line.	Joyce E.	2 miles.	Taylor A. V.	on line.
Bailey Hy.	close to line.	Jarred Wm.	1½ miles.	Thackeray H. G. M.	on line.
Brown Arthur	on line.	Joyce Thos.	on line.	Taylor A. J.	on line.
Cramb Peter	on line.	King Jno. H.	on line.	White C.	1 mile.
Clode J. F.	1½ mile.	Lynch Bros.	2½ miles.	Webb H.	on line.
Canor John	close to line.	Marooney John	1 mile.	Webb G. J.	on line.
Crowe Patk.	close to line.	Nash A.	3½ miles.	Webb C. D.	1 mile.
Crowe Paul	close to line.	Massey A. G.	on line.	Quinn Thos.	on line.
Crowe Wm.	close to line.	Powell P.	1 mile.	Caldwell J. A.	10 miles.
Crowe Patk.	close to line.	McNamara T.	1 mile.	West Thos.	12 miles.
Dempsey Richd.	2 miles.	Myers Hy.	2½ miles.	Mackenzie J. W.	9 miles.
Dempsey F.	2 miles.	Martens A.	close to line.	Hargrave Jas.	5 miles.
Dempsey P.	2 miles.	McKenzie D.	close to line.	Regan W. G.	15 miles.
Doherty H.	1½ mile.	McNickel A.	4½ miles.	Light P. J.	4 miles.
Dooley Geo.	close to line.	Martin G.	1½ miles.	Cusack J. E.	4½ miles.
Fitzgerald M.	on line.	Martin A.	on line.	Flanagan Jas.	4 miles.
Frudenstein F.	3 miles.	Napier John	1½ mile.	Crowe Paul	3 miles.
Gorman J.	1 mile.	Powderly C. and W.	on line.	Crowe T. M.	1½ mile.
Flanagan J.	2 miles.	Plowes J. T.	close to line.	Walsh P. J.	3 miles.

There are many more residents within reasonable distance of the line who are not mentioned in the list.

1095. How far out from Young does the list commence? About 4 miles.

1096. How far on the Young side of Grenfell does it cease? About 6 miles.

1097. Therefore, these people are resident contiguous to the line on approximately 20 miles of country? Yes; the majority of them are within 20 miles of Young.

1098. Have you any further statement to make? I consider that the "white line" would command all the trade between the Bland Creek, and as far down as Curraburrama. I contend that the whole of the country from the "white line" to the Bland is country which would be served by that line. The country extends for about 30 miles.

1099. Do you care to make any statement with regard to an extension over the Bland country? I think it would be a very bad route for a railway. As a rule, it is subject to flood and is very rotten country. The water extends a great way over it in flood-time. I think it would be a very expensive line to construct and maintain.

1100. Do you desire to make any statement, with regard to the question of statistics? I can confirm the distances mentioned in the statistics of the holdings from the "white line." They do not exceed a distance of 5 miles from the "white line," with the exception of four or five holdings.

1101. Have you any knowledge of the agriculture on the Kikiamah, Burrumunda West, and the Arramagong holdings? I know there is a great amount of country which, in the event of the "white line" being constructed, would be put under cultivation in a short period. This country lies pretty much on the west side of the "white line." Operations are going on there now for the cultivation of land. If the line be constructed from Young to Grenfell, it will serve Grenfell, the country north, a portion of the country east, and the country west.

1102. In your opinion, will the "white line" serve the district better than the Koorawatha line, or fully as well? Fully as well.

John

John Forsythe, storekeeper, Young, sworn, and examined :—

1102½. *Mr. O'Connor.*] How long have you been in Young? Over fifteen years.

1103. With what district do you carry on business? Monteagle, the Bland, and out Temora way—a distance of 40 miles.

J. Forsythe.

28 Feb., 1898.

1104. What effect would the "white line," if constructed, have on the trade of the district? In my opinion the "white line" would be a great convenience to the residents along it. I can say, honestly, as a business man, that I would just as soon that neither of the lines were built at all; but if either is to be constructed, that will be more beneficial to the larger number of people.

1105. How far do you send goods towards Grenfell from Young? I send out to Arramagong, a distance of 25 miles.

1106. Would it be a fair thing to state that Young, in store goods, pretty well controls two-thirds of the distance to Grenfell? I think so.

1107. What effect would the Koorawatha line have on the Young trade? I think it will just about settle it. I do not think that it will do many settlers much good, and it cannot do business people much good. I do not know what effect it would have upon Grenfell, but as far as Young is concerned most of us would have to look for fresh positions.

1108. What is the commercial position of Young? We have five banks here, and if that is any guarantee of the stability of the town we are well off. The business of the banks extends over a large scope of country. Commercially Young has been, and no doubt will continue to be, the centre of this large district, including the Bland, if we are not cut off by railways. When I first came here we had a large scope of country, but it has been reduced. The Temora line took a certain amount of it. The land is now more closely settled between Young and Grenfell, and all the farmers are *bona fide*. At the present time they are the most substantial support Young has, and if a line be constructed from Koorawatha to Grenfell I take it that the majority of these people will go to the nearest point of railway communication, and we shall lose their trade. The town of Young has in the past made strenuous efforts to become a large commercial centre. It has erected a flour-mill, a butter factory, and meat works. A large amount of capital has been expended in the erection of these properties, and if our commercial and trading circumference is limited these institutions must of course fade away. For that reason I think we are entitled to be considered in the construction of a railway. With regard to the Co-operative Flour Mill, of which I have been chairman for a number of years, we have had plans before us for its enlargement which will entail the expenditure of a certain amount of money. The directors have been seriously considering the advisability of enlarging it to twice its present capacity. The mill will either have to be enlarged or other mills erected to take some of the trade which our mill has had to let pass. The mill has been a large feeder to the railway. We send flour as far as Newcastle, Sydney, Wyalong, Cooma, and all quarters of the Colony. Grenfell is a very large supporter of the mill.

1109. Would the construction of the railway do the district a great amount of good? The construction of the "white line" would. It would induce many persons resident upon it to go more largely into agriculture than they have done in the past. They are already making large additions to their cleared land. We have twice as much land under cultivation on the "white line" as we have had in the past.

John Marooney, farmer and grazier, Lower Coolagong, sworn, and examined :—

1110. *Chairman.*] Where is Lower Coolagong? Midway between Young and Grenfell, and 3 miles from the "white line" on the eastern side. J. Marooney.

1111. Have you any statement to make? Yes; I desire to hand in the following statutory declarations from residents of Thuddungra :— 28 Feb., 1898.

Bulla Creek, 25 February, 1898.

WILLIAM HUGHES, Thuddungra, Young :—I am a farmer; I was misled when I signed for Koorawatha to Grenfell line; I publicly withdrew my name when I found my error; I am about 10 miles to the west of the Young to Grenfell line; the Koorawatha to Grenfell line, if made, will be of no use to me; I am in favour of the "white line," that is Young to Grenfell; my market is Young and Sydney; I own 452 acres; I farmed 100 acres last year; if the "white line" were built it would induce me to increase my agricultural area. I run sheep on my land; they pay me well.

his
WILLIAM x HUGHES.
mark

The above statement was read over to Hughes, and he appeared to fully understand the nature and contents thereof, and it was duly signed and witnessed in my presence by me,—JOHN C. WATSON, J.P.

Bulla Creek, 25 February, 1898.

GEORGE McLAUGHLAN, Kikiamah :—I signed for Koorawatha to Grenfell line in error; I find the Koorawatha line, if built, will be of no service to me, as I live about 8 miles west of Young to Grenfell line; if this line be built it will serve my purpose; my market is Young and Sydney; I own 640 acres on Kikiamah Holding; I farmed 80 acres wheat last year; I am increasing my area up to 120 acres this year; if railway communication is offered me by the "white line," I shall still further increase my wheat area; I also run sheep on my land.

G. McLAUGHLAN.

Signed in the presence of and witnessed by,—JOHN C. WATSON, J.P.

Bulla Creek, Young, 25 February, 1898.

CHRISTOPHER BYRNE, Thuddungra, farmer :—I publicly withdraw my support from the Koorawatha to Grenfell line, as I was misled into signing for it; I am about 11 miles west of the Young to Grenfell line; this line I support; the Koorawatha line, if built, would be of no use to me; my markets are Young and Sydney; I farmed last year 100 acres of wheat; this year I am putting in over 250 acres; if the line I favour is built, I shall be enabled to increase my wheat area.

his
CHRISTOPHER x BYRNE.
mark.

The above statement was read over to Byrne, and he appeared to fully understand the nature and contents thereof, and was duly signed and witnessed in my presence by me,—JOHN C. WATSON, J.P.

Bulla Creek, Young, 25 February, 1898.

CHARLES PALMER WILLIAMS, Pine Grove, Thuddungra :—I am a farmer; I own 570 acres, of which I farmed 160 acres; my land, for sixteen years, has given me an average of over 15 bushels per acre, of wheat; I oppose the Koorawatha to Grenfell line, as it would be of no service to me or this district; I am about 11 miles west of the Young to Grenfell line; if the "white line" is built it will stimulate me to increase my farming area at once; my markets are Young and Sydney.

CHARLES WILLIAMS.

Signed and witnessed before me,—JOHN C. WATSON, J.P.

Bulla

J. Marooney.

28 Feb., 1898.

Bulla Creek, Young, 25 February, 1898.
HENRY E. HUGHES, Thuddungra, Young:—I am a farmer, and supporter of Young to Grenfell line; the Koorawatha to Grenfell line will be of no use to me if built, as I reside about 9 miles west of the "white line"; Young is my market town; I farmed about 14 acres of wheat last season, and I am going to farm about 100 acres this season; if the "white line" were built it would be profitable to this district, and bring more acres under cultivation.

HENRY E. HUGHES.

Signed and witnessed before me,—JOHN C. WATSON, J.P.

Bulla Creek, Young, 25 February, 1898.
HUGH McALISTER, Thuddungra:—I am a farmer and hotel-keeper on the Bland road; if the Koorawatha to Grenfell railway is made, it will be of no use to me as I reside 10 miles west of the Young to Grenfell line; that is the line I support; I farmed over 50 acres last year; I will put in 160 acres of wheat this year if the "white line" is built; I can profitably increase my area, and will do so; my total area is 370 acres; my market lies at Young and Sydney.

J. HUGH McALISTER.

Signed and witnessed before me,—JOHN C. WATSON, J.P.

Bulla Creek, 25 February, 1898.
WILLIAM CAUSER, Thuddungra:—I am a farmer and grazier; I own 530 acres; I had over 40 acres under wheat crop last year; I purpose putting in 200 acres of wheat this year; the Koorawatha-Grenfell railway will be no advantage to me as I am 9 miles west of the Grenfell to Young proposed line: if this line (the "white line") is made, I will increase my cultivation as it will pay me to do so; my sheep pay fairly; wheat pays me better; my market is Young and Sydney.

WILLIAM CAUSER.

Signed before and witnessed by me,—JOHN C. WATSON, J.P.

1112. *Mr. Fegan.*] How long have you lived at Lower Coolagong? All my life.
1113. What area do you hold? 5,500 acres.
1114. How do you utilise it? By farming and grazing. I have 1,020 acres cleared. Last year I had 330 acres under wheat, and 35 acres under hay. That does not represent my usual sowing, the season being a dry one. The wheat averaged 7 bushels to the acre last year, and I had 50 tons off the 35 acres of hay. The previous year's average was 12 bushels to the acre.
1115. How long have you been cultivating your land? For twelve years, on my own account.
1116. What is the general average, taking good with bad years? About 12 bushels to the acre.
1117. How many sheep do you run? About 6,000 at present. I run more than a sheep to the acre.
1118. What was your clip last year? Ninety-four bales, or 6 lb. 10 oz. to the sheep.
1119. Is that a fair clip? Yes; considering the year.
1120. What is the lowest price at which you have sold wheat? Two shilling and twopence per bushel.
1121. Did it pay at that price? Yes; it paid better than sheep.
1122. Do you employ labour? Yes.
1123. We had evidence on Saturday to the effect that you could plough, sow, reap, and mow for 10s. an acre? I think it could be done at that.
1124. Therefore, at the price of 3s. 6d. a bushel, wheat can be grown at a nice profit? Yes.
1125. How far are you from the Young main road? There is a road running through to connect with the main road at Landra west, *via* Monteagle, and I am right on it.
1126. How far are you from Monteagle? About 9 miles. I send my produce to Monteagle, and thence to Young by rail.
1127. How far would the "white line" be from your holding? Half a mile, and 3 miles from my residence.
1128. Then that would suit you better than the other line? Yes; if there were a platform at Bulla Creek I should save from 3s. to 3s. 6d. a ton on wheat, and 3s. to 4s. a ton on the carriage of wool.
1129. What does it cost you to take your produce to Monteagle? From 7d. to 8d. a sack, or about 6s. 8d. a ton. From Monteagle to Young it costs about 1s. 8d. a ton.
1130. Is there any difference in the cartage in good seasons as compared with the last two dry seasons? I do not think so. The cost of cartage is as cheap now as it has been for some time.
1131. I suppose the distance from a railway keeps you and others from having a larger area under cultivation? Yes, it has a deterring effect.
1132. If the "white line" were constructed, would it give an impetus to wheat-growing? Yes, I would continue to clear land.
1133. Did you take a prominent part in the agitation at Bulla Creek for the "white line"? Yes.
1134. What is the general opinion of the people about there regarding the "white line"? The opinion is that if it is constructed there will be a greater area of land under cultivation out there.
1135. Do you know both routes fairly well? Yes; I should say that the soil on the "white line" is superior to that on the Koorawatha line. The soil on the Koorawatha line, for a good part of the distance, is of a very sandy nature. A good deal of the country was thickly covered a little time back with what they call No. 10 grass. Wherever that grows luxuriantly the soil is of a sandy nature. I think the presence of this No. 10 grass seed had a great deal to do with landholders in that part of the district going in for agriculture, because where it exists to such an extent as it did there the land is practically unfit for pastoral purposes.
1136. Under those circumstances the people in the Koorawatha district should not have the same number of bushels to the acre as you have here? I would not go so far as to say that.
1137. There must be a difference if the soil is inferior there? A sandy soil will grow crops very well for two or three years, but it will not last so well.
1138. Do you remember any agitation prior to the present one to connect Young with Grenfell? Yes. The line was promised, and two routes were surveyed, and I believe land was reserved as far back as 1883, and there is no doubt that that has conduced to settlement to a great extent along the route.
1139. Do you farm your land yourself? Yes. I have one halves farmer who is putting in 500 acres.
1140. What is your opinion of the ultimate result of the halves system? I should say that as the system develops the farmers will be found going further afield. They will not continue farming land if they can get virgin soil. The farmers are at the present time leaving landra every year—in fact, some of them are coming over to the "white line" district.
1141. Do you know how many have left Landra this season? No; but I know of two. They are taking land on the halves system at Burrumunda Troy.

1142. Do you think the halves system has come to stay? It is questionable. When the land begins to get worked out it is questionable whether the tenants will continue to work it when they can get new. J. Marooney.
28 Feb., 1898.
1143. Do you think they will only work on the halves system until they get sufficient capital to start for themselves? I think so.
1144. How far would the Koorawatha line draw traffic from Grenfell? Not more than 6 miles.
1145. Have you seen the names mentioned in the statistics presented to the Committee? I have seen a lot of them.
1146. Do you know whether the whole of them ought to be included in the statistics? I should say so. I know the statistics were taken very hurriedly.
1147. Do you think they are fairly correct? Yes.
1148. Have you anything further to say? It has been stated that the country adjacent to the "white line" is inferior to that along the proposed line from Koorawatha, and is composed of steep ridges. About 7 miles on the Grenfell side of Koorawatha, however, we have a tract of country, commonly known as Crowther Mountain, which could not be exceeded for roughness in New South Wales. This land is unfit for cultivation, whilst any ridges on the "white line" are all good grazing lands. I consider that Crowther Mountain is not fit even for that. It would not carry one sheep to 50 acres. Again, on the other side of the Koorawatha route, we have the Waterfall Hills. I do not think any man in his senses would think of cultivating those. After we pass Mr. Wood's Station, we have another rough tract of country between there and the Grenfell-Cowra Road, which is not fit for cultivation.
1149. Is the area of good arable land, as extensive on the Koorawatha route as it is on the route to the "white line"? I should say not. The Koorawatha route runs right through the valley of the good lands which lie there. It is not backed up by country on the other side. As you get towards Bumbaldry it is very rough country indeed. Some of it is hardly traversable. I think the roughest land on the "white line route is just on the line."
1150. You do not know the area of the good land on the other side? No.
1151. Therefore what you say now is more guesswork than anything else? Yes.
1152. Having travelled over both routes, not knowing the area, you are of opinion that there is much better land on the line known as the "white line" than on the proposed line? That is my opinion.
1153. Have you anything further to say? It has been said that lucerne has been laid down on cultivated land to recoup and cleanse it. I think that when lucerne is laid down, particularly by pastoralists who are breeding crossbred sheep, it is laid down to recoup the banking account. The quickest method of cleansing land is by fallowing it, and running it down with sheep. It is not an easy undertaking to plough up a lucerne-sown field; the roots are of a tenacious character.

Romer Meadows, Inspector of Stock, Young, sworn, and examined:—

1154. *Chairman.*] What are the limits of your district? Sixty miles each way. Young is the centre. R. Meadows.
28 Feb., 1898.
1155. What is the number of stock in your district? Cattle, 31,475; sheep, 1,525,551; horses, 10,860—that is for this year.
1156. Could the district run more stock than that? Last year there was more. The number is less this year on account of the drought. This year there is a decrease in horses of 9.75 per cent.; in cattle, 8.22 per cent.; in sheep, 8.65 per cent.
1157. Is there an improvement in the class of stock? Yes.

John Donald Mackenzie, grazier, Thuddungra, sworn, and examined:—

1158. *Mr. O'Connor.*] Where is Thuddungra? On the verge of the Bland and the Young district—18 miles from Young. J. D. Mackenzie.
28 Feb., 1898.
1159. How many acres have you? 3,350.
1160. How do you utilise it? By carrying stock on the whole of it. The railway communication I have at the present time will not admit of its cultivation.
1161. If a line is constructed from Koorawatha to Grenfell will it do you any good? No.
1162. How would the "white line" suit you? It would suit me better. I should only be 12 miles from it.
1163. How many sheep do you run at present? I have 5,000 sheep. I may state that I have been dealing in stock, and in years gone by I have shorn as many as 12,000, but of late I have only been shearing from 4,000 to 5,000.
1164. Are there many settlers about your place? A good number.
1165. What is your opinion of the proposed line? I strongly support the "white line," and so do my neighbours. I may state that there are a good number of inhabitants and permanent holders close to that vicinity who are strongly in favour of the "white line." A number of people out there who have signed in favour of the Koorawatha-Bimbi line were in a fog at the time as to what to do. If the railway does not go beyond Grenfell they are strongly in favour of the "white line," but at the present time they favour a Koorawatha to Bimbi line. I may add that had the Federal line been constructed during the last year or two, no doubt a number of stock could have been saved by the aid of it in getting them to pastures, I myself signed in favour of the Koorawatha-Bimbi line prior to any steps being taken by the Young people to advocate the "white line." If such a line came to Bimbi it would be within 6 miles of me.
1166. Do you know the country well? Yes; and the whole of the country between the "white line" and the Bland is fit for cultivation, but you must use your own judgment as to seasons. Some you can cultivate for years, but others you must cultivate in accordance with the seasons. From Young to Williams' Crossing the distance is 60 miles. If the "white line" is constructed a number of the people in the Bland district will go in for farming. The soil is admirably adapted for cultivation.

John

John Carlton Watson, grazier and farmer, Greenbank, near Young, sworn, and examined:—

- J. C. Watson. 1167. *Mr. Fegan.*] What is the area of your holding? Approximately, 18,000 acres.
- 28 Feb., 1898. 1168. What is the area under cultivation? I have 2,000 acres in course of preparation, and I expect, if the season will permit, to have not less than 1,000 acres under wheat, and perhaps more, with the prospective intention of putting it into grasses.
1169. Have you any statement to make? A great number of people in the immediate vicinity of Koorawatha and thereabouts now make use of the Western rates to send their produce by the Southern line. I may point out that that is bad business for the railway. With regard to the Burrangong Valley, it has been proved that there is an almost inexhaustible supply of water there. I have had it brought under my notice within the last few days that tomatoes, melons, and cabbages have been grown there notwithstanding the drought we have had. They are equal to anything which has been sent to the Young district from the Richmond and Hunter Rivers. If the "white line" is constructed it will enable those parties upon its confines to go in for these auxiliary aids, and supply Sydney and the district, instead of calling upon us to draw our supplies from the Hunter and Richmond Rivers, and it will enable us to export. There are other minor industries, such as the production of poultry and eggs, which can be increased with railway facilities. I think the credibility of the Koorawatha statistics has a right to be impugned, because it is within my knowledge that the names of parties have been obtained who will have nothing to do with the Koorawatha to Grenfell line, but who are in favour of the "white line."
1170. Can you give us the names and the areas? I know of the name of one party which the Chairman of the Grenfell League says he is in doubt about—George McLaughlan. His area is 640 acres, and last year I think he had 80 acres under cultivation. He has given evidence to the effect that he will increase it to 120 acres.
1171. Do you know of any other names? There is Edwards, who is in Thuddungra. His area is something under 300 acres.
1172. Have these men given you that information? McLaughlan did.
1173. We have already got McLaughlan's evidence, and also that of Hughes and Williams? There are several. Twenty-five or twenty-six years ago the land in and around Grenfell was considered valueless for agriculture. Mr. Greene said the same of the land around Condobolin and Euabalong. It will be apparent that the action of the Government will be inconsistent should the Koorawatha to Grenfell line be constructed, because it will mainly benefit three large estates, and because the Government are endeavouring to induce a system of closer settlement on Crown lands. As a matter of fact, we have closer settlement on the "white line." The Government has ignored the existing permanent closer settlement. With regard to cultivation on the halves system, the adoption of this system, I contend, is not an improvement on the older methods, but the reverse. I know of no man who, after four years, is in a position to buy himself a farm, because if a man increases the area of his cultivation on halves he has to increase his plant *pro rata*, and machinery and horses become worn out. The halves man who tills the land is left with worn-out machinery and horses, perhaps, that do not represent the capital value which they represented at the initiation.
1174. When the wheat is ready for cutting does the tenants' machinery cut and winnow, and so forth, the proprietor's wheat? Yes; the owner provides no machinery.
1175. Do I understand you to say that under the halves system the owners simply clear the ground and buy the seed and the tenants do the remaining work? That is as it stands.
1176. Your contention is that the tenant finds all the machinery and has all the wear and tear? Yes; the owner is left with his land as a valuable estate at the end of the agreement. The other man has given his labour and invested his capital, and it has not been shown in any instance that he is much better off. In contradiction of some of the evidence which has been given as to the quality of the land in the Young district, I wish to state that long before these noted half-share men were here the Young district produced wheat which took first prize at the Philadelphia Exhibition, and the flour ground from that wheat also competed against the world and took first prize. If the Koorawatha to Grenfell railway be built the whole of the adjacent country, with the exception of $7\frac{1}{2}$ miles, will be controlled by three men. In the vicinity of the "white line" there are five public schools and three provisional schools. On the Koorawatha route there is only one school, and there is another which is dismantled. There are three churches at Thuddungra—the Presbyterian Church, with an average attendance of thirty; the Church of England, with an average attendance of fifty; and the Roman Catholic Church, with an average attendance of sixty, and sometimes more. Then there is the hall at Bulla Creek, which is used for church purposes by the Roman Catholics and the Presbyterians. I am not prepared to state the number of Presbyterians. These churches mean population, whereas I am not aware that there are any churches on the other route. It has been stated in evidence that population has advanced on the Koorawatha route. This evidence has been given by Mr. Greene, Mr. Harper, and others. I deny that, and I will prove it hereafter. The Young to Grenfell line would command a large area of agricultural and pastoral lands, and there is an impression abroad that much of this land has been overlapped by the Grenfell League. There are four large estates between Koorawatha and the Brundah holding, namely, Iandra, Warrangong, Kinleside's, and Brundah. They are credited with having 33,000 acres fit for the plough. Iandra is credited with having 15,000 acres, Brundah with 9,000 acres, and Warrangong with 5,000 acres. That only totals 29,000 acres.
1177. What about Kinleside's holding? That is only a small place. If Mr. Greene's evidence be correct, he must have 19,000 acres of cleared land, which if deducted from his run area of 31,000 acres, leaves him with 12,000 acres of uncleared land. There is a large percentage of this 12,000 acres, which, by reason of creek exemptions and broken country, is invaluable, so that, before the railway line can be built, at the rate of progression of clearing, Mr. Greene's holding will be practically exhausted. I think area under grass or lucerne on Iandra is from 3,000 to 5,000 acres. Mr. Greene has only been cultivating for five years, and if we take the rate of progression of returning it to pasture, there will be a great deal of it in pasture lands very soon. With regard to the character of the country, Mr. Greene says that the Koorawatha and the "white line" routes are similar; yet he says that the Koorawatha to Grenfell railway will pass over the best agricultural land in the Colony. He has also said that the land about Young is not fit for agriculture. Mr. Greene also says that on the Koorawatha to Grenfell route enormous strides have been made in the way of population. I challenge that statement, because within the last ten years Mr. Greene has incorporated within his estate the following settlers:—Messrs. McCue, Simpson, Harris, Beplate (who is now in Africa), Berry, Holt, and William Fowler. These represent seven families, and the Government Statistician's average of each family is $4\frac{1}{2}$ souls, which would make an aggregate of thirty-one souls.

Mr.

Mr. Greene says that he can only give definite evidence with regard to three properties along this route. From the north-west boundary of the Brundah estate, which is approximately $7\frac{1}{2}$ miles into Grenfell, the settlements in the immediate vicinity of the Koorawatha line consist of Bell Brothers—I believe there are four of them—Newman, Bembrick, and Neale. Mr. Greene stated in his evidence on the 3rd February that a statement had been made by the advocates of the “white line” that the projected Koorawatha to Grenfell line would only pass through the estates of three large holders, and he added, “I wish to give that an absolute denial.” He says, “It does pass through three large estates, but then, when it emerges from Brundah, and comes to Grenfell, it passes through very thickly populated country.” I may state that the Minister, in moving Parliament to refer the Koorawatha to Grenfell scheme to the Public Works Committee, made the alleged fact of the land between Koorawatha and Grenfell being given to the Government free of charge one of his strongest points. That is not so.

1178. *Chairman.*] We have evidence of that;—we know whether it is or is not true? If it be not true, the “white line” people can claim the Minister’s support on the same grounds. With regard to the profitability of the share system, one man is cited as a most capable man with a large plant who, after four years’ operations, has been enabled to pay off £700 of his indebtedness contracted under this system. I might state that the individual referred to came there with a fairly large plant. If that is the maximum of success to be obtained by the best farmers under this system, it is clear that it is a very doubtful one, and is not a permanent industry such as would justify any Government in mortgaging posterity. I may say it would not pay me to persevere with agriculture beyond three years, because the land becomes exhausted and dirty.

1179. *Mr. O’Connor.*] Will three crops fully exhaust the land? It will bring it to a vanishing point if you do not return something to it. I wish to state that Burrumunda has 1,000 acres going into cultivation this year, and it is intended to clear another 1,000 acres. Kikiamah has 600 acres, which are being cleared now. Arramagong—I mean the station held and managed by the Union Bank—has a large area which is being cleared now—up to 300 to 400 acres. James Caldwell has cleared over 200 acres, and he purposes clearing still further if railway communication is afforded. The executors of the late Steel Caldwell have about 150 acres cleared, and it is their intention to clear more. On my own holding I will put in 1,000 acres of wheat this year, and I am clearing up to 2,000 acres. I may state, with regard to myself, that whether railway communication is or is not opened up, I intend to go on clearing, because I consider it will pay to do so.

1180. *Chairman.*] All these holdings are to the west of the “white line”? Yes; I may also state that there are a number of small holdings which are being cleared. These stations are an index of what is going on, and will go on in the district. Mr. Greene stated that when he bought his run it would only carry 6,000 sheep. The improved conditions, however, now enable him to carry half as many more, namely, 9,000 sheep. That is what he states. As a matter of fact, before he started to clear—in 1886—he had 32,000 sheep returned. In 1888 he had 34,000 sheep returned; in 1890 he had 33,000 sheep returned; and in 1891 he had 41,000 sheep. I put that against his statement that the whole of his run could only carry 9,000 sheep under up-to-date conditions. Again, at Koorawatha it was stated that a further 93,000 acres would come under cultivation. I cannot find out where it is to come from, unless it laps over upon the “white line.” Therefore, I say that that evidence should be received with a due amount of caution. The “white line” would form a portion of the Federal line, and that is a strong reason for advocating it. If that line had been built it would have let the people of this district out to the north or south, and as we never have drought all the year round in New South Wales, we should have been able to save 250,000 sheep in the past season. That is capital lost to this district and to the whole of the Colony.

William Ehrlich, storekeeper, Young, sworn, and examined:—

1181. *Chairman.*] How long have you lived in this district? I have been in Young for twenty-seven years. I have known the district since 1862. Fourteen years ago, when the railway line from Young to Blayney was discussed, great opposition was shown by Members of Parliament, especially by Mr. Reid, Mr. McElhone, and others. The *Daily Telegraph* strongly advocated the extension at that time of the continuation from Young to Grenfell, and stated that such extension would serve over 3,000 people more. The line to Blayney was constructed, I believe, more as a safety-valve for the Western line. The line from Young to Blayney has not been a profitable one. Railways should be constructed for the benefit of the many; but such seems not to be a fact. We have no less than half a dozen suckers on the Southern line, which have swallowed up from the proceeds of the railway revenue no less than over £120,000 in 1897. The Koorawatha line, if constructed, will start with an annual loss of close on £2,000. I do not say that Grenfell should not have a line. This country, the interior, is devoid of navigable rivers, hence the iron horse is the settler and civiliser. Koorawatha itself consists of two public-houses, and a store, and railway station-house. The population between Koorawatha and Grenfell is of a nomadic kind. The electoral district shows seventy-two electors, one public school at Mitten’s Creek, and the enrolment of children twenty-six in number. If the Government were to construct the line from Koorawatha to Grenfell, thence to Wyalong, that would be the death-knell to Young’s prosperity. Temora and Barmedman would suffer in proportion. Grenfell’s ambition and parsimonious spirit would be satisfied. Grenfell would command not alone the northern part for 20 miles or more, but it would largely capture the trade for 15 more miles along the Wyalong route, on the southern side along the line. That would be the greatest blow a town like Young could receive. If the line from Young to Grenfell should be favoured by the Government, we have a large population to start with. Passenger traffic is the best paying, and requires the least attention. Wheat is the most unremunerative for railway revenue. Young has a splendid railway station, goods-shed, and keepers’ homes, which cost £13,000. It has a magnificent milling plant capable of milling 60,000 bags of wheat. We have a butter factory, soap factory, and splendid meat-chilling plant, which cost £12,000. The population of the Young Police District is 5,658. Along the route between Young and Grenfell the people are all *bonâ fide* settlers. They all farm their own land, with the exception of three who farm on the halves system. These are Messrs. Thackeray, A. Taylor, and Aston. The population on this line is between 500 and 600. There are along the line four public schools, 153 children, with adjacent provisional schools, making a total of 263, and Grenfell, with its 1,000 of inhabitants, offers this line a fair remuneration. Sooner or later this must become a section of the Federal line to Werris Creek, thence on to the Queensland Border. Koorawatha has a line;

J. C. Watson.
28 Feb., 1898.

W. Ehrlich.
28 Feb., 1898.

W. Ehrlich. line; Grenfell requires one. Wyalong and Barmedman desire to be connected with Temora, and on to Hillston. Between these three lines the settlers would have an easy access, the furthest, perhaps, 20 miles; between Koorawatha and Young-Grenfell line the furthest distant would not exceed 16 miles, while between Young-Grenfell and Temora-Wyalong line the furthest point perhaps would be 20 miles. I shall now give a few figures, which will show that the Grenfell people can be served just as well from Young to Grenfell as from Koorawatha to Grenfell. The freight is as follows:—

To Grenfell, <i>via</i> Koorawatha, 266 miles, 6-ton waggons, per ton:—					
Mixed.	A.	B.	1st.	2nd.	3rd.
19s. 5d.	£1 2s. 4d.	£1 18s.	£3 19s. 10d.	£4 19s. 3d.	£6 17s. 10d.

To Grenfell, <i>via</i> Young, 282 miles:—					
Mixed.	A.	B.	1st.	2nd.	3rd.
£1 0s. 1d.	£1 3s. 2d.	£1 19s. 7d.	£4 3s. 3d.	£5 3s. 6d.	£7 3s. 9d.

Probably not more than one-third of the land on the Young-Grenfell route the Government will have to pay for. There are seventy holdings along the line. Young, Grenfell, Forbes, are the largest wheat-producing districts on the southern table-lands.

1182. Will you grant, then, that the freight *via* Young will be more costly towards Grenfell than *via* Koorawatha? Yes, a few shillings more. At the same time, the "white line" would be more beneficial to the community. The rates per ton for wheat are:—Grenfell to Young, 3s. 6d.; Grenfell to Koorawatha, 3s.; Grenfell, *via* Koorawatha, to Young, 5s. 7d.; Cowra to Young, 4s. 9d.; Koorawatha to Young, 3s.; Crowther to Young, 2s. 6d.; Monteagle to Young, 1s. 6d.

William Parker, carrier, near Grenfell, sworn, and examined:—

- W. Parker
28 Feb., 1898.
1183. *Mr. Fegan.*] Where is your residence? About 4 miles west of Grenfell.
1184. How long have you been in the district? Twenty-six years.
1185. Have you done much carrying between Grenfell and Koorawatha? I drew sleepers there when the main line was being constructed.
1186. Are you drawing wheat from Grenfell to Young? Yes; I have been doing so during the whole of the season. Some of it goes to the mill, and some goes to the railway.
1187. From how far east do you bring wheat? It comes to Young from about 9 or 10 miles on the other side of where I live. There is no market there for it.
1188. Is there a mill at Grenfell? There is a roller-mill there at present, but some people are not satisfied with the flour.
1189. Do you think that if you had a mill in Grenfell equal to the one in Young, you would carry more wheat to Grenfell than to Young? I suppose so, if they were as well able to buy it, but I doubt then whether they would consume as much as Young, because they would have to avail themselves of the Sydney market there.
1190. Do you know the route of the proposed railway from Koorawatha to Grenfell? Yes.
1191. You say you drew sleepers from there for use in connection with the construction of the main line? Yes.
1192. Have you any idea of the kind of country there? Yes; some of it is very good on this side, and part on the other, but when you get a few miles from the other side of the Cowra-road you will find it is not fit for settlement. It is barren, and is not fit for agriculture—that is north of Cowra Road.
1193. Have you tried to grow wheat yourself? Yes, this year. I am not only a carrier, but a farmer.
1194. What is the area of your holding? About 900 acres. My son has it, but I work it.
1195. Are you a fair judge of the quality of land? Yes.
1196. And you think the land on the Cowra side is unfitted for cultivation? On the north side of the Cowra-road.
1197. What is it like on the south side? It is very good there from the boundary of the Cowra-road to Young.
1198. Are you acquainted with the land on the "white line"? Yes.
1199. Does the land on the Koorawatha side compare favourably with the land on the "white line"? Yes; but to a larger extent on the "white line."
1200. Would the people of Barmedman bring their wheat to Young? Yes; if they got an extension to Wyalong.
1201. What is the farthest point from which you bring produce or wool into Young? Grenfell is the farthest I have drawn from, or 5 miles on the other side since the line opened to Forbes.
1202. If there were a railway station at Grenfell—whether the line is connected with Young or Koorawatha—Grenfell would be the depot? Yes, all from the other side. As long as the railway station is at Grenfell, the people will make use of it.
1203. But in your opinion there is a larger tract of land fit for cultivation on the "white line" than on the Koorawatha line? Yes, adjacent to the "white line."
1204. From where did you bring the load of wheat you have in town? From the Weddin Gap, 35 miles from Young.
1205. What is the cartage for that distance? For this wheat I get 1s. 1d. a bag down, and 15s. a ton back for the flour.
1206. If you had no load to go back what would you charge for the wheat to come in? I have carried from the "7 miles" at 1s. a bag—that is for the man who held the wheat; but I had other loading to go back with for other people.
1207. What would you cart wheat for, and go back empty? Not less than 1s. 6d. a bag. I think, the "white line" would be the best to construct, because it goes through more country and through a large population. On the other side the land is not in large holdings, so that there is not likely to be small settlement unless the owners cut their holdings up. The "white line" is more permanently settled.
1208. Do you know anything about the Bland trade? Yes.
1209. What is the greatest distance from which the Bland trade will come to find a market in Young? What is on the Forbes side of Marsden will go to Forbes, and what is on this side of Marsden will come to Grenfell or Young. There is a certain line of country which is in doubt. There is a line of hills known as the Pinnacles, and all on the other side of that will go to Forbes—that is from about Boyd, 12 or 13 miles from Forbes; but all on this side of that point will come to Grenfell on account of the roads being better.

1210. Have you much work between Cowra and Grenfell? Occasionally I have been engaged in carrying pretty well all the year. W. Parker.
28 Feb., 1898.
1211. What is the charge from Grenfell to Cowra? It varies according to the goods; but sugar in loads of 6 tons, is £1 per ton. Sugar, iron, and wire, are carried cheaper than cased goods, which are charged £2 per ton.
1212. What is the difference between the cartage from Grenfell to Young, and the cartage from Young to Cowra? I would sooner cart to Young for 15s. than cart to Cowra for £1. It is a better road, and there is more grass, and as a consequence the bullocks will stand more work.
1213. Do you think the Koorawatha line would pick up more side traffic than the "white line"? I do not think so. There is no settlement to cause more traffic on the Koorawatha line.
1214. I suppose you do the greater portion of your work between Grenfell and Young? No; between Grenfell and Cowra, except in the wheat season. It is immaterial to me which way the line goes.

George Whiteman, storekeeper, Young, sworn, and examined:—

1215. *Chairman.*] How long have you been resident in the district? Fourteen years.
1216. How far do you deliver goods towards Grenfell? Within about 6 miles of Grenfell; occasionally I send some right into Grenfell. G.
Whiteman.
28 Feb., 1898.
1217. How many customers have you more than 20 miles from Young along the Grenfell main road? Five or six.
1218. How many have you in the second 10 miles from Young within a radius of 4 or 5 miles along the main road? Thirty or forty. The town pretty well holds the trade up to the Tyagong Creek.
1219. Where do you deliver from Young on to the Bland? As far out as 100 miles; 25 miles beyond Marsden.
1220. Have you many customers beyond Marsden? Four or five. The Forbes competition becomes keen at Marsden. I go 25 miles beyond Marsden. I deliver at Williams' Crossing, and sometimes at Curra-burrana. Beyond Bimbi, up to Williams' Crossing, most of the people deal with Young. With regard to the Young butter factory I may state that if a line be constructed from Young to Grenfell, inasmuch as we shall be in touch with a better means of communication, we shall get milk or cream over a distance of 40 miles, whereas we are limited now to cart carriage, and can only get it over a distance of 5 to 6 miles in that direction.

Alfred Blackman, manager, butter factory, Young, sworn, and examined:—

1221. *Mr. O'Connor.*] What is the capacity of your factory? At the present time 5 tons of butter per week. A. Blackman.
28 Feb., 1898
1222. What is the area from which your cream is supplied? We obtain it from Cowra, Binalong, and Junee by rail, and 20 miles by road.
1223. How would the construction of the "white line" affect the industry with which you are connected? We should be able to work all the distance from here to Grenfell, whereas now we cannot work it beyond a distance of 6 miles. We should be able to work also for 10 miles on each side of the line.
1224. Have you anything further to state? The capacity of the factory, without adding more machinery, is about 5 or 6 tons of butter per week, representing about 4,500 gallons of milk a day. At the present price of butter, it means about £1,400 a month distributed in the district.

Thomas Hancock, coach proprietor, Young, sworn, and examined:—

1225. *Mr. Fegan.*] Have you any statement to make? I know the country through which both lines would pass. I think the land along the "white line" is quite equal to the other, and there is more of it. T. Hancock.
28 Feb., 1898.
1226. Have you the contract for the mail between Young and Grenfell? Yes.
1227. Do you do other carrying yourself? Yes; I have been in the forwarding agency line.
1228. What are the rates of carriage from Grenfell to Young? On general merchandise about 25s. to 30s. a ton. The highest it has ever been is 32s. That was when the Union was here, and it kept the prices up.
1229. Do you do any carrying from any other point? Yes, out to the Bland. The nearest point of the Bland will be 34 miles out.
1230. What is your carriage freight to the Bland? It is lower this year than it has ever been. Wool is cheaper grown there.
1231. Would not the construction of the "white line" affect the carrying trade? It certainly would be better for the farmer. I suppose it would affect the road carriage business.

James Archibald MacKinnon, agent, Young, sworn, and examined:—

1232. *Chairman.*] Were you formerly a representative of Parliament in this district? Yes.
1233. How long have you been in the district? Twenty-five years. J. A.
MacKinnon.
28 Feb., 1898.
1234. *Mr. O'Connor.*] Will you give us your opinion of the two routes? I wish to state that after the first two years I came here I owned the Iandra property, now held by Mr. Greene. In 1882, I went into Parliament as representative of this electorate. When I went there a great debate was on as to the right route to take to connect the Great Western or the Great Central line with the present Southern line. The question then was whether the railway should go from Young to Koorawatha and Cowra, and Blayney, or from Young to Grenfell. Previous to that I voted against the line going to Koorawatha, Cowra, and Blayney, because I looked upon this as the most central and best connecting line, and I looked upon the country which would be served between Young and Grenfell as being better than the country which would be served the other way. My present opinion is that the best agricultural land is on the route from Young to Grenfell. In my position as land valuer and appraiser I have had to appraise, for the different Appeal Courts, special area lands, both in Young, Grenfell, and Cowra. I have been better able to uphold the valuations of the Government on the special areas and the lands they have thrown open in this district than I have been in connection with any of the lands round about Koorawatha, Cowra, and other places.
1235. Do you know the value of land on either side of the rival routes? Yes. I look upon the land on

J. A.
MacKinnon.
28 Feb., 1898.

the western side of the proposed Koorawatha to Grenfell line as being far better land. You get a bigger scope, and a greater area of good agricultural land than you do when you go away from the "white line." I agree that there is some good agricultural land on a portion of the route from Koorawatha to Grenfell. The country to the eastern side of the range, dividing the waters of the Tyagong from the Crowther is not, to my mind, too good. Passing on to the waters of the Tyagong it is good, and it runs good for a great distance west. In fact, I may say, right down to the Bland. What I said with regard to the good country to the west applies to Bumbaldry and a portion of Kelly's Creek towards the Crowther Range and Cowra-road. I also regard Brundah as good, and it is good into Grenfell.

1236. What is your opinion as to the probability of support which either line would get? I think the railway from Young to Grenfell would get the best support, because the land is divided into so many different holders, who have put their all in it, and who have to live there. They are not in a position to get away or to put the land into grazing again. I think every acre along there will be made productive. With regard to the other route, there is not the population nor the *bona fide* workers which there is on the "white line" route.

1237. In other words, there are a lot of people who have made good substantial homes for themselves, who are bound to stay where they are doing well, whilst others who are not doing so well are also bound to stay? That is so. In 1889 there was a great agitation to have the "white line" established. I had the pleasure of driving Mr. Oliver and other members of the Department along the "white line" route. I know that Mr. Oliver, as Railway Commissioner, was greatly pleased and well satisfied with the country. In fact, with all due respect to him and the Department, he is not responsible for the action of the Minister for Lands or the Minister for Public Works. He met a lot of people, with whom he conversed, and he said, "I think your land is good enough, and I think you ought to have a railway." Whether that caused the people to go in for improvements and the making of homesteads, I do not know; but I think it had a little to do with it.

John Adolf Rossbach, District Engineer, Young, sworn, and further examined:—

J. A.
Rossbach.
28 Feb., 1898.

1238. *Chairman.*] Do you wish to make a further statement? I desire to state that in the event of the line from Young to Grenfell being constructed, the plan I produce delineates what, in my opinion, would be the trend of traffic to Young. The boundaries would extend somewhat more easterly than in the previous diagram, and would extend pretty well half way to Forbes. Divisional line between Forbes and Grenfell would be pretty well determined by distance and other minor conditions. It will be seen from this that it embraces all the land of the Bland and Marsden on the west. The eastern boundary has been pushed a little further east than otherwise was intended.

1239. In point of fact, it is the area which Young holds, or will hold, in her own right as a centre, plus the area which Grenfell will hold in her own right? Yes. These boundaries, of course, are approximate.

Reverend William McGrath, Young, sworn, and further examined:—

Rev. W.
McGrath.
28 Feb., 1898.

1240. *Chairman.*] I understand you wish to make a further statement? Yes; I wish to state, as regards the position of Morangarell, that if the "white line" is constructed, and runs *via* Kikiamah, it will bring Morangarell 30 miles nearer to Sydney than it would if people were forced to go to Temora.

John James Monday, police constable, Young, sworn, and examined:—

J. J. Monday.
28 Feb., 1898.

1241. *Chairman.*] I believe you collected the wheat-yields for the years 1897 and 1898? I collected most, and compiled the whole of the returns, which I believe to be correct.

1242. Have you had an opportunity of seeing the statistics put in by Mr. Taylor? Yes. His figures represent what are collected in these portions of the counties for the Police District of Young. They would not comprise the whole of either of these counties.

1243. How far does the police boundary of the district extend? A distance of 20 miles,—as far as Baker's on the Grenfell-road; Tubbal, towards the Bland; Thuddungra; Kikiamah; and on to the Temora-road.*

1244. Do you believe his statement to be, with regard to the returns, a full one? I do not think so. Since the income tax has come into vogue people are rather dubious about giving their full returns. I feel sure that there is some shortage in the returns.

1245. Has the statement of the number of acres under cultivation anything to do with the possible price of wheat? Yes; if there was a big yield there is no doubt the millers would not give quite as much.

1246. The tendency, therefore, of the farmer is to understate? Yes.

1247. Therefore, you think the figures might be increased? Yes.

Edward Taylor, Chairman, Railway League, Young, sworn, and further examined:—

E. Taylor.
28 Feb., 1898.

1248. *Chairman.*] I believe you wish to make a further statement? Yes. To the 16 miles of land which will be given for the purposes of the construction of the line from Young to Grenfell there has to be added $1\frac{1}{2}$ mile belonging to Mr. J. Fowler, and $3\frac{1}{2}$ miles already built. There remains, therefore, only about 11 miles of line which will have to be resumed or paid for, but from this has to be deducted the distance of land represented by two holders who own 1,020 acres, who will make concessions, and one other holder who holds 420 acres who will probably make a concession. These holders are H. King, junior, 320 acres; C. and W. Powderley, who hold 700 acres. Mrs. Fitzgerald and three others are, so far, undecided, but they would probably be willing to exchange. It is probable, therefore, that the State will not have to pay for more than one-third of the land required. I may mention that the manager of the mill, Mr. Chapman, told you that the cost of the trainage from Koorawatha to Young was 5s. a ton instead of which it should be 3s. 8d.

* NOTE (on revision):—I understood Q. 1243 to be:—On an average what distance across would the police district extend? My answer was:—Twenty miles, meaning 10 miles any way from Young, as far as Baker's, on the Grenfell Road, Tubbal, towards the Bland, Thuddungra, Kikiamah, and on to the Temora-road; these distances would average 20 miles from Young, but towards Marengo and Wombat it only extends 5 or 7 miles, respectively.

[One plan.]

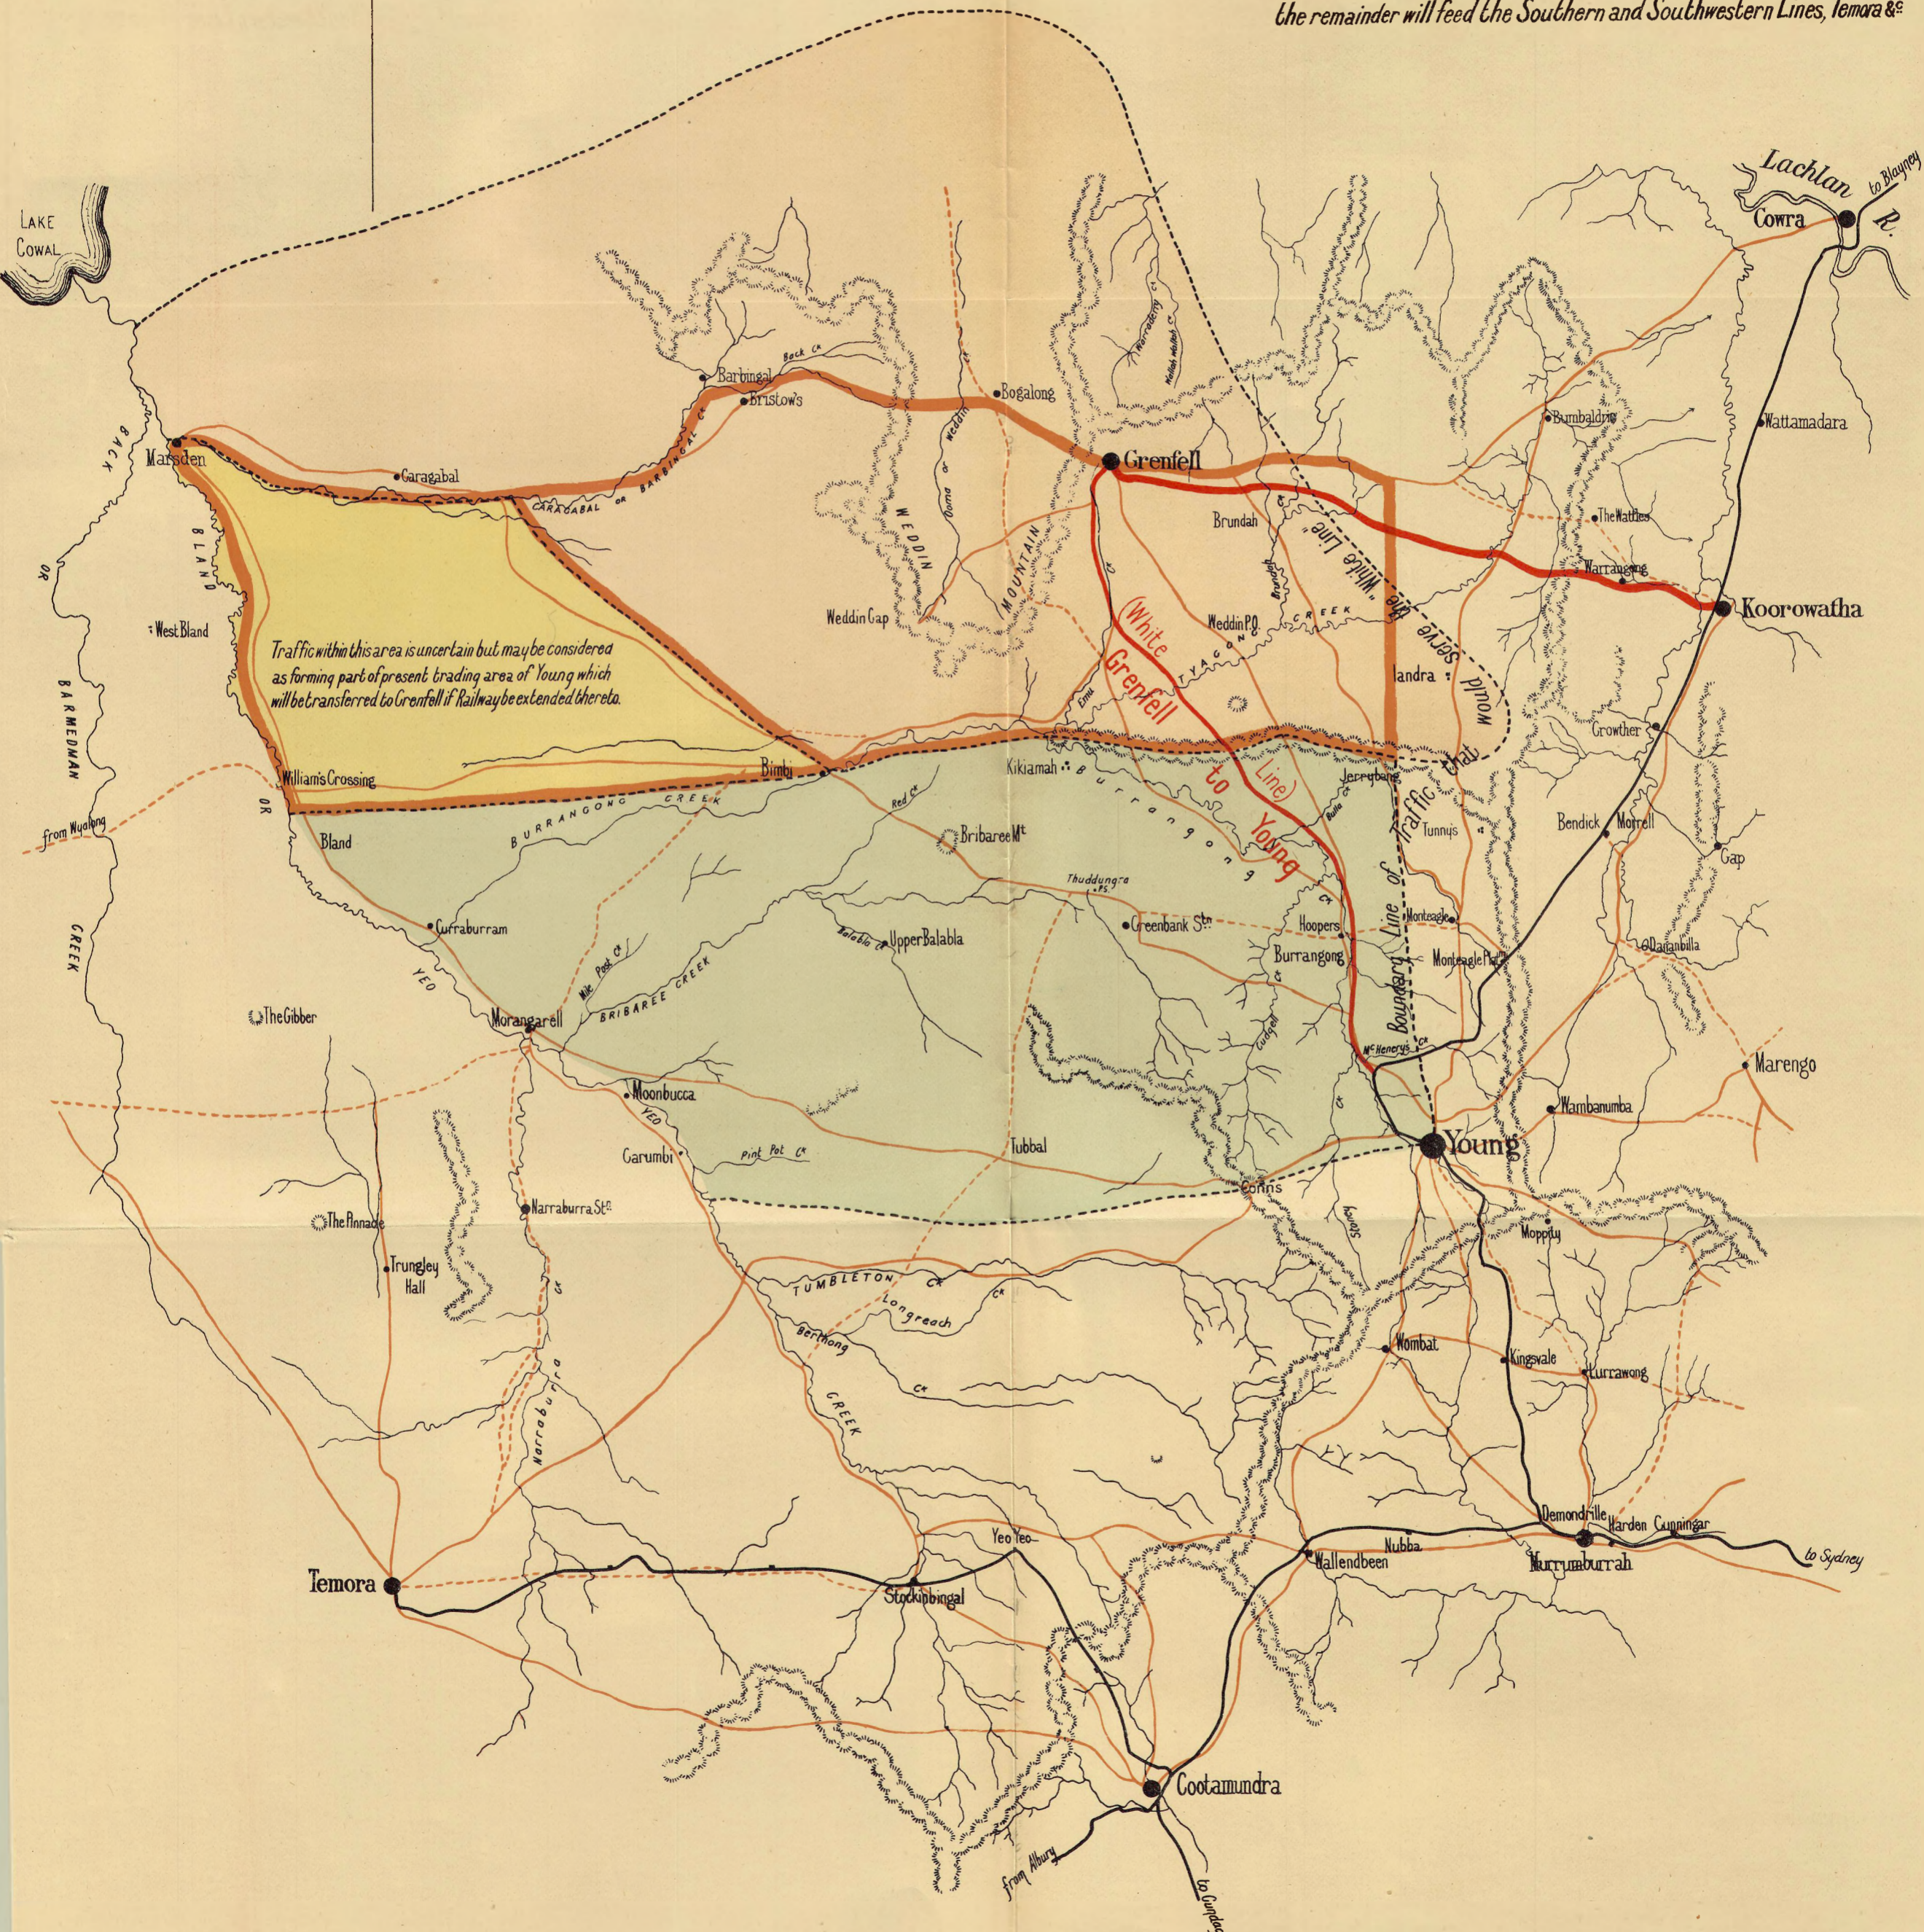

KOOROWATHA TO GRENFELL RAILWAY

Plan to accompany Sectional Committee's Report

H. Deane

NOTES

Area tinted Red The traffic within this area will go to Grenfell and to the North of it to Forbes
 D^o Yellow D^o is uncertain and at present goes to Young
 D^o Blue D^o will go to Young as at present
 To the South of the area tinted Blue one half will probably go to Young
 the remainder will feed the Southern and Southwestern Lines, Temora &c

PLAN.

Byrock to Brewarrina Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM BYROCK TO BREWARRINA.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Byrock to Brewarrina," have, after due inquiry, resolved that it is expedient the railway should be constructed, provided that it be made legally binding upon the Crown lessees in the district served by the railway to pay, until the railway shall become self-supporting, one farthing per acre rent additional to their present or ordinary assessment, such additional rent to be credited to the Railway Commissioners; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

PROCEEDINGS WHICH LED TO THE PROPOSAL FOR THE RAILWAY.

1. The proposal to construct a Railway to Brewarrina appears, from the official statement before the Committee, to have originated in a petition from the residents of the town and districts, forwarded to the Minister for Public Works in September, 1881. That petition resulted in a survey which was completed in 1883, the length of the line being $55\frac{1}{2}$ miles. Three years afterwards an estimate was made of the cost, and this was represented at £4,366 per mile; but the following year, on the estimate being revised, the cost per mile was reduced to £3,806. In 1889 the proposal was reported upon by the Railway Commissioners, who stated the line could not, on commercial grounds, be recommended, but pointed out that as ordinary roads between Byrock and Brewarrina were, on account of the nature of the soil, costly to make and maintain, it was worth considering whether in lieu of an ordinary road an inexpensive railway might not be constructed.

With the object of constructing a cheap line an amended flying survey was made in 1892, with the result that a route was found 58 miles 48 chains in length, and the cost per mile further reduced to £2,623. To the total cost, however, it was necessary to add, it was explained, the sum of £19,600 for junction works, stores, &c., unless the Railway Commissioners could supply a sufficient quantity of serviceable second-hand permanent-way material at a cheap rate, or could reduce the charge for the carriage of new rails.

In 1895 the matter was again urged upon the attention of the Minister for Public Works, and a further revision of the estimate brought the cost per mile down to £2,340. The Railway Commissioners, however, were still unfavourable to the line, which they stated they could not recommend, on the ground that the probable traffic as represented in a report from the Chief Goods Superintendent would not justify

justify its construction, and at this point the project remained until 1897, when, it being decided to refer the proposed line to the Public Works Committee, the Railway Commissioners were asked to report on the proposal in accordance with the requirements of the Public Works Act.

DESCRIPTION OF THE RAILWAY.

2. The proposed railway branches from the Great Western Railway at the north-west end of the Byrock station, and follows generally for about 19 miles the travelling stock reserve No. 1,207. Then, in order to avoid heavily-flooded ground, it leaves the reserve and continues about 2 miles to the eastward of it, and generally parallel to it, until it reaches Brewarrina, where it ends at 514 miles 25 chains from Sydney. The length of the line is 58 miles 43 chains. The country traversed shows slight undulations, but is generally flat. The heaviest grade on the line is 1 in 75, and the sharpest curve 20 chains radius. Two important watercourses are crossed, the Bogan River and Tarrion Creek, over which there would be built timber viaducts.

ESTIMATED COST.

3. The estimated cost of the line, exclusive of land and compensation, is £146,350, or an average of £2,500 per mile. Of this amount, earthworks would absorb £15,782; bridges, £12,639; level-crossings, cattle-stops, and fences, £2,055; permanent-way materials, £36,524; freight, £11,885; plate-laying, ballasting, and sleepers, £34,902; station works and buildings, £10,470; water supplies, £3,000; gradient and mileage posts, telegraph, and miscellaneous, £2,756; and engineering and contingencies, calculated at 12½ per cent., £16,662.

This estimate, it will be observed, is in excess of that which was made in 1895 by £8,350, or £160 per mile. The difference, as explained by the Engineer-in-Chief for Railway Construction, is due to the latest estimate having been very carefully gone into and nothing omitted. The lower estimate was based on the supposition that the line would be carried below the flood-level; since then it has been decided that the line should be kept above the flood-level. Land resumption on the route of the line would be very small.

RAILWAY COMMISSIONERS' REPORT.

4. The Report of the Railway Commissioners indicates, in the comparison between expenses and earnings, an annual deficiency of £4,299. The estimated annual cost is £9,140, made up of 3 per cent. interest on capital expenditure, £4,390, and cost of maintaining permanent way and traffic and locomotive expenses, £4,750. The traffic estimate, based on a tri-weekly service, amounts to £4,841—goods and live stock, £3,348; coaching, £775; and mails, £618. "The estimated value of probable traffic," the Commissioners say, "has been made upon the most favourable basis, and it is doubtful whether the sum will be fully realised"; and they invite special consideration to the fact "that the larger proportion of the traffic would be diverted from the main line from Bourke, and would consequently correspondingly reduce the receipts therefrom," and, further, that "there is little, if any, prospect of a new traffic being created." Under these circumstances, they report that the construction of the line cannot be recommended.

THE COMMITTEE'S INQUIRY.

5. The inquiry carried out by the Committee has included a careful investigation by the full Committee in Sydney, and a visit of inspection and the examination of witnesses by a Sectional Committee along the route of the proposed line. In Sydney, besides the official witnesses, several graziers whose holdings would be affected by the construction of the proposed line, and stock and station agents were examined. The Sectional Committee were occupied in the examination of local witnesses from Monday, 14th, to Saturday, 19th, March, and, during the course of the week, inspected portions of the surrounding district, and, afterwards, the route of the proposed railway.

CROWN LAND IN THE DISTRICT.

6. The Crown land within an area of 20 miles on each side of the route of the proposed railway, and the same distance beyond Brewarrina to the north, amounts, the Committee were informed by the Chief Draftsman of the Department of Lands, to 830,000 acres, of which quantity 221,300 comprise reserves. With the exception of 4,000 acres, which are untenanted, the whole of the land within this area is held under pastoral lease; 669,110 acres being under homestead lease, and the remainder under settlement lease. The number of pastoral leases wholly or partly within the area is sixteen, and the leases will not expire until the year 1918. The reserves, including camping reserves, population reserves, and temporary commons, are mostly for travelling stock and water. There is no probability for some years to come of any land being made available for small settlement; but, as far as the information from the Lands Department goes, there is no demand for land for this purpose. Two attempts were made near Brewarrina to have an area within 10 miles of the town withdrawn from lease, but on neither occasion did the withdrawal take place, no demand for small holdings being shown to exist.

TRAFFIC PROSPECTS OF THE RAILWAY—ESTIMATE BY THE RAILWAY COMMISSIONERS.

7. The traffic prospects of the line, as estimated by the Railway Commissioners, indicate, as stated in the summary of the Commissioners' Report, an annual revenue of £4,841, and an annual deficiency of £4,299. The details of the traffic estimate are as follows:—

	£	s.	d.
Goods, 2,000 tons at 10s.	1,000	0	0
Wool, 3,100 tons at 10s.	1,550	0	0
Wool, 330 tons at 7s. 6d. (wool on route of line between Byrock and Brewarrina)	123	15	0
Live-stock, 1,000 trucks at 15s. 6d.	775	0	0
Passengers, 1,500 at 9s.	675	0	0
Coaching	100	0	0
Mails	618	0	0
	<hr/>		
	£4,841	15	0

These figures are taken from the report furnished by the present Chief Traffic Manager and late Goods Superintendent, Department of Railways, to the Railway Commissioners, and upon which they base their report. In the Chief Traffic Manager's report and evidence it is explained that a most searching inquiry into the probable traffic on the railway was made by him, and that in arranging his estimate he took into account the most favourable season experienced in connection with the district, and rates for wool and goods as low as they could be made, and yet such as it might be found impossible to maintain in the face of river competition. The great bulk of the traffic, he points out, is carried by river; and he draws attention to the fact that the Government have undertaken the work of locking the river Darling for the purpose of making it permanently navigable, and to the extreme doubtfulness of obtaining traffic at Brewarrina at such rates, in competition with river-borne traffic, as would pay working expenses. In his mind, he says, there is no doubt that, under the altered conditions which will arise from an improved river, the carrying capacity of the river steamers will be improved, and the time occupied in the transit of wool by steamer between Brewarrina and Bourke, as well as the rates of freight, considerably reduced.

Wool taken by steamer to Bourke reaches the New South Wales railway system at that town; and the Chief Traffic Manager is of the opinion that for all traffic within access of the Darling and its navigable tributaries reliance should be placed upon the improvement of means of water carriage to Bourke rather than upon attempts to tap these streams at other points. So far, he states, the carrying companies established at Bourke, who have large vested interests in that town, have to the fullest extent possible concentrated the river-borne traffic at that point.

The

The traffic estimate prepared for the Railway Commissioners includes the traffic in connection with Walgett. If the traffic arriving at Brewarrina for and from Walgett and up-stream therefrom were excluded, the estimate would be less by £1,150, and the details as follow :—

	£	s.	d.
Goods, 1,800 tons at 10s.	650	0	0
Wool, 1,500 tons at 10s.	750	0	0
Wool, 330 tons at 7s. 6d. (wool on route of line between Byrock and Brewarrina)	123	15	0
Live stock, 1,000 trucks at 15s. 6d.	775	0	0
Passengers, 1,500 at 9s.	675	0	0
Coaching	100	0	0
Mails	618	0	0
	<hr/>		
	£3,691	15	0

The live stock in each of these estimates represents double the quantity shipped the year previous to the date of the report at Byrock and Bourke, and the passenger traffic is calculated at local rates. With reference to the stock, considerable doubt is felt whether 1,000 trucks would be carried during a good season, as between Brewarrina and Bourke and Byrock there are three excellent stock routes, one of which, even in a dry season, would permit of stock being driven to Byrock for trucking purposes. During a good season, when stock can travel, owners, it is stated, are not anxious to join the railway at the nearest point; but, in order to save expense, travel their stock for longer distances than is otherwise necessary. At present, most of the stock traffic from Brewarrina goes by road to Bourke.

As for agriculture, the Chief Traffic Manager does not look upon the district round about Brewarrina as one in which this industry is likely to increase.

THE LOCAL TRAFFIC ESTIMATE.

8. Local witnesses urge that the traffic upon the railway will be much larger than stated by the Chief Traffic Manager. One estimate is as follows :—

Goods—Wool, 10,000 tons at 10s.	£5,000
Live stock, 3,000 trucks at 15s.	2,250
Passengers, 6,000 (3,000 each way) at 6s. 8d.	2,000
Parcels... ..	200
Mails	618
	<hr/>
Total	£10,068

These figures, which were submitted to the full Committee, differ slightly from others put before the Sectional Committee who visited the Byrock-Brewarrina district, but they are recognised by the advocates of the railway as a fairly accurate representation of the amount of traffic which may be expected to come to the line.

In the composition of this estimate, the goods traffic is calculated upon an up-river goods traffic from Bourke to Brewarrina, and to places beyond Brewarrina as far as Walgett, and upon the general goods, or return, traffic by road from Bourke to the stations in the Brewarrina district. From Bourke to Brewarrina, an average of 2,054 tons per annum is taken, and for places beyond Brewarrina 396 tons; for the return general road traffic, 200 tons is claimed;—in all, 2,650 tons.

The wool estimate is arrived at, chiefly, by taking the average number of bales per annum landed at Bourke from Brewarrina, and from beyond Brewarrina up stream as far as Walgett. On this basis it is claimed that 18,000 bales, representing 3,450 tons are absolutely certain to be trucked at Brewarrina. Seven thousand bales, or 1,300 tons, are then added as the wool traffic from Brewarrina to Bourke by road; and what is called Byrock traffic (wool and goods combined each way), which, it is explained, refers to goods from Byrock to Brewarrina and the surrounding districts, and wool which comes from Marra Creek and across from the Bogan, and, in some instances, from right up to the Queensland Border, is set down at 2,600 tons.

With

With regard to the traffic in live-stock it is estimated that from 160,000 to 170,000 fat sheep will be trucked at Brewarrina, and it is thought reasonable to suppose there will be at least 10,000 cattle. These numbers, it is represented, would require the 3,000 trucks mentioned in the complete estimate. Several important stock routes from the Queensland border converge at Brewarrina, and the Sectional Committee were informed that a movement has commenced for the establishment at Brewarrina of meat-works, and fellmongering, scouring, and boiling-down works, which will be partly supplied with Queensland stock.

The estimate of passenger traffic is made on the basis of the returns of railway-tickets issued at Byrock and Bourke. It is locally asserted that a large number of passengers, who now join the train at Bourke, would find Brewarrina a more convenient starting point.

Parcels, it is believed, would bring £200, for the reason that the coaches now carry a very large number, and, with a railway for their conveyance, the number is certain to increase.

CONFLICTING NATURE OF THE EVIDENCE.

9. The evidence given in the inquiry is throughout very conflicting. On the traffic question many of the statements made by the officers of the Railway Department are directly contradicted by local witnesses; and, in reply to these contradictions, the Railway authorities maintain that the traffic will not be more than they estimate and probably will be less, and that in any case the line will not be a profitable undertaking.

The Sectional Committee were of opinion that the probable volume of traffic is a very open question.

INJURY TO THE RAILWAY TO BOURKE.

10. Not only does it appear from the evidence of the railway officers that the railway will not be profitable, but it is pointed out that the construction of it will bring into existence a length of line which will add £146,350 to the capital expenditure of the railways of the Colony, and deprive the Bourke to Byrock line of some traffic which that extension was constructed to obtain. At present nearly all the wool carried down the river to Bourke is forwarded thence by the railway to Sydney. Whatever portion of that wool might, in the event of the proposed railway being constructed, be taken to Brewarrina, to that extent the Bourke line would suffer. If the traffic which now goes to the railway at Bourke by river should continue to go there, then still poorer traffic prospects for the new line present themselves.

LOCAL RATES.

11. The advocates of the railway express their willingness to pay local rates for the conveyance of their produce, to an extent which will prevent the line from being worked at a loss; but, in reply to this, it is contended that the adoption of such rates would lead to a competition by river and team which would compel a reduction in the railway charges.

SUGGESTED METHOD TO MEET THE DEFICIENCY.

12. One witness in the inquiry suggested that, to cover the deficiency estimated by the railway authorities, an addition should be made to the rent paid by the pastoral lessees upon their holdings, and the Sectional Committee, adopting this suggestion, recommend in their report the construction of the railway on the condition that the consent of the lessees be first obtained (in such a way as will make the compact legally binding upon them until the railway shall become self-supporting) to the payment by them of $\frac{1}{4}$ d. per acre rent additional to their present or ordinary assessment. But

in

in the way of this there is a want of unanimity among the pastoral tenants. Many, the Committee are informed, would be agreeable to pay the extra amount, while others would not. A few, it is stated, are altogether hostile to railway extension into the district, fearing that the railway will result in closer settlement and land resumption.

GROUND'S UPON WHICH THE RAILWAY WAS ADVOCATED BEFORE THE SECTIONAL COMMITTEE.

13. Generally the grounds upon which, before the Sectional Committee, the railway was advocated, were—(1) the great convenience of having railway communication 60 miles nearer than it is at the present time; (2) that station produce now sent to Bourke, by either road or river, would be put upon the railway at Brewarrina, and charged for at local rates; (3) that inasmuch as the existing Bourke to Byrock section of the Western line is practically non-productive (the rates for station produce from either of those places to Sydney being nearly the same) the Railway Department would reap the benefit of absolutely new revenue, and the earnings of the branch from Brewarrina to Byrock would be amply sufficient to pay interest on the cost of constructing it as well as the working expenses; and (4) the high-class character of the country and its suitability for closer settlement under pastoral occupation, in proof of which the rents now paid are higher than in any other district within the jurisdiction of the Bourke Land Board.

It was pointed out to the Sectional Committee that above Brewarrina there are nearly 60 miles of water in the river navigable almost all the year round, and that goods arriving at Brewarrina by railway could sometimes be conveyed to their destination between that town and Walgett fourteen days before the state of the river below Brewarrina would permit of goods being brought up from Bourke.

UNCERTAINTY OF AGRICULTURE.

14. Grazing, the Sectional Committee ascertained, is practically the only industry in the district through which the railway would go, for so far cereals have been grown merely for station consumption in the form of hay; but it was represented by the local residents that the line would lead to increased settlement and to agriculture upon a larger scale than at present. While, however, in the opinion of the Sectional Committee, "there is no doubt that in fair seasons a comparatively small area may be cultivated profitably to meet local requirements," "owing to less favourable climate and other adverse conditions, it is questionable whether the Brewarrina District would be able to successfully compete against districts possessing more suitable soil and having a lower temperature and a greater and more regular rainfall, with the additional advantage of nearness to the best markets for the disposal of their surplus production."

On this question, it should be stated that in previous inquiries respecting railway proposals where, notwithstanding the fact that it was not likely the proposed line would pay at the outset, the full Committee have recommended its construction, such recommendation has only been made in cases where the railway would pass through agricultural districts affording an opportunity for close settlement and increasing production. In the Byrock-Brewarrina district, where the land is purely pastoral, there is no immediate prospect of either close settlement or agriculture.

THE COMMITTEE'S RESOLUTION.

15. After a careful consideration of the evidence, and of the report submitted by the Sectional Committee, the full Committee are of opinion that it is expedient the proposed railway should be constructed, provided that it be made legally binding upon the Crown lessees in the district served by the railway to pay, until the railway shall become self-supporting, one farthing per acre rent additional to their present or ordinary assessment, such additional rent to be credited to the Railway Commissioners.

The

The resolution adopted is shown in the following extract from the Committee's Minutes of Proceedings :—

“ Mr. Humphery moved,—‘ That, in the opinion of the Committee, it is expedient that the proposed railway from Byrock to Brewarrina, as referred to the Committee by the Legislative Assembly, be carried out, provided that it be made legally binding upon the Crown lessees in the district served by the railway to pay, until the railway shall become self-supporting, one farthing per acre rent additional to their present or ordinary assessment, such additional rent to be credited to the Railway Commissioners.’

“ Mr. Fegan seconded the motion.

“ Mr. Lee moved,—‘ That the motion be amended by the omission of all the words after the word “ out.’ ”

“ The amendment was seconded by Mr. Hassall, and negatived on the following division :—

Ayes, 5.	Noes, 8.
Mr. Trickett,	Mr. Ewing,
Mr. Clarke,	Mr. Humphery,
Mr. Lee,	Mr. Hoskins,
Mr. Hassall,	Mr. Roberts,
Mr. Farnell.	Mr. O'Connor,
	Mr. Fegan,
	Mr. Black,
	Mr. Wright.

“ The motion was passed on the following division :—

Ayes, 11.	Noes, 2.
Mr. Ewing,	Mr. Hoskins,
Mr. Humphery,	Mr. Black.”
Mr. Roberts,	
Mr. Trickett,	
Mr. O'Connor,	
Mr. Clarke,	
Mr. Lee,	
Mr. Fegan,	
Mr. Hassall,	
Mr. Wright,	
Mr. Farnell.	

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 22nd June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM BYROCK TO BREWARRINA.

FRIDAY, 1 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Byrock to Brewarrina.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make? Yes. It is as follows:—

Department of Public Works, Sydney, 29 September, 1897.

RAILWAY FROM BYROCK TO BREWARRINA.

As far back as September, 1881, a petition from residents of Brewarrina urging the construction of this line was forwarded by Mr. Russell Barton, M.P., and in November of the same year Mr. Secretary Lackey authorised a survey to be made.

In May, 1883, Mr. Whitton reported the completion of the survey, the length being 55½ miles; but no estimate of cost was made till July, 1889, when Mr. Deane reported that the line could be built for £242,400 = £4,366 per mile. This estimate was revised in June of the following year, the cost being reduced to £211,220 = £3,806 per mile.

In 1886 a proposal was made to guarantee the Government against loss in the event of its consenting to construct the line; but it was not taken up, and ultimately came to nothing.

Between the years 1885 and 1889 several deputations waited upon the different Ministers, urging the construction of the line; but no definite action was taken till May of the latter year, when Mr. Secretary Bruce Smith asked the Railway Commissioners for a report on the proposal.

In their report, dated 15th July, 1889, the Railway Commissioners stated the line could not, on commercial grounds, be recommended, but there was another aspect of the case. There was practically no means of communication between Byrock and Brewarrina. Ordinary roads, from the nature of the soil, were costly to make and maintain, and it was worthy of consideration whether an inexpensive railway might not be constructed (in lieu of an ordinary road) to afford a means of transit.

Colonel Wells reported that the cost of a road between the two places would be enormous. A ballasted road would cost at least £4,000 a mile, or £250,000, and the expense of maintenance would not be less than £11,000 per annum.

Mr. Scarr was also instructed to report on the proposal, and the conclusions, briefly put, at which he arrived were:— (1) The traffic would be confined to wool, stock, station, and store goods, and a limited number of passengers. (2) There was a fair prospect of the line proving a financial success, but it would be at the direct expense of existing lines. (3) There was a fair prospect of considerable stock traffic, but insufficient to compensate for the competition with existing lines for wool and goods traffic. (4) If an extension from Narrabri to Walgett was to be carried out, this line should not be constructed, as the two would be in ruinous competition.

With the object of making a cheap line, an amended flying survey was made by Mr. Burge, in October, 1892, the length of the line being 58 miles 40 chains, and Mr. Deane, in forwarding the report to the Minister, stated he could not see how the cost could be reduced below £2,623 per mile (to which had to be added to the total cost the sum of £19,600 for junction works, stores, &c.) unless the Railway Commissioners could supply a sufficient quantity of serviceable second-hand permanent-way material at a cheap rate, or would reduce the charge for carriage of new rails.

The matter then slept till April, 1895, when a deputation, representing the residents of the district, introduced by Mr. Willis, M.P., waited upon Mr. Secretary Young, and again urged the construction of the line. The Minister promised to give the matter favourable consideration, and in August of the same year Mr. Deane made a further revision of the estimate, and stated that although it may be very considerably lessened there are several features which prevent it being made as cheaply as the lines lately considered by the Public Works Committee. These are, firstly, that some extensive watercourses, including the Bogan River, have to be crossed; and, secondly, sleepers and ballasting will be expensive on account of the difficulty in obtaining them, and the freight on material, on account of distance, will be high. Mr. Deane proposed to include ballast for a quarter of the length only. The question of stations he had gone into with the Railway Commissioners, and these would probably involve an expenditure of £10,400. Under these conditions the estimate he arrived at for cost of the line, including engineering and office expenses and contingencies, was £2,340 per mile, or £138,060 for the 59 miles.

On receipt of this report, Mr. Secretary Young asked the Railway Commissioners for their views on the proposal, and the Commissioners, in reply, forwarded (11/10/95) a copy of a report made to them by Mr. Harper, Goods Superintendent, in which they concurred generally, although they were of opinion he had taken too liberal a view of the probable traffic, and they could not recommend the construction of the line.

In November, 1896, Mr. Willis, M.P., forwarded to the Minister a statement traversing the report of Mr. Harper, and therein Mr. Young minuted—

I should be pleased if the Railway Commissioners will say whether, in view of the statements made herein by Mr. Willis, and the fact that the locks proposed are not now likely to be proceeded with, they would now be prepared to recommend the construction of this line of railway.

R. R. P.
Hickson.
1 Oct., 1897.

There appears to have been no reply to this minute, but it having been decided to refer the proposal to the Public Works Committee, the Commissioners were requested to forward their report, in accordance with the provisions of the Public Works Act, of which the following is a copy:—

Proposed Line of Railway from Byrock to Brewarrina, 59 miles.

As requested by the Honorable the Minister for Public Works, and in accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under:—

<i>Cost of Construction—</i>	
The Engineer-in-Chief for Construction estimates the cost of construction of a light railway line (exclusive of land and compensation) at	£146,350
<i>Annual Cost—</i>	
Capital expenditure at 3 per cent.	£4,390
Cost of maintaining permanent way and traffic and locomotive expenses.....	4,750
Total Annual Cost	9,140
<i>Traffic Estimate—</i>	
Live stock and Goods	3,448
Coaching	775
Mails.....	618
Total estimated traffic	4,841

The estimated cost of the proposed line as shown above has been materially reduced since the question was first under consideration, as also has the cost of working and maintenance, the locomotive and traffic expenses being based on a tri-weekly service.

The estimated value of probable traffic has been made upon the most favourable basis, and it is doubtful whether the sum will be fully realised.

Notwithstanding the reduced estimate of annual charges on account of interest, working and maintenance, and the favourable estimate of value of probable traffic, a very considerable annual loss will ensue if the line is constructed.

It is worthy of special consideration that the larger proportion of the traffic would be diverted from the main line from Bourke, and would consequently correspondingly reduce the receipts therefrom; and further, there is little, if any, prospect of a new traffic being created.

Under these circumstances the construction of the line cannot be recommended.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed, this second day of July, One thousand eight hundred and ninety-seven, in the presence of—	} CHARLES OLIVER, Commissioner. } W. M. FEHON, Commissioner.	(L.S.) (L.S.)
H. MCLACHLAN.		

2. *Mr. Lee.*] As the question of railway communication to Byrock is involved in the question of the locking of the river between Bourke and Brewarrina, could you tell us what has been the result of the weir that has been erected just below Bourke, and whether the Department contemplates extending that system? The weir that has been erected at Bourke has been a success. The cost, I think, has been slightly over the estimate, but as regards retaining the water it has been successful.

3. Equal to expectations? Yes.

4. Has the Darling been in flood since the weir was erected? Yes, a slight flood.

5. And up to the present time, it has stood the severe conditions supposed to be brought against it in time of flood? Yes.

6. I presume that the Committee have to consider this line on its merits, without any reference to what may be done in future? I think that is for the Committee to say.

7. Does the Department place this scheme before us in connection with any alternative scheme, or simply for us to say whether the line should be made for the development of the country? The scheme is submitted by the Department with a view of passing it if the Committee think it right.

8. There is nothing behind it in the shape of an alternative scheme? No.

9. There has been considerable influence brought to bear upon Parliament for many years by the residents to obtain railway communication to that district? Yes.

10. Beyond the facts you have placed before us, are there any other reasons known to the Department why it would be advisable to submit a line of this character under present conditions? I have given you all the facts that are in the possession of the Department.

11. *Mr. Hoskins.*] Has the Department ever considered that if a line is made from Narrabri to Walgett, or the river is made navigable by the construction of weirs, that the railway to Walgett or the navigation might make this line almost useless? I think that if locks are put on the river the line would not be justifiable.

12. *Mr. Wright.*] With regard to the question asked by Mr. Lee about the weir, what has been the experience as to the raising or lowering of the shutter of that weir? I could not tell you of my own knowledge. I believe there has been no difficulty.

13. Since the construction of that weir there has been nothing like a big flood in the Darling, has there? Not a heavy flood.

14. Not one that would submerge the whole thing? I am not sure that it was not out of sight for a short time.

15. Is Mr. Harper's report of 1895 the latest you have had from him? It is the latest that we have had. The Commissioners report over-rides that, and it is based, no doubt, on a later report from Mr. Harper.

16. The Commissioners state in their report that the probable estimate is estimated on a liberal scale? Yes.

17. *Mr. Roberts.*] Is this railway put before the Committee on account of the Committee not having recommended the locking of the Darling? It is put before the Committee on its merits.

18. Will not the annual loss come to something like £5,000 a year? £4,299 is the estimated amount.

19. Does the Department hope for any increased settlement in the district, between Byrock and Brewarrina? I do not think much can be expected.

20. Is the land there principally leased land? I think so.

21. How far is Brewarrina from Walgett? About 120 miles by water and 60 miles by road.

22. Is it in contemplation to touch Walgett with the railway? It is not proposed by the Department just now; but there is a proposal before you to make a line from Narrabri to Pilliga.

23. Are you in a position to say that Walgett would be the objective point? I could not see much justification for making a line to Pilliga, unless it was to go on to Walgett.

24. If we could assume that a line should go to Walgett, would it be a wise thing to construct a line from Byrock to Brewarrina? I am hardly in a position to answer that.

Henry

MINUTES OF EVIDENCE—RAILWAY FROM BYROCK TO BREWARRINA.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

25. *Mr. Hoskins.*] In the statement which has been laid before the Committee by Mr. Hickson, it is stated that you had sent in three estimates of the probable cost of a line from Byrock to Brewarrina? I think it is very likely. The estimates have been revised from time to time.

H. Deane.
1 Oct., 1897.

26. Your later estimates of expenditure for the proposed line are considerably less than the original estimate? Yes.

27. What is the reason of that? Partly the lowering of prices, and partly a reduction in the style of design.

28. You propose to make this line a pioneer line? Yes.

29. Are there many watercourses to cross? There are two important watercourses—the Bogan River and the Tarrion Creek.

30. Will you require to have costly bridges over them? Yes; it would be necessary to have timber viaducts.

31. Will you make a statement, based on the last estimate of the line you propose to construct? I have here a copy of the estimate, which is as follows:—

BYROCK TO BREWARRINA.

Revised estimated cost of a single line of railway 58 miles 43 chains in length, with 60-lb. rails; ruling grades, 1 in 75 and 1 in 77 with the load; sharpest curve, 20 chains radius.

Description.	Estimated Cost.	Average per mile.
	£ s. d.	£
Earthworks.....	15,782 10 0	270
Timber bridges and small timber openings.....	4,919 15 0	84
Large bridges.....	7,791 19 6	133
Level crossings, cattle stops, and fences.....	2,055 0 0	35
Permanent-way materials.....	36,524 16 3	624
Freight.....	11,885 0 0	203
Platelaying at 1s. = £5,151 10s.....	34,902 0 6	596
Ballasting (½ ch.) at 3s. 6d. = £4,508.....		
Sleepers at 3s. 6d. = £25,242 10s. 6d.....		
Station works, including junctions and sidings.....	5,105 10 0	87
Station buildings: passenger building, £300; waiting-sheds, £300; passenger platform, £300; station-master's house, £300; goods-shed and platform, £350; loading banks, £450; 20-ton weighbridge, £300; 5-ton crane, £220; trucking-yards, £770; engine-shed, £500; carriage-shed, £275; coal-stage, £200; turntables, £1,100.....	5,365 0 0	92
Water supplies.....	3,000 0 0	51
Gradient and mileage-posts.....	878 2 0	15
Telegraph.....	878 2 0	15
Miscellaneous.....	1,000 0 0	17
Cost of works.....	130,087 15 3
Engineering and contingencies, 12½ per cent., nearly.....	16,262 4 9	278
Total cost.....	146,350 0 0
Average cost per mile.....	2,500 0 0

32. Would you expect to get any ballast on the route between Byrock and Brewarrina? No; I think it will have to come from the main line.

33. Therefore, ballasting would be rather an expensive item? Yes; I put it down at 3s. 6d. per lineal yard.

34. You only propose to ballast in bad places? That is all, where required.

35. Is timber scarce there for sleepers and bridge-building? Yes. There is no timber for sleepers and bridge-building. It will have to be brought from the Dubbo district, the larger timber coming, probably, from the coast.

36. Has your Department ever been engaged in making preliminary surveys for the construction of the line from Narrabri to Walgett? Yes; some years ago there were surveys made.

37. If a line were made from Byrock to Brewarrina, would not such a line take away a great deal of the expected traffic on the Narrabri and Walgett line? I do not know that it would; but I have not studied the question from that point of view. Perhaps Mr. Harper could give you better information on that question.

38. I notice that in your statement of the proposed expenditure you have included water conservation;—does that mean that you have to make tanks to supply the engines? I think so. Of course at Brewarrina we should get water from the river; but the Bogan River and Tarrion Creek, I believe, are generally dry.

39. Do you think you have allowed a fair margin for that extra expenditure? I think so.

40. I suppose that this line would be somewhat similar to the line now working so successfully between Narrabri and Moree? It will be a light line.

41. Have you given any consideration to the proposal which has been mooted for locking the Darling River? I cannot say that I have.

42. Have you been to Brewarrina yourself? I have not. I intended to go, but I have not had time since this proposal was placed before Parliament.

43. Have your engineers and surveyors pointed out to you that if the navigation of the Darling River were made pretty permanent by the construction of weirs the produce of the district would be taken to Bourke, instead of going by the proposed railway? I think that is a fact which is pretty well understood—or at least the probability.

44. Is it not a fact that whenever the river is up all the produce from, and stores going to, Brewarrina are taken by the river to Bourke? Yes, I think so.

H. Deane.
1 Oct., 1897.

45. If the navigation of the Darling were improved so that vessels of light draught could navigate it during most of the year, as water carriage is so much cheaper than railway carriage, does it not seem probable that the line would not be very extensively patronised? I do not think it would under such circumstances.

46. *Mr. Trickett.*] I suppose you cannot describe the line in detail? I have a short description here which I will read, then I will supplement it:—

Byrock to Brewarrina Railway.

(Length, 58 miles 43 chains; estimated cost, £146,350, or £2,500 per mile, exclusive of land and compensation.)

This line branches from the Great Western Railway at 455 miles 62 chains, at the north-west end of Byrock station, and follows generally the travelling stock reserve No. 1,207 for about 19 miles; here, in order to avoid heavily flooded ground, it leaves the reserve and continues generally parallel to it, about 2 miles to the eastward, to Brewarrina, ending at 514 miles 25 chains from Sydney.

The country is flat and the grades easy, but some important watercourses are crossed requiring bridging.

47. Shortly after leaving Byrock the line seems to go away to the westward? Yes.

48. What is the object of that? It is chiefly to get the required grades. The country is generally flat, but there are slight undulations. I will now give you some further particulars. The datum to which the levels are reduced is 100 feet below high-water spring-tide in Sydney. The reduced level, after the commencement of the line, is about 595 feet above the datum—that is, at Byrock. Then the ground rises gradually till you get to about 461 $\frac{3}{4}$ miles. There the level is 724 feet. Then it is slightly undulating till you get to 466 miles, and there it is 787 feet; then the ground falls again until at about 470 $\frac{1}{2}$ miles it is 663 feet. So you see the ground is by no means level. Then it rises again till you get to nearly 473 $\frac{3}{4}$ miles, and it is 719 feet there; then it falls away with a gentle undulation until you get to 491 $\frac{1}{2}$ miles, and there you reach the bank of the Bogan River channel. The level there is 489 feet. Then the country still falls away slightly till you get to 501 miles, and there it is 483 feet. Then it is level for some considerable distance, only varying a foot or two, and at 507 $\frac{1}{2}$ miles the level is 491 feet. Then you come upon the Tarrion Creek, which is by far the most important watercourse met with. From there, after passing the creek, the ground pretty well preserves its level till you get into Brewarrina, and the level in Brewarrina is 491 feet. I have a section of the line which I will hand in. I have also a plan, to a 10 chain scale, and the Book of Reference.

49. *Mr. Hoskins.*] Is there much alienated land there? No; it is all Crown land, excepting portions Nos. 10 and 15A. Portion No. 10 is at 479 miles, and portion 15A is near the 492 miles on the Bogan River.

50. *Mr. Trickett.*] What length would the line go through before getting to them? Twenty-four miles and 37 miles from Byrock.

51. So that the land resumed on the route would be very trifling? Very slight.

52. At Brewarrina is there much expense for station purposes? No; the ground is very flat, and the buildings to be put up will be inexpensive.

53. The station would be on Government land? Yes.

54. Then the line presents no engineering difficulty? No; the heaviest work will be those viaducts over the river and the creek.

55. I suppose that the approach to the Bogan River would have to be of considerable length? Yes; it would be on piles.

56. Would it be similar to that at the Bogan Gate, half way to Condoblin? Yes—you mean over the Gunningbland Creek; but it will be more expensive.

57. What will be the worst grade on the line? One in 75.

58. The greater part of the line is through red-soil country, is it not? I have not noted that.

59. The greater part of the way is high land, is it not, and not subject to floods? It is high land.

60. Is it a line that would be likely to be affected in the same way as the Narrabri to Moree line has been? No, I think not.

61. There is not likely to be a large spread of water affecting the permanent way? No; the water is chiefly concentrated at these two watercourses, and I have made considerable provision for timber openings.

62. By box-drains along the route? Box-drains and timber openings.

63. I suppose you are aware that Brewarrina is looked upon as a very large stock country? Yes; I believe it is.

64. Has it not been a question whether the railway should not have gone to Brewarrina instead of going to Bourke? I cannot speak as to that.

65. *Mr. Clarke.*] This is to be a cheap line of railway? Yes.

66. Do you know anything about the description of roads that they have between Byrock and Brewarrina? No.

67. You do not know what is the cost of making roads in that part of the country? No.

68. You do not know the nature of the country at all? I have not been over the line myself; but I can get the reports if required.

69. You propose to ballast a portion of the line? Where it is absolutely necessary.

70. Is it a country as easy for the ballasting as that between Moree and Narrabri? It should be a much better country to build a railway through than Narrabri to Moree, on account of its undulating character. The difficulty to contend with on the Narrabri to Moree line has been due to the flatness of the country, and the overflow of the creeks over very large areas.

71. Some time ago it was stated that the cost of locking the Darling would be £150,000? Yes.

72. This railway from Byrock to Brewarrina would not cost so much? The cost of this railway will be £146,350, according to the estimate.

73. If the Darling should ultimately be locked, and the traffic should go by water instead of by land from Brewarrina to Byrock, would the people not have to pay river freight in addition to the railway freight? Yes; I suppose they would.

74. Then, in the event of the present line not being made, would not the people about Brewarrina be at a disadvantage as regards getting their goods to market? Of course it would be a convenience to them to have the railway, as they could travel more quickly by rail than by water.

75. Would they not have to go first to Bourke, then on to Byrock, and from there to Sydney? It would depend upon what they would have to pay whether it would be an advantage to them to have the railway.

76. Passenger traffic would still have to go by coach from Brewarrina to Byrock? Yes. 77.

H. Deane.
1 Oct., 1897.

77. *Mr. Lee.*] How will the cost of this line stand as compared with the cost of the Narrabri to Moree line? It is a little more expensive. The average cost of the Moree line was £2,400 per mile.
78. This is practically the same line? There is not very much difference.
79. Would that estimate include the bridge across the Namoi? Yes.
80. The difference is about £80 a mile? Yes; on this line the sleepers would be more costly. That alone, I think, would account for the difference.
81. There are no sleepers in the district? No.
82. And not a great deal of ballast? No.
83. Do you intend to make the earthworks as you did on the Narrabri line? We shall carry them out in the same style.
84. Do you think the nature of the soil is such that the banks will stand in heavy rain? Yes.
85. Have you had any similar country under consideration elsewhere? I think we have had now pretty well all classes of soil, and the embankments stand very well.
86. There is a great difference between the country between Byrock and Brewarrina, and the country between Brewarrina and Bourke;—have you taken those features into consideration? Yes.
87. Would you care to give any opinion from a railway point of view as to the reaching of the river Darling by way of either Pilliga or Brewarrina? I do not think I am prepared to give any opinion.
88. Considering the close relationship of these two routes the Brewarrina and the Narrabri to Pilliga, both intended for some portion of the same trade—are you of opinion that it would be an advantage if these two lines were considered in conjunction with each other? They do not altogether serve the same districts. I do not know that I should recommend that.
89. You are aware that the Darling River when navigable is used for conveying a large quantity of station produce down towards Brewarrina? Yes.
90. If Brewarrina were the depôt for the railway traffic, it would, to a certain extent, interfere with the traffic that must be relied upon for a line if carried towards the river in the direction of Walgett? Yes, it might do so, but I have not studied the subject very carefully. It is rather out of my province.
91. Are you quite sure about the flood-level in this country? Yes; we have had careful investigations.
92. They have had some very heavy inundations there at times; town and district have been flooded? The Tarrion Creek spreads out very largely.
93. Are you making any provision against flood waters? I propose to keep the railway above the floods. I have a sufficient sum of money down for earthworks. I have put down £270 a mile, which, for this class of line, is quite high enough to provide, over a considerable length of line, fairly high embankments.
94. What number of water openings have you left in the vicinity of Brewarrina? The openings are not marked on the section, but with the experience that we already have I should certainly provide sufficient to make the line quite safe. In the neighbourhood of Brewarrina within the last mile and a half there is evidently a great deal of country that is liable to floods, and it would, of course, either have to be bridged over, or the embankments would have to be made sufficiently high to keep the rails out of it.
95. Does it mean that if a daily service had to be run the line would have to be better maintained or more strongly built? No; it might mean that more men would be put on to repair, that is all.
96. Not necessarily that the line would have to be built more strongly in the first instance? No, not unless the traffic were very heavy.
97. I suppose by "very heavy" you mean heavy trains, not frequency of trains? It means the quantity of traffic going over the line.
98. If the cost of maintaining it is based on a tri-weekly system, that cost would have to be increased if it were a daily service; then that would be a cost which would fall upon the maintenance branch? Yes.
99. Do you purpose dealing with the requisites for stock in any special way, having yards built to suit any special trucks? I have a sum of £770 down for trucking yards.
100. Are they to be on the same pattern as those erected in most other places? I should think so. At present the question of accommodation has not been thought out in very great detail.
101. The stockyards come under your Department? Yes.
102. Have you not received very many complaints, from time to time, of the unsuitability of the yards at which stock are trucked? I think every district would like to have a different style of yard.
103. Has it not been brought under your notice that in many cases horned stock are actually ruined when being put into the trucks, owing to the unsuitableness of the yard? That I cannot say. The present design of yards has been very carefully revised in conference with the Railway Commissioners' officers, and what we are erecting now I suppose is perfect as nearly as possible.
104. Then you are not contemplating any change in the design of your trucking-yards? No.
105. This district is known to be a very large stock-producing district, and a large proportion of the revenue is expected to come from stock? Yes.
106. Therefore it is one of those places at which, if an improvement could be made in the trucking-yards, it should be made? Yes, if it is necessary.
107. In view of the many complaints about these things, the Committee would like to know whether it is contemplated to make any special arrangements at Brewarrina? I do not think so. My reply is that the question of the design of proper trucking-yards has received special consideration during the last couple of years or so, and it is believed that we have now the best design.
108. At all events the Department does not intend to make any alteration? I know of no alteration contemplated. If any improvements were suggested they would receive consideration, and would be carried out if found desirable.
109. Inasmuch as the cost of the yards is not very much, and alterations are very easily made, I presume that the Department, in cases like this, if it sees a more suitable design adopts it? Yes; it is only a matter of small detail.
110. But you will admit that it is an important one, as far as the trucking of fat stock is concerned? Decidedly.
111. *Mr. Wright.*] Has there been much investigation of that country? I think so.
112. Has there ever been a line surveyed to Gongolgon? I am not sure.*
113. Has there been more than one survey made in order to get between Bourke and Brewarrina? Yes the present survey is a revised one.
114. Is that the only survey that has been made there? The present survey is a revised survey—a new survey.
115. It is considered the best? Yes.

116.

* NOTE (on revision) :—The route has been examined and reported against.

- H. Deane.
1 Oct., 1897.
116. What kind of country is it from about 20 miles on this side of Brewarrina to close in to Brewarrina? There is a good deal of country there that is subject to floods.
117. Are you aware that in ordinary floods the whole of that country is under water? Not the whole of it.
118. A belt of country about 20 miles in width? A good deal of it.
119. Have you any description of the nature of the country and its soil? I have not the reports here.
120. It is very soft country, is it not? If you will allow me I will refer to the reports.
121. In what part of the town of Brewarrina is your railway station to be? Between Bokhara-street and Novena-street.
122. Right in the town? Yes.
123. On comparatively dry land? Yes.
124. Can you tell the Committee what water-openings you have got across the Tarrion Creek? I have not the details here, but I shall be glad to supply them.
125. Is this the best and shortest line that has been submitted? I do not think that it is the shortest, because it winds about considerably to get the ruling grade.
126. Is distance sacrificed to get a grade of 1 in 75? Yes.
127. Is there any necessity to get such a grade on a line that will never carry very heavy traffic? I think that a grade of 1 in 75 is the steepest that we ought to have.
128. You look upon it as the maximum? Yes; in that country for stock traffic.
129. According to Mr. Hickson's report, I find that one of your estimates was to construct the line at £2,626 per mile, and another to construct it at a cost of £2,340 a mile, or a total of £138,060, whereas now your estimate is to make the line at £2,500 per mile, or an increase from £138,000 to £146,000? Yes. I should have to refer to the circumstances under which that lower estimate was made. I am not satisfied that it was sufficient.
130. There is a difference of over £8,000? Yes.
131. That would point to the fact that the latest survey is not an improvement upon the former survey? It would imply that the estimate has been very carefully gone into, and that nothing has been left out.
132. Or that the previous estimate had been carelessly gone into? No; I do not think so. I am not prepared to answer the question; but I will take a note of it. I think, if I remember rightly—and I should like to correct my statement if it is wrong—that the lower estimate was based on the supposition that the line would be carried below the flood-level. Since then I have altered it, so that the line shall be kept above the flood-level.
133. That is the result of more mature deliberation? I expect the other estimate was made under instructions.
134. Having again thought out the whole question, you think that the estimate was a little too low, and you have increased it? Yes; it is a different line, as it were.
135. It is an improved line? Yes.
136. *Mr. Roberts.*] What is the exact length of the proposed line from Byrock to Brewarrina? Fifty-eight miles 43 chains.
137. Can you tell the Committee the distance from Byrock to Bourke? About 49 miles.
138. And the distance from Bourke to Brewarrina? Sixty-eight miles by road.
139. According to the statement put in by Mr. Hickson in 1889, the cost of the line was estimated at £4,366 per mile. Might I ask whether that estimate was prepared by you? I do not think so. I think that estimate was made in Mr. Whitton's time.
140. Then there is another estimate to construct the line for £3,806 per mile;—was that prepared by you? That would be a revision of prices probably.
141. Then it came down to £2,338? I think that was an estimate for a line which went below flood-level.
142. What would be the difference between a line estimated to cost £2,500, and a line estimated to cost £3,806? Of course, it is difficult for me to say without referring to the plans and sections. It is very likely that that line would be straighter, and that there would be heavier earthworks, and more ballasting. The bridge construction would be of the old type, which would not be so economical.
143. Would there be more sleepers? No; fewer sleepers.
144. Do you think that the line, if constructed at a cost of £2,500, will be capable of carrying all the traffic on it, and will be one that may be constructed with advantage? Yes; I should be quite satisfied with a line constructed for that money.
145. What amount do you propose to spend on earthworks? £15,782 10s.
146. What does that average per mile? £270.
147. That appears to be a fairly low rate compared with other lines? It is higher than we have had in some cases, but I have kept it sufficiently high to allow of embankments being raised through wet ground.
148. On The Rock to Green's Gunyah line the average per mile is £474? Yes, but there are heavy cuttings there.
149. Which do not exist on this line? No.
150. What is the estimated cost of the culverts and timber bridges? For the small openings £4,919 15s., but for the large bridges £7,719 19s. 6d.
151. What is the average for the large bridges? £133 per mile for the large bridges; for the small ones £84 per mile.
152. What is the cost of station buildings—passenger buildings, waiting-sheds, platforms, station-master's house, carriage-sheds, engine-sheds, coal-sheds, turn-tables, and so on? The total is £5,365, or an average of £92 per mile.
153. Will the station-master's houses be of the same class of architecture as you have recommended for these pioneer lines? Yes, only small timber houses.
154. What provision have you made for water supply, and what will be the cost? The cost will be £3,000. It will be necessary to have an engine-tank about half way along the line.
155. At what point? That remains to be decided. But possibly the depression of the Bogan River might be utilised.
156. In the estimated cost, have you allowed 12½ per cent. for engineering and contingencies? Yes.
157. Have these figures been carefully revised? Yes.
158. Do you feel sure that the line could be built for the sum stated? Yes; I have gone into it very carefully.

TUESDAY, 5 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

John Harper, Goods Superintendent, Department of Railways, sworn, and examined:—

159. *Mr. Humphery.*] Have you prepared a statement for the information of the Committee? I have a report here which I made for the Commissioners, and which I will read. It is as follows:—

J. Harper.
5 Oct., 1897.

PROPOSED RAILWAY—BYROCK TO BREWARRINA.

(Distance, 59 miles; estimated cost, £2,338 per mile.)

I HAVE made a most searching inquiry into the probable traffic on this proposed railway, having had the opportunity of comparing the manifests of Messrs. Rich & Co., and Wright, Heaton, & Co., for wool and goods water-borne between Bourke and Brewarrina and the district beyond with the station books at Bourke, and have also analysed the returns of Byrock station.

As the Commissioners are aware, the great bulk of through traffic to and from Brewarrina is carried by river. During the past seven years the river has been available during the most important portion of the season, and any failure which has taken place has been during the months of January, February, and March, when the wool clip, which represents the most important feature of the business in this district, has been carried.

I may also mention that the Government have undertaken a very extensive work in connection with locking the river between Bourke and Brewarrina, for the purpose of making it permanently navigable. At the present time works, estimated to cost £19,000, are being undertaken 3 miles below Bourke, and I gather from Mr. McKinney, Engineer-in-Chief for Water Conservation, that borings have been made, and all the preliminary work undertaken in connection with providing for locks which will be necessary for the purpose mentioned. It will be seen that under these circumstances the probability of obtaining any traffic at Brewarrina, at such rates in competition with river-borne traffic, as will pay working expenses, is extremely doubtful.

Under the circumstances of an ordinary river, which has, up to the present, remained unimproved by snagging operations or otherwise, the rates between Brewarrina and Bourke have varied between 12s. 6d. and 20s. per ton, and the time of trip from sixteen to thirty-six hours; the steamers in some cases bringing as much as 1,200 bales of wool.

There is no doubt in my mind that, under the altered conditions which will arise from an improved river, not only will the time occupied in performing the journey be very materially reduced, but it will also be possible to improve the carrying capacities of the steamers and to reduce the freight to, probably, 5s. or 7s. 6d. per ton.

In the face, both of existing circumstances and the probable improvements, we could scarcely look to obtain any traffic from this district in competition with the steamers.

There is also another phase of the question. So far, the carrying companies established at Bourke, who have large vested interests in that town, have concentrated, as far as they possibly could, the river-borne traffic to that point. Should these interests be disturbed it is quite possible that we may find them seriously competing with us by taking traffic down stream to South Australia. I simply refer to this as being a contingency likely to arise by shifting our base of operations on the Darling. My own strong conviction is that, for traffic within access of the Darling and its navigable tributaries, reliance should be had rather upon the improvement of the means of water-carriage to Bourke than that any attempt should be made to tap other points of these streams.

In connection with the Queensland wool and traffic, it may be incidentally mentioned that the result of my inquiries shows that no Queensland wool or goods traffic was dealt with at Brewarrina during last season, which was the most favourable one we have had.

This would appear to indicate that even with the extension to Brewarrina we could expect very little, if any, diversion of this traffic to our lines, or even from Bourke and Moree.

From carefully compiled returns, I have ascertained that the population of the Brewarrina Police District is 3,175. Of this number not more than 2,000 would be within reach of the projected railway. The population of the town of Brewarrina is 500. The Crown lands of the district represent an area of 4,557,000 acres in occupation by 297 holders. There are 153 homestead leases, but it is currently stated that a large number of these are not occupied by the lessees. This is to a certain extent verified by the fact that the last sworn stock return only indicated 118 holders of stock in the whole district.

When I was at Brewarrina an impression prevailed amongst those who were candid enough to admit it that this number would continue to decrease.

I have deemed it necessary to make these general remarks in order that the Commissioners may appreciate the objections which exist to constructing the railway to what may be considered a splendid pastoral district.

Estimate of traffic.

The relative distances from Darling Harbour to the centres at which the present traffic is dealt with, are:—

Byrock	457 miles.
Bourke	504 „
Brewarrina	516 „

The rates to and from Bourke and Byrock for general goods are the same, *i.e.* £41 per truck load. The same applies to sugar, wire, iron, rice, and wool. The rates for stock are:—from Bourke, £9 7s. 9d., and Byrock, £8 13s. 9d.

As already indicated, serious regard must be had to river competition, and in making my estimate I have taken the most favourable season and an arbitrary rate for wool and goods, which I consider it is doubtful if we could maintain in the face of the competition referred to.

Estimate of traffic between Byrock and Brewarrina, including up stream to Walgett.

	£	s.	d.
Goods, 2,000 tons at 10s.	1,000	0	0
Wool, 3,100 ton, at 10s.	1,550	0	0
Wool, 330 tons at 7s. 6d. (wool on route of line between Byrock and Brewarrina)	123	15	0
Live-stock, 1,000 trucks at 15s. 6d.	775	0	0
Passengers, 1,500 at 9s.	675	0	0

	<hr/>		
	£4,841	15	0

Live-stock.—Quantity shipped last year at Byrock and Bourke, doubled.
Passengers.—Calculated at local rates.

If

J. Harper.

5 Oct., 1897.

If the traffic arriving at Brewarrina for and from Walgett and above stream were excluded, the estimate would be:—

	£	s.	d.
Goods, 1,300 tons at 10s.	650	0	0
Wool, 1,500 tons at 10s.	750	0	0
Wool, 330 tons at 7s. 6d. (wool on route of line between Byrock and Brewarrina.)	123	15	0
Live-stock, 1,000 trucks at 15s. 6d.	775	0	0
Passengers, 1,500 at 9s.	675	0	0
Coaching	100	0	0
Mails	618	0	0
	£3,691	15	0

With reference to the stock, I am very doubtful if 1,000 trucks would be reached during a good season between Brewarrina and Bourke and Byrock. There are three excellent stock routes, one of them passing through Charleton and Tarcoom runs is 2 miles in width, and for a great portion of the distance carries a large quantity of "mulga," which even during a dry season would permit of stock being driven to Byrock for trucking purposes.

Should it be decided not to proceed with this railway, I would suggest for the consideration of the proper Department that water should be provided where necessary on this route in order to enable stock to reach Byrock.

160. Do you show in your report the probable loss on the line? No; that phase of the question has been dealt with by the Commissioners.

161. Are we to understand that the maximum earnings of the railway, assuming Walgett to be reached by the extension from Narrabri or Coonamble will be £3,691? No; I do not say that. I say it is doubtful whether we shall get the traffic. That represents the maximum output of the district.

162. Have you estimated what portion of that traffic would probably reach the railway at Brewarrina, or between Brewarrina and Byrock? No; I have given the whole of the traffic of the district. That represents the traffic of the district with the rates fixed as low as I could possibly fix them.

163. You have given the possible earnings? Yes.

164. What is your opinion as to the probable earnings? That may be very much discounted by the river competition. It is impossible to say, where you have water competition, how much an estimate of this kind might be discounted; that I prefer to leave to the Committee.

165. Are we to understand that at present the rates from Byrock are similar to the rates from Bourke? Yes; both as regards wool which represents the staple of the district, and goods of ordinary consumption. There is a very small difference in some items, but it is almost inappreciable. On iron, rice, and wire the rates are the same at Bourke as at Byrock. There are articles which enter, to a small extent, into consumption, the rates on which differ. The maximum difference is 9s. a ton.

166. *Mr. Wright.*] In favour of Byrock? Yes.

167. *Mr. Humphery.*] Then, when the river is navigable, it is just a question whether the freight by steamer is greater or less than the carriage by the railway between Brewarrina and Byrock? Yes; that is precisely the position.

168. Although Byrock would be, in round figures, 60 miles nearer Sydney than Bourke, yet the carriage being the same, the cost to anyone using the railway would be no greater from Bourke? No. In regard to stock the difference is greater.

169. Explain in what way? The stock is carried on a mileage basis without competition. Of course, the steamers cannot carry stock down to South Australia. The charge from Byrock is £8 13s. 9d. per truck; Bourke, £9 7s. 9d.—a difference of 14s.

170. What would the rate be from Brewarrina? I have allowed 15s. 6d. in my estimate.

171. Then 15s. 6d. would have to be added to £8 3s. 9d.? Yes.

172. Does all the traffic of the line north from Bourke and Walgett reach the railway? No; not necessarily. There are occasions when there is no river, and it comes into Narrabri.

173. It reaches the railway on the east? Yes; that is until you get to the Queensland border.

174. Will you explain what additional traffic would come to the New South Wales railway system on the construction of a line between Byrock and Brewarrina? Taking a line due north from Walgett, all the eastern traffic goes into Moree.

175. I suppose that when the river is not navigable between Brewarrina and Bourke, the traffic finds its way direct to Bourke and Byrock? Yes.

176. What additional traffic will come to the Western railway system by reason of the construction of this proposed line? I cannot conceive of any additional traffic coming. Under existing circumstances we are effectually debarred from getting any Queensland traffic.

177. In sending traffic from Queensland, is there an export duty? Yes.

178. And you have to take that into consideration in fixing the rates for the carriage of wool? Yes.

179. Therefore you offer an inducement? Yes.

180. What are the distances from Walgett *via* Narrabri, to Newcastle and *via* Coonamble, to Sydney? The distance from Walgett to Newcastle *via* Narrabri is 470 miles, and the distance from Walgett *via* Coonamble to Sydney is 462 miles.

181. What is the rate by the present road from Narrabri to Newcastle as compared with the charge from Bourke to Sydney? Will you pardon my suggesting, in connection with the Narrabri traffic, that you have to deal practically with Sydney. Eighty per cent. of the wool delivered at Narrabri has to come to Sydney to be offered, whether it comes by rail or steamer from Newcastle.

182. Does the northern wool come to Sydney? Nearly 70 per cent. of it is offered here.

183. Seventy per cent. of the northern wool brought by railway comes to Sydney? Yes; my object in mentioning that is to keep before the Committee the fact that Sydney is the place where the traffic is eventually disposed of.

184. *Mr. Wright.*] Sydney is the objective point of 70 per cent. of the wool? Yes; and for that district Sydney is also the depôt for 85 per cent. of the live stock.

185. *Mr. Humphery.*] I asked for a comparison of the rates? The rate for wool from Bourke is £4 a ton, and the rate from Byrock is the same. The rate is £5 for scoured wool and £4 for greasy wool. We do not carry more than 12 per cent. of scoured wool, and we generally discard it for purposes of approximation. From Narrabri to Newcastle the charge is £2 13s. a ton for greasy wool, and £3 10s. 9d. for scoured wool.

186. Assuming a railway extension to Walgett, and calculating at the same rate, what would the cost be for wool from Walgett instead of from Narrabri? 69s. to Newcastle, and 87s. to Sydney. Then, of course,

course, there is another consideration. I am quoting through rates by the Northern line to Sydney. As a matter of fact, the steamers are able to carry the traffic between Sydney and Newcastle at a cheaper rate than we can carry it at.

J. Harper.
5 Oct., 1897.

187. Have you given me the rate charged? I have given you our published rate through to Sydney from Narrabri, and through to Newcastle. I say the steamers carry the wool to Sydney more cheaply than we do.

188. Is there any appreciable difference? Yes; a difference, including cartage in Sydney, of about 4s. in favour of water carriage.

189. Have you any other comparison that it will be convenient to give us now? I do not think so.

190. What traffic at present reaching the western system would be diverted in the event of a line from Narrabri to Walgett being constructed? I could not say. I have no idea what rates would be charged. Assuming that a line were constructed to Walgett, the conditions might be altered. Is this not anticipating my evidence on another line which is before the Committee.

191. If you are going to divert from the western system to the northern system traffic at present carried on the western system, that point must be inquired into? My own impression is that if a railway were made from Brewarrina to-morrow, and if a railway were made to Walgett, we could not prevent the diversion of the wool traffic, from near Brewarrina or Walgett; it would go down stream to Bourke.

192. Do you say, it would be cheaper to send the wool from Bourke than from either Brewarrina or Walgett? Yes, I think so. When the wool was once on the steamers we should have to make rates to pick it up at Bourke.

193. Then, is this your view: That the construction of a railway from Byrock to Brewarrina beyond being of some convenience locally, will not in any way increase the earnings of the railway? I do not think it will. On the other hand, I think it would be an additional length which, in certain seasons may, when the river is not navigable, serve the purpose which the road serves at present, and which, under ordinary circumstances, assuming that the rates are made low enough, may deprive the existing main line of some portion of its traffic.

194. Will you explain in what way it can deprive the existing line of any traffic? The traffic would probably be delivered at Brewarrina that comes to Bourke at the present time.

195. What difference would that make;—does it not mean that you would carry traffic over 60 miles between Byrock and Brewarrina instead of between Byrock and Bourke? You increase the capital cost of the railway by £140,000 to form a competitor with an existing line, and you diminish the earnings of that line.

196. Your contention is that the cost of the proposed line between Byrock and Brewarrina will leave a permanent charge upon the railway for interest upon capital and annual expenses? Yes; that is my contention.

197. And that it will do that without, in any way, swelling the earnings? Yes.

198. When were you last in Brewarrina? In 1895.

199. You have not been there since you prepared your report for the Railway Commissioners? No.

200. Do you think that in the course of time you could overtake the annual cost by fixing special rates between Byrock and Brewarrina? I do not think so, because so long as you have the river a factor, and competition on it increasing, I do not see how you are going to improve the condition of affairs. Apart from that, since 1895—I do not know for what reason—the position generally in that district has not improved very much. I had some information from most reliable sources the other day which will lead us up to the present year, and with the Committee's permission, I will read it. In the seasons 1893–94 there were carried by the river, from Brewarrina and intermediate stations, between there and Bourke, 13,000 bales of wool.

201. Do you distinguish between the quantity of wool carried from Brewarrina and the quantities from intermediate stations? No; I can scarcely do that without a great deal of trouble. Altogether there were 18,000 bales carried during that season—1893–4—and of that quantity 13,000 bales were carried by the river. In 1894–5 there were 17,468 bales carried, of which 12,528 bales went by the river. In 1895–6 there were 10,000 bales of wool carried, of which 209 were carried by the river. Of course, that indicates a failure of the river. In 1896–7 there were 9,876 bales carried, of which 2,608 bales went by the river.

202. The difference between the 2,608 bales and the 9,876 bales represents the number of bales of wool which reached Bourke by team? Yes; either Bourke or Byrock. From Walgett and above in 1893–4 there were 9,270 bales carried altogether, received from the western stations irrespective of Narrabri.

203. Would you mention the point at which that wool reached the western system? Of this quantity, 8,755 bales were carried by river. In the season 1894–5 there were 8,800 bales carried, of which 8,255 reached Bourke by river. In the season 1895–6 there were 2,462 bales received at western stations, of which 17 arrived by river. In 1896–7, last season, there were 2,061 bales received, of which 924 were carried by river. From the intermediate districts between Brewarrina and Byrock on the route of the proposed line in the season 1893–4 there were 1,253 bales received at Byrock. In 1894–5, 2,162 bales; in 1895–6, 3,265 bales; in 1896–7, 4,182 bales.

204. Can you say approximately what proportion of that would have gone to Brewarrina had the railway been constructed? I cannot in the absence of any knowledge as to what the river conditions might be. That has to be reckoned with, and I cannot tell what aspect it may assume. We are concerned with the question every time there is a good river to Bourke for a much greater distance than exists between Brewarrina and Bourke. Every time there is a rise in the river we lose a certain amount of traffic, owing to the river existing over a journey of approximately 1,500 miles.

205. Is it your experience that much of the northern traffic by the river passes Bourke? No, it does not pass Bourke down stream. The wool does not go down stream. We lose no wool at all. An odd clip might pass down the river occasionally, but it is quite exceptional.

206. The whole of the traffic coming in from the north and north-east to Bourke at present reaches the railway? Yes; it is not carried past Bourke.

207. Would a railway from Byrock to Brewarrina intercept any traffic at present lost to the railway? No; absolutely none.

208. Can you say what advantage the railway would be locally? It would be a very distinct advantage to the district.

209. In the way not only of convenience at the present time, but of development? It would be a very distinct advantage to the district; but I am not prepared to say that any great development would arise from it.

- J. Harper.
5 Oct., 1897.
210. In what way would it be advantageous to the district? No doubt the fact of having a railway to Brewarrina would give a higher value to the land, and the township of Brewarrina particularly. No doubt anyone having land in the vicinity of Brewarrina would profit by reason of being able to reach a railway station close at hand, instead of having to drive stock 60 miles.
211. There would be advantages to the district, but it would not be remunerative as a railway? No.
212. Do you know the district between Brewarrina and Byrock? I have travelled it over all three routes.
213. Did it strike you that there would be any difficulty in the way of the construction of the line? No, it should be a comparatively easy line to construct; but of course there is a river to cross, and there is Tarcoom Creek. There is a good deal of swampy country. I do not know what engineering difficulties that might entail.
214. The greatest difficulty, I suppose, that presents itself to you from a traffic point of view is the competition of the river? Yes.
215. Assuming the construction of a railway between Narrabri and Walgett, would you gain any additional traffic from the north? No; we should be robbing some other part of the system, because, as I have already pointed out, as long as the existing barrier exists on the Queensland border, I cannot conceive any very large development of trade.
216. Would you be in a position to offer inducements to bring the traffic to the system? I am afraid we cannot. I have a letter in my pocket from two or three Queensland people, but I am afraid we cannot offer them anything against the £2 10s. a ton duty.
217. Your differential rates would not cover that? No; and there is no guarantee that if we could offer sufficient inducements, the duty would not be increased to £5. I fancy that the disposition is that way.
218. *Mr. Trickett.*] What was the Brewarrina wool traffic for the year 1893-4? From Brewarrina and intermediate points there were 13,018 bales; in 1894-5, there were 12,528 bales; in 1895-6, there were 208 bales; in 1896-7, 2,608 bales. From Walgett in 1893-4, there were 8,755 bales; in 1894-5, there were 8,255 bales.
219. You will find from the evidence taken on the locks and weirs that Mr. Shainwald made an estimate considerably in excess of yours;—he says in the season 1893-4 the total river-borne wool from two points would be 22,000 bales; and he gives 26,000 for 1894-5, and 24,000 as against 21,000? My returns are checked by the wool that we receive at Bourke. It may be that intermediate stations have been included by him, which we should not include.
220. Mr. Shainwald's evidence shows that up to 1893-4 the quantity of wool sent from Brewarrina and Walgett to Bourke exceeded by 4,000 bales the quantity that you give? The figures I have handed in are correct. The difference may be accounted for by his not taking exactly the same points or the intermediate stations.
221. Do I understand that you favour the locking of the river between Bourke and Brewarrina? Yes; I am strongly of opinion that the best way to utilise the river and to afford transit for heavy traffic is to improve the river.
222. Will you state why? For the simple reason that carriage by water is very much cheaper than carriage by rail; and water carriage has always been, under all circumstances, within our experience, the most formidable competitor with any line of railway that has ever been built in New South Wales, and is always likely to be. I speak from our experience of the Murrumbidgee. I speak from our experience of the Darling at Bourke. I speak from the wider experience of our competition on the North Coast, at Newcastle, at Grafton, on the South Coast, and at other points.
223. Can you fairly make a comparison with the sea-going portion, seeing that that is a coal traffic? No; it is, unfortunately, not a coal traffic.
224. What is it? Traffic in all kinds of merchandise, especially that from which the higher rates are derived on the railway.
225. Does it apply to the carriage of stock? Certainly not. I may mention what our experience is in connection with stock. During a good season when stock can travel, the owners are not anxious to join the railway at the nearest point; they frequently make the stock travel far longer distances parallel with the railway than the distance between Brewarrina and Byrock. I also wish to emphasise a matter to which I draw attention in my report. I do not know how the thing stands to-day, but in the year when I came by Tarcoom back from Brewarrina there were any number of fat stock beyond Brewarrina which could not reach a market on account of the roads being impassable. I know that the whole of that travelling stock route 2 miles wide was in the occupation of pastoral tenants, and there is absolutely no provision made for permanent water on it. On the other hand, the route by Gongolgon, which is about half a mile wide, and not a suitable road for stock—stock could not be driven over it—has been supplied with permanent water. Practically the road by Gongolgon to Bourke forms two sides of a triangle. The other is a direct route, and it carries a great deal of dense mulga, which is very suitable for travelling stock. In my report I drew attention to the necessity for opening that route and making better provision for stock passing in that direction.
226. Then you do not think that even for the transport of stock, this railway would be availed of to such an extent as the people in the district anticipate? I do not.
227. Except in drought times? Of course, instead of carrying stock for wool they might fatten in the district. The returns I have obtained of stock produced in the district which would be served by the line and trucked at Byrock and Bourke are as follows:—In the year 1893-4, 135 trucks; 1894-5, 319 trucks; 1895-6, 634 trucks; 1896-7, 862 trucks. These consignments have been identified as coming from the district which would be served by this line. I am not going to say that the existence of the railway there might not alter production; it might pay them to fatten stock.
228. Is the carriage of stock a profitable thing for the railway? All our business is profitable if we get enough of it.
229. I understood you to say that if the river were made navigable, it would tend to send the trade into the colony of Victoria? If the river were made navigable we should have to make efforts to prevent it from going.
230. Unless some special rates were imposed the tendency would be for our trade to go that way? Assuming that the river was made navigable as far as Bourke or Wilcannia, the risks of the lower river are such that with ordinary rates we might be able to secure the traffic. It is more than probable—and

I hope it will be realised—that the railway between Bourke and the Bogan will be used in the transport of heavy traffic. It is a legitimate use of the river, and a legitimate use of the railway.

230½. *Mr. Hoskins.*] Is it not a fact that during the last two or three years a great deal of merchandise going through Wilcannia is taken down by steamer from Bourke? Yes; but as a matter of fact we do not always know how it gets to Bourke. It is one continual fight on the river. We make a rate to-day on a heavy line, and perhaps in three months' time it is absolutely altered by competition on the river.

231. Is it not a fact that Messrs. Rich & Co., of Bourke, have established a line of steamers on the river to run down to Wilcannia? They have, but they have a line running from South Australia to Wilcannia, by which the bulk of their supplies go. They are trading from both ends. We do not know what goods come up the river, but we know what the possibilities are. The uncertainty of the navigation of the river is the only help to us in fighting for the traffic.

232. Since the tariff has been so low, has not the trade in merchandise from Sydney to Bourke, and Bourke down to Wilcannia, largely increased? I think it has increased more owing to the river not being very favourable lately. As a matter of fact, our revenue at Bourke is falling off. We had a rate of £3 per ton for sugar, but we had to reduce it to £2, owing to the steamer competition at Bourke from South Australia.

233. *Mr. Trickett.*] Which do you consider the better trade centre with regard to wool and stock, Brewarrina or Bourke? That is rather a difficult question; but I think Brewarrina might have been made a better township than Bourke is to-day.

234. That is if the railway had gone there in the first instance? Yes. I think that probably the Queensland trade might have been tapped from Brewarrina under more favourable circumstances than from Bourke.

235. Would you go so far as to say that, supposing the Bourke line had not been constructed, you would have thought it better to have had a line from Byrock to Brewarrina than from Byrock to Bourke? I do not think it was necessary to go to Bourke at all. The line should have gone due north, following the Bogan. I think a good line, ignoring both places, might have been discovered near the Queensland border, in the neighbourhood of Barringun.

236. I understood you to say that the rate of the river freight had ranged from 12s. 6d. upwards? Yes.

237. When a Sectional Committee was at Brewarrina, all the leading storekeepers and carriers were asked that question, and they all said that they had never known it to be less than £1;—where did you get your information? I got it confidentially, and from most authentic sources. It is not every one who knows the rates at Brewarrina.

238. We asked many leading men, and they all denied any knowledge of such a low rate of freight? I had very satisfactory evidence placed before me that such freights had been charged, and I have no doubt that the Committee can get that evidence if they apply to principals. I may mention that it is not by any means a low rate there, in view of the fact that we have to quote £2 a ton from Sydney to Bourke to prevent the sugar business going by South Australia.

239. Do I understand you to say that you allow 7s. 6d. a ton for goods between Brewarrina and Bourke? No; 10s.

240. What is the road carriage? I think about £2 a ton.

241. Is not that rather a big jump to take down to 10s.? No; we have to take bigger jumps than that.

242. On some of those short lines of railway, would it not be more like 15s. or £1? I do not think so, because we have been dealing with traffic within 12 or 20 miles of a railway line. When you have teams coming in from the back with wool, it is very different from a man starting from a farm.

243. Do you not think that 15s. is a rate that would be readily paid? I do not think so. The people at Byrock at one time used to pay more than the people at Bourke, because the people at Bourke were served by the river. The people at Byrock were not content, neither were they anywhere along the line, the result being that we had to reduce our charges generally, and to make the Bourke rate the maximum rate for the line. I do not think that in a district like that, where competition is so keen, you could levy a local rate at all.

244. How much is your rate? There would be no difference in the ordinary rate for either wool or goods. The ordinary merchandise—rice, sugar, and wire—are practically the same to-day at Bourke as they are at Byrock. We should be in this position, that with a difference of 47 miles and 59 miles, we should be charging 10s. a ton more for the 59 miles than for the 47 miles.

245. Do you look upon the district round about Brewarrina as one in which agriculture is likely to increase? I do not think so, unless some well-defined scheme of irrigation is carried out. I cannot conceive, under existing conditions of rainfall and other circumstances, that much can be done.

246. Therefore you cannot look for any large increase in railway traffic in that direction? No.

247. It must be regarded chiefly as a pastoral traffic? Yes.

248. Is not the extra handling of the goods, passing them on to the steamers and then on to the railways, a frequent cause of complaint? It is; but it is wonderful how a small difference in freight will get over it. When wool arrives at Morpeth or Newcastle, intended for Sydney, I do not think that we get more than about one-tenth of the whole of it for carriage by rail. The balance is put into steamers at Morpeth and Newcastle, and either exported or sent to Sydney.

249. Is there anything between Brewarrina and Byrock that would be likely to create an increased traffic? No; there is no settlement until you reach the Bogan. There is some red-soil country there; but I am afraid that the rainfall is too small. The soil is excellent. In the neighbourhood of Gongolgon I have seen some of the best oranges that I ever met with growing by irrigation in a Chinese garden. I never met with better oranges in my life.

250. *Mr. Clarke.*] I suppose you are well acquainted with the road between Byrock and Brewarrina? I have traversed it two or three times.

251. What kind of roads have they there? Some of them are very bad. I have had two experiences there. I have been there in time of heavy weather, and I have been there in time of drought. At Gongolgon more or less public money has been spent on the road, but nothing has been spent on the Tarcoom-road.

252. Are the people in that neighbourhood, who have to come to Sydney, compelled to go by way of Bourke? They can go to Byrock. A mail-coach runs there, and I think they have a service five days a week.

J. Harper.

5 Oct., 1897.

- J. Harper.
5 Oct., 1897.
253. I suppose they go whether the roads are good or not? The roads were good enough when I passed over them.
254. Is that not a kind of country where it is difficult and expensive to make roads, on account of the want of metal? Yes, I suppose they would have a difficulty; but there is metal along the Gongolgon-road, and metal can be found on the other road. There are plenty of gravel ridges on the Tarcoom-road.
255. Would it not be almost as cheap to make a light railway as to make and maintain an ordinary road in such country as that? It might be as cheap to make one, but I do not think it would be as cheap to maintain. If you build a railway you have to keep engines running, and employ fettlers on it.
256. Would not a road in country like that involve a great expense? They do not get very much traffic on country roads generally.
257. What does the traffic there generally consist of? I will read the figures as to the traffic which came into Byrock during the years which I have mentioned. In the year 1893-4, 522 bales of wool went to Byrock from Brewarrina, 731 bales from the Tarcoom district, making a total of 1,253 bales of wool. In 1894-5, there were 913 bales of wool from Brewarrina and Goodooga, and 1,249 from Tarcoom, making a total of 2,162 bales. In 1895-6, 2,687 bales from Brewarrina and district, 578 from Tarcoom. In 1896-7, 3,477 bales of wool from Brewarrina and district, and 705 from Tarcoom and district, making a total of 4,182. That represents the whole traffic in wool which came on the Byrock-road. During the year 1893-4, there were 177 tons of goods to Byrock; 613 during 1894-5; 660 in 1895-6; 876 during 1896-7—that is, taking the maximum years when there was no river, 1896-7, about 1,500 tons, roughly speaking, went into Byrock, passing over the two roads there during the twelve months. Then there is the river road from Bourke. In 1893-4 there were 430 tons of wool passed by road to Brewarrina and district. That is exclusive of Walgett. In 1894-5 there were 700 tons; in 1895-6 there were 1,400 tons; in 1896-7, there were 1,100 tons of goods; in 1893-4 there were 172 tons; in 1894-5, 600 tons; in 1895-6 there were 1,100 tons; in 1896-7 there were 900 tons.
258. You have stated already that the country is a purely pastoral country? Yes.
259. Not adapted for agricultural purposes? No, not with ordinary rainfall. I have testified to the richness of the soil.
260. The soil is good? Yes.
261. It is the want of a regular rainfall that prevents it from being used for other than pastoral purposes? Yes.
262. Does the stock traffic now go from Brewarrina to Byrock, or by way of Bourke? Most of it goes to Bourke.
263. Not by the river? No; by travelling. Some of it goes down the Bogan.
264. If the Darling were locked would the cattle go by the river? Certainly not; not by steamer.
265. I suppose, from the tenor of your evidence, that you agree with the Commissioners that it is not desirable to make this railway at the present time? I think not; I think the whole question should be settled—whether those rivers are going to be made navigable. If they are, I cannot conceive that the railways will pay anything like working expenses.
266. The Public Works Committee have decided that it is not desirable to lock the Darling at present? There were conditions surrounding that, were there not.
267. There were? Those conditions might be realised.
268. But it would be advisable to see how the lock at present erected at Bourke would be able to withstand the floods? Yes.
269. Have there been any floods since that lock was completed? I do not think so.
270. We have not had sufficient evidence whether the locks and weirs would be a success? No; in the absence of definite information, it would be unwise to make a railway which, to a certain extent, would be competed with by the river. A waterway, such as the Darling, must be improved.
271. If you improve the Darling from Brewarrina to Bourke, you must continue the improvements further? That will have to come.
272. Would not New South Wales be making a river to take away the traffic to another colony? I suppose we shall have to face the idea of being a united Australia soon.
273. *Mr. Lee.*] Could you give us what, in your opinion, would be the traffic that will be obtained by the line if it is made? Yes.
274. We already have two estimates—one of £4,841, and the other £3,691? Yes; one includes the Walgett traffic, and the other the traffic falling in at Brewarrina.
275. The Commissioners say they are of opinion that you have taken too liberal a view of the traffic; they do not think it will be realised? Mine is not an estimate of traffic; it is a statement of what the district has produced. But in my report I distinctly say that with the river there, there is no guarantee that we shall get that traffic.
276. Do you think that you have very largely under-estimated the traffic? I am absolutely sure that I have not.
277. Do you not think 1,000 trucks of stock a year is a small number? I have given double the quantity of stock that has come from that district.
278. Is it not a district where the movements of stock are very large? Yes.
279. I understand that you have drawn no line between Brewarrina and Bourke, showing what traffic would gravitate to Bourke, and what traffic would gravitate to Brewarrina? I cannot have any knowledge of what the steamers may do. The matter is absolutely in their hands.
280. You have taken your own gross returns at Bourke? Yes.
281. Have you tried to locate that traffic? I have absolutely located it.
282. If you have located the traffic, you must have drawn a line showing which way the traffic would go? Yes; as far north as the Queensland border.
283. What portion of it would naturally go to Bourke, and what portion to Brewarrina? The traffic which I have given here, leaving the river out of the question altogether, would give some to Narrabri, some to Bourke and some to Byrock. Assuming that there were no river the great bulk of it would find its way to Bourke, or would be brought into Brewarrina and shipped there.
284. You would get it only at Bourke? Yes.
285. Is it not a fair assumption that if a line were made 60 miles further into the interior of that pastoral district, it would be more likely to attract traffic which would not come to the railway? No; I am absolutely

absolutely sure that it would not, because we are met in the north with an absolutely insuperable barrier in the shape of an export duty imposed in Queensland. J. Harper.

286. You have got over that in other cases? We have got over it as far as we can. We have lost 20,000 bales of wool at Bourke this year. 5 Oct., 1897.

287. If that duty were abolished, of course it would make a great difference to your earnings? I do not know that it would make a great difference as far as this line is concerned, but it might generally. Before the duty was imposed, the only Queensland clip that we had coming into Brewarrina was a small clip of about 500 bales.

288. There must be a future for that district? I think it has a very good present. I do not think that a railway will make either its present or its future.

289. You have told us you do not see how the traffic is going to increase in the future; but surely that country is not going to stand still? I have not thought out the problem as to how it is going to improve.

290. Has that depôt, being at Bourke, attracted traffic there? The river had been for years carrying supplies to the station before we went to Bourke. We have been winning traffic from the river every year.

291. You have had experience of Bourke, which was practically an unknown country? Yes; quite an unique experience too.

292. Here is another point;—the next thing is to strike out from that line in an opposite direction a distance of 60 miles, and will not that have the effect of attracting a great deal of traffic that you have not had? I cannot see it. I have to appear before the Committee in connection with two or three other railways, all more or less intimately associated with this, and I should like to have the merits of all of them weighed.

293. You know the country higher up, and the proposed connection between Walgett and all those other places;—does your experience lead you to suppose that both of these proposals should be considered alongside of each other? It does.

294. As the case is presented to us, it would appear that the earnings of the line would just about cover the working expenses? That is, assuming that we get the whole of the traffic.

295. You cannot see how the traffic is going to be sufficient to pay interest on working expenses? No.

296. *Mr. Roberts.*] When the Sectional Committee was at Bourke, Mr. Andrew David Kerrigan gave evidence, and he said this:—

I am a native of Brewarrina, and have been with Messrs. E. Rich and Company for fourteen years. I have a full knowledge of the traffic of the river. The present traffic between Bourke and Brewarrina is 10,000 tons—4,000 tons up stream, and about 6,000 tons down stream. The present rate for the carriage of wool is 25s. a ton delivered on the trucks, and including all charges except insurance. The insurance sometimes comes to 6s. per cent. That is the lowest rate that I know of. The rates for ordinary merchandise vary from £1 to 25s. a ton. For wool the Commissioners charge the same rate from Bourke as from Girilambone. If a railway were constructed to Brewarrina I think that a few more hundred tons of wool would come in from the north. The 10,000 tons to which I have just referred would go by train if the railway were here, and there would be a little more. Charging the present rates, the revenue derived from the carriage of that wool would be about £10,000 a year. I do not think that a steamer company could afford to carry anything between Brewarrina and Bourke for less than 10s. a ton, even if the river were locked. Wool and merchandise come in here from the north, north-west, and north-east. There are only about 300 tons of intermediate traffic between here and Bourke. I think that the present fleet of boats would be sufficient, even if the river were permanently navigable. During the last four or five years we have averaged between 27,000 bales and 30,000 bales of wool between Brewarrina and Bourke; that would be from 5,000 to 6,000 tons. Then there would be about 4,000 tons of merchandise.

—? I would suggest that his principal be examined. I know what the statistics are.

297. You have some doubt as to the accuracy of the statistics? I am not going to say a word about it. I suggest that his principal should be examined.

298. *Mr. Hoskins.*] You said just now that the revenue at the Bourke railway station had diminished;—what have you lost? We have lost a lot of the Queensland trade.

299. When the Upper Darling River is navigable, do not nearly all the pastoral products from the Brewarrina district go down by the river to Bourke? Yes.

300. Does much go past Bourke down to South Australia? No.

301. In reply to Mr. Trickett, you said that the railway could not compete with water-carriage, as a rule;—would that apply to the Darling River if the Upper Darling were made navigable all the year round? I think that the position of the steamers trading there would be improved by that.

302. Do you think it would be just to the community if a series of locks were made on the Upper Darling, unless the persons taking advantage of the river navigation paid tonnage dues for the benefits they received? I certainly think they ought to do it.

303. Then, if tonnage dues were charged, would not that necessitate their increasing their charges for the conveyance of products by the river, and, consequently, neutralise your contention that river navigation is so much cheaper than railway carriage? It would modify my views; but I should expect to find very much improved methods of communication, and the regularity of their trips, I should imagine, would more than counterbalance any fair dues which might be imposed.

304. Suppose that £150,000 is spent in improving the navigation of the Darling between Bourke and Walgett, do you not think that a fair charge ought to be made? I certainly think so. The users of the railways have to pay the interest on the capital and the working expenses as well.

305. If the river is a formidable competitor, and we improve the navigation of the river, would not that tend to divert the traffic of New South Wales to other colonies? Not if that improvement were limited to the part of the river above Bourke. If it were extended down the river, no doubt the introduction of a better class of steamers would compel us to reduce our competitive rates still further. It would be a fight between the railways and the river.

306. I gather from what you told Mr. Trickett that you cannot see that there is any probability of any other development in that tract of country from pastoral pursuits? No; I cannot at present. It is a splendid district for grazing. I should like to be able to realise that it was capable of more intense cultivation. Perhaps it may be in the future.

WEDNESDAY, 6 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

John Harper, Goods Superintendent, Department of Railways, sworn, and further examined:—

J. Harper.
6 Oct., 1897.

307. *Chairman.*] A line from Gunnedah on the North-western railway, running in a westerly direction, would pass about 20 or 30 miles south of Coonamble, and would intersect the main Western railway somewhere about Coolabah; another line going south from Coonamble would run through Gulgong and Mudgee, and, if extended north, would strike the Barwon between Brewarrina and Walgett;—do you know the country which would be intersected by such lines? I know a good deal about it.

308. Are you prepared to express an opinion as to the advisability of constructing a railway from Mudgee to Gulgong, and on to Coonamble? No. I have already reported to the Committee upon the subject on an extension from Mudgee to Gulgong, but I am not prepared to express any opinion upon the question now.

309. Do you know the country from Coonamble to Coonabarabran? I have been over it.

310. Are you prepared to express an opinion with regard to it? I should prefer not to do so.

311. What is your opinion of the country between Warren and Coonamble? I think that an extension of the railway from Warren to Coonamble promises to be one of the best paying lines that could be constructed.

312. Do you know the country going from Coonamble north to the Barwon? I have been over it.

313. What do you think of it? I do not think so much of it as I think of the country between Warren and Coonamble.

314. Where, in your opinion, is the limit of the wheat-growing land between the North-western and the main Western railways? I should not like to say, because I saw it stated in to-day's newspaper that wheat had been grown at a place the other side of Bourke.

315. The growth of wheat depends upon the rainfall and the quality of the soil;—is the quality of the soil and the rainfall in the district between Coonamble and the Barwon, going north-west, suited to the growth of cereals? I do not know that we know yet what country is suited to the growth of cereals; but, from present knowledge, I should say that that country was not very suitable for the purpose.

316. Where would you place the limit? I would not like to place a limit. I cannot inform the Committee where the limit should be placed. A little while ago it was thought impracticable to grow wheat anywhere west of the Macquarie; but I am informed, upon very good authority, that this year 80,000 bags of wheat will be placed upon the railway at Naromine, and even as far as Nyngan the prospects of the crops are very favourable.

317. Naromine lies a good way south from Coonamble. The fact that wheat is grown there does not touch the question whether Coonamble may be regarded as an agricultural area? I did not look upon it in that light. I may say that they are able to grow wheat in the neighbourhood of Coonabarabran. There used to be a mill there. Coonabarabran is as far north as Coonamble.

318. You are not in a position to divide the country lying between the North-western and the Western railways into agricultural and pastoral areas? No; it has never been my business to do that.

319. If you got instructions could you do it? I would do anything I was told to do if I considered it reasonable.

320. How long would you take to do it? I do not know.

321. Can you tell the Committee how far west the influence of the North-western railway extends? It depends upon the conditions of the river.

322. If it were possible I would rather compare the influence of the North-western railway with that of the Western railway without taking into account the influence of the river conditions? You cannot dissociate them. As a matter of fact, the first supplies that reached Walgett not very long ago came up the river from Bourke, because of a rise of the river. We had hundreds of tons of stuff stored at Narrabri, but it could not be taken on to Walgett. I do not think you could alter that state of things very much.

323. Ought the North-western railway to control the country as far as Coonabarabran? Decidedly not.

324. In your opinion the Coonabarabran traffic ought to come on to the main Western line? Yes.

325. That is not very much further than 60 miles from Gunnedah? But the country is very difficult. The Coonabarabran traffic comes into Mudgee.

326. And it will never go east towards the North-western railway? I do not think it will.

327. Therefore, the influence of the North-western railway only extends to some point between Gunnedah and Coonabarabran? Yes.

328. How far east from Coonabarabran would that point be? I could not tell you off hand.

329. The whole of the country east from the main Western line, and west of Coonabarabran, will drain either to the main Western line directly or to the Mudgee line? I think so.

330. Can you tell us what it costs the Commissioners to take a ton of produce from Newcastle to Narrabri: I do not want to know the rate that you charge the public? I never knew any sensible railway man who was prepared to answer such a question. The Americans are the only people who attempt to answer questions of that character. The cost of carriage depends upon so many circumstances.

331. The cost of carrying a ton of goods on a railway depends upon the character of the line and upon the distance which the goods have to be hauled? It depends upon a number of things—upon the distance, the grade, the speed, and the load.

332. But the distance and the grade are the two dominating factors? I do not know. Speed is an important consideration, and there are considerations such as the capital cost of the line and the load. I do not think that any sane railway man ever attempts to ascertain exactly what is the cost per mile of hauling a ton of goods.

333.

J. Harper.
6 Oct., 1897.

333. Would it be cheaper to bring a ton of goods to Newcastle from a point 200 miles along the North-western line than to bring a ton of goods to Sydney from a point 200 miles along the main Western line? I should not like to say.

334. In making railway extensions, it should be our object to send out the lines in such directions as will enable produce to be brought to a market in the cheapest way? If you confine yourself to the question of grades I can answer the question, because the grades are fixed. I should say that the grades are more favourable between Newcastle and a point 200 miles away on the Northern line for hauling towards Newcastle than they are between Sydney and a point 200 miles away on the Western line for hauling towards Sydney.

335. So that probably there is less expenditure of power in hauling towards Newcastle on the Northern line than in hauling towards Sydney on the Western line? No; there is always a certain waste of power. We do not get all the trains fully loaded.

336. Who could give us this information? I could not suggest anyone. It is admitted that it is absolutely impossible to ascertain the cost per ton of hauling goods over a given length of line.

337. *Mr. Trickett.*] When you were examined before the Committee in connection with the proposal to construct locks and weirs on the river Darling, you were asked (Question 269)—

If this scheme is carried out would the traffic of the Great Western railway be enlarged?

To which you replied—

I think it would. Traffic would come from Queensland which we do not get, and which we shall not get by the Moree station.

Does the same state of things prevail now? I do not think so.

338. Why? Because the Queensland railway authorities are now quoting very low rates for through carriage to Brisbane. This is in addition to the border duties.

339. Have the border duties been put on since you gave that evidence? No; they were in existence then.

340. Is it since then that the Queensland railway authorities have established competitive rates? No; they had competitive rates prior to that time.

341. Then what has happened to alter the circumstances? The Queensland railway authorities, in addition to having reduced their rates, are subsidising the teams to such an extent that we find that we cannot compete generally for Queensland wool.

342. They are actually subsidising teams to bring wool to their railways? Yes; they are quoting through rates from the stations to Brisbane.

343. Has that system been started since our railways have been pushed out towards their border? It has been started since our railways were extended to Bourke and Moree.

344. I suppose no such policy is adopted in this Colony? Not in New South Wales.

345. *Mr. Hoskins.*] The Queensland Government have extended their railway to Cunnamulla? I think they are gradually pushing their line on to Cunnamulla.

346. *Mr. Trickett.*] Do you know to what extent the Queensland Government subsidises the teams? I do not.

347. Does this policy take any wool from us? I do not know that it has had that effect since the line to Moree was opened. In the neighbourhood of Boggabilla they may have obtained a clip or two.

348. *Mr. Hoskins.*] If the Darling were locked between Bourke and Wilcannia, would that tend to send more wool and produce to the Bourke railway station? We practically get the whole of the traffic between Bourke and Wilcannia now. One or two clips in the neighbourhood of Wilcannia go to South Australia; but we get most of the traffic. Out towards the south-west corner of Queensland and the South Australian border the supplies are distributed from Wilcannia.

349. *Mr. Wright.*] You say that the Queensland Commissioners are subsidising teams for the carriage of wool;—have you any authority for making that statement? Nothing beyond my personal judgment.

350. Is it not a fact that the Queensland Commissioners have become contracting carriers? Yes.

351. And they make what arrangements they please with the teamsters? That amounts to the same thing.

352. It may or it may not;—as a matter of fact, the Railway Commissioners are doing the business done by forwarding agents in the adjacent colonies? Yes.

353. No one, except the railway officials, knows what proportion of the rates paid goes to the teamsters, and what proportion goes to the railway? No.

Francis William Bacon, grazier, sworn, and examined:—

354. *Chairman.*] What are you? I am a grazier, residing at Dumble, near Goodooga, 75 miles north of Brewarrina. I have lived there sixteen and a half years. This is the seventeenth shearing which I have conducted at the station.

F. W. Bacon.
6 Oct., 1897.

355. *Mr. Trickett.*] I suppose you are engaged in pastoral pursuits out there? Yes.

356. Where do you send your stock and wool? To the Western line *via* Brewarrina.

357. Through Brewarrina to Byrock? Either to Byrock or Bourke, according to the season.

358. I suppose you send it to Bourke when the river is up? During the last three years I have found it cheaper to send directly to Bourke or to Byrock by road, and not to use the river.

359. Can you give us the comparative rates of carriage? In 1895, it cost us £3 3s. a ton to send wool by road to either Bourke or Byrock. The carriers had the option of taking it to either place; but they mostly went to Bourke in order to get return loading. In 1896 it cost us £3 a ton to send our wool by road all the way, and this year it cost us £2 15s. a ton. I let a contract for the conveyance of 100 tons at £2 15s. a ton.

360. That is what it cost you to send the wool from the station to the railway? Yes. The rate of carriage to Brewarrina is, and has been, £2 a ton for wool, and the rate from there to Bourke by steamer 25s. a ton, making the combined road and river carriage to Bourke £3 5s. a ton, so that we have saved from 3s. to 10s. a ton by not using the river.

361. Would 25s. a ton cover all river charges, including insurance? No, not insurance. That is about 4s. per cent. more—about 2s. a ton more.

362. It has been stated by the Department that the river charge between Bourke and Brewarrina is often as low as 12s. 6d. a ton;—do you confirm that statement? Well, I have lived in the district seventeen years

- F. W. Bacon. years, and I have never paid less than 25s. a ton, while I have frequently paid from 30s. to £2 a ton for up-loading. I am prepared to swear that, and I can produce documents in support of my statement.
- 6 Oct., 1897. 363. You have never had your goods carried for 12s. 6d. a ton? Never.
364. I suppose you look upon Brewarrina as the centre through which all the trade of the district goes? Yes.
365. Do you send to Sydney, or to Newcastle? Always to Sydney.
366. If a railway were constructed from Byrock to Brewarrina would you always use it? Yes.
367. Even if it were cheaper to use the river? Yes; I would sooner pay 10s. a ton extra to use the railway.
368. Why? There is always great risk in sending by river, and great delay. The conduct of the river business is most unsatisfactory. Your wool is tumbled out and put under tarpaulins; but it frequently gets wet. Sometimes a stock of 1,000 or 2,000 bales accumulates, and your wool is sent away in detachments, so that sometimes you have to wait two months before you can offer it at auction. Now-a-days wool has to be classed very carefully, and you cannot offer five bales of ewe combings and a bale of wether combings. This delay is very unsatisfactory. I would sooner pay more to have the wool taken right through. The river people, however, have kept the rates up, so that for three seasons running the teamsters have been able to compete with them.
369. Mr. Shainwald, the manager for Messrs. Rich & Co., at Bourke, stated that with a permanent river 10s. a ton would be a fair charge for conveying goods from Bourke to Brewarrina? I have seen it stated that the river has practically been permanent for seven years; but they have never charged less than 25s. a ton. I should be sorry to have to send the wool by river.
370. If the river rate were only 10s. would you still prefer to send by train? Yes.
371. What about the live stock traffic? Our crying want is that we are not able to get rid of fat stock. We have been obliged to give up fattening stock and to content ourselves with breeding and selling.
372. If the river were permanently navigable, it would not offer any facilities for the transit of live stock? No. I heard it stated that a firm proposed to put boats upon the river to carry sheep; but I would never send the sheep by boat. I would sooner travel them to Mudgee or to Coonamble.
373. Brewarrina is the centre of a very large and rich district? Yes, probably one of the richest districts in the Colony. The Land Board thinks that it is, because it has assessed us at the highest rents in the Colony.
374. If the railway were taken to Brewarrina the export of live stock would increase very much? Yes. There are a number of small holdings in the district, holdings of from 10,000 to 30,000 acres, which are well-suited to the breeding of crossbred lambs for export. They comprise very rich fattening country.
375. Mr. Harper said yesterday that stock-owners always dodged the railway when the opportunity occurred;—is that your experience? No. My experience is that the sooner you get your stock on to the railway the better. I have sent stock from both Bourke and Byrock. The roads to both places are very bad. Sometimes we have been compelled to go to Narrabri or to Dubbo when the season was better in those directions.
376. Can you, as a practical grazier, refute the statement that it would be better to drive stock, and thus save carriage, than to truck at once at the nearest railway station? My experience is that if you drive stock far you drive all the fat off them.
377. Do you think that it is the practice of graziers to do that? No; it is the practice of graziers to use the railway as much as they can for the conveyance of fat stock.
378. If a man is sending his stock to market the less he drives it and the sooner he gets it into the train the better? Yes. The travelling-stock routes have become practically impassable during the last few years.
379. *Chairman.*] It would be as reasonable to imagine that a grazier at Brewarrina, if there were a railway there, would drive his stock to be trucked at Bourke as to imagine that a grazier at Bourke would drive his stock to be trucked at Byrock? Yes; or from Nyngan to Dubbo, or any similar distance.
380. *Mr. Trickett.*] Looking at the map, it would seem that Walgett and Brewarrina are about equidistant from Goodooga? It is about 15 to 20 miles further to Walgett than to Brewarrina.
381. Would it suit you as well to send stock to Walgett as to send it to Brewarrina? Not quite as well. The road is not quite as good.
382. In what way is it not quite as good? You have to go 15-mile stages without water. You have to water at the Government tanks. Going to Brewarrina you follow the river, and you have nice open country all the way.
383. *Mr. Clarke.*] Does any of the Queensland wool go through Brewarrina? It does now. One of my places is in Queensland; but the sheep are shorn at Dumble. I have about 40,000 sheep over the border. Wool is sent to Brewarrina too, from Curriwillingham, from Brenda, an estate belonging to the Bishop of Newcastle, and from Kinglebilla. There has lately been a good deal of settlement in Queensland, just across the border, by New South Wales people. The Carter family, from Goodooga, have taken up 50,000 acres in Queensland, and the Murphys have taken up a large area there. These, being New South Wales people, prefer to deal with this Colony.
384. Does any of the Queensland wool go to Bourke? This wool goes to Bourke just as mine does. Bourke is the terminus of the railway, and the carriers like to go there in order to get back-loading. There is a truck-rate to Bourke.
385. The people about Brewarrina and out in the district from which you come would prefer to use the railway, if it were extended to Brewarrina, to using the river? They will not use the river if they can help it. They want a railway, and nothing else will suit them. To make the river navigable would cost as much as to construct a railway, and we are entitled to railway communication in common with the rest of the Colony. The river can be of no service to us. I have shown you that I prefer to send my wool by road, and to get stuff back by road. That proves that the river is of no use to me.
386. Do you consider that it is unjust to the people in that neighbourhood to compel them to go to Bourke? Yes.
387. I suppose this is all purely grazing country? I am inclined to think that it is more than that. I saw the sample of wheat referred to by Mr. Harper in Mr. Grainger Barton's hands. I have grown wheat at Dumble for seven years past. I only cut it for hay; but on several occasions the heads have been quite full, and as good as I have seen anywhere else. We have a rainfall of 19 inches, and I am sure that a great deal of the red ground would grow wheat.

388. Does the rainfall generally come in the proper time of the year for cereals? No; most of the rainfall is in the summer-time; but I have grown fair crops in five years out of seven. F. W. Bacon.
389. I suppose the country is somewhat similar to that between Moree and Narrabri? Somewhat similar. 6 Oct., 1897.
390. It has a good rainfall, but the rain does not come at the right season to suit cereals? Yes; there is a great want of knowledge of agriculture amongst our people; but I think that with other crops, and with proper cultivation, there is great room for expansion.
391. Is it probable that that country will be able to support a large population? Undoubtedly. It is some of the best grazing land in the Colony. It is similar to the Murrumbidgee and the Deniliquin country.
392. Is it red-soil or black-soil country? Both. There are patches of red-soil, but most of it is black-soil country. It is very rich grazing-land.
393. In the event of the proposed line from Byrock to Brewarrina being built, will not the carriage of wool and other produce cost you much less than it does now? It will cost us less.
394. The rate from Sydney to Brewarrina would be the same as the rate from Sydney to Bourke? I do not think so. I think we should have to pay more, and we should be quite willing to do so. We could not expect the Government to make 50 or 60 miles of railway and not get any return. We are quite prepared to pay a branch-line rate.
395. *Chairman.*] What you would save, would be the difference between the extra charge from Byrock to Brewarrina, and the £1 5s. you pay now to get from Brewarrina to Bourke? Yes; the present rate from Brewarrina to Bourke being £1 5s., we should be prepared to pay a rate of 10s. or 12s. 6d. upon the proposed railway. That would save us one-half.
396. *Mr. Clarke.*] What about the passenger traffic? I think there would be a large passenger traffic. There are two sets of coaches every day, and they are always well filled. The conditions of labour which prevail now are very different from those which formerly prevailed. Formerly, the men lived in the country all the year round; but now we have to import a great deal of our labour. Every year we have to send to town for a large number of men to do all kinds of work. In the old days there was more work to be done, and the people stayed about. Now we have to get up men from town, and we have to pay their fares.
397. That would give traffic to the railway? Yes; I know that the coaches have a very profitable time during the shearing season. In my evidence before the Land Board here, I was able to say that what I paid in conveying labour to the station amounted to ¼d. an acre or rather more upon my rent.
398. In the event of the proposed line being constructed, would you use it for sending away cattle and sheep? Most certainly. Two travelling-stock routes are shown on the map as existing between Brewarrina and Byrock; but of these only one is used. There is no water along the direct stock route, and it is never used by people except those living along it. The route from Byrock to Gongolgon is very scrubby, and there is only one tank on it.
399. In wet weather the country is difficult to get through? Yes; very difficult. In wet weather, one part of the road between Gongolgon and Brewarrina is almost impassable.
400. *Mr. Roberts.*] Your homestead is about 75 miles north from Brewarrina; how far is that from the Queensland border? About 10 miles.
401. Have you ever sent your wool to Brisbane? No.
402. Have any overtures been made to you to get you to send it to Brisbane at a lower rate than you have to pay to Sydney? We got a circular from the Queensland Commissioners once or twice; but no inducement was offered to us to send it to Brisbane.
403. You can send to Sydney at a lower price? At as low a price. We should not think of going to Brisbane, because we should have no market there. Two stations which formerly sent to Bourke have been diverted to Brisbane; they are Woolereina and Coomburrah. They are 40 miles above us, and would send to Brewarrina if the railway went there.
404. Their wool still goes to Brisbane? It has gone to Brisbane this year.
405. I think you said, in answer to Mr. Clarke, that Queensland wool frequently comes to Brewarrina? Yes.
406. Is there not an export duty upon wool in Queensland? Yes; but I understand that this duty is always rebated to people who send to Sydney. It is an open secret that any Queensland man who sends wool to Sydney will get a rebate equal to the amount of the duty.
407. Is that allowed by the Railway Commissioners? I only know what I have heard. I shear my sheep in New South Wales to avoid the duty, so that I cannot speak of this rebate from my own experience; but I have always understood that the rebate is allowed.
408. What is the amount of the duty? I think it is £2 a ton. I may say that I have not heard anything about the subsidising of teams, though I am in constant communication with people across the border. The only clips which have been diverted are those from the stations I have mentioned.
409. What advantage do you think the Colony will get from the construction of the proposed line; are you able to show that it will cause more wool or a larger quantity of goods to be sent over the main Western line? It would assist to increase and develop the existing trade, and I believe it would bring a great deal of fresh traffic from Queensland.
410. Notwithstanding the export duty? Yes; Sydney is a better market than Brisbane for both wool and stock. The people across the border up towards St. George would prefer to send their stock and wool to Sydney. The freights are cheaper, and you have the best market in Australia. The Sydney wool sales are increasing in importance very much. It is only the other day that one of the banks which has until recently shipped all its wool ordered it to be sold in Sydney this season.
411. Is any advantage to be obtained by purchasing goods in Sydney; can goods be landed on the stations from Sydney more cheaply than from Brisbane? Yes, very much more cheaply. Sydney has the great advantage of being a free port, and things are very much cheaper here. The Queensland Government has lately extended its railway to Cunnamulla, and if its line is taken from Byrock to Brewarrina, and perhaps on to some point near the Queensland border, it will practically checkmate that move.
412. *Mr. Humphery.*] How far is Cunnamulla from Barringun? Eighty miles.
413. *Mr. Roberts.*] Do you think that the proposed railway, if constructed, would be able to compete with the river? I am certain of it. No one would use the river if there were a railway.

- F. W. Bacon. 414. Is that because of the frequent handling that the goods are subject to in travelling by river? Yes. and there is the knocking about and the extra insurance. Then, too, there is a lot of trouble at Bourke. The wool has to be lorried from the railway to the steamer there.
- 6 Oct., 1897. 415. But from Bourke it is carried to Sydney at the same price as from Byrock? Yes.
416. *Mr. Hoskins.*] Seeing that the proposed railway would intersect a purely pastoral country, would not the traffic during six months of the year be extremely dull? I think you are wrong in saying that this is a purely pastoral country. The first few miles of it is red-soil forest country—as good wheat-growing country as you have in the Colony. There is a good deal of land 9 miles out of Brewarrina of the same character. Cultivation is spreading there very rapidly. Every one is going in for it more or less. The wheat I saw this morning was grown 30 miles out of Bourke, at the back of Warraweena.
417. There has been no large settlement in the district of the people at whom the squatters look with so much horror—the Victorian selectors? Some Victorian graziers have come into the district; but I do not think the selector is looked upon with so much horror now. The squatter is the agriculturist. The place at Naromine from which Mr. Harper hopes to get so much wheat this year was started by Mr. Mack, an old Victorian, who has shown them the way to cultivate wheat in the district in a successful and profitable manner.
418. There can, however, be very little traffic in this district during six months of the year? Well, it will not be profitable to occupy it for close settlement without a railway.
419. Do you think there will be close settlement there? I think that all that country will be used for wheat growing between Byrock and the Bogan.
420. Is not natural water very scarce there? Yes; but any amount of water can be conserved. Tank-work can be done now for 5d. or 6d. a yard, when formerly it cost 1s. or 1s. 2d. a yard.
421. Has any artesian water been obtained in the district? Not between Byrock and Brewarrina; but north of Brewarrina there is a bore, at Goodooga.
422. The experience in this Colony is that a railway constructed through a sparsely populated district does not pay? Our railway system as a whole pays, and we shall have to follow the American plan of making railways to create traffic.
423. We are told that it is no use people going out there, because they cannot live? That is a great deal their own fault.
424. With respect to what we have heard about the subsidising of teams by Queensland, is it not a fact that the Queensland Government, in order to attract wool to Brisbane from the border stations, has been quoting through rates to consignees, so that there must be some agreement with the carriers to take the consignments direct from the producers? Yes.
425. The Queensland Government actually pays the carriers; but they quote the rates to the producers? I have heard something of it; but I do not know anything about it from personal experience.
426. Suppose the railway were made from Byrock to Brewarrina, do you not think that, from the necessity of retaining and attracting custom, the proprietors of the river steamers would cut their rates very low? They say that the present rates do not pay them, although now they get 25s. a ton. How, then, could it pay them if the rate were 7s. 6d. or 12s. 6d. a ton.
427. If the Darling were locked between Bourke and Brewarrina and between Brewarrina and Walgett, as some people think it ought to be, and the river was made permanent, do you not think that the steamer rates would be cut down? That is quite possible; but I should be prepared to pay more in order to send by the railway.
428. Do you think that you are now expressing the opinion of a large number of residents? Yes. The river would not take any live stock traffic. As far as passenger traffic is concerned, I would sooner go by the coach than by the steamer now. As to sending wool by steamer, I would sooner pay 3s. 6d. or 5s. a ton more and send it some other way.
429. When the river is navigable, how long does it take to go from Brewarrina to Bourke? I have been down three or four times, and it has taken from twenty-four to thirty-six hours.
430. How long are the mails in travelling from Byrock to Brewarrina? They leave Byrock at 4 o'clock in the afternoon, and get to Brewarrina at 7 o'clock next morning; but I have frequently driven over the road in my own buggy in eight or nine hours.
431. When wool is sent by boat it is knocked about a good deal, and the bales become very dirty, especially after rainy weather? Yes.
432. That destroys the appearance of the wool and depreciates it? Yes, very materially.
433. *Mr. Humphery.*] Do you know what quantity of wool and stores comes to Brewarrina? No.
434. I suppose you are aware that there is a very serious discrepancy in the evidence in regard to this matter? Yes.
435. Have you any opinion upon the subject? No, I have not. I have no statistics.
436. At the present time the railway earnings between Byrock and Bourke are nominal? Yes.
437. The rate of carriage is the same from Bourke to Sydney as from Byrock to Sydney? Yes.
438. The construction of the proposed line would be a substantial benefit to the Railway Commissioners, inasmuch as the persons using it would be prepared to pay a local rate? Yes.
439. Have you any information which would assist the Committee in estimating what the earnings of the proposed railway will be? No; I have nothing that I can lay before you.
440. *Mr. Hoskins.*] How many coaches run between Byrock and Brewarrina? There is a coach five times a week; and I think that on three days of the week there is an opposition coach.
441. *Mr. Humphery.*] Would the construction of a railway from Narrabri to Walgett appreciably affect the earnings of a railway from Brewarrina to Bourke? I do not think it would affect them at all.
442. You are aware that a large quantity of wool now finds its way from Walgett to Bourke? Yes; when the river is up. The steamship-owners make concessions to people. I understand that they take wool from Walgett or from Boorooma at the same rate that they take it from Brewarrina. They are fighting against the Northern railway. Mr. Harper stated that upon one occasion goods were brought to Walgett by steamer from Bourke more quickly than they could be taken from Narrabri. Of course, that occurred under exceptional circumstances. The teamsters' animals were not in a fit state to travel, and when rain came the carriers would not venture out with poor horses and boggy roads.
443. The river could be used when the roads were not passable? Yes, exactly.
444. You think that a railway to Walgett would not interfere with the traffic upon the proposed line? Not

Not to the extent of one clip. For some years before going into the station business I was a forwarding agent and a stock and station agent in Gunnedah and Narrabri. We had to deal with some of the clips about there, and I have an intimate knowledge of the way in which the wool has gone. There is a well-marked line between the district which sends to the Western railway and the district which sends to the North-western railway. The station adjoining us sends to Narrabri; while west, commencing with our own place, the wool all goes in a different direction. I do not think that a railway to Walgett and another to Brewarrina would alter the trend of traffic a bit.

F. W. Bacon.
6 Oct., 1897.

445. Would not the distance from Walgett to Newcastle be shorter than the distance from Walgett to Sydney? Yes; but most people now prefer to sell their clips in Sydney. They do not use Newcastle so much. The wool goes right through by train.

446. Is not much of the wool brought from Newcastle by steamer? A certain proportion of it is; but that is a matter I could not speak definitely about. No doubt the Newcastle steamers have tried to attract the traffic by cutting down the rates.

447. Is it not a fact that it is merely a question as to the cost of moving the wool from the station to the market, and that if you could come by the North-western line more cheaply than by the Western line, you would come by the North-western line? Yes; but of course local conditions must guide one to a very great extent. These conditions are affected by the state of the seasons—the trend of traffic. We never get any Narrabri carriers at Dumble. We get our goods through Bourke, and consequently our carriers come from Bourke.

448. If the railway were brought to Walgett, what change would that make? It would depend upon the through rate from Walgett to Sydney as compared with that from Brewarrina to Sydney.

449. With the river navigable between Brewarrina and Walgett, do you think the earnings of the Brewarrina line would be affected owing to the shorter distance from Walgett to Newcastle? I do not think so. As a rule the wool is not taken up the river against the current. It is usually taken down stream. To make the river permanently navigable between Bourke and Walgett would require an expenditure of probably £750,000.

450. But assuming the river to be navigable between Brewarrina and Walgett? That would feed the railway.

451. At Walgett? No, at Brewarrina. Wool rarely goes up stream.

452. You are of opinion that the earnings of the proposed railway would not be diminished by the construction of a line from Narrabri to Walgett? That is so.

453. *Mr. Wright.*] Can you give the Committee any idea as to the number of bales of wool coming in to Brewarrina? No.

454. If it has been stated that about 15,000 bales are annually received there, do you think the statement a correct one? I think that more wool than that is sent there. At all events quite that quantity of wool is sent.

455. Do you think that 20,000 bales of wool are sent annually to Brewarrina? I think that that is more likely to be the number of bales sent.

456. Brewarrina is a very large stock depôt? Yes. It has this peculiar advantage, as compared with Bourke, that it has good stock routes leading to it. The stock routes going to Brewarrina pass through good open plain country. There are three stock routes leading into Bourke, one from Wanaaring, one from Barringun, and one from Hungerford. These routes go through some of the worst country in the Colony. I lately had a painful experience in travelling sheep out there in what was called a good season, and I suffered a heavy loss. Those roads are so bad, that a large number of Queensland cattle avoid them. On the other hand, I do not know a better road in the colony than that from Goodooga to Brewarrina.

457. That is the great stock route for cattle coming from Queensland? Yes.

458. Are many fat sheep sent to market from that district? A great many, especially to the Sydney market. Quantambone station sold 28,000 sheep to the Messrs. Richards, the great carcase butchers, quite lately.

459. What effect would a railway to Walgett have upon the quantity of wool received at Brewarrina or Bourke; certain clips always come to Bourke when there is a river? Yes; Gingie and Boorooma always do.

460. And Euroka? That sometimes goes the other way.

461. These clips would represent between 5,000 and 6,000 bales? Yes.

462. If there were railway communication to Walgett, that wool would be lost to Bourke and to Brewarrina? Not altogether. I think that the Boorooma wool—about 2,500 or 3,000 bales—would come down the river to Brewarrina in any case.

463. If there were no river it would go the other way? Then it would go by road.

464. You think that, under any circumstances, if there were a railway to Brewarrina, it would go there instead of to Walgett? Yes.

465. So that the extension of the railway to Walgett would not affect the Brewarrina trade to any appreciable extent? No.

466. I think you said that the extension of the railway from Byrock to Brewarrina would attract a large amount of traffic from the southern parts of Queensland? Yes.

467. I suppose you are aware that the New South Wales Railway Commissioners fight the Queensland Railway Commissioners by giving special rebates for wool coming from Queensland into New South Wales? I understand that the amount of the duty is paid back to people who send their wool into New South Wales.

468. At Bourke the Commissioners give them back the whole amount of the duty by reducing the railway charges to that extent? Yes.

469. The competition of Queensland is neutralised by this action of our Commissioners? Yes.

470. For this reason you think that an extension of the railway to Brewarrina would attract trade from Queensland? Yes, coupled with the fact that a large number of New South Wales people have settled in Queensland.

471. A lot of the wool from that part of Queensland comes into New South Wales now? Yes.

472. What about the Cubbie wool? That wool now goes towards Narrabri; but if the proposed railway were made, it would come to Brewarrina.

473. There are about 5,000 bales of wool sent from the stations formerly held by Mr. C. B. Fisher? I think 8,000 or 10,000 bales. Some of that wool we should never get.

474.

- F. W. Bacon. 474. I suppose that wool would come to Brewarrina from all the country round about St. George? Yes.
- 6 Oct., 1897. 475. The people in that part of Queensland would naturally get their supplies from New South Wales? Yes.
476. Except for passengers and live stock, the New South Wales railway rates for long distances are much less than the Queensland rates? Yes.
477. So that there would be a natural tendency for storekeepers and pastoralists near the border to trade with New South Wales through Brewarrina? Yes.
478. Would you, as a pastoralist, be prepared to pay from 15s. to 17s. 6d. a ton as a local rate between Brewarrina and Bourke? I would be prepared to pay an extra local rate. According to the *Daily Telegraph* report of Mr. Harper's evidence, he has told the Committee that if the interests of the carrying companies at Bourke are disturbed they may take the trade away to South Australia. I cannot understand why he should make such a statement. People are not in the hands of the large carrying companies. There are only two carrying companies in Bourke, and I am sure that they would not be able to induce people to send their wool to Adelaide.
479. There are three carrying firms in Bourke? Well, I am pretty sure that they could offer no inducements to people to send to Adelaide, unless they were prepared to throw their money away in a suicidal competition. I do not think the people would send their wool to Adelaide down that long stretch of river, even if extremely low rates were quoted, because the risks are so great and the insurance is very high. I understand that at the present time a reduction is made to people a certain distance down the Darling to induce them to send their wool back to Bourke, and I think that the Commissioners' policy would prevail against any attempt of the forwarding agents to send the wool to Adelaide. I am surprised that Mr. Harper should make such a confession of weakness.

William Chandos Wall, sworn, and examined:—

- W. C. Wall. 480. *Chairman.*] Will you make a statement upon this matter? Yes; I think it will expedite business if I do so. I at one time resided in Brewarrina for four or five years, and I have a thorough knowledge of the district and its resources. As the Committee are well aware, I have been concerned in investigations into the advisability of constructing several similar lines, and I can say that, in my opinion, no line is likely to be more remunerative, or would settle more population upon the soil, than the line now under your consideration. I will very briefly state the reasons which have led me to that conclusion. The country referred to by Mr. Bacon comprises the overflow of the Balune. Goodooga, and the country lying to the north-east of Brewarrina, is actually the best pastoral land in New South Wales. Not only has it the advantage of the natural rainfall, but it is naturally irrigated by the overflow of the Balune. I do not know of any country which is better situated in this respect. The Balune at times runs a mile or two wide, and a foot deep, and irrigates the whole country. Reference has been made to the agricultural capabilities of this district. I was present with Mr. Sawers at the Brewarrina Show some years ago when a cabbage was exhibited weighing 14 lb. That cabbage was grown in the district. I might also mention that when I was managing a run near Goodooga, the gardener on the adjoining run cultivated some corn which grew 9 feet high, and which was cut down by the manager because he feared a raid of selectors. Remarks have been made in regard to the decrease in the number of homestead leases held in this district. It is true that the number has decreased; but that is because the land is of such value that it has been purchased by the pastoralists, and in many cases the leases were taken up by them. I was retained at a sitting of the Land Court in connection with a certain large holding for which twenty-three homestead leases had been taken up. The whole of the resumed areas were taken up in the interests of the pastoralists, and they are falling back now that the conditions have been fulfilled. In other cases the lessees have been bought out. Anyone who has any knowledge of that country must know that no part of the Colony can surpass it in its prospects of agricultural development. I have seen 40 bushels of wheat to the acre grown at Wommerall, about 40 miles from Brewarrina in a south-easterly direction. The whole of that country on to Brewarrina and thence on to Byrock is good agricultural country. Wommerall is close to the junction of the Castlereagh and the Macquarie. There is a special reason why the proposed line should be constructed. At Brewarrina there is what they call a bar. The river is often navigable to Brewarrina, when it is not navigable past Brewarrina. Many years ago, before the railway was taken to Bourke, boats used to be sent up the Darling from Adelaide with supplies, and used to take the whole of the wool back. Only the other day when I was in Bourke, I found that a very large mercantile firm there—Messrs. Rich and Company—were getting goods up from Adelaide, and were guaranteeing a load of wool back. Every station is a wharf from the time you leave Bourke until you get to Walgett, and when the wool is put on to the boat, it seldom leaves until it gets down near Adelaide, so that our railways are deprived of freight which would otherwise come to them. The Bourke line has for years been robbed of its legitimate traffic by the arrangement made by merchants in Bourke to have goods brought up by the Adelaide steamers. It is a customary thing when there is a fresh in the river for these steamers to come up with barges and to open a store on board. I have seen them selling retail from the barges for month after month. The proposed extension to Brewarrina would, if it were made, take the whole of the wool from Goodooga, from the overflow of the Balune, and from the rich Narran country. I was there during the drought, and I know that from one station 222 head of stock were sent away every fortnight. These cattle would have taken the railway at Brewarrina if it had been made. Most of them went to Victoria. There is no doubt that it would be impossible to obtain the trade from the Queensland border without tapping the river somewhere between Bourke and Walgett. If the Queensland railway is extended south from Cunnamulla to the border at Barrington, or some other point, it must take the whole of the wool grown in the rich pastoral districts to which I have referred. That wool now comes down to Bourke; but immediately the Queensland line is extended it will be keenly competed for. When I was out there the competition was so keen that they were running their mails on alternate days, in order to compel you to go through Queensland. They so arranged their coaches that if you wanted to come back to New South Wales you had a delay of a day. As soon as the Queensland railway reaches the border they will get the traffic from Goodooga, from the Balune, and from the Narran. When I was there they had about 100,000 sheep on the land. There is also Mr. Sawyer's place, at Bundabooka, and other stations round there from which we ought to get the traffic. All the country there is rich fattening country; but it would be easy for them to go to Queensland if the Queensland railway were brought down to Barrington. I cannot see why our
Commissioners

Commissioners should be opposed to the construction of the proposed line. If they knew the character of the country it would serve, and the trend of the trade, they would look upon the line as indispensable to preserve traffic which must otherwise go to Queensland. I am not speaking from a casual knowledge of the district. I lived in it for many years, and I have had an opportunity of inquiring into the why and the wherefore of the construction of other lines. In my opinion it is essential that this line should be made to preserve to this Colony the trade of a very rich district. I know of no more convenient point than Brewarrina at which to tap that trade. The river is nearly always navigable between Brewarrina and Walgett, and between Brewarrina and Bourke. The "Jolly Miller" was once stuck in the mud for twelve months; but there is a little steamer plying between Brewarrina and Walgett which would bring the whole of the traffic from Walgett. Then there will be the traffic coming from Goodooga. I have seen the time on Moorabinda run when you could mow 20 or 30 miles of wild oats, which makes as good hay as any you can grow. As I have said, the Balune overflows and inundates this country for miles. Very often, when there is no local rain, it overflows and spreads over the country for 2 or 3 miles, and you then see the plains covered with vegetation such as I do not think you will see in any other part of the Colony. If the Committee visit the district, I think they will have the same impression of its value that I have.

W. C. Wall.
6 Oct., 1897

THURSDAY, 7 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Peter Collinson Close (Hill, Clark, & Company), sworn, and examined:—

481. *Chairman.*] You know the country under consideration? Yes.

482. *Mr. Clarke.*] Will you give the Committee your views in regard to the construction of the proposed railway from Byrock to Brewarrina? I may say that I have come practically unprepared, because I was taken by surprise. I only got word this morning that I was expected to come, and I am very busy just now. I think it would be advisable to construct the proposed line. The district which it would serve is a very good and a very rich one. The small men living there at the present time are under a great disadvantage, because they cannot get rid of their stock. A man may have 100 or 200 sheep or ten or twelve head of cattle or horses which he wishes to send away; but he cannot afford to send them away in such small numbers when there is no railway. These men are also at a great disadvantage in regard to their wool. If there were a railway to Brewarrina they could put the wool on board the train there, and it would come straight down to Sydney without any further delay or trouble. This would mean a saving of freight and of insurance. The rates of insurance for wool sent by river are very high, and all these things add to the expense of sending in produce. A good number of selections have been taken up on the other side of the Queensland border, out towards Thurulgoona. That wool can come to Brewarrina more easily than to any other place, and if there were a railway at Brewarrina there would be a considerable saving in carriage.

P. C. Close.
7 Oct., 1897.

483. Cannot the people living near Brewarrina and out towards Walgett come down to Bourke now? Yes; but if a man has only a few head of stock it is not worth his while to drive them all the way to Bourke. It is the small men—the men with 10,240-acre leases—who would benefit most by the construction of the proposed railway.

484. What about the larger men? They will use the railway too. Instead of driving to Bourke or to Byrock, they will take advantage of the train at Brewarrina. They will not drive their stock further than the can help, especially in dry times.

485. If the Darling were locked, would that give them any extra facility? Not for getting down stock. It would be right enough for wool.

486. Are you aware that it is estimated that the loss upon the proposed railway will be something over £4,200 a year? I do not know how that estimate is made up; but it is probable that credit has not been taken for the produce of a great many stations. For instance, there are the stations on the Neibine. Cattle go from those stations to Bourke and to Dubbo; but if there were a railway they would go to Brewarrina in preference.

487. Do you think it possible that in course of time the probable loss will be reduced? I should think so. The country is all wonderfully good.

488. I suppose it is purely pastoral country? Yes; it is grazing country. At the same time you could not find better agricultural country. Every one who has tried agriculture there has succeeded admirably.

489. Is it likely to become an agricultural district? I should say that there is no doubt of it. It is only a matter of time.

490. At the present time there is no agriculture there? There is some, but very little. On the Tarrion they have even gone in for irrigation. So far all their experiments have been successful.

491. Does much of the Queensland wool come to the New South Wales railways? They are forcing it to go to Brisbane as much as they can by imposing a duty prohibiting export into this Colony. They are also offering great concessions on the railways. The men who are taking up 20,000-acre leases, however, will send a great deal of their wool to the New South Wales railways, because they are right on the border.

492. Do not our Commissioners make concessions to attract the trade this way? Yes.

493. Do you know the nature of those concessions? I could not tell you from memory what they are; but they are very reasonable and fair.

494. There appears to be a regular cut-throat competition? Yes. The New South Wales railways are at a disadvantage, because they have to fight against the Queensland export duty as well as the Queensland railway concessions.

495.

- P. C. Close.
7 Oct., 1897.
495. Do you think that it is an injustice to the people of Brewarrina and of the country to the north of it to compel them to go to Bourke? I do not think that they should be compelled to go to Bourke. I think that they ought to have a railway to Brewarrina to tap all the surrounding country.
496. The fact still remains that there would be a heavy annual loss upon such a line? Well, I cannot go into that question. I presume that it is a matter for the railway authorities to deal with. Not knowing how their calculations are made up, it is impossible for me to offer an opinion upon them. I believe that the traffic of the district is very large and very extensive.
497. In the event of the proposed line being constructed, the carriage of produce of all kinds would cost less than it does now? Yes.
498. That would be a benefit to the whole district? Yes.
499. The live stock of the district is at present sent to either Bourke or Byrock? Yes.
500. If the proposed railway were constructed it would be more economical to truck stock at Brewarrina? It would be most advantageous to stock-owners to truck there.
501. Do you think that the country would carry more if there were a railway to Brewarrina? There is no question about it. It is a great fattening district, and people would be able to send stock to market who have now no opportunity to do so.
502. What would cause the population to increase? I think that a lot of the larger holdings would be cut up into smaller holdings.
503. Would that cause more cattle and sheep to be kept? Yes. A man holding 10,000 acres runs more sheep to the acre than a man holding 100,000 acres.
504. Why? The paddocks are smaller, and the sheep can be better looked after in them. All the work of these small places is practically done by the family of the lessee.
505. Do you think it is possible that wheat or hay or oats will be grown in the district? There is no question about it. It will be a wonderfully good agricultural district when it is opened up. We have lent money on places out there, and they all say that they would prefer to send their produce away by train instead of by steamer.
506. Is there much passenger traffic between Brewarrina and Byrock? A good deal.
507. I suppose that if there were a railway there would be more? A great deal more.
508. *Mr. Lee.*] Are there many homestead lessees in the district? A great many.
509. How many? I could not tell you.
510. What is the area of their holdings? 10,240 acres.
511. You could not settle very many people in the district if all the holdings were of that size? Well, you would carry a great many more sheep.
512. Have you reason to doubt the correctness of the estimate of traffic given by the railway officials? I do not know what it is; but I am surprised that they should estimate that the loss would be so large. I cannot dispute the calculations of professional men, who ought to know their business; but it is a surprise to me that there should be a loss.
513. It has been estimated that the proposed railway, if constructed, would carry 3,100 tons of wool; allowing $5\frac{1}{4}$ bales to the ton, that would be about 16,300 bales;—do you consider that an under-estimate or an over-estimate? I think it an under-estimate. All the big properties there yield very heavily, and I should say that with a railway the yield would be increased.
514. Of course, a certain proportion would continue to go to Bourke. The calculation of the Commissioners only takes in the wool which it is believed will go on to the proposed line? Another thing to consider is the possibility of the construction of a railway to Walgett. That would take some of the wool away. I think, however, that there should be enough wool for the proposed railway in the Brewarrina district alone.
515. How many sheep would be required to produce 16,300 bales of wool? Of course, flocks differ; but I should reckon that there are generally about 7 lb. of wool to the sheep.
516. That is a fair average? Yes.
517. *Mr. Humphery.*] From eighty to 100 fleeces go to the bale? Yes.
518. *Mr. Lee.*] The Commissioners estimate that 1,000 trucks of sheep and cattle would be sent over the proposed railway;—how many sheep go to a truck? About eighty woolly sheep go to a truck, and between ninety and 100 shorn sheep.
519. Taking the truck load as eighty, the Commissioners estimate a transport of 80,000 sheep;—would that be an abnormally large transport from that district? No; I look upon that as a small estimate. There is some of the finest fattening country in Australia in this district.
520. It is essentially a pastoral district? Yes, and a very good pastoral district.
521. I presume that there are few pastoral districts which move more stock during the year than that district moves? Very few.
522. Taking into consideration the sale of store stock, and the consumption by the metropolis, the movements of stock in that district must be very large? Yes.
523. 80,000 a year is not a very large estimate? No; I do not think there is any comparison between this and the Bourke district, so far as fat stock is concerned.
524. Has there been an increase in the number of stock or in the quantity of wool sent from the district during the last few years? I think there has been a decided increase in the number of stock. This year, of course there has been a severe drought nearly everywhere.
525. Does the district continue to hold its own in supplying fat stock to the metropolitan markets? Most certainly. Ben Richards buys extensively in the district, both for export and for Sydney consumption.
526. Would the construction of this railway bring a larger quantity of stock to market by enabling those who have small lots to send them? Yes; it would induce people to send in more stock. When you are travelling sheep, although they may start in fair condition, after they have been a fortnight on the roads they have lost a great deal. If you could put them into the trucks after a journey of 20 or 30 miles, there would not be that loss. It makes a great difference to the condition of stock when you have to travel them along a hard, dusty road. When stock begin to waste they go right away.
527. Would the waste be equal to the cost of transit? It would be more.
528. The cost of transit would be 15s. 6d. a truck—4d. a sheep;—would the depreciation be equal to that? I think so. Sheep get knocked about terribly in travelling along these bad roads.

P. C. Close.

7 Oct., 1897.

529. You firm are very largely interested in the western district? Yes.
530. Is the country still held in large pastoral holdings, or is there a tendency to cut it up into smaller holdings? I could not tell you. Of course, everyone who has a big piece of land likes to keep it. We are interested in the small men, not in the large holders. The men in whom we are interested are selectors and homestead lessees.
531. Can you give us any evidence to prove that the official estimate of the traffic is a wrong one, or can you show us how any immediate loss will be met in the future? I cannot understand that there should be any loss. I have been all over that country. There are certainly no engineering difficulties there. The line would not be like the Mudgee line, which is a constant drag upon the Colony. I think the traffic from the district must be very heavy, and, if you increase the number of holders there, you will increase its production. Small holders are always sending in something to market. If they are near a railway, and have 200 or 300 head of sheep, or a few head of cattle to send away, they send them.
532. Is it your experience that small settlement has been a success in that district? Yes, a great success. All the men we have had anything to do with have started in debt, but very many of them have paid off their debt, and have done well. A great many of them who were quite poor when they started are now able to manage their properties without any assistance.
533. *Mr. Wright.*] Did you ever live in Brewarrina? No.
534. When were you in the district last? About six years ago.
535. You have been there sufficiently often to know it? Yes; I know the district all through.
536. I suppose that you are a fair judge of the quality of country, and of its carrying capacity? A fairly good judge.
537. You could form a reliable estimate of its capabilities? Yes; I should reckon this country as capable of carrying a sheep to 2 or 3 acres.
538. You know good agricultural land? Yes.
539. You assert that this district is a very rich pastoral district, and that it might be suitable for growing cereals? Yes.
540. Have you any knowledge of the number of homestead lessees in the Western district now? I know that there are a great many; but I could not tell you how many.
541. If it is asserted that they are decreasing, and are being bought out by the large proprietors—do you agree with the assertion? I cannot speak on that subject. I know that in many instances men with 640 acres conditional purchase and conditional lease have sold to larger holders, and have gone to Queensland to take up areas of 20,000 acres.
542. I am speaking of homestead lessees? I cannot tell you.
543. To your knowledge, is it a fact that the number of homestead lessees in the Western district is decreasing, and that the pastoral holdings are increasing in size? I have not heard.
544. According to the Departmental estimate, 1,000 trucks of stock, or between 70,000 and 90,000 sheep would be sent from Brewarrina;—do you think that that is half the number of sheep which would pass over the proposed line? I think that a great many more would pass over it.
545. More than double the number? I think fully twice the number.
546. A great many cattle would also be sent over it? Yes.
547. So that probably 3,000 trucks would be required instead of 1,000? Yes. When Ben Richards goes out there, he will sometimes buy 20,000 or 30,000 sheep at one deal.
548. I take it then that you think that the figures placed before the Committee are not reliable? I could not say that. I do not know what they are.
549. Well, for instance, it is estimated that 1,000 trucks a year will be required;—You say that 3,000 are likely to be required? Yes.
550. You feel sure of that? Yes.
551. Taking into consideration the fact that in a good season a great many stock may be sent by road? Yes, though people are not very fond of sending their stock by road even where the roads are good. When a man gets to Narrabri with a lot of stock, and finds that there has been some mistake about his trucks, he is not very pleased at having to travel all the way down to Gunnedah to truck. He likes to get his stock away by the railway as soon as he can. In travelling the sheep get full of burrs, and they lose condition. Everything is against them.
552. The stock routes of this Colony are fairly eaten down, and the stock deteriorate appreciably in every 20 or 30 miles? They deteriorate every mile. The roads are covered with burrs and rubbish.
553. That does not affect shorn sheep? It affects all sheep. They do not like them.
554. The tendency is to truck stock as soon as possible? Yes.
555. Do you consider the Departmental estimate of the live-stock traffic a fair one, notwithstanding that in good seasons some of the stock may be driven along the road? No; I do not. Even though some stock may be driven along the road, there would be a great many more stock sent by rail.
556. Then you think the estimate a small one? Yes; a very small one.
557. If the Committee has heard from one source that the ordinary merchandise traffic would be about 2,000 tons per annum, and from another that it would be 8,000 or 10,000 tons per annum, to which estimate do you attach the greater importance? I think it would be a great deal more than 2,000 tons per annum.
558. Do you think 2,000 tons per annum an under-estimate? Yes.
559. Do you think 8,000 or 10,000 tons per annum an over-estimate? Of course there is a great difference between the two amounts.
560. I suppose we might say 4,000 or 5,000 tons? Yes, easily.
561. If it has been said by some witnesses that between 16,000 and 17,000 bales of wool come into Brewarrina, and by other witnesses that 30,000 bales of wool come in there, to which evidence do you attach most importance? Well, I think the wool traffic there must be enormous.
562. I am speaking of the wool coming through Brewarrina to Bourke and to Byrock? I should say that it would be nearer 30,000 bales than 17,000 bales.
563. Have you any particular knowledge of the quantity that is sent to Brewarrina? No; I should think, however, that the Brewarrina traffic must be tremendously heavy.
564. You have not had time to ascertain the amount of the clips sent to Brewarrina from the various stations? No; I have not had time to obtain any information at all. I can only give you a bare opinion in favour of the line, based upon my general knowledge of the district.

- P. C. Close.
7 Oct., 1897.
565. Have you any personal knowledge of the passenger traffic of the district? No.
566. Do you think that the passenger traffic on the proposed route would average ten persons a day to and from? I should think it would be greater than that, taking all the year round.
567. The Commissioners estimate it at 1,500 persons per annum, which is less than five a day? I think that is an under-estimate.
568. *Mr. Roberts.*] Which is the better country—that to the north of Brewarrina, or that to the south of it? It is very good country in both directions.
569. Does it get better going north-west or going north-east? You cannot go wrong anywhere in the district. It is very good country all about there, right down to Gongolgon.
570. And right up to the Queensland border? Yes; of course there are patches of bad country; but as a general rule it is "A 1."
571. What are some of the best stations there? There are a number of good stations. Mr. Dickson's property is "A 1," and Mr. Sawers has splendid country.
572. What is the distance between Walgett and Brewarrina by road? About 80 miles.
573. Is it necessary to tap the river at both Brewarrina and Walgett? It is difficult to say. I do not think that the two lines would interfere with each other. The Brewarrina line would take all the traffic from its immediate district, and the traffic from the country lying to the north. The Walgett line would affect it very little.
574. Are we to understand that you think there ought to be sufficient traffic for both lines? Yes; the Walgett line will have a traffic of its own. All the country out Goodooga way would go to Walgett.
575. Would the traffic be divided about midway between Brewarrina and Walgett? I do not know exactly how the traffic would go. It would depend a good deal upon the freights from the two places.
576. Does more stock go into Brewarrina than into Bourke? More stock goes into Bourke; but if the proposed railway were made, quite as much stock would come to Brewarrina. All the stock from the district round about Brewarrina, which is essentially a fattening district, would go to the proposed line.
577. Are the roads to Bourke and the roads to Brewarrina equally good? No; the roads from Brewarrina go through the better country. Stock coming from Barrington have a better road if they come through Brewarrina.
578. If the proposed railway were made would it get any traffic that goes to Queensland now? I should say that the traffic right through from Bundaleer and Thurulgoona would come to Brewarrina. A lot of homestead leases were taken up there quite recently.
579. Traffic that would come from that direction would be wool? Wool and stock.
580. Will not the Queensland export duty prevent Queensland wool from coming this way? No; I do not think so, where the stations are right on the border. The carriage to the Queensland railway is very heavy, because of the enormous distances.
581. But the duty will have to be paid? Yes; but the fact that there will be less road carriage to pay would be an inducement to send this way.
582. Even if the wool came to Brewarrina, is it not likely that it would go down the river from there? Some of it might, but there would be extra insurance to pay in addition to the freight.
583. Would not the frequent handling materially add to the cost of transit? Yes; the less you handle the wool the better.
584. Do you not think that if the railway is constructed the steam-boat proprietors will reduce their fares? I think the Railway Commissioners would be able to deal with that.
585. Is it not acknowledged that river carriage is cheaper than land carriage? It is supposed to be so; but it would be impracticable to carry stock on the river. During the last drought thousands of stock would have been sent away by the railway if it had been possible to get them to the station.
586. Do you know what number of sheep, cattle, and horses there is in the Brewarrina district? No; I have no statistics upon the subject. I only know the district is a very rich one.
587. And you think that if the proposed railway were constructed, the traffic upon our lines would be increased? Yes.
588. *Mr. Hoskins.*] The country between Brewarrina and Byrock is very thinly settled? Yes.
589. If the proposed railway were constructed, there would be scarcely anything for it to do after the wool season was over? After the wool season was over there would be the live-stock traffic.
590. The people would not send all their live stock out of the district? No; but they would send away a great many fat stock.
591. In other districts there is the mining industry, and other things to give traffic to the railways? Of course, they are mining round about Gongolgon. We do not know what the resources of the district are.
592. The tract of country between Byrock and Brewarrina is very badly watered? There is the Bogan, but the district you speak of is not well watered.
593. There is no artesian water there? No.

Grainger Barton, grazier, sworn, and examined:—

- G. Barton.
7 Oct., 1897.
594. *Mr. Lee.*] Do you reside in the district which would be affected by the construction of the proposed railway? Yes.
595. Whereabouts? I am interested in a holding about 7 miles from the proposed railway, and about 25 miles from Byrock.
596. Have you been in the district long? I have been about thirty years in the Bourke district.
597. I suppose you had opportunities to travel all through that district? Yes.
598. You have seen it in good seasons and in bad seasons? Yes.
599. An agitation has been going on there for railway extension for years past? Yes.
600. Since the railway was extended to Bourke has there been a desire to take the line beyond Bourke, or to extend it from Byrock? It has been suggested that the line should be taken on to Barrington from Bourke, and it has also been suggested that the line should be taken from Byrock to Brewarrina.
601. What part of the Darling country do you consider most suitable for pastoral purposes? I think the Brewarrina district is the best. From Bourke to Walgett and out to the Queensland border, and down on the Marra towards Nyngan it is all very good country.

602. If the proposed railway were constructed, do you think it would lead to an increase of settlement? I do. I am going in very largely for wheat growing. I have already 250 acres under wheat, and next year I hope to have over 1,000 acres under wheat. I will keep on increasing my area. G. Barton.
7 Oct., 1897.
603. Have you had a crop every year? Yes; I have had as much as 2 tons of hay to the acre, and over 30 bushels of wheat. Mr. Millen showed some of the wheat grown in the district at the House the other night.
604. I suppose your place is close up to the Bogan? It is not far from the Bogan. I have given wheat growing a trial, and I find that it pays me a great deal better than growing wool. Since I began no fewer than five others have started. I think that if the proposed railway is made a good deal of the land between Byrock and Brewarrina will be used more for farming than for sheep growing. It is thickly-timbered country, and is more suitable for wheat growing than for stock. There is another man not very far from me on the Bogan, and not very far from the proposed railway, who is clearing 100 acres, which he will sow next year. If the experiment is a success he will go on increasing his area. He is interested in one or two homestead leases there, just as I am.
605. Do you think that wheat growing can be carried on in the district upon a sufficiently large scale to permit of export, or will the wheat be consumed locally? There is a considerable consumption of chaff and wheat in the district. I have to cart my produce 40 miles to Bourke; but, if there were a railway, I could send it by train to Brewarrina, to Bourke, and to Cobar, and in years to come, if we grew more wheat than could be consumed locally, we could send the surplus to Sydney. Forty miles of land carriage keeps us out of the market altogether.
606. I suppose if people go in for farming there it must be in small areas? I do not think so. I have 16,000 acres there in two homesteads, and between 10,000 and 12,000 acres of it are very suitable for wheat growing. My country is similar to that for miles round. Wheat growing has gone ahead immensely in the last few years out in the Western district. Travelling frequently by railway as I do, I see a change every time. People are clearing their land, and are putting in wheat in all directions. If they get facilities for sending their produce to market, the people out west will go in for wheat growing just as the people in the southern districts, at Berrigan and elsewhere, are going in for it. I have proved that it can be made to pay.
607. If mixed farming can be carried on to any large extent in the district, the country will carry a much larger population than it has hitherto carried? Certainly.
608. Good as your results have been, have they not been obtained under favourable conditions? No, not necessarily so. I started to grow wheat in 1894. Last year I got a very fair crop and a good sample of wheat. The present is not a very favourable season, because we did not have rain until June, and we sow in April, or even in March; but we expect to have a first-class crop. Amongst the wheat which I gave to Mr. Millen were some of the best heads that I have seen.
609. But the years during which you have been growing wheat have been favourable years? They have not been out of the ordinary. Our rainfall this year has been $9\frac{1}{4}$ inches, and I have wheat growing now which will be a thorough success.
610. What rainfall had you last year? We had a tremendous fall in February, and the rainfall for the year was probably above the average. In an ordinary season, with an average rainfall of 16 inches, we can get an excellent crop of wheat.
611. The authorities say that a rainfall of 20 inches is necessary for the successful cultivation of wheat? I think they are mistaken. I know that we have only had $9\frac{1}{4}$ inches this year, because I keep a rain gauge.
612. You say that no matter what the rainfall has been, you have grown wheat successfully? I have grown wheat successfully during three years out of four. 1895 was the driest year that we have had. We only had 6 inches of rain at Bourke in that year, and the crops were a failure. I estimate that I will get a good crop three years out of four, and I think that is a fair estimate of what can be done in the district.
613. There must be some years when you will get no crop at all? Yes; 1895 was such a year; but in three years out of four you will get a good payable crop.
614. Would the Committee be correct in assuming that if the proposed railway were constructed any loss during the first few years would ultimately be made up by the agricultural freight in addition to the pastoral freight? Yes. This year I shall have from 300 to 500 tons of chaff, which I should send by the proposed railway if it were made. I have now to cart it to Bourke, at a cost of from 15s. to £1 per ton. It is my intention to increase my production to the fullest capability of the land.
615. Can you grow grain as cheaply as it can be grown in adjoining districts? I see no reason why not. There is not so much clearing to be done, the ground is no harder to work, and labour is as cheap. If the proposed railway were constructed, the cost of carriage would be nearly the same.
616. Could the land be brought into cultivation in large areas, say areas of 2,000 up to 6,000 acres? Yes; the whole of the land between the Bogan and Byrock, with the exception of small stony hills, is good agricultural land. Two-thirds of the land between Byrock and the Barwon, and from 20 miles from Bourke to Nyngan is magnificent farming land.
617. About Nyngan and Dubbo they are cultivating very large areas, and are using the latest machinery, including traction engines;—does your district offer sufficient inducements for the introduction of such machinery? I think so. I have some of the most modern machinery on my own place.
618. The first condition is to have large areas of land? Yes; anyone holding 10,000 acres of land in the district would be justified in going in for machinery.
619. There are large areas of suitable land? Yes; I might mention that my wheat is about 3 feet high at the present time.
620. The Railway Commissioners tell us that the proposed railway would have to be run at a loss, and that they see no prospects of an improvement;—you say that there must be an improvement, because, if facilities for transport are given, large areas will be brought under cultivation? Yes; as I have said, no fewer than five people have started growing wheat in the district, because they saw the chaff that I grew last year. People say: "If Barton can grow chaff, so can we." There are three people between my place and Brewarrina who have crops in, and there are two or three others who are preparing the land for next year.
621. You do not irrigate? No; we depend upon the rainfall. Not only can I grow wheat near Byrock, but I am growing it at a place 15 miles north of Bourke, out towards the Queensland border.

- G. Barton.
7. Oct., 1897.
622. *Mr. Wright.*] Anywhere near the Pera bore? Not more than 3 or 4 miles from the Pera bore. This is the first year that I have tried it there, and it has proved a great success. I am not irrigating there.
623. *Mr. Lee.*] There is less alkali in the Byrock country than in the Pera bore country? There is no alkali in the Pera bore country. The alkali is brought up from a great depth by the water of the bore.
624. Is there any land available for settlement in the district, or is it all held by a few owners? It is chiefly held by lessees. The resumed areas all round my place have been taken up by lessees.
625. The land held under pastoral lease will not be available for closer settlement for some years to come? No; but half of the land there has been taken up in homestead leases.
626. If the proposed railway is built, it will start with a loss of £5,000 per annum? That is the Departmental estimate.
627. Yes. The estimate of traffic may be too low; but we must take the figures before us. Do you think that in ten years after the completion of the line, the revenue derived from grain and from other produce would be sufficient to cover that loss? I think so.
628. Because of the increased production? Yes. The bulk of this land has been already taken up, and is being used for grazing; but in some places that is not so good as wheat-growing. I daresay you are aware that at Berrigan they get £4 an acre from land used for wheat-growing. You cannot get as much as that for grazing land. The people out west are all going in for wheat, and within ten years the bulk of the land will be held in farms, and the people will have combined agriculture with stock-raising. Another thing which Mr. Mack, of Naromine, has shown us to do, is, to grow lucerne after we have been growing wheat for two or three years. In that way we can fatten more stock than by any other means. There was a time when they never had a fat sheep on the Naromine station; but now Mr. Mack has some of the best sheep in the market. I intend to follow his example, and no doubt other people will do the same.
629. I suppose Mr. Mack was only able to do that after he got a railway? Yes; he could not grow wheat without a railway.
630. You hold that if you can obtain facilities for going to market, you will be able to do what they are doing in Naromine? Yes; and so will many others.
631. Given the same advantages, you would turn your land to the same good account? Yes.
632. *Mr. Wright.*] What is the land around Bourke like? It is black-soil country for a certain distance—for 10 or 11 miles back.
633. Is it good, bad, or indifferent country? The plain country is good grazing country.
634. But it is not good country for cultivation? No; the red country is good for cultivation.
635. What is the land held by your brother like? The greater part of it is very good grazing land—open plains and black soil. Another part of it is red-soil country, which is fair grazing land, and good farming land. I have tried to persuade my brother to go in for wheat-growing.
636. It is thirteen years since the railway to Bourke was opened, and there are miles of good country between Nyngan and Bourke;—are there 50 acres of cultivation between the two places? Yes, there are hundreds of acres.
637. How is it that during all this time Bourke has been supplied with chaff, flour, butter, and other things from the western and south coast districts? It is not so; Bourke is being supplied to a large extent from Girilambone and Nyngan.
638. But how is it that no one has thought of cultivating the land? I daresay that you remember when it was said that you could not grow wheat in South Australia north of Gawler Town. The then Surveyor-General surveyed a line beyond which he said nothing would grow; but, as a matter of fact, they are now growing wheat at a profit hundreds of miles north of that. So, too, people did not believe that we could grow wheat far back until the Victorians came into our southern districts. I have always said that wheat could be grown; but then I was engaged in other pursuits, and had no chance of trying it. Ever since 1870 I have thought that it could be grown.
639. For a long time wheat has been grown around Dubbo and Trangie, notwithstanding the prophecies of the ancients;—I want to know why people have not thought of going in for cultivation further west? Well, there has been a great objection to irrigating land from bore water. The squatters who held land in large areas were very jealous of the small settlers, and were afraid of them coming into the district. But now that people have taken up homestead leases they have gone in for cultivation, and you will see dozens of places between Nyngan and Bourke where there are very good crops.
640. There is a vast area of country this side of Nyngan which is quite as good if not better than anything west of that place,—why should people go further west when there is land available nearer the coast? There is a lot of land this side of Nyngan which would be better adapted for grazing. I do not say that all this country will grow wheat. Of course there are places like Trangie where the land is rushed. You will find that before long all that country will be cultivated.
641. There are belts of country suitable for one thing, and belts of country suitable for another thing? Yes; there are hundreds of acres between Nyngan and Bourke which are as suitable for agriculture as for anything.
642. Your contention is that the western country is capable of producing cereals at a profit to the grower, and that the construction of a railway from Byrock to Brewarrina would lead to a large area of land in the district being put under cultivation, and a large population established there? Yes. At the present time, if a man has a homestead lease, he and his son do all the work, except at shearing time; but when people go in for agriculture they must employ a considerable number of hands.
643. A homestead lessee might either cultivate a large area himself or have it cultivated on the halves system? Yes; I am cultivating my land with my brother on the halves system.
644. You contend that if the proposed railway were constructed a large area of land would be put under cultivation by homestead lessees, and possibly by pastoralists also, and that eventually the country would become more thickly populated? Yes.
645. *Mr. Roberts.*] Was it this year that you put in 250 acres of wheat? Yes.
646. Has this been a favourable year? Not particularly so. So far we have only had 9 inches of rain during the year, and, as our average rainfall is 16 inches, that leaves us 7 inches to come during the next three months. But, even if we do not get any more this year, the crop will have had sufficient to cause it to mature.

G. Barton.

7 Oct., 1897.

647. The crop will not be a failure? No; we will get good crops in three years out of four.
648. Over what period has 16 inches been the average rainfall? Eight inches has been the lowest rainfall in any year, except 1895, when the rainfall was about 6 inches.
649. What is the maximum and what is the minimum rainfall? The maximum rainfall is as much as 24 inches, and the minimum, with the exception of one year, has been about 8 inches.
650. You are very sanguine as to the success of your experiment? Yes; I am so satisfied with it that I have laid out between £500 and £600 upon implements and machinery.
651. What area of land do you hold? Where I am going in for this farming, I have about 26,000 acres. I have 16,000 acres in one place, near Byrock, and 10,000 acres where I live, some distance north of Bourke.
652. You carry on your agriculture upon the halves system? Yes, at Byrock. My brother manages that place for me, and does the agricultural work on the halves system. My intention is to cultivate every acre. I am satisfied that there is more in wheat-growing than there is in raising sheep.
653. *Mr. Black.*] Will the present yield last? Of course no land will keep on giving good crops for ever, unless it is manured; but this land will do as well as any other.
654. *Mr. Roberts.*] Have you gone in for fruit-growing at all? Yes, I am going in for that.
655. What kind of fruit do you grow? Different kinds of stone fruits, and citrus fruits. In no place in the world will citrus fruits do better than they do out there.
656. Are they being successfully grown in the district? They are being grown at all the Government bores—at Pera, at Native Dog, at Enngonia, at Barrington, and at other places.
657. Do you think, if the proposed railway were constructed a large amount of traffic that now goes to Narrabri would come to Brewarrina? That is a matter which I have not gone into at all.
658. *Mr. Black.*] I gather from your replies that experience has shown you that a heavy rainfall is not required for wheat-growing; that you only require rain about the time of sowing, and during the first period of growth? Yes; if we get rain at the end of May, or about the middle of June, and then about August and September, we do very well. This year we got no rain until the middle of June, and then we got none again until September. We sowed in March, April, and May, and the seed was lying in the ground till the rain came. We had a fair rain in September.
659. Do you ordinarily have rain towards the end of the summer? Yes; February, March, and April are generally our best months for rain.
660. That would suit your sowing? Yes; we generally look for the break-up of the drought in February, and the rain lasts on to March and April.
661. If you put all this land under crop, where do you expect to find a market for the produce? Anywhere. The rates for wool, wheat, and flour are low. With crops of 30 bushels to the acre you could send wheat to Sydney, or even to England.
662. Are you growing wheat to cut it for chaff? Yes, principally. Mr. Rich has had the plans and specifications prepared for a mill, which, he says, he will put up in Bourke as soon as there is enough wheat grown in the district.
663. How far north from Naromine is your property? Byrock is about 150 miles from Naromine. The line runs in a north-westerly direction.
664. Do you think it would pay to irrigate cereal crops? I think it would under some circumstances.
665. How much per 1,000 gallons could you afford to pay for water? I do not know. That is a matter I have never gone into. It pays to irrigate with bore water. I know that in some cases they have got as much as 4 tons to the acre by irrigating.
666. Would it pay to raise water from the river to irrigate? That is a moot question. Of course, the bore water is very cheap, no pumping being required.
667. Will the crops pay if you have one bad year in four? I think so.
668. Do you not find the hot winds prejudicial to stone fruits? No; the hot winds are not so prejudicial at my place as they are near Adelaide, where they grow fruit very successfully.
669. Mr. Machattie, in giving evidence before the Sectional Committee at Brewarrina, said that he found it impossible to grow stone fruits, because of the shrivelling effect of the hot winds in November? Well, they grow very well in Bourke.
670. He says:—
The excessive heat is too much for the trees, no matter how much water you put on to their roots. If you spray water on to the trees, they will blister and die at once. We have exceptionally hot winds during January, February, and even as early as in November.
- Has that been your experience? Not in the Bourke district. I do not know Brewarrina so well. Almost every kind of fruit can grow at Bourke. I have grown apricots, peaches, nectarines, and figs, and citrus fruits grow splendidly.
671. *Mr. Humphery.*] Have you been to the Pera bore lately? I was there a few months ago.
672. How many of the farms are now unlet? I think they are now all let. The last one was taken the other day. I was there last May.
673. Is wheat grown there? A little. They are experimenting with it.
674. You cannot say what the results have been? No; but I was told the other day by one of the settlers that it was looking very well.
675. What is the cost of carriage from your holding to the nearest point on the proposed railway? The distance is about 7 miles.
676. What would be the cost of carriage? About 5s. per ton, and probably less—say from 2s. 6d. to 5s. a ton if you did it yourself.
677. What is the cost of carriage to Byrock now? The same as to Bourke—from £1 to 25s. a ton.
678. Have you sent any wheat to Byrock? No; I have kept my wheat for sowing. I have sent chaff to Bourke and to Brewarrina. It costs about £1 a ton to send it.
679. Then you could afford to pay 12s. 6d. a ton to send it by railway? Yes; though that is an excessive price.
680. It would be less than you pay at the present time? Yes; but the average rates are much lower than that.
681. Where do you send your wool now? To Bourke, where I have it scoured. It then goes to Sydney by rail.
682. I suppose if there were any difference in the trainage between Byrock and Bourke you would send to Byrock? Yes.

683.

- G. Barton.
7 Oct., 1897.
683. *Mr. Black.*] From which property do you send your wool to Bourke? I shear on the property where I am growing my wheat.
684. *Mr. Humphery.*] Are you in a position to say anything in regard to the probable traffic on the proposed line? No; I have not gone into the matter at all.
685. What is the lowest rate you have paid for water-carriage from Bourke to Brewarrina? Fifteen shillings a ton.
686. And how much down stream? I do not know what is charged down stream. That is what Mr. Rich charged me on some chaff I sold to him.
687. You have not heard of any lower rate? No.
688. Do you know the district between Brewarrina and Walgett? No; I have never been above Brewarrina.
689. Do you know the district between Walgett and Narrabri, or between Walgett and Coonamble? No; I have never been there.
690. I suppose you are unable to give any information as to the probable trend of traffic in the event of the proposed railway being constructed? I could not tell you anything about it. I have not gone into the matter at all.

FRIDAY, 8 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane.
8 Oct., 1897.
691. *Chairman.*] Can you give us the cost of the Mudgee line, as far as you have any surveys, towards the north-west? From Mudgee to Coonamble the distance is 147 miles, and the estimated cost is £478,936, or £3,258 per mile.
692. What is the date of that estimate? July, 1896.
693. Do you desire to alter it at all? No.
694. Can you describe the country through which that line would go, and the public needs it would meet—the class of country and the kind of settlement? The country is on the whole very good. There is one hard ridge which you go over between Cobbora and Mendooran, and there is a little rough country a little to the west of Mendooran. As you approach Coonamble you get on to the black soil. From Coonamble to Walgett the distance is 68 miles. The estimated cost of this portion of the line is £186,872, and the cost per mile is put down at £2,748. There is a good deal of flooded country along that line, but it is probably possible, by keeping a little to the north or north-east away from the river to get a drier line. I think the estimate I have just given could be reduced in that way down to £2,500 per mile, or a total of £170,000.
695. Then the estimated cost from Mudgee to Walgett would be £650,000 approximately? Yes.
696. Can you give us the estimated cost of a line from Dubbo to Mendooran, and from Mendooran to Werris Creek, or right through from Dubbo to Werris Creek? The survey from Dubbo to Werris Creek has not been recently revised.
697. Reducing it by the percentage that has been followed on recent surveys in comparison with the amounts previously given, you might, perhaps, get some approximate estimate which would of course only be regarded as a rough statement? Taking it in that way, I should put that line down, adopting the usual reduction, at about £3,200 per mile right through. The estimate from Warren to Coonamble was revised last year, and will be fairly correct. The length is 63 miles and 33 chains, and the estimated cost £150,000 or £2,366 per mile.
698. What is your opinion of the country? It is very good country.
699. Pastoral or agricultural? It is claimed that a good deal of it is suitable for agriculture, although at present it is chiefly used for pastoral purposes.
700. Then from Dubbo to Coonamble? The distance is 93 miles and 45 chains, and the estimated cost £207,285 or £2,215 per mile.
701. And what is the class of country? It is not so good as between Warren and Coonamble. Between Dubbo and Gilgandra you go through some ridgy country, and from Gilgandra north to Coonamble the country is fairly good.
702. Is there good timber on the route towards Gilgandra for railway purposes? Between Dubbo and Gilgandra you get into the ironbark belt.
703. That line would open up some timber country? Yes.
704. What is the country like from Dubbo to Werris Creek? I think on the whole it is good country, though there are some ridges that are not very good. I have not been over that line myself, and I can only judge by the reports that have been made.
705. *Mr. Hoskins.*] There are several rivers to cross? None of the rivers are very troublesome. I do not think a survey exists of a line from Dubbo to Coonabarabran.* I believe there was an exploration, but I do not think there has ever been a survey, or if there has been, it was made a long time ago, and probably the plans are not available. With regard to the estimated cost of this line, I could not speak with any degree of accuracy, but I should think it would not be less than the cost from Dubbo to Werris Creek, which I put down at £3,200.
706. Has a survey been made from Woolabra to Collarendabri *via* Millie? It keeps a little south of Millie.

* NOTE (on revision):—I find that a survey from Mendooran to Coonabarabran and thence to Narrabri was made in 1884; no estimate was made, but the country is very rough in places; in fact, there is scarcely any level ground.

707. Do you know whether it is a light line? Yes; it is a very easy line, and although some few miles of the line go through flooded country, it will cross no water-courses except after the start, where two of the creeks break over and join. Otherwise, passing down the belt of country between those two creeks, the line is pretty dry. It would not, at any rate, be subject to damage by floods.

708. *Mr. Wright.*] Could you not start the railway to Collarendabri from Millie on the Moree-Narrabri line? No; I chose Woolabra as the starting-point on account of the water. If you take any other point than that, either north or south, you get very serious difficulties.

709. *Chairman.*] Have you the particulars with reference to the line from Narrabri *via* Wee Waa, and Pilliga to Walgett? Yes. The length of the line from Narrabri to Pilliga is 56 miles, and the total cost is £128,650, or a cost per mile of £2,297. There is a good deal of poor country—sandy country—on the south side of the Namoi. From Pilliga to Walgett the distance is 58 miles, and the estimated cost £133,400, or £2,300 per mile. The total cost from Narrabri to Walgett is £262,050.

710. Returning to the Mudgee end of those lines;—can you express an opinion as to whether the line should go *via* Mount Stuart, or by a more westerly route? The Mount Stuart route was examined and reported against. It was decided that the more direct route was much the best.

711. *Mr. Wright.*] Does that route go through Coolma? It goes through Cobborah.

712. *Chairman.*] For engineering reasons and for the due development of the country, the western line, and not the Mount Stuart line, is the better one? Yes.

713. That deals with all the surveys wherever made in that belt of country lying between the north-western and the western lines? Yes; I have given particulars according to the improved surveys.

714. What about the Muswellbrook to Cassilis line? That is a very rough line with heavy grades. Great difficulty was experienced in getting up and down some of the places.

715. Are you in a position to express an opinion as to what portion of the country should reach the north-western line, and what portion should reach the western line? I do not think I am prepared to give an opinion about that. At present Coonamble is a collecting centre, and the traffic chiefly runs into Warren and Nevertire. North of the Namoi I believe the traffic pretty well goes through Narrabri.

William Sawers, grazier, sworn, and examined :—

716. *Mr. Wright.*] You have a pastoral holding near Brewarrina? Yes.

717. You know something of the proposal which the Committee are now considering? Yes.

718. Would you like to make a statement to the Committee on the subject? Yes; I should like to make a short statement first, and then I should be glad to answer any questions that might be put. I advocate the construction of a branch line from Byrock to Brewarrina. I have considered the rival proposal to make the river navigable between Brewarrina and Bourke, but, in my opinion, a railway alone can meet the requirements of the district. I am aware that this railway will deprive a small section of the Western railway of a considerable amount of traffic. I do not regard this as of extreme importance, as almost any development of our railway system would be open to a similar objection. Only 47 miles of the Western line would be deprived of any traffic; but, as the Byrock and the Bourke rates are practically equal, the railway would not be deprived of any serious amount of revenue. In regard to the average up-river traffic—that is, from or to Bourke, the agent of the steamer company at Brewarrina gave evidence in June, 1896. He then stated that the traffic between Brewarrina and Bourke amounted to 10,000 tons yearly—4,000 tons up-stream and 6,000 tons down-stream; and he stated that his company, during the previous four or five years, had carried on an average between 27,000 and 30,000 bales of wool between Brewarrina and Bourke. A rate of 25s. per ton, delivered on the trucks at Bourke, was stated to be the lowest rate the agent knew of. This statement is doubtless correct, but it completely ignores the possibility of the railway being extended to Walgett. I will deal with the probable traffic to be obtained by a railway at Brewarrina, even if the railway also existed at Walgett. Fortunately, Mr. Shainwald furnished the Sectional Committee that inquired into the locking of the river Darling with a return for the years 1892, 1893, and 1894. He stated that this return was absolutely correct, and I accept it as such. During the three years referred to 80,436 bales of wool were landed at Bourke from Brewarrina and from beyond Brewarrina, up-stream.

719. Would that also include intermediate places between Brewarrina and Bourke? No; it includes the intermediate places between Brewarrina and Walgett, but no places below Brewarrina. The average number of bales was 26,812 per annum. Of the quantity stated in this return, 14,434 bales were loaded at Brewarrina, and 12,378 bales came from beyond Brewarrina, up as far as Walgett. Some important wool-sheds are on the bank of the river between Brewarrina and Walgett. Wool from Boorooma Station, about half-way to Walgett, and from that point down to Brewarrina, representing probably 3,500 bales, would be trucked at Brewarrina, whether the river were navigable or not. So I credit Brewarrina with an average river wool traffic of 17,934 bales. The balance of 8,878 would probably drift to a railway at Walgett. If there were no railway at Walgett, Brewarrina would naturally receive more traffic; in navigable years doubtless the whole 8,878 bales referred to. A railway at Collarendabri would not draw traffic by river from below Walgett. Unless there were a railway at Walgett the full up-river traffic would be drawn to Brewarrina, as navigation even as far as Walgett is regarded rather as an adventure. In round numbers I claim, from average river wool traffic, 18,000 bales, representing, at 5½ bales to the ton, 3,450 tons as absolutely certain to be trucked at Brewarrina. Keeping to Mr. Shainwald's return for the same period of three years, I find that the up-river traffic from Bourke to Brewarrina—goods traffic—averaged 2,054 tons, while over another 1,000 tons annually passed Brewarrina for places further up stream as far as Walgett. Probably about half of this 1,000 tons would be landed at various points between Brewarrina and Walgett. However, I claim only 396 tons, which, added to goods actually landed at Brewarrina, gives a total of 2,450 tons. The total down and up stream tonnage certain to form traffic for the proposed railway would thus amount to 5,900 tons—that is, even if there were a railway at Walgett. As to the ability of steamers to compete with a railway, I assert under no circumstances is it possible. River freight charges would require to come down to fully one-fourth of the present rate—12s. 6d. is the lowest rate hinted at; but this would probably be from wharf to wharf. The cartage at the Bourke end would be 3s. 6d., and a special river insurance of 5s. per ton would be a further essential charge. This would bring the total cost to 21s. a ton, or at the lowest £1. The people of the Brewarrina district would willingly pay such special rates

H. Deane.
8 Oct., 1897.

W. Sawers.
8 Oct., 1897.

W. Sawers.
8 Oct., 1897.

as would place the new line on a paying basis. We only advocate its construction on this condition. I base my contention on an average charge of 10s. per ton. This rate would completely remove all chance of river competition. Mr. Shainwald and Mr. Harper, in evidence before this Committee in connection with the locking of the river, have both referred to 12s. 6d. as a freight rate. Mr. Harper said he found this to be the "prevailing rate" between Bourke and Brewarrina, and the other way. This is a most inaccurate and misleading statement; 25s. a ton for wool delivered on trucks at Bourke has been the prevailing rate from Brewarrina, and I believe, though I do not absolutely know, that 30s. is about the usual up-river rate. I would here refer to Mr. Barton's evidence of yesterday when he mentioned 15s. as the freight he was charged. This really was not freight at all. The conditions were that Mr. Barton sold to Messrs. Rich & Co. a certain amount of chaff from his farm. He delivered portion of his chaff at Brewarrina according to agreement, and portion at Bourke by teams. As chaff was being sold at Brewarrina at a higher rate than at Bourke, Mr. Barton naturally demurred at being paid the same at Brewarrina, and Messrs. Rich & Co., who absolutely control the management of the steamers, allowed him 15s. extra for the quantity of chaff delivered at Brewarrina. But this seems to me to be no indication as to what actual freight rates are. Of course, the steamer company may send a special parcel at any rate for purposes of their own; but it is contrary to fact to quote anything under 20s. as a prevailing rate. Referring to the question of a locked river, the Government would either have to charge river dues sufficient to return interest on a capital of £120,000 or suffer a loss at 3 per cent., of £3,600 per annum. If interest has to be returned it must be as a special charge on tonnage with cost of management and maintenance added (say) £1,000 on a traffic of 10,000 tons. This would amount to a charge of about 9s. a ton. If actual freight, with the essential river insurance added, were as low as 10s. a ton, the total result would amount to 19s. per ton. If I could load wool on railway trucks at Brewarrina, I should do so, even if the river rate were 5s. a ton lower. It would only be apparently cheaper, as the river insurance would bring the prices about equal. I wish to draw attention to a statement made by Mr. Shainwald before the Committee which inquired into the locking of the river. In answer to question 420, he said, referring to the Brewarrina to Byrock line:—

How could the cost of constructing such a line be repaid by its earnings, when there is a river to give constant competition? We can carry goods by river from Bourke to Brewarrina and from Brewarrina to Bourke for as little as 12s. 6d., though the regular rate is 20s. a ton.

Even so, if cartage at Bourke is 3s. 6d. and insurance 5s., the total charge would amount to 21s. per ton—certainly not under 20s. A railway could take the traffic at half the cost, or even less, and the extra handling, which is most objectionable, would be avoided. The bog of river competition in this inquiry will doubtless be used to its utmost. In reference to another phase of this question, I would draw attention to the Byrock returns, at page 38 of the last annual report from the Railway Commissioners. The out and in traffic combined amounted to 7,815 tons. This is about the average. Half of this tonnage would probably use the Brewarrina branch railway. But to keep within absolutely safe lines, I will claim only 2,600 tons out of this total of 7,815 tons. During the past few years I have frequently, owing to a fall in the river, had to send portion of my clip by road to Bourke, although I use the river when available. My neighbours would have a similar experience. I want particularly to point out that the proved average river traffic only represents a large proportion of the district wool traffic, by no means approaching the whole of it, the balance being divided between Bourke and Byrock in the way of road carriage. Several clips from the district are never sent by river from Brewarrina, but direct to Bourke or Byrock. The wool, for example, grown along the western side of the Culgoa River always goes by road to Bourke. I would like to illustrate this: Take the case of a station (say) 35 miles from Brewarrina and 60 miles from Bourke. The cost by road to Bourke would probably be 65s. per ton, and to Brewarrina 40s. But, as the steamer charges and the insurance added would amount to a further sum of from 28s. to 30s. a ton, it is cheaper and better to send by road. If there were a railway at Brewarrina, at a charge of 10s. by rail to Byrock, the wool could be landed at Byrock at 50s., as against 65s. by road to Bourke, a clear gain of 15s. per ton. About twenty-five homestead lessees settled along the Culgoa River are exactly in the position thus illustrated. Those homestead lessees combined send about 2,000 bales of wool to Bourke by road every year. Some large stations are exactly in the same position. If there were a railway at Brewarrina they would find it cheapest and quickest to truck there. I will give some particulars. Milrea station sends direct by road to Bourke, about 60 miles, although only about 30 miles from Brewarrina. Kenneberree is about 28 miles from Brewarrina, but 50 miles from Bourke, and Weilmorangle is about 60 miles from Brewarrina, and 104 miles from Bourke. These three stations always send their wool by road to Bourke, and they turn out between them on an average at least 3,600 bales of wool. I could mention other stations, but altogether I am prepared to prove that about 7,000 bales are annually carted to Bourke from this portion of the district, which would otherwise most certainly be trucked at Brewarrina, as after paying 10s. per ton for the use of the branch line to Byrock, the saving would amount to from 10s. to 20s. per ton on the transaction. The people of the Brewarrina district of course recognise that a considerable traffic would be diverted from the Bourke railway station; but as they are very willing to pay a special rate for the use of the branch line, I cannot understand why the Railway Department should be so very antagonistic, as I cannot see that any actual revenue would be lost. Mr. Harper, in his evidence, completely ignores, or is ignorant of, the large wool traffic now going to Bourke which would be diverted to the new line. This gentleman puts the estimated railway traffic, which would be brought to the new line between Byrock and Brewarrina, including, as he says, the up-stream traffic to Walgett—that is to say, ignoring the possibilities of a railway at Walgett—as follows:—Goods, 2,000 tons. This estimate amounts to only two-thirds of the proved existing river traffic alone. According to a return furnished by Mr. Shainwald, as absolutely correct, for the years 1892, 1893, and 1894, the river goods traffic from Bourke to Brewarrina alone averaged 2,054 tons, while over another 1,000 tons passed Brewarrina up stream in the direction of Walgett, making in all fully 3,000 tons of river traffic alone, and exceeding Mr. Harper's estimate by over 1,000 tons. Mr. Harper puts the wool traffic, again including up stream to Walgett, at 3,100 tons. Mr. Shainwald's return of wool traffic from Brewarrina and up stream to Walgett, stated by him as absolutely correct, and as extracted from his company's books, amounted to an average of 26,812 bales of wool, or, at an estimate of five and a quarter bales to the ton, 5,100 tons. This, it must be borne in mind, is for river traffic only. Mr. Harper apparently ignores the existing wool traffic to Byrock from the Marra Creek country, and also the traffic from Byrock to Brewarrina and stations from the south side of the Darling River

River across to the Marra Creek. Altogether, I consider the estimates as supplied by Mr. Harper, to be so wide of probability as to be quite useless. We are quite ready to prove our case at close quarters, and show every station and detail. Live stock would constitute quite a new traffic. Owing to the want of a railway it has not been very profitable to fatten stock. It would be an immense benefit if settlers could keep on trucking small lots to market. The larger stations, of course, send large lots of fat stock from the district, which are trucked at Bourke, at Byrock, and sometimes at Nyngan or Nevertire. I leave out what would be sent to Narrabri, as that would come within the influence of a railway at Walgett. Each of the other places named would lose some stock traffic if there were a railway at Brewarrina. The sheep trucked at Bourke and Byrock combined for the last railway year amounted to 255,207, and at Nyngan and Nevertire combined 397,151. The whole of the Brewarrina district constitutes perhaps the finest extent of fattening country in the Colony. There may be country equal, but certainly none superior. I estimate that from 160,000 to 170,000 fat sheep are certain to be trucked at Brewarrina, including a portion at Tarcoom. I would not be surprised if the number exceeded 200,000, as the Brewarrina railway would probably draw some Queensland traffic. In reference to this matter, Mr. Machattie is prepared to give proof in detail, taking station by station, and groups of small holdings. Referring to the cattle trade, many mobs of fat cattle annually pass Brewarrina towards Gongolgon, and travel up the well-watered Bogán frontage. Those cattle are chiefly trucked at Nyngan, as cattle drovers going to Byrock are away from the river frontage. Nyngan, therefore, almost a pure sheep district, trucks 7,920 head of cattle, and Bourke, according to the latest returns, trucks 19,209. Brewarrina, of course, would deprive both places of some traffic, and would draw fresh cattle from Queensland. I give my evidence in reference to cattle with some diffidence; but I think it reasonable to suppose that at least 10,000 would be trucked at Brewarrina annually. I therefore estimate that sheep and cattle combined would require 3,000 trucks, which at 15s. per truck would amount to £2,250. The sheep from that district being very largely-grown animals, they cannot be jammed in like smaller sheep from the poorer districts. Dealing with the probable passenger traffic, I would call attention to the Byrock and Bourke returns as published by the Railway Commissioners last year, and which represent a fair average. The number of tickets issued at Byrock was 1,918, and at Bourke 5,542. I claim that over three-fourths of the tickets issued at Byrock were to passengers who would join the railway at Brewarrina. A large number of Bourke passengers would find Brewarrina a more convenient starting point while without doubt a railway would develop this traffic. I estimate that at least 3,000 passengers would join a train at Brewarrina throughout the year, and allowing for passengers returning from Byrock, this would constitute 6,000 single tickets. I would point out to the Committee that the number of tickets issued at Bourke or Byrock only indicates the number of passengers going one way. Passengers returning to either place would be credited to the station from which they started. From an investigation of the returns it appears evident to me that each station is credited with the number of tickets there issued. Bourke, as I say, gets credit for 5,542 tickets; but this number only refers to the actual tickets issued at Bourke, and in no sense refers to the return passengers arriving at Bourke. I, therefore, claim 6,000 single tickets as a reasonable estimate covering each way, and at 6s. 8d. per ticket this passenger traffic would amount to £2,000. Parcels would probably bring £200. I may state that the coaches now carry a very large number of parcels, and, doubtless, they would increase if there were a railway. The mails, I believe, are put down at £618. I desire to state from my own knowledge and experience that a railway will tend to develop the district, and enable settlers to stock up their country with a feeling of security. It is always just when a drought is threatening to become serious that stock are fattest. Settlers would then ease their country by gradually sending fat sheep to market. Had a railway been at Brewarrina during the past ten or twelve years the losses which it would have been the means of preventing would have been sufficient to pay for its construction at least twice over. During a period of four years—from 1891 to 1894—as proved by the evidence of the Sub-collector of Customs at Bourke given before the Sectional Committee in connection with the locking of the river, £150,393 worth of bonded stores alone were landed at Bourke from southern colonies. It is also within my personal knowledge that South Australian boats often trade as far as Brewarrina, being, in fact, floating hawkers' shops. I have based my estimate of traffic on the assumption that a railway would be in competition at Walgett. If at Collarendabri, the total result would work out about the same. If there were a railway at Walgett, Brewarrina would not get the traffic of the country on the river east of Boorooma, and would gain some from the Upper Narran country. If there were a railway at Collarendabri, Brewarrina would lose the Upper Narran country, and would gain the country nearly to Walgett along the river, especially when the river was navigable.

720. You say that if a railway were constructed to Walgett, Brewarrina would lose a portion of its river traffic, but would gain more of the Narran traffic. How could that be the case? What I mean to convey is that whether the railway were at Walgett or Collarendabri it would not materially affect the result as regards traffic at Brewarrina.

721. Why should the existence of a railway at Walgett force the Upper Narran trade to Brewarrina if it does not go there now? If there were a railway at Walgett all the trade on the Walgett side of the Boorooma station would be Walgett trade, but if the railway were extended to Collarendabri instead of to Walgett —

722. But why would Brewarrina gain a portion of the Narran trade, if the railway were at Walgett? Because the people on the Upper Narran would prefer to send their wool to Collarendabri rather than to Walgett. I refer to the country about Angledool and up to the Queensland border.

723. That part of the country now sends its traffic to the Narrabri railway. Why would the fact of a railway coming nearer to them at Walgett cause them to send the traffic past that railway to Brewarrina? The squatters on the Upper Narran have told us that some of the people there have been advocating a railway to Collarendabri, and are not in favour of a railway to Walgett, because the roads into Walgett are very bad, and there are very good roads into Brewarrina, and also fair roads into Collarendabri. I do not wish to express any opinion as to whether the railway should be at Walgett or Collarendabri. I will put it in another way. Take country within 20 miles below Walgett on the river. Take Gingie, for instance, and Ulah—large stations from 10 to 30 miles down the river from Walgett. If there were a railway to Walgett their wool would go there, but if there were a railway to Collarendabri, they would prefer to send their wool to Brewarrina.

724. You have gone away from my question. You say that though Brewarrina would lose some of the up-river

W. Sawers.
8 Oct., 1897.

W. Sawers. up-river traffic it would gain some of the Upper Narran traffic, and I want to know why? I can only say this: that the Angledool people do not advocate a railway at Walgett at all; they are in favour of a railway at Collarendabri.

8 Oct., 1897.

725. But they do not at present send their wool to Brewarrina? Yes, some of them do, though the Angledool station does not. For instance, we have a letter from Mr. Sherwin whose station is close to Angledool, stating that he would send his wool to Collarendabri if there were a railway there, and that he would prefer Brewarrina to Walgett.

726. What you mean to convey is this: that if this railway were constructed to Brewarrina, it would draw some of the Narran and Angledool traffic that now goes down the northern line? I wish to convey this: that if a railway were extended to Collarendabri, the Brewarrina railway would get traffic from up close to Walgett, because the river is mostly navigable above Brewarrina, and although you cannot pass Brewarrina still you can have a small steamer above the bar navigating right up the river. There is a small steamer owned by Rich & Co., called the "Brewarrina," constantly running up and down the river, and using Brewarrina as a depôt for the wool. My contention is that if a railway were constructed from Byrock to Brewarrina, it would bring traffic to Brewarrina that does not now come there—that a new factor would come in.

727. And increase that volume of traffic? If there were not a railway at Walgett, we would get all the sheds as far as that place. But under any circumstances this is an aspect of the case that cannot materially affect my estimate of traffic. Most of the country on the south side of the Darling River would send its traffic to Brewarrina even though it is geographically nearer to Walgett. This is owing to the flooded country towards Walgett. I strongly protest against a scheme for locking the river. It appears almost an outrage to a pastoral community if they are offered a locked river, instead of a railway. In time the live stock trade will greatly increase. The river transit is of very little value generally, and for the conveyance of fat stock would be absolutely useless. In the event of chilled meat works being established at Brewarrina, river navigation would be useless. I now submit my estimate of probable traffic. I have felt it my duty to carefully avoid anything like exaggeration, and I am confident that the estimate I submit would be fully realised, and it is based on the assumption that there will be a railway at Walgett. In the first place, I take the existing river traffic, from which I claim in round numbers 18,000 bales of wool, or 3,450 tons. These are from the figures given by Mr. Shainwald. The goods traffic up stream as far as Boorooma, I estimate, again taking the figures as proved by Mr. Shainwald, at 2,450 tons. The wool traffic now drawn by road to Bourke is 7,000 bales, or 1,300 tons. The return general road traffic from Bourke back to the stations I put down at 200 tons. The Byrock traffic, wool and goods combined, each way, I have put at a modest estimate, not being in a position to give the exact details, of 2,600 tons. That refers to goods from Byrock to Brewarrina and the surrounding district, and the wool which comes from the Marra Creek and across from the Bogan, and in some cases right up to the Queensland border. These items give a total of 10,000 tons, which at 10s. a ton shows a return of £5,000. Then 3,000 trucks of live stock at 15s. a truck would be £2,250. The passenger traffic I put down at 3,000 each way, which at 6s. 8d. per head would amount to £2,000. The parcels I put down at £200, and the mails at £618, which is the estimate of the Railway Department. These different items of traffic show a total of £10,068. I put this forward as my deliberate conviction, and am prepared to show cause. The estimated passenger traffic may, perhaps, appear somewhat excessive, but I believe it would be even exceeded within three years after the construction of the railway. However, even if you care to reduce it by £900, it would only mean knocking £300 off my estimate. My estimates are based on present conditions. But even from a pastoral view the district is capable of great development, while there are many possibilities in other directions.

728. You have lived a long time in the Brewarrina district? Yes, for many years.

729. I believe you formerly represented the district in Parliament? I did.

730. I suppose you have an intimate knowledge of the district? Yes; a most intimate knowledge.

731. In making your calculations have you been guided by your own knowledge? I have gone into this matter entirely on my own knowledge, and without prompting, and I have taken the returns of the Railway Commissioners, and Mr. Shainwald's sworn returns, as a basis.

732. You rely largely, I suppose, on the returns supplied to this Committee on a former occasion by Mr. Shainwald, and also on the returns furnished by the railway authorities? Yes.

733. And, judging from these figures supported by your own knowledge of the district, you feel satisfied that the estimate of traffic submitted by Mr. Harper is a long way from being as large as it should be? I go further, and say it is simply absurd.

734. Take, in the first place, the passenger returns;—your estimate of the number of passenger tickets is 6,000;—that is exactly 75 per cent. more than the estimate of the Railway Department, which is only 1,600;—in making these estimates Mr. Harper, who is a railway expert in these matters, applies a rule which he has found fairly successful in the past;—he takes the total population of the district, and estimates for each person one railway journey per annum, and he says his experience tells him that that represents approximately the number of passengers who patronise the railway of a particular district? In reply to that I cannot give exact numbers; but, roughly speaking, I should say that the Brewarrina district would compare very favourably with the Bourke district in regard to population; and yet the Bourke station shows 5,542 passengers. I ask how that would work out on Mr. Harper's plan.

735. Judging from the respective size of the two towns, I should think Bourke was about ten times as large as Brewarrina? It may at present; but in five years' time, if there were a railway at Brewarrina, it would be a larger town than Bourke. Before Bourke got a railway I frequently travelled there by coach with only two or three passengers. If that had been taken as a guide of the number that would use the railway to Bourke, the estimate would have been very far out.

736. Your estimate of the number of passengers is based not on the present population of Brewarrina, but on the population that would be attracted by the existence of a railway there, and the additional facilities thus given to the people to travel? It is, of course, based upon that consideration, as well as upon the present population. I will give the Committee an instance with regard to the Bourke traffic. On the last two occasions when at Byrock I took particular notice, and counted the passengers in the train from Bourke, and the number of people who got into the train at Byrock from Brewarrina was greater than the number that came from Bourke.

737. So that, without working on any defined data, but from your general knowledge of the district and the country, you believe your estimate of the passenger traffic will be realised? I thoroughly believe so. But even if you knocked off 1,000 that would not make much difference.

738. You spoke just now about the large amount of tonnage received at Byrock during the past year, and I think you mentioned 7,000 tons.—was not that the year when the river could not be used at all? In reference to that I can simply say that I looked over the returns of the Railway Commissioners for four years, and I am prepared to give the figures to the Committee, as they relate to the Byrock traffic. The wool forwarded from Byrock in 1894 amounted to 7,768 bales; in 1895, 10,192 bales; in 1896, 9,738 bales; in 1897, 11,155 bales. The total earnings at Byrock are given as follows:—In 1894, £6,844 5s. 3d.; in 1895, £6,686 8s.; in 1896, £5,079 5s. 9d.; in 1897, £6,632 13s.
739. Those figures giving the earnings at Byrock would include all the traffic between Brewarrina and Byrock, and all the traffic coming in from the southern portion of the line? Yes; they represent all the traffic coming into Byrock.
740. When the river is navigable, does not a good deal of the Byrock trade go down the river? I am not prepared to say, but I do not think much of it does.
741. If there were no river traffic the earnings at Byrock would be greater? Yes, immensely greater.

W. Sawers.
8 Oct., 1897.

TUESDAY, 12 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Henry Septimus Badgery (Pitt, Son, and Badgery), sworn, and examined:—

742. *Mr. Lee.*] You have been engaged in the business of a stock and station agent for many years? Yes.
743. Have you a personal knowledge of the country through which it is proposed to take the railway? I have twice been to Brewarrina from Byrock.
744. One of the points which the Committee would like to be made clear is as to whether, if the proposed railway were made, there would be any increase in the stock traffic of our railway system;—do you know what quantity of stock comes from this district? I am not prepared with any figures, but I know that large numbers of stock come from the district.
745. At the present time most of the stock-owners in the district are compelled to truck at Bourke, and the stock have to travel long distances down the river to get to Bourke? Yes; or else they go across to Byrock.
746. If the proposed railway were constructed, could we expect an increase in the stock coming from Brewarrina, and the country north of it, without seriously robbing the Bourke line? I do not know that the question whether it would be wise to rob the Bourke line is one which I can answer. I can only say that the proposed railway would be a great convenience to the producers about Brewarrina, and to the north and north-west of that place. A large number of the Queensland stock that now comes to Bourke would come to Brewarrina if the proposed railway were made. That would ease the stock routes very much. Now they are sometimes very bare.
747. There are times when, owing to the scarcity of feed on the stock routes, it is impossible for owners to drive their stock any considerable distance? Yes.
748. The nearer the railways can be taken to the pastures the more likelihood is there of securing the traffic from them? Yes.
749. To what extent would you say fat stock depreciate in travelling 46 miles? A great deal depends upon the state of the roads.
750. And upon the water? Yes; you cannot travel without water. The track from Brewarrina to Byrock is badly watered. There is no water after you leave the Bogan.
751. Do you think that 1,000 trucks a year is an over or an under estimate of the probable traffic in stock over the proposed railway? I should think that it would be an under estimate.
752. About how many trucks of stock come into Flemington in the course of a week? Lately we have been receiving a very small number, because of the losses suffered during the drought. Some time ago I should think the average number of sheep dealt with would be 70,000 a week.
753. And how many cattle? Between 2,500 and 3,000 head.
754. Is it a fact that the country on the Darling, the Culgoa, the Bogan, and the surrounding district is essentially a fattening country? Yes.
755. And large quantities of stock, both fat and store, are moved from it? Yes.
756. I suppose that, taking all the year round, that district supplies a fair proportion of the fat stock consumed in the metropolitan market? Yes; it is a rich pastoral country.
757. There are times when, owing to droughts, the supplies are very limited? The better the country the more it suffers in times of drought.
758. There is no country better suited for fattening purposes than that country? It is about the best of the inland pastures for fattening.
759. You have seen many droughts? Yes.
760. You are aware of the many difficulties with which the people in that district have had to contend? Yes.
761. Have you reason to suppose that there is less stock there now than there used to be, or that investors have less confidence in the district than they used to have? No. If they have had losses recently, the number of stock may be less than that usually carried.
762. But there would be no decrease in the number of stock from the lack of investment? Certainly not.
763. The country is so good that it is still held, and produces well in fair seasons? Yes; splendidly.
764. Do you think that, if the proposed railway were made, it would lead to the further development of the country, and would be of assistance to the people settled there? Most decidedly.

H. S.
Badgery.
12 Oct., 1897.

H. S.
Badgery.
12 Oct., 1897.

765. Do you think it would attract trade? Yes; and would increase the value and productiveness of the properties there.
766. Would those properties be capable of further stocking so as to increase their output to any appreciable extent? Yes; they would be able to make use of the market at any time, and would not run the risk that they run now in being a long distance from the railway. If you have quick communications with a market you can deal with your stock quickly.
767. If the railway were brought 60 miles nearer to the Queensland border, stock would not have too great a distance to travel from the border to get to it? No.
768. Do you think that the proposed railway would attract stock to it? Yes; a great many of the stock which now truck at Bourke would truck at Brewarrina. The drovers speak very well of the road to Brewarrina.
769. Do you think that we could fairly expect additional traffic? I am sure of it.
770. Would the proposed railway attract more wool traffic? Of course it would.
771. Are you prepared to state definitely that the country would be justified in constructing the proposed railway, because its construction would materially assist the people settled in the district, and would attract to our railway system an amount of traffic which it does not now get? It is for the Railway Department to decide as to the wisdom of constructing the proposed railway. I can only give an opinion as to the benefit likely to arise from its construction.
772. The proposed line would be of great service to the district, and would attract additional traffic? Yes; it would settle people in the district. Small holders cannot go away from railways, and if you put a railway into the centre of a large and productive district such as this, you give encouragement to people to invest their money in, and to devote their labour to, the pastoral industry.
773. Has small settlement been a success in this district, so far as you know? A fair success. I think that the homestead lessees on the Darling, considering the seasons which they have had, have done fairly well where there has been proper management.
774. In a good season, when grass and water are plentiful, do you think stock would be likely to travel along the railway line in order to save freight? Only under exceptionally favourable circumstances. If it were a very favourable season, and the stock were prime and fresh, and there was a chance of hitting a certain market, they might be travelled; but, generally speaking, people cannot afford to travel stock alongside the railway.
775. Are the rates at present charged for bringing sheep and cattle from Bourke such as will admit of stock being sent to market at a profit? People have to use the railway; but they complain very much of the charges imposed upon them.
776. If an added charge of 10s. per truck were made, would that be a prohibitive rate? Where the people must use a railway you can hardly impose a prohibitive rate; but the people in the district complain very much of the present charges, and if the charges were increased they would avoid travelling by rail as much as possible.
777. If a rate of 15s. 6d. a truck were charged upon the proposed railway, would that cause stock in fair seasons to be driven to Byrock instead of to Brewarrina? No; I think they would be trucked at Brewarrina.
778. Is there any other point you would like to bring before us? There is only the question of the railway *versus* the river. If wool from the Brewarrina district is sent down the river to Bourke, I suppose the chances are that it may go still further down. It is quite out of the question to travel stock by river. I do not think we could arrange for the transit of stock by steamer, and I do not think that stock-owners would care to take the risk, the inconvenience, and the expense.
779. If the river were locked, and there were no railway, steamers might be employed to carry goods and wool, but they would not be used to convey stock? Certainly not.
780. The question at issue is,—would a railway tapping the river at Brewarrina take a large amount of the traffic that now goes to Bourke, and obtain additional traffic? It would take a great deal of the traffic that now goes to Bourke, and it would attract a lot of the Queensland stock, which might go to Bourke, or which might go to Dubbo.
781. What has been your experience in regard to the extension of railways into the interior;—has it increased the quantity of stock coming to the metropolitan market? I do not know that I can say that the extension of railways has increased the number of stock coming to this market. What has increased the number of stock coming here has been the operation of a large company which has made a market into which stock of all descriptions has been poured, especially at bad times and in dry seasons. Of course, the railways have brought stock into the market which otherwise could not have come in.
782. Before the railway was opened to Bourke, not many stock came from that district to the Sydney market? Yes; we have always had stock from that district.
783. Has not the quantity sent increased enormously since the railway has been built? Yes, very much.
784. Which pays an owner best—to drive fat stock or to truck them? To truck them.
785. To truck them gets them to market more quickly? Yes; and saves so much condition. You cannot travel stock beside a railway except under exceptional circumstances.
786. I suppose it is acknowledged among pastoralists that the railways must be used for the transmission of stock? Yes.
787. And the inference is, that the further they are extended the more they will be used? Yes.
788. The nearer you bring them to the pastures, the more they will be used? Yes; because the owners will derive more benefits from them.
789. *Mr. Trickett.*] I should like to pointedly draw your attention to an opinion given by Mr. Harper, who is an expert officer upon the staff of the Railway Commissioners, in regard to this matter. He was asked what the effect the construction of the proposed railway would be upon the carriage of stock in the district, and he said:—

I may mention what our experience is in connection with stock. During a good season, when stock can travel, the owners are not anxious to join a railway at the nearest point. They frequently make the stock travel far longer distances parallel with the railway than the distance between Brewarrina and Byrock.

—? I have no doubt that that is so in good seasons. At the same time, I do not give up my contention that it does not pay.

790. To travel stock, affects their value? Yes.

791.

H. S.
Badgery.

12 Oct., 1897.

791. Although people do travel stock alongside the railway, it would be better for them to use the railway? Yes.
792. Then, why do they not use it? They imagine that they save by not using it. By travelling their stock they avoid parting with so much money.
793. But the travelling affects the price of the beasts when they arrive at their destination? Yes; of course some people have an objection to cattle which have been trucked from long distances, because they are sometimes bruised; but the loss of condition is a more serious thing.
794. Is it a good thing to have wool taken off the drays and put into barges, and then taken off the barges and carted to the railway station? No; the less wool is handled the better.
795. Do you think that if the proposed railway were extended, a great deal of the wool that now goes down the river, and at Bourke is carted from the river to the railway station, would go straight from Brewarrina, if the charges were reasonable? I am sure of it. If the producers could put their wool on the trains at Brewarrina, they would rather do so than send it down to Bourke.
796. There is a risk of damaging the wool in sending it by river? Yes; a great risk. The bales get discoloured and knocked about, and do not come into the market in the same trim as if they had been sent all the way by rail.
797. The cartage at Bourke means so much extra handling and expense? Yes.
798. *Mr. Wright.*] Is it not a fact that a great deal of stock from the north-western country is now driven to Nevertire and to Dubbo, instead of being trucked at Bourke and Byrock? A great deal of stock from that district goes down there. I had some stock yesterday from Yarrowin station. If the proposed railway had been constructed, that stock would have been trucked at Brewarrina.
799. Does not the stock from the country to the north and west of the Darling—from the Narran country—come to Dubbo? Yes, possibly. When people have to make a long journey with stock, they are often willing to go a slight extra distance in order to save railway carriage.
800. When a man could strike the railway in 100 miles, would he travel 200 miles to save railway carriage? In some cases he would.
801. Is not much of the stock which travels long distances knocked about very materially? Yes, sometimes.
802. That has a deteriorating effect upon its value? Yes.
803. Taking all things into consideration, cattle can be sent more cheaply and in better condition by train than by travelling along the stock route? I believe that it is more profitable to send them by train.
804. Although they get knocked about in the trucks a little, they do not lose condition? No.
805. You do not know this country intimately? No, not far out. I have been on to the Culgoa.
806. On general principles, you think that the nearer a railway is to people the more advantages they derive from it? Certainly.
807. *Vice-Chairman.*] Assuming the stock route to be well grassed, would it pay to drive sheep 60 miles when they could be sent that distance by rail for 2d. a head? I think it would be better to truck at Brewarrina.
808. Would there not be more than 2d. a head saved by trucking at Brewarrina? Yes.
809. What do you think would be saved? That is a very difficult question to answer.
810. Could you not say approximately? No; you could hardly calculate the saving.
811. Taking into consideration the cost of driving and the loss in weight? I can only say generally that it is not profitable to travel stock alongside a railway, but I cannot say what the saving is in using the railway.
812. Would you consider 2d. a head an appreciable saving? Certainly, in 60 miles.
813. *Mr. Wright.*] What would it cost to drive sheep 60 miles? That would depend largely upon their number.
814. Would it cost much for a flock of 300 or 400? If you had to get a man to take sheep from Brewarrina to Byrock; it would cost more than 1d. a head.
815. Suppose that were only part of the journey? An owner would not send 400 or 500 sheep a long journey.
816. They do not send many more than 400 or 500 head of fat sheep at a time from the stations out there? They could not afford to travel such small lots from the out stations. Of course, if they had a railway near them they would take advantage of it to send in any number of sheep that they might have ready for market.
817. It would pay them to send only a truck-load, then? Yes.
818. That would be between eighty and 100? Between eighty-five and 100, according to the wool. When a man is close to a railway he can take advantage of it directly he has anything to send to market; but where he has no railway he has to wait until he has a sufficient number of stock to make it worth while to send.
819. *Vice-Chairman.*] What number of stock are dealt with at Flemington during the year? We shall get through considerably more than 2,000,000 sheep this year.
820. Arriving by train? You may say that they all arrive by train. Between the 1st January and the 1st September of this year, 2,044,921 sheep and 87,424 cattle were dealt with at Flemington, exclusive of large lots purchased by the Riverstone Meat Company.
821. How many truck-loads would that be? You can allow 100 to a truck.
822. It would be reasonable to assume that a fair proportion of those sheep and cattle came from the pastoral district of Brewarrina? Yes, a large proportion.
823. But you cannot say how many, even approximately? No; I look upon this as a very large producing district, and one which is well stocked. They have splendid stock here. A large quantity was sold off Quantambone the other day.
824. One thousand trucks would carry between 85,000 and 100,000 sheep? Yes; we allow 100 sheep to the truck. Sometimes you can put more than 100 shorn sheep in a truck; but as the wool grows you have to put in fewer sheep. The average number carried by a truck would perhaps be a little under 100.
825. Do you regard 100,000 as a fair estimate or as an under-estimate of the number of stock coming from the Brewarrina district? I should say that it was an under-estimate.
826. *Mr. Wright.*] You must remember that, even if the railway were constructed, some drovers would continue to drive to the main line? Yes; but it must also be remembered that some stock would be taken

- H. S. Badgery.
12 Oct., 1897.
- taken over the proposed railway which would otherwise go to Bourke. The stock routes to Brewarrina are better than those to Bourke.
827. *Vice-Chairman.*] Do you think that the estimate would be an under-estimate, assuming that the railway is constructed from Narrabri to Walgett? A line to Walgett would take some of the traffic which would otherwise come to the proposed railway. Of course you could hardly expect people living nearer to Walgett to drive their stock to Brewarrina, if they could truck at Walgett without additional expense.
828. Have you sufficient knowledge of the district to say that the estimate of 100,000 stock a year would be a fair one if a railway were constructed to Walgett? I think it would be; but it would be an under-estimate if the railway were not taken to Walgett. There are some very fine stations back from Brewarrina, and the owners of those stations would sooner truck at Brewarrina, because there is a good, well-watered track there.

William Sawers, grazier, sworn, and further examined:—

- W. Sawers.
12 Oct., 1897.
829. *Mr. Wright.*] On Friday last you said that you based your estimate of traffic very largely, if not entirely, upon the returns published by the Railway Commissioners, and upon a sworn statement of Mr. Shainwald, the manager of Messrs. Rich & Co.? Yes.
830. You then showed that the tonnage passing in and out of Brewarrina was greater than that estimated by Mr. Harper? Most decidedly.
831. What effect would the construction of the railway from Byrock to Brewarrina have upon the line from Bourke to Byrock? We admit that it would deprive it of a considerable amount of traffic. It would deprive it of all the up river traffic, and of the traffic which now comes in from the Culgoa side.
832. It would deprive it of all the traffic of which Brewarrina is the depôt? With the exception of the traffic that goes across to Byrock by road—that not being Bourke traffic.
833. So that in calculating the cost of the proposed railway some allowance should be made for this loss of revenue? We submit that the loss will be very little. If a special rate were paid upon the Brewarrina line there would be practically no loss.
834. What is the name of your holding? Bundabulla.
835. How far is it from Brewarrina? Thirty-three or 34 miles.
836. You resided there for a long time? Yes.
837. You know the district intimately? I think there is no one who knows it much better.
838. What is your opinion as to the adaptability of the district for the growing of cereals and the probability of any part of it being used for that purpose? I believe that the whole stretch of country between Byrock and the Bogan is, with the exception of a few ridges, good agricultural land. Four-fifths of it is fit for the plough.
839. Is the rainfall there sufficient for wheat-growing? I believe that the rainfall is about 18 inches a year.
840. It has been said that from 18 to 20 inches a year is the minimum rainfall under which wheat can be grown? The soil is very light, and I have often observed that when the heavier plains to the north of Brewarrina have not responded to the rain the country between Brewarrina and Byrock has been looking green. A very light rainfall will make that country respond. It is most magnificent agricultural soil, and Mr. Grainger Barton has found out that he can grow wheat upon it.
841. What is the country north of Brewarrina like? No doubt there are isolated patches of agricultural land there; but, generally speaking, that is pastoral country.
842. Is there any possibility of it being utilised for wheat-growing? I cannot give an opinion. Mr. Grainger Barton is now the pioneer of wheat-growing in the district near Bogan River.
843. But he has grown nothing up to the present? He says that he has obtained 30 bushels of wheat to the acre.
844. How many bushels of wheat has he grown? I could not say.
845. Do you think that on this belt of country the average homestead lessee will abandon sheep and go in for agriculture? I do not think entirely so.
846. Do you think that the country is likely to be still further used for the rearing of fat stock and the production of wool? Yes, with the exception of this particular tract, which may produce much wheat.
847. Notwithstanding that, you think the Government would be justified in constructing the proposed railway, and that the railway, if constructed, would pay very well? I am quite sure of it. The country could be developed to a very large extent, even from a pastoral point of view.
848. A man holding 100,000 acres of land does not get the same result from it as ten men each holding 10,000 acres? They may, or they may not.
849. The subdivision of the land into smaller holdings gives more production? I think the very large stations are not so well developed as smaller stations.
850. Do you think that there is any holding of 100,000 acres in New South Wales so well developed as it would be if held by five men in 20,000-acre blocks? I do not think so.
851. The subdivision of large areas has invariably proved the land to be capable of carrying more stock, and producing more wool? That is the general experience.
852. You see a future before this district, in which a larger population would be settled on it, and in which there would be a larger pastoral production? Yes; I think the district is capable of immense development. It is not half improved yet.
853. That statement will apply to the country to the north of the Darling equally as well as to the country to the south of it? Yes; it applies generally.
854. All that Narran country is very rich? Yes; it is magnificent country. The whole district between the Narran and the Culgoa is unsurpassed in New South Wales as a pastoral district.
855. And it is every year being increased in productiveness? Yes! except when checked by extreme drought.
856. You think that this increase in productiveness will continue for a long time? Yes; it only requires expenditure in providing for water, and in the subdividing of the land into small paddocks. When I went into the district it was supposed to be capable of carrying 3,000 sheep to a 16,000-acre block, or a sheep to something over 5 acres. The whole district now carries a sheep to about 3 acres, while my run carries a sheep to 2 acres. Tanks answer very well, and can now be put down very cheaply—at half previous cost.

W. Sawers.
12 Oct., 1897.

857. Then, you have practically doubled your carrying capacity? Yes, and I can increase it still more. Of course, the whole district has not been improved to the same extent; but it is capable of being improved to a still greater extent.

858. The Railway Commissioners estimate the passenger traffic upon the proposed railway at 1,500 persons a year;—I think you stated that you thought it would be more? Yes, and I based my opinion upon the information contained in the yearly reports of the Railway Commissioners. I would draw the attention of the Committee to the statements contained on page 44 of the Railway Commissioners' report for the year ending June, 1896, and on page 38 of the Commissioner's report for the year ending June, 1897. In the year ending June, 1896, 2,000 tickets were issued at Byrock.

859. Is there any out traffic from Byrock other than that towards Brewarrina? There is a certain area surrounding the town which supplies traffic to the railway, but it is inferior pastoral country. It is very light carrying country. I am certain that Byrock derives its importance chiefly from the fact that it is the nearest point upon the main line from the district of Brewarrina.

860. If we took 25 per cent. of the tickets issued as having been issued to people residing in the immediate vicinity of Byrock, 1,500 would represent the number of tickets issued to people coming from Brewarrina? I believe that three-fourths of the passenger traffic from Byrock comes from the Brewarrina district.

861. The figures you have given represent the number of passengers alighting at Byrock? I take it that every railway station is credited only with the number of tickets sold there. The out-tonnage from Byrock during the year 1896 was 7,239 tons.

862. That is wool, &c.? Wool and other produce sent from the stations. The in-tonnage was 1,845 tons. There is also an item here "Out-mineral tonnage 2,686 tons." I presume that that is contained in the total tonnage.

863. Are there not a lot of ballast quarries close to Byrock? I believe that there are; but I do not know much about them. 9,738 bales of wool were forwarded, and 60 trucks of chaff were received. The revenue from goods and live stock was £3,013 16s. 2d., and the total earnings, exclusive of special earnings, were £6,071 5s. The total earnings for the previous year were £6,686 8s.

864. Are your figures borne out by the figures you have just read? I think so. I had only the returns for 1897 when I drew up my estimate. I assumed that they afforded a fair basis, and I claimed about one-third of the total tonnage—2,600 tons—for the proposed railway. I thought I was fully justified in doing that, as Byrock itself is a very poor place, and its chief traffic comes from the Brewarrina district. The Commissioners' return for 1897 gives the following figures:—Number of tickets issued, 1918; revenue from tickets and coaching traffic, £2,943 11s. 2d.; out-tonnage, 5,933 tons; in-tonnage, 1,876 tons; mineral out-tonnage, 315 tons; number of bales of wool forwarded, 11,155; revenue from goods and live stock, £3,689 1s. 10d.; and total earnings, £6,632 13s.

865. During the period to which those figures apply, the river was not navigable between Brewarrina and Bourke? Yes; it was. That year we sent about one-half of our wool by river to Bourke. We sent the whole clip into Brewarrina, and about one-half of it was taken away by the steamer. The remainder, after it had lain at Brewarrina for a couple of months, we had to pick up and cart into Bourke.

866. Would the railway returns which you have read in any way bear out the figures in regard to the proposed line placed before the Committee by the railway traffic expert? I do not think so. I think they support my contention.

867. *Mr. Trickett.*] It appears to me that this question largely depends upon the amount of traffic which would come to the proposed railway;—could you give the Committee information as to the number of stations which would send traffic to the proposed line, the number of stock—sheep and cattle—on each of these stations, and the quantity of wool sent away by them? I could only give it to you now approximately. I know every block of country in the district, and I could take station after station all over it, up and down the different streams.

868. Could you give us some definite statement which it would be necessary for the Department to challenge? I shall be prepared to give you a written statement containing the information you require. Perhaps it would be better to put it in before the Sectional Committee at Brewarrina. From several of the stations we have returns as to the number of stock actually carried, and, in regard to the other stations, we know the area and the kind of sheep they carry, and we can calculate approximately what their output of wool would be, also fat stock.

869. What are your views in regard to the district as a place for moderately small holders? I think the available acreage in the district has been taken up by small holders. It is the only district in the Western Division where homestead leasing has been a success.

870. Mr. Harper said the other day:

There are 153 homestead leases; but it is currently stated that a large number of these are not occupied by lessees. This is, to a certain extent, verified by the fact that the last stock returns only indicated 118 holders of stock in the whole district.

? I think Mr. Harper seems to have gone out of his way to disparage our claims to a railway.

871. He says that out of 153 homestead lessees there are only 118 holders of stock in the district? Every homestead lease which has been taken up still exists. A homestead lessee can only sell to another homestead lessee. Some of the leases, however, are no doubt grouped. Nevertheless, they exist, and are stocked, and so far as their capacity for bringing traffic to the railway is concerned, Mr. Harper's statement has no relevance.

872. Your explanation of these figures is that two or more holdings may be merged into one? Yes; they may be grouped. In some cases these leases may be leased to pastoralists. On the whole, I think that homestead leasing has been fairly successful in the district.

873. A man can get along with 10,240 acres there? Yes; with first-class country. These lessees do not become wealthy, but they manage to live. A railway would greatly improve their position.

874. This country is sometimes subject to floods? Portions of the Brewarrina district are subject to floods.

875. Is the district worse off in that respect than other parts of the country? We are subject to floods now and again, and they curtail our area. The only serious floods which have occurred within the memory of living man are the floods of 1864 and 1890.

876. Those floods resulted in the destruction of a large number of stock? Yes.

877. But they may be regarded as quite exceptional? Quite exceptional, though both of them did a great amount of damage.

878.

W. Sawers. 878. Mr. Harper hazards this opinion in regard to the number of homestead leases :—

12 Oct., 1897. When I was at Brewarrina an impression prevailed amongst those who were candid enough to admit it, that this number would continue to decrease.

Is that your opinion, as an old resident of the district? I see no reason to form that opinion. The number of homestead leases cannot decrease. They may be leased, or they may be grouped; but they cannot cease to exist.

879. You are frequently in Brewarrina? Yes.

880. Do you hear any opinions of this kind advanced by the residents there? You hear it remarked that some of the country is being used by the squatters. I have no objection to being one of the candid people Mr. Harper refers to. Men sometimes take up homestead leases on too limited a capital, and they then find it pays them better to lease them to someone else.

881. But those cases are exceptional? Yes.

882. Were you engaged in squatting pursuits before you went into the district? I have been engaged in pastoral pursuits for over thirty years.

883. And before you went into the Brewarrina district? Yes.

884. You look upon this as a really first-class pastoral district? There is no question about it. It is a magnificent pastoral district. The only drawback is that, like all western country, it is subject to periodical droughts, and has only a small rainfall. A railway, however, would enable the settlers there to carry on business with a feeling of security, because it would provide them with a means of escape in dry seasons.

885. The carrying firms say that with a sure river they could reduce their charges to 7s. 6d. or, perhaps, 5s. a ton. I believe that the river has been navigable for as long as three years at a stretch;—do you know if the pastoralists and others have ever had their freights reduced to the extent mentioned, or to anything approaching it? I have never paid less than 25s. a ton for my wool. This year Messrs. Rich & Co. have taken the through contract to deliver our wool from Brewarrina to Sydney for £5 a ton. The railway published rates from Bourke to Sydney are £4 a ton; but we have very little doubt, though we cannot prove it, that Messrs. Rich & Co. obtain a considerable concession by offering a big parcel. I have no doubt that they are pocketing fully 25s. a ton, even this year.

886. Mr. Harper says :—

Under the circumstances of an ordinary river, which has up to the present remained unimproved by snagging operations, or otherwise, the rates between Brewarrina and Bourke have varied between 12s. 6d. and 20s. per ton.

? That is absolutely misleading. I am not prepared to deny for a moment that the company have not taken a parcel of something for 12s. 6d., where it has suited their own purposes; but I do not think that any pastoralist in the district has paid lower rates than those I mention.

887. You give that as an absolute fact? Yes. I am quite prepared to produce from our agents the receipts of Messrs. Rich & Co., which show that we have been charged 25s. a ton for years past, and I have no doubt that for small parcels higher rates are charged. Our clip has amounted to between 700 and 1,000 bales a year.

888. Mr. Harper has told us that :—

During a good season stock owners send their stock far longer distances parallel with the railway than the distance from Brewarrina to Byrock.

? I am not prepared to say that this has not been done by short-sighted pastoralists in the past; but the stock routes are yearly becoming worse. No pastoralist who knows his business would now dream of driving fat stock where he could truck them, even in ordinarily fair seasons. In exceptionally good seasons men might dodge on a little. A good many stock have not gone into Bourke because of the extremely bad roads to that town. Drivers have preferred to go through Brewarrina to Gongolgon, and then up the well-watered Bogan frontage to Nyngan. Cattle waste less going that way than in going to Bourke. During a bad season, two or three years ago, I had a big lot of sheep which I might have saved by sending them to Bourke; but I found that they would have wasted so much on the way that it was better to run the risk of leaving them on the station. At one time I used to send at least 10,000 fat sheep yearly to the Sydney market, driving them all the way from beyond Brewarrina to Homebush, a three months' trip. At that time the roads were so good that we could do it; but during the past few years I have practically abandoned sending fat sheep. We sell our sheep as stores now because we have no convenience for getting them to market. If we had the railway we would truck fat sheep.

889. You refer to people who drive their sheep past a railway station as short-sighted, because, although they may save a little in freight, they lose in the prices obtained for their stock? Yes; because the stock will lose in condition. Of course, some people do not like paying any more money than they can help. It was somewhat difficult for me to get an estimate of the wool traffic of the district until I read Mr. Shainwald's statement, at page 16 of the evidence taken in connection with the Committee's inquiry into the proposed construction of locks and weirs on the Darling. I should like the Committee to take particular notice of that portion of my evidence which refers to the West Culgoa traffic—traffic which has apparently been entirely ignored by the Railway Department. The other day I stated the distance to Weilmoringle wrongly. The distance is 61 miles from Brewarrina and 104 miles from Bourke. This clip, which amounts to between 1,700 and 1,800 bales, goes by road to Bourke, but it would go to Brewarrina if the proposed railway were made.

890. Have you noticed if there has been a falling-off in the traffic from Queensland? I only know from what I have heard in the district that Woolrina, a station which produces about 1,000 to 1,200 bales a year, and which used to send its clip to Brewarrina, sent to Queensland last year, owing, I presume, to the inducements offered by the Queensland Government. I know that some of the Queensland traffic would come to the proposed railway, because of the statements made to us by station-owners.

891. I suppose it would pay some of the people near the border to get their supplies from New South Wales if the railway came a little nearer? They do so now. There are several run-holders across the border who get their supplies through Brewarrina. I know that Mackenzie & Co. and the Brenda station people both do so at Brenda. They shear a lot of sheep at their sheds in New South Wales, which are depastured over the border. That wool would come to Brewarrina if there were a railway.

892. Are the approaches to Brewarrina better than the approaches to Walgett? The approaches to Brewarrina are better than the approaches to any place on the Upper Darling. The roads pass over a succession

succession of creeks which run into the Darling, which are bridged, and they are above flood-level. No flood will now prevent you from getting into Brewarrina, except equal to 1864 or 1890 floods.

893. The Brewarrina country is better country for travelling stock over than the Walgett country is? The country to the north of Walgett is extremely low, and subject to floods. I have here some samples of the wheat grown by Mr. Grainger Barton.

894. *Mr. Clarke.*] There is a great discrepancy between your estimate of traffic and that of Mr. Harper? According to Mr. Shainwald's sworn return, the down-river traffic in one year amounted to 15,960 bales of wool, and the up-river traffic to Brewarrina to 2,192 tons. That in itself gives about 5,000 tons. Mr. Shainwald also speaks of 12,285 bales of wool coming through Brewarrina from the direction of Walgett. I claim that all the wool coming from 40 miles beyond Brewarrina is produced within the Brewarrina district, and would come on to the proposed railway. He also speaks of 1,393 tons passing up stream, a large portion of which I claim never goes to Walgett. The river traffic alone far exceeds Mr. Harper's estimate of the probable traffic on the proposed railway. He does not take into consideration the Culgoa traffic, which now goes to Bourke, or from the Lower Macquarie to Byrock, or in some cases from north of Brewarrina. Mr. Harper's estimate seems quite inadequate.

895. What do you think would be the amount of traffic from all sources? I claim an average of 18,000 bales from the existing river traffic, that being the amount of wool shipped at Brewarrina, or including 40 miles above Brewarrina. I also claim that 1,300 tons of wool would come in from the Culgoa side. Then taking 2,600 tons for the Byrock traffic—or about one-third of the average total Byrock traffic—I claim 10,000 tons altogether. Mr. Harper does not include the Culgoa traffic, and he does not give the amount of the river traffic.

896. Do you still think that this country will be taken up in small holdings? I think that it would have been better if Parliament had allowed people to take up 20,000-acre holdings instead of 10,000-acre holdings. I think that for pastoral purposes a holding of 10,000 acres is too small in that district.

897. It is the opinion of some people that small holdings can be worked more economically, and to more advantage than large holdings? Out there we consider 20,000 acres a small holding.

898. Is wheat-growing likely to succeed with a rainfall of only 18 inches? If Mr. Grainger Barton can make a success of it, there is no reason why it should not be successful over hundreds of thousands of acres between the Bogan and Byrock.

899. If wheat could be grown in the district to any great extent, that would be a good reason for giving better means of communication to it? Certainly. I believe that there is a strip 2 miles wide reserved along the route of the proposed railway. The Government could cut that land up into agricultural farms and dispose of it straight away.

900. I suppose, as you go further north, the rainfall becomes less? I think that the rainfall is about the same right up to Goodooga.

901. Have attempts ever been made to grow English grasses in the district? Not to any extent. Most of the stations grow a considerable amount of hay. I grow wheat for hay, cutting it before the ears become full.

WEDNESDAY, 13 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Laurence Henderson, stock and station agent, sworn, and examined:—

902. *Mr. Hoskins.*] You are acquainted with the district of which Brewarrina is the centre? Yes.

903. Have you any statement which you wish to make to the Committee? I should like to confine my evidence to the stock traffic of the district, and the facilities which the proposed railway would give for the export of fat stock from the district. During the current year the firm of which I am a member—Messrs Henderson Brothers—have had control on behalf of constituents of 37,000 fat stock in the Brewarrina district. That number of stock is equivalent to 423 truck-loads. Had the proposed railway been constructed, the whole of that stock would have been trucked at Brewarrina. As it was they were trucked at Byrock, Girilambone, and Nyngan.

904. Have you travelled through the district? Yes, a good many times, and right inland.

905. Does the trade of the Brewarrina district come to Sydney? The stock traffic comes chiefly to Sydney.

906. You are confining yourself to the stock traffic? Yes, I should like to confine my evidence to that.

907. How have you managed to get fat stock from the Brewarrina district to Sydney during the recent drought? We have generally travelled them to Byrock; but in some cases they have had to come to Nyngan and Girilambone. To travel stock long distances materially decreases their value.

908. I suppose the district between Byrock and Brewarrina is purely a pastoral district. No other industry except grazing is followed there? Not at the present time.

909. The traffic from a purely pastoral district is generally very limited, except during the wool season? Yes.

910. Then, I presume, that for six months in the year there would not be much traffic over the proposed railway? Well, that is going a little beyond what I wish to discuss in my evidence. If the proposed railway were made, the district might become an agricultural district; but as I am not an agriculturist, I cannot give evidence upon that point.

911. Unless there is a large accession of population, if the district is purely a pastoral district, the traffic must be very limited, except during the wool season? Of course there is the fat stock traffic all the year round. Fat stock are being sent from the district all the year round when the seasons are favourable.

912. Do you think that the number of fat stock sent from that district would be sufficient to pay the working expenses and interest upon the cost of the line? I could not answer that question.

913.

W. Sawers.

12 Oct., 1897.

L. Henderson.

13 Oct., 1897.

- L. Henderson. 913. If the proposed railway were carried out, would fifty trucks of stock be sent over it in a week, or would there be more? I should not think there would be more.
- 13 Oct., 1897. 914. You know what freight is paid on a truck of live stock? Fifteen shillings.
915. The Railway Commissioners estimate that there would be a loss of between £4,000 and £5,000 a year on the working of the proposed line? Well, I should like to explain that it is not half an hour since I was asked to come here to give evidence, and I have been able to make no preparations. I have not gone into the evidence of previous witnesses, so as to be able to criticise it. I have simply come prepared with a statement of the business transacted by the firm to which I belong in the district during the current year.
916. If the railway were extended from Narrabri to Pilliga, would that take from the proposed Brewarrina line any of the stock to which you have referred? No; all that stock would go to the Western line.
917. Suppose the railway were taken from Narrabri to Walgett? In any case the stock to which I have referred would go to the Western line.
918. What are your reasons for saying that? They would have a longer distance to travel to reach Walgett than to reach Brewarrina, and every mile which the sheep travel by road tells against them. I always advise people to drive their stock to the nearest railway station, and to truck there. It is false economy to travel sheep by road in order to shorten the railway journey, because the stock deteriorate in travelling.
919. Would not the country between Brewarrina and Walgett be much better country to travel stock over than that between Brewarrina and Byrock—is it not better grassed and better watered? There is too much water there at times; that has been the experience this year.
920. I am speaking of normal seasons? I should say that the pasture is richer. I believe that the Railway Commissioners estimate the stock traffic upon the proposed railway at 1,000 trucks per annum; but we, who are only a small firm in the city, have controlled 423 trucks during the present year.
921. You know nothing of the wool traffic in the district? No.
922. *Mr. Clarke.*] Have you any reason to offer in favour of the construction of the proposed railway? I advocate its construction for the transit of live stock to this market.
923. Have you any idea of the amount of revenue that would be obtained by the Commissioners from the transit of that stock? No; they would get 15s. a truck.
924. How many truck-loads would be sent? I should think at least 1,500 a year.
925. Are you aware of any other source of revenue? Of course a great quantity of wool would be brought that way. I have spent probably two months in the district this year, and all those whom I met there were much in favour of the construction of the line. They would support it in preference to the river, because the river is so uncertain. That is especially the attitude of people living above Brewarrina, where the river is not navigable so frequently as it is further down.
926. I suppose that the people in the district think that if the proposed railway were made they would get to market more cheaply than by sending by river to Bourke and from Bourke to Sydney by train? Yes, and there would be more certainty of delivery.
927. The Commissioners estimate that there would be a deficiency of nearly £5,000 per annum upon the working of the proposed railway;—it would take a large amount of traffic to make up that deficiency? Well, any statement I could make in regard to the traffic other than the stock traffic would be mere guess-work.
928. Can you say anything as to the possibilities of agriculture in the district? No; I am not an agriculturist.
929. *Mr. Trickett.*] I suppose you can tell us what is the effect of driving stock long distances? Once you take stock out of a paddock and put them on to the roads to travel they begin to deteriorate, no matter how good the roads may be.
930. Would that apply to cattle as well? Yes; you may start your animals in prime condition, but they deteriorate.
931. This is the evidence of an expert officer of the Railway Commissioners:—
- Our experience is, in connection with stock, that during a good season owners are not anxious to join the railway at the nearest point. They frequently make the stock travel far longer distances parallel with the railway than the distance between Brewarrina and Byrock.
- Is that your experience? No, it is the exception. I think that a man who does that is just travelling for experience, and he will have to pay for that experience.
932. You think that any saving in freight would be more than counterbalanced by a decrease in the value of the stock travelled? Yes. I always advocate trucking at the nearest point. I say to people, "Get the stock on to the railway, and have them slaughtered or disposed of as soon as you can after leaving the paddocks."
933. Even when the season is a good one? Yes. Of course you will understand that the fat-stock market is subject to fluctuations, and it may be advisable at times to keep stock back for a little while, to enable any "glut" to work off. On such occasions stock may be travelled down the railway line as a means of delay; but these occasions are exceptional. To travel sheep beside a railway in order to save freight is a cut-throat policy.
934. Do you look upon Brewarrina as a large stock centre? Yes.
935. Is it a bigger stock centre than Bourke? I could not say.
936. Can you tell us from how far up the river beyond Brewarrina station-owners would send their stock to Brewarrina to be trucked if the proposed railway were made? Some time ago I was spending a few days on a station which is 60 miles above Brewarrina, and they told me there that they were very much in favour of having a railway to Brewarrina. Stock from that run were travelled to Byrock *via* Brewarrina within the last month. Something like sixty or seventy truck-loads of sheep were sent.
937. Do you mean 60 miles by road or 60 miles by river? Sixty miles by road. The distance would be more by river.
938. Would not the station you speak of be nearer to Nevertire or to Dubbo than to Brewarrina? No.
939. Are the approaches to Brewarrina favourable for droving? Yes. You have the river to travel by, so that there is plenty of water.
940. Can stock be sent by river? No.
941. Why? Well, the time occupied in transit is against it. Then, too, the river north of Bourke is not in a very good condition, and the steamer might run against a snag, or be stuck in the mud, and you could

could not land the stock, or make provision for feeding them. It would be impossible to carry stock by river. L. Henderson.

942. And there would be the extra handling? Yes.

943. That would be undesirable? It would never do.

944. It is entirely out of the question to carry stock by river from Brewarrina to Bourke? Yes.

945. Does that apply to a modified extent to the carriage of wool? That is rather outside my business, although I have been told that a great deal of wool is sent to Byrock by road.

946. Even when the river freights are low there are expenses in the shape of insurance, and cartage from the river to the railway? I am not quite clear upon the point; but I think that the forwarding agents contract to deliver right through at a certain price.

947. Do you know anything of the road from Brewarrina to Byrock? Yes.

948. What is the character of the country through which it passes for the first 20 miles? For the first 8 miles you are on red ground.

949. That is good hard ground? It is good ground for travelling over in wet seasons. From there, after crossing the Tarrion, and until reaching the Bogan, a distance of 19 or 20 miles, you travel over black soil country.

950. That is bad country for travelling over? Yes, after rain it is almost impassable for heavy traffic.

951. Then you have the river to cross? Yes, and from there on to Byrock you have red soil country again.

952. That is good country for travelling over, and easy country for railway construction? It is very good country for railway construction, and good country for travelling over, but it is not good country for stock, and it is badly watered. On the direct route from Charlton to Byrock you have to go 35 miles without water in dry seasons.

953. Are you prepared to give evidence with regard to the proposed extension of the railway to Walgett? No; I am not very familiar with the country between Narrabri and Walgett. I have been over it, but I do not know very much about it.

954. *Mr. Wright.*] Sydney being the best market for stock, they come here by the most direct route, whichever that happens to be? Yes; some of the stock to which I referred were trucked through from Byrock to Melbourne. Stock intended for Melbourne markets would not go Walgett in any case, because they would have so much more railway freight to pay.

955. The trend of the traffic from the Brewarrina district is south, towards Sydney or towards Victoria? Yes.

956. Therefore the proposed railway would secure the bulk of the traffic irrespective of any other line? Yes, that is my opinion. It would secure traffic from close up to Walgett.

957. What is the name of the station which you spoke of as being 60 miles above Brewarrina? Milrea station.

958. What is the distance from Walgett to Brewarrina by road? I think that it is 85 miles.

959. The Department estimates that the number of stock which would be sent over the proposed railway would be 1,000 truck-loads per annum;—do you think that that is an under-estimate? Yes.

960. Does your firm control 25 per cent. of the total stock traffic of the district? I think we have had more than that this year. Of course the business is not assured to any one agent for more than a year.

961. Do you think you have 30 per cent of the traffic of the district this year? We have not had one-third of it. It is very hard to estimate the traffic. A great deal of the stock which might be trucked at Brewarrina if the proposed railway were made is now taken down to Nyngan, or to Girilambone.

962. At any rate, you are satisfied that the traffic over the proposed railway would be more than 1,000 truck-loads of sheep per annum? Yes.

963. Do you deal in cattle as well as in sheep? Yes.

964. Have you had many cattle from the district? No; we have not had much to do with cattle this year. It has not been a favourable season for cattle.

965. Have you had any experience of the cattle traffic through Brewarrina? The sheep traffic is heavier than the cattle traffic there.

966. Would not cattle from the neighbourhood of St. George sooner come to Brewarrina than to Bourke? Yes; Brewarrina would be the trucking-station for them.

967. Brewarrina has for many years been one of the great passing places for stock travelling from Queensland? Yes.

968. The inference is that, in addition to sheep, a large number of cattle would be trucked at Brewarrina? Yes.

969. That being so, which estimate of stock traffic do you think more reliable—the Departmental estimate of 1,000 trucks a year, or an estimate of 3,000 trucks per year? I should think the latter estimate.

970. From your knowledge of the trade can you state definitely that you consider 1,000 trucks a year an under-estimate? I consider it rather under the mark.

971. You do not profess to know anything about the probable transit of merchandise or of wool? No; I would rather not say anything about it.

972. What is your opinion of the country? It is a splendid pastoral district; and I think that a great deal of the red ground is suitable for agriculture.

973. Your experience leads you to believe that certain areas would be suitable, so far as the soil is concerned, for the growing of cereals? Yes.

William Sawers, grazier, sworn, and further examined:—

974. *Mr. Lee.*] The Vice-Chairman yesterday desired you to obtain certain information for the Committee? Yes, and I hand in now a map upon which is shown enclosed by red lines the area of country which I think would be certain to send all its produce to the proposed railway. That area comprises 4,600,000 acres, and includes the following pastoral holdings:—Milroy, Quantabone, Gnomery, Brenda, Muckerawa, Wirrah-warrab, Willow, Morrabilla, Boorooma, Gilgoin, Ballaree, Charlton, Weilmoringle, Keribree, Talawanta, Denman, Dumble, Cuttabunda, Upper-Bundabulla, Bundabulla, Collawaroy, Yarrawin, Lower Willie East, Calga, Tarcoom, Compton-Downs, together with 153 homestead leases. The traffic from that country is certain to come to the proposed railway. I have not dealt with any stations the traffic from which is doubtful. I have not dealt with stations the traffic from which might, under certain conditions, go to Walgett, or to Collarendabri, or to Bourke. I might state, that the number of homestead leases is approximate only; but at all events there are fully the number I have mentioned within the area shown on the map. I contend that upon the score of cheapness and convenience the area W. Sawers.

13 Oct., 1897.

- W. Sawers. marked upon the map must use the proposed railway even if a special rate is charged upon it as being a branch line. I should like to add that such stations as Toulby, and other country across the Queensland border, would probably send their wool, and certainly their fat stock, to Brewarrina if the proposed railway were made. We do not confine our estimate of traffic entirely to the traffic coming from the area shown upon the map; but the traffic from that area would be absolutely certain to come to the proposed line.
- 13 Oct., 1897. 975. Can you tell us approximately what quantity of wool came from Queensland to Brewarrina before the imposition of the Queensland export duty? I think you could get that information at Brewarrina without much trouble.
976. If it has been stated that, prior to the imposition of the Queensland export duty, only one clip of 500 bales came to Brewarrina from Queensland—do you think that that statement is correct? I think that it is incorrect. I have reliable information to the effect that the Woolerina clip alone amounts to over 1,000 bales. I would suggest to the Committee that if they put the representative of the steamship company into the witness-box they could get from him accurate information upon this point, as the clip has come to Brewarrina.
977. In your opinion the statement to which I have referred is incorrect? To the best of my belief it is incorrect.
978. We have before us three estimates of traffic—the Departmental estimate, £4,841; your estimate, £10,068; and the returns of the total business transacted at Byrock railway station during 1896, £6,071? Yesterday, at the request of Mr. Wright, I read out the returns of the Byrock railway station, and it has struck me since that the returns for passenger traffic might appear to bear out Mr. Harper's contention. In my evidence-in-chief I stated that of nearly 6,000 passengers booked at Bourke many would find Brewarrina a much more convenient point at which to join the railway, and that if they were charged a higher rate than the rate from Bourke to Byrock there would be no actual loss to the Department.
979. The Departmental estimate of expenses is £4,841 per annum, and your estimate of traffic is £10,068 per annum. Therefore, if your estimate were realised, there would be no loss upon the proposed line? That is so.
980. The Departmental estimate of traffic is £4,841 per annum, whereas you have shown that the Byrock returns for 1896 amounted to £6,071? Yes.
981. Do you think that, from the area enclosed within red lines on the map you have handed in, the Department would be certain to obtain all the passenger as well as all the live stock and wool traffic? Certainly.
982. The Departmental estimate of passenger traffic is based upon a tri-weekly service, which would mean 156 trips each way, or 312 trips both ways during the year; if only five passengers travelled on each trip, that would make the annual passenger traffic sixty in excess of the Departmental estimate. The proposed railway will be nearly 59 miles in length. Do you think it possible that the trains will run 59 miles without collecting more than five passengers each trip? The estimate seems to me perfectly absurd.
983. Are the people there to be carried? I can only say that the traffic averages as much as that now. The coaches are carrying more than that now. I have travelled by them quite lately, and each time we have had at least five passengers. The coach traffic now exceeds the Departmental estimate, and people do not travel by coach if they can avoid doing so.
984. How often do the coaches run? There are coaches six days in the week—three times *via* Taroom, twice *via* Gongolgon, and twice from Bourke—with return trips to match.
985. Who are the contractors? Local residents.
986. Where are their headquarters? At Brewarrina. You will have no trouble in getting evidence from them upon the spot. Of course, if the proposed railway were made, more people would travel by the trains than now travel by the coaches. If there were not a railway to Bourke there would not be 6,000 passengers travelling there by coaches out of Bourke.
987. You estimate a passenger traffic of 6,000 a year between Brewarrina and Byrock? Yes; 3,000 each way.
988. Why do you fix the price of tickets at 6s. 8d.? I thought that was a fair charge.
989. The Departmental charge is 9s.? I do not know if that is for a double or for a single ticket; 6s. 8d. is my idea of a fair charge one way, as an average.
990. If we charge your estimated number of passengers 9s., that will increase your estimate of revenue by one-third? By very nearly one-third. The coaches charge £1 each way, and they have charged £1 10s.
991. You have already said that you consider the Departmental estimate of stock traffic absurdly small? I view it as ridiculously low.
992. Supposing the Committee have been informed that the estimate has been based upon twice the number of stock coming from the district now, what would you think? I should be very much surprised. The evidence of Mr. Henderson that his firm alone had sent during this year nearly one-half of the Departmental estimate is sufficient to capsize that estimate. His firm is not the largest in the city.
993. Five hundred truck-loads represent about 50,000 sheep? Yes.
994. Do you know of your own knowledge if a lesser or a greater number has ever left the district in any one year? A small portion of the district would turn off that number.
995. How many have you known to leave the district in any one year? I am not in a position to tell you; but I know that I am quite capable of sending away 10,000 a year, and I hold only a very small portion of the entire district.
996. If I were to tell you that the Railway Commissioners are of opinion that their estimate is too great, what would you think? I would simply say that the Commissioners exhibit profound ignorance of the capabilities of the district.
997. Do you think it possible that they and their officers have been misled in regard to this matter? That is very likely. I assume that they do not know the country in detail. Their officers have probably visited the towns, and have acquired information from certain quarters, but they seem to have been grossly misled. Stock trucked at Byrock represents only portion of the traffic.
998. If there had been either wilful or unintentional misrepresentation regarding the probable revenue from the carriage of stock, you think a further searching investigation should be made? I crave and press for such an investigation.
999. You are of opinion that a closer investigation will show that the Departmental estimate is too low? Yes; and that my estimate is a very reasonable one. At Brewarrina we shall be able to put documentary evidence before the Sectional Committee in regard to the traffic from each station. Of course some stations may not give us this information; but where we have information from the surrounding stations we shall be able to strike an average, as country generally of an equal character.
1000. You are not able to go so closely into details in regard to the estimate of goods traffic? I can only make an approximate estimate of the goods traffic, but information can be obtained at Brewarrina. 1001.

1001. You have questioned four of the large heads of traffic; your contention is, that the estimates in regard to all these heads of traffic are considerably below the mark? Yes; very much so. The stock traffic has been under-estimated to a degree that really makes the estimate almost a farce. W. Sawers.
18 Oct., 1897.

1002. What passenger traffic would there be from Byrock if you excluded the Brewarrina traffic? The population round Byrock is very sparse, because the country is inferior. There are a few stations there; and if you go a little way up the line you have a platform at Glenariff, and you have a wool-trucking station at Coolabah.

1003. If Byrock has had a ticket issue of 2,000 a year; it would appear that to estimate the traffic from Brewarrina at 1,500 a year is to under-estimate it? Certainly. When the railway was made to Bourke I suppose the Department never anticipated a ticket issue of 6,000 a year; but that is the issue now. Before the railway was extended to Bourke there was a coach running there once a day, and I frequently travelled in that coach when there was only another passenger besides myself. The passenger traffic to Bourke at that time did not equal the passenger traffic to Brewarrina now.

1004. I think you said yesterday that the wool from your station was being conveyed to Sydney for £5 a ton? For £5 5s. a ton from Brewarrina. I believe that is what we are being charged this year.

1005. What is the distance from your station to Brewarrina? Thirty-four miles.

1006. And what is the rate of carriage from there to Brewarrina? It varies; 30s. a ton is about the usual rate.

1007. If the proposed railway were made, and it cost 10s. a ton to send wool from Brewarrina to Byrock, it would cost you £6 to send your wool into Sydney? Yes, as against £6 10s. at the present time. In addition to paying freight on the river, I have to pay a special river insurance, and the wool has to submit to a most objectionable amount of handling. Railway transit would save the insurance.

1008. If the proposed railway were made, would you send your wool to Brewarrina by river? No; my station is right away from the river, out towards the Queensland border. I always have to cart my wool to Brewarrina.

1009. If the proposed railway were made, you could send your wool to Sydney more cheaply than at the present time, and it would not be handled so much? Yes; I would willingly pay more if it were necessary to send it direct by rail.

1010. Can you tell us whether any of the stations given on your list would send their wool to Brewarrina by river? Yes, Boorooma, and possibly Collawaroy would do so. The stations on the river bank would probably come by river.

1011. *Mr. Wright.*] Do you include Euroka on your list? No, we do not go east of Boorooma. We hardly go one half of the distance to Walgett.

1012. *Mr. Lee.*] Those stations which are not able to use the river would have to bring their wool to Brewarrina by dray? Yes. Most stations are away from the river.

1013. Once wool is on the drays it might as well go to the railway station as be transhipped on to a river steamer? Yes; I object so strongly to the river transit that I am always telling my manager to get drays and send the wool direct to Bourke. The handling is so detestable that I should be glad to avoid it, even if it is to cost a little more for carriage.

1014. When there was a good river right up from Wentworth would the steamship owners be in a position to cut their rates lower than the railway rates, and thus secure a larger portion of the wool traffic? I am not in a position to say how low they could cut their rates; but I am positive that if the proposed railway were constructed no wool from the area I have marked on the map handed in would ever go to South Australia, or even to Bourke. In the old days I used to send wool to South Australia, though I do not know what the rates are now. The route is a most objectionable one, because the insurance rates are so high, and, added to the freight, are almost prohibitive.

1015. At the present time the steamship owners have little or no competition to meet above Bourke; but if the proposed railway were constructed they would have a competitor. Would not that lead them to reduce their rates, when there was a good river to such an extent as to make it impossible for the railway to compete? I do not think so, taking into account the insurance rates. Besides, I presume that if the Government made the proposed railway no Minister would be idiotic enough to put money on the Estimates for the snagging of the river between Brewarrina and Bourke.

1016. What becomes of the wool that goes to South Australia;—is it shipped to England from Adelaide, or is it sent around to Sydney to be sold? Some of it may be sent to Melbourne to be sold. In the olden days, before our railways were extended beyond Dubbo, a great deal of wool went down the river to South Australia, and was shipped directly to England; but the system of selling wool in the Colonies is growing, and, generally speaking, wool going to South Australia would come to Melbourne or to Sydney for sale.

1017. Sydney is almost the Australian depôt for wool? The largest sales are held here; but, of course, Melbourne competes with us.

1018. The Sydney sales are continuing to increase? Sydney is cutting Melbourne out; but both are large wool markets.

1019. Given a good river, if one lot of wool were despatched by steamer from Brewarrina to Adelaide, and another lot by train to Sydney, what would be the length of the respective journeys? The wool despatched by train would reach Sydney in twenty-four hours, I suppose; while the wool going to Adelaide would take, perhaps, twelve days. The journey used to occupy at least a fortnight, and often more.

1020. When the wool reached Adelaide, if it were a large clip, it would probably be shipped directly to England, because there is no large market for wool in Adelaide? There is no good market for wool in Adelaide.

1021. The wool sent to Sydney by train would be sampled and offered for sale before the wool sent by river reached Adelaide? It would be sold, and the money received a week before the other wool reached Adelaide.

1022. *Mr. Wright.*] Shipping down the Darling from Brewarrina is a thing of the past? Yes.

1023. All the wool that has gone down the river of late years has been transhipped at Bourke? Yes.

1024. *Vice-Chairman.*] What effect would the extension of the railway to Collarendabri have upon the Brewarrina traffic? The extension of the railway to Collarendabri would not affect the traffic in the area enclosed within red lines on the plan; but if the railway were extended to Collarendabri, instead of to Walgett, traffic would come to Brewarrina from almost as far east as Walgett. There are several large stations east of the area marked on my plan which would send to Brewarrina if the railway were taken to Collarendabri instead of to Walgett.

1025. If the railway were extended to Walgett from Narrabri, what effect would that have upon your estimate of traffic? The map which I have handed in was prepared upon the assumption that the railway is

W. Sawers. is to be extended to Walgett. If it is not extended to Walgett there will be more traffic coming to Brewarrina. I do not claim traffic from the country round about Angledool. I submit that that traffic would go to Collarendabri if the railway were taken there, and, failing a railway to Collarendabri, most of it to Walgett, if there were a railway at Walgett. My estimate is based upon certain returns. If I had dealt with the question entirely upon my own knowledge of the district I confess that my estimate of traffic would have been less; but I took Mr. Shainwald's return as authentic, though no doubt some of the traffic he refers to came from the direction of the Queensland border and possibly from the lower Narran country. I am quite clear, however, that if the north-western railway system were extended to Collarendabri and not to Walgett, my estimate of traffic for the Brewarrina line would prove too low. We should get more traffic for the Brewarrina line if the railway were taken to Collarendabri than if it were taken to Walgett.

18 Oct., 1897.

1026. You are firmly of opinion that the produce from the area marked on your map will go to Brewarrina, notwithstanding any extension which may be made to Walgett or to Collarendabri? Yes. That area, with the exception of some country in the direction of Byrock, includes some of the finest pastoral country in New South Wales, and it is capable of very great development. From the Darling to the Queensland border almost every block of it is magnificent fattening country.

1027. *Mr. Lee.*] If there were 1,000,000 sheep in the district what percentage would be sent to market as fat sheep? Well, some go in for breeding extensively, while others go in for fattening. We used to send 10,000 fat sheep to market every year; but, owing to the roads becoming bad, I am now selling my sheep as stores. I could, however, send away 8,000 fat sheep every year from 120,000 acres. I think that you might assume that 5,000 fat sheep would be sent away annually from every 100,000 acres.

1028. An eighth would be an approximate average? Yes, one-eighth of stock would be turned off as fats, or 12 per cent. This is rather a low estimate. It represents 180,000 fat sheep,—from 1,500,000 sheep.

THURSDAY, 14 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

HENRY CLARKE, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

CHARLES ALFRED LEE, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

H. 1029. *Mr. Clarke.*] Have you any statement to make to the Committee? No; I understand that the report of the Railway Commissioners has already been submitted to the Committee.

1030. Have you any evidence to offer in support of that report? No.

1031. Neither for nor against it? No.

1032. Have not the people of the district expressed a great wish for the construction of the proposed line? I believe so.

1033. Do you think that if the proposed railway were constructed it would take away any trade from a railway to Walgett? I do not think that much trade would come down the river if the railway were taken to Walgett.

1034. Colonel Wells has reported that a ballasted road through this district would cost at least £4,000 a mile, or £250,000 altogether, and that the expense of maintenance would not be less than £11,000 per annum;—do you not think that a good reason for the construction of this railway is that it would do away with the necessity for an expensive road? I do not think that the construction of the railway would do away with the necessity for roads. It might make an increase in the number of roads necessary. Of course, they have roads there at present.

1035. Do you think it likely that the Darling will be used for taking goods from Brewarrina to Bourke? It is used considerably at the present time.

1036. When the river is high? Yes; which is, on the average, half the time. The river is navigable at the present time, and it may remain so for a considerable period.

1037. It has been said that the proposed line might pay, but that it would only pay at the expense of the existing lines. Mr. Scarr says:

There is a fair prospect of the line proving a financial success; but it would be at the direct expense of existing lines.

? The Railway Commissioners do not agree with that opinion.

1038. You think that under existing circumstances the proposed railway would not be likely to pay working expenses and interest? No.

1039. Do you think it is likely to pay at some future time? That time is a long way ahead.

1040. Do you not think that the people in the district should have better facilities than they have at present? I do not see why they should get them at the expense of the country. They have already means for getting to market. Of course, a railway would give them further facilities; but it would be at the expense of the country.

1041. What way have they for getting to market now? By river and road.

1042. The river is not always navigable? It is navigable half the year.

1043. At other times they have to send goods by road? Yes.

1044. To Bourke? To Bourke or to Byrock.

1045. Taking everything into consideration, you are of opinion that it is inexpedient to construct the proposed line at the present time? That is the opinion of the Commissioners.

1046. *Mr. Trickett.*] This proposal, like a good many others, seems to have been under consideration for a number of years? Yes; it was reported upon by the Railway Commissioners in 1889.

1047. The Commissioners in their report, dated 15th July, 1889, stated that the line could not, on commercial grounds, be recommended; but that there was another aspect of the case;—have they altered their opinion in regard to it? On that occasion they suggested that the proposal was worthy of consideration. Since that it has in a much more definite form received full consideration, and they are not prepared to recommend it. The line when it was first reported upon by them would have cost a great deal more than it would cost if it were made now, and it is upon a knowledge of that fact that the Commissioners base their present recommendation.

1048.

1048. Mr. Harper has given us the cost of a ballasted road;—do the Commissioners take matters of that kind into their consideration? Yes; in a general way.

1049. I suppose ballasted roads of this length are never made in outlying districts;—when was the Bourke line opened? In 1884.

1050. I suppose it was in course of construction a couple of years before that time? Yes.

1051. Have the Commissioners any opinion as to which is the best commercial centre—Bourke or Brewarrina? I have not heard them express an opinion upon the subject.

1052. So far as you know they have never considered whether, supposing we were commencing again, the line should be taken to Brewarrina instead of to Bourke? No.

1053. I believe that a railway to Walgett is now under consideration? Such a line has been suggested; but I do not think any definite proposal has been made. There has been some talk of taking a line through Coonamble to Walgett, and of taking another line to Collarendabri; but the Commissioners have not been asked to report upon the former proposal.

1054. If a railway were constructed from Narrabri to Walgett, how would it affect the proposed line? There are a number of railway extensions which are likely to be considered, and they would all, to some extent, interfere with the traffic in the Brewarrina district. For instance, take the line from Bourke to Barrington. That line would take Queensland traffic away from Brewarrina. We do not get it now, and we should not be likely to get it on the Brewarrina line if that extension were made. Extensions to Walgett have been suggested from one or two centres, and an extension from the Moree branch to Collarendabri has been proposed. All these proposals isolate the Brewarrina line, and leave it to its local resources.

1055. Did you go into the question with Mr. Harper as to what extent of country there is likely to be served by the proposed railway? No. The Commissioners received Mr. Harper's estimates.

1056. You have not gone closely into the matter yourself? No.

1057. The Commissioners do not recommend the proposed line;—is that simply because it will not pay? Because it will not pay, and they do not see any prospect of development which would make it pay within a few years.

1058. Mr. Harper gave us some evidence the other day about stock-owners driving their cattle long distances in order to save railway freight;—do you know anything of that? I do not know anything about the stock traffic of this district; but Mr. Harper told me that he was prepared to support any of his estimates which have been questioned if he were recalled by the Committee. He went into the district, and made very exhaustive inquiries before submitting an estimate.

1059. Are the Commissioners favourable to the locking of the river between Brewarrina and Bourke? Yes; they have expressed an opinion in favour of that work. In a letter sent to the Committee some time ago they expressed themselves as favourable to it.

1060. They think it would be better to make the river permanently navigable than to construct the proposed railway? They think that in any case the river would always be a competitor for this traffic.

1061. How would the Government be recouped for the use of the river? I am not aware. I think that the Commissioners looked at the matter in this way: That if the Government wish to spend a large sum of money, without a prospect of remunerative return, the greatest advantage could be obtained by locking the river, because that would give a supply of water for irrigation as well as a waterway for traffic, and the cost would be slightly less than the cost of the railway.

1062. *Mr. Wright.*] I suppose that, as a rule, the Commissioners are in the habit of taking Mr. Harper's figures as substantially correct? Yes; of course they check the figures, and ask him the reasons upon which he has formed his estimate. If they think anything wants further elucidation, they ask him to go into it again. As a rule, they take his figures as correct.

1063. I should like to call your attention to one or two startling discrepancies between Mr. Harper's estimate of traffic, and the estimates of witnesses who have come before us. When this Committee sent a Sectional Committee to Brewarrina to inquire into the proposed locking of the Darling, the local agent of Messrs. Rich & Co. told them that:

The present traffic between Bourke and Brewarrina is 10,000 tons per annum—4,000 tons up stream, and about 6,000 tons down stream.

That would represent between 28,000 and 30,000 bales of wool. Mr. Harper, however, estimates the traffic as 2,000 tons of goods and 3,430 tons of wool. Then again, Mr. Sawers, making deductions from evidence given by Mr. Shainwald, the manager for Messrs. Rich & Co., traversed Mr. Harper's evidence, and stated that the traffic was under-estimated by more than one-half. Do you think that Mr. Harper can verify his figures? Mr. Harper is anxious to have an opportunity to do so. I saw that his estimate had been disputed, and I asked him about it, and he told me that he would be prepared to come before you and to verify his figures.

1064. Does the Railway Department receive the whole of the wool sent from this district, either at Bourke or at Byrock? I believe so.

1065. I suppose you receive the whole of the stock? Yes.

1066. Do you know the country in question? I have not been through the district.

1067. Have you found Mr. Harper in his deductions as to traffic generally correct? Yes.

1068. You think that those who say that the wool and goods traffic of the district is greater than Mr. Harper's estimate have made a mistake? Yes; it is not unusual for people interested in a proposal to exaggerate the value of the resources of the district it affects.

1069. Mr. Harper estimates the passenger traffic upon the proposed line at 1,500 passengers a year, while the Commissioners' returns show that 2,000 tickets have been issued at Byrock each year for the last two years;—that is only the traffic outwards from Byrock? Yes.

1070. If the inwards traffic were one-half the outwards traffic, that would make 3,000 passengers a year? Yes; but a certain number of tickets issued at Byrock would be issued to local people. The estimates of passenger traffic are, of course, only approximate. You might increase the number of passengers by 1,000 without affecting the earnings of the line very much.

1071. Mr. Harper estimates that 1,000 truck-loads of stock would be sent over the proposed line annually—that would be about 80,000 sheep? From 80,000 to 100,000 sheep.

1072. We have it in evidence that the number of sheep coming from the district is more nearly 250,000 than 80,000, and that in addition there is a large number of cattle;—you still think that Mr. Harper's figures would be borne out? He says that he is anxious to verify them. Byrock is not a very great trucking centre. In 1897, 11,000 bales of wool were sent from there, and in 1896, 9,700 bales. All that wool would not come through Brewarrina.

1073. Nineteen-twentieths of it would? With regard to live-stock, 116,000 sheep, or about 1,200 truck loads, were sent from Byrock, and 652 cattle.

- H. McLachlan.
14 Oct., 1897.
1074. In answer to Mr. Clarke, you said that so far as you know the Commissioners are opposed to the construction of the proposed railway upon two grounds—first, that it would not pay; and, secondly, that they saw no immediate prospect of the district developing sufficiently in order to make it pay within a reasonable time? Yes.
1075. *Mr. Lee.*] Supposing it were shown that the line would pay, would that meet the objections of the Commissioners? If the Commissioners saw that the line would pay they would recommend its construction.
1076. The only objection they have to it is that there is no prospect of its paying in the immediate future? Yes.
1077. If it is disclosed in the course of this inquiry that the traffic would be sufficient to pay interest on the cost of working, I presume that the Commissioners would withdraw their objection to the line? I think so.
1078. Do you attach much importance to the diversion of traffic from the main line? I do not think there is a great deal in that, because, of course, we should charge local rates. The rates from Bourke are practically the same as the rates from Byrock. The earnings of the proposed lines are based upon local charges.
1079. The Commissioners have asked for the special consideration of the fact that a large amount of traffic would be diverted from the main line;—I should like to know how it would affect the main line if the branch line carried its own traffic and were made to pay? What the Commissioners indicate is that there would be no new traffic on the proposed line; that the traffic coming from the district already comes to the railway. The construction of the proposed railway will not bring traffic from Queensland, nor is it likely to bring more traffic from the district than comes to the railway now.
1080. They are of opinion that they get all the fat stock traffic now that they would get if the proposed railway were constructed? A little more fat stock traffic might be obtained; but it would not be enough to make the line pay.
1081. The figures submitted by Mr. Harper have been very seriously questioned, and the Committee would like to obtain information upon various points from the local station-masters? Mr. Harper has already obtained all the information which they can give.
1082. Do the Commissioners offer any objections to the local officers submitting their books to us? I think you had better re-examine Mr. Harper. To examine a station-master is like examining the local agent of a firm, who does not know the firm's whole business.
1083. Mr. Harper assumes that on a line 59 miles in length the passenger traffic will amount to only five passengers a trip? The population of the district is very small. Of course you can lay down no rule as to the amount of passenger traffic that will be obtained on any railway.
1084. But the inference is that if the population is so small the amount of produce that would be sent from the district would be very little? We know that the district is not thickly populated.
1085. But is not Mr. Harper's estimate a very low one? It is reckoned upon the basis of one journey a year for each member of the population. You cannot lay down any fixed rules for passenger traffic. People will travel frequently over a line 10 miles in length which is near a big town, when they will scarcely travel at all over a line 100 miles in length which is a long distance from any large centre.
1086. But the people out in this district would travel more than once in the course of each year? I do not think so. They would not be likely to travel to Byrock for a picnic, nor would they go there on business, because their business centre would be Brewarrina; neither would they make many journeys to Sydney. The district is to some extent a self-contained district.
1087. *Mr. Hoskins.*] The country between Byrock and Brewarrina is almost wholly occupied by people engaged in pastoral pursuits;—does any great volume of traffic come from such country? Not when the traffic is confined to a local area, unless, of course, it drains to an immense centre like Bourke.
1088. At Narrabri you have an immense tract of country draining to a terminus, but at Brewarrina you are within 60 miles of the great commercial centre of Bourke, and within 80 miles of Walgett, another commercial centre? Yes.
1089. Therefore, the traffic from the Brewarrina district would be limited? It would be local.
1090. Do you know any case in point where a railway has been worked at a profit? I do not recollect any similar instance. In regard to the estimate of coaching traffic, I might mention that the population on the country between Culcairn and Corowa is much greater than the population between Byrock and Brewarrina, and the people there travel more frequently, because they are near to Albury and to other centres. The Culcairn to Corowa line is only 12 miles shorter than the proposed line, and the coaching traffic upon it amounts to £1,800 a year, including mails. The coaching and mail traffic upon the proposed line is estimated at £1,400.
1091. The Commissioners do not consider that Brewarrina would be the centre of a large tract of country? They consider that the traffic upon the proposed line would be almost purely local.
1092. Different estimates have been made as to the probable cost of this line:—in 1889 Mr. Deane estimated the cost at £4,366, and in the following June that estimate was reduced to £3,806; Mr. Deane now estimates the cost at £2,500 per mile;—can you say if the Commissioners, in making their report, have taken into consideration this reduction in the estimate of cost? They made their report on the last reduced estimate, and they consider that the proposed line would not pay.
1093. *Vice-Chairman.*] How many sheep were carried upon the railways last year? 4,390,000.
1094. Can you say how many of these sheep came from Brewarrina? No.
1095. How many came from Byrock? 116,000, and from Bourke 138,000.
1096. Would most of these sheep be fat sheep? I could not say.
1097. Can you say how many of them went to Flemington? I think the number received at Flemington was about 2,500,000.
1098. Would the rest of the sheep sent by train be store stock? Yes; and sheep going to Riverstone, to Albury, to Aberdeen, and to other places. Flemington is the principal receiving station for sheep. All the sheep that went to Flemington would be fat stock. I suppose three-fourths of the sheep carried would be fat stock.
1099. That would be over 3,000,000 sheep? Yes.
1100. We have been told that about 10,000 tons of freight would come in at Brewarrina, even if a line were made from Narrabri to Walgett;—assuming that these figures were correct, do you think that by charging special rates upon that traffic sufficient revenue would be obtained to justify the proposed extension to Brewarrina? 10,000 tons at 10s. a ton would give £5,000. That would make a difference of about £2,000 upon Mr. Harper's estimate.

1101. Mr. Harper's estimate of the live-stock traffic was 1,000 trucks at 15s. a truck; some of the witnesses examined, however, have said that a much larger number of sheep would be trucked;—supposing 2,000 sheep were trucked, instead of 1,000? That would increase the revenue by £750.

H.
McLachlan.
14 Oct., 1897.

1102. Leaving the goods and coaching revenue at the amount fixed by Mr. Harper, but altering the two items to which I have referred, what loss would there be upon the proposed railway? About £1,200 a year.

1103. What percentage would that be? About 1 per cent.

1104. If the figures which I have given you could be supported, do you think the Commissioners would feel justified in reconsidering their report? I think so.

1105. For the through traffic between Brewarrina and Bourke, what would be the difference in rates for merchandise and live stock, distinguishing wool? Between Byrock and Bourke, practically the same. Truck rates prevail in regard to most classes of traffic.

1106. May we say that the bulk of the traffic coming from or going to Byrock and Bourke, will be charged about the same rates? Yes.

1107. So that the line may be regarded almost as a free line beyond Byrock? The same rates prevail as far as Bourke as are charged to Byrock.

1108. The Commissioners practically give the free use of the line between Byrock and Bourke for goods going to Bourke? The same rates prevail; wool and truck loads of goods are charged at the same rate. On almost every system you have maximum rates of this kind. We have them on the Southern line, on the South-western line, on the Western line, and on the Northern line. Most railways charge these rates where competition has to be faced.

1109. Suppose the whole of the traffic which we are told would come in at Brewarrina reached Byrock by road, would the earnings of the railway be just about the same as if the traffic were taken from Bourke? Yes, so far as wool and general goods are concerned. Of course wool is a big item. For live stock the rates are different.

1110. Therefore, if you were paid a special rate upon the line between Brewarrina and Byrock, you would get so much new revenue? Yes. That is how the revenue for the proposed line is calculated. The estimate before the Committee is based upon local charges.

1111. At the present time it is all the same to the Railway Commissioners whether the traffic that you might expect to get at Brewarrina joins the railway at Bourke or at Byrock? We get the same rates for wool at either places.

1112. Assuming that the figures which have been placed before the Committee are correct, special rates charged upon the traffic carried from Brewarrina to Byrock would bring in a large additional revenue to the Western railway system? You would have an additional revenue to the extent of the local earnings upon the proposed line; but that line would cost more to keep up than the amount of this additional revenue.

1113. Inasmuch as at the present time a very large quantity of traffic goes to Bourke which, if the proposed railway were made, would probably go to Brewarrina, would not the figures which have been placed before us be considerably increased if you were to give Brewarrina credit for the whole of that traffic? We reckon that the increased traffic will return £4,841. I cannot see how more than that could be obtained.

1114. You have told us that 250,000 sheep come from Bourke and from Byrock? Yes; 138,000 from one place, and 116,000 from the other.

1115. You estimate a traffic of 1,000 truck-loads over the proposed line? Yes.

1116. Do you not think that that estimate could be largely increased? Mr. Harper thinks not.

1117. Do you think he has looked at the question from the point of view which is now presented to you? I think so. Of course, he can speak for himself; but I understand that he has given the railway credit for everything it would earn. The Commissioners think that his estimate places the prospects of the line in the most favourable light.

1118. Looking at the matter from the point of view I present to you, which is practically that of those who advocate the construction of the line, do you not think that you should reconsider your estimate of the probable earnings, having regard to the fact that a special rate would be charged between Brewarrina and Bourke, and that your earnings between Bourke and Byrock are at the present time very small? I do not see how that would affect the estimate. The additional general goods traffic upon the proposed line would be charged 10s. a ton, and the revenue we should obtain would be £4,841 a year. That would not pay anything like the interest, or cost of working the line.

1119. You say that from your point of view the earnings will not be increased; but, supposing it can be shown that the tonnage would be twice that estimated by Mr. Harper, the earnings of the line would be sufficient to induce the Commissioners to reconsider their recommendation? Yes. I think the Committee ought to re-examine Mr. Harper. There seems to be a conflict of evidence, and he would like to support his own figures.

1120. May we accept this as the position taken up by the Department: that if it can be shown that the line can be constructed and worked at a loss of not more than 1 per cent. per annum its construction would be favourably considered? The Commissioners would, in that case, be glad to reconsider the matter.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

1121. *Mr. Trickett.* Can you give us any information in regard to the population of the district through which the proposed line will pass? From the electoral rolls I have ascertained the number of electors living upon the country within 20 miles on each side of the proposed line, commencing at a point 10 miles from the Western line, and going as far as Brewarrina. W. McIntyre.
14 Oct., 1897.

1122. *Mr. Wright.* Have you gone north from Brewarrina to the Queensland border? No; I have not gone beyond Brewarrina. I find that within Byrock division there are fifty-seven electors, who, I assume, represent a population of 114 persons, allowing one additional resident to every elector. In Brewarrina I estimate that there are 346 electors, or a population of 778 within the area defined.

1123. *Mr. Trickett.* That includes the population of the town of Brewarrina? Yes; I did not go beyond that town. The total number of electors within the area to which I have referred is 403, and the population 892.

1124. *Mr. Wright.* Can you give the Committee any information as to the population between Brewarrina and the Queensland border? No; the population in the Brewarrina Division is 1,050 persons.

1125. Would that include the population of Brewarrina? Yes; there are 226 electors at Brewarrina.

1126. How is it that you only allow one additional resident to each elector? Well, I find that there are 473 electors on the roll of the Brewarrina Division, and the Police, who have collected returns, reported that

the

W. McIntyre. the population in that division was 1,050, which means that the entire population is about twice the number of electors.

14 Oct., 1897. 1127. Can you obtain for us an estimate of the population within the area surrounded by pink lines on the map before you? Yes; I can make an approximate estimate of the population within that area.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

W. A. Smith. 1128. *Mr. Wright.*] Have you any return to read to the Committee? I have a statement showing the scheduled roads affected by the construction of the proposed railway from Byrock to Brewarrina. It is as follows:—

Item No.	Mile-age.	Roads.	Amount Voted.						Amount Expended.
			1892.	1893.	1894.	1895.	1895-96.	1896-97.	
1372	85	Walgett to Goondabloui.....	£	£	£	£	£	£	£ s. d.
1373	105	Do via Goodooga to Brenda.....	...	555	450	270	500	450	1,647 2 7
1374	29	Do to Combogolong	350	350	380	80	150	100	1,017 7 0
1375	70	Do to Brewarrina	70	40	...	280	150	269 8 0
1379	60	Collarendabri towards Angledool.....	...	300	110	120	200	200	689 17 11
1381	28	Goodooga to Brewarrina.....	28	160	150	240 10 1
1384	49	Wee Talaba, via Angledool, to Goodooga	...	125	40	50	80	80	326 6 4
95/6									
1218	57	Byrock to Brewarrina (not now on Schedule).	129	...	2 13 7
1222	75	Brewarrina to Engonia (not now on Schedule).	150	...	75 11 7
		Total	350	1,400	1,020	548	1,649	1,430	4,454 11 7

Total amount voted £6,397 0 0

„ expended..... 4,454 11 7

1129. What was the total expenditure, taking out the roads from Walgett to Goondabloui, from Walgett to Combogolong, from Collarendabri towards Angledool, and from Wee Talaba, via Angledool, to Goodooga? £2,235 5s. 10d.

1130. Have you any personal knowledge of this district? No.

1131. Have you ever been in the district? It is many years ago since I was out as far as Nyngan. I do not know this part of the district at all.

1132. Have you any other information with which you could supply the Committee? No.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

C. E. Rennie. 1133. *Mr. Lee.*] Do you produce a map showing the tenure of land between Byrock and Brewarrina within a certain distance of the proposed railway? Yes.

14 Oct., 1897. 1134. Will you explain the map? Yes. The area surrounded by a red line shows country within 20 miles of the proposed route of the railway on each side, and beyond Brewarrina to the north.

1135. What point is on the line bounding the 20-mile limit to the north? It would be a point near the northernmost part of portion 1, parish of Morabilla.

1136. That is on the Bokhara River? Yes.

1137. How many acres of Crown land are there within this area? There are 231,350 acres comprised in reserves, and 599,070 acres not reserved, or 830,000 acres altogether. The Crown land reserved is coloured green, and ordinary Crown land brown. The blue hatching represents homestead leases and settlement leases. There are ninety-two homestead leases, and two settlement leases.

1138. How is the Crown land held? With the exception of about 4,000 acres, which are untenanted, it is held under pastoral lease.

1139. Until what period? Until 1918.

1140. What is the nature of the reserves? They are mostly travelling stock reserves and water reserves.

1141. Is there no Crown land in the district available for settlement at the present time? No—if you except the 4,000 acres which are untenanted.

1142. Are there reserves for camping purposes and town commons within this area? There are camping reserves, population reserves, and temporary commons.

1143. What is the size of the temporary commons, and where are they? There is a temporary common at Brewarrina; but I could not tell you, off-hand, what its size is, though it probably contains several thousand acres. There is a small population reserve at Gongolgon.

1144. How many pastoral holdings are there within this area? Sixteen leasehold areas either wholly or partly within the limits of the area shown on the map. They are as follows:—

Name.	No.	Name of Tenant.
Beemery	6	The New Zealand Loan and Mercantile Agency Co. (Limited).
Compton Downs	33	Australian Mortgage, Loan, and Finance Co. (Limited).
Wyuna Downs	41	The Agency Loan and Finance Co. of Australia (Limited).
Quantambone	44	R. H. Meares, J. C. Meares, and A. G. Meares.
Taroom	52	Bank of New South Wales.
East Bogan No. 15	75	Edward Smith Hall.
Collawarroy	76	Commercial Banking Co. of Sydney.
Yarrawin	83	James Tyson.
Mullingawarrina	98	N. R. M'Phillamy, H. A. M'Phillamy, and W. Wilson.
Mitroy	125	Dalgety & Co. (Limited).
Doradilla	171	Goldsbrough, Mort, & Co. (Limited).
Byrock	215	Commercial Banking Co. of Sydney.
Charlton	236	A. G. Langmore.
East Bogan No. 17	267	Bank of New South Wales.
Murrumun and Dural	280	James Tyson.
East Bogan No. 16	282	Bank of New South Wales.

1145. Do you know if there is any demand for land for small settlement within this area? So far as I C. E. Rennie know, there is not. There were two attempts made to have an area within 10 miles of Brewarrina withdrawn; but on neither occasion did the withdrawal take place, because no demand for small holdings was shown to exist. On the last occasion a very full report upon the question was obtained from the local surveyor, and the Land Board held an inquiry into the matter. 14 Oct., 1897.
1146. As a matter of fact, the area shown on the map is closed against small settlement? Yes, practically.
1147. Have the homestead leases within the area continued to be held? I cannot give you particulars in regard to the homestead leases; but they all stand good.
1148. Does not the map give one a fair idea of the result of homestead leasing in the Western Division? I think so.
1149. Probably three-fourths of the area shown on the plan is held under homestead lease? The total area held under homestead lease is 669,110 acres, while the area of Crown lands is 730,000 acres.
1150. Inasmuch as there is no land available for further settlement within this district, the increase of population must be slow? Yes.
1151. What is about the average rental value of pastoral leases in the district? I could not say without looking the matter up.
1152. What is the average rental value of the homestead leases? The average rental is 1'76d. per acre per annum.
1153. Where is the Land Office for the area shown on the map? Brewarrina would be the Land Office for most of that country.
1154. Are you able to say whether the conditions you have described as applying to the coloured portion of the map apply to the portions outside the coloured area? I could not say without looking the matter up.
1155. What part of that district was looked upon as the best of the Western districts? I could not say; I have no local knowledge. I have been out there; but I have comparatively no personal knowledge of the country.
1156. Are we to understand definitely that there is no probability of any land being made available for settlement within this district until after the expiration of the pastoral leases? Well, at any rate not for some years to come.
1157. What is the probability of close settlement convenient to the township of Byrock and Brewarrina? Well, as I have said, the question of exercising the power of withdrawal near Brewarrina was twice considered, and on both occasions no demand for land for small settlement was shown to exist.
1158. There is a very large common at Brewarrina? The common is of considerable size.
1159. Is it contemplated to deal with that common in the same way as the Lands Department has dealt with other parts of the country;—does the Department think of resuming part of it to convert it into homestead selections? I do not think so.
1160. It may be so dealt with if the land is required? Yes.
1161. There would be no legal objection to its conversion? No.
1162. Round most of the towns in the interior, large commons—either permanent or temporary—were left, and where they are preventing the spread of these towns it is the policy of your Department to resume portion for close settlement? That has been done in many cases.
1163. If the necessity arose, land would be available for close settlement in the neighbourhood of Brewarrina? Yes.

FRIDAY, 15 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).
 The Hon. JAMES HOSKINS. | HENRY CLARKE, Esq.
 The Hon. WILLIAM JOSEPH TRICKETT. | CHARLES ALFRED LEE, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

1164. *Mr. Hoskins.*] Have you any information to give us with regard to the rainfall in the district between Byrock and Brewarrina? Yes; I have come prepared with a number of records from places extending all round the route of the proposed railway. They are as follows:— H. C. Russell, C.M.G. 15 Oct., 1897.

Station.	Period.	Rainfall.	Station.	Period.	Rainfall.
Weelmoringle	10 years	19·10 inches.	Gongolgon	12	19·23 inches.
Warraweena	19	16·70 ..	Gilgoim	19	17·70 ..

Mt. Oxley	12	17·62 ..	Curraweena	16	16·59 ..
Yanda	9	17·28 ..			

There are only three other stations in the district, but their records extend over very short periods. I have not so many stations in the district as in most of the other parts of the Colony.

1165. Is the rainfall greater at any particular time or season than it is at other times? Most of the rain falls during the first six months of the year in these districts. The rainfall is not so large during the latter half of the year.

1166. Can you say whether the amount of rain received at these places is sufficient for the growth of cereals? I think the time at which the rain falls in these districts is against the growing of cereals; but I have no special knowledge of the subject.

H. C. Russell, C.M.G. 1167. *Mr. Lee.*] The planting season would extend from April to June;—could you give us any information in regard to the number of wet days in those three months? I can obtain the information for you.
 1168. Can you also obtain for us information as to the number of wet days in the first six months of the year? Yes.

W. McIntyre. William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and further examined :—
 15 Oct., 1897. 1169. *Mr. Lee.*] You have some additional information to supply to the Committee? Yes; I have estimated the population within the area shown on the map submitted by Mr. Sawers. I estimate that there are 2,032 people living within that area.
 1170. *Mr. Wright.*] Does that include the aboriginal population? Yes.
 1171. *Mr. Lee.*] Have you taken your figures from the census returns? No; I have based them upon the electoral rolls. I have ascertained from the census returns the proportion of the adult males to the women and children in that district, and I find that the number of the adult male population, multiplied by two, will give the entire population approximately. There are very few women in the district. The census returns for the county of Culgoa—within which a part of this area is situated—show a population of 437 males and 185 females. This area comprises parts of the counties of Culgoa, Narran, Clyde, and Cowper. I find that the proportion between the sexes is about the same in all those counties.
 1172. What is the number of electors upon the last roll? I have that information in connection with divisions of the electorate of the Barwon. I find that there are about 1,047 electors within this area. The Brewarrina division contains 473 electors, or a population of 1,050.
 1173. That includes the township of Brewarrina? Yes, and a large area around the township.
 1174. The abnormal ratio of adult males to females and children is, I suppose, accounted for by the scarcity of schools, and other adjuncts of civilisation? Yes.
 1175. The further you go out the more the male population predominates? Yes; that is shown by the census returns.
 1176. Do you know if the population has increased or decreased during the last few years? I think that there was a large decrease about the year 1894; but the district has improved so far as the number of electors is concerned. The electoral rolls show that the number of electors is increasing.
 1177. *Mr. Wright.*] Have you had sufficient experience in the electoral office to enable you to make deductions as to the meaning of an increase of electors in this district;—have you been able to ascertain that it means a larger amount of settlement? The increase has been gradual. There has been no exceptional increase.
 1178. Still there has been an increase. The district has not been going back? No, it is going forward.
 1179. From what source do you get your information as to the population of the district? During 1896 we asked that the police might be instructed to furnish returns of the population in the divisions of electorates, in order to furnish a basis for the payment of registrars. The information thus collected was carefully checked, and it is the latest information which we have in regard to the population.
 1180. Do you find that the police occasionally miss a good number of names? They do not collect the names of voters. They simply furnish statistics as to population in order that we may have a basis upon which to pay the registrars. Self-registration is the principle upon which the electoral rolls are compiled. The rolls are made up from the butts of the electors' rights. The lists thus prepared are exhibited every year—during the month of August—for objections to be lodged, and these objections are dealt with by the revision courts.
 1181. Is there any connection between the return of population furnished by the police and the number of voters within any area? By taking the number of electors within the area, you can make an estimate of the population by which to check the returns furnished by the police. I have found that the police returns are very correct. The total of the whole of the divisions has been ascertained and compared with the population as estimated by the Government Statistician.
 1182. Supposing 500 persons in an electorate did not apply to register, what means would you have of knowing that those persons were practically disfranchised? None whatever.
 1183. You only obtain information as to the number of electors in a district through their voluntary applications for registration? Yes.
 1184. Your position does not require you to make inquiries on the subject? No.
 1185. Then it is possible that the population of the district might be wrongly calculated upon the basis of the number of electors' rights issued? Not to any great extent. Of course in a place like Wyalong, where there are a great number of people rushing in and neglecting to register, it might be different.
 1186. But at any rate this is not an infallible way of estimating the population? You only get an approximate estimate.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined :—

J. Harper. 1187. *Vice-Chairman.*] Have you had an opportunity of reading the evidence of the witnesses who have been examined here since your examination? I have not seen the official report. I have read paragraphs in the newspapers.
 15 Oct., 1897. 1188. Have you seen the evidence of Mr. Sawers? I have only seen newspaper paragraphs about it.
 1189. That evidence is contradictory of the evidence given by you, and the Members of the Committee would like an explanation in regard to certain points connected with it? —
 1190. *Mr. Trickett.*] Mr. Sawers has handed in a map upon which he has enclosed by a pink line the area from which he thinks all traffic would come to the proposed railway? I doubt very much if the whole of that traffic would come to the proposed railway. I can give you figures, showing the actual traffic during a series of years. I think, however, that it would be better if I were afforded an opportunity of looking into these matters again before my further examination by the Committee.

TUESDAY, 19 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.,

CHARLES ALFRED LEE, Esq.,

FRANCIS AUGUSTUS WRIGHT, Esq.,

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

1191. *Mr. Lee.*] You have some information to lay before the Committee? Yes; but before doing so I should like to recall the return which I put in last Friday, and to substitute for it the following return of stock for the years 1891 to 1896 inclusive for the Brewarrina and parts of the Walgett and Bourke Sheep District. G. C. Yeo.
19 Oct., 1897.

Sheep District.	1891.			1892.			1893.			1894.			1895.			1896.		
	Horses.	Cattle.	Sheep.	Horses.	Cattle.	Sheep.	Horses.	Cattle.	Sheep.	Horses.	Cattle.	Sheep.	Horses.	Cattle.	Sheep.	Horses.	Cattle.	Sheep.
Brewarrina ..	4,045	19,147	1,479,862	4,465	19,615	1,443,395	4,709	18,577	1,317,859	4,765	16,164	1,371,470	4,924	11,177	1,155,968	4,983	9,265	1,003,892
Par of Walgett	402	2,718	171,320	431	1,695	200,700	462	1,686	165,118	612	1,788	190,463	575	1,182	177,421	663	916	176,302
Par of Bourke	197	1,190	84,300	150	894	73,000	162	125	30,247	157	1,078	32,000	113	529	15,640	114	396	22,500
Total	4,644	23,055	1,735,482	5,046	22,204	1,717,595	5,333	20,388	1,513,224	5,534	19,030	1,593,933	5,612	12,888	1,349,029	5,760	10,577	1,202,694

1192. This return is compiled from the registrars' return for the area of country which it is supposed would be interested by the construction of the proposed railway, and which was marked upon the plan submitted to you? Yes.

1193. What other information have you? I have also a return for the year 1896 of the stock entering New South Wales from Queensland at Brenda:—

Road.	Horses.	Cattle.	Sheep.
Brenda <i>via</i> Brewarrina	125	4,038
Brenda <i>via</i> Walgett.....	314	19,690
Brenda <i>via</i> Bourke	18	560	10,448
Total	457	24,288	10,448

This return applies to the area shown upon the plan to which you refer. There is only one crossing-place within that area, namely, at Brenda.

1194. The stock shown in the return might have gone to Bourke, to Dubbo, or to Byrock? Yes; but they must have passed through one of the three places I have named, namely, Brewarrina, Walgett, and Bourke.

1195. You have no evidence to show where this stock went? We have the inspectors' certificates, and the owners' declarations regarding all stock coming into the Colony from Queensland. The stock is distributed chiefly to Dubbo, to Muswellbrook, and to Sydney.

1196. Part of the stock would go to the North-western line? Yes; to Narrabri, Muswellbrook, and other places along that line.

1197. What further information have you? I have a return made out by the Brewarrina Inspector of Stock, showing the number of stock moving in the Brewarrina sheep district during the year 1896. The return is as follows:—

ANNUAL Stock Traffic, Brewarrina Sheep District.

Road.		Annual Stock Traffic.		
From.	To.	Horses.	Cattle.	Sheep.
Toulby <i>via</i> The Culgoa and Biree	Brewarrina	400	6,250	325,000
Brenda <i>via</i> Goodooga and Bokhara	Brewarrina and Walgett	800	35,000	450,000
Barwon River and Brewarrina	Marra Creek and Bogan River	450	22,000	340,000
	Total	1,650	63,250	1,115,000

1198. That is the return of one inspector. None of the stock are counted twice? No; it is the return of one inspector. It shows the stock moving backwards and forwards, south and north. I have also a detailed list giving the names of all the holdings within the area marked on the map submitted to me, and the number

G. C. Yeo. number of stock on each holding. This area takes in portions of the Bourke sheep district, and the Walgett sheep district, and the whole of the Brewarrina sheep district.
19 Oct., 1897.

ALPHABETICAL List of Stockowners, with their Addresses, and Number of Stock in a portion of the Sheep District of Bourke, for year 1896.

I also hand in a map showing the driftways of stock in the district. Upon it the various travelling stock reserves are tinted green, and I have shown by brown lines the roads referred to in the returns I have read. 1199.

1199. Your returns show that within the area marked on the map there were held 5,760 horses, 10,577 cattle, 1,202,694 sheep, and 264 pigs? Yes. G. C. Yeo.
1200. Have you any information in your office as to the average clip from that district? I do not think so. 19 Oct., 1897.
1201. You do not know what full-woolled sheep average there? No.
1202. The stock in the district are held by 233 different owners? Yes.
1203. After examining the map submitted to you by the Committee, and which was prepared by a resident of the district, are you inclined to think that his ideas and yours in regard to the traffic of the district closely resemble each other? In what way.
1204. That the bulk of the stock passing through that part of the country travel through this district? Yes.
1205. There are not many crossing-places in this part of the country? The nearest crossing-place on the east of Brenda is Mungindi, and on the west Barringun.
1206. The driftways within the area shown on the map are very important, and that is why so many stock pass through the district? Well, I do not know that there are more stock passing through that district than pass through other districts. A great many stock pass through Barringun and Hungerford.
1207. But Brenda is the chief crossing-place between Barringun and Mungindi? It is the only crossing-place.
1208. These are the only crossing-places within the western district? Well, if you go further west there is Wompa.
1209. But Barringun is the crossing furthest west? Yes, of the three I have named.
1210. The Mungindi crossing is largely used by stock going to Moree? Yes.
1211. The Brenda crossing is largely used by stock going to Bourke and to Dubbo? Yes.
1212. *Mr. Wright.*] Are you aware that a great deal of the stock crossing at Brenda goes to Bourke to be boiled down there? No, I am not.
1213. You are not aware that a great number of sheep go to Bourke to be boiled down? No, though my returns show that a great many sheep go to Bourke from Brenda.
1214. Are you aware that the bulk of those sheep go to Bourke, not to be trucked, but to be boiled down, or otherwise dealt with at the local meat-works;—stock coming from the Narran country to the meat-works at Bourke would come to Bourke whether the railway were constructed or not? Yes.
1215. Can you tell us the total number of sheep sent to Bourke during 1896? No; but I will get you the information.
1216. Would you also get us the same information in regard to Nyngan, and in regard to Byrock? Yes.
1217. Are the returns which you have placed before the Committee copies of the sworn returns sent in by the pastoralists? They have been compiled from the returns made under the Pastures and Stock Act.
1218. A stockholder has to send in a return if he only owns four or five head? If he only owns a single beast.
1219. Therefore your returns would give us the actual number of stock in the district? Yes.

WEDNESDAY, 20 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

1220. *Vice-Chairman.*] You have seen the map handed in by Mr. Sawers on which is marked the area from which he thinks produce would come to the Brewarrina line? Yes. J. Harper.
1221. You have also seen a list of the stations within that area? Yes. 20 Oct., 1897.
1222. Are you of opinion that the wool and live stock from all the stations mentioned in the list would be sent by way of Brewarrina? With the exception of two or three, which I think will always send to Girilambone.
1223. Which are they? A few holdings in the south-east corner of the area marked on the map, namely, Burren, Brigalow, Ballaree, and Calga.
1224. Have you information as to the number of sheep upon those stations? No; but I can tell you approximately the number of bales of wool sent from them.
1225. How much wool would be sent from those places? 1,000 bales—about 200 tons.
1226. Then, with the exception of 1,000 bales, all the wool from the area marked on plan 2 would reach Brewarrina? It would reach Brewarrina. I do not say that it would come from Brewarrina by rail. It would either reach Brewarrina or it would come to some point on the line between Byrock and Brewarrina.
1227. Will you give us a detailed estimate of the quantity of wool that would probably be received from the area shown on Mr. Sawer's map, excluding the stations which you have mentioned? In the estimate which is now before the Committee I have included practically every one of the stations within that area. I have given the quantity of wool coming from places between Byrock and Brewarrina, and going up stream towards Walgett. The wool traffic from all this area I estimate at 3,400 tons.
1228. Are you dealing now with the area shown on plan 2? Yes.

1229.

J. Harper. 1229. Will you give us the details of that wool traffic? I will give you the figures for the year 1893-94, relating to the traffic from Brewarrina, Goodooga and district, and then I will give you the traffic from Walgett and district:—

Abydos	94 bales.	T.B. over Willot	187 bales.
Coolaburra	95 "	Wirrah Warrah	90 "
M.R. over Brewarrina	40 "	Walkharra	295 "
J.M. over Cato	208 "	D. over D.D. and Warrawin... ..	1,170 "
Guisely	301 "	Yambacoona and G.W.G.	104 "
Gnomery	872 "	R.V.R. over Yurcurrie and	
Gilgoin	523 "	Mapoga	"
L. Brothers over Homebush... ..	129 "	Small clips	853 "
TRS over Lipsley	48 "	By river	172 "
Lolleep	61 "	Ballandool and Dumble	1,117 "
Milroy... ..	1,422 "	Bunna	129 "
Morrabilla	98 "	Brenda	1,421 "
Muckerawa	364 "	Bundebulla and Bokhara	861 "
Mogilla	184 "	Bogundra and R.C.B.	154 "
Nullawa	548 "	Chip's Folly	116 "
H.Z. over Oakleigh	180 "	Coobiendfa	135 "
Quantambone	1,150 "	Cuttabundya, Coobung, and	
Robb & Co. over Talawanta... ..	1,057 "	W.E. over Narran	138 "
R.A.L. over Tarrion	663 "	Denman	142 "
W.N.W. over Tarrion	179 "	Weilmoringle... ..	1,429 "
Tarra... ..	181 "	Woolerina (Queensland)	960 "
Willawillingdah	107 "	Small clips	31 "

1230. *Mr. Wright.*] You have not included Boorooma in that list? I have included it in the Walgett district. It is included in my estimate of the traffic coming to Brewarrina; but I have distinguished between the Brewarrina and the Walgett portions of that traffic. These are the figures for Walgett and district:

Brewan	35 bales.	Llanillo	967 bales.
Boorooma, Brina, and Mein		Milroy... ..	433 "
over Narran	1,955 "	Moorabie	347 "
Barwon Vale	130 "	Moorlands	186 "
Bell Brothers, Flemington, and		Mayfield and Myhan... ..	63 "
J.D. over J.B.	168 "	Piangobla	168 "
Craigmore	169 "	Ulumbie	256 "
Dungalear	1,500 "	Eulah	249 "
Euroka	654 "	White Wood	115 "
Gingie... ..	1,650 "	Small clips	225 "

From Tarcoom and district—that is, the intermediate district between Brewarrina and Byrock—we got:
Charlton 522 bales. Tarcoom 209 bales.

Altogether, we received 1,253 bales at Byrock and 26,449 bales at Bourke.

1231. *Vice-Chairman.*] I make the total 27,702 bales? Yes; that is about it.

1232. *Mr. Lee.*] Those figures include the Walgett district? Yes.

1233. *Vice-Chairman.*] What portion of that wool do you say would reach Brewarrina, supposing the proposed railway were constructed? Do you put aside all other considerations? I have received notice to attend here later on, to give evidence upon the proposed railway from Narrabri to Pilliga.

1234. I think that you had better explain that in the event of other lines being constructed, deductions will have to be made? Yes; in the event of a railway being made to Walgett or to Collarendabri the traffic to the proposed railway would be considerably affected.

1235. But supposing no other line were constructed, this traffic would probably go by way of the proposed line? No. It might reach Brewarrina; but I am not prepared to say that it would go over the Byrock to Brewarrina line.

1236. Not any portion of it? I daresay part of it would.

1237. I want you to make a distinction? I cannot do that. I cannot say what the river competition will be.

1238. Then how did you arrive at your estimate? I have obtained the figures for the traffic from the district; but I leave it to the Committee to consider what are the probabilities of that traffic coming by river to Bourke, or finding its way on to the railway at Brewarrina.

1239. How many tons of traffic would 27,000 bales of wool give? The year for which I have given you the figures was an exceptionally good one—in fact, the best year we have had. Roughly speaking, that number of bales would represent about 4,000 tons. The average traffic for the four years 1893 to 1897, taking the same clips, has been 3,422 tons. Of course, there is some scoured wool among this.

1240. How many tons do you estimate will reach the Brewarrina railway? I estimate that 3,100 tons will reach Brewarrina, and that 330 tons will join it at intermediate points, or 3,430 tons altogether.

1241. You say that, assuming that the whole of the wool from the stations you have named reached the railway at Brewarrina, the tonnage would not be greater than that for which you have allowed in your estimate? That is so. I am absolutely clear upon the point.

1242. Have you estimated in the same way the number of live-stock that would probably come to the railway? No; but I have taken out the actual number of live-stock trucked at Bourke and at Byrock.

1243. Have you given us that information? Yes; but I will repeat it. In the year 1893-4 there were 235 trucks; in the year 1894-5, 319; in the year 1895-6, 634; and in the year 1896-7, 862 trucks—an average of 512 trucks per annum.

1244. Coming from those stations? From the area marked on Mr. Sawyer's map [*plan 2*], as taken from our books at Byrock and at Bourke.

1245. For how many truck loads have you given credit in your estimate? For 1,000—practically double the average number sent at present, 1246.

J. Harper.
20 Oct., 1897.

1246. *Mr. Wright.*] I suppose the returns regarding the number of bales of wool sent from the district are taken from the railway books at Byrock and at Bourke? Yes.
1247. Piangobla is not within the area marked on Mr. Sawers' map? No.
1248. Neither is Llanillo? No.
1249. Nor Euroka? I think Euroka is.
1250. Gingie is also outside that area? Well, the estimate is a most liberal one. It practically includes all the wool coming in to either Walgett or Brewarrina.
1251. Boorooma wool would go to Brewarrina? I think it would go to Walgett if the railway were taken to Walgett. We have to face that possibility. I have included it within the Brewarrina traffic; but I must keep my eyes open to the fact that I shall very shortly be examined by the Committee in regard to another railway proposal.
1252. Is the wool from Compton Downs included in your list? No; it is a question whether that wool would come. The clip is only a small one, and would probably go down to Girilambone.
1253. Have you included Collawaroy? That wool must have gone to Girilambone in the year I quoted—1893-4. In the year 1895-6 we got 134 bales from that station.
1254. Do you include Brenda in the Walgett list or in the Brewarrina list? In the Brewarrina list.
1255. And Dumble also in the Brewarrina list? Yes.
1256. I suppose it is owing to the difficulty of identifying these places that you have given us the names of some stations outside the area marked on Mr. Sawers' map, and have not given us the names of others inside that area? There are one or two inside the area which I have omitted. For instance, there is Ballaree, which is a cattle station, and there are the others which I named.
1257. What wool comes from Gingie, Euroka, and Llanillo? 3,271 bales, or about 500 tons.
1258. How did you get your stock returns? They were taken from the live stock contract-book, and every consignment was identified.
1259. You have given the number of stock trucked to Sydney from this district? Yes.
1260. Both from Bourke and from Byrock? Yes; every entry in the live-stock book for these years has been gone through, and each consignment identified.
1261. A great deal of stock has gone from the Narran district to be trucked at Bourke? At Bourke there were trucked in the year 1893-94, 71 truck-loads; in the year 1894-95, 13 truck-loads; in the year 1895-96, 224 truck-loads; and in the year 1896-97, 102 truck-loads. From Byrock were sent in the year 1893-94, 164 truck-loads; in the year 1894-95, 306 truck-loads; in 1895-96, 410 truck-loads; and in 1896-97, 760 truck-loads.
1262. Taking the best years of each place, it only gives a little over 1,000 truck-loads? Yes; but that is taking one year for Bourke and another for Byrock.
1263. Do you know what number of stock is trucked lower down the line? I do not; but, as a matter of fact, some of the stock trucked at Byrock travelled down from Bourke. A great deal of the stock that is trucked at Byrock comes from Bourke. It travels parallel with the line down to Byrock.
1264. Is not a great deal of stock consumed at the Bourke boiling-down works? A great many have been in past years. Lately, very little has been done there.
1265. So that a considerable number of stock have gone there to be treated locally? Yes.
1266. That would decrease the number of stock to be carried by rail? Yes.
1267. A witness who represents a small firm in the city has told us that in nine months he has received nearly 500 truck-loads of stock from Byrock alone, and he estimates that his business affects between 25 and 30 per cent. of the stock trucked from that district? He may have had that quantity of stock from Byrock; but it does not follow that it came from Brewarrina way. We frequently have sheep travelling along the railway, while they are waiting for a market.
1268. He was of opinion that this stock came from the country about Brewarrina and north of that place? I cannot say where it came from; but I have taken my figures from the signed contract-books of the Department.
1269. You give the wool traffic of the proposed line as 3,430 tons? Allowing $5\frac{1}{2}$ bales to the ton, that would represent about 18,000 bales.
1270. In your evidence you say that during 1893-4, 18,000 bales were carried, and of that quantity 13,000 bales were taken by the river. Now, you submit an estimate showing the wool traffic from the district to be 27,000 bales? Yes; but this latter return is for the very best seasons we have ever had. The average traffic for four years was 22,000 bales.
1271. That would be 4,000 bales more than you previously estimated;—have you looked over Mr. Sawer's evidence? I have glanced through it.
1272. In making your calculations have you remembered that possibly all this traffic may not be secured by the proposed line if it is constructed? I have allowed for everything likely to be carried on the line. In regard to the goods tonnage, there was nearly double the usual tonnage carried during the years 1893-4 and 1894-5, because of the great quantity of wire-netting that was being sent to Queensland.
1273. But having consulted the railway books, you wish us to understand that inasmuch as nearly the whole of this traffic comes to the railway at Bourke, your figures are as reliable as they can be? Yes; I knew that adverse statements had been made, and, therefore, I had my figures checked and brought up to date. Every reliable source of information was exhausted in obtaining them.
1274. *Mr. Hoskins.*] Do you know what is the average charge for conveying wool by river between Brewarrina and Bourke? That is a rather serious question. I do not want to give the carriers away. The Committee can understand the delicate position in which they may be. It may suit them to carry more cheaply for one man than for another, and I am sure that honorable Members do not want me to give them information in regard to other people's business. I can say, however, that things have been carried for 12s. 6d. a ton.
1275. We have had it stated in evidence that the usual charge is 25s. a ton, and a witness has told us that he can send by team from Brewarrina to Bourke as cheaply as by steamer, and that he would rather send by team? Well, he may have been able to make a good bargain with the teamsters, while the boat proprietor may have wanted to make a good bargain with him. In collecting my information, I am, to a certain extent, taken into confidence by business firms, and it would be the last thing the Committee would wish that I should give them information which I had obtained in this way.

J. Harper. 1276. We have been given to understand that the river would prove a formidable competitor with any railway, and, on the other hand, we are told that the average charge upon the river is 25s. a ton. If the river rates were only £1 a ton the railway ought to be able to compete? Yes; I would point out to the Committee, however, that before the railway was taken to Hay the rate through to Melbourne was £7 a ton, and of that amount the steamer companies got £5 a ton. Now they are glad if they get £1 a ton. There is not the least doubt that if the proposed railway were constructed, the same thing would occur between Bourke and Brewarrina. In my report to the Railway Commissioners, I said:—

Under the circumstances of an ordinary river, which has up to the present remained unimproved by snagging operations or otherwise, the rates between Brewarrina and Bourke have varied between 12s. 6d. and 20s. per ton.

1277. *Mr. Lee.*] In what year was that report written? In the year 1895.

1278. *Mr. Hoskins.*] The Murrumbidgee was a very different river from the Upper Darling? Yes; but you can see how the construction of the railway affected the steamer rates on the Murrumbidgee, and I would be the same on the Darling. Since my report was written, the river has been improved to a certain extent by the construction of a weir below Bourke, and I am in a position to inform the Committee that docks are to be built at Bourke. A crane and a wharf are to be provided there, and, in all probability, the railway will, in a very short time, be extended to the river side. The existence of docks in Bourke will make a great deal of difference to the steamers. Now they have to go down to Adelaide every year to be overhauled for insurance purposes; but when the docks are finished they can be overhauled at Bourke. There is another phase of the question: If the river were navigable from Walgett, wool put on board a steamer at Walgett would not stop at Brewarrina; it would go right down to Bourke.

1279. If the proposed railway were constructed, I suppose the charge for goods sent over it would be about 10s. a ton? I have put down 10s. a ton; but that is an arbitrary rate, based on a charge of 2d. a ton per mile.

1280. How far is it by river from Brewarrina to Bourke? About 119 miles, as the river people measure it.

1281. *Mr. Lee.*] I have in my hand a return submitted by the Stock Department, showing the number of sheep carried on the holdings within the area marked on Mr. Sawers' map—the number of sheep within that area is 1,003,892;—can you estimate the wool clip from a certain number of sheep? Generally speaking, it is regarded as a fair thing if you get fifteen bales of wool from 1,000 sheep. There are very many districts in the Colony where they do not get as much. The figures I have given, however, are absolutely correct.

1282. Your estimate of the wool traffic on the proposed line is 3,430 tons—Mr. Sawyer's estimate is 4,750 tons? I should like Mr. Sawers' estimate to be correct.

1283. But you think it is too high an estimate? I think so; compared with the traffic that we do now.

1284. Do you think it ever will be realised? Well, we have not had as much as that even in the best year; we have only got a little over 4,000 tons.

1285. Mr. Sawers estimates the goods traffic up stream from Bourke to Brewarrina at 2,450 tons;—you allow nothing for probable traffic of that kind? I allow 2,000 tons.

1286. That is the tonnage which now goes up stream to Brewarrina, but which, if the proposed railway were made, would go by rail? Yes. The average goods traffic for the four years I have mentioned was 2,892 tons, but those years included two years in which between 2,000 and 3,000 tons of wire-netting were carried under special circumstances.

1287. You estimate the live-stock traffic at 1,000 truck-loads, while Mr. Sawers estimates it at 3,000 truck-loads? We cannot get away from the solid facts before us. I am not going to say that the traffic might not grow to 3,000 truck-loads; but I cannot deal with possibilities of that kind.

1288. How many sheep would 3,000 truck-loads represent? About 300,000, which would be about 33 per cent. of the stock of the whole district. That would be a very heavy draft of fat sheep.

1289. You think that Mr. Sawers' estimate cannot be realised? I do not say that it cannot be realised; I simply lay the facts before the Committee as I find them.

1290. Do you think it will be realised? I am very doubtful about it.

1291. The estimate that seems to me very doubtful is the estimate of passenger traffic—1,500 passengers a year? Yes; about ten a day.

1292. Five passengers each way? Yes.

1293. That would be only thirty a week? Yes; I think the estimate is about correct.

1294. Do you not think it too small for so long a line? I do not.

1295. During 1896 some 2,000 tickets were issued at Byrock? Yes; but probably most of them were issued to the next platform. Besides, Byrock issues tickets from all the platforms between it and Bourke.

1296. But only half of that traffic would give 1,000 tickets? Well, I allow 1,500 passengers at a full fare each. I do not say that there will not be more than 1,500 passengers travelling between intermediate stations. I only give credit for through travelling. If you doubled my estimate the return from passenger traffic would not be very much. There is absolutely no settlement between Byrock and Brewarrina.

1297. Would not the railway induce a larger number of the Brewarrina people to travel? Well, if they all took two or three journeys a year it would not increase the estimate very much.

1298. You see no reason to doubt your figures? No.

1299. If the passenger traffic has been estimated at 6,000 people, do you think the estimate is likely to be realised? I do not.

1300. You estimate the traffic from the proposed line at £3,691 15s., supposing the traffic arriving at Brewarrina for and from Walgett and above stream were excluded? Yes.

1301. At present that traffic comes to Brewarrina? It comes to Bourke, and I am not going to say that it would not come to Bourke if the proposed railway were constructed.

1302. You have already said that in your opinion goods put on board the steamers above Brewarrina would go down to Bourke? Yes.

1303. Why? Because it would be in the interests of the steamship owners to quote reduced through rates. It is the loading and unloading that costs the greater part of the freight. The towing down stream costs comparatively little, and very little time is consumed in the work.

1304. How often is the river navigable from Walgett to Bourke? During the year 1893-4 it was closed for twenty-eight days; during the year 1894-5, for eighty-three days; during the year 1895-6, for 311 days; and I have no returns for 1896-7. The returns show that it is open about half the year on an average.

1305. The river was closed during nearly the whole of 1896? Yes; and probably it will be open all next year. J. Harper.
20 Oct., 1897.
1306. When the river was closed, to what point on the railway was the wool sent? In 1896 over 10,000 bales of wool came to Bourke from Brewarrina, Goodooga and district. Only seventeen bales came from Walgett and district. Nearly all of the Walgett wool came to Narrabri. Whenever there is no river, the Walgett wool generally goes to Narrabri. During 1896, 2,687 bales came to Byrock. Even in 1896 we managed to send some of the wool down the river, 2,400 bales coming that way.
1307. That is very much below your estimate? Yes; but that was the year of the drought.
1308. Is it the usual practice, when there is no river, for the up-stream clips to find their way across to Narrabri? Yes; though a number of circumstances control the destination of the wool.
1309. Do you know whether the river is open, as a rule, during the wool season? Yes; it is during the season. It generally comes down in the early part of the year during the wool season. At all events, it has done so very often.
1310. When the river is not navigable owners must send by dray? Yes.
1311. Since you were here last have you further considered the question that was put to you as to whether the construction of a line out towards Brewarrina would attract traffic which our railways do not at present get? I cannot say that I have thought of it since then, because I have thought of it so frequently before. During the last three or four years we have never left off thinking about how to get the Queensland trade. If it is found that the £2 10s. a ton duty is not enough to keep the wool from coming this way, the Queensland people are prepared to charge a higher duty.
1312. You lose no traffic in that district? No.
1313. The trouble is that you do not attract traffic from the neighbouring colonies? Yes; traffic which has always been ours, and which would be ours now if the duty were taken off.
1314. Do you know if the Queensland people are pushing out their lines? Yes; they are pushing on to Cunnamulla, and they are talking of going to St. George.
1315. Do you think that they will attract traffic from our side of the border? I do not think so, though they would like to get the wool taken to Brisbane, and then sent down to Sydney for sale.
1316. If the Queensland people push their lines out close to our border, and we stop where we are, will we not have to face a ruinous competition, such as we have to meet on the southern border? Well, they cannot make any further allowance; they cannot go any lower. I think we shall be able to look after our trade.
1317. Only by a reduction of rates? Well, this is not a line which will affect the matter about which you are speaking. I think, however, that if action had been taken four or five years ago the line to Cunnamulla would probably never have been built.
1318. Is what has happened on our southern border likely to happen in this district? I do not think so.
1319. We slept rather long in regard to the southern trade;—is it possible to avoid a recurrence of what has taken place down south? I do not think that the same thing is likely to occur again.
1320. Cannot it be avoided by judicious railway extension? Even if to-morrow we pushed our lines to the Queensland border, going through Brewarrina, or from Bourke to Barrington, we should be met at the border with an absolutely prohibitive tax to prevent the export of wool from Queensland. They do not make any secret about it in Queensland. They say that if a tax of £2 10s. a ton will not stop the wool from coming this way, a tax of £5 a ton will. They have the courage of their policy over there.
1321. *Mr. Hoskins.*] They do not prevent some of the wool from coming to Moree? The Australian Pastoral Company's wool comes to Moree; but that is the only Queensland clip of importance.
1322. *Mr. Clarke.*] There appears to be a great discrepancy between Mr. Sawers' estimates and yours;—you adhere to your original statements? Yes, decidedly.
1323. How do you get your returns—from the books at the various trucking places? Yes.
1324. Then they must be pretty correct? They are absolutely correct. We have been paid freight upon these statements.

THURSDAY, 21 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
The Hon. JAMES HOSKINS. The Hon. WILLIAM JOSEPH TRICKETT. HENRY CLARKE, Esq.	CHARLES ALFRED LEE, Esq. FRANCIS AUGUSTUS WRIGHT, Esq. FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

John Simpson, leaseholder, Narran Creek, sworn, and examined:—

1325. *Mr. Hoskins.*] Is your holding situated between Byrock and Brewarrina, or is it beyond Brewarrina? It is about 45 miles beyond Brewarrina, in a north-easterly direction. J. Simpson.
21 Oct., 1897.
1326. Is it anywhere near the Narran Lakes? Yes, it is close to them.
1327. Do you depasture sheep or cattle? Sheep.
1328. Where do you send your wool? To Byrock.
1329. And thence to Sydney? Yes.
1330. Do you sell your sheep as fat stock or as stores? As fat stock. This time last year I sent 2,500 fat sheep to be trucked at Byrock.
1331. You nearly always send your sheep to Sydney? We always send them to the Sydney market.
1332. How far is your place from Bourke? About 130 miles.
1333. How far is it from Byrock? About 110 miles by the road we have to go.
1334. Do you ever send any of your wool to Bourke? No; we always send it to Byrock.
1335. Then you do not use the river? Not now. When I was manager of Boorooma I used to use the river.
1336. How far was Boorooma from the river? Boorooma is alongside the river. We used to shear on the banks of the river.

- J. Simpson. 1337. What did you pay to send wool from Boorooma to Bourke by steamer? It depended upon the condition of the river. When it was necessary to trans-ship at Brewarrina we paid 50s. a ton. When we could go right through, we paid 30s. a ton.
- 21 Oct., 1897. 1338. Boorooma is above Brewarrina? Yes; it is 42 miles on the Walgett side of Brewarrina.
1339. Was 30s. a ton the usual price for conveying wool from Boorooma to Bourke when the river was navigable right through? I never paid less.
1340. What was the average charge when the river was high? Thirty shillings a ton from Boorooma. I was manager on Boorooma for seventeen years.
1341. *Mr. Wright.*] Boorooma is practically half-way between Brewarrina and Walgett? Yes; we call it half-way.
1342. *Mr. Hoskins.*] Is the number of steamers plying between Bourke and Walgett increasing? I do not think so. During the last three years they have not been able to run for more than about two months in the year. Most of the wool was carted last year.
1343. Where to? A great deal of it went to Byrock.
1344. And some to Bourke? Yes.
1345. I suppose Bourke is the centre for all kinds of business on the Upper Darling, for the reception of merchandise and produce, and despatch of goods? As a rule, we do not deal much with Bourke we deal with Brewarrina.
1346. Do the storekeepers at Brewarrina get most of their merchandise from Bourke, or do they get it from Byrock? I am not in a position to say.
1347. Do you think that if the proposed railway were constructed, the people would prefer to use it, instead of using the river, supposing the river were navigable? Yes; I should prefer to do so.
1348. Is it not a fact that squatters prefer to send their produce by the cheapest route, which is generally the water route? Well, the river is most unreliable. It is very likely to be down at the time that you want to get your wool away. If the proposed railway were made, you would always be certain of getting your wool away from Brewarrina without any trouble. I send my wool to Byrock.
1349. What do you pay a ton? £3.
1350. What is the average charge for carting from Brewarrina to Bourke? I do not know. The charge from Brewarrina to Byrock is £1 a ton.
1351. If the proposed railway were constructed, the probability is that the Department would carry wool from Brewarrina to Byrock for 10s. a ton;—do you think that that rate would be sufficiently low to prevent the wool being taken by steamer? I should think so. I should be only too glad to avail myself of the opportunity of using the railway. I think that it would be a great boon to our district.
1352. Do you think it would be to the interest of the residents of the district to have the proposed railway constructed? I feel certain that it would. The proposed line would draw trade from the Queensland border, which now goes elsewhere.
1353. Does the trade from the Queensland border now go to Bourke or to Brewarrina? I believe that if the railway were constructed to Brewarrina, it would attract trade that now goes elsewhere.
1354. How far is Brewarrina from the Queensland border? Seventy-six miles I believe.
1355. The country between Byrock and Brewarrina, and from there on to where you live, is all pastoral country? It is very good grazing country. There is no better country in the western district.
1356. There is no other pursuit followed there? No, not extensively.
1357. The business of conveying stores to a pastoral district and bringing away produce is conducted within five or six months of the year? Yes, mostly.
1358. Then if the proposed railway were constructed, for half the year it would have very little to do? It would have fat stock to carry, and there would be the passenger traffic.
1359. The passenger traffic would be very small indeed? The railway would create a lot of passenger traffic which does not exist at the present time.
1360. Is there a coach running between Byrock and Brewarrina now? Yes, five times a week.
1361. *Mr. Wright.*] What have you had to pay for cartage from Boorooma to Brewarrina? We usually paid 25s. a ton.
1362. If you paid 25s. a ton to Brewarrina, and 15s. a ton on the proposed railway, it would cost you £2 a ton to get to Byrock, whereas you say that when there was a good river you used to be able to get to Bourke for 30s. a ton? Yes; but it very seldom happens that there is a good river at the right time. The river is very uncertain.
1363. If you were managing Boorooma, and you could get your wool taken to Bourke by steamer for 10s. less than it would cost you to send it by rail, which way would you send it? No doubt I should send it by the cheaper route; but you have not a good river every year.
1364. Have you much knowledge of the trade of Brewarrina? No.
1365. Can you give us any approximate idea of the quantity of wool coming from the district of which Brewarrina is the depôt, including the wool coming through from the north, and from the Narran country? I could not give you anything beyond Boorooma.
1366. Do you think the wool from that district would amount to 20,000 bales? I think it would be more than that. The average clip at Boorooma during twelve years was 1,500 bales.
1367. You think that more than 20,000 bales would come from Brewarrina? Yes.
1368. Would there be 25,000 bales coming from there? I should think that there would be fully that number. It is a very rich pastoral district, and heavy carrying country. It is all good country. There is none of it bad.
1369. You spoke about the possibility of Queensland traffic being attracted to the proposed railway; are you aware that in Queensland there is an export duty upon wool of £2 10s. a ton? I was not aware.
1370. As long as that duty is in existence there will not be much wool coming from Queensland? If it were removed—for instance, as a result of Federation—the wool would come into New South Wales, and would increase the traffic of the proposed railway. It is all rich pastoral country up the Narran, and the Balooone.
1371. Are you aware that the Queensland Government are thinking of extending their railways to St. George and to Cunnamulla? Well, that would affect the traffic to some extent. Of course, the wool will go to the nearest railway.
1372. If the Queensland railway were extended to St. George, you could not expect to get much wool from Queensland? No; but the Sydney market is the best market we have for wool. 1373.

J. Simpson.
21 Oct., 1897.

1373. Do you think that the port, from which the wool is shipped, has an effect upon its price in the London market? At one time it had.
1374. In the event of the Government determining to construct a railway to Walgett, what effect would that have upon the possible traffic of the proposed line? I do not think it would interfere with it very much.
1375. Would it interfere with the Narran country? I do not think so, unless it were pretty far up.
1376. Would it affect Brenda? No.
1377. The distance from Walgett to Newcastle would be much less than the distance from Brewarrina to Sydney, and the freight might be less;—what effect would that fact have upon the clip of the district? Fifteen years back I could get wool taken to Newcastle at £9 a ton; but I preferred to give £10 a ton to let it go the other way.
1378. Wool would come more expeditiously to market if it came down the Western line? Yes; they have better means of getting it to market that way.
1379. What effect do you think the construction of a railway to Walgett from either Coonamble or Narrabri would have upon stations like Boorooma? If there were no river Boorooma wool would still come to Brewarrina.
1380. You cannot speak about the other stations up there? No; but I suppose they would avail themselves of the nearest railway.
1381. From your general knowledge of the district and its requirements, do you think that the proposed railway would pay? Yes.
1382. If the Committee have been informed by competent authorities that the tonnage coming into Byrock and district is about 2,000 tons per annum, do you doubt the correctness of the statement? I should not like to give an opinion about it.
1383. You are not in a position to contradict it? No.
1384. Still, having lived in the district so long, you should be able to form a rough idea of the consumption of a number of the stations there? In some years, when we were making improvements, we consumed 50 tons of stuff.
1385. All kinds of stuff? Wire-netting, and general requisites for station use.
1386. What quantity of stuff would a station like Boorooma require, including general supplies, wool-packs, and wire-netting? I have never gone into figures; but I know that at Boorooma we use a very large quantity of supplies. I remember getting 50 tons of wire and wire-netting.
1387. How many wool-packs alone would you use; the clip often amounts to 2,000 bales? We have clipped 3,000 bales.
1388. You would want 60 bales of wool-packs for 3,000 bales of wool? Yes.
1389. They would weigh about 15 tons? Yes. I should think the annual consumption of the station would be over 100 tons per annum.
1390. If one station in the district consumed 100 tons in a year, could you give a guess at the total consumption of the district? No.
1391. If there were twenty stations there the consumption would be 20,000 tons? Yes; but I am not prepared to say what the consumption really is.
1392. Do you know the district within the area bounded by a red line on plan 2? Yes.
1393. If it has been stated that the total export of wool in that district would be from 18,000 to 20,000 bales per annum, is that an under estimate? I think that the production of wool in that district would be fully 20,000 bales per annum. I would sooner say more than less.
1394. It is more likely, you think, to be over 20,000 bales than to be under that quantity? Yes.
1395. It has been said that wool has been taken from Brewarrina to Bourke for 12s. 6d. per ton? I never heard of so low a charge being made.
1396. What is the usual rate you have heard quoted between Brewarrina and Bourke? I have had no experience. I always send my own wool to Byrock.
1397. Do you think that wool has ever been taken from Brewarrina to Bourke for 12s. 6d. a ton? I do not think so.
1398. If the river were made permanently navigable, do you think wool could be carried at a profit from Brewarrina to Bourke for 10s. a ton? I do not. I do not think they could exist on that.
1399. You cannot give us any information as to the rates between Brewarrina and Bourke? No.
1400. What rates did you have to pay for sending stores from Bourke to Brewarrina by steamer? Well, I usually got my stores landed at Boorooma.
1401. That is only in recent years? I did that for the last ten years.
1402. You are not in a position to say what rates are paid by the storekeepers for carriage to Brewarrina? I am not.
1403. You say that the carriage between Brewarrina and Boorooma would be about 25s. a ton? From £1 to 25s. a ton.
1404. Have you had much stuff sent over that road? I have had my clips carted several times. When they were carted, they were carted to Byrock.
1405. What do you pay to send to Byrock? Fifty shillings a ton.
1406. If you could get your wool carried from Brewarrina to Byrock for 15s. a ton, it would pay you better to send it that way than direct to Byrock? Yes.
1407. Do you support the railway? Yes.
1408. *Mr. Trickett.*] Your holding is north of the Narran Lakes? A little north-east of the Narran Lakes. It is really situated in what is called the Walgett district; but we never send to Walgett; we send to Brewarrina.
1409. Is yours a very large holding? I and my sons hold 50,000 acres.
1410. What number of sheep do you carry? About 20,000 sheep.
1411. Is your run of about the average carrying capacity? Yes.
1412. It is a fair sample of the land in the district? Yes; the country there is all about the same.
1413. What is your experience as to the size of the holding that a man could live upon in that district? It depends upon the position he means to keep up. Homestead lessees can make a good living upon holdings of 10,240 acres.
1414. What is your experience of the people who have taken up homestead leases in the district? Nearly all of them are prosperous.

J. Simpson. 1415. It has been stated by a Government officer that there were 153 homestead leases in the district, and that it was currently reported that a large number of these were not occupied? That is not my experience.
 21 Oct., 1897. 1416. This is the evidence we have had upon the subject:

There are 153 homestead lessees, but it is currently stated that a large number of these are not occupied by the lessees. This is to a certain extent verified by the fact that the last sworn stock return only indicated 118 holders of stock in the whole district. When I was at Brewarrina an impression prevailed amongst those who were candid enough to admit it that this number would continue to decrease.

That seems to imply that homestead leasing has been a failure? I do not think that it has been a failure.

1417. Have some of the homestead leases become merged in the larger holdings? I do not think so.

1418. Do you think that the people who have taken up these leases are still living upon them? All that I am acquainted with—and I know a good many—are doing so.

1419. How many? Fifty or sixty.

1420. All those homestead lessees are sticking to their holdings? Yes, I believe so.

1421. They are occupying the holdings which they have taken up? Yes.

1422. You have had considerable experience in sending stock to market? Yes.

1423. We have been told this:

During a good season owners are not anxious to join a railway at the nearest point. They frequently make the stock travel far longer distances parallel with the railway than the distance between Brewarrina and Byrock.

What do you say to evidence of that kind? I feel certain that all owners of stock would avail themselves of this railway. The track into Byrock is very bad for stock. There is no water, and no grass, between the Bogan and Byrock.

1424. What is the effect of driving fat stock long distances;—does it improve them? It knocks the fat off them. The further you drive them, no matter how careful you may be, the more they lose weight.

1425. Although there may be exceptional circumstances, what is the general practice of owners of stock;—do they truck at the nearest railway station? Yes, I think so in nearly every case now. In former times the stock might have been travelled more. We should be able to get stock into Brewarrina quite fresh; but if we took them further from there on to Byrock, there would be no water or grass, and they would get knocked about and all the fat taken off them.

1426. Although a little railway freight may be saved by driving stock, you think that more is lost by the deterioration of the animals? Yes; they lose condition and thus their market value depreciates.

1427. Do you know what it would cost to send in wool from a place like yours to Brewarrina by team? I suppose I would get my wool brought in for about £1 15s. a ton.

1428. If, in addition to that, you had to pay 15s. a ton to have it taken from Brewarrina to Byrock, you would save upon what it at present costs you to get to the railway? I should save 10s. a ton.

1429. The Commissioners have put down 10s. a ton for the conveyance of wool from Brewarrina to Byrock; but you could afford to pay 15s. a ton? I would rather pay 15s. a ton than send my wool down the river. There is always a great risk in sending by river, and the insurance rates are high.

1430. There is also the extra handling and carting? Yes. The reshipping tears the bales to pieces. It is much better for a man to send directly from the station to the trucks. The wool gets less knocked about in transit, and arrives in better condition.

1431. During a severe drought, how does the Brewarrina district compare with other parts of the Colony? I think very favourably.

1432. Is it likely to continue a large sheep-breeding district? I think so.

1433. *Mr. Lee.*] It is estimated that if the line is constructed there will be an annual loss of £4,000 a year upon it;—can you show us how that loss could be made up in the future? No, I am not in a position to do that.

1434. *Vice-Chairman.*] What is the nature of your holding? It is a leasehold.

1435. How many tons of wool do you send to Byrock in the course of a year? About 30 tons.

1436. And how many tons of goods do you get back? From 10 to 12 tons.

1437. What number of live stock do you annually send away? From 2,500 to 3,000 sheep.

1438. To Brewarrina? Through Brewarrina. They are trucked at Byrock.

1439. Do you agree with Mr. Sawers that the area enclosed within the red lines shown on his map would be served by the proposed railway to Brewarrina? Yes, I think that that area would be served by the proposed line.

1440. Are there any stations within that area which would send wool to Bourke or to Walgett, or to any railway station other than Brewarrina? I think that the wool from the whole of that area would come to Brewarrina.

William John Callaghan, storekeeper, Goodooga, sworn, and examined:—

W. J. Callaghan. 1441. *Mr. Trickett.*] In what direction does Goodooga lie from Brewarrina? It is north-east from Brewarrina.

21 Oct., 1897. 1442. How many miles distant? Seventy-six miles.

1443. Have you been there long? Since 1890.

1444. How do you get your supplies? Principally from Byrock or from Bourke. It all depends upon where the carriers are, and upon the state of the roads. Lately I have been getting my goods from Byrock, because the feed is good on that road; but generally I have got things from Bourke, there being a good agency there.

1445. You do not use the river at all? I get my goods carried from Bourke to Brewarrina by steamer when the river is navigable; but it is always a risk.

1446. What is the ordinary rate of carriage from Byrock to Goodooga? £3 a ton.

1447. What is the rate of carriage from Bourke to Goodooga, *via* Brewarrina? £3 a ton.

1448. Is it always the same? It very rarely varies. It depends upon the feed along the road. Sometimes it is as high as £5 a ton.

1449. Do you know the rate of carriage by river from Bourke to Brewarrina? Twenty-five shillings, and it costs £2 a ton to get things from Brewarrina to Goodooga, or £3 5s. a ton altogether.

1450. It has been stated that the rate of carriage on the river between Bourke and Brewarrina varies from 12s. 6d. a ton to 25s. a ton;—have you ever known the rates to be as low as 12s. 6d. a ton? No; not even if you took a steamer load, which would be about 90 tons.

1451.

W. J.
Callaghan.
21 Oct., 1897.

1451. When the river has been navigable for two or three seasons in succession have the rates ever been reduced to that extent? No.
1452. If there had been such a reduction, you would have heard of it, and would have got the benefit of it? Certainly.
1453. Then the statement was a mistake? Yes.
1454. I suppose all your transactions are outwards towards Goodooga? Yes. We cannot go over the border.
1455. You have had no experience in sending goods from Goodooga to Byrock? I have simply seen the wool go through.
1456. You are not a carrying agent? No.
1457. Your interest in the goods traffic is confined to getting up goods to your own store at Goodooga? Yes.
1458. Which do you think is the best route for you to take? The road from Byrock.
1459. Why? For one thing, it is better than the other road; but sometimes I cannot get things any other way. After heavy rainfall it sometimes takes three months to bring things from Bourke to Goodooga.
1460. Is the road bad between Brewarrina and Byrock? No; the road is good between Brewarrina and Byrock.
1461. Is the rest of the road fairly good, too? Yes.
1462. How does the road to Byrock compare with the road to Bourke? There is no comparison.
1463. Do you get goods from Queensland? No.
1464. What is your experience in regard to wool coming from Queensland into New South Wales? I think that wool would go to the nearest railway.
1465. Does much wool come into New South Wales from Queensland? The Queensland wool all goes Narrabri way. The country adjacent to us belongs to the Australian Pastoral Company. The Queensland Government have offered them special facilities; but they are so far from the railway that it would pay them, allowing for the rebates allowed to wool from Queensland, to pay the export duty and send their wool into New South Wales. There is a better market for wool in Sydney than elsewhere.
1466. If the railway were constructed to Brewarrina would that draw any of the wool traffic from Queensland? Yes, a considerable amount of it. There are three large stations close to the border the wool from which would, I know, come to Brewarrina if a railway were made. If wool can be carried from 12s. 6d. or 15s. a ton from Bourke to Brewarrina by rail, it is certain that it will come to Brewarrina.
1467. Where does that wool go now? To Brisbane.
1468. Do you think that if the proposed railway were constructed, it would pay better to send it to Brewarrina? Yes, there would be a margin of profit in favour of sending it to Brewarrina.
1469. That is, taking the duty into consideration? Yes.
1470. How far are the stations you speak of from the nearest Queensland railway? I think about 200 miles. Mitchell is the nearest railway station.
1471. How many miles journey would they save by going to Brewarrina? I do not know that they would save any great distance, but the carriage would be less. When they sent to Brisbane there would be carriage down from there.
1472. By sending to Brewarrina, it would only have one handling? Yes.
1473. Is that a great consideration? It would be.
1474. Is Goodooga a town of any size? No; it is only a small town.
1475. How many inhabitants does it contain? I suppose 200.
1476. Do you know what tonnage of wool would come from your locality to Brewarrina if the proposed railway were constructed? All the wool from there goes to Brewarrina now. Wool goes to Brewarrina from Goodooga, and from the Bokhara, the Birie, and the Culgoa country.
1477. Do you know to what extent this traffic would be increased if the proposed railway were constructed? I am not able to say.
1478. You have no data to go upon? No.
1479. With regard to the stations in our own Colony, do you know if there would be an increase in the quantity of wool produced, supposing that the proposed railway were constructed? I could hardly say.
1480. Mr. Sawers has told the Committee that all the traffic from the district enclosed within red lines on plan 2 would come to Brewarrina? That is the country I spoke about just now—the Birie, the Narran, and the Culgoa country.
1481. Do you think that that country would feed the proposed railway with wool and with stock? Yes; the roads are well grassed and well watered.
1482. How long does it take you to get up supplies? It all depends upon the state of the roads. In rainy seasons it takes three months.
1483. Where does the principal delay take place? Between Bourke and Goodooga.
1484. How many miles is it from Bourke to Goodooga by road? I suppose it is 140 miles.
1485. About the same as to Byrock? Yes.
1486. Have you often had as long a delay as three months in getting up goods? Yes, pretty well. In dry times, when they can travel quickly, it may take three weeks.
1487. How far is it from Brewarrina to your place? Seventy-six miles. The road is much better into Brewarrina. There is not the same network of creeks to cross, or as much swampy country.
1488. When your goods come that way do you have as much delay? No; it is all red-soil country around Byrock. They can travel there in almost any weather.
1489. Have you had any experience in connection with homestead leasing beyond Brewarrina and Goodooga? Yes.
1490. What is your experience in regard to the system? I think that all the steady and industrial lessees have made money.
1491. Do you know if many of the leases have been abandoned? They have not been abandoned, though some of them may have been sold to people wanting an investment. None of them have been thrown up.
1492. If the number of occupiers has decreased, it has not been because of their failure to make a living; but because they were able to get reasonable terms on parting with the land? Yes; in which case someone else takes their place. Lots of the men who have given up were, I think, single men, and they probably sold out to men having wives and families.

W. J.
Callaghan.
21 Oct., 1897.

1493. We have been informed that there are 153 homestead lessees in the district; but that the number of occupiers is decreasing;—is that your experience? No. The leases have increased in value every year since they were first taken up. There may be fewer original lessees; but the people who have purchased are residing upon the land.
1494. They are not all rapidly selling out to the larger holders? No; that is being done only in a few cases. I know three or four homestead lessees who have sold out; but they sold out on favourable terms.
1495. They probably sold to men who had families, and who were increasing their holdings? Yes.
1496. People are not clearing out of the district, because it is not profitable to hold land there? Certainly not.
1497. Are the people with whom you have business transactions fairly prosperous? Yes.
1498. Do they pay their way pretty well? Yes.
1499. Do you consider the district to be a prosperous one? Yes.
1500. A district eminently suitable for pastoral purposes? Yes.
1501. Do you agree with former witnesses that the Brewarrina district withstands drought as well as, or better than any other part of the Colony? Yes, as far as my knowledge of other parts of the Colony goes.
1502. In your trade relations, have you always dealt only with New South Wales? Yes, since I have been at Goodooga.
1503. *Mr. Clarke.*] How long have you been a resident of the district? Eleven years.
1504. I suppose you have a thorough knowledge of the country through which it is proposed to take the railway? Yes.
1505. Are goods generally taken more care of when they are being carried by railway than when they are being carried up a river by steamer? Yes.
1506. How is that? When goods are taken by a steamer they often have to be transhipped once or twice, and dragged up the steep banks of the river. I daresay we could afford to pay 5s. a ton more to have things carried by train. In sending things by river you take the risk of damage, and have high insurance rates to pay.
1507. If the charge by river were the same as the charge by rail, would you prefer to send by rail, and would you be ready to pay even a little more to avoid sending by river? I would not pay more; but I would be willing to pay the same.
1508. Is there a large passenger traffic from Byrock to Brewarrina? I cannot speak definitely about it. From Goodooga there are two lines of passenger coaches running, and the passengers average about thirteen a week.
1509. Would the passenger traffic increase if the proposed railway were made? Yes; we should then have a great command of the Queensland traffic. The wool from these stations now goes to Eulabah, or to the north-western railway. Of course, in any case this traffic would come to our railways; but owners prefer to send their wool by the quickest route.
1510. Are the roads in your district good? In dry times they are good; but in wet times they are very bad.
1511. Would it be expensive to make roads through the district? It would not be possible. There is no stone within 100 or 200 miles.
1512. I suppose the expense of making a road would be almost as great as the expense of making a railway? That I cannot say; but I should think so.
1513. Are you aware there would be a loss of about £4,300 per annum on the proposed line? I was not aware of it; but I know that when the question was first mooted, interest upon the cost of construction was guaranteed by certain people.
1514. I suppose the country is nearly all taken up by homestead lessees? Yes, whatever country has been available for settlement has been taken up. Of course, the pastoral leaseholds are the property of the Crown.
1515. If the proposed railway were made would there be any expense for compensation? None whatever. The land is all Crown land.
1516. Is this a purely grazing country? From Brewarrina to Goodooga it is; but between Byrock and the Bogan, the country is suitable for wheat-growing. Of course, it would want a certain amount of clearing.
1517. We have it in evidence that wheat has been grown not far from Byrock? Yes, and successfully grown.
1518. Will the production of wheat be likely to increase? Certainly, as settlement becomes thicker and the railway is extended. It would be of no use to grow wheat unless there were a provision for taking it away. One man has tried wheat-growing and has made money out of it. During the first year he planted 50 acres of wheat, and this year he has 300 acres.
1519. It is only in favourable seasons that wheat can be grown? Yes.
1520. In dry seasons it will not be possible to grow it? No. The district would then fare like any other drought-stricken district.
1521. Is the rainfall in the district sufficient for wheat-growing? I think so, in two seasons out of three. The yield of wheat is so good that it would more than compensate for any failure during one year.
1522. Does the rain come in at the right season for the growth of wheat and other cereals? Yes.
1523. When does it generally fall? It is generally falling from February to June.
1524. After what Mr. Deane has said, would you not require a larger rainfall before putting in the crops? I am not a sufficiently good farmer to be able to give you reliable information on the subject; but we get showers throughout the year which would be sufficient to freshen up the crops.
1525. Do you think that in favourable seasons a large quantity of wheat is likely to be grown? Yes.
1526. As far north as the Bogan? Yes. I do not think that any wheat could be grown beyond the Bogan.
1527. Is the country too dry? It is not too dry, but it would not be suitable for wheat-growing.
1528. You think that a good deal of wool would come to Brewarrina from Queensland if the proposed railway were made? Yes; from stations near the border.
1529. Would not the Queensland wool duty make it difficult for them to send their wool to Brewarrina? Yes; but if the railway charges from Brewarrina to Byrock are only 12s. 6d. or 15s. a ton, they would probably send to Brewarrina.

W. J.
Callaghan.

21 Oct., 1897.

1530. The competition between the Queensland and New South Wales railway authorities is very keen? Yes. Of course, if the Queensland people found that their wool was coming this way, they would still further reduce their rates.
1531. Are you aware that the railway authorities of this Colony make special arrangements in regard to Queensland wool? I know that a certain rebate is given, but I do not know how much.
1532. *Mr. Lee.*] Do you live near the Queensland border? Yes.
1533. How far from it? Six miles in a direct line, or 9 miles from the Custom House.
1534. Do you live on a road going into Queensland? Yes; on the main road from the Bokhara.
1535. Where does that road go to after it crosses the border? In one direction it goes to Cunnamulla, and in another to St. George.
1536. Do you know if much wool came from Queensland before the export duty was imposed? Yes. All the Woollerina wool came into New South Wales. The present clip will be, I suppose, about 1,500 bales.
1537. The export duty has completely prevented this traffic? I think the special reductions offered by the Queensland railways have done more than the export duties to keep the traffic from coming to New South Wales.
1538. What is the nature of the concessions you speak of? I do not know.
1539. Do you know if the Queensland Government has been making contracts for the conveyance of wool from the runs right to Brisbane? I am not aware.
1540. If the Queensland Government is in a position to offer very favourable terms to wool producers on the other side of the border, how would the proposed railway attract the traffic to Brewarrina? Well, Brewarrina would be very much nearer. When I spoke of the Queensland wool coming to Brewarrina, I was basing my opinion upon conversations which I have had with managers upon the Queensland side, who have spoken to me about the trouble of getting their wool away. They would like to see a railway made to either Brewarrina or Walgett, but to Brewarrina for choice.
1541. Brewarrina is 80 miles from the Queensland border;—how far is Cunnamulla? It is 180 miles from Goodooga.
1542. There is a railway station at Cunnamulla? Not yet. The line is in course of construction.
1543. When that railway is completed, will it not serve the stations on the border? No; Eulabah will still be their nearest point.
1544. The conditions which existed before Queensland extended her railways out into the interior are very different from the present conditions. The question is whether the railway to Cunnamulla will not attract wool that used to come to our railway? It may take some of the traffic; but it will not take traffic from the Goodooga side.
1545. When that line is made, it will be used to compete with our railway, and to secure trade which Queensland never got before? Yes.
1546. Can we reasonably expect any large quantity of wool or stock from Queensland in the future? Yes, I think so; because we have the better market. The conditions being equal, the stock and wool would come this way.
1547. Stock coming to New South Wales have a choice of roads. They can go to Byrock, to Brewarrina, to Dubbo, or across to Narrabri. As a matter of fact, it would not cost much more to drive stock to Bourke than to drive to Brewarrina? No; but there would be the loss in condition.
1548. If people are able to send their wool by train to Brisbane, and thence to Sydney, in less time than it takes to carry it by team to Brewarrina, and thence by train to Sydney, will they not send to Brisbane? That is only natural.
1549. The present rate for wool from Brewarrina to Byrock is about 25s. a ton? I do not know.
1550. You know that it is proposed to charge 10s. a ton upon the Brewarrina railway? Yes; that would give a saving of 10s. a ton on wool coming from Goodooga.
1551. But that would be the only saving? Yes; but the people out there do not want that saving. I am sure that they would be content to pay £1 a ton to have their wool sent by rail from Brewarrina to Byrock. They would then be paying no more than they pay now, and they would get their wool carried much more quickly.
1552. Could the nearest stations on the Queensland side send wool to Sydney *via* Brewarrina more quickly than *via* Brisbane? Yes.
1553. Much more quickly? Yes.
1554. What would the difference in time be? In wet weather it might be two or three months on the road.
1555. Would it not be the same on either side of the border? No, because on the Queensland side they have a network of creeks similar to that between Bourke and Goodooga.
1556. But in rainy seasons, all the roads in these districts are pretty well impassable? The roads on the New South Wales side are better than the roads on the Queensland side.
1557. But are they not all bad? Yes. The road from Goodooga to Brewarrina is always passable. It is bridged now.
1558. It is made, but not metalled? Yes. There is natural water all the way, and a telegraph line.
1559. Then how does it come about that you have your goods sent from Bourke? They come through Brewarrina.
1560. You have them sent by train to Bourke, thence by river to Brewarrina, and thence by team to Goodooga? Yes.
1561. When the river is not navigable, do you still go to Bourke? Yes.
1562. You have a long way to cart? Not further than to Byrock, and there are more teams available at Bourke than at Byrock. Trade has drifted towards Bourke, because it is an old-established place, and because the large agencies are there.
1563. Most of the wool is sent to Bourke, and you take advantage of the teams to get up back loading? No, that has nothing to do with it, so far as I am concerned.
1564. If you have a good road from Goodooga to Brewarrina, and from Brewarrina to Byrock, why do you not avail yourself of it? Because there are no teams and no agency at Byrock. I get my goods sent from Byrock whenever I can.
1565. It is because carriage from Bourke is more reliable that you send goods that way? Well, Bourke is the depot, while Byrock is only a passing station. I would far sooner send to Byrock.

W. J.
Callaghan.
21 Oct., 1897.

1566. If there were the same number of teams at Byrock as at Bourke, which place would you get your goods from? From Byrock. There would not then be a ton of stuff sent to Bourke from Brewarrina or Goodooga.
1567. I suppose all your goods are conveyed on drays, not on camels? Yes.
1568. Apart from the actual saving in cost and in time to the people of the district, what good would the construction of this line do to the country? It would bring in a lot of fat stock from Queensland, and a lot of stock that now travel all along the Bogan would be trucked at Brewarrina. A lot of stock which go right down to Nyngan would be trucked at Brewarrina. The stock route to Bourke is very bad.
1569. Does most of the stock go to Bourke? Yes, in anything like a good season.
1570. If the proposed railway were made, and the road from Goodooga to Brewarrina were very bad, whilst some other road was good, the probabilities are that the stock would follow the good road. The conditions out in that part of the country are very variable? They are more equable there than in other places I know of. Cattle can travel there when they cannot travel in any other part of the country. There is always grass there.
1571. Do you see any probability of a further development there? I think that all the country between Byrock and the Bogan will be thrown open for settlement.
1572. What about the country between your place and the river? That is already held in small holdings.
1573. There is no room for expansion there? No.
1574. It is held under settlement leases, and there is not likely to be any subdivision of them? Not so far as I know.
1575. For further settlement we must look to the area between Brewarrina and Byrock? Yes.
1576. It is estimated that the proposed railway would start with a loss of over £4,000 a year? I hardly know how that can be.
1577. Can you tell us if, in your opinion, the district would progress so greatly after the construction of the railway as in a short time to make up for the loss? No, I cannot speak as to that. Of course, an increase in population would naturally follow the construction of the railway.
1578. You are not prepared to go into estimates of traffic? No, I am not able to do that.
1579. The real object of your attendance here to-day is to inform the Committee of the disadvantages under which the settlers in that part of the Colony live, and the necessity for bringing them closer to market, if possible? Yes.
1580. *Mr. Wright.*] I think you said in answer to a previous question that you were not aware that many homestead leases had been transferred? I am aware that there have been sales of homestead leases.
1581. Homestead leases out there are too valuable to abandon? Certainly. I do not know one that has been abandoned.
1582. Although there has been a decrease in the number of homestead lessees, that has been caused by the fact that the leases have been sold to pastoralists and to others? Yes.
1583. You have said that you are not aware that the number of homestead lessees has decreased very largely? I am not aware of it.
1584. Does not a pastoral lessee sometimes rent a homestead lease for the grass upon it? I have known that to be done; but I do not know of half a dozen such cases.
1585. How many homestead lessees are there on the resumed area of Dumble? I think five. All the original lessees, except one, are there.
1586. Can you name the people who are there? There is Mr. W. R. Moore, of Mogilla; his son, William Moore; and his son, Charles Moore.
1587. Are all the members of the Moore family still in possession? Yes; they have been there ever since they took up the land.
1588. Is it your experience that the homestead lessees have been successful? Yes.
1589. Is it not a fact that in many places homestead leases are held in groups by, perhaps, a father and two or three sons, and in that way a large extent of country is acquired? Yes.
1590. Where homestead leases have been taken up in the Narran country the lessees can always command a good rental for their land? Yes; or get a good price if they want to sell out.
1591. That is proof positive of the value of the country? Yes.
1592. You said that you believed that some people at Brewarrina had formally guaranteed the interest upon the cost of the proposed line;—were they substantial guarantors, who could have met the obligation? I believe so; but this was some years ago. Things may have changed since then.
1593. Do you think the Wooleerina wool will come to New South Wales while the export duty is in force? I think it might. The New South Wales Commissioners allow a large rebate.
1594. They would have to carry the wool from Brewarrina to Sydney for £2 a ton if they allowed a rebate to the amount of the stock tax? Well, that is a matter for them to deal with.
1595. Do you think there is a possibility of any portion of that wool coming to New South Wales, seeing that the Queensland Government are offering very low rates, and are acting as forwarding agents? I should not think so.
1596. Therefore, we cannot put much faith in the Queensland traffic? That traffic would have to be competed for very eagerly.
1597. From your knowledge of the district and its possibilities, do you think that the proposed line should be constructed? Yes.
1598. Could you give the Committee any idea as to the tonnage taken into the district? No.
1599. If we have been told that the tonnage going into Brewarrina is about 2,000 tons, what would you say? I think that is inside the mark.
1600. Do you think that the estimate is too low? Yes.
1601. It has also been stated that the average quantity of wool produced within the area shown on plan 2 does not exceed 20,000 bales per annum? Well, I have seen 23,000 bales at Brewarrina.
1602. You think the estimate of 20,000 bales for that district too low? I think so, for a good season.

FRIDAY, 5 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 HENRY CLARKE, Esq.
 CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

George Charles Yeo, Stock Branch, Department of Mines, sworn, and further examined:—

1603. *Mr. Wright.*] Can you now furnish the Committee with a return of the stock which were treated at the meat-works at Bourke during 1896? It is as follows:—

G. C. Yeo.
 5 Nov., 1897.

How treated.	Cattle.	Sheep.
Boiled	2,537	28,258
Chilled	1,506	21,279
Preserved	280
Total	4,323	49,537

1604. Have you brought a return of the stock which came into Bourke during 1896? Yes; it is as follows:—

Road.	Horses.	Cattle.	Sheep.
From north-west to Bourke	630	25,968	152,901
From north to Bourke	1,072	67,535	319,743
From north-east to Bourke	437	2,250	121,600
Total	2,139	95,753	594,244

1605. That return only includes the horses, cattle, and sheep which came in by the roads from Narran, Hungerford, and Wanaaring? Yes.

1606. Can you furnish a return of the stock trucked at Bourke during 1896? In that year 1,299 horses, 23,555 cattle, and 99,837 sheep were trucked at Bourke.

1607. Have you a return of the stock which came into Byrock during 1896? By the road from north-east to Byrock, 230 horses, 750 cattle, and 57,335 sheep.

1608. Have you a return of stock trucked at Byrock during 1896? 113 horses, 835 cattle, and 66,415 sheep.

1609. These figures you have obtained from your own inspector? Yes.

1610. You desire to correct the answers which you gave to Questions 1200 and 1201? I desire to state that the area indicated by the red line on the map submitted by the representatives from Brewarrina yielded 2,551 tons of wool in 1896. That clip is described by our local stock inspector as being fairly good.

1611. The clip on the whole of the stations within that district indicated by the red line was 2,551 tons in the year? Yes.

1612. You now desire to correct the answer you gave to question 1,201. "Do you know what full woolled sheep averaged in there"? I am now in a position to answer that question. Sheep in the grease, 6 lb; sheep scoured, 3 lb. 8 oz.; lambs in the grease, 2 lb. 4 oz.; lambs scoured, 1 lb. 4 oz. That is the average clip for 1896 in the Brewarrina district.

1613. *Mr. Fegan.*] How do the figures for 1896, with reference to stock coming into Bourke and Byrock, compare with the figures for last year? I did not work out the figures for last year.

1614. Will you supply the figures for last year? I will.

1615. *Mr. Lee.*] I think you now have a return in the Department showing the estimated losses in that district during this year? I believe we have.

1616. Was it a particularly severe year owing to the drought? I could not well answer the question.

1617. Were the losses caused by starvation from the drought? Starvation.

1618. And by cold weather after shearing? The greatest number of losses were owing to the drought.

1619. The losses were supposed to be heavy last year? They were not so heavy in that district as they were in some of the others. They had a fairly good season towards the latter end in that district.

1620. Have you reason to believe that last year would be an average year? It would be about an average year.

1621. It would follow that there are fairly heavy losses every year? Yes.

1622. If we take the figures for last year, it would be about as close an approximation as we could get? Yes.

1623. Will you forward to the Secretary a return of the losses for this year? Yes.*

THURSDAY,

* NOTE (on revision):—Horses, 500; cattle, 1,000; sheep, 50,000; lambs, 150,000.

THURSDAY, 11 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Charles Louis Shainwald (E. Rich & Co.), Sydney, sworn, and examined:—

- C. L. Shainwald,
11 Nov., 1897.
1624. *Mr. Hoskins.*] Do you reside in Sydney or Bourke? In Sydney, but I visit Bourke and the district every month.
1625. Are you engaged in business in the Bourke district? I am manager of branches for E Rich & Co., Limited. They have their office here, and branches inland at Bourke, Walgett, Brewarrina, and Wilcannia.
1626. Does your firm send much loading or merchandise from Bourke to Brewarrina? Yes.
1627. Can you give a statement of the quantity? I have a statement here which I laid before the Committee on the inquiry into the lock and weir on the Darling, and that covered practically the same question. Freight from Bourke to Brewarrina and district in 1892 amounted to 2,192 tons; 1893, 2,078 tons; in 1894, 1,893 tons.
1628. Has your experience since 1894 led you to form the opinion that in 1895 and 1896 the average of the traffic was the same as in the years quoted? No; I should say it was slightly less, for the reason that at that time there was a very large increase in the traffic owing to the fact that the stations used wire netting, on account of the rabbits. That caused a large volume of traffic.
1629. Has the traffic since diminished? Yes.
1630. Seriously? I could not say seriously. It is only a matter of estimate, for after 1894 the river has been hardly navigable for any length of time, and there were no means of arriving at the river traffic after 1894.
1631. Am I to infer that the traffic on the river from Bourke to Brewarrina has diminished during the last three or four years in consequence of the river not being navigable? Yes, because of the smaller demands on the part of the residents. There have been no improvements going on. The demands of the residents for traffic have been less since 1894.
1632. Has that arisen from any of the runs being abandoned from the serious loss of stock, or from the general adversity which may have prevailed? I should say it has arisen from the serious loss of stock and the depression in the Colony everywhere.
1633. Prior to 1894, were you in the habit of receiving much wool from the Brewarrina district? Yes; I have a return which I laid before the previous Committee as follows:—Wool from Brewarrina and district, 1892, 15,960 bales; 1893, 14,592 bales; and 1894, 12,749 bales.
1634. Has your firm an office at Brewarrina? Yes, and a staff of employees.
1635. Are there other forwarding agents there besides Rich & Co.? Yes, Wright, Heaton, & Co. have a representative there. I think that is all.
1636. In the years you have quoted did Wright, Heaton, & Co. forward wool from the Brewarrina district to Bourke? Yes, and that wool is included in my return, which represents the whole of the traffic.
1637. How far does the range of your Brewarrina business extend? It is very difficult to say, because the Brewarrina office is the centre for the Walgett business as well, and all the Walgett traffic filters through Brewarrina.
1638. Then the wool which you specify as coming by steamer to Bourke might have come by Walgett as well as Brewarrina? No; I have taken the stations separately.
1639. Is your firm or any other forwarding agents stationed at Walgett? I do not think there is another firm of forwarding agents with an office at Walgett. I am not positive.
1640. Do you forward much wool through your Brewarrina office by carriers to Narrabri? Not from Brewarrina at all—from Walgett to Narrabri. We limit our business wholly to the Bourke and Brewarrina district.
1641. Do you do business with Walgett? Yes, but only in general merchandise.
1642. Have you been in the habit of forwarding wool from Brewarrina to Byrock? Yes.
1643. Has the quantity of wool forwarded from Brewarrina to Byrock during the last three years increased in volume? I have no return, but I should say it has increased, for the reason that there has been no river traffic.
1644. What is the average rate charged per ton for the conveyance of merchandise from Bourke to Brewarrina, and for the conveyance of produce—wool, &c.—from Brewarrina to Bourke by river? That is a point that I would not care to state, because it would be, to some extent, divulging certain business arrangements, and it depends wholly upon what the traffic will bear. It depends upon what we can get.
1645. What has been the average rate? The rate varies. It has been low in some instances and high in others.
1646. Can you give a maximum and minimum? I would answer that question by saying that under existing circumstances the minimum rate has been 12s. 6d. and the maximum 25s.; but what the rate will be when there is a railway I am not prepared to say.
1647. When was it as low as 12s. 6d.? With the high river in 1892.
1648. Has the construction of the weir near Bourke facilitated navigation in the Darling? I do not think it has. I do not see how it could. There is only one weir. It throws the water back 25 miles, and you might get blocked at that point. It is only in an experimental stage.
1649. Is it the general opinion that the experiment will be successful, if other weirs were constructed, in keeping the river open? Personally, I do not think there is any question about it, nor do I think that those who have seen the weir would question the practicability of doing so.

1650. Since the weir has been constructed, has there been any heavy floods calculated to injure it? There have been two floods which covered the weir absolutely since it was constructed, but they did no injury. I think the highest flood this year, was when the river was up 28 or 29 feet at Bourke. The weir is covered when the river is 15 feet at Bourke. So the weir was practically covered by 14 feet of water, and it was again covered in the late flood.

C. L.
Shainwald.
11 Nov., 1897.

1651. Do you consider that if the navigation of the Darling were improved by the construction of weirs between Bourke and Brewarrina, the owners of steamboats and punts could convey loading to and from Bourke and Brewarrina at a lower rate than it could be conveyed by rail, and yet pay? Yes.

1652. Have you heard many people complain of wool being knocked about when sending it by river? Yes.

1653. Still they do not hesitate to send it when the river is navigable, when there are facilities? The facilities are now being improved. A contract has been let, I think, by the Harbours and Rivers Department for the construction of a wharf and crane accommodation at Bourke, which will, of course, lessen the handling of the wool very materially. In addition to that, the use of the lock and weir has been approved of by the Department for the docking of steamers, which will obviate the necessity of sending the steamers to South Australia for that purpose. The result of that will be that the running expenses of the vessels will be very materially lessened, and the cost of running as a whole will be reduced.

1654. What fuel is used? Wood.

1655. Is there any difficulty in obtaining wood? No; it costs from 4s. to 6s. a ton. I wish to substantiate some figures which I gave to the Committee in connection with the Locks and Weirs inquiry. Some doubts have been expressed as to their correctness. In order to place those figures in proper comparison with the figures already submitted to the Committee, I obtained from the Secretary the evidence given before this Committee, especially that given by Mr. Harper and Mr. Sawers. I now beg to refer categorically to that evidence. In reply to question 201, Mr. Harper gives the following figures as to the receipt of wool at Bourke from the Brewarrina district:—

	1893-94	1894-95.	1895-96.	1896-97.
River	13,000 bales.	12,528 bales.	209 bales.	2,608 bales.
Road	5,000 "	4,940 "	9,791 "	7,268 "
	<u>18,000 "</u>	<u>17,468 "</u>	<u>10,000 "</u>	<u>9,876 "</u>

In reply to Q. 202 and Q. 203, Mr. Harper adds:—

	1893-94.	1894-95.	1895-6.	1896-97.
Walgett	9,270 bales.	8,500 bales.	2,462 bales.	2,061 bales.
	<u>27,270 "</u>	<u>26,268 "</u>	<u>12,462 "</u>	<u>11,937 "</u>

The figures given by me (p. 16, Locks and Weirs evidence) were made up from January 1st to December 31st of each year, whereas those given by Mr. Harper are apparently made up from June of one year to June of the following year, as is the railway practice. The statement made by Mr. Trickett (Q. 219 and Q. 220) is incorrect in that it declares my figures in the Locks and Weirs evidence to have been given for the season 1893-94. On the contrary, the figures are for the years 1893 and 1894 individually. Nevertheless, taking the series of years 1892, 1893, and 1894, my figures will be found to agree substantially with Mr. Harper's, thus:—

1892.	1893.	1894.
28,245 bales.	27,120 bales.	25,071 bales.

The small discrepancy is accounted for by my having included intermediate wool, which Mr. Harper quite properly rejects as outside the scope of the present inquiry. Q. 296.—Mr. Kerrigan's statement cannot be treated as statistically correct, as he has had no books from which to arrive at figures with any exactness. When he states that the traffic is 10,000 tons he is making a manifest over-estimate. In no one year has the traffic reached that quantity. The figures I have already given were taken from our books at Bourke, where only the complete records are kept. Q. 471.—Mr. Bacon says that a lot of wool from that portion of the Colony of Queensland, North of Goodooga, comes into New South Wales now. Stations partly in Queensland and partly in New South Wales can hardly be included wholly under the category of Queensland stations. I know of no wholly Queensland wool, except Kinglibilla, from that section coming into New South Wales at present, nor is the railway likely to bring it. Q. 719.—Mr. Sawers credits the Boorooma wool to Brewarrina. I believe with a railway to both Walgett and Brewarrina, it would go to Walgett, for the reason that the rate thence is lower, *vide* Mr. Harper's evidence, Q. 186:—Walgett to Newcastle, £3 9s.; Brewarrina to Sydney, £4 10s. In same question, Mr. Sawers states the cartage at Bourke at 3s. 6d. At present it is 2s. 6d., and will probably be further reduced when the wharf and crane accommodations at Bourke (for which tender is let) are completed. The estimate of river freight is capable of reduction under the late altered conditions whereby a dock is shortly to be completed at the Bourke weir, thus reducing the maintenance expenses of steamers very materially. Hitherto it has been necessary to include in estimated expenditure the cost of a voyage every two years to South Australia for docking, which will be done away with when the dock is completed at Bourke. Mr. Sawers credits Brewarrina with an average wool traffic of 17,934 bales, but this has not been reached in any one of the years 1892, 1893, or 1894 specified in my evidence on the Locks and Weirs inquiry. The highest was in 1892, in which year it was 15,960, or, say, 2,000 bales less than Mr. Sawers' estimate, and this 15,960 bales includes intermediate wool between Brewarrina and Bourke. It is for the Committee to say whether, with the evidence of Mr. Harper on river competition before them, Mr. Sawers' estimate is likely to be reached. Mr. Sawers bases his wool tonnage on an average of $5\frac{1}{2}$ bales to the ton, but I have here a return covering 21,333 bales received at Bourke in years 1892 and 1893 from the Brewarrina and Walgett districts indiscriminately, on which the average is $6\frac{2}{3}$ bales to the ton, so that Mr. Sawers' tonnage calculation is very materially over-estimated. For example, Mr. Sawers states that his estimate of 17,934 bales is equal to 3,416 tons at $5\frac{1}{2}$ bales. The same number of bales of wool on the proven average, as shown herewith, of $6\frac{2}{3}$ bales to the ton, is only 2,686 tons, an over-estimate of 730 tons. A further deduction of 300 tons (2,000 bales) should be made representing the difference in the average (17,934 bales) claimed by Mr. Sawers and that proven by my figures (15,960 bales). A further deduction should be made of intermediate wool between Brewarrina and Bourke, which in season 1892-93 was 391 tons, and in season 1893-94, 437 tons (see return), or, say, 400 tons average, thus leaving the wool tonnage on Mr. Sawers' own figures 1,986 tons, against Mr. Harper's 1,500 tons. Of the two, I believe Mr. Harper's to be nearer to

C. L. Shanwald
11 Nov., 1897

to actual figures, and in support of same I have here a return prepared of wool in tons actually received by my firm at Bourke, made up from June, 1892, to June, 1893, and June, 1893, to June, 1894, as follows —

Wool loaded at Brewarrina	1892-3	1893-4
	1,443	1,445 tons
Wool loaded above Brewarrina, and at Walgett ...	1,641	1,659 „

This substantially represents the whole of the wool traffic, as probably four-fifths of it is handled by our firm. Shortly then, the foregoing statement may be summarised as follows —

Mr Sawers estimates the Brewarrina average wool traffic	Bales	Tons
From which I deduct over-estimated weight	17,934	3,416
		730
Leaving tons		2,686
I next deduct the difference in average traffic . . .	2,000	300
Leaving	15,934	2,386
I then deduct intermediate wool between Brewarrina and Bourke . . .		400
Leaving tons		1,986

The Committee have, therefore, these three results — Mr Sawers, 1,986 tons, Mr Harper, 1,500 tons, my figures, 1,445 tons. I would also hand in to the Committee the following detailed returns —

Return of wool actually loaded at Brewarrina, and between Brewarrina and Bourke, by E Rich & Co. (Ltd)

Season 1892-93	Ton cwt	Season 1893-94	Ton cwt

Average weight per bale, 3 cwt 0 qr 3 lb, or 6½ bales to the ton

1656 Have you any doubt in your mind that if there were a favourable river between Brewarrina and Bourke, the greater portion of the traffic of Brewarrina would be sent to Bourke by river? I feel satisfied that, with a favourable river, the traffic would always go to Bourke.

1657 Why? It is a matter of price

C. L.
Shainwald.
11 Nov., 1897.

1658. Would the loading be carried cheaper by the river to Bourke than from Brewarrina to Byrock? Yes, especially from above Brewarrina, because there would be no trans-shipment necessary at Brewarrina.
1659. If a railway were constructed from Byrock to Brewarrina, would your firm enter more vigorously than it has done into the forwarding business at Brewarrina? By all means.
1660. *Mr. Trickett.*] We have had a number of witnesses before us, and we have asked them if they ever heard or knew of the rate of carriage by river from Brewarrina to Bourke being as low as 12s. 6d. per ton. In every case they denied the statement. Mr. Bacon said that he has lived in the district for seventeen years and he never paid less than 25s. a ton, and that he has frequently paid from 30s. to £2 a ton for up loading. The statements are so very conflicting that I should like to ask you whether the rate you mentioned of 12s. 6d. per ton was an isolated case? It was certainly an isolated case.
1661. I suppose it is not intended by you to put that down as a kind of average? As bearing upon the present inquiry, I should say yes, because it shows the minimum rate that we have been charging, and we might be prepared to go under that if a railway were constructed.
1662. That would be a cutting rate? Exactly.
1663. Would 12s. 6d. per ton give you a profit? That is very hard to answer.
1664. Would insurance have to be added on to that rate? Yes.
1665. Would cartage from the wharf at Bourke to the railway have to be added? No; we give our rates through to the railway. Only insurance would have to be added.
1666. Does Mr. Harper estimate the rate of carriage from Brewarrina to Byrock and *vice versa* at 15s. a ton? He estimates goods traffic at 10s. a ton, wool at 10s. a ton, and intermediate wool at 7s. 6d. a ton.
1667. If you were to come down so low as 12s. 6d. per ton, why would people pay 12s. 6d. when they could send their goods by train for 7s. 6d.? We do not say that we would come down to 12s. 6d.
1668. You say you might come down to that? No; we say that that has been the maximum and minimum rate up to the present, but we do not say what we are prepared to charge if a railway is constructed.
1669. Are you likely to come down to 7s. 6d.? I cannot say.
1670. I suppose you concede that with regard to stock carriage the railway would always be used in preference to the river? There is no question about that; but I do not concede that we are not in a position to carry stock by the river.
1671. Still the stockowners prefer the railway? There would be less handling by train.
1672. What has been the effect of the construction of the weir at Bourke? After the first flood we had a splendid sheet of water from 20 to 25 miles north of Bourke.
1673. Therefore, with a view to improving the depth of water at Bourke, and a few miles above it, the weir is performing the work expected of it? Unquestionably.
1674. Mr. Sawers was asked to supply certain information, and to produce a block map showing the area of country that he thought would feed the Byrock-Brewarrina railway if it were constructed. He supplied the plan which you have before you, and a list of stations;—what is your opinion with regard to that map? Looking at it very roughly, I would draw the line on the east side of the Culgoa River. All the country east of the Culgoa is flooded when the river is high.
1675. What stations are comprised in the area you mention? From Milroy, with high water, the wool would just as likely go to Bourke as it would go by road to Brewarrina. At present it goes to Bourke by road. The bulk of the stations mentioned are quite correct. Boorooma is doubtful as far as the Byrock to Brewarrina railway is concerned. I happened to see the manager of that station a fortnight ago, and I asked him casually which way he would be likely to send his wool in the event of a railway being constructed to Walgett and also to Brewarrina, the rate from Walgett to Newcastle being £3 9s. per ton, and from Brewarrina to Sydney £4 10s. a ton. With these figures before him, I asked him which way he would send his wool. He said to Newcastle, as being the nearest and cheapest point to the sea-board. Milroy, Boorooma, Weilmoringle, Kunreebree are doubtful. The latter station appears as Kerreebree in the evidence. Calga is doubtful. The others are unquestionably correct.
1676. Are they doubtful only in the alternative of a railway being constructed to Walgett, or are they doubtful if there is only the railway to Brewarrina? Boorooma would be doubtful, leaving out the question of river competition. The wool from Weilmoringle would go to Brewarrina when the roads were dry. In wet weather it would go to Bourke by road, where it goes at present. Kunreebree the same. There would be three very bad creeks to cross before reaching Brewarrina.
1677. Are all those stations which you have named very large stations? Yes.
1678. Would that make a considerable reduction in the traffic? Yes, over 5,000 bales. In really bad weather we have had Weilmoringle wool coming in by Engonia. It is never shipped.
1679. Have you gone very carefully into this question of the estimated traffic? There is no difference between Mr. Sawers' figures and mine. I took Mr. Sawers' figures as a basis. I have given you other figures to show where I think he makes an over-estimate. He has made an over-estimate in averaging the bales at $5\frac{1}{2}$ to 1 ton. I estimate that there should be $6\frac{2}{3}$ bales to 1 ton.
1680. Do you give an estimate of the wool which would be sent by those stations which you say are doubtful? I can safely say that the quantity would be over 5,000 bales.
1681. Why do you think that none of the Queensland traffic would come over this way? As far as that section of the country is concerned, the Queensland Government are already considering the extension of the railway to St. George, which would take much of that traffic. We never had a very large section of that traffic even before the Queensland Government brought in the border tax. The only large station we had was Woolerina. Even without the border tax, I do not think it would come in, because they have moved the head station 70 miles away from where it was before, towards the Queensland railways.
1682. Are the Queensland Government competing very hard for that traffic? Yes.
1683. Is it a fact that they are going in for contracting on the Queensland railways? They did so some time ago. Whether they are doing so at present I cannot say. They give the station-owners a through rate from the stations. They pay the cartage themselves.
1684. Are they going on with that? I cannot say.
1685. Supposing weirs were constructed in preference to a railway, would your firm, or any other firm, come forward to make fixed charges for carriage to last for a considerable time, the same as the railways make fixed rates? I think they would be in a better position to do so than at present. With a settled river, there is no doubt there would be competition between the boats themselves. At present the river

C. L.
Shainwald.
11 Nov., 1897.

is so uncertain that it does not pay boats to compete. If there were a fixed river, there would be competition, and rates would have to be fixed, and fixed pretty low.

1686. With regard to the two systems of carriage, what is your experience as to which is the most availed of—where there is a railway and where there is a river? I should think that, all the world over, river traffic has the preference over any other method as being the cheaper.

1687. *Mr. Hoskins.*] Is there much wool sent by river from Bourke to Melbourne or South Australia? Very little.

1688. *Mr. Clarke.*] You have stated that in the event of the river being navigable, the traffic from Brewarrina to Bourke would go by river in preference to a railway? Yes; on the assumption that the rate would be lower.

1689. During the last two or three years the weather has been very dry, and the river could not be taken advantage of? Quite so.

1690. How do they convey the wool? To the railway at Bourke or Byrock.

1691. Is the land-carriage from Brewarrina to Byrock cheaper than the water-carriage? The land-carriage to Byrock is higher than the water-carriage from Brewarrina to Bourke.

1692. If a railway were constructed from Byrock to Brewarrina, is the traffic likely to increase? I cannot see from what source it can be increased. It would simply take the traffic away from some other point.

1693. Would there be much probability of the loss on the railway being recouped? I cannot see it.

1694. Would a railway be more convenient on the whole for the people about Brewarrina and the adjoining country than going by way of Bourke by water and thence by rail? Yes; under existing conditions.

1695. *Mr. Humphery.*] I think you contrasted the traffic on the Western and North-western systems of railway, favouring the North-western system, because of the favourable difference in the railway rates? I do not think I made a contrast, except in the case of one station—Boorooma.

1696. Upon the assumption that it would be worth while for that station proprietor to send his wool by the North-western system instead of by river down to Brewarrina and Byrock, and by the Western system, what would be the effect of the construction of the Narrabri-Walgett railway on the river traffic now going to Bourke;—would it be the means of attracting traffic up stream to Walgett? Up to a certain point it certainly would. The river competition would be the same at either point.

1697. To what extent would that affect the prospects of the railway? I should say that any station from Boorooma north would be just as likely to go to Walgett as to come down the river.

1698. What stations, included in the red boundary, would send their wool by Walgett in the event of a railway being constructed to that point? If a station like Boorooma, which is the largest, took the step which the manager said would be taken, I should conclude that any station north of that point would do the same.

1699. Mention the stations that would be similarly affected? Moonabie, Gingie, Euroka, Llanillo—there are a great number of selections around there—Ulah, Milrea. These are the largest stations on the river from Boorooma north to Walgett.

1700. Do you say that with the rates quoted the probability is that the wool from those stations would go to Walgett up stream instead of to Brewarrina? Yes; leaving out the question of river competition. Purely as a railway matter, if they had those rates before them, they would take the line from Walgett to Newcastle.

1701. How many bales would be sent from those stations? Probably 7,000 bales.

1702. About 1,000 tons? Yes.

1703. At present does the wool reach either one or the other system of railway? Yes.

1704. So that if a railway from Byrock to Brewarrina is made, and also a railway from Narrabri to Walgett, it is just a question whether the wool would come by the Byrock-Brewarrina or the Walgett-Narrabri railway? Yes.

1705. *Mr. Lee.*] Have you examined the names of the stations enumerated in question 974, and are you of opinion that the destination of the produce from some of them would be doubtful; that some would go to Brewarrina and some to Bourke? Yes, under certain conditions of the seasons.

1706. Therefore, if it has been stated that the produce of those stations would be absolutely certain to go by this proposed railway, and that the traffic could not be diverted to any other place, are you of opinion that that statement is correct? No; I would not take it as an absolute certainty, and I would deduct it from the return.

1707. Could any of that traffic be diverted if a railway were made to Walgett, or if a railway were made to Byrock from Brewarrina? Boorooma is the only one.

1708. Supposing the statement is correct? Yes; there is no doubt about it.

1709. Have you dealt with the goods traffic? No.

1710. Have you seen the return given in Mr. Sawers' estimate of the goods traffic? I have not had time to go into the goods traffic very closely.

1711. Have you any reason to question the accuracy of Mr. Sawers' statement in that respect? No reason whatever, but I have not examined it closely.

1712. Is Mr. Sawers' estimate an over-estimate? If it is only the goods traffic as far as Boorooma I should consider it is an over-estimate.

1713. How much? It is very difficult to say.

1714. Do you find a difficulty in dividing the traffic as far as Boorooma and as far as Walgett? Yes, without making a special examination of the traffic, because my estimate includes all the intermediate traffic between Bourke and Brewarrina.

1715. Mr. Sawers has relied upon your figures, and there may be a different destination? The scope of the inquiry was different. That was an inquiry as to all the traffic coming to Bourke as a terminal, whereas the present inquiry is what will come to Brewarrina from that section only. I think that is where Mr. Sawers made a mistake.

1716. Taking it on the Brewarrina basis, and assuming that Brewarrina was the railway depôt, do you think there would be, from that point up stream, 2,450 tons of goods? No.

1717. If you had the whole of the trade dealt with between Bourke and Walgett, it would only amount in the best year to 3,500 tons? Yes.

1718. If a railway were constructed to Brewarrina, with a favourable river, would there be competition from Bourke to a point beyond Brewarrina? Yes, undoubtedly.

1719.

1719. As to the traffic of the western country generally during the past five years, has there been an increase or a decrease, or has it stood still? That is only a matter of opinion. I should say that there has been a decrease. There has been a constant decrease since 1892.
1720. Have there been some special reasons for that—periods of drought or flood? Yes.
1721. Would not that operate against an increase of production? Yes.
1722. Would it be fair to take that traffic as a basis? No.
1723. Would it be reasonable to suppose that we will come back to a period when there was as much traffic as there was in 1892? It is very hard to say, because at that time there were a great many improvements going on. Whether that will occur again I cannot say.
1724. What settlement is there likely to be in that country? I think the general trend in the back country is that with an increase of settlement there will be an increase of production.
1725. Has there been an increase of produce? According to the returns there has not. Whether it is due simply to a bad season, or whether the country generally is in a worse state, it is difficult to decide. There has been more settlement.
1726. Do you handle nearly all the produce in that part of the country? Yes.
1727. Taking all station produce, except live stock, has it increased or decreased? It has decreased in volume and bulk, but it may have increased in the number of growers. The settlement is larger, but the produce has not been commensurate with it.
1728. As far as your returns would show, if any of the stations had been converted from sheep into cattle stations it would show a decrease in your returns, because you do not handle live stock? Yes.
1729. Has there been any such change? No, it is quite the reverse. Some who had cattle at that time have sheep now.
1730. What is your opinion as to the future of the country there;—is it going to increase in production? In the immediate future, say within the next ten years, I do not think so. Within the next quarter of a century I hope to see it a great agricultural country.
1731. What could happen to increase the grazing capabilities of the country? I do not know that I can offer a suggestion to the Committee.
1732. Is the country capable of carrying 50 per cent. more stock than at present? By no means.
1733. Then you are unable to see how the returns are going to be increased unless there is increased agriculture? Unless fresh conditions arise.
1734. Those conditions are not there to-day? No.
1735. If that be the case, and any railway to any point is to be made under the condition of a loss to start with, what prospect can be held out by you and others of that loss being recouped in the near future? Nothing other than a large growth of population in the more populous centres.
1736. Have small settlers in that country been a success? No.
1737. Is the statement correct, that to carry on sheep-farming at a profit in that uncertain country the area must be large and the number of stock carried also large? The area must be large. As to the number of stock, that would depend upon the quality of the country.
1738. Does the history of that country prove that it has always been subject to periods of disaster? Yes; subject to drought and flood.
1739. Is that likely to continue? Yes.
1740. If small settlement has not been established there under the favourable conditions of the land laws what prospect is there of small settlement coming later on? The only way in which I can see small settlement could come there is by using the land for different purposes, as Mr. Barton is doing now, for agriculture. I might say that there is already a lot of land available for that purpose where there is a railway—that is, from Bourke down to Nyngan. But I believe that is what will come eventually. There will be a large agricultural country, but not in this century.
1741. Would you like to embark in that yourself? No.
1742. Then you are utterly unable to show the Committee, if a railway is to be made to Brewarrina which will show a large loss upon its completion, how that loss is to be made up in the future? No; not in the immediate future.
1743. Are you also of opinion that if a railway is made there the river will always compete with it under favourable conditions? When the river is favourable, at all times.
1744. A good season on the river would be disastrous for the railway? Yes.
1745. What could happen to drive all the trade on to the Brewarrina railway and take a certain portion away from Bourke? Only two conditions that I can see—one, that the railway should cut the rates down below their present estimate, or another which would, of course, entail considerable hardship; that is, not to snag the river, so as to prevent boats from travelling.
1746. Or imposing a river tax? Yes.
1747. None of which you advocate? No.
1748. *Mr. Wright.*] You have looked over Mr. Harper's estimate and his estimate of traffic, and also Mr. Sawers—Mr. Sawers says that he bases his figures on your figures, and his deductions from the figures you submitted to the Committee on a former occasion lead him to believe that Mr. Harper has under-estimated the traffic by 50 per cent.? Yes.
1749. Have you shown that Mr. Sawers' figures are incorrect? I say they are over-estimated. I take Mr. Sawers' figures and I show where I think they are over-estimated, and I bring out a result equal to Mr. Harper's figures.
1750. You say that you take an average of 6½ bales of wool to the ton;—is not that very large? I extracted that from my own books.
1751. The number of bales that Mr. Sawers estimates, and the number you estimate is practically the same, yet you bring out the result of 730 tons less? Yes.
1752. Does it all hinge on the question of a certain number of bales to a ton? Yes.
1753. Do you agree that it is a growing practice to scour more wool on the stations which decreases the weight? Yes.
1754. It is also the practice to use a smaller-sized bale? Yes.
1755. Mr. Harper estimates the goods at 2,000 tons, Mr. Kerrigan, your agent at Brewarrina, estimates it at double that quantity. Can you give the Committee any explanation;—do you say that Mr. Kerrigan's estimate is unreliable and incorrect? Yes; he has no books to guide him.

C. L.
Shainwald.
11 Nov., 1897.

C. L.
Shainwald.
11 Nov., 1897.

1756. Are Mr. Harper's figures approximately correct? As far as my knowledge and examination have gone, I should say that Mr. Harper's figures are very nearly correct—quite as correct as I could arrive at them.

1757. Are they correct on the tonnage? Yes.

1758. A great deal of stress has been placed upon the importance of this railway, because it was stated that there was an immense truckage of stock from that district, and that, therefore, the railway is of importance to the stock-owners, and would pay. Mr. Harper estimated that there would be 1,000 trucks of live stock per annum. That was disputed by some people in Brewarrina. One agent said he himself sent 900 trucks of stock from that district. In getting evidence from the Stock Department, we find that Mr. Harper's figures are substantially correct in that respect also;—is there a large quantity of stock taken to Bourke? I am not able to speak on that subject, but there are meat-works at Bourke, and a considerable amount of stock is sent there.

1759. Would not that stock go to Bourke under any circumstances? Yes, unless similar works were constructed at Brewarrina.

1760. Are not the works at Bourke largely owned by people in the Narran district? Yes.

1761. Are they likely to put up works at Brewarrina? I very much doubt it.

1762. Do you say that the prospects of agriculture are great in the future? That is my opinion.

1763. There has been no agricultural settlement of consequence during the last thirteen years between Bourke and Nyngan, and what prospect is there of any immediate agricultural settlement between Byrock and Brewarrina? It is not likely; there is no immediate prospect. Land is being taken up along the railway line between Bourke and Nyngan for agricultural purposes.

1764. What are they growing? Wheat chiefly; there are some very good crops.

1765. You are largely interested in the Bourke business, but disabusing your mind of that, can you tell the Committee whether you think it would pay the State, and be justifiable, to construct a railway between Byrock and Brewarrina? I do not think it would under present conditions.

1766. Unless conditions alter very materially, do you think it would be an unjustifiable expenditure? Yes, taking everything into consideration, especially the competition from other sources for the traffic.

1767. Would the construction of this railway confer a very large benefit on the people around Brewarrina to the north-east and north-west? There is no question it would confer a benefit, particularly on the town of Brewarrina.

1768. Would it confer a great benefit on that large agricultural and pastoral district? I do not think it would confer a benefit commensurate with the loss that would fall on the State.

1769. Would the State be justified in spending £4,000 per annum more than it received to confer a benefit on that particular district? I should say not.

1770. Would it be cheaper for the State to subsidise them by distributing £4,000 amongst the people there, in order to improve their present means of communication? I should say so; because if you did distribute £4,000 you would arrive at an exact figure, whereas if you construct the railway, you do not know where the expenditure is going to end.

THURSDAY, 9 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The HON. FREDERICK THOMAS HUMPHREY.

The HON. JAMES HOSKINS.

The HON. CHARLES JAMES ROBERTS, C.M.G.

The HON. WILLIAM JOSEPH TRICKETT.

The HON. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Joseph William Boulton, Superintendent of Public Watering-places and Artesian Bores, Department of Mines, sworn, and examined:—

J. W.
Boulton.
9 Dec., 1897.

1771. *Chairman.*] The limit of your artesian water to the south and east is practically a line from Wallangra down to Warialda and south-westerly to Gilgandra, and then going in a westerly direction from Gilgandra, it passes out towards the Cobar country? Yes; we have only been able to get it across the Macquarie in one bore yet.

1772. When from Gilgandra it gets to the Macquarie, that is the limit? Yes; the Warren bore is the one I am speaking of.

1773. The area of the country under consideration extends from Brewarrina to Byrock; taking those two points on the west, and extending easterly along the line just laid down as the eastern boundary of the artesian water, will you tell us where the bores have been a failure, and where they have been a success? I should like to point out that between the North-western railway-line and the Macquarie River, and the Barwon on the north, we have not had a successful bore. The whole of the country to the west of the Bogan—between the Bogan and the railway line—in shown as the older formation, in which it is hopeless to seek for artesian water. Then, east of the Bogan extending up to the Marra Creek, there is a patch of tertiary country running the whole way from the Barwon right down nearly as far as Nevertire. We have put two bores down—one at Narraween and another at a place called Tarrion—neither of which was successful. The Tarrion bore was a failure, and from the Narraween bore we just got a flow and that was all—the water just trickled over the surface.

1774. The Narraween bore would be somewhat south of Brewarrina? It is right on the Marra, pretty well due east from Byrock.

1775. And the Tarrion bore? That is south from Brewarrina about 8 miles.

1776. The Tarrion bore was an absolute failure;—what did you get into? Into granite. We got down to the bed rock.

1777.

J. W.
Boulton.

9 Dec., 1897.

1777. In the case of the second bore at Narraween you got some result? Yes, just a flow; that was all. A very good pumping supply, no doubt. We have not put a pump on it yet. Since that bore was put down, Mr. Pittman has made an examination of the country on the line between the Bogan and the railway, and a discovery was made of some extinct mud springs on Willaroon. That would be pretty well east from Coolabah station, and there is no doubt that portion of the artesian basin comes in there very close to the railway line, and sometime or other I suppose a trial will be made. The mud springs at the time of our visit were practically extinct to all appearances, but we opened them up and they flowed readily.

1778. Is that the nearest place to Byrock on the south that you have any knowledge of? Yes.

1779. And Tarrion would be virtually on the line from Byrock to Brewarrina? Yes.

1780. And between Tarrion and Byrock have you any information? Between them there is no chance of artesian water, because at Charlton and also at Gologgon, the granite outcrops in the bed of the Bogan itself, and there are several outcrops of granite in between Charlton and Byrock.

1781. That is virtually all the information you can give us with regard to artesian boring? Yes, on that particular line.

1782. Would you care to express an opinion with regard to the class of country there? It is very hard scrubby country between Byrock and Charlton, and also between Byrock and Gologgon, until you get pretty close up to the Bogan, and then you get on to the river flats which are fairly good; but there is a terrible amount of that box scrub growing all through the country.

1783. Do you regard it as good country between Byrock and Brewarrina? From the other side of the Bogan into Brewarrina it is good.

1784. Is it poor country south from the Bogan? From the Bogan to Byrock, I would not call it first-class country.

1785. Do you regard it as purely pastoral country? Entirely so; although I may say that at the Government tank 16 miles from Byrock, between that place and Charlton, the Crown tenant has grown wheat for hay very successfully. He has grown hay crops on a small area of about 4 acres.

1786. There has not been sufficient agriculture to justify you in expressing a definite opinion? No.

1787. Are we justified then in believing it to be your opinion that from Brewarrina to the Bogan it is a fair pastoral country, and from the Bogan to Byrock it is inferior pastoral country? Yes. There are many thousands of acres of the Byrock country you could not put a plough into, because it consists of hard quartz ridges.

1788. Going east from the Bogan towards the Macquarie, will you tell us what your operations have been there? Following the rivers up from their junction with the Barwon: on the Marthaguy we have the Carinda bore, and on the Macquarie, we have the Warren bore. These two bores are separated by about 130 miles, and the whole of this intermediate country would be artesian water-bearing. On the Castlereagh we have the Euroka bore, about 8 miles from the Castlereagh; and then, following the river after you get to Coonamble, and then to Gilgandra, there are three bores on the river. Between the Castlereagh and the Marthaguy and the Macquarie, we have the Tenandra bore and the Bourbah bore. They are pretty low down. Then between the Marthaguy and the Castlereagh again, we have the Collie bore. That is in progress, and they are down about 2,700 feet. That is due west of Gilgandra.

1789. Then going east from that again? We get nothing then until we reach the other side of the Namoi, and then we have the Woolabra bore, on the Narrabri to Moree railway line, and the Bullyeroi bore on the Thalaba Creek.

1790. The Bullyeroi would be pretty well north of Wee Waa? Yes. The Bullyeroi is near a place called Meriwinebone. It is on the Thalaba Creek. It would be pretty well south-east from Collarendabri, and north-west from Wee Waa. Then we have the bore at Moree. Then north of that we have bores at Wallon, Gilgai, Dolgelly, Tulloona, and another one will be put down between the Gilgai Creek and the Dolgelly bore. That has not been commenced yet.

1791. Does that fairly well prove the country between the Macintyre and Moree? Yes; Dolgelly is the nearest bore to the Macintyre. Of course that will give us a further line. But Mr. Pittman is of opinion that the water-bearing rocks are a long way the other side of the Macintyre.

1792. You mean north? Yes, north-east altogether; so that we should be well within the basin at that place.

1793. You have nothing east from Warialda? No; Mr. Pittman made a careful examination of the country about Warialda, and he was of opinion that that was the extreme limit of the basin.

1794. Then the line goes down tolerably direct to Gilgandra? Fairly direct to there. There is a lot of country there that is overlaid with basalt, and basaltic floaters, so that you cannot see what it is until you actually try it with the drill. Then beyond Collarendabri, going out in that direction, we have on the old 60-mile track the Moongulla, and the Dungle Ridge bores, and right on the border the Finger-post bore.

1795. Near Angledool? The other side of Angledool, to the eastward of Bokhara. We have a bore at Bokhara, which is also called Goodooga. Then between Walgett and the Narran, we have a very good bore where we have just got the flow at a place called Moorameena, a little north-west of Walgett. There are several private bores in the same locality.

1796. The country is proved to the north and north-west of the Barwon River? We might say that the whole of the country between the Barwon and the Queensland border to the Bourke-Hungerford Road, has been proved to be artesian water-bearing. There has been one failure in that area, and that is the Whitewood bore directly north of Brewarrina. That would be on the same line of rock as the Bendemere bore.

1797. Going down to the south-western portion of the area is Warren supposed to be on the limit? No; I think the limit is between Warren and Nevertire.

1798. The line from Gilgandra then would pass north of Nevertire and south of Warren? Yes.

1799. A little south-west of Gilgandra? It would go more south than Gilgandra, in the direction of Dubbo, and then go north.

1800. It would go south immediately it left Gilgandra? Yes; it would go southerly, because there is the bore at Ballymore, which is 20 miles beyond Dubbo.

1801. Then it must go half way between Gilgandra and Dubbo? Yes, fully that.

1802. Looking at the map, you will see a railway line marked from Woolabra to Collarendabri, also a line from Narrabri to Pilliga and Walgett, and a line from Warren to Coonamble; will those three lines all be in country where artesian water is possible? Yes.

1803.

J. W.
Boulton.
9 Dec., 1897.

1803. And as far as your information leads you to believe, the line from Byrock to Brewarrina will not be? As far as the information at our disposal goes, I consider there would be no chance of getting artesian water on the line from Byrock to Brewarrina.

1804. What has been the effect of bores in this country? I do not think that people at all realise what they have got in the matter of artesian boring yet. The only practical experiment that has been made to utilise the water to the fullest extent has been at Pera, and there we have been more than successful. The whole of the blocks that were thrown open have been taken up, with one exception. We are throwing open some blocks at the Euroka bore, and some at Tenandra, and also at Woolabra for small settlement on the same scale as at Pera.

1805. Pera still remains your practical example? Yes.

1806. Apart from irrigation, what do you think will be the effect of artesian water in the country? It will enable the pastoralists to carry 20 per cent. more sheep than they do at present.

1807. *Mr. Lee.*] Does it do so? I do not think it does at present, because I do not think they are dealing with the matter in a practical way.

1808. As a matter of fact, are there not, at this moment, runs upon which they have artesian water where the sheep are dying in hundreds from want of grass? That may be; it has been an extreme season.

1809. Has the artesian water been of any benefit? It has, undoubtedly. You carry the water through your paddocks, and you have a double frontage to the drain, which is far superior to any river. You do not run the risk of sheep bogging; and you do not have the concentration of sheep in large mobs to one watering-place, and the wool does not suffer to the same extent that it does where the sheep have to concentrate to a tank or well, and there is also the advantage that during the lambing season the ewes are able to bring their lambs to the water here, there, and everywhere, instead of having to bring them to one place. Of course, people who do not understand pastoral work would hardly realise what it means.

1810. It has many advantages, even in good seasons? Yes.

1811. In badly watered country it distributes the sheep, and thereby prevents the concentration of stock? Exactly. Another thing is, you can have your stock in a very much smaller paddock, and the stock, when they have the water through the paddock do not travel to the extent they otherwise would, and neither do they destroy so much food. They destroy more grass tramping to and from the water than, perhaps, they eat.

1812. These advantages seem very good in theory; but have they been really proved? I think they have in a few instances. There are station-managers and station-managers. One man will deal with the thing in a practical manner, and the other will miss it.

1813. Has not this taken place—that in consequence of the wonderful advantage afforded by a flow of water in country previously dry, station-owners, in moderate seasons, have been induced to put a larger number of stock on their runs? I would not like to say that, because I have not had experience of it. I am thinking of one station particularly, between Bourke and Barrington, where they seem to have the most intelligent way of dealing with artesian water that I have seen. They have over 30 miles of drains running through their country and they were enabled to carry sheep much longer. During the past drought they would otherwise have been compelled to sell much sooner than they did.

1814. *Mr. Hoskins.*] Does the Government make any charge for the use of the artesian water? Yes; for travelling stock.

1815. In some of the places where they have artesian wells, is not the water allowed to run to waste? I do not know whether you would call it running to waste. The water is allowed to go down the creeks, and the people below derive benefit from it. During the last period of drought the Minister gave directions that the whole of the bores were to be allowed to flow full on.

1816. Does anybody pay for the use of the water coming from the bore at Moree? No; the only people who pay for that water are those having travelling stock. We are cutting up the land there for an irrigation farm.

1817. Has it ever been represented to you that artesian water makes stock pot-bellied, and causes them to lose fat? I have never heard so. I have never heard a single pastoralist make such a complaint.

1818. *Mr. Lee.*] You described the artesian area on the eastern side of the Barwon? Yes.

1819. Some of those bores have been put down for many years, and the station-owners, consequently, have had the fullest opportunity of proving what benefits are to be derived from them? To the east of Barwon, on the Macintyre, there are only one or two station private bores at the outside.

1820. But all through that country, within the artesian area, there are Government bores, and station bores? Yes.

1821. Can you state with any degree of definiteness whether that country is carrying more stock than it was before artesian water was obtained? I could not say. I do not think it is at the present moment.

1822. Does artesian boring bring settlement, bring population, and increase the productiveness of the country? That is what the effect should be.

1823. Have you any data to enable you to say conclusively one way or the other? No.

1824. As the subject under consideration involves the country out towards the Queensland border and the other adjacent districts within the artesian area, have you any reason to suppose that the country would become either more suitable for carrying stock or capable of carrying larger numbers of stock? I think that, with the smaller holdings and with the better improvements and the larger supplies of water which the bores will enable pastoralists to have on the runs, the country will certainly carry more stock; because that is the experience of every pastoralist, that the more water you have and the smaller your paddocks, the more stock you can carry. That is really the lesson that the cutting up of the land into these selections is teaching us. The country that was previously under the Crown tenant is carrying now far more stock under the smaller man, taking it all through.

1825. Are you aware that there is a very unfortunate state of affairs existing out in that country at the present time on the western side of the Barwon? Yes, it is very bad.

1826. You are aware that the loss in stock going on at the present time is very considerable? Yes.

1827. Almost threatening to be one of the worst droughts the country has ever seen? Yes.

1828. That country has had the benefit of artesian water for some years and it does not appear to have mitigated the evil? But they have had an exceptional season. The station of which I used to be manager lost last season 50,000 sheep, and unless something happens they will lose the whole lot; and the station is a well-improved one.

J. W.
Boulbee.
9 Dec., 1897.

1829. The seasons are no worse now than they were years ago before we had any artesian water? I do not remember that there has been such a bad drought since 1879.

1830. We have to take this view of the matter, in considering the construction of a railway, we are told that the country affected will furnish a large traffic in wool. We want to know if it is possible that the country will be habitable under all conditions, and whether the intelligent expenditure of money that has gone on there in the past will be the means of enabling that country to be more reliable than it has been? There is no question that the whole of the country covered by the proposed railway lines is far and away superior as a pastoral country to the country to the west of the Barwon of which I have been speaking. There is no comparison. I was speaking of the country out west beyond the Warrego, or west from the Bourke-Barrigun Road. All that country is suffering severely from drought; but even in the best of seasons it is not comparable with the country in the central division affected by the proposed railway lines. Besides, I believe that the country from Coonamble to Warren is as good agricultural country as you could get anywhere.

1831. But I am speaking of the hundreds of miles of country in a straight line from Brewarrina to the Queensland border? The country to the east of a line from Brewarrina to the Queensland border is very much superior to the country to the west.

1832. But it is now suffering very severely from drought? Yes; it is suffering very badly.

1833. Prior to entering the Public Service, you were a resident out there? Yes.

1834. Before the sinking of artesian bores, droughts came periodically, and the losses in stock varied from 25 to 50 per cent.? Yes.

1835. Does not precisely the same thing go on now. Though the bores have been put down, is not the present drought likely to cause a loss in stock of 50 per cent.? I would not like to say the loss would be as high as 50 per cent all round.

1836. I want to know what alterations the artesian water has made, and whether it has changed the position as it ought to have done? You must remember that the conditions under which the land is occupied at the present day, are entirely different from the conditions a few years ago. Under small holdings the country is carrying, you may say, 50 per cent. more stock than it did previously, and if you were to put the country back under the same conditions that existed when the artesian water was first struck, I daresay you would find that the country would not have carried them through a two or three years drought.

MONDAY, 28 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

JOHN LIONEL FEGAN, Esq.

The Hon. DANIEL O'CONNOR.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Charles Louis Shainwald (E. Rich & Co., Ltd.), Sydney, sworn, and further examined:—

1837. *Vice-Chairman.*] When you were last before the Committee you gave some information with reference to the river traffic, and the road traffic reaching Bourke. Since your examination, local evidence has been taken, and a list of stations has been handed in, some of which were apparently omitted from the estimate which was furnished in Sydney;—will you be good enough to look over the list, and say if, in your opinion, the wool specified in that list finds its way to either Bourke or Byrock, by river or by road? All the wool in the return set before me is included in my statement. It is all wool which has been actually shipped.

C. L.
Shainwald.
28 Mar., 1898.

1838. Would it be included also in Mr. Harper's estimate? That I could not say.

1839. Have you examined Mr. Harper's estimate? The only thing I can say is that, inasmuch as Mr. Harper arrives at the same result as I do, I should say that the wool was included. I compared my evidence with Mr. Harper's on a previous occasion.

1840. And you say that your total agrees with Mr. Harper's? Approximately, not exactly.

1841. You conjecture, therefore, that the whole of the wool in this list would be included in Mr. Harper's estimate of traffic? I should conjecture that it was included from the fact that we both arrive at the same result. I am not prepared to say that the whole of this list is included in Mr. Harper's estimate; but I am prepared to say that it is included in mine.

1842. In your estimate of traffic did you include all the station produce which arrived at Bourke or Byrock by road as well as that which arrived at Bourke by river? Yes.

1843. You confirm the figures as given in your previous examination? They are absolutely correct; they are taken from our books at Bourke.

1844. Would it be possible for traffic other than that which you have included in your estimate from the Brewarrina district, to arrive at either Bourke or Byrock? Not at Bourke. But certain traffic may have reached Byrock, of which I have no exact figures. In my estimate I made allowance for it; but whether my estimate is correct for that small quantity of traffic I cannot say.

1845. With regard to the river freights the evidence has been somewhat conflicting; what are the prevailing rates at the present time? From 20s. to 25s. I might possibly remove a source of conflict in the minds both of the Committee and of other witnesses who have given evidence locally, if I pointed out that the rates of 20s. and 25s. a ton from Bourke include river freight plus the commission charges and delivery to the ship's side or warehouse. When I say that the rate is 20s. or 25s., I mean that that is the whole charge of handling the produce from the time it leaves the growers until it reaches the agent in Sydney.

1846. Does it include insurance? No. For example we say to the growers "The rate from Brewarrina is 20s. a ton, including all charges excepting insurance and trainage. The 20s. covers the actual rates paid by steamer, the haulage charges at Bourke, the cartage from the river bank to the railway at Bourke, our commission charges in Bourke and Sydney, and cartage from Darling Harbour into the store at Sydney." We calculate that our commission on all these charges, and delivery into the store at Sydney is 2s. 6d. a ton. We calculate the haulage at Bourke at 9d. a ton; the cartage from the river-bank to the railway at Bourke, 2s. a ton. These three charges come to 5s. 3d. If you deduct them from the 20s. which we charge all through, it leaves the actual river-freight at 14s. 9d. on ordinary occasions. I am speaking of Brewarrina, below the Fisheries, as the shipping point.

1847.

C. L.
Shainwald.
28 Mar., 1898.

1847. What about the produce reaching Brewarrina by river, and transferred there? When the river is not navigable through, as is the case on occasions, we make an additional charge for landing the wool or cargo at Brewarrina, carting it across to the Fisheries, and reloading it below the Fisheries.

1848. What is the charge for that? It depends upon circumstances. It depends upon what through rate we get from the upper river. It is a matter of the through rate. We make a through rate when the river is navigable throughout, and another rate when the river is not navigable and when we have to re-ship. When competition compels it we make no charge for that re-shipment.

1849. Does the trainage include delivery into the wool-brokers' stores? Yes.

1850. Therefore, when you include that in your charge, it amounts to nothing? It does in a way, because we are responsible for the wool until it reaches the warehouse.

1851. Your responsibility continues, but that is all? There is a certain amount of clerical work to be done, although we do not make a specific charge. We have to maintain a clerical staff to advise the wool in Sydney, to inspect it, and see that it arrives properly. We have also to submit to any reasonable claim which the consignee may make, so that the cost is considerable in the way of keeping up a staff. We make no specific charge to the shipper for that service.

1852. What is the through rate to Sydney *via* the Murray Bridge, or Morgan, from Brewarrina? There is no established through rate. It will depend wholly upon the condition of the river.

1853. Assuming the river to be navigable as far as Brewarrina, what would be the cost of obtaining merchandise by that route? That also is hampered by conditions, because there is no fixed rate. I could give you a maximum and a minimum; but no rate could be fixed with certainty. It would depend a great deal upon the height of the river, the term of navigation, and the rates of insurance, which are sometimes very heavy. We have had freight from Sydney to Brewarrina, by the route you name, as low as £3 10s.

1854. What would be the cost of sending wool from Brewarrina to Sydney, by that route, and under favourable conditions, and in the absence of competition? I could not arrive at that; it would be merely the expression of an opinion which would be of no value to you.

1855. Supposing wool were sent to a South Australian seaport, what would be the charge, without specifying any port? I should say from £3 10s. to £4 a ton. That is purely a matter of opinion.

1856. Will you explain why the wool comes to Sydney now, by way of Bourke, the freight being higher by rail than it would be by river? The uncertainty of navigation, the time of navigation, and the heavy rates of insurance.

1857. Do you think it probable that the wool from the Brewarrina district, which is at present sent from Bourke, would be sent by rail in the event of the proposed branch from Byrock to Brewarrina being constructed,—or would much of it go past Brewarrina and Bourke to South Australia? As a steam-boat owner I should say that if competition of that kind presented itself we must fight it. We must make every effort to obtain the traffic if necessary, and take it to South Australia, if it were forced upon us.

1858. In order that you may retain the river traffic between Brewarrina and Bourke? Yes.

1859. You would not be satisfied to retain the traffic between Brewarrina and Walgett, shipping at Brewarrina instead of at Bourke? It would not pay us with the fleet we have. The traffic would not be large enough.

1860. How do you arrive at your estimate of 6½ bales to the ton? I took the actual weighbills as supplied to us by the station-owners, and totalled the number of bales, greasy and scoured, dividing it by the number of tons railed, and gave that result.

1861. You have no doubt as to the accuracy of your figures? No, I consider that they are absolutely correct.

1862. Did the river steamer "Cato," in which you have an interest, earn during a period of fourteen months a sum of over £4,000? I cannot say positively that I did have an interest at the time, although I should have some knowledge of the running of the vessel from my connection with the firm of Rich & Company, Limited, who are, or were, the agents. I question the correctness of the figures. I was away from the Colony in part of 1891, and I cannot absolutely refute the statement; but Mr. Rich, the managing director of our company, can, I believe, if called upon, say whether or not it is correct. As a matter of opinion, I fail to see how it would be actually possible for the boat to earn the money. The "Cato" and barge when full will carry 700 bales of wool, which is equal to 110 tons of greasy and 85 tons of scoured. To earn such a sum as £4,443 would mean that she would have to carry, on the basis of 25s. a ton freight, all greasy wool, some 3,550 tons. With full loads, which the boats get but seldom, this means somewhat over thirty-two voyages, which has not been accomplished by any one boat in any one year.

1863. Have you taken the traffic one way only? I know it has never occurred that a boat has taken thirty-two voyages and has got a full load every time. I do not think any boat in our fleet ever made thirty-two voyages in a year. I might add to that statement that if Mr. Kerrigan has included the profits on the merchandise which the boat may have carried in connection with hawking business, it would be misleading to the Committee.

1864. What has been your experience since the owners of the river boats formed a company under the title of George White & Co.? My experience has been that they made money in 1892, 1893, and 1894, and that they have lost heavily ever since up to this minute.

1865. Notwithstanding the non-competitive rates? Yes.

1866. Have you distributed any profits during the last past three years? No.

1867. If you have been unable to distribute any profits during the past three years, would it be possible for you to compete against a railway from Byrock to Brewarrina, carrying at about half your present rates? I contend that the conditions would be wholly altered. We should not, as at present, content ourselves with quoting only the rate to Bourke—we should quote from Brewarrina to a South Australian seaport, and I am satisfied that going to one of those ports we could compete with any railway from Brewarrina to Sydney.

1868. Assuming that the growers desired to send their wool to Sydney, would you in that case be able to compete? I think so. The ocean freight from Sydney to Adelaide to-day is only 7s.

1869. You think you would be able to compete against the railway conveying the freight by river to South Australia, and thence around to Sydney? Yes.

1870. I understand that this is the case—that at present it suits you to send all the station produce which you control by rail to Sydney; but that in the event of competition with the railway you could quote terms which would enable you to compete successfully against it? Quite so.

1871.

1871. *Mr. Hoskins.*] But freights from Adelaide to Europe would be higher than from Sydney to Europe? There is not very much difference at the height of the wool season.
1872. There would be a difference of 5s. a ton would there not? There would be that difference.
1873. Then, on the basis of the last three years, it is questionable whether you would be able to make any profit at all if you were obliged to quote cutting rates? We have not made money during the last three years, because there has been no river to make it on. Once we got water we should be able to compete with the railway without any question.
1874. You know that more wool than ever is being sold in the Sydney market at the present time? Yes.
1875. Sydney is undoubtedly the best wool market in Australia? Yes.

C. L.
Shainwald.
28 Mar., 1898.

TUESDAY, 29 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

JOHN LIONEL FEGAN, Esq.

The Hon. DANIEL O'CONNOR.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Charles Louis Shainwald (E. Rich and Co., Ltd.), Sydney, sworn, and further examined:—

1876. *Mr. Wright.*] You were asked yesterday if you could furnish certain returns to the Committee;— have you anything prepared? No. It was impossible for me to get what you wanted in the time.
1877. You have seen a copy of the *Brewarrina Argus*? Yes.
1878. Have you seen the evidence given at Brewarrina before the Sectional Committee as to the wool traffic of the district? Yes.
1879. Did you go through any of the clips named? Yes, generally.
1880. How does the evidence given accord with your ideas as to the quantity of wool sent from the various stations? Looking at the returns generally they seem fairly correct.
1881. How far is Quantambone shed below Brewarrina? I cannot say with certainty; but it is not on the river. Their wool is carted into Brewarrina.
1882. Did you have the contract for the Tallywanta wool for any length of time? Yes.
1883. It is returned at 1,126 bales;—is that substantially correct, or is it an over-statement? I could not say from memory.
1884. The return is for the season of 1894;—was that an exceptionally good year? I consider that 1894 was an exceedingly heavy year.
1885. Does the Brenda wool come into Bourke, or does it go to Brewarrina? To both places. We have had the contract for some years to take it by road to Brewarrina, and thence, river permitting, by steamer to Bourke, or, river not permitting, direct to Bourke.
1886. What is the cost from Brenda to Bourke by road, and from Brenda to Brewarrina by road? From Brenda to Bourke the cost is, approximately, £3 per ton; from Brenda to Brewarrina it would be from 35s. to 40s. per ton.
1887. Brewarrina is the natural destination of that wool under almost any circumstances? I should say so, except during floods.
1888. Have you had the Boorooma wool? Yes.
1889. Have you any idea what number of bales they send away each year? I can only speak approximately.
1890. Their return is 1,897 bales? I should not like to say anything about it from memory.
1891. Have you ever had a contract for the Gingie wool? Yes.
1892. Have you any idea what they get each year? The clip varies very much; but I could not state what it is.
1893. They are returned at 2,195 bales? I should think that would be for an exceptional year.
1894. How far is Llanillo from Walgett? I think about 40 miles.
1895. If the railway were constructed to Brewarrina, do you think that that wool would come down the river to Brewarrina, or would it go to Narrabri? Much would depend upon the condition of the river. The nearest route to the seaboard would be *via* Narrabri.
1896. If there were a river, I suppose it would come to Brewarrina? We should hope to be able to influence it there.
1897. You know Dumble Station? Yes.
1898. The return from Dumble is given at 1,400 bales, and from Ballandoon, which is shorn at Dumble, at 300 bales;—you have never had the contract for that wool? No.
1899. But you supply the woolpacks? Occasionally.
1900. Have you ever supplied 1,700 woolpacks a year? I do not think our firm has ever supplied so large a number as that in one year.
1901. Do you know Milroy Station? Yes.
1902. Have you had the contract for that wool? Yes.
1903. Have you any idea as to the number of bales they shear there per annum? I am afraid I cannot give you the figures without my books.
1904. Have you had the Bundaleer wool? We have had the Bundaleer wool; but it goes to Brisbane now.
1905. You get no Queensland wool now? We get some; but not *via* Brewarrina.
1906. Do the Railway Commissioners still give a rebate of £2 a ton upon Queensland wool? They give a certain rebate; but I am not prepared to say what it is. I can say that it is not £2 a ton; but I should not like to say whether it is more or less.
1907. They give a certain rebate in order to meet the Queensland Border duty? Yes.
1908. You do not care to state what it is? Yes.
1909. Has this rebate enabled you to influence much wool from Queensland to New South Wales? It has enabled us to keep a certain proportion of the wool.
1910. But not all? Not all. I deal with that matter in a statement which I have prepared, and which bears also upon the evidence given at Brewarrina.

C. L.
Shainwald.
29 Mar., 1898.

C. L.
Shainwald.
19 Mar., 1898.

1911. You stated yesterday that the returns you gave were approximately very close to those of Mr. Harper? Yes.

1912. The evidence given before the Sectional Committee challenges both your statements and those of Mr. Harper. The witnesses examined say that a much larger quantity of wool is obtained than either of you give credit for, and they say that if the proposed railway were made a very large quantity of additional wool would be secured;—have you read carefully the statements published in the *Brewarrina Argus*? Yes; I have examined them closely.

1913. Have they shaken your belief in the correctness of your own returns and of those of Mr. Harper? No. The statement I made was prepared from the figures which appear in the books of my company. It was not my personal opinion that I gave you.

1914. Your company have had, for a number of years, practically, the entire command of the traffic of the territory with which we are now concerned? Yes, practically.

1915. You should know almost to a ton, how much goes up the river, and how much comes down the river? Yes, very closely.

1916. Having had the books of your firm at your disposal, you feel satisfied that your statements as to the inwards and outwards traffic of the district are approximately correct? Yes.

1917. You said something yesterday about Mr. Kerrigan's evidence? Yes. I refer to his evidence in the statement which I have prepared, and which, with your permission, I will now read; it is as follows:—

IN reference to the local evidence given before the Sectional Committee at Brewarrina, I find it necessary, in justice to myself, to rebut certain statements made by other witnesses.

These I now propose to deal with categorically as follows:—

Mr. Jameson in his return No. 4, covering alleged Queensland Border wool which would be sent to Brewarrina, claims, Fernlee, Coombura, Wooleerina, and Bundaleer. I contend, and am prepared to prove, that the wool from none of these four stations would reach the Brewarrina railway. To induce the wool into the New South Wales railway from these very stations the New South Wales Railway Department made a special concession almost equal to the amount of the Border Tax imposed, but even this concession was not sufficient to bring the traffic to the New South Wales line. It is quite unlikely that the same wool will be influenced to the Brewarrina railway when exactly the same conditions exist. Mr. Jameson may reply that the Border Tax will be abolished; if this is so the New South Wales rail rate must and will be advanced so that there is no advantage.

These four stations wipe out fully four-fifths of the additional traffic which Mr. Jameson claims from this source.

Mr. Kerrigan states (apparently without any reservation in his evidence) that it takes 8 B/- scoured wool and 5 B/- greasy wool to weigh a ton. I refer the Committee to my previous statement wherein it is shown on figures carefully prepared from the books of my company, that taking the average of wool from the district under discussion it requires 6½ B/- mixed to weigh a ton. For 5 B/- greasy to weigh a ton it would mean 4 cwt. per bale, and I am satisfied if Mr. Kerrigan will examine the matter he will not deny that the bales of greasy wool that weigh 4 cwt. each are very few and far between. Generality is rather between 3 cwt. 2 qrs. and 3 cwt. 3 qrs.

Mr. Kerrigan, in his evidence, states that the lowest fee the company he belongs to (that is, I assume, G. White & Co.) has carried goods, &c., was a £1 a ton. I must take issue on this statement and deny its accuracy. The fixing of the rates has been always placed in the hands of the Bourke office of E. Rich & Company (Limited), the agents for the boat-owners, and at no time has Mr. Kerrigan had authority to fix rates, nor is he in position to state, with absolute accuracy, what the rates have or have not been.

I have already shown the Committee that even granting the minimum rate to be 20/- per ton the deductions for haulage, cartage, forwarding charges, and delivery to ship's side, or warehouse Sydney, leave the steam-boat-owner a net freight of only 14/3 per ton.

Mr. Kerrigan is quoted to have stated that the boats are run under the name of G. White & Co., but that Messrs. E. Rich & Company (Limited), have shares. As this is a most damaging statement and absolutely incorrect I am compelled to give it unqualified denial. The firm of E. Rich & Company (Limited), have never been stock-holders in steam-boat property and are not connected with G. White & Co., in any other capacity than as the agents of this concern.

Mr. Kerrigan is stated to have said that he has as much to do with the boats as myself, thereby apparently conveying an impression upon the Committee that he was in as good position as myself to state the absolute facts. I wish, therefore, again to emphasise the fact that rates in connection with the steamer traffic are absolutely fixed by the Bourke office of E. Rich & Company (Limited), over which Mr. Kerrigan has no control, whereas my management is subject only to the instructions of my board of directors. Mr. Kerrigan is strictly under my orders and has absolutely no independent powers or discretionary rights.

1918. Can you give the Committee any information in regard to Mr. Kerrigan's statement of the earnings of the steamer "Cato"? I can add nothing to what was said yesterday. I can only make a deduction from the premises.

1919. Are you satisfied, from your knowledge of the trade, that neither that boat nor any other boat could earn £4,000 in fourteen months? I think it is impossible that the steamer could have earned that sum in the time.

1920. What is the greatest number of trips made by a steamer between Bourke and Brewarrina in any year? I should say twenty.

1921. Would that number of trips require a full river all the year round? For the greater part of the year.

1922. Given a full river for the whole year, how many trips could both make in twelve months? Allowing for delays in the loading and discharging of cargo?

1923. Yes? Under such conditions a boat might make thirty or thirty-two trips.

1924. That would be an abnormal state of affairs? Yes, absolutely.

1925. If the "Cato" carried a full cargo both ways, and made the maximum number of trips, do you think she could earn £4,000 in fourteen months? I do not think she could earn that amount by carrying cargo. She might earn that sum by carrying cargo, and by the profits on merchandise.

1926. It would be impossible for her to earn such an amount in freight? Yes.

1927. These steamers do a certain amount of hawking? Yes.

1928. If there is a chance of selling 20 or 30 tons of a particular class of goods upon a trip, it is the practice to put those goods on board and allow the captain to sell them at a fixed rate? Yes.

1929. Your contention is that while the "Cato" may have earned £4,000 within fourteen months, part of that amount was probably derived from profits on the sale of cargo? Yes.

1930. You are not prepared to deny that the steamer earned £4,000? No.

1931. You have dealt with Mr. Jameson's number 4 statement. May I now refer you to his statement of the goods and wool traffic. He traverses Mr. Harper's figures, and calculates that instead of there being 5,434 tons of freight there would be at least 10,000 tons of freight;—in your evidence you put the inwards and outwards traffic at about 6,000 tons? I think it would be about that.

1932. In giving evidence before the Sectional Committee which inquired into a proposal to lock the Darling, your agent, Mr. Kerrigan, said that the inwards and outwards traffic would be about 10,000 tons;—you say that it would not be more than about 6,000 tons? Yes.

1933.

C. L.
Shainwald.
29 Mar., 1898.

1933. Do you still feel confident that your estimate, being based upon actual figures, is a correct one? Yes.

1934. I suppose you know nothing about the stock traffic of the district? I cannot deal with that.

1935. To whose evidence would you attach most importance, to that of a railway expert, whose statements were based upon figures obtained from the books of the Department, or to that of Mr. Jameson revised by Mr. Kerrigan? To that of a railway expert, because his evidence would not be a matter of opinion.

1936. Can you tell us anything about the stock route from the Narran and the country north and north-west of Brewarrina? I do not think I can give evidence with any definiteness.

1937. Does any large number of stock come from that district into Bourke? The stock west of the Culgoa comes to Bourke.

1938. To be trucked? Yes.

1939. And some of it is consumed at the Bourke Meat Works? Yes. They naturally take a good deal of the stock.

1940. A great many stock would come to Bourke even if the railway were constructed to Brewarrina? Yes. There is some risk in crossing the Culgoa, the Biree, and the Bokhara, and for that reason stock-owners would prefer to come to Bourke. There is a good road to Bourke down the Culgoa.

1941. I suppose you know practically nothing about the stock coming to Brewarrina? No.

1942. You are aware that a great deal of the stock passing through Brewarrina has gone to stations other than Byrock? Yes. Some of it goes down the Bogan to Gongolgon, and on to Nyngan or Dubbo, where there are meat works. If you made Brewarrina a trucking depôt you would of course catch a certain portion of the stock traffic.

1943. A considerable quantity of stock goes through Brewarrina from the northern parts of the colony and from Queensland? Yes. Brewarrina is situated upon one of the main stock routes.

1944. When the stock arrives at Brewarrina it disperses, some of it going down the Bogan to Nyngan, some of it going to Dubbo, and some of it going through Warren to Nevertire? Yes.

1945. If the railway were constructed to Brewarrina, do you think the whole of that stock would be trucked at Brewarrina? I do not. No doubt a great deal of stock would be trucked there; but I do not think it would all be trucked there.

1946. You think that a good deal would travel further on? Yes; but how many would depend upon the season.

1947. Is it a fact that owing to the poor character of the country between Brewarrina and Byrock, stock have been driven to Bourke, and travelled from there to Byrock? I cannot say.

1948. But you are not in a position to deny it? I am not in a position to deny it.

1949. Have you ever been north of Brewarrina? Yes; I have been to Goodooga, Currawillinghi, and to Bundaleer.

1950. Do you think that the interests of the district are likely to change? No; except that in the future there may be agricultural interests there.

1951. Do you think that the district is likely to continue for many years a first-class pastoral district? Yes.

1952. Is there any likelihood of the country being divided into smaller areas, and thus carrying a larger number of stock? I do not think one can look for any large increase in the carrying capacity of the district generally.

1953. Do you consider the district fairly well improved? Yes.

1954. It is carrying pretty well its maximum number of stock? It would, no doubt, be able to carry more stock if the runs were subdivided.

1955. That would largely increase the carrying capacity? Not largely, but moderately.

1956. The present leases have nineteen or twenty years' currency? About that.

1957. Until they expire there is not much chance of subdivision? Not unless there is an alteration of the Land Law.

1958. Is this country ever likely to develop into an agricultural district? I think it is capable of such a development.

1959. The country round the Narran, the Biree, and the Bokhara is very rich? Yes.

1960. Is the rainfall sufficient for wheat? I do not know so much about wheat as about other cereals. There is more black soil than red, and I think the red soil is the best for wheat.

1961. Looking at the matter apart from the interests of the firm you represent, and the interests of Bourke, do you think that the Government would be justified in spending between £120,000 and £130,000 in giving railway communication to Brewarrina? I do not think there would be any adequate return from the expenditure.

1962. You do not see much prospect of the population of the district largely increasing? Not in the immediate future.

1963. Or of its production largely increasing? No.

1964. I suppose your contention is that the people of Brewarrina have very good communication with the railway by means of the river now? Yes.

1965. The people of Brewarrina and of the district north of it lay great stress upon the argument that the country is good fattening country, but that the 60 miles of poorly-watered and poorly-grassed country between Brewarrina and Byrock prevent them from sending fat stock to market? The country between Brewarrina and Byrock may be poorly watered, but the country between Brewarrina and Bourke is certainly not badly watered.

1966. So that, although there may be some difficulty in sending stock from Brewarrina to Byrock, there is not the same difficulty in sending stock from Brewarrina to Bourke? Not as regards water.

1967. The rate of trucking is the same from Bourke as from Byrock? I think so, but I am not positive about it.

1968. It is said that if the proposed railway were constructed it would take a large part of the traffic which now goes from Bourke to Byrock, but which pays nothing to the revenue, because the rate is the same from Bourke as from Byrock; and that if 14s. or 15s. a ton were charged as a local rate from Brewarrina to Byrock there would be so much gained? I see the force of the contention, but I claim that the river competition would nullify any possible earning of that kind.

1969. You think that the river rates would be cut so fine that a great deal of wool would continue to go down the river? I feel confident of it.

- C. L. Shainwald.
29 Mar., 1898.
1970. And therefore there would not be the anticipated gain? Yes.
1971. Even though the tonnage inwards and outwards is more than you and Mr. Harper have estimated, you think that the competition of the steamers would take away a great part of that traffic, and thus reduce the revenue of the railways to at least the amount estimated by you? Yes.
- 1972, *Vice-Chairman.*] How would growers of wool within 10 miles of Bourke reach the Sydney market;— would they truck their wool at Bourke? You refer to people upon the railway line between Bourke and Byrock?
1973. Within 10 miles of that line? There is a siding, I think, 14 miles on the Sydney side of Bourke where the smaller clips are trucked. Other clips are carted into Bourke.
1974. Do the growers send their wool and other produce through an agent or direct? In some cases, direct.
1975. It costs such growers to send their produce to market £4 a ton for greasy wool and £5 a ton for scoured wool, plus the cartage from their stations to the railway stations? Yes.
1976. Would not that be the total cost to them? Yes.
1977. Would not the total cost to the Brewarrina people be the freight from Brewarrina to Sydney, plus the cartage to Brewarrina? And any charges that might be incurred in Brewarrina. It is all right where people are only 10 or 15 miles from the railway station. Such people can cart their own wool; but where a man is 100 miles from a railway station he will employ an agent.
1978. That would have to be done in any case? I think so.
1979. You fixed 14s. 3d. as the net return to the river steamers? Yes.
1980. That is for carrying goods between Brewarrina and Bourke? Yes; upon the basis of 20s. per ton for a through rate.
1981. As a matter of fact, does it not cost the grower 20s. a ton? Yes, certainly.
1982. If the railway charge from Brewarrina to Byrock were 20s. a ton, it would cost him precisely the same amount as he pays now? Yes; he would have nothing to pay besides the railway rate, and any commission charges in Brewarrina.
1983. The steamers only earn 14s. 3d.; but the sender of the wool pays 20s. a ton? Yes.
1984. If the railway rate between Brewarrina and Byrock were 10s. a ton, the sender would save 10s. a ton upon the present charge? Yes; but the difference between 14s. 3d. a ton and 20s. a ton will gradually pass away. As I stated upon a previous occasion, they are now building a wharf at Bourke, and when that wharf is completed the railway will run right down to the river. That will save the cartage at Bourke, and will take 2s. 6d. from 20s. As conditions alter and improve, the river rates must be reduced. The conditions existing now will probably not exist three months hence.
1985. And the rate instead of being 20s. a ton, will be reduced because of the facilities afforded at Bourke? Yes; facilities now near completion.
1986. With regard to the fat stock sent by rail, is it not a fact that where a railway is within a short distance of the centre of a district, small lots of stock are sent away which would not be sent away if there was any long distance to travel? I think that that is so.
1987. Therefore, it is likely that if the railway were taken to Brewarrina the number of small senders would increase? Small consignors.
1988. Small consignors? I have no doubt the number of small consignors would increase.
1989. That might considerably increase the railway earnings? Well, it is point upon which I cannot speak.
1990. What do you think? I cannot say. Stock-trucking is entirely out of my province.
1991. Is the assumption reasonable? Yes.
1992. Of course you are aware that the advocates of this proposal believe that the earnings of the railway will be sufficient to pay not only working expenses, but interest upon the capital cost? Yes.
1993. So earnest apparently are they that they considered that it would not be unreasonable if the Government increased the rents over the whole of the pastoral area embraced within the red line shown upon Mr. Sawyer's map by something like ¼d. an acre. Is that a view that presents itself to you as a fair one? I do not think that the majority of the run-holders, especially the larger run-holders, would consent to any increase of rent.
1994. Not if they were confident that in a very short time the railway would be self-supporting? I think they would like to see a direct *quid pro quo*.
1995. You believe that if the test were made the run-holders would not be prepared to consent to a small addition to their payments? I do not think they would.
1996. Therefore you doubt their *bonâ fides* in giving this evidence? I do not doubt their *bonâ fides*, but I think that probably their judgment is being a little clouded by local pressure and conditions.
1997. Of course, you recognise that the district is a splendid pastoral district, and it is only a question whether the railway earnings will be sufficient to cover working expenses and give a substantial return upon the cost of construction? Yes.
1998. You are confident that it will not do anything of the kind? I think it will not.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper.
29 Mar., 1898.
1999. *Mr. Fegan.*] In your earlier evidence you estimate the goods returns as 2,000 tons at 10s. a ton; how do you arrive at that estimate? From what I know of the quantity of goods actually carried from our railway-stations, and by steamers to Brewarrina.
2000. You have no idea, as to what quantity of goods is carried by steamer? Yes; I had access to the books of the agents for the steamers.
2001. And you find that altogether by rail and by steamer the goods-traffic amounts to 2,000 tons? Yes.
2002. Would it surprise you to hear that the Sectional Committee have been informed at Brewarrina that the goods-traffic amounts to 10,000 tons? I am never surprised at anything of that kind.
2003. I suppose you had some facility for arriving at an approximate estimate of the number of stock sent by rail, by referring to the books in your department? Every travelling stock permit for four years past was examined. This showed us where the stock came from.
2004. How far down the line did you come from Byrock? I did not come any further down than Byrock, because I could not conceive that any stock reaching the line below Byrock would be driven back to be trucked at Byrock. 2005.

2005. Some of the evidence given before the Sectional Committee at Brewarrina was to the effect that large quantities of stock which now went through Brewarrina to Nyngan would be trucked at Brewarrina if the railway were taken to Brewarrina;—do you think there is any likelihood of that? I do not. J. Harper.
29 Mar., 1898.
2006. Do you think that the stock coming from the country north of Brewarrina and going to Nyngan and other places, would be trucked at Brewarrina if the railway were taken to that town? It is possible that some of it might; but I should be surprised if it all were. If the stock routes were open to Nyngan, the stock would be travelled over them.
2007. Do you not think that the seasons would have to be exceptionally good for that to be done? No; an average season would allow stock to travel from Nyngan down the river.
2008. What number of stock would go that way? I have no idea.
2009. The number would not be equal to the difference between 1,000 and 3,000 truck-loads? Certainly not. The thing is ridiculous. I do not think that there are as many stock trucked all the way between Nyngan and Byrock.
2010. You say that the estimate which places the stock traffic at 3,000 trucks is an exaggerated one? Yes.
2011. Have you anything to add to the evidence which you gave in regard to the wool clip? Nothing. I arrived at my estimate after an analysis of the books at the various railway stations.
2012. Other witnesses had not that facility? No; the wool traffic was examined clip by clip, and bale by bale, and the books of the various stations were searched to ascertain the quantity trucked.
2013. This is the evidence given before the Sectional Committee at Brewarrina with regard to the trucking of fat sheep:—
Between 13 and 16 per cent.? I have put it at 12 per cent. to be on the safe side, and that would amount to 210,564 fat sheep. Allowing 90 to a truck—and, as a rule, not more than from 80 to 85 would go in a truck, if they were at all fat—that would be 2,339 trucks. I regard that estimate as being within the domain of absolute certainty, and to show that it is so, I may mention that the actual number of fat sheep sent from this district in the twelve months, 1896-7, and trucked at Byrock, Bourke, Nyngan, and Narrabri, when the greater part of the district was suffering from a severe drought, was 161,200, or 1,791 trucks.
- ? The estimate is an exaggerated one. In the season referred to, that was the only part of New South Wales where there was good grass. They assume that the Brewarrina line is the only line to be considered, as if no other extension into the northern part of the Colony were contemplated.
2014. How far would a railway to Brewarrina influence the entry towards Walgett;—do you think it would secure the Walgett traffic? Do you assume that no railway will be constructed in the neighbourhood of Walgett.
2015. Assuming that a railway is constructed to Walgett, or to some place near Walgett, would such a line interfere very greatly with the earnings of the proposed Byrock line? Decidedly. There would then be no traffic coming into the Brewarrina line from the direction of Walgett.
2016. For what reason? A line going towards Walgett would go nearer to the centre of production.
2017. In estimating the wool traffic, you have not left out of consideration, so far as you know, the traffic from any station whose wool clip would come to Brewarrina if the proposed railway were constructed? No. As a matter of fact, I may remind the Committee again that a certain amount of the traffic credited to the Brewarrina line is common to both the Brewarrina and the Walgett line. I have left it to the Committee to decide where that traffic will go.
2018. *Mr. Wright.*] In your first examination did you state that you had taken into consideration all the stock that came through Brewarrina, irrespective of where it was trucked? No. I think what I said was that I had taken the returns from our books. I know that I did not go as far as Nyngan; but I took the returns shown in the books at Girilambone, Byrock, and Bourke.
2019. I suppose you are aware that some of the stock from the Narran has been sent as far as Nevertire and Dubbo? That is quite possible, and I expect that it will go there again.
2020. Am I right in assuming that you have made a liberal allowance for contingencies? Yes; I doubled the actual figures.
2021. You found, by referring to your books, that a certain number of trucks had been used for the stock traffic of the district, and you estimated for double that traffic? Yes.
2022. Therefore, I suppose you consider your estimate a liberal one? Yes.
2023. It is hardly possible that the traffic would exceed your estimate three times? I am sure that it would not. The stock which can be reckoned as likely to be trucked upon the proposed line could not be three times the number I have estimated.
2024. You do not think the actual stock traffic will be four times the estimated stock traffic? No.
2025. Therefore if the local evidence is that 3,500 trucks would be required for the stock traffic of the district, you are of the opinion that that estimate grossly over-states the case? I am of opinion that the witnesses do not know as well as I do what they are talking about.
2026. Will the same remark apply to the local estimate of the wool traffic? I regard my estimate of the wool traffic as absolutely correct. It is based upon figures obtained from the books of the Department.
2027. The local witnesses took an exceptionally good year—the year 1894? I took the years 1892-3, 1893-4, and 1894-5.
2028. Your estimate is based upon actual facts? Yes; I obtained the weights from our books.
2029. You are satisfied of the correctness of your source of information? Yes.
2030. Do you think it possible that if the proposed railway is constructed the river competition will be so keen as to cause the freights to be largely reduced? Yes. I think that in my former evidence I indicated that that would be so. That has happened wherever the railway has come into competition with water carriage.
2031. Suppose you have understated the traffic by 50 per cent., would the river competition be so keen as to take away half the traffic from the railway? The river competition would very seriously interfere with the railway traffic; and you must also take into consideration the probability of an extension from the north-east.
2032. But considering this line by itself, do you think that, except in times when there was no river, it would obtain the whole of the traffic? No.
2033. *Mr. Hoskins.*] Are you of opinion that, if the line were made the river companies would so reduce their freights to Adelaide as to under-bid the railway? Yes; they could do it at any time, so far as rates are concerned.
2034. And they would still obtain a profit? Yes.
- 2035.

- J. Harper. 2035. Do you think that the danger of a diversion of the wool traffic down the Darling and the Murray to Adelaide, is one to be feared? Yes. That is an ever-present danger, and one that we have to take the greatest precautions to protect ourselves from.
- 29 Mar., 1898. 2036. Do you think that it would be increased by constructing the proposed railway? I do not say that it would be increased; but the construction of the proposed railway would make the river competition a little keener.
2037. *Vice-Chairman.*] If the river steamers are not working at a profit, with the prevailing rates, do you think you need be very apprehensive of competition? I fancy that the people who own the steamers are not likely to work them at other than a profit.
2038. Suppose we have been told that, the steam-boat proprietors have not received any dividend for three years? That may not be because of the lowness of the rates. The proprietors of these boats are also interested in steamers trading in other parts of the river.
2039. *Mr. Hoskins.*] The person who gave us that evidence stated that the wool had been taken to Adelaide in competition with the railway? I cannot speak as to the circumstances of the river companies. It is difficult to say how they make their profits. They may make them by distributing goods which they sell themselves.
2040. *Vice-Chairman.*] Do you think it probable that you would have to reduce the railway rates which you have based your estimate upon? Yes. My impression is that, before very long we should have to charge the same rates from Brewarrina as we charge from Bourke, in order to obtain any business at all. Of course, that does not apply to the stock rates.
2041. Are you not in a similar danger, so far as Bourke is concerned? At Bourke we do not compete with the steamers trading between Bourke and Brewarrina. At the present time those steamers can make the rates what they like, subject to the competition of the teamsters. What we should have to fear at Brewarrina would be the possibility of a through rate.
2042. Must not any through rate include the 20s. now paid between Brewarrina and Bourke? Yes; but in the through rate not more than half that amount might be charged.
2043. The ever-present danger you speak of will not be increased by the construction of the proposed railway? That is so; but if we imposed special rates on the Brewarrina railway it is quite possible we should not get the traffic. The rates upon which my estimate is based are arbitrary rates, and the conclusion I have come to is that, before the line has been made very long, we shall have to charge Bourke rates in order to secure the traffic. Otherwise we may find the steamers taking the wool to Adelaide.
2044. That means that you would have to carry free from Brewarrina to Byrock? Yes; the steam-boat proprietors, rather than take their steamers off this length of river, will be prepared to consider the question of taking wool through to Adelaide. The extension of the railway to Brewarrina would interfere with their trade. These attempts to compete with water-carriage have never succeeded anywhere. The attempt has not absolutely succeeded at Bourke, at Hay, or anywhere where the railways touch a navigable stream.
2045. Do you seriously tell the Committee that the steam-boat proprietors will be prepared to carry wool from Brewarrina to Bourke free? No.
2046. That is really the point;—at the present time the prevailing river freight is 22s. 6d. a ton, and it may come down to 20s. a ton? That is between Brewarrina and Byrock.
2047. Do you say that in the event of the railway being constructed from Brewarrina to Byrock the river steamers would carry freight free from Brewarrina to Bourke? I do not say anything of the kind; but if we compete with the river steamers they will have to quote rates through to Adelaide, and we shall have to fix our rates accordingly. To maintain our connection with the traffic of the district we shall have to quote rates as low as their rates.
2048. *Mr. O'Connor.*] But we were told at Brewarrina that if the proposed railway were made they would not avail themselves of any opportunity to send wool to Adelaide? The people at Hay said much the same thing, but to-day they are availing themselves of the river.
2049. *Vice-Chairman.*] You say that 2,000 tons of goods are taken from Bourke up-stream by the steamers; are you aware that in addition to the goods carried by the steamers a large quantity of goods are taken by teamsters? I have already stated that I have included them in my estimate. I have allowed for the whole of the traffic.
2050. In your estimate of the wool traffic what weight have you allowed for the bale? I have based my estimate upon the actual weights as registered by our weigh-bridges.
2051. But how many bales have you allowed to the ton, distinguishing between greasy and scoured? Some of the clips went about $6\frac{1}{2}$ bales to the ton and some $5\frac{1}{2}$ greasy, while as to scoured wool some clips go 8 bales to the ton, and others $7\frac{1}{2}$.
2052. But what is the average number of bales to the ton? For the year 1893-4 the average was about $6\frac{1}{2}$ bales to the ton; in the year 1894-5, about $6\frac{1}{2}$; in the year 1895-6, about $5\frac{3}{4}$ —there was a larger proportion of greasy that year; and in the year 1896-7, about $6\frac{1}{2}$. The average for the four years, taking the greasy and scoured together, was about $6\frac{1}{2}$ bales to the ton.
2053. With regard to the live-stock traffic, have you made any allowance for the small lots that would probably be sent from Brewarrina, and which are not sent now, owing to the distance to be travelled, and to the bad character of the stock route to Byrock? I have allowed for more than double the actual traffic.
2054. Do you think you have made a sufficiently liberal allowance, taking into consideration the probability that large numbers of stock would be sent in small consignments? I think so. In the four years which I have mentioned the average number of truck-loads per annum was 392.
2055. That was from Bourke? From Bourke, Byrock, and Girilambone.
2056. We were told that a large number of sheep are generally removed from the district between June and December, so that the stock returns which are prepared in December do not accurately show the carrying capacity of the district, and the average number depastured;—is that your experience in connection with other districts? No doubt a great many fat sheep and other sheep are sold off the shears before December. However, so far as my returns are concerned, the figures are taken from the actual traffic.
2057. Assuming the area enclosed by the red line shown upon Mr. Sawers' map to be 4,500,000 acres, and its carrying capacity to be 1,500,000 sheep, how much wool might be expected to come from that district, allowing $6\frac{1}{2}$ bales to the ton? I should like to know how many fleeces would go to the bale there. In some

some districts they get twelve bales from 1,000 fleeces, in others fourteen, in others fifteen, and in some as many as seventeen. If the railway returns had been such as to require further checking, or if there had been any doubt about them, I should have endeavoured to ascertain how many bales were obtained from 1,000 fleeces in the district.

J. Harper.
29 Mar., 1898.

2058. But what is the average number of bales obtained from 1,000 fleeces? It varies from twelve to fifteen, and in some districts goes as high as seventeen.

2059. You have never known it to go above seventeen? Not throughout a whole district. I consider that it requires a good district to produce fifteen bales of wool from 1,000 fleeces.

2060. You have already said that you regard the Brewarrina district as a splendid pastoral district? Yes.

2061. Therefore, we may fairly conclude that fifteen bales of wool would be obtained from 1,000 fleeces there? Yes; but I do not give that as an expert opinion. I do not want to give an expert opinion upon a matter in regard to which I am not an expert.

FRIDAY, 15 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

William Sawers, grazier, sworn, and further examined:—

2062. *Chairman.*] As one of a deputation from Brewarrina, you desire to make a further statement to the Committee? Yes; I should like to correct one or two of my previous statements, and to add to what I have already said. When giving evidence last October I estimated the weight of wool as five and a quarter bales per ton. Mr. Shainwald took objection to that estimate, and gave as the actual average weight six and two-thirds bales per ton. For the sake of convenience in estimating the wool traffic, I counted it all as greasy wool, and applied the rate of 10s. per ton as a local railway rate. It is quite understood that washed wool always pays about one-fourth more than greasy wool. Mr. Shainwald's criticisms, therefore, appear to me to be of no value.

W. Sawers.
15 April, 1898.

2063. What difference is there between your estimate of revenue and Mr. Shainwald's? I have not looked into that. Mr. Shainwald attempted to disparage my estimate by showing that the tonnage would be considerably less; but he did not impugn the correctness of my statement as to the number of bales. I do not know what the proportion of washed and greasy wool is.

2064. Therefore, you are not in a position to tell the Committee what it would mean in revenue if we took your figures and what it would mean if we took Mr. Shainwald's? Washed wool always pays more than greasy wool. If we paid 10s. a ton on greasy wool we should be prepared to pay one-fourth more on washed wool, so that the result works out about the same. I desire to refer to some fresh grounds of contention opened by Mr. Shainwald, and in regard to which he was supported by Mr. Harper. The evidence given before the Committee has proved that a local rate of 15s. a ton between Brewarrina and Byrock would prevent river competition, because, to compete with it, the steamers would have to come down to 10s. a ton, and a charge of 5s. for insurance would make the rates equal. Any wool-grower would be willing to pay higher rates to avoid using the river steamers.

2065. Do you contend that the steamers could not carry from Brewarrina to Bourke for 10s. a ton? We have never paid less than 25s. a ton, and the steamer company has not declared a dividend for three years past. I desire to correct the statements which I made on the last occasion in regard to the freight paid last season. I said that my freight had been reduced to 20s. a ton; but I find that I paid 25s. a ton, and I have never paid less than that amount.

2066. Does that charge include insurance? No.

2067. If insurance is a constant charge, you pay 30s. a ton? The charge, including insurance, would be about 30s. a ton. Mr. Shainwald now raises the fresh objection that the river traffic to South Australia would compete against the railway, and in this he was supported by Mr. Harper. Mr. Shainwald, in reply to Question 1867, says: "We should quote from Brewarrina to a South Australian seaport, and I am satisfied that going to one of these ports we should compete with any railway from Brewarrina to Sydney." I hold this to be simply bluff. It now cost wool-growers 105s. to send wool from Brewarrina to Sydney, or, with insurance added, 110s. a ton. If the railway charge from Brewarrina to Byrock were 15s. a ton, the cost of sending wool by rail from Brewarrina to Sydney would be £4 15s. a ton, or 15s. a ton less than we at present pay to send it by way of Bourke. Yet we hear nothing at the present time about wool going to South Australia.

2068. If there would be danger of river competition at Brewarrina it should be still greater at Bourke? Yes.

2069. Are you prepared to say that the river competition at Bourke is not dangerous? I believe that only a small quantity of wool goes down the river from Bourke, and that wool is sent to Melbourne, *via* Echuca, to suit Goldsbrough, Mort, & Co.

2070. Do you know what they pay to send it from Bourke? No.

2071. *Mr. Hoskins.*] Do you not think that if the navigation of the Darling were improved by the construction of locks, wool could be conveyed by steamer from Brewarrina to Morgan for £3 a ton? Not if the Government tried to get back interest upon the money expended. It is better for the Government to spend money in the construction of a railway, the revenue of which will pay the interest on the work, than upon a work from which they will get no return.

2072. *Chairman.*] The Darling has not been locked yet? No; I understand no wool goes to South Australia from Bourke now.

2073.

- W. Sawers. 2073. But some wool goes down the Darling? I believe that for some special reasons Goldsbrough, Mort & Co. send one or two clips to Melbourne *via* Echuca. Mr. Harper was asked (Question 2033): "Are you of opinion that if the line were made the river companies would reduce the freight to Adelaide so as to underbid the railways?" And he replied, "Yes." Further on, in answer to Question 2034, he said that they would still obtain a profit. In my opinion, that answer shows profound ignorance of the conditions of the wool trade. The steamers could not obtain wool from the Brewarrina district for South Australia even if they quoted a lower rate than the railway. A steamer and barges—and this is a point to which I desire to direct the particular attention of the Committee—loaded with wool, would take, on the average, at least a month to reach a South Australian seaport from Brewarrina. Putting the freight at a minimum, I allow £3 per ton from Brewarrina to South Australia, or, with net river insurance, say 23s. a ton—£4 3s. a ton, everything included.
2074. *Mr. Hoskins.*] How can you prove that it would take a steamer and barges a month to go to South Australia? I know that from reliable information. Mr. Shainwald admitted it himself.
2075. He did not say that it would take a month? He admitted to me that if a trip only lasted three weeks it would be extremely rapid and successful, and he told me, in the presence of my friends, that on the average a trip would take a month. I maintain that, on the average, the steamers would not reach a South Australian seaport from Brewarrina in less than a month.
2076. *Chairman.*] When you say "seaport" what do you mean? I am using Mr. Shainwald's words.
2077. The seaport would be Port Adelaide? Yes; because the wool would either have to be shipped from there to England or sent round from there to the eastern colonies. There is no good wool market in South Australia, so that consignments, if not shipped to London, must be sent to either Melbourne or Sydney for sale. The charge for that, including insurance, would be about 10s. a ton. So that the total cost from Brewarrina to Melbourne or Sydney would be £4 13s. a ton, as against £4 15s. a ton by railway—assuming the local charge from Byrock to Brewarrina to be 15s. a ton.
2078. Would it not be cheaper to send wool to Melbourne *via* Echuca? I cannot say, but I think not. I am simply traversing Mr. Shainwald's evidence. The Brewarrina wool-growers and storekeepers have their business and financial arrangements with Sydney houses, so that the wool must of necessity go to Sydney. If it were sent by rail direct, it would be sold in the best wool market in Australia within a week or ten days from the time of its being trucked. If it were sent round to Sydney *via* South Australia about two months would elapse before the wool could be sold. No wool-grower would dream of waiting so long as that to realise on his wool, although the charge *via* South Australia might be less. The extra handling would be intolerable. I have here a letter which I will leave for the information of the Committee giving quotations of insurance from Brewarrina to South Australia.
2079. *Mr. Wright.*] What percentage do you pay from Brewarrina to Bourke for insurance? I believe that the insurance averages about 5s. a ton.
2080. A ton of greasy wool is not worth £100? No. It varies; but I should put down the value at about £60. People generally insure their wool at its full value.
2081. As a matter of fact, the wool does not pay 5s. a ton, but 5s. per cent.? Mr. Bacon has paid 10s. per cent. Scoured wool is worth £100 a ton. I pay a general insurance from the sheep's back to London, but if I use the steamers between Brewarrina and Bourke I have to pay an additional special insurance, which I think would be about 2s. 6d. a ton.
2082. According to your statement it would not be 5s. per ton, but 5s. per cent.? I am informed that this year the charge was 10s. per cent. I am merely putting it at 5s. per ton to be within the limit of safety. Referring to the recommendation of the Sectional Committee that the Crown lessees of 4,500,000 acres should agree to contribute up to another $\frac{1}{4}$ d. an acre for their land in order to cover any possible loss in the working of the railway, I desire to say that such a recommendation could not be carried into effect. Many would be agreeable to pay this extra amount, but unanimity among the lessees would be impossible. A few of the Crown lessees are hostile to railway extension. In some instances they dread the coming of the railway, because it will mean more stock traffic through their country; while in other instances the lessees are afraid that the railway will mean closer settlement and land resumption. Should the Committee have doubts as to the paying capability of the proposed line, I would respectfully suggest that some other plan than the impossible one proposed should be put into effect. My previous estimate was based on a rate of 10s. per ton, but if a rate of 15s. per ton were required to make the line a paying one we should be glad to pay it. I believe that many of the wool-growers and many of the chief business people of the district are prepared to pay 15s. a ton, and to guarantee to use the railway exclusively. In reply to Question 2011, Mr. Harper says that he considers an estimate of the fat stock at 2,000 trucks an exaggerated estimate. I should like to know what he thinks of my estimate of 3,000 trucks. The opinion of myself and others, all experienced men, who know the capabilities of the district, should surely be of more weight than that of a railway official. The question is not what the district has done, but what it would do if it had railway facilities. I adhere generally to my previous evidence. If the volume of traffic appears to the Committee likely to be too small, that difficulty can easily be met by increasing the local rates. I stated last October that the bogey of river competition would doubtless be raised during this inquiry, and in that expectation I have not been disappointed.
2083. *Chairman.*] You estimate that 18,000 bales would be sent by railway from Brewarrina to Byrock? I claim more than that. I claim that about 1,300 tons of wool would come to the railway from the Culgoa. Mr. Harper gives Bourke credit for that traffic, but we claim that Brewarrina is nearer, and that it would go to Brewarrina instead of to Bourke. If you refer to page 32 you will find that I claim 18,000 bales of wool from the existing river traffic, or 3,450 tons. I take the goods river traffic at 2,450 tons. The quantity of wool now drawn by road to Bourke is 7,000 bales, or 1,300 tons. Then I take the goods and wool traffic, of which Byrock is the depôt, at 2,600 tons, making a total of 10,000 a tons.
2084. You say that a large part of this traffic, if it were carried for 15s. a ton, would save you 15s. a ton? I think that a railway would save the people in the district from 10s. to £1 a ton.
2085. Let us say 10s. per ton? It would be more than that. Most of the large stations lie back from the river. The wool is carted to Brewarrina as the depôt. It is dumped down there higgledy-piggledy, and is taken away by the steamer irregularly, so that when it reaches the sale-rooms it is all mixed up. If it were sent direct from Brewarrina it would be kept together, and the clip would go down in order. At the present time the steamer takes away a few bales of this sort and a few bales of that. This tends to diminish the value of the clips.

W. Sawers.
15 April, 1898.

2086. We will take it for granted that the railway will be worth about £6,000 a year to the wool-growers, putting the traffic down as 10,000 tons, and the saving at 15s. a ton;—for what acreage would the holders participate in that benefit? Of course, some people would derive twice as much advantage from the construction of the line as other people would get. Personally, I would sooner pay more for my land than I pay now, if the railway were constructed; but we know as an absolute fact that unanimity on the question cannot be obtained, because certain lessees are actively hostile to railway extension. Even under the present Act land can be resumed, and they are in a funk lest some change in the land laws may be made, and the land resumed more easily.

2087. *Mr. Fegan.*] What are your main objections to the Sectional Committee's report? I have only had an opportunity of glancing at it, but I saw what was printed in the *Herald*. I object to the recommendation of the Committee. With all respect to the Committee, I say that it imposes an impossible condition. If the Crown were to put an extra $\frac{1}{4}$ d. an acre on our land by Act of Parliament, without asking our consent, that would be a different matter.

2088. You would be entirely in favour of the proposal of the Committee if you thought that that proposal could be enforced? I say that, personally, I should be glad to pay the extra amount, but I know that it is absolutely impossible to get all the lessees to agree to that.

2089. Will you tell us how the discrepancy between your estimate of traffic and those of the railway officials, and of the agent for Messrs. Rich & Co., comes about? I am only responsible for my own evidence.

2090. Would you not think that the railway officials, whose duty it is to report on the proposals put before the Committee, and who have the right to enter into any railway station office and obtain the traffic statistics compiled there, would be in a better position than you to give us information? I had command of the same information as they had. You will find it tabulated in the yearly reports of the Commissioners.

2091. Then, how is it that your estimates differ so much? Because Mr. Harper does not give us credit for an amount of traffic which we claim must come to the railway at Brewarrina. He gives credit to Bourke for all the West Cullgoe country.

2092. How many bales of wool do you allow to the ton? Five and a quarter bales of greasy wool. Mr. Harper averages the greasy wool and the scoured wool.

2093. Yes, at six and two-thirds bales to the ton? Washed wool always pays a higher rate than greasy wool.

2094. The additional rate for scoured wool is £1 per ton? Yes; from Bourke. I gave the figures for greasy wool for the sake of convenience. Scoured wool will soon be a thing of the past. If I were dividing the wool into scoured and greasy, I should put down 12s. for scoured wool, and 10s. for greasy wool.

2095. If you allow six bales to the ton, that is a little over 4,500 tons? We can produce 4,500 tons of wool from the area of land shown on my map, allowing a sheep to 3 acres, and 7 lb. of wool to the sheep.

2096. Your suggestion is to increase the local rates rather than to add a farthing an acre to the rent of the land? Yes.

2097. You would not suggest that the line should be run at a loss of £4,000 a year? No.

2098. You suggest that the local rates should be increased? Yes; if there were likely to be a loss.

2099. The higher you raise the railway rates, the greater the opportunity you give to the river competition? I have proved that the possibility of river competition is a myth, which is maintained by the self-interest of the owners of the steamers. Mr. Shainwald in his last evidence seems to have abandoned the contention that the steamers would compete for the wool between Brewarrina and Bourke, and he raised the boggy that the steamers would take the wool to South Australia. It must be evident that no wool-grower, short of an idiot, would send his wool round that way. It is simply nonsense to suggest it.

2100. *Mr. Humphery.*] Would it be possible to obtain unanimity with regard to the increase of rates, and to get an undertaking from the people of the district that all station produce would be sent away by railway, and all goods brought up by railway? I do not think you will get unanimity in these matters; but we have the sworn statements of leading storekeepers and pastoralists that they would send by the railway, if the local rate of 15s. a ton were charged. There are three of us present now who would never dream of using the river if we could get our wool carried to Byrock by railway for 15s. a ton. If it would suit us to use the railway, it would suit others.

2101. I think you said that no one but an idiot would take into consideration the possibility of the steamers successfully competing with the railway? No; I said that no pastoralist who was not an idiot would ever think of sending his wool round by way of South Australia. If he did, he would lose two months before he could get any money back.

2102. What would be the position of the pastoralists, supposing the wool could be sent to Adelaide for £3 10s. a ton? It could not be sent for that price, if insurance charges were added.

2103. What would the insurance charges be? Thirty shillings per cent. That would be 30s. a ton on washed wool, and £1 a ton on greasy wool.

2104. I suppose the wool is worth in round figures £10 a bale? Fully that.

2105. That would be 15s. a ton for insurance? Well, as wool is generally insured at its full value, and as scoured wool is worth £100 a ton, I reckoned it at about 20s. to 23s. as an average.

2106. From £3 18s. to £4 would cover all the charges of sending wool to Adelaide by river? £4 a ton might.

2107. Then the contention is that the freight to London is higher from Adelaide than from Sydney or Melbourne? Yes.

2108. Inasmuch as the cost of sending greasy wool from Bourke or from Byrock to Sydney is £4 a ton, and for sending scoured wool £5 a ton, would not this difference tell in favour of the river;—it must also be remembered that the river steamers might see fit to reduce their present rates? If the practice were to send wool to England there might be something in the arguments; but none of the small settlers and very few of the big settlers in the Brewarrina district do anything else than sell their wool in Sydney.

2109. What is the freight from Adelaide to Sydney? From 5s. to 7s. a ton. With insurance added it would be at least 10s. a ton.

2110. You have to add to the present railway rates 15s. a ton, which would be the local rate from Brewarrina to Byrock.

2111. That would make the railway rate to Sydney from Brewarrina £4 15s. a ton for greasy wool, and £5 15s. a ton for scoured wool? Putting it at £4 a ton to Adelaide from Brewarrina, and 10s. a ton from

- W. Sawers.
15 April, 1898.
- from Adelaide to Sydney, the cost of sending to Sydney, *via* Adelaide, would be £4 10s. a ton, so that the difference would be in favour of the Adelaide route.
2112. With competition, would not the steamer rates be lowered? I do not think the steamers would take the wool for less than £3 a ton.
2113. We have been told the contrary? The Railway Commissioners could also afford to lower their rates. They are taking wool now from a point 80 miles below Bourke. My great contention is that the loss of time occasioned in shipping wool to Sydney, *via* Adelaide, would prevent the steamers from competing successfully with the railway.
2114. Would not the saving of 15s. to £1 a ton be of great importance to the wool-growers? Certainly.
2115. The whole question is whether the earnings of the railway would cover the interest and working expenses;—the evidence as to the probable earnings of the line is conflicting? The only evidence of any weight against us is Mr. Harper's.
2116. That is very important evidence? Mr. Shainwald's evidence is interested. All I can say is that we are reliable witnesses, and that our knowledge of the district is superior to that of any railway official.
2117. Do you think it would be impossible to obtain the consent of a considerable majority of the Crown lessees in the district to an increase of rent? You might get a majority of them to consent to an increase of rent, but a large part of the district is controlled by mortgage companies, who are notoriously adverse to railway extension. They would sooner see the railway 100 miles further away from Brewarrina, because they are afraid of closer settlement. I daresay we could get a majority to consent to an increase of rent, but these companies control so much wool that it would be hard for us to do more than that.
2118. Do you not think that argument inconsistent with what you said about the direct pecuniary advantages to be derived from railway extension;—I suppose the mortgagees would be beneficially affected by the construction of the line? My experience is that there are pastoralists in this country who are very sorry that the railway ever went past Dubbo. They are afraid of small settlement.
2119. *Mr. Hoskins.*] Suppose the Darling were improved between Brewarrina and Wentworth, so as to make it navigable for nine months in the year, do you not think that the steamers would successfully compete with the railway, and take wool, if not to Adelaide, to Echuca? My answer to that question is that if the Government were willing to do the work without charge the steamers could compete; but that if they tried to get interest on their expenditure the steamers could not compete.
2120. This Committee has been charged with the work of considering a proposal for the locking of the Darling from Bourke to Wilcannia? I carefully investigated the evidence given before the Committee in regard to the proposal to lock the river between Brewarrina and Bourke at a cost of £120,000. I said in my evidence-in-chief that if the Government were to charge tonnage dues to get back the interest upon that expenditure the steamer charges would be higher than the railway charges.
2121. Do you know that the people of Hay asked Parliament to construct a railway to Hay, and at the time expressed the same opinions as the people of Brewarrina are now expressing, but that after the line was constructed they took advantage of the lower steamer rates to send their wool away by river? I do not doubt it; but Hay is in a very different geographical position from Brewarrina. It must have been patent all along that the Hay railway could not compete with the river. In our case, however, self interest would prevent us from using the river.
2122. You said that the Adelaide wool market was of little consequence;—do you know that all the principal wool-buyers go to Adelaide, and that they have regular markets there? I do not know that all the principal buyers go there. Some years ago they made an attempt to establish a market there.
2123. Elder, Smith, & Co. do a large business there? It has pretty well collapsed now, I think.
2124. You said that the Brewarrina people would have to continue to send to Sydney, because of their connection with Sydney houses; but do you know that one of the largest wool-producers on the Lachlan has recently been sending his wool to Sydney instead of to Melbourne, where he formerly sent it? He is nearer to Sydney than to Melbourne, and he finds it more advantageous to send to Sydney.
2125. Mr. Shainwald, the manager of the largest forwarding firm in the western district, said that he felt confident that, if the railway were made, they could reduce the river rates so as to compete against it? That was an utterly ridiculous statement. The steamer company has not declared a dividend for years.
2126. Mr. Shainwald said that they had declared a dividend? There are three or four squatters in the room now, and I dare say they would all be willing to declare upon oath that upon no consideration would they send their wool by river if they could send it by railway.
2127. You admit that wool is now sent by river from Bourke to Echuca? Not from Bourke, I think; but from one or two stations further down the river. The Dunlop and the Tooralic wool come to Bourke, although those stations are 80 miles further down the river.
2128. You feel confident that if the proposed railway be made, we need not fear the river competition? Emphatically that is my opinion.
2129. *Mr. Hassall.*] Is it not a fact that Messrs. Rich & Co. now control the river traffic? They control it by our grace. They take our wool, because we give it to them.
2130. There is no other firm to compete with them? They practically control the traffic.
2131. If you were a member of a firm, you would like the Government to spend £120,000 in locking the river between Bourke and Brewarrina? I cannot think that the Government would enter upon that expenditure simply to benefit Messrs. Rich & Co.
2132. You are practically dependent upon this firm for the conveyance of your wool from Brewarrina? Yes; unless we employ teamsters.
2133. You contend that if the river were locked the tonnage dues would make the rate so heavy as to prevent the river from competing with the railway? Yes; unless the Government made a present of the expenditure to the steamship companies.
2134. You also say that the wool growers in the Brewarrina district would willingly pay 10s. and 15s. a ton to have their wool carried by rail from Brewarrina to Byrock? The great majority have expressed their willingness to do so.
2135. During the last three years the principal sales of wool have been held in Melbourne and in Sydney? Yes; and especially in Sydney.
2136. Sydney is now looked upon as the leading wool market in the Australian Colonies? Yes.
2137. The smaller growers naturally desire to send their wool to the nearest and best market, and under any circumstances they would make use of the railway if it were constructed? They must do so. The importance

importance of the live-stock traffic seems to have been rather ignored. We look upon it as likely to be a great factor in the railway returns. It is monstrous to offer a pastoral community an improved steamer traffic, because we cannot send fat stock by steamer. W. Sawers.
15 April, 1898.

2138. The steamers are of use only for the conveyance of goods and wool? Yes.

2139. *Mr. O'Connor.*] When you are most anxious to get stock away the river is dry? Yes; not navigable.

2140. *Mr. Hassall.*] The country behind Brewarrina is well grassed and watered? There is no finer fattening country in New South Wales than that between the Culgoa and the Narran, and up towards the Queensland border. Mr. Harper says that he has examined the railway books, and that his sources of information enable him to know exactly the number of fat stock coming from the Brewarrina district. I have pointed out before, however, that owing to the want of a railway, and the bad character of the stock routes, most of the squatters have ceased to fatten stock for market, and sell their sheep as stores. Years ago I averaged 10,000 fat sheep a year; but for a long while past I have not sold fat sheep. If we had a railway the district would be in a position to supply Sydney with fat stock. It is not what we are doing, but what we could do that should be considered.

2141. The fattening of stock for market in your district has practically been neglected of late years, because of the difficulty of getting stock away? Yes.

2142. If facilities were afforded you would be able to send fat stock away in large numbers at almost any time? Yes.

2143. The railway would obtain a very large revenue from this traffic? I am confident that my estimate would be realised, and I am in a better position to form an opinion than is any railway expert. I think that it is ridiculous for Mr. Harper's opinion to be offered against that of reliable witnesses upon a question of this kind.

2144. You have asked for the reopening of this inquiry in order that the residents of the district may state emphatically their willingness to pay local rates for the conveyance of produce and stock upon the proposed line to minimise any loss which may occur through the smallness of the traffic? Yes.

2145. You have no fear of the river competing with the railway? None whatever. In my opinion it is absolutely impossible that the river should compete with the railway.

2146. Do you think that the probable loss upon the railway has been very much exaggerated? In my opinion the railway will pay from the jump—that is to say, from within twelve months of its being made. If a railway is not extended to Walgett, when the river is navigable we shall get the whole of the wool from as far as Walgett.

2147. How would a line running between Collarendabri and Walgett, in the direction of Goodooga, affect the Brewarrina trade? If the railway were extended from Narrabri to Walgett, and went to the river, the wool from the sheds on the river would go to Walgett; but if the railway were not taken to the river that wool would probably come to Brewarrina.

2148. Does it not follow that the wool on the banks of the river between Brewarrina and Bourke would be taken to Bourke instead of to Brewarrina? Yes. However, I have not included the Walgett wool in my return.

2149. *Mr. Lee.*] The working expenses and interest charges of the proposed railway are estimated at £9,140 a year, and the earnings at £4,841 a year, showing a loss of £4,299 a year. You estimate the traffic as worth £10,068 a year. While you say that Mr. Harper's estimate of traffic is too low, it may happen that your estimate is too high. If we split the difference between the two estimates that will make the total earnings £7,261, which will make the loss per annum £1,879? On what rate basis.

2150. Adopting your own rates? Well, the loss could be made up by increasing the rates.

2151. Would we be getting close to the actual traffic if we took the mean between your estimate and that of Mr. Harper? You would stand on absolutely safe ground if you did that.

2152. Can you assure the Committee that there is a future for this district which in the course of a few years will enable you to wipe off any loss with which the railway may start? To me that is beyond doubt. The district even from a pastoral point of view will greatly improve in a few years.

2153. But the river competition will be much stronger than it is now, so that it is probable that the river will be improved? All I say is that the district must develop as the years go by.

2154. You are satisfied that increased production will mean increased traffic? Yes.

2155. *Mr. Fegan.*] If it were possible to put into force the recommendation of the Sectional Committee, would you be satisfied with it? Personally I should be satisfied.

2156. You are only speaking for yourself? I cannot speak for the whole district.

2157. *Mr. Lee.*] You express your confidence in the future prosperity of the district;—will you show us how this prosperity is to come about? From increased production. The district could carry more stock than it carries at the present time, if more water were made. It is magnificent country, but a great part of it is very dry, because there are not many natural water-courses. The trouble has been solved in some measure by putting down bores; but bores are too expensive for the ordinary settler. In the old days, tank excavation used to cost 1s. 6d. per yard. The price was then reduced to 1s. 1d. a yard. I have spent at least £10,000 in putting down tanks at 1s. a yard; but now I can get the work done for as little as 5d. and 5½d a yard. At this price the water difficulty is solved, and the settlers can afford to make the district as well watered as it is possible to conceive. When this is done the production of the district in wool alone will be increased by 20 or 25 per cent.

2158. Then in your opinion the grazing interest has not yet been thoroughly developed? Certainly not.

William Dickson, grazier, Yarrawin, sworn, and examined:—

2159. *Mr. Humphery.*] You are a pastoralist, and you have a holding near Brewarrina? Yes, at Yarrawin. W. Dickson.
15 April, 1898.

2160. You desire to add to the evidence which you gave before the Sectional Committee at Brewarrina? I simply wish to give emphasis to the statement of Mr. Sawers, especially with regard to the river traffic. As a wool-grower, I wish to say that the pastoralists of the district would rather send their wool by railway than by river, under almost any conditions. We would never attempt to send our wool to Adelaide.

2161. *Mr. Hoskins.*] Why would you not send by river if you could get your wool taken by the steamers at a much lower rate than by the railway? To send by river means extra handling and loss of time, and time is valuable to us.

- W. Dickson. 2162. Do you sell your wool within the Colony? No; we ship the bulk of it.
 15 April, 1898. 2163. Then time is of little consequence to you? The facilities for sending wool from Sydney are greater than the facilities for sending it from Adelaide. Some years ago we sent wool to Adelaide, but the arrangement was most unsatisfactory to us. It took something like two months for the wool to reach Adelaide, and then we had to pay a higher freight from Adelaide than we should have had to pay from Sydney.
2164. But the traffic to Adelaide has been expedited during the last two years by the improvement of the river? Not to any great extent. The river has been snagged in some places.
2165. Wool is sent now from the Upper Darling to Echuca and Morgan? Not from the Bourke district. Wool may be sent from places lower down than that.
2166. The Committee have been informed by the Manager of Messrs. Rich & Co. that, if the railway were constructed to Brewarrina, the steamboat proprietors could make better arrangements for the conveyance of wool by river, and that they would cut down the rates as low as possible. They could minimise the handling by using derricks as they do at Hay? Hay is much closer to Melbourne than either Bourke or Brewarrina. If wool were put on to a steamer at Brewarrina, that steamer might not have a full load, and she would take on more wool lower down, which would necessitate the shifting of some of the wool already on board. Every handling injures wool.
2167. The experience of the Railway Commissioners is that the producers of low-class greasy wool do not care what means of transit are used, as long as it is cheap? That is not the feeling in the Brewarrina district; the people there would prefer to send away their wool by rail.
2168. They said the same thing at Hay before the Hay railway was constructed, but afterwards they took advantage of the low steamer rates? It is only a short distance from Hay down the Murrumbidgee to the Murray, and the navigation of the Murray is comparatively safe. Besides, the distance is much less than the distance from Bourke.
2169. You believe that if the proposed railway were constructed wool would be sent by it from Brewarrina direct to Sydney? Yes, nearly the whole of it. Our clip and the clips from two adjoining stations have not been included in Mr. Harper's estimate, so far as I know. That wool now goes to Girilambone or Nevertire.
2170. The large financial institutions whose headquarters are in Melbourne control the movements in the wool, and force people to send it where they think proper? To some extent they may do so; but I think that every year the producers are getting more independent.
2171. *Mr. Fegan.*] If the recommendation of the Sectional Committee could be carried into effect would it satisfy your people? I should be satisfied with it, and so would a great many others; but it would be difficult to carry it into effect.
2172. If it were passed into law it could be carried into effect? Then it would be satisfactory.
2173. The condition would then be acceptable to the people up there? Yes; so far as I know.
2174. There is a great difference between your estimate of traffic and that of the Railway Department;—if your figures are correct there is no necessity for making an extra charge upon the land;—you would not advocate a railway which would not pay? We do not wish to advocate the construction of a railway which would be drag upon the resources of the country.
2175. The recommendation of the Sectional Committee, if carried into effect, would get rid of any loss? I should be willing to accept that recommendation.
2176. It would get over the difficulty? Yes; or you could get over the difficulty by charging higher rates. If there were a railway to Brewarrina we should send our wool to Brewarrina. I should also like to state that when we send wool from Brewarrina to Bourke we never pay less than 25s. a ton, without insurance. As a rule, we have paid 28s. 6d. a ton.
2177. You do not send any wool to Bourke? Not during the last three years, except small quantities. Last year we sent about 50 tons to Bourke.
2178. What did you pay then? From Brewarrina we paid about 25s. a ton. The bulk of our clip we shipped there.
2179. The rate from places further up the river was higher? Yes.
2180. In the first place, there is 10s. for the transhipment at Brewarrina? We generally sent our wool away at times when the steamers could cross the Brewarrina rocks.
2181. What services were performed for the 28s. 6d. you paid? Our wool was taken from the river bank at Brewarrina, put upon the river steamers, carried to Bourke, and placed upon the railway trucks at Bourke. We were supposed to pay 25s. a ton for the steamer carriage, and 3s. 6d. for the handling of the wool at Bourke. The wool landed on the trucks at Bourke was in the same position as wool that is landed on the trucks at Girilambone.
2182. The evidence of Mr. Shainwald is to the effect that these rates include carting and the storing of the wool in Sydney? That is absolutely wrong.
2183. This is Mr. Shainwald's evidence:—
1845. With regard to the river freights the evidence has been somewhat conflicting;—what are the prevailing rates at the present time? From 20s. to 25s. I might possibly remove a source of conflict in the minds both of the Committee and of other witnesses who have given evidence locally, if I pointed out that the rates of 20s. and 25s. a ton from Bourke include all charges plus the commission charges and delivery to the ship's side or warehouse. When I say that the rate is 20s. or 25s., I mean that the whole charge of handling the produce from the time it leaves the growers until it reaches the agent in Sydney.
1846. Does it include insurance? No. For example, we say to the growers, "The rate from Brewarrina is 20s. a ton, including all charges excepting insurance and trainage. The 20s. covers the actual rates paid by steamer, it covers the haulage charges at Bourke, the cartage from the river bank to the railway at Bourke, our commission charges in Bourke and Sydney, and cartage from Darling Harbour into the store at Sydney."
- ? I maintain that there are no charges for commission and for cartage in Sydney. The Railway Commissioners convey the wool to the stores without charge. That evidence conveys the idea that something is paid for cartage and commission in Sydney.
2184. Mr. Shainwald goes on to say:—
- We calculate that our commission on all these charges, and delivery into the store at Sydney is 2s. 6d. a ton. We calculate the haulage at Bourke at 9d. a ton; the cartage from the river-bank to the railway at Bourke, 2s. 6d. a ton. These three charges comes to 5s. 3d. If you deduct them from the 20s. which we charge all through, it leaves the actual river freight at 14s. 9d. on ordinary occasions. I am speaking of Brewarrina, below the Fisheries, as the shipping point.
- ? That is, reckoning the steamer freight at 20s. a ton. 2185.

2185. Are those charges the usual charges? I cannot quite understand them in that form. I maintain that the lowest rate we ever paid from Brewarrina to Bourke was 25s. a ton. That included all charges. W. Dickson.
15 April, 1898.
2186. And you have paid as high as 28s. 6d. a ton? Yes.
2187. When you send your wool away by rail what service do you get from the Railway Commissioners? We pay £4 a ton for greasy wool and £5 a ton for scoured wool from Girilambone. We deliver the wool into trucks there, and it is sent to the stores in Sydney without further charge.
2188. Then the figures we have here are misleading? Yes. It has been said that the river may in course of time be locked, and that then the steamers will be able to reduce their rates. It will, however, be many years before the locking of the river can be carried out, and in the meantime the development of the district will be such that the railway authorities may be able to see their way to a reduction of railway freights, which would meet any lowering of steamer rates. It would take probably ten years to lock the river.

William Nicholas Willis, Esq., M.P., sworn, and examined:—

2189. *Mr. Lee.*] You represent the Electorate of The Barwon in the Legislative Assembly? Yes. W. N. Willis,
Esq., M.P.
15 April, 1898.
2190. I understand that you desire to supplement the evidence which you gave before the Sectional Committee at Brewarrina? I desire to supplement the statement I made before the Sectional Committee in regard to the increased rentals that might be obtained from the pastoral and homestead lessees if this railway were constructed, provided a loss accrued from its construction. What I wished to convey to the Sectional Committee was that the land through which the railway will pass belongs to the State, and is subject to reappraisal at intervals of seven years. I think the last reappraisal took place two years ago, so that these lands will be reappraised in five years' time. When the reappraisal is taking place the fact of the construction of the railway will be taken into consideration by the chairman and the members of the Land Board in fixing the new rentals, and no doubt the rentals will be increased because of the advantages given by the railway. If the railway did not pay—though I think it will—the homestead lessees and other Crown lessees would not growl if they were charged a farthing an acre more for their land. In Queensland the Government wanted to make a railway from Charleville to Cunnamulla. I pointed out to the Premier there that a railway should be made to open up that country. Of course, the usual objections were made, especially on the part of the Railway Commissioners. Sir Hugh Nelson called for a report showing how many acres of land would be thrown open for homestead lease, and when he received that report he said, "The best thing we can do if the line does not pay is to charge 1d. for the land, instead of $\frac{3}{4}$ d. an acre." All the land that has been thrown open along that line has been greedily taken up, and people are now waiting to take up any land which may be thrown open at the increased rate. In the Brewarrina district the land is already in the hands of leaseholders, but it will ultimately revert to the Crown. The Government can increase the rent charged for this land apart from the railway. Down about Nyngan, land which, before the railway was made, was leased for $\frac{1}{2}$ d. an acre, is now leased for 2d. and 2 $\frac{1}{2}$ d. an acre.
2191. So that the State is benefited indirectly, if not directly, by the construction of a railway? Exactly. That is what I wanted to convey to the Sectional Committee. I also want to take objection to the proposal to get an undertaking from the Crown tenants to pay $\frac{1}{4}$ d. an acre more for their land before the railway is constructed. Some of the Crown tenants do not want a railway, and would be glad if a railway never came into the district. It is not that they would not be benefited by the construction of the line, but they fear settlement. Under our Land Act, the Government can take away certain areas from the big pastoral holdings, and throw them open for small settlement. I have tried to get land thrown open, but I have always been met with the objection that the settlement would not warrant its resumption. If the railway were made that excuse would be valueless. If, however, the construction of the line depends upon the signing of a guarantee, such as I speak of, we shall never get a railway. While I believe that 75 per cent. of the people of the district would agree to give a guarantee, the other 25 per cent. would not. Personally, I should be only too glad to pay a higher rental.
2192. Would it not follow, as a matter of course, if the railway were made, that the rents would be raised at the next appraisement? Yes. The railway could not be constructed, even if it were sanctioned by the next Parliament, in much less than five years, and the land will then be open for reappraisal. My opinion is that the rents will then be increased, not by $\frac{1}{4}$ d. an acre, but by perhaps as much as 1d. an acre.
2193. Are you of opinion that in the event of the construction of the railway the natural traffic of the district will be sufficient to cover the working expenses and interest? I am clearly of that opinion. The geographical situation of Brewarrina proclaims it to be the natural depot for Queensland sheep and cattle; and meat-preserving works, boiling-down works, and wool-washing establishments would start there if a railway were made. Then, too, a great deal of the land between Byrock and the Bogan, and between the Bogan and the Tarrion will be cultivated. I am prepared myself to clear from 500 to 1,000 acres of land, and to put it under wheat. I would guarantee to do that. According to the reports of the Government Astronomer, the rainfall of Narromine, Byrock, Nyngan, and Gongolgon is about the same. They are growing wheat in the most luxurious fashion in and about Narromine. Some years ago I attended a meeting at Dubbo to protest against the Government raising the rents there above $\frac{1}{2}$ d. an acre. Now all that land is under wheat, and is worth £2, £3, £4, and £5 an acre. I am sending 100 bushels of wheat up now to plant. The rich chocolate flats on the Tarrion would all be cultivated if the railway were made, and that would increase the traffic. There would also be a lot of extra traffic of which no account has been taken.
2194. What has been your experience of the effect of railway extension? A few years ago I had a store at Nyngan, but I did not, in my wildest dreams, imagine that they would ever grow crops there, and I left the place. Twenty years ago, when I first went to Dubbo, if a man spoke about growing crops there, he would be considered a raving lunatic. Now they are growing crops from Dubbo to beyond Nyngan.
2195. Will the effect of the construction of this line be to open up more cultivation? The land will be put to its proper use. People will cultivate it as well as run sheep. Some sort of railway communication must be given to all this country in the interior. That is the only way in which you can get millions of acres of land to be taken up and properly used.
2196. You do not know how the land about Hay compares with the country between Byrock and Brewarrina? No; I have never been there. At Lachlan Downs, which is between Nymagee and Cobar, we grow

W. N. Willis, Esq., M.P. grow crops very well, but we can only grow enough for our own use, because it does not pay to send anything away. I made the proposition to the Government that if they would put the carriage of wheat from Cobar upon the same footing as the carriage of wheat from Wellington, I would guarantee to put 1,000 acres of pine scrub land under crop; but they would not consent to that.

15 April, 1898.

2197. Do you think that there is a reasonable prospect of this line paying within a few years? Yes; I think that more light lines should be made in this country. I should like to see the Committee put its foot down upon the heavy and expensive style of construction. What does it matter if the trains only run 12 or 15 miles an hour. That is quicker than a bullock-dray can travel. In Queensland they make 4 or 5 miles of railway for what it costs us to make 1 mile, and they get a return from the land, if not from the railway.

2198. Is there any other point you would like to refer to? Only this: that I would suggest that if there should be any loss upon the line the rates should be increased. I paid 25s. last year to send my wool from the Tarrion to Bourke, and I should be glad, if the railway were not paying, to pay 15s. or 17s. 6d. instead of 10s. as a local rate. Three trains a week would be quite enough for the present requirements of the district. I would beg the Committee to remember that the land in this district belongs to the people. Very little of it has been alienated—I suppose not 1 per cent. In making the railway we are improving the estate of the people; and the more you improve this estate the more you get in rent. It is like putting an extra front into a shop, and charging so much more rent for it.

TUESDAY, 19 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Byrock to Brewarrina.

Francis William Bacon, grazier, sworn, and further examined:—

F. W. Bacon. 2199. *Mr. Humphery.*] The Committee understand that you desire to supplement your evidence? Yes. Before being examined again, I should like to briefly state the reasons why I and some of my brother graziers have come here again to-day. We saw in the newspaper a *précis* of the report of the Sectional Committee containing the recommendation that the various lessees should agree to pay a farthing an acre additional rent to make up any loss that might occur in connection with the proposed railway. While personally, I should be in favour of making up the loss in that way, I know that it would be impossible to get the lessees to agree unanimously, or with anything approaching unanimity, to such a proposal. They do not desire better means of communication than now exist. Some are actively hostile to railway construction. Many of the large stations in the district are controlled by financial companies, having the expenditure of English capital, and, so long as the properties give a fair return, they do not wish to see the *status quo* altered. As was pointed out by Mr. Sawers last Friday, they do not wish the railway to come any closer to their property than it is at present, because they fear further settlement. In about five years from now, all the properties in this district will be re-appraised, and I should like to point out to the Committee that the last Land Act specially recommends the Chairman and Members of the Land Boards in fixing rentals to take into account the cost of carriage. We therefore know for an absolute certainty that if the proposed railway is made our rents will be increased, and this increase of rental will, of course, be an indirect return to the State from the construction of the line. Another reason why we have come here is because of the evidence tendered by Mr. Shainwald. Early in the inquiry it was stated that the rate of carriage by steamer from Brewarrina to Bourke was as low as 12s. 6d. a ton. Mr. Shainwald, in his supplementary evidence, stated that the rate was £1 a ton, and he went into a number of calculations to show how that rate was made up. I can only regard his evidence as an intentional effort to mislead the Committee. The rate of carriage by river from Brewarrina to Bourke has always been 25s. a ton; leaving out of consideration forwarding charges at Bourke. Mr. Shainwald put down 9d. a ton for haulage, and 2s. 6d. a ton for cartage, but there are not two such separate charges. The wool is taken from the Bourke wharf to the railway station, and a charge is made for cartage; but there is no distinct charge for haulage. This year I paid 25s. a ton to have wool taken from Brewarrina to the Bourke railway station. The insurance, which was extra, came to 3s. 8d. a ton, reckoning 5½ bales of greasy wool to the ton.

2200. So that, with insurance, you paid 28s. 8d. a ton? Yes; in addition to that I had to pay the usual forwarding charge of 2s. 6d. a ton to Messrs. Wright, Heaton, & Co. We are all very indignant about Mr. Shainwald's evidence. He further stated that his firm made a charge for delivering the wool from the Sydney railway station to the stores here; but he must know that no charge is ever made, because the Commissioners deliver the wool to the stores free of charge. Neither Messrs. E. Rich & Co., Wright, Heaton, & Co., nor any other firm have anything to do with the delivery in Sydney. They perform no service beyond putting the wool on the train. The total charge for the wool from Brewarrina free on rail at Bourke was £1 11s. 2d. per ton. Only part of my clip went by river then—about 550 bales.

2201. How did you send the balance? By team to Bourke and to Byrock. For the last two or three years I have been able to send more cheaply by team to either Bourke or Byrock than by steamer from Brewarrina.

2202. What did it cost you to put your wool on the train at Bourke, sending it by team? £2 15s. a ton.

2203. What is the usual charge to take it from the station to Brewarrina? From 35s. to £2 a ton. Taking the lower rate—35s.—and adding £1 11s. 2d., the cost of conveyance by steamer from Brewarrina to Bourke, and other charges which I have mentioned, the total charge comes to £3 6s. 2d., as against £2 15s.

2204.

2204. That naturally suggests the inquiry why you did not send all your wool direct to the railway by team? The shed was blocked up with wool, and we thought it better to pay the extra money in order that the carriers might have a shorter distance to go, and be able to get back more quickly. In some instances they did not consult me about the matter at all, and, yielding to the solicitations of Messrs. E. Rich & Co., they put the wool on the steamer at Brewarrina without my permission. I had arranged with these men verbally that if the wool were shipped they were to pay river insurance; but they were not charged for it, so that I had a further loss to bear.

2205. Have you reason to believe that 25s. a ton was the usual rate for river carriage from Brewarrina to Bourke during the season which is just over? Yes.

2206. You did not hear of any wool being carried for less than that? I did not hear of any wool being carried for less than that. Since 1889 there has been an exceptionally good river. I have lived in the district for more than seventeen years, and for the first eight years after I came there it was almost an unheard-of thing for wool to be sent by river from Brewarrina to Bourke, because the river was barely navigable. At one time I lived near Wilcannia, and it then frequently happened that two clips went to Melbourne together, because of the river not running during one season. Mr. Kerrigan stated at Brewarrina—and he is a partner in the steamship company—that the steamers have paid no dividend since 1894. This has been during a period when the river has been good, and the rate 25s. a ton, so that it is unlikely that they will be able to pay dividends if the rate is lowered and less wool is carried by them. If the railway is made to Brewarrina the rates will have to be lower to compete with the railway, and, in any case, some of the wool will be taken by the railway, so that it seems to me that it will be impossible for the steamers to continue. Mr. Kerrigan stated that in one year, whilst he was sole owner of the "Cato," he made a large sum of money by her, and, tempted by that success, he and others bought other steamers and tried to control the whole of the traffic. Mr. Shainwald has stated—a statement which caused us considerable irritation—that Messrs. E. Rich & Co. do not hold shares in this steamer company. Technically he may be right. The firm may not hold shares in the company, but some of the members of the firm are shareholders, and they practically control the traffic and fix the rates. Mr. Shainwald himself stated that Mr. Kerrigan had no right to make certain statements, because he was not in possession of the necessary information, as all the rates were fixed at Bourke. Whether the railway is made or not, none of our wool will go by the river steamers. This year I have been offered a contract at 5s. a ton lower than the steamer rates. Another point is this: It has been suggested that Messrs. E. Rich & Co., if the railway were made, might influence a lot of wool, and cause it to go to Adelaide. I have an intimate knowledge of the accounts of the stations in the district, and I do not think that the company could influence 1,000 bales. They may have made advances upon small clips, but they cannot control any large clips. It may be said that they would reduce the steamer freights in order to compete successfully with the railway. Assuming that we paid a local rate on the railway from Brewarrina to Byrock of 15s. a ton, that would make the charge to Sydney £4 15s. a ton. Now, I have taken the trouble to get a quotation of the cost of conveying wool to Sydney from the district, *via* Adelaide.

2207. Is that the cheapest route? The cost would be about the same, *via* Echuca and Melbourne. The freight from Brewarrina to Morgan is put down at £2 10s. a ton; the insurance at 32s. 6d. per cent.—taking $5\frac{1}{2}$ bales of greasy wool to the ton, at 17s. 7d.; the freight from Morgan to Adelaide, at 16s. 10d.; the outward wharfage at Adelaide, at 2s. 6d.; the freight to Sydney, £1; the wharfage in Sydney, 3s.; cartage in Sydney from the wharf to the store, $5\frac{1}{2}$ bales at 4d. a bale, 1s. 10d. a ton, or a total of £5 11s. 9d. The insurance rates are guaranteed by quotations which I have received within the last few days.

2208. Are you aware that Mr. Shainwald stated that the freight from Adelaide to Sydney at the present time was only 7s. a ton? I think he said that the freight from Sydney to Adelaide was only 7s. a ton. Sydney, as you know, is now the centre of the re-export trade, and they send wire and heavy things back to Adelaide at a very low rate per ton. Of course, the same rates would not apply to wool, which takes up more room, and has to be stowed.

2209. You say that the freight from Adelaide to Sydney is nearly three times as much as the freight from Sydney to Adelaide? Yes; and I have taken the trouble to obtain quotations from shipping people. There is a difference of 16s. 9d. in favour of the direct route by train from Brewarrina to Sydney. For many years Messrs. William McCulloch & Co., of Melbourne, did a large steamer traffic on the Darling; but heavy losses forced them to sell their steamers, and to give up the business. During the last few years there have been several instances in which great loss has been incurred by the sinking of barges through snags. The river route is a difficult one, and the voyage takes from three to six weeks. Wool 60 and 80 miles below Bourke comes up the river to Bourke, and is sent from there direct to Sydney. Wool comes to Bourke from Currinyalpa, Eldorado, Dunlop, Tooralie, and Wittagoona—all stations further down the river. Another advantage in coming to Sydney is that here you get the best market in the colonies. This year the number of bales of wool sold in Melbourne was 197,000, while the number of bales sold in Sydney came to 425,000, or more than twice as many. Owing to the commercial supremacy of Sydney during the last ten years, nearly all the big Melbourne financial houses have established offices here, and they do not direct wool to Melbourne as much as they formerly did. Of course, there are some strange anomalies. Messrs. Goldsbrough, Mort, & Co., have seven or eight accounts with places near Bourke from which in some cases they send the wool to Melbourne. It may be in one case that the station owner is an old Melbourne man, and prefers to sell there. I know of similar anomalies in other districts. I cannot account for them; but they do not affect the result.

2210. *Chairman.*] What is the cost of sending wool from Brewarrina to Melbourne, *via* Echuca? About £5 5s. a ton, I think.

2211. What is the cost of sending to Adelaide by the cheapest route? £4 6s. 11d. I think the strongest argument against the contention that wool would go to Adelaide, if the proposed railway were made, is the fact that it does not go there now, and that it comes to Bourke from stations further down the river. I am sure that the Railway Commissioners are capable of protecting their own interests. They have obtained this trade for Sydney, and they can be trusted to keep it.

2212. *Mr. Humphrey.*] Mr. Shainwald in his evidence explained that, in the event of competition rendering it necessary, he should quote rates from Brewarrina to South Australia, against which the railway could not compete; what is your opinion on the subject? It is absurd to make such a statement. If Mr. Shainwald's Company saw that a profitable business could be done they would take wool to Adelaide now. But I have already shown that the river trading is not profitable.

- F. W. Bacon. 2213. Mr. Jamieson, in his statement, said that wool would be sent to Brewarrina for shipment by train from Fernleigh, Coomبرا, Wooleerina, and Bundalear; Mr. Shainwald took exception to that statement, and said that special concessions had to be made to secure that wool at the present time, these concessions being equal to the amount of the Queensland border duty;—do you think that wool would be sent to Brewarrina? I do. Formerly Coomبرا and Wooleerina wool always went to Brewarrina and Bourke. Fernleigh and Bundalear wool went direct to Bourke. The Queensland Government have now taken off the export duty in regard to stations within 40 miles of the border, so I think that this wool will certainly come to Brewarrina.
- 19 April, 1898. 2214. Are the stations I have named within 40 miles of the border? Yes, with the exception of Fernleigh. Wooleerina adjoins a property I own—Ballandool. The Queensland Government last year made special offers to these stations. The season then was better in Queensland than in New South Wales, and a number of New South Wales carriers went there to spell their bullocks. It suited them better to take wool over a route on which they could get grass than to bring it into New South Wales.
2215. Where did they take the wool? To Mitchell, a distance of 150 miles. Wooleerina would be within 115 miles of Brewarrina. The people who control these stations live in Sydney, and do business here. There is another point to which I would draw the attention of the Committee. On the basis of one sheep to 3 acres, allowing 7 lb. of wool to a sheep, a rate of $\frac{1}{4}$ d. an acre would mean a charge of 19s. 9d. a ton upon the wool of the district in addition to the local railway rates.
2216. *Mr. Fegan.*] If the local railway rates were 10s. a ton, the carriage of wool would then be equal to 29s. 9d. a ton? Yes. That, of course, would be a very oppressive charge, though, for my own part, I should be glad to pay it, because of the many advantages given by a railway; but I would point out that the storekeepers, publicans, and other people in the towns who get up large quantities of goods by rail would not have to pay anything towards making good any possible loss. A railway enables a pastoralist to save in a good many ways. As I pointed out before, we have now to import a great deal of our labour, and the item of coach fares is a very heavy one in a year. It came to nearly a farthing an acre upon some land which I had, as I proved to the Land Board. We were paying £500 a year for our leaseholds at the time, at 275d. per acre, and our coach fares came to £50 a year, or one-tenth of our rental. I should explain that these fares were for people employed on two stations which we worked as one; but you can see that this is a considerable item. A tremendous number of men come into the district from Sydney in the shearing season, and many of them use the coaches.
2217. Not as many come up now as formerly;—you have a large number of local labourers? There are fewer now than we used to have. People do not stay in the district now as they did formerly. Only yesterday I sent up a boy, and now I have to send up a married couple to fill the place of a boundary rider who is leaving. The coach fare is £3 or £3 10s. a passenger, and the fares soon mount up. For a number of years I cut twenty bales of wool to the 1,000 sheep, including a large proportion of scoured wool, so that you will see that in averaging the “cut” of the district as 7 lb. to the sheep I am well within the mark. In my opinion the best way of making up any deficiency on the railway would be by the imposition of an extra local rate. I quite recognise that it is almost impossible to properly adjust the conflicting evidence which has been put before you. Mr. Harper claims for Bourke Culgoa wool, which we think would come to Brewarrina. Lately they have made a number of bridges over the creeks in that district, and the wool will come to Brewarrina if a railway is made, because that will be the nearest point. I suppose, too, that he has not included wool within a certain distance of Walgett, which would come down the river.
2218. *Mr. Humphery.*] Do you desire to say anything in regard to the probable live-stock traffic? The evidence taken upon that point has been very full. I have repeatedly sent stock to Dubbo and to Narrabri, because the road from Gongolgon to Bourke was so bad. When, by driving stock 200 miles instead of 140 miles, you can save 6d. or 9d. a head, you drive the longer distance. If, however, there were a railway at Brewarrina I should only have 70 miles to drive, and a good road. I could come down either the Bokhara or the Birie, over first-rate country. A large number of stock go up the Mara Creek, and up the Barwon, of which, perhaps, no account has been taken.
2219. You think that Mr. Harper has not been sufficiently liberal in his estimate of the earnings of the railway? I think not.
2220. Although he has allowed double the average traffic of the past few years? Yes; a great deal of stock goes by of which Mr. Harper can have no knowledge. A railway will create traffic. It would cause people to fatten stock for market which they do not fatten now.
2221. I suppose a large number of stock would be sent away in small lots which cannot be sent away now? Yes; in lots of from 100 to 1,000.
2222. Mr. Harper seemed to be of the opinion that if the local rate were charged on the railway an agitation would be got up against it later on, which the Commissioners could not resist, and that the steamboat proprietors would take a great deal of the wool to Adelaide. He pointed out that the railways had not been able to compete with the river steamers in other places, and he seemed to fear that it would be the same at Brewarrina? The facts are all against him. As I have already shown, wool comes up the river to Bourke.
2223. But do not the stations which send it get large concessions from the Railway Commissioners? I understand that large concessions are given, but similar concessions are given as at Hay. These concessions are given to prevent the trade from going to Victoria.
2224. *Mr. Hoskins.*] Are not concessions given to the Dunlop and Tooralie stations because of the large number of sheep which in drouthy seasons are sent from there into Riverina and brought back again? I have heard it mentioned that the Commissioners give special concessions to Mr. McCaughey, because of the large number of sheep which he sends backwards and forwards. With regard to the Upper Darling traffic, it is to a great extent a local traffic between Bourke and Walgett, and only lasts while there is a good river. The river is very irregular. Sometimes it is navigable for a few weeks, and then the steamer traffic becomes impossible again. You cannot rely upon the river. I do not think the oldest inhabitant ever remembers the river being so good as it has been during the last nine years. The back creeks have been running almost continuously, but when I went up into the district first we had to make dams across them to save water for stock. When we get back to normal years there will be no navigation upon the Darling. I contend that if the steamers cannot carry the wool to Adelaide now, in competition with the railway, they will not be able to do so when the railway is brought to Brewarrina. I would sooner pay 10s. or £1 extra to send my wool to Sydney, because that is the best market for it. Last year, according to the latest official statistics, the shortage of wool in New South Wales alone was

100,000 bales, but the wool sales of Sydney showed an increase of 40,000 bales over the sales of the previous year. That shows how people take advantage of the Sydney market. We all want money, and we want to realise quickly. If I could save £1 a ton by sending *via* Adelaide I would not send that way, because I might lose more by a fall in the market. I sold my first lot of wool last year on 7th October, and it brought from 8d. to 8½d. a lb. A month later, practically the same wool brought from 7d. to 7½d. There had been a fall in the value of "tops" at Home, and it was reflected out here. I had only 120 bales to offer at the first sales. 500 bales were detained owing to the scarcity of grass; but if I could have got them down earlier I should have obtained a ½d. a lb. more for the wool. My clip came to about 200 tons, scoured and greasy. Sending it by river the wool comes to the stores irregularly, and there might be a delay of three or four months. As it was, it took eight or nine weeks to sell my wool last year.

2225. *Mr. Humphery.*] The same objection would apply to sending wool to Melbourne as applies to sending it to Adelaide? Yes; if I sent my wool to Adelaide I would ship it from there round to Sydney.

2226. Your contention is that the advantages offered by the Sydney wool market and by the quick railway transit more than cover any savings which might be made by sending the wool down the river? Immeasurably more than cover it. At Sydney, in sending to other places, you can take advantage of the lowest freights, and early and late in the season you can get most advantageous freights. I have had freights as low as ¼d. a lb., with a rebate.

2227. *Mr. Hoskins.*] Are you aware that the Railway Department intends to construct a wharf at Bourke, to enable the steamers to discharge directly on to the railway trucks? I am aware of that.

2228. Will not that reduce the river charges? According to Mr. Shainwald it will make a difference of 2s. 6d. a ton.

2229. Have you heard that it is also intended to make a dock at which the steamers can be overhauled and repaired; this will save them a long river journey, and ought also to lessen the cost of transit? I do not think it would make much difference. Were the steamers to carry for little or nothing the bulk of the wool would go by railway, for the reasons I have given.

2230. Some of the witnesses who have preceded you have stated that it would be impossible to increase the rents as recommended by the Sectional Committee; but they think it would be advisable to increase the local railway charges upon the proposed line if necessary? That is exactly my view.

2231. But by increasing the railway charges you give more opportunity for river competition? No; the two points are not the same. A local rate obtains between Forbes and Condobolin at the present time. We ask for this railway with a high local rate as a condition precedent. We are willing to pay a local rate. If the steamers cannot be made to pay when they are charging 25s. a ton, how could they be made to pay at a rate of 15s. a ton, especially if they got only half the trade that they get now.

2232. Do you place reliance upon the statement that the steamers do not pay? That statement has been made by Mr. Kerrigan and by Mr. Shainwald. You could not have better evidence than that.

2233. You appear to have a preference for a railway, but in other parts of the country there are rich people who, to save trouble, send their wool in by teams? Then they are very short-sighted. I do not think there are any such people in the Brewarrina district.

2234. I suppose you know that the Bourke Meat-works have been purchased by the people who control the Deniliquin Meat-works? Yes; Mr. John Cooke is one of the purchasers.

2235. Will not the existence of these works at Bourke tend to draw the stock traffic there instead of to Brewarrina? Certainly not. At the Bourke Meat-works the meat is chilled, and is then sent by rail to Sydney to be frozen hard for export purposes. It is intended, however, to erect an extract plant. The best thing to do with an ordinary sheep or bullock—that is, with an animal which is not prime fat—is to melt him, and make extract out of him.

2236. Sheep in the Brewarrina district that were not first-class would be driven to the Bourke Meat-works, instead of being sent by rail, from Brewarrina? Certainly. I should never send middling sheep to Brewarrina to be trucked to Bourke. I would drive them direct to Bourke. Fat sheep, however, would have to go to Brewarrina. Medium sheep would not stand the expense of train carriage.

2237. *Mr. Wright.*] You do not consider the recommendation of the Sectional Committee a practicable one? No.

2238. Do you think that the majority of the pastoralists in the district would undertake, for a period of three or five years, to send away their produce by train and to get back their stores in the same way, paying 15s. a ton? I feel certain that most of them would.

2239. The Committee would like a guarantee that the local rates will continue in force for some length of time;—do you think that it could be obtained? I do. Some years ago, when the railway was first mooted, several of the graziers about Brewarrina, including Mr. Dickson, who was here the other day, agreed to enter into a bond to make good any loss amongst themselves. The railway would be of great advantage to the storekeepers and others in the district. To show how uncertain the present means of communication are, I would like to inform the Committee that recently I have been cutting bush hay, but some of the knives having been broken, I have been compelled to discontinue the work, because it will take six weeks to send new knives up to the stations. Occasionally we have paid 6d. a lb. per mile to get things taken by coach, so you will see that we work under great disabilities.

2240. *Chairman.*] If Mr. Harper's figures are correct, you would have to pay about £1 on every ton of wool to make up the loss on the railway? Personally, I should be glad to do so; but I feel certain that Mr. Harper has under-estimated the traffic. The truth, no doubt, lies in the mean. Perhaps Mr. Jamieson's evidence was biassed to a certain extent, and I know that he has made one or two blunders. We feel, however, that Mr. Harper is a special pleader against the railway, and we think that he has not given us a fair show.

Richard Randolph Machattie, stock and station agent, Brewarrina, sworn, and examined:—

2241. *Chairman.*] You are a stock and station agent, residing in Brewarrina? Yes.

2242. *Mr. Humphery.*] You have heard what Mr. Bacon has said;—do you support his statements? I do. Do you desire to add anything to them? Since I had the recommendations of your Sectional Committee wired to me, I have made it my business to move pretty quickly through the district, and I am under the impression that it would be difficult to get anything like a unanimous approval of the proposal

F. W. Bacon.

proposal that the graziers there should consent to pay an additional farthing an acre for their land. The small owners would be willing to pay this charge; but it would be difficult to get the whole body of pastoralists to consent to it. There are a number of associations controlling stations there which do not favour railway construction in the district. I would point out, however, that at the last assessment of rents the most material and pertinent questions were asked by the Land Board as to the distances of holdings from the nearest railway station, and the rates of carriage. It is an undoubted fact that the nearer a property is to a railway the higher is the rent charged. If the recommendation of the Sectional Committee were carried out, publicans, storekeepers, and the townspeople generally would not be called upon to bear their share in any possible loss, whereas I think everybody in the district should bear it. These people have expressed their willingness to assist in paying off any deficit which might occur. When the reappraisements are made, if the railway has in the meantime been constructed, our rents will undoubtedly be increased, so that if there is any loss upon the railway there will be a much greater indirect gain. In my opinion the increase of rent will more than double any loss upon the railway.

2244. When will the leases be reappraised? In less than five years' time.

2245. *Mr. Fegan.*] Is it not a fact that the rents in the district have been reduced considerably;—that was the evidence we obtained from the Chairman of the Local Land Board? In the far west the rents have been reduced materially; but in our district the reductions have hardly been perceptible. In some cases there have been increases.

2246. If the recommendation of the Sectional Committee were passed into law, do you think it would give satisfaction to the people of the Brewarrina district? I believe that if the Committee's recommendation could be enforced by Act of Parliament it would give satisfaction.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM BYROCK TO BREWARRINA.

REPORT.

THE Sectional Committee appointed on the 11th February, 1898, to inspect, take evidence, and report with reference to the proposed Railway from Byrock to Brewarrina, have the honor to report to the Parliamentary Standing Committee on Public Works:—

The Sectional Committee, consisting of the Hon. Frederick Thomas Humphery, M.L.C., Chairman, the Hon. Daniel O'Connor, M.L.C., and John Lionel Fegan, Esq., M.L.A., accompanied by Mr. G. V. Mocatta, Surveyor, of the Railway Construction Branch, left Sydney at 8 p.m. on the 11th March, and arrived at Byrock on the 12th. There not being any evidence forthcoming at Byrock, it having been arranged that all the witnesses should be examined at Brewarrina, the Sectional Committee left for the last-named town next morning, and, travelling *via* Gongolgon, reached Brewarrina in the evening of the same day.

The hearing of evidence was begun on Monday, 14th March, at the School of Arts, Brewarrina, and the examination of the local witnesses concluded at noon on Saturday, 19th March.

In the course of the week the Sectional Committee made an inspection of portions of the surrounding district, driving on one occasion in a northerly direction as far as the Narran Lakes, and on another proceeding nearly 20 miles up the river by steamer.

In the afternoon of the 19th the Sectional Committee commenced their return journey to Byrock, travelling along the approved route of the proposed railway. Byrock was reached on the evening of the 20th, and, after examining a Departmental witness there the following morning, the Sectional Committee left for Sydney, where they arrived on Tuesday 22nd March.

The proposal under consideration was the construction of a light line of railway estimated to cost about £2,500 per mile. Starting from Byrock, the country, which consists of red soil, is generally free from liability to flood to within 2 miles of the Bogan River, a distance of 32 miles, with quartz and ironstone ridges necessitating small cuttings and a considerable amount of curvature, and some culverts, but no important bridges. Immediately on the other side of the Bogan the country changes to a black soil, and a considerable area of it being liable to flood, several rather large bridges would be required. The first bridge would be at the Bogan River, where a viaduct would also have to be built for about a mile or a mile and a half as a provision against floods. Six miles beyond the Bogan another bridge would have to be built—across the Nyrang Bogan. From that point onwards the line would follow a buddah ridge to within half a mile of the Tarrion Creek, which is an overflow of the Barwon, and thereabouts a considerable area liable to flood would have to be bridged over. The Tarrion Creek is 54 miles from Byrock. For the remainder of the journey, to Brewarrina, about 6 miles, the country consists of open plain, and provision would have to be made to permit of the passage of flood-waters. The line would not be difficult of construction, and ballast could be obtained either from the immediate neighbourhood or from quarries conveniently situated on the main Western line. The station at Brewarrina would be built on Government land—a 60-acre reserve being available for that purpose. The amount that would have to be paid for resumption or severance is inappreciable.

Description of
the proposed
railway.

Suggested extension of the proposed railway.

Although the proposal before the Committee was merely for the construction of a railway from Byrock to Brewarrina, a future extension of the line to Goodooga was urged, in order to secure Queensland traffic principally by tapping the St. George basin country. It was, however, admitted that a line which has been suggested from near Narrabri to a point somewhere between Angledool and the Barwon might attract traffic which it is said would otherwise come to this railway, whether it were or were not extended to the border.

The Sectional Committee were informed that in the St. George basin country from 3,000,000 to 4,000,000 acres have lately been thrown open for smaller settlement, and that some of that land has been taken up by persons who are interested also in pastoral pursuits on the New South Wales side of the border.

The nearest Queensland railway is said to be a considerable distance from St. George, and at the present time large numbers of sheep and cattle cross the border and make their way *via* Brewarrina to some point on the Western railway below Byrock, turning off between Brewarrina and Byrock, because of the badly watered and insufficiently grassed track between the Bogan and the last-mentioned town. Several important stock routes from the Queensland border converge at Brewarrina, and it is asserted that the proposed railway (even if the terminus were at that town) would always secure additional traffic on that account. There is also, the Sectional Committee were told, a movement on foot for the establishment of a meat-works, fellmongery, scouring works, and a boiling-down at Brewarrina, which would be partly supplied with Queensland stock.

River navigation.

In connection with the navigation of the river, in relation to the proposed line, it was pointed out that above Brewarrina there are nearly 60 miles of water navigable almost all the year round, and that goods arriving at Brewarrina by railway could sometimes be conveyed to their destination, between that town and Walgett, fourteen days before the state of the river below Brewarrina would permit of goods being brought up from Bourke, a consideration, no doubt, especially in times of drought.

The rainfall.

The district is watered by the rivers Culgoa, Narran, Birrie, Bokhara, Barwon, and Bogan, also by the Marra, Tarrion, and Womerah creeks; but owing to the severity of droughts some of these watercourses are occasionally dried up for a long period, the average rainfall being between 15 and 20 inches, the quantity varying considerably in different parts of the district.

How the land is occupied.

Most of the land in the Brewarrina district is in occupation under either pastoral or homestead leases, and at the present time there are available for further settlement (excluding the county of Gregory) 50,000 acres. The area at present available for settlement in the Land District of Brewarrina East is 6,400 acres. The leasehold areas expiring in 1900, which can then be made available for settlement, comprise 307,000 acres. The area which could be made available by withdrawal under section 6 of the Crown Lands Act of 1895 is: Around Goodooga, 17,000 acres; around Brewarrina, 30,000 acres; total, 47,000 acres. The area comprised in reserves for railway purposes, 1 mile on each side of the original trial line, and a reserve at the Bogan River, is 73,600 acres; but these reserves cannot all be made available for settlement until the expiry of pastoral leases, about the year 1913.

As regards the area enclosed by the red lines on what is known as Mr. Sawers' map, the particulars as furnished by the officials of the Local Lands Office are as follows:—Total area, 4,505,600 acres; area in pastoral leases, 2,376,000 acres; area in homestead leases, 1,584,000 acres; number of pastoral leases, 35; number of homestead leases, 162; area at present available for settlement, 56,320 acres; area which will be available in 1900 (upon expiry of Central Division leases), 198,400 acres; area of railway reserves not in leasehold areas in Western Division on Byrock-Brewarrina railway trial lines, 13,440 acres, of which 1,600 acres are within the Brewarrina common.

The character and capabilities of the district.

The Sectional Committee were informed that at the time of their visit the season in the Brewarrina district was an exceptional one, owing to a recent abundant rainfall.

Between Byrock and Brewarrina much of the country before reaching Gongolgon was found to be of an inferior description for grazing. However, an improvement was noticeable on approaching Gongolgon, and in going thence to Brewarrina.

After

After crossing the Barwon, and proceeding through Quantambone towards Goodooga, the true character of the major portion of the Brewarrina district was revealed, and during the investigation evidence was given which confirmed the statements of witnesses who had been previously examined before the general Committee, as to the excellence of the pasture for fattening stock.

The importance of the district being evident, the fact should be borne in mind that nearly the whole of the area in question is unalienated, and its development would be much assisted by the proposed railway, with largely beneficial results to those who have already made their homes there.

The testimony of the Chairman of the Land Board, formerly the District Surveyor, who has frequently travelled over all the district, and also the evidence of the Stock Inspector, corroborated by numerous witnesses (the latter of course more or less interested in obtaining the proposed railway), are conclusive as to the superior quality of the extensive area referred to as enclosed by the red lines on Mr. Sawers' map. These lines embrace over 4,000,000 acres that would be served by the proposed railway, and it is estimated that that tract of country is capable of carrying about 1,500,000 sheep. The returns furnished by stock-owners do not show that number, without credit being given for removals during the six months preceding the date upon which information is, according to law, furnished to the Department.

If any further proof of the superiority of the district for grazing purposes were required, it could be found in the fact that the rents of Crown lands in the Brewarrina district are higher per acre than the rents of Crown lands in any other district within the jurisdiction of the Bourke Land Board. With absolutely safe stocking, the Chairman says, 1,450,000 sheep may depasture, and, in his opinion, the carrying capacity of the land could be considerably increased by further improvements.

There are only from 9,000 to 10,000 cattle, and very few of these are fattened there for market.

It is said that the construction of the proposed railway would enable landholders to profitably combine agriculture with grazing, which is practically the only industry now carried on in the district. So far, they have grown wheat and oats merely for station consumption in the shape of hay; but it is believed that a railway would lead to increased settlement, and result in agriculture being carried on upon a larger scale, more particularly as regards cereals and fruits.

There is no doubt that, in fair seasons, a comparatively small area may be cultivated profitably to meet local requirements; but, owing to less favourable climate and other adverse conditions, it is questionable whether the Brewarrina district would be able to successfully compete against districts possessing more suitable soil and having a lower temperature and a greater and more regular rainfall, with the additional advantage of nearness to the best markets for the disposal of their surplus production.

The Sectional Committee, therefore, in dealing with the proposal for a branch railway from Byrock to Brewarrina, have discarded any expectations of traffic not based on results that may be reasonably looked for from what is rightly described by all the witnesses as a splendid pastoral district.

From a perusal of the evidence it will be seen that the case of those who advocate the line rests mainly upon the grounds that they would be greatly con-
 Reasons in support of the proposed railway.
 venienced by having railway communication 60 miles nearer than they have it at the present time; that station produce now sent to Bourke either by road or by river would be put upon the railway at Brewarrina and charged for at local rates; and that, inasmuch as the existing Bourke to Byrock section of the Western line is practically non-productive (the rates for station produce from either of those places to Sydney being nearly the same), the Railway Department would reap the benefit of absolutely new revenue, and the earnings of the branch from Brewarrina to Byrock would be ample to pay interest on its cost of construction as well as the working expenses.

Undoubtedly the residents of the district would be convenienced in having additional and quicker means of transit from Brewarrina to the Western line, and their contention that the section between Byrock and Bourke is unremunerative
 Would the proposed line pay?
 must

must be admitted ; but the Railway Commissioners, through their late Goods Superintendent and present Chief Traffic Manager, Mr. Harper, join issue with the advocates for the proposed railway as to the prospects of its being a paying line, at any rate for many years to come, and estimate an annual deficiency of £4,299.

The Sectional Committee, after carefully sifting the evidence given at Brewarrina, regard the probable volume of traffic as being a very open question.

The Railway Commissioners' opposition to the proposal.

To the fear of indirect disastrous results from river competition, and a possibility of adding another non-paying branch to the list of unprofitable railways, must be attributed much of the strong opposition of the Railway Commissioners ; but if it can be demonstrated that the Department would not suffer any loss from the construction and working of the line, it would be manifestly unfair to the people of the district to deny them the much craved for benefit of railway connection.

The Chief Traffic Manager, notwithstanding the figures and sworn testimony placed before the Sectional Committee, most emphatically insists on the fulness of his estimate of earnings, and that he has given the branch line credit for all the traffic which, under the most favourable conditions, could be reasonably expected to reach it, either at or between Brewarrina and Byrock. He claims to have sources of information which enable him to testify with absolute accuracy as to the tonnage received at Byrock and Bourke, including the weight of the wool-bales (in regard to which there were differences of opinion, even on the part of expert witnesses at Brewarrina) ; and he asserts that, in estimating the traffic belonging to the Byrock-Brewarrina district, he has included every thing brought by road, as well as that conveyed by steamers on the river.

Whilst great weight must be attached to this positive evidence given on behalf of the Railway Commissioners by their trustworthy, able, and experienced officer, the equally positive evidence given by well-informed local witnesses of repute, to the effect that the traffic would be ample to cover both working expenses and interest, cannot be ignored, although, as already indicated, the Sectional Committee do not see their way to accept it as conclusive.

Proposal to levy a special land tax.

The evidence as to probable earnings is so conflicting, and consequently the payableness of the proposed line so much in doubt, that the Sectional Committee are of the opinion the traffic problem might well be solved by the adoption of a course suggested by the evidence of the Member for the district, viz., the making of a slight addition to the rents of the Crown lessees (who would be the principal gainers from the construction of the line) until it can be clearly shown that the railway is self-supporting.

The Sectional Committee, in making this suggestion, bear in mind the fact that several of the witnesses who are engaged in pastoral pursuits expressed their willingness (because it would be worth their while from a pecuniary point of view) to pay for the carriage of their wool from Brewarrina to Byrock, even more than the freight that the Railway Commissioners propose to charge, in preference to using the river.

Fully recognising the claims of the district to generous consideration, the Sectional Committee are indisposed to make an adverse report in connection with the matter entrusted to their investigation if the Railway Department can be protected against the anticipated deficiency, and an arrangement of the nature suggested would give the wool-growers a direct pecuniary interest in the success of the railway, as well as fully provide for the risk of the line entailing an annual loss to the Railway Department.

Therefore, under all the circumstances, they feel justified in recommending that the proposed line should be constructed on the condition, but not otherwise, that the consent of the Crown lessees be first obtained (in such a way as would make the compact legally binding upon them until the railway should become self-supporting), to the payment by them of one farthing per acre rent (additional to their present or ordinary assessment), which on, say, 4,000,000 acres, would yield about £4,000 per annum, and the amount to be credited to the Railway Commissioners.

F. T. HUMPHERY,
Chairman.

5 April, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM BYROCK TO BREWARRINA.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 14 MARCH, 1898.

[The Sectional Committee met at the School of Arts, Brewarrina, at 3 p.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Byrock to Brewarrina.

Richard James Kelly, chemist and druggist, Brewarrina, sworn, and examined:—

1. *Chairman.*] Have you prepared any statement to place before the Committee? Yes. I have been in Brewarrina thirty-one years. I lived in Bourke four years before I came to Brewarrina. I am of opinion that Brewarrina is entitled to a railway for many reasons. Large numbers of travelling sheep and cattle cross here annually. The Brewarrina district has been favoured by nature in having the Cato, the Bokhara, the Narran, the Birie, the Culgoa, the Upper Barwon, and the Barwon Rivers, besides tributaries to those watercourses. I would point out to the Committee that on several occasions very conflicting statements have been made in regard to the estimated cost of the proposed line from Byrock to Brewarrina; and I think that the estimate given by the Engineer-in-Chief could be reduced, judging by the cost of lines in similar country. He is mistaken when he states that no ballast could be obtained along the route of the proposed line from Byrock to Brewarrina. I think that a reduction of the estimate is a very important matter for your consideration.

R. J. Kelly.
14 Mar., 1898.

2. Are you speaking of the latest estimate? Yes.

3. Do you know the amount of the latest estimate? I understand that the cost of the proposed railway, as estimated by Mr. Deane, will be £146,350—for about 58 miles, at £2,500 per mile. I think that that estimate might be considerably reduced. One of the reasons why I am in favour of the construction of the proposed line is because it would serve the homestead lessees, graziers, and settlers residing on the Bokhara, the Birie, the Narran, and the Culgoa Rivers, and others in the neighbourhood of Goodooga, and, indeed, a very large population right out to the Queensland border, who now have a very great difficulty in obtaining their supplies. In order to keep that traffic, I think that at no distant date the proposed line should be continued to Goodooga. It has been stated that goods have been conveyed by river from Brewarrina to Bourke for 12s. 6d. a ton; but I know that the freight charged is from £1 to 25s., and even 30s., per ton. I may say that I have seen teams laden with wool going to Byrock, notwithstanding the fact that steamers have been lying here, the people preferring to send their wool to Byrock by road rather than to send it by steamer to Bourke. A great many of the station-holders do not care to send their wool by steamer, on account of the double handling. During the late drought, and also during the many droughts that I have witnessed here, numbers of sheep and cattle might have been saved if we had had an opportunity of getting them away to places where there was plenty of grass and water. During the last big flood—the flood of 1890—we had from 50,000 to 55,000 sheep camped on the common; and in the case of a big flood we are able to save many sheep on account of having the ridges there. I think that this part of the country is well adapted for wheat-growing, or at any rate portions of it are. For some years I kept a very careful account of the quantity of wool passing through Brewarrina and going by teams or by steamer, and during a period of thirteen or fourteen years the average number of bales that passed through each year was from 25,000 to 30,000. I am of opinion that Mr. Harper's statement in reference to the wool is not correct. I think he has been misinformed as to the quantities. I believe that the average number of sheep passing here annually would be something like 700,000 or 800,000, with the addition of from 80,000 to 100,000 head of cattle.

4. Do you mean fat sheep for the market? I would not like to say that all that stock was going to market, though unquestionably many of them were. Whether stock would be sent by the proposed railway from Brewarrina to Byrock is a question that would depend on the railway freight. I do not think that any sane man would drive his stock 60 miles if he could send them by train at a charge of 2d. per head for sheep and 1s. 6d. or 2s. per head for cattle, because travelling them 60 miles by road would reduce the "fats" considerably. I do not see how the construction of the proposed line from Byrock to Brewarrina could be regarded as robbing the line from Byrock to Bourke, seeing that goods are carried to or from Coolabah for £48 10s., and to or from Bourke for £41. I think that the Bourke end of the main Western line is run for nothing in the interests of one firm. The stock-owners in this district are willing to pay from 15s. to £1 a ton freight from Brewarrina to Byrock, and it will be a vast advantage for the Government to be able to get some revenue from the proposed railway from Byrock to Brewarrina. Mr. Harper states that, at the time of his visit to Brewarrina there were 153 homestead leases in the district, and that he had heard that the number of homestead lessees was decreasing. He also states that there were 118 stock-owners in the district, and that their number was decreasing. He likewise states that there are three travelling stock routes between Brewarrina and Byrock, whereas I know of only two. I think he has been misinformed with regard to those matters. I have also heard that the Railway Commissioners have stated that they never recommended this line for consideration. I will later on show you their recommendation. On several occasions in the evidence given before your Committee, some of the witnesses have stated that no wool from

R. J. Kelly. this district passes through Bourke, but I can prove that a good deal passes through Bourke and goes down the river. It is not correct to say that all the wool passing through Brewarrina to Bourke goes on to the railway at Bourke, because some of it has passed through Bourke, and has gone on by the river to South Australia. I am of opinion that if the proposed railway from Byrock to Brewarrina were constructed a boiling-down establishment and a meat-freezing works would be established at Brewarrina.

14 Mar., 1898.

5. You have said that later on you would show that certain statements made by Mr. Harper are not correct;—do you not think that it would be convenient for you to state now in what respect Mr. Harper's statement is inaccurate? Yes. As regards the quantity of wool and other things that would be carried by the proposed railway from Byrock to Brewarrina, Mr. Harper, first of all, puts it down at 2,000 tons of goods at 10s. a ton, 3,100 tons of wool at 10s. a ton, and 330 tons of wool at 7s. 6d. a ton, and 1,000 trucks of live stock at 15s. 6d. a truck. I think he would be nearer the mark if he said 4,000 trucks. One firm alone in giving evidence before your Committee said they used 900 trucks themselves. That would leave a very small margin for the other firms. Mr. Harper's statement is also incorrect as to the quantity of wool.

6. Will you be good enough to show us in what respect it is incorrect? Mr. Harper, excluding the traffic arriving at Brewarrina for and from Walgett and above stream, puts down the goods at 1,300 tons, and wool at 1,500 tons and 330 tons, and then he goes on to state that he does not think that even that amount would be reached. I am of opinion that he has estimated the quantity of wool at about 1,000 tons less than would be carried.

7. On what do you base your opinion? I judge from my experience in years gone by, and I say that, as we are now receiving the wool from the district north of Brewarrina, the quantity of wool that would be sent by the proposed railway from Brewarrina to Byrock would be about 5,000 tons, whilst about 5,000 tons of goods would also be conveyed by the proposed line, making altogether 10,000 tons per annum. Mr. Harper does not say where he got his information from.

8. You say you are of opinion that, instead of the quantity estimated by Mr. Harper—1,500 tons—the quantity of wool that would be conveyed by rail from Brewarrina in the event of the proposed railway from Byrock to Brewarrina being constructed, would be 5,000 tons? Between 4,000 and 5,000 tons.

9. But you have not given us any data? I kept returns for several years, but eighteen months or two years ago I gave the proprietor of the local paper those returns, and they have, unfortunately, been burnt. 10. What you have put forward now is simply your own opinion? Yes. I said the same before the Sectional Committee on the proposed construction of locks and weirs on the river Darling about eighteen months ago, when I had the information quite fresh in my mind.

11. Have you any details showing from where the 5,000 tons would be obtained? No; I have not any details, but I know the various stations, and I think that my evidence as to the quantities will be borne out later on.

12. We may regard what you have said as being a matter of opinion that will be supported by evidence yet to be submitted to us? Yes.

13. You say that the 1,300 tons of goods is an under estimate? Yes.

14. What is your reason for challenging Mr. Harper's statement? I myself kept an account for fifteen or sixteen years of the goods in and out carried by teams and other means, and I found that the average was about 10,000 tons annually.

15. Will any evidence be submitted that the probable freight between Byrock and Brewarrina in respect of goods will be 5,000 tons instead of 1,300 tons? Yes; that evidence will be submitted to your Committee. The next matter is the live stock. Mr. Harper gives credit for 1,000 trucks of live stock at 15s. 6d.

16. How many trucks do you say? I shall be nearer the mark if I put down four times the quantity—that is for sheep and cattle.

17. You estimate that there will be 5,000 trucks? No, 4,000—2,500 trucks of sheep, and 1,500 for cattle. I am putting down about one quarter of the number that passes Brewarrina.

18. You say that there are only two travelling stock routes between Byrock and Brewarrina? I went for information to the Chairman of the Land Board, and I could not find that there were more than two stock routes between Byrock and Brewarrina.

19. Will you mention the two stock routes to which you refer? One goes by Gongolgon, and the other by Tarcoon.

20. Do you think that the estimated receipts of the proposed railway from Byrock to Brewarrina would be affected by any error on Mr. Harper's part as to the number of stock routes between Byrock and Brewarrina? I think that his statement that there are three stock routes between Byrock and Brewarrina is an incorrect statement. I am not prepared to differ from Mr. Harper in regard to the amount of passenger traffic put down by him—1,500 passengers. I think that that is as near as we can get in regard to that matter. I have not gone into it carefully enough to understand the matter properly, but Mr. Sawers, who has already given evidence before your Committee in Sydney, has gone into it.

21. The next point to which you referred was that the railway between Byrock and Bourke would not be occasioned any great loss by reason of the construction of the proposed railway from Byrock to Brewarrina;—will you explain why? My reason for saying that is that goods going to or from Coolibah now are charged for at the rate of £48 10s. a truck, and that the charge for carriage to or from either Bourke or Byrock is £41, and if the Government could get 15s. a ton for the carriage of goods on the proposed railway from Byrock to Brewarrina, I fail to see where the loss would come in.

22. What you say is, that, as there would be a local rate between Byrock and Brewarrina, there would be a gain instead of a loss, inasmuch as only a nominal rate is now charged between Byrock and Bourke? That is exactly it. The rate from Bourke down freight is the same as from Nyngan, and therefore the rate that would be charged on the proposed railway from Brewarrina to Byrock, 15s. a ton, would compensate for any possible loss on the back loading.

23. In other words, you contend that the steamer earnings on the river between Brewarrina and Bourke would go to the Railway Commissioners;—is that so? That is correct.

24. You say that a rate would be charged between Brewarrina and Byrock which would be fairly equivalent to that now paid for conveyance by steamer from Brewarrina to Bourke? Yes.

25. And that inasmuch as the freights charged from Bourke to Sydney are similar to the freights from Byrock to Sydney on nearly all classes of goods, there would be a considerable gain to the railways by the running of the proposed line from Byrock to Brewarrina, without any loss to the main line? Yes; Mr.

Shainwald,

R. J. Kelly.
14 Mar., 1898.

Shainwald, in his evidence, stated that it was doubtful whether the owner of Boorooma station would send his wool by the proposed railway, but I have a statement from the late manager and the owner of the station themselves as to whether they would prefer the locking of the river to the proposed railway, and it is to the effect that even if the river were made permanently navigable the owner of Boorooma station would prefer to use the Byrock-Brewarrina railway, and the owner of Boorooma station told me himself personally that he would prefer to put his wool on teams and send it by railway from Brewarrina rather than putting it on the river at all. He said: "I am certainly in favour of the proposed railway from Byrock to Brewarrina in preference to locking the river."

26. When you made a statement as to the rates between Byrock and Brewarrina you said something as to steamer freights—by way of comparison? Yes; I have never known the steamer freight to be less than £1 a ton, and the general freight is 25s. I have known it to be as high as 35s.; in fact, I have paid that amount myself.

27. Do you happen to know the rates at the present time? Yes; the steamer rates are 25s. and 30s. per ton.

28. What are they by team to Byrock? About 25s. or 30s. The people prefer now to put their goods on the teams rather than to put them on the steamer.

29. You contend that if the Railway Commissioners could carry the traffic at half that rate there would be no river competition? None whatever. The steamer proprietors say that the present rates do not pay them, therefore there is a very poor chance of their carrying goods—as Mr Harper says they might—at 5s. or 7s. 6d., even if the river were permanently improved.

30. Do you think that the wool coming into Brewarrina would be sent on to Bourke or would be put on the train at Brewarrina? The wool coming in to Brewarrina would be put on the railway at Brewarrina.

31. You have stated that the rate from Bourke to Sydney is the same as the rate from Byrock to Sydney; therefore wool going from Bourke to Sydney would be taken at the same rate as from Byrock? Yes.

32. Would the wool put on the steamer above Brewarrina go on to Bourke, or, if not, what advantage would it be to the owner to put his wool on the trucks at Brewarrina? I do not think that the owners would put the wool on the steamer at all.

33. You contend that no wool would come down stream to Brewarrina, but that all wool reaching Brewarrina would come by team, and be put on the train at Brewarrina? Yes; that is what I contend, judging from what the owners of the wool have told me. With reference to Mr Harper's statement that there are only 118 stock-owners in the district, I have a reply from the Stock Office, dated 17th November, 1897, in answer to a letter written by me on the subject, and showing that there were 227 stock-owners in the district on the 31st December, 1896, and on the 29th October I ascertained from the Land Board Office at Bourke that there were in the Brewarrina district 152 current homestead leases.

34. Therefore, Mr Harper's statement that there were 153 is incorrect? Yes; but it is also incorrect to say that they were leaving the district.

35. I gather from your statement that you have no personal knowledge of the matter, but that the information you have obtained is from official records? That is so.

36. In the first portion of your statement you allowed us to infer that the Railway Commissioners at one time recommended the construction of a railway between Byrock and Brewarrina;—what evidence have you to offer on that point? The Railway Commissioners, in their Annual Report for the year ended 30th June, 1891, on page 8, made a direct recommendation. They said:—

We would suggest for consideration in dealing with railway extensions in districts like Jerilderie and Deniliquin, Narrabri and Moree, Byrock and Brewarrina, where the country is practically level, and the traffic will be very light, that lines to be designated "pioneer lines" be constructed at a cost of about £1,750 per mile, exclusive of bridges and land (which latter we hope can be dealt with as suggested on page 7), the trains to be worked at a speed of about 15 miles per hour, and during daylight only. Later on, when the traffic has developed, and will justify the class of line being raised, a capital vote to be granted as to make the line capable of carrying the traffic under the same conditions as on other parts of the railway.

As an illustration of how outlying branch lines may be cheapened, the short line from Yass station to the town, a length of about 2 miles 64 chains, may be cited. By arrangement with the Works Department, selected second-hand rails have been used, which will carry the traffic for many years, and the cost for rails and carriage amounted to £1,420, instead of £3,016, as would have been the case under the old system.

37. Do you contend that since that report was published in 1891 nothing has occurred that should induce the Railway Commissioners to alter their views with regard to a railway between Byrock and Brewarrina? Nothing, in my opinion.

38. Within the past eight years has there been any development in the district which would, in your opinion, improve the prospects of the proposed railway? Considerably so.

39. Will you state generally what they are? There have been homestead leases taken up in the district, and we know now what we did not know before, viz., that this may be considered a wheat-growing district.

40. Has there been any increase in settlement or in the number of stock? Yes; according to the returns there has been an increase in the number of stock, and also an increase in the number of homesteads as well.

41. Has there been a large increase in the population of the district during the last eight years? I would not like to say that there has been a large increase, but there has been an increase. Mr McIntyre says that there has been an increase since 1894.

42. You said that before you came to Brewarrina you resided for a considerable time at Bourke;—were you there during the time of the agitation for the Bourke railway? No; I was living at Brewarrina, but I used to travel backwards and forwards to Bourke. I was there two or three times a week.

43. At that time did you interest yourself in the proposal for a railway to Bourke? Yes; and I then tried to prevent the railway from coming through Brewarrina.

44. At the time of the proposal to construct the Bourke line you opposed a railway being made to Brewarrina? Yes, considerably.

45. And you supported an extension of the railway to Bourke? Yes.

46. On what grounds did you support an extension of the railway to Bourke, and oppose an extension to Brewarrina? I was of opinion that if the railway came to Brewarrina, and went on from Brewarrina to Bourke, the trade of this town would be lost, and the trade would be taken to Bourke; therefore I blocked the line from coming to Brewarrina, and allowed it to go to Bourke by the present route.

47. You were of opinion that a railway to Brewarrina would be injurious to the district? Yes, if it were carried on to Bourke from Brewarrina, as I thought it would be. It was not then proposed to make the railway from Byrock to Bourke. The proposed railway was to come *via* Mount Harris, Warren, Cannonbar, Gongolgon,

R. J. Kelly. Gongolgon, and Brewarrina. It was the route that I objected to; therefore I opposed the line then proposed.

14 Mar., 1898.

48. Your fear being that the railway would be extended from Brewarrina to Bourke? Yes.

49. And that the railway reaching as far as Bourke, the district of Brewarrina would be prejudicially affected? Yes.

50. *Mr. O'Connor.*] You wished to have Brewarrina a terminus? Yes.

51. And now you advocate making Brewarrina a terminus? No; I have no wish to do that. I wish the railway to go on to Goodooga, and to catch the Queensland trade there.

52. *Chairman.*] At that time you entertained parochial views, but now your views have widened? Yes; I was young then. At another time I advocated the locking of the river. That is many years ago; but I have seen the error of my ways in regard to that.

53. You have no doubt now that this district would be very largely benefited by the construction of the proposed railway? That is certainly my opinion. I would not advocate it if I did not think that. Considering the quantity of goods that I have named, and the stock that would leave here, I am satisfied that the traffic on the proposed railway would justify its construction, and that it would not rob the Bourke line of 1d. The proposed line might take some traffic from the Bourke line, but there would be no loss of revenue to that line, whereas on the other hand there would be a good deal of gain by saving the wear and tear of the line to Bourke.

54. You say you think that Brewarrina should not be the terminus of the proposed railway;—in what direction do you think it should be extended? I think it could be safely extended to Goodooga. Brewarrina has a district of its own independently of Goodooga, and can hold its own, but I think that the proposed railway should be extended to Goodooga, more especially to catch some of the Queensland trade. Some of the station-holders on the other side of the Queensland Border send their sheep across to be shorn on this side of the border in order to avoid payment of the Queensland export duty on wool.

55. You think that by the extension of the proposed railway to Goodooga much of the traffic that now goes by the Queensland lines would go by the New South Wales lines? That is my view of the matter.

56. You think that Queensland sheep would be shorn on the New South Wales side of the Border and that the wool would be put on the trucks at Goodooga? Yes.

57. If you wish to say anything further on the subject, we will be glad to hear anything you desire to say? I understand that Mr. MacVean will be unable to attend as a witness before you, but the evidence that he gave during the inquiry in reference to the proposed construction of locks and weirs on the river Darling would be pertinent to this inquiry, and should be read with the evidence elicited by you. I desire to quote from the evidence given by Mr. Millen, M.P. for Bourke, on the 24th June, 1896, in regard to the proposed construction of locks and weirs on the river Darling, because, in my opinion, what he said strongly supports the proposal for the construction of a railway from Byrock to Brewarrina. He said:—

I am a journalist and Member for the Electoral District of Bourke. I am familiar with the proposal before the Committee. I had not intended to make any statement before the Sectional Committee; but I have been so long interested in this subject, and have such an intimate knowledge of the district affected by the proposal, that I think I should do so. The Brewarrina district is unquestionably the finest pastoral district in the Western Division. It has the heaviest settlement, and, in my opinion, has developed to such a stage as to entitle it to some better means of communication than now exist. There has always been, and is now, a demand which I regard as legitimate for railway communication with the Western line. I view this proposal as an alternative to that. The railway proposal, if carried out, would offer the advantage of better transit; but would not offer, as the improvement of the river does, that advantage coupled with an abundant supply of water.

I may also point out that when Mr. Scarr was asked to give an estimate of the cost of a road from Brewarrina to Byrock, he put it down at £150,000—from which, of course, there would be no revenue; and Colonel Wells, on being asked to further go into the matter, estimated the cost of the road at £400,000. Comparing that with a railway which would cost £140,000, and which would be revenue-producing, I know which is the better. I may point out in favour of the construction of the proposed railway that there are three banks established at Brewarrina, and from what I can see they have no notion of leaving the town. I refer to the New South Wales, the Commercial, and the Joint Stock Banks, who have purchased land here. That shows that we are not in a state of insolvency.

58. It shows that there has been an increase in the commerce of the district? Exactly. The Commercial Bank has been established here twenty years, the Bank of New South Wales eighteen, and the Joint Stock Bank eight or nine years.

59. *Mr. O'Connor.*] You point to the fact that the Bank of New South Wales and the Commercial Bank had been established here for some years, and that notwithstanding that another large bank came and has been established here for eight or nine years, and your deduction from that is that they would not have come here if they had not had a reasonable confidence in the prosperity of your district? Certainly. I am greatly astonished at the peculiar interest displayed by the Bourke people in regard to the proposed railway from Byrock to Brewarrina, as is shown by the evidence they have given. When Mr. Bacon was giving evidence at Sydney, he was asked:—

Would you, as a pastoralist, be prepared to pay from 15s. to 17s. a ton as a local rate between Brewarrina and Byrock?

His reply was:—

I would be prepared to pay an extra local rate. According to the *Daily Telegraph's* report of Mr. Harper's evidence he has told the Committee that if the interests of the carrying companies at Bourke are disturbed, they may take the trade away to South Australia. I cannot understand why he should make such a statement. People are not in the hands of the large carrying companies. There are only two carrying companies in Bourke, and I am sure that they would not be able to induce people to send their wool to Adelaide.

60. There are three carrying firms, are there not? I do not know of my own knowledge. I know only Wright, Heaton, & Co. and Rich & Co.

61. *Mr. Fegan.*] What you wish the Committee to understand is that you, as a resident of Brewarrina for thirty-one years, prefer the people of Bourke to take an interest in somebody else—that you are perfectly able to take care of your own interests? That is exactly what I wish to convey.

62. What we, as a Committee, desire to ascertain is the various reasons why you think the proposed railway from Byrock to Brewarrina should be constructed, but you have been combating other men's reasons, instead of giving reasons of your own, why the proposed railway should be constructed—is that not so? Yes.

63. What are your chief products in the Brewarrina district? Fat stock, wool, and hides.

64. Where is your nearest market? I do not think there is a market nearer than Sydney.

65. How do you get your goods to market—do teams take them to Byrock or to Bourke? Sometimes to Bourke and sometimes to Byrock.
66. It depends a great deal on the state of the roads, and of the feed along the roads? Yes.
67. Have you any idea what the charges are on the various roads? I have already stated that they are 25s. and 30s. a ton.
68. The charge for wool is 25s. or 30s. a ton, but you would not get other goods taken at that rate? We have to pay very often more—35s. and 40s. a ton.
69. But the people of Brewarrina do not live on wool or hides; there are necessaries of life that you have to get from elsewhere, because you do not produce them in Brewarrina. Would you mind mentioning the rates in regard to these? Other gentlemen who are better seized with the facts of the case will do that.
70. Have you anything else to say? Yes? there is the estimated cost of the line.
71. Have you seen the figures that Mr. Deane has given? Yes.
72. Does he not give very good reasons why the estimate should be £2,500 a mile? Very good reasons indeed.
73. You cannot object to that? No; because he states distinctly that he makes provision in case of flood.
74. Comparing the expenditure per mile of the proposed railway with the expenditure on other lines, you think that that is a fair estimate? I do, because what is put down for ballast, I think might well be spent in making extra provision against floods.
75. Is there anything else you wish to say? I know of one boat that in one year earned £4,433 11s. in running between Bourke and Walgett. That boat was plying between Bourke and Walgett only.
76. Do you think that as soon as the proposed line were constructed that boat would be taken away? I would not like to say that.
77. How, then, would it help the proposed railway? What I wish to point out is that one of the reasons why the steamer people oppose the proposed line is that that steamer earned that amount in one year. I would also point out that Mr. Harper says that the proposed line of railway could earn only £3,600 a year, whereas that boat alone, without carrying passengers, earned nearly £4,500 in one year. If that steamer could earn that amount the proposed railway, carrying many other things beside wool, would earn ever so much more.

R. J. Kelly.
14 Mar., 1898.

TUESDAY, 15 MARCH, 1898.

[The Sectional Committee met at the School of Arts, Brewarrina, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).
The Hon. DANIEL O'CONNOR. | JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Byrock to Brewarrina.

Thomas Huggins, pastoralist, Oakleigh Station, near Brewarrina, sworn, and examined:—

78. *Chairman.*] Where is your holding? On the Bogan, between Brewarrina and Byrock.
79. *Mr. O'Connor.*] How long have you resided in this district? Ever since 1863.
80. You know this district well? Yes.
81. You know its capabilities? Yes; I have seen it both at its best and at its worst. I have seen some very good seasons, and a number of droughts.
82. What is the area of your holding? We have about 65,000 acres in the family—we hold homestead leases amounting to that.
83. How do you utilise it? With sheep, cattle, and horses.
84. Any agriculture? Yes; this year I am putting in about 80 acres of wheat.
85. That would be for home use? Yes, and for sale.
86. Is the land between Byrock and Brewarrina fit for agriculture? The whole of it between Byrock and the Bogan is.
87. I mean along the surveyed route of the proposed railway between Byrock and Brewarrina? I think that between the Bogan and Byrock there is good agricultural country for about 25 miles.
88. How far is the Bogan from Brewarrina? It is about midway between Byrock and Brewarrina.
89. Would you, in your own way, tell the Committee your reasons for supporting the proposed railway;—I presume you are in favour of it? Yes, I am. I think that a railway from Byrock to Brewarrina would tap one of the richest pastoral districts in New South Wales—that is the country lying between Brewarrina and the Queensland Border, Goodooga way. The country between the Culgoa and Walgett, I think, is some of the richest pastoral country in New South Wales, but, of course, its productiveness depends on the extent of the rainfall. I think that instead of carrying a sheep to 7 acres it would, in many places, carry a sheep to 2 acres or even 1 acre if the present rainfall were more regular; but, apart from that, I think that in many places it is a good agricultural district. I know a neighbour of mine who has gone in for agriculture during the last three years. For the first season he put in about 100 acres from which he got about 1 ton and a half of hay to the acre, and also grew his own seed-wheat. The year before last he had a very good crop again of hay, and also grew his own seed-wheat. Last year he put in 160 acres, and I think that he sold over 80 tons of splendid chaff, and also had seed-wheat sufficient for himself and some for sale. A sample of his seed-wheat compared very favourably with seed-wheat for which I gave 6s. a bushel, and which came from another district. His wheat was as good as that, with the exception that it contained a few smaller grains, it not having been so well graded. I am not prepared to go into figures as to the number of bales of wool, or the quantity of stock likely to be sent by the proposed railway from Byrock to Brewarrina, but Mr. Jameson and Mr. Machattie can perhaps tell you that. I do not think that the enormous number of live stock that would use the proposed railway could be ascertained at the present time, because on account of having a bad road for stock between Brewarrina and Byrock a good deal of the stock is taken by other routes, whereas if the proposed railway from Byrock to Brewarrina were constructed the stock would be brought to Brewarrina and would be put on the railway here, with the result that the stock-owners would be saved a good deal of expense, and also loss of stock. I am quite sure that if the proposed railway were constructed there would be a great deal of additional settlement in this district, and the rents of Crown lands would be increased. If we had cheaper means of getting our goods to and from the market, the settlement would be much closer, and I feel satisfied that the proposed railway would pay handsomely. I am not prepared to say that it would not interfere with other lines, but I do not think it would

T. Huggins.
15 Mar., 1898.

T. Huggins. would do so to any great extent. As regards the carriage by steamer between Bourke and Brewarrina, I have been told that it costs from 25s. to 30s. per ton, in addition to which the extra handling and the way the steamer employees knock the wool about in hauling it up and down the banks depreciate its value. I think that one of the chief things that would be sent by the proposed railway would be live stock. The country between Brewarrina and Byrock is very bad country through which to travel live stock in dry weather, especially fat stock. Some years ago certain gentlemen in this quarter offered to guarantee a certain amount of interest on the cost of construction of a railway between Brewarrina and Byrock. Those gentlemen had lived many years in this district, and were station-holders, and had a large interest in the district, and I do not think that they would have been likely to guarantee the interest and the working expenses of the line unless they had been perfectly satisfied that it would pay.

15 Mar., 1898.

90. To where do you send your wool? To Bourke.

91. What distance? Forty miles.

92. Is Bourke nearer to your holding than Byrock is? Yes, a little nearer, but the proposed railway, according to the present survey, would pass within a few miles of our top boundary. I always go to Bourke because things there are a little cheaper—rations and other things—although the cost of carriage is about the same.

93. On the average how many bales of wool do you send annually? About 300.

94. Live stock? From 4,000 to 5,000 sheep and cattle—but I have sold locally mostly. At one time I was sending a nice lot of cattle down.

95. Are there many holdings near you? Yes, quite a number. All the country is taken up in small holdings, and at the present time the landholders are clearing and ploughing, I suppose, over 1,000 acres of land for cultivation in my immediate neighbourhood. Mr. O'Dwyer is putting in something like 50 or 60 acres; Mr. Barton purposes putting in over 200 acres; I purpose putting in from 80 to 100 acres.

96. Principally wheat? Yes, for seed—wheat and hay. Mr. Lloyd is putting in 60 or 80 acres, and I think that Mr. Fennell purposes putting in nearly 100 acres—that is on this side of the Bogan between Brewarrina and Byrock. In my immediate neighbourhood I think that there are over 1,000 acres put under cultivation this year.

97. And if there were a railway from Byrock to Brewarrina affording a ready means of transit that would encourage a larger development of agriculture? I think it would, naturally.

98. How much do you pay a ton for the carriage of your goods to the railway? From 25s. to 30s. But wool they have carried at from £1 the last two seasons.

99. £1 is the lowest, I think? Yes; in fact it is a starvation rate for the carriers, and I do not know how they carry for that money.

100. Is there anything else you would like to say? I have a firm conviction that the proposed railway, would pay. I am not prepared to go into figures, but I am sure that it would be a great boon to the people on the other side of the river towards Goodooga even more than it would to us because we are nearer the main Western line.

101. Is Goodooga in a pretty direct line with the Queensland border? Yes, a pretty direct line. The railway, if extended in that direction, would go through very rich country there.

102. How are you situated here in regard to the rabbits? They are not very numerous here. On my holding I am nearer the rabbit line. The main railway line being netted is a great check to the rabbits coming in this direction. There is a certain increase, but not so much as you would naturally expect with the small means we have taken to check them.

103. They are not as serious a danger to you as they are in other portions of the Colony? I think not.

104. Is your own holding pretty free from them? We have a good number there, but by poisoning them I think we can keep them down. I do not fear the rabbits. Now that we can use phosphorised pollard we can keep them within reasonable bounds. I do not think that we shall ever get rid of them altogether, but we can prevent them from doing a great deal of injury.

105. You think that your neighbours are equally fortunate with yourself? Yes; I think they are in the same position, and if we went to work simultaneously with poison I think we could pretty well clear the rabbits out, at any rate, for a time. They will, of course, keep on increasing, if they are left alone.

106. Do you think that the construction of the proposed railway, and the bringing about of closer settlement, would be the means of finally extinguishing them? Certainly it would. It is on the large holdings now that there are the greater number of rabbits. On Beemery the rabbits were in very large numbers, but now, owing to the use of poison, they are diminishing. Beemery holding is enclosed with wire-netting, except along my boundary, and the rabbits keep on moving towards the north, the check that they receive from the wire-netting preventing their increasing to any great extent.

107. *Chairman.*] Have you had any experience of the country north of the Barwon? Yes; I have travelled over it.

108. In the direction of Walgett and Collarendabri? I have never been that way.

109. How far north have you been? Angledool is about the farthest place to which I have been in that direction.

110. Can you speak from personal knowledge as to the character of the country that would probably be served by the proposed railway? Yes; I can. That is, the country through which it would pass, and also the country through which I myself think would reap the greatest amount of benefit, and from which the largest quantity of goods would be sent to it, namely, the country north of the Darling, between here and the Queensland border.

111. Do you know the area of country comprised within those thick red lines on that country map? I know a portion of it only.

112. Will you describe the portion that you know? I know the country pretty well to the east of the stock route about 100 miles. On the West Bogan it is chiefly red soil, the greater part of which, I suppose, in years to come, will be placed under agriculture.

113. You think that all the red soil of the district will be suitable for agriculture? Yes. On the East Bogan it is all rich pastoral country; portions of it are suitable for agriculture; and on the East Culgoa the country is suitable for agriculture, whilst between the Culgoa and the Bogan I think it is chiefly pastoral country. Our rainfall is not sufficiently heavy to warrant our trying agriculture in the black soil, for it requires much more rainfall, but on the East Culgoa and the West Bogan I think every acre is suitable for agriculture.

114. Do you mean that within the "red" lines the area with which you are familiar is either good pastoral country or suitable for agriculture? Yes; that applies to all the land between the "red" lines. As regards the country between the Culgoa and the Bogan, I do not think that you can say there is any better pastoral country in New South Wales. T. Huggins.
15 Mar., 1898.
115. How many years have you lived in the district? Thirty-five.
116. Then you have an excellent knowledge of the rainfall? Yes.
117. With your knowledge of the seasons, can you say whether agriculture could be profitably pursued? Yes; it could. Our average rainfall during the last records that I have kept for twelve years has been about 17·2. I suppose that even where the people depend entirely upon agriculture they have droughts and with them bad seasons, but I am sure that in this district good crops could have been grown in two out of three seasons during the last twelve years.
118. Does the rainfall come at the right time? Yes, in two out of three seasons.
119. That has been your experience? Yes.
120. You have at times suffered very severely from droughts? Yes; but in the red soil we get the crop in early, and with a little rain during the winter and more rain in the spring the crop is brought on quite sufficiently for hay at least.
121. Can you say from what holdings between Byrock and Brewarrina traffic would be obtained by the proposed railway? Tarcoon, Charlton, Gongolgon, Gralga, and Wyuna Downs. Beemery would be almost as near to Bourke as to the proposed line, but I have no doubt that Beemery would come into this line.
122. How far is Beemery from Bourke? About 40 miles.
123. How far would Beemery be from the nearest point on the proposed line? About 20 miles.
124. It would be only a question as to the cost of carriage? Exactly.
125. If the cost of road carriage plus the local railway rate between Byrock and Brewarrina were less than the cost of road carriage from Bourke, I suppose that Beemery traffic would come into the Brewarrina line? Certainly.
126. Have you mentioned all the traffic that you think would come into the proposed line? No; the traffic of the whole of the country within 30 miles of the line between Brewarrina and Byrock would come in and even some nearer Bourke, because the roads are better for drays, &c., to cart on—on the red soil than on the black, which is very bad in wet weather.
127. So far as regards the country you know, do you think that any of the traffic within the area shown on that map by "red" lines would go to Bourke and not to the Byrock-Brewarrina railway? The whole of the traffic of the eastern portion of the country within the "red" lines would come into the Byrock-Brewarrina railway. I do not know the western.
128. In your opinion, none of it would go to Bourke? I am quite certain of that, because it would be against their interest to send it to Bourke.
129. What would be the lowest rate of carriage to Bourke for any portion of the traffic within the "red" lines? Except in the immediate neighbourhood of the nearest "red" line, it would not be less than £1 a ton; in fact, carriers cannot handle a load of wool or produce and carry it any distance for less than that. The rate is as high as £3 or £4 for portions of the district.
130. I suppose you get all your goods from Bourke? Yes; it is the cheapest market.
131. Do you send all your station produce to Bourke? Yes, except in wet weather, when I take it to Byrock, because there is a better road to go on.
132. You said something about a probable increase in the land revenue in the event of the proposed railway being constructed;—in what way would that increased revenue be obtained? On the same ground that the Land Board increase our rents—that is, the lighter the rate of carriage that we have to pay for our station supplies and produce, they put a proportionately higher rent on the runs.
133. You would not anticipate, I suppose, an immediate increase, but when the leases fall in? At the next appraisalment.
134. You are speaking of the pastoral holdings, and not the homestead leases? The pastoral holdings and the homestead leases, I think, are appraised about the same time. We shall have another appraisalment in five or six years.
135. Do you think it is probable that there will be any appreciable increase in the rent of the land within the "red" lines on that map? We naturally expect so, because of the conditions when we applied for and took up the leases, viz., that there would be a graduating scale and an increase of 25 per cent. every period of five years.
136. But if the Railway Commissioners were to charge a rate for the carriage of goods sufficient to cover working expenses and interest on the cost of construction, would it be reasonable also to increase the rents of the lessees? From my point of view it might not be.
137. Do you think it would be? I naturally expect the Land Board would do so.
138. Because of the additional railway facilities? Yes; they have always taken into consideration the rate of carriage in fixing the rent of the run, and naturally we suppose they will continue to do so.
139. Therefore you contend that in addition to the earnings of the railway there will be a large increase in the revenue from the land? Yes, I do.
140. Do you really think there will be? I do, indeed, because of closer settlement, and all the Bogan country being taken up, too. There is a lot of country on the East Culgoa that has been lying idle, and which they are throwing open as improvement leases, scrub leases, and settlement leases.
141. Do you know if the rents have been increased in other portions of the country where a railway has been made? I cannot say, because I have not had any experience out of my own district.
142. The Railway Commissioners look for revenue to the earnings of the railway, and do not take into consideration the increased rent obtained by the Government for Crown lands? I think they should do so. It is a national work, and anything that adds to the Government revenue should be taken into consideration.
143. At the present time is there any land between Byrock and Brewarrina which is not occupied? I think not.
144. Is it occupied by homestead lessees chiefly? Homestead lessees and pastoralists. The whole of the resumed area has been taken up by homestead lessees.
145. How many years have the leases to run from the present time? Most of them twenty-one years from now—twenty-eight years from 1889.

- T. Huggins.
15 Mar., 1898.
146. Do you know whether the rents have recently undergone revision? Yes; at the last appraisalment there was a reduction made in some and an increase was made in a few instances.
147. There have been increases? There have been a few increases. At the first appraisalment the Land Board assessed the leases at more than we anticipated, and the bad seasons and consequent depreciation of stock coming on the top of the increases in rent, we naturally asked for a decrease in the rents, which the Land Board have taken into consideration, and our rents have been lowered to nearly the original rate.
148. So there has been a very substantial reduction? Yes, in many cases. In some cases there has been an increase, according to the value of the country; but the reduction was made owing to the high rate that we paid at first, and the bad seasons, and the lowered value of our produce. When we took up these leases wool was worth from 8d. to 9d. a lb., but afterwards it went down to about 5d., which made a material difference in our income, and what with droughts and scarcity of money we found it very difficult to make ends meet; in fact, I think that most of the pastoralists at that time were going down a little, but during the last few years I think they have gone on very well.
149. Generally, are you prepared to say whether there has been retrogression or progression in the district during the last eight or nine years? During the last four years there has been a great advance—everybody has been doing very well—but between 1891 and 1894 I think there were heavy losses. Since 1894 I think that in most places they have done very well.
150. An increase of stock? Until last season I think that the increase of stock in our district has been very great.
151. And an increase of population? Decidedly.
152. And a large area put under and at the present time being prepared for cultivation—is that correct? Yes; that is quite correct. I am speaking only of my own immediate neighbourhood when I say that from 1,000 to 2,000 acres are being put under cultivation, but nearly everybody that I speak to is talking of putting land under cultivation.
153. In what direction, besides the locality in which you live, has cultivation taken place? On the west side of Bourke, and up the Bogan to the west of where I am.
154. Principally wheat? They grow wheat for hay. Wheat stands frost better than anything else does, and, therefore, we put in wheat for hay; and during the last two years they have also grown their own seed-wheat.
155. Is the produce to which you have referred grown for use on the stations or for market? Both.
156. More than necessary for station use? Yes. In a good season like the present we could sell the whole of it, because we do not require to feed our working horses with it, but in bad seasons we retain it to keep our stock alive and to feed the horses.
157. What does it cost you per acre to put your land under wheat? The first cost—that for clearing—is the heaviest cost.
158. Can you mention one sum covering the whole cost from sowing to harvesting? About £1 an acre, I think, will cover the whole of it.
159. Would £1 an acre cover the cost of conveying to the railway as well? I should say that 22s. 6d. would do it. We pay 10s. an acre for ploughing and sowing on land that has been cleared, and I do not think that the cost of reaping and harvesting and carriage would come to 12s. 6d.
160. Of course, if a very large area were put under cultivation the cost would be considerably reduced? Yes. Some land has cost me 10s. an acre for clearing. I think that on a large scale we could clear that land out there for agriculture for about 5s. an acre—that is, by ringbarking and pulling the lighter scrub out by bullocks, and burning the heavy timber down.
161. Have you considered whether you could successfully compete against other wheat-producing districts, considering the less favourable conditions under which you cultivate, you being handicapped with a long distance of railway carriage? I could not say at present, I have not gone into that matter, but I know that the wheat that I have had to purchase during the last two years for seed-wheat has cost me 6s. a bushel landed in Bourke.
162. To where would you look for a market for agricultural produce? Locally. If we grew sufficient wheat I think that we would make our own flour in the district, but it would take some years' cultivation to supply the wants of the population round here.
163. You think that you would be able to supply the local wants at lower rates than wheat can be brought from places between here and Sydney? Yes; at the present rate they cannot land wheat in Bourke at less than 5s. or 5s. 6d. a bushel.
164. Do you get your wheat from Sydney or from Narromine and Dubbo? From Narromine and Dubbo. Rich & Co. charged me 6s. a bushel, and I suppose that they would pay perhaps 5s. a bushel for it, and I think that it could be grown and sold by the producer here for 3s. or 3s. 6d.
165. I suppose that maize cannot be grown here successfully? It grows very well on irrigated ground; and on the other side of Bourke, where they have the bore water and red soil, they grow it, but whether it pays I cannot say at present. All these industries require some years to get them on to a proper commercial basis to enable us to live upon them.
166. I suppose you are of opinion that cultivation will pay here? Yes; eventually. I think there will be a greater population living on agriculture in the near future than there is now on pastoral pursuits.
167. And you think you would be able to successfully compete with outside markets? I think so. The soil is good, our rents are lighter, and we can use fresh soil for some years to come.
168. You think that your crops will bear favourable comparison with crops grown in more favoured districts? What we are growing—wheat—at the present time compares favourably with the wheat that comes from other places.
169. You did not say what the average return per acre was? I could not tell you that. They have threshed only sufficient for seed-wheat for themselves and a little they have sold to their neighbours. Mr. Fennell bought, I think, 50 bushels from Mr. Barton, who threshed more than sufficient for his own seed.
170. So far, I suppose that Mr. Barton may be regarded as the largest producer of wheat in the district? Yes; I think he is. Last year he had over 400 acres under cultivation, and this year he will have 800 acres under cultivation. He has grown some wheat both this side and the other side of Bourke. He has bought agricultural machinery for one farm at the back of me which has cost him over £300. He must have very good prospects to go in for that.

171. You think that Mr. Barton's success will encourage others to follow his example? Undoubtedly. T. Huggins.
172. *Mr. O'Connor.*] How many acres on your station will be fit for agricultural purposes? 30,000 acres. 15 Mar., 1898.
About half our country is saltbush country and black soil, and the other half is nice alluvial mulga country, very suitable for agriculture.
173. And you would not be disposed to go in for cattle and sheep if you could do better by devoting your land to agricultural purposes? No; I should like to see some of it put into agricultural farms. That would not prevent us from having cattle and sheep; on the contrary, it would enable us to do that better, as we should not fear the droughts, for we could keep sufficient forage in hand to tide us over a bad season. I think it is very necessary that agriculture should be encouraged in every possible way. In my opinion the success of the pastoral industry depends a great deal on cultivation. I certainly hope that the proposed railway from Byrock to Brewarrina will be constructed. I do not wish to see the country run into any expense that is not warranted, but, considering the disabilities under which we labour here in times of drought, I think that the Government should do all they can to encourage us. Certainly our lines have not been cast in pleasant places for a good many years.

Walter George Jameson, stock and station agent, Brewarrina, sworn, and examined:—

174. *Mr. Fegan.*] How long have you been in this district? Since the beginning of 1888.
175. Have you had any other position besides the one you are occupying at the present time? In the year 1894 I was on the Weilmoringle Station, on the Culgoa, as storekeeper, book-keeper, and overseer. W. G. Jameson.
15 Mar., 1898.
176. Have you prepared any statement to lay before the Committee? Yes; I have prepared a short statement. Some of my reasons for claiming that Brewarrina has a right to railway communication are— (1) That it is a commercial necessity for the proper development of a very rich district; and (2) that the proposed railway would pay from the start. In support of this latter assertion I have prepared a return of the wool traffic which has passed through Brewarrina by team, and by steamer, and also a list of the stations which would be influenced by the railway, and the wool and produce of which would come to the railway at Brewarrina if it were constructed. The abstract of the return of goods and wool is as follows:—
- | | |
|--|----------------|
| Actual amount of wool sent to Brewarrina by steamer, season 1894, from stations within sphere of railway, as per return No. 1, 14,219 bales..... | Tons.
2,300 |
| Other wool produced in district within sphere of railway, and every bale of which we can fairly claim, 12,356 bales (That is allowing 15 bales for every 1,000 sheep, which is a very low estimate. In most cases with the improvements that have been made in the breeding of sheep the average is from about 18 to 20 bales per 1,000, but I am calculating it at 15 bales, so as to put it very low.) | 2,144 |
| Skins, hides, tallow, and general produce..... | 500 |
| Return loading sent to stations..... | 3,100 |
| „ distributed among townships, hotels, country stores, hawkers, &c..... | 2,000 |
| Total..... | 10,044 |

The amount of wool sent to Brewarrina, 1894, does not include 6,763 bales, weighing 1,324 tons, sent from stations in the Walgett district, and which came through by steamer from the Walgett district (see Return No. 2), nor 4,944 bales, weighing 941 tons, which would come from stations just over the Queensland border, and which would be almost certain to be trucked here, this being the natural outlet and the nearest and most convenient point.

A great many of those station-holders also have land in New South Wales, and they bring the sheep across the border, and shear them on this side, so as not to have to pay the export duty on wool which is charged by the Queensland Government. The tax is imposed by the Queensland Government, in order to prevent the wool from being sent through New South Wales instead of *via* Brisbane. The wool from the stations above Boorooma, which I have classed as being in the Walgett district, 1,324 tons, and the wool from the Queensland stations, 941 tons, would make an extra 2,265 tons, which would probably come to the railway at Brewarrina. The following is a return of wool that actually passed through Brewarrina in 1894, which I can vouch for as being absolutely correct in every detail, and I challenge anyone to prove it to be incorrect:—

Return No. 1.

RETURN of Wool sent to Brewarrina, Season 1894, for shipment.

During the wool season 1894, the river was not running for a considerable period, and about 5,000 to 6,000 bales of wool passed through Brewarrina on teams going to Byrock or to Bourke. 177.

W. G.
Jameson.
15 Mar., 1893.

177. Where did the bulk of the wool which you have enumerated go to? It went by steamer to Bourke.
 178. We have evidence before us, given by Mr. Harper, who is now the Chief Traffic Manager of the railways, and who says that altogether the railway received 1,250 bales at Byrock, and 26,449 bales at Bourke;—what year is your return for? For the shearing season of 1894.
 179. The return that we have received for 1893-4 differs from your return in some respects? Of course I cannot say what the receipts of the railway were at Bourke; but I say absolutely that the wool that I have quoted went from Brewarrina.
 180. If you were to have a railway terminus at Brewarrina, where would the wool go to then? Most of it would go from that terminus.
 181. How many of those 14,000 bales approximately would have gone by rail from Brewarrina if there had been a railway here? Within 1,000 bales of the total.
 182. Would you say that 10,000 bales of those 14,000 bales would have gone to the Brewarrina railway? Yes, quite. That wool was actually sent through Brewarrina in 1894, and then there was wool from the Walgett District sent by steamer past Brewarrina to Bourke, as follows:—

Return No. 2.

Wool from Walgett District sent past Brewarrina in steamers to Bourke, Season 1894.

I may state that the river stations up as far as Ulah on the Barwon have a standing contract with the carrying companies for the conveyance of their wool either by river or by road *via* Brewarrina.

183. That is to Bourke? Yes, *via* Brewarrina. Those two returns give the whole of the wool that actually passed through Brewarrina on the steamers.

184. And the total is about 21,000 bales? Yes. I have a return here of places which would come within the sphere of the proposed railway over and above those places which I have already mentioned. It is as follows:—

Return No. 3.

Wool which would be sent to Brewarrina to be trucked if proposed railway constructed.

185. In round numbers, making a total of 33,000 bales? Yes. Those stations that I have already mentioned as being on the Queensland border are as follows:—

Return No. 4.

W. G.
Jameson.
15 Mar., 1898.

QUEENSLAND Border Wool which should be sent to Brewarrina for Trucking, as most convenient and nearest point.

Name.	Place.	No. of bales produced.	Name.	Place.	No. of bales produced.
Scottish Investment Co.	Fernlee	853	C. McKenzie & Co.	Kinglebilla	300
Machonachie Bros.	Coomburrah	368	F. W. Bacon	Ballandool	300
A. M. L. & A. Co.	Woolerina	968			
M. Tully	Mulga Downs	450			4,944
Squatt. Inv. Co.	Bindaleer	1,705			

Several of the above clips are now brought into New South Wales to be shown.

186. But they are nearer railway influence and would not come to either Bourke or Brewarrina, are they not? No, none.

187. None whatever? No. They are all almost in a direct line north from Brewarrina. In the matter of stock-trucking by the proposed railway I believe that the estimate made by the Department was about 1,000 trucks, which is manifestly absurd. The number of sheep in this district as per the evidence of Mr. Yeo, Stock Branch, Department of Mines, whose figures I adopt, is 1,754,707. The usual proportion of fat sheep on a station is one-sixth of the whole.

188. Is your idea to show us that with a railway terminus at Brewarrina a certain proportion of those sheep would be sent from here by rail? Yes; one-sixth or one-seventh is the usual proportion of fat sheep sent off a station.

189. *Chairman.*] Between 13 and 16 per cent.? I have put it at 12 per cent. to be on the safe side, and that would amount to 210,564 fat sheep. Allowing 90 to a truck—and as a rule not more than from 80 to 85 would go in a truck, if they were at all fat—that would be 2,339 trucks. I regard that estimate as being within the domain of absolute certainty, and to show that it is so, I may mention that the actual number of fat sheep sent from this district in the twelve months 1896-7, and trucked at Byrock, Bourke, Nyngan, and Narrabri, when the greater part of the district was suffering from a severe drought, was 161,200, or 1,791 trucks. Those were actually sent from stations within the sphere of the proposed railway from Byrock to Brewarrina. Besides that, during the same time 25,000 sheep from outside the district passed this way for the purpose of being trucked, they coming through Brewarrina on account of the good roads leading to this town. They would make 287 more trucks. The number of cattle in this district, according to Mr. Yeo's figures, is 9,265. There is also cattle in the adjoining district which always make this way to market, such as Mackay Brothers, and cattle from stations just over the border, amounting to about 40,000 head altogether. That would make a total of a little over 49,000, and I estimate that 20 per cent. of them go to market and would come to Brewarrina to be trucked; that would make 9,853 head, which at nine head to the truck would amount to 1,094 trucks, making a total of 3,433 trucks of fat stock—cattle and sheep. As most of the cattle which are on the stations about here are kept for fattening purposes, I estimate that 20 per cent. is a very moderate estimate of the number sent to market. Mr. Harper's estimate of the sheep and his estimate of the cattle to be trucked would be largely exceeded. I assert that 3,000 trucks would be an absolute certainty.

190. At how much per truck do you put it down? At the figures given by the Department, viz., 15s. 6d. per truck. I may also mention that a great many of the landowners about here, such as the Bundabulla lessees, at one time produced a very large number of fat sheep and sent them overland to Sydney, but the state of the roads now is such that they can no longer do that, but if the proposed railway from Byrock to Brewarrina were constructed, a great many of those men would go in for less breeding and for more fattening of stock, because the latter would give them a much better return. The stock that passed through Brewarrina during the twelve months from 1st January, 1896, to 31st December, 1896, amounted to 752,777 sheep, and 80,597 cattle. These sheep mostly come in from Queensland and along roads which all converge at Brewarrina. People here would go in for buying sheep that came in that way and would fatten them. What the people living in this district did not breed they would buy from outside sources for fattening purposes.

191. I suppose that in any case the store stock would not go by rail? No, except in case of drought.

192. I mean under the conditions you speak of now? No; they do not go by rail, but are sold just where they go. I maintain from the figures I have given that the proposed railway from Byrock to Brewarrina would pay from the start—that basing the receipts on the charges mentioned by the Department they would more than cover the interest on the capital outlay and also the working expenses.

193. *Mr. Fegan.*] Mr. Harper calculates for only 1,000 trucks of live stock at 15s. 6d.? I estimate 3,000 trucks as an absolute certainty at the same charge. I do not know where Mr. Harper got his figures from, but I cannot accept them as being at all correct. Another reason in favour of the construction of the proposed railway is that the revenue derived from this line for traffic between Brewarrina and Byrock would be absolutely new revenue.

194. Why? Because any goods that now go *via* Bourke are conveyed free between Bourke and Byrock, and the same the other way. I mean that the charge for goods is the same to Bourke as it is to Byrock. In support of that I can quote the trucking rates issued by the Railway Department. People at present pay carriage by river never less than £1. and up to 30s. a ton, whilst the charge for conveyance by road is never less than £1, and generally nearer £2 a ton, and I know that they would willingly pay 10s. a ton, or even 15s. for any goods sent by the railway in preference to having them brought by road or by steamer. I contend that through there not being a railway terminus at Brewarrina a great deal of stock traffic which otherwise would be sent from here goes now to Narrabri on the northern line, or to Nyngan and other stations on the western line, so as to avoid the bad track between here and Byrock, which knocks a great deal of value off fat stock. Although the railways actually do get that stock traffic at present, if it were sent from Brewarrina it would create new mileage, as the stock would have to travel farther by rail. Another argument in favour of the proposed railway is that Brewarrina is the converging point of all the principal

W. G.
Jameson.
15 Mar., 1898.

principal stock routes from Queensland, and of a good many from different parts of New South Wales. All those stock routes are well watered and pass through good country which is always well grassed, and therefore stock can come this way when otherwise they could not get near to Bourke. Nearly every year we see sheep go through this way to get to Bourke. They come from Queensland and through Brewarrina go down the river to Bourke, although the shortest way for them would be a straight line to Bourke. They cannot get to Bourke by the direct stock route. Brewarrina requires a railway to properly utilize that traffic. I also maintain that no other means of disposing of the products of the district would meet its requirements. I believe that evidence has been given to the effect that stock could be sent by steamer; but that is absurd on the face of it.

195. In whose evidence is that? I think that it is in Mr. Shainwald's evidence on the proposed construction of locks and weirs on the river Darling. I do not think that it is necessary for me to go further into that matter, for such evidence is absurd on the face of it.

196. If you wish to say anything further in regard to it, please do so? Well, in the first place you could never reckon on the stock reaching their destination by steamer, owing to the rise and the fall of the river, and that method of transit would be so slow that the stock would all be dead before they got there, if they ever did reach their destination, and they would require quite a large fleet of steamers. I may mention that the rent obtained by the Government from Crown lands in this district totals in round numbers over £40,000, or more than 2d. per acre, showing that the class of land in this district is the best in the Western Division. I think that the facilities that would be afforded by the proposed railway, and the consequent development of the resources of the district would greatly enhance the value of the land, a lot of country being used in a better way than has hitherto been the case. To show that my estimate of the probable truckings of fat sheep is well within the mark, I will name a few of the stations which I know from personal knowledge have within the twelve months that I spoke of, viz 1896-7, sent fat sheep:—

Baird & Co., Quantambone	26,000 sheep.
Lindsay Bros., Charlton	15,000 "
Yeomans Bros., Gilgoin	15,000 "
W. & T. C. Dickson, Yarrowin	15,000 "
E. Mackenzie & Co., Kinglebilla	10,000 "
G. A. & P. Main, Boorooma	10,000 "
J. G. Colless, Abydos	3,000 "
Fennell Bros., Wolkara	5,000 "
William Crowley, Collywarry	5,000 "
F. Randall, Tarcoon	5,000 "

These places represent only a very small proportion of the fattening country in the district, which is acknowledged to be of the best character for fattening. As regards the other stations, the country is equally good, and produces a proportionate number of fat sheep. At the present time owners, owing to the want of a convenient railway, have to sell their surplus stock as stores, and I contend that is quite reasonable to suppose that if there were a railway to Brewarrina, the district generally would turn off at least one-seventh or one-eighth of the total number of sheep as fats. The estimates that I have of stock-truckings, amounting to about 3,500 trucks, is quite apart from the Queensland sheep from stations just over the border, and for which Brewarrina would be the natural depôt. I have taken only those stations actually within the red lines. There are stations outside those lines which would send sheep to Brewarrina, this being the most convenient and best centre. I contend that the Byrock stock-trucking returns are not a reliable guide as to the probable truckings from Brewarrina, inasmuch as most of the sheep turn down the Bogan and the Marra towards Nyngan, the owners preferring the road that way, rather than to take their sheep along the Byrock track.

197. I suppose that having a larger market has something to do with it? No, it is owing to the road being so much superior. As to the only alternative that has been suggested instead of a railway, viz., the locking of the river, I would point out that the disadvantages of river transit are very evident, entailing extra handling and special insurance, which is practically so much extra freight, slowness in transit, &c. To compete with a railway carrying goods at 10s. per ton, the steamers would have to charge a freight not higher than 6s., because the river insurance and the cost of extra handling would amount to 5s. at least, making a total of 11s.,—which the steamers would have to charge as against 10s. railway freight. The traffic between Brewarrina and Byrock, being altogether new traffic, would mean increased railway revenue, and would also decrease the wear and tear of the line between Bourke and Byrock, over which at present traffic goes free, and therefore gives no return. It has been asserted that goods have been carried by steamer from Brewarrina to Byrock at as low a charge as 12s. 6d. a ton. I believe that this was done on one occasion; but someone has tried to make out that that is the usual charge. I believe, however, that evidence will be given that the charge has never on any ordinary occasion been less than £1, and generally more than that, and that the steamer owners have actually refused even 25s. a ton. I challenge those who say that the charge is 12s. 6d., to produce particulars of the case in which the charge of 12s. 6d. was made.

198. You have no doubt that it has occurred very rarely indeed? I believe it only occurred once, and that it was under special circumstances, and for a special purpose. It has also been said that wool does not go past Bourke, on the steamers,—that it all goes on to the railway at Bourke; but on Wednesday, 17th November, last year, the following notice appeared in the Bourke paper:—

On Thursday, the steamer "Pilot" will be despatched to Goolwa, S.A., with 500 bales wool from Youngerina, Thurloo Downs, Pirilie, and Taleyeale.

I have here the *Brewarrina Argus*, of Saturday, 31st August, 1895, which gives an account of a visit made to Brewarrina, by Mr. Harper, who was then inquiring about the proposed railway.

199. Have you the figures that were placed before Mr. Harper? Yes, they are contained in the report that was published in the *Brewarrina Argus* on the 31st August 1895, of the deputation from the Progress Association which waited on Mr. Harper in Brewarrina.

200. That was a deputation introduced by Mr. Kelly, and the figures are contained in the statement made by Mr. Kelly and by Mr. Cathie on that occasion? Yes.

Mr. Kelly then read over figures showing the incoming and outgoing annual tonnage, which showed that on an average there were despatched from Brewarrina, 30,000 bales of wool, representing 5,000 tons, and that the inward tonnage amounted to 6,500 tons annually. The number of stock in the Brewarrina stock district was:—1,371,470 sheep, 16,164 cattle, and 4,765 horses. The postal returns, including the sale of stamps, post office orders, and postal notes, money orders, and telegraph business, amounted to £9,998, or in round numbers about £10,000 a year. Mr.

W. G.
Jameson.
15 Mar., 1898.

Mr. H. L. Cathie then laid before Mr. Harper a return showing the number of acres of leased Crown lands in the Brewarrina Land District, as well as the annual revenue derived from same. The return showed there were thirty-seven pastoral leases, with a total area of 2,588,401 acres, from which the Crown received an annual income of £28,318 15s. 7d. There were seventeen occupation licenses, comprising a total area of 418,520 acres, from which the Crown annually received, as license fee, the sum of £2,556 1s. 7d.; 153 homestead leases, comprising an area of 1,405,669 acres, the yearly aggregate rent amounting to £15,177 8s. 11d. Of conditional leases there were ninety, comprising an area of 145,402 acres, yielding a total annual rental of £1,784 15s. 10d. Mr. Cathie said that it would thus be seen that the annual land revenue for the Brewarrina District, in round numbers, amounted to £48,000; * * * he would like to point out to Mr. Harper that the average rental per acre on all the leased lands was 2½d., a very large amount when compared with other averages for land in the Western Division. * * *

Mr. Harper thanked the deputation for having met him, and also for having given him such desirable information. He explained that the object of his visit was to supplement the information that had already been gathered by the Railway Commissioners. Mr. Harper expressed himself as more than satisfied with the facts and figures, which he had made a note of, and said that, without wishing to commit himself in any way, he would give the projected work all the credit that lay in his power. The average assessment of 2½d. per acre was indeed most satisfactory.

201. Were you present at that deputation? I was.

202. From memory, do you know if that is a correct report of what Mr. Harper said to the deputation? Yes, it is.

203. So he gave you the impression that he was favourable to the construction of the proposed line? He gave me the impression that he was very favourable to it.

204. In giving an estimate of the traffic between Byrock and Brewarrina, including up-stream to Walgett, Mr. Harper puts down goods, 2,000 tons, at 10s.; wool, 3,100, at 10s.; wool, 330 tons, at 7s. 6d. (wool on route of line between Byrock and Brewarrina). Then comes a great difference in regard to the live stock traffic. You estimate for 3,000 trucks of live stock at 15s. 6d., but Mr. Harper estimates for 1,000 trucks of live stock at 15s. 6d.; in other words, you have trebled the number of trucks that Mr. Harper has in his estimate;—do you not think you have been rather extravagant in your estimate? No; I think that I have been very moderate.

205. You think that you have not only been not extravagant, but that you are rather under the mark of what will actually take place? Yes.

206. Did you, at that deputation, make any representation to Mr. Harper as to the quantity of goods that come in annually at Brewarrina? No, I think not, except that something near the amount of goods coming in may have been mentioned.

207. Do you think that 2,000 tons is a fair estimate? I think that my own estimate is nearer the mark.

208. Your estimate is that, altogether, you would have 10,044 tons? Yes.

209. You can see at once that the great difference between your estimate and the figures given by Mr. Harper means a line paying all expenses, as compared with a line losing over £4,000 a year? Yes; there is one thing I have not taken into account at all, but have left for other witnesses who are better able to deal with it, I mean the passenger traffic, mails, and parcels, and things of that sort.

210. Mr. Harper has put down 1,500 passengers, at 9s.? I cannot speak on that point at all.

211. Have you any information as to the rainfall within the area marked by red lines on the map? I think it averages about 18 inches. I kept a record of the rainfall at Weilmoringle from 1888 to 1894.

212. What was the lowest fall you had there? About 7 inches, and the highest was about 33.

213. *Chairman.*] When you compiled your statement which you have laid before the Committee to-day, did you have before you the return appearing upon page 52 of the evidence given before the General Committee, showing an alphabetical list of stock-owners, and the number of sheep, &c., in the Brewarrina District for the year 1896? No; I had not seen that, but I had another list.

214. Have you had an opportunity of making a comparison between that list and the one that you have now presented to us? No.

215. Did you have before you an official list of any description? No; it was a list published in a directory that I had, which may have been compiled from an official list.

216. Do you, of your own knowledge, happen to know the number of sheep on the stations, or have you been supplied with information by the stock-owners? I have a general knowledge of the number within a few thousand.

217. Take one or two stations, by way of example? Of course, the stations vary a good deal. In a good year they may have double the number of sheep that they had in a bad year.

218. Is your statement compiled from information which you derived at the end of 1896 or a previous year? A previous year.

219. What year? 1895, I think; but I am not sure.

220. Would there be any material difference between the returns of the two years? Not a great deal.

221. We will take Dumble station;—how did you obtain your information as to the number of sheep on Dumble? I think I got that from Mr. Bacon.

222. How many sheep did he tell you were there? Just the number that is on the list.

223. You do not give the number of sheep, but the number of bales? But I based my calculation at fifteen bales to the 1,000 sheep.

224. In your return you say, "Wright and Bacon, Dumble"—I suppose that means the station now in the occupation of Mr. Bacon? Yes.

225. There you estimate 1,400 bales of wool? Yes.

226. That would represent the clip of 120,000 or 130,000 sheep would it not? About that.

227. Do you think that would be about the number at Dumble? I think that that is the number of bales that on one occasion actually went by steamer on their account.

228. Is Dumble in both colonies? There is some other country taken up by the owners outside this sheep district.

229. This return on page 52 indicates that there are only 13,000 sheep on Dumble? That must be a mistake.

230. It says, 84,000 acres in New South Wales, carrying 13,000 sheep? Their Queensland country would be as much again.

231. You are not, I suppose, in a position personally to make any statement in regard to Dumble? No.

232. Except that you know that 1,400 bales of wool came from that station? Yes.

233. How many bales have you estimated to the ton—I am taking now the whole quantity in your statement? In the one case I take the actual bales of wool as by the weigh-bills.

234. Where the weights were not known to you, what have you estimated—5¼ or 6⅔ bales? Six and two-thirds.

W. G.
Jameson.
15 Mar., 1898

235. So that, in your estimate of the weight, you have accepted Mr. Shainwald's evidence, is that so? I do not actually accept it, but I use it as a basis.
236. You agree with it? No; I think that the estimate is rather too high.
237. Mr. Sawers, in his evidence before the General Committee, I think, estimated that there would be $5\frac{1}{4}$ or $5\frac{1}{2}$ bales to the ton, and Mr. Shainwald estimated $6\frac{3}{4}$ bales—which do you think is accurate? I should be inclined to go between them, because the proportion of scoured wool which Mr. Shainwald says raises the estimate is only in the proportion of about $\frac{1}{3}$ to $\frac{2}{3}$ of the greasy wool.
238. You think that a fair estimate would be about 6 bales to the ton? Yes.
239. In the return now placed before the Committee have you estimated 6 bales to the ton? No; I have taken $6\frac{3}{4}$, so as to be on the safe side.
240. Although you think that 6 bales would be a fair estimate, you have actually estimated $6\frac{3}{4}$ bales, in accordance with the evidence of Mr. Shainwald? Yes.
241. And, notwithstanding the liberal estimate as to the weight, you think that your return would be accurate as to the total tonnage of wool which you think would go by the Brewarrina railway? I think that my estimate is a little under what would actually go.
242. You think that, if anything, yours is an under-estimate? Yes.
243. You now have before you a plan showing an area embraced by red lines, and stated by Mr. Sawers to be the country that would be served by the proposed railway, do you agree with Mr. Sawers that the whole of that country would be served by the proposed railway and that the wool and station produce therein would find its way to Brewarrina? Yes.
244. In your estimate of the stations that would be served by the proposed railway, would you desire to exclude any portion of that area? No; I think that all the country embraced within the red lines can be fairly claimed for the proposed railway.
245. Is it probable that traffic from outside that area would reach the railway? Yes, I think so.
246. From what direction? From Queensland. A little, but not any appreciable quantity from outside that area.
247. Therefore, for our purposes, we may regard the red lines on that map as fairly indicating the whole of the country that would be served by the proposed railway? Yes, with the exception, as I say, of a few places just over the Queensland border.
248. And in your estimate have you included any stations not within that area? I do not think so.
249. Mr. Harper states that the total quantity of wool received at Byrock in 1893-94 was 1,253 bales, and the quantity received at Bourke was 26,449 bales, making a total of 27,702 bales;—how does that agree with your statement? I do not, of course, know what wool came from the Bourke district.
250. Mr. Harper includes in his estimate the whole of the wool arriving at Byrock and Bourke, including the wool from the Walgett district, and he makes the total 27,000 bales; assuming that the Brewarrina railway would receive the whole of the wool, that would be the total quantity;—do you agree with Mr. Harper in that statement? No; that cannot be correct. I have not had an opportunity of seeing the figures of the receipts at Bourke and Byrock.
251. Do you know the district between Goodooga and the Barwon, and east as far as the Narrabri-Moree railway? No; I do not know the latter at all.
252. If you look at that map you will observe that at the present time there are under consideration four proposals for a railway—(1) Warren to Coonamble, (2) Walgett to Pilliga *via* Wee Waa, (3) Woolabra to Collarendabri, (4) Byrock to Brewarrina;—assuming that the line from Narrabri to Pilliga be constructed and extended to Walgett, how would that affect your estimate of traffic for the Byrock-Brewarrina railway? I do not think it would affect it at all, because I have been very careful to keep within the area that would be served by the Brewarrina railway, and have taken into account only those people who would send their produce to Brewarrina.
253. Assuming that the proposed line from Woolabra to Collarendabri were constructed, would that affect your estimate of traffic for the Brewarrina railway? I do not think that the Collarendabri extension would affect my estimate of traffic either.
254. A further suggestion has been made for a line starting from near Narrabri on the Narrabri-Moree line, and going past Wee Waa, and along the north bank of the Namoi, and being continued to a point somewhere between Angledool and the Barwon;—assuming that that extension were carried out, would that line affect your estimate of traffic? No.
255. Would any portion of the traffic that you estimate would come from the area enclosed by those red lines be diverted to the line that I have just indicated to you? I do not think so; at least not any appreciable amount.
256. Your answer is that such a line would not serve any of the country that would be served by the Byrock-Brewarrina railway? No; it would not.
257. Have you any information that would enable you to say if Mr. Harper is correct in his approximate estimate of the live stock that would come from the district, having regard to the railway returns for the past year or two? Not the railway returns from Byrock or Bourke. I think they are misleading. Much of the live stock has gone on lower down the line.
258. At Question 1245 Mr. Harper was asked: "For how many truck loads have you given credit in your estimate?" and he said, "for 1,000, practically double the average number sent at present"? From where.
259. From Byrock and Bourke? But a very large number of the live stock of this district do not go to Byrock at all.
260. To where are they sent? They go to Nyngan and to stations between Byrock and Nyngan, and also to Narrabri.
261. Then in your estimate have you included the stock trucked at Nyngan? I have not taken into account any actual truckings at any particular station. I have only tried to arrive at the number of live stock that would be sent annually from the district, and calculated how many trucks would be required to take them.
262. Do you admit that Mr. Harper may be correct in his estimate as to the number of trucks that would come from the Byrock-Brewarrina district? No; I do not think he is correct.
263. Why do you question his evidence upon that point; he is speaking apparently from railway returns? I cannot see how he could arrive at the correct number that came from this district, unless he inquired

as to where every little lot of sheep came from. Without taking Narrabri, Nyngan, Bourke, and Byrock, and all intermediate stations between Byrock and Nyngan, and ascertaining where the sheep came from that were trucked at those places, I do not see how he could arrive at a correct estimate.

W. G.
Jameson.
15 Mar., 1898.

264. It might be correct as to the actual number trucked at Byrock and Bourke, but at Nyngan a large quantity of live stock may be trucked which, in the event of this line being constructed would go by this railway;—is that what you mean? Yes.

265. Then why should the stock be trucked between Byrock and Brewarrina, or at Brewarrina, instead of going as at present to Nyngan? Because they will arrive at their destination more quickly and be less knocked about.

266. Will you explain that more carefully, for without explanation, Mr. Harper, being correct in his estimate as to the number now trucked, and giving credit for double that number, would, so far as we can see, be justified in adhering to his estimate of traffic so far as live stock is concerned? The road is so bad part of the way between Brewarrina and Byrock that people avoid it as much as possible, especially with fat stock, they prefer to go up the Marra, along one of the best stock routes in the country, or up the Bogan, or else to go to Narrabri.

267. Would there be a much greater distance to travel to Nyngan than to Byrock by road? A good deal.

268. What would be the difference? I suppose 60 or 70 miles.

269. That would be 120 miles as compared with 60? Yes; somewhere about that.

270. At the present time is it the practice to travel 120 miles in order to truck at Nyngan in preference to trucking at Byrock, which is only a distance of 60 miles, simply because of the better route? Yes.

271. Is there any difference in the charge? The charge, of course, is less from Nyngan.

272. Do you not think that that is a factor in the decision to send from Nyngan instead of from Byrock? No; I do not think that that is taken into account with fat stock, because the deterioration on the roads more than makes up for the difference in the freight.

273. Do you know what the difference is? I could not tell you from memory.

274. Is there a substantial difference? I do not think that the difference is a very large one, but I could not say from memory.

275. Is that how you explain the difference between your estimate of 3,000 trucks and Mr. Harper's estimate of 1,000 trucks—that 2,000 trucks additional would probably come in for live stock that now reach Nyngan? Nyngan, and also other stations, including Narrabri. I think that stock at present sent to other stations, and sheep that are not sent away at all now on account of the want of facilities, would make up the difference between Mr. Harper's estimate and mine.

276. How far is Narrabri from the point at which you have estimated the live stock would come into the Byrock Brewarrina railway? About 160 miles.

277. Do you know what the difference in the freight is? I think it is about 6d. a head, but I would not be certain on that point speaking from memory.

278. Do you not think that it is highly probable that the fat stock will still continue to go by Narrabri? No, I do not think so.

279. What inducement would there be to send fat stock by this proposed railway? Less knocking about and quicker transit.

280. It is rather difficult to reconcile the three facts that you have mentioned—that in preference to sending to Byrock a large quantity of fat stock is sent 120 miles to Nyngan, and that fat stock is even sent 160 miles to Narrabri, and yet you say that the whole of that fat stock would come in between Byrock and Brewarrina? Of course when I mention that distance from Nyngan to Brewarrina I should say that many sheep would go from places nearer than that on the road between Nyngan and here—from stations up the Marra for instance.

281. Mr. Harper may point to the improbability of 2000 additional trucks of live stock going on to the Brewarrina-Byrock railway in view of the fact that at the present time most of the live stock on which you have based your calculations go by Narrabri or Nyngan, the extra distance not deterring the owners from sending the stock to those stations instead of to Byrock, which would be 60 miles nearer;—how would you meet that objection to your estimate? I should say that any places which I reckoned upon as producing fat stock and sending them this way would all send them this way, in spite of the difference in the distance.

282. Your opinion is that this fat stock would go by the Byrock-Brewarrina line notwithstanding the fact that at the present time it goes by Nyngan and Narrabri—it is a matter of opinion, is that it—yours as opposed to Mr. Harper's? Yes; and it is also a matter of the views of stock-owners who have expressed their intention of sending this way in preference.

283. Can you say that it would be of so much advantage to the stock-owners to use the Byrock-Brewarrina railway that they would change their present mode of sending their stock to market? Yes; there is a consideration that is to be kept in view, and that is the fluctuations in the markets in Sydney. When a man starts a lot of fat sheep, which may be perhaps a month on the road, he does not know what the state of the market will be when he gets there, whereas if he can put his sheep straight into the trucks, he knows exactly what sort of market he will have to meet, because they will be at the market within the next few days.

Eugene Patrick Fennell, pastoralist, Wolkara Station, near Brewarrina, sworn, and examined:—

284. *Chairman.*] Are you a homestead lessee? Yes.

285. Where is your holding? About 14 miles from here, on the Barwon, between Brewarrina and Bourke.

286. What is the area of your holding? My brothers and myself have about 80,000 acres.

287. All homestead leases? Yes.

288. What stock have you? We have about 20,000 sheep and about 100 head of cattle.

289. At the present time where do you send the produce of your station to? Bourke and Byrock.

290. How do you send it? By teams and by steamer.

291. What freight do you pay by steamer? We pay from £1 to 30s. a ton.

292. Have you ever paid less than £1? No.

293. By team to Byrock what do you pay? I have never sent any by team to Byrock. We send fat stock to Byrock.

E. P. Fennell.
15 Mar., 1898.

- E. P. Fennell. 294. You send your fat stock to Byrock and your wool to Bourke? Yes.
 15 Mar., 1898. 295. How far are you from Byrock? The nearest point of our station is about 40 miles from Byrock.
 296. But how far are your shearing sheds from Byrock? About 50 miles.
 297. You know the proposal to construct a railway from Byrock to Brewarrina? Yes.
 298. If that railway were constructed, what distance would your holding be from the nearest point to the railway? About 4 miles of the surveyed line joins our holding.
 299. In that case, I suppose you would send the whole of your wool and fat stock by rail? Yes, certainly.
 300. Is your land adapted for any use other than pastoral use? Yes; portions are suitable for farming, and we are at the present time farming some of it.
 301. What area do you farm? This year we are putting in about 60 acres of wheat.
 302. I suppose for home use? If the crop turns out well, we expect to have more than we shall require and then we shall send some to market.
 303. Do you expect to have more than necessary for home use? Yes; about half of what we grow will be sufficient for home use, I think.
 304. What area will be fit for agriculture? About 10,000 acres out of the whole lot.
 305. Will that be subject to inundation? No.
 306. Is any portion of your holding subject to inundation? Yes; but those portions which I consider fit for cultivation are not subject to flood.
 307. Do you get your station supplies from Bourke, at the present time? Chiefly from Bourke, sometimes from Brewarrina.
 308. Have you experienced any inconvenience in sending away wool or fat-stock? Considerable inconvenience in sending away fat-stock. Last year we had a very good lot of fat lambs, in fact all this district had, the best lot of lambs that I have seen in any district—I never saw better in the Sydney sale-yards—but we could not move them. The road from here to Byrock is so dry and unfit for travelling stock that we could not send them away at all but had to keep them on the place. Lambs are so much more delicate than grown sheep. We could send grown sheep but they have suffered a good deal on the track.
 309. Did you suffer any loss by not being able to send them away? I could not say that, but we could have got ready money for them, and as it turned out we had to hold them on.
 310. Do you think that you would use the railway from Byrock to Brewarrina in an ordinary good season? Yes; I should only be too glad to have the chance of doing so, because we would get the stock on to the trucks without wasting.
 311. You would not drive your fat stock as far as Byrock? No.
 312. Nor to Bourke? No.
 313. Do you send fat stock to Bourke? We have sent some.
 314. To be sent on to Sydney? Yes.
 315. Did you observe that they had deteriorated in value at all by droving between your holding and Bourke? Yes; in no instance have we sent sheep to Byrock or to Bourke without their wasting a good deal on the road.
 316. You feel quite confident that the fat stock would go by the proposed railway if it were constructed between Byrock and Brewarrina, and would not be driven to any point on the main Western line in good seasons? Yes;—you mean from our own holding.
 317. No, I mean generally from the district that would be served by the proposed railway? I think so. I think that the owners would be only too glad to avail themselves of the opportunity of getting their stock on the trucks quickly.
 318. Then, if it has been suggested that the proposed railway would not be used in good seasons for trucking stock because there would not be any loss to the owner in having the fat stock driven to Byrock or some other point on the main Western line, you are not of that opinion? I would not do it myself.
 319. I suppose, because you think it would be more advantageous to use the railway? Yes.
 320. And you conjecture that what would be useful to you would be equally useful to others in a similar position? Yes; I should think so.
 321. Have you considered whether you would be able to compete with outside markets in regard to agricultural produce? I have not considered that, but taking into account the price at which we get our land compared with what is charged for land in farming districts, I think that we would have a fair chance against them.
 322. You think that you could put your land to more profitable use than by using it for pastoral purposes? Yes; those portions suitable for farming.
 323. What do you pay per ton for the carriage of wool from Bourke to Sydney? I think it is about £5.
 324. And for live stock per truck? I think it is £3 10s. 10d. from Byrock to Sydney.
 325. Do you think that 15s. 6d. per truck would be a moderate charge from Brewarrina to Byrock? I think it would be a moderate charge.
 326. You could afford to pay that? Yes; we should prefer to pay it, instead of droving to Byrock, or to any other point.
 327. What difference per head would that make? There are about eighty to 100 in a truck of sheep.
 328. That would make a difference of about 2d. per head? Yes; I suppose it would be about 2d. per head all round.
 329. Do you think that you could afford to pay 2d. per head? I think so; because we have to pay it pretty well now.
 330. What would it cost you for droving? It depends on the times. If times are bad, it is very expensive.
 331. Taking the average? Taking an average, I suppose it would be 1½d. to 2d. per head.
 332. Then it would cost you as much for droving to Byrock as by train at 15s. 6d. a truck? I think it would be about the same, and we would have the advantage of getting the stock on to the trucks before they wasted.
 333. The cost not being less for droving than it would be by train, you would have the advantage of improved prices because of the better condition of your stock;—is that so? Yes.
 334. Do you think it would make any considerable difference in the selling price of your fat stock to train all the way instead of droving a portion of the distance? I think that trucking them very near their own paddock would make a difference in their favour.

E. P. Fennell.
15 Mar., 1898.

335. A substantial difference? Yes. Trucking is an enormous advantage to us over droving.
336. What quantity of wool did you send last year? 330 bales, I think. The exact number sent to Sydney was 254 bales.
337. From Bourke? Yes.
338. What did it cost you to send it to Bourke? Twenty-five shillings a ton, including forwarding charges by E. Rich, & Co.
339. By steamer? No; by team.
340. Why did you send it by team instead of by steamer? Because we could get no advantage by sending it by steamer. We could have got one lot taken at 22s. 6d.; but they handle the wool very badly on the steamers. They use a single hook for handling the bales, whereas carriers as a rule carry double hooks. The single hooks tear the bales very much, and the wool is cut out and rolled about on the ground before it is put on the boat, and it gets similar treatment in Bourke when they are unloading; whereas if you load it on to a team you load straight out of the shed.
341. You had the choice of sending by steamer or by team, and you found it more advantageous and not more costly to send by team? Yes; it suited us better to send by team last year, when procurable.
342. And of course it would be still more advantageous to you if you could send it by railway at a less charge? Certainly.
343. Therefore, in your case there can be no doubt about your using the railway? There is no doubt whatever.
344. Nor about your willingness to pay the local rate? I am quite willing.
345. You understand that from Byrock and Bourke the rates are similar? Yes.
346. And it is only a question of the cost of carriage from Brewarrina to Bourke, either by road or by steamer in the one case, or from Brewarrina to Byrock by road in the other case, as compared with the cost of rail carriage from Brewarrina to Byrock? Yes.
347. Do you know the country north of the Barwon? Yes; a good deal of it.
348. Do you know the country out east as far as Walgett and Collarendabri, or in that direction? I know it as far as Walgett.
349. Do you know it up to Goodooga? Yes.
350. And between Goodooga and Moree? I do not know that country at all.
351. Do you know the Narrabri-Moree line? No, I do not.
352. How far west of that line do you know the country? I know it to the Warrego pretty well.
353. About how many miles west of the Moree line would that be? I do not know the distance, but I think it would be about 150 miles or more.
354. Do you know a very large area of country over there? I know a lot of the country north of the Barwon.
355. What is the character of the country over there? It is very different in portions. The country east of the Culgoa is rich grazing country—some of it suitable for agriculture; and the country west of the Culgoa seems to be all suitable for agriculture.
356. East of the Culgoa may we take it that the country is of the highest class of pastoral country? Yes, I think so.
357. That is for the whole distance you know it east of the Culgoa? Yes, as far as I know it, it is a much better class of country than that west of the Culgoa.
358. And how far north? To within a few miles of the Queensland border.
359. As far as Angledool? Yes, and Goodooga.
360. Would it be all of the same class? Pretty well. Now and again there are a few sandhills towards Angledool. The country gets a little lighter in colour.
361. It is what you regard as the very best description of pastoral country, is it, north of the Barwon? Yes, it is. The country between the Narran and the Culgoa I consider to be of the very best description of pastoral country.
362. What portion of the area enclosed within the red lines on the map known as Mr. Sawers' map do you thoroughly know? The whole of the country with the exception of 24 miles to the east of the Marra.
363. With the exception of that portion, can you offer any opinion as to whether the proposed railway would thoroughly serve the area embraced within the red lines? I think so. I think it would suit the people there very well. It would be their nearest railway line, and they would naturally use it.
364. You are of opinion that the whole of the wool and the station produce of that area would come into Brewarrina? Yes. I know all the country west of the Marra.
365. And you say that the whole of that country is good pastoral country? Yes.
366. *Mr. O'Connor.*] What do you pay for wheat here? 4s. 6d. we paid for some seed-wheat lately—about 50 bushels.
367. I mean wheat for milling purposes? I have not bought any, and could not say. The seed-wheat for which I paid 4s. 6d. a bushel was locally-grown wheat, but neighbours of mine have bought wheat in Bourke which was grown somewhere down the line in a farming district, and they paid 6s. 3d. and 6s. 6d. for it.
368. *Mr. Fegan.*] Have you ever grown any wheat? Only for hay.

Cecil Lane Brown, manager, Brigalow Station, near Brewarrina, sworn, and examined:—

369. *Chairman.*] How many miles from Brewarrina is your station? Between 70 and 75.
370. In what direction? East—close to the eastern line shown on Mr. Sawers' map.
371. What is the area of the station managed by you? About 40,000 acres.
372. How many sheep does the station carry? The station buys and sells a lot during the year. We generally shear about from 30,000 to 40,000, and sometimes up to 45,000; but at other times we get down as low as 18,000 to 20,000 on the place. It is a buying and selling place. In good seasons we carry the sheep perhaps for three months at a time.
373. Where you send your wool to at the present time? Our wool has been going to Nevertire lately.
374. Why do you send it to Nevertire instead of by the river to Bourke? We have no river traffic unless we send it down as far as the Barwon, and the state of the country there is rather flooded sometimes.
375. Does it cost you less to send it to Nevertire than it would to send it to Bourke? It would be less carriage.

C. L. Brown.
15 Mar., 1898.

- C. L. Brown. 376. What does it cost you to send it to Nevertire? £3 10s. to £4 a ton. It varies in different seasons.
 15 Mar., 1898. 377. And what is the rail charge to Sydney? £3 13s. 6d., I think, speaking from memory.
 378. What do you estimate it would cost you to send it by road into Brewarrina? I think from 35s. to £2 a ton.
 379. Do you know whether the rail charge from Nevertire to Sydney is the same as from Byrock to Sydney? I am not certain, but I think there is very little difference between them.
 380. Then if 10s. for carriage between Brewarrina and Byrock were added to the road carriage to Brewarrina, which you say would be about £2 a ton, there would be a saving to you of nearly £1 a ton by your using the proposed line; is that so? Yes.
 381. Therefore you are prepared to say that you would use the proposed line if it were constructed? Yes. We would not send our wool exactly to Brewarrina, but to a midway station.
 382. You would send it to a point on the Byrock-Brewarrina line? Yes.
 383. How do you obtain your station supplies—from Nevertire or from Bourke? Sometimes they come from Girilambone, and at other times from Nevertire.
 384. From where you can obtain the cheapest carriage? The land carriage is not material to us. The only question is, as to the state of the roads.
 385. Do you pay at the same rate? Yes.
 386. Do you know the whole of the country from that eastern line to the Culgoa? Yes, I have a fair knowledge of that country.
 387. Can you speak as to the character of the country—is it of the highest class of pastoral country? It is; that is, speaking of the country as a whole.
 388. Is that country equal to the 40,000 acres that you manage, generally speaking. Generally speaking, I do not think that it is.
 389. But it is of a high class of pastoral country? Yes, it is.
 390. Do you know the country to the east of your station? Yes.
 391. Between your station and the Narrabri-Moree line? Yes.
 392. Do you know the whole of that? Yes.
 393. Have you been over it? Most of it.
 394. How would you describe that country? It is almost on a par with the other country.
 395. It is all good? Yes.
 396. Have you travelled on the Narrabri-Moree railway? I have not been on that line.
 397. Do you know Walgett and Collareendabri? Yes.
 398. You will see on the map before you, suggested by a red line, a railway from Narrabri along the north bank of the Namoi, passing Wee Waa on to a point between Angledool and the Barwon; it stops short of Angledool, but if extended it would pass between Angledool and the Barwon;—do you think that that line would serve any of the country embraced within the red lines shown on Mr. Sawers' map? I think that if the two lines were constructed it would not interfere with the Brewarrina railway to any great extent; it might interfere with it a little, but not very much.
 399. You think that none of the traffic estimated in connection with the Byrock-Brewarrina line would be diverted to that line? I do not say that none of it would; a little might, but very little.
 400. Where would the traffic come from? Traffic from about Angledool might go by that railway, but for stock purposes it would be a very roundabout way to get to market.
 401. Will you explain why? The stock would go to Newcastle, and there is always a delay there in shunting stock, whereas on the other line there would be only a first transshipment.
 402. But at the present time does not a very large proportion of the fat stock go down the Northern line? Yes; the Western system, however, would be a much better route for stock to travel to from that area.
 403. As a matter of fact, at the present time do not the Narrabri-Moree line and the Northern line carry a very large proportion of the fat stock? They carry them because the owners have no other way of getting them to market.
 404. What would be the difference in distance do you think? I cannot say.
 405. Would the Byrock-Brewarrina line be the quicker route? Yes.
 406. And you think it would be the better line for the district? Yes.
 407. If you had the choice of two lines you would prefer to go down the Western rather than go by way of Narrabri? Yes; there is always delay in sending stock that way.
 408. Where? There is a delay at Newcastle, and then, again, at Strathfield. There is more traffic on the Western line than on the Northern, and the stock trains have to wait near Homebush for the convenience of passenger trains.
 409. Your answer is that stock is more expeditiously dealt with on the Western line than on the Northern line? Yes.
 410. And that would be an advantage to the owners of fat stock in getting their stock more speedily to market? Yes.
 411. *Mr. Fegan.*] Have you tried any of your land for agricultural purposes? I have tried a little of it, but only on a very small scale.
 412. How many acres? We have about 400 acres under cultivation in different patches.
 413. Under wheat? Some under wheat, other under lucerne, and some under oats.
 414. What are the results? The wheat is most satisfactory.
 415. I suppose it is all for hay? Yes—for station use.
 416. Not for seed? No.

WEDNESDAY, 16 MARCH, 1898.

[The Sectional Committee met at the School of Arts, Brewarrina, at 10 a.m..]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Byrock to Brewarrina.

Joseph Mackenzie, pastoralist, Upper Bundabulla East, near Brewarrina, sworn, and examined:—

417. *Mr. O'Connor.*] How far is your station from Brewarrina? Forty-seven miles.
418. In what direction? Goodooga.
419. North from here? Yes.
420. How long have you lived there? Twenty-eight years.
421. What is the area of your holding? 24,134 acres.
422. How do you utilise it? Sheep and cattle.
423. How many of each? About 400 head of cattle and about 10,000 sheep.
424. Is any of your land fit for agricultural purposes? Yes.
425. How much of it? A good area; but I could not tell you exactly how much.
426. About 2,000 acres? Yes, fully.
- 426½. Are you in favour of the proposed railway from Byrock to Brewarrina, or are you against it? I am in favour of it.
427. For what reasons? I could get my stock away far better to market, and in better condition, and I am fully prepared to pay a greater freight on account of that to the railway. Moreover, our produce is handled in such a way by the steamer hands—dragged about and torn—that it is nothing like in proper order afterwards to meet the market. I would far rather pay a greater fee for sending it by railway from Brewarrina than for sending it any other way.
428. The condition of the cattle would be preserved? Yes.
429. And the gain to you would be so great that you could afford to pay a substantial sum for their delivery in better condition? Yes.
430. That would apply to both sheep and cattle? Yes.
431. How do you dispose of your wool? In Sydney.
432. By which railway do you send it? It goes to Bourke.
433. What do you pay for the carriage by boat? I pay 25s., and I have paid 30s. a ton.
434. What does it cost you to carry your produce from your station down to the steamer? £2 per ton.
435. And then 30s. besides? Yes.
436. So virtually, it costs you to send produce to Bourke alone £3 10s. per ton? It does.
437. Where do you get your supplies from? Chiefly from Brewarrina.
438. What is the quality of the land about where you live? Very good.
439. Have you many neighbours near you? Yes.
440. So far as an opinion goes, could you safely say that they would be as anxious to have the railway as you are? Yes, I can.
441. Then you regard the construction of the proposed railway as being very beneficial to you? I do.
442. And also to your neighbours? I do.
443. Do you think it would promote settlement? I am sure of it.
444. How many sheep do you send to market annually? From 2,000 to 2,500.
445. Every year? Yes.
446. How many bales of wool? I had 104 or 105 last season.
447. Is that about the general average? Yes; I never overstock.
448. How many sheep do you run? 10,000.
449. How many head of cattle do you send to market? Generally I send about 100 every year.

J. Mackenzie.

16 Mar., 1898.

Walter George Jameson, stock and station agent, Brewarrina, sworn, and further examined:—

450. *Chairman.*] Have you looked through the figures given by Mr. Harper in reply to Question 1229? Yes.
451. Have you checked his return of wool reaching Bourke and Byrock? Yes.
452. Are you prepared to say if there are any inaccuracies in that statement? Yes; I consider the statement is quite inaccurate and misleading.
453. Will you say in what respect it is? In the first place, there are only forty-three places mentioned as being in the Brewarrina district, for which he gives figures, in place of something like 140, which are actually in the district and from which wool will come. In the second place, some of the stations mentioned are not in the district at all, but in the Walgett district. On the other hand, in his return of wool coming from Walgett, he has included places actually in the Brewarrina district and close to Brewarrina. So he is evidently quite at sea as regards his calculation of the amount of wool that would come from the Brewarrina district.
454. Do you think that the item "Small clips, 853 bales," would cover the produce of the small holdings included in your list? That is not nearly enough to cover the other places.
455. Will you give the figures accurately, just pointing out the actual number of bales that you, in your statement, show would come from the holdings omitted from Mr. Harper's statement? Yes; in the first place, I would like to point out "Guisely, 301 bales." That is in the Walgett district, and should have been placed there instead of in the Brewarrina district. Guisely is within 25 miles of Walgett. Then, Milrea (which is spelt "Milray" in Mr. Harper's list) is credited with 1,422 bales, whereas Milrea is a small station belonging to Mr. G. A. Murray, and is within 20 miles of Walgett, and the number of sheep he runs is, I think, 20,000. So that is manifestly absurd.
456. Mr. Harper has credited Milrea with 1,422 bales;—how many have you credited Milrea with? Three hundred and seventy-eight. That was the number of bales that came by steamer from Milrea station in 1894; and, I suppose, that from 350 to 450 bales would be about the average from that station.

W. G.
Jameson.

16 Mar., 1898.

457.

W. G.
Jameson.
16 Mar., 1898.

457. Then you say that Mr. Harper's estimate is fully 1,000 bales in excess of the actual number for Milrea? Yes; then there is "R.A.L. over Tarrion." That is a 10,000-acre lease belonging to Mr. Robert A. Low, and I suppose runs about 4,000 or 5,000 sheep, and it is credited with 663 bales, which is also absurd.

458. How many bales have you credited "R.A.L. over Tarrion" with? Cedar Glen is the name of the place, and I have credited it with 66 bales. Further on there is "Ballandool and Dumble," which in Mr. Yeo's return appears as "Dumble," and is there credited with 13,000 sheep. Mr. Harper says that 1,117 bales come from "Ballandool and Dumble." That shows that there are a good many more than 13,000 sheep. I would point out that Ballandool is situated just over the Queensland border, and at the time that return was made up some of the sheep belonging to Dumble were running in that Queensland country, and, therefore, did not appear in the New South Wales return.

459. Although the sheep do not appear in the return, the wool was sent by way of Bourke? Yes. The wool would be taken off about August or September, and the sheep would be sent to the Queensland country in November or December. In the Walgett portion of the traffic, as shown by Mr. Harper, there is a place called "White Wood," credited with 115 bales. The proper name is White Woods, and that place is situated 26 miles from Brewarrina, and belongs to Messrs. Cornish and White. It is a few miles off the Bokhara River. That shows that Mr. Harper is at sea as regards where places are. That holding is credited to the Walgett list, whereas it should be in the Brewarrina list. Abydos is credited with 94 bales by Mr. Harper, but I credit it with 100. That is only a slight discrepancy. From Gilgoi I have seen 773 bales actually sent by steamer, but Mr. Harper credits Gilgoi with only 523 bales.

460. *Mr. Fegan.*] You do not know what the destination of that wool was—it may have been sent on to South Australia? It may have been. I can only say that it passed through Brewarrina. "T.R.S. over Lipsley" is credited by Mr. Harper with 48 bales, but 84 were sent by steamer. R. Doogan, of Lolleep, is credited by Mr. Harper with 61 bales, but 105 bales were actually sent. Morrabilla is an out-station of Milroy, and is credited by Mr. Harper with 98 bales. Milroy and Morrabilla in conjunction, I believe, sent about 1,400 bales.

461. *Chairman.*] Can you say that Milroy is not included in any other entry in that list? It is not in the list.

462. Are there any other serious discrepancies to which you can point? Muckerawa is credited by Mr. Harper with 364 bales, but in 1894 568 bales were sent. Quantambone is credited by Mr. Harper with 1,150 but 1,296 were sent. Tallawanta is credited by Mr. Harper with 1,057, but 1,126 were sent. In almost every case there seems to be a discrepancy.

463. Having closely scrutinised Mr. Harper's list, and compared it with your own, are you prepared to say that your list is the more accurate? Yes, I am. There is not only the differences in the numbers, but also the omission by Mr. Harper of a great many places which would increase the total very largely.

464. Are all the places to which you have referred within the area enclosed by the red lines shown on what is called Mr. Sawers' map? All the places in my list are within the area, but Mr. Harper has mixed up the two areas, and has put some that are outside it in, and some that are inside it out.

465. That would be giving the railway credit for places outside the red lines? In some cases, and also the opposite in cases in which places have been left out of the list altogether.

466. Has Mr. Harper omitted any important places? Yes, a great many.

467. Can you mention a few of them? Places like Milroy.

468. You have included Milroy in your list, have you? Yes.

469. Mr. Harper has omitted it? He has it in his Walgett list, but it is on the Culgoa, and therefore should be in the Brewarrina list.

470. Would that not be within the area enclosed by the red lines? Milroy is within the area, but Mr. Harper has put it within the Walgett district.

471. Have you, in pointing out the discrepancies in the two lists this morning, regarded the returns from the Walgett District, included in Mr. Harper's list, as being excluded by him from the Byrock-Brewarrina railway traffic? Yes.

472. It now being pointed out to you that all the wool in that second list, known as the Walgett area list, is credited to the Byrock-Brewarrina traffic, are you prepared to make any correction of your evidence? Only so far as to say that Mr. Harper's is not a complete nor an accurate list.

473. I want you to show me as clearly as you possibly can where the great differences exist between your figures and Mr. Harper's;—may your representation be taken to have been correct with regard to those differences, now that your attention has been called to that fact? Yes; the difference between the number of bales credited by Mr. Harper and by myself still remains.

474. Then you say that in your list you have omitted a great many of the stations which Mr. Harper has included in his? Yes.

475. So that, if you were to add to your list the stations referred to as being included in Mr. Harper's list, the number of bales would be very much greater than appears by your list;—is that correct? Yes, that is correct. I have omitted the Walgett traffic, amounting to 6,763 bales. That is included in Mr. Harper's list. I have credited the proposed railway from Byrock to Brewarrina with nothing above Boorooma on the river.

476. What do you say would be the total tonnage of the wool as per list produced by you? 4,444 tons.

477. And if you were to include the 6,763 bales appearing in Mr. Harper's list, and which you have excluded, how much would have to be added to it? 1,324 tons.

478. Making the total? 5,768 tons—that is exclusive of 941 tons from stations just over the Queensland Border near Goodooga.

479. Having compared both lists, and having most carefully gone into the details, you adhere to the statement you have made, viz.: that the traffic in wool, instead of being 3,000 as estimated by Mr. Harper, would be fully 6,000 tons? Yes.

480. And you have taken steps, have you, to satisfy yourself absolutely as to the accuracy of the figures appearing in your schedule? I have.

481. *Mr. Fegan.*] You gave evidence on the assumption that the Walgett traffic, as placed by Mr. Harper in his second list, was not included by Mr. Harper as traffic that would be likely to come to the Brewarrina railway station if the proposed line from Byrock to Brewarrina were constructed;—is not that so? Yes. I think that in another portion of his evidence Mr. Harper says that this traffic, or some portion of it, would not come to Brewarrina in the event of a railway to Walgett being constructed. 482.

482. How many bales do you think you would be sure to get for the Byrock-Brewarrina railway from the districts surrounding Brewarrina? About 26,500 bales, or 4,444 tons.
483. How many do you think you would get from the Walgett district? 6,763 bales, or 1,324 tons.
484. Would you get any other? 4,944 bales, or 941 tons, from stations near Goodooga—over the Queensland Border. I may mention that those 1,324 tons from the Walgett district actually did come to Brewarrina, therefore it is no assumption to say that they would come.
485. In other words your grand total would be—what? 38,207 bales.
486. How many bales do you reckon to the ton? Six and two-thirds. The total weight that I have already mentioned was the actual weight of what was sent through Brewarrina.
487. That would be approximately double what Mr. Harper has credited the proposed railway from Byrock to Brewarrina with? Yes.
488. In regard to live stock, have you, since your examination yesterday, considered the matter, and tried to find out how the great discrepancies between yourself and Mr. Harper arose? Yes; Mr. Harper, in reply to a question, said that he had analysed the returns at Byrock and Bourke stations, and had credited the Brewarrina line with the stock coming from stations in his Brewarrina list, which, as you see, contains only about forty-three stations instead of about 140 stations. That would quite account for the discrepancy.
489. The difference is that he has credited only forty-three stations instead of 140, is that it? Yes.
490. On pages 52, 53, and 54, of the evidence already printed, you will see a large number of holdings; but in some cases, although the area of the holdings is mentioned, no sheep whatever are returned? Yes.
491. Is it possible for you to fill in those blanks? The Stock Inspector, I think, would be the best man to do that.
492. *Chairman.*] At Question 1227 Mr. Harper was asked—"Will you give us a detailed estimate of the quantity of wool that would probably be received from the area shown on Mr. Sawers' map, excluding the stations which you have mentioned?" and he replied, "In the estimate which is now before the Committee I have included practically every one of the stations within that area. I have given the quantity of wool coming from places between Byrock and Brewarrina, and going up stream towards Walgett. The wool traffic from all this area I estimate at 3,400 tons." Now, notwithstanding that answer of Mr. Harper, do you still assert that your list is correct, and that his list does not contain a great number of stations that are in that area? I do most decidedly.

W. G.
Jameson.
16 Mar., 1898.

James Howe Saunders, merchant and storekeeper, Brewarrina, sworn, and examined:—

493. *Mr. Fegan.*] How long have you been living in this district? A little over eight years.
494. So you have a fair knowledge of the business transacted in this town and district? I have.
495. You send stores to the various stations, or do they come in for them? I send stores out, and they come in for them as well.
496. Where do you get your goods from? Sydney principally.
497. *Via Bourke?* *Via Bourke* or Byrock. Some classes of goods come to Byrock more advantageously.
498. And some come by team and some by river? Yes.
499. Have you a written statement that you wish to read? Yes. It was written by me when I was about to leave the district for a few days, and I made the statement under affidavit. It is as follows:—

J. H.
Saunders.
16 Mar., 1898.

The Secretary, Brewarrina Railway League.

Sir,

Brewarrina, 20 November, 1897.

Replying to your inquiry as to weights of goods received by us for twelve months prior to 31st October, 1897, we say 400 tons or a little over.

A few years ago we went into the matter very carefully, and put over 1,000 tons through our hands; but having gone out of the forwarding trade we have now no interest in making up quantities.

In addition to this the bad season of the year under review induced us as far as possible to refrain from pushing trade.

We may also say that since considerable concessions have been made by the Railway Commissioners for large lines of wire, sugar, &c., we have been compelled to entirely cease getting these heavy goods direct by 6-ton trucks, as we used to do, and now have to depend on the mammoth importers of Bourke for a supply.

With regard to price, seeing that under existing arrangements, and with a good river, we are paying 25s. river freight, 3s. 6d. trolley rate through Bourke streets, and the additional labour of getting our goods from steamer here to our stores, we are quite satisfied to bind ourselves—other people do the same—to pay at least 15s. per ton per rail from Byrock to this town, and shall feel we are immensely served by such a reduction in cost, in addition to the advantage afforded by despatch, less handling, &c.

As business will compel my absence from town, I have made this statement on affidavit.

Yours,

SAUNDERS & CO.

500. Do you not think that in making that statement you ought to have given us the cost of the carriage of the various articles; would you mind telling the Committee what the carriage of the various classes of goods by river, rail, and road cost you,—first by rail? By rail from Sydney "A" rate goods are all sent in loads of 2 tons or more, but the charge I think would be something like 35s. a ton from Sydney to Bourke. "B" rate goods are sent in loads of 1 ton or more from Sydney to Bourke.

501. What would "A" rate include? Potatoes, oats, bran, pollard, and goods of that class. They are divided again, and some have an addition of 20 per cent. put on them lately. Flour comes in 8-ton truck loads, which we do not get from Sydney, but from places along the line generally, at a cost for carriage at from 16s. to 19s. per ton, say from Wellington or Dubbo. "B" rates include resin, salt, colonial wines, and goods of that class—perhaps twenty items, of which we handle only eight or nine. They come to about £3 9s., from Sydney to Bourke. First-class goods, half-ton loads, come to £6 to Byrock, and £6 9s. to Bourke. They include lime, cheese, bacon, golden-syrup, and treacles, and things of that kind. The second and third-class goods we generally put together and pay a truck rate for them. They include general drapery, fancy goods, and small ironmongery, and for a 6-ton truck we pay £42—that is about £7 a ton. If we were to get them separately we would have to pay more for some goods—about £11 for drapery, in fact for all third-class goods. Then we have to pay a commission to the forwarding-agent in Bourke, who has to pay the railway and load teams for us.

502. What is the commission you pay him? It varies slightly, according to the class of goods, but we may fairly reckon it at 5 per cent. For carriage by road from Bourke we pay from £1 5s. upwards per ton.

503.

J. H.
Saunders.
16 Mar., 1898.

503. What is the most you pay? In the time of the Unions we sometimes paid £2 10s., but now, with open competition, we would not expect to pay more than £1 5s. or £1 10s.
504. That is about the present price? The present price is exactly £1 10s.
505. What is the lowest price for which you have got the carriage done by road? £1 5s.
506. No lower? Not by the Bourke road.
507. What by the Byrock road? I have had large quantities as low as £1 when the season was good, but never less than £1. The charge is generally from £1 to £1 5s. There is not much difference by road. It depends upon on which road the grass is best.
508. Would it be fair to strike an average, and say that throughout the year the charge would be £1 10s. a ton? That would be a fair average.
509. Do you get any goods by steamer from any other colony? We do when the river is available.
510. Have you any idea how much merchandise you have got in the eight years from other colonies? I think that during the first four years that I was here the river was pretty well open, and I must have had about 500 tons probably.
511. What do you do now? 400 tons last year.
512. And you are only one out of how many? Messrs. McMahon Bros. put through more than I do, and there are three Chinese stores here. I have some knowledge of their business, as some of their goods pass through my hands, and the three may be put down at 100 tons between them. McMahon Bros. do a larger business than I do, and they carry on a large baking business which involves a lot of flour, which I do not handle for that purpose.
513. There was a time when you put through 1,000 tons? Yes, some years ago, when I was doing the forwarding trade.
514. Now you are in the retail trade only? Yes. Rich & Co. put through a very much larger quantity than any of us do.
515. But there was a time when you got 500 tons by river? Yes, from Adelaide and Melbourne.
516. Is there as much trade with Brewarrina carried on by river now as there was formerly? The river has been intermittent for some years past.
517. Therefore it is uncertain? It is too risky for us to order goods round while the river is in a low state.
518. All your goods this year you have got from Sydney? Entirely.
519. What is the cost of carriage by steamer from Bourke? I have paid nothing less than 25s., and as high as 30s. for some time past.
520. For how long past? The last two years.
521. Would it seem strange to you if people got goods from Bourke to Brewarrina for 12s. 6d. per ton? It would. I have never heard of such a thing.
522. You think that they would be a privileged class? Undoubtedly.
523. I suppose that your goods are no worse to handle than any other people's? No.
524. And you think that if anybody else got them for 12s. 6d. you would have the same privilege? If I believed it I would have a row with the people who carried for others for less than they charged me, and I should tell them that they must treat me in the same way as they did others.
525. If there is ever a 12s. 6d. rate it must be on rare occasions? I have never known such an occasion.
526. And you have been trading with the Bourke steamers for some years? Nearly nine years.
527. And you have never had an opportunity of getting your goods from Bourke to Brewarrina or to Brewarrina from Bourke for 12s. 6d.? Never for less than £1.
528. And you have paid from 25s. to 30s.? Yes.
529. How much would you be willing to pay the Railway Commissioners for the conveyance of goods by the proposed railway from Byrock to Brewarrina? 15s. a ton. It would be a great concession to me.
530. You think that you would profit considerably by it? Undoubtedly.
531. Though you would profit considerably by that, I understand that the greatest gain would be from the less handling and the quicker transit? Yes.
532. And not from the saving of money? We would save interest on the money. We should not have to stock so heavily, because there would be greater facilities for stocking with rapidity when required. We now lose business sometimes by the great delay which takes place in stocking.
533. As regards the cost of carriage, there would be the difference between 25s. or 30s. and 15s.? Yes; and also the saving of 3s. 6d. trolley rate for the conveyance of goods through Bourke to the steamer. There would be the difference between 15s. and 28s. 6d. at the very lowest, and sometimes more, besides the incidental advantages.
534. Have any of the landholders bought seed-wheat from you this year or last year? No.
535. Is there anything else you can tell us? I believe that the business of the distributors in this town would increase if we had the proposed railway, inasmuch as in the direction of Walgett the river is very often open for some little time after it is closed between Brewarrina and Bourke. It is open earlier and open later, and I believe that our business would be increased in volume in consequence of that.
536. Have you any idea as to the farthest distance you send your goods? Yes; 120 miles is about the outside range.
537. North or north-east? We send to Angledool.
538. You supply Angledool, do you? Yes.
539. Is Angledool chiefly supplied from Brewarrina? I would not say chiefly, but it is largely supplied from Brewarrina.
540. How do they get the major portion of their stores? *Via* Walgett.
541. They are nearer to Walgett than to Brewarrina? I think they are about half-way.
542. If the proposed railway from Byrock to Brewarrina were constructed, how far do you think you would be able to supply stores to people in the direction of Walgett? We go as far as Milrea, and I think that if we were to have the railway it would enable us to stretch out a little farther—pretty well up to Walgett. Milrea is about 40 miles from Walgett.
543. It would all depend on the prices? Yes; I think that our volume of trade would increase because we should have more facilities for business.
544. The river being navigable from Walgett to Brewarrina, do you think that the Walgett people would be able to cut you out of that trade? It would assist us.
545. Then you supply goods along there by means of river transit? Greatly, when the river is open.
546. Not by road? Both.

J. H.
Saunders.
16 Mar., 1898.

547. But when the river is navigable do you use it in preference to the road? Yes.
548. On account of its being cheaper? Yes.
549. Is carriage by river quicker than carriage by team? Yes.
550. The construction of the proposed railway to Brewarrina then would help you to capture a larger portion of the trade this side of Walgett? It would assist us in that, decidedly.
551. Materially? Yes.
552. But if a line were constructed from near Narrabri along the north bank of the Namoi, and *via* Wee Waa, to a point between Angledool and the Barwon, would that line interfere with the earnings of the Byrock-Brewarrina railway in any way? If it passed Walgett, I think it would.
553. If that line were constructed to Walgett, would it interfere with the earnings of the Byrock-Brewarrina railway? No; I do not think it would.
554. How far would the proposed railway to Brewarrina influence trade towards Walgett and more north? I think that we may say that Milrea is about the limit of our influence from here, or a little distance past Milrea, perhaps. Milrea is just about half way. It is about 50 miles from here.
555. You would be able to take all the Goodooga traffic, then, I suppose, of which you get a portion now? Yes; I think that we should command Goodooga.
556. Therefore, if Walgett were the objective point on the North-West line, the construction of that line would not interfere in any way with the earnings of the proposed railway from Byrock to Brewarrina? I do not think it would.
557. Would it not take some of the station products—such as live stock and wool? I do not know how it would affect the wool trade. Not being in the wool trade I would not like to express an opinion.
558. Do you wish to say anything more? I am under the impression that, if we were to have the proposed railway from Byrock to Brewarrina, stock would come into this town more freely than it does now. We have about the best stock-routes this end of the Colony. I think, also, that, very probably something in the shape of a boiling-down establishment might be started here, if we were to have a railway by which to send away the waste products.
559. You would not boil down, except in times of drought? Certainly.
560. And very few men will speculate for times of drought only? Well, men in a district like ours must look forward to that.
561. Would you not rather say meat-chilling or freezing works? That is rather too large. I was thinking of it more as a means of relief in times of drought, which would give a lot of traffic to the railway. During the last drought everything had to be sent into Bourke to be killed, because we had no railway by which to send the stock away.

Thomas McMahon, storekeeper, Brewarrina, sworn, and examined:—

562. *Chairman.*] How long have you been in business in Brewarrina? I have been in Brewarrina within T. McMahon. a few months of twenty-four years.
563. How many tons of goods do you handle yearly? Our return for last year was about 711 tons— 16 Mar., 1898. Byrock and Bourke together.
564. What was the average cost to you for carriage? From Byrock the average cost was 22s. 6d. by team. It cost us about 24s. 6d. including commission to land goods here from the railway.
565. And from Bourke? 31s. plus insurance.
566. How did the goods come from Bourke? I am referring only to steamer trade from Bourke. We got the carriage done as cheaply or more cheaply by team. We paid by steamer 25s., and also 3s. 6d. for conveyance from the railway to the steamer at Bourke plus commission and insurance.
567. Have you known the freight on the river to be as low as 12s. 6d.? I have gone through the list of charges since 1892, and I can tell you the rates that we have paid, and can also show you documentary evidence in support of my statement. For river freight only from Bourke to Brewarrina, in 1892, we paid 30s. a ton in May; 30s. and 25s. in June; 25s. in July. 1893: January and February, 40s., 30s., and 25s. 1893: March, to March 1894, 20s. 1895: November, 30s. 1896: January to May, 25s.; August and September, 20s. 1897: January to 15th May, 1898, 25s. I may also state that having a large connection with Rich and Co. during the last ten years, we always got our freight 5s. a ton cheaper than any other consignee. We have had as much as 99 tons in one month.
568. There would be a very considerable saving to you if you could get goods from Byrock to Brewarrina, you would, of course, use the proposed railway? Decidedly. If the charge were 15s. a ton, I would use the proposed railway. Except as regards 150 tons last year—out of the 711,—we used the team from Byrock in preference to the river from Bourke.
569. If you could get your goods brought from Byrock to Brewarrina at 10s. a ton, you would effect a saving of, at least, from 15s. to 18s.? Yes.
570. Have you ever heard of anyone getting freight on the river as low as 12s. 6d.? I do remember one thing, which I think is an explanation of the matter to which you refer. I think it was in 1893, when we had a continuous river for one year, that Captain Pybus ran a steamer here in the interest of one of the Adelaide firms against Rich & Co. for the purpose of getting wool. Rich & Co. had already secured the principal part of the clip from the different stations, and Captain Pybus offered to carry wool from here to Bourke for 12s. 6d., but the trade having been already secured by Rich & Co., he did not get much to carry—only small lots. That is the only instance, of which I know, of such a low freight, and that was only for a few odds and ends.
571. Have you heard of any serious competition on the river during the time you have been in business here? We had several companies, as well as private individuals, running steamers when we had a good river.
572. During that time was the freight less than 20s.? Never. In fact, I think that in 1893 it was 20s, Mr. Saunders, I think, paid 25s. when we were paying only 20s.
573. Do you deal with Sydney or South Australian merchants? We had goods sent from Sydney, *via* South Australia, and also *via* Melbourne, by steamer in 1893.
574. Why did you not give the railway the benefit of the carriage? Because we could land goods from Sydney to Melbourne for about 4s. a ton, and for the carriage from Melbourne to Brewarrina we paid, I think, 75s. or 80s. a ton. That was cheaper than we could land them at Byrock.

- T. McMahon. 575. Can you not, at the present time, get freight at the same rates? It is not quite so low as it was then, and the river is not a certainty either.
- 16 Mar., 1898. 576. If the river were navigable, would it cost you less to get your goods from Sydney, by way of South Australia, than by rail from Sydney? Yes, I think about nearly half.
577. Then why do you not get your goods by steamer instead of by railway? We have no certainty of the river.
578. I mean when the river is navigable? But that would mean six months' navigation for a certainty.
579. Did the 700 tons of goods to which you have referred as having been handled by you in the course of a year, come by rail from Sydney to Byrock? Yes.
580. None of it by way of South Australia? None of it; the river was not sufficiently lasting.
581. Do you handle much wool? Very little, if any. I would not say that we handle any, except odds and ends.
582. Can you say if any of the wool of this district passes Bourke and goes on to South Australia? Yes, a good deal of it.
583. How many bales, approximately? I cannot say. I have not gone into the matter, but I think that a lot has gone down.
584. Do you mean thousands of bales or hundreds? One steamer would take pretty well 1,000; any of the ordinary steamers would take from 700 to 1,000.
585. You know of some of the steamers taking wool beyond Bourke? Yes; some of the last clip. I know that some of Rich & Co.'s steamers went down the river. I do not know whether the wool was taken to Adelaide or to Melbourne. I think that those steamers went to Echuca.
586. How far north does your business extend? We generally keep a commercial traveller on the road and we do business up to Walgett, and even in Walgett and from Walgett to Angledool and that neighbourhood, and sometimes across the border into Queensland and then take a run down the Culgoa and that way home. That is our general route. Then we go out to Corinda beyond the Marra Creek.
587. Have you seen a plan known as Mr. Sawers' plan, enclosing a large area by red lines;—do your business relations spread over the whole of that area and beyond? We go round through the Macquarie district and then across to Boorooma and Muckerawa. We go out by Comborah Springs. That is about as far north as we go.
588. Assuming that a line of railway were constructed from a point north of Narrabri and along the northern bank of the Namoi River and going between Collarendabri and Walgett to a point between Angledool and the Barwon, would the Byrock-Brewarrina railway be deprived of any of the traffic enclosed by the red lines on Mr. Sawers' map? My opinion is that it would all come this way—that is from as far as Walgett.
589. Are you aware that the route by the line I have indicated and the northern line would be about 50 miles shorter than the line from Brewarrina to Sydney? That may be, but this seems a more direct route.
590. Would that line interfere with your own business spreading as far as Walgett? No; if we had a railway from Byrock to Brewarrina the other line would not interfere with our business at all.
591. Do you think you would handle as many or more tons? More tons. I think that it would give us a better opportunity of doing a more extensive business, simply because we have Bourke to contend with and we now have to pay an extra rate from Bourke to Brewarrina. In that case we should have to pay freight from Byrock and that would enable us to compete against the Bourke trades-people in our own district. Rich & Company for instance now do a lot of trade up the river.
592. With cheaper carriage between Byrock and Brewarrina you would be able to augment your business because it would enable you to sell at lower prices than you can at present? Yes. If we can do business at Walgett now, we should be able to do it much better if we were to have a railway here.

W. Dickson.
16 Mar., 1898

William Dickson, pastoralist, Yarrowin, near Brewarrina, sworn, and examined:—

593. *Mr. O'Connor.*] How far is your holding from Brewarrina? The head station is about 30 miles from Brewarrina, but the boundary of the run comes within 8 miles of Brewarrina.
594. What area have you? About 254,000 acres—that is, Crown lands and freehold lands combined.
595. How do you utilise it? Growing wool and fattening sheep and cattle.
596. How many sheep? We generally shear from 80,000 to 90,000 every year.
597. How many cattle? We do not breed many cattle. We chiefly fatten cattle. Last year we sent 700 fat bullocks to Sydney.
598. Would you mind telling the Committee the reasons why you think the proposed railway from Byrock to Brewarrina should be constructed or otherwise? I will first of all make a statement of our own business. During 1897 we sent away fully 700 head of fat bullocks, all railed from Nyngan to Homebush; also, about 14,000 fat wethers, part being treated at meat works at Nyngan, and the products being railed to Sydney; the balance were railed from Nyngan to Dubbo, and treated at the meat-works there, and the products were railed on to Sydney. If all the stock had been railed to Sydney direct, about 250 trucks would have been required for their conveyance. With railway communication, Brewarrina would be one of the best places in the Colony for meat-works. During 1897 we sent about 151 tons of scoured wool and nearly 16 tons of greasy wool to Sydney, and used nearly 70 tons of stores, wire, and other material; and already, in 1898, we have received over 40 tons of stores and other material from Sydney *via* Bourke. I would always use the railway rather than steamers for the carriage of wool and goods, as I should thereby save extra handling and expense. Until this inquiry was commenced, I never heard of wool being carried by steamer from Brewarrina to Bourke for 12s. 6d. per ton, and I do not think it is at all likely. We have generally sent our wool to Rich & Co. of Bourke, and have always paid 25s. per ton and upwards for carriage from Brewarrina to Bourke, and, in addition, have paid other charges and also insurance. From Brewarrina to Bourke alone the latter would amount to (say) 10s. a ton on scoured wool. I may say, that during 1897 we sent only about 50 tons of scoured wool by steamer from Brewarrina to Bourke, and the insurance on that was £27. Quite recently we have had to pay 40s. and 45s. per ton on goods from Bourke to the 18-mile point—a place about 16 miles up-stream from Brewarrina—and at a time when there was plenty of water in the river. We have generally cultivated from 50 to 60 acres every year since 1889 for growing hay, and we generally get fair crops. Of wheat, we get fair crops four seasons out of five.

599. Did you say how many bales of wool you sent annually? I did not give the number of bales, but the weight, namely, 151 tons of scoured wool and 16 tons of greasy wool. We had about 1,386 bales of scoured wool and 84 of greasy wool. I may say further, that the bulk of our wool for the last three years has been sent *via* Girilambone. It is carried by teams to Girilambone and thence by rail to Sydney; therefore it would not appear in Mr. Harper's returns. W. Dickson.
16 Mar., 1898.
600. In your immense area of land is there much fit for agricultural purposes? A considerable portion of it would be fit for agriculture.
601. I suppose that if you had the facilities that a railway would afford you would put a lot of that under crop if it would pay you? Yes, if it would pay me. Generally speaking, my land is pastoral land; but still there are portions which would be suitable for growing cereals and fruit.
602. You think it would be a great advantage if a railway were constructed from Byrock to Brewarrina? I think it would be a great advantage in many ways. It would be the means of saving a great many valuable stock during times of drought, either by bringing forage to this district or by carrying stock to districts not drought-stricken. If this part of the country were drought-stricken stock could be sent by the proposed railway to places where plenty of grass and water were available.
603. *Chairman.*] What did it cost you for the carriage of wool to Girilambone? £3 per ton is what we paid for road carriage.
604. What distance? About 85 miles.
605. And what is the railway freight;—on scoured wool, £5 per ton, making the total for carriage to Sydney £8? Yes, about £8.
606. What would it cost you to send by rail, assuming that a railway between Byrock and Brewarrina be constructed;—and what would be the road carriage to the nearest point on that railway? About 30s. would cover the road carriage to Brewarrina, and 10s. would pay for the railway freight to Byrock, making altogether £2 per ton, and the freight from Byrock to Sydney would be £5.
607. So you would save £1 per ton? Yes.
608. And I suppose that it may be assumed that if you could see your way to save £1 per ton you would send to Brewarrina instead of to Girilambone? Undoubtedly; if a railway were constructed from Byrock to Brewarrina we would send all our wool to Brewarrina.
609. What would be the saving in distance if you were to send to Brewarrina instead of to Girilambone? We would save about 50 miles of road carriage.
610. How would the Byrock-Brewarrina railway benefit you by the carriage of fat stock? It would cost us more to rail fat stock from Brewarrina to Sydney than it costs us to send it at the present time; but we would have the advantage of getting them on the rail more quickly. At present we send our fat stock to Nyngan. We send them about 100 miles by road. If there were a railway to Brewarrina we should have to send them only about 30 miles by road to Brewarrina.
611. Would it cost you more for railway freight from Brewarrina to Sydney than from Nyngan to Sydney? Yes; as it is now we send fat stock from our station to Nyngan, and we have to pay droving expenses. If there were a railway from Brewarrina the freight from Brewarrina to Byrock would be 15s. 6d. a truck, and that 15s. 6d. would just about pay for the present droving from our station to Nyngan; so that if the proposed railway from Byrock to Brewarrina were constructed we should have our fat stock landed in the trucks at Byrock for the same cost as we now land them in the trucks at Nyngan, and they would be in better condition; but we should have to pay the additional railway freight between Byrock and Nyngan.
612. What would be the additional railway freight? I think that on cattle we should have to pay about 3s. a head more from Byrock than we now pay from Nyngan.
613. And on sheep? About 2d. or 3d. per head more from Byrock than we pay from Nyngan.
614. So although it might directly entail upon you an additional charge of 2d. or 3d. per head for sheep, the indirect advantages would be much greater? Yes.
615. *Mr. Fegan.*] How many leases have you in that 254,000 acres? In the Western Division we hold 174,000 acres of Crown lands approximately, and they have between twenty and twenty-one years to run. In the Central Division we hold about 28,000 acres of Crown lands, and the leases will expire in two years' time. We also have nearly 32,000 acres of freehold land, and we have 20,000 acres of conditional purchase and conditional lease land. That is a total of 254,000 acres approximately.

William Lindsay, pastoralist, Charlton, near Brewarrina, sworn, and examined:—

616. *Chairman.*] Are you one of the proprietors of Charlton and Compton Downs holdings? Yes. W. Lindsay.
16 Mar., 1898.
617. Situated where? Between Brewarrina and Byrock.
618. *Mr. Fegan.*] What is your area? Charlton station: 97,000 acres leasehold land, and about 8,000 acres freehold land, and about 12,000 acres travelling stock and railway reserves, and about 5,000 acres resumed for railway purposes—to be cut up for settlement or otherwise. Compton Downs: Leasehold area, 25,000 acres; resumed area, 4,000 acres; freehold, about 160 acres. The sheep carried on the two stations are from 60,000 to 75,000 sheep, according to the seasons. We have on an average from 1,000 to 1,100 bales of wool, weighing from about 180 to 200 tons. We also have on an average about 9,000 fat sheep for market in ordinary seasons, and in good seasons sometimes more. There are two stock routes through one holding and one stock route through the other. Last year we cultivated a small area for hay—from about 6 to 7 acres—with the result that we got altogether about 12 tons off that area. It had always been said that we never could grow hay there, but the last two years we have tried it. I may mention that the ground last year was ploughed on the 5th March, and the seed was sown about the 13th of March, and it had no rain to make it grow until the 18th or 19th of June—that is, the seed was about three months in the ground without any rain. The crop was cut on the 29th of October, with the result that we got about 2 tons to the acre, clearly showing that the land was good for wheat-growing. Fat stock I have generally sent to Byrock and trucked there for Sydney, but should a railway be constructed to Brewarrina we should often send trucks of 100 or 200 sheep by train then, whereas it would not pay us now to send less than from 800 to 1,000 to Byrock. All our wool and stock both from Compton Downs and Charlton would go by rail if the proposed railway from Byrock to Brewarrina were constructed. I may mention that the area of about 5,000 acres that was resumed as a railway reserve is all good wheat-growing country. About one-half of Compton Downs is also good wheat-growing country.

311 (a)—D

619.

- W. Lindsay. 619. How far are you from Byrock railway station? Charlton is about 35 miles from Byrock railway station and Compton Downs is about 23 miles from it.
- 16 Mar., 1898. 620. Is Charlton Station east or west from here? South—right on the Bogan. The surveyed railway line runs through the whole of the resumed area of Charlton.
621. Brewarrina railway station would be nearer than the Byrock railway station to you? Yes.
622. But if the proposed line were constructed you would take your produce to Byrock? If there should be any platforms erected on the line between Brewarrina and Byrock we should take it to the nearest.
623. But considering only Byrock and Brewarrina, if the proposed line were constructed you would take your produce to Byrock in order to save carriage? From Charlton we should take it to Brewarrina, but from Compton Downs we should take it to Byrock.
624. Therefore, half your holdings only, it may be said, would give anything like a return to the proposed railway? More than that, because we shear more sheep at Charlton than we do at Compton Downs? Compton Downs has not such a large area as Charlton has.
625. Are the capabilities of the land on the two stations equal? No.
626. Which is the better? Charlton; it has also a larger area.
627. So you would give much more freight to Brewarrina than you would to Byrock? Yes.
628. If the proposed railway were constructed, do you expect that a greater area would be put under crop, after the experience you have had? Yes; because of the country being suitable for growing crops, which has been proved.
629. Would you find a market locally? We should find a market locally for a certain quantity, but the excess over that would have to be taken to Sydney or elsewhere.
630. What is the ruling price of hay in the district? We have never purchased hay; but we have paid as high as £9 a ton for chaff.
631. Would you look upon hay as superior to chaff for fattening purposes? Most certainly the hay grown in the district would be, for the chaff you buy is generally rubbish. In 1895 we bought a great quantity of chaff, but instead of doing the stock good it did them harm, on account of the rubbish that was in it.
632. So the hay grown in the district you would prefer to chaff for which you pay £9 a ton? Certainly.
633. Would that be the average price? It would be rather high.
634. What is the average price? About £6. We have to pay extra carriage on the hay.
635. You say you got 12 tons from 6 acres? Yes.
636. That would be £72 for the 6 acres? Yes, and under unfavourable conditions, the seed being three months in the ground without any rain.
637. That would pay you much better than stocking? Yes.
638. I suppose that under present circumstances the reason why no greater area is put under cultivation for wheat or hay is because you think you have not fair facilities to reach the market? That, and because it has never been tried, the impression being that hay would not grow here.
639. After your experience, what are you doing this year? Putting in another crop.
640. What area? The same area, because I have not had time to increase it on account of the season being so dry previous to the last fall of rain.
641. It is not too late to put in a larger area now? It has to be in about March—that is the proper time for this district.
642. A part of the land there is not heavily timbered, and would not want much clearing? It requires a certain amount of clearing.
643. Not very much? No, not very much.
644. The position is this: You say you pay £6 for hay, which would be £72 for 12 tons, and, as a man who thoroughly understands his business, you would think you were doing fairly well if you ran a sheep to the acre? You cannot run a sheep to the acre in this country.
645. I say that you would do fairly well if you could do that? Certainly.
646. I see it figures out that you cannot run 2 acres to the sheep? No; it takes 3.
647. Well, if you could get £6 an acre, would not hay pay you a great deal better? Most certainly, if we had railway communication and could take the hay to market.
648. But even as you are at the present time, seeing that half of your run is very much nearer to Byrock? But I think you do not understand that the last crop we put in was only just in the experimental stage.
649. But if the experiment has turned out so well as to give you that return it would be a fair thing to rely upon it, would it not? Yes; but where that crop was grown we have not sufficient country available to cultivate on account of being surrounded by Crown lands. The cultivation was on freehold land, but it would not pay us to improve the Crown lands considering that the resumed area by which that freehold land is surrounded is open to be taken away from us at any time. We cannot cultivate on the resumed area with freedom.
650. But you have 160 acres of freehold? Where the proposed railway line is surveyed we have about 440 acres freehold, but we require that for horse-paddocks, and a garden, and so on, for household purposes.
651. But are those 440 acres equal to the 6 acres you put under cultivation? Yes.
652. Well, that is a fair area upon which to grow hay if it pays so well as that? But we cannot do without the paddocks.
653. If you were to put 300 acres under cultivation would you be able to get £6 a ton for your hay—would you have a market for it? I think we should have a market for it provided that we cut it up into chaff, because at the present time people cart chaff from, I think, about 15 miles on the other side of our holding into Brewarrina.
654. If the experiment has proved so successful, do you not think that it is worth while to put a larger acreage under crop? I do, most certainly.
655. Do you think that there are many of your neighbours who are disposed that way? Yes. There is a homestead lessee on the resumed area who put in a crop last year for the first time. He is satisfied with the result, and is going to put in a crop again.
656. How far does he live from Byrock or Brewarrina? He is about 25 miles from Brewarrina and about 40 from Byrock.
657. What does it cost to clear your land: probably all these areas will be open for selection at some time in the future, and if it costs a great deal of money to clear this land it means that a poor settler or small

- small holder cannot very well take up the area? Well on the 5,000 acres that I mentioned, I do not believe that there is more than 1,000 acres that would require clearing, because most of it is plain country, well grassed. W. Lindsay.
16 Mar., 1898.
658. Then it would not need a man of large capital to go on to it? No.
659. And under those conditions it means that a number of those areas could be thrown open to make homes for a great many more than are living there at present? Yes. As regards the area we cultivated I do not think it cost us more than about 3s. 6d. an acre to clear it.
660. What would it cost to prepare it and sow it and do everything else ready for cropping? To clear it and sow it and harrow it and make it ready for cropping would cost, the first year, about 17s. 6d. or 18s. an acre.
661. At the outside you could do everything for £1 an acre? Yes, that would cover it all. The next year it would cost about 12s.
662. I suppose that you are not troubled with rabbits on your run? Not to any extent.
663. Is your holding fenced in? It is wire-netted on two boundaries; it is not surrounded with wire-netting.
664. Did you wire-net it? No; we paid a proportion of the cost of the wire-netting.
665. The Government did not wire-net it? No; an adjoining station.
666. I suppose it cost something between £50 and £60 a mile to fence and wire-net it? I think that the wire-netting costs £60 a mile.
667. That is, fencing and wire? No; wire-netting it and adding new posts to the old fence.
668. It costs, then, something like £70 or £80 a mile to wire-fence your holdings? If you put up a new fence, it would cost about £60; but this fence was wire-netted and new posts had to be put in in different places and wires taken out, and this caused a lot of trouble.
669. With new methods, you are now able to cope fairly with the rabbits;—they are not the huge pest they seemed to be at one time? Oh, no.
670. Where do you get your stores from? From the Byrock railway station.
671. From Sydney? Yes, principally.
672. And, of course, you send your wool and other products in connection with your station to Sydney? They go direct to Sydney.
673. Do you send any either to Melbourne or to Adelaide? No, they all go to Sydney.
674. What timber is there on your land—any ironbark? No ironbark. There is beef-wood on the Compton Downs and iron-wood.
675. Not of very much value at present? Not at present.
676. *Chairman.*] What does it cost you to send your wool at the present time to Byrock? We generally cart it with our own teams.
677. What do you estimate it would cost you if you had to employ teams? From Compton Downs it would cost about 15s. a ton, and from Charlton, I suppose, we might get it done for 30s., but we have paid as much as 35s. and 40s. from Charlton.
678. Therefore, you could afford to pay 7s. 6d. from any point between Byrock and Brewarrina, or 10s. from Brewarrina, by railway? Yes, it would pay us better to do that.
679. In that case, about how many tons would you send by the Brewarrina railway? From about 180 to 200 tons of wool only.
680. How many tons of station supplies do you receive in the course of a year? About 40 tons.
681. What does it cost you to get your supplies? They are generally carried by our own teams.
682. And you would estimate the cost of carriage at the same rate as you have already mentioned? Yes.

John O'Dwyer, homestead lessee, Avondale, near Brewarrina, sworn, and examined:—

683. *Mr. O'Connor.*] What distance is your station from Brewarrina? About 30 miles.
684. What area are you cultivating? I have none under cultivation at present, but I am clearing land for cultivation. J. O'Dwyer.
16 Mar., 1898.
685. How many acres are you in possession of? Ten 240-acre blocks. There are myself and sons, and we have 30 odd thousand acres.
686. How do you utilise the land? By grazing.
687. How many sheep do you run? About 10,000.
688. Any cattle? Yes; 20 or 30 head, and 14 or 15 horses.
689. Where do you send your produce to at the present time? Byrock.
690. What is the distance from your place to Byrock? From the homestead itself, about 25 miles.
691. What do you pay for carriage? From 15s. to 17s. 6d. a ton. We have paid as high as 35s.
692. Where do you send your wool to? Byrock.
693. And on to Sydney? Yes.
694. What wool are you producing in a year? From 20 to 30 tons—an average of 22 or 25 tons.
695. Is any of the land that you hold fit for agricultural purposes? Fully one-half, or more than that.
696. Have you tested it at all? No. I am now clearing land for cultivation; but the land immediately outside my fence has been tested by my neighbours to the extent of 200 and 300-acre paddocks.
697. You know the route of the proposed railway from Brewarrina to Byrock? Yes; I should be about 5 miles off that route.
698. Would you like to make a statement of the reasons why you think the proposed line should be constructed, or otherwise? My principal reason for wishing for a railway is that I should like to go into cultivation. We find that we cannot do so well on the small areas, unless we combine agriculture with grazing, and the land being so good we should like to put in a lot of crop, but at the present time the cost of carriage is against us. I know that from my neighbours who are cultivating largely. A neighbour of mine had 240 acres in last year, and the crop was about a mile from my boundary, and on similar land. Off that paddock he cut 100 tons of hay, and about 300 bags of wheat. He had to send that 40 miles to Bourke, and, of course, that is a big item. If we had a railway along the surveyed route from Brewarrina to Byrock, I do not think that there is any doubt that a lot of us would get a siding from which to send our crops away.
699. Is the surveyed line close to your land? It is within 5 miles of my homestead. 700.

- J. O'Dwyer. 700. Are there any holdings alongside of yours? There are several. There are ten or twelve homestead lessees in that locality.
- 16 Mar., 1898. 701. Close to you? Yes; all adjoining.
702. Have you any idea what the rainfall is in your district? About 19 inches has been the average for the last sixteen years.
703. You can produce wheat with that rainfall? Yes; I have seen it produced during the last three years.
704. If you had facilities such as this railway would afford you, you would go in pretty largely for cultivation? We should like to get in about 2,000 acres; that is our idea.
705. And I suppose that what you did your neighbours would do also? Yes; they are doing it before me.
706. Is your land equal to theirs? About the same; there is only the boundary fence between their land and mine. I think it is some of the best agricultural land in Australia. I know all the Junee and Wagga country, and I knew it before it was ever cultivated, and have seen it since. This is similar land. The soil on my holding is in some places 17 feet deep.
707. How long have you been in the district? Between sixteen and seventeen years.
708. Have you been a pastoralist during all that time? Yes. I was managing a large station. I managed Glenariff for ten years.
709. How were you employed before you came here? I was grazing in the Wagga district. I came from Wagga to this district.
710. Does the land here bear favourable comparison with that land? I say it is equal to the Junee land and to the Cootamundra land, which I consider is as good land as there is in Australia.
711. Have you ever been in the Riverina? Yes, I have been all through the Riverina.
712. Were you ever near Jerilderie, Berrigan, or Finley? I have not been there, but I have been all round the Wagga district and Junee, and also in the Cootamundra district, which I knew very well before there ever was a farm there.
713. And you are of opinion that the land here is as good? Yes; I am sure it is. On my place I have fruit trees, and all kinds of fruit and vegetables grow as well as they do in the Wagga district.
714. Will you be able to produce fruit here to any extent? In any quantity.
715. Grapes? Yes, in any quantity. I am growing them now. I have a nice orchard, and I have been only seven years on the place.
716. Under what conditions do you hold your land? It is a homestead lease.
717. How long is your lease for? It is a twenty-eight years' lease.
718. What portion of that time has expired? Eight years.
719. You have twenty years left? Yes.
720. Is there anything you wish to add to your evidence? What I wish the Committee to understand is that 10,000 acres of this land are too small an area for grazing sheep alone, and we should like to add agriculture. I and my sons have 30,000 acres between us, but some of my neighbours have only one block, and I suppose that a little later on my sons will be going on their own hook, and then we shall have a 10,000-acre block apiece. A 10,000-acre block would carry from 2,500 to 3,000 sheep at the outside. From 500 to 1,000 acres of crop would pay me better than 2,500 sheep.
721. Your evidence summed up means that you with many others similarly situated are considerably embarrassed for want of means to get to market, and that the construction of the proposed railway from Byrock to Brewarrina would afford you facilities, and you could not only raise sheep and grow wool, and graze cattle, but you would also be able to grow vegetables and particularly fruit, including grapes to any extent, which means an important industry? Yes, and wheat and hay.
722. But without a railway you are practically paralysed? Yes; it simply blocks us. If we had railway communication with the market I could to-morrow get several people to come and work the country on the halves system—I fencing the blocks and supply water, and they finding the labour.
723. That system is extending very much in this colony? Yes; and I think we could get it carried out here if we only had the means of getting our produce to market.

Andrew David Kerrigan, manager, E. Rich & Co. (Ltd.), Brewarrina, sworn, and examined:—

- A. D. 724. *Chairman.*] What is your position? I am manager for Rich & Co. at Brewarrina.
- Kerrigan. 725. How long have you occupied that position? From about 1893. I have been in the firm about sixteen years, and have been here about six years.
- 16 Mar., 1898. 726. How long have you been in the district? Ever since I was born.
727. Do you remember being examined before a Sectional Committee in 1896 in reference to a proposal to construct locks and weirs on the River Darling? Yes.
728. On that occasion you gave certain evidence as to the tonnage passing by the steamers from Brewarrina to Bourke? Yes.
729. Have you before you the figures showing the actual tonnage reaching Bourke from Brewarrina and districts? I have not made it up, but I have it here.
730. Well, take three years—1892, 1893, and 1894? I have not 1892.
731. Have you 1893? I have.
732. Well, take the tonnage up-stream first? I cannot give you that. I have not the book here; I have only oddments in this book.
733. Can you give the tonnage up-stream for 1892? No.
734. For 1893? I have never added the lot together; but I have it all here.
735. Can you say what quantity left Bourke, and was delivered between Bourke and Brewarrina? I can give you only the tonnage that arrived here from Bourke in 1893 from April to December, and was despatched out to the back creeks. It was about 526 tons.
736. What was the intermediate traffic? I cannot tell you; I never kept an account of it.
737. Have you any means of ascertaining? I have—from Bourke.
738. But you cannot tell us the traffic between Bourke and Brewarrina by any books to which you have access in Brewarrina? No.
739. Was 526 tons the total traffic that reached Brewarrina in that time? That is not including the up-river traffic at all, but simply what was sent out back.

740. What quantity reached Brewarrina to pass on to Walgett, or to places between Brewarrina and Walgett? I should say double that quantity.
741. That would be 1,000 tons? Yes.
742. Can you say, approximately, from your knowledge of the traffic of the river, what quantity of goods would have been delivered between Bourke and Brewarrina? I should say about 60 or 70 tons.
743. Can you give similar information for 1894? I have the information for 1894, but have not added it up yet.
744. Have you similar information for 1895? Yes.
745. And for 1896? No.
746. Up to what month in 1896 have you? I have only odd months—August, July, May, and April.
747. So you would not be able to give the details for 1896? No.
748. With regard to the wool and station produce coming down stream from Walgett to Bourke, have you similar information? Yes.
749. For the years that have been specified, or for a longer period? For 1893, 1894, and 1895.
750. Was the river navigable the whole of 1892? Yes.
751. And the whole of 1893? Not the whole of 1893. We sent some wool by teams in 1893.
752. For what period was it navigable? August, September, and October, and part of November—about four months.
753. For about four months only? Yes, during the wool season.
754. And in 1894, was the river navigable throughout the year? Yes, I think it was navigable throughout the whole year.
755. Can you say if the river was navigable in 1895? It was navigable, but for short periods. It was an uncertain river; it would be navigable three or four weeks and then drop, and afterwards go up again.
756. The returns that you gave of traffic up stream by steamer extended over four months only, the river being navigable for that period? No; from April to December.
757. Was the river navigable for the whole of that period? Yes.
758. It was navigable for up-stream traffic from April to December? Yes.
759. But for down-stream traffic during the wool season it was navigable for wool traffic for four months only? Yes.
760. What wool came to Bourke past Brewarrina in 1893? Roughly speaking, 22,000 bales.
761. Is that the whole of the wool that came by river from Brewarrina and from Walgett? Yes, the whole of the wool traffic by river that passed through our hands.
762. Did any other pass through your hands to be sent on by team? Yes. There are different stations which had wool that went to Nyngan and which sent only a few bales this way. McKay Bros. sent only a few bales this way.
763. Would your 22,000 bales comprise all the clips of the district that would be served by the proposed railway from Brewarrina to Byrock? No, I should think they would extend over that number.
764. About how many bales? I could not say without going into the matter.
765. Can you get the information? I think so.
766. Information that will enable the Committee to estimate the probable traffic that would reach the Byrock-Brewarrina railway? Yes.
767. On page 70 of the evidence already given there is a list of stations with the number of bales from the whole of those stations;—would you be able to examine that list and say if, in your opinion, the wool from those stations would reach the Byrock-Brewarrina railway in the event of that line being constructed? Yes.

A. D.
Kerrigan,
16 Mar., 1898.

Augustus Sullivan, pastoralist, Cowga Station, near Gongolgon, sworn, and examined:—

768. *Chairman.*] Are you a leaseholder? Yes.
769. How many miles is your station from Brewarrina? Thirty-seven.
770. *Mr. Fegan.*] In what direction? It is east of south from Brewarrina, and about 8 miles from Gongolgon.
771. What is your area? Between 42,000 and 50,000 acres. I have three 5-mile blocks.
772. What do you utilise it for? For grazing sheep.
773. Anything else? A few cattle.
774. Have you tried any under cultivation? Yes, a little.
775. How many acres? About 5.
776. Wheat for hay, I suppose? Oats for hay.
777. What was the result? I do not know.
778. What would the distance be from the proposed railway to your station? About 18 miles, I think.
779. How far are you from Byrock? Forty-six miles.
780. What is the distance to Brewarrina from your station? Thirty-seven miles.
781. How many sheep do you run on your station? From 15,000 to 20,000.
782. What was your clip last year? From 200 to 300 bales.
783. Did you send it to Byrock? Yes.
784. What was the cost of carriage to Byrock per ton? Thirty shillings; that is what I usually pay.
785. You have had to pay more at times? I have had to pay as much as £3 a ton.
786. And sometimes £1 a ton, I suppose, when you could get it done for that? No, never.
787. Thirty shillings is a fair average price? Yes.
788. Do you send any fat stock to market? Yes.
789. What do you send? Sheep; but I very seldom train them.
790. What do you call your market for them? Bathurst, generally.
791. Do you drove them all the way to Bathurst? Yes, I have always done so.
792. In what condition do your stock arrive at Bathurst? Very good; but they have been trained from Bathurst to Sydney, though.
793. So, really, Sydney is your market? Yes.
794. It would be very expensive taking them to Bathurst that way, would it not? It is cheaper than by train.

A. Sullivan,
16 Mar., 1898.

- A. Sullivan. 795. So that, so far as railway communication between Byrock and Brewarrina is concerned, it would afford you no facilities, considering the cost of taking fat stock to market? If the train were to come by Tarcoon I would rather truck them at Tarcoon than send them by road. For the future, I intend to truck them all at Nyngan if the train does not come closer than Byrock.
- 16 Mar., 1898. 796. What distance is Tarcoon from your station? Between 18 and 28 miles.
797. Then, as far as fat stock is concerned, if the proposed line from Byrock to Brewarrina were constructed it would not give you very much more facilities than you have at present? Yes, a good deal, because I would truck my stock.
798. I am looking at the distance you take your stock to Bathurst—a considerable distance—although you have railway communication nearer to you than that, in the face of that you take your stock to Bathurst, and pass several railway stations much nearer from which you could truck? But the reason why I did that was because I had a holding at Bathurst; but I have no holding there now.
799. The real reason why you drove them to Bathurst was on account of the drought here whilst you had good country there? Yes.
800. How far is Bathurst from your station? About 320 miles.
801. You have given up your holding at Bathurst and retained your holding here? Yes.
802. Because it is better country? No, I do not think so.
803. Have you trucked any stock from Byrock or Nyngan? I have trucked cattle from Byrock and Nyngan.
804. How much per truck did you pay? I cannot say exactly.
805. Where do you get your supplies from? Bourke.
806. How far are you from Bourke;—much farther than from Brewarrina? A little farther.
807. Why do you get your supplies from Bourke? I buy my goods at Bourke, and they are delivered at Byrock for me.
808. But is not Brewarrina nearer? Yes.
809. Thirty-seven miles compared with 46? Yes.
810. Are goods much cheaper at Bourke? Much cheaper.
811. Do you know the reason why? I cannot say the reason.
812. What quantity of supplies do you have annually for your station? Between 8 and 9 tons.
813. How long have you been in this district? Over twenty years.
814. As regards the stores that you consume they would amount to very little so far as railway traffic would be concerned? I may probably use more than I have said. I get about 8 tons at shearing time.
815. Do you know any other reason why the proposed railway should be constructed? I think that all the West Bogan country could be turned into agricultural country.
816. There are large blocks of country along the existing railway lines which have not been turned into agricultural country, although they have had railway communication, is that not so? Yes.
817. However, you think that the construction of this proposed railway would be the means of inducing landholders to put a greater area under agriculture? They would do it on the river country where they have water, but where the surveyed line goes along they have no water at all.
818. There are not many rabbits on your holding? Not very many.
819. You are not afraid of them the same as you used to be—at one time it was a terrible thing to think about them, was it not? Yes.
820. But since you have phosphorised pollard and other things you do not think much about the rabbits? No.
821. Although it is rather costly to deal with them? Yes.
822. It takes a lot out of the returns? Yes, it does.

THURSDAY, 17 MARCH, 1898.

[The Sectional Committee met at the School of Arts, Brewarrina, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Byrock to Brewarrina.

Andrew David Kerrigan, manager, E. Rich & Co. (Ltd.), Brewarrina, sworn, and further examined:—

- A. D. Kerrigan. 823. *Chairman.*] Have you brought with you a statement showing the whole of the river traffic? I have brought only a few things.
- 17 Mar., 1898. 824. For how many years? For 1893 and 1894.
825. Have you now before you a statement showing the whole of the river traffic up and down stream for the years 1893 and 1894? Yes.
826. Will you read it? For 1893, 22,000 bales or about 3,300 tons, and at the same time in 1893, there were 2,000 or 3,000 bales that went by road, equal to 1,200 tons more.
827. Making the total by road and river, 4,500 tons? Yes; I am giving the road traffic approximately only. We do not take account of the number of bales that go through by road. That is just an idea—perhaps more went through.
828. In saying 4,500 tons you consider that is the minimum? Yes, I do.
829. Now up stream for the year 1893? I gave that information yesterday.
830. That would be correct? Yes.
831. Yesterday you gave the figures only as far as Brewarrina? I simply gave the figures from Brewarrina outwards. I did not know the others.
832. You did not give us the tonnage that left Brewarrina for delivery at Walgett? I cannot give you that, because I am not in a position to do so. The steamer takes the bills of lading on.
833. Can you say approximately? From what I know I should say that from 1,500 to 1,700 tons went up the river.

834. Can you say approximately how many tons were delivered at Brewarrina from Bourke during the year? I should say that from 1,500 to 1,600 tons passed through Brewarrina for delivery above Brewarrina, between 60 and 70 tons were delivered between Brewarrina and Bourke, and 700 tons came here to be sent out back, and 1,800 tons were left in Brewarrina for the Brewarrina shed, and McMahon and Saunders, and the Chinese stores; making a total of about 4,200 tons.

835. Do you think you have under-estimated or over-estimated the traffic for the year 1893? I do not think I have over-estimated it.

836. You think that is about accurate? I think it is as near as possible.

837. At any rate you can pledge yourself to over 4,000? I think, I can safely do that.

838. Now give me 1894? 1894 was almost a similar year.

839. But in 1893 you had only nine months, whereas in 1894 you had the whole year? Very often we do not have the river available here for more than four or six months in the year, but in 1891, 1892, and 1893, we had it for nearly the whole year round.

840. Have you included in your total of 4,000 tons the road traffic as well as the river traffic? Yes; all the traffic that passed through here.

841. And in 1894? Very similar. It was a bad year. A lot went by teams. It did not come through here exactly, but went up the Culgoa. If there had been a railway here I think it would have come here and gone by it, but having no feed on this route they had to go up the Culgoa.

842. Are you sure that not less than 4,000 tons of loading left Bourke for and above Brewarrina? I cannot say for a certainty whether there was more or less, but that is my idea as to what did go.

843. What experience have you had which would enable you to accurately judge of the traffic? I have been here since 1893, and have handled everything that has gone through the place except what Wright, Heaton & Co., handled when they were here, and I know what they handled pretty well.

844. Is there any one in the district able to give more accurate information on this subject than you are? I do not think so.

845. Now take the down-stream traffic of the district for the same years? About 22,000 bales went by river during the season 1893, amounting to 3,300 tons, and there was also a great quantity that went by load; I cannot say exactly the number of bales or the weight.

846. If you were asked to estimate the quantity, about how many tons would you say went by road? I did on one occasion go through the wool that went through Brewarrina during 1893, 1894, and 1895, and I estimated that each year from 28,000 to 30,000 bales went through here, including the river and the road traffic.

847. Went past Brewarrina? Yes. When the river is running, and the wool can be sent down stream by boats, teams fetch it in from out back.

848. Do you think that the whole of that would go by rail if a railway were constructed between Byrock and Brewarrina? I do not say the whole, but I say that what we would lose in one way we would get from other sources.

849. That there would be the equivalent to 28,000 bales sent by railway? Yes.

850. What would be the tonnage of the 28,000 bales? I think it would run into between 5,000 and 6,000 tons if it were principally greasy. You can average greasy and scoured wool together at about six bales to the ton, or a little more. We average greasy wool at five bales to the ton, and scoured at eight.

851. What other produce besides wool would be likely to reach the proposed railway? Hides, tallow, and skins.

852. Giving approximately what tonnage? I cannot say.

853. Can you form an opinion? About 200 tons I should say.

854. You had placed in your hands last night a statement put in as evidence by Mr. Jameson, showing the whole of the stations from which traffic might be expected in the event of the proposed railway being constructed; the statement placed in your hands is supposed to contain a list of the whole of the wool received from stations within the area shown by the red lines on the map, known as Mr. Sawers' map. Can you say, from your knowledge of the traffic of the river and the road, whether that is a correct list? I have checked all the figures in that list with my own figures, and have proved them to be correct with the exception of those relating to Charlton and a few other stations. Mr. Jameson has put down the quantity for Charlton Station at 339 bales. I think it will be considerably over that. Weilmoringle, he has put down at 1,273 bales. That may have been the quantity for one year, but I think it is generally more than that. The quantities from a few of the stations are over-estimated by Mr. Jameson.

855. Will you point out wherever in your opinion the quantities mentioned are excessive? There is White & Co., Yucurrie. Mr. Jameson has put that down at 153 bales, and he shows it again in the abstract.

856. Twice entered—is that it? The explanation that he gave to me when I asked him about it, was, that it was not estimated enough, inasmuch as some had gone by road, and he put it in there to show there would be seventy bales more.

857. How many bales are entered? 223 altogether.

858. In your opinion how many bales would come from Yucurrie? Not more than 211. That was what they had in 1893.

859. With regard to that station, there is probably a discrepancy of 11 bales? Yes.

860. Will you look at the total given in Mr. Jameson's statement? Yes.

861. Are you prepared to say that that is correct—that is, from the knowledge that you have of the wool and produce coming from the various stations? I think he has over-estimated hides and tallow and skins.

862. To what extent? I should say, fully 200 or 300 tons.

863. You are aware that Mr. Harper's estimate of traffic from wool, skins, tallow, and hides is 3,430 tons? Yes.

864. Do you say that is an under-estimate? I believe it is.

865. Do you say that Mr. Jameson's statement—that the actual amount of wool sent to Brewarrina by steamer for the 1894 season from stations within the sphere of the proposed railway, as shown upon the map produced to you, would be about 2,300 tons, and that other wool produced in the district, also within the sphere on the proposed railway, would be 2,144 tons, making altogether 4,444 tons, would be a fair estimate? Yes, I should say so.

- A. D. Kerrigan.
17 Mar., 1898.
866. Do you think it is an extravagant estimate? I think he has exaggerated the tallow and hides.
867. I am speaking of the wool? I think he has over-estimated the tonnage.
868. To what extent? I cannot exactly say.
869. Well, what is your own opinion? I think he has over-estimated it by about 300 tons.
870. For skins, hides, tallow, and general produce Mr. Jameson's estimate is 500 tons;—do you regard that as a correct estimate? No.
871. What, in your opinion, would be the maximum quantity? About 200 tons.
872. Therefore, you think that Mr. Jameson is wrong to the extent of 300 tons in that estimate? Yes.
873. I suppose that you are in a better position to form a correct estimate of the probable tonnage than Mr. Jameson would be? I should say I am.
874. Now, with regard to return loading, your estimate for which is 4,200 tons as against Mr. Jameson's estimate of 5,100 tons;—do you consider Mr. Jameson's estimate is excessive? I do not know where he got his figures from; he may be more accurate than I am. I am only giving mine as far as I can remember. I have no books dealing with the matter, and he may have got his figures from a more reliable source than I have, and I would not like to say he is wrong.
875. You are of opinion that the quantity would not be less than 4,000 tons? I am of opinion that it would not be less than that.
876. Would that embrace the whole of the traffic of the district which is likely to reach the proposed railway from Byrock to Brewarrina? No.
877. What other traffic would, in your opinion, come to the proposed railway? I should say 268 tons of extra out-loading would come through here.
878. Have you the evidence of Mr. Shainwald on page 70? Yes.
879. Have you carefully considered the figures given in Mr. Shainwald's evidence, and can you explain the discrepancy in quantities between his returns and those you have given us to-day—I mean as regards the loading both ways? The only way I can explain the discrepancy is, that he does not take the team traffic into consideration. He does not seem to have considered that at all.
880. You have taken into consideration the road traffic, but Mr. Shainwald's returns are confined solely to the river traffic? I think so.
881. Do you think that if you were to add to the figures given by Mr. Shainwald the road-traffic which would reach the Brewarrina-Byrock railway the figures would be accurate, or nearly accurate? As near as I can give it to you.
882. Therefore, there would be no discrepancy if Mr. Shainwald had not omitted from his returns the road traffic? I do not say that he has omitted it, but it appears to me that he has done so.
883. Do you think that that is a fair explanation? It is as fair as I can make it.
884. Now will you turn to Mr. Harper's evidence; from the figures before you you can see that Mr. Harper has arrived at a total of about 55 per cent. of that given by yourself; the details are contained in the evidence before you now, can you offer any explanation that you think would account for so wide a difference? In the Brewarrina district he has "Guisely" which is actually in the Walgett district, and to which he credits 301 bales, whereas all that we have ever sent was 105, and 196 bales in 1893 and 1894.
885. In that case he has given the proposed railway credit for more than it would actually receive? Yes. He has Milrea 1,422 bales, whereas all that we ever received in 1893 and 1894 was 426 and 378 bales.
886. That is a difference of about 1,000 bales, for which Mr. Harper has given the proposed railway credit over and above what you know has come from that station? Yes.
887. Will you show me where Mr. Harper has omitted to credit the proposed railway with probable traffic? As regards Yarrawin, which in 1893 and 1894 sent 1,172 and 1,536 bales, he credits it with 1,170 bales. Then he places Boorooma in the Walgett district, and he credits it with 1,955 bales, whereas 1,966 bales were sent. He has also placed Milroy in the Walgett district, and he has credited it with 433 bales, whereas 767 were sent through us by steamer alone, and about 700 more went by team. White-woods is in the Brewarrina district, but he has placed it in the Walgett district. Then he has "small clips, 225 bales." I should say they would average more than that.
888. The differences you have mentioned would not make anything like 2,000 tons? No.
889. And 2,000 tons would be the difference between Mr. Harper's estimate and yours? There are lots of places he has not put down at all.
890. Are there in Mr. Jameson's statement many holdings specified which are omitted from Mr. Harper's statement? Yes, there are a large number.
891. About how many;—do you think there are more than forty? I would not say just now that there are more than forty, but I have already counted twenty-six, and there is a large number which I think would make up the difference.
892. Would the quantity of wool coming from those stations not mentioned in Mr. Harper's estimate be material in connection with possible railway traffic? Yes.
893. Do you think that you could furnish to the Committee to-morrow morning a list showing the omissions from Mr. Harper's estimate? I will try.
894. Have you seen Mr. Harper's statement of the total quantity of wool received by the existing railway at Byrock and Bourke, viz., 1,253 bales at Byrock and 26,449 bales at Bourke? Yes.
895. Can you explain in any way the apparent discrepancy between Mr. Harper's statement of the wool actually sent by rail from Bourke, and the quantities you say you know passed through this district to Bourke? Mine went by steamer and by team.
896. Mr. Harper says that the total quantity of wool received at Byrock and Bourke was 27,702 bales? Yes. I make mine by river 21,738 bales; and that bears out my statement that a lot went by team.
897. But your estimate of what went by team is nearer 2,000 tons? It would be about 6,000 bales.
898. But Mr. Harper says that the average tonnage for the three years is only 3,400 tons of wool that reached the railway at Byrock and Bourke? But I think that he takes the scoured wool and the greasy wool all alike. If he were to make up the weight of the greasy wool and the weight of the scoured wool separately it would make a vast difference in his estimate.
899. But that would scarcely explain the wide difference between your estimate of nearly 6,000 tons and the figures which Mr. Harper says he has obtained from the railway authorities, viz., 3,400 tons? I cannot account for the way he has made it up.
900. Is it possible that he has made a mistake by omitting to give credit to the Brewarrina-Byrock railway for

A. D.
Kerrigan.

17 Mar., 1898.

for wool that actually came this way from the Brewarrina and Walgett districts and has credited it to the west? Yes, it is quite possible! He has certainly left out a lot of wool.

901. I suppose that a very large quantity of wool comes from stations to the north and west of Bourke? There are a lot of stations from which the wool would come in here if we had a permanent river or a permanent means of getting it away, whereas it now goes direct to Bourke.

902. If you can, I want you to offer some solution of the very difficult question as to the quantity of wool that should be credited to the proposed Byrock-Brewarrina railway; Mr. Harper credits it with about 3,400 tons against nearly 6,000 tons, which is your estimate, and he says that he has given credit for every bale of wool that now comes to the railway at Byrock and Bourke from the Brewarrina and the Walgett districts? I do not think he can have done that.

903. You think that Mr. Harper must have been in error? I think he has made a mistake somewhere.

904. As to the upstream traffic, I suppose you are in quite as good a position to judge as Mr. Harper as to the quantity reaching Brewarrina from the Brewarrina and Walgett districts? I should think so; we handle it all.

905. You think that you are more likely to be correct than he is? That is an awkward question to answer.

906. Supposing that you were to meet Mr. Harper, do you think that you could satisfy him that he is in error? I could not satisfy him, as I have not the books; I have gone only by what I know has really passed through.

907. Can you say if freight on the river has for any considerable period been as low as 12s. 6d. a ton? Never that I know of.

908. What is the lowest freight that you have charged from Brewarrina? £1.

909. What is it at the present time? Twenty-five shillings, delivered on the trucks.

910. That includes cartage I suppose? Yes; storage and everything else.

911. What is the lowest charge for carriage by road? We have got wool away at £1 and 22s. 6d. At that time we had a contract on and had to take it away.

912. Do you know the quantity of tonnage by river or by road that would be influenced by Rich & Co., at Bourke—that is, tonnage that they could control, so that in the event of the proposed railway being constructed that tonnage would still go by river? I cannot answer that question.

913. You have no information on that point? No, I have not.

914. What is the cost of obtaining goods from Sydney *via* South Australia? I do not know.

915. You do not know what the difference is between the cost of trainage direct from Sydney to Bourke, and the cost of obtaining goods by sea, rail, and I suppose team or river, to Brewarrina? I am not in a position to say.

916. Do you know the river freights below Bourke? Without fully estimating them I could not give you an accurate answer to that question.

917. I suppose that your knowledge is confined to the traffic between Bourke and Brewarrina, and as far as Collarendabri? Yes.

918. Do you know anything of the traffic of the districts shown on the map before you that would be served by railways from Narrabri to Pilliga, going on to Walgett, and from Warren to Coonamble, and from Woolabra to Collarendabri? No. I do not know exactly where those lines come in.

919. There is a red line on the map showing the proposed railway from a point between Narrabri and Moree, passing along the north bank of the Namoi, and coming out between the Barwon and Angledool;—assuming a line to be constructed as there indicated, would that affect any of the traffic which, according to the estimate which you have given us to-day, would reach the Byrock-Brewarrina railway? I think it would affect it a little.

920. Would that railway serve any portion of the area indicated by Mr. Sawers' map better than the Brewarrina-Byrock railway would, having regard to the fact that the distance to Sydney *via* the first-named line would be 50 miles shorter, so far as railway carriage is concerned? I think that most of the traffic would come to Brewarrina, the people there having all the necessary facilities for coming this way, whereas they have no facilities for going the other way. Even if a line were constructed to that point it would be difficult for them to get there at any time. The Narran overflows its banks, and goes out for miles. The other day it was all over the country, and people had to shift all their stock on to the red soil.

921. Could facilities be provided, the absence of which, you think, would be an obstacle to them at the present time in going that way? They could, at great cost.

922. You think that the estimate of traffic for the proposed railway from Byrock to Brewarrina would not be affected by the construction of the line I have indicated? That is my opinion.

923. What effect would the construction of a railway from Warren to Coonamble have on the estimate of traffic by this route? None at all.

924. Would the proposed line from Narrabri to Pilliga, if extended to Walgett, affect the estimate of traffic for the proposed line from Byrock to Brewarrina? Not to any great extent.

925. From your own personal balance-sheet, can you tell the earnings of the steamers between Bourke and Walgett? All I can show you is a copy of a ledger showing the exact debits and credits to the earnings of the boat.

926. Do you feel at liberty to give that information without consulting your principals? It is my own private affair, and I do not think I need consult them.

927. Are you willing to give that information? Certainly.

928. Will you be good enough to state what the earnings of the steamers have been for any one year? I can produce the balance-sheet and papers from August, 1890, to October, 1891, showing the gross earnings to have been £4,443 17s. 6d., by my own steamer, between Bourke and Walgett, up and down.

929. Is that the steamer "Cato"? Yes.

930. That steamer was owned by yourself? Yes.

931. And you say that your earnings by one boat were £4,443 17s. 6d.? Yes.

932. At that time was your steamer running in opposition to the steamer of Rich & Co.? No.

933. Had you the whole of the traffic of the river? No.

934. Was there any competition at the time? Yes.

935. What other boats were running? The "Pilot," "Elfie," "Mundoo," "Sadler," and another boat.

936. Did the other boats receive a fair share of the traffic? I think, I received the bulk of it.

A. D.
Kerrigan.
17 Mar., 1898.

937. What proportion of the traffic did you receive? Every time the boat came down I could get a load for it.
938. Comparing the traffic obtained by you with the total traffic of the river, about what proportion did you get? I should say that I got a good half.
939. So that the probable earnings of the whole of the steamers during the whole of that year were about £8,000? I think that would be very nearly correct.
940. Why did you discontinue running your steamer—I suppose it was profitable? Yes; it was profitable.
941. Can you say why you discontinued running it? We formed the concern into a company.
942. What company? G. White & Co.
943. Did G. White & Co. continue to run the boats after the company was formed? Yes.
944. I suppose you have kept in touch with the traffic generally? I am still in the firm.
945. Well, let us have the benefit of your experience as to the river traffic after you formed the company? As far as I can remember, the first year it paid very well, but since then they have been purchasing more boats, and the result is that we have found ourselves behind in bad years. The river has been so uncertain, it was bad in 1894, 1895, 1896, and 1897, and the wool traffic has been only a quarter or half of what it would be, if the river had permanent water in it. If a substantial rise in the river took place and let us run for a couple of months at the right time we would do very well.
946. Are you still connected with the same firm? Yes.
947. I thought you said you were connected with Rich & Co.? They say they own the boats, but I do not think they do.
948. The boats running on the Barwon are owned by G. White & Co.? Yes.
949. Not by Rich & Co.? No.
950. Are Rich & Co. interested in the boats? They have shares.
951. Are there any boats running in competition with you? Yes.
952. Running in competition with White & Co.? Yes.
953. Has the traffic increased or has it diminished since 1891? It has not diminished.
954. Can you say if it has increased? I think it has.
955. Substantially? It would increase substantially if we could always make sure of shipping peoples' wool here.
956. Does the company pay any dividends? I am sorry to say that we have not had a dividend for some time past.
957. May we infer from that, that it would not be possible to carry the traffic on the river profitably at as low freights as are at present quoted? According to the rivers and seasons we have had the last three years, it would be impossible.
958. Taking the result of your experience since 1890, do you think it would be possible to declare dividends or run the steamers at a profit if you were to carry wool at less than 20s. a ton? I do not think so.
959. So if you were to attempt to carry wool at 12s. 6d. or 12s. a ton you must incur a very heavy loss? From my experience, I should say so. If they started doing that I should sell my shares out quickly.
960. Do you think that if the proposed railway from Byrock to Brewarrina were constructed, it would be likely to depreciate the value of your shares? Not at all; I think it would increase their value.
961. Will you explain in what way;—supposing that that railway is to get all the traffic, how will it increase the value of your shares? For the simple reason that we will go up-stream into other portions of the river—out Mungindi and other ways—and have a large place here in which to put the wool, and bring it here by water.
962. That is to say, your steamers could be profitably worked between Brewarrina and places farther up? Yes.
963. Making Brewarrina your depôt instead of Bourke? That is it.
- 964-5. I suppose that you would not regard the earnings of the Byrock-Brewarrina line as at all prejudicially affecting the Bourke line, inasmuch as at the present time the through rate to Byrock from Sydney is the same as to Bourke? Yes. And as there are practically no earnings between Byrock and Bourke, the earnings between Brewarrina and Byrock would be a substantial addition to the railway revenue.
966. *Mr. Fegan.*] Do you know of any time when the freight was down to 12s. 6d. a ton? No.
967. How long have you been connected with the steamer company? I think it was in 1893 or 1894 that we formed the company.
968. Therefore, you would have a very good idea if the freight went down as low as 12s. 6d.? Yes, I would have a good idea.
969. In your evidence you said that it would be impossible to carry goods profitably for less than £1 a ton? I do not think it would pay.
970. You said you would sell your shares if such a thing happened? Yes, I would.
971. That shows you think that it would be very unprofitable—very bad speculation—to carry wool for less than £1 a ton? Yes.
972. I suppose you have seen the evidence where a gentleman representing Rich & Co. said that they had carried it for 12s. 6d.? I have.
973. Do you think he made a mistake? I think he must have. He may have meant 22s. 6d.
974. You think that is what he meant? I think so.
975. And that it was a clerical error;—it ought to have been 22s. 6d. instead of 12s. 6d.? I have never known it 12s. 6d.
976. And I suppose that you have been dealing with the produce just as much as Mr. Shainwald has? Yes.
977. I suppose that goods could be carried by team without your knowing the quantity? Yes.
978. How have you arrived at the estimate of the goods carried by team? I have an idea of how many teams come in and how much stuff we get in ourselves, and, multiplying one by the other, you get a fair idea.
979. What is the next place for loading wool above Brewarrina up the river towards Walgett? Walgett.
980. What is the freight from Walgett to Bourke? £2 10s.

981. Does that include transshipment at Brewarrina? Yes.
982. How much do you put down for that? Ten shillings a ton.
983. Much handling of wool and produce deteriorates their value, does it not? Certainly. They are handled a good deal, but they are carefully handled by us.
984. If you load 4 or 5 miles up the river you have to pay 10s. a ton for re-handling? Yes.
985. That makes it more expensive for the producers? That is the difficulty now, in getting wool to come this way.

A. D.
Kerrigan.

17 Mar., 1898.

FRIDAY, 18 MARCH, 1898.

[The Sectional Committee met at the School of Arts, Brewarrina, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Byrock to Brewarrina.

Blakeney Broughton, Inspector of Stock, Brewarrina, sworn, and examined:—

986. *Chairman.*] What is your position in the Public Service? Inspector of Stock for the district of B. Broughton, Brewarrina.
987. Have you brought with you a statement showing the extent of the area within the red lines marked upon a map known as Mr. Sawers' map, and also the number of stock within that area? I have brought a book showing the number of stock in that area approximately.
988. How many acres are comprised in that area? 3,490,660.
989. Will you give us a general idea of the description of the country and its carrying capabilities? It is first-class pastoral country.
990. The whole of it or the greater portion of it? The whole of it. Well, there is a very small area of country that is not rung which would be good if it were rung—west of the Culgoa—but that is a very small area compared with the whole area, nearly the whole of which is first-class pastoral country.
991. Well-watered? Well-watered by the rivers Culgoa, Narran, Birie, Bokhara, and the Barwon, the Marra Creek, the Bogan River, and the Womerawah and Tarrion Creeks.
992. In addition to that have the pastoral lessees provided tanks where necessary? Yes, tanks wherever necessary—well improved.
993. How many sheep are there according to your return, say for three years, depastured in that area? About 1,250,000 would be the average for the three years.
994. How many years' returns have you? I have returns for 1895, 1896, and 1897.
995. Will you give them respectively? 1895: horses, 4,765; cattle, 16,164; sheep, 1,371,470. 1896: horses, 4,983; cattle, 9,265; sheep, 1,038,092. 1897: horses, 4,516; cattle, 7,979; sheep, 1,019,170.
996. Are your figures compiled from the owners' returns? Yes, from returns made on the 31st December each year according to law. Of course, the numbers are considerably less than they would be at shearing time, because all owners reduce their stock about that time of the year. If the returns were made in June or July—shearing time—there would be a difference, I should think, of quite 300,000, taking the district through.
997. Then we may take the average as being 1,500,000. Is that so? That would be about it.
998. Your district, I think, does not comprise the whole of the land shown on the plan known as Mr. Sawers' plan? No, it does not include the whole of that.
999. You have pointed out a small portion not comprised in your district and also a portion in your district not shown on that plan? Yes.
1000. What would be the difference between the number of sheep depastured upon those two portions? I should think about 50,000.
1001. Should that be deducted from the 1,500,000 or do you think that 1,500,000 would be a fair average? I think 1,500,000 would be a fair average.
1002. Is there any information which you could give which would be of service to the Committee, with regard to the travelling stock routes, for instance, and also with regard to the live stock leaving the district and the direction in which they travel? Crossing from Queensland into this district there were on the average each year about 500,000 sheep and 40,000 cattle during the last three years.
1003. Are the travelling stock routes through this district very important ones? Very important.
1004. As important as any other travelling-stock routes in the Colony? I think it is the best outlet for travelling-stock from Queensland, and very important.
1005. Can you say in what direction the 500,000 sheep and the 40,000 cattle would be distributed? That is Queensland stock alone that comes through. Of course, there is an enormous number of stock that come from the stations in the district.
1006. Well, take the Queensland stock first—at what point of the railway would they be trucked? A great part of them would be trucked here. Of course, a number of them are store stock.
1007. And would not be trucked? No. The owners travel them down in a good season.
1008. You are not now speaking of fat stock? Not that total number.
1009. In connection with the proposed railway, it may be better for you to specify about how many would be fat stock? 100,000 of the sheep would be fat and about 5,000 of the cattle.
1010. Where would the fat stock be trucked, assuming that there was a railway between Byrock and Brewarrina? They would be trucked at Brewarrina.
1011. The whole of them? Yes, certainly.
1012. That is dealing with Queensland stock; now take the stock from the district comprised within the red lines shown on the plan? About 250,000 would be, I suppose, the average number of fat sheep; and there would be very few cattle—hardly worth mentioning.
1013. Therefore, according to your estimate about 350,000 sheep and 5,000 cattle would probably be trucked at Brewarrina? Yes; 250,000 would be about the number of fat stock that would leave the district annually

B. Broughton. annually—I mean of the district stock—and they would be trucked here, I have no doubt, if they had the convenience.

18 Mar., 1898. 1014. In your opinion, a total of 350,000 sheep—that is, 100,000 from Queensland and 250,000 from the district—and 5,000 cattle would probably be trucked at Brewarrina? Yes.

1015. Can you tell me the number of holdings? The number of owners returning stock last year was 194.

1016. And for previous years? 225 for 1896, and 149 for 1895. Why the number was greater in 1896 was because a lot of teams were returned, but this year the owners have not returned them.

1017. The numbers you are giving us include the returns by carriers? Last year especially. The 225 includes a lot of carriers, but this year they have not returned.

1018. You cannot distinguish, I suppose, between stock owned by carriers, and those on the settled holdings of the district? I can give you the sheep owners for last year.

1019. If you can give the sheep owners that will be a better guide than if you include the carriers? 110 sheep owners.

1020. And the previous year? 104.

1021. And the year before that? Ninety-eight.

1022. So there has been an increase during the years 1896 and 1897? Yes. There are actually more owners than that, because in the case of running stock together, one man returns the lot—the stock are not divided.

1023. There are more owners now than there were four years ago? Yes, because they have divided the country into a lot of paddocks.

1024. Can you say from observation that there has been any increase in the area of land put under cultivation in your district? A slight increase, but only for growing bush hay.

1025. For station use? Yes; wheat and oaten hay for station use.

1026. Has the increase in the number of sheep to which you have referred occurred in connection with the smaller or the larger holdings? Amongst the smaller owners.

Andrew David Kerrigan, manager, E. Rich & Co. (Ltd.), Brewarrina, sworn, and further examined:—

A. D. Kerrigan. 1027. *Chairman.*] You were asked yesterday to prepare a list giving the sheep-owners not included in the return furnished by Mr. Harper—have you prepared it? Yes.

18 Mar., 1898. 1028. Have you all the totals and the list before you? I have.

1029. Will you give the number of stations omitted by Mr. Harper, the number of sheep carried, and the estimated wool returns? I make 99 stations and small holdings left out by Mr. Harper, giving a total of about 10,500 bales—that would be about 1,600 tons.

1030. You heard the evidence given by Mr. Broughton, the stock inspector? Yes.

1031. You heard Mr. Broughton estimate the number of sheep within the area shown on the plan, on the 31st December of each of the years 1894, 1895, and 1896, giving an average of 1,250,000, and estimating that for the year through the average might be taken as being 1,500,000, as there are more sheep in the cool months of the year than at the end of December, when the returns are prepared;—do you agree with Mr. Broughton as to that, with your knowledge of the district? Yes; I think that that is about right.

1032. Assuming the average to be 1,500,000 sheep, how many bales of wool to the thousand sheep do you usually estimate? I generally estimate about fifteen bales to the thousand sheep.*

1033. For the whole of the area with which we have been dealing that would give about 22,500 bales? Yes.

1034. What is the total number of bales that you say would reach the proposed railway from Byrock to Brewarrina, according to the lists prepared by Mr. Jameson and yourself? About 30,000.

1035. There would be a discrepancy of some 8,000 or 9,000? Yes.

1036. Can you explain how the difference arises? Yes; there are Kinglebilla, Bundalear, Fernlee, Coomburah, Mulga Downs, and Toulby. Those places would average about 4,100 bales altogether. They do not come to Brewarrina at all now, with the exception, I think, that some wool from Kinglebilla came here last year. Some of the wool from those stations goes to the Queensland railways, and some of it sometimes goes to Bourke.

1037. Why do you think that that wool would reach the Byrock-Brewarrina railway? For the simple reason that the distance would be shorter. The owners would have to send their wool by road only 60, 70, or 80 miles instead of from 150 to 160 miles the other way.

1038. It would be more to the owners' advantage to send to Brewarrina than it is at the present time? Yes.

1039. What is the total number of bales? About 4,100.

1040. How many tons? About 600.

1041. You are still 4,000 or 5,000 bales short? Well, in the area that Mr. Broughton has given I do not think he includes places like Llanillo, Gingie, and others. They are out of Mr. Broughton's district altogether.

1042. Are they shown on the map to which reference has so frequently been made? They are not included within the red lines.

1043. Nor do they appear in the list furnished by Mr. Harper? Yes; they appear in Mr. Harper's list.

1044. But not in the list furnished by Mr. Jameson—is that so? I cannot say; but I should say that they were there.

1045. Then if we add those now we shall be estimating them twice? You see that Mr. Broughton has not calculated them at all in his sheep district, because they are not in his sheep district.

1046. Mr. Broughton's estimate is for the holdings within the red lines;—are these within the red lines? No, they are outside them; but the wool would go to the proposed railway.

1047. What additional number of bales and what weight might be expected from the stations that you have mentioned? About 6,000 bales, or 1,400 tons.

1048. That is your explanation of the apparent discrepancy between your estimate and the estimate of Mr. Broughton? Yes.

1049. What would be the weight approximately of 22,500 bales? 3,750 tons.

1050. That is estimating 6 bales to the ton? Yes.

1051.

NOTE (on revision):—I have no experience of what sheep cut, or what number of bales will cut per thousand. The difference between my estimate and that of Mr. Jameson arises through my only estimating 15 bales to the thousand, whereas those with more experience estimate 18 or 19 bales per thousand.

1051. Speaking from your own experience and knowledge, what do you think would be a fair allowance in estimating the average weight of the bales coming from this district? Between 3·1 and 3·2.
1052. How many bales to the ton would that be? About six.
1053. It has been estimated at $5\frac{1}{2}$ and $6\frac{2}{3}$;—what is your estimate? I generally give about 6, taking scoured wool and greasy wool together.
1054. So the wool from the area within the red lines shown on Mr. Sawers' map would, according to the returns just furnished by the Stock Inspector, give a total tonnage of from 3,500 to 3,700 tons—is that right? Yes.
1055. You observe that Mr. Harper's estimate is 3,400 tons? Yes.
1056. Well, inasmuch as Mr. Harper's attention has been directed always to the area embraced by those red lines his figures appear to be fairly accurate? Yes.
1057. Until this morning it has appeared from the local evidence that the anticipated tonnage might be fairly reckoned by adding about 5,000 tons to that? Yes.
1058. About 30,000 bales? Yes.
1059. And your explanation is that an additional 1,300 or 1,400 tons would come from stations outside the area to which attention has been directed up to the present time? Yes, that is my explanation.
1060. Therefore, Mr. Harper's estimate may be regarded as correct, and the difference in the estimated tonnage that would reach the proposed railway cannot be regarded as being likely to come from the area indicated by Mr. Sawers? I cannot say that.

A. D.
Kerrigan.
18 Mar., 1898.

William Nicholas Willis, Esq., M.P., sworn, and examined:—

1061. *Chairman.*] I daresay you desire to make a statement before we put questions to you on the subject of the proposed railway from Byrock to Brewarrina; perhaps you will generally describe your electorate and the important places embraced within it? This proposal has been before various Governments of the country for a considerable number of years. I have had the honor of introducing it in the Assembly on several occasions, and I have also received promises from various Governments that the matter would be considered and sent on to the Public Works Committee for consideration and report. In fact, I had the most distinct assurance from Mr. Bruce Smith, of the late Parkes Administration, that the matter was worthy of consideration. However, with all our efforts we have now arrived simply at the investigation stage. I think that there can be little doubt that this line would be a paying one if it were constructed on a proper basis. When I say "on a proper basis," I mean that the estimate of £2,500 a mile should be reduced by at least £700 or £800 a mile. I would respectfully suggest that the time has arrived when the Committee, of which you gentlemen are Members, should put its foot down on the very heavy expenditure that is proposed by the officials for these small and what we call light lines of railway to open up various centres of the country. Whilst admitting that in Queensland the railway is of smaller gauge, and certainly of not so much stability as our own railways, I would point out to you that the Queensland Government are putting down 3 or 4 miles of railway for the same cost as we are putting down 1 mile in this Colony. I would specially draw your attention to the Charleville-Cunnamulla line which the Queensland Government are now constructing. The people who live in that remote portion of Queensland were in a state of semi-bankruptcy. They could not get their products to markets, nor could they get flour, tea, and sugar out to various stations except at very prohibitive rates. Sir Hugh Nelson formed a plan to put that railway through that country, and he called a lot of the lessees—myself amongst the number—together, and asked them if they would be prepared to pay a little more taxation if that railway did not pay. We all agreed. We paid something like $\frac{1}{2}$ d. an acre for the land, and we agreed to be taxed another farthing if the railway did not pay, or, if it did not pay then, another $\frac{1}{2}$ d., so that we might get facilities for sending our products to market. That railway is now an object-lesson that your Committee and Parliament generally might well take into consideration. 120 miles of railway have been made there at a cost of a little over £600 a mile, which will answer all the purposes for which it is required. It is an extremely light line, which will open up a vast area of country that has been practically dead or lying dormant. What I most vehemently suggest is, that your Committee should insist on the Government officials reducing the cost of this line—together with other lines that you are about to investigate—by reducing the weight and the carrying capacity of the line, so that we may get a light line of railway—light in every sense—that would open up this country and give the people who have been struggling here for years to my own knowledge—I myself struggling amongst them for a great number of years—a chance of getting their stock away in times of drought, and of obtaining the good things grown about Bathurst and Orange in that more favoured climate—eatables that have been thrown away, so to speak, given to the pigs, such as good potatoes and pumpkins. We cannot get them here, because the rates hitherto have been prohibitive. We want a light line of railway that will bring those products to our doors, and give us them cheaply. With all respect to you and the Government, I ask are we not entitled to some consideration, seeing that every available acre of land for hundreds of miles around here is under occupation, and bringing in a very high rental indeed to the Crown. Within the last few years the rents have been increased something like 50, 60, or 70 per cent. in and about Brewarrina. This is called the pastoral garden of New South Wales, and where we used to get land for 1d. an acre we have now to pay 3d., $3\frac{1}{2}$ d., $3\frac{3}{4}$ d., and on some of the back creeks as high as 4d. an acre. We have been taxed up to the very hilt, and we have had no expenditure of public money in this part of the country—no consideration. Government after Government has just treated us as aliens, and has not given us that consideration which I hope and trust your presence amongst us now will ensure that we shall get. Another point to be discussed in regard to this railway is, will this line end at Brewarrina? I maintain that for the benefit of the railway, the benefit of the Government, the benefit of this town, and the benefit of the whole body of taxpayers, who will have to pay for the construction of this railway, this line should go on and ultimately touch the Queensland border at Goodooga. It would not only open up all the country between here and Goodooga—most magnificent pastoral land—but it would also tap Queensland at a place where the trade of millions of acres would be drawn into New South Wales. It would tap what is known as the great St. George Basin—the country lying between Goodooga and St. George, some 2,000,000 or 3,000,000 acres of which has been thrown open for smaller settlement in 20,000-acre blocks. It has been taken up in nearly every case by New South Wales people. I think that there is a gentleman in the room now who has some land over the border there, and if the proposed railway from Byrock to Brewarrina should ultimately

W. N. Willis,
Esq., M.P.
18 Mar., 1898.

W. N. Willis, Esq., M.P.
18 Mar., 1898.

ultimately be extended to the border, those people having all their business obligations and ties in this country, this railway will draw all the St. George Basin trade into New South Wales. That is a phase of the question I have put to some of the officials, and I think it has been favourably received.

1062. In putting that before the railway officials, did you take into consideration the Queensland export duty of £2 a ton on wool? Yes. But the time is not far distant when the Queensland Government will have to take that duty off, or it will be the duty of our Parliament to put a tax on the sheep coming into this country. It is an iniquitous thing that a man living on the border should be penalised in having to pay £2 per ton on his wool because he sends it to a New South Wales railway; but that tax may be abrogated, for the Queenslanders themselves do not believe in it, and do not like it; in fact, it has been so obnoxious to them that the Queensland Government have found it necessary to give this blood-money to the local bodies to defray the cost of making their roads. The Queensland Government will not touch it themselves. If this proposed railway were extended to Goodooga, it would then be almost at those people's door; it would be so near to them that they would be glad even to pay the export duty of £2 in order to be able to send their wool along this line. I do not know the distance from Goodooga to St. George; but I know that the distance from Goodooga to Mitchell or Roma is about 350 miles. Our railway would, so to speak, be nearly at the door of that great basin of country of which I have spoken, and to go away from our railway in order to get on to one of their own railways those Queenslanders would have to go 350 miles, to get a connection with the Queensland Western line. Therefore, we would get the whole or nearly the whole of the traffic from St. George by having our railway at Goodooga.

1063. Will not the Queensland railway system approach very nearly to our border when the present Queensland railway policy is put into force? No. It might approach a little closer when the Cunnamulla line is constructed; but those people would have a great objection to go 200 miles north when they wanted to go south.

1064. The Cunnamulla line would be 200 miles north of Goodooga? Yes, and if they should want to go south they would have a very great objection to go 200 miles north to get to Sydney. The Cunnamulla line, if constructed, would have interfered with the proposed line from Barrington to Bourke which was thrown out. The Cunnamulla line would bring the Queensland railway system to within about 90 or 100 miles of that portion of the border near Barrington, therefore, if we had constructed the proposed line from Bourke to Barrington, our and the Queensland railways would have been within 100 miles of each other, and the Barrington line would have had no chance of paying, whereas this proposed railway which I suggest should go on to Goodooga, would tap what you may call the unexplored country—a country that has no railway facilities whatever. The people there have been struggling, as we have all been struggling here, to get railway communication; but there has been so much opposition and contention that if we go on to Goodooga with this railway, I am sure that many years will elapse before the Queensland Government attempts to compete with us. Another thing I would like to point out is that in connection with this proposed line to Brewarrina, we are opposed not by people who have any just claim to oppose us, but by people who are absolutely selfish in the matter, and whose interest it is to keep us in the back ground; but I think that there is a spirit of fair play in this country which will not allow others, who are absolutely interested, as the people of Bourke are, to make us a suburb of Bourke. I do not think that you will allow their influence to prevail. When the people of Bourke were trying to get their line of railway, we all put our shoulders to the wheel to help them; but now that we are struggling to get a light line here, we are simply told that we are to be a suburb of Bourke, and that Walgett is to be ditto.

1065. There is nothing before the Standing Committee that would indicate that the people of Bourke are in any way opposing this line? Well, the whole tendency of the evidence given by Mr. Harper, and by the other Government officials, is in that direction—that Bourke is to be the depôt, that the people of Bourke have their line, and that if we want to use a railway we must go to that line. I think you will admit that the whole of the evidence is in that direction.

1066. *Mr. O'Connor.*] Do you not think that it is a fortunate thing that Mr. Harper is not the highest authority on this subject, and has not the power of deciding this matter? I think it is a blessing that we have someone to overlook his statements.

1067. *Chairman.*] Our position is this: we have been appointed by the General Committee to inquire into the probability of the proposed line paying; one of the functions of the Committee is to ascertain whether the traffic on the proposed line will be sufficient to cover the working expenses, and also within a reasonable time, at any rate, pay interest on the cost of construction; therefore this is what you may call a complete inquiry into the prospects of the proposed line? Exactly so. I have broken new ground in order to show how additional revenue might be obtained if the proposed line were the first section of a railway to the border—if there were a proposition not to leave the terminus of the line here but to extend the line ultimately—perhaps in the course of some years—to the Queensland border.

1068. Clause 12 of the Principal Act provides:—

Where such work purports to be of a reproductive or revenue-producing character, the Committee shall have regard to the amount of revenue which such work may reasonably be expected to produce, and to the present and prospective value of such work

? The estimated cost of the proposed line should be reduced—the Committee, in my opinion, would do a public duty if they were to insist on the estimated cost being reduced—and if it were reduced to what it ought to be, viz., £1,500 or £1,600 a mile—double the amount which is expended in Queensland in railway construction, I have no hesitation in saying that this proposed railway would pay well, and confer a great boon on the public—in fact so convinced was I that the proposed railway, if properly constructed, would pay that I at one time had everything in preparation to get a private Bill passed into law to permit of the railway being built by private individuals. It was at that juncture that I obtained a promise from the Government that they would go on with it. Between Brewarrina and Byrock there are tens of thousands of acres of rich flats that would grow wheat. I expect you have had abundant evidence of that. Some time ago we saw a paragraph in the *Sydney Morning Herald* expressing astonishment that such splendid wheat had been grown near Bourke; but as a matter of fact that which was shown in the lobbies of the Assembly had been grown on Mr. Barton's holding, some 8 or 9 miles from this proposed railway. I myself have grown wheat on the Tarrion, and have cut for hay, and I have got from 13 cwt. to 2 tons to the acre. I have grown potatoes, onions, maize, pumpkins, and fruits. If you have your land properly cultivated any seed that you like to put into earth here, if you attend to it, and give it the necessary water, will grow well. But all those flats between Byrock and the Bogan, also those rich flats between the Bogan and the Tarrion, will

grow

grow wheat—the rainfall is sufficient to insure an abundant crop of wheat. The people, however, cannot go into that cultivation unless they have a railway.

1069. *Mr. Fegan.*] We have evidence that that land will grow 12 tons to the acre? I do not know anything about that, but I know that I grew from 13 cwt. to 2 tons to the acre. I remember the time when if anyone had said that wheat could be grown at Nyngan, Nevertire, and Narromine, he would have been apprehended for a lunatic; but now there are thousands of acres of wheat-land there. Mr. Mack has 1,800 or 1,900 acres under wheat there, and that land is similar to this. I do not say that the black clay land—that is land that becomes solid under the influence of the sun—will grow wheat except in a very favourable season; but the red loamy land between here and Byrock will every acre of it grow wheat in abundance, exactly the same as Narromine, or Trangie, or Nyngan. It is the same class of country, and has the same rainfall, and a few years ago it was despised the same as the land here is now. I remember the time when land in the Dubbo district was put up by auction at $\frac{1}{3}$ d., and tens of thousands of acres of it could not find an occupier; but Mr. Mack, with that energy which we all know he possesses, went into the matter, and he now has 1,800 or 1,900 acres under wheat, and it is paying him well. So would all the flats pay well between here and Byrock. You do not require any further evidence on that point than that given by Mr. O'Dwyer and Mr. Barton. Mr. Barton is not a Brewarrina man—his sympathies are not with us—he is a Bourke man, but he grows wheat in this district, and he took some down to the House, and everybody marvelled at it, and next day a paragraph appeared in the *Herald*, which no doubt you gentlemen saw, referring to the marvellous crop which, it was said, had been grown at Bourke, whereas it was grown some 8 or 9 miles off this proposed railway line.

W. N. Willis.
Esq., M.P.
18 Mar., 1898.

1070. *Mr. O'Connor.*] Do you think that this line would interfere with the Walgett line? No; it would not interfere in any way with it. This is a totally different district—it is differently supplied. The two lines would deal with altogether different portions of the country. Geographically speaking, the Walgett trade really belongs to the Northern Line. But up the river here as far as Boorooma, and also from here to Goodooga, and from there on the road to Barrigungum, all the trade belongs to the western railway system. The way to prove to you that it would do no harm is this: Whether the rate of carriage is high, or whether it is low, whether we have river carriage, or whether we have road carriage, no man is ever insane enough to send from here to Narrabri for flour, tea, or sugar, or stores of any sort, neither are the Walgett people insane enough to send to Byrock for their goods. The geographical positions of the two places are diametrically opposite to each other. The one place naturally belongs to the north, and the other to the west. They are both important centres; they are both valuable assets of the State. There are hundreds of thousands of acres of land that belong to the people, and if they be opened up and made more valuable by light lines of railway—not railways each costing as much as £2,500 a mile; then, if the railways do not pay, the Government can always tax the land by increasing the rental of the land so as to meet the expenses of those railways. The land is nearly all held under lease, and if the Government propose to build a railway to my door, and for the land I occupy I pay, say, for argument's sake, 1½d. per acre, and if they will do away with the road carriage, they are quite justified in saying, "This railway will not pay, and therefore we shall charge you 2d. per acre." Then I would simply say, "Give us the railway, and charge us 2d. an acre. We shall be glad to get it." These two railways would not be opposed to each other, because they would be in different districts, and be separate affairs altogether. This Brewarrina line would be a small branch of the Western railway, whereas the Walgett Line would be a branch of the Northern railway. The Walgett people trade northwards, and do all their business northwards, whereas we here trade and do all our business westwards.

1071. Have you considered the question of the locking of the river? I have, and at one time I was an advocate of the locking of the river. I became an advocate of it in the sense that a man will sometimes fly to drink to cure pain. I had been so long advocating the construction of a railway that in utter despair I rushed to the locking of the river, and I did advocate it very strongly talking to our present able Premier, but after mature consideration, and after further investigating the matter, and looking at the lock at Bourke, and watching the ravages that some of the floods made there, I came to the conclusion that the expenditure on the locking of the river would be money wasted, because there are so many rivulets and ana-branches. If you were to put a lock at Brewarrina, the first thing you would have to do would be to block up the mouth of the Cato, and directly you did that the vested rights and interests of the people on the Cato would come in. If you were to cut off the water from any man's block of land, and, so to speak, take away his means of living, he could obtain a certain amount of damages against you, unless an indemnifying bill were passed by Parliament, and I do not think that in this enlightened age such a bill would be passed. Then, in going on further, the supply of water to the Tarrion would have to be cut off; and all ana-branches supplying the settlers to the right and to the left have to be taken into consideration, and if you wanted to confine the water in one channel it would end in a fiasco, and the loss of hundreds and thousands of pounds to the people, though personally it would suit me very well; but I am not considering my personal interests just at present, and I do say that it would end in disaster, because all this black land when a flood comes over it becomes a sort of sugary substance, and after a flood you will find little rivulets in places where none existed before, and if you block up one channel, in a few years' time the water will form another for itself somewhere else. However, it is one of those serious undertakings which I do not think the country is prepared to go into at present. But there is some difference in locking the river between Bourke and Wilcannia, because the river there has deeper banks, and is more confined within its banks, and the channel is deeper. That is a matter which might receive consideration. I do not know much about it; but here I have watched the process very keenly, and I have found that what I say is a fact.

1072. *Chairman.*] You appear to be of opinion that much of the Queensland traffic would come into the Byrock-Brewarrina railway if that railway were extended in the direction of Goodooga, and that extension you would extremely advocate? Yes; I would.

1073. What would be the effect of a railway starting from a point between Narrabri and Moree carried along the north bank of the Namoi, and between Collarendabri and Walgett and extended to a point between Angledool and the Barwon? It would be a selfish line, which would cause a lot of irritation to Queensland, and do very little good to our own people. It would be a line that would be built at the bidding and the will of the Railway Commissioners; and I think that it will be a sorry day for New South Wales when we allow the Railway Commissioners to dictate the railway policy of this country.

1074. But, leaving that view of the question out of consideration for the present, what effect would that line

W. N. Willis, line have on the earnings of the line suggested by you to be constructed from Brewarrina to Goodooga, as an extension of the proposed line from Byrock to Brewarrina? If the line that I suggest should go from Brewarrina to Goodooga were built, it would certainly obtain the whole of the Queensland trade that I have mentioned.

Esq., M.P.
18 Mar., 1898.

1075. I want to know what effect the construction of a line from the Narrabri-Moree line to a point between Angledool and the Barwon would have on the earnings of the proposed line suggested by you from Brewarrina to Goodooga? It would simply take the place of the line from Brewarrina to Goodooga.

1076. What effect would it have on a line between Byrock and Brewarrina, assuming that Brewarrina would be the terminus? It would certainly be detrimental to the extent that it would curtail our trade, and would only allow us to trade to or about the border, whereas if we were left alone, and an opposition line were not run we would get the whole of that Queensland Basin trade.

1077. Would it in your opinion interfere with the traffic that would reach the Byrock-Brewarrina railway between Brewarrina and the border? No; certainly not.

1078. It is represented to the Committee that the whole of the area between those red lines on Mr. Sawers' map would be served by a railway from Byrock to Brewarrina; do you think that any of the traffic from that area would be diverted in the event of a railway being constructed from the Narrabri-Moree line and extending in the direction I have mentioned, viz., to a point between Angledool and the Barwon? Most certainly if that line were constructed it would interfere with the traffic of this line, but not very much. That suggested line certainly would not take the Queensland traffic that I hope to see come in from Goodooga to Brewarrina. It would take a lot of trade about Comborah Springs, Grawan, Angledool, and Narran Lakes, and of course all the intermediate trade. It might also take the Narran and Booroma trade, but if that suggested line were constructed instead of a line going to Collarendabri and Angledool, I may say that as against what Brewarrina would lose through that line going near Comborah Springs we would certainly gain a good deal of the Queensland traffic that would not go into that line.

1079. *Mr. O'Connor.*] And in view of the federation of the colonies we may say that the Queensland export duty of £2 a ton would disappear? Yes, I think so, because I think that Queensland would come into the federation.

1080. *Chairman.*] If you will look at the map of the Colony you will see that at the present time there are under the consideration of the Parliamentary Standing Committee on Public Works proposals for the construction of railways from Warren to Coonamble, from Narrabri to Pilliga, with possibly an extension to Walgett, and from Woolabra to Collarendabri,—would any of those railways, if constructed, affect the traffic which it is estimated would come to the Byrock-Brewarrina railway? I have no hesitation in affirming that they would not, if constructed to-morrow, affect one penny of the traffic from the area indicated by the "red lines" on Mr. Sawers' map. On the other hand, I think that that area ought to have a big addition made to it.

1081. Touching your statement as to the cost of the proposed railway, have you seen the details of the estimated cost of £2,500 a mile? No; I just saw that it was £2,500. However, I have the details now before me.

1082. Can you suggest in what direction the cost of the proposed railway could be reduced, because no doubt it is extremely important that this line, if constructed at all, should be a cheap line, having regard to the nature of the traffic and the fact that the heaviest portion of it will be for a short period of a year only? I know very little about the construction of these railways, I say at once, but on broad general principles I assert that the officers should be made to reduce the cost of the lines by using lighter material in their construction. They should call for tenders in this instance for a railway from Byrock to Brewarrina to cost, say, from £1,500 to £1,600 a mile. Not being an engineer, and knowing very little about railways, I cannot say how these amounts in the estimate for this line should be reduced; it would be simply casting ridicule on my evidence for me to do that. But there are some amounts here that seem to me to be outrageously high, for instance, station works £5,105 10s., and station buildings 5£,365, making for those two items about £10,500. Let us have small stations or platforms—something cheap. We do not want palaces.

1083. I suppose you are aware that the cheapest railways that have been constructed up to the present time, in districts which lent themselves more readily than this district will to very cheap railway construction, we have not been able to make for less than £2,000 a mile? My reply is that it is a calamity. Of course the officers will stick to each other from what I see of them; but I think that that is a calamity. I think that now is the time for the Committee to speak out, and to close their able labours by demanding that something shall be done to give the people really light lines of railway. The people and the press of the country are in favour of such lines, but the officials are against them.

1084. All the branch lines have been of cheaper construction than the trunk lines, and ballast has been dispensed with wherever it was possible to dispense with it, and regarding this proposed railway as a branch line the Departmental evidence fixes the average cost at about £2,500 a mile; but if it could be shown that the line could be constructed for £1,500 or £1,600 a mile, that might make a very considerable difference in the view the Committee may take of it? I will undertake to go into the matter, and get some evidence, and to address a letter to you, giving my views on the subject.

1085. Could you place that evidence before the general Committee in Sydney? Yes, with pleasure. There is another item—freight, £11,885; I do not know why the officials charge us with that amount for carriage.

1086. The Construction Department has to pay the Running Department? That is only "robbing Peter to pay Paul."

1087. But in the returns of the Railway Commissioners giving 3½ per cent. on the total cost of construction, these figures are estimated as part of the earnings? They had all this fight over the railway to Cobar, but that line is paying, and I think paying pretty well. It is a marvel to me that a line constructed so expensively should pay.

1088. That, in a great measure, is attributable to the activity of the copper-mine? Yes, and the gold mines.

1089. Is there anything else you would like to place before the Sectional Committee? I understand that Mr. Harper has said—I have only been told this; I have not seen the evidence—that the river freight is 12s. a ton.

W. N. Willis,
Esq., M.P.
18 Mar., 1898.

1090. No, that is not the case; it is in evidence that the freight has been as low as 12s. 6d. a ton, but that is the evidence of one witness only, whereas the evidence of many witnesses, I think, confirms the evidence received in Sydney that the minimum charge for freight is about 20s., and the actual cost about 22s. 6d., including the land cartage? I have been here for some years, and I never knew it to be 12s. 6d. I think that the lowest which I ever paid or knew to be paid was 17s. 6d., but we have more times paid 22s. 6d., 25s., 30s., 35s., and even up to £2 when the steamers got into the hands of a "ring." It was 17s. 6d. only when steamers were cutting each other. For road carriage I always pay 25s. to Byrock from my place on the Tarrion, and that is little enough for the work which the unfortunate men have to do.

1091. Some evidence has been given this morning as to the number of bales to a ton and the average number of fleeces to a bale;—can you say from your own experience about how many fleeces go to the bale, and how many bales to the ton? I should say an average of seventy-five fleeces to the bale, which ought to average five and a half bales to the ton.

1092. Have you heard Mr. Kerrigan's estimate of about fifteen bales to 1,000 sheep? Mr. Kerrigan is a better judge than I am, for he has had more handling of wool; he has handled thousands of bales, whereas I have handled only the wool off my own sheep, and sometimes I have very good sheep, and at other times very bad. Sometimes you have a drought, and are overstocked, and that would reduce the amount of wool, but right through I think my sheep cut about fourteen bales to the 1,000, greasy wool, and about eleven and a half to twelve scoured.

1093. Then you would be disposed to accept Mr. Kerrigan's estimate of fifteen bales to the 1,000 sheep as a very fair estimate? I think so.

1094. Have you had any experience in the training of live stock from this district? I send my fat stock through to Byrock, and there is a good deal of fat stock that goes from this country, but ten times the amount would go were it not for the track between here and Byrock. No matter how prime your stock may be when they come off these beautiful, sweet plains here—no matter how prime the fat stock may be when they start—if they have to go over the hard country with kangaroo grass, and occasionally a bit of mulga, and have to lie in camp all night without water—for there is only one watering-place between Byrock and Brewarrina—they waste; and by the time they get to Byrock they have depreciated in value to the amount of nearly 1s. a head. These are all salt-bush plains, with edible scrub and blue grass and Mitchell grass, and when they come off that sort of plum pudding, and you put them on to hard, stale bread, so to speak, in going across to Byrock, they will not eat it. They sulk and waste. They do not like the water at the Byrock tank, at the other end of the town, because refuse from the town goes into it, and they will not drink it. They go sulkily into the trucks, and when they reach Homebush they are more like hunted devils than sheep. That would be all obviated if we had a railway from Brewarrina to Byrock. People now say, "What is the use of sending these wethers to Homebush? I will sell them on the station." They are sold on the station, and afterwards they are driven to Riverstone, perhaps in a mob of 10,000, and the railway is done out of the freight. A butcher buys 2,000 here, 1,500 there, and 1,800 somewhere else, and he simply drives them away, and the railway is done out of the freight, and the country loses so much.

1095. Mr. Harper, basing his estimate on the actual figures supplied by the station-masters at Byrock and Bourke, has ascertained that the average number sent by rail from those stations is 500 trucks a year, and he has in his estimate given credit for 1,000 trucks to the possible earnings of the proposed railway;—are you of opinion that Mr. Harper's estimate is a fairly liberal one? I think that the number is very much understated. I have no hesitation in saying that; but if it were liberal and correct, which I doubt, I say that it does not touch the case at all, for the reasons I have already advanced. People will not run their neck into ruin, so to speak, by sending their stock over here to face that dry track.

1096. I am afraid you did not catch the drift of what I asked you;—Mr. Harper says that at the present time the traffic in fat stock may be taken as averaging 500 trucks a year, and in his estimate of the earnings of the proposed railway from Byrock to Brewarrina he has given credit for 1,000 trucks, and I ask you do you think that would be a sufficiently liberal estimate in the event of the proposed railway being constructed? No, I do not.

1097. What are your reasons for differing from Mr. Harper? I think there is a good deal more fat stock trucked. I think that I can show by my own books that I sent over 100 trucks myself last year, and I am only a small selector compared with the big stations. Of course, if Mr. Harper has the figures, I cannot say they are incorrect. He ought to know; but I would beg of the Committee to call for a return of all the stock trucked at Byrock and Bourke, and of the names of the people who sent them. Then you could come to a proper understanding as to what should go to the credit or the debit of the place; but even that does not touch the question, which is: if this railway were constructed would that traffic increase. I say most unhesitatingly that it would increase tenfold if the proposed railway were constructed, because we would be able to take the stock off the plains and put them into trucks without delay, and we would be able to compete with Bathurst or any part of the country where the people have plenty of lucerne. Butchers would be able to obtain sheep fat and unwasted fresh off these plains, and if the sheep could be sent fresh off these plains into the market they would fetch from 1s. to 1s. 6d. a head more.

1098. We have the evidence of the Inspector of Stock that by the travelling stock routes through this district, and from the district within the boundaries shown on Mr. Sawers' map, altogether about 350,000 fat sheep are sent annually to market;—what proportion of that number do you think would reach the Byrock-Brewarrina railway? According to Mr. Sawers' map, I think that nine-tenths of that number would reach the railway, because people are only too glad to get railways and to pay high freights for their stock—for they are outrageously high—when they can simply pop them off the good soil into the trucks, and send them away fresh.

1099. Then, in your opinion, about 300,000 out of these 350,000 would be trucked at Brewarrina, or between Brewarrina and Bourke? I think so.

1100. About how many trucks of fat stock would that represent? 3,150 trucks.

1101. Therefore, on the assumption that a large proportion of the fat stock travelling through the district would reach the Byrock-Brewarrina line, you cannot regard Mr. Harper's estimate as being other than very much short of what the actual traffic would be? I say that it is very incorrect and very hostile. Another point is that the moment the proposed railway has been constructed—I can assure the Committee

W. N. Willis, Esq., M.P.
18 Mar., 1898.

and those who have to do with the railway—meat-works and a boiling-down will be established here, and all the traffic that would necessarily result from such an undertaking as that would be added to the railway. The skeleton of a prospectus has already been drawn up, and some of the largest holders about here are on the eve of combining together for the establishment of a meat-works and a boiling-down, so as to utilise their surplus stock in that way. That will bring a tremendous lot of the Queensland cattle here to be treated, for the road is much better from the Queensland Border to Brewarrina than from the Queensland Border to Bourke. If you go from the Queensland Border to Bourke you have to pass over sandhills, scrub lands, and barren waste lands, and you have to pay at every stage nearly what people consider a very high rate for water for your stock. In a great many instances the cattle especially will not drink the water out of the troughs, and there are all sorts of difficulties in getting to Bourke which would all be obviated if the stock came to Brewarrina, because they would come through good country, with creeks and ana-branches of the rivers, and have plenty of good water and grass all along. The stock roads this way are much better than they are the other way. There is the Barwon, the Cato, the Bokhara, the Birie, the Culgoa, and the Burban. All these watercourses intersect the land between the Queensland Border and Brewarrina, and they offer every facility along these stock routes for people to bring their stock to Brewarrina in good condition.

1102. Greater facilities than are offered by any other stock routes? Yes. This is really the highway to Queensland. All those bridges that have been made were made with the object of offering every possible facility to constitute this the highway to Queensland. Our geographical position proclaims us to be the central depôt in New South Wales for all the trade that comes from Queensland, and if the proposed railway be constructed meat-works will be established here, and also fellmongery and scouring works, the same as at Nyngan and Bourke, and that will help the railway very considerably. On behalf of my constituents I wish, in the most public way, to thank you gentlemen of the Committee for the very patient, very fair, and very proper hearing that you have given to the evidence adduced in connection with this proposed railway. We are all quite conscious of the fact that our case has been fairly and fully investigated, and whether we win or lose we are quite conscious that we have had a fair trial.

1103. *Mr. Fegan.*] In regard to the former part of your evidence in relation to a reduction of the estimated cost, you are still of the opinion that, even if you cannot persuade the officials to make a lower estimate, the proposed railway will pay even on the present estimate of £2,500 a mile? I am. I think it will pay working expenses, but not pay so well as it otherwise would. Every day the country is being opened up and put to better use. The small selectors are ringbarking and improving their holdings and growing more wool, and I have no hesitation in saying that the proposed railway would pay, but, of course, not nearly so well as it would pay if the cost were reduced, and I strongly advocate a reduction of the cost of construction not only as regards this line but as a matter of general policy. We have heard a great deal about these light lines of railway, but they are very much like certain bridges we have heard so much about—we never get them.

1104. I think that £2,500 a mile is a big come down from the former cost? Yes; but I think there is room yet to come down more, and I believe that with your forward policy you agree with me.

Colin Campbell Fraser, manager, Weilmoringle Station, near Brewarrina, sworn, and examined:—

C. C. Fraser. 1105. *Chairman.*] Are you a pastoralist? I am manager of Weilmoringle Station.

1106. How far from Brewarrina? 65 miles.

1107. In what direction? On the Culgoa.

1108. North of the Barwon? Yes.

1109. *Mr. O'Connor.*] Would you kindly, in your own way, tell the Committee your idea as to the expediency of constructing the proposed railway from Byrock to Brewarrina? I think it would benefit the district materially, produce greater settlement, enhance the value of property throughout the district, and be of great advantage to the Colony to have a railway from Byrock to Brewarrina. I have had twenty-two years' experience in the district, and I find the sheep to average from 7 lb. to 7½ lb. of greasy wool. I was manager of Milroy Station for seven years. That is one of the largest stations in the district. I was afterwards managing Gnomery Station, and I am now managing Weilmoringle, on the Culgoa. In times of drought I have found that the losses of stock have been tremendous through the want of means of exit, for thousands of stock would have been saved if there had been means of getting them out of the district. I have seen them perishing in tens of thousands, whereas, if there had been a railway in the district, they could have been taken away to where there was grass and water. When I was managing Milroy we had wool lying for eighteen months on the station, we not being able to get it away, there being no grass between here and Dubbo, where the terminus of the railway then was, and no river communication with Adelaide. Of course, the wool was depreciated in value though being pressed and lying in the shed for such a long time. I do not agree with the statement of the last witness as to the number of bales to the 1,000 sheep. I say there are about eighteen bales to the 1,000 sheep, that is 7½ lb. to the sheep. Allowing each bale to weigh 400 lb. on the average, that gives eighteen bales to the 1,000.

1110. Where do you send your fat stock and wool to at the present time? To Sydney, *via* Bourke. The distance from my station to Bourke is 110 miles.

1111. What do you pay a ton for the carriage of the wool? £4 to Bourke.

1112. And from Bourke to Sydney? About £4; about £8 a ton altogether from my station to Sydney.

1113. Supposing that there were a railway between Byrock and Brewarrina, what would it cost you to send your wool to Brewarrina? I think I could get the wool to Brewarrina for £2 10s. a ton. I may state that much of the country out back is by ringbarking being improved from 10-acre country to about 4-acre country, and, of course, all that back country in a few years will carry double the stock it does now.

1114. How many bales do you send? The last two years I have not sent many, because we had a big drought, and a lot of my sheep had to be sent to Queensland for grass, and they got home again only three months ago.

1115. What is the extent of your holding? 440,000 acres.

1116. How many sheep do you carry? Between 50,000 and 60,000 are on the station now, counting some I bought lately.

1117. Any cattle? Between 200 and 300.

1118. Is any portion of your land fit for agriculture? Yes. We irrigate with artesian water. We have about 50 acres under crop this year; we are putting it in now. Last year we had 40, and the year before that 33. In 1896 we grew 3 tons of wheat to the acre. The wheat stood up as high as my forehead, on the average, right through the field—that is about 6 feet high. It came to a splendid head, and the same thing occurred last November and December. C. C. Fraser.
18 Mar., 1898.
1119. How many bushels to the acre? We did not test it. We kept only a little for seed, just to sow the field again, and we cut the rest for feed. The crop last year was not quite so high, but it was a splendid crop of wheat. Almost everything grows on that soil. We tried this year amber cane, and cow peas, and maize, the same as the Pera bore. The maize is now standing in the field with splendid well-filled cobs.
1120. Do you grow any fruit? No, except just for the station.
1121. What was your wool clip last year? 400 bales.
1122. How many sheep did you shear altogether? 35,000. The run is only half stocked now.
1123. *Mr. Fegan.*] How are your runs watered? By the Culgoa, the Birie, the Burban, and by artesian wells No. 1 and No. 2 bores, Weilmoringle.
1124. That is in this Colony? Yes. One bore gives 1,700,000 gallons a day, where the irrigation farm is, and the other bore is giving something under 50,000 gallons a day. By the use of these bores we are utilising the back country not used before—the ringbarked country.
1125. You are sure of the figures you have given the Committee—that you shored 35,000 sheep last year, and you got 400 bales of wool? Yes, as near as I can remember.
1126. That is less than twelve? It was that year, but the clip was a very poor one.
1127. *Chairman.*] Do you not think that Mr. Kerrigan and Mr. Willis are more likely to be right than you are when they give an average of fifteen? I have had more experience than they have had.
1128. But you said the average would be eighteen, and it worked out less than twelve? Yes, that year; but other years nearer twenty.
1129. Do you know exactly the number you shored last year, and the exact number of bales? I have no information with me—no books.
1130. Upon reflection, do you feel disposed to reduce your estimate of eighteen bales per 1,000 for the whole district? Not under 7 lb. to the sheep. About 400 lb. is about the average to the bale, and that would be about $5\frac{1}{2}$ bales to the ton. The reason our clip was so small last year was that all the Borrara sheep lost their belly wool through its being torn off by the grass seed.

John Watson, Gnomery Station, Brewarrina, sworn, and examined:—

1131. *Mr. Fegan.*] What are you? Manager for Dalgety & Co., Gnomery Station. J. Watson.
18 Mar., 1898.
1132. How many miles from here? Seventy.
1133. In what direction? North from here—close to Goodooga.
1134. What is the area? 101,000 acres.
1135. What of? It is all leasehold, except about 1,000 acres.
1136. What is that? Freehold.
1137. When does the lease expire? It is in the Western Division, and it will expire in 1918.
1138. You have been in the Court all this week, have you not? Yes; off and on.
1139. How many sheep have you running on the 101,000 acres? Only about 30,000 sheep, and 1,000 head of cattle.
1140. How many sheep did you shear last year? We shored only about 22,000 or 23,000.
1141. What was the result? A fair clip of wool. We had, as near as I can remember, 350 bales of greasy wool.
1142. Have you taken the average of your clip during any term? Yes.
1143. What have you got? I consider that we get fully fifteen bales to the thousand of greasy wool, besides two and a half or three bales of scoured.
1144. Scoured wool is much lighter? Yes, of course.
1145. If not scoured, the wool would be about twenty bales to the thousand sheep? Yes; at any rate fully eighteen or nineteen.
1146. What is the largest number of sheep you have had on your holding? Up to 57,000.
1147. You have been managing it for a long time I suppose? Five years. I owned a place about 20 miles from here myself for eleven years.
1148. How is your land watered? By the Birie—it has a double frontage to the Birie—and by tanks.
1149. Have you ever tried sinking for water? No; we have plenty of water without it.
1150. If you have plenty of water, how is it that you run so few sheep? I have said that we have run up to 57,000. I think that is a fair average—2 acres to a sheep.
1151. But we have heard of some places where they run a sheep to the acre? We could do it now for a short time, but it would be risky. It is impossible to get sheep at present at fair prices.
1152. How far would you be from the proposed railway if it were constructed? The distance is 70 miles from our homestead to Brewarrina.
1153. Therefore Brewarrina would be the station you would load at? Most certainly.
1154. What is the average tonnage of the stores that you use in a year? About 10 tons.
1155. From where do you get them? From Rich & Co., of Bourke, either by team or by boat.
1156. You are satisfied with doing business with Rich & Co.? Yes; I have never done it with anybody else since I have been at Gnomery, except for small lines.
1157. What is your rainfall? Eighteen and a half inches on the average.
1158. How many inches did you have last year? Something like 11 or 12, but the rain fell at the wrong time.
1159. I suppose that your holding is used only for pastoral purposes? Yes.
1160. The company has never tried it for agriculture yet? No.
1161. Not only in this district, but also in other districts where they have large pastoral holdings? I have never tried agriculture at Gnomery.
1162. The company is satisfied with pastoral pursuits? Yes; the country is good enough for that—we make it pay well enough in good seasons.

- J. Watson.
18 Mar., 1898.
1163. Do you send your wool by road or by stream? Rich & Co. have contracted for the last two years to deliver it in Bourke.
1164. At what price? Last year I think £3, and the year before £4. The wool was mostly sent by teams. It was optional whether they took it by team or by stream. The contract was that they should remove our wool to Bourke for £3 a ton.
1165. In the event of the proposed railway from Byrock to Brewarrina being constructed, would that induce you to put more stock on? Most certainly it would. It would induce us to fatten more stock, because we should have a better chance of getting them away.
1166. How long does it take a mob of sheep or cattle to go down to Brewarrina from your place? About ten days.
1167. Is there plenty of grass on the way? There is always a very good track.
1168. Even in dry weather? Yes; we can always get a bit of grass along there, but from here to Byrock is the great drawback.
1169. There is no doubt that if there were a railway connecting Brewarrina with Byrock, Brewarrina would be the place to which you would come? Most undoubtedly.
1170. Therefore, from you we can look for a larger number of fat stock going to market than at the present time? Yes.
1171. Where do you send your fat stock to now? We sell them sometimes on the station. Two years ago we had 20,000 fat sheep, and three different people from Sydney came up to inspect them on the ground, and agreed to take them on the condition that we would deliver them at Byrock, but we found the road so bad from Brewarrina to Byrock that we would not take the risk, therefore we had to send them down ourselves. We sent two scrub-cutters with each mob. We had to get them off somehow, and we lost fully 2s. a head. We should have made 2s. more on each of those sheep if we had had a railway here.
1172. Owing to circumstances over which you had no control which prevented you from landing the sheep in fair condition at Byrock, and thus complying with the conditions, what was the loss to you? The loss was between 1s. 6d. and 2s. a head.
1173. That would be a great consideration? Yes.
1174. Then you could manage to pay 15s. 6d. a truck from Brewarrina to Byrock? Yes. Those sheep were approved of at 6s. 6d., and we did not get 5s. after all the expenses in Sydney were paid.
1175. Have you tried to grow hay on your land? No; we have never required it.

Richard Randolph Machattie, stock and station agent, Brewarrina, sworn, and examined:—

- R. R. Machattie.
18 Mar., 1898.
1176. *Chairman.*] How many years have you been in this district? I have been here since 1883, but I have been connected with the district altogether since 1862.
1177. I understand that you desire to make a statement in reference to the proposed railway from Byrock to Brewarrina? I do. I first of all desire to give evidence to prove that the area of country included in Mr. Sawers' plan is properly credited to the proposed railway. You have had evidence from Mr. Brown, of Brigalow, whose holding is on the extreme south-east corner of Mr. Sawers' plan, and he told you that he thought it was desirable that a railway should be constructed from Byrock to Brewarrina. Following the "red" line in a northerly direction, you had the evidence of Mr. Dickson, of Yarrawin, who spoke in favourable terms of the proposed line. Going from there a little more north, I have in my possession a letter from Mr. E. K. Mackenzie, the manager of Boorooma, in which he says that he is in favour of a railway from Byrock to Brewarrina, that he would send about 1,400 bales of wool and 10,000 fat sheep, and that his return goods are between 50 and 75 tons per annum; that he would be willing to pay 10s. per ton railway carriage for the certainty of having railway communication, and that he would regularly send his cast fat stock by the railway. Mr. Simpson, across the Narran, writes the same way. Then on the north-east corner of Mr. Sawers' plan there is Mr. W. R. Moore, who owns a place called "Mogala." I may mention, for the information of the Committee, that "Mogala" is between Goodooga and Angledool; and Mr. Moore distinctly says:—
- In replying to your circular *re* the Byrock and Brewarrina railway, I would state I send 300 bales annually to Sydney. My return goods amount to about 20 tons; 5,000 fats annually; would willingly pay 12s. 6d. additional freight per ton for railway; Brewarrina, with the railway, is a most suitable site for freezing and meat works.
- You have had the evidence of Mr. Bacon in Sydney, and just now you had the evidence of Mr. Colin Fraser, who manages "Weilmoringle," near the north-west corner of this area. You have in Mr. Harper's list Milroy Station, which is on the western boundary going south. Going due south, you have had Mr. Barton, of Salisbury, and you have had Mr. Huggins and Mr. O'Dwyer, and then on the extreme south-west corner you have had Mr. Lindsay. So I think I have clearly shown that the area which Mr. Sawers says belongs to Brewarrina has been proved by the evidence to belong to Brewarrina.
1178. Mr. Sawers' contention as to the area that would be served by the railway has not been challenged? In that area I may mention that there are actually 4,800,000 acres. That was the accepted area as given before you in Sydney.
1179. That is not consistent with the evidence to-day? That is the evidence given in Sydney. At all events, that is the area computed in the Survey Office, Sydney, for me. I paid the chief draftsman to have it computed for me.
1180. You heard the evidence of Mr. Broughton that the area was about $2\frac{1}{2}$ miles? But Mr. Broughton is the sheep inspector, and he distinctly went in for a sort of give-and-take. I can depend on my figures. They were computed by instruction of the chief draftsman in the Survey Office in Sydney, and they come to 4,800,000 acres as being in Mr. Sawers' area. I have taken the trouble to ascertain the capability of our district, which is 3 acres to a sheep, and by working that out carefully I find that it will carry 1,600,000 sheep.
1181. You agree with the Stock Inspector? I did not know that, but I have been told since I worked it out that he came very close to my statement.
1182. Mr. Broughton's evidence is that a fair average, taking several years, and estimating for the whole area, would be 1,500,000? I am glad he is so close to me. In making the computation I have reckoned 7 lb. per sheep, which I know of my own knowledge, from having been engaged here for ten years in pastoral pursuits, is a correct and honest estimate of the cutting capability of the sheep in this district. No man would dream of keeping an ordinary breeding ewe that did not cut 5 lb. of wool. Our ordinary hoggets

R. R.
Machattie.
18 Mar., 1898.

hoggets cut 9 lb. of wool, and wethers as high as 12 lb., and it is correct to say 18 lb. or even 19 lb. of greasy wool; but the skirts and also the bellies, on account of the long carriage, are generally hand-washed, or are sent to small scourers in the district, and I am competent to state that the loss in this district, taken on the average, is nearly 50 per cent., so it is perfectly clear that I am right when I state that there are 18 bales to 1,000 sheep.

1183. *Mr. Fegan.*] How do you mean a loss of 50 per cent.? The portions washed here are the bellies, the locks, and the bags, which are always full of dirt, urine, &c., and they are very heavy. There are, perhaps, as much as 6 cwt. of bags in a bale, but the ordinary reduction from 100 lb. for locks, bellies, &c., amounts to about 50 lb., so that makes my remarks correct. Putting the wool at 7 lb. per sheep, which I consider a low estimate. I find that my figures come to exactly 28,571 bales.

1184. Taking 7 lb. to the sheep, that would be 5,000 tons? Yes. Put it at 3 cwt. and 2 qr., and I vouch for the fact that my figures, 28,571, are perfectly accurate.

1185. That only gives something like 1,600 bales over Mr. Harper's estimate? I am not drawing any comparisons. I say that there are 28,571 bales. I want to let you clearly understand that this estimate is for the area within those red lines. I also want to point out that at Question 1231 and 1232 Mr. Harper said the total number of bales received at Byrock and Bourke was 27,702, and that those figures included wool from the Walgett district; but I want to add to my 28,000 bales 6,000 bales which came by steamer from the Walgett district, as per Mr. Jameson's return, and I wish also to add the Border wool that comes from Kinglebilla, Comburah, Mulga Downs, and Bundlear—altogether, 1,000 bales. I claim that, in addition to the 28,571 bales which we actually own, and which cannot be disputed in any possible way, we have the right to control 7,000 other bales, provided that the proposed railway be constructed. I would point out that Mr. Harper has never included the Boorooma clip in his returns for this district, but has given it to Walgett, and that that clip amounted to 1,400 bales. Adding the Boorooma clip of 1,400 bales to Mr. Harper's 27,000, that makes Mr. Harper's estimate equal to my own, but I want to plus that with 7,000 more bales. Therefore, I strongly assert that we have a right to say that, without in any way trespassing on the area of other railways, we should send 36,000 bales of wool by rail from Brewarrina. It is desirable that I should give you some information as to the passenger traffic. It has been a very difficult matter to arrive at an exact estimate, owing to the coaches in this district having changed hands, and also owing to the fact of the continual opposition here; but, after careful and honest consideration of the matter, I think I am justified in saying that it is a fair thing to reckon the coach traffic at thirty-five passengers per week. I, however, wish you to understand that that does not include the private traffic nor the swagmen, but only those who travel by public coach; and anyone cognisant with bush habits knows that more people travel by their own vehicles in this district than by coach—females especially do not get into coaches unless from absolute compulsion.

1186. *Chairman.*] Mr. Harper's estimate is 1,500 passengers;—what do you estimate them at? 1,820; that is the number of coach passengers alone; but I maintain that 500 people at least use their own private vehicles, and therefore that number should be added.

1187. *Mr. Fegan.*] How did you get your figures? In going about and consulting the various offices, and I am sure that I am well within bounds when I say 35 passengers per week go by coach. I say that the railway passenger traffic would be 2,820 per annum. As to the matter of fat stock, from the particulars given by Mr. Dickson, and also from those that I have in my own possession, I am safe in saying that over 300,000 fat stock are sent away from this district annually. I have made this up from returns that I have obtained from large pastoralists in the district, and on the average there would be ninety to the truck.

1188. *Chairman.*] Speaking from your experience as a sheep-owner, about what percentage of the total number of sheep do you say may be regarded as a fair average of fats? Some stations have not a fat sheep on them year after year, because they only breed sheep, whilst others fatten. The question is a hard one to answer. Some stations never send a fat sheep away. At the present time this district is not used so much as a fattening as a breeding district.

1189. You cannot answer that question? No; not directly in that way.

1190. 300,000 coming from this district, and not coming in from Queensland, would represent 20 per cent. of the total number of sheep in the district;—do you think that would be a fair estimate? I do not think it is too much to say.

1191. It seems rather a large estimate, taking into consideration the fact that many of the stations are breeding stations? It does; but places like Collmaroy never breed sheep, but buy and fatten them. It is a very poor sheep that does not cut 3s. 4d. clear, and that is about 6½ lb. at the general rate of sheep. That is proof that an ordinary clip is over 6 lb. I contend that the construction of the proposed railway from Byrock to Brewarrina will in no way interfere with, nor has it anything in common with any other proposed railways that are now before the Public Works Committee, so far as I can ascertain from this plan—I mean the area enclosed in the red lines. There is a proposal to construct a railway from Warren to Coonamble. Knowing every yard of that country, I can speak with a good deal of assurance in saying that there is no possibility of connecting Coonamble with Brewarrina. The nature of the country forbids that in every possible way. As to the construction of the proposed Narrabri-Pilliga railway—and supposing that it will go to Walgett—it is impossible for the Brewarrina people ever to go to Walgett to meet the railway. It is equally impossible for the Walgett people ever to come here to enjoy our railway. As far as the eastern boundary of Boorooma we can go at any time; but between there and Walgett the Moonee River comes in from Queensland, and there are enormous billabongs, and on the approach this side of Walgett there are 4 miles of water sometimes; therefore it is perfectly impracticable for the two places to be in any way associated. As to the proposed railway from Woolabra to Collarendabri, I have no doubt that that is a reasonable line; but let it be constructed to Angledool, and I emphatically say that not one soul out of this area would use it, provided that the proposed railway from Byrock to Brewarrina be constructed. If that railway were made I distinctly say that only from the immediate neighbourhood of Goodooga might a few people go to it. I have desired to show clearly that this line should be considered, and can stand entirely upon its own merits.

SATURDAY, 19 MARCH, 1898.

[The Sectional Committee met at the School of Arts, Brewarrina, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Byrock to Brewarrina.

Richard Randolph Machattie, stock and station agent, Brewarrina, sworn, and further examined:—

R. R.
Machattie,
19 Mar., 1898.

1192. *Mr. Fegan.*] You know the route which the proposed line would traverse? Yes.
1193. Do you know whether there is any private, freehold land along there;—in preparing your case, has the amount of severance or resumption that will have to be made, been taken into consideration? With the exception of a small holding at the back of Tarcoon, and G. Colless' conditional lease 537, there will be no necessity for any land resumption, I think, or perhaps the line may interfere with portion 5, parish of Morla, on the Bogan. I may mention that, the original surveyed line has 'all been reserved.
1194. You are a land valuer? I can hardly say that I am a land valuer, but I am a surveyor and engineer by profession.
1195. But you have given advice? I have.
1196. Can you give the Committee an approximate estimate of what the resumption in this case would cost? I think that, if the land-holders were returned what they paid the Crown for any land that might be resumed, they would be fairly remunerated, except in the case of Mr. Colless' where the portion would be severed.
1197. I suppose you know there is no proposition to fence the line? Yes. If the railway were to pass through any large property of mine, not destroying it but merely cutting off a portion, and leaving sufficient for a paddock, I should be only too pleased to give for nothing whatever land was required for the line.
1198. To give a full valuation, what do you think the resumption would cost approximately? I do not know what the Crown will take for the railway, but allowing $1\frac{1}{2}$ chain wide for it, that would necessitate the resumption of about 40 acres altogether, the greater portion being conditional leases. In the Tarcoon case, unless the line should go very close to the tank and interfere with it, I think that a very small amount of remuneration would be enough. As to Mr. Colless' property, some of his land being cut off, it would have to be fenced at any rate on one side and a tank put there; stock could not be continually taken over the railway line to and from the water, therefore, the part severed from the main portion would have to be fenced and water provided upon it. Judging from the character of the country immediately surrounding the Tarcoon block, I think that it might not be necessary to interfere with the Tarcoon block at all.
1199. Do you know Colless' land well? Yes.
1200. Can you give the Committee any idea what the cost in that case would be? Well, the land would have to be fenced on one side, and that would mean a $1\frac{1}{2}$ mile fencing, and a tank would be required for 120 acres. I think that £150 would be a fair thing for Mr. Colless to ask for—£50 for fencing, and £100 for a tank. Nothing less than a 2,000 yards tank would be of any use at all there, and the cost at 6d. per yard would be £100.
1201. So you think, taking all things into consideration, that £300 would pay for the severance, &c., in connection with the line? I think it would amply pay for it.

Wilfred John White, pastoralist, Tara Station, near Brewarrina, sworn, and examined:—

W. J. White,
19 Mar., 1898.

1202. *Mr. O'Connor.*] How far is your station from Brewarrina? Twenty-two miles.
1203. In what direction? About north.
1204. Between Brewarrina and Goodooga? Yes.
1205. What stock do you run? From 10,000 to 12,000 sheep.
1206. I believe that you desire to give some information with regard to your last clip and its weight? Yes. We shored 10,081 sheep, and they yielded 191 bales of wool.
1207. What weight? About an average of from $7\frac{1}{2}$ lb. to $7\frac{3}{4}$ lb.
1208. Of greasy wool? No; about 30 bales of it was scoured.
1209. About 12 per cent. of the wool was scoured? Yes, about that.
1210. How many bales to the 1,000 sheep? About nineteen; from eighteen to nineteen, I think, would be the average.
1211. For how many years? I have had the place three years, but have only taken two shearings.
1212. Was the first shearing equal to the other? No; we had between eighteen and eighteen and a half bales to the 1,000 sheep in the first shearing in 1896.
1213. That is including scoured and greasy? Yes.
1214. I think there is a difference in the railway rates for greasy and for scoured wool? Yes; a difference of £1 a ton.
1215. What do you pay for greasy? £4 per ton.
1216. And for scoured? £5 per ton.
1217. Is there any cultivation on your holding? None whatever.
1218. Where do you send your wool to at the present time? Byrock.
1219. What does it cost you for carriage to Byrock? £2 10s. per ton.
1220. By road the whole way? Yes.
1221. What does it cost you as far as Brewarrina? I have never had any taken by the boats.
1222. What does it cost you by road from your holding to Brewarrina? From 25s. to 30s. a ton.
1223. And the difference between Brewarrina and Byrock? Yes.
1224. It has never cost you less than £2 10s.? No, and it has cost me as high as £2 15s.
1225. Have you any difficulty in getting your wool to the railway station? Yes, when the roads are bad.
1226. What does the difficulty arise from principally? Heavy roads after rain, or in bad seasons the want of grass for the carriers.

1227.

1227. Do you get the rainfall here about the time you want to send your wool to the railway? Yes, during the spring and autumn as a rule. W. J. White.
1228. Has it frequently happened that you have been delayed in sending your wool to the railway station? We had last season and the second season considerable difficulty. 19 Mar., 1898.
1229. How long have you been in the district? Twelve years.
1230. You can say from your own experience that there has been difficulty in getting wool to the railway station by reason of heavy roads after rain? Yes, I can.
1231. *Mr. Fegan.*] What is the rainfall at your place? For the three years we have been there the rainfall has averaged 14 inches per annum.
1232. What was the average according to previous experience? More than that.
1233. What has it been the last two years? It averaged between 14 and 15 inches for the last two years; but taking the whole period for twelve years the average must have been between 17 and 18 inches.
1234. Where do you get your stores from? From Brewarrina partly, and partly from Sydney, and some from Bourke.
1235. How much stores do you get during the year? about 6 tons.
1236. How are your runs watered? By river and by tanks.
1237. Have you ever tried sinking wells for water? No.

Walter George Jameson, stock and station agent, Brewarrina, sworn, and further examined:—

1238. *Chairman.*] Do you wish to add something to your former evidence? Yes; about eighteen months ago Mr. Bacon, of Dumble Station, near Goodooga, wished to dispose of some of his sheep, and sent my firm particulars of the sheep, and at the same time, as a guide to any intending buyers, he sent samples of the wool and the different weights he had cut per sheep, so that any other sheepowners could ascertain what they were going to inspect; and I have here in his own handwriting a description of the number of pounds per sheep cut and samples of the wool. I was instructed that he had from 5,000 to 6,000 six-tooth wethers, which cut 9 lb. of wool per head, and about the same number of four-year-old wethers, which for 372 days' growth cut 9½ lb. He had also a small lot of six-year-old ewes, with 60 per cent. of lambs at foot, which cut 8½ lb. W. G. Jameson.
19 Mar., 1898.
1239. Did that comprise the whole of his sheep? No; only his surplus stock, which he wished to dispose of.
1240. That was the stock he had for sale? Yes.
1241. Can you from that estimate the average cut? I should say that the average cut would be fully up to that, because naturally he would not sell his best sheep.
1242. *Mr. Fegan.*] Would his sheep be only equal to the other sheep in the district? I should say that they would be a fair average of the station clips about here. He deals a good deal, and I think that that would be just an average clip. I also wish to state that whilst I was at Weilmoringle, as storekeeper, I personally weighed the whole of the clips for about three years. When I went there, in 1888, they had 82,000 sheep, which they worked up to 150,000 sheep; and when the resumed country was taken up they reduced the number to about 110,000; and during the years that I weighed the clips we used to average the quantity of wool cut per head, and it never came under 7 lb. per head.
1243. Taking the whole district through, would you call 7¼ lb. a fair average? It would be a very fair average.
1244. *Chairman.*] Would it be a full average? No; I think it would be a moderate estimate, for within the last few years the different boiling-down establishments have got rid of the old and inferior sheep, and the class of sheep in the district is improving very rapidly.

George White, Brewarrina, sworn, and examined:—

1245. *Chairman.*] Are you a steam-boat proprietor? I am not now, but I have been until lately; I am merely a master now on the river. G. White.
19 Mar., 1898.
1246. How long have you been in this district? Over twelve years on this end of the river.
1247. Before you became a member of the steam-boat company for which you are now master were you a steam-boat proprietor? I have been a steam-boat proprietor.
1248. How many boats were trading on the river before you joined the company? Two, between Wilcannia and Walgett.
1249. When did you join the company? In 1891.
1250. Were your boats taken over by the company? Yes.
1251. Since that time you have been in the employment of the company? Yes.
1252. And you have a full knowledge of the river traffic? A fair knowledge of it.
1253. How many boats at the present time are working on the river—the total number, including your company's? It would puzzle me to tell you; there are hundreds of them; there are several companies. Permewan, Wright, & Co. have nearly a dozen boats of their own, whilst Chaffey Brothers, and Keen and others have boats working on the Murray, Murrumbidgee, and Darling.
1254. I do not mean boats working on the Murray, but on the Darling, between Walgett and (say) Wilcannia? I think there would be about thirty steamers running exclusively on the Darling and the lower part of the Murray. The boats that we have running between Walgett and Wilcannia would not average more than four or five, but we run our boats right down to South Australia as well. There are a large number of boats between Walgett and Wilcannia. The general average would be four or five—sometimes more and sometimes less. Sometimes we send an extra boat lower down, and sometimes an extra one coming up is required.
1255. How many steamers have you running on the Darling, carrying to or from any point between Bourke and Walgett, or higher up the river? At the present time we are using three or four, but in the wool season it may be necessary to put on four or five.
1256. How many other steam-boats not owned by your company are running? About two or three only outside boats at this end. The other boats seldom come up above Wilcannia; in fact, there is a sort of agreement that they shall not come up.

- G. White.
19 Mar., 1898.
1257. You say there are seven steam-boats running on the river between Bourke and Walgett, or above Walgett? In a good wool season, and when we have a good river, there would probably be between Bourke and Walgett four or five steamers constantly running, but should occasion require more vessels to be put on they would be put on. It depends on how the wool comes in.
1258. Have you any knowledge of the traffic from Bourke up river? I can speak roughly of it.
1259. What is your estimate approximately? I should think about 4,000 or 5,000 tons per annum.
1260. And down the river to Bourke? A little more down.
1261. So you think the river traffic would come to something over 8,000 tons? I think it would come to over 10,000 tons; in fact, if we had a railway at Brewarrina I think it would be much more than that, for the railway would draw a great deal of traffic that now goes by team to Narrabri.
1262. Do you consider that 8,000 tons would fairly represent the traffic on the river? Yes, I think so.
1263. Some of the witnesses have said 10,000 tons, and others less? Some years it is larger than others. It may be 8,000 tons this year and, perhaps, 11,000 tons next year. Sometimes there are improvements going on, and sometimes the clips are heavier.
1264. Are you of opinion that 8,000 tons would be a fair estimate? I think that about 10,000 tons would be a fair average estimate.
1265. Have you carried any large quantities of loading from South Australia to Bourke or Brewarrina? I have not done so since I have been in my present employment. But I have brought up as much as 400 or 500 tons with one steamer belonging to South Australia—in 1884, I think.
1266. Do you know the cost of carriage from Sydney, *via* Adelaide and Goolwa, to Bourke? I am not quite sure of the figures, but I believe that goods can be carried to South Australia—Adelaide or Victor Harbour—from Sydney for about 15s. by passenger boats.
1267. What would be the rail? The average rail would be about £1 to Goolwa or Murray Bridge.
1268. That would make £1 15s.? Yes.
1269. What would the river carriage to Bourke cost? From £1 to £3. It depends on the goods to be carried. You can carry 500 lb. on the river as cheaply as 1 lb., so long as there is room for the goods.*
1270. Then you cannot average the cost of obtaining goods from Sydney by way of South Australia? I consider that goods can be landed in Bourke from Sydney for £3 10s., including all charges.
1271. So it is cheaper to obtain goods in some quantity by way of Adelaide than by rail from Sydney? I think so, provided you have the quantity; only you cannot depend on the river—that is the great trouble.
1272. What is the time of the journey? It would take a boat five weeks to come from South Australia alone—that is, loading and unloading and getting here—and there would be the time from Sydney as well, which would make it over six weeks before the goods could be delivered at Bourke, even under favourable conditions.
1273. At the present time is much loading brought from South Australia to Bourke? There has been a great deal, but lately we have not had good rivers sufficient to run goods up.
1274. When the river is navigable are goods brought in any quantity? Yes.
1275. So the steamers are still running in competition with the railway? Yes; from South Australia, when the river is open.
1276. Does much wool go to South Australia? Very little goes from this side of Wilcannia, but nearly all the wool from near or below Wilcannia goes to South Australia or to Melbourne.
1277. I am speaking of wool going from Brewarrina or Bourke? None goes now, but prior to the railway to Bourke a good deal of wool went right down to South Australia from this district. Beemery, for instance, sent all their wool down. But since the advent of the railway at Bourke only a few bales have gone down the river from Bourke.
1278. An appreciable quantity? Very small. I know of only one load that for a long time has gone down.
1279. Would any traffic lower down than Wilcannia affect the proposed railway now under consideration? I do not think it would. I think that that lower traffic will go that way while there is a river to carry it, no matter how many railways we may have.
1280. What is the lowest freight at the present time on this part of the river? The average freight from Bourke to Brewarrina is about £1 a ton.
1281. Have you ever known the freight to be low as 12s. 6d.? No.
1282. When you were working the boats for your own benefit did you ever charge less than £1? Never. I have charged as high as £2, but never less than £1.
1283. Speaking from your experience as a steam-boat proprietor, and the information that you possess as the master of a steamer working under the Company, can you say if the loading could be carried at a profit for less than the present rate of £1 per ton? With the small quantities that we at present get it could not be carried under £1 a ton, but with larger quantities it could be.
1284. That is to say, the loading is so distributed amongst the boats now that you could not carry for less than £1 a ton, but if you had very large loads for each of your boats the freight could be reduced? It could be reduced with larger loads.
1285. But would the system now adopted in collecting the up and down loading admit of your obtaining large quantities for each boat? At present I do not think it would, because 500 or even 400 tons is a large quantity to bring to this town in one loading, and you would require to take loads like that to make a good profit at less than £1.
1286. Do you get loads of 400 or 500 tons now? Not at this end.
1287. What do you mean by this end? I mean from Bourke upwards.
1288. Do you get loads of 400 or 500 tons from Brewarrina to Walgett? No.
1289. Why is it that you do not get heavy loads like that? The distance is short, and we make many trips, and carry the goods as they come in. When we have a sufficient load we start away with it.
1290. When you say that you could carry at less than £1 if you had heavy loads, you mean that the traffic of the district at the present time is of a character that does not allow you to obtain heavy loads for any one steamer—is that what you mean? I mean that we cannot be kept regularly going with heavy loads for any number of boats, and we have to scramble and take what we can get, and at the present rate of £1 a ton there is barely any profit. But if we had more chances and larger loads to carry we could carry at much less.
- 1291.

NOTE (on revision):—These figures are incorrect. What I meant to convey is that the expense of moving a small quantity nearly equals that of a large quantity, providing it is within the capacity of the vessel.

1291. The nature of the traffic on the river is such that you cannot carry at less than 20s. per ton between Bourke and Brewarrina? I do not think that it would pay under 20s. on the river at the present time.
1292. Do you know if the steamboats have been profitably worked at that rate? They have been profitably worked until the last three years, when we have had droughts which have not allowed us to run. We have been lying up, and have been losing money the last three years. Last year was a fairly good year, but it did not recoup us for bad previous years. The last three years, I know, the steamboat company has got behind, and into debt financially.
1293. Do you think that it is possible that boats could be run at 10s. or 12s. 6d. profitably? Not at present.
1294. If not at present, how about the future, and what has been done in the past? There is such a thing as putting on a different class of boats that would be cheaper to run—boats better adapted to the trade, with labour-saving machinery which would reduce the cost of carriage materially.
1295. That is to say, under existing conditions it would not be possible, but with improved boats and facilities the freight might be reduced;—is that it? Yes.
1296. Do you think that it could be reduced to 10s. or 12s. 6d. a ton? It would be cutting it very fine at 12s. 6d.
1297. No margin of profit left? Very little. So far as distributing goods from, or bringing goods to a railway at Brewarrina is concerned we have the advantage of the water-carriage here at least fourteen days sooner than they have it at Bourke. A quantity of goods consigned to Walgett, or any stations up the river from Brewarrina could be landed from the railway here, and be taken to their destination at least fourteen days earlier than they could possibly come by river from Bourke.
1298. Do you mean that you have a navigable river between Brewarrina and Walgett a fortnight earlier than between Bourke and Brewarrina? Yes.
1299. Is the river navigable for a longer period between Brewarrina and Walgett than it is between Bourke and Brewarrina? Yes. I have run from here to Walgett and brought down full loads of wool when boats were stuck up between Brewarrina and Bourke. At any time we have 60 miles of water here which is navigable nearly all the year round, no matter whether there is or is not a drought, until we come to a bar called Collaroy. When we get over that it takes a very little rise to enable us to get to Walgett. In fact, I have been to Walgett when the gauge read 6 feet, but I failed to get back. However, on 7 and 8 feet at Walgett I have made a trip from here and back. Leaving Walgett with 7 feet on the gauge, which does not give 7 feet on the river—I have returned safely to Brewarrina. The lowest I ever tried was 6 feet, and I then got stuck at Collaroy. I had to camp there and wait for a rise of a few inches. In 1892 we had three vessels—the “Rob Roy,” “Brewarrina,” and “Excelsior.” The company was formed in July, and each of four shares in six months cleared £525 in cash—between July and 1st January, that is to say, the three steamers earned in those 6 months something over £2,000.
1300. For how many months in the year on the average is the river opened to Mungindi? You cannot strike an average. In 1892, 1893, and 1894, you could go up nearly all the year round, but in 1895, 1896, and 1897, you could not get there at all.
1301. It would be only occasionally that your steamers could go as far as Mungindi? Yes.
1302. And I suppose that in the event of a railway reaching the Barwon at Walgett, or near Walgett, any traffic from Mungindi would be trucked at Walgett? It would not come this way at all; it would go either Moree way or from Walgett.
1303. Therefore that traffic would in no way affect the proposed line now under consideration? If that railway were not built, our traffic here would be increased, but if a railway were built there we could not look for that traffic, but we should get a large quantity of it if that railway were not built.
1304. That is upon the assumption that a railway were not extended to Collarendabri from Woolabra or some other point on the Narrabri-Moree Railway, or to Walgett or Pilliga from Narrabri? Yes. We should have a considerable addition to our present carriage of goods, for a railway which would embrace those districts, and a number of large stations, such as Dungaleer, about Collarendabri, and on this side of Collarendabri, would bring a lot of traffic here which at the present time is carried on to Narrabri. If a railway were not built to Collarendabri that traffic would come here.
1305. Always on the assumption that the river would be navigable as far as Mungindi? No. Even if the river were not navigable at all, a number of those places would cart goods to Brewarrina in preference to sending them to Narrabri, the distance this way for road-carriage being shorter.
1306. You mean, cart the goods to Brewarrina instead of taking them to Walgett? In some cases I believe they would. We have had from Gingie, which is close to Walgett, wool carted right to Bourke.
1307. You know the reason for that—of course, you understand that the railway carriage from Narrabri to Newcastle or Sydney would be very much shorter than from Bourke to Sydney? Yes; but at the time I speak of I think that the carriage from Narrabri to Sydney was nearly equal to the carriage from Bourke to Sydney, but I understand that a reduction has been made since.
1308. That is to say the through rate was an inducement? I think that the rate being a through rate, probably had something to do with the wool coming this way. I do not know why it did come this way, but it did.
1309. I suppose that we may assume that it was because the through rate was less *via* Bourke than it would have been *via* Narrabri—when I say “through rate” I mean road carriage as well as railway carriage? I cannot tell you the reason why, but I know that we had the wool here.

G. White.
19 Mar., 1898.

Charles James Robine, Post and Telegraph Master, Brewarrina, sworn, and examined:—

1310. *Chairman.*] What is your position in the Public Service? I am Post and Telegraph Master at Brewarrina.
1311. How long have you occupied that position? Twenty-three years.
1312. Can you give me the average postal returns, say, for three or four years, including returns from telegrams and money orders? The total revenue from all sources at Brewarrina for the year 1896 was £1,693; for 1897, I think about £1,640; and for 1895, a little more than for 1896.
1313. Has there been an improvement since 1895? There was a little falling off in 1897, I think, on account of the drought.

C. J. Robine.
19 Mar., 1898.

C. J. Robine. 1314. Up to the present period of 1898, by comparison with a similar period in 1895 and 1896, do you think that there continues to be a falling off, or is there an improvement over 1896? I think there is an improvement in the present year. I attribute the little falling off in 1897 to the drought. Following is a statement of letters, &c, actually posted in the letter-box at Brewarrina during the years 1896 and 1897 respectively:—

	1896	1897

Thomas Willans Conolly, District Surveyor, Bourke, sworn and examined —

T. W. Conolly. 1315. *Chairman*] What is your position in the Public Service? I am District Surveyor, Bourke Land Board District, Lands Department.

1316. Does that district embrace Brewarrina? Yes.

1317. Have you been over the district to Brewarrina? No; I have not to any extent. I have not very much personal knowledge of it.

1318. Then the information you give us to-day is obtained by you from official sources? It is.

1319. Can you say what the total area available for settlement is? The area at present available for settlement in the Land District of Brewarrina, excluding the county of Gregory, is 50,000 acres. The area at present available for settlement in the Land District of Brewarrina East amounts to 6,400 acres. The leasehold areas expiring in 1,900, which can then be made available for settlement, amount to 307,000 acres. The area which could be made available by withdrawal under section 6 of the Crown Lands Act of 1895 is as follows —Around Goodooga, 17,000 acres; around Brewarrina, 30,000 acres; total, 47,000 acres.

1320. Has the power of withdrawal been exercised at all? At Brewarrina there was one inquiry into a proposed withdrawal, but it was shown at that time there was not sufficient public necessity to exercise the power of withdrawal under the Act.

1321. Then the power of withdrawal has not been exercised? No. The area comprised in reserves for railway purposes 1 mile on each side of the original trial line, and a reserve at the Bogan River amounts to 73,600 acres. But these reserves cannot all be made available for settlement until after the expiry of pastoral leases about 1913. A point of law has been raised as to whether they could be made available then. At any rate, a very large part cannot be made available until after 1913.

1322. That question has arisen in connection with the construction of certain sections of the Acts of 1884, 1889, and 1895? Yes. The total area included within the "red lines" on the map known as Mr. Sawers' map is 4,505,600 acres; the area in pastoral leases, 2,376,000 acres; the area in homestead leases, 1,584,000 acres; the number of pastoral leases, 35; the number of homestead leases, 162; the area at present available for settlement, 56,320 acres; the area which will be available in 1900 upon expiry of Central Division leases, 198,400 acres; the area of railway reserves not in leasehold areas in Western Division on Byrock-Brewarrina railway trial lines, 13,440 acres, 1,600 acres of this area being within the Brewarrina Common.

Richard James Kelly, chemist and druggist, Brewarrina, sworn, and further examined —

R. J. Kelly. 1323. *Chairman*] I understand that you wish to add something to your evidence? Yes; I wish to call attention to what Mr. Harper said before your Committee in Sydney, viz, that Brewarrina is far better situated for a railway than Bourke is.

1324. You wish to draw attention to that very important statement? Yes; I think it has a very important bearing on the question of the construction of the proposed railway, especially coming from Mr. Harper, who travels about so much. He said that in his opinion Brewarrina should have been the centre instead of Bourke.

1325. I suppose you are of the same opinion? Most certainly

Edward MacFarlane, Chairman, Land Board, Bourke, sworn, and examined:—

E. MacFarlane. 1326. *Chairman*] You are chairman of the Land Board? Yes; head office, Bourke.

1327. You were previously, I believe, District Surveyor? Yes.

1328. For Bourke and Brewarrina? For the same Land Board Districts.

1329. Which embraced Bourke and Brewarrina? Yes.

1330. *Mr. O'Connor*] Do you know the district well? I believe I do.

1331.

1331. How long have you been in the district? I first came into Bourke in 1879; I visited it again in 1880, and I took charge on the 1st January, 1881. Since then I have been constantly resident in the district. The district is a varied one, and in my opinion it is principally a pastoral district. It contains some very valuable pastoral land and also some inferior pastoral land, but, taking the Brewarrina district generally, its carrying capacity is on the average not less than 3 acres to a sheep; it may carry more sheep. A good class of wool can be grown in the district, the sheep are singularly healthy—they are free from disease—and I suppose generally that for a large area of country there is no better pastoral district than the Brewarrina district.

E.
MacFarlane.
19 Mar., 1898.

1332. How long is it since you increased the rents? I have been reducing them.

1333. I understood that you increased the rents here by 7 per cent.? No, we have reduced the rents very materially. We made some small increases. We increased the rent of Boorooma slightly the other day, and one or two homestead leases, but, taking it on the whole, the result of the late sitting of the Land Board was a reduction in rental.

1334. How does the Brewarrina district compare with other districts? It carries the highest rents.

1335. They pay a higher sum to the Crown here than in the Bourke district? Per acre they do, but not gross.

1336. And the adjoining district? I do not know the Walgett rents very well. I am under the impression that the Brewarrina rents are even a little higher than the Walgett rents at per acre, but certainly of all the districts with which I have connection the Brewarrina rents are the highest.

1337. From the most intimate knowledge which you undoubtedly have of this vast district, do you see your way clear to advocate the construction of a railway between Byrock and Brewarrina? May I say, with respect, that the decision is for you, and not for me.

1338. But we would like your opinion if you like to give it? On the whole, you would benefit the district if you put a railway from Byrock to Brewarrina.

1339. *Chairman.*] Have you travelled over the district very frequently? Constantly.

1340. You know it thoroughly? Yes.

1341. What area is comprised in the district of which you were District Surveyor? 59,000,000 acres—three-tenths of the Colony.

1342. About what population was settled there? A small one—about one person to 1,500 acres; that would be about 40,000 people.

1343. Compared with other pastoral districts, does Brewarrina carry its due proportion of population? The Brewarrina district is the most closely settled of all the districts with which I have had to do officially.

1344. Have you formed an opinion as to the carrying capabilities of the district—the total number of sheep? Yes. I said a sheep to 3 acres in the Brewarrina district.

1345. I want you to give me in round figures an estimate of the total number of the whole district? The 59,000,000 acres generally ought to carry over all of it a sheep to 6 acres.

1346. That would be 10,000,000? Yes; it has gone as high, I believe, as 12,000,000 of sheep, but the district would not be over-stocked carrying 10,000,000 of sheep.

1347. What would be the number of sheep that might fairly be estimated to be carried by the area that would, in your opinion, be served by the proposed railway? Something over 1,450,000—that is with safe stocking.

1348. Do you consider that at the present time the country is lightly or heavily stocked? I have not seen a sheep for months. I do not know what the number of sheep in the district at the present time is. The stocking varies; you have to constantly follow it and be about to know if it is lightly or heavily stocked. The country is looking very well, and the probability is that it is not over-stocked at present, but I could not be positive.

1349. During the time you were District Surveyor I suppose that large improvements were effected on the different holdings? Enormous improvements were effected.

1350. Were all those improvements effected with the view of increasing the carrying capabilities of the country? Mostly with the view of increasing the grazing capacity of the country.

1351. Do you remember if, during the time you were District Surveyor, any very marked difference occurred in the carrying capabilities of the country? I could not say. I know the district was very lightly stocked when I came here, and I know that after the 1884 drought the country was very poorly stocked, and I also know that in 1891 and 1892 it was very heavily stocked; but the relative proportions between 1884, 1888, and 1892 I could not tell you from memory.

1352. Is it your opinion that still further improvements in the same direction would increase, either largely or moderately, the carrying capabilities of the district? I believe that by further expenditure in improvements the carrying capability of the country could be very considerably increased.

MONDAY, 21 MARCH, 1898.

[The Sectional Committee met at the "Royal Hotel," Byrock, at 9 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Byrock to Brewarrina.

George Voss Mocatta, surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1353. *Chairman.*] What is your position in the Public Service? A railway surveyor.

1354. Were you the surveyor in charge of the proposed line from Byrock to Brewarrina? Yes.

1355. Can you produce your plans and sections of the line? Yes.

1356. Will you describe the line, having regard to the flooded portion of the country which the line will traverse and also the nature of the work—whether the railway will be easy of construction or difficult? It is a light line.

G. V.
Mocatta.
21 Mar., 1898.
1357.

G. V.
Mocatta.
21 Mar., 1898.

1357. What is known as a cheap light line? Not the cheapest kind of light line. The estimate of cost is given in Mr. Deane's evidence. Starting from Byrock the country is red soil, generally free from liability to flood to within 2 miles of the Bogan River, a distance of 32 miles.
1358. Is that portion of the line of the easiest construction? No, it is not. Part of the distance referred to consists of quartz and ironstone ridges where some small cuttings and a considerable amount of curvature will be necessary.
1359. Any bridges? Culverts, but no important bridges.
1360. Will you describe it from that point onwards towards Brewarrina? From that point onwards towards Brewarrina the country changes to a black soil, and there will be several large bridges, there being a considerable amount of country liable to flood. The first bridge will be at the Bogan River, where there is from a mile to a mile and a half of country liable to flood, which would also require a viaduct. There need not be any other bridge until the Nyrang Bogan is reached. That is about 6 miles beyond the Bogan. From this point onwards the line follows a buddah ridge to within half a mile of the Tarrion Creek, which is an overflow of the Barwon, and there is also a considerable area of country liable to flood which would need bridging. The Tarrion Creek is about 54 miles from Byrock. The remainder of the line, about 6 miles, into Brewarrina is liable to light floods. It consists of open plain, and certain provision would have to be made to allow the flood waters to pass through.
1361. Would there be any difficulty in obtaining material for any necessary ballasting? No; there would be no difficulty in obtaining material, but it is very doubtful whether it would not pay better to bring the ballast from existing quarries on the main line rather than to erect a plant to get ballast on the line itself, inasmuch as the ballast from the main line could be obtained as the work of constructing the proposed line proceeded, and there would be no difficulty as regards conveyance.
1362. It is a matter, I suppose, that would be optional with the contractor? Yes.
1363. He would make the best terms possible in his own interest? Yes.
1364. Is the country through which the railway would pass of a similar character or superior to the road from Byrock, *via* Gongolgon, to Brewarrina? The first 32 miles from Byrock on the proposed route is decidedly superior to the country on the road between Byrock and Gongolgon. For the remainder of the distance to Brewarrina the country by both routes is similar. It consists of good black soil, very well adapted for pastoral purposes.
1365. Would you describe it as pastoral country all along the proposed line? Very good pastoral country.
1366. Do you know where it is proposed the line should terminate? The proposed line would commence at 455 miles 62 chains from Sydney, and terminate at 514 miles 25 chains from Sydney.
1367. Did you select the station site? No; that question was left open, because it was considered that the line would very likely be continued past Brewarrina.
1368. Would there be any difficulty in obtaining a satisfactory station site in close proximity to the township? I do not think so. Very great floods may go outside the River Barwon at any time, and may flood the ground. There are records of floods having been all over the town of Brewarrina, but that occurs only once in thirty or forty years. I would not say that you can pick a station site, except at a considerable distance from the town, which would be absolutely out of the reach of all floods.
1369. *Mr. Fegan.*] Is there no station reserve then? There is, I think, a reserve where the line goes in.
1370. You cannot tell us the exact position of the station site? There is a reserve upon which the station might be built.
1371. There would be sufficient space available for station requirements? Yes.
1372. Do you know the area of the reserve? About 60 acres.
1373. Affording ample room for station purposes? Yes.

1898.

PLAN. Narrabri to Pilliga Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM NARRABRI TO PILLIGA.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Narrabri to Pilliga," have, after due inquiry, resolved that it is not expedient the proposed railway should be carried out, but suggest a route by which a railway would go from Narrabri to Eurie Eurie, and, if necessary, thence on to Walgett; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

ORIGIN OF THE PROPOSAL.

1. An agitation in favour of a line of railway from Narrabri to Walgett, the Committee are informed, has been in progress for many years, but no definite steps with regard to the proposal for a railway from Narrabri to Pilliga were taken until July, 1896, when a deputation pressed the subject upon the attention of the Honourable the Minister for Public Works, and he promised to consider whether the settlement and trade in the district would justify the construction of the line. In May, 1897, it was decided to submit the proposal to Parliament for reference to this Committee.

DESCRIPTION OF THE PROPOSED LINE.

2. The proposed railway, which is 56 miles in length, is a light or surface line cheaply constructed. It commences at the west end of Narrabri West Railway Station, at 251·75 miles from Newcastle, and runs nearly parallel with, and to the south of, travelling stock reserves, Nos. 1,227 and 1,116, to Wee Waa. Thence it follows the course of the Namoi River, keeping about 3 or 4 miles to the south of it, and ends at Pilliga at 307·75 miles from Newcastle.

The country traversed is flat, and Crown land—principally railway reserve No. 1,945—is occupied almost throughout. Very little alienated land is interfered with. A number of water-courses, more or less important, have to be crossed, but no large bridges are necessary. In some places the flood-waters of the Namoi reach out to long distances, but sufficient earthworks are provided for to keep the line above flood-level, and also sufficient waterways to carry off the water flowing across the line.

ESTIMATED COST.

3. The Engineer-in-Chief for Railway Construction estimates the total cost of the line at £128,650, or £2,297 per mile, which is about the same as the cost of the railway from Narrabri to Moree. Included in the total amount are earthworks, £10,807; timber bridges and small timber openings, £11,685; level crossings, cattle stops,

stops, and fencing, £1,620; permanent-way materials, £34,935; freight, £8,952; laying, ballasting, and sleepers, £30,553; station works, including sidings and station buildings, &c., £10,121; water supplies, £3,000; gradient and mileage posts, telegraph, and miscellaneous, £2,683; and engineering and contingencies, £14,294.

RAILWAY COMMISSIONERS' REPORT.

4. The Railway Commissioners, in their report upon the proposed railway, estimate an annual loss upon the working of the line of £4,366. The annual cost is given at £9,086, which amount is made up of interest upon capital expenditure at 3 per cent., £3,859, and cost of maintaining permanent-way and other traffic and locomotive expenses, £5,227; and the traffic estimate, calculated, the Commissioners say "upon the most favourable basis, no deduction whatever being made on account of river-borne traffic to Walgett, which must be expected when the river is navigable," is £4,720, comprising live-stock and goods, £3,150, and coaching and mails, £1,570.

"A careful investigation into the merits of the proposed line," the report goes on to state, "indicates that there is little prospect of it returning working expenses."

With regard to river competition, the Commissioners point out that the river has been navigable seven times in the last fourteen years, and that in view of the policy to improve river navigation, it may be more frequently so in the future. The river freight during the year 1895 in goods was, they state, 790 tons, and in wool, 2,035 tons, which would represent about £1,300 of the railway revenue that has been included in the estimated traffic mentioned in their report. Other railway extensions which are under consideration, they say further, will affect the probable traffic on the Pilliga line. The proposed railway from Warren to Coonamble would, if constructed, compete for a part of it, and competition would also take place in connection with the proposed line from Woolabra to Collarendabri. "After duly weighing all the circumstances," the Commissioners say, in conclusion, "we cannot recommend the construction of the line."

INQUIRY BY A SECTIONAL COMMITTEE.

5. The Sectional Committee, appointed to visit the district for the purpose of inspecting the route of the line, taking evidence, and reporting on the proposal, regarded the proposed railway and that from Woolabra to Collarendabri as so closely associated with the question of the best method by which the country passed through would be developed, that it seemed to them this was what they really had to consider. Consequently, they dealt with the two railway proposals together, and with another mentioned in the evidence, which would go from Narrabri between the two proposed lines to Eurie Eurie, and, if necessary, from Eurie Eurie to Walgett.

"The country which will be developed by the two lines," they say in their report, "is, generally speaking, bounded on the east by the Moree-Narrabri line and its extension towards Newcastle; on the north by the limits of such traffic as may reach Collarendabri, or any portion of the line from there to Woolabra in preference to Moree, that area of country extending beyond Angledool to the Queensland Border, which will probably reach Collarendabri and Walgett in preference to Brewarrina, were a railway constructed to the latter place; and that portion of the colony of Queensland the traffic of which would find its way *via* Angledool, Mogil Mogil, or any routes to the north, to Collarendabri or Walgett. On the south, its limits would be first affected by the proposed railway into Coonamble."

In order not to overstate the area the Sectional Committee, for the purposes of their inquiry, inferred that it is possible the railway system of the Colony will be extended as far as Coonamble and Brewarrina within a reasonable time. As a recent Queensland Government *Gazette* notice removed the £2 10s. duty on wool shorn across the Border, within a distance of 30 miles therefrom, they consider that, in all probability, the wool and stock depastured within this 30-miles limit will find its way to New South Wales, and they are of opinion, further, that as the influence of railways to Collarendabri and Walgett would probably extend another 30 miles northwards, the area of New South Wales railway influence may be taken

as

as 60 miles north of the New South Wales boundary, extending to midway between Walgett and Coonamble—say about Combogolong—on the south, to midway between Walgett and Brewarrina on the west, and to within 25 miles of the Moree line on the east. The country is pastoral, but contains extensive tracts suitable for agriculture, and there appeared to the Sectional Committee no reason why cereals should not be grown with a fair prospect of success.

River competition is a matter affecting the question of a railway to Walgett or Collarendabri, and they found that, although at times the river traffic might affect the returns of the railway, it would not happen frequently. "Even as far as Walgett," they say, "the Barwon river cannot be regarded as a reasonable outlet to so important a district, and that being so, it is clear that an approach by the Barwon to Collarendabri, for ordinary trade purposes, is out of the question."

Dealing with the question of the Narrabri-Pilliga line as a proposal to construct a railway from Narrabri to Walgett, they recommend the adoption of a route described in the evidence of the Engineer-in-Chief for Railway Construction, by which a railway would go from Narrabri to Eurie Eurie, and, if necessary, thence on to Walgett. This route, referred to in the Sectional Committee's report as the "green line," leaves the Narrabri railway station on the Narrabri-Moree railway at about 255 miles from Newcastle, and bearing in a north-westerly direction round what is known as the Gravelly Ridge it crosses the T.S.R. Narrabri to Moree to the north of the Ironbarks Hotel. Thence following the low ridges (about 3 miles out from the Namoi River) which form the watershed between this river and Galathera Creek, crossing one or two swampy places *en route*, it strikes the T.S.R. Gurleigh Point to Boolcarrol at 278 miles, about 5 miles from Tribe's Hotel. From this point it bears south-westerly, keeping well north of the Wire Lagoon, and follows the highest ground round to the head of Pian Creek, about Keileher's Hotel, at 291 miles, and near where the T.S.R. to Burren and the upper T.S.R., on the north side of the river, join. This point is almost 8 miles from Wee Waa, which is accessible by bridges across the river and the important creeks. A distance of about 10 miles of this portion of the route is more or less flooded, as when the Namoi rises to a certain height it breaks across here, and the flood-waters flow round by Boolcarrol, Nowley, and Burren, joining the Barwon flood-waters in Mercadool. After passing Keileher's, the line gets on to dry red ridges, which form the divide between the Namoi and Pian Creek, and these are followed almost continuously in a north-west to westerly direction to near Cryan New Station; Pilliga being passed at a distance of about 20 miles to the south. Thence black soil is encountered to Pian Creek, which floods along its banks. After passing this creek the line strikes the plains of Eurie Eurie (country which in all ordinary floods is dry, one portion at the Old Stockyards having never been known to be under water), and crossing these plains, it bears round in a southerly direction and ends within about $1\frac{1}{2}$ mile of Walgett on the northern side of the Namoi River.

The extension from Eurie Eurie to Walgett is a matter respecting which they were not free from doubt, but taking into consideration the expenditure of Government money, and the results of private enterprise, in the town of Walgett, they regard the extension as justifiable. It seems, they say, improbable that the line can be brought nearer to Walgett than $1\frac{1}{2}$ mile from it; but investigation may show the feasibility of extending it to a greater distance towards the south-west. The question of whether the railway should for the first portion of its length leave the main line on the north or on the south side of the Namoi is also, the Sectional Committee were of opinion, a matter requiring consideration. If it should be determined to leave the Narrabri-Moree railway on the north side of the river by starting from a point further north than is indicated on the plan, a more easterly course for the first 15 miles can be obtained, and some miles of new construction may be saved.

The length of the suggested line and the one recommended to Collarendabri would, the Sectional Committee point out, be somewhat over 150 miles. The proposals of the Government are 196 miles—that is, if the Committee be right in the conjecture that Walgett is the objective point of the Pilliga line. The saving in distance is, therefore, about 45 miles, and in cost of construction approximately £100,000. The only question, therefore, remaining to be considered is, whether

the development by this method will be as satisfactory as that proposed by the Government. In the opinion of the Sectional Committee the scheme is better because it gives a shorter length of haulage from Walgett, and passes through superior country. The extent of Crown lands in the districts that would be served by the railway is considerable, and should be readily taken up in small areas. The returns from the line should be satisfactory.

THE COMMITTEE'S RECOMMENDATION.

6. For the reasons mentioned in the Sectional Committee's Report, and which shortly stated are—(1) that for the first 60 miles a line between that proposed from Narrabri to Pilliga and that from Woolabra to Collarendabri would do the work of both these lines; (2) that such a line would be located in better country than if placed on the south bank of the Namoi; and (3) that by its construction a saving of about £100,000 would be effected,—the Committee are of opinion that the conclusion arrived at by the Sectional Committee should be adopted; and they accordingly recommend that the proposal for the construction of a railway from Narrabri to Pilliga remain in abeyance until a survey of a route from Narrabri to Eurie Eurie and thence to Walgett has been made, and the advantages of a line by that route definitely ascertained.

RESOLUTION PASSED.

The resolution passed by the Committee, as shown in their Minutes of Proceedings, is as follows:—

“That, in the opinion of the Committee, it is not expedient that the proposed Railway from Narrabri to Pilliga, as referred to the Committee by the Legislative Assembly, be carried out; but they suggest a route by which a railway would go from Narrabri to Eurie Eurie, and, if necessary, thence on to Walgett.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 23 June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM NARRABRI TO PILLIGA.

TUESDAY, 19 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Narrabri to Pilliga.

Robert R. P. Hickson, Under-Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

I. *Vice-Chairman.*] Have you a statement to make to the Committee in regard to the proposal which we are now investigating? Yes. It is as follows:—

AGITATION in favour of a line from Narrabri to Walgett has been going on for many years, but no definite steps with regard to the proposal from Narrabri to Pilliga were taken until July of last year, when a deputation from several Members of Parliament and the residents of Walgett, introduced by Mr. Collins, M.P., urged upon Mr. Secretary Young the construction of the line to Walgett. The Minister, in reply to the deputation, said he thought the continuation of the line from Narrabri through Wee Waa to Pilliga was a matter worthy of consideration, and putting the proposed railway right to Walgett on one side, as not being a work of absolute necessity at that particular time, he would carefully consider the matter as to whether the settlement and trade would justify the Government in taking the line from Narrabri to Pilliga.

In May of this year, it was decided to submit this proposal amongst others to Parliament with the object of placing it before the Public Works Committee, and Mr. Deane was asked to prepare the necessary estimates, &c., so that a report could be obtained from the Railway Commissioners.

Mr. Deane estimated the cost of a single line (56 miles in length) at £128,650 = £2,297 6s. 5d. per mile.

The line begins at the west end of Narrabri West Station at 251.75 miles from Newcastle, and runs nearly parallel to and to south of travelling stock reserves Nos. 1227 and 1116 to Wee Waa. Here it follows the course of the Namoi River, about 3 or 4 miles to the south of it, ending at Pilliga at 307.75 miles from Newcastle.

The country is flat and the grades easy; and Crown land, principally railway reserve No. 1945, is occupied almost throughout.

The Railway Commissioners, in compliance with our request, forwarded their report on the proposal on the 6th July, of which the following is a copy:—

Proposed Line of Railway from Narrabri to Pilliga, 56 miles.

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under:—

Cost of construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a light railway line (exclusive of land and compensation) at..... £128,650

Annual cost—

Capital expenditure at 3 per cent. £3,859
Cost of maintaining permanent-way, and for traffic and locomotive expenses 5,227

Total annual cost £9,086

Traffic estimate—

Live stock and goods..... £3,150
Coaching and mails..... 1,570

Total estimated traffic £4,720

A careful investigation into the merits of the proposed line indicates that there is little prospect of it returning working expenses. The revenue has been calculated upon the most favourable basis, no deduction whatever being made on account of river-borne traffic to Walgett, which must be expected when the river is navigable.

So far as can be ascertained the river has been available seven times in the last fourteen years, and, in view of the policy to improve river navigation, it may be more frequently so in the future.

The river freight during the year 1895 in goods was 790 tons, and in wool 2,035 tons, which would represent about £1,300 of railway revenue, which has been included in the estimated traffic mentioned in this report.

Other railway extensions which are under consideration will affect the probable traffic. The proposed line from Warren to Coonamble would, if constructed, compete for a part of it, as also would the more recently proposed line from Woolabra to Collarendabri.

After duly weighing all the circumstances, we cannot recommend the construction of the line.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed, this sixth day of July, One thousand eight hundred and ninety-seven, in the presence of—

}	CHARLES OLIVER,
	Commissioner.
}	W. M. FEHON,
	Commissioner.

H. McLACHLAN.

- R. R. P. Hickson.
19 Oct., 1897.
2. *Mr. Wright.*] Have you any knowledge of this country? I know the country between Narrabri and Moree; but I have not been out as far as Pilliga.
 3. Of course you can give the Committee no information in regard to the estimates which you have just submitted? No; they are the estimates of the Railway Commissioners.
 4. Do you know if the country between Narrabri and Pilliga is good country? So far as I have gone over it the soil is good.
 5. Is any part of it low-lying and subject to inundation? Part of it is low-lying; but Mr. Deane in his estimate has made provision for protecting the line against inundation.
 6. Can you give the Committee any information as to the number of roads in the district and their annual cost? I will obtain that information.
 7. *Mr. Trickett.*] Do I understand that there has been much agitation for this railway? There has been a good deal of agitation for a railway to Walgett.
 8. I suppose you have none of the petitions which were sent in by the residents? Not with me; but they are available in the Department.
 9. Do they contain any information which would be of use to us? I will send you a *précis* of them.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works,
sworn, and examined:—

- H. Deane.
19 Oct., 1897.
10. *Vice-Chairman.*] Have you a statement to make to the Committee? I have some plans to hand in. I hand in a compilation of parish maps to the usual scale, a plan of the line to a 10-chains scale, and a longitudinal section—the horizontal scale being 10 chains to an inch, and the vertical scale 100 feet to the inch. I also hand in the Book of Reference.
 11. *Mr. Hoskins.*] Have you been over the country between Narrabri and Pilliga? I have only been a few miles beyond Narrabri.
 12. Has a careful survey been made of this country? Yes. The country is very flat, but a number of water-courses more or less important have to be crossed.
 13. Do you think you have sufficiently calculated the probable cost of making provision for draining away the water in time of flood? Yes. The flood-waters of the Namoi in some places reach out to long distances; but I shall provide sufficient earthworks to keep the line above flood-level, and sufficient waterways to carry off the water flowing across the line.
 14. Do you think that the line can be sufficiently secured from flooding during times of heavy rainfall for the amount you have set down? Yes.
 15. You propose to construct a light line somewhat similar to those we have already had before us? Yes.
 16. Will you experience much difficulty in getting timber for sleepers in the district? No. There is an ironbark forest on the south side of the river.
 17. How far is Pilliga from Walgett? Fifty-eight miles.
 18. From what you know of the country, would a line to Pilliga attract the trade of the large district of which Walgett is the centre? I am not very well versed in the question of traffic routes.
 19. You would not cross the Namoi at all? No. I propose to keep on the south side of the river all the way.
 20. Therefore you will have no large bridges to construct? No.
 21. *Mr. Clarke.*] There will be a considerable loss upon the proposed line? Yes, according to the calculations of the Railway Commissioners.
 22. What is the nature of the country? As to that I would refer the Committee to page 17 of the report of Mr. Jones, Examiner of Public Works Proposals. The report is dated 17th June, 1891. Mr. Jones was appointed by Mr. Bruce Smith to inquire into certain railway proposals.
 23. Does he describe the country? Yes, on page 17 of his report. I have also short reports from the surveyors who laid out the line. The line was surveyed in 1884, the surveyors being Mr. Carter and Mr. Harwood. In a report to the Engineer-in-Chief they say:

The flood-level shown on this section has been ascertained only after considerable trouble, and may be relied upon as being correct, much valuable information in connection therewith having been given by the owner of the property through which this line passes, and who has resided in the vicinity for the past thirty-five years. It will be seen that several swamps and creeks have been crossed by this line, which were not shown on the trial plan.

We have been depending upon these flood levels in laying out the line. Mr. Harwood speaks about ironbark, belar, and pine being obtainable along the route. He says in a report:

Timber.

Ironbark.—There would be no difficulty in obtaining any quantity of this timber, suitable either for fencing, sleepers, or bridges. For the latter it would have to be drawn a few miles, as the trees near the line are mostly pipey, and of no great length in the barrel. In Robertson's forest timber reserve, No. 1,104, there is an unlimited amount of this kind of timber.

Belar.—Very plentiful along the line, suitable for fencing rails.

Pine.—Can be obtained at many places close to the line. There are pine forests near the round swamp, and near Pilliga.

Ballast.

Stone.—Procurable only in the neighbourhood of Narrabri, where there are knolls of porphyritic basalt. The distance from these to the railway station would be about 6 miles.

Shingle.—In the bed of the Namoi River, near Molle Station, there are some long but superficial shingle beds.

Burnt clay.—There would be no difficulty in getting clay from the banks of several of the creeks, and the scrub between the fence widths could be used for burning it.

Mr. Carter reports on the 28th November, 1884:—

Having now completed the plan and section of my portion of the trial survey from Narrabri to Walgett, namely, from the town of Walgett back to a junction with Mr. Harwood, 35 miles from my point of commencement, I have the honor to report as follows:—The district traversed by this portion of the line consists entirely of plains, for the most part destitute of timber, what little exists being of a stunted growth, and quite useless for any practicable purpose. No streams are crossed, but water can be obtained at Walgett from the river Namoi, on which the town is built. At Come-by-Chance, a small settlement 30 miles from Walgett, a supply of water could also be obtained at a little cost, from a lagoon half a mile to the west of the line. No ballast is procurable in any part of this district, nor do I think from any place nearer than Narrabri.

- I know, however, that there is ballast at Molle. Mr. Carter then refers to the fact that in a rainy season the surface of the plains is covered for many miles by flood water from the river Namoi. H. Deane.
 24. Then there would be no difficulty about getting timber? No. 19 Oct., 1897.
 25. Do you propose to ballast the line as you ballasted the line from Narrabri to Moree? I should like to ballast part of it. My estimate is for the ballasting of one-fourth of the line. The ballasting would be used in the station yards, and on those other portions of the line where it is absolutely required.
 26. Would there be any difficulty in getting ballast? No. Although there is no ballast at the further end of the line it would have to be run out on the contractors' waggons from Narrabri to Moree.
 27. If the proposed line were constructed, would it interfere with the line from Coonamble to Walgett? If a line were made from Coonamble to Walgett there would, I think, be very little necessity for this line.
 28. And if this line were made, I suppose there would be very little use in making a line to Coonamble? I think Coonamble would support itself in any case. Even if this line were made, I should say that the line from Warren to Coonamble ought to be made.
 29. According to Mr. Jones' report there is very little agricultural settlement along the proposed line? Very little.
 30. It is chiefly a grazing district? Yes.
 31. Is there any likelihood of agricultural pursuits being followed there? So far as my experience goes, it is too far west for agriculture. The soil in some places might be suitable; but the rainfall is too uncertain.
 32. Mr. Jones says that the population to be served between Narrabri and Walgett on the south side of the river did not exceed 6,000 people. That was six years ago. Have you any idea whether the population has increased since then? No, I could not tell you anything about it.
 33. Mr. Trickett.] Will you kindly read to the Committee your detailed estimate of the cost of the line? If you will allow me I will first read the description of the line:—

Narrabri to Pilliga Railway.

(Length, 56 miles; estimated cost £128,650, or £2,297 per mile, exclusive of land and compensation).

This line begins at the west end of Narrabri West Station, at 251 m. 75 ch. from Newcastle, and runs nearly parallel to and to south of Travelling Stock Reserves Nos. 1,227 and 1,116 to Wee Waa. Here it follows the course of the Namoi River, about 3 or 4 miles to the south of it, ending at Pilliga at 307 m. 75 ch. from Newcastle.

The country is flat and the grades easy, and Crown land, principally railway reserve No. 1,945, is occupied almost throughout.

The Book of Reference will show that the line goes through very little alienated land.

NARRABRI TO PILLIGA.

Estimated cost of a single line of railway 56 miles in length with 60-lb. rails. Ruling grade 1 in 100. Sharpest curve, 20 chains radius.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	10,807 15 0	193
Timber bridges and small timber openings	11,685 6 0	209
Level crossings, cattle stops, and fencing	1,620 0 0	29
Permanent-way materials	34,935 6 0	624
Freight	8,952 6 0	160
Laying at 1s., £4,928	30,553 12 0	546
Ballasting, (½ in.) @ 4s., £4,928		
Sleepers @ 3s., £20,697 12s.		
Station works including sidings	4,231 10 0	76
Station buildings, passenger buildings, £500; shelter sheds, £200; passenger platforms, £600; station-master's houses, £400; goods sheds, and platforms, £600; loading banks, £500; trucking yards, £740; 20-ton weighbridges, £550; 5-ton cranes, £400; engine-shed, £500; carriage-shed, £200; turntable, £550; coal stage, £150	5,890 0 0	105
Water supplies	3,000 0 0	54
Gradient and mileage posts	840 0 0	15
Telegraph	840 0 0	15
Miscellaneous	1,000 0 0	18
Cost of works	114,355 15 0	
Engineering and contingencies, 12½ per cent. nearly	14,294 5 0	255
Total cost	£128,650 0 0	
Average cost per mile	£2,297 6 5	

34. How does this line compare as regards its cost per mile with the Narrabri to Moree line as completed up to date? It will work out at about the same.
 35. Is that including the £4,000 spent in providing additional waterways on the Narrabri to Moree line? Yes, it will work out at about the same. The extra waterways on the Narrabri to Moree line only amount to about £60 a mile.
 36. You have put down 3s. each for sleepers;—is not that a high price to pay for sleepers in that district? We paid 2s. 6d. and 2s. 3d. for sleepers on the Moree line. Of course there is the adzing to be reckoned in; but it is a full price.
 37. Will you get a better class of sleepers? No.
 38. Then there may be some saving in connection with this item? Yes.
 39. On the Narrabri to Moree line, you were able to use some old rails which had been re-rolled? No.
 40. Was not that originally contemplated? Yes; but the estimate was adjusted so as to provide for the cost of new rails.
 41. You will use new rails upon the proposed line? Yes.
 42. Rails of what weight? Sixty-pound rails. I think that 60 lb. is a satisfactory weight for rails where additional sleepers are put in.
 43. And with slow trains? Yes.

- H. Deane.
19 Oct., 1897.
44. At what rate will trains be able to travel upon the proposed line? I do not think that any time-table has been worked out; but it is generally understood that the limit of speed upon these new lines will be 20 miles an hour.
45. Is it proposed to fence the line? No.
46. Trains will only be run in the day time? Yes.
47. I suppose there will not be many stations? I have allowed for about six sets of sidings and stations.
48. What have you allowed for stations and sidings? For station works—that is, the earthworks, metalling, permanent way, and sidings—I have allowed £4,231 10s.
49. For that amount do you provide loading places for wool? No. In another item I provide for station buildings, shelter sheds, goods sheds, loading banks, trucking yards, trains, turn-tables, and so on. For that I have put down £5,890.
50. Why is it that you have to expend so much upon providing water supplies? You must have a couple of stations at which you can get water. You may take it from the river or from the creeks; but in any case some works will be necessary. If you get it from the river, you must lay lines of pipes. I do not think that the amount I have put down—£3,000—can safely be reduced, though I think it is ample.
51. Do you consider that you have made a liberal allowance for the whole line? Yes, I think so.
52. Where are the gentlemen who surveyed this line? I do not know where Mr. Harwood is; but Mr. Carter is a member of the firm of Carter, Gummow, & Co.
53. The line seems to be taken very close to the river; is that an advantage? I do not see that it is any disadvantage; it has been kept clear of floods.
54. Do you know if Pilliga is such an important centre that it is necessary that there should be a diversion in its direction, instead of going straight to Walgett? I think it will be found cheaper to go round the bends of the river, and to keep on the same side, than to cross at Wee Waa and at Walgett.
55. Keeping on the south side of the river, you would only have to cross the Baradine Creek? That and the Brigalow are the only long creeks; but there are other creeks of importance. Below Narrabri the river is very troublesome to cross. I have been down it a good many miles, and looked at various places.
56. What is the need for the elbow in the line near Wee Waa? To keep the railway out of flood reach. There are swamps in between that portion of the line and the river.
57. Does much water drain to the Namoi from the country between Narrabri and Gunnedah? Yes, several creeks of importance cross the railway. The country on the southern side of the river is higher than that on the northern side. We have had a survey made of a line between Narrabri and Coonabarabran, and the country through which it passes is very rough.
58. *Mr. Lee.*] Why do you go on the south side of the river instead of on the north side? To avoid crossing the river, and to make sure of sounder ground. On the north side of the river you get more black-soil country than on the south side.
59. But is not the country better on the north side? Yes, for pastoral purposes.
60. Then, by going on the south side, you gain no other advantage than that of avoiding low-lying country? Yes. The floods run out much further at the north side of the river.
61. What portion of the line between Pilliga and Narrabri is subject to floods? I cannot speak from a personal knowledge of the country; but I believe that the line has been taken along the edge of the flooded country.
62. Is it possible to take a line from Narrabri to Pilliga, without going through flooded country to some extent? Yes, only where you cross the creek you get flooded country.
63. Is not the whole of that country subject to floods? I do not think it can be said to be subject to floods. The line is kept at some distance back from the river and away from floods.
64. Is it to be considered a surface line? Yes.
65. Then it is not to be banked up? Where there is a likelihood of its being flooded I should raise it above the surface.
66. Upon an embankment? Upon an embankment, or upon piles.
67. Will there be much piling to do? Not an extraordinary amount. The worst creek to cross is the Brigalow Creek, a few miles out of Narrabri.
68. Do you think that the line will be more difficult to maintain than the Moree line? I do not.
69. The country is somewhat the same in both cases? A good deal of the country between Narrabri and Pilliga is harder and more sandy than that between Narrabri and Moree.
70. The proposed railway would be closer to the main watercourse? Yes.
71. What experience has been gained by leaving lines unfenced? So long as the traffic is conducted in daylight there is no risk.
72. Have any losses been incurred and any claims made against the Department, because of accidents upon unfenced lines? No.
73. No objection has been raised against them? There has been no representation on the part of the Railway Commissioners to the effect that future lines should be fenced.
74. I suppose the Moree district would test the matter as well as any other, because of the number of sheep depastured there? Yes; the matter would be thoroughly tested there.
75. Do you know whether there would be a train a day upon the proposed line? I do not know.
76. In estimating the annual cost of the working of the line, would it not make a considerable difference if the train ran only three times a week instead of six? Yes.
77. If the estimate is framed upon a tri-weekly service, and the trains have to run twice that number of times, the estimate should be largely increased? Yes.
78. I notice that the Book of Reference shows that the line goes through seven freeholds;—do you know if it passes through freehold estates for any considerable distance? No. The freeholds are for the most part small. The first freehold is at a point 262 miles from Sydney—an 160-acre block—and the line goes through it for a distance of about half a mile. Through the next block, No. 8, we only go about 7 chains.
79. And the next? About a mile.
80. Then No. 19? That is at 283 miles from Sydney. The line goes through that property for about 22 chains.
81. Then there is No. 25? That is at 287 miles 60 links. The line goes through it for a distance of 7 chains.
82. Then there is No. 26? The line goes through it for about 7 chains.

H. Deane.
19 Oct., 1887.

83. Then there are portions 35 and 36 near Pilliga;—do you know if the line would interfere much with that property, which, I believe, is used as a racecourse? No; it only goes through a very small corner of it, and it would only have to be moved about 3 chains to avoid it altogether.
84. Although that land is spoken of in the Book of Reference as Crown land, it is vested in trustees, and the claim would be made by these trustees for any damage that was done to it? Well, I think that the line could be made to avoid it altogether.
85. I notice that the line passes through a large number of settlement leases;—what provision has been made for dealing with those cases: the lessees of this land have the right to alienate a certain portion of it? I have made no provision for compensation of any kind. I have not dealt with the question of compensation at all.
86. You are not able to say what provision the Crown has made in connection with resumptions of this kind? No; but if this land were as valuable as freehold to resume, it would only cost a very small proportion of the whole cost of the line.
87. Yes, but inasmuch as the line is estimated to be a non-paying one, it should be loaded with as little resumption as possible. Will the Land Valuer be able to give us any information in regard to this matter? I do not know.
88. I suppose you have designed as cheap a line as possible consistent with safety? Yes.
89. Could you submit a line to us which would answer the purposes of the district but at a cheaper rate? I do not think so. I should not like to be asked to do so.
90. If the present gauge is to be maintained this is the cheapest line that you can recommend? Yes.
91. The country through which it goes is quite flat? Yes.
92. And continues so as far as Walgett? Yes.
93. If it can be shown that the traffic will not pay interest and working expenses upon the cheapest line that you can construct, using the standard gauge, will you be prepared to consider the advisability of using a narrower gauge? I would not recommend the use of a narrower gauge.
94. You would not depart from the standard gauge under any circumstances? I would not depart from it in this case, or in any similar case. The saving would not be sufficient to pay for the inconvenience.
95. Do I understand you to mean that this is not the country in which a departure from the standard gauge could wisely be undertaken? Yes.
96. What are the prospects of our being able to make these extensions upon the standard gauge, if they cannot be constructed for smaller amounts than your estimate? Well, it is not part of my business to give an opinion as to the advisability of making these lines. My function relates merely to the construction of lines.
97. The extension of the railway into distant districts is so intimately connected with their financial prospects that we have to consider these matters. It becomes a question for us to consider whether we cannot construct railways at a cheap enough rate to enable them to pay? If it were possible to save £300 or £400 per mile by narrowing the gauge, the increased working expenses of the line would more than counterbalance that saving. To extend a narrow-gauge railway from Narrabri for 50 or 100 miles would mean the construction of new rolling stock to work the line. The station yards would have to be longer and the sidings would have to be longer. Thus the cost of stations upon the narrow-gauge line would be as great as the cost of stations upon the standard-gauge line; while at the junction of the two systems, you would require to have a double set of sidings.
98. The necessary additions to existing stations would more than swallow up any saving? I think so.
99. Under what conditions could a narrow gauge of railway be favourably considered? In the case of a mountain line, having a mineral traffic, I should consider that there might be circumstances justifying the use of a narrow gauge.
100. These lines are suitable for heavy country rather than for flat country? Yes. I should not recommend them for flat country under any circumstances. I cannot think of any circumstances under which they would be useful in flat country.
101. *Mr. Hoskins.*] Are you aware that means have been devised for moving the body of the truck from a standard-gauge under-gear to a narrow-gauge under-gear? Yes; but it would be out of the question to do that where the gauges differ very materially. On the standard gauge we have trucks to carry 8 tons, and bogey trucks to carry 20 tons or more. You could not very well put these trucks on to under-gear suited for a narrow gauge, because it would be too large. On the other hand, the bodies of narrow-gauge trucks would be too small for use on a standard-gauge line.
102. *Mr. Lee.*] I presume that the difficulty of transshipping stock from one gauge to another would be a great objection to the use of two gauges? Yes.
103. I understand that latterly this difficulty has been accentuated on both our northern and southern boundaries, and that great inconvenience and loss have resulted through having to take stock out of one train to put them into another? Yes.
104. In many cases stock have travelled long distances to avoid this transshipment? Yes; and I think that if the proposed railway were constructed it would be found that a great deal of stock and produce would be sent to Narrabri to avoid transshipment and would be lost to the extension.
105. You would not consider any alteration of gauge in connection with the proposed extension? I would not.
106. Whatever may be said in favour of a narrow gauge, you are strongly of opinion that it is not suitable for the class of country and under conditions such as we are considering? No; there would be no gain in using it here.
107. Have you any knowledge of what these lines have cost in other parts of the world? Yes; I have collected information in regard to them.
108. *Mr. Hoskins.*] When you were in Europe a year or two ago did you see any of the narrow-gauge lines that they have on the Continent? Yes; I saw the Decauville system at work.
109. How do the narrow-gauge lines answer there? They answer very well as local feeders, or to run to separate centres. They do very well to bring produce to market towns.
110. I suppose you know that many engineers in England consider that light narrow-gauge railways might with advantage be introduced into England? I think there is a great deal of opposition to them. Some people have always advocated the narrow gauge, but I think that those who hold to the standard gauge are in the majority. I can see no fatal objection to the narrow gauge under special circumstances, where a standard gauge would be so costly as to be prohibitive.

- H. Deane.
19 Oct., 1897.
111. A narrow-gauge line should be altogether independent of a standard-gauge line, so that the rolling stock and everything connected with it may be worked quite separately? Yes. I take it that the great advantage of a narrow-gauge railway is in the small curves that you are able to use. Of course, that would be no advantage in flat country. The drainage, which is a great question in connection with the proposed line, would be the same whether you had a narrow gauge or the standard gauge, and the station accommodation would be about the same in either case. Any saving that would be effected would be chiefly in the width of the earthworks and in the lightness of the rails.
112. Would there not be a saving in the bridges? Yes; but not a very great saving.
113. I suppose you have read of the narrow-gauge line in Wales? Yes; I have been over that line.
114. It works very well? Yes; but it is a line of a special character.
115. Many people have thought that we want lines of a special character? The Festinogg line has all its grades in the one direction. The slate trains are brought down from Festinogg with the use of the brakes only. All that the engines are required for is to take the empty trains back. Of course, there is now a considerable amount of passenger traffic there too. I do not know that there is any place in New South Wales where the conditions are the same as they are at Festinogg.
116. *Mr. Lee.*] Would it cost as much to maintain a narrow-gauge line as to maintain a standard-gauge line? I think so, very nearly.
117. What would be the saving upon the proposed line if the narrow gauge were used? If you used 60-lb. rails, which they use in Queensland, the saving would be practically nothing.
118. Would you save £300 per mile? Not with 60-lb. rails.
119. Assuming that £300 a mile could be saved, the total saving would be £16,800, and the annual saving would be 3 per cent upon that amount, which would only be a small proportion of the whole annual cost of the line? Yes.
120. If we saved £20,000 upon the whole line, it would hardly affect the prospects of the line, looking at it from the Commissioners' point of view? Yes; but we could not save £20,000 on the line. Mr. Stanley and others who have made comparisons between the standard and other gauges assume that much lighter rails than 60-lb. rails are to be used.
121. There is very little difference in initial cost between the lines you are making and the 3-ft. 6-in. lines which they make in Queensland? Very little.
122. I suppose you do not know what the difference is? There would be no saving in rails, and the cost of bridges would be about the same. The saving would be in the width of earthworks, and in the length of sleepers.
123. Are you of opinion that £300 a mile could not be saved on the proposed line? Yes; unless you used a 2-foot gauge. You could save it then.
124. Could you put down a 2-foot or a 2-ft. 2-in. gauge for £1,800 a mile? I think so; but the rails would be much lighter than I propose to use, and to carry the same traffic the trains and therefore the station-yards would have to be longer.
125. Before you could recommend the introduction of the narrow gauge into this country there must be special conditions which do not exist in this case? Yes.
126. *Mr. Trickett.*] Mr. Jones in his report speaks of the land on the north side of Namoi as less liable to floods than the land on the south side of the river;—has a line been surveyed on that side of the river? No; there has been no survey made there.
127. Will you look into the matter? Yes.

WEDNESDAY, 20 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane.
20 Oct., 1897.
128. *Vice-Chairman.*] You have some information to give the Committee? I was asked yesterday to obtain information upon two points. One was upon the liability to flood of the country on the northern side of the Namoi; and the other had to do with the survey between Woolabra and Collarendabri. I have not been able to get information in regard to the country on the north side of the Namoi; but I have ascertained that Mr. Corbett, formerly of the Roads Branch, and now in the Sewerage Construction Branch, has been in the district, and I have asked Mr. Davis to get him to call to-morrow morning. I will then see what information he has, and if it is thought desirable the Committee might examine him. With regard to the Collarendabri line, a survey has been made and an estimate prepared. The estimate is divided into two parts. The first part includes a length of 69 miles 64 chains, starting from Woolabra, on the Narrabri to Moree line. That part reaches up to the edge of the flooded area of the Barwon. The second part goes entirely through flooded country, and is 10 miles 72 chains in length. The estimate was divided because I thought it would probably be decided, if the construction of the line were sanctioned, to stop on the south-eastern side of the Barwon. It is proposed to use 60-lb. rails. The ruling grade would be 1 in 100, and the sharpest curve would be a curve of 15 chains radius. There is only one such curve, and that is at the junction of the main line. The total cost of the first part would be £160,362, or £2,297 9s. per mile. The second part would cost £47,436, or £4,351 18s. 6d. per mile, the extra cost being due to the timber construction of the viaducts. Included in the total is a sum of £10,391 for the openings over the main channel of the Barwon, and £10,650 10s. for other timber openings. I have included in my estimate of the first part of the line the cost of the station arrangements at Collarendabri, because, whether the line stops on this side of the river or is continued across the river, that station would have

have to be constructed. The cost of the second part of the line is merely the cost of carrying the line on into Collarendabri and making a small station on the southern side of the river.

129. Without the cost of the stations, I suppose there would be a considerable reduction in the estimate of the first section of the line? Yes; if you took out the cost of the Collarendabri station it would make a difference. The total cost of station works and station buildings on part 1 of the line would come to £207 per mile. That includes the cost of intermediate stations.

H. Deane.

20 Oct., 1897

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

130. *Mr. Farnell.*] Have you studied the proposal now before the Committee? The Railway Commissioners have considered it very carefully. In their report they say that the line would show a considerable loss, and, therefore, they do not recommend its construction.

H.
McLachlan.

20 Oct., 1897.

131. Have you anything to add to the report? No; it expresses the opinion of the Commissioners.

132. I suppose the Commissioners are satisfied to take the figures supplied to them by their officers? Yes. It would be better for the Committee to examine some of these officers. The details of traffic have been estimated from figures supplied for the most part by Mr. Harper.

133. From your knowledge of the country through which the proposed railway will go, do you think the line would affect the proposed line from Byrock to Brewarrina? I have not been through the country; but I believe the line would have a slight influence upon the Brewarrina line. Mr. Harper shows that the goods carried by river during the year 1895 amounted to 790 tons, and the wool to 2,055 tons. That traffic would pass Brewarrina.

134. It is possible that a good deal of the traffic that would otherwise go to the Brewarrina line will be diverted by the proposed line? Yes; but the line which would take most traffic from the proposed line is the proposed line to Coonamble and the line to Collarendabri. The first section of the Coonamble line, that from Noverre to Warren, is now nearing completion, and I believe the Government have under consideration the extension of the line from Warren to Coonamble.

135. Will the railway system receive the full benefit of the traffic from this district if the proposed railway is constructed? There would be no competition to meet. We should get all the traffic.

136. *Mr. Wright.*] I suppose, under no circumstances, would it be wise to construct a line from Narrabri to Pilliga, and another line from Byrock to Brewarrina? The Commissioners are of opinion that neither line should be constructed.

137. Under no circumstances would they favour the construction of both lines? No.

138. One would unquestionably compete with the other? Yes; though to a comparatively small extent. The Collarendabri and the Coonamble lines would compete with the line.

139. Any line that brings Walgett nearer to Newcastle than it is now, will attract traffic from the Brewarrina district? Yes. I should not like to say too much about the Walgett line, because a definite proposal to extend the railway to Walgett has not been considered by the Commissioners; but in 1889 they said that they felt that it would be better to connect Walgett with the Western line, rather than with the North-western line.

140. Lines approaching Walgett from the west and from the east would compete against each other? Yes.

141. *Mr. Clarke.*] Would the proposed line interfere in any way with the line from Warren to Coonamble? Yes; both lines would be draining the same country. I do not think that Coonamble is more than about 60 miles from Pilliga in a straight line.

142. Would a line from Coonamble to Walgett interfere with this line? Yes; still more so.

143. You know nothing of the country through which the proposed railway would go? I have not been through it; but officers of the Department have been over it.

144. *Mr. Lee.*] The Commissioners have now reported against two proposed routes to connect the railway system with the Darling;—have they any reason for reporting against these proposals other than that the lines would not pay? Their main reason is that the lines would be unprofitable.

145. Very great importance is attached by them to the possibility of competition by a navigable river? Yes.

146. There might be competition at a place like Brewarrina; but do you think that the river could compete with the line under consideration? As a matter of fact the probable receipts from the proposed line have been calculated upon the most favourable basis, and no reduction has been made on account of river-borne traffic to Walgett. At Pilliga there is not much traffic; but higher up there is a good deal of traffic which would be affected in good seasons by the proposed line.

147. Is it likely that wool would be sent by steamer from above Walgett to Bourke, a long and dangerous river journey, and then sent by train from Bourke to Sydney, a distance of 500 miles, when it could be sent by train from Pilliga to Sydney, a distance of only 400 miles? I think that under favourable conditions the traffic would come to Pilliga.

148. Therefore, this river-borne traffic which has been mentioned would not be lost to the railway? The Commissioners have credited the railway with that traffic. If, however, there were a good river, and the road between Walgett and Pilliga were in a bad condition, it is likely that wool would go by steamer to Bourke, in order to get a market in Sydney.

149. But the river rate from Walgett to Bourke would not be less than £1 a ton? I should not think so.

150. Then there are all the dangers and delays of a long journey, and the high insurance rates? The Commissioners have allowed for this traffic in any case.

151. The only reason why traffic might go by river would be the distance from Walgett to Pilliga? Yes.

152. If the line were taken to Walgett there would not be the same danger of loss of traffic? No.

153. If the traffic went down the river the loss on the line in any one year would be £5,600 instead of £4,300? The Commissioners say that there is a possibility of £1,300 worth of traffic being taken by the river.

154. That would make the loss on the line £5,600 a year? Yes.

155. Do you see any immediate prospect of the line paying? I do not think there is any prospect of the line paying for a long time to come.

156. In the opinion of the Commissioners, does this part of the country require opening up? No; I think not. They do not see any prospect of its immediate development. Of course, if it became an agricultural district we should at first lose a certain amount of traffic, because we now send a great deal of agricultural traffic to the district.

- H. McLachlan.
20 Oct., 1897.
157. Do you think there is a demand for railway convenience, in the interests of those who have pioneered that country and have settled there, and to create further settlement? Not at the expense of the country.
158. Has any special reason been brought before the Department for the construction of this line? Not to my knowledge. These matters are referred to the Commissioners by the Minister.
159. Both the Commissioners and their officers must, by this time, have an intimate knowledge of the whole Colony, and should be in a position to know where any pressing demands for a railway exists; they believe that if this line were made there will be an annual loss to the country, and that there is no prospect of the line paying within the near future? Yes; of course they look at the financial aspect of the question more than at any other.
160. Do they oppose this extension because they think the railway should tap some other point on the Darling? Their previously expressed opinion is that the best connection would be from the Western line through Coonamble to Walgett.
161. Have they favoured any connection from the Moree line? They have favoured an extension from Woolabra to Collarendabri.
162. But they think that there is no justification for the proposed extension? That is so.

FRIDAY, 22 OCTOBER, 1897.

Present:—

THE HONORABLE FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
The Hon. JAMES HOSKINS.	HENRY CLARKE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	CHARLES ALFRED LEE, Esq.
FRANK FARNELL, Esq.	

The Committee further considered the proposed Railway from Narrabri to Pilliga.

John Herrick Corbett, Resident Engineer, Department of Public Works, sworn, and examined:—

- J. H. Corbett.
22 Oct., 1897.
163. *Mr. Clarke.*] Are you well acquainted with the country between Narrabri and Pilliga? Yes.
164. And the proposed line of railway? Yes.
165. Have you a written statement prepared? None whatever.
166. Can you give the Committee any information as to the country through which this proposed line would pass? I can give no information except as regards floods.
167. Is the proposed line liable to floods? Yes; from Wee Waa to Pilliga.
168. But only in flood time, after heavy rain? Yes; after heavy rain.
169. Are you aware that the proposed line is to be made chiefly without being ballasted? No, I am not.
170. Would the line, not being ballasted, or being partially ballasted, be secure, or safe? It would not be secure or safe in my opinion.
171. Do you think it would require ballasting the whole way from Wee Waa to Pilliga? It would.
172. But if the Engineer-in-Chief thinks it would be safe to have it partially ballasted, would you be inclined to dispute his opinion? Looking at the section I should say that it would all require ballasting.
173. Would that plan give you an idea as to how the railway would be constructed? Yes; it is a surface line, apparently, and it certainly requires ballasting.
174. You still think it would not be safe for a portion of the line to be constructed without being ballasted? From my knowledge of the country, I think the whole of it would require to be ballasted from end to end.
175. That is contrary to the opinion of the Engineer-in-Chief for Railway Construction? I am sorry for that; I cannot help that; that is my opinion.
176. Is ballast easily obtained in that district? No; indeed it is not.
177. Where would it have to come from? It would have to be brought up, I should say, from the main line between Werris Creek and Narrabri West.
178. Is there much settlement there? Very little. Mind, I am speaking of the main-road track.
179. Say 10 or 15 miles on each side of the proposed line? Then you cross the river on the right-hand side. It is only from 4 to 6 miles from the river all the way down. Of course there are large stations there.
180. But not a large population? No.
181. It is purely a pastoral country? That is all, and most of it scrub.
182. Not fitted for cultivation or for settlement? I daresay it would be if it were cleared—that is, parts of it.
183. But would the revenue from the traffic depend upon the wool, or anything of that kind; it would not be agricultural produce? No; I cannot speak as to the traffic, more than to say that the teams come up that road.
184. Are you aware that, if this line is constructed, there will be a considerable loss? I am not.
185. £4,350 in round numbers? I have not gone into that question at all.
186. Still you think there would be sufficient traffic on this line, say in the future, to pull up this loss? That may be; but I cannot say.
187. Can you give an opinion? I can give no opinion one way or the other.
188. Then you cannot give an opinion, except as to what you have already stated? The floods: that is all I was asked to give an opinion on. I know nothing about anything else; but I know the line is liable to be flooded the whole way down.
189. *Mr. Lee.*] Have your duties taken you to that district very much? I was there for a little over two years.
190. Between what points? Between Narrabri and Pilliga.
191. What were you doing there? I was Resident Engineer in charge of the roads, under the Roads Department.
192. Have you seen that country under flood? I have.

193. Would you be good enough to describe to the Committee, on the wall map, using names to locate your positions, the extent of country that you have seen flooded? From within 5 miles east of Wee Waa down to Pilliga. J. H. Corbett.
22 Oct., 1897.
194. Have you seen the whole of that country under flood at one time, following the railway route? Yes.
195. More than once? Oh, yes.
196. More than once in two years? I have seen it three times in two years, I think. The floods are very sudden.
197. That is during the last two years? That is within six months.
198. Have there been any exceptionally high floods during that period? One was a high flood.
199. When was that? That was about eighteen months ago—just before the drought commenced.
200. I suppose the water would be the overflow from the Namoi River? Not at all. The water comes down from Baradine Creek and other creeks to the south, not shown on this map. There are eight bridges between Wee Waa and Pilliga not shown on this map.
201. Where does the road run between the two points? I should say between the red line and the river, that is, on the south side of the river.
202. Has your road been covered with flood-water? Yes.
203. Is it a made road? No.
204. Not macadamised? Oh no; it is a mere corduroy road.
205. What would be about the general depth of water during a flood of that kind? It varies very much.
206. Say the highest flood you have seen? I should say, in some places only 18 inches; in other places, 3 feet; in other places, 10 feet; and in other places you cannot pass at all during a flood.
207. Would the highest point of that line that you have described be covered to the depth of 18 inches? That I cannot say.
208. Have you not found any old flood-levels in that district? Many of them.
209. Did you find any showing a greater height than you have ever seen? I do not think so. I have seen the highest and taken the highest at two bridges.
210. Where were those bridges? One close to Pilliga, and the other near Wee Waa.
211. Were they both high-level bridges? They are supposed to be above flood-level.
212. There has been no flood so high since? No.
213. What area of country would a high flood cover? I could not tell you the number of acres.
214. But what distance in miles? About 4 or 5 miles back from the river in places.
215. Do we understand that that country would be almost one continuous sheet of water under a high flood? Yes, certainly.
216. And how long would the water remain? Not long—perhaps three or four days.
217. But quite long enough to suspend all traffic? So it does; the coaches are very often stopped.
218. Then, if the running track of a railway is to be kept above flood-level, what height, in your opinion, should it be kept above the surface of the ground? I should say the section I have looked at ought to be raised about 3 feet.
219. Have you known the Namoi to overflow and flood the country on that side? Yes, I have, but not from local rains. The floods come down from above suddenly, and spread over the country down below.
220. To have a railway track that would be available for traffic in all weathers, it would have to be at least 3 feet above the surface of the ground? So far as I can say, from this section.
221. That is the section supplied by the Engineer-in-Chief for Railway Construction? Yes.
222. Can you tell us what effect the flood-waters have upon the embankments there, what is the nature of the soil—how does it stand? It is all sand, nearly the whole way.
223. Therefore the subsidence must be very great after a flood? But you are speaking now of newly made banks.
224. Yes? They would have to be made up $1\frac{1}{2}$ inch to the foot. Supposing the bank were 3 feet high, you would have to add $1\frac{1}{2}$ inch for each foot in height.
225. That would be another $4\frac{1}{2}$ inches? Yes.
226. Practically about 3 feet 6 inches? That is about it.
227. Then I want to know whether the nature of that soil would stand contact with water? Certainly not, unless there are plenty of culverts and bridges made. It would not stand as a dam.
228. Is not the soil of a friable nature—that is, it crumbles away easily? I should say it would crumble away.
229. You have experience on your roads? Yes; and the soil all goes away the first flood.
230. So far as the roads are concerned, the embankments are generally washed away? We never make embankments; we simply cut down trees, and make a corduroy road between the bridges. We avoid making embankments, because they will not stand.
231. That is your reason? That is my belief.
232. If that be the case, what do you think would be the position of the railway embankments? I should say that they would go at once, unless there were plenty of water-ways.
233. But admitting that there are water-ways, and knowing at the same time it will be impossible to put in waterways that would give the same scope as nature now gives to the water—because it has the uninterrupted country to run over at the present time—if you put up a railway line you practically make an embankment, do you not? Certainly.
234. Consequently you could not possibly drain the water off as effectively as nature now does? No.
235. And if the embankment is 3 feet under water, will the earthworks stand it? It will not stand it at all.
236. Will the current be too strong, or will the embankments subside? Both, unless you make openings for the water. If you make a dam of the embankment the whole of the embankment must go; but if you leave a sufficient number of openings, you are perfectly safe.
237. But if there is an accumulation of 18 inches to 4 or 5 feet of water over the face of the open country now, will there not be a much higher depth of water when this dam, in the shape of a railway line, is erected? Certainly.
238. Therefore, the conditions will be much more severe than they are now? Yes.
239. It is from that point of view I would like you to say how you think the railway line would stand the flood? I say I do not think it would stand it, unless sufficient waterway were provided.

- J. H. Corbett. 240. Do you not perceive how difficult it is to make sufficient waterways to carry off the water which nature itself will not carry off? There is no difficulty about it; it is all a matter of money.
- 22 Oct., 1897. 241. Do you think if ample waterways were made that the embankment would stand? Certainly.
242. That is to say, you do not think it would partially disappear by subsidence? I do not think so at all.
243. Well, if an earthen embankment will stand so well, why the necessity for ballasting? You must have ballast on any embankment.
244. You know there are some lines in your part of the country without ballast? I do not think there are many that will stand long.
245. From Narrabri to Moree, for instance? That has not stood.
246. A large portion of it is not ballasted? It is not all ballasted; but there is some ballast on it all.
247. In the worst places? Yes.
248. Supposing the same conditions were applied to this line? That might be; but I am not prepared to speak about that. In fact, in this part of the country, you never can tell until you build a line of railway and see where the water wants to go.
249. Is there any special reason for taking the Government road on the southern side of the Namoi? I think it is the higher of the two, taking it all through; but I have never taken any continuous levels.
250. And of course you avoid crossing the river? Yes. I have been at one or two stations on the other side—at Drilldool, for instance, which is built on a knoll—and I have seen the flood-levels there showing that the whole place has been surrounded by water; the house has been simply on an island.
251. You have been to Walgett? I have, once.
252. Is it in your district? No, it is not.
253. Have you seen the country between Walgett and Pilliga? I have; but I went to the other side of the river. I went up from Bucklebone, on the other side of the river, that being a shorter road.
254. Is it not a fact that, under conditions of heavy floods, nearly the whole of the country from Walgett to Wee Waa is under water? I cannot speak from Pilliga to Walgett; but I should say so.
255. What do the old residents say? They say it is liable to floods very often. They do not know the moment floods may come on them.
256. Are you of opinion that any special condition should be observed in making the railways into that country? I should not like to give an opinion.
257. I mean any special conditions as to their height and their being ballasted? If you provide sufficient waterway, and make the banks high enough over flood-level, you are quite safe.
258. The soil is good enough to stand? The soil is good enough, as I think.
259. Compare it with the Moree line—that would be a fair comparison, would it not? That is quite a different soil. The Moree soil is black, and this is nearly all sand.
260. The country on the north side of the river is much better, is it not, than on the south? It is lower.
261. But it is better country? Oh, far better country.
262. What is the trend of the traffic in that district—to and from what points does the bulk of the traffic go and come? From Walgett to Pilliga, and on to Wee Waa, and up to Narrabri on this side. Then there is a lot of traffic which goes the other side in dry weather. In wet weather they always use the Pilliga road, so far as I have seen.
263. Is the flow of traffic from Walgett to the railway terminus at Narrabri? I think so, unless the river rises high enough at Walgett to allow the steamers to take the wool away.
264. The usual class of loading, such as wool and station produce, comes in from there, I presume? Oh, yes.
265. Anything else? I do not think so.
266. Any minerals? I do not think so.
267. Is Narrabri a centre for much of the country west of it; take Pilliga, which is west of it, as a starting point, and look to the north, and the south, and the west; that is the country which supplies Narrabri, is it not? Yes, a great deal of it. There is a great deal comes in from Collarendabri as well.
268. Would not that go to Moree now? I suppose it will, but yet I do not think so; I think it will come into Narrabri.
269. But Moree must be much closer than Narrabri? It depends on the roads; there are large stations that do not think it worth while.
270. But those are the stations that are as close to Narrabri as to Moree at the present time? I think they are closer to Narrabri.
271. But the Collarendabri traffic must go to Moree? The Collarendabri traffic will go, of course; but there are a lot of stations between Narrabri and Moree that prefer coming in to Narrabri.
272. I suppose the greatest traffic over these roads would be in the months of December, January, and February, would it not? Well, after the shearing.
273. Would those three months embrace the shearing season? I do not think so.
274. Would from October to February cover it? Yes.
275. Is that the period of the year when you have the heaviest rains? Yes, certainly.
276. Have you known, of your own knowledge, the dray traffic to be suspended for any length of time owing to the badness of the roads? Yes, frequently.
277. I am speaking of the ordinary bullock teams that would travel over almost anything;—have you known that traffic to be stopped? Yes, I have; I have been stopped myself.
278. In your own buggy? In my own buggy.
279. And on your own road? On roads in any district.
280. As to the traffic that lies to the west of Narrabri, towards the Barwon River, and various points north and south of it *en route*, do you think it is likely to be captured by the proposed railway extension to Pilliga? Not all of it, certainly; part of it may be.
281. If that line is made, would not the Collarendabri traffic still go to Narrabri or Moree? I think so.
282. But the Walgett traffic will, of course, go to Pilliga? The Walgett traffic will go to Pilliga.
283. Take the points, say, between Wee Waa and Pilliga, but lying 40 miles to the west, and to the north, and 40 miles to the south,—do you not think, when once the wool is on the drays, it would be more likely to go to Narrabri than to stop at Wee Waa? I think so.
284. It will have to be put on the dray in any case? Yes.

J. H. Corbett.
22 Oct., 1897.

235. And the distance from Wee Waa to Narrabri is so insignificant that probably the drays will continue their journey? They will go through to Narrabri, I think.
236. Therefore, that portion of the trade will not be arrested by this proposed extension? I do not know anything about the trade; but I do not think it is likely. I think if a man once loads up his waggon, and has only 25 miles to go to a railway station, he will go on.
237. If your roads were macadamised, would that enable the traffic to proceed at all times, except in flood? It would.
238. What would it cost per mile to make macadamised roads? I would have to go into a tremendous calculation to answer that. In the first place, you could not get anything to macadamise the roads with up there.
239. Macadamisation has not been attempted there for want of material? For want of material.
290. Can you give us an approximate idea of the cost per mile? There is a very good quarry at Narrabri, and I know I had to pay on behalf of the Government something like between 5s. and 7s. a cubic yard for stuff unbroken up for metal.
291. How many yards to the running yard? One and a half.
292. Well, that would be about £650 per mile for metal? Well, I should think so; but I did not do much of that.
293. At that rate you could make a good macadamised road for £1,000 per mile? We would have to form the road first.
294. But it would not cost you £400 a mile to form the road, you know? It all depends upon what the distance is. Some parts of the road are very rough, and you have to cut through in places; other parts are very easy. It is useless to put metal on the black-soil plains, because it disappears as fast as you put it on, and sinks in.
295. Wee Waa is a small township, is it not? Yes; but it is rising.
296. How many residents are there? About 800, I should say.
297. Pilliga—how many there? With the district round about, I think about 1,100.
298. Have they progressed much since the line was open to Narrabri? Wee Waa has. When I was at Pilliga last they were building very fast.
299. Which side of the river does the coach run? On the side the proposed railway would run; on the south side.
300. Is there much delay at any time in the delivery of the mails? Yes; but only in flood time.
301. So it would appear that under ordinary circumstances the traffic would proceed in the ordinary way, except under exceptional conditions, those exceptions being floods? Yes.
302. And nothing short of a railway built out of flood reach would ever meet the difficulty? No.
303. *Mr. Hoskins.*] Have you been over the Narrabri to Moree railway? No, I have not, except as far as Edgeroi.
304. But have you walked over it to see the principle on which it is constructed? Yes.
305. I presume you are aware that the Narrabri to Moree railway is what is termed a light railway? I am.
306. Constructed at a smaller cost than the average railway—say the railway from Gunnedah to Narrabri? Yes.
307. Did you notice that the line there was made by making wide drains at the side, and taking the stuff out of those drains, and banking it up on top of the surface of the ground so as to make a sort of embankment? Yes, what we call side-cutting.
308. Did you also observe that the sleepers were much closer together than on ordinary lines? I did.
309. There is no ballast, is there, on that line, except in places? The part I saw was nearly fully ballasted.
310. But where it is ballasted it is ballasted to a very shallow depth compared with other lines? Compared with other lines it is very shallow; but there was about 9 inches on it.
311. Do you not think that, if the same principle were observed in the construction of what we call a light line of railway from Narrabri to Pilliga—that is, by having wide side-drains, and the material taken from the drains banked up so as to make a railway embankment, and the ballast, which must be scarce in that district, used only in the worst places, and the sleepers placed closer together—the line could be worked there with as great facility as on the Narrabri to Moree railway? Certainly, if plenty of waterway is left.
312. In that country, in rainy weather, there are springs, gullies and watercourses, which make the ground very rotten if there is not sufficient waterway? Yes.
313. You find that difficulty with the roads? Yes; but we do not bother about the roads; we just cut down trees and corduroy the roads. We have corduroy roads, because there is no ballast, and we could not afford to get it.
314. Then I gather that the fact of the country being flooded after heavy rains would not, in your opinion, if the line were made on an embankment with plenty of waterways, be any obstacle in the way of constructing a light line of railway? I do not think so.
315. *Mr. Trickett.*] How far is Edgeroi along the Narrabri line? About 30 miles, I think.
316. Then you had an opportunity of seeing this line? I only drove over it in my buggy along the line. They had a road made all along it, and I have often driven along that as a short cut on going home to Narrabri; but I never examined the line.
317. But I thought you might have observed what the effect of the washaways would be which we heard of? I did not see them.
318. Because you said, in answer to Mr. Lee, that the Narrabri to Moree line had been washed away? That was only hearsay; in fact, I heard it from the engineer who built the line.
319. Was it after a very heavy rainfall that the floods occurred within the last two years along the road from Narrabri to Pilliga? Yes; local.
320. A very quick rise? Just so.
321. And a sudden subsidence? Yes.
322. Is that part of the country subject to that? Yes.
323. The soil between Narrabri and Pilliga is, I understand, of a sandy character; while that along the Narrabri to Moree line is more of a red clay? It is black soil.

- J. H. Corbett. 324. Well, would not the sandy stuff between Narrabri and Pilliga be much more likely to wash away than the black soil? No.
- 22 Oct., 1897. 325. It would not? I do not think so.
326. You spoke of plenty of waterways;—would you give us an idea of what you think would be plenty of waterways? If you come to a large creek you must get the flood area, and calculate the width of your bridge so as to allow for the water to get through.
327. I am not referring to bridges; I am speaking of box-drains; is it not box-drains which they propose to put along there for railway purposes; there will not be any bridge, I understand? No, culverts. As long as the water gets away from under your line, that is sufficient.
328. Is the country of a uniformly level character;—do these flood-waters sweep over it in one big mass, or are there defined waterways? Defined waterways, nearly all of them.
329. Then the danger from a washaway would not exist over a greater part of the line, but only where these waterways occur? You can build your embankment any height as long as you give sufficient waterways over the flood-level.
330. *Mr. Hoskins.*] Although the country is called level, there is sufficient depression in the ground, if there are ample waterways, for the water to flow away readily when the rain subsides? Plenty; the water will always get away there.
331. *Mr. Trickett.*] Do you think the line would have a better chance of standing if it were built further away from the river bank? I do not know, because I have never seen the line. I have never been over it. I am judging from the old road; but I believe the railway line would run close to it all the way.
332. You are not able to give an opinion as to whether better country for the construction of a railway exists more to the south of the river? No, I am not.
333. Excepting the two townships of Wee Waa, and Pilliga, there is very little settlement along the line of route? None at all. Following the river there is none, except at Wee Waa, Pilliga, and Walgett.
334. What is the nature of the country between Narrabri and Pilliga? All scrub.
335. Is there not almost a forest towards Pilliga, or is it scrub? There is a forest 8 miles to the southward.
336. Is it not good timber there? Very good timber is to be had there.
337. But this country it thickly scrubbed? There is nothing but scrub; no timber in it.
338. Except on towards Pilliga? That is all.
339. What is the character of the timber there? Chiefly ironbark.
340. That will be suitable for railway construction? Oh, yes—for sleepers, girders, and such things.
341. Some years ago, in 1891, Mr. Robert Jones, railway engineer, made a report upon various routes to connect Walgett with the railway system, and in dealing with the connection between Narrabri and Walgett, he strongly advocated that the line should go on the northern side of the Namoi instead of the southern side;—what do you think of that proposal? I think he was wrong; but mind, I am only speaking from driving over the country.
342. At page 17 of his report, he says:—
This line passes over ground less liable to inundation than on the south side of the river. It also serves a larger area of good grazing country, and would be within easy access from Pilliga to Wee Waa, the latter more especially. It also passes through the centre of extensive settlement on Pian Creek and Jew's Lagoon.
Do you know sufficient of the country to say anything about that? I do not know of any extensive settlement on Pian Creek; I have been down there frequently.
343. There is some settlement? There is some.
344. Is it a township? No.
345. What is Jew's Lagoon;—is there a settlement there? No.
346. There is some, I suppose? Oh yes.
347. Not very extensive? Not very extensive.
348. What about the country not being so subject to flood on the north side;—what do you think of that? Here and there he may get hillocks of sand that he will not get on the southern side; but I should prefer the southern side, because the floods are higher on the northern side. The trend of the country is down that way; it falls to the north-west.
349. Then the flooding on the southern side of the river is not occasioned by the river overflowing its banks, but by the rush of water to the river? By the rush of water through all these creeks to the river, and local storms.
350. And, therefore, on the northern side of the river you get the overflow of the whole of the river? Of the whole of the river.
351. That is why you say that that part is more liable to floods than the southern side? That is what I think, although here and there it is higher.
352. Could you give an opinion as to the character of the country there for grazing, comparing the north with the south? The southern side cannot be compared with the northern; the northern is much better.
353. You agree with Mr. Jones in that respect? Yes.
354. There is not much alienated land along this route? I think it is all Government land.
355. Therefore, the traffic to come to a railway is very much in the future;—it would depend largely upon future settlement? Yes.
356. As far as the district is at present concerned, do you see a very large revenue likely to be derived from the railway? That I cannot say; but judging from the team traffic, I think there ought to be.
357. You could not say to what extent? I could not.
358. You have not gone into any figures? No.
359. Are you able to say whether, in considering a line of railway such as this, Walgett is not the ultimate place to be looked to as the destination of the railway? I do not know; but you want to extend it beyond Walgett.
360. But do you not look upon Walgett as a place which is deserving of railway connection? I cannot say that.
361. You are not sufficiently acquainted with the railway systems of the Colony to be able to say whether or not Walgett seems to be a central spot between two lines on either side? I am aware that Walgett is a central spot; but whether it would pay to construct a railway there —
362. I am not asking about paying; but whether Walgett does not seem to be a kind of central spot with two lines on either side of it? Oh, yes.

363. I suppose you must be aware, from your residence in the district, that Walgett has for many years been agitating for a railway? Yes, I have heard of that. J. H. Corbett.
364. Have you ever considered the other lines of railway, or the other routes by which Walgett should be approached by rail? I have never been asked about it. 22 Oct., 1897.
365. You would not like to say whether the connection from Mudgee, for instance, would be a more direct and better route? No; I do not know the country at all.
366. *Mr. Hoskins.*] Are there any evidences of a trial survey for a railway having been made between Narrabri and Pilliga? Yes; I have seen the pegs myself as far as Wee Waa; I have met them occasionally between Narrabri and Wee Waa.
367. Do you think that the line, as pegged out by the railway surveyors, would be likely, if made, to be the least liable to be flooded? That I could not say, unless I went over the ground myself. I need not tell you it is very deceptive country; the water comes down from the south, and the further south you go the more you head the watercourses. There may be a better line, but I would not say.
368. Are there not in that part of the country blind gullies and dry gullies where for nine months in the year no water runs? Quite right.
369. And you would suggest making ample waterways at all these places by having culverts constructed? Yes.
370. So that when there was heavy rain, the water would get away, and keep the road fairly dry? So as to keep the road safe.
371. Therefore, your reference to waterways has no direct application to bridges over creeks, but to culverts? To culverts, to keep the embankments safe the whole way.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

372. *Mr. Lee.*] Have you ever had occasion to report on this district more than once to the Commissioners? Only once. J. Harper.
373. Before opening the inquiry, could you give us this information: you made an estimate of the probable traffic to Moree before that line was sanctioned; could you tell us how your estimate of traffic compares with the actual traffic? We have not had the line in our possession during a season. It has only been in our possession about six or seven months, and we lost the greater part of the last wool season. It was in the hands of the contractor during the busiest part of the last wool season; so it is rather premature to give that information yet. 22 Oct., 1897.
374. In giving us the particulars of the traffic of this line under discussion, will you be good enough to show if you have separated the traffic from the traffic that you estimated for the Brewarrina to Byrock line? I will be able to do that.
375. I think I will now let you proceed in your own way? I will begin by reading the following report:—

PROPOSED EXTENSION OF THE RAILWAY LINE, NARRABRI TO PILLIGA.
(Distance, 56 miles; estimated cost, £128,650.)

As directed by the Commissioners, I have had searching inquiries made into the probable traffic of this proposed line. For the purpose of the estimate, a favourable year (that of 1895) has been taken, and the actual traffic carried to and from the districts which this line will serve has been taken as the basis.

Bearing in mind that a projected extension from Nevertire to Coonamble has already been dealt with by the Commissioners, all the traffic included in that estimate has been excluded from the one under notice; and as the proposed extension from Woolabra to Collarendabri is also under their consideration, traffic which might be expected to fall in to the latter line has also been excluded from the Pilliga estimate.

The season of the year 1895 has been taken as being one which was not only most favourable as far as the district was concerned, but also one in which the condition of the river to Walgett was of a most favourable character for the transport of goods to Bourke; and as a matter of fact, two-thirds of the traffic falling in at Walgett, both from north and south of the river, was river-borne. There is, of course, very little doubt that if the river did not happen, as during the present season, to be navigable, this traffic would be dealt with at Pilliga. If, however, the river should be navigable during the wool season, there is no doubt that it must always be regarded as a formidable competitor with the projected line. For the purpose of recognising these two factors—that is, a navigable and a non-navigable river—I have prepared two estimates. I may also incidentally mention that during the fourteen years between 1882 and 1896 the river was available about one-half.

The rates which have been taken are the same as those taken on a proportionate mileage basis as between Narrabri and Moree.

First Estimate.

Goods and wool traffic actually falling in at Wee Waa and Pilliga during the year 1895:—

Goods and live stock:—			
General goods, 905 tons	£505	18	9
Special classes, 655 tons	192	16	6
Wool, 2,548 tons	814	0	0
Stock, 900 trucks	323	15	0
			£1,836 10 3
Passengers:—			
800 at 2s. 6d.	£100	0	0
2,000 at 7s.	700	0	0
Parcels, &c.	100	0	0
Mails	672	0	0
			£1,572 0 0
			£3,408 10 3

Second Estimate.

As already stated, considerable traffic, amounting to 790 tons of goods and 2,055 tons of wool, was river-borne during the year in question. Assuming that the river were not navigable, and this traffic found its way to the proposed terminal point at Pilliga, the estimate would be:—

Goods and Live-stock	£3,151	15	0
Passengers, &c.	1,572	0	0
Total	£4,723	15	0

376. Narrabri to Moree is a special rate? No, it is an extension of the through rate; it is midway between that and local rates.

377. The total freightage of the district is supposed to be represented in that report? Yes, including that which was river-borne and rail-borne.

- J. Harper. 378. This shows what it actually is? Yes. It shows the capabilities of the district.
 379. This is, what the district yields? Yes, what is turned out in that year, which was the best year.
 22 Oct., 1897. 380. How do you manage to get all these tonnages and weights? By analysis of the agents' and store keepers' books. I had an officer engaged at this for nearly a month under my directions.
 381. And you had access to the carriers' books? Yes.
 382. Getting the wool clips is an easy matter? Yes; but the other has to be taken out in detail.
 Mr. Trickett.] I understood you had exempted Warren to Coonamble? Yes, I have, and also Woolabra to Collarenebri. From Coonamble I have not gone any further north than Urawilkie—that is, the north-eastern boundary of the line of traffic which I have credited to Coonamble. Even if a line were built to-morrow to Pilliga that Urawilkie traffic would not go there, it would go down to Warren, as it does now. I have a map here which partially indicates the line of traffic. The letters on it indicate the traffic credited to Coonamble. Urawilkie is the extreme north-east; that indicates a point on the line intermediate between Coonamble and Byrock. "C" indicates Coonamble itself. The boundary that has been taken for that is Toora.
 383. Mr. Lee.] It would appear from the two estimates you have given us that the second or total estimate of the whole district is the one that has been taken credit for by the Railway Commissioners as the probable traffic? Yes; in their report they refer to its including the river-borne traffic.
 384. Which, as a matter of fact, is about £1,300 more than the traffic which, you think, would go to the Pilliga railway? Decidedly, given a river.
 385. That being the difference between the first and the second estimate? Yes. I will give a list of the stations and you will get a general idea from the map of the pastoral holdings of the information you require. These are the particulars of the wool traffic which would fall in at Wee Waa, assuming that the line were built under any conditions. It would not go back to the river; it would find its way into Narrabri, even assuming there was a river.
 386. That would be within your first estimate? Yes; the stations are as follows:—

	bales	tons	cwts.		bales.	tons	cwts.
Burren	820	131	5	North Lynne, Dempsey Brothers...	131	25	0
Boolarrool	2,152	351	1	H over Namoi	150	27	10
Bullerawa	67	8	2	Merah	607	99	0
Cryon	527	92	7	Pian Creek	141	23	10
Drilddool	775	128	0	Roselea	150	25	0
Gorian	1,101	192	3	Warranbri	22	38	3
Wee Waa, South	266	44	2	West Drilddool	169	27	10
Nowley	382	63	6	Small clips	535	91	16

You will be able to identify nearly all those; there will be one or two homestead leases which are not shown. Then falling in at Pilliga are the following:—

	bales.	tons	cwts.		bales.	tons	cwts.
Bugilbone	1,047	167	13	Gerongera	80	13	6
Bungle Gulley	709	108	12	Kercargo	345	56	1
Buchanan, homestead lessee on				Keeleendi	954	157	2
Bungle Gulley... ..	238	39	0	Phelps	102	17	8
Come-by-chance	174	18	10	Ulumbie	34	4	5
Euray Euray	626	99	10	Yarralldool	554	92	2
Euroka	886	149	3	Small clips	600	104	13
Goangra	916	152	5				

387. Mr. Humphery.] Taking the entire clip it would be about six bales to the ton? Yes. If you take it at Bourke, where wool comes long distances, it would come out at seven bales, because a large proportion of it is scoured.

388. Mr. Lee.] That includes the whole of the wool which found its way to the railway line in that year, and would find its way in any year whether there were a river or not? The greater part of it would; one or two clips might go to the river. I cannot give you the details of those other clips that went by river, but, in addition to the figures I have given, 2,055 tons went by river from Walgett. I may mention that that wool is largely represented by the wool which I read out to you the other day in connection with the Brewarrina estimate. Nearly everyone of those clips which I gave you the other day as coming from above Brewarrina are in that list. Amongst those clips which came down the river from Walgett are those which were shown in the Brewarrina estimate when we dealt with it the other day. When I was dealing with the Brewarrina estimate I gave you wool coming into Brewarrina. Now that we are dealing with the Pilliga line, that 2,000 odd tons which has been included in my second estimate, represents almost entirely the wool which has already been dealt with as coming into Brewarrina.

389. Then, if the Brewarrina line is made, and the Pilliga line is made, that river-borne estimate must be deducted from either the one or the other? Either the one or the other, or both, because that does not do away with the fact of its coming down stream to Bourke. As a matter of fact, this wool went down stream to Bourke; and, assuming that both lines were built to-morrow, there is no guarantee that it would go by either of them.

390. It might go past? It might go past both, and that is not a singular position, because we have the same thing occurring on the Murrumbidgee. Over 10,000 bales of wool used to pass Hay every year, but by extreme concessions we have been able to stop some of it. Still there is a considerable portion coming from 100 miles above Hay which goes past our railway station. There is no guarantee that the same thing would not happen here. To make this more clear, I will go through the list of some of the clips I read the other day, which I have been absolutely able to identify. As you can understand, this information being got from other sources than the railway books, cannot be got quite so well. However, these are the clips that are shown in that 2,055 tons of wool as going by river from Walgett, and credited to the Pilliga extension in the terms of the Commissioners' report, and also credited to the Brewarrina extension: Brewan, Boorooma, Mein over Narran, Dungalear, Gingie, Llanillo, Morenda, Milrea, Moorabie, Piangobla, and Ulumbie. These, probably, will not make up the totals, but they will give you a general idea.

391. Where did you pick up that trade? At Walgett.

392. Where did it touch your railway system? At Bourke.

393. All of it? Yes, all of it.

394. Might I inquire whether the Commissioners have had any control over, or allowed any rebates on the river-borne traffic? None.

395-6. Would your No. 2 estimate be worked out at the same rates as the No. 1? Yes.

397. That is, taking a proportionate rate to that which exists to-day on the Narrabri to Moree line, one is worked out in the same way as the other? Decidedly. The wool and the goods river borne have been added to the goods rail borne. J. Harper.
22 Oct., 1897.
398. Will you explain why there is such a difference in the rate between the proposed extension, Byrock to Brewarrina, and that from Narrabri to Pilliga? An arbitrary rate of 10s. a ton for the 59 miles was taken in the case of Byrock to Brewarrina.
399. And on this other line it works out at about 6s. 6d., does it not? It is split up. Wee Waa is 5s., about 19 miles; then at Pilliga the rate would be 8s. That may appear rather peculiar, in view of the arbitrary rate of 10s. between Byrock and Brewarrina. But this report was made in July of this year, and the other report was made two years ago. Since then the Railway Commissioners have reduced the rates on wool, and, practically, if you applied the rate which has been established between Narrabri and Moree to Bourke and Brewarrina, it would be about 8s. 6d.; but in any case that would not alter the facts very much.
400. There is a similar reduction in the stock rates? No; they would be about the same.
401. The stock rates are 15s. 6d. on the Brewarrina line? But there is 5s. 3d. from Wee Waa, and the bulk of the stock would be trucked at Wee Waa. There would be more stock trucked at Wee Waa than at Pilliga.
402. This works out at about 10s.? Yes, it is the difference between 16s. 4d. and 5s. 3d.; but the varying quantities do not give uniform rates.
403. As far as the figures are concerned, although you give the number of trucks, and tons of wool, and total freightage derivable from both, it is really mixed up by intermediate stations? Yes.
404. Have you any more data to put in to make your case complete at this stage? I do not think so.
405. Taking Brewarrina on the one hand, and Pilliga on the other, and bearing in mind the inquiry that you have made on the Coonamble side, you have practically dealt with the entire question of the produce of the western district, with the exception of that portion which goes to Moree? No, I have not; there are two other features; there are Coonamble and Collarendabri.
406. But you have given us Coonamble? I have told you the boundaries of Coonamble.
407. With the exception of the stuff that now goes to Moree, you have practically dealt with the whole of the traffic? Yes; there is a considerable amount of traffic in the north-west that would find its way to Collarendabri, but not to Walgett.
408. But it is still traffic in that western country which all comes on to New South Wales lines at some point? Decidedly.
409. You have practically now touched the whole question? Yes.
410. And have given this Committee an estimate, as closely as it can be obtained, of the produce of that country? Yes. I have some other information that may be of interest. An analysis of the wool coming from this particular district we are dealing with indicates that two-thirds of it finds its way to Sydney, either for sale or shipment. I mention that, so that the fact may not be lost sight of that Sydney must be looked upon as terminal point as against Newcastle.
411. But does not a large portion of the wool come to Morpeth, and thence by steamer to Sydney? But I include Morpeth in Newcastle, as Sydney is the ultimate destination. Of the Wee Waa estimate, there were 3,015 bales shipped at Newcastle, and 5,187 bales forwarded to Sydney; of the Pilliga estimate, there were 1,944 bales shipped at Newcastle and Morpeth, and 5,271 bales came to Sydney. Out of a total of 15,000 bales, 10,000 bales were dealt with in Sydney, and 5,000 bales were dealt with in Newcastle.

WEDNESDAY, 27 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

412. *Mr. Lee.*] You have some information to give us regarding the distances of various points within the area affected by the proposed railway extensions to Brewarrina and to Pilliga, and the rates that would probably be charged? Yes; I have calculated the distances from Darling Harbour, because an investigation which I made disclosed the fact that more than two-thirds of the wool coming from the Pilliga district finds its way to Sydney for sale or shipment. J. Harper.
27 Oct., 1897.
413. Some of that wool may have come to Sydney by steamer from Newcastle or Morpeth? Yes; but Sydney was its destination. The following table will give you the information you require:—

	Distance.	Rates for wool.		Rates for live stock.
		Scoured.	Greasy.	
	Miles.	per ton.	per ton.	£ s. d.
Narrabri	354	88/9	71/-	7 3 8 per truck.
Moree.....	414	100/-	80/-	8 0 11 „
Wee Waa	374	105/-	85/-	7 8 11 „
Pilliga	420	108/-	88/-	8 2 11 „
Walgett.....	469	116/-	96/-	8 13 3 „
Bourke	504	100/-	80/-	9 7 9 „
Brewarrina	516	110/-	90/-	9 9 3 „
Collarendabri	463	109/6	89/6	8 15 6 „
Coonamble, <i>via</i> Nevertire	416	100/-	80/-	8 1 9 „

These rates are based upon the proportionate charges upon the main line to Moree.

414.

J. Harper.
27 Oct., 1897.

414. You have now given us details of the actual produce of the western district from Bourke to the Queensland border, along the Queensland border to the Barwon, and down the Barwon to Brewarrina? Yes; excepting the small portion of traffic that may be expected to come to Collarenebri if a line is extended out in that direction. That traffic is not included in the Pilliga estimate. The country north of Pian Creek, on the east side of the Barwon, and south of Dunglear, on the west side of the Barwon, might be expected to go to Collarenebri, and the country south of the northern boundary of Urawilkie might be expected to go to Coonamble.

415. You have also given us the distances and probable rates to various points within the district, so that we now have before us all information in regard to the traffic to be dealt with by either or both of the proposed extensions, viz., from Byrock to Brewarrina and from Narrabri to Pilliga? Yes. Of course there are two other proposals affecting the district which have not been put before the Committee, viz., a line to Coonamble and a line to Collarenebri.

416. We have excluded those lines; they have not entered into our calculations? Neither have they entered into mine.

417. Do you know the trend of the goods traffic in the district which would be affected by the Pilliga line;—how is that country fed? Whenever there is a river the great bulk of the stores comes to Walgett by steamer. Near Pilliga they more usually get their goods by way of Narrabri. Whenever there is a good river goods are brought up by steamer to Walgett and places north-west of Walgett, and as a rule people stock up heavily then.

418. Supposing the line to Pilliga were obstructed if the wool went down the river to Bourke, would not goods come back that way? Yes, undoubtedly. That is precisely what happens now when there is a river.

419. You have told us that if the line goes to Pilliga it must be taken on to Walgett, but if there will be a loss on the Pilliga extension and the line is continued another 56 or 58 miles without any prospect of additional traffic, the loss must be doubled? That is so. The cost of working would not be increased in proportion to the extra length of the line; but the interest upon the cost of construction would.

420. But our investigations go to prove that working expenses do increase in proportion to the length of a line? Only maintenance expenses. Traffic charges in this case would not increase in proportion to the added length of the line.

421. If the loss on the line to Pilliga amounted to £4,300 a year, the loss on a line to Walgett would amount to £7,000 a year? Yes. The extension of the line on to Walgett would not bring any more traffic.

422. You have given us information as to the whole of the traffic produced in this north-western district and you say that you see no prospect of an appreciable increase? Yes.

423. Therefore, if the proposed lines would create a loss when first constructed they would continue to do so for all times? Yes, so far as I can see, I do not know what developments may take place.

424. Prior to the imposition of an export duty upon wool you got a larger quantity of wool from Queensland than you get to-day? Considerably more.

425. The export duty has been the chief cause of the falling off in the traffic from Queensland? Yes.

426. Since the imposition of the duty, has not Queensland been pushing out its railways to Cunnamulla and St. George? To Cunnamulla; but not yet to St. George.

427. What effect will the extension to Cunnamulla have? It will secure the whole of the Queensland wool.

428. Then you will never get that traffic back again even though the duty may be removed? No. Then, too, the imposition of the duty has created vested interests in favour of sending the wool to Brisbane, which, would lead it to continue to go there.

429. Therefore we must not expect to get again all the trade which we used to get from Queensland? No; I do not think we shall ever have that trade again.

430. The conditions of traffic there have absolutely changed during the last five or six years? Yes.

431. You have gone thoroughly into this question? Yes. When the Queensland railway to Cunnamulla is completed, the Queensland line will be nearer to most of the wool-producing centres out and around that district than we shall be.

432. The information you have laid before the Committee in reference to these proposed railways has been laid before the Railway Commissioners in detail? Yes.

433. Is it in consequence of that information that they have come to the conclusion that it is not desirable to extend the railway to either Brewarrina or to Pilliga? Yes. The Commissioners have also made a personal inspection of both routes.

434. Have they any alternative proposal to offer? No.

435. Are they of opinion that the existing lines must get all the produce from the district? Yes.

436. There is no immediate probability of the loss of any northern trade by gravitation to Queensland? None.

437. The produce of all this part of the country and the goods required by it are carried by the existing lines, and no extensions would secure more traffic to our railway system? That is so.

438. *Mr. Clarke.*] The Commissioners say in their report that the river has been open seven times in fourteen years? That means that it has been open during the wool season for seven years out of fourteen; but it has also been open at other times of the year, when advantage had been taken to rush forward heavy shipments of goods. The following table shows the number of days during which the river was navigable to Walgett, from 1882 to 1895:—

1882...	84 days.	1889...	190 days.
1883...	44 "	1890...	354 "
1884...	21 "	1891...	282 "
1885...	31 "	1892...	247 "
1886...	222 "	1893...	337 "
1887...	269 "	1894...	282 "
1888...	82 "	1895...	54 "

During the year 1894-95, from June to June, two-thirds of the wool and goods traffic were carried from and to Walgett by river. That indicates that the river was available during the whole of that wool season.

439. *Chairman.*] A railway competing with it during that year would not have taken the traffic? No. We should be in the position there that we are in at Bourke. I had a wire to day to say that three steamers have arrived in Bourke from South Australia, with an average general cargo of 90 tons each. If that is happening at Bourke what would prevent it from happening at Walgett.

THURSDAY, 28 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Neville David Cohen (David Cohen & Co.) sworn, and examined:—

440. *Mr. Wright.*] What is your usual place of residence? I am living in Sydney now; but up to the N. D. Cohen.
last eighteen months I have been living in West Maitland.

441. Do you know the country which the proposed line would serve? No.

28 Oct., 1897.

442. Have you any statement to make to the Committee? I should like to say that for a great number of years past I have taken considerable interest in the question of an extension to Walgett. My firm, and several other firms in the Newcastle, West Maitland, and Singleton districts, are a good deal interested in this extension, because the trade from the district which would be affected by it has hitherto always come to Newcastle, and we think that if it were diverted to some other place, it would do a great injury to the large towns in the northern district. Irrespective of any personal interest which I may have, I consider that any railway to Walgett should be taken from Narrabri, so that the trade would not be diverted from Newcastle. The trade of Newcastle is at present very large, and it is a growing trade; but if an extension were made to Walgett from Mudgee a good deal of this trade would be taken from Newcastle and brought to Sydney. I do not come here because of my own personal interests, for I do not think it would do me much harm if the trade were brought to Sydney. I come here to advocate the special claims for consideration which are possessed by Newcastle, and to ask that the trade that now goes there shall not be diverted. Ever since I have been in the colony I have advocated that Newcastle should be looked upon as likely to be a very large port; but if you take away this trade from Newcastle you do a serious injury to the port and to those who have been connected with it for a great number of years. For sixty years past my firm has been doing a very large business in the northern and north-western districts. We have been settled in West Maitland for nearly sixty years, and there is not the slightest doubt that if the traffic from the Walgett district is diverted from Newcastle it will do harm to Newcastle and to all the firms interested in it. At a public meeting held in West Maitland eighteen months or two years ago, I mentioned that the future developments of the colony should be taken into consideration by those whose province it is to determine these questions. The colonies are likely to develop to a very large extent within fifty or 100 years, and if the whole of the trade is centralised in one place it will create congestion and do a serious amount of harm. If the line to Walgett is taken *via* Mudgee, the traffic from the Walgett district will all come to Sydney, whereas if the line is taken from Narrabri the traffic will come to Newcastle. This will relieve Sydney, and will help to develop one of the principal ports of the colony. The Members of the Committee must all be aware of the great facilities for shipping which are offered by the port of Newcastle. I have travelled a great deal in my time, and I have seen most of the ports of the world, and, in my opinion, Sydney and Newcastle are the most effective ports for loading and discharging which I have visited. At Newcastle, deep-sea ships coming from any part of the world are within the harbour and alongside the wharf—in the very centre of the city—within a few minutes, and the same thing occurs at Sydney. At London, however, it takes a very long time and considerable expense to go to the docks, say, at Tilbury. These two ports are so important that they are likely to become in time the central ports of Australia, especially if we have federation.

443. But the proposed extension will not have the effect of diverting traffic from Newcastle? No; and I am advocating the construction of a line to Walgett from Narrabri instead of from Mudgee. A deputation waited upon the Secretary for Public Works some time ago in reference to this subject, and amongst those who attended was the President of the Newcastle Chamber of Commerce. That gentleman, in his address at the annual meeting of the Chamber of Commerce, referring to the necessity to see that no injustice was done to Newcastle and the towns along the Great Northern line by the tendency to construct railways to carry the products of the Colony past the natural and nearest port, said—

An example of this is apparent in the efforts that are now being made to have the town of Walgett connected with the Sydney-Mudgee or the Sydney-Dubbo line, instead of connecting with a point on the Great Northern railway—say Narrabri. This would be the shortest and least expensive line to construct, and it would also be the least costly to work, besides giving the people in the country the option of shipping and landing their goods, merchandise, etc., at either of two ports, instead of limiting them to one only. . . . The general physical features of the Narrabri-Walgett country are immensely superior for railway construction to those of the other suggested routes, plains of fine black soil predominating, and rivers are few, so that no great number of bridges would be needed. No less an authority than Mr. Bruncker stated that the cost of this extension would not exceed £2,000 per mile; and the line, if constructed upon such a rate, would yield a very large income.

444. You do not swear to the correctness of that report? No.

445. Were you present at the meeting? Yes; and so far as I know, that is exactly what was said. I may state that West Maitland has initiated this movement, because for a great number of years it was one of the most important towns in the north.

446. It was the *dépôt* for all that part of the Colony? Yes. Unfortunately at the present time its glory has somewhat departed, and I do not suppose it will get it back again. Fifteen years ago West Maitland took the initiative in this movement, because most of the trade from the district round Narrabri, Walgett, Pilliga, Wee Waa, and those places came to it. They formed a league called the Narrabri-Walgett Railway League. We have had a great number of meetings since then, and three or four deputations have waited upon various Ministers for Works; but up to the present nothing has been done. Now, in the opinion of myself and of other members of the league, a climax is likely to be arrived at, and they have asked me to point out the position to you, and to urge that the claims

N. D. Cohen. of the northern district should be studied and that trade should not be taken away from that district, as it will be taken away if the line is taken *via* Mudgee to Walgett. If that line is made, all the wool and the live-stock will come to Sydney, and the traffic of the district will be diverted from what has been its natural destination ever since there has been any. Although my firm have been settled in West Maitland for over fifty years, West Maitland is not now the place it was when I first came to the Colony; and if the north is to keep its position, the traffic from the district I am speaking of must come to Newcastle. My firm have spent large sums of money in putting up buildings at Newcastle. We put up a large building there six or seven years ago, and we are now putting up another very large building, while many others have spent large sums of money in settling down at Newcastle. If, then, trade is diverted from Newcastle and brought to Sydney it will do a great deal of harm to Newcastle and to a large number of firms, who, like ourselves, have interests there. At present the north-western district is not nearly so much developed as it is likely to be in years to come. About two years ago a large deputation from the north waited upon the Chief Secretary. Among those who formed the deputation there were present: from West Maitland, Mr. J. Gillies, M.P., the mayor, Mr. H. Crothers, Aldermen Cobb, Taylor, Leopold, Ross, Quinton, Young, Ribee, and Clark, Messrs. N. D. Cohen, (David Cohen and Co.), J. D. Prentice (Wolfe, Prentice, and Co.), H. H. Capper, (E. P. Capper and Sons); and many others, including representatives of Murrurundi, of Newcastle, of East Maitland, of Morpeth, of Wickham, of Hamilton, of Stockton, of Greta, of Carrington, and of Wallsend. Letters of sympathy were sent from the Hon. A. J. Gould, Minister of Justice, Messrs. W. H. B. Piddington, T. H. Goodwin, W. T. Dick, J. L. Fegan (Members of Parliament), and others. This was one of the largest deputations that ever took an interest in the matter. In replying to the deputation, Mr. Bruncker, who is one of the strongest advocates of the line, is reported to have said:—

In the report he had there from Mr. Jones, it was said this country would not give the same proportion of produce as that from Mudgee *via* Coonamble to Walgett; but he found that this gentleman, whoever he was, had credited the former line with produce from a large tract of country which would come by the Narrabri route. This was most unfair. If submitted to a Government who knew nothing about the country the Government would be likely to decide on it. Any man who knew from experience the capabilities of the country would give no credit to such a report placed before him. The gentleman who made such a report was deserving of something more than ordinary condemnation. . . . He had explained that his colleagues would take the course that was in the best interests of the country. . . . This line must be constructed if justice was to be done to those settled on the land. Something had been said about Newcastle and its being the natural port for the north and north-west—that Nature had so designed it. He was proud to say that, in proportion to the amount expended, it gave the best return of any seaport in New South Wales.

447. That is substantially your case? Yes.

448. In the construction of a railway, what do you consider the primary object to be served? The interests of the district.

449. A weak point in your statement is, that you made no mention of anybody identified with the Walgett district as having been connected with this movement? I forgot to mention that I am here to-day specially to represent Walgett. I had no idea of attending until I received a letter from the honorary secretary to the Railway League at Walgett, who asked me to attend. The people of Walgett have been in favour of the construction of this line. The people of Narrabri have never taken so much interest in this matter, because they consider that it would be better for them to have the terminus at Narrabri. Only to-day I received the following telegram from Walgett:—

Harper states to Committee, Woolabra-Collarendabri-Warren-Coonamble railways will take traffic from Narrabri-Pilliga. Contradict this. These lines not yet contemplated by Government. Young opposes first-named.—T. CLARKE, Hon. Secretary, Railway League.

The Walgett people have been kept so long in suspense that they do not care now where the line comes from so long as they get a railway.

450. Your main contention is, that the trade from the north-western district has for many years come to Newcastle and the towns on the northern line, and that any attempt to interfere with that traffic would seriously prejudice those towns, while the district would not be better served by an alternative route? Exactly.

451. You contend that, in considering a matter of this kind, the Government should, as far as possible, conserve existing interests? Yes.

452. They should not interfere with existing trade relations, unless for very good reasons? Yes; I contend that the port of Newcastle has special claims for consideration.

453. If Walgett and its neighbourhood could be more cheaply and efficiently served by a connection with the Western instead of with the North-western line, what would be the duty of the Government? I think that in any case the Government ought to take into consideration the future development of those parts of the Colony. It might at the present time be cheaper to take the traffic that way, and you might save a large amount in the construction of the line; but that country is likely to be a very important district in years to come, and you will do a great injury to the important port of Newcastle if you take from it its natural trade. It is not as if there were a bar at Newcastle, or the port were unsuited for the trade. It is in every way suited for it. There is every facility for doing a large trade there, and why should not the traffic which has gone there for a number of years continue to go there, instead of to Sydney.

454. But if it is conclusively proved that the country around Walgett can be better and more cheaply served by a connection with the Western line, do you not think it is the duty of the Government to make that connection? I do not think so. I do not think that the question of cheapness should be so much considered as the possible future development of this country.

455. I am not speaking only of cheapness, I am speaking also of effectiveness? Well, it is open to question whether such a connection would suit that country.

456. Are you prepared to say that you believe that Walgett would be as well, if not better, served by a connection with the North-western line? I am.

457. Mr. Hassall.] Do you think it would be of any use to take the line from Narrabri to Pilliga and to leave it there? No.

458. The objective point must be Walgett? Yes.

459. Are you aware that the country on the southern side of the Namoi is rather poor country? I have heard so; but Mr. Bruncker, in the speech which he made to the deputation to which I have referred, is reported to have said:—

It was all very well to say it would go through a sandy desert. He knew there was a belt of sand that they could take it along if it was desirable to construct it along that; but, he said, "Look at the surroundings." If they did that they would find it would be the most settled in New South Wales.

460. I presume that the extension of a railway to Walgett from Narrabri, or any other point on the railway system, would not sever your business connections with the district? I do not think it would. N. D. Cohen.
451. It would not prejudice your business interests if the connection were made from some point other than Narrabri? It would to some extent; but I should like it to be understood that I am not here to defend my personal interests. I am not speaking for David Cohen & Co.; I am speaking for the whole district. 28 Oct., 1897.
462. You are here, not only to defend your own business relations, but those of a number of towns between Newcastle and Narrabri? Yes.
463. It is well known that practically the whole of the business of the Walgett district with the sea coast has been carried on through Narrabri? Yes.
464. When the terminus of the railway was at Murrurundi the business went through that town, as it did before through Muswellbrook, and before that again through Singleton? Yes.
465. Do you not think that, instead of taking the line on the south side of the river, it would be better to cross the river at Narrabri and go through the better country on the northern side? I think so.
466. Do you know from your business dealing whether any great settlement has taken place on the north side of the Namoi? So far as I know, trade up there is increasing, because the amount of business which we do with the storekeepers up there is increasing.
467. Then the natural inference is that settlement is also increasing? It must be.
468. I suppose you still deal in wool? Yes.
469. A good many clips come through your hands, either directly or indirectly? Yes.
470. And stations get their supplies and stores back from you, if not directly, indirectly through the distributing houses in the district? Yes.
471. The trend of traffic in that district has for many years been in the direction of Newcastle by way of the North-western and Northern line, and you think that the traffic should be allowed to continue in that direction? Yes. In time of drought, that district draws very largely upon the Hunter River district for its supplies. Around Maitland there is a very rich agricultural district, and the demand for chaff and other produce is very great. If the district should be connected with Sydney instead of with Newcastle this trade would cease.
472. The district might then get its supplies from Orange or Dubbo? Yes; but that would mean great loss to the people who now have the trade.
473. But you must show some consideration to the people whom the extension of the line is intended to benefit? I am not sure that the agricultural districts you mentioned are as near to the district as is the Hunter valley agricultural district. Then, too, the land in the Hunter River valley is more to be depended upon in times of drought than that in any other part of the Colony. At the present time the land around West Maitland is more valuable for agricultural purposes than land in any other part of the world—at least, so I have been told. There is no land in any other part of the world which will fetch £100 an acre purely for agricultural purposes. I have property in the district which cost me £85 an acre. Since I have had it, there have been several very heavy floods, which have done it an immense amount of damage, and I have not got so much out of it as I would otherwise have got; but if the floods had not been so frequent it would have paid me from 10 to 12½ per cent. Last year, when there was a very heavy drought up north, they got better lucerne in Maitland than anywhere else, and land pays a better return in Maitland than in any other part of the Colony. Consequently, the district can produce large quantities of hay and other produce more cheaply than any other parts of the Colony.
474. The great market for the Hunter River lucerne is Sydney? Yes; because of the great demand here.
475. By constructing a line from Mudgee to Walgett you would bring Walgett nearer to Sydney than if you constructed a line from Narrabri to Walgett? That may be so, but it must be borne in mind that there is only one branch from the Northern line, whereas on the Southern and Western lines you have several branches; and, in deciding in regard to this matter, you must take into consideration not only present requirements but future requirements. Why should Newcastle be deprived of a large amount of trade. It is to the interests of merchants and shippers there that the trade should be fostered. The quantity of wool that is now taken to Newcastle is hardly sufficient to keep the steamers going, and if you divert a great deal of the traffic things will be still worse. What is the use of spending immense sums of money upon Newcastle if you are going to take the trade away from the port.
476. You think that no benefit could be derived from an extension of the line to Pilliga? It would be a great advantage to Pilliga and the surrounding districts.
477. We have it in evidence that the annual cost of the proposed line, including interest upon capital and cost of maintenance and working, would be £9,086, and the revenue £4,720, leaving an annual loss of about £4,300; that being so, do you think the Government would be justified in constructing the line? I think so, considering the future before the district. I am of opinion that once a railway is made from Mudgee to Walgett the trade will never come back to Newcastle again, because then it will never answer to make a line from Walgett to Narrabri.
478. If it could be shown that a line from Mudgee to Walgett would pay, while there would be a loss of £4,300 on a line from Narrabri to Walgett, do you think the Government would be justified in constructing a line from Mudgee to Walgett? I think that the Government should look to the future development of the Colony, and take steps to bring the trade to Newcastle.
479. Would you make one of a syndicate to construct a line upon which there would be an annual loss of £4,300? I do not know that I would; but this line would belong to the Government, and would be constructed for the future as well as for the present. You will find that some of the railways in England do not pay at first, but when coal is in demand they pay handsomely. Although it may be shown upon paper that there would be an annual loss of £4,300, it must be borne in mind that there would be a considerable loss to the Newcastle district—a loss which is not stated—if the trade were diverted from Newcastle.
480. *Mr. Roberts.*] On what grounds do you recommend an extension from Narrabri to Walgett in preference to other routes? Ever since the district was known, it has always traded with Newcastle, and it does so at the present time. If the traffic were diverted, people who have vested interests all the way up the Northern line from Newcastle would be deprived of a large amount of their natural trade. Once you tapped the Walgett district by another line, the whole of the traffic would come to Sydney, to the detriment of the northern district, and that would do serious harm to all who had business relations with the district.

- N. D. Cohen. 481. Newcastle has been the recognised port for that district for many years past? Always.
482. Does a very large quantity of wool come from Walgett to Newcastle? Yes.
- 28 Oct., 1897. 483. Is it shipped at Newcastle? Yes.
484. Are you aware that the distance from Sydney to Walgett, by way of Nevertire, is 478 miles? No.
485. The distance from Sydney to Walgett *via* Conamble is 468 miles, *via* Dubbo 436 miles, and *via* Mudgee 400 miles; whereas the distance *via* Newcastle and the North-western line is 468 miles? You cannot compare the distances from Walgett to Sydney by these various routes, because Newcastle is at the present time the terminus for the traffic from the district. That traffic does not come on to Sydney.
486. Is the whole of the wool from that district shipped at Newcastle? Yes; but the competition amongst shipping companies is so great that they are prepared to bring it from Newcastle by the Hunter River Company's steamers, and ship it from Sydney, for the same cost as they would ship it from Newcastle. Of course, if people like to do that, you cannot consider that the wool comes naturally to Sydney, because its natural terminus is Newcastle. We ship all our wool to London from Newcastle, though unfortunately there is not sufficient at the present time to entirely load up the ships. We ship the wool from Walgett, Moree, and all that district direct to London, and we send goods there which are imported direct from England and other parts of the world to Newcastle.
487. Does your firm import all the merchandise required for the northern district at Newcastle? Most of it.
488. That merchandise is then sent away by train? Yes.
489. If the river were up, would it not be more advantageous to send produce away by steamer than to send it away by train? I do not think so. Of course, this line would serve the whole district. The Narrabri people are not taking any great interest in the matter, because they have an idea that if the line is extended past Narrabri it will take trade from that town. The Walgett people, too, have been so disappointed during the last eighteen years, that they do not care where the line comes from, so long as they get a line.
490. Would the greater quantity of traffic come from the district north of Walgett? Yes. A large amount of traffic would also come to the line from the Queensland border. There is not the slightest doubt that Walgett should be connected with our railway system. An immense district would be developed by such a connection.
491. Do you think that the line would attract trade from Queensland? From the border of Queensland. I am supplying a great number of stations on the Queensland side of the border. Of course we have to pay the duty.
492. Where are the branches of your firm established? We have branches at Sydney, Maitland, and Newcastle.
493. *Mr. Black.*] Did I understand you to say that you would close your Maitland store if the railway were extended to Walgett from Mudgee? No; I did not say that. I said that Maitland is not so important now as it was twenty years ago, and that on account of the traffic going to Newcastle we might one day have to close our business-place there; but that has nothing to do with this railway proposal. We are putting up a very large building at Newcastle because we consider it the natural centre of the trade.
494. You are merely transferring your headquarters to Newcastle? Yes. If the Walgett traffic were brought direct to Sydney it would do us an immense amount of harm, because a great deal of the wool that now comes to us at Newcastle would be consigned to other agents at Sydney.
495. *Mr. Hoskins.*] Are you aware that a great deal of the trade to and from Walgett is done by the river steamers? Yes.
496. Do you know that the trade is increasing, while the trade with the Hunter River valley is decreasing? Yes. I think that is because the railway has not been made to Walgett.
497. If we have been told by the Chief Traffic Manager that he believes that loading could be taken by the steamer from Walgett to Bourke for a sum of 12s. 6d. a ton, especially if the river were locked, do you think that the railway could compete? I do not think so. A great deal of that trade leaves the Colony altogether.
498. We have it in evidence that all the traffic brought to Bourke from the Upper Darling comes to Sydney by rail? Yes; but you should bear in mind that, in constructing the proposed line you are not only serving Walgett; you are also serving an immense district between Walgett and Narrabri.
498. We have it in evidence that that district is very sparsely populated; that settlement is not increasing there; and that it is devoted entirely to pastoral enterprise; while the construction of a railway would entail an annual loss of £4,300? I have heard it stated that a railway could be constructed there for £2,000 a mile.
500. If a line were constructed for £2,300 a mile, there would be an annual loss of £4,300 a year upon it. The Chief Traffic Manager, who has been over the district many times, says that he sees no probability of the traffic increasing, and that if the Darling is improved, the trade will go down the river? In England the canals which have been in existence for 100 or 200 years have had to knuckle under to the railways. Even in Staffordshire and that part of the country, everything is taken by train.
501. Would you be surprised to hear that the Chief Traffic Manager stated that, because of the extension of the Queensland railway to Cunnamulla, the quantity of traffic we get from Queensland is decreasing? No.
502. You do not consider that the Walgett district will be anything but a pastoral district for many years to come? Not unless a large population settles there. From what I hear, the country between Narrabri and Walgett is all black soil, and it is very difficult to travel over except in fine weather. Traffic, therefore, naturally goes to the river, the steamers providing a quicker and cheaper means of conveyance than the drays. If the railway were made that would not be so.
503. But it has been stated that wherever a railway comes into competition with water carriage, water carriage wins the day? Yes.
504. Therefore, do you think this line ought to be made—do you think the Government ought to disregard financial considerations? No.
505. *Mr. Lee.*] The main point you wish to establish is, that nothing should be done which will divert the traffic of this district from the port of Newcastle? That is exactly what I came here to say.
506. If no railway is made at all, Newcastle will be no worse off than it is now? No.

507. The question is, whether it would pay to extend the railway from Narrabri to Pilliga? I think it would. N. D. Cohen.
508. We have had evidence before us as to the exact amount of produce obtained from that district, and the quantity of goods sent into it; and it has been shown that there would be a large loss upon any railway that was made;—you have not shown that a railway would bring any additional traffic to Sydney or to Newcastle? I am not prepared to show that. There may be a little extra traffic from the Queensland border, but how much I do not know. 28 Oct., 1897.
509. I think you somewhat over-estimate the importance of the Queensland traffic. We have it in evidence that about two-thirds of the produce of this district finds its way to Sydney, either by rail direct or by steamer from Newcastle or Morpeth? No doubt a large part of the produce of the district is sold in Sydney. It may be that Sydney will become the entrepôt of all the produce of the Colony. At the present time, however, very large quantities of frozen meat and other produce are shipped directly from Newcastle to other parts of the world.
510. The proposed extension would not affect the frozen meat trade? If a line were taken to Mudgee it would take a good deal of the trade in a different direction.
511. But I am speaking of the line under consideration? I do not think it would have very much effect if it were only taken to Pilliga. A railway there would develop the country.
512. It would secure the traffic of that part of the country? Yes.
513. Newcastle is the distributing centre for the northern and north-western districts? Yes.
514. It is of more importance to the people of Newcastle that the North-western railway should be extended to Walgett, than it is to the people of the north-western district that they should get their produce to the sea-board? I do not think so. The producers would benefit as much by a connection with Newcastle as by a connection with Sydney.
515. Would it suit the people of Newcastle and the Hunter district to let things remain as they are? So far as Maitland and Newcastle are concerned, it would not make any difference. It would leave them *in statu quo*.
516. *Chairman.*] Do you know what proportion of the produce which comes from the Walgett district to Newcastle is shipped from Newcastle, and what proportion comes on to Sydney? No. Sydney is becoming of great importance, so far as the wool sales are concerned. Do what you may, you cannot prevent the wool from coming here; but it would come as cheaply by the North-western and Northern line and the Hunter River Company's boats as through Mudgee. No doubt in years to come nearly all the wool will be sold in Sydney. If, however, Newcastle developed to a large extent, wool sales would take place there. At present the quantity of wool sent to Newcastle is not sufficient to justify foreign buyers in going there. Dalgety & Co. tried to have the wool sold at Newcastle, but the supply was found to be too small. If a line were taken from Mudgee to Walgett this would still more diminish the quantity of wool coming to Newcastle. I should also like to point out that in Great Britain all the trade is not centralised in one port. London is a great port; but if you want to buy cotton seed, palm oil, and other African produce, or American goods, you go to Liverpool. For other things you go to Hull, and for other things you go to Cardiff. Why should not the ports of this Colony be developed in the same way.
517. People must go to Newcastle for coal? Yes; and I would like them to come to Newcastle for other things as well. Every ton of wool which you take from Newcastle and send to Sydney keeps back the development of Newcastle.
518. Do you know what proportion of the goods that are sent into the Walgett district is landed at Sydney, and what proportion is landed at Newcastle? I think nearly the whole of the merchandise sent into that district is landed at Newcastle. The amount of the freight from Sydney to Newcastle is the profit that the merchants make. Of course articles of local manufacture, such as corn-flour and sugar, are sent from Sydney, but goods from other parts of the world are imported direct to Newcastle.

FRIDAY, 29 OCTOBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Robert Edward Jones, M. Inst. C.E., District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

519. *Chairman.*] For the purpose of this inquiry we will consider Walgett an objective point, and any of the railways of the Colony as furnishing opportunities for joining that point with the railway system. R. E. Jones,
M.I.C.E.
- That was broadly how you looked at the case before? Yes. 29 Oct., 1897.
520. Therefore the country under consideration, generally speaking, is that bounded by the North-Western line, by the main Western line, and by the river Darling? Yes.
521. *Mr. Roberts.*] You know the line under the consideration of the Committee, from Narrabri to Pilliga? Yes.
- 522-3. Have you been over that country? Several times.
524. Have you been from Pilliga to Walgett? Yes.
525. Have you been over the country from Warren to Coonamble and thence on to Walgett? Yes.
526. And from Dubbo to Walgett *via* Coonamble? Yes.
527. Have you been over the country from Mudgee to Walgett *via* Gulgong and Coonamble? Yes.

- R. E. Jones,
M.I.C.E.
29 Oct., 1897.
528. Were you commissioned by the Minister for Public Works to make a survey of these routes? Not a survey, but I was instructed to make inquiries.
529. What position do you hold in the Department of Public Works? District Engineer.
530. How did you come to make the report? Instructions were given me by the Under-Secretary for Public Works to make these inquiries.
531. How long ago was that? My instructions were delivered in 1890, and I finished my report in 1891. I have been in charge of the northern division as regards roads, comprising all these districts, since then, and I was at Walgett as late as last April.
532. Have you been over the line from Narrabri to Pilliga recently? Yes; in April I went from Walgett to Narrabri.
533. And as to the other routes I have just mentioned? I suppose it is two years since I was in Coonamble.
534. Were you called upon to make any recommendation as to railway construction? Yes.
535. Perhaps you will briefly state what you were commissioned to report upon? My instructions, as set forth in the first page of my report, embraced the following:—
- “1. The proposal to join Werris Creek with the western line, either at Dubbo or Wellington.
2. The junction of the western line from either Dubbo or Wellington, according to which place it is decided the Werris Creek extension should join through Forbes, to connect with the Blayney-Murrumburrah line, with Young, Cowra, or at some other point which the inquiry will show to be best.
3. The question of extending the Mudgee line, *via* Gulgong, to a point on the proposed cross line between Dubbo and Werris Creek, as the inquiry will show to be most desirable.
4. The connection of Walgett with the existing system, either from Narrabri or some point on the suggested Dubbo-Werris Creek line, *via* Coonamble, or from the northern line at Singleton, Muswellbrook, or at some other point *via* Cassilis and Coonabarabran.”
536. The object was to tap the Barwon River, was it not? Yes; to give access to the districts of Coonamble and Walgett.
537. After traversing the different routes, what conclusion did you arrive at? That a line best serving the country would be one from Mudgee through Gulgong, Munderooran, Coonamble, and on to Walgett.
538. Did you prefer that route on account of the distance from Sydney being shorter than by any other route? It is a shorter distance from Sydney for the places mentioned than any other route.
539. What about the engineering difficulties? It is an expensive line, no doubt, particularly between Mudgee and Munderooran.
540. What would be the cost per mile between Mudgee and Munderooran? According to the present estimate of the Engineer-in-Chief, the cost from Mudgee to Coonamble would be about £3,260 per mile for 147 miles.
541. Where does the expensive portion of the route cease;—does it cease when you get west of Munderooran? It ceases within about 40 miles of Coonamble. That would be 117 miles out of the 147.
542. Is the expensive part of the route north or south of the intersecting line from Dubbo to Werris Creek? Chiefly on the Mudgee side—the southern side; for a distance of about 40 miles on the northern side it is better country.
543. And the last 40 miles to Coonamble? That is good.
544. Undulating country and fairly level? Fairly level.
545. And thence on to Walgett, what is the country like? That is all level.
546. Have you the figures showing the cost per mile from Coonamble to Walgett? Yes; I have the figures of Mr. Deane, which show a cost per mile of £2,750.
547. And can you give the Committee the cost per mile from Mudgee to Walgett right through? Virtually £3,100.
548. And you recommend the line from Walgett to Mudgee in preference to any other? I did so at the time I made my report.
549. Are you still of the same opinion? Since then the line from Nevertire to Warren has been authorised, and that somewhat alters the position of matters.
550. Would that go through a country more favourable to railway construction? Yes; it is the cheapest line of all.
551. What would be the cost per mile from Warren to Walgett *via* Coonamble? £2,550.
552. What is the distance from Warren to Walgett by way of Coonamble? One hundred and thirty-two miles.
553. And from Mudgee to Walgett? Two hundred and fifteen miles.
554. With those figures before you, which line do you think, in the interests of the country, it would be desirable to construct, if any? If I had to do with the railways of the country I should say certainly make the one from Warren to Coonamble, as being the means of obtaining the greatest results at the least cost; but in regard to opening up the country it would be a different matter, and the line from Mudgee would do that better.
555. Would it serve a larger number of people? It would serve a larger scope of country and a larger number of people, but at a far greater cost. The Warren route would burden the people of Coonamble and anywhere north with the additional mileage of about 78 miles, by making the circuit to Nevertire as against going straight to Mudgee.
556. Which line would be best suited for settling an agricultural population? The line from Mudgee to Coonamble.
557. Is it all good agricultural land? Very much of it.
558. I understood you to say it is rather rough after leaving Mudgee? About the Warrambungles, which is a hilly district, there is some splendid agricultural land.
559. Is it quite equal to the country between Warren and Coonamble, and thence to Walgett? Not for pastoral purposes, but it is better for agricultural purposes.
560. In the districts to which we have been referring, where, in your opinion, is the best country for wheat-growing? In the valley of the Talbragar, and from there about half-way to Coonamble, and of course around Coonabarabran.
561. Is it good agricultural country between Warren and Coonamble? No.
562. Is it all pastoral country? Yes, nearly all pastoral country. It is all flat, and there is practically no agriculture there.

B. E. Jones,
M.I.C.E.
29 Oct., 1897.

563. It is all sheep country from Warren to Walgett? Magnificent sheep country.
564. How would you describe the country between Mudgee and Coonamble, as at present occupied;—is that all sheep country? No. At Gulgong there is mining. If there were access to a market a good deal of the country would be put to agriculture up to within 40 miles of Coonamble, and then the country is pastoral right up to Walgett, and from there to the Queensland border.
565. From your knowledge of the country, do you think if a line were constructed to Walgett any agricultural settlement would take place? I do not think so, unless on the river by means of irrigation.
566. You think that pastoral pursuits would still engage the attention of the people living there? Yes.
567. Approaching Walgett, is the country what one might term flooded country? Yes.
568. Is that so on both sides of the Namoi river? Yes; anywhere within a certain radius of Walgett it is all flooded country.
569. Looking at the route from Pilliga to Walgett, as shown on the plan, would that escape the flooded country? No.
570. Would that all go through flooded country? Yes. The flooded country extends within 16 miles from Walgett towards Pilliga, and follows up the Barwon at distances varying with the branches of the river, and it extends from Collarendabri about 16 miles eastward.
571. Is Wee Waa an important place;—do you regard it as necessary to tap that place? I do not think it is an important place.
572. According to your report in 1891, there were about 300 people there;—do you know if it has progressed since? I do not think it has gone back. The last time I was there, in April, it seemed, if anything, to have progressed since I made my report.
573. And Pilliga, is that as large a place as Wee Waa? No.
574. What would be the population of Pilliga at the present time? I cannot say what is its present population. In 1891, I think it had a population of 920 people within a radius of 30 miles. Pilliga itself is a very small place.
575. Is there any cultivation around Pilliga? There is a little on the Baradine and Dubbo Creeks.
576. What do they grow there? Chiefly wheat. There is also a little cultivation on the north side of the Namoi, between Narrabri and Wee Waa.
577. How many sheep do they run to the acre, speaking generally—a sheep to the acre? No. If you took a line to Pilliga, you would include the great scrub, which is a large unoccupied country.
578. Take the country between Warren and Walgett? For the country west of Narrabri, on the south side of the Namoi, to Walgett, I give in my report virtually 3,000,000 sheep on an area of 8,000,000 acres, which is about equal to one sheep to 2½ acres. That would include the unoccupied country.
579. And in reference to the country from Nevertire to Walgett *via* Coonamble? I say in my report that the trafficable sphere includes 8,500,000 acres, but I do not give the quantity of stock. From Dubbo to Walgett the area is 10,500,000 acres, on which there are 3,750,000 sheep. That is about the same average as in the other case—one sheep to 3 acres.
580. That would pretty well apply to all that country? Yes. I daresay it would be one sheep to 2 acres on the Warren route, because it is better country.
581. In your report you give an estimate of the wool tonnage that would produce revenue on the line, and you estimate 950 tons as coming from Queensland. Was that before the export duty on wool? Yes, I think it was. There is a duty now of £2 10s. per ton.
582. Would any wool come over from Queensland now, notwithstanding the export duty? Yes.
583. In reviewing that estimate of 950 tons from Queensland, having in view the export duty on wool crossing the Queensland border, what quantity of wool do you think would come from Queensland to Walgett at the present time? I do not think the export duty would influence the quantity very much. I think we should still pretty well get that quantity, because there is no railway anywhere near on the Queensland side of Goodooga and Angledool.
584. In your report, you made some reference to the enhanced value of the Crown lands around Walgett? It is not so much around Walgett as generally.
585. You say “the enhanced value of the Crown lands would be felt chiefly in the Walgett locality”? Since my report was made, the Crown leases have fallen in and the conditions are somewhat different. There is far more alienated land under the new land bill.
586. If Coonamble were connected with the railway system of the Colony, do you think that would lead to any marked agricultural settlement round there? It will all depend upon which route you adopted. If you took the Mudgee route, it would lead to an increase of agriculture in the neighbourhood of Warrambungles, and other parts, including the Talbragar. But if you made a line to Warren, I do not think it would, to any extent, lead to agricultural settlement.
587. Is the country not so well adapted for the growth of cereals? No, not from Warren to Coonamble.
588. Where is the indifferent country? It is not indifferent; it is splendid pastoral country.
589. Have any attempts been made to grow cereals between Warren and Coonamble, or around Coonamble? No; the agriculture is very insignificant—just on the river, consisting of Chinamen’s gardens and so forth. It is very little—you may call it nothing.
590. Are you aware that they are producing wheat between Byrock and Brewarrina? It may be so. I know they are up to Nyngan. There was not a bit of wheat at Naromine when I made my report; but since then there are thousands of acres under crop. That is very suitable country for wheat.
591. Do you know the country between Byrock and Brewarrina? I have only been over it once.
592. How does it compare with the country between Warren and Coonamble? I cannot say. I have been over it once, and that was partly in the night; it was in the flood of 1891.
593. Do you know the rainfall of Coonamble? The average for a period of ten years was 21·72.
594. And at Walgett? 19·28.
595. Can you tell the Committee which seems to be the route most favoured by the people around Walgett? Until the time of my visit, I think the favoured route was the one always put before them—that from Narrabri.
596. They have a preference for reaching Newcastle instead of Sydney? I think so; their trade interests are with Newcastle undoubtedly.
597. At present they do all their business with Newcastle? Yes. Of course like most places their anxiety is to get a railway.

- R. E. Jones, 598. And they do not care very much where it comes from? No.
M.I.C.E. 599. When you were at Walgett was the river navigable? It has been on occasions when I have been
there. I have seen a steamer right up at Walgett.
29 Oct., 1897. 600. Do you not think it probable that whenever the river was navigable the railway would not be used by
people around Walgett? There is a probability of that, especially if two or three obstructions in the
river are removed.
601. Have you any record as to the number of months in the year when the river is navigable from
Walgett down to Bourke? I find in my notes that in 1890-91 the wool from Euroka, Boorooma, Milrea,
Gingie, Ulumbie, and Llanillo, went to Brewarrina, and on to Bourke, by water. Of these places, Euroka
is virtually on the river, Boorooma is right on the river, and Milrea and Gingie are virtually on the river;
while Ulumbie is on the Namoi, and Llanillo is not far away from the Barwon.
602. The whole of the traffic, pretty well, from Walgett to Sydney or Newcastle, would consist of wool,
would it not? That would be the chief traffic and live stock. The latter, I suppose, would go to Sydney,
and the wool to Newcastle.
603. That is, of course, if the Pilliga route were adopted? Yes.
604. Could you tell us whether the river is navigable, as a rule, when the wool traffic is proceeding? I
should think upon an average it would be navigable three years out of four.
605. What are the months of the year when wool is sent in to Walgett? From August to November, or
to the end of the year.
606. Is the river, as a rule, higher at that period or lower, than from January to August? The big floods
have occurred in the early part of the year, in January—the big floods of 1890 and 1891; but generally
speaking I think the river is higher in the winter than in the summer.
607. Of course, in summer, evaporation takes place? Yes; the river is generally lower in summer.
608. The rainfall is less between August and the end of the year, than in the winter time? Yes.
609. Is it a fair thing to say that for three years out of four the river is navigable from Walgett to
Bourke? Yes.
610. Do you know where the wool goes to at the present time;—does it go to any of the other colonies
from Walgett? I do not think so. Some of the wool, I think, goes right on beyond Bourke.
611. When the river is up? Yes; I think that is only a very small percentage.
612. It goes to Victoria and South Australia? Yes.
613. *Mr. Black.*] Do you think it would be advisable to intersect the country, speaking broadly, which
lies between the Castlereagh and the northern line by lengthy lines which run southwards, or by shorter
lines running eastward? I think we must take into consideration the country to be served, and also the
terminus to be aimed at, as well as the question of the market to be reached.
614. Presumably the terminus is Sydney? Then they desire the shortest way to get there.
615. I do not want to consider only how you can most quickly get to Sydney, but by what method you can
best serve the greatest areas of country and of population, and the most productive areas? As already
stated, I consider the line from Mudgee to Coonamble is the best. It bisects the country to be served
better than any other scheme, and serves the greatest population.
616. What is the distance between Coonamble and the nearest point on the northern line at present?
Nearly 120 miles.
617. Then, if you construct a line from Mudgee to Coonamble, it leaves 120 miles of country, which is not
penetrated by any railway nor served by any railway line? Quite so, but what kind of country.
618. That was involved in the question I asked you;—could not that country, speaking of it as a whole,
be developed by means of a railway;—is it a class of country not fitted for agriculture? Some of it is
fitted for agriculture. About Baradine the country is well fitted for agriculture.
619. I am speaking of the country which would be intersected by a line drawn from Pilliga through Coona-
barabran, and thence on, perhaps, to the Western line? There was such a scheme, I think, many years
ago. I think there was a survey made through Coonabarabran.
620. Would it be better to construct two trunk lines running north or to construct lines branching off
from east to west? The lines leading to Sydney would be much better, especially to serve a pastoral
district. Wool is the chief freight to be obtained.
621. Speaking broadly, you are in favour of longitudinal lines? Lines tending southward, instead of lines
tending westward—lines aiming at the terminus to be reached.
622. And serving greater areas of country? Quite so.
623. By this means tending to develop the country? Exactly.
624. Would such lines be expensive on account of the grades, or the crossing of rivers? The line from
Warren to Walgett, as I have already stated, is not expensive.
625. The line I am thinking of now is the one which would intersect the country between that line and
the Northern line? With regard to a line from Pilliga to Coonabarabran, and on to Cassilis, joining
with the Northern line, portions of that line would be very expensive.
626. Either to the Northern line or to the Western line? The line from Pilliga, taken through Coona-
barabran, and on to Mudgee, would be at the same rate per mile as the line from Mudgee to Walgett—a
little over £3,000.
627. Do you not think a better intersection would be provided by a line from Dubbo to Walgett on the
one side, and on the other from Pilliga to Mudgee—would not that make a better intersection than if both
lines ran northwards out from Mudgee? It would be a very good intersection, no doubt; but I do not
think it would be justifiable. I do not think the country to be served would warrant the making of those
two railways, so closely parallel to each other.
628. Do you not think that if the country is good, and the railways are 60 miles apart, they can attract
sufficient traffic on each side to prove payable with increased settlement? Not 30 miles of pastoral
country.
629. Then you think there is not enough agricultural land? I do not think so; and I do not think you
would find a market for the produce if it were there. The cost of getting the produce to market would
be prohibitive.
630. If, in the area we are speaking of, there is so little good agricultural land, would it not be better to
construct spur lines to centres of population, than to endeavour to construct a line for the purpose of
developing settlement? I do not think so. In the case of any line that is made, the intention is to get
to

- to some market; and treating this as pastoral country, the desire is to reach Sydney. Therefore, I consider that the lines extending in that direction are the lines to be made. R. E. Jones,
M.I.C.E.
631. But you think that at present one would be sufficient? I do.
632. Which one do you think would be most beneficial to the country to be served, and to the revenue of the country? Looking to the revenue of the country, and from a railway point of view, the line having been made to Warren I consider the best way to reach Coonamble is from Warren. It is less costly and will obtain a great amount of traffic—leaving the line from Mudgee for future consideration. 29 Oct., 1897.
633. *Mr. Clarke.*] Are you well acquainted with the nature of the country between Narrabri and Pilliga? Yes, fairly so.
634. And also between Pilliga and Walgett? Yes.
635. In 1891 you reported on a line from Narrabri west on to Walgett? Yes.
636. The population of Pilliga at that time, I think, was not very large. According to your report it had about 150 inhabitants? Yes.
637. Do you think the population has since increased? Very slightly indeed.
638. From your knowledge of the country is the population likely to increase? I do not think so to any appreciable extent.
639. I suppose it is purely pastoral country? Yes. There is some good timber near, but it would not produce any great industry.
640. The timber, I suppose, would be sufficient for making sleepers for the railway line? Yes.
641. But would timber be an export from there to any other part of the country? The Roads Department has used it for bridges some 80 miles away. It uses a lot of timber from Pilliga.
642. Is there plenty of ballast upon the proposed line? No.
643. Where would the ballast have to be obtained from? Some of it would have to be obtained from Mollie, near Narrabri. But I think it would be better almost to bring it from the parent line.
644. It is only proposed to use a small quantity of ballast? I believe so.
645. If this line were constructed from Narrabri to Pilliga, I suppose, as a necessary consequence, it would have to go to Walgett? I take it that that is the object of it. Pilliga is no place to end it in.
646. In favourable seasons, when the Darling is navigable, a large portion of the wool traffic, both from portions of Queensland and New South Wales, would go on by water to Brewarrina, and thence to Bourke? Yes, unless favourable rates were given on the railway as against the rate from Bourke. I do not think that is likely. The rate at present for greasy wool from Bourke is £4; from Moree, £4; and from Narrabri, £3 11s. After looking at these rates, I am inclined to think that the railway freight could be fixed so that the traffic would be attracted by railway from Walgett, because by the river there would be insurance and other charges, and it is very likely nearly all of the wool would go by rail.
647. Is any proportion of the goods by the river Darling landed at Brewarrina without going on to Bourke? Not much.
648. According to your evidence and your report, you prefer the line from Warren to Coonamble? From the financial point of view. Not as serving the greatest extent of country, but as bringing the best revenue at the least expense to the country.
649. You are aware that the proposed line from Narrabri to Pilliga would leave a loss of something like £4,500? I am not surprised to hear it.
650. If the line went to Walgett do you think there would be any probability that the increased traffic would reduce the loss on the line? No, I do not think so. It is one of those lines, as I think I pointed out in my report, which would bring country into use that is perhaps not now available, and would give an enhanced value to Crown lands, and, unless the railway is to get some credit for that enhanced value, I do not think it is possible for it to pay.
651. Can you say how those Crown lands are held? There are different conditions. The Barwon is the boundary between the Western and Central Divisions; so that there are different conditions on each side of the river.
652. Have you any idea as to the period for which the land is held under lease? No.
653. You seem to know the whole of this country thoroughly, and reported upon it in 1891;—do you see anything to justify the building of this particular line, when it will leave such a loss to the country as has been estimated? I do not.
654. *Mr. Lee.*] Have you seen the country under consideration under flood? Yes.
655. What is the height of the flood that you saw? I saw one in January, 1891—travelled through it.
656. That was the highest flood that has occurred for many years? The flood in 1890 was slightly higher.
657. Was that the highest of which there is a record? Yes.
658. What would you consider about the average height above the surface. I am talking of the route from Narrabri to Pilliga, and Pilliga to Walgett? From Narrabri to Pilliga the railway route I should think could be put fairly above the flood-level, but from Pilliga to Walgett that would be impossible. I am talking of the natural surface; of course you could build it up.
659. But do you think that between Narrabri and Pilliga the surface is free from water? Yes, except in places—comparatively free.
660. Does not a large quantity of the flood-water come from inland, from creeks—water which finds its way down to the Namoi? Over-flow creeks, but there is no great volume of water in them.
661. Are they not the cause of the inundations, more than the overflow of the river? No, I do not think so.
662. Do you think the natural soil of which the railway embankments would be made is of that character that it would stand the pressure of flood-water? I think myself that the less embankment you could have on the natural surface, where the ground is liable to inundation, the better.
663. But as nearly the whole of the country is more or less subject to flood sometime or other, there would have to be some embankments made? Then I should make them as little as possible, and try to have as good drainage as possible.
664. Plenty of waterways? Yes; and I should make the banks with good convexity.
665. And is the soil of that nature that it will stand without ballast? Well, I do not think so; but the opinion expressed about the Moree line is against mine—they say it will.
666. What experience have you had on your roads—do they stand? I do not think the roads are a parallel case; I do not think you can make a comparison between the two.

- R. E. Jones, M.I.C.E.
29 Oct., 1897.
667. In the case of the roads, there would be a natural consolidation of the soil, while in the other case there would be a mere surface-packing? Yes.
668. Confining ourselves to the immediate question of the extension to Pilliga, from a flood point of view alone, do you apprehend any danger to a railway if constructed? No.
669. And from that point of view, then, the undertaking might be adopted? I think so, from an engineering point of view.
670. Provided sufficient waterways were given? Quite so. Of course, I do not know what has been done. I think the line will cross about nine creeks.
671. Which side of the river do you favour for railway construction if it should be decided to construct a line—north or south? North.
672. For what reason? I think it is better, country—better country to be served, and generally less liable to floods. There is also the question of tapping the Collarindabri traffic. It would serve that traffic very much more easily than any line south of the Namoi. There is more settlement on the northern side.
673. As a railway route you favour the northern side of the Namoi, because the land is better and less liable to inundation? Yes, near to Walgett.
674. Starting from Narrabri, it would necessitate crossing the river? Yes; it would be more expensive in consequence of that. Perhaps it would mean making the junction at Narrabri, instead of Narrabri West.
675. I think there can be no doubt that the good country in that neighbourhood is on the northern side? Yes.
676. Until you get some considerable distance away, and then you get in the neighbourhood of Coonamble? Yes.
677. But the country likely to be influenced by the Pilliga line really lies to the north? Yes, and of course westerly. The line projected to Pilliga is, I take it, to obtain the Walgett traffic.
678. I notice that in your report of 1891 you made no reference to any possible grain traffic, but confined your estimate of traffic entirely to wool, station supplies, timber, passengers, mails, and stock;—is that because you are of opinion that the country is not suitable for agriculture? I think so, and another reason is because I understand the carriage of grain is scarcely payable.
679. But apart from that consideration, your observation leads you to believe that the country is not capable of producing grain? There are little portions adjoining the Namoi where they could grow grain, and on some of the creeks. As I have pointed out, on the Dubbo and Baradine Creeks there are at present grain crops.
680. In favourable seasons? Yes.
681. But at the best it would be an uncertain crop? Yes. I think cultivation has been tried at Narrabri, and has failed. In my report I put the cultivation down as virtually *nil*.
682. With the exception of some patches for station use, I suppose cultivation is not carried on there by the settlers? No.
683. Might that be accepted as a fair indication of the impracticability of the industry there? There is no doubt that a part of the Pilliga scrub could be cultivated if it were cleared; but the cost of clearing would be out of all proportion to the results. At present it is not even occupied.
684. What would be developed if a line were taken to that country? No industry that I can see, except as to timber from the Pilliga forest, and the pastoral industry.
685. And there would be the station produce and the goods to the stations? Yes.
686. At present one is compelled to come to the river, and the other to go a certain distance? Yes.
687. The question is, would the extension of a line to Pilliga have the effect of increasing the production of the station properties? I do not see how it could make the land sustain more sheep to the acre than it does at present.
688. That being the case, if the line were constructed, and it showed a heavy loss the first year, your reasoning would point to the fact that there would be no prospect of that loss being arrested? Quite so.
689. I notice that you estimate the wool tonnage—that is, if the line were made from Narrabri West to Walgett, at £7,338—how did you arrive at that? I took the number of sheep within the trafficable area, and I based my estimate upon the quantity of wool produced from so many million sheep, and on that data I calculated the weight. I assumed that the rate would be the present rate to Narrabri, with a diminishing rate as to the distance increased.
690. And you also included 950 tons from Queensland? Yes.
691. Then your estimate would include the whole of the wool produced within that area, and right down to Walgett, and north and south of Walgett, and possibly from the other side of the river from Walgett? Yes; within the trafficable sphere shown on my sketch map.
692. You estimate that all that wool would come to the railway? Yes.
693. You are aware that of late years the conditions on the Queensland side of the border have very much altered? Yes.
694. Owing to the extension of the Queensland railways? Yes.
695. At the time you made your estimate there was no export duty in force in Queensland? No.
696. And since then the railways in Queensland have been extended? Yes.
697. Consequently if the time should come when the export duty is removed, this country will never get the traffic from the south of Queensland that it used to get? No.
698. Therefore, your estimate of 950 tons of wool from Queensland might, at this period, be viewed as somewhat problematical? Yes.
699. I wanted to direct your attention more particularly to your estimate of the wool traffic, because it differs very largely from the Departmental estimate. It is estimated now, after very careful investigation by the railway officer, that, if the whole of the traffic were obtained, including that which comes down the river, and including all the general goods to the district, and the stock and wool from the district, as well as the passengers and mails, the total earnings of the line would only be £4,723, or a little more than half of your estimate? Yes; but mine was from Narrabri to Walgett, and the estimate of which you speak was from Narrabri to Pilliga, which is only for one half the distance.
700. But still the line to Pilliga would take all the wool? No; as from the Goodooga district it would still go to Brewarrina, whereas if the line were made to Walgett it would most probably go there. Then there is other traffic, such as cattle.
701. If Pilliga would take all the wool, there would be little traffic for the other part of the line covered by your estimate? In my estimate I included the mileage rate between Pilliga and Walgett. 702.

702. Even if you doubled the railway estimate, that would be £9,000? Even then my estimate would be in excess for wool. The number of sheep has diminished since I furnished my report, which I think was made in a most successful year. R. E. Jones,
M.I.C.E.
29 Oct., 1897.
703. However, you give a very good reason for your estimate—you take the number of sheep? Yes.
704. And probably, on the whole, you are not very far astray as far as the wool is concerned, though you might be a little astray as to Queensland? Yes.
705. You are certain that no increased traffic from any source could be expected if the railway were extended, and that nothing that would occur in future would justify railway construction? There would be some revenue from timber which is not obtained now. There is a splendid forest of timber behind Pilliga. It is probable also that the stock traffic would be greater than it is now.
706. But the timber traffic would be limited as far as the railway is concerned, and the traffic in stock would depend very largely upon the seasons? Yes. I cannot see that there would be any increase of traffic from any other source. There would be no new industry created, and the railway would not much affect the pastoral industry, or the amount of wool to be produced.
707. All that traffic has to come to the railway now? Yes.
708. The wool is carried to the railway, and the live stock convey themselves to the railway? Yes.
709. And it is only in very bad seasons—wet seasons—that the traffic is suspended? Yes. The only thing that would, perhaps, cause an increase of traffic would be the facility for quick conveyance.
710. For how long have you known the roads to be closed to wheel traffic? I have not known them to be closed to wheel traffic.
711. Not entirely? No.
712. In wet weather, of course, they are difficult? Yes; during the 1890 flood I did not happen to be there. The roads towards Walgett were then closed, because I know they had to use boats for some time during that flood.
713. But even the construction of a railway would not save the lives of the stock on the run in time of flood? No.
714. It would appear, then, from your evidence that the only good that would be secured by the construction of a line would be to give easier transport for the produce coming from the country, and the goods going there? Yes.
715. But you do not see how it is going to result in the settlement of the country—in close or small settlement? No, I do not think it will.
716. From which a large quantity of traffic would be obtained? No.
717. *Mr. Wright.*] Looking at the country from the Upper Barwon to the Narran as the objective point, which line, in your opinion, would best serve the inhabitants of the district by giving them cheap transport, and which line at the same time, in your opinion, would open up the largest area of country for settlement with a likelihood of successful settlement? I think the line from Mudgee to Walgett would answer the whole of those objects. Of course, I do not mean to continue it beyond Walgett.
718. A line from Mudgee to Walgett would secure to all that country cheaper transport, and afford the largest possibility of future development? Yes. It is the most direct route to Sydney, intersects the country that is not at present served in the best manner, and serves the largest amount of population within the area of the country at present unserved by a railway.
719. And how about its capacity for carrying increased population? I think there is likely to be a great increase, especially between Mudgee and Coonamble.
720. It is more likely than any other route to develop the country? Yes.
721. *Chairman.*] Your report virtually decided, in your opinion at least, that the Walgett traffic should reach the seaboard at Sydney? Yes.
722. Although the distance from Walgett to Newcastle is 40 miles shorter than the nearest route to Sydney? Yes.
723. Why, in your opinion, should Sydney and not Newcastle be regarded as the outlet for the Walgett produce since Newcastle is nearer than Sydney? I do not consider that there is a reason why Sydney should be preferred to Newcastle. I did not consider that then, nor do I now, except with regard to passengers. I know that passengers all want to get to Sydney rather than to Newcastle.
724. In your report you make it clear that it is your opinion that the Walgett produce will reach, eventually, the port of Sydney, and will not use Newcastle for over-sea purposes;—can you inform the Committee what reasons brought you to that conclusion? My first reason was that with regard to passengers; they all desire to reach Sydney. With regard to wool, although at present much of it from the north goes to Newcastle, yet a fair percentage passes Newcastle, and comes on to Sydney, while other portions may be loaded in ships at Newcastle with the desire to reach Sydney, Sydney being the ultimate port for the delivery of the wool.
725. Have you any doubt about that? No.
726. Then, with regard to back freight, imports into the Colony, have you taken into consideration whether the station supplies, and goods of that class that would pass up the line to Walgett, would be landed first in the port of Newcastle, or in the port of Sydney;—have you any knowledge with regard to that point? I have no knowledge. All I know is this: that at present several of the stations in the neighbourhood of Walgett get their supplies presumably from Newcastle or from Maitland. I do not know whether they are imported direct to Newcastle or come from Sydney.
727. You have said that you prefer the line from Warren to Walgett, *via* Coonamble? Yes;—what strengthened my opinion in favour of that railway was, that the country round Coonamble had to be reached by a railway from some point. Assuming that Coonamble must be served by a railway, I considered it was the easiest mode of reaching Walgett, the distance being only 68 miles, as against 114 miles from Narrabri.
728. Irrespective of Walgett, a railway will have to be taken some day to Coonamble, and therefore you have to consider the case of Narrabri and Walgett *versus* Coonamble and Walgett? Yes.
729. Now, compare those two cases? The line from Coonamble to Walgett passes through rich country; it is only 68 miles in length, and can be made at a cost of £186,000, as compared with £256,000, the cost of a line from Narrabri to Walgett, the distance of the latter being 114 miles. I did not overlook the question of the country to be served by both these lines. The country along the route from Narrabri to Pilliga I have already described on the south side. On the northern side, owing to want of bridges over the Namoi, and

- R. E. Jones,
M.I.C.E.
29 Oct., 1897.
- and means of communication, the railway would, perhaps, be of little advantage to settlement. Proceeding further with the question, and regarding Coonamble as an objective point, I have already explained that the extension of the railway from Nevertire to Walgett, to some extent, alters the problem to be solved. A line from Coonamble to Warren, although it is a longer route to Sydney, furnishes easier grades, and therefore less cost in working, as compared with the route from Coonamble to Mudgee. This, however, would only affect such produce as came *via* Walgett, Coonamble, and for a portion of the distance towards Warren, because, as you approach Warren from Coonamble, and get out of the direct line, neither route would have any advantage over the other as regards distance to Sydney.
730. Is that tract of country a very important piece of country—the country that would be legitimately tapped by Walgett, and the country from Walgett to Coonamble, and down, say, along a third of the line from Coonamble to Warren—is that country that would produce a great deal of traffic to the railway? I think it would produce a very large amount of traffic from the pastoral industry, consisting of wool and station supplies.
731. Are there any local reasons, in your opinion, for the construction of a line between Dubbo and Mulooran? Not sufficient to justify the large expenditure that would be needed.
732. Except as portion of the design you laid down? Yes.
733. And the same remarks would apply from Mulooran to Mudgee? Quite so.
734. The first-mentioned line must be aided by other traffic, and the last-mentioned one, from Mulooran to Mudgee, to be justifiable, must depend upon Coonamble? Yes, on its being extended towards Coonamble.
735. You have already said that you believe the Coonamble district is entitled to a line? I consider the Coonamble district is entitled to a line.
736. Is the Walgett district entitled to a line? Well, there are different interests coming in there. There is the water traffic. Then, again, if a railway were made from Byrock to Brewarrina, that would enter into competition with a line to Walgett. It is only 76 miles from Goodooga to Brewarrina, and by the road from Goodooga to Walgett it is 95 miles. By another route it is 90½ miles.
737. Have you a statement with you of the Crown lands lying on these various routes? No; I have not.
738. You have not considered the possibilities of any railway extension beyond Walgett? No; I regard Walgett as the final point in that direction.

TUESDAY 2 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

H. C. Russell,
C.M.G.
2 Nov., 1897.

739. *Mr. Hassall.*] You have some information to give the Committee with regard to the rainfall in that part of the country which would be affected by the construction of the proposed railway from Narrabri to Pilliga? I have here the records of a number of stations between Narrabri and Walgett at which observations have been made for a sufficiently long time to enable us to determine the average rainfall. At Narrabri the rainfall is 27·39 inches; at Edgeroi, 26·84—Edgeroi is about 20 miles north of Narrabri; Wee Waa, rainfall is 26·04; at Boolcarrol, a station north-north-east of Wee Waa, it is 25·25 inches; at Barra, Baradine, 40 miles south-south-east of Wee Waa, 25·18 inches; at Pilliga, 27·77 inches; at Deenderrah, 25·26 inches; at Oreel, 20 miles further north, 22·46 inches; at Pilliga, 20 miles to the south, it is 21·71 inches; at Terrembone, going still further south, it is 21·96 inches; at Wingadee it is 20·07 inches; at Goangra 20·04 inches; at Walma 22·26 inches; at Mercadool 24·02 inches; at Collarendabri, 20·98 inches; at Walgett, 20·08; at Quabothoo, 20·07; at Yowendah, which is west of Walgett, 21·70 inches; at Wilkie, 20 miles west-north-west of Walgett, it is 22·37 inches; and at Dungaleer, which is due north of Walgett, it is 19·60.

740. There is a gradual increase of the rainfall as you go west from Narrabri? Yes; and it is rather striking just here, because Narrabri is on comparatively high land. At Rangari, a station to the east of Narrabri, and not very far from Barraba, the rainfall is 33·50.

741. Can you tell us the rainfall going west from Walgett towards Brewarrina? It drops from about 20 inches at Walgett to about 17½ inches at Bourke.

742. Judging by these records, there would not be much likelihood of successful agriculture beyond Walgett? The rainfall at Walgett is about 20 inches a year, and is pretty easily distributed between the two halves of the year. At Narrabri it is rather better in the second half than in the first half of the year; but at Walgett it is a little better in the first half than in the second half of the year. Between these two places the rainfall is nearly equal in the two halves of the year.

743. Is the rainfall at such periods of the year when it would be beneficial to crops? I think so.

744. Have you any records of the temperature in this part of the country? This is a very hot part of the country; but I did not know that you would require information as to the temperature. However, I will send it to you.

745. How does this part of the country compare with the country between, say, Parkes or Condobolin and Hillston? There is more rainfall in the northern part of the Colony, but the temperature is several degrees hotter.

746. It is said at Hillston that a rainfall of about 20 inches is ample for the successful cultivation of wheat; of course, the question of temperature must also be taken into account? I have no personal experience in growing cereals, but I know that a very hot country does not produce as good wheat as a colder

colder country. Speaking from memory, I think that with a rainfall of 20 inches at Walgett you would get, perhaps, 9 inches in the second half of the year; while at Hillston you would get, perhaps, 11 inches. H. C. Russell,
C.M.G.

747. You think that any difference in temperature between the two places is to the advantage of the southern district? Yes; the temperature falls at the rate of about a degree for each degree of latitude as you go south. That would make a difference of about 3 degrees between the two places. 2 Nov., 1897.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

748. *Chairman.*] You have some information to give to the Committee? Yes. I produce a plan showing the tenure of land within 20 miles on each side of the route of the proposed railway from Narrabri to Pilliga, and 20 miles beyond Pilliga. Near Narrabri the scope of country that would be affected by the proposed line is narrowed down both on the northern and on the southern side of it by the influence of the main North-western line. C. E. Rennie.
2 Nov., 1897.

749. *Mr. Lee.*] What is the extreme north-easterly point of the area marked on your map? It is near portion 30, parish of Burrendong. Within the area shown on the map there are 425,350 acres of alienated land, 43,610 acres comprised in settlement leases, 591,630 acres included within reserves, and 505,180 acres of other Crown lands. The total amount of Crown land, including reserves, is 1,096,810 acres. Of the Crown land, 105,880 acres are included within leasehold areas expiring between 1898 and 1900, 233,300 acres are held under occupation license, and 166,000 acres are untenanted.* The areas quoted as under lease and occupation license do not include reserves within the holding.

750. *Chairman.*] The land under settlement lease has gone from the control of the Crown? Yes. The settlement leases run for twenty-eight years. The unalienated Crown land, excluding reserves, is tinted brown, the reserves are tinted green, the alienated land is tinted blue, the blue shading shows the settlement leases, and the red spots are the townships of Wee Waa, Pilliga, and Narrabri.

751. Have you any knowledge of this country? I have no personal knowledge of it, but I know from the district surveyor's report that the bulk of the large forest reserve, on the south side of the river, is very poor land.

752. What is the area of that reserve? About 315,000 acres.

753. Is there no possibility of there being any settlement upon that land? I believe it is intended to consider the question of making the part near Pilliga available for settlement; but it would only be in large areas.

754. How many acre blocks? I could not say. I only know in general terms that the question is being considered. The papers are not in the office.

755. At what distance from Pilliga is the part you speak of? I am speaking of the land within 24 miles south-east of Pilliga.

756. What is the large reserve shown in the south-west corner of the area marked on the map? That is a forest reserve; but I do not know anything about it.

757. *Mr. Lee.*] What is its area? Approximately about 96,000 acres

758. Are there any forest reserves on the north side of the Namoi? Not within the area marked on the plan.

759. What are the small reserves shown on the plan? Most of them are travelling stock reserves. There is very little Crown land on the north side of the river, compared with the area of Crown land on the south side of the river. The great bulk of the reserved land is on the south side of the river.

760. *Chairman.*] The large block of land on the south side of the river, coloured brown, is land held under lease? Yes; that is land held under different tenures. The block you speak of includes about 205,000 acres, roughly speaking.

761. Do you know anything about it? No; I have no knowledge of this country.

762. *Mr. Lee.*] On which side of the river are the settlement leases? There are some on each side of the river. There are some on the south side near Wee Waa; there are some nearly midway between Wee Waa and Pilliga, on the north side; and there are some within a mile or two of Pilliga, on the south side.

763. Does it not appear that nearly the whole of the land on the north side of the river has been alienated, except a few widely-separated pieces of Crown land? Yes; that is so.

764. There is very little land available for additional settlement on the north side of the river? Well, 56,400 acres upon Bugilbone holding are being subdivided into twenty-two settlement leases, and 53,700 acres on Drildool holding are being subdivided into twenty-one settlement leases.

765. When that country is taken up, what area will be available for additional settlement? The only land that will be left will be that included in the areas coloured brown.

766. There will only be odd pieces left? Yes.

767. If any large amount of settlement is to take place in the future it must be on the south side of the river? Yes.

768. But there you say the land is not suitable? A large part of it is poor.

769. When the settlement leases you speak of are taken up there will be only forty-three additional families upon the land? Yes.

770. Is the Department making arrangements for subdividing settlement leases on the southern side of the river? Not that I am aware of at present.

771. What land would be available there for the purpose? It would depend upon what was done with the reserves. All the country tinted brown would sooner or later become available for settlement.

772. When do the leases of the various runs expire? I have not those particulars with me now. †

773. Are there any reserves within this area giving refuge from floods to stock? I do not think so; but I could not be sure without looking carefully through the parish maps.

774. Could you speak of the land going out west towards the Barwon, beyond the coloured area? Not until I looked up the maps.

William

* NOTE (on revision):—Probably part of the last-mentioned area is under annual lease, particulars of which are not recorded on the maps at headquarters.

† NOTE (on revision):—Partly under occupation license; partly, probably, under annual lease.

‡ NOTE (on revision):—Edgeroi, 30 April, 1898; Boolcarroll, 30 July, 1900; Millie, 30 July, 1899; Burren, 10 July, 1900; Pilliga, 10 January, 1900; Bungle Gully, 10 January, 1899.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

W.
McIntyre.
Nov., 1897.

775. *Chairman.*] You have some information to give to the Committee with regard to the population of the district which would be affected by the construction of the proposed railway? I have made an estimate of the population within 20 miles on each side of the proposed railway from Walgett to Wee Waa, and 20 miles beyond Walgett; but I have not taken in Narrabri. The number of people living within that area I estimate at 4,244, and I have compared my figures with the figures for the divisions, and they are almost identical. The population of the Walgett division of the Barwon electorate is 1,262, and the population within the Burren, Millie, Pilliga, and Wee Waa divisions of the Narrabri electorate is 3,550. These divisions take in almost the same country as that for which I made my estimate. The Wee Waa division contains a population of 1,050, and has 245 electors on the roll. Half of the division lies north of the Namoi, and half of it south of the Namoi. West of the division of Wee Waa is the division of Pilliga, which embraces the Pilliga township, and extends to within a short distance of Walgett. The population of that division is 1,500, and it has 351 electors on the roll. Therefore, the population of the whole district, leaving out Walgett and Narrabri, is about 2,500, the greater number of whom live on the south side of the river.

776. *Mr. Wright.*] Is it correct to allow four and a half people to an elector in the sparsely-populated districts? I think that is a fair allowance within the Eastern Division. I have checked my estimate by comparing it with the police returns collected in March, 1896, and I find it to be very close.

777. You have taken all reasonable precautions to ensure accuracy? Yes. Taking approximately 80 miles of the country on the south side of the Namoi, between Walgett and Narrabri, and beyond the influence of those towns, there appears to be a population of about 2,000 settled there. The population of the municipality of Narrabri is 2,450, and of West Narrabri 750. This estimate was furnished by the Council in February of this year.

778. *Mr. Lee.*] Can you tell us whether the population of the district has increased or decreased during the last few years? No; I have not looked into the matter.

779. I suppose your information only goes back to the time of the passing of the present Electoral Act? Yes.

Percy Scarr, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

P. Scarr.
2 Nov., 1897.

780. *Chairman.*] You have some information to give to the Committee? Yes; I have here a statement showing Schedule roads affected by the construction of the proposed railway from Narrabri to Pilliga:—

Item No.	Mileage.	Roads.	Amount Voted.						Amount Expended.
			1892.	1893.	1894.	1895.	1895-6.	1896-7.	
239	44	Coonabarabran to Tenandra	400	400	£ 724 12 0
246	62	Boogaldi to Pilliga	200	80	80	50	100	365 9 5
373	41	Coonamble to Combogolong	360	430	140	350	300	1,194 5 5
374	15	Coonamble towards Billaroy	75	40	20	40	30	108 0 7
375	28	Coonamble towards Baradine	150	80	80	80	80	317 9 3
376	43	Coonamble towards Tunderbrine	55	120	100	275 8 1
970	58	Narrabri to Pilliga	870	700	500	500	490	2,438 10 9
974	25	Walgett Road, at Wee Waa, up Pian Ck.	60	50	70	70	130 3 7
1372	85	Walgett to Goondabloui	300	185 14 6
1373	105	Walgett, via Goodooga, to Brenda	555	450	270	500	450	1,647 2 7
1374	29	Walgett to Combogolong	350	350	380	80	150	100	1,017 7 0
1375	70	Walgett to Brewarrina	70	40	280	150	269 8 0
1378	40	Collarendabri towards Narrabri	150	120	120	230	200	844 6 6
1379	60	Collarendabri towards Angledool	300	110	120	200	200	689 17 11
1382	66	Pilliga to Walgett	700	450	240	400	350	1,488 3 3
1383	60	Pilliga, via Bugilbone, to Eurie	295	200	100	200	150	610 19 6
1384	49	Wee Talaba, via Angledool, to Goodooga	125	40	50	80	80	326 6 4
			710	4,270	2,750	1,905	3,650	3,550	12,633 4 8

Total amount voted..... £16,835 0s. 0d.
 ,, expended 12,633 4s. 8d.

781. What has been the average expenditure on the road between Narrabri and Pilliga? Roughly speaking, about £500 a year.

782. That would practically be the only road which would be affected by the construction of the proposed line;—the cross roads cannot be materially affected by it? Probably not; but it is very hard to say what roads would be affected.

783. What is the distance by road from Narrabri to Pilliga? Fifty-eight miles.

784. Then, if you saved the whole of the money voted for the road between Narrabri and Pilliga, you would only save £10 a mile? Yes.

785. *Mr. Hoskins.*] I suppose it is hard to get materials for roadmaking in this district? I believe it is; but I have never been in the district, and I have no personal knowledge of it.

786. There is very little done to the roads there? Comparatively little.

787. I suppose you only expend money in the worst places? Yes.

788. It would cost as much to make a good metal road as to make a light railway? Yes; as a rule, it does cost as much in that part of the country, because of the want of material for road-making.

WEDNESDAY, 3 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. FREDERICK THOMAS HUMPHERY.	JOHN LIONEL FEGAN, Esq.
The Hon. JAMES HOSKINS.	THOMAS HENRY HASSALL, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
CHARLES ALFRED LEE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

James Patrick Joseph Bell, sworn, and examined:—

789. *Chairman.*] You are a resident of Walgett? At the present time I am residing at Bondi; but I have a property on the Castlereagh, near Walgett. J. P. J. Bell.
790. *Mr. Farnell.*] How long have you been living near Walgett? For seven years last January. 3 Nov., 1897.
791. How are you interested there? In grazing and farming. I am a selector.
792. What is the extent of your holding? I and my two brothers hold between 22,000 and 24,000 acres.
793. How did you acquire that area? Some of the land we selected, and some we bought from other selectors.
794. What is the extent of your freehold, and what is the extent of your leasehold? Altogether I think we have about 23,500 acres, of which one-third is conditionally purchased, and the remainder conditionally leased land.
795. How far is your property from Walgett? I think that the nearest boundary is 14 miles from Walgett.
796. Would you be within the influence of any railway to Walgett? Yes; a railway to Walgett would be within 14 or 15 miles of our place.
797. In which direction does your property lie from Walgett? It fronts the Castlereagh, and is almost due south from Walgett.
798. What number of stock do you carry? We have shorn as many as 21,000 sheep.
799. What is the average carrying capacity of the run? This year we shored 14,000 sheep, and we have shorn as many as 21,000. Last year the season was very bad.
800. You would carry a sheep to every acre and a half? Something like that.
801. Do you know the average rainfall there? We keep a rain-gauge; but I have not a copy of the record with me.
802. Would it be about the same as the rainfall at Walgett? Yes, about the same.
803. Do you use your holding for anything except grazing? I have grown hay. I have put in about 23 acres of wheat for hay.
804. Have you grown oaten hay? No; I have always grown wheaten hay.
805. You have never taken the trouble to ascertain the yield of wheat per acre? No; because we cut the crop for hay. Yesterday I got a letter saying that this year we should get about 41 tons of hay.
806. Do you think the land is adapted for the growing of cereals? Well, the seasons vary. I have had six crops off my land, and only one of those crops was a failure.
807. From what cause? Because of the drought. Even with that crop we got about 1 ton to every 4 acres, or something like that.
808. Is your wheat ever attacked by rust? No; it is very clean. There is no sorral there. Of course it is new country.
809. Are there many holdings round about you where they have gone in for wheat-growing? No; I am the only one.
810. Do you think there is a good future before the district if railway facilities are given? Yes; it is one of the best districts in New South Wales for irrigation.
811. How would you irrigate there? I am going to irrigate from an artesian bore which is 5 chains from my boundary. Next year I shall irrigate 80 acres from it. The soil is very heavy black soil, which will last for years. At the Pera Bore the soil will not last long, no matter how much water you put on it, because it is very light. This is a very strong soil, and if you put water on it it will last for years.
812. You do not think that it will require periods of rest? No; I think you could cultivate it year after year, so long as you used water.
813. Have you any scheme to propound for general irrigation? The country there is so level that water could be run for miles anywhere. Then, too, water is found at no great depth. The bore adjoining my property is only about 1,450 feet deep.
814. You would not irrigate by putting weirs in the river? I think it would be cheaper to irrigate from bores. Of course the country could be irrigated from the rivers. The Namoi and the Barwon are both large rivers.
815. Do you think that artesian bores will be put down by private enterprise? Yes; there is a bore about 5 miles from my place which was put down by a private company.
816. What is the character of the country near your holding? It is practically open plain country, covered with blue grass and Mitchell grass. The soil is red and brown, or black.
817. Do you know if there is any area of Crown land available for settlement in that part of the district? Of course there are the resumed areas, which have not yet been thrown open. Then there are the remaining portions of the leaseholds of Euroka, Goangra, and Boolroi.
818. Do you think the proposed railway would serve the district pretty well? I think so.
819. Do you know the country on the north of the Namoi? Yes.
820. Do you think it would be better to take the railway on the south side of the river, instead of on the north side? Yes.
821. Where do you send your wool now? To Sydney *via* Narrabri. I believe that this year a portion of it went *via* Nevertire. That was because the carriers came through from Coonamble, and they would not go to Narrabri.
822. If a railway were constructed to Pilliga, would you take advantage of it? Yes, certainly.

- J. P. J. Bell.
3 Nov., 1897.
823. Do you deal in fat stock to any large extent? No. In most cases I sell my fat stock, on the ground, to Richards, to the Aberdeen Company, and to others.
824. If the railway were extended to Pilliga, I suppose advantage would be taken of it for the conveyance of live stock to market? Yes. I have had a good deal of experience in Riverina and other places; but I never saw a district where stock mature more rapidly than they do in this district. If we had a railway close to us we could send fat lambs away more quickly and earlier than other districts. We cannot travel lambs on the roads for more than five or six days or a week. After that time they knock up.
825. Have you ever known the Castlereagh to cease running? Yes; it is not a permanent river at all. I have known it to stop running for six months at a time. We dam it.
826. If a railway were constructed to Brewarrina, would it be of any advantage to you? It would be of no use to us at all.
827. It would be just as easy to send produce to Narrabri as to Brewarrina? It would be almost impossible to send produce to Brewarrina, because of the creeks and the swampy character of the country, and the want of good roads.
828. Do you know the country between Pilliga and Narrabri? Yes.
829. Is it subject to inundation by floods? No.
830. Do you think it is country suitable for railway construction? Yes. The country between Narrabri and Pilliga is not as good as the country between Pilliga and Walgett. You get on to the good country after you pass Pilliga.
831. Do you think there would be any justification for extending the line to Pilliga without making Walgett the objective point? I think that if you stay at Pilliga you will be staying on the edge of the cream of the country.
832. Have you tried fruit-growing out there? No. There is a little fruit-garden on the river close to me—a Chinaman's garden, with twenty or thirty trees in it.
833. How do the trees seem to thrive? I could not say. I should not think that it was a fruit-growing country.
834. Are there any mineral deposits round about Walgett? I do not think so. I have heard of some out towards the Narran Lakes, but I do not think it is a mineral country.
835. *Mr. Hoskins.*] Do you reside principally at Bondi? Yes.
836. Have you ever lived any length of time in the district where your run is situated? Yes; I lived there until about nine months ago. I lived there for about six years.
837. How far are you from Pilliga? About 60 miles, I think.
838. During the six years you have been in the district, how have you sent your wool away and got your stores up? We have sometimes got our stores from Narrabri. For two years we sent our wool from Nevertire, and during one or two wet seasons it went down the river.
839. In, say, five years, does not the greater portion of the wool produced in the Walgett districts go down the river to Bourke? I should not like to say that. I do not think the river takes it so often. The wool has gone that way for two or three years; but it was compulsory to send it by steamer in those years because the teams could not travel any other way. In the black-clay country, when the season is a wet one, the teams cannot travel.
840. If the river were navigable this season or next season, would you send your wool by steamer, or to a railway? I would send it to the railway if I could get it there. I have had to pay £1 a ton to have my wool taken to the steamer, and I can get it taken to Narrabri for £3 a ton. When I have sent to the steamer I have been unable to get teams to take it to Narrabri. In wet seasons it is impossible for carriers to travel to Narrabri, and we have had the greatest difficulty in getting the wool taken to the steamer.
841. Is it not a fact that when the river is navigable the greater portion of the produce of the district is sent by steamer to Bourke? A good deal is sent that way. All the stations on the river send that way.
842. Is it not cheaper to send the wool from Walgett to Bourke by river than it is to send it by road to Narrabri? No; in most cases the road is the cheapest. We have more railway carriage to pay from Bourke to Sydney than from Narrabri to Sydney. When the teams are able to travel that way we can send it to Sydney more cheaply by sending it *via* Narrabri.
843. When there has been a good deal of rain the country is not traversable? It is almost impossible to get the wool away in a wet season. I have known of wool being four or five months on the road from a place near Walgett to Narrabri. That was in 1890.
844. But in a season like that is not the wool generally sent by steamer to Bourke? Yes, when the river is high enough, and the roads are too bad to travel to Narrabri. Of course people on the river banks below Walgett mostly send by river if they can get a steamer.
845. If by a series of weirs and locks the Darling were made navigable from Bourke to Walgett for nine months in the year, do you not think that the greater part of the produce of the district would be taken by river from Walgett, instead of by railway from Narrabri or from Walgett? I do not.
846. If the river were navigable more often than it is at present, would it not be cheaper to send the wool by water instead of by railway? Yes; but when the wool gets to Bourke, it is further from Sydney than it is at Walgett. There is more railway carriage to pay from Bourke.
847. *Mr. Fegan.*] Did I understand you to say that it was not expedient to construct a line from Narrabri to Pilliga? Of course, at Pilliga you are only on the fringe of the good country. I think it would be better if the line went to Walgett.
848. *Mr. Hoskins.*] The country between Narrabri and Walgett is all pastoral country? Yes, I believe it is.
849. There is no close settlement there? There are a great many selectors between Pilliga and Walgett, people holding from 2,500 up to 5,000 acres.
850. But the people there are all engaged in grazing pursuits? Yes.
851. Has there been any accession of population worth mentioning during the last five years? Yes, there has been a large increase.
852. How has this been brought about? Well, at Yowindah something like 45,000 or 46,000 acres were thrown open about nine months ago in blocks of from 3,000 to 4,000 acres. Those blocks have all been taken up. All the available land in the district has been taken up.
853. How far would that land be from the route of the proposed railway? Yowindah runs from the Castlereagh across to the Barwon.
- 854.

J. P. J. Bell,
3 Nov., 1897.

854. It would be a long way from Pilliga? It would be down the river from Walgett.
855. Towards Bourke? Yes.
856. The persons residing there could use the river when it was navigable? Yes, of course.
857. *Mr. Lee.*] Have you any idea of the estimated traffic on the proposed railway? No.
858. Are you aware that, according to the calculation of an officer of the Railway Department, the proposed line would show a very large loss? No, I am not.
859. Will you explain to the Committee what prospect there would be of the line paying in the future? Well, there will be more land available for settlement within a short time. I think they have only about twelve months to run at Euroka.
860. How many acres would there be there? I think 40,000 or 50,000 acres.
861. How many acres are required? From 600 to 2,500 acres.
862. But what area does a man require to make a living? I think from 2,000 to 2,500 acres, although close to Walgett they have put people on to blocks of about 600 acres. I do not think, however, that that area is large enough.
863. Euroka, then, would be capable of maintaining about twenty-five additional families? Yes. About the same number might be put on Goangra. Come-by-chance is, I think, taken up.
864. With the exception of a few portions at some considerable distance back from the line, the land on the northern side of the railway has nearly all been alienated? I believe that at Eury-Eury they have about 60,000 acres of purchased land; but it is flooded country—the worst country on the place.
865. Are you aware that all the land on the northern side of the river within the influence of the proposed railway has already been alienated—that is, with the exception of a few isolated patches? No, I am not aware.
866. Are you aware that the available land on the southern side of the Namoi is chiefly comprised in forest reserves? Down at Pilliga, between Wee Waa and Pilliga.
867. Beyond Pilliga? I know that there is a very large timber reserve on the southern side of the river, extending for about 40 miles, I believe.
868. Are you aware that the land on the southern side of the river is much inferior to the land on the northern side of the river? I believe that it is.
869. Do you know of your own knowledge? Yes; I have seen the inferior land. It is heavily-timbered country.
870. If that land were thrown open for settlement would it be taken up? There is a lot of country there which I admit is not worth taking up.
871. Therefore we must not look for any large amount of settlement in that part of the district? No; I think that any further settlement would be between Pilliga and Walgett.
872. The country is already well stocked with sheep and cattle—would additional settlement mean more sheep and cattle? I think there can be no doubt about that.
873. To what extent? To a very large extent. Small holders always increase the carrying capacity of a district.
874. Do you think it possible that the carrying capacity of the district may be doubled? I should not like to say that, but I think that the additional population would cause a certain amount of extra traffic.
875. The position is this: the district is already well stocked, and it is shown that if a railway were constructed there would be a large loss on it every year; I should like to know from you whether settlement is likely to increase to such a degree that the consequent increase of freight will make up that loss? I should not like to say that the produce of the district will double; but it will increase very largely. A large paddock with one tank in the middle of it will not carry as many sheep as 2,500-acre blocks each with a tank of its own.
876. Is the country capable of carrying twice as many stock as it is carrying now? I should not say that the number of stock would be doubled; but with small settlement it would be increased very largely.
877. I suppose the increase in freight would be in connection with wool and station produce? Principally.
878. There might be additional traffic from agricultural centres? I think there will be a good deal of irrigation in that district.
879. Irrigation is a long way off at the present time; there are so many other districts which have an ample rainfall for wheat-growing that wheat-growing by irrigation is too expensive at present; irrigation in that district must at any time be uncertain? It is uncertain.
880. There would be seasons when they would get very good crops there? Well, I have only had one failure out of five or six crops. This year we have had a splendid crop. The cultivation paddock is about 18 miles from Walgett, and about 2 miles from the Castlereagh.
881. Did you have five good seasons in succession? Very nearly.
882. Did you choose your seasons? No. Last year the crop was a failure; but the four crops before that were very good, and this year is a good crop.
883. It would be a stretch of the imagination to suppose that either hay or grain could be grown there in sufficient quantities for export elsewhere? I do not say that that will be a farming district.
884. Whatever is grown there will be consumed within the district? I believe that the district is the soundest grazing country that I have ever been in, and I have travelled a good deal. I have had a place in Riverina, and in other parts of the country. In this district we are free from foot-rot, from fluke, and from everything like that.
885. In your opinion, the settlers out there are entitled to railway connection, and if they got that connection they would be able to work their properties to greater advantage, benefiting by a saving in the cost of carriage, and the certainty of transit? Yes. Whenever an acre of land there is made available for settlement, it is balloted for. There is always a great demand for land in the district, and sometimes there are twenty-five applicants for one block. I do not think there has been a case during the last five months when land has not been balloted for, principally by people from the south.
886. Is the land being thrown open in settlement leases? I think that Yowindah has been thrown open in settlement leases.
887. Were homestead selections in existence in the district prior to the passing of the Act of 1894? No. On the other side of the Barwon there are what are called homestead leases.
888. The alienations in your district have been under the new Act, and chiefly in the form of settlement leases? Yes.

- J. P. J. Bell. 889. Sufficient time has not elapsed to show whether the land can be worked profitably under those conditions? I think so. Those who selected in 1890 ought to know by this time what can be done. I selected then, and it has been a profitable investment for me.
- 3 Nov., 1897. 890. You are of opinion that there is a fair prospect of the population increasing? I am sure of it.
891. You also think that there is a good prospect of the traffic increasing, though you cannot say how much? I am certain that there will be an increase.

THURSDAY, 4 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	JOHN LIONEL FEGAN, Esq.
The Hon. JAMES HOSKINS.	THOMAS HENRY HASSALL, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
CHARLES ALFRED LEE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 892. *Chairman.*] The question of connecting Walgett with either the western or the north-western line is under consideration;—will you explain why you believe that Walgett should be connected with the north-western line, or with the western line? I did not say that it should be connected with either.
- 4 Nov., 1897. 893. It is a question of Newcastle or Sydney being the port for Walgett? I can give information on that subject. I gave information before as to the returns of wool. I have had some information prepared with regard to goods, live stock, and passenger traffic between Sydney and Narrabri, and between Newcastle and Morpeth and Narrabri. In the year just terminated, the goods forwarded to Narrabri from local storekeepers—that is, locally sold in Newcastle—amounted to 1,600 tons. During the same year, the goods carried from Sydney and delivered on the train at Morpeth for delivery at Narrabri, amounted to 2,000 tons. The quantity carried by steamer from Sydney and loaded at Newcastle in railway trucks, was 120 tons. The goods loaded in Sydney was 1,050 tons.
894. *Mr. Lee.*] What was the point of destination? Narrabri.
895. Could you trace it beyond Narrabri? No; it would take two or three months.
896. You do not know whether those goods went to Moree, or where they went to? A portion of them, we know, did not go to Moree, because Moree would be included only for a portion of the period. Since the Moree line has been opened, these are the goods that were actually booked to Narrabri. I thought it would be sufficient if I showed the general trend of the Narrabri trade—the trade to Narrabri. The totals work out in this way—about 66 per cent. from Sydney, and 33 per cent. from Newcastle.
897. *Mr. Humphery.*] Newcastle and Morpeth? No; the Morpeth goods are all Sydney goods—steamer-carried from Sydney. The object of this is to ascertain the trend of trade. All the goods from Morpeth are carried from Sydney by steamer. It is a question of getting to Morpeth either by steamer or by rail.
898. So that you are distinguishing now between the traffic from Newcastle, and the traffic from Sydney? Yes.
899. *Chairman.*] To say that 33 per cent. of the traffic comes from Newcastle and 66 per cent. comes from Sydney is clear enough in itself; but it does not cover the case, because of the 33 per cent. from Newcastle a portion may have come by sea to Newcastle—it may have been in Sydney once? It may have been, certainly; but I think it is sufficient if the goods find their way to Newcastle and are sold at Newcastle, and go from thence to Narrabri.
900. *Mr. Lee.*] It does not matter how the goods get to Newcastle;—you are showing the proportion of traffic from there from a railway point of view? Yes; I am showing the amount of trade done direct with Newcastle as compared with that done direct with Sydney.
901. And it does not matter whether the goods are sent from Sydney to Newcastle? The object is, as far as rail-carried goods are concerned, to show where they come from and where they go to.
902. *Mr. Wright.*] Is it not possible that of the 66 per cent. of goods sent from Sydney, a great proportion was sold by Newcastle firms who have houses in Sydney also? That would not alter the fact of their coming from Sydney.
903. You are taking the point from which the traffic starts and the point at which it arrives? Yes.
904. *Mr. Humphery.*] What is the total tonnage by rail to Narrabri? The total tonnage to Narrabri from Sydney, Morpeth, and Newcastle is 4,770 tons. While on the subject of tonnage, I might remark, by the way, that the tonnage credited to the Pilliga extension is 2,350 tons. The tonnage carried, which is the chief tonnage carried to Narrabri, and which at the present time embraces the Pilliga traffic, the Collarendabri traffic, and part of the Moree traffic, amounted to 4,770 tons. I mention this, because it has been said that the estimate of traffic for Pilliga was a low one. As a matter of fact, the extension to Pilliga has been credited with half of the tonnage sent to Narrabri, which includes during part of the year the goods going out to Moree and the goods going to Collarendabri and the Queensland border.
905. Have you any means of ascertaining about what percentage of the whole of the traffic would go to other places than Pilliga? Yes; I have very fair means of knowing that, through having made inquiries into the Collarendabri line. As a matter of fact, there would be more traffic going to Collarendabri than to Pilliga.
906. *Chairman.*] Would any portion of the traffic representing 4,770 tons go eastward of the north-western line? No traffic of any extent would go in the direction of Bingara and Barraba. There might be a few small supplies, but nothing of importance. Then, with regard to stock, the total quantity of stock forwarded to Farley, at West Maitland, during the year, was 216 trucks. The total quantity forwarded to Flemington was 1,600 trucks, making a total of 1,816 trucks. That represents about 88 per cent. of the stock traffic that came through to Flemington, which practically means Sydney, the remaining 12 per cent. going to the neighbourhood of Newcastle.

907. *Mr. Humphery.*] What proportion of that 88 per cent. do you estimate would come from Walgett? Very little would come from Walgett. J. Harper.
4 Nov., 1897.
908. Between Walgett and Narrabri? I could not tell you without analysing the figures. The traffic varies so much according to the seasons. I could not tell you how much was carried during the seasons. I should say, relatively, a small quantity, because most of the stock came from the north of Narrabri and not from the west. Fat stock were sent from between Narrabri and the Barwon—from east of Collareendabri, and also from west and north-west of Collareendabri. Some of the stock came from due north—the Moree district. During the whole of that period we had not the line open and in our possession. It was in the contractor's hands, and no stock was being carried to any extent. However, the figures I have given show the total stock carried to those two stations during that year.
909. Are you speaking now of stock from Narrabri or from Moree? Narrabri.
910. Would that include the live stock to Narrabri? That is the whole of the stock carried from Narrabri during the twelve months ending September last.
911. Have you included in your estimate the whole of the stock from north of Narrabri? I have included the whole of the stock trucked at Narrabri.
912. What proportion of the 88 per cent. have you credited to the proposed extension now before the Committee? 900 trucks.
913. But what proportion of the 88 per cent.? I do not know. The figures with regard to the passenger traffic are also very significant. For the twelve months ending September last, there were 136 passengers booked from Newcastle, and 1,144 booked from Sydney, or 83 per cent. from Sydney, and 17 per cent. from Newcastle. Those were passengers to Narrabri.
914. How many passengers have you credited to the Narrabri-Pilliga line? 2,800. You could not take these figures from a comparison for the simple reason that these are only the Sydney and Narrabri passengers, while there would be local traffic in the other case.
915. As regards passengers you consider your estimate a very full one? Yes.
916. *Chairman.*] You have already given the figures with regard to wool? Yes; in answer to Question 411. It shows that 66 per cent of that traffic comes to Sydney.
917. Then the case stands in this way: Of live stock, 88 per cent. of the traffic comes to Sydney; of the goods traffic to Narrabri, 66 per cent. goes from Sydney; of the passenger traffic, 83 per cent. goes from Sydney; and of the wool traffic, 66 per cent. comes to Sydney. Those are the figures? Yes, with an increasing tendency, as far as wool is concerned, in the direction of Sydney. Every year the quantity of wool brought to Sydney is increasing. The wool offered in Sydney has for some time past shown a marked increase every year.
918. Have you given any returns as regards wheat? No.
919. *Mr. Hoskins.*] I suppose you know the Railway Department receives a good deal of traffic from Walgett *via* Bourke to Sydney? Yes. I desire to say that I did not unduly inflate my figures, for in the comparison as to how the wool was dealt with at Sydney and Newcastle, I did not take into account the wool which during the season came from Walgett to Bourke, and thence to Sydney. I dealt with only the rail-carried wool which came that year from Narrabri. I omitted altogether the 2,000 tons which were carried from Walgett. If that 2,000 tons, which absolutely came to Sydney, were added to the other wool which also came to Sydney, the percentage in favour of Sydney would be infinitely greater.
920. *Mr. Lee.*] You say that in your second estimate, which is really the estimate of revenue we are dealing with, you only dealt with rail-borne wool? Yes; in taking out the percentages coming to Sydney and Newcastle. I am giving the quantity of wool coming to Sydney and Newcastle respectively. It would have been unfair to Newcastle to include in my statement wool which came by river. I simply took the wool which found its way on to the northern railway that year, and showed its ultimate destination.
921. *Mr. Hoskins.*] You have given the amount of loading taken by rail to Narrabri. Do you not believe that a very much larger proportion of the loading that goes to Narrabri is sent to other districts than Walgett, and that Walgett gets a very small proportion of it? Yes, I am sure of it.
922. *Chairman.*] According to your evidence, the produce from Walgett and the up-trade coming *via* Narrabri, if there were a railway from Narrabri to Walgett, would travel a distance of 469 miles, because 66 per cent. of it goes from Sydney? That is so.
923. *Mr. Hoskins.*] Still you believe that if the Darling were navigable, even although there were a railway from Narrabri to Walgett, a good deal of wool from that district would be sent round by Bourke? I do.
924. *Chairman.*] But if the people desired to get from Walgett to Sydney, they would scarcely use the river to Bourke, and then pay railway freight for 501 miles to Sydney, in preference to using the railway a distance of 469 miles *via* Newcastle;—what is the river freight from Walgett to Bourke? Twenty shillings a ton.
925. Therefore, the railway would have to carry the goods a greater distance for £1 less, to induce a Walgett man to leave Walgett and go down the river? Yes; that would not be unusual.
926. Is there much doubt that if a line were extended from Narrabri *via* Pilliga to Walgett, the Walgett produce would go *via* Newcastle, and two-thirds of it would pass Newcastle? That is so.
927. There would not be any contention that there would be a probability of the produce of Walgett going down the Barwon to Bourke, and then paying rail carriage along the line to Sydney? Yes; there would be every prospect of it.
928. Paying £1 to get to Bourke, and then paying for a longer distance to Sydney? Yes; because from Bourke down-stream they can always control the Walgett trade, so far as merchandise is concerned, and when they can control it as regards merchandise, they can control it as regards wool. Take a firm like Rich & Co., who have half a dozen steamers, and who are also merchants in a large way. The very fact of their being able to sell one big line would probably influence a couple of thousand bales of wool, and you could not tell what the rate was. They would probably get some line carried from South Australia at 30s., and they are prepared then to accept a contract for a big clip of wool at a rate that we never know of, and it is a through rate. We cannot follow these transactions, and we cannot give quotations to secure the traffic. It does not matter what we quote, these people get the traffic. A Walgett man might pay £1, or something approaching that for river carriage by a longer route, even if he were going to Sydney.
929. That would not last? I do not know so much about that. It exists to-day, and it is very prevalent also down the Murrumbidgee.

- J. Harper.
4 Nov., 1897.
930. Because there you have the border duties and rebates, and a competing centre like Melbourne? But we have the same thing at Bourke; we have to maintain a competing rate there.
931. Are you prepared to express an opinion as to whether, if it be justifiable to extend the railway to Walgett, that place should be regarded as ultimately trading with Newcastle or with Sydney? I think with Sydney. The returns we have of the traffic carried from that district all indicate it.
932. If Walgett is to be connected with the railway system of the Colony, Sydney, in your opinion, will be its trading depôt? Not only is that so in my opinion, but the evidence I have given, obtained from the books of our Department, discloses it to be a certainty.
933. And that evidence is, of course, the basis of your opinion? Yes.
934. *Mr. Fegan.*] But where is the necessity to come down to Sydney from Newcastle? I am simply dealing with facts as they are. I do not express an opinion; I simply bring the information obtained from the books of our Department and offer it to the Committee.
935. But you add that, if a railway were constructed to Walgett *via* Narrabri, the market would still be Sydney and not Newcastle? I cannot see how the conditions are going to alter, because the conditions of carriage are precisely the same, as far as my statistics are concerned, to Newcastle to-day as to Sydney to-day.
936. Though there is a difference of 102 miles between Newcastle and Sydney? Yes; and notwithstanding that fact two-thirds of the traffic comes to Sydney. That is the position. I wish it to be absolutely clear that I express no opinion, but only lay before the Committee the information which our books give. If my personal opinion is asked about the matter I do not mind expressing it. I think that if Walgett is approached by railway at all, it should be approached by Coonamble.
937. *Mr. Hoskins.*] A very much longer distance? I think only about 12 or 15 miles longer.
938. *Chairman.*] The distance from Sydney to Walgett *via* Nevertire and Coonamble is 485 miles as against 469 miles from Sydney to Walgett *via* Narrabri and Pilliga, showing a difference of 16 miles? Yes.
939. *Mr. Roberts.*] How far is it from Warren to Walgett by way of Coonamble? About 130 miles.
940. *Mr. Fegan.*] But, on the other hand, the route *via* Newcastle to Sydney would be the shortest for Pilliga? Yes; but I do not think that anyone would seriously consider that a railway ought to be built as far as Pilliga is concerned, which is on the edge of a brigalow scrub and which can produce nothing.
941. *Chairman.*] What is the character of the country from Narrabri to Pilliga? On the south side of the line it is absolutely worthless country. There may be some timber in it, but I do not think there is very much.
942. Does this poor country extend southwards for a distance of 30 miles? Nearer 60 miles. The inferior country, comprising brigalow scrub, extends from about Eurawilkie on the west, thence in the direction of Coonabarabran, round south-east near Baradine, and thence back in a north-easterly direction towards Narrabri.
943. Describe in general terms the country from Coonamble to Warren and Coonamble to Walgett? The country from Warren to Coonamble, with the exception of three or four monkey-sandhills, is all rich black soil, boree and myall plain, with some red soil in it, and comprising some of the best pastoral country and agricultural country that I know of anywhere.
944. What is the rainfall at Coonamble? Eighteen or 19 inches. I would point out why I think it would be an advantage to Walgett that it should have its railway communication from the west. I am satisfied from an examination of the country that this is a line that would pay from its inception—I mean the line from Warren to Coonamble. The Commissioners have reported on this line, and they say that if extended rates from the main line were charged, with no local rates, the traffic would be of such a character that from the start of the railway it would pay working expenses and a portion of the interest on the capital cost. Therefore, if an extension from Coonamble to Walgett were carried out, it would be an extension from a line which would not be burdened by any local rate, but to which the ordinary extended rates would apply. Added to these considerations is the fact that the distance to be built is comparatively small as compared with that *via* Newcastle. There is an alternative line from Mudgee *via* Coonabarabran, but I am not speaking of that.
945. Could you describe the country from Coonamble to Walgett? For about 30 or 40 miles it is practically of the same character—not quite so good, probably—as that between Warren and Coonamble. Then, when you get towards Walgett, you get on to flooded country—fair pastoral country, but a good deal of it is flooded; but it floods to a far greater extent in the direction of Pilliga than it does in the direction of Coonamble.
946. Describe the country from Walgett to Pilliga? There is about 20 or 30 miles of flooded country—probably more—as you approach Walgett. The country is about of equal character to that midway between Coonamble and Walgett. It is practically the same right into the river, except that it floods out more between Pilliga and Walgett.
947. Is there any agricultural land between Narrabri and Walgett? No—that is to say, agricultural land in the sense of producing anything for railway carriage.
948. What is your opinion of Coonamble as an agricultural district? I do not think that Coonamble would grow much; but between Warren and Coonamble there is some splendid agricultural land.
949. And you believe that the temperature and the rainfall would enable it to be dealt with? I am sure it would.
950. *Mr. Hoskins.*] If the trade increased largely in consequence of the opening of a railway from Warren to Coonamble and Walgett, would not that increase the difficulties of working the western line, owing to the severe grades? If the trade increased from anywhere the difficulties would be increased, but still it would always pay to get over those difficulties by reason of having the traffic. The work that is being done now in reducing the grades on the various railways is doing away with a lot of difficulties which formerly had to be encountered.
951. What is the distance by railway from Sydney to Warren? 353 miles.
952. *Mr. Humphery.*] The distance from Narrabri to Walgett is 114 miles, and from Warren to Walgett 132 miles? Yes. It is 63 miles from Nevertire to Coonamble, and 69 from Coonamble to Walgett; making a total of 132 miles. From Narrabri to Walgett the distance is 115 miles. There is another point in connection with the Coonamble extension. I think you will agree with me that a line that can show such results from the crucial test of the Railway Commissioners as I have mentioned—namely, that it will pay—must have strong claims to be built some day. Assuming that a line is built to Coonamble—as it will be, whether

- whether it is extended to Walgett or not—you will then have only 69 miles of construction to reach Walgett. J. Harper
4 Nov., 1897.
953. Do you know the character of the country sufficiently well to say whether the cost of construction between Warren and Coonamble and Coonamble and Walgett, would be greater or less than between Narrabri and Walgett? If anything, I think it would be less by Coonamble, because there is less flooded country as you approach Walgett from Coonamble side, than there is coming from the Pilliga side.
954. And between Warren and Coonamble? Between Warren and Coonamble there are no difficulties at all. You cross the Macquarie at Warren, and after that there are one creek and two or three blind watercourses.
955. From your knowledge of lines which have recently been constructed, can you compare the country between Warren and Coonamble, as to the cost of construction, with any other line that has been built? The estimated cost of 64 miles of railway from Warren to Coonamble, including a bridge over the Macquarie is £177,000, which would be about £2,700 per mile.

FRIDAY, 5 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
HENRY CLARKE, Esq.
CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

956. *Chairman.*] You have something to add to your previous evidence? Some information was asked for by the Committee with regard to the extension of the Great Northern Railway from Werris Creek to Narrabri. Unfortunately the papers belong to the Public Works Department, and they cannot be traced, and in the year when the proposal came before Parliament, there was no official record of the debates of the House. I have here, however, an extract from the *Sydney Morning Herald* of the 25th April, 1877, which says— J. Harper
5 Nov., 1897.

Mr. Hoskins laid upon the Table of the House copies of plans, sections, and books of reference, regarding the proposed extension of the Great Northern Railway from Werris Creek to Gunnedah. He gave notice that he would to-morrow (Wednesday) move that they be approved by the House.

An extract from the *Sydney Morning Herald* of 27th April, 1877, says—

On the motion of Mr. Hoskins that the extension of the Great Northern line of railway from Werris Creek to Gunnedah be approved, the question was discussed. In the course of the discussion, Mr. Hoskins read a report from the Engineer-in-Chief as follows:—This extension leaves the Great Northern Railway at a point 11½ miles north of Quirindi Station, and 155 miles 32 chains from Newcastle, follows the course of Werris Creek for a distance of 3 miles, crosses the creek at a place called The Gap. From this point to the crossing of the Mooki River at Breeza, the railway passes for 9 miles in a straight line across Breeza Plains. From Breeza to Gunnedah, the line has been kept above the level of the floods, and terminates in the town of Gunnedah, a position favourable for continuing the line either to Narrabri or to the northern districts. The steepest incline is one in fifty for 25 chains, falling from the station at the junction with the main line. The works are very easy, being principally side cutting, the embankment being kept about 3 feet above the natural surface of the ground on that portion subject to floods. The amount voted last session for railways was £220,000 for 40 miles in length, but this distance has been increased by 1 mile in consequence of the inhabitants requesting the Government to place the station in the town of Gunnedah. The motion was agreed to.

The plans of the Werris Creek to Gunnedah line were approved by Parliament on 9th May, 1877. The contract was let 6th September, 1877, the line was opened to Breeza on 25th March, 1879, and to Gunnedah, 11th September, 1879. The plans of the Gunnedah to Narrabri line were approved by Parliament 17th June, 1880, and the line opened in sections—the Gunnedah to Boggabri section, 11th July, 1882, and the Boggabri to Narrabri section, 1st October, 1882. I have also the following return:—

WERRIS CREEK TO NARRABRI.

SECTIONAL Expenditure and Earnings for the under-mentioned years.

Particulars.	1883.	1887.	1890.	1894.	1895.	1896.
Capital cost.....	£ 614,184	£ 610,234	£ 610,234	£ 677,574	£ 678,502	£ 678,909
Interest on capital.....	24,567	24,409	24,409	27,080	27,113	27,127
Working expenses.....	39,667	31,462	23,670	27,353	29,897	29,393
Working expenses and interest.....	64,234	55,871	48,079	54,433	57,010	56,520
Earnings.....	54,073	40,925	44,690	69,114	68,509	67,018
Profit on working exclusive of interest.....	14,406	9,463	21,020	41,761	38,612	37,625
Profit or loss on the year's working including interest.....	Loss 10,161	Loss 14,946	Loss 3,389	Profit 14,681	Profit 11,499	Profit 10,498

957. *Mr. Lee.*] If such excellent results have been obtained from the Narrabri extension, why should they not be obtained from an extension to Pilliga? I do not think that there are the opportunities at Pilliga which there were at Narrabri.

958. *Chairman.*] Are there any local reasons against the construction of a line between Coonamble and Dubbo? No; but the country lying between those two places is not as good as the country between Warren and Coonamble. Besides, the selectors on the Marthaguy and the Macquarie would not be benefited by such a line.

959. What is the country like coming through Gulgong into Mudgee? The area of good country on that route is not so great as between Warren and Coonamble.

- J. Harper.
5 Nov., 1897.
960. *Mr. Fegan.*] The distance from Narrabri to Walgett is less than the distance from Warren to Walgett? Yes; but very little less, and there would be a great difference in the amount of traffic picked up.
961. Would there be any difference in grade? The country is pretty level in either case.
962. But you think that the country between Warren and Walgett is better than the country between Narrabri and Walgett? Yes; it is far better country. For 62 miles, charging an extension of the local rates—that is 1d. per ton per mile on wool—it would produce over £10,000 a year. That is a length only 5 miles longer than the line from Narrabri to Pilliga.
963. But the country from Pilliga to Walgett is equal to the country between Coonamble and Walgett? Yes, for the most part; but the country near Coonamble is better than any of the country further north.
964. The rainfall between Pilliga and Walgett is less than between Coonamble and Walgett? I think they get a little more rain at Coonamble.
965. Which would be the better grade—from Walgett through Narrabri to Newcastle; or from Walgett *via* the western line to Sydney;—would not the difference be in favour of the line to Newcastle? Not very much. There are few grades on the western line now until you get to the mountains.
966. But if Newcastle were the terminal point, it would be easier for the traffic to go there than to come to Sydney? Yes; but the conditions are against its doing that.
967. Are these conditions unalterable? I do not say that; but it would take a very long time to alter them. The tendency is, for the wool-brokers to offer more wool for sale in Sydney every season. With two-thirds of the wool already coming to Sydney, that tendency must increase.
968. Do you not think that the northern trade may ultimately centre in Newcastle? I cannot conceive of such a possibility. It is notorious that no business demands centralisation so much as the wool business does. So far as the stock business is concerned, of course, there is a very large tendency for it to come to Sydney, because of the immense consuming population.
969. There was an increase in the quantity of wool shipped from Newcastle last year? There was an increase in the whole Colony.
970. Notwithstanding the great drought? We are feeling the effects of the drought now. The clips of the Australian Pastoral Company's station represented nearly 20 per cent. of the wool sent from Newcastle. We got more of that wool last year than in previous years; but it may at any time go to Brisbane.
971. *Mr. Hoskins.*] Is it not a fact that a great deal of wool produced in the north-western district, as well as in other parts of the Colony, is controlled by banks and other financial houses in Sydney? Yes.
972. And the producers must send it where their mortgagees compel them to send it? Yes.
973. *Mr. Fegan.*] These men have got into the hands of the banks and they must remain there? It was the large financial companies who used to ship the wool Home; but they are showing an increasing disposition now to offer in Sydney.
974. Have you more streams to cross between Coonamble and Walgett than between Narrabri and Walgett? No. They are mostly blind creeks, and the bridge work should not cost more than £1,500 or £2,000 for each. The only one of any consequence is the Marthaguy.
975. How many of them are there? Well, they are principally very small creeks running into the river. They could hardly be shown on the map, but they would have to be provided for in the construction of the line.
976. Would you not have to cross the Castlereagh in going from Coonamble to Walgett? Yes; but not if you stopped at Coonamble.
977. If you get the line to Coonamble, it will be only a short time before it goes on to Walgett? I do not admit that. I do not think that anything entitles Walgett to a railway. In a very short time it will be absolutely necessary to construct the railway to Coonamble, and when the line goes there it will be within a much shorter distance of Walgett than any other line. It would obtain the great bulk of the Walgett traffic except that river borne.
978. How does that traffic now find its way to Sydney? In one year two-thirds of it came through Bourke. Circumstances do not warrant the construction of a line to Walgett; but if at any time it were necessary to construct such a line, the best thing would be to take it *via* Coonamble.
979. The most expensive portion of the line will be from Coonamble to Walgett? No, I do not think so, though I do not know how the engineers propose to get over the flooded country between Pilliga and Walgett.

Richard Dalrymple Hay, Chief Clerk, Forestry Branch, Department of Lands, sworn, and examined:—

- R. D. Hay.
5 Nov., 1897.
980. *Chairman.*] You can give us no information, except what you have obtained from official reports and statements which have come under your notice? No.
981. You are, however, prepared to tell us something about the forest reserves between Narrabri and Pilliga;—what is the area of the first one of which you have to speak? There is a series—numbers 24,587, Baradine; and 24,588, White. Within those reserves are comprised an area of 337 square miles, or 215,000 acres.
982. Those reserves are south from Pilliga, and run east? Yes. The only commercial timbers upon them are ironbark and pine.
983. Are you getting any revenue from them? We are just starting to get revenue from them. People are taking timber from them now.
984. What does the ranger say with regard to the quality and quantity of the timber? It is estimated that there is one matured pine, and two matured ironbark trees to the acre, and that there are six commercial trees to the acre coming on.
985. What royalty is charged? Two shillings a tree upon pine, and 4s. a tree upon ironbark.
986. Can you sell it at that rate? That is what we charge; but the demand is limited.
987. What would be the gross value? Eight shillings per acre for the matured timber, or about £86,000 altogether. There was a fair demand for timber some five or six years ago for road and bridge construction; but it fell off for a time, and this year it has increased again.
988. Was the timber for the railway from Narrabri to Moree obtained from this forest? No.
989. What is the annual return from the reserve? For the last five years there has been practically no return, though things are looking more hopeful.

990. Have you any statement as to the value of the land? No; but one of the reports of the forest ranger says that the land is not suitable for settlement. R. D. Hay.
5 Nov., 1897.
991. Do you know if the construction of a railway to Pilliga would increase its value? I am sure that it would not. If there were any extension beyond Pilliga a lot of the timber would be taken. At the present time the roads of access to this particular forest are from Narrabri.
992. *Mr. Hoskins.*] There is a forest near Narrabri? South from Narrabri. There is none between.
993. *Chairman.*] What is the next reserve? The nearest reserve is down south, near Baradine. There is no forest reserve nearer than that.

WEDNESDAY, 10 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

<p>The Hon. FREDERICK THOMAS HUMPHREY. The Hon. JAMES HOSKINS. The Hon. CHARLES JAMES ROBERTS, C.M.G. The Hon. WILLIAM JOSEPH TRICKETT. The Hon. DANIEL O'CONNOR. HENRY CLARKE, Esq.</p>	}	<p>CHARLES ALFRED LEE, Esq. JOHN LIONEL FEGAN, Esq. THOMAS HENRY HASSALL, Esq. GEORGE BLACK, Esq. FRANCIS AUGUSTUS WRIGHT, Esq. FRANK FARNELL, Esq.</p>
--	---	---

The Committee further considered the proposed Railway from Narrabri to Pilliga.

William Henry O'Malley Wood, District Surveyor, Moree, sworn, and examined:—

994. *Chairman.*] What are the boundaries of your district? The boundaries of my district, for the purposes of this inquiry, may be taken to be from between Moree and Woolabra; thence going westerly and southerly, striking the Namoi between Pilliga and Walgett; thence across the Namoi, and, crossing the Castlereagh to the Macquarie, thence northerly to the Queensland border which is my northern boundary. W. H. O'M.
Wood.
10 Nov., 1897.
995. What is the character of the country north of the Namoi River, between Walgett and Narrabri? It is for the most part plain country.
996. Do you regard it as pastoral country? Yes; rich pastoral country.
997. Are there any agricultural possibilities? Yes; but there has been so little agriculture there up to the present time that I do not regard it as agricultural country now, nor probably will it be so for many years to come. The soil is good enough, and the rainfall varies from about 20 inches at Walgett to about 25 or 26 inches at Narrabri. That rainfall is good enough for agriculture; but there would be some seasons when the crops would miss, and up to the present time no considerable extent of agriculture has been carried on.
998. It is possible to grow crops? I have known crops to have been grown there, and grown well. I grew a crop myself this year at Moree, consisting of about 2½ tons of hay to the acre. The rainfall at Moree is about 25 inches.
999. Do you know the country between Narrabri and Woolabra, on the east, and Collarendabri and Walgett on the west? Yes.
1000. What are the possibilities of agricultural settlement? I think it is possible to grow cereals there; but I would place agriculture in that district a considerable time ahead.
1001. Are there other places at present unused which, in your opinion, are more suitable for the growth of cereals? I think the country lying to the east, notably the Inverell country, is so admirably adapted for agriculture that it is improbable the less favoured district to the west will be used for agriculture for some time to come.
1002. Because of the competition offered by the Inverell, Warialda, and Bingera lands? Yes.
1003. What kind of country is that from Narrabri to Pilliga? You pass through some very good country; but as this is in the Tamworth land board district, Mr. Poate would be better qualified to give evidence concerning it.
1004. What is the country like from Pilliga to Walgett? From Pilliga to Come-by-Chance the country is not very good. There is a good deal of brigalow scrub.
1005. Extending back far from the Namoi? Yes; it extends a long way back from the Namoi. Most of that scrub is in the Tamworth district. You come on to good country at Goangra, near the junction of the Baradine Creek and the Namoi. From that westerly the soil in the Moree district is good. Most of the country is open. There is some scrub country, and parts of it are subject to inundation. There is a great deal of country between the Barwon and the lower parts of the Namoi, the Castlereagh and the Macquarie, that is subject to inundation in wet seasons.
1006. Speaking of the country generally, do you regard it as a pastoral country? Yes.
1007. Do the remarks you have made apply to the country further up the Barwon—between the Barwon and further up on the Narrabri and Moree line? Yes. I think the rainfall generally is from 20 to 21 inches over the whole of that country.
1008. But do other parts of the country in the vicinity—that is, east from the Moree line—offer better opportunities for agricultural settlement? Yes.
1009. Therefore, you do not expect any development of agriculture at present in the country just referred to? No.
1010. Do you see the line marked on the map from Woolabra to Collarendabri; what sort of country does that pass over;—is it flooded? I think the exact site of the line is not much flooded until you get near to Collarendabri. I have not followed the line, and do not know exactly where it goes; but I imagine that in very wet seasons, in times when the Barwon is very high, parts of that country would be flooded.
1011. Woolabra would not be flooded? No, never. The flooded Barwon country extends about 8 miles from Collarendabri, in the direction of the Telaba, on the main road to Narrabri, before you pick up the toe of the dividing elevation.
1012. What depth of water would there be outside of Collarendabri when there was a flood? Speaking from memory, I think that in Collarendabri itself, at the time of the 1890 flood, there was about 3 feet of water all through the town. 1013.

- W. H. O'M. Wood.
10 Nov., 1897.
1013. Did it run fast? I was not there; I think it would run pretty fast. I remember going down to Collarendabri just after the 1890 flood, and seeing sheep hanging higher than the middle wire of a fence. This was about 8 miles out from the town. But there would be places between that and Collarendabri where the water would be deeper. I understand that on the proposed railway route they have picked out the highest parts of the country in the neighbourhood of the Barwon.
1014. Going from Walgett to Pilliga, do you know how wide the flooded country is there? Speaking from memory, I think it is 14 miles. They have to go down along the Coonamble road in a southerly direction to escape the flooded land, and then they run easterly to Come-by-Chance.
1015. Going down 14 miles from Walgett you strike higher land, and then a line going easterly from that point towards Come-by-Chance passes higher country? Yes; but I think there are parts of that country that would be flooded in such a flood as that of 1890.
1016. Is the country 14 miles out from Walgett flooded more or less? It is flooded completely for 5 or 6 miles out, and in places beyond that.
1017. Not so much? No. In the 1890 flood I think they went 5 or 6 miles out from Walgett in a boat, or even further. The water would then be over 3 feet deeper in the town of Walgett.
1018. And, extending perhaps 5 miles out, it then commenced to shallow? Yes.
1019. Then the country would be variable for how many miles? There are patches of high red ground, and there is good high ground out where the bore is. That is 14 miles out, and is never flooded. But there would be swamps and warrambools where the Namoi water breaks over and flows towards the Castlereagh. I could not tell you exactly of any continuous stretch of high country. All along there are patches that I know are high, but I do not know whether they are continuous.
1020. It means formation, more or less? Yes.
1021. Do you know Walgett? Yes; very well. I do not regard the town of Walgett itself of vital importance in considering the question of railway extension, but the district as a whole is a good one, and the country is sound and produces good wool.
1022. What effect would railway construction have on the district, it being a pastoral district? A railway would carry the wool and fat stock to market.
1023. Is there any trouble in getting the wool away now? In dry seasons I think there is some difficulty. In wet seasons they can get the wool away by boat.
1024. In wet seasons does the Walgett district suffer any disability? Not as regards getting rid of the wool, but it does in getting rid of fat stock.
1025. In a wet season the wool can be sent away? Yes.
1026. And in a medium season? Even in a medium season the river is generally full enough to get the wool away.
1027. In a dry season they have 100 miles of land carriage now? Yes.
1028. Do you consider that 100 miles in the carriage of wool is a serious matter? No; if the stock reserves were properly cared for I do not think it would be a serious disadvantage.
1029. *Mr. Hoskins.*] Taking a given period of five years, can you say of your own knowledge how frequently the river would be available for traffic? I should think it would be available for traffic for fully three years out of the five. I would not be quite sure about this, and the Committee could get more definite information from some other source.
1030. *Chairman.*] What would be the effect of a railway on Walgett as regards the extension of the present pastoral enterprise, the creation of new enterprises, and the closer settlement of the land? It would be an advantage to small settlers, inasmuch as stock could be got away to market much more readily than is possible at present owing to the heavy cost of droving on small lots. A similar advantage in regard to the carriage of stock would be derived by the squatters. I do not think any new enterprise, or, at any rate, many new enterprises, would be started.
1031. Would there be any great increase in the population? No, I do not think there would be; but a railway would help the settlement leasing, which is confined mostly to small pastoral settlers. It would help those small settlers and save them a great deal of expense in the conveyance of their produce. To all those within the distance of 30 or 40 miles of the line it would be an advantage in this respect.
1032. But you can see no special element which the railway would introduce or create? No, I do not think it would induce much closer settlement.
1033. What is the rental of the settlement leases, say, in the Walgett district? From 3d. to 4d. an acre. Between Walgett and the Castlereagh the average is about 3d.
1034. Taking a similar class of country to that within 15 or 20 miles—or such distance as you would regard as being served reasonably by railway communication; are you leasing any land similarly situated in other parts of your district? Yes, the rentals under settlement leases would be about 4½d.
1035. It is a reasonable inference then that if a railway were extended to Walgett you would get 4½d. for your leases there? I rather doubt it.
1036. Then it would not be materially affected by railway communication? It would be benefited, when you look at the rents and consider how they are fixed. They are fixed on capital values, and under this additional system there is not room for great variation in rentals. I do not think you would get more than a 1d. an acre.
1037. So that the Crown Estate would not be materially increased in rental values by the construction of a railway? An increase of 1d. an acre would mean an increase of 6s. 8d. in the capital value.
1038. *Mr. Lee.*] Of the two sides of the Namoi which, in your opinion, is the most suitable for railway construction—from a flood point of view? The south.
1039. That is to say, the north is more liable to inundation? The north is the better country, but it is more liable to inundation.
1040. You will observe from the map that the survey line does not go a very great distance from the Namoi at any point? Yes.
1041. As a matter of fact, has not nearly all the land on the northern side of the river passed away either by conditional purchase or by settlement lease? I believe the bulk of it has, but it would be better to obtain evidence on this point from the District Surveyor for Tamworth.
1042. Will you look at the county map furnished by the Lands Department. The black line represents the railway from Narrabri to Pilliga and the survey from there to Walgett, and an area of about 20 miles

is embraced on either side. Looking at the area coloured brown on the north side, what land do you see there for future settlement. The parts marked brown represent the Crown lands; no doubt a large proportion of these are unsuitable for settlement? I do not think so; I think nearly all that land is good for settlement.

W. H. O'M.
Wood.
10 Nov., 1897.

1043. For pastoral purposes? Yes; north of the river.

1044. What is the area of the settlement leases in that district? Most of them are from 2,560 to 3,000 acres.

1045. I suppose the brown areas on the map really represent those leaseholds which have not fallen in? I think they do.

1046. And when do they fall in? They will all fall in within the next three years.

1047. When the whole of that brown area shown within 20 miles of the railway is brought under pastoral settlement, do you think the produce of that part of the country generally will be doubled or trebled? I do not think it will be even doubled. That country is carrying a great deal of stock now; it is very heavily stocked.

1048. From information before us, the railway, if constructed, would show a loss at the start;—in your opinion, is there a probability of that loss being arrested in the future? I do not think the stock-carrying capacity of the country would be increased by smaller settlement to the extent of more than 50 per cent.

1049. And that would be a very large allowance? Yes, I think that would be a very liberal allowance. It is really good country—very good fattening country, and is well stocked now.

1050. The pastoralists are stocked up to their utmost capacity? I think they are, according to the present size of their paddocks. They could carry more by small paddocking, further water improvements, and ringbarking.

1051. Has not experience proved that if the owners wish to maintain the carrying capacity of their country, they will have to reduce the stock on it? Either that, or increase the improvements. By providing smaller paddocks and more water improvements I think the carrying capacity of this country could be considerably increased. That is what would occur under smaller or closer settlement.

1052. But you think a margin of 50 per cent. is the most possible? I think that would cover it.

1053. You notice the green areas shown on the map? Yes.

1054. Do they denote travelling stock reserves chiefly? A great many of them do—the lengthy ones do.

1055. In any future dealing in that part of the country under settlement lease or other form of alienation these travelling stock routes will have to be preserved? Some of those parallel to the railway line might perhaps be altered; but I think we should have to increase the accommodation as regards the cross-lines.

1056. It may be necessary to alter some, but those drift-ways to which you refer will have to be kept open? Yes; I do not think they could be reduced very much.

1057. Therefore, we must not expect much settlement on the land at present reserved for travelling stock routes? No.

1058. You said just now that agriculture had not developed itself in the district, although the soil was good enough and the rainfall sufficient. From the fact that agriculture had not established itself, you were of opinion that it was very problematical whether it would be carried on in the future? Yes.

1059. Is there any assignable reason for that state of things;—if the soil is good and the rainfall sufficient, what is the reason there is no agriculture? The rainfall is not such as to ensure crops in all seasons.

1060. Does that mean that the rainfall does not come in sufficient quantities at the proper seasons? In some seasons you have no rainfall to speak of for six months, and in other seasons you have a rainfall that is suitable for production. That, of course, applies all over the Colony; but in this district the conditions as regards rainfall are a little more precarious than in many other places.

1061. To make agriculture tolerably certain, the rainfall must be fairly spread over the year? The rain must fall, at any rate, during the winter and spring months.

1062. There are no reasons known to you, I suppose, other than those you have given, why agricultural farms should not be established in the district? There are no mills in the district.

1063. Take, for instance, the country around Narrabri;—I suppose that is as good land as you could get in the district anywhere we are speaking of? There is some land at Narrabri quite as good as anything you could desire.

1064. If it were possible, is it not likely that agriculture would take place there, where there is a larger population and easier access to a market, than in the outer districts? It would certainly be more likely.

1065. Has it taken place there? They have just started a flour-mill there, and they are growing crops. They grow hay crops regularly at Narrabri.

1066. What is the object of starting a mill if there is no wheat there? There is some wheat there, but not very much. I do not think it pays them to send it down the line.

1067. I suppose you know personally, or have heard, of the great developments in wheat growing that have recently taken place in the south and south-western portions of the Colony? Yes; my brothers are now engaged in growing wheat near Grenfell.

1068. You remember some years ago it was held that wheat could not be profitably grown in the south-western districts? On my brothers' station, when I left, it was considered that you could not grow wheat there.

1069. Do you think we are making the same mistake as regards the north that the earlier settlers made as regards the south and south-western districts? I feel certain we are, to a great extent.

1070. Do you think it possible that the country between Narrabri and Walgett will ever become an agricultural district? The only thing against it that I know of is the mechanical difficulty in working the black soil. The soil is strong enough but it is difficult to work. It is not so easy as the red soil of the western and south-western districts. The rainfall is also a little less.

1071. In wet weather the soil is too heavy to work, and in dry weather it cracks? Yes; but at Inverell they are working the black soil.

1072. Is there any comparison with the black soil of Inverell and the black soil round about Walgett? It is different I admit.

1073. You are aware that in the Walgett district, and between Walgett and Narrabri, in a dry season the earth cracks in every direction? Yes.

1074. You very rarely find the same thing in red country. No.

1075. In the part of the country of which we are speaking the extremes of the season are very great, are they not? They are; but on matters regarding the rainfall and climate the Government Astronomer would be a better authority than I am.

- W. H. O'M. Wood.
10 Nov., 1897.
1076. For years past the rainfall has been about the same, the soil has been the same, and the land has been open for settlement and cultivation, and yet it has not been taken up for that purpose;—that being the case, can you reasonably assume that in the future, if the railway were made, this land would be cultivated? It is very hard to say. I only go by the experience in the south and south-western districts. A few years ago agriculture was reckoned impossible there, and now it is carried on to a very large extent.
1077. *Mr. Hoskins.*] Is it a fact that the people who occupy land in the northern districts as conditional purchasers, conditional leaseholders, and settlement leaseholders, are not, as a rule, so energetic, pushing, and intelligent a class of people as the farmers in the southern districts of the Colony? I do not think there is any doubt about their lack of energy.
1078. The fact of their not engaging in agriculture as well as pastoral pursuits is an evidence that they are of the old-fashioned type and not equal in intelligence to the men of the south? The most progressive and the best men in the north are mostly men who have come from the south.
1079. *Mr. Black.*] How do you account for this alleged difference between the two classes of men—is it due to the climate? No; I think the superabundance of land in the north induces people to look more to the pastoral industry, from which they get their revenue with less labour.
1080. It is not the men, but the land conditions? I think it is a great deal owing to the land conditions.
1081. Where there is a smaller quantity of land the men are forced to make better use of it? Yes. They try to secure as much as possible. As long as they are building up good pastoral properties they will not bother about agriculture. Most of the men employ labour where, I think, they ought to do the work themselves. This opinion is merely the result of observation, and I do not know that it is worth very much.
1082. *Mr. Hassall.*] You know the Walgett district fairly well? Yes, fairly well.
1083. Your duties take you down there pretty often? Yes.
1084. What is your opinion of the Walgett district as a place for closer settlement;—does it compare favourably with the Moree district? No; it is not so good.
1085. Can you say from your own knowledge whether settlement is increasing in the Walgett district? Yes, it is. Most of the leases are taken up as fast as we throw them open.
1086. Do you think that the extension of a railway to Walgett would lead to any considerable increase in the applications for land in that district? Certainly, I think there would be a greater number of applications. Railway communication would enable settlers from other districts to go more easily to that country to inspect it, and it would result in a greater number of applications being put in for the land as it was thrown open.
1087. As a matter of fact, the district has been isolated to a certain extent for a number of years? Yes.
1088. The difficulty of reaching it, owing to bad roads, has been to some extent a bar to settlement? Yes, to some extent.
1089. Having regard to the fact that the extension of the railway to Moree has resulted in a largely increased demand for land in that district, do you think that the extension of a line of railway to Walgett from any point would be followed by a similar result to that which has occurred in the Moree district? I think so, but not to quite so great an extent.
1090. You do not think the country is quite so good down there? No.
1091. Still, as regards a very large area around Walgett, it is looked upon as first-class grazing country? It is good fattening country, and most of it is very sound country.
1092. And a good quality of wool is grown there? Yes; a very clean, good quality of wool is grown there.
1093. And the chances are that with increased facilities of communication there might be largely increased settlement? Yes; I think a greater number of strangers would come there for land. Most of the land is taken now, but it is chiefly by local people. I think strangers would come to a greater extent than is the case now. By taking the line further west you would add considerably to the convenience of wool-producers, both on large and small areas, to the north-west and up near Angledool, and as far as southern Queensland.
1094. Such a railway, you think, would command the country extending north-west from Walgett and up as far as the Queensland border? Yes.
1095. Which is all good wool-growing country? Yes; that would be in seasons when the river was not navigable. When the river was navigable, I think nearly all that wool would go by river while the present railway tariff was in existence.
1096. Railway communication with Walgett, therefore, would, in your opinion, not only develop and command the trade of that district, but would also be a great convenience to a large extent of country lying on the northern side of the Barwon? Yes; I think it would be a great advantage as regards wool and stock—especially fat stock in dry seasons.
1097. Would a line from Narrabri, or from a point between Narrabri and Moree out towards Collarendabri, serve that district equally as well as an extension to Walgett;—would a line from Woolabra in the direction of Collarendabri be a very great advantage to Walgett? It would; but a line to Collarendabri will serve a more limited extent of country.

David Morgan Jones, sworn, and examined:—

- D. M. Jones.
10 Nov., 1897.
1098. *Chairman.*] I believe you desire to give evidence with regard to the proposed line of railway from Narrabri to Pilliga? Yes.
1099. You know that district and also the Walgett district? Yes.
1100. *Mr. Black.*] Are you a resident of the district? At present I live at Rylstone, but I have been associated with the district in question for the past forty years, and lived there for thirty years consecutively.
1101. Are you in favour of the construction of a railway from Narrabri to Pilliga? I am.
1102. For what reason? Because I think it is a line which if constructed would lead to splendid results.
1103. In what way;—would it induce closer settlement? Perhaps that could hardly be done now, as I think every acre of land that is available has been taken up.
1104. Where did you live during the thirty years that you were in the district? All over the district. I was the mail contractor for that period, and my lines ran all over the district.
1105. Is any of the land in the locality suitable for agricultural purposes? I think it is all suitable.
1106. Is the climate suitable? I think so. 1107.

1107. Do you think the rainfall is sufficient? It is as good as it is anywhere else, except on the coast. D. M. Jones.
1108. Does the rain fall at the right time for agriculture? It falls at all times, and it may fall at the right time—that is to say, when you want it. There is no periodic fall. Often, just as a man thinks he is ruined he makes his fortune. 10 Nov., 1897.
1109. Do you think the route proposed is the proper course for the railway to take? I think so.
1110. On the southern side of the river? Yes.
1111. Is the land better on the southern side than on the northern side of the river? I think it is just as good. The character of the land varies. On one side of the river, at a particular point, a run may be worth a heap of money, and on the other side it may be worth nothing, and 10 miles lower down the river the position may be reversed.
1112. Then you cannot speak definitely? I can speak as definitely as the character of the country will permit.
1113. But can you say definitely on which side of the river the best land is situated? I think the best land for grazing purposes, and for all round purposes, is on the south side.
1114. Is the land equally good all the way through from Narrabri to Pilliga—are there any bad patches? It is all about the same, unless you call the scrub land inferior; but very often that is the best land when it is cleared. Squatters value scrub sometimes. It affords shelter for the stock in the winter, and shade in summer, and scrub does not at all times mean a bad run.
1115. How about the land beyond Pilliga, towards Walgett? It gets better if anything. It is more open; it is myall country.
1116. If the railway were constructed, do you think there would be sufficient traffic to warrant the expenditure? Yes.
1117. Of what would the railway traffic chiefly consist? It would consist of supplies for the district, and produce from the district, as well as the passenger traffic and the mails.
1118. What kind of produce? That would depend upon the use to which they put the land, when they saw they had the means of getting the stuff away.
1119. But now? Well, at present the chief product is stock.
1120. Then the railway traffic would consist of stock and wool? Yes; and passengers and mails.
1121. How many passengers travel there in a week? I am not in a position to say exactly, but the coaches cannot carry them. You have to book ahead to get down in the coach.
1122. What would be the cost of the mail service between Pilliga and Narrabri—say, a daily service both ways? From £500 to £600 a year.
1123. Is the river ever in flood between Narrabri and Pilliga? Not very much.
1124. Not enough to interfere with the construction of the railway? No.
1125. Nor enough to require heavy embankments? No.
1126. Or very extensive culverts? No; there are well-defined channels there which carry off any flood-water.
1127. They are not shown on the plan? I can enumerate them if you desire. One is a very wide and deep creek, which you pass not long after leaving Narrabri; it is called the Brigalow Creek. Then you go a considerable distance to a place called Guthbri, and there you have another large creek known as Sandy Creek; then, 12 miles further, there is a creek known as the Taluba; and 10 miles from there there is another creek called Double Creek. These are creeks which have their rise in the scrub country, which, as it extends south, becomes higher, and the water flows down towards the Namoi. The Double Creek would be about 2 miles from Pilliga. Those are the four chief creeks.
1128. Do they run far back from the river? Perhaps from 20 to 30 miles.
1129. They would require to be bridged, of course? Yes; but the work would not be heavy.
1130. *Mr. Hoskins.*] How many coaches are running daily between Narrabri and Pilliga, and through to Walgett? There is one mail contract from Narrabri to Walgett.
1131. You said the coaches were all loaded;—how many coaches are running there? I suppose there are about three—perhaps four.
1132. Four coaches running every day? Not starting from the one terminus; they have to start from each end of the line.
1133. Are there four coaches—two each way—running between Narrabri and Walgett, *via* Pilliga? I should think there must be. They leave Walgett twice or three times a week.
1134. Then they do not run every day? Not from the one office; but they are travelling on the road every day.
1135. Are there coaches despatched daily, and if so, how many from Narrabri, *via* Pilliga, to Walgett, and from Walgett to Narrabri? I think there is only one that leaves each day. I do not know that there is one mail each day. I think the tender has been let, but I do not think the service will commence until the 1st January. At present there are three a week.
1136. The mails are sent three times a week each way? That is so.
1137. How long have you lived in the Walgett district? Since 1858.
1138. Do you live there now, or do you live in Sydney? I live in Rylstone, near Mudgee; but I have never severed my connection with the Walgett district. I have property in Walgett now.
1139. Taking a period of five years, is it not a fact that during the greater portion of that time most of the produce from the Walgett district would be sent down by steamer to Bourke? I am prepared to say positively that for five years and for ten years consecutively it has been scarcely possible to send a load away by the steamer. These steamers are a complete myth. You can never depend upon them. You never know when they are coming, and when they are going, and nobody pretends to believe in them.
1140. In spite of the uncertainty of the steamers, is it not a fact that the greater portion of the produce from the Walgett district, except on a few occasions when there is a drought, is sent by steamer to Bourke? No; it is absolutely not a fact.
1141. How many teams are on the road usually between Narrabri and Walgett, by way of Pilliga? That is the only means they have in that district of getting the produce away. How else could the thousands of tons be sent from there?
1142. Then, as a matter of fact, the statement that has been made to the Committee by responsible persons, that a great deal of the wool from the Walgett district is sent by steamer, is nonsense, and is not true? Perhaps I may be allowed to qualify my evidence in this way: such large stations as Boorooma, which is

D. M. Jones. 45 miles below Walgett; Milray, which is 40 miles below Walgett; Eurah, which is 25 miles below Walgett; and Gingie, which is 5 miles below Walgett—all these stations have their sheds absolutely on the bank of the river; they shear on the bank of the river. If, by a fluke, the river goes down, the steamers, which are all on the watch, dart up, and the wool from these stations is bundled on board, and got away as quickly as possible, and then, occasionally, the steamers are stuck fast on the rocks, and have to stop there, and be unloaded, and the wool has to be taken across to Byrock.

10 Nov., 1897.

1143. If that state of things exists, the wool would accumulate in large quantities on the banks of the river? The wool would be in the sheds, which are on the banks of the river.

1144. And would not be sent away by team at all? Under the circumstances I have stated, if the steamers came up, the wool would be bundled into their holds as fast as possible, and the steamers would be rushed off; but if not, the squatters would hold on to the wool in the hopes of a rise in the river. As a rule, these large clips are carried by contract made with one of the forwarding firms, who make the best terms they can by allowing the squatters a certain rebate on the original sum if their wool is delayed in the sheds; and they chance it. If there is a possibility of the river going down, they pay the fine on the wool for keeping it in the sheds rather than undertake the expense of teams and land carriage; and very often they are beaten. On one occasion the wool was kept in the Euroka shed for twelve months, because a certain forwarding agency had failed to get it out. There was no river, and there were no teams.

1145. I gather from what you say that these squatters who have their sheds on the banks of the river, instead of sending the wool away, keep it until the river is navigable, because they find that river carriage is much cheaper than carriage by team? Well, they have signed themselves away, and they are in the hands of the forwarding agents.

1146. Are there not some large general stores in Walgett? Yes, seven.

1147. Do the people who keep these stores get their goods up to Walgett by team or by river? By either means. If the road is so boggy that teams cannot get down, they will avail themselves of another opportunity if they can.

1148. Of the river? Yes.

1149. Is it not a fact that both merchandise and wool can be transmitted cheaper by river than by teams? I do not know so much about that. I cannot understand how stuff can be carried 800 miles cheaper than it can be carried 400 miles; but I can say this, that in a very dry time—and such times are not unusual in that district—the price of forage will rise, but the cost of carriage will not rise proportionately. Those who can manage to do without their supplies do so. The carriers not being able to get loading—because people cannot pay the extravagant rates of carriage—do not care about feeding their draught stock for nothing; so they manage to keep them alive in various ways other than paying an excessive price for forage. Then, when the rain falls and the ground is sticky and boggy, the poor impoverished horses cannot get their loads along. If the weather still continues propitious, as far as the river is concerned, people who have stuff lying at Narrabri send it back to Sydney, to be forwarded on to Bourke, and it comes round that way, and the people are put to the expense of these hundreds and hundreds of miles of carriage.

1150. Did you never see any one grow forage for the carriage of stock at Walgett or between Walgett and Narrabri? Yes; between Pilliga and Narrabri.

1151. Therefore, the difficulty in getting loading down in time of drought, owing to the scarcity of forage, no longer applies if people now grow forage between Narrabri and Pilliga? Yes; but let me explain. In those times to which you refer, in and around Narrabri the price of forage rises. Unless the people who have grown that forage on their farms can get something like a *pro rata* return, they will not undertake a long haulage of 120 or 130 miles to Walgett. They will not do this unless the carriage is proportionate to the profit they could make on the sale of the stuff in Narrabri, without knocking up their horses and undergoing the journey themselves. They would sooner sell at Narrabri than take the low rate of carriage to Walgett, with all the expense and fatigue and trouble attaching to the journey.

1152. Did you see any hay or forage grown between Pilliga and Walgett? Yes; I saw plenty of it a little off from the river.

1153. How long is it since you were in the district? I still belong to it, and though living at Rylstone sometimes travel to Walgett.

1154. During the last five years have you noticed any increase in the number of persons growing forage between Pilliga and Walgett? No.

1155. Therefore, everything is at a standstill with respect to agriculture? The reason is because wool pays better.

1156. Would not that apply even if they had a railway? They would grow enough for themselves, I suppose. There is a mill at Narrabri to grind it.

1157. If all the wool and all the fat stock from the Walgett district were sent by rail, and none by river, do you think it would pay for the cost of the railway? Yes; twice over. The district is one of the most magnificent in the whole of Australia. The wool from my sheep was sold yesterday, and brought 10d. a lb.

1158. The Railway Commissioners and the principal officers of the Railway Department have shown that there would be a loss on the line of £4,500 a year? Well, they do not know anything about it. My opinion to the contrary is based on forty years' residence in the district, and every one who knows the country will support me in that opinion. From my knowledge and experience, I have the greatest confidence in the resources of the district, which has suffered so long by being isolated from the rest of the Colony.

1159. *Mr. Clarke.*] The country between Narrabri and Pilliga is purely a grazing country at the present time, is it not? I am afraid it may be said to be almost purely grazing country at present.

1160. Is it adapted for agriculture? Yes; I think so, judging from what I have been able to learn from farmers.

1161. Why is it that this country is entirely devoted to the growth of wool? We do not seem to have had a farming element upon it; but just now there are a few Wagga selectors going over there, and those who have done so, and have put the plough into the ground, have had splendid results. They have been selling their chaff in Walgett at £7 10s., £8, £9, and as high as £10 a ton, and they seem to be fairly well satisfied. I am now referring to Messrs. Bell Brothers, who reside 18 miles from Walgett.

1162. Is it possible to grow wheat, oats, or any other cereals in that locality in all seasons, or can it only be done in one year out of three or four? I believe that if practical men, who understand the sort of season

season necessary to grow these products, will adjust the time of planting to the climate, the result will be as good as in any other district.

1163. Is the rainfall regular or irregular? I am afraid it is not remarkably regular.

1164. I suppose it is more by reason of the irregularity of the rainfall than from its extent that there is a difficulty in growing agricultural produce? Yes; but I have seen splendid oranges grown 5 miles from Walgett, and also most beautiful grapes grown on the banks of the Castlereagh, and the vineyard is still there.

1165. The principal traffic from the district would be wool, and we have it in evidence that if the railway were constructed from Narrabri to Pilliga, there would be an annual loss of £4,500, and that the revenue, consisting chiefly of wool, would not be much more than half that amount? I heard similar statistics and opinions expressed in reference to the extension of the line to Narrabri, and afterwards to Moree; but none of those anticipations have been fulfilled.

1166. Do you think it would be fair, in the interests of the country generally, to construct a railway line which would leave such a very heavy loss? I do not think it would be fair on the strength of statistics, based to a large extent upon imaginary data, to keep such a district as I have described cut off from all communication with the rest of the Colony simply because there may possibly be a loss on the line. On the Mudgee line, which runs through one of the richest agricultural districts in the Colony, there is a loss. I am convinced that splendid results must follow if the district in question is connected with the railway system of the Colony.

1167. Independently of wool and live stock, from what source could revenue be made up? The thing would create its resources. Across the river, about 15 miles from Walgett, there is some magnificent country either for carrying stock or human beings. I refer to the locality where water has been recently struck by an artesian bore, which is yielding thousands and thousands of gallons per day. This land possesses great capabilities; but unless we give facilities for putting people upon it, we shall never get any return. At present men cannot get to this country. They have either to buy a turnout to go down and look at the land and see if it will suit them, or they have to get into a coach and pay very heavy travelling expenses. There is no opportunity for the country to be visited, or for any knowledge to be obtained concerning it. There is no means of getting to it. It is like a man building a splendid flat with every accommodation, and not supplying a lift or a staircase to get to it. That is the position the Walgett country is in.

1168. If a railway were made it would give greater facilities for the settlement of the country? Yes; and connect it with the seaboard, either at Newcastle or anywhere else you like.

1169. You have already said that not much of the wool goes from Walgett to Bourke by the river? Very little indeed. It is a very uncertain means of conveyance. The wool may be turned upside down, or stuck on some shoals or rocks.

1170. *Mr. O'Connor.*] The transit on the river is both uncertain and unreliable? Yes.

1171. I understand from what you say that you are in a way a unique witness, inasmuch as you have known the country from your earliest boyhood? Yes; since I was 18 years of age.

1172. From what you know yourself practically, and taking also a statesmanlike view of the question, you consider that a railway should be constructed, not because it will pay immediately, but in order to develop the country, so that at a future time the line will return a splendid income? Yes; but I almost think it would yield a return from the start. Why should we have armies of agents hunting and shadowing us for our wool when we might have a splendid national means of conveying it to market? I may give an illustration of the difficulty we have at present to contend with. On one occasion I had 20 tons of wool being conveyed by three carriers. After they started on their journey some extra rain came and filled the Castlereagh. At one point on the journey the coachman who drove the mail was allowed the privilege of making a detour through a squatter's property, along the bank of the flooded river. The three bullock drivers who were carrying my wool followed along the same track; but they were proceeded against and fined 30s. apiece for going off the road. Driving up shortly afterwards, I saw 10 tons of the wool lying at the public-house, where it had been necessary to leave it. My case, no doubt, is the same as that of many others. I have already referred to the experience of Mr. Wolseley, of the Euroka station, the whole of whose clip remained in his shed for twelve months. Had the line being carried to Walgett, as originally intended, instead of stopping at Narrabri until the ballot-box got too strong to let it go anywhere else, Walgett would now have been a great city—a little Chicago. The existence of diverse interests has, up to the present time, interfered with the prospects of the line. I consider that the present proposal is the most economical and the most effectual one by which to connect Walgett with the railway system of the Colony. Other extensions will follow as they are required. These things all work out properly if left to themselves. Walgett should be connected with the Northern line.

1173. *Mr. Wright.*] Do you not think the line should follow the proposed route through Pilliga and on to Walgett? I have carefully studied the matter, and I think that is the best route. The route, as proposed, involves no difficulties whatever. You could jump over all the difficult places. As regards the character of the country, there is no doubt there is a bit of scrub; but graziers like scrub—it warms the stock in the winter, and shelters them in the summer, and in time of drought it can be cut down for feed. Even pine scrub is useful for timber.

1174. Do you think Walgett would be better served from the north than from any other direction? I think Walgett would be better served by the line as proposed. It is all cut and dried as regards surveys and plans, and has been well discussed. It would be a pity now to break new ground and go over the same thing again, probably with no result.

1175. Do you know the country between Walgett and Coonamble? Yes.

1176. It has been suggested that the best way to reach Walgett would be from Mudgee *via* Coonamble? I have just driven over that road in a buggy, and there is no doubt that the country is really good country. It is true that a railway by that route would be shorter, and would open up a lot of grand country; but the people do not want a line that way. In Mudgee they are at the present time split up over the question, and they would not attend a meeting of the league there. As I drove down that country recently, I found that the people did not want a line that way.

1177. And would the Walgett people sooner preserve their connection with Newcastle than advocate any other route? I am afraid that at present the Walgett people would not say "No" to anything.

1178. *Mr. Fegan.*] How many miles on each side of the line would a railway open up from Narrabri to Pilliga, as proposed? There is some scrub country on the south or left hand, but it could not be accurately gauged for settlement.

- D. M. Jones. 1179. But as far as Wee Waa it is very good country, is it not? Yes.
- 10 Nov., 1897. 1180. From Wee Waa to Pilliga is it all scrub? On the right side of the line to Walgett the country consists of beautiful open black-soil flats, but on the left side there is scrub.
1181. Is not that good for pastoral purposes? I am afraid the dividends would not be too great.
1182. The proposal before us at present is only for an extension as far as Pilliga? The character of the country is all right. Every man does not want the cream of the country. There are thousands of people who would be content to go on to land from which they could make what they would call a good living; but perhaps it would be land which another man accustomed to better country would not touch.
1183. Would the extension of the railway to Pilliga assist the Walgett people in any way? Yes, very much, and it would assist the Coonamble people also. It would be about midway.
1184. What are the roads like from Walgett to Narrabri, from your experience as a mail contractor? They are all right in dry weather.
1185. They are not made roads, but bush tracks? Yes, cleared.
1186. Nothing has been done to keep them in repair? Not so far as I know. The timber is cleared; but no one will follow a cleared road after it is made.
1187. How is that? I do not know how it is, but they will not follow a cleared road; they will follow a track.
1188. If the roads cost nothing for construction, very little would be saved from the Roads Vote by the making of a railway? Carriers and others will not follow a metalled road, as it knocks their stock up and lames them.
1189. You think that an extension of the line from Narrabri to Pilliga would pay in a very short time? Yes; I am certain that a railway would pay in that splendid part of the country.
1190. Do you know anything about Newcastle? Yes, from calling there.
1191. If a line were constructed from Pilliga *via* Narrabri, do you think Newcastle would become the depôt for the wool-growers of Walgett and Pilliga, or do you think they would send their wool on to Sydney? Speaking personally, I should not be inclined to leave my wool-brokers in order to go to Newcastle.
1192. Sending the wool on to Sydney means another 100 miles carriage? I suppose people who ship their wool straight Home would prefer to send it to Newcastle? I may say, incidentally, that I understand a large dumping plant belonging to a leading firm in Sydney has been transferred to Newcastle, and this would seem to show which way the wind blows.
1193. You think it probable, then, that the squatters of Pilliga, Wee Waa, and Walgett, would make Newcastle the port of shipment for their wool? It is, perhaps, only natural that they would wish to save the 100 miles carriage; and I have no doubt those who send their wool Home would avoid the extra freight to Sydney.
1194. I suppose your wish is to have a line constructed to Pilliga, with the prospect of its being extended in the near future to Walgett? To take it only to Pilliga would be like holding the cup of water to Tantalus.
1195. One reason why you advocate this extension is because you hope it will ultimately be continued to Walgett? That is so; and every man who knows the country will say that such further extension would be justifiable.
1196. You think the line would be more profitable if it were carried on from Pilliga to Walgett? Yes; I believe the whole of the extension would pay, and that there would be no loss.
1197. If the line were extended to Walgett, how far would the wool come to the railway? You would have the Boorooma wool, 40 miles from Walgett; the wool from Milray, 35 miles; Dingie, 5 miles; Euroka, which adjoins Walgett, and Llanillo, which is 30 miles away. These are all large stations.
1198. Where does the wool go now? I think it goes to Narrabri. There is also Bundabareena, Dungalear, Euray Euray, and other stations.
1199. What is the average clip this year? I will put the average at over 6lb. My clip averaged 8lb., but the sheep had to be removed 300 miles from the run, and were not shorn until November.

FRIDAY, 12 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Louis Rich, sworn, and examined:—

- L. Rich. 1200. *Chairman.*] You were a member of the firm of Nelson, Rich, & Co., of Walgett? Yes.
- 12 Nov., 1897. 1201. You desire to give evidence with regard to the proposed railway from Narrabri to Pilliga, to form portion of a line from Narrabri to Walgett? Yes.
1202. *Mr. Humphery.*] Have you been in business at Walgett for any time? I was in business there from 1873 to 1889.
1203. What is the nature of your business? General storekeeper.
1204. What information do you desire to give the Committee concerning the proposal under consideration? Having lived in the district for a long period, and being acquainted with its resources, I think I possess a certain amount of knowledge as to the advantages that would result from railway communication. From my experience in business, I know that this part of the country has suffered a great deal in the past for want of railway communication.
1205. Do you know the district between Narrabri and Walgett, also between Coonamble and Walgett, and between Byrock and Brewarrina? Pretty well.
- 1206.

1206. And the district north of the Barwon? Yes; I may say that I know the country pretty well for a radius of 100 miles in all directions from Walgett. L. Rich.
12 Nov., 1897.
1207. Have you had transactions in moving stock and transporting wool? My transactions have varied from the smallest to the very largest items.
1208. Do you know anything about the freights on the river? Yes; I have paid river freights.
1209. Do you know anything about the extent of the traffic? Yes, I have some idea.
1210. In a general way will you inform the Committee of the extent of the traffic between Walgett and Narrabri, the freights that you have paid, and the probable number of bales of wool that would reach Walgett in the event of a railway being constructed to that place from Narrabri or from any point on the Western line? I was at one time one of the largest supporters of the railway in the shape of traffic sent from Narrabri. The goods traffic on a line from Walgett to Narrabri would be very great indeed, greater than I can at this time imagine. With regard to the probable traffic in wool, I am unable to speak definitely as to the number of bales.
1211. Assuming that a railway were constructed between Byrock and Brewarrina, what wool traffic do you think would reach Walgett? Traffic on the south side of the Barwon down to Brewin, and round by Wallari and right down to Carinda. I am supposing that there was a railway to Brewarrina and one to Walgett. If so, all this traffic would come to the Walgett railway.
1212. Can you speak of your own knowledge as to the probable traffic that would reach Walgett in an ordinary season? I could not from memory give any figures on that point. The traffic would vary according to the seasons.
1213. During the time you were in business at Walgett can you say where the traffic usually reached the railway—the traffic coming into Walgett? Narrabri. The wool from Brewin and the other places I have mentioned went to Narrabri.
1214. In the event of a railway being constructed between Narrabri and Walgett, would any wool, in addition to that which now reaches Walgett and finds its way to Narrabri, come to Walgett? Unquestionably.
1215. What additional wool would come in there? Wool that goes down the river when the river is up. When the river is navigable, which it is occasionally, though very seldom, the squatters take advantage of that means of transit.
1216. How much wool at present going by river to Bourke would come to Walgett in the event of there being a railway? I cannot give the number of bales, but can only speak in general terms.
1217. Have you any knowledge of the freights prevailing between Walgett and Bourke? Yes.
1218. What was the lowest freight per ton at the time you were in business? £3.
1219. Are we to understand that for the last eight years you have no knowledge of what has been going on in the district? Not very much, although I am still connected with the district.
1220. You are not living there now? No; but I have an interest in the district.
1221. How long is it since you ceased to have such a connection with the district as would require your constant presence there? I left in 1889, and I have only been there once since.
1222. So that you are not quite up to date in your information? Perhaps not quite, although I am in communication with the district yet.
1223. Are you able to say whether it would be more advantageous for the district of Walgett—I am not speaking of the township—to construct a railway between Narrabri and Walgett than to take a line from Coonamble to Walgett, assuming a line to be constructed to Coonamble either from Mudgee or Warren? I have a general knowledge of the district, acquired in connection with my business as a storekeeper, and also, I might say, as a financier, and I have a knowledge of the country, and particularly that between Narrabri and Walgett, over which I have travelled on foot, on horseback, in buggy, and in coach. In view of the proposals to extend the railway from Byrock to Brewarrina, and also from Mudgee and Dubbo to Coonamble, I think that a line from Narrabri to Walgett would be most advantageous, not only to the district itself, but to the Colony as a whole.
1224. Have you any knowledge of the character of the land? A fair knowledge.
1225. Can you make any comparison between the country through which a line would pass between Warren and Walgett, and that which would be traversed by a line from Narrabri to Walgett? In either case, the line would pass through good country.
1226. Which is the better country? I think the country between Pilliga and Walgett is good country.
1227. Do you think it equally as good as the other country? Yes, equally as good. If anything, the advantage would be greater in respect to the Narrabri to Walgett country, because the result of a railway would be that the indifferent country would become more useful and more valuable.
1228. Do you refer now to its value for pastoral purposes only, or for agricultural and pastoral purposes? I should say for pastoral purposes. I have just been looking at some terribly bad country—I suppose the worst country in Australia. I refer to parts of Western Australia. I have also lived in other districts, and I have seen some of the choicest country in New South Wales—that in the Yass district—and still I think the country we are speaking of is very good country. The country between Narrabri and Walgett will stand comparison with any country I have seen.
1229. But you are of opinion that that country is only good for pastoral purposes? Yes; mostly for pastoral purposes.
1230. And not suitable for agriculture? Not quite. With the application of science, and in the hands of capable men, it might become suitable for agriculture. The Yass district, for instance, is supposed to be agricultural country, but probably they may not have good men in it.
1231. As far as the district is concerned, would it be equally advantageous to the residents to have a line connecting with either the Western or the North-western railway systems? I am disposed to think it would be more advantageous to them to be connected with the North-western line.
1232. Will you give your reasons? The people would be able to get their supplies from Newcastle, which would be an advantage to Walgett.
1233. In what way? They could get their supplies from Newcastle at the same price as from Sydney.
1234. You mean they could do their business with Newcastle, instead of with Sydney, and thus save 100 miles of railway carriage? Yes; they would save the railway freight and other expenses. I cannot tell the exact amount, but there is an advantage in favour of Newcastle in regard to the purchase of goods.
1235. What was the extent of your business? Our turn-over some years was £60,000.

- L. Rich.
12 Nov., 1897.
1236. So that you are in a very large way? Yes. Our railway freights came to over £500 a month.
1237. I suppose you are aware of the rates of carriage between Walgett and Narrabri? Yes.
1238. What was the rate per ton when you were in business? For freight from Narrabri to Walgett, I have paid as low as £3 10s. and £4 per ton, and as high as £18 and £20 per ton.
1239. What is the lowest you have paid from Walgett to Narrabri for wool? The lowest was £5 10s. per ton.
1240. Do you know the rates at the present time? I do not.
1241. Beyond being able to tell the Committee that the traffic in your district would, in your opinion, justify the construction of a railway between Narrabri and Walgett, you are not in a position to give very much detailed information which would assist them? From my business connection with the residents of the district extending over a number of years, and particularly with small holders, I am in a position to testify to the advantages which would result from railway communication. The district is a pastoral one, in which there are more sheep farmers than cattle graziers, and the sheep farmers would succeed much better if they had access to a market to enable them to send away their young stock.
1242. And there would be a larger population? Yes; the population would increase.
1243. There would be more smaller holdings as the result of the railway? Yes; and less fear of the consolidation of holdings, such as has frequently been the case. Small holders are forced to sell out, because they cannot compete with others, owing to the difficulties of finding a market. I have a client up there at the present moment who has been struggling for many years. If, during the last year or two, he had been able to send his few lambs to market he would be in a far healthier position, and he would not have such a struggle for existence.
1244. I suppose you would support the statement made by other witnesses that in unfavourable seasons there is the river difficulty, and the difficulty of land carriage between Walgett and Narrabri? Exactly; the small holders are virtually starved out.
1245. Owing to the high rate of carriage? Owing to the inability of transit.
1246. The cost and the difficulty of transit? It is not only a question of cost, but the stock cannot travel.
1247. Then you would put it in this way: With regard to goods, there would be the difficulty, and the high cost, and there would be the impossibility of sending stock in an unfavourable season without the railway? Yes; I wish it to be distinctly understood that the greatest difficulty is in the case of the small holders who cannot move their stock in indifferent seasons.
1248. *Mr. Lee.*] I understand you to say that if a railway were made to Walgett, there would be a very large trade for it? It would unquestionably increase.
1249. What would cause this increase of trade? It would take place chiefly in connection with small holders. A railway would allow them to live there.
1250. What is the district going to produce;—what does it produce now? Wool.
1251. What will it produce in the future? Wool.
1252. What increase do you think is likely to take place in the production of wool as the result of a railway; when all that country is settled by small holders, or in any other way you like, what would be the increased production? According to last year's calculations the increase in a good season would be fourfold.
1253. Is not that country stocked at the present time? Not by any means.
1254. Do you think it capable of carrying four times the quantity of stock? I said, according to last season, which was a bad season.
1255. All seasons not being alike, you must take an average? Well, taking an average, I should say the increase would be more than double. I feel confident that increased settlement would take place.
1256. Do you think it a fair thing to estimate that the production of wool will double what it is at the present time? Yes. You may, of course, look forward to some agriculture, but not, perhaps, to the extent of estimating any real returns from that source. We can grow a little hay there, and probably wheat may be grown also.
1257. But only in quantities that would be used within the district? It would be more or less used in the district.
1258. It would not be exported to Sydney or Newcastle? That is more than I am prepared to say, after seeing the Riverina and other districts lately.
1259. Suppose the production of wool were double what it is at the present time, and that even when that additional railway freight was obtained, the loss on the line was over £3,000 a year, would you still advocate the construction of the railway? That loss would be made up by other traffic and other business. There would also be an increase of population and an increase in the stock traffic. The small holders, instead of losing their lambs as at present, would be able to send 100, 200, or 500 lambs to market, and they would also be able to send their fat stock. You must not look at the wool only, but also at the increase of stock.
1260. In this district, about how many acres are supposed to be sufficient to keep a settler? Since the introduction of artesian water, I think a man can live very nicely on 2,500 acres, even if he starts with small capital.
1261. That being about the average size of a settlement lease? Yes. A settler could live on less; but I think we might take 2,500 acres as a fair average, with the advantages now possessed in the shape of artesian water.
1262. Taking 2,500 acres as the area for one man, what room is there in that district for a large population? The district embraces a very large extent of country. There is a large tract of country between Pilliga and the back of Bullorora out towards the Castlereagh, and from there towards Carinda, and on the Barwon towards Brewin there is a fair stretch of country which you may call Walgett country.
1263. A large portion of which is unsuitable for close settlement? Yes, I think so; particularly the portion which is partly scrub country, although for purposes of settlement it would be very useful.
1264. If you put 100 additional families in that district it would mean 250,000 acres of land, and if you took 1,000,000 acres of land under settlement that would only represent 400 additional families;—where, then, is this enormous increase of trade going to come from as resulting from small settlement? You have also the northern side of the river from the Namoi to the Barwon and towards Goodooga.
1265. But 10,000 acres would only carry four families? In estimating 2,500 for one settler I am taking an average. I know one family who live on 40 acres, and who do well, and there are market gardeners living near the town on small areas.
- 1266.

1266. The construction of the line would depend upon the probable future development of that country. At present the estimate of traffic shows an enormous loss, and the Committee would like to know what is the prospect in the future? I fail to see how there could be a loss, even at the starting of the railway, though I am not in a position to say positively that there would not be a loss. On a former occasion I reasoned the matter out with the late Railway Commissioner. L. Rich.
12 Nov., 1897.

1267. But you are not now prepared to go into details of that kind? No.

1268. *Mr. Wright.*] You know the country pretty well. It is said that if a railway were constructed between Byrock and Brewarrina all the following stations would send their wool into Brewarrina, notwithstanding that there was a railway at Walgett:—Milroy, Quantambone, Gnomery, Brenda, Muckerawa, Wirrah-warrah, Willow, Morrabilla, Boorooma, Gilgoin, Ballaree, Charlton, Weilmoringle, Kerrebree, Talawanta, Denman, Dumble, Cuttabunda, Upper-Bundabulla, Bundabulla, Collawaroy, Yarramin, Lower Willie East, Calga, Tarcoom, Compton Downs? Pretty nearly all those stations would send their wool to Brewarrina, though probably the wool from Dumble and Brenda might go to Walgett.

TUESDAY, 16 NOVEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

1269. *Mr. Hassall.*] You have heard of the proposal to construct a railway from Narrabri to Pilliga? Yes. G. C. Yeo.
16 Nov., 1897.

1270. You have a knowledge of the stock depasturing in that district? I have a return giving information regarding stock.

1271. Does your return embrace, not only Narrabri to Pilliga, but as far as Walgett? I have a map showing the area it embraces. The following are the holdings likely to be affected by a railway:—Burren, Boolcarroll, Bullerawa, Cryan, Drildool, Gorian, Wee Waa South, Nowley, Merah, Pian Creek, Buglebone, Bungle Gully, Come-by-Chance, Eurie Eurie, Euroka, Goangra, Kucargo, Ulumbie, Yarraldool, Pilliga, Mercadool, Warragan, Tharambone, Billeroy, Coghill, Wangen, and Cubbo.

1272. Those are the holdings within the scope of the proposed line? Those are the holdings supplied to me. I have a return of stock on those holdings in 1896. It is as follows:—

Holding.	Horses.	Cattle.	Sheep.	Holding.	Horses.	Cattle.	Sheep.
1. Burren.....	65	70	31,340	15. Euroka	36	90	33,541
2. Boolcarroll	132	804	77,400	16. Goangra	57	41	28,497
3. Bullerawa	36	1,260	10,914	17. Kucargo	23	60	8,717
4. Cryan	75	80	17,200	18. Ulumbie	32	85	12,450

117	Smith, A.	Brigalow Ridge	Millie	28	12	900

The list contains seventy-five other holdings of a similar character.

1273. *Mr. Wright.*] Are town allotments included in the holdings you have given? Yes; everybody has to make a return. The number of large holders is twenty-seven, and the number of small holders 192. The number of stock on the large holdings in 1896 I have already given. The stock on the small holdings in the same year was 3,001 horses, 7,741 cattle, and 391,886 sheep. This gives a total number of holdings, large and small, of 219, carrying 4,422 horses, 20,006 cattle, and 1,028,800 sheep. I have also a return of the stock for the last four years within the same area. It is as follows:—

Year.	Horses.	Cattle.	Sheep.
1893.....	4,618	21,154	1,099,220
1894.....	4,640	23,157	1,148,425
1895.....	4,120	19,498	989,381
1896.....	4,422	20,006	1,028,800

I have also a return of the estimated number of stock passing Pilliga during 1896. According to the figures shown in the returns, the year 1896 might be taken as an average one. Travelling south—that is, going up the Namoi, making for either Narrabri, Muswellbrook, or any of the southern markets—the figures were—large stock, 3,000; sheep, 280,000. Then travelling north—that is, going towards Walgett—the figures were—large stock, 1,500; sheep, 130,000; the total being 4,500 large stock and 410,000 sheep. I have also a return of the number of sheep shorn, and the weight of clip for 1896, on the runs mentioned. The estimated number of sheep shorn was 875,000, and lambs, 125,000, making a total of 1,000,000. The weight of fleece in the grease was—sheep, 6 lb.; lambs, 2 lb. The total weight of clip was 2,455 tons 7 cwt.

1274. *Mr. Hassall.*] According to the figures you have given the number of stock for the years mentioned did not vary very much? No; 1895 was a very bad year, and 1894 was a good year in that locality.

1275. And 1894 compares favourably with 1896? Yes.

1276. The district was not more fully stocked in 1896 than in 1893, practically speaking? No.

1277. The figures for the years from 1893 to 1886 give a very good idea of the number of stock pastured in that district year by year? Yes.

1278. You would not anticipate any large increase on that number? No.

1279. In regard to the stock passing through Pilliga, travelling south, have you any knowledge of their destination—whether they would be going to market or whether they would be travelling to other pasturage? No.

1280. I suppose the estimate you could make of the number of stock travelling for rail would only be approximate? It would be difficult to say what proportion would be travelling for rail. Some would be going to fattening country, others would be going to the markets, and others would be going to be trucked at Narrabri.

1281. They might go in half a dozen different directions? Yes; they might branch off at Pilliga and go south to Coonabarabran and down to Coolah, or they might go into Narrabri and on to Muswellbrook.

1282. The estimate for 1896 would be a pretty fair estimate of a year's wool traffic? Yes; the clip of 1896 increased 1 lb. on the 1895 clip, and the inspector puts it down as a fair average.

1283. So that practically it would represent about the quantity of wool that would be available for transit year by year? Yes.

1284. In the list of smaller holders you gave there are a large number with a very limited quantity of stock;—do you know whether those men are selectors or whether they are town residents? I could not say, but I should surmise that they are town residents.

1285. No man could make a living off thirteen horses and eight sheep, for instance, or ten horses and sixteen cattle? No; I think those holdings would be held by residents in the town. The holdings carrying numbers of sheep would be those of selectors.

1286. The men with over 200 sheep might be selectors? Yes; or they might be butchers.

1287. If the line were extended to Walgett a very much larger number of holdings would be served than those mentioned in your return? Yes.

1288. What you have given are only the holdings which would be served by the extension to Pilliga? Yes.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined :—

J. Clarke. 1289. *Mr. Roberts.*] Could you give the Committee information as to any mail contracts at present existing from Narrabri to Wee Waa, from Wee Waa to Pilliga, and from Pilliga to Walgett? Yes; 16 Nov., 1897. I have the particulars here of the present contract prices on mail lines along the sections you have mentioned, and the prices for next year's contracts in the case of those that will run out at the end of this year.

1290. Have all the contracts of the mail service for 1898 been accepted? Nearly all.

1291. Then your information will be what I might term up to date? Exactly. The return I have prepared is as follows :—

PARTICULARS of Contracts for the Narrabri, Pilliga, and Walgett Mail Service, and Branch Lines therefrom for the current year, and, in cases where they will expire on the 31st December, of the new contracts from 1st January, 1898.

Postal Lines.	Distance in Miles.	Frequency of Communication.	Mode of Conveyance.	Annual amount payable to Contractors.	Date of termination of Contracts.
Narrabri, Wee Waa, Cuttabri, Pilliga, Come-by-Chance, and Walgett.	125	No. of times per week. Three ...	Coach, 2 or more horses.	£ s. d. 1,095 15 0	31 Dec., 1897.
Narrabri and Collarendabri, via "Myall Vale Hotel," Boolcarroll Station, "Rosehill Hotel," Harden Brothers', Lower Boolcarroll, "Yarranbar Hotel," Nowley station, Maloney's "Bulyeroi Hotel," Barrett's, Lord's, G. Shearer's, Merrywinebone, and Pockataroo.	110	Two	4-horse coach.	447 10 0	31 Dec., 1897.
With a branch mail to and from "Myall Vale Hotel," Wall's, Power's, Wyatt's, Cohen's, Maxwell's, and Lehane's.	13	Two	Horseback		
Nowley station, Cryan, and New Cryan, via Wyatt's, Nowland's, Barton's, Burren station, "Burren Hotel," Old Burren, and Galara.	45	Two	Conveyance, 2 horses.	100 0 0	31 Dec., 1898.
Collarendabri, Moongulla, and New Angledool, via Gamalally, "Moongulla Hotel," Moongulla station, Piangobla station, Moondoo Bore, and Yeranbah station;	66	One	4-wheeled vehicle.		
With a branch mail to and from "Moongulla Hotel" and Dunimbral station; and	9	One	Horseback	169 0 0	31 Dec., 1897.
Collarendabri and Piangobla, via Pearce and Humphries', Sherritt and Grant's, Stinson and Leehy's, "Moongulla Hotel," Dunimbral and Moongulla Stations.	50	One	Horseback or by vehicle, as required.		
From Narrabri, via Shutz's, Blaney's, Bailey's, Egan's, G. Smith's, Frater's (Deep Creek), Gett's, Brake's, F. Smith's, W. Smith's, Barton's, Whalen's, Gregory's Billingsley's, and Orman's, to Dunmore's, returning to Narrabri, via Marshall's, Donaldson's, Robinson's, and the other places named.	30	Two	Horseback	44 0 0	31 Dec., 1898.
Narrabri, Eulourie, and Bingara, via Killarney, Edgeroi, Avondale, Single's, Berrigal (Terrihi out station), Rocky Creek, Pallal, and Derra Derra.	112	One	Horseback	89 10 0	31 Dec., 1898.
Wee Waa and Bugilbone, via Nowland's, Fern Grove, Holcombe's, Boysdale, Newstead, Boo Boo, Thompson's, Fenwick's, St. Clair's, Pine Grove, Knight's, Russell's, Bennett's, Powell's, Dempsey's, Murphy's, and Capp's, Millie.	60	Two	Horseback	89 0 0	31 Dec., 1897.

New Contracts from 1st January, 1898, in cases where present Contracts will expire.

Narrabri, Wee Waa, Cuttabri, Pilliga, Come-by-chance, and Walgett, three times a week—James Rutherford, of Bathurst, coach, 2 or more horses, 3 years, £1,350 per annum.
 Narrabri and Collarendabri, via "Myall Vale Hotel," Boolcarroll Station, "Rosehill Hotel," Harden Brothers', Lower Boolcarroll, "Yarranbar Hotel," Nowley Station, Maloney's "Bulyeroi Hotel," Barrett's, Lord's, G. Shearer's, Merrywinebone, and Pockataroo, twice a week—James Rutherford, of Bathurst, coach, 2 or more horses, 3 years, £594 10s. per annum.
 To and from "Myall Vale Hotel" and "Boggy Creek Hotel," via Wall's, Power's, Wyatt's, Maxwell's, Cohen's, Lehane's, junior, Lehane's, senior, E. S. Borthwick's box, and W. M. Borthwick's (Ford's) twice a week, on horseback, for one year only, £88.
 "Myall Vale Hotel" (on the Narrabri-Collarendabri mail line), Wall's, Power's, Wyatt's, Cohen's, Maxwell's, and Lehane's, twice a week. Fresh tenders invited; to be opened Monday, 15th November, 1897.

Collarendabri, Moongulla, and New Angledool, via Gamalally, "Moongulla Hotel," Moongulla Station, Piangobla Station, Moondoo Bore, and Yeranbah Station, once a week (with a branch mail to and from "Moongulla Hotel" and Dunimbral Station, once a week); and Collarendabri and Piangobla, via Pearce and Humphries', Sherritt and Grant's, Stinson and Leehy's, "Moongulla Hotel," Dunimbral and Moongulla Stations, once a week—G. T. Henry, of New Angledool, 4-wheeled vehicle, 2 or more horses, 3 years, £149 per annum, conditionally.

Wee Waa and Bugilbone, via Nowland's, Fern Grove, Holcombe's, Boysdale, Newstead, Boo Boo, Thompson's, Fenwick's, St. Clair's, Pine Grove, Knight's, Russell's, Bennett's, Powell's, Dempsey's, Murphy's, and Capp's, Millie, twice a week—John J. Knight, Wee Waa, horseback, 1 year, £85, conditionally.

Postal Lines.	Distance in Miles.	Frequency of Communication.	Mode of Conveyance.	Annual Amount payable to Contractors.	Date of Termination of Contracts.
Wee Waa, Bennley Park (Bennett's), and Lezayre, <i>via</i> Kellaher's, M'Phee's, Long Point, A. Belson's, Hutchison's, Moore's, C. Belson's, M'Farlane's, Baldwin's, Francis', G. Capel's, H. Capel's, Linwood, and Moorefield.	69	No. of times per week. Two	Horseback	£ s. d. 79 15 0	31 Dec., 1898.
Cuttabri and Baradine, <i>via</i> Cumble, Yuligle, Cumble, Upper Cumble, and Gibbean. (Contractor to convey mails once a month by two-horse buggy, and at other times on horseback, for the sum of £75 per annum, if required).	64	One	Horseback	64 10 0	31 Dec., 1897. (This service will be discontinued from 1st January, 1898.)
Pilliga, Bugilbone, and New Cryan, <i>via</i> Bugilbone Station, O'Mullane's Yarraldool Station, Moffat's, Balgarnie's, Forest's, Magner's, Holcombe's, Rutley's, and Athawe's.	52	One	Buggy, 1 horse.	55 0 0	31 Dec., 1898.
Pilliga, Bugilbone, and Yarraldool, <i>via</i> Bugilbone Station, O'Mullane's, Balgarnie's, and Moffat's.	34	Two	Buggy, 1 horse.	85 0 0	31 Dec., 1898.
Come-by-Chance and Kensington, <i>via</i> W. Colless', McQuillen's, T. Firth's, and E. Bishop's.	19	One	30 0 0	At one month's notice.
Walgett, Boorooma, and Brewarrina.	105	Two	2 or 4 horse coach.	168 0 0	31 Dec., 1897. Walgett, Boorooma, and Brewarrina, twice a week—James Flanagan, of Bourke, 4-wheeled vehicle, 2 or more horses, 3 years, £200 per annum.
Boorooma and Willenbone, <i>via</i> Overflow, E. Young's, T. R. Young's, Binghi, Buckingham, Narranreggie, Box Camp, and Ross' selection.	25	Two	Horseback	34 0 0	Contract to terminate at three months' notice on either side.
Walgett, New Cryan, and Cryan (Lynam's), <i>via</i> Moore's Walmar, Binnie's, Clarke's Box, J. A. Colwell's, Brough's, and Webeck's.	40	One	Horseback	58 10 0	31 Dec., 1899.
Walgett, Collarenebri, and Mogil Mogil, <i>via</i> Eurie Eurie, Manilla, Mercadool, "Mercadool Hotel," Millar's, Dodd's, M'Donnell's, Smith's, Taylor's, Cameron's, O'Connell's, Walpole's, Kirby's, Jennings', and Wright's.	97	Two	Buggy, 2 or more horses, when required, between Walgett and Collarenebri; thence to Mogil Mogil by buggy, 2 or more horses.	174 17 6	31 Dec., 1897. Walgett and Collarenebri, <i>via</i> Eurie Eurie, Manilla, Mercadool, "Mercadool Hotel," Millar's, Cameron's, M'Donnell's, O'Connell's, Kirby's, Wright's, and Jennings', twice a week—George J. Christoff, of Walgett, light 4-wheeled vehicle, 2 or more horses, 1 year, £140. Collarenebri and Mogil Mogil, twice a week—George T. Henry, of Collarenebri, 4-wheeled vehicle drawn by 2 horses, 1 year, £39. Mogil Mogil, Cambo Cambo (Sevill's), and Burrenbah, <i>via</i> Burren Burren Station, Picton's, "Gundablue Hotel," Gundablue Station, and Ryan's (Kundilla), twice a week—P. P. Commins, of Mogil Mogil, horseback, 3 years, £65 per annum. Walgett, Angledool, New Angledool, Currawillinghi, Hebel, and Goodooga, once a week—Richard F. Gore, of Brewarrina, 4-horse coach, 3 years, £239 per annum.
Mogil Mogil and Cambo Cambo (Sevill's), <i>via</i> Burren Burren station, Picton's "Gundablue Hotel," Gundablue station, and Ryan's (Kundilla).	23	Two	Horseback	80 0 0	31 Dec., 1897.
Walgett, Angledool, New Angledool, Currawillinghi, Hebel, and Goodooga.	140	One	Coach, 2 or 4 horses.	278 0 0	31 Dec., 1897.
Walgett, Comborah, and Goodooga, <i>via</i> Springs, Grawin, Wilby Wilby, and Muckerawa*.	86	One	Conveyance, 2 or 4 horses.	*140 0 0	31 Dec., 1898.
Comborah (on the Walgett-Goodooga mail line), and John Simpson's, <i>via</i> Potts', Loughnan's, and M'Phee's.	30	One	2-wheeled vehicle, 1 horse.	39 0 0	31 Dec., 1897. Comborah, and John Simpson's, <i>via</i> Potts', Loughnan's, and M'Phee's, once a week—Not yet decided.
Walgett and Goodooga	97	One	Coach, 2 or more horses.	160 0 0	31 Dec., 1899.
Weetalibah and New Angledool..	14	Two	4-wheeled vehicle, 2 horses.	39 10 0	31 Dec., 1897. Weetalibah and New Angledool, twice a week—Joseph Hammond, of New Angledool, waggonette, 2 horses, three years, £52 per annum.
Walgett and Carinda, <i>via</i> Old Kidgear, Polly Brewan, The Wilgas, Bogewong, and Warren Downs.	60	One	Conveyance, 2 or 4 horses.	134 0 0	31 Dec., 1898.

* Contractor allowed £10 per annum extra for travelling on return journey to Walgett, *via* New Bangate Station, Loughnan's, Wilby Wilby, Grawin, and Springs, from 1st February, 1897 (96 miles).

- J. Clarke.
16 Nov., 1897.
1292. What are the branch services between Narrabri and Walgett? The most important one is the second on the list I have just given, the total annual payment to the contractor being £447 10s. The amount of the contract for next year is £594 10s.; and there has been also an additional branch service at the cost of £85, the contract for which was accepted to-day.*
1293. What is the difference in the amount of the last year's contract and next year's contracts? The difference is £232.
1294. How do you account for that increase over last year—is the mail-matter to be carried heavier? Yes. Besides, about three years ago, Cobb & Co. cut in at very low prices.
1295. Is there any increase in the contract price of the service from Narrabri to Walgett over last year? Yes; there was an increase of £254 5s.
1296. Can you tell the Committee whether the increases in the mail contracts for next year, as shown in your return, are common all over the coaching traffic of the Colony;—could you give us the amounts paid by the Department for the carriage of mails, apart from the railways, for the years 1897 and 1898? No; but I could give you the amounts paid for the carriage of mails by horse, coach, &c., for a certain number of years. For 1893 the expenditure was £95,550 7s. 3d.; in 1894 it was £95,867 8s. 6d.; in 1895 it was £95,805 11s. 8d.; and in 1896 it was £88,675 17s. 3d. There was a material reduction last year, and I think you might say that for next year there will be a slight reduction of those figures.
1297. There have been no lines of railways, to any extent, opened in the last few years that would make a difference? That does not affect us very much. You can see that by the figures all through. The expenditure in regard to coaches and horses is generally about the same; because when a railway is constructed the result is several small mail lines instead of one large one.
1298. If a railway were constructed from Narrabri to Pilliga, what mail contracts by coach or horse would be cancelled? The contract from Narrabri to Pilliga would be cancelled.
1299. Has the Department power to cancel a contract during the year? Yes; on the extension of a railway.
1300. What expenditure would be rendered unnecessary for the carriage of mails by coach if the railway were constructed from Narrabri to Pilliga;—what is the Department now paying for the carriage of mails? We have one contract from Narrabri to Walgett for which we will pay next year £1,350, or a little over £10 per mile.
1301. Then the distance from Narrabri to Pilliga being 53 miles, the amount paid by the Department for the carriage of mails between those places may be said to be under £600? Yes.
1302. Do you know what is the estimate of the Railway Department for the carriage of mails between Narrabri and Pilliga in the event of the railway being constructed? It would be either £12 or £20 a mile, according to the weight of the mail-matter. I think in this case it would be £20 per mile. Where the weight of the mail-matter does not exceed 2 cwt. per day, the charge is £12 per mile; and where the weight is over 2 cwt. per day the charge is £20 per mile.
1303. The heavier the mail, the more you have to pay? Yes; I think in this case the weight of the mail would take the service out of the £12 category.
1304. Could you give us a few examples—1st grade, 2nd grade, and 3rd grade? From Jerilderie to Berrigan would be a £12 section, and from Goulburn to Bungendore and Cooma would be a £20 section.
1305. What would an intercolonial line be? South, it would be £36. Another element comes in with regard to the south. Up to the year 1885 there were a number of lines for which we used to pay a certain amount. Then it was agreed to bunch those lines and fix the amount for a certain number of years, and on all lines opened since 1885 we pay the £12, £20, and £36 rates.
1306. You would not pay £36 from Sydney to Albury? No; that comes within the lump sum, and the same in regard to some of the lines going west.
1307. From Sydney to Bourke? Part of that line comes in under the 1885 arrangement, and we pay a lump sum.
1308. Could you give the Committee information as to the amount of correspondence at Pilliga? The figures giving the quantity of mail-matter and parcels between Narrabri and Walgett are as follows:—Average number of bags per trip, tri-weekly, 19 to 32; average weight per trip, 7 to 9 or 16 cwt.; average number of bags per week, 79; average weight weekly, 1 ton 13 cwt. That is from Narrabri to Walgett. Then back from Walgett to Narrabri there are from 15 to 23 bags tri-weekly, weighing about 3 cwt.; average number of bags per week, 61; average weight per week, 9 cwt. I took the average from the time-bills of two or three months.
1309. Do you believe that the correspondence along the line from Narrabri to Walgett is on the increase? I think it must be, because we have had numerous representations in regard to the difficulties of getting the mails along the line at a certain pace. We wanted to increase the speed, but it was represented that that was impossible owing to the larger number of mails and the weight of the mail-matter.
1310. Has there been any demand for a daily mail from Narrabri to Walgett? Yes; there has been an application for a daily mail.
1311. Do you know anything about the passenger traffic on the line? No; I only know that the coaches carry passengers. Of course, we take care that they do not carry more passengers than they ought to do, or such a number as would cause delay in the mails.
1312. If a railway were made from Narrabri to Pilliga, do you think any marked increase would take place in the revenue from the carriage of parcels;—would not the parcel post be more largely availed of than at present? I do not think so.
1313. Did the institution of the parcel post add very much to the expenditure of your Department;—I mean by increasing the prices of the mail contracts? No; not very much.
1314. All your contractors are bound to carry parcels? Yes; a horse mail up to 3 lb., and a coach mail up to 11 lb.
1315. Would it not happen that, in consequence of the parcel post, you would have, in many cases, to call for a contract for a coach service where a horse service previously sufficed? We very seldom specify the mode of conveyance. We leave that to the tenderer, and always give preference to the conveyance of mails by vehicle.
1316. Is there any increase in the newspaper traffic from Sydney? I could not say at present. I could not give any statistics in regard to the newspaper traffic. I know it is pretty considerable on Wednesday, when

* NOTE (on revision) :—The cost of the service between Narrabri and Walgett is now £1,095 15s. per annum, and the price for next year's contract £1,350.

when the weekly papers are transmitted. Where formerly there were one or two bags we now have to send perhaps three, four, five, or six.

1317. You only carry newspapers that are less than a week old? We only carry those free. On newspapers more than a week old we charge a half-penny up to 10 oz., and a penny for anything beyond that.

1318. I suppose there are not many newspapers carried that are a week old? I do not think so.

1319. Have you any record of the amount of revenue received from the carriage of such newspapers? I do not think so.

1320. Could you tell the Committee what it costs the Department to carry the newspapers free over New South Wales? I do not think we have anything to show that. We take the tenders for the whole. The only way would be to knock off the newspapers altogether, and then see what the tender price would be. I do not think it would make much difference.

1321. From your experience, do you think there would be any marked decrease in the contracts if the newspapers were not carried free;—would there be a number of horseback services instead of vehicles? Horses are replaced by vehicles according to the requirements. A traffic springs up, and then a coach comes in, and we get services at a lower price, and the public pay to some extent, as it were, for the convenience.

1322. Is it a fair thing to assume that the carriage of newspapers is not really a serious expenditure to the Government of the country? Not with regard to the conveyance, I should imagine. Of course, there is the handling; there is a good deal in that way.

1323. What is the maximum size of the parcels that you carry by parcel post? Eleven pounds.

1324. Is that all over the Colony? To all places where there is a conveyance by vehicle, steamer, or train. On horseback lines the weight is only 3 lb.

1325. *Mr. Humphery.*] Can you tell the Committee in which of the other colonies newspapers are carried free? The information is contained in the memorandum which I now hand in. [*Vide Appendix.*]

1326. Can you say what amounts are paid in the other colonies for the carriage of mails by rail? The particulars, so far as they can be obtained from the information at my command, are shown in the statement which I have prepared and now hand in. [*Vide Appendix.*]

WEDNESDAY, 8 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Henry Nelson, sworn, and examined:—

1327. *Chairman.*] You have written a letter to the Committee asking to be examined? Yes.

1328. *Mr. Wright.*] You were for some time a resident of Walgett, were you not? Yes.

1329. Were you in business long at Walgett? I was in business there since 1865; but I resided in Walgett from 1873 to 1889.

1330. You had a business there some years before you resided there? Yes; we owned a business on Meri Meri, and after that we owned a business in Coonamble.

1331. I suppose you know the country fairly well? I ought to; I have been there for many years.

1332. Do you know the Narran country and all up that way? Yes.

1333. Will you give the Committee your opinion about the proposed railway? A railway from Narrabri to Walgett would undoubtedly open up a great extent of country, and not only a rich timber country, but land which, if not all fit for pastoral purposes, would be fit for agriculture.

1334. You mean the land between Pilliga and Walgett? Between Narrabri and Pilliga. The land between Pilliga and Walgett, I should say, would be most suitable for pastoral purposes. It is all good country; but between Narrabri and Pilliga, any of the land along that line, if it were cleared, would make really good cultivation country. It is not much good for pastoral purposes.

1335. Is the rainfall sufficient for cultivation? Of course the country is liable to drought, and there would be seasons when you would not get a crop.

1336. I am speaking of the average rainfall. It wants 20 inches per annum to cultivate wheat;—do you think there is such a rainfall in that district? I really do not know what is the actual rainfall. I know that in the Walgett district we always suffered from want of rain. We had either too much or too little.

1337. Will you kindly look at the map and tell us what you think of the proposed route? From Narrabri to Wee Waa you could not go in a much straighter line.

1338. Is that line carried on the right side of the river? Yes; I should think so.

1339. You think the south side is the best? Yes; on the south side you get a lot of agricultural country between Narrabri and Pilliga. It is really good timber country, which would be very valuable to all that district if it could be utilised.

1340. There is a considerable ironbark forest there? Yes; and it is valuable timber. There is also good pine for building purposes.

1341. Is ironbark usually grown in good country or bad country? It is not the best country where ironbark grows; but still the country of which we are speaking could be utilised for agriculture in almost any part of it.

1342. You think it is all good for agriculture? As far as my knowledge goes, I should say it was.

1343. What is the country like between Pilliga and Walgett? That is all what you might call pastoral country. You might grow wheat in some seasons.

1344.

J. Clarke.
16 Nov., 1897.

H. Nelson.
8 Dec., 1897.

- H. Nelson.
8 Dec., 1897.
1344. Is the country good? The country between Pilliga and Walgett could not be beaten. I do not think there is richer pastoral country in the Colony.
1345. What is the country between Walgett and Goodooga, for instance? It is all first-class country.
1346. And out to Angledool? It is all first-class country until you get to Angledool.
1347. Then the whole of the country north and north-west of Walgett you class as good country? Yes, first-class country; you could not beat it. It consists mostly of myall and yarran plains.
1348. Where did the Walgett traffic always go to? Narrabri. Most of our traffic was from Narrabri out to Walgett.
1349. Did you ever have much traffic by the river? Yes; we had a lot of goods out by the river. We could not always get sufficient from Narrabri, because both in dry weather and in wet weather it is impossible for the teams to travel, there being no made road. It is a very hard road to travel in wet weather, and also in dry weather.
1350. What was the average cost per ton of transit between Narrabri and Walgett? I have paid from £2 10s. up to £25.
1351. Could you state what thing would be a fair average (say) for a period of five years? I believe carriage is down a lot now. I suppose, at the present time, £4 or £5 would be a fair thing between Narrabri and Walgett, except, of course, in wet weather, or under other specially adverse conditions. I owned teams myself, and I credited the teams with £12 per ton for the carriage of goods landed in my store, and £8 per ton for the carriage of goods the other way. Even at that price it did not pay, owing chiefly to the difficulty of getting feed for the horses. At that time I was paying 7s. a bushel for corn in Narrabri. It was in 1882 and 1883, which were exceptionally dry years.
1352. That was paid at that time to the ordinary carriers? They did it for about £12. A carrier taking his own team would just about make it pay at £12.
1353. The traffic between the coast and Walgett has always come by Morpeth and Newcastle? In my time we had to send lots of our goods round *via* Adelaide.
1354. That was when the river was navigable? Yes; when the river is navigable now there would be very little traffic going that way, because it is much more convenient to use the railway.
1355. If a railway were constructed as far as Walgett from Narrabri, do you think it would command, at all times, the entire traffic of Walgett and the surrounding district? Yes; as far as my knowledge of that district goes, if a railway were constructed to Warren, it would tap the Narran country and as far north as the Queensland border, which is only 6 miles from Angledool. Walgett is in the most suitable position as a centre for all that country.
1356. You think it would form a good distributing centre for all the country north and north-west? Yes; and the result would be that the Government would get thousands of pounds a year where at present it does not get a thousand farthings.
1357. If a railway were constructed to Walgett, what would be the position of the people of Walgett in the event of there being a navigable river—would they patronise the railway, or would they go by the river? I believe they would patronise the railway in preference to the river, because by the river the risk of loss is always great. I have sent goods by the river, on which I have lost hundreds and hundreds of pounds, the goods not having been fully insured. They used to charge very high rates of insurance, owing to the liability of steamers to be snagged in the river.
1358. If the charge by railway were £5 a ton, and if, on the other hand, the river were navigable for six months, and would convey the goods at a cost of £3 per ton, which means of transit, do you think, would be adopted? If I were there in business, I know which I should adopt. I should still stick to the railway.
1359. *Mr. O'Connor.*] Is the river always navigable? No.
1360. *Mr. Wright.*] You would stick to the railway, because you would recognise that one was a certain mode of transit, and the other was an uncertain mode? Yes.
1361. But, as a business man, would you not take advantage, if opportunity offered, to save a couple of pounds a ton freight on your goods? I had the opportunity for years, and never took advantage of it, unless in exceptional cases. I used the river several times, because we could not otherwise get the goods up. The goods, however, get so much knocked about when carried by the river that we always preferred the railway, or even teamsters.
1362. It has been stated to the Committee that, in the event of a good river Bourke would enter into active competition with the railway; that a great deal of stuff would, very likely, come *via* Bourke and then by river to Walgett? No doubt some goods would come that way, but not, I think, to such an extent as is imagined.
1363. You know that owing to the competition by river, particularly low rates are now charged by the railway? They are charging more by the river now than we could get teams to carry for.
1364. But particularly low rates are being charged on the railway to Bourke, a concession being made on goods over 100 tons in quantity, and a further concession as regards goods over 200 tons; is not this in view of the low rates on the river? It is cheaper to send goods that way than by the river. You cannot get goods from Adelaide to Bourke under £3 10s. a ton; it costs £1 10s. to get them up to the point where the river is navigable, and from there to Bourke as much as £2.
1365. What did you generally pay between Bourke and Walgett when there was a river? Never less than £3.
1366. If the Committee have been assured that it has been done for less than half that sum, you think they would not be justified in giving credence to the statement? I should not do so. They are now charging 25s. to Brewarrina, when the river is navigable. I paid that only about three weeks ago.
1367. It is double the distance from Walgett to Bourke than from Brewarrina to Bourke? Yes; and the risk is greater to Walgett than to Brewarrina.
1368. So you think that under any circumstances, if the railway were constructed to Walgett, it need not fear competition by the river from any source? Yes; I am certain of that.
1369. I suppose all that Narran country is held principally by New South Wales men? Yes, there are a few Victorians; but they are mostly New South Wales men.
1370. The interests of the bulk of the people there are identical with the interests of New South Wales? Yes.
1371. There would be no danger of their sending their produce to South Australia or Victoria, because they

H. Nelson.

8 Dec., 1897.

they were South Australians or Victorians? I do not think so. I own a business at Goodooga, and have some interest there, and, as far as my knowledge goes, I think they would all favour Sydney.

1372. There is a proposal before the Committee to construct a railway from Byrock to Brewarrina;—if such a railway were constructed, what effect would it have upon the country north and north-east of Walgett—that is, the Narran country? If there were a railway, I should say that part of the Narran traffic should naturally go to Brewarrina; for instance, the people up towards Goodooga would naturally go to Brewarrina.

1373. Suppose there were a railway both to Brewarrina and to Walgett? Goodooga is as near to one place as to the other.

1374. In your opinion, which railway would command the largest portion of the trade? I think the railway to Walgett. I think Walgett would dominate the trade. Brewarrina would have a very good innings; but it would not be equal to Walgett.

1375. You think there would be a large trade in both places, but Walgett would have the larger? Yes; there would be no comparison.

1376. And do you think that approaching Walgett from Narrabri is the best route? I think so.

1377. It has been suggested that a line should be carried from Mudgee, through Coonamble, to Walgett, and that the distance by that route would be much less than *via* Narrabri; a route has also been suggested which would go from Warren to Coonamble and on to Walgett;—which of these do you think is the better one? The route straight through from Narrabri.

1378. You think that is the route which would serve the people best? I think so; because in time of drought it would be very important to be able to send stock to New England for grass and water.

1379. You think one of the advantages of constructing a line from the north-western line to Walgett would be that the people would have an opportunity of getting access to the table-lands of New England in dry seasons? Yes.

1380. Is there much business between the high lands of New England and the Walgett country, in the shape of horse-feed? I should think there would be if there were a railway.

1381. As a business man in Walgett, did you ever bring down horse-feed from the Hunter? Yes. I always got my maize in Maitland, and my lucerne in Singleton.

1382. Is there not a considerable trade in those commodities at Walgett? I have done a big trade in them in my time.

1383. If the cost of transit were cheapened by the construction of a railway, that trade would be largely increased? Yes; people would save all their horses, and perhaps also milking cows.

1384. The people of the district would get horse-feed and feed for their cows at a cheaper rate from the Hunter than by any other route? Yes.

1385. If Walgett were connected with Sydney *via* Mudgee, they would lose the advantage of the Hunter trade altogether? Yes.

1386. And they would have to pay more for forage than if they were connected *via* Narrabri? Yes.

1387. Am I right in assuming that the interests of a great number of people in that district are with Newcastle and the Hunter? Yes. According to my experience years ago, those people always traded with Newcastle and Maitland.

1388. Was not the country largely taken up in the first instance by people from the Hunter? Yes; most of them were from the Hawkesbury and the Hunter districts.

1389. So that the feeling of the people is in favour of a northern connection? Yes.

1390. And you, as a business man, with large experience, think that would be best in the interests of the people, and of the country generally? Yes; it would be best not only for the people of the district, but also for the Colony generally. I am sure that the railway if constructed would pay well after a little while. Just look at the stock that would be saved. About eighteen months ago, when I was up at Goodooga, I passed through a run on which the stock were rolling in fat, and when I returned in a few weeks time the change was lamentable—the place was destitute of food. If there had been a railway all that stock could have been sold and sent away.

1391. It could have been sent to Sydney? Yes.

1392. In your experience of the district, was it often subject to drought? Droughts used to occur sometimes.

1393. If the country is subject to drought, is not that fact rather opposed to your idea of agriculture being carried on? I do not think you could make absolutely certain of a good crop every year; but I think that if agriculture were carried on, there would be a change in the character of the seasons.

1394. You think that the cultivation of the soil would produce a climatic change? Yes; I believe so.

1395. What reason have you for believing that? Wherever there is any agriculture going on you do not see the dry times such as you see where the land is growing nothing. Go out on the plains where there are no trees, or any other growth, and you see that everything is dry and barren. But when you come near to a town, or even near to a station homestead, you see a difference.

1396. Do you think the turning up of the soil and its cultivation would have an effect on the rainfall? That has always seemed to be the case in my experience.

1397. So that you believe if this part of the country were opened up by railway, not only would the pastoral holders be benefited, but the effect would be to induce closer settlement and agricultural settlement? Yes; a station would pay better with 20,000 acres if there was a railway than it would with 50,000 acres without a railway.

1398. Would the construction of the proposed railway induce increased settlement? I should say it would, because all the country between Walgett and the Narran is really good. There is not finer country in the Colony for small settlement. When I say small settlement, I mean from 5,000 acres to 10,000 acres. Such a holding would be a nice little holding out there.

1399. There is a considerable number of homestead leases in the Narran country now, is there not? Yes.

1400. And the present occupiers are all holding them tightly? I think so.

1401. They find it pays them to take up the 10,000-acre blocks? It must pay them, or they would not continue to occupy them. The fact of their holding on to them is a proof that they are making money out of them.

1402. And you think there would still be increased settlement of that class if a railway were constructed? Yes; I think so.

- H. Nelson. 1403. If homestead selections of 2,000 or 3,000 acres were available, do you think land of that area would be taken up? I do not think that 2,000 or 3,000 acres is sufficient for a man out there.
- 8 Dec., 1897. 1404. But if your theory about agriculture is correct, could not the settlers combine the two forms of production? If a man could combine the two together perhaps it could be done. The Narran country is as good wheat-growing country as that in any other part of the Colony.
1405. It is all rich soil? It is all good soil.
1406. And in your opinion the rainfall is sufficient for the cultivation of wheat? I could not speak definitely as to the rainfall, but I think they could grow wheat there as well as anywhere else. It is, of course, no use attempting to grow wheat there now, because there is no sale for it.
1407. Have any of the squatters grown crops for their own use—hay, for instance? Yes; that has been done on Gingie and Dungalear, and also at Angledool. I myself grew oats about Walgett fifteen years ago.
1408. If you were told that 300 tons of splendid hay have been grown this year on Dungalear, would you think that extraordinary? No; I think it quite likely.
1409. You have seen evidence of this yourself in the district? On Gingie they have grown beautiful hay—wheaten hay.
1410. Has the wheat ever been allowed to ripen? I do not think so. The wheat would be of no use to them. They would cut it green for hay.
1411. As far as your experience goes, you think the country is quite capable of producing good wheat crops? Yes, I am sure it is.
1412. And the construction of a railway connecting Walgett with the railway system of the Colony would, you think, tend very largely to induce mixed settlement? Yes. The country there is equally as good, and even a good deal better, for growing wheat than the Narrandera country, which is supposed to be good wheat-growing country.
1413. The Committee are told that the country in the Narran district is some of the best in New South Wales? I do not think you can surpass it for growing anything.
1414. For producing either stock or cereals? Anything. Where you do not see a blade of grass, you will find flocks of sheep fat.
1415. Is the country fairly well improved, as far as water and fencing are concerned? The country could stand a lot more in the way of improvements. You have to go a good distance in these places to get water—14 or 15 miles.
1416. Have any bores been put down in the district for artesian water? I believe a bore was put down on the Narran since I was up there.
1417. Are you aware that a bore is being put down close to Euroka? I saw it, but it was not finished when I was there.
1418. I suppose the fact that artesian water can be got there will still further enhance the value of the country? I should think so.
1419. You think, in the event of a railway being constructed to Walgett, that the production of the district in sheep alone would be considerably increased? I do not think anybody can tell how much a railway would pay if it were constructed to Walgett, principally by reason of the quantity of stock that would be sent away.
1420. You think the carrying capacity of the country would be largely increased by the fact of there being easy communication? Yes.
1421. I suppose better provision would be made for water, so that the country would carry more stock? No doubt. There was one selector at Euroka who has use of water from the bore, who told me only a fortnight ago that he had 20,000 sheep.
1422. Does not the same thing apply to almost every station in the district;—have not the sheep largely increased of late years? Yes.
1423. Am I right in the supposition that country which fifteen years ago was supposed to be capable of carrying 20,000 sheep will now carry from 40,000 to 50,000 sheep? Country that was capable of carrying 50,000 sheep fifteen or twenty years ago will now carry 150,000 sheep.
1424. And you think there is room for still further increase by making additional water and other improvements? Yes. With smaller paddocks people could carry double the stock.
1425. As far as your knowledge is concerned of the capacity of the district to raise produce in the shape of wool and stock, it is not nearly at its maximum at the present time? No, it is not.
1426. And you believe that a railway under any circumstances, and with the existing state of affairs, would pay well? I am sure of it. I think if any district deserves a railway that district does. I speak as a disinterested person, and not because I have any interest there now. Railway communication is necessary, because in dry weather, and also in wet weather you cannot get anything up there.
1427. The fact is there is a beautiful fertile tract of country cut off almost from communication? They are cut off from civilisation, and everything else. At times you cannot get food there, and yet it is such a fine tract of country.
1428. *Mr. Fegan.*] Do you know the country well from Walgett to Coonamble? Yes.
1429. Having lived there a considerable time you know the views of a majority of the people of Walgett in regard to railway communication? Yes.
1430. The people of Walgett have been agitating for a railway for a long time? Yes.
1431. Were you ever on a deputation to the Minister on the subject? I do not remember positively, but I do not think I was.
1432. From time to time, extending over a long period, you have joined with other residents of the district in the request for railway facilities? Yes.
1433. Did you at any time say that one route would be preferable to any other? We always gave the preference to the Narrabri route.
1434. The majority of people of Walgett prefer that route? I think so.
1435. Will you tell us why the route *via* Narrabri would be preferable to a line *via* Coonamble? The reason is very easy to give. We have always thought in dry weather we should be able to get the stock away to New England for grass and water; and we could get our produce more cheaply from the Hunter River.
1436. I think you said you carried on squatting;—where was your land? Eighteen miles from Walgett on the road to Coonamble.

H. Nelson.
8 Dec., 1897.

1437. How many years is it since you followed squatting pursuits? We only followed it for about three years.
1438. What area did you hold? Only 32,000 acres.
1439. Why did you give up squatting? Because I retired from business. Owing to my wife's illness, I had to come to Sydney.
1440. Will the land between Walgett and Pilliga compare with the land between Coonamble and Walgett? The land between Walgett and Coonamble is very good for pastoral purposes—you cannot surpass it.
1441. How many sheep did you carry on your station of 30,000 acres? We carried about 22,000 once. It was too many for the improvements at the time.
1442. With more improvements, how many sheep would it carry—nearly one to the acre? Pretty well, I suppose, if it were well improved. In good seasons you cannot overstock the country between Coonamble and Walgett, and between Walgett and the Narran. You could put five sheep to the acre on it in good seasons.
1443. Do you know the country between Narrabri and Pilliga? Yes.
1444. Are there many belts of ironbark there? I believe so. I have never been all through the bush.
1445. What traffic could be relied upon to bring in a return for the expenditure on the railway? The traffic would consist chiefly of wool and stock being taken to the market, and of goods being brought back to the district. A lot of country would be opened which is now lying dormant.
1446. Do you think an extension of the railway to Walgett would develop that country and increase settlement, and thus be the means of finding homes for a large number of people? Yes.
1447. In answer to Mr. Wright, you said you did not think the river would come into competition with the railway? Not if it is not snagged. If the Government snagged the river, and constructed weirs, so as to keep water in the river, it might come into competition with the railway. But under present conditions there would be no such competition.
1448. How long does it take a barge or boat to go from Walgett to Brewarrina? It would take about three days to go from Walgett to Brewarrina, and about a fortnight from Brewarrina to Walgett, because in the latter case you would be travelling against the stream.
1449. So that in dealing with this railway proposal you think there is no necessity to consider the question of river competition? I think not.
1450. Do you know if any of the people have tried to grow fruit in the Walgett district? I know that some very fine grapes have been grown there, and with proper management I have no doubt other fruits could be grown. A Frenchman who had a garden across the river did very well growing fruit. The Chinamen there grow fruit well, and produce some beautiful grapes. Europeans could do the same if they liked to take the trouble. In that climate the fruit would be more forward than in localities about Sydney.
1451. Has there been any attempt at wine production in the district? No.
1452. *Mr. Roberts.*] I gather that from your intimate knowledge of this part of the country, and from the hardships which the people there have had to put up with for some years past, you have come forward to urge the granting of railway communication to Walgett? Yes. I was asked by the Walgett people if I would have any objection to do so.
1453. Can you recollect when the first agitation for railway communication with Walgett took place? I do not remember exactly, but it must have been about ten years ago. The railway to Narrabri was finished just before I left. We were among the biggest customers of the railway in the northern district.
1454. For what radius did you supply goods to the settlers? I sent goods across to the Queensland border.
1455. Where did you get your goods from when you were in business at Walgett? From Sydney and from Adelaide. When the weather was wet I had to get goods from Adelaide. These goods came by river. I could not always get the goods from Sydney. I have had goods lying at the railway station in Sydney for four or five months. I have not been able to get teams to take them up, and I have had to order another lot to go round by Wallerawang.
1456. Was the railway at that time extended to Narrabri? No; it only went to Murrurundi. In wet weather I have had goods lying at Narrabri for months. The roads are impassable in wet weather, you might say, almost from Narrabri to Walgett.
1457. What rate of insurance would you pay on the river? Two per cent.
1458. When you were in business at Walgett did you transact your business principally with Newcastle or Maitland or with Sydney direct? With Sydney, except as regards forage and flour. I could always buy 5 or 10 per cent. cheaper in Sydney.
1459. Could you describe the country along the proposed line from Narrabri to Wee Waa? That, I suppose, would be mostly pine country; but there is a portion near the Namoi which is beautiful country. If a railway were constructed there would be a lot of traffic between Narrabri and Wee Waa.
1460. What is the country like between Wee Waa and Pilliga? There is some rough country; but I saw a beautiful crop of wheat or oats in a selector's paddock. It was only a few acres; but it showed what could be grown if there was sufficient inducement.
1461. And on to Walgett? It is all good pastoral country.
1462. Where does the black soil commence? Fifteen miles from Pilliga.
1463. Then the land improves as you approach Walgett? Yes.
1464. *Mr. Lee.*] You advocate the line to Pilliga as the first extension to Walgett? Yes.
1465. You hold that it should go to Walgett? Yes.
1466. Because you believe that Newcastle and Sydney are your natural ports? Yes.
1467. Pilliga is about half-way between Narrabri and Walgett? Yes.
1468. You told us that you never paid less than £3 a ton by the river from Bourke to Walgett? Not in my time.
1469. You will see that in considering this railway question the river as a probable opponent of the railway is an important factor? Yes.
1470. I want to find out from you as accurately as possible—first, what is the charge by river for wool per ton from Walgett to Bourke? I really do not know; I have not been up there lately.
1471. But in your own time? I have told you that I have sent wool from Brewarrina to Bourke, but not from Walgett.
1472. What was the freight from Brewarrina to Bourke? £1 5s.
1473. That was the lowest? That was the lowest they charged us.

- H. Nelson. 1474. And what would be a fair rate to put on for the distance from Brewarrina to Walgett—another 25s.? Yes, I should think so.
- 8 Dec., 1897. 1475. Do you think that £2 a ton from Walgett to Bourke by river would be a fair and reasonable charge? I really cannot speak in regard to the present time; I have not been living there for the last eight years.
1476. What would be the value of a ton of greasy wool? We always insured a bale of wool at £10 on the river.
1477. It would be at least 6d. a lb., which would be £56 per ton, and the insurance on that at 1 per cent. would be £1? Yes.
1478. And you think that the river freight on wool from Walgett to Bourke at £2 a ton would be a fair thing? I know that they charge about 25s. a ton from Brewarrina; I do not know anything about Walgett.
1479. But suppose the river were locked, and they had a good river all the year round, do you think they would be able to carry goods from Walgett to Bourke for less than 25s. a ton? No.
1480. Do you think they would carry them for 25s. a ton? No.
1481. For 30s.? They might carry goods to Bourke now at certain times for 30s. for all I know, because they might take wool from the stations when there was an empty steamer, and earn a £10-note that way, for all I know.
1482. Will you follow me in these figures: River freight from Walgett to Bourke, 30s. per ton; insurance, £1; railway carriage from Bourke to Sydney, £4; total, £6 10s.;—in your opinion, it could not be done for less? No.
1483. Now take the other route; it is estimated that wool will cost 6s. 5d. a ton to be conveyed from Pilliga to Narrabri by rail; therefore, if the line is carried to Walgett, the freight will be 12s. 10d. from Walgett to Narrabri; the rate for wool from Narrabri to Sydney at the present time is £2 13s., making a total of £3 5s. 10d. per ton;—if the line is made to Walgett, and the wool can be conveyed direct to Sydney for £3 5s. 10d. per ton, which is the Railway Department's own estimate, do you think there is any probability of the river competing against the railway when the cost by that mode of carriage would be £6 10s. per ton? I should not think so.
1484. It is proposed to charge £1 a ton on general goods from Narrabri to Pilliga, and 6s. a ton on goods of a special class, so that if you take a ton of each the carriage will cost you an average of £1 6s. per ton. If the line is carried to Walgett the freight will be double that amount, viz., £2 12s. per ton. If the business people of Walgett can get their goods carried from Narrabri in all seasons, and when they want them at £1 6s. per ton, are they likely to trust to the uncertainty of the river? No; they would prefer to pay £2 12s. by rail than £1 6s. by the river.
1485. Would they be prepared to pay a higher freight if necessary? I think they ought to.
1486. Do you think, for instance, that on general goods £2 a ton from Narrabri to Walgett would be too high? No.
1487. You are clear as to the fact that Walgett is the point where the trade must be fought for with the railway as against the river? Yes.
1488. A lot of the trade would come in from the other side of the Barwon as well as from the northern side of the Namoi? Yes; Walgett is the most central point.
1489. If the railway rates from there to Sydney were as high as those from Walgett by river to Bourke, and thence by rail to Sydney, would not the people prefer to send their goods the more certain and quicker way—by railway, than they would by the longer route? Of course they would. Goods are always worth a little more to go straight by the railway, because they are not knocked about.
1490. You say you were up in this part of the country from 1873 to 1889? I was there since 1865.
1491. Were you there in 1886? Yes.
1492. Do you know that the river was navigable for 222 days in that year? I do not remember. I know it was navigable for a little while.
1493. We will assume that those figures are correct, and that for the period mentioned there was free access for all steamers up and down the river, do you happen to remember whether the river freights were cut down very much that year? I am sure they were not, for we had to get our goods *via* Narrabri.
1494. Then a good river has never made any difference in the rates? Not much, because it costs so much to Bourke. It costs £41 per truck for the goods to go to Bourke; it used to cost more.
1495. Then, in consequence of the extra railway carriage to Bourke you were compelled to bring your goods round by Narrabri, and thence by dray? Yes.
1496. Given two things—a railway to Walgett and a year when there is a splendid river, navigable three-fourths of the year, do you think it is likely that steamboat proprietors under those conditions would reduce their rates as to take the bulk of the freight away from the railway? They could not reduce them sufficiently to have that effect. If a man has to send goods from Sydney to Bourke, and from Bourke by steamer, it can only make a difference of a few shillings.
1497. It is very clear they cannot send the wool that way, because at the lowest computation it would cost £6 10s. as against £3 5s. 10d., and, therefore, you are clearly of opinion that it would be impossible to get the goods that way—I mean, commercially impossible? Yes, it would not pay.

THURSDAY, 9 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

John Hannon Murphy, sworn, and examined:—

1498. *Mr. Hassall.*] You are resident in the country lying between Narrabri and Millie, I believe? J. H. Murphy.
9 Dec., 1897.
Yes.
1499. How long have you resided there? I selected in 1880. I was in the district prior to that for about ten years.
1500. So that you have a knowledge of the country for the last twenty-seven years? Yes.
1501. I believe you have carried on a good deal of work as a contractor? Yes; I was for twenty-four years a contractor under the Government of this Colony. I worked on the Southern line and made a great portion of the line on the Zig-Zag—as a sub-contractor.
1502. You have heard of the proposal to run a railway from Narrabri to Pilliga on the south side of the Namoi? Yes.
1503. Do you think it would be advisable to construct a railway from Narrabri to Pilliga, allowing it to stop there? In preference to the line from Narrabri to Pilliga, I would recommend the construction of a line which has been surveyed from Woolabra to Collarendabri, and also a line from Mudgee to Walgett *via* Coonamble, these two lines forming a junction at Walgett. The greater portion of the country in the vicinity of Pilliga is scrub country and valueless. The line from Woolabra, even if it went only to Bulleroi, where an artesian bore has been put down, would embrace a large district where there is a great quantity of wool and valuable stock. This country is at present deprived of any means of communication. In the district where I am living we have neither a road nor a railway. The Government have taken away the travelling stock route from Boggy Creek to Narrabri, and the syndicate into whose possession it has gone has not left a blade of grass on it during the last couple of years. I have good sheep now and cannot send one of them to Narrabri. I have had to boil sheep down—sheep that would sell well in Sydney.
1504. Do you know the country between Mudgee and Coonamble and between Coonamble and Walgett? Yes; I travelled it thirty years ago. It is a magnificent piece of country, down along the banks of the Castlereagh. If the line from Woolabra were constructed there would be no necessity for the Pilliga line, and the line going from Woolabra to Collarendabri would pass through the centre of magnificent country, every acre of which is paying a yearly rental. I am but a selector and my rent to the Government is about £500 a year. A clip of about 500 bales of wool belonging to my son and myself is being sold to-day by Hill, Clark and Co.
1505. If a railway were extended from Woolabra, on the Narrabri-Moree extension, towards Collarendabri it would not only open up a large extent of valuable country along the route, but it would also serve a large extent of country lying out towards the Narran, beyond Collarendabri? Unquestionably so. It would go through good land all the way with not a single acre of scrub on it.
1506. Do you think there is any prospect of settlement taking place on the country between Narrabri and Pilliga? No, not as regards the greater portion of it; unless the Government were to send a number of unemployed to clear and scrub the land, which in its present condition is valueless.
1507. Having had such long experience in that part of the country, I presume you have seen a great alteration take place there from the time you first went to the district twenty-seven years ago? Yes.
1508. At that time was not the country nearly all in cattle stations? There was hardly a sheep in the district when I selected there.
1509. And no selections? I believe I was the first selector in that part of the country.
1510. From cattle stations the country has been turned into sheep runs? Yes. In the district in which I live you could not get an acre of land; it is all taken up.
1511. The country is now occupied by selectors holding considerable areas of land, and grazing large numbers of sheep? Yes; it is all thoroughly stocked.
1512. A railway constructed through that country would serve a very large district, give facilities to a very large number of selectors, and there would be every probability of its paying expenses? Yes. Very recently, when land was thrown open at Bulleroi, every acre was taken up. The number of applicants was in excess of the area available.
1513. If it were decided to take a line from Narrabri to Pilliga, and on to Walgett, which would be the better side of the river for the railway to go as regards settlement and traffic? I think the northern side. That would be the only chance there would be of its being a service to the good country, because on the southern side the country is not so valuable. A vast amount of the country there is scrubby.
1514. You know the bore which has been put down at Bulleroi? Yes.
1515. There is a splendid flow of water there, is there not? Yes, very good.
1516. The fact that water can be obtained by artesian bores all over that part of the country, goes to prove that it is splendid country for people to settle upon for the purpose of carrying on pastoral pursuits? Unquestionably. But the bores should not be put on the edge of a creek, and the water allowed to run into the creek. The site of the bore should be on elevated ground, so that the water could be distributed over the surrounding country.
1517. *Mr. O'Connor.*] How long have you been in the country? Since 1854.
1518. Have you resided principally in the interior? Yes, principally, since 1860.
1519. You know Narrabri? Yes.

1520.

- J. H. Murpley. 1520. And you know, from your personal knowledge, the land between Narrabri and Walgett? I do not know all the land to Walgett. I know the country as far as Bullaroi. I know from the surveyor, and from others who are familiar with the country, that a line from Woolabra to Collarendabri would open up a very large area of magnificent land. There would be a large traffic to the railway in wool, sheep, and cattle. At present I cannot send my fat sheep to market.
- 9 Dec., 1897. 1521. Is the land suitable for agriculture or for pastoral purposes? It would be adapted for agriculture if we availed ourselves of the seasons. If wheat were sown in March, so that it would ripen before the excessive heat occurred, I believe that the crops would yield from 30 to 50 bushels per acre.
1522. Have 30 bushels to the acre been obtained? Yes; a farmer between Millie and Warialda, named Hunt, told me he had about 100 acres of wheat which he fully believed would go from 45 to 50 bushels to the acre.
1523. Would you say it would be possible to produce so large a yield as 35 bushels to the acre? I believe the land between Narrabri and Moree would yield between 35 to 40 and 45 bushels to the acre. It is heavy loamy land; it will last for years.
1524. What is the distance from your homestead to the nearest railway station? About 20 miles.
1525. What is the name of the railway station? Woolabra.
1526. In what land division is your place situated? In the Central Division.
1527. What do you pay to carry your produce to the railway? I carry it by my own teams. The other day for two loads of wool from my place to Narrabri, I paid 1s. 3d. a cwt.
1528. What is the distance? About 40 miles.
1529. What area of land do you hold? About 18,000 acres, consisting of *bonâ fide* selections.
1530. Having lived a considerable time in the district, and knowing the country so well, would you say whether you are in favour of the construction of the proposed railway from Narrabri to Pilliga? I think it would be a great mistake to construct a railway through such a fearful piece of country. I should advocate, as I said before, a line from Woolabra to Collarendabri, and eventually on to Walgett, and also a line from Mudgee through Coonamble to Walgett. These two lines would pass through magnificent country, leaving the scrub and inferior country in the vicinity of Pilliga in the middle.
1531. Is the country between Woolabra and Collarendabri suitable for pastoral or for agricultural purposes? Owing to the excessive heat it is better adapted for pastoral purposes; but I have no doubt that when I am dead and gone there will be thousands of acres of wheat grown in that country. The soil is very fertile. I have myself grown magnificent vegetables.
1532. What distance are you from Narrabri? About 36 miles.
1533. Is the road pretty good? We have no road; the Government would not lay out £1 on the road.
1534. *Mr. Fegan.*] You know Pilliga very well? Not very well. I have never lived there, but I have passed through Pilliga several times.
1535. You say that the country between Woolabra and Collarendabri is of better quality than that around Pilliga? Unquestionably.
1536. How do you know that if, as you say, you do not know Pilliga very well? I know the district. Pilliga itself is a very small place.
1537. You know the route to Collarendabri exceedingly well? Not further than Bullaroi. But my son tells me it is all magnificent country, and the surveyor also told me.
1538. You have never been from Pilliga to Walgett? No; I was never in Walgett.
1539. What is the nearest you have been to Pilliga? I have been through the district. There is only one public-house in Pilliga.
1540. How far does the district of Pilliga extend? It is 25 miles from Narrabri to Wee Waa, and 70 miles from Narrabri to Pilliga, so you can take the balance between the two.

FRIDAY, 20 MAY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Narrabri to Pilliga.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 1541. *Chairman.*] You wish to make a statement to the Committee? With regard to the approach to Collarendabri, it appears that this is approximately the position: Over fairly good country—in this vicinity—where there will be no trouble with water, you may estimate the line for practical purposes as costing £2,300 per mile. The cost of carrying the line into Collarendabri without these waterways, in a fairly good country, would be about £25,300; but my estimate reaches £47,000. Therefore, the extra cost of approaching Collarendabri, due to water, is between £22,000 and £23,000. These figures must be regarded as approximate, but I believe they are a fairly correct approximation. With regard to placing lines under flood-level in country rarely visited by heavy rainfalls, such as that under consideration, great caution should be exercised. There are places where channels have to be crossed, and if the bridges there are built too low, there is great danger of their being entirely destroyed.
- 20 May, 1898.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and further examined :—
 1542. *Chairman.*] You desire to hand in a statement? I beg to hand in the following statement:—

C. E. Rennie.
 20 May, 1898.

Schedule of areas in connection with line Narrabri to Walgett.		Acres.
Alienated land		1,231,100
Reserves		523,600
Settlement and homestead leases		380,300
	(Includes 192,300 acres, homestead leases, Western Division.)	
Crown lands		773,800
Tenure of Crown Land.		
Leasehold areas, expiring 1898-1900.....		393,400
	(Includes 78,700 acres, Western Division, expiring 1918.)	
Held under occupation license		258,800
Untenanted.....		126,600
Areas in connection with line, 315 miles to Collarendabri, outside limits of line Narrabri to Walgett.		
Alienated land		392,000
Reserves		105,250
Settlement and homestead leases		251,680
	(Includes 167,160 acres, homestead leases, Western Division.)	
Crown lands		201,050
Tenure of Crown Land.		
Leasehold areas, Western Division, expiring 1918		149,360
	(Includes 18,560 acres, Central Division, expiring 1898-1900.)	
Held under occupation license		51,690
Untenanted		Nil.
Areas in connection with land common to lines from Narrabri to Walgett and Narrabri to Collarendabri.		
Alienated land		864,200
Reserves		305,400
Settlement and homestead leases		145,000
	(Includes 13,200 acres, homestead leases, Western Division.)	
Crown lands		493,500
Tenure of Crown Land.		
Leasehold areas, expiring 1898-1900		156,600
	(Includes 12,400 acres, Western Division, expiring 1918.)	
Held under occupation license		210,300
Untenanted		126,600

NOTE.—Areas quoted as under lease and occupation license do not include reserves within the holdings.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Narrabri to Pilliga.

APPENDIX.

A.

[To Evidence of R. R. P. Hickson, Under Secretary for Public Works.]

PRECIS OF PAPERS.

In October, 1882, Mr. Dangar, M.P., presented a petition to the Legislative Assembly urging the construction of a line to Walgett, as that town was considered the head of the important Darling River traffic, with a large and increasing population, while the number of live stock was approximately 3,000,000 sheep, 200,000 head of cattle, and 10,000 horses. Walgett, the petitioners also pointed out, was the natural output of nearly the whole of the north-western portion of the Colony up to the boundary of Queensland, &c.

Later on in August, 1884, a deputation consisting of Messrs. Brunner, Fletcher, Melville, Gill, Burns, Luscombe, Ellis, and Dangar, Ms.P., waited upon Mr. Secretary Wright and presented numerous signed petitions from residents of West Maitland, East Maitland, Morpeth, and surrounding districts.

Amongst other reasons it was urged that as the trade had emanated from and had always been conducted with the towns on the Great Western Railway and the Port of Newcastle, the connection should be made in that direction. Mr. Secretary Wright in reply stated he attached great weight to the opinions of the members of the deputation, supported as they were by so many big petitions. The petitions, he stated, put the matter very fairly when they said the Government should construct a line which would prove the greatest benefit to the greatest number.

In May, of 1886, another deputation, accompanied by Messrs. Cramsie, Collins, Fletcher, Brunner, Ryrie, Gould, and Creer, Ms.P., waited upon the Minister. The representations previously urged in favour of this extension were again put forward, and the deputation asked that the Government would submit the line for approval of Parliament.

Mr. Lyne in reply stated he would use every endeavour to have this railway included in the first railway proposals it was intended to submit to the House. He was strongly in favour of it, both as a means of developing the district and for providing a road for the carriage of stock, as by such a means of transport between the table-land and plains, residents would, in times of drought, be able to move stock from places where there was no feed to districts where grass was obtainable.

Mr. Wright also received a deputation on 14th July, 1885, from Messrs. H. E. Cohen (Minister for Justice), H. Levien, W. Coonan, T. G. G. Dangar, J. Gould, J. F. Burns, H. H. Brown, Ms.P., and others.

Mr. Brunner, in introducing the deputation, said they were there for no local purpose as could be seen by the representative nature of the deputation, and they desired to give effect to the opinion of Parliament that it was necessary any line to Walgett should go from Narrabri, and they wished the Government to propose this extension, and if desirable a further extension of the Western line from Dubbo to Coonamble. The agitation in favour of such lines was no local movement, but was general all over the western district. The trade had always been transacted between Newcastle and the northern towns and the far north-west, but the line proposed last session, viz., Mudgee to Walgett, would disarrange all these commercial associations and divert the trade from the channel along which it had always passed.

Mr. Secretary Wright in reply stated that he took the full blame, if any, of submitting the Mudgee to Walgett line to Parliament, and promised to submit the Narrabri-Walgett route to his colleagues.

In September of the following year, 1887, a deputation from representatives of the northern districts accompanied by Messrs. Thompson, Wilkinson, Hassall, Ellis, Brown, and Fletcher, Ms.P., again urged the construction of the line. Mr. Sutherland promised to submit the matter to his colleagues, but pointed out that there were three alternative routes submitted which had to be carefully considered before dealing with the matter.

The matter was not revived until October, 1895, when a deputation introduced by the Hon. J. N. Brunner, and Messrs. Fegan, Watkins, Gillies, Dacey, Wheeler, Edden, Dick, and Piddington, Ms.P., and others, waited upon Mr. Secretary Young and urged the submission of the line to the Public Works Committee. Mr. Dick said he knew there were rival routes, but believed the evidence was in favour of the line being taken from Narrabri. Newcastle was greatly interested in the matter as the products of the districts to be served by the line should actually go to that part. Mr. Brunner stated he knew the district thoroughly, and could say there was no richer belt of country in Australia than that lying between Narrabri and Walgett. The Mudgee to Walgett route could not compare with it as regards productiveness, and would be much more costly to construct.

Mr. Secretary Young in reply said, with regard to the remarks which had been made as to the centralisation of trade in Sydney, there was no desire on his part, nor on the part of the Ministry, to divert any of the traffic to which Newcastle was justly entitled. But when they came to talk about trade going to its natural port, it would seem, on looking at the map, that the natural port of the district might be considered to be Grafton. He would, however, gather the best information obtainable to find out which route in the interests of the whole country—without giving any preference to either Sydney or Newcastle—was the best one to adopt.

In July, of 1896, Mr. Young promised a deputation that he would have enquiries made with reference to continuing the line from Narrabri-Pilliga.

The last deputation on the subject waited on Mr. Young at Wee Waa, in April last, and consisted of Messrs Collins and Gillies, Ms.P., and several other gentlemen. It was pointed out that the land between Narrabri and Walgett, over 1,000,000 acres, had been valued at from £1 to £1 18s. per acre by the taxation officers, and other arguments already mentioned were put forward.

Mr. Young, in reply, stated that with reference to the requirements of Walgett he had often said Walgett ought to be connected with a railway system, and that, so far as he was concerned, he would do his best to bring it about, and the opinion was expressed before he had such an intimate knowledge of the trade as he has now, but fortunately or unfortunately the residents of Walgett and district possessed two means of conveyance, and when the rivers were up, and they could

send their produce to other ports of shipment and evade the ports of Sydney or Newcastle, then the stuff instead of going over the lines would be sent down by river to Melbourne or Adelaide. The deputation could readily see the great difficulty there was in bringing about the construction of a line of railway to a point like this when confronted with the fact that for possibly three years out of every four practically nothing would be carried from Walgett. It was all very well to say the Mudgee-Walgett line would cost more, but they must remember that making the railway through the greater mileage would certainly not only serve the people of Walgett and Coonamble, but would also serve the people in those portions of the colony passed through. He was not going to say whether he was in favour of one or the other, for there were very serious considerations to be gone into.

B.

[To Evidence of H. Deane, Engineer-in-Chief for Railway Construction.]

Railway Construction Branch, Public Works Department, Sydney, 1st November, 1897.

I AM directed by the Engineer-in-Chief to forward herewith a statement of the length, cost, and distance from Sydney of the various railway routes to Walgett.

The Secretary, Public Works Committee.

E. HUNGERFORD.

RAILWAY CONNECTION WITH WALGETT.

STATEMENT of lengths, cost, &c., of various routes.

STATEMENT showing the Amounts paid in the other Colonies for conveyance of Mails by Railway.

Colony.	Year.	Amount.
Queensland	1896	£ 40,000
New Zealand	1896	14,539
Victoria	1896	56,383
South Australia	1895	15,352
Western Australia—		
Government Railways	£4,004	8,804
Midland Railway	1,200	
Great Southern Railway	3,600	

NOTE.—In the case of Queensland, the amount paid is a fixed annual sum. In the other Colonies the amount varies with each year.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM NARRABRI TO PILLIGA.

REPORT.

THE Sectional Committee appointed on the 22nd April, 1893, to inspect, take evidence, and report with reference to the proposed Railway from Narrabri to Pilliga, have the honor to report to the Parliamentary Standing Committee on Public Works, as follows:—

The Sectional Committee, consisting of Mr. Thomas Thomson Ewing, M.L.A., the Hon. Charles James Roberts, C.M.G., M.L.C., Mr. John Lionel Fegan, M.L.A., and Mr. Thomas Henry Hassall, M.L.A., left Sydney on Saturday, 30th April, and arrived at Newcastle the same day. Having examined witnesses at Newcastle, the Sectional Committee proceeded to Narrabri, and, accompanied by Mr. Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works, journeyed over the route of the proposed railway to Pilliga, taking evidence *en route* at Wee Waa. Leaving Pilliga, the Sectional Committee proceeded, by way of Keeleendi and Come-by-Chance, to Walgett, where further evidence in reference to the proposed railway was taken. Subsequently, the Sectional Committee travelled to Collarendabri and Woolabra, and after taking evidence in reference to the proposal to construct a line between those places, returned to Sydney on 19th May.

It is usual, in dealing with any work referred to the Committee for consideration, to consider its merits without special reference to any other work; but in the two cases which have been referred to the Sectional Committee for inquiry, it was apparent to the Full Committee, before the local investigations took place, that the two works might possibly merge into one. This view was strengthened as the Sectional Committee obtained fuller information. They therefore determined to consider the question of the development of the country which possibly would be affected by a line from Narrabri to Pilliga, and from Woolabra to Collarendabri, as being so intimately connected, that it was possible to deal with the whole matter in a single report. This report will be common to the two proposals, and will also be much more comprehensive than two reports which would lose weight by endeavouring to deal with the development of country by different proposals which really belong to the same area.

The Sectional Committee make this explanatory note before dealing with the matters under consideration.

The distances from Sydney by the various routes to Walgett and Collarendabri have already been placed before the Full Committee. The distance to Newcastle is also in the evidence given before the appointment of the Sectional Committee. These distances taken into consideration with the fact that the trade relations of the whole of the area of country are with the Newcastle district, and that a proportion of the wool now goes over-sea from Newcastle, justify the Sectional Committee in coming to the conclusion that the approach should be with the North-western line and not with the Western.

The country which will be developed by the two lines previously mentioned is, generally speaking, bounded on the east by the Moree-Narrabri line, and its extension towards Newcastle; on the north by the limits of such traffic as may reach

reach Collarendabri, or any portion of the line from there to Woolabra, in preference to Moree; that area of country extending beyond Angledool to the Queensland border, which will probably reach Collarendabri and Walgett in preference to Brewarrina, were a railway constructed to the latter place, and that portion of the Colony of Queensland the traffic from which would find its way, *via* Angledool, Mogil Mogil, or any routes to the north, to Collarendabri or Walgett. On the south its limits would be first affected by the proposed railway to Coonamble.

In order not to over-state the area under consideration, the Sectional Committee have, for the purposes of the inquiry, inferred that it is possible that railways will be extended as far as Coonamble and Brewarrina within a reasonable time. The Sectional Committee desire to lay down the limits of the country with regard to which there is no doubt better accommodation will be given by termini at Walgett and Collarendabri than by any other scheme. The Moree-Narrabri line will serve all areas lying, say, 25 miles west therefrom. The Coonamble line will possibly draw the traffic half-way between that place and Walgett. Angledool traffic will probably, under all circumstances, reach Collarendabri or Walgett. Weetalibah and Goodooga may, however, be considered debatable country from which it is possible some produce will find its way to Brewarrina.

The recent *Gazette* notice published by the Queensland Government on 11th December, 1897, removes the £2 10s. duty on wool shorn across the border from within a distance of 30 miles therefrom.

The Sectional Committee believe, after considering the cost of carriage and railway freight, taken into consideration with the relative importance of Brisbane, Sydney, and Newcastle as ports, that in all probability the whole of the wool grown on this 30-mile limit, and also most of the stock and cattle depastured thereon, will find its way to New South Wales. It is probable that the limits of the influence of Collarendabri and Walgett, if railways were extended to them, would require to be fixed, perhaps, another 30 miles to the north. A limit, therefore, of 60 miles north of the New South Wales boundary on the north, to midway between Walgett and Coonamble, say about Combolong on the south, on the west to midway between Walgett and Brewarrina, and within 25 miles of the Moree line on the east, embraces the area under consideration.

That portion of this area within the Colony of New South Wales, north and south of the Namoi, and west of Come-by-Chance, may be regarded as first-class grazing country, large portions of which will, probably, in the near future, be placed under cereals. Over the Queensland border there is a large area of inferior country, but still a territory 60 miles wide, which will supply a very considerable amount of produce that will aid in contributing to the commercial basis of lines having their termini at Collarendabri or Walgett.

West from Narrabri and extending beyond Pilliga—separated from the river by a narrow tract of good land—and extending west towards Come-by-Chance, and passing south therefrom, and reaching almost from the road from Come-by-Chance to Coonamble, and then extending south-east towards Coonabarabran, is a large tract of country known as The Scrub. Although there is little doubt that there are portions within these limits which can be utilised either for agricultural or pastoral pursuits, still there is no probability of there being any extensive demand for them until areas which can be more readily cultivated and brought more cheaply under cultivation are fully utilised. The Sectional Committee do not dismiss the class of country known locally as the scrubby country as being valueless, but, for the present, it appears probable that there will be no extensive settlement upon it, and most of the returns which a railway could obtain would be from the pine and ironbark timbers of which there is a large quantity.

The approximate distance from Walgett to Coonamble is 72 miles; Brewarrina to Walgett, 90 miles; Narrabri to Walgett, 123 miles; and from Narrabri to Collarendabri, 100 miles. The traffic at present reaches the district almost wholly *via* Narrabri.

Although the cost of carriage varies, according to the evidence, very considerably—taking one season with another—it is not probable that the rate of
road-carriage

road-carriage from Collarendabri or Walgett to Narrabri will be very much under £3 per ton. The method of approach is by road, a great portion of which is black soil and, after even a reasonable fall of rain, traffic is almost suspended.

After due consideration of the access offered to Walgett by the river Barwon, the Committee have come to the conclusion that although, at times, the river traffic might affect the returns of a railway at Walgett, it would not frequently happen. That being so, it is clear that an approach by the Barwon to Collarendabri, for ordinary trade purposes, is out of the question.

The first proposal before the Committee is the line from Narrabri to Pilliga, the cost of which is given at £128,000. The Sectional Committee do not believe that it was ever seriously contemplated to stop a line at that place for any length of time. The objective point must be Walgett, and the construction of any line from Narrabri to Pilliga would certainly carry with it an extension to Walgett. Therefore, it has been determined to take into consideration not only the present proposal—the line from Narrabri to Pilliga—but the line Narrabri to Walgett.

Pilliga is approximately half-way to Walgett. The cost of reaching Walgett would be somewhat more than double the amount already mentioned, say, £260,000. The length is 115 miles. The distance from Woolabra to Collarendabri is 80 $\frac{2}{3}$ miles, at a cost of £207,798. The total length of lines, therefore, proposed by the Government, to tap the country which would find depôts at Walgett and Collarendabri, is approximately 196 miles, at a cost of (approximately) £467,798.

The return from the Collarendabri line, according to the Railway Department, will be £7,190 per annum; from the Pilliga line, £4,720. This would certainly be materially increased if the line were extended to Walgett. Both proposed lines show a considerable loss in revenue.

The mission of the Sectional Committee really resolved itself into the question of whether it were possible, with due regard to the State lands to be thrown open; settlement of an agricultural population; and a proper approach to the depôts proposed to be tapped (Walgett and Collarendabri) to provide a scheme which would develop the country more satisfactorily than the two lines under consideration, and at a cost which would permit them to recommend its acceptance.

The State lands within 20 miles of the two lines, namely, Narrabri to Walgett *via* Pilliga, and Woolabra to Collarendabri will embrace an area of 2,454,000 acres. Full information with regard thereto has been given before the Full Committee. The annual rainfall at Walgett and Collarendabri being not much above 20 inches, must, with our present ideas of what constitutes satisfactory agricultural settlement, even if the land were suitable—taking into consideration the time at which the rain falls in this northern part of the Colony—be regarded as the extreme limit; but thence towards the east, as the rainfall increases, the Sectional Committee see no reason why cereals should not be grown with sufficient success to justify the hope that a portion of this area will be put under crop.

The main difficulties in approaching Walgett and Collarendabri are the crossing of the rivers Namoi and Barwon and several creeks, which, although usually of no great magnitude would, in flood-time, furnish serious obstacles. The route suggested is a modification of the proposal already mentioned before the Full Committee, with such alterations as fuller knowledge enables the Sectional Committee to make.

The evidence of the Supervising Engineer, Mr. Stuart, before the Full Committee, the Sectional Committee have found to have been given with a full and intelligent knowledge of the country under consideration. There are several points with regard thereto, however, which will require further investigation. A line, which for the first 60 miles will form an approach to both Walgett and Collarendabri, turning somewhat south of west through Eurie Eurie to the first-named place, and north-west across the Thalaba to the latter is the best route obtainable. The Committee will state what they believe to be necessary before finally deciding upon the location of the line in detail.

The

The line known to the Full Committee as the "green line," leaves the Narrabri-Moree line a short distance north from the town of Narrabri. If it be determined to join the main line in this direction, it should be considered whether the "green line" could not follow a more easterly course for the first 15 miles, thus saving new construction. The Railway Commissioners might be consulted with regard to this, for a junction might be more satisfactory to them close to Narrabri than a few miles further north as suggested. A closer investigation of the country would also require to be made in order to determine whether there would be any engineering difficulties on the route. Although the Sectional Committee are of opinion that these do not exist, still, until the levels have been taken, it is not wise to express definite opinions with regard to construction.

Although there is better land on the north side of the river, still, contiguity to the timber forests on the south side, and the presence of the town of Wee Waa, are matters that should be fully considered. It is well, as far as is possible, to preserve as trading depôts those centres already established by the residents, unless such preservation entails a greater expenditure of State funds than is justifiable. The Sectional Committee, therefore, suggest that there be a careful consideration of the "green line," with regard to its approach to the Narrabri-Moree line, and also that a survey and estimate be taken out, and a full consideration given to the line on the south side, crossing the Namoi at Wee Waa, and joining the "green line" west therefrom, before it be definitely decided upon which side the line can be located in the best interests of the State and with due regard to existing interests. East from a point west from Wee Waa, on the north side, will be found a piece of flooded country opposite Boolcarrol; west therefrom, to the junction of the lines in the parish of Dewhurst, about 315 miles along the "green line," there will probably be no serious difficulties experienced; thence on the extension towards Walgett, as far as Eurie Eurie, the line follows what is known locally as the Red Ridge as far as Cryan, west from which is black soil, but no serious impediment to a cheap line will be experienced except the crossing of Pian Creek to Eurie Eurie. From Eurie Eurie, on the north bank towards Walgett, is flooded country which will entail considerable additional expenditure.

This extension from Eurie Eurie to Walgett is a matter with regard to which the Sectional Committee had considerable doubt, but after fully weighing the matter, and taking into consideration the expenditure of Government money, and the results of private enterprise in the town of Walgett, the Sectional Committee have determined to suggest to the Full Committee that, notwithstanding the expenditure of a larger amount per mile than usually is necessary on lines in the western district, still they feel they would not be justified in disregarding that expenditure of public money, and also the fact that large bridges have been constructed over the Barwon and the Namoi, really concentrating the trade of a considerable portion of the district upon the town of Walgett.

If Eurie Eurie were chosen as the terminus there would be the following result:—The construction of expensive bridges from the west to approach it, and the temporary transference of the business of the town of Walgett to that place, if the certain agitation which would, probably, eventually result in an extension towards Walgett were unsuccessful for a time.

It seems improbable that the line can be brought nearer to Walgett than perhaps $1\frac{1}{2}$ mile; but investigation may enable it to be extended still further towards the south-west. This can only be decided by actual survey; but, in the opinion of the Sectional Committee, it should be placed as close to Walgett as possible, on the north side of the Namoi.

Turning now to the line to Collarendabri from the point previously mentioned—315 miles along the "green line"—the evidence obtained locally, and investigations by Mr. Stuart bring the Committee to the following conclusions:—For the first 15 miles—that is, to the north side of Burren Creek—there will be no difficulties; thence there will be a few miles of low country but not offering any serious obstacle to construction; thence, *via* Merrywinbone, east of which it will join the Woolabra line, at about 340 miles, to within 10 miles of Collarendabri, no serious difficulty will be encountered.

encountered. Further on there will be some flooded country, and the Grawin Creek and the Barwon will require bridging. Thence into Collarendabri there will be no engineering difficulty.

It was stated by the Department that it would be well to make the terminus of the line some 11 miles from Collarendabri, but it appears to the Sectional Committee that the line will some day be extended towards Angledool, and if that be so, for reasons similar to those stated in the Walgett case, it will be as well to preserve the centre already established by the Government and bring the line adjacent to the town; the position of the terminus should be so chosen that the approach to the west will be the best obtainable.

The length of the two lines under consideration would be somewhat over 150 miles; the proposals of the Government are 196 miles—that is, if the Committee is right in the conjecture that Walgett is the objective point of the Pilliga line. The saving in distance is, therefore, about 45 miles, and the saving in cost of construction approximately £100,000. The only question, therefore, remaining to be considered is, whether the development by this method will be as satisfactory as that proposed by the Government. In the opinion of the Sectional Committee the scheme is better because it gives a shorter length of haulage from Walgett, and passes through superior country. The extent of Crown lands on the two lines, namely, Narrabri to Walgett on the north side of the Namoi, and *via* Eurie Eurie, and from 315 miles on that line to Collarendabri amounts to 1,609,000 acres, which will be readily taken up in small areas. The returns from these lines will be satisfactory. The only reduction from the returns in the proposed lines will be in regard to some country lying about Bunna Bunna and Millie, which will be within reasonable distance of the Moree line and will make to it.

Taking into consideration that the extension on the south of the Namoi is only as far as Pilliga, and also the fact that the circumstances to the north of the New South Wales boundary have been altered by the proclamation already referred to, and the great area of State lands to be developed, the Sectional Committee would suggest that the lines be located as proposed by them, it being, in their opinion, the best way to develop the district, and one which will, almost at once, result in a profitable enterprise to the State.

The evidence given before the Sectional Committee shows the liability of the rivers referred to in the report to flood. It may be laid down that, as a general rule, a flood may be expected once in every seven or ten years. The experience of men who have lived in the district for the past thirty or forty years bears out this statement. Therefore, since the district is liable to inundation only at long periods, it may not be necessary to carry out such engineering works as would be required in case of more frequent visitations.

If the line be located on the north side of the Namoi, the connection of Pilliga, and trade from the south, should be arranged for at once, and the best possible roads of access should be immediately laid out and improved, in order to provide means of communication with the nearest railway station.

Since the statement by the Chief Traffic Manager apparently does not include much return for timber or wheat, and as already pointed out, only applies to half the distance on the south side of the Namoi, it is difficult to form a comparison, but the Sectional Committee have no hesitation, after full investigation in the district, in recommending the General Committee to suggest the full consideration of these works by Parliament.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

SATURDAY, 30 APRIL, 1898.

[The Sectional Committee met at the "Great Northern Hotel," Newcastle, at 2:30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | JOHN LIONEL FEGAN, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Narrabri to Pilliga.

George Frederick Earp, Vice-President, Chamber of Commerce, Newcastle, sworn, and examined:—

1. *Chairman.*] I understand you desire to express the views of the mercantile community of Newcastle, in reference to the proposed Railway from Narrabri to Pilliga? They are the views of the Chamber of Commerce, representing the mercantile community. The people of Newcastle ask for no favours, but merely for common justice—justice, in the first place, to the Government of New South Wales, as the owner of the railways, and as the custodian of the public funds; justice, in the second place, to Newcastle, as the port and natural outlet for the district covered by the proposed railway; and justice, in the third place, to the people of Walgett—with whom we are working in conjunction, as the shippers of produce from that district to the markets of the world. The port of Newcastle is a port on which the Government has spent something like £1,000,000 towards making it suitable to the trade of the north. That money would never have been spent for the sake of the paltry bit of trade of Newcastle only. Its expenditure would never have been justified excepting to make Newcastle a port for the district which it naturally commands at the back—I refer to the northern and the north-western portion of the Colony, which is naturally commanded by the port of Newcastle. Steamers can leave this port drawing 23 feet 3 inches at neap tides, and about 23 feet 9 inches at spring tides. That includes 99 per cent. of all the steamers of the world. There are very few steamers drawing more than that. Works passed by the Public Works Committee are at present in progress with the view of increasing the depth by scouring the channel. During 1897, there were entered and cleared, independently of coasting vessels, 1,363 deep-sea-going vessels, representing 1,729,761 tons. These vessels are trading to every port in the world. Probably the ports that would be most interested, in addition to intercolonial ports, so far as this particular district is concerned, are those of the United Kingdom, the Continent, and the west coast of South America; also, in futurity, Japan and China. Regular lines of vessels go to these places. During the wool season we have two firms putting on regular sailing vessels and steamers to convey the wool, which is carried at about the same rates as from the port of Sydney. We also have regular lines to the east which are carrying freight on the same terms as from Sydney. Thus the port of Newcastle stands unrivalled, in respect of shipping facilities, by any port of the world.

2. *Mr. Roberts.*] Are any wool sales held here? No. Wool sales are held in Sydney, and, of course, we have railway and steam communication with Sydney. The wool can be sent to Sydney from here at a low rate of freight. The local steamers are bringing freight to this port as 3s. 6d. per ton. Only this week I arranged for 600 tons of cargo at that price.

3. *Mr. Fegan.*] Is there anything to hinder Newcastle ultimately becoming a wool depôt? Nothing whatever. Newcastle claims the trade of a certain portion of the country. The Government figures show that the distance from Newcastle to Narrabri is 255 miles. The distance from Narrabri to Walgett, *via* Pilliga, is about 113 miles. That gives a total of 368 miles from Newcastle to Walgett. I will take the most probable alternative scheme to the one you are considering—that is, Sydney to Walgett, *via* Coonamble and Warren—and I will give you the distance on that route. The distance from Sydney to Warren is 353 miles, and the distance from Warren to Walgett, *via* Coonamble, is about 128 miles. That gives a total distance of 481 miles. The difference, you will at once see, is 113 miles. Of course, there would not be that distance of line to make, seeing that the railway has got as far as Warren, but we have to look at something beyond the mere laying of metal and plates; we have to look for all future time to the haulage, which, I take it, is of greater importance to us and the people of Walgett than the question of merely laying a few extra miles of railway. As I have stated, the difference of haulage between these two routes would be 113 miles; and I will endeavour to show you, from the merchandise and live-stock rates book, what that means. There are two descriptions of traffic which we have to consider. First of all there is the down traffic from the sea-board to the interior. That consists of supplies, stores, requisites, and that kind of thing, required by the people within the district. The other description of traffic is the up traffic—that is, the produce of the country going to the sea-board.

G. F. Earp. In one instance it is a question of supplies, and in the other a question of sending produce to market. There are in the rate-book six classes of goods, and six methods of fixing rates. I will refer to some of the articles which every settler, squatter, and inhabitant of this district requires. Take seeds, which are required by every agriculturist. Going *via* the Sydney line, the freight on seeds would be £1 8s. 5d.; *via* the proposed Warren-Coonamble line, £1 3s. 8d. This means that the people of that district have to be dealt with unjustly and made to pay a higher mileage scale than they need, or that the Government have to lose an equivalent in the cost of haulage. With regard to Class A, consisting of flour and bran, by the Newcastle line the rate is £1 7s. 11d., and by the Sydney line, £1 14s. 2d. In addition to that there is 20 per cent. added. Take salt, cement, agricultural implements—all largely used by squatters and settlers. The cost *via* the Newcastle line is £2 8s. 2d.; by the Sydney-Coonamble-Warren line, £2 19s. 6d.; difference, 11s. 4d. Then we come to another class of article, such as sugar, assorted groceries, and fencing wire. These come under Class I. The rate by the Newcastle line would be £5 1s. 3d.; by the Sydney-Warren-Coonamble line, £6 5s.; a difference of £1 3s. 9d. With regard to bridge work and boilers, bar and wrought-iron, which come under the second class, the rate from Newcastle is £6 6s., and from Sydney £7 15s. 8d.—a difference in favour of Newcastle of £1 9s. 8d. I should say that these rates are all down rates. Then we come to the third and last class—spirits, tea, drapery, &c. The rate from Newcastle is £8 15s. 4d., and from Sydney £10 16s. 10d.—a difference of £2 1s. 6d. on every ton of goods which would go over the Sydney line as against the people who are buying the stuff up there. That deals with the traffic one way. Of course, the traffic the other way is of a different kind, and special rates are made by the Department with the view of favouring it, and as an incentive to the growers, and farmers, and squatters to increase it. I might say that I think the proportion coming this way will be about the same as the proportions coming the other way. I will take stock and wool, which I believe are the chief products. The rate for this class of goods is fixed by the truck, and a truck of stock from Walgett to Newcastle, would cost £7 5s. 5d. A truck of stock from Walgett to Sydney would cost £8 19s. 3d., a difference of nearly £1 13s. 10d. on every truck of stock which would go to Sydney in place of coming to Newcastle. I think, in these figures, I have shown that there is a very great principle at stake—both to the people interested and to the people of the Colony generally, whose funds are being spent on the construction of railway lines. The difference is enormous, and I think I need hardly further dwell upon it.

4. *Chairman.*] If a line is constructed from Dubbo, it will make an alteration of about one-third in your calculation? Yes.

5. You still would be 70 miles to the good? Yes, that would make a difference; but I understand that the scope of the inquiry scarcely covers that line, and therefore I have not referred to it. I may state that I presume the Walgett Railway League represents the majority of people in that district. No doubt there are people in Walgett who are opposed to the construction of the railway, and indeed to the construction of any railway; but we must regard the voice of the majority of the people, and I presume the Railway League at Walgett represents the majority of the people there. The Chamber of Commerce, yesterday, received a telegram from the Walgett League as follows:—

We say Newcastle natural outlet Walgett and back country.

That is from the League at Walgett. A number of reasons have been given by the Secretary to the League (Mr. Clarke), of which I will give you a *resume*. He says:—

1. The Walgett Railway League urges the construction of the line from Narrabri, on the south side of the Namoi, the ground being higher. Only 8 miles of this country was flooded in 1890, which is the highest flood recorded.

2. The country from Pilliga to Walgett cannot be excelled in the Colony—good for anything. From Narrabri to Pilliga there is a large timber trade.

3. The distance is 113 miles. The cost of construction would be £260,000, or £2,297 per mile. The annual cost would amount to £18,333. The revenue from the present traffic would exceed that amount; but if the railway were constructed the estimated increase would give a revenue ample to repay all charges and interest.

This estimate the Walgett League considers would be less than that for the line *via* Warren, because five or six bridges would have to be crossed on that route. On the Narrabri to Walgett line there are no engineering difficulties. The revenue from the present traffic would far exceed £18,333, but if the line is constructed there will be a very fast increase, judging from what has taken place in connection with the construction of railways in other parts of the Colony—an increase of 15 to 25 per cent.; and that would give a sufficient profit to pay all expenses and interest on the capital outlay, which, I take it, is all that the Government of this country expect from any line built.

4. Thousands of stock, which perish every time there is a drought, would be saved if the line were built.

5. The Walgett League, representing a majority of the Walgett people, urged this route as the natural outlet of Walgett and the back country.

6. A proportion of the traffic leaving Newcastle has previously come from Sydney? I had intended to say a word on that. Newcastle is as good a market for the people of the north as is Sydney. Rock salt, salt, cement, sugar, and all the leading lines can be purchased at Newcastle at identically the same prices as in Sydney. We have to compete with the Sydney houses. We could not sell at any higher prices than they sell in Sydney. The steamers are taking the goods from Sydney to Morpeth, and they are actually paying truck rates from Morpeth, so that we have to compete with them, and if we did not make our prices the same as those of Sydney, we should lose the trade. All the leading lines are imported direct. We have three lines of vessels from New York, bringing kerosene and American produce. We have two lines of sailing ships, and a large number of tramp steamers bringing British merchandise from London. We have three lines of sailing ships from Liverpool, bringing salt, earthenware, beer, and spirits. We have a line of vessels from Glasgow, bringing beer, wood, machinery—everything in fact that is shipped from Glasgow. We have a line of sailing ships, and also a line of steamers from Hamburg—the German-Australian S.S. Co., bringing stuff from Hamburg. We have also a line from Antwerp; so that Newcastle imports the great bulk of its stuff. Sydney buys from Newcastle in the same way as Newcastle buys from Sydney.

7. *Mr. Roberts.*] If a man at Walgett buys his merchandise at Newcastle, does he save the freight between Newcastle and Sydney? Yes, in a great many instances. For instance, he will save it on rock salt. A steamer could not afford to carry rock-salt at all. The whole of the supply of salt, which is the principal item a squatter uses, is bought from Newcastle. The firm I represent alone gets through 5,000 tons per annum, all of which is forwarded to this district and places on the northern line. There are other firms doing an equally large trade.

8. *Mr. Fegan.*] What you wish to convey is that you are not dependent on Sydney for your supplies? *G. F. Earp.*
 No. We get our supplies from the ships direct from the port of shipment.
9. What proportion of imported goods comes direct to Newcastle, over sea? Fully 75 per cent. If a Sydney merchant requires a line of goods for a squatter, he frequently buys it from a Newcastle house. Lister, of Sydney, frequently buys large amounts of stuff from us to send to squatters.
10. What is the freight on wool from Morpeth or Newcastle to Sydney, by water? There is competition at the present time, and it is a matter of arrangement.
11. Give us a fair running price? It is a very low price. I know that stuff is being carried both ways at prices varying from 2s. 6d. to 4s. per ton. Of course, the tariff rate may be 7s. per ton, but large discounts, amounting to 50 per cent., are given, and unless you are a customer of one of the companies you do not really know what freight you can get. I may say that the freight is a nominal one.
12. I suppose, however, that that state of things is not going to last? I believe it is. It is just the same as the running of penny buses in London, which has resulted in a vast increase of traffic.
13. Then wool can be taken from Morpeth or Newcastle to Sydney for 4s. a ton? There is no doubt that general goods are carried at that rate. Of course it is a matter of arrangement.
14. What is the freight by rail for wool or ordinary commodities?—The distance to Sydney is about 120 miles, and the freight for scoured wool is £1 4s. 6d. Of course no one sends wool that way. It is sent by steamers at a cheaper rate. The rate from Goulburn to Sydney for wool undumped and scoured is £2 5s., and for greasy wool £1 13s. 9d. per ton.
15. What is the mean of the greasy and the scoured? About £1 19s. 4d.—say £2.
16. What about the stock? Stock are on a different basis. [*Vide Appendix.*]

James F. Kerr, agent for the Singer Manufacturing Company, Wallsend, sworn, and examined:—

17. *Chairman.*] Have you heard the evidence of Mr. Earp? Yes. *J. F. Kerr.*
18. Do you believe it to be correct? I do. *J. F. Kerr.*
19. *Mr. Roberts.*] Would you like to make a statement? I wish to refer to one portion of Mr. Earp's evidence. He said it would cost 16s. more per ton to take goods *via* Dubbo to Sydney. That is not a fair statement, because the haulage over the Blue Mountains is extra haulage. An engine could carry double the quantity of goods on the Narrabri line than it could over the Blue Mountains. It would be more expensive to take the goods that way, because engines cannot draw the same quantity of goods as on the Northern line. It would cost the State very much more to draw over the Blue Mountains than to draw to Newcastle. Again, produce is brought more cheaply to Newcastle than to Sydney, inasmuch as it is carried as ballast. I have known corn to be landed here almost free. We get produce from other colonies more reasonably than they do in Sydney, because we are able to send coal as return goods. From 1875 to 1878 I was on a station at the head of the Castlereagh, and I had to purchase Hunter River lucerne hay, brought all the way from Sydney to Mudgee and to Coonabarabran. In time of drought a light line constructed to the pastoral district of Walgett would enable the squatters to preserve their stock.
20. I take it that what you wish to impress on the Committee is the fact that if it should be decided to connect Walgett with the railway system of the Colony, the best way to do it would be by way of Narrabri and Pilliga? Yes.
21. Do you know that country well? Yes; I have resided in Coonabarabran for seven years, and also in Narrabri.
22. Do you know the country between Narrabri, Pilliga, and Walgett? Yes.
23. Which side of the river would be the best for the construction of a line? The southern side. From Narrabri to Pilliga the country is very flat. I do not know of 60 miles of country anywhere through which a railway could be constructed at such a low cost. Between Narrabri and Pilliga there is splendid white pine, and ironbark. When you get towards Pilliga you come to open and better country, and from there to Walgett the country is not to be excelled. I have heard of as much as 40 bushels to the acre being grown. I anticipate that a light line of railway would cost the country less than the present road. The country about Coonamble and Moree is clayey, and when it is wet it is impassable.
24. Is there any flooded country along the route? The ground is flat, and there has been one large flood; but there is no force of water. In flood-time the water lies back harmless on the plains. The distance from Dubbo to Coonamble is 109 miles; from Coonamble to Walgett, 75 miles; that means that from Sydney it is 463 miles over the Blue Mountains. From Newcastle to Narrabri the distance is 250 miles; from Narrabri to Walgett, 115 miles—total, 365 miles. From Sydney to Mudgee the distance is 191 miles; from Mudgee to Coonamble, 144 miles; from Coonamble to Walgett, 75 miles; total, 410 miles. Going from Narrabri to Pilliga, and on to Walgett, you open out a vast tract of good country. Going towards Barradeen there is some very good agricultural country. I estimate that the 60 miles of line from Narrabri to Pilliga could be constructed for less than the first 15 miles of the line from either Dubbo or Mudgee. There are no engineering difficulties whatever.
25. Do you look upon Newcastle as the natural outlet for the north-western district? I do. I may state that the Railway Commissioners have been over all the proposed lines but that from Narrabri to Walgett. If they were to go over it there would be no doubt about their recommendation.
26. *Mr. Fegan.*] Is there any necessity for the construction of any bridges as far as Pilliga? None whatever.
27. *Mr. Roberts.*] Is the country between Narrabri and Pilliga pastoral country? Not the whole of it; there are a few good farms. It is, however, principally a pastoral district.
28. If the proposed line were constructed, do you think the country would become to any extent an agricultural settlement? Yes. The Barwon comes within 4 miles of Walgett, and thousands of tons of produce go to Queensland that way, and they would come this way if the proposed line were constructed.
29. *Mr. Fegan.*] Would the construction of the line give an impetus to small settlement? It would; the pastoral country there is nearly all Crown land.

Michael March, wool manager for Dalgety and Co., Newcastle, sworn, and examined :—

- M. March.
30 April, 1898.
30. *Mr. Fegan.*] Have you heard the evidence given by Mr. Earp? Yes.
31. Have you any further information to give in relation to the wool traffic? The rate for wool from Morpeth *via* Newcastle to Sydney is 13s. 6d. per ton. We go to Morpeth to take advantage of the lower steam freight to Sydney. There is also a little difference in the railway rate. The rate from Newcastle to Sydney, by rail, is 18s. per ton, as against 13s. 6d. by steamer. To that you have to add the cartage in Sydney.
32. Do you remember it being lower than 13s. 6d. at any time? Yes, it has been a little lower. It always used to be about 2s. per bale, and it comes to much about the same thing.
33. Do you get a great deal of wool from the north? Yes.
34. Where from, principally? We have stations north and north-west. We have some near Tamworth. We get wool from there, and from almost every station on the Northern line.
35. How many stations north and north-west have Dalgety and Co.? I could not say, because those stations are managed by the Sydney office.
36. Can you tell us from what stations you get your wool? The best thing to do would be to get that information from the Railway Department. The firm might object to their business being published in that way.
37. Can you tell us the total amount of wool which passed through your hands from the north and north-west portions of the Colony this year? I can give you it approximately. I should say that the amount which arrived at Newcastle from the north-west—that is, which came to Narrabri railway station—would be about 15,000 bales, or 270 tons. That includes the wool from Narrabri, west of Narrabri, and north-west of Narrabri. It does not include wool brought over the Moree railway.
38. Do you export direct Home? Yes.
39. Without sending to Sydney? Yes.
40. Did the 270 tons of wool which you have received go away direct? Yes; all we had went direct.
41. What freight do you pay from Narrabri? The rate on greasy wool to Newcastle is £2 13s. a ton, and on scoured wool, £3 10s. 9d.
42. Do you send anything into the interior from Newcastle? Very little; we do more of an export trade.
43. I believe you have a direct line of steamers? Yes; we have the Aberdeen line, also the sailing ships, the Capital Port Line, the Federal Steam Companies, the Mogul Steam Company, and there are always tramp steamers coming in.
44. Have you any frozen meat trade? Yes; there is a fair trade.
45. What was your output last year? I could not tell you, but I could supply the information.
46. Has that trade increased during the last few years? Yes, it has greatly increased.
47. Where does the mutton chiefly come from? From the Aberdeen works.
48. Have you any further information to give? I might state that I know the Narrabri and north-western districts, and from what I know of the country and the settlement which has taken place, I can strongly recommend the construction of the proposed line. It is a very rich grazing district, and the settlers, especially on the Namoi, are very well to do. I take that to be a good sign.
49. Has your company any stations on the route of the proposed railway? No; there is one on the other side of Walgett.
50. Do you take the wool from there to Brewarrina? No; it came this way this year.
51. But whenever the river is up you generally take it to Bourke? No; I do not think the river will affect the proposed line if it is constructed.
52. What is the nearest point of any of your stations to the proposed line? There is a station some miles from Walgett, but I could not tell the distance; but I am not advocating the railway on that account.
53. Could you give us the capabilities of that station? I am afraid that if Mr. Carruthers' Land Bill is carried it will not be in existence; in a few years it will be very much cut up. Of course that will be all the better for the railway. I was at Narrabri when one of the runs was thrown open two years ago, and there was a tremendous rush for about thirty blocks. People came from Victoria, and all over New South Wales.
54. There is no doubt of the quality of the land there? No; the people already settled there applied for it for themselves or for their sons, and that proves the quality of the land.
55. And, as you say, the settlers are nearly all well to do? Yes, especially on the Namoi and the Pian Creek district.
56. I suppose there are not many in those districts who are giving up their holdings? No; they are all *bonâ fide* settlers.
57. Have you any further information to give? I heard something about the suggested railway from Bourke to Brewarrina. I can corroborate all that Mr. Earp said about Dubbo, Coonamble, and Warren; but I should like to go a little further. I suppose the Pilliga line would eventually go to Walgett.
58. I suppose you could not see your way clear to support the construction of the line if its destination were not Walgett? Yes; I could support it if it went to Pilliga.
59. Do you know that there would be a loss of £4,000 a year upon it? It is probable; but I should think it would pay as well as other lines, from Werris Creek to Gunnedah, and from Gunnedah to Narrabri.
60. You think the construction of the line would give an impetus to settlement, and also greater facilities for the pastoralists to send their live stock, &c., to market? I do. I may mention that when the settlers of the district want to send their sheep to Narrabri, to truck them to Maitland or to Sydney, they have to go along the southern side of the Namoi, and there is no feed there to speak of; consequently, the sheep have to go four or five days without anything to eat. I have heard several people say that it means a loss of 3d. per head. If there is a railway, that will be avoided. I hold that if they went to Walgett it would be better for the people in the north-west, and for the country at large, than the railway from Bourke to Brewarrina.
61. I may mention that the Brewarrina people admit that? I was about to state that the distance to Newcastle, which is the shipping port, is very much shorter, and Newcastle has facilities equal to those of the port of Sydney. The freights are never higher. Again, if people want to send their wool to Sydney for sale, there would still be a saving of 50 or 60 miles of railage. The people of the north-west ought to have the privilege of being able to ship their wool, if they want to do so, at the nearest port, and then if they want to send it on to Sydney for sale, it will be no injustice to the Brewarrina or Bourke people.

- people. I may state that I recommend the line, as well as for the reasons I have already given. I have been over some of the district. M. March.
30 April, 1898.
62. As far as your knowledge is concerned, then, the country is equal to that you have described from Narrabri to Pilliga? I think so; it is excellent grazing country.
63. Would you advocate the construction of both lines—that, is the line from Narrabri to Pilliga, and from Woolabra to Collarendabri, or a central line instead of the two;—have you been to Eurie Eurie? Yes.
64. How would a line do if it struck the north bank of the Namoi and proceeded to Eurie Eurie? It might suit Walgett, because it is not more than 12 miles from there, but I am afraid the Collarendabri people would not be satisfied, because they would have the same objection that the Moree people had to the Gurleigh Point road.
65. What is a reasonable distance for a pastoralist to take his wool or stock? I should think that if he got within 25 miles or 30 miles of a railway he would be all right.
66. Would 40 miles be too much? I do not think it would; it all depends on circumstances.
67. If there were anything like a road you would not think 40 miles out of the way? No; especially in the north-west.
68. Would a railway on the north bank of the Namoi to Eurie Eurie serve all purposes? Where would you cross the river—would you go on the south bank as far as Pilliga?
69. No; on the north bank from the commencement? Would you go by Bulyeroi?
70. A line of that kind would be between Bulyeroi and Wee Waa? That line would catch all the Wee Waa settlement undoubtedly, but it would not suit the Wee Waa people.
71. *Chairman.*] What quantity of goods distributed from the port of Newcastle comes over sea to Newcastle? I should think Mr. Earp's estimate of 75 per cent. is correct. A lot of goods come to Newcastle which are shipped direct, but for the convenience of the vessels in Sydney they tranship them at their expense. For instance, vessels come to Sydney with 100 tons out of 2,000 tons for Newcastle. It does not pay them to come on here, so they send them on by coastal steamer at a very cheap rate.
72. Do they charge the Newcastle man that rate? No; I think they pay it themselves.
73. What proportion of the wool that comes to the Hunter or the port of Newcastle is exported direct over sea, and what proportion goes to Sydney? The wool which comes to Newcastle is almost solely exported direct, with the exception of a few clips which are taken on chiefly to Melbourne.
74. How does the trade in wool to Sydney compare with the Newcastle export trade in wool? During the last two or three years the quantities have been pretty equal—60,000 or 70,000 bales each.
75. Are we justified in saying that all the wool that comes down the Northern line divides into two when it reaches the Hunter, one half going to Sydney by steamer, and the other half going over sea? I think so, approximately.
76. Does some go by rail? Yes.
77. What proportion? A small proportion—not much.
78. Would you say one-fourth? No; it might be one-eighth.
79. It is not enough to alter the two divisions you have made? I do not think so. I should like to state that far more wool comes to Newcastle from the north-western district than to Morpeth.

MONDAY, 2 MAY, 1898.

[The Sectional Committee met at "Thurlow's Hotel," Narrabri, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

Albert Ernest Collins, Mayor of Narrabri, sworn, and examined:—

80. *Chairman.*] Do you desire to express any opinion in reference to the proposal before the Committee? A. E. Collins.
2 May, 1898.
- On receipt of your telegram and letter from Newcastle, I made it my business to see some of the aldermen and representative people of the town, and it was their opinion that Narrabri should remain in a position of neutrality in regard to the proposed line. They are of opinion that any line going away from Narrabri would do the town a certain amount of injury. They, therefore, think it better not to prejudice the proposed line in any way, but to remain in a position of neutrality. My remarks apply also to the construction of a line from Woolabra to Collarendabri.

Walter Neville Sendall, District Surveyor, Tamworth, sworn, and examined:—

81. *Chairman.*] Have you a knowledge of the country under consideration by the Committee? Yes, as far as Come-by-Chance, on the southern side of the river, and also extending northward to the Thalaba Creek. W. N. Sendall.
2 May, 1898.
82. Will you describe the country on the southern side of the Namoi, as far as Pilliga, running from Narrabri west, past Millie and Wee Waa? Between Narrabri and Wee Waa there is a stretch of good pastoral country, extending from the river to the cleared road. South from that the country is poor scrub, and is partly sandy—I should say the bulk of it is sandy.
83. Does that extend far to the south? I have not been right through it; but I know it extends a very considerable distance from Wee Waa to Pilliga. With the exception of the banks of the river it is similar country over an average width of about 5 miles. It broadens out towards Come-by-Chance to a width of 10 miles, and south of that it is again inferior scrub country. I have been a little beyond Come-by-Chance, but my knowledge with regard to the country between there and Walgett is not personal; but its general repute is that it is better country.
84. Would the green line shown on the plan pass through better country? Yes; I know that country as far as Burren—that is about north from Pilliga. I also know the country lying between the surveyed line

- W. N. Sendall. line marked green, and the river Namoi as far as Yarraldool. That country is also good pastoral country.
- 2 May, 1898. 85. Is there any doubt that the green line goes through better country for almost any purpose than any land on the south? I am not prepared to speak about the agricultural possibilities of the country.
86. What is your opinion of the two routes, as far as production is concerned? The country on the north of the river is superior to that on the other side. It will carry more population, and give better returns.
87. Is there much settlement on the northern side of the Namoi? There is a good deal of settlement taking place on Nowley and Merah, and there is no doubt that the whole of the Crown lands, as they become available, will be readily taken up for pastoral purposes.
88. On what terms are you leasing your Crown lands there? As settlement leases for twenty-eight years, at about 4½d. per acre, taking the country all through.
89. What would you get from the pastoralists? I think about 3d. per acre.

Bishop Lyne, Inspector of Conditional Purchases, Narrabri, sworn, and examined:—

- B. Lyne. 90. *Chairman.*] Do you wish to make a statement with regard to the country in the neighbourhood of the proposed line of railway? I have an intimate knowledge of the country from here to Wee Waa, and of the tributaries on the southern side of the Namoi. The country is heavily timbered with ironbark, cyprus-pine, box, oak, and the usual timber. I consider the ironbark and the pine of very great value. I estimate its value at about £1 an acre, on an area extending back for 30 miles. I base that estimate to a great extent on the fact that at this end, since I have been in the district, about £10,000 worth of railway sleepers have been delivered at West Narrabri, and I have applied the area from which they have been obtained to the whole district. The sleepers are of such a character that they are used on all important lines. I think they are used on the suburban lines. They are shipped from here to Sydney, and north along the other lines.
- 2 May, 1898. 91. How far are the sleepers drawn? Thirty miles. Of course, the bulk are obtained from about 15 miles, but they are being drawn at present for 30 miles.
92. And that belt of country runs from Narrabri, beyond Pilliga, back from the country which fronts the north side of the Namoi? Yes.
93. And there is a frontage of pastoral country on both sides of the Namoi? Yes; a frontage of agricultural and pastoral country; but all through this area there are patches of good wheat-producing country.
94. What proportion of it—take 20 miles south of the Namoi? Taking the whole area right through, the proportion would not be greater than 1 acre in 10. Of course there are some few thousands of acres together, and then you come to ironbark ridges where there is no agricultural land at all. The whole of this forest is interspersed with creeks, and most of them have permanent water in them. Although the agricultural land is not in acreage extensive, still fronting most of these creeks there is a strip of agricultural land on each side.
95. How far does your district extend? To 8 miles on the other side of Come-by-Chance.
96. There, I believe, the ordinary pastoral land is a little wider? Yes, it widens out from Pilliga.
97. Now take the north side of the Namoi? The north side of the Namoi, from Narrabri to opposite Pilliga, is rich grazing country of a fattening character—very similar the whole of the distance. There is rich alluvial soil on the frontages, and salt-bush plains at the back. The salt-bush is not there to any extent at present, but that is the character of the natural state of the country.
98. Is there any timbered country suitable for agriculture at present? Not as far as my experience goes. It is of a limestone formation all through, and it has not been tested in this district for wheat-growing.
99. What is there at the back of that country again, keeping, say, 20 miles back to the river? My description applies to the whole of it. The frontages are a lower kind of country with the coolabar bush upon it, and it then merges into salt-bush at the back.
100. Do you know of any country on the north side of the Namoi which you regard as suitable for the growth of cereals, if the climatic conditions are favourable? Personally, I regard it as suitable for cereals, but it has not yet been tested. I have seen the same character of country in the Parkes and Forbes district, and at the head of the Bogan, and it has produced excellent crops of wheat.
101. Then there is a fair probability that if the country is required to grow cereals it will do so if the climatic conditions are favourable? Yes.
102. What do you think of the future of the district? I believe there is a great future for it. Up to the present the people have not resorted to agriculture to obtain a living, but the country only requires developing. It is a splendid district. I have had experience during the last twenty-five years of many districts of the Colony, and the climate and class of soil of this district suggest that it will be a heavy wheat-producing district in time. I take it that the reason that farming in some cases has not been successful is the fault of those going in for the industry. I should like to state my impression with reference to what is looked upon as a wilderness on the other side. I think the acreage is altogether about 3,000,000 acres, and I have an impression that it is quite possible that a number of small farmers would make very good livings there—first of all, on account of the fact that there is natural water there; and secondly, on account of the fact that there is an industry there for them to commence with—I refer to the timber—which will be of a lasting character for the next fifteen or twenty years. In many parts the soil is particularly well adapted to agriculture. Where the silver-leaf ironbark is on the flats—such as the parish of Meit, opposite Pilliga—there are from 6,000 to 10,000 acres of that class of country, with very few breaks in it. Narromine and other parts of this country would be exceptionally good for wheat-growing. It is open forest of scattered pine and coolabar box. I attach great value to the timber. There is an acreage of it of 80 miles by 30 miles. From Baradine to Pilliga the country is very level, and water is obtained in shallow wells. Wherever I have seen people attempt to obtain it they have been successful. I should like to mention that seven years ago the representative of a South Australian syndicate spent several days in this forest, his object being to bring South Australian farmers out here. He made a proposal to the Government of this country to bring 100 farmers into that forest, if they would agree to certain terms which he proposed. The terms were that they should have the land free of rent for twenty years, and that the Crown should then assess it with the improvements upon it, and fix a fair rental. I am not certain in regard to any other stipulation. However, his terms were not agreed to. The country

country has been heavily stocked—perhaps more than any other part of the country—with marsupials. Dozens and dozens of men are living there doing nothing but hunting and shooting the marsupials for their skins. The best timber is not at the end from which so much ironbark is obtained, but at the further end, where there is a very extensive timber reserve. It extends for 25 miles by 12 miles. I attach more importance to the value of the timber in connection with railway construction than I do to the pastoral interests on this side. The country from Narrabri to Pilliga is very level.

B. Lyne.

2 May, 1898.

Richard Ford Jenkins, Road Superintendent, Moree, sworn, and examined:—

103. *Chairman.*] What are the boundaries of your district? Moree and Narrabri are the boundaries of my district. R. F. Jenkins. 2 May, 1898.
104. *Mr. Hassall.*] Do you know the country traversed by the proposed line? I do not know it for any great distance on either side of the road; but I know it along the road. Taking it as a whole, it is bad country. It is covered with brigalow, and rosewood scrub, belar, coolabar, and patches of oak. There are patches of flat black-soil country on the river frontage. It is good herbage country, but not first-class country. The scrub country is nearly all sandy, and in my opinion is of very little value.
105. *Chairman.*] For any purposes? If some of it were cleared it might perhaps grow wheat.
106. *Mr. Hassall.*] Do you think that wheat-growing would last? I do not think it would. I do not think, owing to the expense, that it would be worth clearing.
107. Do you know the country lying back from the road? No; I believe there is little or no settlement there; in fact, there is an enormous area of agricultural land available for improvement lease lying there vacant, and no one will touch it.
108. Do you know the country lying to the north of the Namoi? Yes. I do not know the country very well beyond Bulyeri and Boolcarrol. I know the country between Narrabri and the Namoi River, running north to Moree, and running west as far as Bulyeri; and also west from Bulyeri, running north, on to the Meehi country, and towards Mogul; but I am not very well acquainted with the country lying west and south-west from Bulyeri—the country bounded on the west by the Barwon River, and on the south by the Namoi.
109. Do you look upon the country lying between Narrabri, down towards Wee Waa, as far west as Bulyeri, as suitable for settlement? Yes; speaking generally, I should call it first-class grazing and fattening country.
110. Do you know whether it is settled to any great extent? There is a fair amount of settlement down there. There is a fair amount of settlement from Narrabri to Boolcarrol; but the country between Boolcarrol and Bulyeri is not so thickly settled. There is a lot of land not yet available for settlement, and when it is available I have no doubt that practically the whole of it will be taken up. In this country there are little patches of scrub which are of no use. They are, however, only small; but the good country is so extensive that it must support a large population. The whole of the country between Narrabri, Moree, Mogul, and Wee Waa is very good.
111. What sort of a road is there between Narrabri and Bulyeri? The greater part of it is black-soil plain and open forest country.
112. I suppose there is not much chance of making a macadamised road through it? No.
113. Taking into consideration the distance the metal would have to be drawn, what would it cost to construct a road there? It would vary from between £400 and £800 per mile.
114. Where would you get your metal from? I do not think you would be able to get it at all.
115. Do you know of any metal on the road? No; only gravel, and you would not get that in any quantity beyond Wee Waa. Therefore, I think you might say it would be impossible to construct a road beyond Wee Waa—that is, unless the metal were carried from Wee Waa, and that would mean enormous expense.
116. Looking at the proposed line marked on the map, and with your knowledge of the county between Narrabri and Pilliga, and your knowledge of the country between Narrabri, Boolcarrol, and Bulyeri, and then looking at the approximate position of the recently surveyed line running in the direction of Walgett, on the north side of the river, which, in your opinion, would be the better route for a railway to take—the south or the north side of the river? I think that a railway constructed on the northern side would serve a very much larger amount of settlement, and open up a very much better country than one on the southern side.
117. What sort of an approach would there be, supposing the lines were 8 miles north of Wee Waa? We could make a road there for that distance for about £2,800.
118. Do you know what would be the cost of a road-bridge over the river at Pilliga? About £4,000. A bridge over the river below Pilliga would be available, and the most suitable point for traffic coming in by way of Come-by-Chance.
119. Do you think the green line marked on the map would serve the country out towards Bulyeri? Yes; it would serve a good deal of the settlement around that quarter.
120. How far would the line be from Bulyeri? About 20 miles.
121. Have you heard of the proposal to construct a line from Woolabra to Collarendabri? Yes.
122. From what you know of the country, and the settlement which has taken place upon it, do you think it would be justifiable to run a line on the south side of the Namoi, *viâ* Pilliga, to Walgett, and another on the north side of the Namoi from Woolabra to Collarendabri? No.
123. Do you think a line, as suggested, running from Narrabri on the north side of the Namoi towards Eurie Eurie, within 12 miles of Walgett, would practically serve and open up the country lying north-west towards the Barwon, and the country beyond it? I should say that it would serve better country if it went further north still, between the Woolabra-Collarendabri line and the other.
124. A line in that direction further north would not serve the Walgett traffic so well? There is no doubt a line in the position named would serve the Walgett traffic as well as the Collarendabri traffic.
125. How far is Boolcarrol from the proposed line? It is close to it.
126. What traffic comes through Boolcarrol? All the traffic from Collarendabri and Mogul, and about there.
127. How far is Boolcarrol from Narrabri? Thirty miles.

R. F. Jenkins. 128. If the line marked green were constructed, where would the Collarendabri traffic strike it? I think it would use the present road for a certain distance—perhaps to Bulyeroi—and then branch off near Pilliga at about the 310-mile peg. That would mean opening up a new road. There would also have to be a new bridge across the creek. The opening up of new roads in that country is not an expensive matter; it only means a little clearing. I think a line running through the country referred to would serve the country to Collarendabri and beyond, as far north as Gundablui, on the Moonie Creek, and then the country extending west and south from there down towards the Darling River.

WEDNESDAY, 4 MAY, 1898.

[The Sectional Committee met at the Court-house, Wee Waa, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

Walter William Richard Holcombe, grazier, Weta Waa, sworn, and examined:—

- W. W. R. Holcombe. 129. *Chairman.*] How long have you resided in the district? Twenty years.
130. Where is Weeta Waa? About 8 miles down the Namoi from Wee Waa, on the north side of the river.
- 4 May, 1898. 131. What is the area of your holding? 27,000 acres.
132. How many sheep have you? 24,000.
133. What will the country you hold carry as a rule? A sheep to the acre.
134. Have you cultivated any cereals? I have grown wheat at different times.
135. Are there large areas on the Namoi suitable for the growth of cereals? There are large areas suitable for growing wheat, and wheat is grown, but it pays us better to grow wool, as we have no means of getting the wheat to market.
136. What does it cost to take a ton of wool from Wee Waa to Narrabri? Twenty-five shillings. Wheat would cost about the same.
137. Do you think you could get wheat carried for about £1 a ton? I think you might. The present rate would be about £1 a ton. I may state that there is a large extent of country about here which will grow wheat. I saw corn growing in the scrub towards the south only a few days ago. Even a lot of the black soil will grow grain. For instance, you could grow grain at Pian Creek. I was looking at a piece of scrub country 10 miles from here, and I know that that will grow grain. I saw corn which had been taken off it. I produce samples of oranges and grapes grown in the district. I do this to show that the district is suitable to the growth of fruits of this kind. We grow all the tropical fruits—peaches, stone fruits, oranges, lemons, pomegranates, and figs. There are thousands of acres on Pian Creek better than my land for the purposes of fruit-growing.
138. What do you think of the position of the proposed line? Personally, any of the three lines marked on the map would suit me. If I had my choice I would have the dotted line running on the south side of the river, crossing the line below Wee Waa.
139. Your sympathy with the line on the Wee Waa side is your sympathy with the Wee Waa people, but personally it does not matter to you? That is so.
140. What area have you under vines? Four or 5 acres—quite enough to test the suitability of the soil. We have more than we can use, because we cannot get the fruit away. If we could get our grapes to Sydney I think we could suit the Sydney people, because our grapes come very early. There are grapes at my place at Christmas-time.
141. Have you any land on the other side of the river? No.
142. Is the land on the southern side as good as the land on the other side? No; it is not grazing land at all, but I think there is some possibility of it eventuating in farming.

Albert Coppleson, storekeeper, Wee Waa, sworn, and examined:—

- A. Coppleson. 143. *Mr. Fegan.*] How long have you been in Wee Waa? Eight years.
- 4 May, 1898. 144. Have you any information to furnish to the Committee? When I first came here, in 1890, the population of Wee Waa was about 150. The trade done in the town then amounted to about 240 tons per annum. Last year my own tonnage averaged 30 tons a month. There are three more stores here besides my own, and although they may not dispose of the same amount of goods as I do, I am confident that the tonnage to the outlying districts will amount to 1,350 tons per annum.
145. Where do you get your goods from? From Sydney, Newcastle, Armidale, New England, and different parts.
146. Does it all come through Narrabri? Yes.
147. What is the freight on goods from Narrabri to Wee Waa? About £1 per ton on first, second, and third-class goods. Goods sent from here to Narrabri pay the same amount.
148. If a railway were constructed, I suppose you would look for a reduction of freight? Yes; and it would be a means of getting goods quicker.
149. Do you find much difficulty at times in getting goods here? Yes; frequently in the past it has taken a week or a fortnight, and sometimes three or four weeks, to get goods from Narrabri.

150. I suppose that some of the goods you obtain are perishable goods? Yes; I may state that, on one occasion, I had 2 tons of flour on the road for two months. The flour was spoilt by the rain. A. Coppleson.
151. Can you give an approximate idea of the length of time in a year during which you cannot get your goods as you would like to get them? Of course, if it is too dry the carriers cannot travel quickly because they have to turn their stock out. Last year we only had one carrier coming to the town. 4 May, 1898.
152. Do you supply various stations about Wee Waa with goods? Yes; but some of them get their goods direct from Sydney and other centres.
153. Do you think the construction of the proposed line would result in additional settlement and increased population? Yes. Since the land was thrown open about here—at Merah and other places—the population has increased to a great extent, and that has made a great deal of difference in trade. Not only has the district trade with the town of Wee Waa increased, but the district trade with Narrabri and Newcastle has also increased. As I have already mentioned, when I first came here the population of the town was 150 and now it is about 650.
154. I suppose the quick transit of goods frequently means to you the difference between a profit and a loss? Yes. The present method of getting goods here is not satisfactory. The town would have gone ahead much more than it has done, if we had had a railway. There are many people who would improve their land if there were a prospect of a line coming here. Some people think the line may go to Gurleigh Point and cross the river there, and, of course, if it did it would kill the town. The town would have gone ahead much more than it has done had it been known what course the proposed railway would take. The doubt in regard to that matter has kept us back. I may state that I have examined the figures in regard to the value of the township; the value, including Government property—such as the Court-house—comes approximately to £47,000.
155. I presume the population is still increasing? Yes; the increase in 1890 was 150. I should like to point out that there is a good deal of trade done between here and towards Collarendabri; but another witness will give you information upon that point.
156. What is the highest cost of carriage from Narrabri to Wee Waa? We have paid as much as £2 a ton in very dry and wet times.
157. What would be the average cost? The average for the last eight years would amount to from 1s. 4d. to 1s. 6d. per cwt.
158. Do you know anything about the freight for timber? The freight for sleepers is about the same as the freight for other goods. If a sleeper weighs $\frac{1}{2}$ cwt. it will cost the same as $\frac{1}{2}$ cwt. of other goods.
159. Of the three lines marked on the map, which do you regard as the best? Two of them—the two southern routes to Pilliga. The construction of the green line would kill the town.
160. How? It would cut most of the traffic from the north from it.
161. How far would you be from railway communication if the line marked green were constructed? About 8 miles. We should have to cross the river to get to it. The line would be 6 miles north from the bridge.
162. Do you mean to say that the construction of a line 8 miles from the town will make the line of no importance to the people of the district? It will be of no importance to the people of Wee Waa—in fact it will do us a lot of harm. People who have invested here will go to the wall.
163. In other words, business people here will have to compete with others who will be nearer to the line? They will have no chance of competing.
164. Would you have to pay as much freight over the railway as you would by team? I should, because I would have to pay extra haulage from the line to the town. The haulage from there would be almost as much as it would be from Narrabri. The greatest cost in connection with the carriage of goods is the loading and the unloading.
165. Would you be willing to pay special rates if a line were brought to Wee Waa? Yes.
166. *Chairman.*] What settlement is there up and down the Namoi on this side of the river, from Wee Waa? There is Cuttabri, Cubbo, Coghil, and two or three selections on this side of the river. There are also a good number of people employed about here in log-cutting and drawing.
167. Is it a fact that up and down the Namoi there is a belt of good country from 5 to 10 miles, and at the back of that is the timber country? Yes.
168. Wee Waa, therefore, has the support of this belt of country and of the timber trade of the district? Yes; there is no doubt it would have the support from the southern side, but if we lost the northern side support it would mean that life would not be worth living here. I have no doubt that if there were railway communication here on the southern side the timber trade would be so much extended that all the trade of the district as far as Walgett and Collarendabri would be done from here. I think that if we had a line to Wee Waa it would be a paying one.
169. *Mr. Hassall.*] Then your position is this—that a railway on this side of the river would not intercept any traffic coming in from the northern side, and that you look to the northern side for the principal business of the town? I look for some.
170. Your fear is that a line constructed on the other side of the river would intercept the traffic coming from that direction, and that the country at the back is not sufficiently developed to enable Wee Waa to carry on business as successfully as it has been doing? Exactly.
171. Judging from the evidence you have given, it seems that unless you have a railway on this side of the river, as far as Wee Waa is concerned, you would be as well without a railway at all? As far as I am concerned, I would.
172. *Mr. Fegan.*] I suppose you are not speaking for the people on the other side of the river? No; it would pay them in any case.

John Gray, contractor, grazier, and agriculturist, Wee Waa, sworn, and examined :—

173. *Mr. Hassall.*] Where is your residence? Two miles above Wee Waa, on the north bank of the Namoi. J. Gray.
174. What does your property consist of? 1,800 acres of black soil. 4 May, 1898.
175. What do you devote it to principally? Grazing, sheep, dairying, and cultivation.
176. How much cultivation have you? Nearly 40 acres. I grow wheat for hay, and corn.
177. What is the yield of wheat per acre? It would not pay to grow for wheat, as there are no facilities for

- J. Gray. for getting it to market, but I have grown about 2 acres for use at my place, which has given about 20 bushels to the acre. I have grown wheat now for nine years, and during that time I have only lost two crops, but, with better methods of cultivation and a better understanding of the properties of the black soil, it would not have been a total loss.
- 4 May, 1898.
178. How many sheep to the acre will your property carry? I have run four sheep to 3 acres all through since I have been there. In addition to that I have run from forty to seventy head of cattle.
179. Is the country around you of a similar character to yours? Yes, it is all good country.
180. What do you think of the country on this side of the river? There are large blocks of really good country suitable for agriculture; but there are no facilities for getting wheat to market, and it is not taken up to any great extent.
181. How far back from the river are these blocks? They are scattered.
182. Then whatever settlement might take place, it would mean that one man would be in one part, and another four or five miles away? In some parts a good many settlers would be together. In other parts a large area would lie between them.
183. Are there any large blocks of bad country there? Yes.
184. Which of the routes marked on the plan would be the most suitable for a railway? Either of the lines on the south or north bank of the river. I may say I have been a good deal through the bush, and am able to state that abundance of timber can be obtained for bridges and sleepers. There is a great deal of it, and it could be utilised for the different railways of the Colony.
185. I believe there is an ironbark forest, extending from the back of Narrabri, running some distance east, and going right down to Pilliga? Yes; it is like a belt, and the better country runs into it.
186. I believe a good deal of the timber is pipey, and is suitable for sleepers, but not for bridge-work? That is so. Again with regard to ballast, a good deal of the proposed line would not require ballasting. A large quantity of gravel can be obtained at Mollee. There are outcrops of sandstone between Wee Waa and Cuttabri, which would do for ballast. Nevertheless a great deal of the line would not require ballasting as the country is sandy.
187. Where is the nearest good ironbark? About 10 or 15 miles to the south.
188. What is the cost of conveying a sleeper from here to Narrabri? If the charge were £1 a ton, one sleeper would cost 2s.
189. Which of the suggested lines would be most suitable for conveying timber towards Collarendabri? The line coming from Narrabri West, crossing below Wee Waa.

Walter Coughlan, stock and station agent, Wee Waa, sworn, and examined:—

- W. Coughlan. 190. *Chairman.*] How long have you resided here? A little over two years.
- 4 May, 1898. 191. Have you heard the evidence to the effect that the land on the north side of the river will run a sheep or a little more to the acre? Yes.
192. Do you believe that evidence, and the evidence with regard to the agricultural prospects of the district? I am not too sure that the black soil will grow wheat, but a good portion of it will.
193. You heard it stated that £1 a ton was a low rate on carriage from Wee Waa to Narrabri West? Yes, that is correct.
194. Do you know anything about the scrub country? Yes. From what I have seen of it I think a line along there would almost add a new province to the country. There is a lot of splendid land there, which would all be taken up for agriculture, if we had a line to get the produce away. I know it often happens that scrub land is discarded for years. The same thing occurred in Gippsland, and when a line was constructed the land was rushed for the purposes of agriculture. I believe that most of the land in this district would be taken up if a line were constructed. The great bulk of the scrub land I have seen is of a sandy loam, and would be good for cultivation. I may state that my views with regard to the proposed railway are in unison with those of Mr. Coppleson.

Andrew Hamilton, hotelkeeper, Wee Waa, sworn, and examined:—

- A. Hamilton. 195. *Mr. Fegan.*] How long have you lived in Wee Waa? Twenty-five years. I was a grazier during my earlier residence here.
- 4 May, 1898. 196. Where was your station? For over twenty-five years I was located 3 miles from the river, and for about fourteen years on Pian Creek. I have a good knowledge of the country on both the north and south sides of the river.
197. Do you agree with Mr. Coppleson's evidence as to the progress of the town? Yes; I should like to see the line constructed on the south side of the river. I think it would pay the country and the town itself. My reason for saying so is that we can get timber to-day which can be taken to Collarendabri and Walgett. If the line marked green on the opposite side of the river is constructed, it will ruin the town by taking its trade away.
198. Would a line on the south bank supply as large a number of residents as would the line coloured green? The green line would supply a larger number at present.
199. Is the quality of the land on the south bank equal to that on the north bank? Of course no lazy man would take up scrub land.
200. Seeing that there is a large amount of scrub land on the south bank of the Namoi, do you believe that if the proposed line were constructed, it would induce a number of people to take that scrub land up? Yes.
201. Have you any idea of the quality of the land? It is only fit for the plough.
202. And land fit for the plough, to be of any use, must have railway communication? Yes.
203. Otherwise it is worthless as far as agriculture is concerned, owing to the distance from the market? Yes.
204. Do you get the whole of your stores from Narrabri? Yes.
205. What is the freight? I have paid from 1s. to 2s. per cwt.
206. For how many months in the year have you to pay the higher rate? During the last eight years we have had to pay the higher rate, on an average about three months in the year.

207. Then the average charge per ton is about £1 5s? Yes. I may mention that in 1890 we had to pay the higher rate all the year round. A. Hamilton.
208. Which of the suggested lines marked on the map would suit you? The one which shows the bend near Wee Waa. I would then go almost direct ahead until I struck the blue line near Pian Creek, then I would keep it going right on to Collarendabri; still the dotted line would not be an objection to me personally. 4 May, 1898.

Charles Peter O'Rourke, sawmill proprietor, Wee Waa, sworn, and examined:—

209. *Mr. Hassall.*] Where do you carry on operations? In the district generally. C. P. O'Rourke.
210. Where is your mill? About a quarter of a mile from the town. 4 May, 1898.
211. How long have you been carrying on business? About six months on my own account, but I was manager for two years before that.
212. Do you find business good? Yes, at present.
213. Where is your market? From Merrywinbone, beyond Drilldool, Collarendabri, Mungyer, and round to the Namoi.
214. Where do you get your timber? From Brigalow Creek.
215. Of what description is it? Pine.
216. How far is the timber back from the river? We draw it about 20 miles; the distance is becoming greater every day.
217. Is there any great quantity of it? Towards Pilliga there is an immense quantity. There is an enormous pine forest near Pilliga, which runs to Coonabarabran.
218. Is the ironbark any nearer to you than 20 miles? No; it is all towards the Brigalow Creek.
219. Have you any knowledge of the country on the north side of the river? No; I have never been beyond Weeta Waa.
220. On which side of the river do you think the line should be constructed? On the south side.
221. Would the construction of the line increase your trade? It would to a certain extent in Wee Waa, but I think Pilliga would do me harm, because they could then compete more successfully with me. I may state that since the 3rd March I have sent over 30,000 feet of timber towards Collarendabri.
222. Is timber drawn from here to Narrabri? Yes; small logs are taken from 5 or 6 miles from here. I do not think anyone has any idea of the amount of timber in the scrubs round Pilliga. The forests are of enormous extent, and contain some of the finest timber in the Colony.

Arthur Walter Holcombe, junr., grazier, Cryon, sworn, and examined:—

223. *Chairman.*] Where is your holding? On Block 259, situated on the green line marked on the map. A. W. Holcombe, junr.
224. How long have you been there? A little over twelve months. I have 2,560 acres of land and 1,900 sheep. 4 May, 1898.
225. What sort of country is it? Red chocolate soil and plain open country. It grows myall and white wood.
226. Would the red soil grow wheat? Yes, I think it would grow anything. At Cryon station, on the same sort of soil, they grow cabbages, vegetables, and any sort of fruit.
227. Are any grapes grown about Cryon? No; but they have started a wheat crop this year. I think the country is fit for settlement and for fattening sheep. At present, however, we cannot fatten sheep, because we cannot send them away. The road between Wee Waa and my place is a very dry one—15 or 18 miles without water.
228. How far are you from Wee Waa? Sixty miles; if we had a railway I would send sheep away any day.
229. Where would you put the line if you had the chance? The green line marked on the map goes close to my boundary. I think it is country which would carry a railway. I am on the edge of the red, high ground, on the water-shed between the Namoi and Pian Creek.
230. It does not matter to you whether the line keeps to the southern or northern side of the river when it gets near to your station? No; I may state that I think I could find a track out of flood-reach from here to Boo-Boo, and beyond.
231. What is the shortest width of flooded country you know of on the Namoi? Except in very high flood I think it is about half-a-mile from the bridge. The flooded country is from 5 to 10 miles wide.

Charles Brennan, grazier, near Wee Waa, sworn, and examined:—

232. *Mr. Fegan.*] Have you any statement to make? I own land on both sides of the river east from Wee Waa. I have 3,600 acres of land, and have run over a sheep to the acre for over seven years. At present I have over 4,000 sheep. I have averaged 70 bales of wool for the whole period to send to Narrabri. In return I have had 6 or 7 tons of stores. I have averaged 1,500 fat stock, mainly for the Sydney market, every year. When my stock died, owing to the drought, I sent into other districts for other stock. This is a good fattening country. I have sent fat stock away every year. I know the northern side of the country for 40 or 50 miles. It is all fattening country, and will send stock to the markets. C Brennan.
233. Do you graze any cattle? Yes; 80 head. I would send some to market now if we had a railway line. 4 May, 1898.
234. Do you find the want of a railway an inconvenience? Yes, for small holdings, with one or two trucks of fat stock. I myself am all right, because I am only 25 miles from Narrabri; therefore I have a fair service. Of course, if I had a railway I would send a truck or two more.
235. Which of the lines marked on the map would suit the people, not only of Wee Waa, but of the district as a whole? Taking Wee Waa into consideration, I think the one on the southern bank should be connected with the dotted line.
236. Do you think that would be a better route than the one on the southern bank? I think, on the whole, it would.
237. Would that serve the town of Wee Waa as well as the other? It might not serve the town so well; I think the one marked red connected with the dotted line would be the best.

- C. Brennan. 238. Have you ever tried agriculture here? No; I should like to explain that the timbered country out here is different from the timbered country through which the railway passes to Narrabri, as that is a sandy desert. There is timbered country between Wee Waa and Pilliga, which is fairly good land. There is as much as 4,000 acres in a patch of, comparatively speaking, good land.
- 4 May, 1898. 239. Are you satisfied that the country you are living on is equal to any fattening country you know of? It is almost equal to the best land in Riverina, and it is heavier carrying country than the Riverina country generally.
240. Do you prefer this country to the Riverina country for fattening purposes? Yes; I think the country from Narrabri to the end of the proposed line will carry more stock than the Riverina—that is taking 1,000,000 acres of land in an ordinary season.

FRIDAY, 6 MAY, 1898.

[The Sectional Committee met at "Baker's Hotel," Pilliga, at 11 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

John Henry Robertson, storekeeper, Pilliga, sworn, and examined:—

J. H. Robertson.
6 May, 1898.

241. *Chairman.*] How long have you resided in Pilliga? Nine months.
242. Have you a good knowledge of the district? Yes.
243. Do you wish to make a statement? I desire, before giving my evidence, to inform the Committee that, in my opinion, and also in the opinion of the people of Pilliga, the evidence which will be given in detail at Walgett will make out the case on behalf of Pilliga more satisfactorily than we in Pilliga can make it out ourselves. The Walgett people have all the information necessary. Walgett has always been regarded as the objective point of the railway, and the league there has had opportunities of obtaining information which the people of Pilliga do not possess. I also desire to emphasise the fact that the weather which prevented the Committee from keeping their appointment here, has prevented the gathering to-day from being as large as it otherwise would have been. Men who came in for some distance were unable to remain.
244. Where do you get your goods from? Narrabri.
245. What do you pay for carriage? From 2s. to 2s. 6d. per cwt., or £2 to £2 10s. a ton—an average of £2 5s.
246. Do you know how much stuff comes to Pilliga? I should say about 300 tons.
247. Where does the Pilliga wool go? To Narrabri.
248. Then all the stuff coming to Pilliga as a centre goes to Narrabri? Yes; I have no statistics with regard to the amount of wool passing through.
249. Where does the travelling stock passing through Pilliga go to? Narrabri. I hand in a statement of information which we laid before Mr. Harper, which I believe was correct then, and will fairly well explain our position to-day:—

Information compiled by the Pilliga Progress Committee concerning the probable traffic on the proposed Railway from Narrabri to Pilliga, with other facts bearing upon the same. That was presented to Mr. Harper recently.

For the year ended 31st December, 1896, there were in the Pilliga sheep district 560,881 sheep on which assessment was paid to the Pilliga Pastures and Stock Protection Board, and 144 stock-owners.

The returns for 1897 are not available, but it is not considered that the number has decreased. Of the above number 77,437 may be deducted, as presumably their closest trucking station would be Narrabri, leaving 483,444 sheep to the Pilliga district proper whose wool would be carried by this railway. The number of large stock may be given as 17,256 after making a similar deduction. The yield of wool from the above number of sheep is estimated at 1,295 tons. The number of fat stock annually sent to market is estimated as follows:—Cattle, 3,000; sheep, 120,861. The business people comprising three hotelkeepers, two storekeepers, saddler, two blacksmiths, &c., estimate the quantity of loading they received per annum as 350 tons. The output of sawn timber from the four saw-mills in Pilliga township and neighbourhood is given as 440,000 feet for the previous year. These mills have only worked intermittently, and could turn out three times that quantity. A certain proportion of this timber would be carried by rail both as logs and sawn stuff. The pastoral holdings which would support the proposed railway are as follows:—On the north bank of the Namoi, from the point 20 miles above Pilliga to 20 miles below Walgett, Merah, Drilldool, Cryon, Burren, Gorian, Mercadool, Bundabarema, Merrywimbone, Oreel, Pockataroo, Eurie Eurie, Kercargo, Dungalear, Llanillo, Gingie, Milrea, Boorooma.

On the south bank of the Namoi from the same starting point to the same terminus we have Cuttabri, Bullerama, Wangan, Keeleendi, Bungle Gully, Come-by-chance, Terembone, Billerroy, Tourable, Bunble, Nebrea, Urawilkie, Calga, Gorianawa, Denby, Kunbri, Gibbian, and the Baradine Selectors, Wingadee, Bullarora, Goangra, Warragan, Ulumbie, Euroka, Combogolong, Polly, Brewam, Wangrunally, Carinda, Warren Downs, Bogewong, Mourabrie, Breewan.

The majority of the stations lie within the Walgett and Coonamble Stock Districts but would use this railway, as being their nearest point of connection, in fact three-fourths of their wool at present is trucked at the Narrabri terminus.

The average tonnage of shearing supplies and station requirements is estimated at 30 tons per station per annum. As there are thirty-two stations above enumerated this would give a total tonnage of 1,560 tons.

The area of Crown lands available for settlement within the Pilliga Police District as per latest return collected by the Government Statistician's Department is given as 1,344,256 acres.

The land comprises, on the south side of the Namoi, extensive and valuable timber forest as well as land highly suitable for agriculture. It is considered that wheat-growing would receive a great stimulus from the construction of this railway.

On the north bank of the Namoi the land is almost entirely high-class grazing country with rich alluvial black soil.

Nearly, if not all, the station leaseholds enumerated both on the Namoi and Barwon reach the term of their present tenure within three years, and there will be a great demand for this land in small holdings promoting closer settlement and larger production.

The population of Pilliga township is 150 souls; of the Pilliga Police District, about 1,500.

I may explain that those who could have given information with regard to the farming possibilities of the district have been in, but have returned home because of the wet weather. They are farming on pine blocks and coolabar country. The operations have only extended over two years, but the hay crops have been satisfactory, and so, I understand, have the wheat crops; but the long carriage which is necessary to ship a wheat crop from here would preclude any extension in that direction, without better means of communication. I make this statement, of course, on hearsay, as I am not a farmer myself. I may say, however, that I have seen most of the men to whom I have referred, and have spoken with them. They have come from the mallee country in Victoria, and have all told me that they prefer this country to that.

250. What is your annual rainfall? About 24 inches.

251. *Mr. Hassall.*] Do you know anything about the timber industry in this district? There is only one mill working in the town; but there is a witness here conversant with the timber trade, and he will be able to give evidence.

J. H.
Robertson,
6 May, 1898.

Patrick Kelly, saw-mill proprietor, Pilliga, sworn, and examined:—

252. *Mr. Hassall.*] Have you a knowledge of the timber trade and resources of this district? Yes; the timber consists mainly of pine and ironbark, and is used principally for house-building and bridge work.

253. What is the extent of the timber country? I should say it is from 70 to 80 miles square.

254. What are the boundaries? It commences on the other side of Cuttabri, then goes through Pilliga, up to Coonabarabran, and out towards Coonamble. It consists of first-class pine and ironbark.

255. How far from Pilliga is the pine and ironbark really good? Running back from the river towards Coonabarabran we have first-class pine within 2 miles of the town.

256. Is it not a fact that you have one of the finest pine timber forests in the colony? Yes.

257. Where is your principal market for it? My market is down the river as far as Walgett, following the Barwon to Collarendabri and Goodooga, including all the country on the north bank of the Meehi, within a radius of 60 miles.

258. Is the demand fairly good? Yes, in good seasons. In times of drought it is not; and we have had great droughts here during the last three or four years. We cannot get timber away when there is a drought.

259. I presume it would take many years to work out the timber, even within 10 miles of the town? Yes, a good many years.

260. Do you employ many men? Eight or nine all through the year, and sometimes more.

261. Are there many men employed in the hauling of timber? Yes; there are also some employed in other work, such as bridge-work.

262. Is there anyone else engaged in the trade? Yes; about 6 miles out—Mr. Morrow. I have one mill here, and another 10 miles away. The Walgett people have a mill, and they come to within 9 miles of Pilliga for pine. The Narrabri people also come to within 20 miles of Pilliga for ironbark. The people in the whole of the country lying north-west from here towards the Queensland border have to come here for timber. Timber is carted from here, now, a distance of 160 miles.

263. What is the cost of conveyance from here to Walgett? About 13s. 6d. per 100 feet,—that is for pine, and it includes being cut up at the mill.

264. What is the price at the mill? From 8s. to 9s. per 100 feet. That leaves about 5s. 6d. per 100 feet for cartage.

265. What would 100 feet superficial run into? 100 feet superficial of pine weighs 1 ton 13 cwt., and ironbark goes about two tons 14 cwt. to 100 feet superficial. Roughly speaking it costs about £1 10s. a ton for carriage to Walgett. When the roads are good, however, and waggons are plentiful, we can get it conveyed at the cheaper rate which I have mentioned; but in bad times we have to pay 8s. or 9s. per 100 feet superficial. The price varies according to seasons. At times the country gets so bad that we cannot carry at all.

P. Kelly,
6 May, 1898.

Stephen Dempsey, selector, North Lynne, near Pilliga, sworn, and examined:—

266. *Mr. Fegan.*] What property do you hold? I have a leased property of 15,000 acres in the scrub? I also have a property where I am living of 7,000 acres, making 22,000 acres in all.

267. How long have you lived in the district? Sixteen years.

268. To what use do you put the 15,000 acres in the scrub? Running cattle.

269. Is it good grazing country? No; it is too scrubby.

270. Have you a knowledge of its value if the scrub were taken off? Yes; I think it would make good agricultural land, and would also become good grazing land. I have cleared some of it, and the result has been satisfactory. I have grown as good wheat as any I have ever seen in my life.

271. How many acres do you put under wheat? Five acres.

272. What was the result? I only allowed a quarter of an acre to ripen, but it was very satisfactory. I have had a crop of hay every year I have put it in, and there have been some very bad dry seasons.

273. Have you ever tried more than 5 acres for wheat? No.

274. How many tons of hay did you get per acre? Last year I cut 3 tons of good hay per acre off it; the hay stood between 4 and 5 feet high.

275. Have you heard the evidence in reference to the quality and quantity of the timber of the district? Yes, I can corroborate that evidence.

276. You say that, without being cleared, your property is not good for grazing? That is so.

277. How many cattle or sheep to the acre would it run if it were cleared? I could not say, as I have only cleared a little piece. I think, however, that some of the best of it would carry equally as much stock as any of the black country.

278. What about the 15,000 acres of scrub land? I think that of that fully 5,000 acres are good for nothing.

279. What would it cost per acre to clear the land and make it ready for the plough, and also for grazing? I have been asked 1s. 6d. an acre to ring it, and cut all the undergrowth out of it—that is, merely to ring it and cut the scrub out; and it would cost £2 per acre to clear it fit for the plough.

280. So that a man with very little capital could not come here and settle down? He could if he got the land for a mere nothing, and was able to clear a little at a time. If he wanted to clear it straight away he would require capital. After clearing it, I think he would find it to be good agricultural land.

281. How many sheep are you running? I have not put sheep on the southern side of the river, the country not being suitable on account of the large amount of grass seed.

282. How many cattle do you run? About 300. During the last two years I have been reducing instead of increasing, owing to the dry seasons.

283. Do you send any fat stock to Melbourne? No.

284. Is the country well watered? In some places it is; in other places it is badly watered. In some places,

S. Dempsey,
6 May, 1898.

- S. Dempsey. places, on the Cubbo Creek, you can get water by sinking for it a depth of 2 or 3 feet. I should like to add that, in my opinion, some of the best agricultural land is where the heaviest timber grows. Of course in that case it might cost more to clear than it cost to clear mine.
- 6 May, 1898. 285. Would it not pay you to utilise the ironbark there? Yes. Of course, you might make a little out of the timber when you clear the land.
286. How many sheep have you on the northern side of the river? 5,000.
287. Can you give any idea of the clip? About fifteen bales to 1,000 sheep, or seventy-five bales in all.
288. Where do you send your wool? To Sydney, *via* Narrabri. I get my supplies from Narrabri in return.
289. Do you get your stores direct from Narrabri? Yes.
290. What do you pay for them per cwt.? I have never paid less than 2s. A fair average price would be 2s. 6d.
291. Where do you send your fat stock? To Narrabri.
292. Does driving sheep to Narrabri depreciate their value? It does. Of course, if there is plenty of grass it does not do them much harm. At the same time it is inconvenient, inasmuch as if we had a railway we could send them away in small quantities.
293. Do you think the construction of a railway line would induce more settlement? Yes; I believe many people would settle in the scrub country for the purpose of going in for agriculture. I have heard settlers from Victoria say that the land is equal to anything in Gippsland. A Victorian selector at Mercadool told me that if there had been a railway here he would have settled here before going there.
294. Have you any knowledge of any people who would be likely to settle here? I know of some people who would. At the present time, about Boggabri, they are giving £1 an acre for conditional purchase and conditional lease land, which, I am sure, is no better for agriculture than the land in these scrubs. They are buying it for the purpose of cultivating it.
295. Is the land in this district, which you say is of no value, near the river, or a distance from it? It is a distance from it. I have no doubt the land in question would make fair agricultural land if it were once cleared. At present, however, the timber is so thick that nothing can be grown there.
296. Have you to sink any depth for water on the northern side of the river? Yes; at my place, and it is salty when you get it; 120 feet is the average depth to sink before you can get good water.
297. Have you anything further to say? I think that if a line were constructed a large number of people would settle on the scrubs if they could get them on reasonable terms. If a line is not constructed I am afraid the Government will get all the land back. It will soon get mine back if I do not get something better than I have been getting out of it, for I have been losing money all along.
298. How far is it from Pilliga to Coonamble? Fifty-two miles.
299. What kind of a road is there? Passing from Pilliga you will be in scrub country for the first 26 miles; for the next 3 or 4 miles you get into open country—pretty good country; then into the scrub again, and you remain in it until you get to the open black plain, which is about 10 miles from Coonamble.

SATURDAY, 7 MAY, 1898.

[The Sectional Committee met at "Hawkins' Hotel," Come-by-Chance, at 8 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

Charles Edward Evans, *senr.*, Bungle Gulley, sworn, and examined:—

- C. E. Evans, 300. *Chairman.*] Where is your selection? About 2 miles from Come-by-Chance.
- senr.* 301. What area have you? Originally, I had about 108,000 acres; now I have about 100,000 acres—that is including selections which have gone back to the run.
- 7 May, 1898. 302. What can you run on your 100,000 acres? There are now 35,000 sheep upon it.
303. Do you consider it fairly stocked at that? No; we have shorn about 52,000 sheep per annum, until last year, when there was a drought. I consider the country will run 2 acres to the sheep. One year we shored 80,000 sheep, but that was too many.
304. Where do you send your wool? To Sydney, *via* Narrabri.
305. What do you pay for the carriage of goods to Narrabri? The price varies; about 3s. per cwt. or £3 per ton.
306. Do you get your stores back from Narrabri? Yes; nothing goes from here to Walgett. It all goes to Narrabri, and all our goods come back that way.
307. How far is it from Come-by-Chance to Coonamble? Fifty miles.
308. How far is it from Come-by-Chance to Narrabri? Ninety miles.
309. How far would you go south from Come-by-Chance before you struck the Pilliga scrub? About 4 miles. The road from Come-by-Chance to Coonamble is not quite direct; it makes a bit of a detour, and passes round the scrub. About 12 miles from here the scrub lies on the left-hand side; but from there to Coonamble the road leaves it absolutely.
310. What kind of timber is the scrub? Pine, box, rosewood, and yarran. There is no ironbark about here, although there is some back from Pilliga.
311. What sort of soil is it? A kind of red loam.
312. Is it any good? I believe it is good agricultural soil; there are several selectors upon it.
313. Do you know anything about their circumstances, or what they are doing with the land? Some of them are farming, and also keeping sheep in the scrub. I was in that district six months ago, and I saw a man there who had a very good crop of wheat.
314. What would be the rate of freight from here to Coonamble, supposing there were a railway to that place? About 2s., or £2 10s. a ton for the 50 miles.
315. Do you know where the proposed line is located? Yes.
316. How far to the south of Come-by-Chance? 200 or 300 yards.
317. On high country? Yes.

318. How far can you follow the surveyed line from Come-by-Chance towards Walgett, before you get into the flooded country? We strike flooded country about 20 miles from here, and 14 miles from Walgett. The water runs westerly towards the Castlereagh; but I am not sure it does not go into it.
319. Is there a heavy run in it? It has a steady flow, enough to let you see it is going. In one or two of the warrambools there is a decided current.
320. How far are you from Walgett? Thirty-seven miles.
321. What would be the freight from Walgett to your place in an ordinary season? About 1s. 6d. or 2s. per cwt., or £2 per ton.

C. E. Evans,
senr.
7 May, 1898.

Arthur Colless, selector, Come-by-Chance, sworn, and examined:—

322. *Mr. Hassall.*] How long have you been resident here? Thirty-six years.
323. Do you know the surveyed line to Walgett? Yes.
324. Can you corroborate the evidence of Mr. Evans? Yes.
325. I believe this country was at one time principally held as cattle runs? Yes.
326. And since then it has been transformed into sheep runs? That is so. There are a large number of small holdings.
327. Has settlement increased very much during the last ten years? Wonderfully.
328. Has any land which has been made available been eagerly competed for? Yes.
329. What class of selectors are coming here? They are principally from Victoria; men of means who seem to be doing well, and who have improved the country.
330. Have your trade relations from this part of the country been towards Maitland? Yes, always; Maitland is our natural outlet.
331. Would a railway to serve this district naturally come from Narrabri? Yes.
332. Would the extension of the railway to Coonamble be of any benefit to the district? It would not suit so well for the reason I have already given,—our business relations being with Maitland and Newcastle.
333. What width of flooded country is there along the Namoi, from Pilliga to Goangra? There is very little width from Pilliga to Cumberdown, where there is a greater extent of it. The banks of the river are liable to inundation until you get to Cumberdown, where the water spreads out from the lignum swamps lying between there and Walgett.
334. Is there any prospect of making a road in this part of the country? No; there is a scarcity of metal.
335. Where is the nearest metal to be found? Narrabri, I think.
336. Do you look upon this as a pretty sound district? Yes, and the smaller settlers are doing well.
337. Do you know with whom their trade relations are carried on? With Maitland.
338. Where does your wool go to? Generally to Morpeth, to be shipped from there to Sydney, and sometimes to England.
339. You naturally send it to the nearest port? Of course. I have, however, sent it twice to England; but the last time it went to Morpeth by train, and thence by boat.
340. Do you ship from Newcastle to England? No; from Morpeth.
341. You do not go to Sydney at all? No.
342. I think the wool is principally sent to Sydney by rail? Yes, a good deal of it is sent by rail.
343. I presume contracts are entered into with the carrying firms to convey it? Generally; they name a specified rate to cover all expenses.
344. Where does Mr. Evans ship his wool? Generally speaking, when it goes to England, it goes direct to the port of Newcastle.
345. Do you look upon a railway from Narrabri to this district as one which would give you the easiest access to a port of shipment? Yes.
346. And any line running to the Western line, and going that way to Sydney, would not be so economical to you as the other? No.
347. Do you depasture many sheep? About 14,000.
348. What is the general run of the selectors holdings? 2,560 acres. Some have more.
349. What is the carrying capacity of the country? About one sheep to 2 acres. It is good, sound, healthy country; there is no foot-rot and no fluke.
350. Do you look upon this country as suitable for close settlement? Yes; judging from my experience in the past.
351. Have you any business relations with Walgett? No; except in land matters.
352. Do you approve of the rates of carriage mentioned by Mr. Evans? Yes; I think they are correct.
353. Where do you get your stores from? Maitland. I desire to state, with regard to agriculture, that I believe the possibilities of the country are altogether under-estimated. I have not cultivated anything myself, but I have seen what my neighbours have done. One individual has been cultivating for five or six years, and to my knowledge he has had four good crops. I think a great deal of the country here will, if proper means of communication are provided, be used by agriculturists.

A. Colless.
7 May, 1898.

William Arthur Colless, storekeeper, Come-by-Chance, sworn, and examined:—

354. *Mr. Fegan.*] How long have you been carrying on business here? About four years.
355. Where do you get your stores from? Mostly from Newcastle; also a little from Sydney.
356. What does it cost you for carriage from Narrabri? Two shillings to 2s. 6d. per cwt.
357. Have you ever had higher rates? Yes, at times, as much as 3s. and 3s. 6d.; the average, taking the year round, is from £2 to £2 10s. per ton.
358. Have you any information to give in reference to the necessity or otherwise of a railway being constructed to this part of the country? We are a long way from market, and railway communication would give an impetus to closer settlement, and, necessarily, to trade generally.
359. Are you a landholder here? No; I may state, however, that having lived on the land for many years I can corroborate the evidence of Mr. Colless, senr., in reference to carrying capacity, and also in reference to the suitability of the ground for closer settlement.
360. Do you do any trade with Walgett? No.
361. Where do you send your goods to? Mostly about this district.
362. Do you go as far as Pilliga? No; I go about 15 miles round.
363. Are the roads very often in the condition in which they are at present? When we get rain they are.
364. Have you any idea what the annual rainfall is? Nearly 27 inches.

W. A. Colless.
7 May, 1898.

Morris Russell, Post and Telegraph Master, Come-by-Chance, sworn, and examined:—

- M. Russell. 365. *Mr. Fegan.*] How long have you been at Come-by-chance? Three years.
 7 May, 1898. 366. Have you any statement to make in regard to the progress of the district? From what I know of the people, I think they are a most progressive lot. They are all in very good circumstances as far as I know, and they have come to stay.
 367. Can you give us a statement as to the present revenue of the post-office, compared with what it was three years ago? I am able to state that it is increasing. In the three years it has increased nearly 10 per cent.
 368. Are your mails regular? They are very irregular in wet weather. Half an inch of rain will delay the mail three or four hours.
 369. What has been the delay during the recent rainfall? The delay, yesterday, of Narrabri coach carrying the Sydney mail was twelve hours.

MONDAY, 9 MAY, 1898.

[*The Sectional Committee met at the Court-house, Walgett, at 3:30 p.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

Isaac Collins, grazier, Barwon Vale, near Walgett, sworn, and examined:—

- I. Collins. 370. *Chairman.*] How far is your place from Walgett? Ten miles towards Brewarrina.
 9 May, 1898. 371. What area have you? My sons and myself have 11,000 acres.
 372. Do you use it for pastoral pursuits? Yes.
 373. What number of stock have you? 8,000.
 374. What amount of wool do you send away? About 36 tons per annum, but I have a property which has been rung, and I expect it will shortly carry more.
 375. Do you send any fat stock away? Yes; if we had the use of a railway I could keep a great deal more sheep, because, when there was a drought I could truck them to Sydney and sell them there, or I could send them to some place to depasture.
 376. Where do you send your wool? To Sydney.
 377. Which way does it go? To Narrabri by road, and then by rail.
 378. What does it cost you for road carriage to Narrabri? From £3 to £3 10s. per ton; I would average it at £3 5s.
 379. Is that the cheapest way you can approach the railway system of the Colony? Yes.
 380. Have you ever sent any to Dubbo? No; it has always gone to the North-western line.
 381. Do you regard that as your natural outlet at present? Yes, and that is 140 miles from the nearest railway station.
 382. Do you ever send any wool down the river? I did a few years ago, but it was too expensive.
 383. How long have you lived on the river? Eight years.
 384. How often have you sent your wool down the river? About three times.
 385. Where did you send it to? To Bourke.
 386. What did it cost you? It all depended on whether the boats got over the lock at Brewarrina. If they got over at Brewarrina it was 10s. cheaper; otherwise it was £3 5s. or £3 10s.
 387. Then when the river was up you got your wool to Bourke, including insurance, for about £3 5s. per ton? A little more than that,—say £3 10s. a ton.
 388. Could you send your wool every year by the boat? No. During the last three years there has been no chance of doing it. In some instances the wool has been left on the river bank; it could not be taken away owing to the river going down.
 389. What about the previous five years? There were two years in which I might have sent it during that period, but it was too expensive, and I preferred to send it to the railway at Narrabri.
 390. Have you anything further to say? Owing to the liberal Land Act we have had a number of men with small means settling on the land. If they get a railway, and if they have three or four trucks of sheep to send to Sydney, they will be able to send them and obtain a return of their money in ten days. That would be one means of keeping them on the land. If we had had the same liberal land law in existence when I first took up land we should have had 250,000 more people in the country. Again, if we had a railway we should have the benefit of freetrade; but we never know what freetrade is here. I desire to give the Committee a practical example of what railway communication means to me. About two years ago I had 2,000 splendid wethers, valued at £58. I had to part with them. It cost £25 to get them to Narrabri, and when I got back again I found I had £2 11s. for them. If we had had a railway I should have had 6s. each for them.
 391. Supposing a railway is constructed, do you think there will be any probability of wheat being grown in the district? I think so; a good many ploughs and farming implements have been ordered by newcomers for farming purposes. Two years ago it was quite a treat to see a plough in this part of the country.
 392. Have you cultivated anything yourself? I have not; I have had too much to do in clearing the scrub.
 393. Have you anything further to tell us? I think a railway from Narrabri to Walgett will pay from the commencement.

Robert Dugan, homestead lessee, Milrae, near Walgett, sworn, and examined:—

394. *Mr. Fegan.*] How long have you lived in the district? Nine or ten years.
395. How many acres do you hold? 10,240, on the other side of the Barwon, 35 miles from here.
396. Have you any knowledge as to the navigableness of the river Barwon? Yes; I have been here for 9
R. Dugan.
 May, 1898.
 nine or ten years, and I have always got my wool away by the river, excepting twice, when I took it away by team. I used to wait for the steamer; you could not always depend upon it. I did not care about the steamer, however, inasmuch as you often had to tranship at Brewarrina, and the wool was thrown out on the bank, with the result that if there was any rain it was spoilt.
397. Have you heard the evidence of Mr. Collins in reference to the river? Yes.
398. Do you endorse his statement? Well, the river at his place and at mine is different; the further you go down the better the river gets. Sometimes they can get from Bourke to Brewarrina, and no further. At other times they can get from Brewarrina to what they call Collaroy, and no further, in consequence of the rocks.
399. What did it cost you to send your wool away? £2 10s. a ton for freight alone, delivered in Bourke—that is not including insurance. I do not know what the insurance is.
400. I presume 10s. a ton is placed upon your wool for re-handling, if you cannot get over the rocks at Brewarrina? Yes.
401. When you paid the £2 10s. a ton, could you get over the rocks? If you can get right through it is £2 per ton; but it is very seldom that can be done.
402. Then we must come to the conclusion that you had to pay the extra 10s. because they could not get over the rocks? Yes.
403. Where do you send your produce? To Bourke.
404. If a railway were constructed from Narrabri to Walgett would it assist you? I would then send my produce to Narrabri, and thence to Sydney.
405. How would the line benefit you? In several ways. I send about 100 bales of wool away every year. If we had a railway I could stock more heavily, and I could send very much more wool away by train than I do now. If I had an outlet during the drought, I could clear off my surplus stock. Sometimes the stock routes are very dry, and you cannot get your fat stock away by road.
406. How much wool do you send away? About 21 tons per annum. I also dispose of about 2,000 sheep per annum. Sometimes I sell them as stores, and sometimes as fats. Even if I had no fat sheep I have other saleable sheep which, if there were a railway to Walgett, I could boil down and send along with the skins to market.
407. Have you any boiling-down establishments here? No; but I think it would be a good "spec." to establish one.
408. Are there not railways in various parts of the country where stock and sheep are lost, and yet boiling-down factories have not been established? They have boiling-down factories in Bourke, and in dry weather they send large quantities of tallow and skins to Sydney. If they do not, I do not know what they are thinking about. Personally, I would just as soon get my produce away by teams as by river.
409. Why? Because the teams come right to the door for it. If it goes by steamer I have to draw for several miles, and then stack it on the bank until a steamer comes along, and that may mean a delay of a week or a fortnight.
410. Taking it for granted that a line will be constructed to Walgett, what will it cost you to bring your wool by teams to Walgett? I do not know; probably I should cart it myself. I think I could do it at £1 a day for a team. It would take me about four days to deliver about 6 tons.
411. And if you had to pay a carrier it would cost you more? Yes; it would cost me about £1 a ton.
412. Would you send your wool to Sydney? To Walgett and thence to Sydney.
413. Would that be a benefit? Yes, because I would get it delivered more quickly, and I think more cheaply.
414. I suppose you would not send to Newcastle? It would have to go by way of Newcastle.
415. Do you send to an agent? I send to a woolbroker.
416. Have you shipped any wool to England? Yes.
417. Supposing you were shipping direct to England, where would your nearest port be? Newcastle.
418. Which would mean 100 miles less carriage? Yes; I should always ship to the best advantage; but there are other ways in which a railway would suit me. For instance, if there was a ram sale coming on in Sydney, there is no doubt I should go to it if we had a railway. If I bought stock there at the present time, I should have 140 miles or more to drive them before getting them here. The Railway Department is at present losing my trade so far as that is concerned, because it does not pay me to go down. Again, in a dry season I might want a few tons of forage to feed stock; but it is too risky to give it to a team to carry because before you get it up the weather may break, and it will be left on your hands. If we had a railway we could order the forage to-day, and get it up within a week at the outside. Again, I could carry very much more stock on my land, because I would have an outlet to which to send them.
419. Which way does your wool go when carried by team? To Bourke.
420. How many miles is that by road? About 140.
421. Do you take it yourself, or do you pay for it? Sometimes I pay for it, and sometimes I send my own team.
422. What does it cost you when you send it by road? £2 15s. a ton. I think I would sooner pay £2 15s. a ton by team than £2 10s. per ton by steamer, because of the way in which it is knocked about.
423. How far is it to Coonamble? About 100 miles.
424. *Mr. Hassall.*] Would a railway to Pilliga alone be of any service to you? I do not think so.
425. Would it shorten the road travelling? Not materially. Personally, I would take no interest in it.
426. *Mr. Fegan.*] What is the furthest distance at which a railway would be of any benefit to you? Walgett, which is 35 miles from my place.
427. Would it be a benefit if it were further off? One to Brewarrina would slightly benefit me.
428. How far are you from Brewarrina? Sixty-eight miles.
429. Would a line 40 or 45 miles away be of any benefit to a man following your calling? Yes; you can always take sheep from 30 to 50 miles by road, let it be never so bad.
430. It would mean a difference to you of 45 miles compared with about 110 miles? Yes.
431. What is the distance from Brewarrina to Bourke? Seventy miles.

- R. Dugan. 432. What is the distance from Walgett to Bourke? 170 miles.
 433. What is the distance from Walgett to Coonamble? Seventy-five miles.
 9 May, 1898. 434. What is the distance from Walgett to Narrabri? 132 miles.
 435. How far are you from Coonamble? About 100 miles.

Robert Henderson Duncan, Narran Point, Walgett, sworn, and examined:—

- R. H. Duncan. 436. *Mr. Hassall.*] In which direction do you live? Sixteen miles west.
 437. Have you a frontage to the river? Yes.
 9 May, 1898. 438. What area do you hold? A homestead lease of 10,240 acres.
 439. Is it stocked with sheep? Yes; I have 4,700 sheep at the present time, but it would carry more than that in good times.
 440. Can you corroborate the evidence of Mr. Dugan? Yes.
 441. If a railway were within reasonable distance could you send away one or two trucks of fat sheep when they were fit for market? Yes.
 442. Would a railway to Pilliga be of any service to you? It would not be of much more service than the present line to Narrabri.
 443. How long have you been living in the district? Sixteen years.
 444. Have you had any experience of farming and gardening? Yes; I produce a sample of oaten hay grown on my lease, also of maize, wheat, and oats, grown on my lease. Of the oaten hay, I have cut over 3½ tons to the acre this year.
 445. How many acres had you? One and a half. I cannot speak very favourably of the maize, as the blight injured it.
 446. Do you look upon this as a suitable locality for growing maize? Yes; if you have a fair season. With regard to the oats I am informed it will go 40 bushels to the acre.
 447. What about the wheat? I had a bad sample of seed, but the result shows that wheat can be grown. I have grown three previous crops with very fair results.
 448. Do you think wheat would be a reliable crop in this district? Not every season, unless the land were more broken up. If we had more settlers and the land were broken up, I think we should have good wheat and oats grown.
 449. What sort of soil have you on your holding? It is inclined to be chocolate. It was thickly timbered land, and I cleared it. It was chiefly sandal-wood that I cleared, also some belar and coolabar.
 450. Have you ever tried farming by means of irrigation? Yes, a little.
 451. Did you have any success with it? Yes.
 452. Do you think there is any prospect of much irrigation being carried on on the river? Yes; eventually if settlement comes about; but there is not much being carried on now.
 453. Are you living on the river? Yes; right on the bank.
 454. What is your experience of the river as a mode of conveyance? It is very good when it is up, but there is no depending upon it.
 455. How many times would it have been possible for you to get produce away by the river in a given number of years? About every other year. You cannot rely on a full river every year. The river may be impassable for two, three, or four years at a stretch.
 456. Therefore, there is no dependence to be placed on the river as a means of carriage? No.
 457. I suppose it would not suit you to have your wool lying on the banks for any length of time? No; we should have to get it away by teams.
 458. Would a railway in any other direction suit you as well as one from Narrabri? No; my business relations are with the Hunter River valley, Maitland, Newcastle, and Sydney.
 459. Do you know anything of the country between Walgett and Narrabri? I have been over it once or twice.
 460. Would you call the country on the south bank of the Namoi good country all the way through to Narrabri? It is fairly good, except in the scrubs.
 461. Do you think the open country would be taken up before the scrub? It would depend on whether the man taking it up had the means of improving the scrub land and putting it to profitable use. As it is, it is not of much good, except for the timber.
 462. Do you wish to say anything further? I may state that on two occasions I have grown grapes, pears, peaches, nectarines, quinces, oranges, and melons. I have also grown cabbages as high as 3 lb. weight.
 463. Where do you get a market for them? Locally.

Robert John Polt Higgins, manager, Warren Downs, Walgett, sworn, and examined:—

- R. J. P. Higgins. 464. *Chairman.*] How long have you resided in the district? Twenty-two or twenty-three years. Warren Downs is situated south-westerly from Walgett, beyond the Castlereagh.
 9 May, 1898. 465. How far are you from Coonamble? Seventy-five miles.
 466. Did you ever send any wool that way? Yes; once to Quirindi. I usually send to Narrabri and Nevertire.
 467. What is the distance of the homestead from Nevertire? 114 miles.
 468. What would you pay for carriage from your station to Narrabri? £3 10s. a ton. A railway into Walgett would save me 74 miles of land carriage; but some of our land lies closer to Walgett than that. A railway to Walgett, estimating the land carriage only, is 35 miles better than one to Coonamble. Walgett would be our best outlet.
 469. Are you prepared to express an opinion with regard to any crops in the district? Yes; I have grown wheat and oats for hay. My experience is that one crop out of four fails. The rainfall at Warren Downs is 2 or 3 inches more than it is at Walgett. I have tried a small patch of lucerne, and I found it succeeded very well; but it was partly irrigated.
 470. What do you call a crop? Two tons to the acre.
 471. What kind of soil do you grow upon? Chocolate soil.
 472. How far are you from the river Barwon? The shortest distance is 9 miles.
 473. Do you ever send your wool down the Barwon? I have sent it down twice.

474. Was that method of carriage satisfactory? No.
475. Why do you prefer land carriage? When the Barwon is high enough it prevents us getting to it in consequence of it flowing into a branch.
476. What is your experience of the traffic on the river? I have sent by river twice; but it is more costly to send that way than by road, and it is also more uncertain.
477. Do you look upon the river as a satisfactory outlet for the district? No; it is too uncertain. We want it most in time of drought, and then it is dried up.
478. Have you ever seen wool lying on the banks of the river? Yes; I have seen 200 bales lying there for three months, and then it had to be carted away to Nevertire, and sent to Coonamble. If a line to Walgett were constructed we should use it considerably for wool, and it would enable us to fatten stock. As it is, we have to half fatten them here and then to send them to Liverpool Plains. With regard to our station at Liverpool Plains, we use Newcastle as our shipping port; but we are not able to do that from Warren Downs. If a railway were constructed we should save the distance from Newcastle to Sydney. I desire to emphasise the fact that, in my opinion, Newcastle will eventually be the port of shipment for this portion of the Colony.
479. Would a railway to Pilliga be of any service to you? Not the slightest. A railway would be of considerable advantage to us in moving starving stock. In times of drought we would send the stock to the mountains beyond Manilla. Even without a railway into Walgett we have frequently used a portion of the north-west line in order to reach that place.

R. J. P.
Higgins.
9 May, 1898.

George Wilkins, saw-mill proprietor, Walgett, sworn, and examined:—

480. *Mr. Fegan.*] Where do you get your timber? Between Pilliga and Come-by-Chance.
481. What class and quantity of timber do you get? Nearly all pine; it is chiefly used for building purposes.
482. How do you dispose of your sawn timber? Around here, and out towards the Queensland border.
483. Do you ever send it to Narrabri? No; the distance is too great.
484. How would the construction of a line help your business? I would get as many logs as I required at a cheaper rate than I do at the present time.
485. What do you pay now for the carriage of 100 feet superficial? It costs me 30s. a ton from Pilliga to the mill.
486. How many men do you employ? An average of four or five at the mill; but from twelve to fifteen altogether.
487. Do you employ your own teams for carting timber? No.
488. If a railway were constructed would it be a means of extending your trade by reducing the cost of carriage on timber? It would, and as a result I should employ a greater number of hands. Last year I sold 307,687 superficial feet of timber, or 615 tons. If I could have supplied all my orders, I could have sold double that amount; and even then I should not have supplied the district with all the timber it required.
489. Are there any other saw-mills besides your own in the district? Not nearer than Come-by-Chance.
490. Would cheaper carriage be the means of giving the people cheaper timber? It would. There is no timber about here; consequently, I have to go to Pilliga for it. There is no timber out towards the Queensland border, and I should have a good trade with the people in that direction.
491. What is the nearest point from which you trade? At present, a distance of 50 miles; that is the nearest point from which we get pine, and we get ironbark 60 miles away.
492. Have you any land? Yes, 100 acres.
493. To what use do you put it? I have grown a little hay—about 7 acres.
494. What was the result? I got from 2½ to 3 tons an acre from it.
495. Are you ever short of timber at the mill? Nearly always. I cannot get sufficient teams to bring it down. The roads, at times, become impassable, and in the wool season the teams go away. I consider that the consumption of timber last year would have been fully 2,000 tons in building alone, if there had been a railway; then, of course, there are bridges and other works with which I have nothing to do.
496. Do you think the condition of the roads alone keeps Walgett in a backward state? Yes.
497. Have you ever sent timber down the river? No.
498. From where do the people of Brewarrina get their timber? From Bourke, I think.

G. Wilkins.
9 May, 1898.

Charles William Macauley, butcher, Walgett, sworn, and examined:—

499. *Mr. Hassall.*] From where do you get your fat stock? From pretty nearly the whole of the district.
500. Would a railway from Narrabri to Pilliga be of any service to you in your business? No; not unless it came to Walgett.
501. How would it benefit you then? It would bring more population to the district, and if you wanted to get stock in or send them away you could do it much easier.
502. Do you send any fat stock to Sydney? No; but I hope to do so.
503. Have you heard the evidence given by previous witnesses as to the difficulty of getting small quantities of stock away? Yes.
504. Can you corroborate that evidence? Yes. There are many selectors who have (say) 400 to 700 sheep, but that number is not sufficiently large to be sent to the nearest trucking station. If, however, we had a railway to Walgett they could be sent away without difficulty.
505. As a butcher, you know that it is well to get your stock to market in good condition? That is so. Even if a road is in first-class condition stock fall away.
506. Is this a part of the country which suffers from periodical droughts and floods? It is.
507. Do you think the construction of a railway would mean the saving of stock in bad times? Undoubtedly. In droughty times stock are kept in the hope of rain coming, and then when they are moved they are in such a weak condition that they die.
508. Are there many fat stock coming from or going to Narrabri? There are a good many coming through Walgett to Dubbo, Mudgee, and Narrabri. Queensland fat cattle, as well as large lots of fat sheep, come through Walgett.

C. W.
Macauley.
9 May, 1898.

- C. W. Macauley. 509. In the event of a railway line tapping this district, do you think that stock would be trucked here? Yes.
- 9 May, 1898. 510. From your knowledge of the country and the stock traffic, from a north-westerly direction, you look upon this, I suppose, as the natural point to which they would make in order to get to the railway? That is so.
511. By what route would they come in? They could come through Goodooga, and also by the Lightning Ridge track.
512. Would a railway to Collarendabri intercept the stock? No, but it would intercept the stock nearer to the border.
513. Do you know the country about Walgett? I know all the country lying north and west from Walgett. It is good fattening country, principally occupied by homestead lessees and station holders.
514. Has settlement increased very much during your knowledge of it? It has. A great number of homestead leases have been taken up during the last ten years, and the holders of them appear to be doing fairly well. They devote their attention principally to wool-growing and fattening.

TUESDAY, 10 MAY, 1898.

[The Sectional Committee met at the Court-house, Walgett, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

Thomas Burke, selector, Walgett, sworn, and examined:—

- T. Burke. 515. *Chairman.*] Have you any statement to make? Yes. For the last 6 years I have resided in the Walgett district. I hold 2,200 acres of land, and am engaged in wool-growing principally. I think, in common with many others following the same occupation, that if we had a railway I would be able to combine agriculture with pastoral pursuits, and make both profitable to myself and the district. I am of opinion also that the majority of small holders of land here would turn their attention to fattening stock if we had the railway, because the land is of exceptionally good fattening properties, and we would be able to carry more stock on the land, because it would have a spell at intervals. At the present time I am running 1,500 sheep on my land, and I am of opinion that any fair land in the Walgett district of the same area would do the same, except in very severe seasons of drought. When I speak of agriculture, I may tell you that I have seen some nice growing crops of wheat in this district, as well as some very good grain. Taking into consideration the great amount of settlement there will be in the near future, there should be no doubt as regards the railway being a paying concern from the start.
- 10 May, 1898.

William Godfrey Ferris, homestead lessee, Geronga, near Walgett, sworn, and examined:—

- W. G. Ferris. 516. *Chairman.*] Where is Geronga? Thirty miles north from Walgett.
- 10 May, 1898. 517. If a railway were constructed to Walgett would you use it? Yes.
518. How far are you from Brewarrina? One hundred and thirty miles.
519. Are you able to make any statement with regard to the possibility of the navigation of the river Barwon? I have been in the district for twenty years, and I remember the first steamer that went up to Collarendabri—the “Brewarrina”—commanded by Captain Greville. He petitioned the Government to build a wharf, and to make Collarendabri the head of navigation. The boat started to come back, but she never got to Brewarrina; she got stuck, and was lying on the rocks when they took the engines out of her and started a saw-mill in the bush. She never got over the rocks, and was there for three or four years.
520. When was that? After the flood went down in 1879. In 1883, 1884, and 1885, the river was absolutely dry for a long time. You could walk over half a mile up the river without dirtying your boots. Judging from the past, there would be long periods during which the Barwon, at Walgett, would be absolutely dry.
521. Do you use the river? I have used it for wool when carriage has been very high, and when I could. When the river is high and the steamers are coming up, it means bad routes to Narrabri, and that means delay in getting your wool to market; consequently, we use the river sometimes. In my opinion the river is a sort of “off-chance.”
522. If a railway were constructed to Walgett, how far towards Goodooga would the produce of the district come to Walgett? I think a good deal would come from the other side of Goodooga.
523. Supposing there were a railway at Walgett, also at Coonamble, but not at Brewarrina,—take the present railway system which furnishes you with a railway at Warren,—imagine one then at Coonamble and one at Walgett—how far towards Goodooga would stuff come to Walgett? I think from the other side of Goodooga.
524. As far as Brenda? Unquestionably, and a good deal up to the east of that as well.
525. Take the case with a railway at Brewarrina? I think with a railway at Brewarrina the Goodooga traffic would come here.
526. How far is Goodooga from Brewarrina? Eighty miles.
527. And how far from Walgett? Ninety miles.
528. For practical purposes, then, they are equi-distant? Yes.
529. Then the question resolves itself into a matter of freight from Walgett to Newcastle or Sydney, or from Brewarrina to Sydney, taking into consideration the difficulties which would be experienced from Goodooga to Walgett as against Goodooga to Brewarrina? Yes.
530. Which is the best route to travel? I think the produce would come Walgett way, simply because it would touch the Newcastle port.
531. Is there any difference in the rates? I think they are very much alike.

532. Where will the Angledool produce go? To Walgett—that is, if there is a railway. It will probably pass to Callarendabri, if there is not a railway. W. G. Ferris.
533. What amount of stock have you? 12,000 sheep. 10 May, 1898.
534. What is your carrying capacity? Three acres to a sheep.
535. Have you anything further to say? I am quite sure a railway to Walgett would induce settlement of a good class. There is at present a tendency to go in for agriculture. Again, if we had a railway to carry our stock in time of drought, they would have a better show of living than if they had to walk to fresh pasture. Again, if we had a railway, a man could send a single store sheep to Sydney in better condition than we can now land prime fat sheep.
536. What do you pay for road-carriage? Three shillings per cwt. to Narrabri, but I have paid as much as 6s., 5s. 10d., and 5s. 8d. during the last two years.

Thomas Clarke, secretary, Railway League, Walgett, sworn, and examined:—

537. *Mr. Fegan.*] Have you any statement to make? Yes. The estimate I am about to give you is, in my opinion, not the probable but the actual traffic which must of necessity accrue to a railway constructed between Narrabri and Walgett. The length of such a line would be 113 miles, and would cost, at £2,297 per mile, £259,597. The annual cost of such a line would be:— T. Clarke.
10 May, 1898.

Interest on capital outlay, at 3 per cent. per annum	£7,786
Cost of maintenance, &c.	10,547
Total annual cost	£18,333

My estimate of traffic is:—

2,566 tons goods from Sydney, at £1 16s. per ton	...	£4,618
600,000 feet timber from Pilliga (2,400 tons), at 5s. 3d. per ton	...	630
4,685 tons wool, at £1 3s. 9d. per ton	...	5,564
3,108 trucks sheep, at £2 5s. per truck	...	6,993
100 trucks cattle, &c., at £2 5s. per truck	...	225
Mails, 113 miles, at £12 per mile	...	1,356
Coaching, 1,500 at 17s. 8d.	...	1,325
Come-by-Chance	...	593
Goangra	...	654
		£21,958
Profit per annum	...	£3,625
		£21,958 £21,958

As to the reliability of these figures, I might mention that they took me over two months to collect. Mr. Harper obtained his estimate whilst remaining in Pilliga two hours. I will now explain how I arrive at my figures. The cost of construction is based upon the Railway Commissioners' report on the line from Narrabri to Pilliga, and as there would be less money per mile spent upon bridges between Pilliga and Walgett the estimate must be rather over than under the actual cost. The interest and cost of maintenance is also based upon the Commissioners' estimate. The tonnage from Sydney I have taken from various sources, among others the Commissioners' report. With regard to the timber, Mr. Wilkins, who owns the sawmill here, will swear that he receives this quantity annually, and if a line were constructed the tonnage would double. The estimate of wool and fat sheep and large stock, I have made up principally from replies to circulars, and where those were wanting, from returns made to the Pastures and Stock Board. Returns made to this Board would never be exaggerated. My estimate shows the wool got from 1,522,406 sheep. The stock returns for 1896 showed 1,978,088, and 4,685 tons of wool from such a number of sheep is well within the mark. I say there are 279,750 sheep in 3,108 trucks forwarded. The stock returns showed that 255,000 fat stock travelled through this district, and there is not the shadow of a doubt that they would be all trucked in the event of a station being in Walgett. In fact I have no hesitation in saying that Walgett would be one of the very largest trucking stations in the Colony. The mails I have also estimated at the lowest price, £12 per mile. We are now receiving about, on the average, 19 cwt. of mail matter per week and, if this continues, the Railway authorities would charge £20 per mile, which would increase my figures by £904. My estimate of the passenger traffic is based upon returns made by the police for the year 1896, which are as follows:—

Walgett Police District	...	1,492
Angledool	...	300
Goodooga	...	450
Grawin	...	300
Carinda	...	320
Total	...	2,862

Leaving out Goodooga and Angledool we would be justified in estimating the population at 2,112, and one single fare for each unit. I have only taken three quarters. The amounts set against Come-by-Chance and Goangra are arrived at by the same process. You will please note that I have allowed nothing for any probable traffic from Queensland, which would increase my estimate to a considerable extent, and I have not included Pilliga or Wee Waa. The last returns made by the police show a population of 1,935 in the immediate vicinity of Walgett, 800 of that number being in Walgett proper. This is made by a house-to-house canvass. The area of alienated land in this Police District is 458,343 acres; and Crown lands unalienated 4,315,981 acres; total 4,774,324 acres held by 340 persons (from a return made to Superintendent of Police, Bourke, 10/2/97).

538. How do you define your district? The district would be from Walgett to Dunglear station, thence west to the Grawin. From the Grawin we run down the Narran to a point between Boorooma and Walgett; thence across the river up the Castlereagh on the Marthaguy Creek to Carinda; thence across to Combogolong, through to Goangra, Kercargo, and Cryon; and thence up to Dunglear.

T. Clarke. 10 May, 1898. Dungalear. In the Walgett land district, there are 171,607 acres available for application under the conditional purchase clauses; 8,167 acres for homestead blocks; and 2,638 acres for settlement lease farms; total, 182,412 acres; and in Walgett North, 33,740 acres for homestead lease. With regard to lands coming on for settlement, most of the leases in the Walgett district were extended until 1899 and 1900; but during the next six months, 59,000 acres on Bugilbone, 22,000 on Bogewong, and 31,000 on Euroka; in all, 112,000 acres will probably be opened for various classes of settlement. I will now deal with this great maritime highway, the river Barwon. Mr. Hickson, in his report, states that the river has been navigable seven times in fourteen years. If that is a fact, can any person look upon such an irregular mode of transit as an actual competitor with a railway. A line built *via* Narrabri would be to Newcastle (which I look upon as the natural outlet for the produce of this district) 362 miles, and to Sydney 462 miles. Produce sent *via* the river, thence per rail from Bourke, would have over 500 miles of river carriage, and then 503 miles of trainage, as against a total carriage of 462 miles direct from Walgett to Sydney, or 362 to Newcastle. The river Darling was not navigable higher than Wilcannia for four years continuously in the early eighties, and this may occur at any time in the future, in the event of the river being seriously contemplated as a competitor. I would draw your attention to the fact that there is no get-away for stock, which would be a source of revenue to a railway. With carriage at £2 10s. per ton from this district to Narrabri, no grazier, even with his shed on the bank of the river, would send his wool by water, as this mode of carriage is not only uncertain but unsafe. Mr. Harper, in his evidence, stated that it was his opinion that if a line were constructed to Pilliga and Walgett two-thirds of the traffic would pass Newcastle and go on to Sydney. Walgett, if given railway communication, should be approached *via* Coonamble. That is to say, that the people of the district of Walgett should send two-thirds of their produce 24 miles further than there was any necessity for it to go, and one-third 224 miles further. In his evidence before the Public Works Committee, when that body was inquiring into the Narrabri-Moree line, in answer to questions 619, 620, 621, and 622, page 25, Mr. Harper stated:—

Some traffic comes from Pilliga, not all of it? I understand some goes by river to Walgett, and thence to Bourke. Is the trade from Pilliga gradually being diverted down the river? I think it has been affected during the last year or two.

Is that state of things likely to continue? Yes; if my information is correct there will be a big diversion of trade in the future.

I think no gentleman who would make such a rash statement as that should be allowed to report as to the probable traffic of any line in the back blocks. I now give an unqualified denial to that statement. There never was and never will be one pound of goods forwarded down the river Namoi from Pilliga to Bourke. At one time, in fact on 5/2/98, I noticed the river had been navigable for over a month, and a steamer never came up, although the town was then without forage, flour, potatoes, kerosene, &c. I anticipate a profit on this line on account of the profit earned by the Werris Creek to Narrabri, and the Narrabri to Moree lines. The former in 1891 showed a profit of £907; in 1892, of £9,432; in 1893, of £14,000; and in 1896, of £10,488; and in speaking of pioneer lines the Commissioners state:—

The two latter lines indicate a good prospect, more particularly the Narrabri-Moree line.

To prove the prosperity of our district I would point to the financial healthiness of our local institutions. The amount received at the local Lands office for the year 1897 was £18,499 6s. 4d., and, for the quarter ending 31st March last, £5,468 16s. 10d. The P. & A. Association takes rank with such towns as Dubbo, Forbes, Glen Innes, Hay, Junee, Moree, Orange, Temora, and Warren. The subsidy on money received by institutions granted to Sydney School of Arts was in 1895, £980, Walgett, £764, and the next highest was Newcastle, which only received £271. The Hospital ranks with the like institutions in Armidale, Corowa, Scone, Wallsend, Warialda, Windsor, and Young. The amateur and professional race clubs are both in a flourishing condition. In considering the claims of other towns to railway communication I would respectfully point out to the Committee that there are public buildings in Walgett worth at least £10,000, and about £3,000 has just been laid out in putting them in thorough repair. If a railway were constructed to any other town in the district it would not only destroy the private vested interests but would also render these buildings useless. With regard to the Euroka Station, which has sent about 8,000 stock away for some years, I may state that it is anticipated that this year 12,000 stock will be sent away. Wheat and lucerne are being put under crop on the station. The sum of £2,000 has been spent on a bore on the station, and £4,000 worth of rams have been purchased. I have received the following letter from Mr. J. S. Gordon, who is unable to be present:—

It is so well recognised by all pastoralists that to carry on grazing in this district with any degree of safety it is absolutely necessary to be connected by rail with the nearest agricultural districts in order to get cheaper food for man and beast, that it would be unnecessary to repeat it. Each district depending entirely on its own resources is at a great disadvantage. New England is agricultural and not adapted for grazing on a large scale on natural grasses. This district on the other hand is entirely pastoral. The uncertain climate renders agricultural pursuits (unless combined with irrigation) out of the question, and even pastoral pursuits very risky by reason of the periodical droughts. The two districts combined, if connected by a means of cheap transit, would be worked with distinct advantage to each. Evidence of this may be found in the case of Riverina during the recent drought, when thousands of the most valuable stock (the like of which would take a lifetime to regain) were saved from starvation by the feed introduced from agricultural districts by railway. Had there been no railway the stock would have entirely perished. Settlers in this district are desirous of improving their stock to a much higher degree, but as a severe drought means annihilation, there is no encouragement to do so. And, in fact, a man would be foolish to attempt improvement at much cost until there was some means of either bringing food from the other districts or taking the stock to other pastures. It is only very old residents in this district that have any conception of the severity of the droughts, and the utter impossibility of the present numbers of stock to exist should ever these occur, and no doubt they will be repeated sooner or later, and when they are it will be a revelation to all and a punishment to many.

539. What is the area of Mr. Gordon's holding? About 180,000 acres, which carry 60,000 sheep.

540. How far is his place from Walgett? About 40 miles.

541. Would his wool come to Walgett if there were a railway here? Yes. I may state that Mr. Gordon, at a recent meeting in Walgett, stated that under no circumstances would he again use the river; it did not matter if there was not a railway, and the river was navigable, he would not use it. In my opinion the whole of the Queensland traffic in stock will come by Walgett, that is when crossing near Brenda or Heeble. It will come here in preference to any other town. I have the declarations of seven drovers, who state that they prefer the stock routes leading into Walgett to the stock routes leading into any other town. [*Vide Appendix.*]

542. I think you will admit that your estimate of traffic is very much higher than that of the Railway Department? Yes. 543.

543. Do you take credit in your estimate for the Collarendabri traffic? No, only for the traffic which I think would come to this town. T. Clarke.
544. Can you define the area from which you expect to obtain traffic? I will start from a point up the Namoi, Come-by-Chance, or Bucklebone. I cross Bucklebone to Yarraldool. 10 May, 1898.
545. Then your estimate does not include Pilliga? No, nor Wee Waa, but from Come-by-Chance up to Walgett and further. I cross the river at Bucklebone to Yarraldool and Cryon; thence north, taking in Mercadool station.
546. Do you not see that you are trespassing on the Collarendabri traffic? I may state that Mercadool is rather closer to Walgett than to Collarendabri, and I have it on the highest authority that if a railway were constructed the manager of that station would send his wool to Goangra. Crossing the river at Mercadool I go north to Dungalear and Dunumbral.
547. Do you take in Weetalibah? Yes.
548. And Goodooga? I do not go so far as Goodooga. We cross the river to Quirindi, go through Combogolong, taking in a portion of Bullorora (that is the conditional purchase of Bullorora), and thence to Bucklebone. Although I have not included Bullorora I may state that there are £300 worth of traffic there, which would come to any line built between Pilliga and Walgett. I am assured by persons on that station that if there were a railway to Coonamble, and also to Walgett, they would join the line to Walgett, either at Come-by-Chance, or Goangra, in preference to going to Coonamble.
549. How far is Mercadool from Collarendabri? About 28 miles.
550. That point, then, will equally divide the traffic between Collarendabri and Walgett? Yes. We are 22 miles from Mercadool station, and it is 28 miles from Mercadool to Collarendabri. I have just stated that a gentleman at Mercadool told me that he would use Goangra station if a line were built to Walgett. Mercadool is 17 miles from Goangra.
551. Is there a bridge there? Not at present.
552. Then you would expect one there? I do not say so. I think the Railway Commissioners would ask for it as soon as the line was constructed. It would be to their advantage to have it.
553. You think, then, that you can fairly claim for your estimate of traffic the districts you have defined? Yes.
554. Is there anything else you wish to state? As showing the amount of stock which would come this way from Goodooga and districts in the vicinity of Goodooga and Angledool, I may state that very recently 3,000 large stock passed through Walgett to Newcastle or Sydney. They were to be trucked at Narrabri. Personally, I believe the whole of the traffic from Queensland within the vicinity of Goodooga and Angledool would come here.
555. Have you any idea of the tonnage of goods coming into Walgett for distribution? About 1,000 tons per annum for the town alone.
556. I suppose a large number of the stations are supplied direct from Sydney and other places? The station I was speaking of gets about 50 tons per annum, and, of course, there are several stations larger than that.
557. Have you any idea why your estimate and that of the Railway Department differ so materially? I could not tell you why.
558. Do you think the estimate of the Railway Department is an under-estimate? I think it is. I should like to point out that no one has been here to gather evidence, so that the only evidence they could get is purely approximate. When evidence is taken by the Railway Department it is simply oral. No returns in regard to stock are given. They simply examine, and perhaps only a few would come in to give evidence.
559. Have you any doubt as to the accuracy of your estimate? If you send a man here who is not under Departmental influence, he will find that my figures are almost correct. Such a man would be a disinterested party, criticising the estimates of a disinterested party.
560. Are you a disinterested party? I am. My only desire is to place the case before you in as true a light as possible. I may say that I, myself, have not an acre of land in the district.
561. You have stated that you obtained several returns from the Stock and Pastures Board? I got the returns from the Statistical Register, and also from the Stock Inspector who was here then. Some of them I got from the Stock and Pastures Board, and returns made to that Board are never exaggerated.
562. I suppose you have not been able to get anything like accurate information as to the total tonnage of goods coming into Walgett and district? I got some of the returns from the Railway Commissioners.
563. Were you satisfied to accept their figures? No; simply because the tonnage we receive here is not always received *via* Narrabri. For instance, Mr. Higgins receives some of his tonnage from Nevertire. If the river happens to be up he would get goods from the river, and sometimes from other directions. The tonnage supplied me is by the settlers themselves.
564. Do I understand you to say, then, that you have no idea of the total tonnage of this district? Only approximately.
565. What is it approximately? From Narrabri it is 2,566 tons. I should like to point out that I have put everything down at through rates; and you will allow that if a line is constructed to Walgett, or even to Pilliga only, the Department will charge for a certain period local rates, which will make my estimate greater than it is.
566. Do you think the people of Walgett would be prepared to pay a local rate? I am not prepared to state that, but I am sure the Railway Commissioners would charge it.
567. If it were shown that the cost of construction would exceed the revenue by a considerable amount, do you think the people of Walgett would be prepared to pay a local rate? I think they would; in fact, I am sure of it.

Wallace Ryrie, Inspector of Stock, Walgett, sworn, and examined:—

568. *Mr. Hassall.*] Have you any information to furnish to the Committee with regard to stock in this district? Yes. W. Ryrie.
569. What are the boundaries of your district? From Mungindi, in the north, the crossing on the Narran, towards Goodooga, this side of Come-by-Chance, and Shingle Hut. 10 May, 1898.
570. How far west do you go? To the Macquarie.
571. What area does your district embrace? About 4,820,305 acres. The stock return last year numbered 7,812 horses, 12,230 cattle, and 1,901,243 sheep. That is 76,845 less sheep than were returned last year. 572.

- W. Ryrie. 572. What is the country used for principally? Principally for grazing sheep.
 573. Have you any idea of the number of stock travelling through the district? The number of stock I have passed through Walgett within the last eight months is as follows:—horses, 1,004; cattle, 15,601; sheep, 744,647.
 574. Where did they go to principally? Principally to Muswellbrook, Narrabri, Dubbo, and Mudgee. Of course there are numbers of sheep that have gone through that I have not seen.
 575. What about the fat sheep? The fat sheep that have passed out of the district number 129,235.
 576. Where have they gone to, principally? To Narrabri, to be trucked to Homebush. A few have gone to Dubbo.
 577. What proportion of sheep do you think would go across towards Moree and truck there? If there had been a railway here I believe nearly the whole of the 129,235 fat sheep would have been trucked here. I believe that number of sheep would occupy about 1,430 trucks.
 578. Do you think the construction of a railway would result in many store stock being sent away by rail in bad times? I think so.
 579. What is the general practice here with regard to store stock in bad times? I have only been here since August, but I know that in other parts it is customary to send them to where there is grass.
 580. I suppose the common practice is to wait until the last moment in the hope that rain will fall? Certainly. Frequently they are unable to get them away owing to waiting too long. The number of fat cattle which passed out of this district last year was 1,734. Nearly the whole of them were trucked at Narrabri. They would require about 200 trucks. Of course, a small dealer might have 100 or 200 fats, and it would not pay him to travel them by road. He might, however, join with others and get a number of trucks in order to send them away.
 581. Have you travelled over the district pretty well since you have been here? Yes; but not over the whole of it. The following are the stock routes in my district which connect with Walgett:—Coonamble, Narrabri, the stock route on the opposite side of the river by Bucklebone, Mungindi, *via* Collarendabri, Angledool, and Goodooga.
 582. Where would the stock which you say would be trucked at Narrabri come from? From Boorama, about 50 miles from here; South Grawin, out towards Goodooga; and Gingie, about 5 miles from here. There are also a number of small lots from different places.
 583. Do you get any from the Castlereagh? Yes; low down the Castlereagh, but I could not tell you the particulars from memory.
 584. From how far towards Mungindi do the fat stock come? Some came in the other day from Mogil Mogil, 20 miles on the other side of Collarendabri.
 585. Were they going to Narrabri to be trucked? Yes.
 586. At any rate, you could only look to about halfway between Walgett and Collarendabri for stock to come in this direction to be trucked, and the country to the north and down the river? Yes, about half-way.
 587. Are you aware that there are a number of settlers on the north side of the river? Yes.
 588. And that the country is becoming thickly settled by small holders whom a railway would benefit? Yes. Of course, the reduction in stock has been a great deal less this year than it was last year, when the season was so bad.
 589. Are the stock in this district pretty sound? In my opinion they are.
 590. Is there no disease amongst them? There is a little, but generally speaking they are sound. I look upon this as a good sound stock district.

Charles James Druitt, bank manager, Walgett, sworn, and examined:—

- C. J. Druitt. 591. *Chairman.*] How long have you been in Walgett? Eight years, and twenty-four years on the Namoi.
 10 May, 1898. 592. Are you prepared to make a statement with regard to the financial state of the district? Yes; I am prepared to say that the financial state of the district is absolutely sound. I may add that if a railway should come in any other direction than on the south side of the river the vested interests of Walgett would be ruined—of course, it would mean taking the township and business to another part. Supposing a branch were made to Eurie Eurie, then the business of Walgett would go to Eurie Eurie, and the town would be practically ruined.
 593. How far away is Eurie Eurie? Ten miles.
 594. What is your opinion with regard to the country on the north and south bank of the Namoi? The country on the north side is excellent country, and that on the south side, with the exception of a strip of land between Milkimia and Pilliga, is very good indeed. That land would, I suppose, make good agricultural land if it were cleared.
 595. Is the business of the town growing? Yes, as far as my experience goes. I should estimate the turnover of business in Walgett to be about £20,000 a week.

Wallace Webster, Inspector of Conditional Purchases, Walgett, sworn, and examined:—

- W. Webster. 596. *Mr. Fegan.*] Have you any statement to make? I desire to say something with regard to the river traffic. I have known the river since 1882. In that year I went to a station below Bourke, and was handed bills of lading for shearing supplies, which were received four years afterwards. I may state that on the boat carrying the supplies there was timber, which was intended for the building of an hotel in Bourke for Mr. Huggins. The timber was so long coming up that he bought the Royal Hotel, and spent most of his money before the timber arrived. In 1884 I was in charge of stock there, as the overseer of the run, and in that year we had men in the river to keep the sheep from crossing. We were compelled to erect fences in the bed of the river. We loaded the 1883 clip of wool, and it remained on the barges below the Teraldbegar, at the mouth of the Warrigal, for twelve months—in fact, the next year's clip met that wool in the English market. From 1882 to 1886 there was really no river which you could depend upon. In 1891 I was at Walgett, and saw a steamer there at the bridge, which is as far as a boat can come up. During the last two years there has been a very unreliable river. Really, the river is only reliable for heavy traffic to Wilcannia, and even that is not certain. With regard to the Walgett district, it is very good carrying country, but in a long drought it would not be reliable, on account of there being no scrub. 597.

597. What noxious weeds have you? The Darling pea is the worst. I believe the construction of a line to Walgett would tend very much to increase the carrying capability of the country, and it would also tend to settlement. The land, compared with the Bourke district, is very much ahead of that district, by almost two to one. W. Webster.
10 May, 1898.

598. Their average is 3 acres to a sheep? That is only by returns of sheep coming to and passing through the district.

599. Do you think the Walgett district is, acre for acre, twice as good as the Bourke district? It will be when it is improved and ring-barked, and it is being very much improved now.

600. Do you think the leasing of the travelling stock routes prevents any stock coming to Walgett? I do not think so.

601. You say that the river cannot be relied upon for carriage? It cannot, so far as my experience of sixteen years upon it goes. I may state that I am an old farmer from Victoria, and have seen good crops grown at Wilcannia, which has 11 inches of rainfall, compared with a rainfall of 20 inches at Walgett. I think farming would pay here, to a certain extent, on the east side of the river.

602. North of the Namoi? Yes; I think they would get three crops out of five.

George Lionel Hember, manager, Flemington Station, and secretary, Selectors' Association, Walgett, sworn, and examined:—

603. *Mr. Hassall.*] Are you able to give the Committee evidence with regard to the settlement which has taken place in this district? Yes. G. L.
Hember.
10 May, 1898.

604. For how long? The last eight years. The country taken up amounts to about 200,000 acres—that is land taken up by conditional purchase, conditional lease, and settlement lease. Ten miles from Come-by-Chance, on the Castlereagh, including Yarrandah, there are 140,000 or 150,000 acres. The country on Eurie Eurie and Goangra would make up more than 200,000 acres, which have been taken up by selection during that time.

605. Is there a pretty good demand for land? Yes; the whole of Yarrandah was thrown open a short time ago, and every acre was rushed. Some land is to be thrown open at Euroka shortly, and many people are waiting for it to be made available.

606. What is the principal occupation of the settlers? Wool-growing at present.

607. Are there any evidences of agricultural settlement? Yes; last year I, myself, put in 25 acres. This year I am putting in 50 acres, and am preparing another 100 acres.

608. Do you know anything about the crops which have been grown? They have been very satisfactory with us.

609. What do you grow? Wheat and oats. Wheat is the more successful. Of course, it is only grown for hay. Last year our average was 2 tons to the acre of wheat and oats combined.

610. Will the land which becomes available at Euroka be within the influence of the bore? No. Of course most of the land to be thrown open has frontages to the Barwon.

611. Do you think the grazing qualities of the land are pretty good? Yes, exceptionally good. I think you could put a sheep to 1½ acres on a greater part of it.

612. Have you heard it stated that if a railway were constructed the land might be stocked up to its full carrying capacity? Undoubtedly it could be. With regard to the trucking of stock, I may state that it frequently happens that a man could send 200 or 300 sheep away, but it would not pay him to send that quantity by road. Consequently, they have to be kept and sold as stores. With regard to the river, I may mention that in 1884 I sent 40 tons of wool to it, and paid £1 per ton to cart it to Walgett. We got it to the banks of the river and covered it with tarpaulins. All at once the water ran out of the river, and the steamer did not come up; and it cost us £6 10s. a ton to cart the wool to Narrabri. The river is not reliable. We have only been able to use it on one occasion in eight years. Sometimes when there is water in the river it goes down before the wool can be shipped. I have no doubt that with railway communication a great deal more agriculture would be carried on. Several people are going in for agriculture this year—that is, for hay. Of course it is of no use growing anything else at present. The land, however, will grow almost anything. In a fair year we can obtain very good crops.

Finley Macrae, stock and station agent, Walgett, sworn, and examined:—

613. *Chairman.*] Do you wish to express an opinion with regard to the relative values of the country about Walgett and Bourke? I know both districts very well, and there is no comparison between the two. The Walgett district is by far the best. There is a great extent of good land right to the Queensland border. In my opinion 2½ acres to a sheep is a fair estimate of the district generally for about 30 miles round. If people could send their stock away when they wanted the land might carry more. F. Macrae.
10 May, 1898.

614. What advantage would it be to stockowners to establish a trucking station at Walgett? I should think there would be quite as much if not more stock trucked from Walgett than from Bourke. The district is better, and we have some really good stock routes from Queensland into Walgett. They join at Goodooga and separate there again. There are two routes from there to Walgett, and the stock can travel on whichever is best.

615. Would they prefer to come to Walgett to going to Brewarrina? Certainly.

616. Does wool come to Walgett from Angledool? Yes, from Angledool, Bangat, Manilla, and a great many homestead leases. If there were a railway station here I think it would come all the way from Goodooga.

William Nicholas Willis, Esq., M.P., sworn, and examined:—

617. *Mr. Fegan.*] Have you any statement to make? I have no written statement; I have simply attended to ask you, as representatives of the Full Committee, to do that justice to us which has for a long time been delayed. Walgett is entitled to railway communication. Its importance and the revenue from Government lands in and about the town and district entitle it to better communication with the inner districts than it has at present. There are a number of leases to be thrown open shortly when they fall due. These lands belong to the Crown, and I have no hesitation in saying that long before they are thrown W. N. Willis,
Esq., M.P.
10 May, 1898.

W. N. Willis,
Esq., M.P.
10 May, 1898.

thrown open dozens of people will be waiting for them, and they will be quickly snapped up by the right sort of settlers—the people who make this or any part of the country by settling on small areas of land. A great deal of Government money has been spent in Walgett, and in any railway proposals which the Committee may suggest, I hope they will see the justice of recommending the running of a line right into the town. The people have spent a lot of money on buildings, and they have paid the Government a lot of money for their various allotments of land. The Government has spent about £20,000 in the town. It has its ordinary buildings here, and any stopping short of the line within a few miles of the town would certainly do a serious injury to it, and place me, as representing the district, in the position of having to oppose such a step. The people have been led to believe for the last twenty years that they will get railway communication, and that the railway will come right into the town. They have bought their allotments, and have built and settled here, and have put up with the hardships which are so well known to the people of the district, and if any stoppage of the railway within a few miles of the town takes place, it will be a repudiation, in the worst form, of a promise which, in my opinion, the Government has held out to us. I do not think you can travel in any portion of the Colony and see a richer and a better district than the district of Walgett. The lands are of the very best fattening kind. The district is highly favoured by nature with creeks, rivers, and branches. The land is well watered, and is more favoured by nature in that respect than many other portions of the Colony. If we had a railway here, these small areas, instead of being used for grazing purposes, for which they do not very well pay now, would be used as fattening areas. The stock would be fattened on these small areas, and would be sent to market to the benefit of the railway and State, and the man who is struggling on the land. As things are now, however, if a selector has 700 or 1,000 fat sheep, the mob is too small to go upon the road, and when they get to a railway terminus they have deteriorated as much as 3s. per head on the journey. That means an absolute loss to the whole of the people. It is a loss indirectly to the State, and directly to the man owning the stock. I have known stock to leave here “mud fat,” so to speak, and arrive at Narrabri absolutely poor, and be sold as stores. That should not be. If we had a railway it could be obviated. As I have already stated the lands are of the best, and we have been favoured by nature with artesian well supplies. We have very good supplies at the Euroka bore. We have one of the biggest supplies in the Colony at what is known as Bell’s bore; we also have another supply at Carinda. These supplies differ materially from the supplies of water which we get in Queensland, or even in some parts of the Colony of New South Wales. The moment the water out of these bores goes on the land it simply fertilises it, and the grass or herbage grows prolifically under its influence. In some places—the Native Dog bore, the Barrangun bore, and other bores in New South Wales and Queensland—the water is not so good for irrigation purposes; but here it is absolutely good. I was very much amazed, whilst at the Carinda bore to see the couch grass growing in the drain. It only proves that the water we strike by means of these artesian wells is going to revolutionise the condition of the whole of the district. I have no doubt that a railway to Walgett would pay; but even if it would not pay, I should have every confidence in the Committee recommending it as a national line, and in fulfilment of a promise so long made. The Northern district and Newcastle are entitled to the business of the Walgett district. We do a great deal of business with the north, and a line would simply add to the tonnage on the Northern line and to our commercial relations with Newcastle and surrounding districts. I have very strong objections to the line going from Mudgee. I think those objections were voiced by the late Mr. Eddy and his co-Commissioners, to the effect that that line would not stand the traffic. Then we have the proposed line from Dubbo. If we wait until the surveys take place, and the matter is decided, we shall not only be old men, but we shall be out with our friends on the plain. It is too far to look ahead.

618. If a railway were constructed to Walgett, from how far would the north-western trade come to the town? I think from Angledool, and this side of Narran. Geographically, that really belongs to us.

619. Would the trade of the western side of the Narran go to Brewarrina? I think that would be the dividing line.

Bertrand Sydney Martin, stock and station agent, Walgett, sworn, and examined:—

B. S. Martin. 620. *Mr. Hassall.*] How long have you been in Walgett? A little over twelve months; but I have been in the district for some years.

10 May, 1898. 621. What is the character of the country between Walgett and Wee Waa? I have travelled over the whole of it on each side of the river. On the south side from Wee Waa you come through the brigalow country across the Brigalow Creek. Then you get into the pine and sandy country, a lot of which should be good for agriculture. When you reach Pilliga you get into what may be termed a sand-bed, where you have 7 or 8 miles of inferior land. It is inferior for agriculture or grazing; but still there are some magnificent ironbark and pine forests upon it. Seven or 8 miles from Pilliga you get upon some good land, which opens right out to Coonamble, across the Castlereagh. There is country of a similar description right on to Walgett: You have very little flooded country to contend with—only the Bulgan Swamp, and I think a railway line would miss most of it. You have another mile or two of slightly flooded country between Walgett and Goangra. After leaving Wee Waa, on the north side, for about 6 miles, the country is often flooded. I have seen it in places as deep as 3 or 4 feet. That part lies between the Namoi River and the Pian Creek. At the back of Drilldool you get upon high land. From there you go to Millie, and into flooded country again—5 or 6 miles of it. I travelled through there in the 1890 flood. At Yarraldool there is a good deal of flooded country to contend with. I should think that on the north side there are from 20 to 30 miles of flooded country. You would not have many creeks to cross. I believe the railway would cross Pian Creek in two places. There is also the Gunnedah Creek and several other little creeks of no consequence.

622. Can you give any information with regard to the settlement on each side of the river? On the south side the settlement is becoming thick. From Pilliga, on the Coonamble road, there are a good many settlers. At the back of Goangra and Boolorora there are *bonâ fide* settlers.

623. Have you a knowledge of the settlement on the north side of the river? There is a lot of settlement on the north side. There is a lot of settlement on Pian Creek, within 20 miles of Wee Waa. There is a fair amount of settlement right through. The line would run through a good deal of settlement on the north side, but not more than on the south side.

624. I suppose there is a considerable demand for land on either side when it is available? Yes; but still, if a railway were constructed the whole of the land on the south side would, in my opinion, be utilized.

utilized. It is an unquestionable fact that most of that scrub land will grow wheat. Many people have small areas under cultivation, and the result shows that it will grow wheat. B. S. Martin.

625. How far is it from Walgett to Collarendabri? Fifty miles.

10 May, 1898.

626. Do you know the country in that direction? Yes.

627. Do you think that part of the country is entitled to railway communication? I think that a railway to Walgett will serve Collarendabri. If it comes on the south side to Walgett it will take in the greater part of traffic from Walgett to Collarendabri. People on the Thalaba, further in towards Millie, might not strike Walgett; but they might hit other points, such as Goangra, Come-by-Chance, and Pilliga. Pilliga would receive the greater part of the Burren, Yarraldool, Buckelbone, and Cryon traffic.

628. If you owned this part of the country would you build two railways? No.

629. Is the country on the north bank of the Namoi, running to the Barwon, good country? Yes; it is country suitable for settlement.

630. Does it produce a large amount of wool annually? Yes, and a considerable number of fat stock.

631. From your knowledge of the district do you think the north side of the river has any right to be considered? I will not say it has no right to be considered, but I think the south side should have the preference.

632. Considering that you are bounded by scrub all the way from Narrabri and below Pilliga, and in view of the possibility of a railway being constructed to Coonamble, do you not think that it might be advisable to take into consideration the necessity of providing some communication for the large settlement which is taking place in the area between the Namoi and the Barwon, and the Meehi? A railway constructed on the south side would serve a good deal of the traffic on the north side, and the Moree line would serve pretty well the traffic further north.

633. Do you think the character of the country on the north side is sufficiently good to entitle it to some consideration? Yes.

634. Are there many transactions in stock in this particular locality? Yes. I may add that Walgett is a great stock centre. The travelling stock generally follow the water, and if there were a railway station here it would be largely availed of for trucking stock. I was an agent in Wee Waa for several years, and I know that several mobs of sheep which came there from the Walgett and the Narran district started as fats and were sold as stores.

Terence Francis Fagan, coach-builder, Walgett, sworn, and examined:—

635. *Chairman.*] How long have you been in Walgett? For six years.

T. F. Fagan.

636. Has the town increased since you came here? Yes.

637. Is the progress of the district satisfactory from your standpoint? Yes.

10 May, 1898.

638. Do you desire to make a statement, showing the inconvenience to the people of Walgett because of the bad means of communication? Yes; the people settled in this part of the country suffer great inconvenience through not having facilities to get to market. They have practically no roads. In times of drought it is almost impossible to get supplies here. Teamsters coming here require almost to load up with fodder, and the freight is very high. Then if it comes on to rain they cannot travel. I have repeatedly had to pay my bills at the end of four months, and the goods have been still on the road. To settlers that is a very great handicap; in fact, I do not think that smaller settlers can eventually succeed unless they have better facilities for getting to and from market.

639. Do you think there is a probability of a collapse of some of the small holders if they do not get better means of transit? I do. I have been informed by some of the small holders that, at times, they have had stock fit for market, and dry weather has set in, and, owing to the manner in which the travelling stock routes are managed, it has been impossible to start them on the road. If there had been a railway they could have been trucked to market at once. I know of gentlemen who have invested largely here, and who have erected buildings on the understanding that we were to get a railway. I know of one gentleman who is contemplating selling all his property, and the doubt as to whether we will get a line seriously interferes with the prospect of his selling. With railway facilities the smaller men would go largely in for agriculture. They would combine sheep-farming with wheat-growing—many of them, in fact, have commenced already. Of course, if it were gone in for largely it would not be profitable without means of getting to market.

640. *Mr. Fagan.*] Do I understand you to say that there is a gentleman in the town who is trying to sell his property because he has doubts of the railway coming here? No; but the doubt as to whether the railway will be carried on to Walgett affects the sale.

641. If the line is carried to Pilliga only will it affect his property? No, it will improve it, but if there were a prospect of a line coming to Walgett it would make it more valuable still.

Bernard Joseph Martin, Post and Telegraph Master, Walgett, sworn, and examined:—

642. *Mr. Fagan.*] Do you know what is the revenue of your office? The last revenue, according to the Postmaster-General's report, was £1,970. B. J. Martin.

643. How long have you been at Walgett? Since the 15th of June last.

10 May, 1898.

644. Then you have barely twelve months' experience? I have the experience of the office which leads me to think that business is on the increase. When I first came here it was shearing-time, and the postal correspondence is heavier than during any other portion of the year. For two months after the shearing was over it fell back slightly, but it came again, and now I find a considerable increase in all mail matter. I find that I have to keep applying for more stamps every month. Generally speaking the volume of business is on the increase, and the mail matter is becoming quite cumbersome.

WEDNESDAY,

WEDNESDAY, 11 MAY, 1898.

[The Sectional Committee met at Eurie Eurie at 1:40 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Narrabri to Pilliga.

William Sim, licensed surveyor, Walgett, sworn, and examined:—

W. Sim. 645. *Chairman.*] Will you make a statement with regard to the country lying west from Walgett, with a view to railway construction therein? I am prepared to give a fairly accurate idea of the country lying west, from the point 310 miles on the "green line." In my opinion the "green line," as far as Eurie Eurie, lies on a dry ridge, and railway construction there will be found to be cheaper than on any other suggested route. To the south of the "green line," between it and the Dead Bullock warrambool, floods as high as 2 feet 6 inches may be experienced. Even in the 1893 flood there was a foot of water in the parish of Denham. Between the Dead Bullock warrambool and the river there is a sand ridge about Bugilbone. There are patches of higher country here and there, but the country, generally speaking, does not lend itself to the extension of a line such as the "green line" shown on the plan. East of Bugilbone you get into flooded country towards Drilldool, and you would experience as much difficulty in getting through there as you would from Eurie Eurie to Walgett. After careful consideration of the various routes, and with a full knowledge of the country, I believe, noticing the fact that from Eurie Eurie to within 2 miles of Walgett the country is liable to flood, still taking the line right through, it will be found to be the cheapest to construct. It will be the shortest, and a great portion of it will, as I have explained, be on dry country. Between Eurie Eurie and Walgett I would average the depth of water at about 2 feet in a heavy flood; but there are some warrambools which would require some extensive bridging. With regard to the cost, I am not prepared to express an opinion; but still I think my suggestion is the correct one. I estimate that the water will run about a mile an hour. From the 2-mile, warrambool country of about a similar elevation—I cannot state exactly what it is—would extend to very close on the left-hand side of the traffic bridge over the Namoi into Walgett—almost to the river. No doubt the Committee have information with regard to the character of the country, but in my opinion a large portion of the red country along the "green line" will be found very suitable for the growth of cereals. I do not think there is any climatic reason why the growth of cereals should not be a success.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Narrabri to Pilliga.

SECTIONAL COMMITTEE.

APPENDIX.

A.

[To Evidence of G. F. Earp, Vice-President, Newcastle Chamber of Commerce.]

NARRABRI-PILLIGA-WALGETT RAILWAY.

Sir,

Newcastle, 4 May, 1898.

In reference to evidence given by me on Saturday last, I beg leave to ask for permission to supplement my case as then presented, with the following:—

If the railway is made *via* Narrabri and Newcastle, the Walgett district is put in railway communication with Sydney also, at about same mileage (but avoiding the pull over the Blue Mountains), seeing that Newcastle line connects with Sydney.

The difference between the rail communication in the two routes, therefore, amounts to this:—

Produce.

Narrabri-Newcastle.—Gives access by rail to three markets, namely—

- (1) Maitland, second only to Sydney as a stock market.
- (2) Newcastle, with its large local trade, and fast increasing export of cattle, horses, &c., to New Caledonia, Victoria, West Australia, India. Regular lines of sailing vessels and steamers load wool, produce, timber, &c., at Newcastle for United Kingdom, Continent, &c., at lowest rates. Wool and produce can also be sent by steamer from Morpeth and Newcastle to Sydney at lower than rail freight.
- (3) Sydney, the metropolitan market.

Coonamble-Warren.—Would give access to Sydney only, thus shunting Maitland and Newcastle for no saving in haulage.

Supplies.

The same remarks apply to the purchase of supplies in both markets for shipment by (1) rail all the way from Sydney; (2) or by steamer, Sydney to Newcastle, at 4s. to 5s. per ton, and thence by rail; (3) or the supplies can be bought in Newcastle at about Sydney prices, and 113 miles haulage saved as compared with Sydney.

I feel that I need only call your attention to these facts, and that comment on my part is needless.

Yours, &c.,

G. F. EARP.

The Chairman, Public Works Committee.

A 1.

NUMBERS OF SHEEP, CATTLE, AND PIGS WHICH PASSED THROUGH MAITLAND SALE-YARDS DURING THE YEARS 1896-7.

Dear Sir,

In accordance with a request by Mr. Fegan, M.L.A., before the Public Works Committee, on their recent visit to Newcastle, I now beg to give you the numbers of sheep, cattle, and pigs which passed through the Maitland sale-yards during the last two years:—

Sheep.	Cattle.	Pigs.	
127,980	42,410	21,500	1896
154,327	41,261	14,617	1897

Yours, &c.,

A. BIRKETT, Secretary.

B.

[To evidence of T. Clarke, Secretary, Walgett Railway League.]

Sworn statement by THOMAS CLYDSDALE, THOMAS CARMODY, W. J. MADGWICK, JAMES CULLEN, W. G. EVANS, MAC-VIE FALCONER, and JOHN B. HUTCHINSON.

I am a drover; I have frequently taken stock from Queensland or the districts on the border to the railway, for carriage to market in Sydney; I know the various stock routes from the border to Narrabri; I am of opinion, the result of my experience, that the routes from Goodooga and Angledool to Walgett, *via* Wilby Wilby and Weetalibah respectively, are the best for stock to travel, owing to the greater facilities for obtaining grass and water on the road; I am further of opinion that a trucking station at Walgett, connecting with the line at Narrabri, would be availed of to a greater extent than one in any other locality in the district. And I make this solemn declaration, conscientiously believing the same to be true, and in virtue of the provisions of an Act made and passed in the ninth year of the reign of Her present Majesty, intituled "An Act for the more effectual abolition of Oaths and Affirmations, taken and made in various Departments of the Government of New South Wales, and to substitute Declarations in lieu thereof, and for the suppression of voluntary and extra-judicial Oaths and Affidavits."

* [One plan.]

LIST OF WITNESSES.

[Examined by the Committee.]

	PAGE.
Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works	1-2
Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works	3-6, 18-19
John Harper, Chief Traffic Manager, Department of Railways	6-12
Hugh McLachlan, Secretary to the Railway Commissioners	12-15
Henry Chamberlaine Russell, C.M.G., Government Astronomer	15
William Henry Hall, Sub-editor of Statistical Year-books, Government Statistician's Office	15
Charles Edward Rennie, Chief Draftsman, Department of Lands	16
George Charles Yeo, Draftsman, Stock Branch, Department of Mines	16-17
Edward MacCarthy Allman, Assistant Engineer, Roads Branch, Department of Public Works	17, 22
Charles M'Donnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works..	20-22

[Examined by the Sectional Committee.]

William Sim, licensed surveyor, Walgett	1
Edmund Brennan Loughnan, J.P., secretary, Railway League, Collareendabri	1-3
William Nicholas Willis, Esq., M.P.	3-5
John Theodore Merry, storekeeper and hotelkeeper, Angledool	5-6
Thomas John Sherwin, grazer, Nullawa	6-7
John Augustus Robertson, Currawillinghi	7
Daniel Joseph O'Connell, selector, near Collareendabri	8

	PAGE,
Joseph William Cook Langhorne, grazier, Oreel Station	8
Alfred Blomfield, homestead lessee, Mount Brandon, near Collarendabri	8-9
William Reed, selector, Collarendabri	9
John Charles Humphries, journalist, Collarendabri	9
Frank Adams, grazier, Myambla	9
David Hynes, station-hand, Collymongool	10
Frederick Ludlow	10
William Pearse	10
John Hannon Murphy, Jews' Lagoon	10
Roger Boland, selector, Anglefield	10-11
Alexander Donaldson, manager, Bunná Bunná Holding	11
Charles John Hamilton, selector, Moomin	11
John Herbert Duff, selector, Millie	11
Thomas Joseph Boland, selector, near Millie	11
Robert Cameron, selector, Pidgee Pidgee.....	11-12
John Vaughan Wilson, selector, Thalaba	12

PLAN.

Woolabra to Collarendabri Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM WOOLABRA TO COLLARENDABRI.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Woolabra to Collarendabri," have, after due inquiry, resolved that it is not expedient the railway as proposed should be constructed, but they suggest a route by which a railway would go from Narrabri towards Eurie Eurie, and, at a point about 315 miles from Newcastle, proceed in a north-westerly direction to Collarendabri; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

ORIGIN OF THE PROPOSAL.

1. The proposed railway, the Committee are informed, originated in an expression of opinion from the Sectional Committee appointed in 1893 to inquire into the merits of the railway since carried out from Narrabri to Moree, that if the whole area concerned in the Narrabri-Moree railway question were to be properly served it could only be done by two lines: the Narrabri-Moree line, and a western line following the driest belt of country, which is apparently south of Thalaba Creek, and eventually reaching Collarendabri. In view of the importance of the western trade, they thought it would be well for a full exploration and survey to be made of the country towards Collarendabri, and they suggested that a survey should be started from a point between Narrabri and Edgeroi, thus utilising the bridge which would be constructed over the Namoi on the direct route.

Consequent upon this, an examination of the country was made, and a report forwarded to the Minister for Public Works, pointing out that the most favourable line to construct, as serving the best interests of the district, would be one leaving Edgeroi station, on the Narrabri-Moree railway. Explorations were also made of routes from Narrabri West *via* Gurleigh Point, and from Narrabri West between Wee Waa and Pilliga, crossing the Namoi at the best crossing possible, and thence proceeding towards Burren and Mercadool.

In April, 1896, the Engineer-in-Chief for Railway Construction was authorised to make a survey of the direct route, and this was completed by May, 1897, the starting point being altered from Edgeroi to Woolabra, so that the line should pass near Millie.

DESCRIPTION OF THE PROPOSED RAILWAY.

2. The total length of the proposed railway is 80 miles 56 chains, but the last 10 miles being through country flooded by the overflow of the Barwon River, it is a matter for consideration whether the line should not stop at a point 10 miles from Collarendabri. By junctioning at or near Woolabra, the railway for the greater part of its length can be kept between the water-courses and on fairly high ground.

According

According to the official description, the line commences as a branch from the Narrabri to Moree railway, close to Woolabra station, at 284 miles 16 chains from Newcastle, and, consistent with keeping on the highest ground between the main creeks running westward, and therefore most free from flood, runs as directly west as possible to 334 miles.

At that distance a more northerly direction is taken, following down the Thalaba River, which is crossed, to water reserve No. 4,201, at 353 miles, where the limit of the ordinarily dry country is reached. Beyond this point the line follows the travelling stock reserve No. 4,200, and, crossing the Barwon River near 362 miles, takes a westerly course to Collarendabri, ending at 364 miles 72 chains.

The line is a surface one with very light works for the 70 miles to the reserve at 353 miles; the remaining 10 miles, being in extensively flooded country, require a considerable amount of bridging, in addition to that necessary for the Barwon River. Very little private land is touched.

ESTIMATED COST.

3. The estimated cost of the line for its full length is £207,798, and for the reduced length 69 miles 64 chains, £160,362. These figures show an average cost per mile of £2,574 19s. for the whole distance, £2,297 9s. for the shorter length, and £4,351 18s. 6d. for the last 10 miles.

RAILWAY COMMISSIONERS' REPORT.

4. The Railway Commissioners report favourably of the line as one which has merit, and is worthy of consideration, but they estimate an annual loss from it of £5,904. Their figures are based on the estimated cost of the full length of the railway. Interest on capital expenditure at 3 per cent. amounts to £6,234, and the cost of maintaining permanent way and other traffic and locomotive expenses is estimated at £6,860, which, together, make £13,094. Against this, the traffic estimate shows £7,190, comprising £5,418 for the carriage of live stock and goods, and £1,772, coaching and mails.

The line, the Commissioners remark, "would open up a good class of country and probably form the basis of further extension later on in a north-westerly direction"; but, in view of the country in the immediate vicinity of Collarendabri being unsuitable for cheap railway construction, they regard it as a matter for consideration whether, in the event of the railway being approved, it should not for the present stop at the point where this flooded country begins.

THE TRAFFIC ESTIMATE.

5. The details of the traffic estimate, which are given in a report by the Chief Traffic Manager, Department of Railways, are as follows:—

Wool, 4,554 tons	£2,224	
Goods, 1,686 "	1,537	
Stock, 2,000 trucks	1,657	
									5,418
Passengers, 1,500, at 8s.	600	
Sundries	200	
Mails	972	
									£7,190

For the purposes of the estimate the season 1894-1895, admitted to have been the best the district has experienced, was taken, a liberal margin being allowed for a development in the livestock traffic which would follow rail transit becoming available to small holders for the moving of small consignments of stock; and the rates calculated are an extension of those charged on the Narrabri to Moree line.

"As far as the prospects of the line are concerned," the Chief Traffic Manager remarks in his report, "there is no doubt that it is deserving of the utmost consideration in connection with any steps which may be taken towards either a westerly extension or an improvement of the river navigation." The district traversed by the line, he states, is one of the best stock areas in New South Wales, producing

producing a very large quantity of wool and fat stock, and, in addition to the traffic arising from this source, the line would attract traffic from the north-west of Angledool, and from as far north as the Australasian Pastoral Company's properties in Southern Queensland, if the traffic from there were not secured by Queensland railway extension to St. George.

"It should, however, at the same time be borne in mind," he goes on to say, "that projected lines have been submitted for consideration which would more or less affect the traffic claimed by this district. For instance, the proposed line between Narrabri and Pilliga would most certainly receive a portion of the traffic claimed by the Collarendabri people, and it is equally certain that it would secure the Walgett traffic which was claimed, at least for passenger purposes, by the supporters of the line under consideration. Again, either a navigable river or railway between Brewarrina and Byrock would, to a certain extent, tap more of the south-western district, which the Collarendabri people claim to be within their trafficable area."

LAND IN THE DISTRICT SERVED BY THE RAILWAY.

6. Within the area which would be served by the proposed railway—that is, within 20 miles of the line on each side, converging to a point at Woolabra so as to make allowance for the influence of the Narrabri-Moree Railway—there are, according to information supplied to the Committee by the Chief Draftsman of the Department of Lands, 972,780 acres of alienated land, 370,340 acres of reserves, and 421,610 acres of Crown land. Of the Crown land the leasehold areas comprise 195,800 acres, the leases of which will expire between the present year and the year 1900, and 143,200 acres, the leases of which will expire in 1918. About 60,000 acres of Crown land are now being prepared for settlement lease.

ALTERNATIVE LINES.

7. In the course of the inquiry it appeared to the Committee to be possible to find between the routes of the proposed railways from Woolabra to Collarendabri and Narrabri to Pilliga a route for a railway which would more satisfactorily serve the district and be more desirable in the public interest than either or both of the proposed lines, and the Minister for Public Works was asked to arrange for an exploration of the country north of the Namoi River, with the object of ascertaining the merits of a line between Narrabri and Eurie Eurie, and also to have an examination made of the country between Moree and Collarendabri. This was done by an officer of the Railway Construction Branch, who reported, with regard to a route from Narrabri to Eurie Eurie, that, taken as a whole, with the exception of 10 miles of more or less flooded country between the Boolcarrol-road and Keilaher's Hotel, 36 miles from Narrabri, it might be considered a good one, as no main watercourse except Pian Creek has to be crossed, and the route follows, for a great portion of the way, low dividing ridges specially adapted for drainage. A railway by this route would terminate at a distance of about 103 miles from Narrabri, and about $1\frac{1}{2}$ mile from Eurie Eurie station, close to where the travelling stock routes—Walgett to Wee Waa and Narrabri and Walgett to Collarendabri—meet, and about 12 miles from Walgett (which is accessible by a bridge across the Namoi), and 40 from Collarendabri. The country passed through is described as probably some of the best in the district, and the line, it is thought, would get as large an amount of traffic as any other. Timber suitable for railway construction is available on the southern side of the river; ballast would have to be brought from some distance.

The report on the country between Moree and Collarendabri, with reference to a direct route on the north side of the Gwydir or Meehi River, refers to three routes, any one of which is practicable, but states that owing to the flooded nature of the country, necessitating high embankments, as well as the number of bridges which would have to be constructed, no line in this direction is advisable at the present time, nor would it bring in as much traffic to the railways as a line further south.

SECTIONAL COMMITTEE'S REPORT.

8. The Sectional Committee appointed to inspect, take evidence, and report with reference to the proposed railway, regarded this line and that from Narrabri to Pilliga as closely associated. Consequently they dealt with the two railway proposals—Woolabra to Collarendabri and Narrabri to Pilliga—together, and at the same time investigated, as far as possible, the route mentioned in the report of the officer of the Railway Construction Branch, with a view to ascertain how far it would be suitable for railway communication with Collarendabri. They found that a line by this route from Narrabri, would, for the first 60 miles, prove a suitable approach to both Collarendabri and Walgett, turning off north-west across Thalaba Creek to the former place, and somewhat south of west through Eurie Eurie to the latter. In the construction of this line to Collarendabri, for the first 15 miles—that is, to the north side of Burren Creek—there would, the Sectional Committee say, be no difficulties. From that point there would be a few miles of low country not offering any serious obstacle to the construction of the railway; and further on, *via* Merrywinbone, east of which it would join the proposed line from Woolabra, at about 340 miles from Sydney, to within 10 miles of Collarendabri, no serious difficulty would be encountered. Beyond this there is some flooded country, and the Grawin Creek and the Barwon would require bridging. Thence into Collarendabri there is no engineering difficulty.

It was stated by the Department, the Sectional Committee observe, that it would be well to make the terminus of the line some 11 miles from Collarendabri, but as it appears that the line will some day be extended towards Angledool, it will be as well to preserve the centre already established by the Government and bring the line adjacent to the town, the position of the terminus to be so chosen that the approach to the west shall be the best obtainable.

The country which will be developed by the two lines, Woolabra to Collarendabri and Narrabri to Pilliga, is, generally speaking, the report of the Sectional Committee states, bounded on the east by the Moree-Narrabri line, and its extension towards Newcastle; on the north by the limits of such traffic as may reach Collarendabri, or any portion of the line from there to Woolabra, in preference to Moree; that area of country extending beyond Angledool to the Queensland Border, traffic from which will probably reach Collarendabri and Walgett in preference to Brewarrina, were a railway constructed to the latter place, and that portion of the Colony of Queensland the traffic from which would find its way, *via* Angledool, Mogil Mogil, or any routes to the north, to Collarendabri or Walgett. On the south its limits would be first affected by the proposed railway to Coonamble.

For the purposes of their inquiry the Sectional Committee inferred that it is possible railways will be extended as far as Coonamble and Brewarrina within a reasonable time, and they desired to lay down the limits of the country with regard to which no doubt better accommodation would be given by termini at Walgett and Collarendabri than by any other scheme. The Moree-Narrabri line, they state, will serve all areas lying, say, 25 miles west therefrom. The Coonamble line will possibly draw the traffic half-way between that place and Walgett. Angledool traffic will probably reach Collarendabri or Walgett. Weetalibah and Goodooga may, however, be considered debatable country from which it is probable some produce will find its way to Brewarrina.

As a recent Queensland *Government Gazette* notice removed the £2 10s. duty on wool shorn across the Border from within a distance of 30 miles therefrom, the Sectional Committee considered it very probable that the wool grown and stock depastured within this 30-miles limit will find its way to New South Wales, and they are of opinion further that, as the influence of railways to Collarendabri and Walgett would probably extend another 30 miles northwards, the area of New South Wales railway influence may be taken as 60 miles north of the New South Wales boundary, extending to midway between Walgett and Coonamble—say about Combogolong—on the south, to midway between Walgett and Brewarrina on the west, and to within 25 miles of the Moree line on the east. The country is pastoral, but contains extensive tracts suitable for agriculture.

River competition is a matter affecting the question of a railway to Collarendabri or Walgett, and the Sectional Committee found that although, at times, the river traffic might affect the returns of the railway, it would not happen frequently.

“ Even

“Even as far as Walgett,” they say, “the Barwon River cannot be regarded as a reasonable outlet to so important a district; and that being so, it is clear that an approach by the Barwon to Collarendabri for ordinary trade purposes is out of the question.”

ROUTE OF THE RAILWAY SUGGESTED BY THE SECTIONAL COMMITTEE.

9. The line to Collarendabri, as suggested by the Sectional Committee, would be identical with that from Narrabri to Eurie Eurie and Walgett for 60 miles, at which distance it would reach a point about 315 miles from Newcastle. It would then branch off in a north-westerly direction, passing west of Burren, until it joined the surveyed route from Woolabra to Collarendabri, a few miles from the crossing of Thalaba Creek at Merrywinbone, and by that route it would proceed the remainder of the distance to Collarendabri.

ADVANTAGES FROM A RAILWAY BY THE AMENDED ROUTE.

10. The advantages to be gained from the construction of a railway by the amended route are stated by the Sectional Committee in the following extract from their Report:—

“The length of the two lines (Woolabra to Collarendabri, and Narrabri to Pilliga) would be somewhat over 36 miles 56 chains, these being the proposals of the Government; but should the Committee be right in the conjecture that Walgett is the objective point of the Pilliga line the length would then be 195 miles. If the line now recommended to serve the two routes be constructed there will be a saving in distance of about 40 miles over the last-mentioned distance, and in cost of construction a sum approaching £100,000. The only question, therefore, remaining to be considered is, whether the development by this method will be as satisfactory as that proposed by the Government. In the opinion of the Sectional Committee the scheme is better, because it gives a shorter length of haulage from Walgett, and passes through superior country. The extent of Crown lands on the two lines, namely, Narrabri to Walgett on the north side of the Namoi, and *via* Eurie Eurie, and from 315 miles on that line to Collarendabri, amounts to 1,609,000 acres, which will be readily taken up in small areas. The returns from these lines will be satisfactory. The only reduction from the returns in the proposed lines will be in regard to some country lying about Bunna Bunna and Millie, which will be within reasonable distance of the Moree line and will make to it.”

THE COMMITTEE'S RECOMMENDATION.

11. The Committee agree with the Sectional Committee's suggestion with regard to the route described, and recommend that the necessary survey be made. The resolution passed by them is as follows:—

“That, in the opinion of the Committee, it is not expedient the proposed Railway from Woolabra to Collarendabri, as referred to the Committee by the Legislative Assembly, be carried out; but they suggest a route by which a Railway would go from Narrabri towards Eurie Eurie, and, at a point about 315 miles from Newcastle, proceed in a north-westerly direction to Collarendabri.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 23 June, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC
WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM WOOLABRA TO COLLARENDABRI.

WEDNESDAY, 9 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Woolabra to Collarendabri.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make in regard to the proposed Railway from Woolabra to Collarendabri? Yes. It is as follows:—

R. R. P.
Hickson.

THE first step with regard to this proposal appears to have been taken by the Sectional Committee appointed to inquire into the merits of the proposed railway from Narrabri to Moree, when they came to the conclusion that if the whole area of country concerned in that railway (Narrabri-Moree) question was to be served properly it could only be done by two lines, viz., Narrabri-Moree line and a western line following the direct belt of country which is apparently south of Thalaba Creek, and eventually reaching Collarendabri. They were of opinion that the importance of the western trade warranted a full exploration and survey of the country towards Collarendabri, and suggested that the survey should be started from a point between Narrabri and Edgeroi, thus utilising the bridge constructed over the Namoi on the direct route.

9 Mar., 1898.

Mr. Stuart, of the Railway Survey Branch, was accordingly instructed to make an examination of the country, which was completed on the 16th October, 1894, and Mr. Firth (Acting Engineer-in-Chief) in forwarding his report to the Minister pointed out that the most favourable line to construct, as serving the best interests of the district, would be that leaving Edgeroi station (on the Narrabri-Moree line), the total distance to Collarendabri being 83 miles; out of this 73 miles could be constructed for about £2,270 per mile, but the next 10 miles into the town would probably cost £3,050 per mile, making the average cost £2,362 per mile, or a total of £196,046.

At the time Mr. Stuart was making an examination of the direct route, Mr. Staveley, of the Upper Barwon Progress Association, urged that the line be taken from Narrabri West *via* Gurlough Point to or near Collarendabri; and Mr. Collins, M.P., also advocated the construction of a line from Narrabri West between Wee Waa and Pilliga, crossing the Namoi at the best crossing possible, thence towards Burren Gorrear and Mercadool. The Minister approved of explorations being made of both these routes, which was accordingly done by Mr. Stuart, under instructions from Mr. Firth.

No further action appears to have been taken until April, 1896, when the Minister, desirous of submitting the proposal to Parliament with a view to referring it to the Public Works Committee, authorised the Engineer-in-Chief for Railway Construction to make a survey of the direct route, which upon Mr. Deane's recommendation it was decided should leave the Narrabri-Moree line at Woolabra, passing near Millie.

When the Minister (Mr. Young) was at Moree, in April, 1897, Mr. Hassall, M.P., introduced a deputation from the residents of Collarendabri and district, urging that the railway be extended to that town.

The deputation stated that the proposed line would bisect an enormous tract of country at present used exclusively for pastoral purposes, on which were depastured no less than 1,300,000 sheep (irrespective of large stock), and the wool from nearly all these sheep was at present carried on the roads leading to and from Collarendabri and Narrabri, and would no doubt be sent by rail if a line connecting with the main line were constructed. Other statistics were also quoted by the deputation. The Minister, in reply, promised to consider the matter, and refer the proposal to the Railway Commissioners.

Mr. Willis, M.P., also forwarded a petition from the residents of Collarendabri and district in favour of this line.

The survey was carried out by Surveyors Walker and Calvert, and its completion reported to the Minister by the Engineer-in-Chief on the 17th May, 1897.

Mr. Deane pointed out that the total length of the line into Collarendabri is 80 miles 56 chains, but the last 10 miles are through country flooded by the overflow of the Barwon River, and it was therefore questionable, if the line were constructed, whether it should not stop at a point 10 miles from Collarendabri. The length of the line to this point is 69 miles 64 chains, and the estimated cost £160,362, or about £2,300 per mile.

The length of the remaining part, including the crossing the river into Collarendabri (10 miles 72 chains) is estimated to cost £47,436, or about £4,352 per mile.

R. R. P.
Hickson.

The Minister on the 20th May, 1897, asked the Railway Commissioners for their report on the proposal, of which the following is a copy :—

9 Mar., 1898.

Proposed Line of Railway, Woolabra to Collarendabri—80 miles 56 chains.

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under :—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a light railway line (exclusive of land and compensation) at £207,798

Annual Cost—

Capital expenditure, at 3 per cent £6,234
Cost of maintaining permanent way, and for traffic and locomotive expenses 6,860

Total annual cost..... £13,094

Traffic Estimate—

Live stock and goods..... £5,418
Coaching and mails 1,772

Total estimated traffic £7,190

The proposed line has merit and is worthy of consideration. It would open up a good class of country and probably form the basis of further extension later on in a north-westerly direction.

It is unfortunate that the country in the immediate vicinity of Collarendabri is unsuitable for cheap railway construction, and it is a question whether, in the event of the line being favourably considered, it should not, for the present, stop on the edge of this country, which will be about 10 miles from Collarendabri.

CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The proposed line commences as a branch from the Narrabri to Moree railway close to Woolabra station at 234 miles 16 chains from Newcastle, and runs as directly west as possible to 334 miles, consistent with keeping on the highest ground between the main creeks running westward, and hence most free from flood.

At 334 miles a more northerly direction is taken, following down the Thalaba River, which is crossed, to water reserve No. 4,201 at 353 miles, where the limit of the ordinarily dry country is reached. Beyond this point the line follows the travelling stock reserve No. 4,200, and crossing the Barwon River near 362 miles, takes a westerly course to Collarendabri, ending at 364 miles 72 chains.

The line is a surface one with very light works for the 70 miles to the reserve at 353 miles, the remaining 10 miles, being in extensively flooded country, require a considerable amount of bridging, in addition to that required for the Barwon River. Very little private land is touched.

2. The Railway Commissioners suggest that the line should stop 10 miles this side of Collarendabri? They think that the matter is worthy of consideration.

3. How much would that lessen the cost of the line? By £47,436.

4. If the suggestion of the Railway Commissioners were carried out, the line would cost £160,362? Yes.

5. On page 18 of Mr. R. E. Jones' report on proposed railway extensions, ordered by the Legislative Assembly to be printed on the 29th July, 1891, he deals with a line (No. 19) from Narrabri West *via* Collarendabri to Angledool;—has the Department seen that report? Yes.

6. If Collarendabri is to be approached by railway, the one now before the Committee appears departmentally to be the best connection? Yes.

7. Have you any survey running from Moree due west? I do not think there is.

8. Is that country departmentally known? I do not know it myself. I do not know anything west of Moree and Narrabri.

9. *Mr. Hassall.*] Do you know the country between Moree and Collarendabri? No.

10. There is no survey made in that direction, is there? Not that I know of. Mr. Deane could tell you.

11. There was a survey, I think, made some years ago, running through the water-course country out towards Mungindi? That I could not tell you.

12. Looking at the map, and in view of the extension of the line of railway from Moree to Inverell, does it not strike you that it might be advisable to inquire into the character of the country lying between Moree and Collarendabri, and as to what engineering difficulties there might be in the way of extension from Moree to Collarendabri? It is undoubtedly worth inquiring into.

13. In view of the extension from Moree to Inverell, is it not probable that at some future date an extension may be made from Inverell to the eastern coast? I suppose it will come in time.

14. Well, in the event of that being done, and in view of a line being constructed westerly as far as Moree, do you think it would be good policy on national grounds to extend the railway further west from Moree, giving the people of the north-western district practically the choice of two routes—that is, whether they would go along the present existing line of railway to Newcastle and Sydney, or prefer to send their traffic eastward to any harbour that might be selected on the coast, provided that the railway were constructed to it? Yes.

15. Leaving that part out of the question, can you tell why it is proposed to go as far as Woolabra on the Narrabri-Moree line in order to get an extension westward to Collarendabri? Mr. Deane will be able to explain that better. The whole of that country has been looked into, and Mr. Deane believes this to be the best connection.

16. I believe it is no part of your policy to try to send people much further round than there is any necessity for? No.

17. Well, looking at the map, does it not strike you that an extension towards Collarendabri from Narrabri would serve the country and the people better than an extension from Woolabra to Collarendabri—that is leaving the Moree extension out of consideration? It is a matter of £ s. d. The distance would not be much longer round by Woolabra, and the saving, I think Mr. Deane will tell you, would be considerable.

18. *Mr. Roberts.*] Is this line put forward in the hope of securing any of the Queensland trade? Yes; I think that the Commissioners look forward to getting some of the Queensland trade.

19. Some of the Queensland traffic that at present goes to Brisbane? Yes.

20. Is it in contemplation to connect Collarendabri with Angledool? Not immediately; but probably that would come in time.

21. That will be the ultimate terminus of the line? Probably.

22. Are you able to tell the Committee what proportion of the traffic would come over the Queensland border to Collarendabri? I cannot tell you that. The Railway Commissioners would be able to give you that information.

Henry

MINUTES OF EVIDENCE—RAILWAY FROM WOOLABRA TO COLLARENDABRI.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

23. *Mr. Humphery.*] Have you brought a statement for the information of the Committee? No; I have no further statement. I can give the Committee the details of the estimate, and I will hand in some plans and the book of reference.

H. Deane.
9 Mar., 1898.

24. Will you read the details? Yes; they are as follows:—

WOOLABRA TO COLLARENDABRI.—Part No. 1, 284 m. 16 c. to 354 m.

ESTIMATED cost of a single line of railway 69 miles 64 chains in length, with 60-lb. rails. Ruling grade, 1 in 100; sharpest curve, 15 chains radius.

Description.	Estimated Cost.			Average per mile.
	£	s.	d.	
Earthworks.....	14,671	0	0	210
Timber bridges and small timber openings.....	9,812	10	6	141
Level-crossings, cattle-stops, fencing, &c.....	3,130	0	0	45
Permanent-way materials.....	43,548	11	0	624
Freight, &c.....	12,044	10	0	173
Plate-laying at 1s. = £6,142 8s.	37,315	1	0	535
Ballasting (½) at 3s. 6d. = £5,374 12s.....				
Sleepers at 3s. = £25,798 1s.....	6,543	0	0	94
Station works, including sidings and junction				
Station buildings—passenger building, £300; waiting-sheds, £625; platforms, £600; station-master's house, £700; goods-sheds and platforms, £850; loading-banks, £650; trucking-yards, £1,120; engine-shed, £500; coal-stage, £150; carriage-shed, £250; two turntables, £1,100; 5-ton cranes, £440; 20-ton weighbridges, £600.....	7,885	0	0	113

WOOLABRA TO COLLARENDABRI.—Part No. 2.

ESTIMATED cost of a single line of railway 10 miles 73 chains in length, with 60-lb. rails. Ruling grade, 1 in 100; sharpest curve, 15 chains radius.

Description.	Estimated Cost.			Average per mile.
	£	s.	d.	
Earthworks	2,930	0	0	269
Timber bridges and small timber openings.....	10,650	10	0	977
Larger bridges	10,391	0	0	953
Level-crossings, cattle-stops, fencing, &c.	320	0	0	29
Permanent-way materials	6,805	13	6	624
Freight, &c.	2,214	0	0	203
Plate-laying at 1s. = £959 4s.	6,858	7	0	629
Ballasting (½) at 5s. = £1,199				
Sleepers at 3s. 6d. = £4,700 3s.	569	0	0	52

Station buildings—waiting-shed, £100; loading-bank, £100; trucking-yards, £400	600	0	0	55
Telegraph	163	10	0	15
Gradient and mileage posts	163	10	0	15
Miscellaneous	500	0	0	46
Cost of works... ..	£42,165	10	6
Engineering and contingencies, 12½ per cent. (nearly).....	5,270	9	6	484
Total cost	£47,436	0	0
Average cost per mile	£4,351	18	6

Part No. 1.—69 m. 64 chs. £160,362, or £2,297 9s. 0d. per mile.

„ 2.—10 m. 72 chs. £47,436, or £4,351 18s. 6d. „

Total 80 m. 56 chs. £207,798, or £2,574 19s. 0d. „

In the estimate of the first part, I should say that, on the assumption that the line, if constructed, would stop short of the river and flat country, the terminal station and works have been included, and therefore, in the second part, station works appear very small and do not include the terminal station at Collarendabri. It is clear that if the line were to stop 10 miles short of Collarendabri the terminal arrangements would have to be made there, and also that if the line were carried on to Collarendabri the actual cost due to the extension merely would be the cost of the construction of the line, and perhaps simply a small station at the end of part 1, instead of the large terminal arrangements.

25. That is to say, you have included in your estimate of the first portion of the line the terminal station expenses? Yes.

26. So, without the cost of terminal station, the estimated cost, £2,300 per mile, for the first portion of the line would be reduced? Yes.

27.

- H. Deane.
9 Mar., 1898.
27. Appreciably? It would make a little difference. It would very likely be a matter of £200 or £300 per mile on the second part.
28. Have you included in your estimate of the second portion the cost of the bridge? Yes.
29. What have you allowed for the bridge? I have allowed for the whole of the bridges—that is, bridges over the openings, and the bridge over the Barwon—nearly £21,000.
30. How much for the bridge over the Barwon? That would be a very difficult matter to say, because there are several depressions and ana-branches which might be considered as part of the river.
31. Would the £21,000 cover the whole cost of the approaches to, as well as the construction of, the bridge? Yes; I think that would fairly cover the cost. I should like to say, however, that I think that it is quite possible that if this line were constructed, the waterways included in the estimate would have to be increased, and, that is to say, the contingencies drawn upon. But I believe that the total of the estimate—that is, including the two parts—is quite sufficient to cover the cost of the line. I have gone into the matter as carefully as possible with the officers who have been over the line, and the Committee may take the estimate as being correct.
32. That is to say, that the whole of the work would be carried out for about £200,000? £207,798.
33. With regard to the first portion of the work, have you satisfied yourself by careful examination of the reports and figures placed before you by your officers, that that portion could be carried out for £160,000? Yes.
34. Have you personally examined the proposed line? No; I have not been over the line. I have had very little time at my disposal. I have been very busy in the office, and it was considered by the Minister unnecessary that I should go over the line.
35. What portion of it have you examined? I have not examined any portion of it except the junction at Woolabra. Of course I know the class of country that is to be found in the north-west.
36. The route appears to have been selected upon your recommendation? Yes.
37. Will you be good enough to say in what way you were influenced to select the starting-point at Woolabra? In the first place, I wish to say that my recommendation only went so far as to fix the junction-point on the Moree line. The instructions that I had were to make a junction with the Moree line somewhere, and it was at first proposed to make it at Edgeroi; but I think that anyone will see, on an examination of the map merely, and from a knowledge of the water-courses in that country, that the best place to junction at is somewhere near Woolabra, because you can then follow down for the greater part of the length of the line between the water-courses and keep on high ground. The consequence of taking the position of the line as now adopted is that we keep on fairly high ground. We cross a creek a little way out of Woolabra which is not at all troublesome, and further on we get the crossing of Boggy Creek, and further down again we get the crossing of Thalaba Creek; but those are the only crossings. They are not very troublesome, and we have thus but few to deal with. If you were to start from nearer Narrabri, but still, of course, from a junction on the Moree line, you would have more water to cross. By keeping a mile or two nearer Narrabri, it is true you would avoid the crossing of Gehan Creek, but you would lose the advantage of making your junction at a recognised station. That is an important point. Woolabra is a station very suitable for a junction, or, at least, one which could be expanded so as to make it suitable for a junction; whereas if you were to start on this side of Woolabra you would have to make a new station altogether, because, even if you take Edgeroi, Edgeroi is really merely a siding; therefore, Woolabra is the best place on the line at which to make a start.
38. We may take it, then, that you were influenced solely by engineering reasons in selecting Woolabra as the starting-point? Yes.
39. And having given full consideration to all other points, from which it would be possible to extend the line, it is your opinion that that would be the best starting-point? Yes; I am convinced that is so.
40. It has been suggested that, in view of the construction of a railway from Moree to Inverell, Moree would be a more suitable starting-point than Woolabra;—what have you to say to that? It would make the distance to Sydney very much longer, and I should be afraid that a great deal of difficulty would be encountered in the way of water and flooded land. We should have to follow the Gwydir down.
41. With regard to the distance to Newcastle, which would be the nearest port on the coast;—what would be the difference between a line from Collarendabri, *via* Moree and Inverell, to Grafton, Casino or Coff's Harbour, and a line from Collarendabri, *via* Woolabra, to Newcastle? The distances by the most recent survey from Collarendabri to the undermentioned ports, &c., are—Grafton, *via* Moree and Glen Innes, 378 miles; Casino, *via* Tenterfield, 420 miles; Coff's Harbour, *via* Grafton, 430 miles; Coff's Harbour, *via* Guyra, 426 miles; Newcastle, *via* Narrabri, 364 miles.
42. Is the opinion that you have expressed in regard to the character of the country between Moree and Collarendabri based on your personal inspection of it, or on information that you have in the office? It is based on the features of the country as seen on the map. Full information could only be obtained by an actual inspection of the country; but at the same time I think it must be apparent to anyone who examines the map that there is a probability of difficulty from water. There is no doubt that the river Gwydir and its tributaries break over and join at different points, and that that means there must be a lot of flooded country which it is impossible to avoid.
43. Therefore, you are of opinion that the proposal now under consideration would be the less costly method of giving railway communication to Collarendabri? Yes.
44. You are aware that there is under the consideration of the Committee a proposal to construct a railway from Warren to Coonamble? Yes.
45. If the railway were extended from Coonamble to the flooded country in the direction of Walgett, what would be the distance from Coonamble to that portion of the country to which the railway could be carried at what you regard now as about the minimum cost? There would be no difficulty in reaching Walgett without passing through much flooded country. The distance from Coonamble is 69 miles. The estimated cost based on present prices would be £179,400.
46. Have you any figures showing the probable cost of an extension from Narrabri to Collarendabri *via* Wee Waa, or any suggestion of that kind? There have been suggestions, and Mr. Stuart examined the country, and made some reports.
47. Do you happen to have with you a copy of Mr. Stuart's report with reference to a suggested line from Narrabri West, *via* Collarendabri, to Angledool? I have the report of the exploration to Mercadool, but he does not give any estimate. There is a report of his, dated 14th December, 1894, dealing with a proposal
to

to connect Narrabri and Collarendabri, and there is another report of the same date dealing with a proposal to connect Narrabri and Mercadool. Following is what he says about a connection with Narrabri direct:—

H. Deane.
9 Mar., 1898.

The country passed through from Narrabri to near the Namoi is dry sandy loam; from there to Boolcarrol boundary it is black soil liable to floods. The flood-waters of Galathera, Ten-mile, and Boggy Creeks spread out over the low country, (one place being called Jews' Lagoon) and, in the case of a very high flood would, in conjunction with the flood-waters of the Namoi River and Thalaba Creek, practically form a sheet of water with some dry patches. From Boolcarrol boundary to near Bulyeroi the greater portion is dry country with low red ridges; thence, to the crossing of Thalaba Creek, fairly dry soil with some swampy patches, but said not to be flooded. The northern side of the Thalaba, between Bulyeroi and Merrywinbane, appears higher, but there are some water-courses, presumably overflows of the Moomin, to cross. From the Thalaba to the point A, and thence to the end, the country passed through is the same as I stated in my previous report, Edgeroi to Collarendabri.

48. Did Mr. Stuart report on a suggested line from Narrabri West to Moree *via* Gurleigh Point? I do not remember whether he did.

49. Have you any report from Mr. Stuart in reference to the whole of that country between Walgett and Angledool, between Woolabra and Collarendabri, and any other portion which is likely to come under consideration in dealing with the various proposals now before the Committee? There are these reports which I have in my hand at the present moment. In the report dealing with Mercadool Mr. Stuart mentions a proposed crossing of the river midway between Wee Waa and Pilliga. I think that the result shows that the line as submitted to the Committee now is the only fairly dry line that could be found. Any connection starting from Narrabri West, and going direct towards Mercadool or Collarendabri would have to cross not only the Namoi, but would pass through a great deal of flooded country. It really would be a question of expense. The flooded country could be got over, but it means a great deal of expense in bridging.

50. You not having personally examined the country, and your information being only that furnished to you by your surveyors, I suppose you are not prepared to say in what way the proposed line would serve the whole of that district? No; that is a matter which I do not deal with so much as those do who have been specially instructed to deal with traffic.

51. Your information will guide the Committee only as to the cost of the construction of the line, and the practicability of the route? Yes, I look at it purely from an engineering standpoint. If estimates were required for the sake of comparison from Narrabri West crossing the Namoi below Narrabri, it would be necessary, in the first place, to have levels taken throughout, because it would be impossible merely from an inspection to say what the cost of construction through that country would be.

52. In the event of a railway being constructed from Narrabri to Pilliga—which is one of the proposals now before this Committee—what would be the distance from Pilliga to the point, to which you have referred in your evidence, within 10 miles of Collarendabri? About 50 or 55 miles.

53. What is the distance from Wee Waa direct north to the proposed line and from Pilliga direct north to the proposed line? About 40 miles from Pilliga to the nearest point on the proposed line, and about 28 miles from Wee Waa to the nearest point on the proposed line.

54. What is the nature of the country between Pilliga and Collarendabri? I presume from Mr. Stuart's reports that it consists of patches of black soil and red soil with some timber, stunted ironbark, belah, brigalow, &c.—very similar to what you get throughout the north-west—extensive plains and patches of timber.

55. Was the extension to Collarendabri in contemplation when the survey was made from Narrabri *via* Wee Waa to Pilliga and on to Walgett? There was a pretty old proposal to make a railway extension to Mungindi, and I think that, later than that, there was a proposal to go to Angledool, which line would pass through Collarendabri; but I can look the matter up for the Committee.

56. The proposals before the Committee—a line from Narrabri to Walgett, and a line from Woolabra to Collarendabri—would give a distance of only from 40 to 45 miles between the two lines? Yes.

57. Was it taken into consideration that both lines would, to some extent, be serving the same country—was that taken into consideration at the time the line to Walgett from Narrabri was projected, or the line from Woolabra to Collarendabri? I cannot tell what motives the Minister may have had in bringing forward the two proposals—from Narrabri to Pilliga, and from Woolabra to Collarendabri.

58. But you perceive, do you not, that they are very close together? Yes; they are very close together—within, as I have said, about 40 miles of each other.

59. They pass through pastoral country? Yes.

60. You have simply carried out your instructions to ascertain the cost of construction? Yes.

61. You gave no consideration to the fact that those lines were close together? I was not asked to advise as to whether one or the other, or both, should be carried out.

62. You were instructed to find the best starting point for the line between Narrabri and Moree? Yes.

63. *Mr. Wright.*] Have you ever read Mr. Jones' report on this proposal? I have it here.

64. If you will look at page 18 of that report (No. 19 Narrabri West *via* Collarendabri to Angledool) you will see that in paragraph 5 Mr. Jones says:—

It needs only a glance at the map to show that this scheme is the least useful of all those put forward to give access to the North-west. Coonamble and Coonabarabran would be entirely shut out; Walgett would make very little use of such a line, as it is scarcely likely traffic would be hauled north by road to go south by rail.

What have you to say to that statement of Mr. Jones; it really embraces a line to Angledool, and we are told by the Railway Commissioners that the course of this line now before us may be eventually extended north-west to Angledool? Without going into motives for making this line, I should say, at any rate, that a line to Collarendabri could never be expected to suit Coonabarabran and Coonamble. I do not know why Mr. Jones brings Coonamble and Coonabarabran in.

65. You miss the point; Mr. Jones says:—

It needs only a glance at the map to show that this scheme is the least useful of all those put forward to give access to the north-west.

? Yes; but then he gives reasons for that. He says:—

Coonamble and Coonabarabran would be entirely shut out.

But this line is not intended to deal with those places.

66. Circumstances have altered somewhat since then; but he is speaking of the north-west? This line would not compete at all with a line to Coonamble from Warren or Dubbo.

67.

H. Deane. 67. I am speaking of north-west of the Barwon, which this line is specially supposed to affect? I think that he ought to have left that out, because there is no argument in the fact that Coonamble and Coonabarabran are entirely shut out. They can be dealt with afterwards.
9 Mar., 1898.

68. Kindly read the next paragraph:—

No doubt a few stations west of Goodooga, not within the trafficable sphere of a line to Walgett, would use the Angledool railway; but their wool is already obtained either at Byrock or Bourke, and therefore little extra revenue would be received by the State.

There he is dealing with the particular class of country this railway is to tap? Yes.

69. Mr. Hassall.] Mr. Jones, on page 17 of his report, in dealing with a line from Narrabri West *via* the north side of the Namoi to near Walgett, says:—

This line passes over ground less liable to inundation than on the south side of river. It also serves a larger area of good grazing country, and would be within easy access from Pilliga and Wee Waa, the latter more especially. It also passes through the centre of extensive settlement on Pian Creek and Jews' Lagoon.

And in his first paragraph he says:—

Crossing the river at Gurlough Point, 16 miles from Narrabri, it is proposed to make use of the firm sandy ridges which exist much of the way to the Barwon. The terminus suggested is at Eurie Eurie, 10 miles north of Walgett.

Do you know the distance between Collarendabri and Walgett? About 40 miles.

70. Do you think it would be advisable to take the railway to Walgett, and not to Collarendabri, in view of the traffic that you would get in that part of the country? Very likely not.

71. Do you not think that it might be advisable to give full consideration to the suggestion thrown out in Mr. Jones' report on the line from Narrabri West, *via* the north side of the Namoi, to near Walgett, and to make the terminus at Eurie Eurie, within 10 miles of Walgett in one direction, and within 30 miles of Collarendabri in another direction, traversing rich country all the way? I have not sufficiently considered the matter to express an opinion. Before I could give an opinion as to the desirability of making a railway on the north side of the Namoi to Walgett I should like to have a report by one of my own officers as to the class of country.

72. You can express no opinion on the class of country there? No; and I do not know that any of my officers have been over that country with a view of reporting on a line on the north side of the river. I think that some time ago the statement that the north side of the Namoi was less liable to floods than the south side was disputed. It is a matter that I think should be settled. It seems to crop up every now and then, and it is desirable to get a report upon it. When the Pilliga inquiry was on, there was a great divergence of opinion, and I think it would be desirable to get the country examined. If the Committee would recommend the matter to the Minister, I should be very glad to send some one there. It would not take very long to examine it. Seeing the trend of the Committee's inquiries, I think that very valuable information could be obtained.

FRIDAY, 11 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Woolabra to Collarendabri.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

J. Harper. 73. Mr. Trickett.] The Railway Commissioners have made a report on this line, in which they point out that the probable annual cost would be £13,094, and the annual traffic £7,109, leaving a loss of £5,904; have you a statement you can submit to the Committee in support of these figures? Yes.
11 Mar., 1898.

Sydney, 4 August, 1897.

PROPOSED RAILWAY, WOOLABRA TO COLLARENDABRI.

Distance, 80 miles 56 chains; estimated cost, £207,798; interest at 3 per cent., £6,236.

As directed by the Commissioners, I have made careful inquiry into the prospects of traffic on this line. As they are aware, special attention was drawn to this route by the Public Works Committee which dealt with the line between Narrabri and Moree in 1894. That body, though bearing in view the strong representations made by the occupiers of the grazing district to the west, expressed themselves as unable to agree to the proposed deviation from the direct route between Narrabri and Moree through Millie, but suggested that steps should be taken for exploration, &c., of the country from this line westwards towards Collarendabri. The scheme now under consideration is no doubt the result of the suggestion.

As the Commissioners know, the district traversed by the line is one of the best stock areas in New South Wales, and produces a very large quantity of wool and fat stock. In addition to this, there is no doubt, were the line extended towards Collarendabri, traffic in the neighbourhood of the north-west of Angledool and as far north as the Australian Pastoral Company's properties in Southern Queensland would find its way to it. It should, however, at the same time be borne in mind that projected lines have been submitted for consideration which would more or less affect the traffic claimed by this district. For instance, the proposed line between Narrabri and Pilliga would most certainly receive a portion of the traffic claimed by the Collarendabri people, and it is equally certain that it would secure the Walgett traffic which was claimed, at least for passenger purposes, by the supporters of the line under consideration. Again, either a navigable river or railway between Brewarrina and Byrock would to a certain extent tap more of the south-western district, which the Collarendabri people claim to be within their trafficable area.

In the estimate furnished by the local body I also found that traffic which was included would most undoubtedly continue to make Moree its terminus as at present.

Another matter of very vital importance in connection with the line is that the very large traffic from and to the pastoral companies in Queensland, which in my estimate is credited to the extension, would, in the event of a projected railway to St. George being built by the Queensland Government, be diverted to that point, and even were this not done, would be at any time liable to diversion from the proposed line by an arbitrary increase in the existing Border tax.

I refer to these matters in general terms in order that it may be seen that the estimates prepared by those interested in the railway require, in view of our knowledge of the circumstances referred to, to be weighed and considered very carefully.

In connection with the location of the line, it may be stated that it traverses easy country, comparatively free of floods until within a distance of 10 miles 72 chains of Collarendabri. From this point to the township a number of warrambools or watercourses which are liable to inundation have to be traversed, and the effect of this upon the total cost of the line may be gathered when it is stated that whilst the estimated cost for the first 69 miles 64 chains is £2,300 per mile, the 10 miles 72 chains referred to is estimated to cost £4,352 per mile; and, should it be decided to build the line, it certainly becomes a very serious question as to whether it would not be desirable to terminate on high ground instead of traversing the flooded country referred to.

As far as the prospects of the line are concerned, there is no doubt that it is deserving of the utmost consideration in connection with any steps which may be taken towards either a westerly extension or improvement to the river navigation.

It has occasionally happened that river communication has been opened to Collarendabri by the Darling and Barwon, and indeed to a point as far north as Mungindi. Under existing circumstances this is of rare occurrence, but, of course, should it be decided to improve the navigation of these rivers, such a course would have a most important bearing on the transit of the heavy traffic to and from the area under consideration.

For the purpose of my investigation, which has been a thorough one, the season 1894-1895, as being admitted the best in the district, has been taken, and a liberal margin allowed for the development in the live stock traffic, which would undoubtedly arise were small holders enabled to avail themselves of rail transit for the purpose of moving small consignments of stock.

The rates taken are an extension of the rates prevailing on the Narrabri to Moree line—the circumstances of the two lines being similar.

There would be three intermediate points from which traffic would be delivered on the extension.

It is also necessary to draw attention to the fact that the estimate includes the wool and live stock of the A. P. Co. of Queensland, which would be diverted from Moree. The chief gain in this would be the additional freight from Woolabra to Narrabri, as the freight from Moree to Narrabri and Collarendabri to Woolabra is only 2s. 6d. per ton in favour of the latter.

In justice to the line in another direction it may be stated that the great bulk of the other traffic from the district it would serve at present is carried by road to Narrabri. Were it put on the proposed extension, the existing line would carry it between Woolabra and Narrabri, in addition to its carriage on the Collarendabri line.

Again, on the other hand, were the line constructed to Pilliga, a great deal of this traffic would fall into that extension, assuming it were decided not to construct the Collarendabri one.

My estimate is:—

Wool, 4,554 tons	£2,224	
Goods, 1,686 ,,	1,537	
Stock, 2,000 trucks	1,657	
		5,418
Passengers, 1,500, at 8s.		600
Sundries		200
Mails		972
		£7,190

Detailed Statement of Estimate.

	Miles.	Tons.	£	s.	d.	Total.

						200
						£7,190

74. Is your estimate based upon the whole distance, or upon 63 miles? It is based upon the whole distance.

75. Have you made any estimate that would enable the Committee to see what would be the outlay and the receipts if the line stopped 10 miles short of Collarendabri, as suggested by the Department? Well, it is rather a matter for consideration, but I should say that if you deducted about one-tenth that ought to about represent the estimate.

76. You would get about one-tenth less in the way of revenue? Yes.

77. But the expenditure for the remaining part would be very much greater? Yes.

78. So that it will be better to construct the line only to the 63-mile limit? Yes; it looks so on the surface of the thing.

79. And in the paper which you have read, you start 11 miles from Woolabra? Yes.

80. Meaning that the traffic for that distance would be brought in by waggons and teams? Yes. It is where the Moree road intersects the line.

81. What is the reason of the Department deciding upon Woolabra as the junction point? I gathered from the engineers that the object was to get away from flood-water.

82. More from an engineering point than from a traffic point? Yes; absolutely from an engineering point. As a matter of fact, the suggestion first came from the Public Works Committee in 1894. They suggested that the country should be explored in that direction.

83. So long ago as 1891 it was suggested that there should be a line of railway from Narrabri West, *via* Collarendabri, to Angledool;—did you ever deal with that proposal? No. I think there have only been surveys. That proposal never came on to the Railway Commissioners.

J. Harper. 84. Do you look upon this route from Woolabra to Collarendabri as the best one? I am rather inclined to think, if a route could be got, that it would be better to take the line through Wee Waa, or in the neighbourhood of Wee Waa.

11 Mar., 1898.

85. That would be *via* Narrabri? Yes. But it is so purely an engineering question that I should not like to express an opinion upon it.

86. Have you considered the relative merits of the two lines, one from Narrabri *via* Wee Waa to Collarendabri, and the other from Woolabra to Collarendabri? No, only superficially, by reason of my not knowing the possibilities or otherwise of a line going *via* Wee Waa. But I am of opinion that if it went through Wee Waa, although there would probably be a greater length of line, there would be a greater amount of traffic.

87. For what reason? Well, there is a lot of country about Wee Waa, in the neighbourhood of the line, that would not go north to join this line. It would fall in on to a local line, but it would not go north. It would continue to go on to Narrabri. I have referred to that in my report. I will read the paragraph again:—

Again, on the other hand, were the line constructed to Pilliga, a great deal of this traffic would fall into that extension, assuming it were decided not to construct the Collarendabri one.

What I mean is that to the north of the Namoi you find most of the best country, and the people living south of the Pian Creek, and approaching Narrabri and in the neighbourhood of Wee Waa would not come up to that line—they would continue to go to Narrabri. For a similar reason I had to exclude some of the district to the south of this existing line. That traffic obviously would also continue to come into Narrabri.

88. But would not a line *via* Wee Waa to Collarendabri somewhat clash with a line to Walgett? I think it would serve about the best part of that district.

89. Do you think it might avoid the necessity for a line to Walgett? I think it is quite on the cards that it would.

90. Where does all the traffic from the intervening places between Collarendabri and Woolabra go to now? Chiefly into Narrabri.

91. On reference to the map, does it not look as if a line, if started from Narrabri *via* Wee Waa, might go in a direction midway between Walgett and Collarendabri, and then branch off to the two places? I think you get into very bad country there.

92. The engineering difficulties might be an obstacle? Yes. That country has been examined, and it floods out a long way and very frequently.

93. Does it not seem desirable that if a railway were constructed in the direction of Collarendabri it should go on further to Angledool? Some day such an extension might be considered; there is no immediate necessity for it.

94. If the road for 10 miles east of Collarendabri is as bad as described, would it not be very bad for ordinary traffic? It is corduroyed. A lot of money has been spent on the road.

95. If the line were made 10 miles short of Collarendabri, would you get a lot of traffic from that distance? Yes; the traffic would come in there certainly; it all passes along that road to-day.

96. The district to be served by this railway would be a sheep district? Yes.

97. No cattle? Very few cattle; chiefly sheep.

98. You put down an item of £1,537 for goods,—what class of goods? They would represent the various classes of stores going back for consumption on the stations—back traffic.

99. And what does the item of £1,657 represent? Stock.

100. Do you think the railway there would be largely utilised for the carriage of stock? I think so; it is a splendid fattening country. There is a lot of comparatively small settlement there, and small settlers cannot afford, as a rule, to send their small lots of stock in. Droving is just as expensive with a small mob as with a comparatively large one.

101. That part of the country is a great place, is it not, for dealing in stock; stock shift about a lot there; it is a great place for speculation in stock? Yes.

102. The sum of £1,657 is rather a large amount to put down, is it not, for the carriage of stock? No; it represents altogether about 1,800 trucks. For a district like that it is not a large amount.

103. Did I understand from the reports you read that you put down as an earning of this railway something that the main line would benefit? Yes. The position is this:—If, to-day, that line were built, the probabilities are that the Australian Pastoral Company's wool, consisting of about 6,000 bales, which comes in to-day at Moree, would join this line at Collarendabri, and, instead of running over the 60 miles of the Moree line, would be carried over 29 miles of the existing line between Woolabra and Narrabri, in addition to 81 miles on the new line.

104. That is included in your estimate? Yes; it is taken into consideration in the estimate.

105. The estimate of this line shows rather a large amount of probable loss—close on £6,000—what are your ideas as to the earnings in the future; are they likely to be improved or not? Assuming that it would not be much more costly there for construction and maintenance, I should feel inclined to think that, if it were constructed in the neighbourhood of Wee Waa, that loss would be considerably reduced; that is to say, there would be a great deal more traffic.

106. Then I understand that you have a strong preference in favour of the line going by way of Wee Waa? I think it is worth considering, and worth having a very hard try for; and I should say, for choice, on the north bank of the river.

107. The Commissioners say in their report, "It would open up a good class of country, and probably form the basis of a further extension later on in a north-westerly direction";—in what direction does that mean? To Angledool; or taking a more westerly direction, if considered necessary, on to the Narran.

108. In regard to opening up this country, is it not mostly alienated land? I have no idea what extent of Crown lands remain.

109. The Commissioners also say that the line has various merits;—have you any other grounds you can give us in support of its construction? No; not beyond those I have stated. On the 14th April, 1897, a deputation waited upon the Minister for Public Works in reference to this railway, and the report of that deputation contains a great deal of information on the subject.

110. I suppose you could not tell us how it is that this line from Narrabri *via* a point between Narrabri and Wee Waa, and on to Collarendabri, has not been more carefully inquired into, seeing that you have

a great idea of the trading capabilities of that line? That, of course, I do not know. The Commissioners had nothing to do with the selection of the proposed route. The thing was emphasised, as I indicated just now, by the Public Works Committee.

J. Harper,
11 Mar., 1898.

111. But they did not emphasise any particular route, did they? No; they indicated Collarendabri as a desirable point to reach.

112. This is what they said in the report of the Sectional Committee on the Narrabri to Moree railway:—

We are of opinion that in view of the importance of the western trade it would be well if a full exploration survey should be made of the country towards Collarendabri, apparently the best place to start a survey from being a point between Narrabri and Edgeroi, thus utilising the bridge which will be constructed over the Namoi on the direct route.

? That is what they have practically done, because Edgeroi is only a few miles from Woolabra. I think the objection to going from Edgeroi was that they would not be out of the flood-waters so well as would be the case starting from Woolabra.

113. It is rather a troublesome part of the country as regards flood-waters? Yes.

114. And the more you get to the west apparently the worse it gets? Yes; it floods out on the water-courses.

115. You have no statistics that would enable us to form a comparison between a line *via* Wee Waa and a line from Woolabra? No; but if it be considered desirable at some future time, I might get the information before the inquiry is closed.

116. With regard to the item you have put down for stock, which seems to me rather a heavy one, do you remember when the Byrock to Brewarrina line was before us, you then urged, or somebody from your Department urged, that stock-owners would drive their stock, rather than take them long distances by tram? They would do so rather than pay local rates for them; these are through rates.

117. Therefore that argument does not apply in this case? Exactly; and of course it is better fattening country.

118. Does the line go mostly through private property? No; it is chiefly on the stock route, or through Crown land, I think.

119. Therefore, the amount of compensation would not be very great? No.

120. Regarding it as a line for a distance of 69 miles, I apprehend the Department looks at it as one of those light lines of railway that will not pay at the present time, but has a future before it? Yes.

121. In the way of increased settlement, which would bring traffic? Yes.

122. But the Commissioners are clearly of opinion that the line should stop 10 miles short of Collarendabri? Yes; that is the opinion they have expressed, on account of the cost of construction.

123. What would be the nature of the increased settlement, seeing that it is mostly a grazing country? It is grazed to a great extent in large holdings now; but settlers are taking up smaller holdings, and this will mean a larger quantity of stock.

124. Looking at the various railway schemes that are now under the consideration of the Committee, including the line *via* Pilliga to Walgett, and this line to Collarendabri, does it not strike you that it would be desirable, if possible, to get a line of railway which would serve the interests of all, without making a railway to each place? There are so many districts that I do not see how you could have a line that would provide for them all. You have the Walgett or Pilliga line under consideration, also the line from Byrock to Brewarrina, and the line from Warren to Coonamble. I certainly would not suggest, for a moment, that Coonamble could be served in this way.

125. But Collarendabri and Walgett might be served by one line? Yes.

126. Is Collarendabri a large stock centre? Yes, a great deal of stock passes at Collarendabri.

127. I suppose it is as large a centre as Walgett? I should think larger.

128. Do you think that settlers could profitably drive their stock over the 10 miles of country rather than that the country should be put to the great expense of a railway? Yes; the same thing would apply to wool, having come the distance it has come.

129. What class of road is there over this bad country to the east of Collarendabri? The roads are very bad. They have been corduroyed to a great extent. A lot of work has been done on them. They have been made passable in times of flood for stock and teams, but it would be very difficult to build a railway over that country. Causeways are used over which the water is allowed to flow.

130. Large quantities of stock have been lost in that country in time of flood, I believe? Yes; it is rather bad country for sheep when there is a heavy flood.

131. *Mr. Clarke.*] You are, of course, aware of the proposal to construct a railway from Narrabri to Pilliga? Yes.

132. In your former evidence, I think, you did not approve of that line being made? No.

133. In your opinion, would a line from Moree to Collarendabri answer the purpose as well as the present proposed line? I think it would be bringing them a long way round, and apart from that, from what I have heard of the character of the country, you would most undoubtedly get into bad country there for railway construction.

134. Why? The water-courses are bad, so I have heard from pretty well all the people who have spoken about that district.

135. *Mr. Hassall.*] You do not know the country yourself? No.

136. *Mr. Clarke.*] It is mentioned in their report that the Commissioners do not altogether approve of this line being made; they merely state that it is worthy of consideration? Yes.

137. Do you think that, in the interests of the people of the district and of the country at large, it would be advisable to carry out this railway proposal? As has been suggested by the Commissioners and by myself, I think it is worthy of exhaustive inquiry, which I know it will receive at the hands of the Committee.

138. I notice by the report that a loss of nearly £6,000 is estimated in the first instance? Yes.

139. Do you think that, owing to the increase of traffic, that loss would be reduced, and ultimately the line would be a paying line? I should look for it to be reduced, certainly, in a country like that. I may incidentally mention that in the case of the Moree line the results have now been obtained, and they are very good.

140. Would not this line, if carried out, take away a portion of the traffic from the Moree line? Yes; a certain portion would be taken. It would not be very material. Of course the earnings would be more in proportion—that is to say, they would have to pay a longer mileage from Moree, and that would, of course, largely influence the direction.

- J. Harper. 141. *Mr. Wright.*] You are aware that the Committee have before them, at the present time, a proposal for a line to connect the Barwon with the western railway at Byrock? Yes.
- 11 Mar., 1898. 142. Also a line from Warren to Coonamble with the probable ultimate extension to Walgett, and there is a line from Narrabri to Pilliga, whose objective point, I suppose, is also Walgett. Thus there are four different lines proposed to connect the upper waters of the Barwon with Sydney. Do you think there is anything, or likely to be anything for a very long time, to justify us in tapping the Barwon in three or four different places? No, certainly not. One of the reasons why I think a line somewhere in the neighbourhood of Collarendabri is worthy of consideration is, that they have not the same facilities of water-carriage that exist at other points.
143. Water-carriage is not of much use above Walgett? No.
144. You spoke just now about the enormous traffic secured by the Moree railway extension; is not that traffic caused by the fact that at that point is concentrated all the traffic that formerly came to Narrabri, and a great deal of that which formerly came to Tamworth, Manilla, and other places? Yes, some of that traffic has been diverted to Moree.
145. And Moree has become, for the time-being, the depôt for the northern, and practically a great deal of the north-western, portion of the Colony? Yes; but a great deal of the north-western traffic comes to Narrabri from Collarendabri.
146. Do you think the products of that part of the country are such as can stand a reasonable amount of road carriage—namely, wool and stock? Yes; although I suppose the growers would not say so. Such products would certainly stand road-carriage better than wheat.
147. They would stand high carriage better than any other product we have got? Yes, probably.
148. Do you see any prospect in the near future, or in a quarter of a century, of that country out at Collarendabri, and as far as Angledool, being occupied in small blocks? It is becoming occupied now.
149. Is it not all in the western division? Yes.
150. And, therefore, cannot be occupied for seventeen years? But there are a number of small settlers in that neighbourhood already.
151. In the western division the leases have about seventeen years to run, and the only form of alienation is a homestead lease of 10,000 acres? Those are the class of men who are there.
152. Is it not a fact that all the 10,000-acre blocks in that part of the country worth anything are already taken up? That I could not say.
153. If that is the case, population could not increase there very largely? No.
154. You have been to Collarendabri? Yes.
155. Have you been to Angledool? No.
156. Have you been on the Narran? No; I know the Narran only by reputation.
157. Therefore you cannot say whether it is a fact that all the available country there is practically taken up by homestead lessees? No; I could not say that.
158. Did you go through the country from Narrabri across by Wee Waa? Yes; on both sides of the river.
159. Do you not think that a railway from Narrabri and on towards Collarendabri would serve the district better than a railway from Woolabra to Collarendabri, or a railway from Narrabri to Pilliga? Yes; that is really what I have indicated. I indicated that it was worthy of examination.
160. Has the country been explored? Yes; an exploration has been made extending to the neighbourhood of Mercadool.
161. What is the nature of the report? I do not know.
162. At any rate, I take it from your evidence that you think one line of railway through that country would serve it as well as a double line? Yes.
163. At a considerably less cost to the country, a railway crossing by Wee Waa, and going within 10 or 11 miles of Collarendabri, and within 20 or 30 miles of Walgett, would practically serve both? Yes.
164. And would be all they have a right to ask? I think so.
165. If that line were constructed, and the necessity arose, it could be extended on to Angledool later on? Yes.
166. Just as well from that point as from Collarendabri, and so embrace the whole country? Yes; an extension of that kind would space out the country still better than a line from Collarendabri.
167. That extension would divide the country, and give everybody a better means of access to market? Yes.
168. You do not regard it as of very great importance that the railway should run into the town of either Walgett or Collarendabri? No.
169. So long as it runs within a fair and reasonable distance? Yes; we have too many railways already running into towns.
170. The revenue derived from these little country towns does not much augment your general railway revenue? No.
171. You look to the great products of the country to do that, and not to the small quantities of wine, spirits, and beer which you may carry to country towns? Yes.
172. Have you been over this country yourself? Yes; I went from Woolabra across to Collarendabri, practically on the surveyed route.
173. Have you been over the intervening country between the two suggested lines? No; I came back through Boolcarrol. I did not go over it in such a way as to form a conclusion myself as to its flooded character.
174. You saw nothing of flooded country north of the Woolabra to Collarendabri line, did you? Not on the route from Woolabra to Collarendabri.
175. Did you see anything of flooded country between Moree and Collarendabri? I did not travel between Moree and Collarendabri.
176. You base your opinion upon information you received? Yes.
177. In the event of a railway being constructed between Coonamble and Walgett, do you think it would be desirable to make a further extension north? No; I think it would be going a bit too much out of the way.
178. You think that is too far round? I think so.
179. A connection between our present Western Railway system and Coonamble would tap all the good country between that and the river? Yes, all the good country would come in. 180.

180. The legitimate trend of the traffic north of the river and north of Pilliga would be to the main Northern line? Yes. J. Harper.
181. That is the route by which you think that portion of the country should be served in the matter of railway communication? Yes. 11 Mar., 1898.
182. So that the proper connection for Walgett, Collarendabri, and Angledool is with our main Northern line? Yes.
183. *Mr. Hassall.*] In the event of the suggestion being entertained for a line from Narrabri West across Gurleigh Point near Wee Waa, and through that good country on the northern side of the Namoi, do you think it might not be possible to strike a point on the Barwon, even if you had to cross it between Walgett and Collarendabri? It should be; but, as I said before, that is rather an engineering question, upon which I should not care to express an opinion.
184. And in the event of any further extension of that particular line or branch, you would have the advantage of a good road from Collarendabri to the railway terminus and a good road from Walgett? Yes.
185. You know, as a fact, that the country on the western side of the Barwon is high and dry? That is so.
186. And that on the southern bank of the river the country is inundated for some miles? Yes.
187. So that in the event of a line being constructed through that country, probably a strip of country might be found between the two places, not exceptionally wide, but where a decent crossing might be obtained, and you could get on to high land on the other side of the river. If that were carried out it would provide a first-class road from Collarendabri and also on to Walgett? That is so.
188. And give the whole of the residents of the Walgett district and the Collarendabri district reasonable means of communication with Sydney? That is so.
189. Would there be any justification for taking a line of railway either from Narrabri, *via* Wee Waa, to Pilliga, and on to Walgett, or *via* Warrén to Coonamble and on to Walgett, and then another line from Woolabra to Collarendabri, leaving the terminal points only 40 miles apart? No; I do not think so.
190. That is in view of the settlement which has already taken place in that country, and which is likely to take place? I certainly do not think it would be desirable.
191. The country is essentially pastoral country, is it not? Yes.
192. I presume, from your knowledge of it, you recognise that it must be many years before it could be put under any form of occupation satisfactorily? Yes; I should not expect it.
193. Therefore, the object of this Committee, and, I presume, the object of the Railway Commissioners, is to try and serve that country in the cheapest possible manner? That is so.
194. The suggestion that has been made that consideration might be given to an extension from Narrabri, running near Wee Waa, and going down through the country that is now well settled, would be the most feasible plan to adopt in order to give the people the communication they desire? Yes; that is certainly my view.
195. You know the Pian Creek country? Yes.
196. That country is fairly high, is it not, running up through Boolcarrol towards Narrabri? Yes.
197. A survey has been made to Mercadool? Yes.
198. So that, practically, the country to which I have alluded has been under survey by the Railway Construction Department? There has been an exploration.
199. And it would not be difficult to obtain all the information necessary to enable the Committee to form an opinion with regard to it? I do not think so. I fancy that Mr. Stuart who ran the exploration is now in Sydney.
200. You think the extension suggested would be far preferable to the proposal to run out to Woolabra, then turning at right angles and going on to Collarendabri? Yes.
201. There would be no better country traversed going from Woolabra than by the other route? Certainly not. On the other hand there would be very much better country traversed from Woolabra than that on the south bank of the Namoi.
202. Can you compare the country on the north side of the Namoi with that on the south side? No; you cannot compare it. On the one side there is nothing but brigalow for miles, and on the other side there is some of the best country in the Colony.
203. The line running from Narrabri *via* Wee Waa to Pilliga as proposed would practically go through a lot of very bad country, the only traffic that might be expected being traffic from the north of the river? Yes.
204. To secure that traffic, the better plan would be to cross the river higher up, and go through the good country? Yes.
205. Where would you look to for your traffic from that district—coming in at Wee Waa? Nearly every bit of it would come from the north bank of the river.
206. That country is pretty well settled, is it not? Yes.
207. Instead of large holdings carrying cattle, as was the case twenty or thirty years ago, the country is now occupied by selectors with considerable holdings, carrying large quantities of sheep? That is so.
208. And you think you would get a fair amount of traffic from that part of the country if a light line of railway were constructed? Yes.
209. Do you think that the settlement through that part of the country, the settlement on the western side of the Barwon, embracing the country lying from Walgett, say, on the south, to Angledool on the north-west, and embracing the Narran, part of the Bokhara and the Birie, would justify the extension of a light line of railway to some point such as I have indicated on the Barwon River between Walgett and Collarendabri? I should expect it would, from the information, as far as my memory serves me, in connection with the traffic that would fall into it, which I obtained about the Pilliga line *via* Wee Waa.
210. Do you think that in the interests of the country it would be far better to construct a light line of railway through that country than to attempt to carry a line along the southern side of the Namoi in the direction of Walgett? There is no comparison between the two. The country on the northern bank of the river is exceptionally good, and that on the southern bank exceptionally bad.
211. In the event of a line being extended to the Barwon between Collarendabri and Walgett, do you think it would then be necessary to construct a branch from Byrock to Brewarrina? No, I do not.
212. You think that the trend of the traffic would be on to the Barwon River, at a point between Collarendabri and Walgett? Yes. I think a good deal of the best country in the neighbourhood of Brewarrina and on the Narran, and on the other rivers mentioned, would be best served in the way indicated.

- J. Harper. 213. Have you ever been across the country between Collarendabri and the Narran--across what is known as the Sixty-mile track? No; the country was described to me as being very good.
- 11 Mar., 1898. 214. Do you think it might be justifiable, at some future time, to run an extension through the country between the Namoi and Angledool, and towards the Queensland Border? Yes; I think it would split the country up pretty well.
215. If an extension were carried out in that direction, would it not tap an area of first-class grazing country? Yes.
216. And would it not, in your opinion, secure a very large portion of the Queensland traffic? Yes, if Queensland did not prevent it from coming in.
217. Do you know the nearest point on the railway in Queensland from Angledool? Yeulba.
218. *Via* St. George and Surat? Yes.
219. Do you not know that the Narran, the Bokhara, the Birie, and the Culgoa are all watercouses formed by the overflow of the Baloon River? Yes.
220. And that it is an area of country exceptionally well watered and well grassed? That is so.
221. And will carry a very large number of stock? Yes.
222. And a line of railway running in that direction must eventually command a very fair share of traffic? Yes.
223. In fact, do you not think that if a line of railway were extended into that country, (say to Angledool) you would secure the whole of the border traffic, for which Queensland would probably never compete? I would not like to say that. In Queensland they have a scheme for running a railway from Warwick parallel with the border. I do not think they make a connection at St. George. Their railway station nearest to that country is Cunnamulla.
224. From Wyandra? Yes.
225. That would be almost their nearest point? Yes; unless they build a line from somewhere about Warwick due west.
226. Summing up your evidence, you are of opinion that the suggestion to take a line from Narrabri through the country on the northern side of the Namoi River would be far preferable to any two schemes having for their object the same objective point? That is so.
227. *Mr. Humphery.*] With reference to a possible extension, in the direction indicated by Mr. Hassall, to Angledool, how would that affect the traffic at Brewarrina? We did not say absolutely Angledool, but in the direction of the Narran. You would there pick up the best of the Brewarrina country.
228. Are you of opinion that a railway extending from a point between Collarendabri and Walgett in a north-westerly direction between Angledool and the Barwon would well serve the whole of the country north of Bourke and Walgett? Yes.
229. In the event of such a line being constructed, how would it affect the Brewarrina traffic, assuming the construction of the proposed line from Byrock to Brewarrina? It would simply take the bulk of the traffic that comes into Brewarrina to-day. That is what I should expect it to do.
230. Are you, then, of opinion that the line would render unnecessary any other extension in the direction of the Barwon? Yes.
231. From any of the New South Wales systems? Yes.
232. In that case, assuming the extension from Warren to Coonamble to be carried out, you would regard Coonamble as the terminus? Yes.
233. You think it would be quite unnecessary to extend the railway in the direction of Walgett, or any other point on the Barwon? Yes, assuming that the line referred to were carried out.
234. In considering the proposal before the Committee, of a railway from Warren to Coonamble, the Sectional Committee, in your opinion, should leave out of consideration absolutely any extension in the direction of the Barwon? Yes, I think so; that is to say, in considering the proposal we are now discussing.
235. I am speaking now of the proposal with which you are familiar--to construct a line from Warren to Coonamble? I consider that an extension is necessary to Coonamble, but not beyond.
236. What is the distance from Coonamble to the nearest point on the Barwon? From Coonamble to Walgett the distance by road is 80 miles.
237. Can you prepare a map showing the portion of the district that would be served by the line that has just been indicated north of the Barwon, and south of Angledool? Yes.
238. What would be the difference in distance by such a line, and the line from Brewarrina to Sydney *via* Byrock? I cannot say, pending survey.

MONDAY, 14 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Woolabra to Collarendabri.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

- H. McLachlan. 239. *Mr. Wright.*] In their report on this line the Railway Commissioners adopt rather a peculiar course. They simply say the line has merits, and is worthy of consideration; they do not follow their customary method of either recommending or rejecting the line? No. Personally, they are rather inclined to favour the line, but they do not feel very strongly either way.
- 14 Mar., 1898. 240. They furnish this negative kind of report, and leave the Committee to investigate the whole thing? To some extent the report is rather favourable. They do not directly recommend the line.
241. As a rule they either recommend or disapprove? Yes. 242.

242. In this case they have not done so? No.

243. This is supposed to be a single line? Yes.

244. Before the Committee there is also a scheme to connect Narrabri with Pilliga *via* Wee Waa;—I suppose the objective point of that line will be Walgett? Yes.

H.
McLachlan.
14 Mar., 1898.

245. Seeing that the distance between Walgett and Narrabri is not very great, have you any idea how it would suit to construct a line from Narrabri, crossing the Namoi at Wee Waa, and striking the Barwon at a point equi-distant between Collarendabri and Walgett, that point being the terminus? The Commissioners make it a rule not to look into alternative proposals unless directly referred to them; but this matter has not escaped them, and they think it is certainly worthy of inquiry as to whether it would not be wise, perhaps, to start directly from Narrabri, touch Wee Waa, and then go towards Collarendabri. That is the point they looked at. There is this to recommend it: You would have a slightly greater length of line to make, and it would, perhaps, pass through more difficult country—that would, of course, depend upon the engineer's survey—but there would be this advantage, that Collarendabri would be nearer to its market. Although you would make a longer length of line, you would carry the goods a shorter through distance by rail to their destination.

246. But in the Commissioners' report, and also in the report of the Engineer-in-Chief, the Committee are advised that the line should not go within 10 miles of Collarendabri? Yes.

247. What I suggest is that a line leaving Narrabri, crossing the river at Wee Waa, and running to a point, halfway between Collarendabri and Walgett, would do away with the necessity of a double line there, and would serve the country equally well. I will put it in this way: Suppose a proposal were made to construct these two lines, and there was also a proposal to construct the line I suggest between the two, which would the Commissioners approve of? I should think they would go for the intermediate line; that is my own opinion.

248. If you look at the map you will see that that line from Wee Waa to the Barwon could be taken in a direct line to Angledool with a possible north-western extension later on? Yes.

249. You cannot say definitely what are the views of the Commissioners on the matter? No, because there are other circumstances which may effect the question, such as the cost of construction, and the nature of the country. There is, I should think, some flooded country on the route you propose from Narrabri. A great deal, of course, would depend upon the survey.

250. Do you think there is anything in the trade of that north-western portion of the Colony to justify the construction of a line from Woolabra to Collarendabri, also a line from Narrabri, *via* Pilliga, to Walgett, and one from Byrock to Brewarrina? No.

251. There is no justification for tapping the Barwon at those three points? No. As a matter of fact, the only line the Commissioners favour, or inferentially favour, is the one to Collarendabri, tapping the upper portion of the Barwon.

252. The Committee have asked the Engineer-in-Chief to have an examination made of the intervening country between Wee Waa and the Barwon, halfway between Collarendabri and Walgett? Personally, the Commissioners think such a line is well worthy of consideration, but they would not like to express a definite opinion until they had before them all the facts as to the cost of construction, and the nature of the country.

253. Do you think there is anything in the country beyond Collarendabri to the north-west that would justify an extension to Angledool eventually? There might be eventually, but the Commissioners would not recommend such an extension at present. They have no idea at present of going beyond Collarendabri.

254. They ask us to report on this line, less 10 miles? The proposal is to make a line into Collarendabri, but this Committee is asked to consider whether the line should not stop 10 miles short of Collarendabri by reason of the great cost of construction. I believe the cost for the last 10 miles would be twice as great per mile as for the remainder, and the maintenance would be also much heavier.

255. There is one peculiar thing about the report. It speaks about a possible extension of this line north-west. Therefore, there would be no saving by not going right through to Collarendabri? No; but at the present time the Commissioners have no idea of going beyond Collarendabri.

256. They would be guided in their opinion later on by the development of traffic? Yes; and also probably to some extent by the question of Queensland competition. If Queensland made a railway to St. George, and extended it from that place, that would no doubt affect the question.

257. Do you know the distance from Angledool to St. George? No, I do not know the exact distance.

258. As the Colonies are situated now, is there any strong possibility of our being able to divert any Queensland trade to our north-western railways? We do get some of the Border business. Perhaps we should not get a great deal more.

259. *Mr. Hoskins.*] You get the Australian Pastoral Company's wool? Yes; that comes into Moree.

260. *Mr. Wright.*] You are under the impression that by approaching the Queensland Border you will get a certain amount of additional trade? Yes. We should be in a better position to compete for it.

261. Both ways? Of course special rates would have to be quoted.

262. Do you think the special rates quoted for goods going into Queensland, and wool and produce coming back, are such as to pay our railways? Yes; we do not quote a rate that does not return some profit.

263. No matter how keen the competition, the Commissioners always adopt that rule—that is, that there is a margin of profit? Yes; we would not quote a rate unless there was an advantage in it.

264. There is an estimated annual loss on the proposed railway of nearly £6,000? Yes; that includes interest. The line would pay a little more than working expenses.

265. Is there any reason to believe that the construction of this line would bring a larger volume of trade to the existing railway than exists at present? Personally, I do not think there would be a great increase of traffic.

266. You would get traffic that now goes over the railways? To a large extent, yes.

267. What effect would the construction of a railway to Walgett on the one hand, and to Brewarrina on the other, have on the traffic of this part of the country? A railway to Walgett would affect the traffic which would be reached at Collarendabri if the two lines were in existence.

268. Would the construction of a railway from Byrock to Brewarrina have any effect on that country? I should not think a great deal; but I am not well enough acquainted with the locality to express a definite opinion.

- H. McLachlan.
14 Mar., 1898.
269. You see by the map that Angledool almost stands at the apex of a triangle, having Collarendabri on the one side and Brewarrina on the other; and I suppose that nothing west of Angledool would reach the Collarendabri line, provided the Brewarrina line were constructed? I should think not; but I have not been over the country and should not like to give a definite opinion.
270. What about the country north and north-west of the proposed line;—I suppose that traffic all comes into Moree at the present time? North of Collarendabri. The traffic coming from Collarendabri at present comes principally to Narrabri.
271. But north and north-east of Collarendabri? If the Collarendabri line were made it would take some of the traffic which at present comes to Moree.
272. Do you think it would take the Mungindi traffic? No, I hardly think it would.
273. It appears to me that the area of country around Collarendabri to be served by this line is comparatively limited? Yes.
274. It is served on the one side by the Moree extension, and it may possibly be served on the other side by an extension to Brewarrina or to Walgett? Yes. Of course, Collarendabri would mean a longer railway carriage than Moree, and that would affect the question a good deal in regard to earnings.
275. *Mr. Roberts.*] According to the report of the Railway Commissioners, there will be an annual loss on this line, in round figures, of £6,000? Yes, including interest.
276. That is without land and compensation? Yes.
277. The Commissioners in their report say, "The proposed line has merit"—what is the merit? The merit is this: The line will open up locally a big district, and will develop a large area of country. The people also are at the present time a long way from a railway, and, besides, the line would pay more than working expenses. The Commissioners are always prepared to consider any railway which will more than cover working expenses, although it might not at first cover interest. At the same time, they do not definitely recommend the line. They do not see that it is going to pay—that is, pay everything.
278. It will just about pay working expenses, will it not? Yes.
279. Are the Commissioners looking forward to getting a lot of the Queensland traffic, and do they expect that possibly when the line is extended in a north-westerly direction the traffic will be in a marked degree improved? They do not at present recommend any extension beyond Collarendabri. They would rather have the line considered on its merits at the present time.
280. Do you know whether the Commissioners desire that the line should go as far as Collarendabri, having in view the flooded nature of the country? No; their opinion is that it would be better to stop 10 miles short of Collarendabri.
281. Are the figures in the Commissioners' report based on the line stopping 10 miles from Collarendabri? No; the figures are based on the full distance.
282. And, of course, on the increased cost of going through the flooded country? Yes; the Engineer's estimate of £200,000 covers the whole thing.
283. *Mr. Lee.*] The Commissioners say that the line should stop 10 miles short of Collarendabri, and they also express the opinion that it would form the basis of a further extension later on in a north-westerly direction;—the Committee would like to know if the Commissioners are of opinion that it would form the basis for a north-westerly extension later on, why it should not be taken to Collarendabri at once? The Commissioners are not prepared at the present time to say that they would recommend its extension further to the north-west. The cost of the last 10 miles would be about £40,000, and that in interest alone would mean £1,200, and the extension for the 10 miles would not affect the traffic.
284. But if the line has merit, in so far as it could be made the basis of an extension to the north-west later on, that extension would have to be in the direction of Collarendabri, would it not? Still you could determine to extend it later on. It would not cost you any more to do so at a later date than it would now.
285. But if stopping 10 miles short of Collarendabri at the present time would enable the line to get the traffic of the country west, where would be the policy of extending it further? I do not remember the exact terms of the Commissioners' report, but at the present time they do not recommend the extension of the line to the north-west.
286. Does not the old trouble of water competition enter into this question? No; because at Collarendabri the river is navigable at very uncertain and very remote times.
287. The chief item of railway freight in that country would be wool? Wool and stock and general goods.
288. As a matter of fact, does not your railway system get the whole of that wool at the present time at some point or other? To a large extent, yes.
289. Are you of opinion that an extension of railway in that direction would be the means of increasing settlement? I should not like to be too sanguine in saying that it would.
290. If it were extended in that direction the railway would get the freight on the wool which now passes over the roads to the nearest railway station? Yes, to a large extent.
291. But beyond that the Commissioners do not urge its construction? No.
292. Or, in other words, is it any part of the policy in the Railway Commissioners' office by which they think that portion of the country should be properly subdivided? No; that has not come within their policy.
293. There is no special trade to cater for? Nothing more than the pastoral trade.
294. There are no special reasons for having the railway extended in order to fight the Border trade? I think not.
295. It stands purely on its merits as a local line? Yes.
296. *Chairman.*] The distance from Walgett, *via* Pilliga, to Sydney is 462 miles? Yes.
297. And the distance from Walgett to Sydney *via* Warren and Coonamble is 486 miles? Yes; the Narrabri route has a slight advantage so far as distance is concerned, but in such a long length of line the difference is not great.
298. What views do the Commissioners hold with regard to the Walgett traffic;—is that immaterial in their opinion? They have not looked upon it as an element for grave consideration as to whether the traffic should be diverted either one way or the other. At the present time they do not recommend the construction of a line either way. We get the traffic at present by Narrabri.
299. The distance from Walgett to Newcastle *via* Pilliga is approximately 362 miles? Yes.
300. Therefore, it would be 362 miles to the port of Newcastle, as against 486 miles to Sydney? Yes.
301. That, you think, is immaterial to the Commissioners? Yes, I think so. I might mention as a matter

matter of interest to the Committee, that I got out a few figures showing the earnings on the Narrabri to Moree line. The line is turning out very satisfactorily, and for the first eight months has shown a profit over working expenses and interest, thereby justifying the Commissioners' report.
 302 *Mr Hoskins*] It is paying about 8 per cent, is it not? Yes, it is paying 7 or 8 per cent at present.

H. McLachlan
 14 Mar., 1898.

Henry Chamberlaine Russell, C M G, Government Astronomer, sworn, and examined —
 303 *Mr Hassall*] Have you a statement which you can furnish the Committee, giving particulars of the rainfall in the district affected by the proposed railway? Yes, I have had prepared for the information of the Committee the following tabulated return —

H C Russell,
 C M G.
 14 Mar., 1898.

Average Rainfalls	Stations	No of Years	Average Rainfalls	Stations	No of Years
16 86	Bourke	25	19 42	Euroka	15
16 70	Warraweena	20	20 84	Gamblealley	13
17 62	Mount Oxley	12	22 26	Walma	11
19 10	Weilmoringle	10	19 90	Goangra	20
17 83	Beemery	14	19 53	Gundablue	12
17 13	Talawanta	15	20 67	Mogil Mogil	14
18 49	Biewanna	23	20 98	Collarendabri	12
17 59	Bundabulla	6	22 46	Oreel	11
19 76	Milroy	8	24 02	Meicadool	11
18 42	Quantambone	18	24 92	Mungindi	10
17 39	Muckerawa	6	23 97	Yarawa	13
16 23	Willawillingbah	5	23 85	Goonal	16
16 37	Cuttabunda	5	25 40	Derra	10
22 98	Bunghill Tank	9	21 95	Boolcarrol	18
22 37	Wilkie	10	21 71	Pilliga	14
18 52	Boorooma	15	26 98	Pendennis	6
17 70	Gilgoon	19	26 04	Wee Waa	12
20 92	Angledool	7	28 61	Milie	11
18 08	Eulan	6	26 84	Edgeroi	8
19 60	Dungalear	16	27 39	Narrabri	25
23 96	Dunumbial	6	25 13	Moree	17
20 08	Walgett	18	28 13	Avondale	7
21 70	Yowendah	15	27 84	Welbon	8

Those figures cover a strip of country extending in a straight line from Narrabri to Bourke, then going along the rivers in a north-easterly direction to the Queensland Border, and along to Mungindi, and thence to Moree, a few stations being taken outside of these lines to show what the average rainfall is there.

304 The return seems to show that the country around Collarendabri, which place has a rainfall of 20 98 in, including Mogil Mogil with 20 67 in, Mungindi 24 92, Welbon 27 84, Moree 25 13, Derra 25 40—all these places have a rainfall sufficient for the cultivation of wheat if the soil were suitable? Yes, the rainfall would be ample if the soil were suitable. That is the case from Narrabri to Mungindi, and for a distance of 70 or 80 miles to the west—you might say all the way across. Though the rainfall is sufficient in quantity, its distribution is not favourable for agriculture. Much the greater part falls in the first three months of the year, and, speaking generally, the rainfall is light in the latter part of the year.

305 Which fact is not favourable to the growth of cereals? No, at any rate, wheat.

306 Though some localities show a less rainfall annually, they have the advantage of the rainfall at such a period as to be beneficial to the crops—a less rainfall under those circumstances being more beneficial for agriculture than a large rainfall not so distributed? Yes.

307 Can you say whether the rainfall along the Namoi—for instance, Pilliga, 21 71 inches, and Wee Waa, 26 04 inches—and down towards Walgett, is of such a character as to be suitable for agriculture, or whether the great bulk of that rainfall occurs in the first three months of the year? Every mile you go towards the mountains from a line extending from Narrabri to Mungindi the rainfall improves in the latter half of the year.

308 And the more beneficial the rainfall would be for agriculture, falling as it does in a more suitable period of the year? Yes.

309 On the other hand, the further you go west, the less suitable is the rainfall for purposes of agriculture? Yes.

William Henry Hall, Sub-editor of Statistical Year-books, Government Statistician's Office, sworn, and examined —

310 *Mr. Roberts*] Have you prepared a statement for the Committee in connection with the railway proposal now under consideration? Yes, I have prepared a statement showing the population of districts affected by the proposed railway from Woolabra to Collarendabri.

W. H. Hall
 14 Mar., 1898.

311 What radius of country is included in your return? I have taken a line from Narrabri to Moree on the east, and gone north to Mungindi, thence past Angledool to Culgoa, and then across to Walgett, and through Pilliga and Wee Waa back to Narrabri in accordance with a communication sent to the Department. The statement is as follows —

POPULATION of Districts affected by proposed Railway from Woolabra to Collarendabri.

District	Estimated Population	District	Estimated Population
Narrabri (Mun)	2,450	Angledool	260
Narrabri West (Mun)	750	Goodooga	450
Kerramingly	560	Comborah	260
Moree (Mun)	1,700	Walgett	1,860
Moree	500	Pilliga	960
Mungindi	500	Wee Waa	800
Buuren	450		
Collarendabri	700	Total	12,400
Mogil Mogil	200		

TUESDAY, 15 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Woolabra to Collarendabri.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

- C. E. Rennie. 312. *Mr. Clarke.*] Do you produce a map in connection with the proposed railway from Woolabra to Collarendabri? Yes; the map shows the country within 20 miles of the proposed line on each side, converging to a point on the Moree and Sydney line at Woolabra so as to allow of the influence of the Moree line. The map shows by blue tint the alienated land; the blue hatching shows land held under settlement and homestead leases; the brown tint shows the Crown land; and the green tint the reserves. These areas are as follow:—The alienated lands amount to 972,780 acres; the settlement and homestead leases take up about 431,670 acres. Of this area, 180,400 acres are homestead leases in the Western Division, the Barwon River forming the limit of the Western Division at a point indicated. The reserves amount to 370,340 acres, and the Crown lands to 421,610 acres. Of the Crown lands, excluding reserves, the leasehold areas comprise 195,800 acres, the leases of which will expire between the present year and 1900, and 143,200 acres, the leases of which will expire in 1918. The latter area is in the Western Division—west of the Barwon River. The remaining area of Crown lands (82,610 acres) is held under occupation license.
313. How much alienated land does the proposed railway pass through? It will pass through alienated land for about two-fifths of the distance. The homestead leases and settlement leases have practically gone out of the hands of the Crown, the tenure being twenty-eight years.
314. They must be regarded as private lands for the next twenty-eight years? Yes, practically. Roughly speaking, the proposed line will go for about 25 miles through alienated land, and probably about 38 miles through reserves. For about 15 miles the line would go through Crown lands not reserved, and for about 10 miles it would go through settlement leases.
315. Do you know anything of the class of the country? No; except that I believe a large portion of it is pastoral country. I may say that on the north-west corner of the area shown on the plan, there is a block comprising about 33,000 acres which has been set apart for settlement lease. There is another block in the parish of Single of about 9,000 acres; another in the parish of Long Point, about 13,000 acres in extent, also a small block of about 3,700 acres in the parish of Moomin, and a block of about 2,300 acres is the parish of Minnaminane. The two latter are reserves, and the others are occupation licenses. They are all being got ready for settlement lease.
316. *Mr. Wright.*] Are the Committee to understand that the whole of the unalienated Crown lands within the area shown on the map are now being got ready for settlement lease? Not the whole of them, but the areas I have mentioned, comprising, roughly speaking, about 61,000 acres.
317. I suppose it is the intention of the Crown to survey all that land for settlement? Yes, when the leases fall in. Some of the land is leasehold area, of which the leases will not expire until 1900 and 1918.
318. As soon as possible they intend to throw open all that land? Yes; probably.
319. Is there much of it open for conditional purchase at the present time? Yes, there is a fair amount.
320. All the portions coloured brown, I suppose? Well, no, because in order to permit of the land being set apart for settlement lease those parts are to be reserved temporarily. They have been withdrawn from conditional purchase, but there are patches here and there still available for conditional purchase.
321. I suppose eventually a great many of the reserves at present within the area will be thrown open either as conditional purchases or special areas? Probably; but there are no very large reserves within the area. In the parish of Moomin there is a reserve of 3,700 acres, which is being got ready for settlement, and there is also a reserve of 2,300 acres in the parish of Minnaminane which is also being got ready.
322. Is there any timber on the forest reserve shown on the map? I could not say; the presumption is that there is timber upon it.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

- G. C. Yeo. 323. *Mr. Lee.*] Have you prepared a plan or statement showing the country which would be affected by the proposed railway from Woolabra to Collarendabri? Yes. The area is shown on the map which I now produce. It is bounded on the north by the Queensland Border to the Barwon River; thence down that river about 30 miles; thence east approximately along the Meroe Creek to a point north of Millie; thence by a line south to a point about 30 miles north of Wee Waa; thence generally westerly to the Barwon River at a point about 12 miles lower down than Collarendabri; and thence north-westerly to the point of commencement on the Queensland Border. I have also a return of the stock on the area just indicated. According to the return of the 31st December, 1897, there were 3,179 horses, 8,879 cattle, and 914,634 sheep. The annual traffic between Collarendabri and Millie, which is about 15 miles from Woolabra, consists of—horses, 1,000; cattle, 5,000; sheep, 250,000; and the stock travelling the rivers away from Millie out to Collarendabri comprise—horses, 500; cattle, 1,000; sheep, 100,000. Those figures relate to the twelve months ending 31st December, 1897. Then there is also traffic coming down the river from Mungindi and passing through Collarendabri.
324. Where to? It may branch anywhere. It may go right on down the Barwon, or it may go to Collarendabri and be trucked there, should there be a railway.
325. Would that be stock traffic that would be likely to be affected by a railway at Collarendabri? I think so. That is the reason I took it in. This traffic from Mungindi to Collarendabri represents 700 horses, 7,500 cattle, and 80,000 sheep; and going the reverse way, from Collarendabri to Mungindi, there is a traffic comprising 250 horses, 600 cattle, and 60,000 sheep. These last figures refer to a similar period. I may also state that the average clip per sheep in grease in that locality last year was 6 lb., and for

for lambs, 2 lb. In the area I have given as that which would be affected by the proposed railway I have excluded a large portion of the area shown on the map prepared by the Lands Department, for the reason that I have already included that country within the area to be affected by the railway from Narrabri to Pilliga.

G. C. Yeo.
15 Mar., 1898.

326. Have your Border quarantine regulations of late had the effect of diverting in any degree the traffic that used to come over the Queensland Border? No, not at this particular point.
327. Notwithstanding that under your regulations the cattle coming over have to be examined? Those regulations have not interfered with the cattle coming over.
328. As a matter of fact, that route is just as much availed of now as it was before the quarantine conditions were imposed? Exactly.
329. In the event of the tick pest travelling down in that direction, would the fact not materially interfere with the stock coming over from Queensland? I daresay it would. The chances are that it would cause a prohibition.
330. Does the Department anticipate any such calamity? No, not in that direction.
331. You do not fear the spread of the pest in that direction? No, not out there.
332. You think it more likely to affect the coastal parts? Yes, that is where we fear it most.
333. Has your Department considered the question whether wool passing through a tick-infested district should be liable to quarantine on the Border, the same as live stock? I could not answer that question.
334. It has not been considered yet? Not that I am aware of.

Edward McCarthy Allman, Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

335. *Mr. Wright.*] Have you a statement to make to the Committee with reference to the roads which would be affected by the proposed railway extension? Yes; I have a statement showing the roads which would be affected by the railway, and the expenditure upon them up to date. It is as follows:—

E. M. Allman.
15 Mar., 1898.

SCHEDULE Roads affecting construction of proposed line of Railway from Woolabra to Collarendabri.

Item.	Name of Road.	Years.	Expenditure.					
			Total.		Average.			
			£	s.	d.	£	s.	d.
1897-8.								
795	Moree towards Narrabri	22	24,323	0	0	1,105	0	0
809	Narrabri towards Moree							
796	Moree, <i>via</i> Goonal, to Mogil Mogil	11	5,963	0	0	542	0	0
813	Woolabra (Little Bumble), <i>via</i> Millie, to Meroe.....	8	3,393	0	0	424	0	0
804	Ironbarks towards Boolcarrol	10	2,830	0	0	283	0	0
1,364	Walgett to Goondabloin	1	300	0	0	300	0	0
1,365	Walgett, <i>via</i> Goodooga, to Brenda.....	4	1,773	0	0	443	0	0
1,370	Collarendabri towards Narrabri	4	644	0	0	161	0	0
1,371	Collarendabri towards Angledool	5	976	0	0	195	0	0
1,376	Wee Talaba, <i>via</i> Angledool, to Goodooga	4	326	0	0	81	0	0
			£40,528	0	0	£3,534	0	0

336. Could you give the Committee any information as to what effect the construction of the proposed railway would have upon road expenditure in the district? It is difficult to say exactly what effect it would have, except that it would certainly reduce the expenditure on the road from Collarendabri towards Narrabri. That is nearly coincident with the proposed railway line as far as it is scheduled.

337. Do you think the construction of the railway would necessitate the opening of any roads not now in existence in order to give access to the railway? It is quite possible that would be the case. I cannot say, from my knowledge of the district, how much we might expect in that direction.

338. So that it is quite possible that whatever might be saved on the direct road from Moree to Collarendabri would be more than spent by opening up new roads to give access to the railway? That is quite possible.

339. What is the experience of the Department generally about railways running through a district;—do you find it lessens or increases your road expenditure? I do not think it lessens it very perceptibly. Of course, on parallel lines it would have the effect of reducing the expenditure and reducing the traffic; but on feeder and branch lines, in all probability, the expenditure on roads would increase if the traffic increased.

340. The construction of these branch railways means an increased expenditure on the Road Vote in maintaining roads, and in opening new means of access to the railways? Yes; on some roads the effect would certainly be to increase the expenditure, and in other cases to reduce the expenditure.

341. The general experience of the Department is that it means increased expenditure? I would not like to say absolutely that it means an increase, but I should not think the effect would be to decrease the expenditure—not on the whole.

342. Your experience is that the construction of railways, and of branch extensions especially, does not minimise the cost of the roads? I do not think so—not to any material extent, at any rate.

343. When preparing your statement as to the roads affected by the proposed railway, did you confine yourself to any particular distance from the line? No; we have merely shown the roads likely to be affected.

344. If you will look at the map furnished to the Committee by the Lands Department you will see that they have given as the sphere likely to be influenced by the railway a radius of 20 miles on either side of the line and 20 miles west of the terminus;—could you furnish the Committee with the total expenditure on roads within that area, and state what, in your opinion, would be the increase or decrease in that expenditure caused by the construction of the railway? I could have that information prepared. But I do not think the railway will make very much difference as regards these roads. There are really very few of them.

345. The question is, how will they be influenced by the construction of this railway, or will they be influenced at all? I question whether some of them would be influenced at all, or to any appreciable extent, because we shall still have to maintain them.

MONDAY, 28 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.
The Hon. DANIEL O'CONNOR.JOHN LIONEL FEGAN, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Woolabra to Collarendabri.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane. 346. *Chairman.*] Since you last appeared before the Committee in connection with this inquiry you have had prepared a map showing a line from the north-western system eastward, in the direction of Collarendabri? When I was before the Committee, on the last occasion, I was asked to arrange for an exploration of the country between Moree and Collarendabri, and between Narrabri and Eurie Eurie. I did so, and Mr. Stuart has been over the country, and made a report upon each of those lines. The lines I believe were suggested chiefly by Mr. Hassall. The object of Mr. Stuart's examining the country was, to ascertain the class of country passed through by the routes in question, and the extent to which the river and creek floods would affect them. I have Mr. Stuart's report with me, and also a plan which he has prepared showing the route which he has been over. I would ask the Committee to be so good as to examine him upon the different points, because I think he will be able to give you a great deal more information in detail than I should be able to do. I should be only able to give the Committee the information second-hand. No doubt the Committee would like to obtain from Mr. Stuart information upon points upon which I do not at all feel posted up.

28 Mar., 1898.

347. Can you give the Committee the comparative cost of the several lines in a general way? No; only so far as to say that neglecting the principal water-courses, I should assume that the cost of construction would be about the same as that of the line submitted, that is to say, the first section of the line from Woolabra to Collarendabri.

348. You would prefer to reserve your evidence in regard to cost until Mr. Stuart has been examined? I do not think I am in a position to give further evidence as to cost. I know nothing of these routes beyond what Mr. Stuart has already informed me verbally and in his reports. It is impossible to make an accurate estimate of any line without having the sections taken out—and that is particularly the case with regard to creek crossings and flooded country; so that if an estimate were formed it would be more or less of a guess.

349. *Mr. Wright.*] Could the Committee consider that the expenditure would not exceed roughly £2,000 a mile? I should not like to bind myself in any way; but Mr. Stuart is pretty well versed in my method of making up estimates. I think he would be in a position to give you a rough estimate of the cost.

350. Have you considered Mr. Stuart's reports? I have read them.

351. Will you describe the lines in a general way? I think the best plan would be for me to read the reports. The first report deals with a proposal to take the line from Narrabri to Eurie Eurie, and is as follows:—

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office, Sydney, 28th March, 1898.

Memorandum to the Engineer-in-Chief, Railway Construction.

Sir,

Narrabri to Eurie Eurie.

I beg to report that I have inspected the proposed route, and laid down on the county maps a line (as shown on the accompanying tracing) on the northern side of the Namoi River, which would be easiest constructed, and least interfered with by flood-waters.

Leaving the main Narrabri-Moree line about 255 miles from Newcastle, and bearing in a north-westerly direction round what is known as the gravelly ridge, cross the T.S.R. Narrabri to Moree to the north of the "Ironbarks Hotel"; thence following the low ridges (about 3 miles out from the Namoi River) which form the watershed between this river and Galathera Creek, crossing one or two swampy places, *en route* strike the T.S.R. Gurleigh Point to Boolcarrol at 278 miles, about 5 miles from "Tribe's Hotel"; thence bear south-westerly, keeping well north of the Wire Lagoon, and follow the highest ground (red ridges interspersed with black-soil swamps, sound ground) round to the head of Pian Creek, about "Keileher's Hotel," at 291 miles, and near where the T.S.R. to Burren and the upper T.S.R., on the north side of the river to Warren join; this point is almost 8 miles from Wee Waa, which is accessible by bridges across the river and the important creeks. (Of this latter portion of the route, a distance of about 10 miles is more or less flooded, as when the Namoi rises to a certain height it breaks across here, and the flood-waters flow round by Boolcarrol, Nowley, and Burren, joining the Barwon flood-waters in Mercadool. This flood-water, where the line proposes crossing, varies from nothing to 1 foot on the ridges, and in the swamps from 1 foot 6 inches to 3 or 4 feet at deepest points.) After passing Keileher's, we get on to dry red ridges, which form the divide between the Namoi and Pian Creek: these are followed almost continuously in from a north-west to westerly direction to near Cryan New Station (this part of the route passes Pilliga, about 20 miles distant, to the south, and reached by a T.S.R. which is bridged across the Namoi); thence black soil is encountered to Pian Creek, which floods along its banks; after crossing this creek the line strikes the plains of Eurie Eurie, country which in all ordinary floods is dry, one portion at the Old Stockyards having never been known to be under water; crossing these plains, the line would terminate at 357 miles, a distance of about 103 miles from Narrabri, and about 1½ mile from Eurie Eurie Station (this latter is on flooded country), close to where the T.S.Rs., Walgett to Wee Waa and Narrabri and Walgett to Collarendabri, meet, being about 12 miles from Walgett (which is accessible by a bridge across the Namoi) and 40 from Collarendabri. The country from this point to Walgett is flooded.

Taking the line as a whole, with the exception of the 10 miles between the Boolcarrol Road and Keileher's, the line might be considered a good one, no main water-course, except Pian Creek, having to be encountered; and it follows, for a great portion of the way, low dividing ridges, which are specially adapted for drainage.

An alternative route, to take in Wee Waa, might be got by starting at West Narrabri and, keeping on the south side of the river up to this township, cross about Weeta Waa, and gain the other proposed route in Merah North. Very much the same extent of flooded country would have to be encountered, with bridges across the Namoi and Bohema and Gunidegera Creeks, which latter would increase the cost of the line.

The country passed through on the northern route is probably some of the best in the district, and the line, I think, would get as large an amount of traffic as any other.

Timber suitable for railway construction is available on the southern side of the river. Ballast would have to be brought from some distance.

CHAS. McD. STUART.

352. How will that new proposal compare with the proposed line from Narrabri to Pilliga, or the line from Woolabra to Collarendabri? The line from Woolabra to Collarendabri cutting off the last 10 miles of the route which passes over flooded country is, undoubtedly, the driest that can be got. The line from Narrabri

Narrabri to Pilliga will also be a dry line, because it can be kept clear of the Namoi flats; with the exception of the crossing over the Brigalow Creek and some other creek crossings, the line can be kept entirely out of the flooded area.

H. Deane.
28 Mar., 1898.

353. What would be the length of the line to Eurie Eurie? 103 miles. The line from Woolabra to Collarendabri with 10 miles off would be about 70 miles, and the length of the Pilliga line 55 miles.

354. The haulage would be less than over the Woolabra line? There would be very little difference. The distance from Collarendabri to Newcastle *via* Woolabra would be 361 miles, and the distance from Eurie Eurie to Newcastle 356 miles.

355. *Mr. Fegan.*] How far would the Eurie Eurie line be from Walgett? Twelve miles.

356. *Chairman.*] You think that line would fairly serve the country which it is proposed should be served by the two lines from Narrabri and Woolabra respectively? I should not like to express any opinion about that. I have never been asked to look into the question from the point of view as to which line would suit the country best.

357. But as to service and distance? I think that on that point I would rather not express an opinion. In their terminal points the lines are some considerable distance apart. Each one would serve the district best which is nearest to it, and one line would not altogether take the place of either of the others or of both of them.

358. Without giving any figures, can you say in which class you would place this proposal;—is it a new line? It is a cheap line, except that there would be some expense in crossing the flooded country, or the Namoi, as the case might be.

359. *Mr. Hoskins.*] You do not think that the middle line would take the place of either of the other lines suggested? I do not think so. If I remember rightly, it was suggested by the Committee themselves, when the direct line from Narrabri to Moree was chosen, that a branch should be made from that line to serve Millie. The proposed line from Woolabra to Collarendabri serves Millie by coming within a few miles of it. A line starting from Narrabri and going down the Namoi would not serve Millie.

360. How far would Millie be from the main Narrabri-Moree line? About 12 miles. A good deal of the central portion shown upon the map, which would be served by the line from Woolabra to Collarendabri, would not be served so well by the other line.

361. Taking Walgett as the centre of the district to be served, would this last line suggested be the more convenient way of getting there;—would it be better than having two lines? I should not like to express an opinion on that point. I have been told that a line on the north side of the Namoi, running into Eurie Eurie or Mercadool, would not serve Walgett, because the traffic from the south would not cross the river. I do not know upon what ground that statement is made, but it is made repeatedly. If that be true the suggested line would not serve Walgett at all. It certainly looks as if it ought to serve Walgett, coming within 10 or 12 miles of it.

362. *Mr. Wright.*] You have not been over that country? No; but I know that it is the class of country which we meet with in the north-western district. I also know what the Namoi is like for a few miles down from Narrabri. I have examined crossings on the river there.

363. You do not, as an engineer, care to express an opinion as to the probable traffic on the line? No; but I might be allowed to say that the two lines were considered at the last meeting at which I gave evidence, and it was thought by some members of the Committee that if a line went from Moree to Collarendabri it would have this advantage, that it would be in a direct line with the Inverell country, forming a cross-country link with the New England District. I will now submit Mr. Stuart's report with regard to the Moree-Collarendabri route. It is as follows:—

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office, Sydney, 28th March, 1898.

Memorandum to the Engineer-in-Chief, Railway Construction.

Moree to Collarendabri.

Proposed direct route on the north side of the Gwydir or Meei River.

I BEG to report that I have examined the proposed route which is laid down on the accompanying tracing by a green line:

Leaving Moree at the present terminus it bears north-westerly across the Meei; thence passing through some Government Reserves it strikes across to Greenbah Creek, which it crosses near the same point as the main Moree-Collarendabri road; thence westerly to Tarran Creek, which it crosses, and thence follows the highest ground between the Goonal or great anabranch of the Gwydir River and the Meei, keeping close to the new main road, and crossing the Goonal about 3 miles from where it joins the Meei, and a short distance from the "Melao Hotel"; thence it follows the T.S.R. on the northern bank of the river to Callymunel Station (which is situated on an anabranch of the Barwon River), terminating on the highest ground to the south of the station, and in such a position that, if extended, it would cross the Barwon and its accompanying warrambools and flooded ground at the narrowest point.

This point would be about 386 miles or 71 miles, from Moree, and would be distant from Collarendabri by an extension across the river about 15 miles, and by the present available road bridges about 20 miles.

The greater portion of this line from some 17 miles from Moree to within 10 miles of its termination is more or less liable to floods, as from about this point the Goonal breaks over on both sides forming what is called the Watercourse country,—this flood is comparatively light up to near where the Goonal is crossed; thence to within a few miles of the termination the country is flooded throughout, on the north side of the river, varying in depth from 6 inches to 2 or 3 feet,—in high floods it stretches right across the country to the Boomi anabranch of the Barwon.

A drier route might be got (shown by a dotted line) by recrossing the Meei between Meero and Derrah before it and the Goonal join, and from that point follow down the southern side of the river, which is higher than the northern, but more interspersed with creeks and warrambools; this route to terminate at the same point as the other would necessitate recrossing the river near the present road bridge at the point shown on the map.

Another route, about 5 miles longer, might be taken by keeping south of the Meei, from Moree, and joining the last-mentioned route in the parish of Wirri South, about 55 miles from Moree. This line, although dispensing with the first two crossings of the Meei and of Greenbah and Tarran Creeks, has Hall's, Weale, or Tycannah, the Moonin and Mallowa Creeks to cross, besides several small warrambools and stretches of swampy country.

Owing to the flooded nature of the country necessitating higher embankments, as well as the number of bridges which would have to be constructed, I do not consider any line in this direction advisable at the present time, nor do I think it would bring in as much traffic to the railways as a line further south.

CHAS. McD. STUART.

Charles

Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

C. McD.
Stuart.
28 Mar., 1898.

364. *Mr. Wright.*] With regard to the proposed extension from Narrabri to Eurie Eurie, you state in your report that a portion of the country traversed is under water? Yes.
365. Would the line in your opinion be a cheaply constructed line? With the exception of the 10 miles that are flooded, it would not cost more than the cheapest line you could get. There are some long swamps in the flooded portion which might have to be bridged right across.
366. Will you locate the flooded portion? The line would be flooded from "Tribe's Hotel," on the main travelling stock route to Boolcarrol, and the flooded area would extend to "Keileher's Hotel," near the head of Pian Creek, a distance of about 10 miles. It starts at 278 miles, and the flooded ground does not die out before you get to 290 miles. I have called the distance 10 miles because parts of it are dry.
367. Are we right in assuming that with the exception of that 10 miles the whole of the balance of the country traversed is fairly good for cheap railway construction? Yes.
368. You spoke of timber and ballast being obtained for the line on the south side of the Namoi? Yes.
369. In the event of the line from Woolabra being constructed, timber would have to come from the same place? Yes.
370. And there would be a considerable amount of haulage? Yes.
371. At your terminal point at Eurie Eurie have you fairly high ground? Yes; it would be only under water in the case of an exceptionally high flood.
372. Could a bridge be easily constructed over the river in the event of an extension of the railway to the north-west being considered? In the event of such an extension there would be three large bridges to construct. The first would be over the Thalaba Creek, the second over another warramboul, the name of which I forget, and the third would be over the river proper—the Barwon.
373. You have travelled much over this part of the country? I have been over it two or three times.
374. You have a fair knowledge of the trend of the traffic;—would a line from Eurie Eurie take in any traffic from the Angledool and Narran country? It would tap some of it, which would probably go by the Boolcarrol stock route. From anywhere to the north-west the traffic would go in a south-westerly direction.
375. What about the traffic round about Angledool? I do not know that part.
376. Can you give the Committee an idea, approximately, as to what the cost of the suggested line would be? I think it would be safe to say that it would not cost more than £2,500 a mile, taking the route indicated. The 10 miles of flooded country line would cost a great deal more.
377. The average would be the average cost of cheap railway construction? Yes.
378. You have been on the south side of the Namoi? Only as far as Pilliga.
379. Mr. Deane, in his evidence, expressed the opinion that a line, if constructed from Eurie Eurie, might not serve Walgett;—can you give any reason why it should be so? I did not hear Mr. Deane say definitely that a line would not serve Walgett. It would be within 12 miles of Walgett, and there is a good bridge across the Namoi.
380. You see no reason, then, why a line at that point should not serve Walgett? No.
381. You think that if there were a bridge across the river at your terminal point at Eurie Eurie the bulk of the northern traffic would also come direct to the railway? Yes.
382. Do you not think that a town like Walgett, with a railway 12 miles distant, might be considered well served? Yes.
383. A line to Eurie Eurie would also put Collarendabri and the district round it in a much better position in the matter of communication with Sydney than they are in at the present time? Yes.
384. Do you not think that one railway passing through a pastoral country of this description might be considered to give it a fair and reasonable means of communication? Of course, you must bear in mind that the Woolabra line would be an intermediate line, but the people to the south would not like to go back in order to get on to it. They would prefer to go right into Narrabri.
385. Did you survey the Woolabra line? I went over it; I did not survey it.
386. A portion of that land is also considerably subject to floods? Yes, at a place known as the Jews' Lagoon.
387. How much is there? About 2 or 3 miles of it.
388. But about 10 miles on this side of Collarendabri is all flooded country? Yes; but I do not suppose the line would go into Collarendabri.
389. But if it did go into Collarendabri you would have some 10 or 12 miles of flooded country? Yes.
390. It would appear, then, that whichever of these routes were adopted, there would be about the same area of flooded country to be crossed? Yes.
391. Is there much flooded country on the proposed line from Narrabri to Pilliga? No; but it would pass through very poor country. There is no good country, to my knowledge, on the south side of the river.
392. It would be poor country on the south side for the whole distance? Yes.
393. The only advantage in the construction of that line would be that you would be handy to the timber and ballast? Yes.
394. I understand, then, that on the suggested line from Moree to Collarendabri there would be more flooded country than on either of the other routes? Yes.
395. You have gone on the north side of the river? Yes; that is the way the people down there wished the line to go. I saw the district surveyor and the Chairman of the Land Board, and the line I selected was the line which they recommended.
396. Did you find it the best line from an engineering standpoint? The line to the south of the river would be rather better from that standpoint, but it would cost fully as much to make it owing to the number of creeks that you would have to cross.
397. You said that you could not recommend the suggested line? Owing to the area of flooded country.
398. I understand you to say that you do not think that it will secure the traffic as well as would the other line? Quite so, because the country to the north is so much flooded that it is not approachable except at certain times.
399. Mr. Hassall, in asking that the line from Moree might be considered, thought it would have an advantage in continuing a direct western line? That is a strong point in its favour.

C. McD.
Stuart.
28 Mar., 1898.

400. Apart from that you do not look on it with favour? No.
401. How is the country populated between Moree and Collarendabri? There are only about half-a-dozen selectors. The rest of the holdings are stations.
402. It is pastoral country? Yes.
403. Even the selectors are pastoralists? Yes.
404. What population is there on the route from Narrabri to Eurie Eurie? It is also a pastoral country, but more selections have been taken up.
405. The whole of that country is pure pastoral country? It has been up to the present time.
406. You have had some considerable experience there? Yes.
407. Is it your idea that that country will remain pastoral for many years to come, or that it will come under other occupation? There is a great deal of country in New South Wales quite as well adapted to agriculture as is that part of the country, and I cannot see, therefore, that it is likely to come under agricultural occupation very soon.
408. What are its climatic conditions? It has a fair rainfall, but it is not regular.
409. You think that it is pastoral country, well adapted for agriculture with a more regular rainfall, and that it may be taken up for agriculture at some future time? Yes.
410. You think that agricultural occupation may be regarded as being a long way off? Yes. No doubt ultimately it will be used for agriculture. They are already beginning to grow some wheat at Narrabri, but only on a small scale.
411. Do you see any necessity for intersecting that country with railways? That is an important question upon which I do not wish to express an opinion. I think that the railway system in that part of the country should be gone into as a whole. It is a very big question.
412. Does it not strike you that in that part of the country one railway passing through the centre of it may be regarded as fairly well serving the whole, while it is in its present condition? Yes.
413. *Mr. Fegan.*] Taking the Eurie Eurie line, what would be the nearest point on that line to the Pilliga line? About 20 miles.
414. What kind of country is it about Pilliga? On the north side it is all fairly good country. On the south side it is not. The only thing I can say in favour of the line on the south side of the Namoi is that it passes through the townships of Wee Waa and Pilliga.
415. The line from Narrabri to Eurie Eurie you think will serve the district much better? Yes.
416. Do you think that line will suit the greater number of settlers? I think that that line and the Woolabra line would suit the greater number of settlers.
417. But would you recommend both lines under present circumstances? No.
418. Comparing the Woolabra line with the Eurie Eurie line, which would you recommend? I think I should feel inclined to recommend the Eurie Eurie line, but it is a nice question. You would have to go into details of what the traffic would be. A lot of traffic which you would get by the line from Woolabra to Collarendabri you would not get going the other way.
419. Do you not think that by taking the line to Eurie Eurie you would get the Collarendabri traffic? You would get a great portion of it.
420. And you would also get a great portion of the Walgett traffic? You would get all the Walgett traffic.
421. Also the traffic from out towards Angledool? I do not know about that. There would be a difficulty in getting across the river. There is a bridge some miles west of Walgett and the next is at Collarendabri.
422. Are they good bridges? Yes.
423. But they would not carry a railway? No.
424. Is there not a metalled road into Walgett? No.
425. What would the cost of a metalled road be? I could not say; you have to contend with so much flooded country. For instance, the road from Collarendabri to Eurie Eurie would be impassable in flood-time.
426. What is the distance between those two places? Forty miles.
427. Where would you get the material for road construction at Walgett? I cannot say; I have not been there.
428. It is evident that a great deal depends upon the cost of the construction of a good road—that is as to whether you are likely to get the traffic from Walgett or not? Yes.
429. For how many miles on the other side of Walgett do you think a line to Eurie Eurie would take the traffic? It would get just as much as if the line came into Walgett on the southern side, because the distance from Narrabri is so great.
430. Where would you get your ballast? I do not know. We might have to get it from Woolabra. It would probably mean getting it by rail.
431. Would the line to Eurie Eurie cut through much private land? I do not think so. It would pass chiefly through runs. I do not know what land has been purchased.
432. *Chairman.*] Would the line between Narrabri and Eurie Eurie pass through equally good country with that traversed by the line from Narrabri to Pilliga, or by the line from Woolabra to Collarendabri? It would pass through much better country than would the line from Narrabri to Pilliga, and the country would be equally as good as that on the other line.
433. By way of comparison, which would be the most costly line? If anything the line to Eurie Eurie would be a little more costly, owing to the 10 miles of flooded country.
434. You are comparing that line with the line from Woolabra to Collarendabri? The cost would be about the same, taking it right through. It would not be less, owing to the 10 miles of flooded country.
435. What are the comparative distances, taking the lines from Moree to Collarendabri, from Narrabri to Eurie Eurie, from Woolabra to Collarendabri, and Narrabri to Pilliga—I mean the distances of the respective termini from Newcastle? The line to Eurie Eurie would terminate at 357 miles from Newcastle. The line from Moree to Collarendabri would stop 15 miles from Collarendabri, and would be 386 miles from Newcastle. The line from Woolabra to Collarendabri would be 12 miles from Collarendabri, and would terminate at 354 miles from Newcastle. The line to Walgett *via* Pilliga would be about 365 miles from Newcastle, and this line would go right into Walgett.
436. The line from Moree to Collarendabri would be lengthier than the others? Yes; you would have to add 15 miles to the length I have given you. 437.

- C. McD. Stuart.
28 Mar., 1898.
437. And the country which would be served is inferior to the country which would be served by the new proposal? Yes; owing to so much of it being flooded. You could only run cattle upon it. Sheep would be drowned upon a great portion.
438. Would the Collarendabri traffic be likely to reach a point on the line from Narrabri to Eurie Eurie, or would it come right into Narrabri? It would reach that line at a point about 278 miles from Newcastle, or about 23 miles from Narrabri.
439. *Mr. Hoskins.*] How far would the suggested line from Eurie Eurie pass from Wee Waa? About 8 miles.
440. Would there be much difficulty in communicating between the proposed line and Wee Waa? No difficulty. There is a good bridge across the river, and a good bridge across the creek.
441. Looking at the sparse population in the north-western district, and seeing that the country is devoted entirely to grazing, do you not think that the suggested line to Eurie Eurie would meet all the reasonable requirements of the people? Yes, I think so. Only people within a certain distance will go to the line. For instance, some people might prefer to go to Moree, due east, instead of going down the other way.

WEDNESDAY, 30 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

JOHN LIONEL FEGAN, Esq.

The Hon. DANIEL O'CONNOR.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Woolabra to Collarendabri.

Edward MacCarthy Allman, Assistant Engineer, Roads Branch, Department of Public Works, sworn, and further examined:—

- E. M. Allman.
30 Mar., 1898.
442. *Vice-Chairman.*] I understand that you have prepared some information for the Committee? Yes. I have here a supplementary return dealing with the roads wholly or partly within the district within 20 miles of the proposed railway. The return is as follows:—

Item on 97-8 Schedule.	Name of Road.	Total Mileage.	Mileage within 20 miles limit.	Vote 97-8 for entire length.	Probable increase.	Probable decrease.
795	Moree towards Narrabri	34	18	£ s. d.	£	£
809	Narrabri towards Moree	48		50 0 0	Nil.	Nil.
796	Moree <i>via</i> Goonal to Mogil Mogil	87	25	200 0 0	Nil.	50
813	Woolabra (Little Bumble) <i>via</i> Millie to Meroe	50	33	300 0 0	Nil.	Nil.
1,370	Collarendabri towards Narrabri	40	40	150 0 0	Nil.	100
1,364	Walgett to Gundabloui	85	45	300 0 0	Nil.	Nil.
1,371	Collarendabri towards Angledool	60	22	200 0 0	Nil.	Nil.

So far as the roads *now* on schedule are concerned a small annual saving might be expected, but this would probably be more than covered by increased expenditure in opening new roads to intermediate stations and, until the positions of these are fixed, it is not possible to say, with any certainty, how, or to what extent the annual expenditure may be affected.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM WOOLABRA TO COLLARENDABRI.

REPORT.

THE Sectional Committee, appointed on the 22nd April, 1898, to inspect, take evidence, and report with reference to the proposed Railway from Woolabra to Collarendabri, have the honor to report to the Parliamentary Standing Committee on Public Works, as follows:—

The Sectional Committee, consisting of Mr. Thomas Thomson Ewing, M.L.A., the Hon. Charles James Roberts, C.M.G., M.L.C., Mr. John Lionel Fegan, M.L.A., and Mr. Thomas Henry Hassall, M.L.A., left Sydney on Saturday, 30th April, and, after taking evidence in reference to the proposed Railway from Narrabri to Pilliga, proceeded to Collarendabri, subsequently travelling over the route of the proposed railway to Woolabra. The Sectional Committee were accompanied by Mr. Charles M'Donnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works. Evidence was taken at Eurie Eurie, Collarendabri, and Millie, after which the Committee returned to Sydney on 19th May.

It is usual, in dealing with any work referred to the Committee for consideration, to consider its merits without special reference to any other work; but in the two cases which have been referred to the Sectional Committee for inquiry, it was apparent to the Full Committee, before the local investigations took place, that the two works might possibly merge into one. This view was strengthened as the Sectional Committee obtained fuller information. They determined to consider the question of the development of the country which possibly would be affected by a line from Narrabri to Pilliga, and from Woolabra to Collarendabri, as being so intimately connected, that it was possible to deal with the whole matter in a single report. This report will be common to the two proposals, and will also be much more comprehensive than two reports, which would lose weight by endeavouring to deal with the development of country by different proposals which really belong to the same area.

The Sectional Committee make this explanatory note before dealing with the matters under consideration.

The distances from Sydney by the various routes to Walgett and Collarendabri have already been placed before the Full Committee. The distance to Newcastle is also in the evidence given before the appointment of the Sectional Committee. These distances taken into consideration with the fact that the trade relations of the whole of the area of country are with the Newcastle district, and that a proportion of the wool now goes over sea from Newcastle, justify the Sectional Committee in coming to the conclusion that the approach should be with the North-western line and not with the Western.

The country which will be developed by the two lines previously mentioned is, generally speaking, bounded on the east by the Moree-Narrabri line, and its extension towards Newcastle; on the north by the limits of such traffic as may reach Collarendabri, or any portion of the line from there to Woolabra, in preference to Moree; that area of country extending beyond Angledool to the

Queensland border, which will probably reach Collarendabri and Walgett in preference to Brewarrina, were a railway constructed to the latter place, and that portion of the Colony of Queensland the traffic of which would find its way, *via* Angledool, Mogil Mogil, or any routes to the north, to Collarendabri or Walgett. On the south its limits would be first affected by the proposed railway to Coonamble.

In order not to over-state the area under consideration, the Sectional Committee have, for the purposes of the inquiry, inferred that it is possible that railways will be extended as far as Coonamble and Brewarrina within a reasonable time. The Sectional Committee desire to lay down the limits of the country with regard to which there is no doubt better accommodation will be given by termini at Walgett and Collarendabri than by any other scheme. The Moree-Narrabri line will serve all areas lying, say, 25 miles west therefrom. The Coonamble line will possibly draw the traffic half-way between that place and Walgett. Angledool traffic will probably, under all circumstances, reach Collarendabri or Walgett. Weetalibah and Goodooga may, however, be considered debatable country from which it is possible some produce will find its way to Brewarrina.

The recent *Gazette* notice published by the Queensland Government on 11th December, 1897, removes the £2 10s. duty on wool shorn across the border from within a distance of 30 miles therefrom.

The Sectional Committee believe, after considering the cost of carriage and railway freight, taken into consideration with the relative importance of Brisbane, Sydney, and Newcastle as ports, that in all probability the whole of the wool grown on this 30 miles limit, and also most of the stock and cattle depastured thereon, will find its way to New South Wales. It is probable that the limits of the influence of Collarendabri and Walgett, if railways were extended to them, would require to be fixed, perhaps, another 30 miles to the north. A limit therefore of 60 miles north of the New South Wales boundary, on the north to midway between Walgett and Coonamble, say about Combolong, on the south, on the west to midway between Walgett and Brewarrina, and within 25 miles of the Moree line on the east, embraces the area under consideration.

That portion of this area within the Colony of New South Wales north and south of the Namoi, and west of Come-by-Chance, may be regarded as first-class grazing country, large portions of which will, probably, in the near future, be placed under cereals. Over the Queensland border there is a large area of inferior country, but still a territory 60 miles wide, which will supply a very considerable amount of produce that will aid in contributing to the commercial basis of lines having their termini at Collarendabri or Walgett.

West from Narrabri and extending beyond Pilliga—separated from the river by a narrow tract of good land—and extending west towards Come-by-Chance, and passing south therefrom, and reaching almost from the road from Come-by-Chance to Coonamble, and then extending south-east towards Coonabarabran, is a large tract of country known as The Scrub. Although there is little doubt that there are portions within these limits which can be utilised either for agricultural or pastoral pursuits, still there is no probability of there being any extensive demand for them until areas which can be more readily cultivated and brought more cheaply under cultivation are fully utilised. The Sectional Committee do not dismiss the class of country known locally as the scrubby country as being valueless, but for the present it appears probable that there will be no extensive settlement upon it, and most of the returns which a railway could obtain would be from the pine and ironbark timbers of which there is a large quantity.

The approximate distance from Walgett to Coonamble is 72 miles; Brewarrina to Walgett, 90 miles; Narrabri to Walgett, 123 miles; and from Narrabri to Collarendabri, 100 miles. The traffic at present reaches the district almost wholly *via* Narrabri.

Although the cost of carriage varies, according to the evidence, very considerably—taking one season with another—it is not probable that the rate of road-carriage from Collarendabri or Walgett to Narrabri will be very much under £3 per ton. The method of approach is by road, a great portion of which is black soil, and after even a reasonable fall of rain traffic is almost suspended.

After

After due consideration of the access offered to Walgett by the river Barwon, the Committee have come to the conclusion that although, at times, the river traffic might effect the returns of a railway at Walgett, it would not frequently happen. That being so, it is clear that an approach by the Barwon to Collarendabri, for ordinary trade purposes, is out of the question.

The first proposal before the Committee is the line from Narrabri to Pilliga, the cost of which is given at £128,000. The Sectional Committee do not believe that it was ever seriously contemplated to stop a line at that place for any length of time. The objective point must be Walgett, and the construction of any line from Narrabri to Pilliga would certainly carry with it an extension to Walgett. Therefore, it has been determined to take into consideration not only the present proposal—the line from Narrabri to Pilliga—but the line Narrabri to Walgett.

Pilliga is approximately half-way to Walgett. The cost of reaching Walgett would be somewhat more than double the amount already mentioned, say, £260,000. The length is 115 miles. The distance from Woolabra to Collarendabri is $80\frac{2}{3}$ miles, at a cost of £207,798. The total length of lines, therefore, proposed by the Government to tap the country which would find depôts at Walgett and Collarendabri is approximately 196 miles, at a cost of (approximately) £467,798.

The return from the Collarendabri line, according to the Railway Department, will be £7,190 per annum; from the Pilliga line, £4,720. This would certainly be materially increased if the line were extended to Walgett. Both proposed lines show a considerable loss in revenue.

The mission of the Sectional Committee really resolved itself into the question of whether it were possible with due regard to the State lands to be thrown open; settlement of an agricultural population; and a proper approach to the depôts proposed to be tapped, Walgett and Collarendabri, to provide a scheme which would develop the country more satisfactorily than the two lines under consideration, and at a cost which would permit them to recommend its acceptance.

The State lands within 20 miles of the two lines, namely, Narrabri to Walgett *via* Pilliga, and Woolabra to Collarendabri, will embrace an area of 2,454,000 acres. Full information with regard thereto has been given before the Full Committee. The annual rainfall at Walgett and Collarendabri being not much above 20 inches must, with our present ideas of what constitutes satisfactory agricultural settlement, even if the land were suitable—taking into consideration the time at which the rain falls in this northern part of the Colony—be regarded as the extreme limit; but thence towards the east, as the rainfall increases, the Sectional Committee see no reason why cereals should not be grown with sufficient success to justify the hope that a portion of this area will be put under crop.

The main difficulties in approaching Walgett and Collarendabri are the crossing of the rivers Namoi and Barwon and several creeks, which, although usually of no great magnitude, would in flood-time furnish serious obstacles. The route suggested is a modification of the proposal already mentioned before the Full Committee, with such alterations as fuller knowledge enables the Sectional Committee to make.

The evidence of the Supervising Engineer, Mr. Stuart, before the Full Committee, the Sectional Committee have found to have been given with a full and intelligent knowledge of the country under consideration. There are several points with regard thereto, however, which will require further investigation. A line, which for the first 60 miles will form an approach to both Walgett and Collarendabri, turning somewhat south of west through Eurie Eurie to the first-named place, and north-west across the Thalaba to the latter is the best route obtainable. The Committee will state what they believe to be necessary before finally deciding upon the location of the line in detail.

The line known to the Full Committee as the "green line," leaves the Narrabri-Moree line a short distance north from the town of Narrabri. If it be determined to join the main line in this direction, it should be considered whether the

the "green line" could not follow a more easterly course for the first 15 miles, thus saving new construction. The Railway Commissioners might be consulted with regard to this, for a junction might be more satisfactory to them close to Narrabri than a few miles further north as suggested. A closer investigation of the country would also require to be made in order to determine whether there would be any engineering difficulties on the route. Although the Sectional Committee are of opinion that these do not exist, still, until the levels have been taken, it is not wise to express definite opinions with regard to construction.

Although there is better land on the north side of the river, still contiguity to the timber forests on the south side and the presence of the town of Wee Waa are matters that should be fully considered. It is well, as far as is possible, to preserve as trading depôts, those centres already established by the residents, unless such preservation entails a greater expenditure of State funds than is justifiable. The Sectional Committee, therefore, suggest that there be a careful consideration of the "green line," with regard to its approach to the Narrabri-Moree line, and also a survey and estimate be taken out, and a full consideration given to the line on the south side, crossing the Namoi at Wee Waa, and joining the "green line" west therefrom, before it be definitely decided upon which side the line can be located in the best interests of the State and with due regard to existing interests. East from a point west from Wee Waa, on the north side, will be found a piece of flooded country opposite Boolcarrol; west therefrom to the junction of the lines in the parish of Dewhurst, about 315 miles along the "green line," there will probably be no serious difficulties experienced; thence on the extension towards Walgett, as far as Eurie Eurie, the line follows what is known locally as the Red Ridge as far as Cryan, west from which is black soil, but no serious impediment to a cheap line will be experienced except the crossing of Pian Creek to Eurie Eurie. From Eurie Eurie, on the north bank towards Walgett, is flooded country which will entail considerable additional expenditure.

This extension from Eurie Eurie to Walgett is a matter with regard to which the Sectional Committee had considerable doubt, but after fully weighing the matter, and taking into consideration the expenditure of Government money, and the results of private enterprise in the town of Walgett, the Sectional Committee have determined to suggest to the Full Committee, that, notwithstanding the expenditure of a larger amount per mile than usually is necessary on lines in the western district, still they feel they would not be justified in disregarding that expenditure of public money, and also the fact that large bridges have been constructed over the Barwon and the Namoi, really concentrating the trade of a considerable portion of the district upon the town of Walgett.

If Eurie Eurie were chosen as the terminus there would be the following result:—The construction of expensive bridges from the west to approach it, and the temporary transference of the business of the town of Walgett to that place if the certain agitation which would probably eventually result in an extension towards Walgett were unsuccessful for a time.

It seems improbable that the line can be brought nearer to Walgett than perhaps $1\frac{1}{2}$ mile; but investigation may enable it to be extended still further towards the south-west. This can only be decided by actual survey; but, in the opinion of the Sectional Committee, it should be placed as close to Walgett as possible, on the north side of the Namoi.

Turning now to the line to Collarendabri from the point previously mentioned—315 miles along the "green line"—the evidence obtained locally, and investigations by Mr. Stuart bring the Committee to the following conclusions:—For the first 15 miles—that is, to the north side of Burren Creek—there will be no difficulties; thence there will be a few miles of low country, but not offering any serious obstacle to construction; thence, *via* Merrywinbone, east of which it will join the Woolabra line, at about 340 miles, to within 10 miles of Collarendabri, no serious difficulty will be encountered. Further on there will be some flooded country, and the Grawin Creek and the Barwon will require bridging. Thence into Collarendabri there will be no engineering difficulty.

It

It was stated by the Department that it would be well to make the terminus of the line some 11 miles from Collarendabri, but it appears to the Sectional Committee that the line will some day be extended towards Angledool, and if that be so, for reasons similar to those stated in the Walgett case, it will be as well to preserve the centre already established by the Government and bring the line adjacent to the town; the position of the terminus should be so chosen that the approach to the west will be the best obtainable.

The length of the two lines under consideration would be somewhat over 150 miles; the proposals of the Government are 196 miles—that is, if the Committee is right in the conjecture that Walgett is the objective point of the Pilliga line. The saving in distance is, therefore, about 45 miles, and the saving in cost of construction approximately £100,000. The only question, therefore, remaining to be considered, is whether the development by this method will be as satisfactory as that proposed by the Government. In the opinion of the Sectional Committee the scheme is better, because it gives a shorter length of haulage from Walgett, and passes through superior country. The extent of Crown lands on the two lines, namely, Narrabri to Walgett on the north side of the Namoi, and *via* Eurie Eurie, and from 315 miles on that line to Collarendabri, amounts to 1,609,000 acres, which will be readily taken up in small areas. The returns from these lines will be satisfactory. The only reduction from the returns in the proposed lines will be in regard to some country lying about Bunna Bunna and Millie, which will be within reasonable distance of the Moree line, and will make to it.

Taking into consideration that the extension on the south of the Namoi is only as far as Pilliga, and also the fact that the circumstances to the north of the New South Wales boundary have been altered by the proclamation already referred to, and the great area of State lands to be developed, the Sectional Committee would suggest that the lines be located as proposed by them, it being, in their opinion, the best way to develop the district, and one which will, almost at once, result in a profitable enterprise to the State.

The evidence given before the Sectional Committee shows the liability of the rivers referred to in the Report to flood. It may be laid down that, as a general rule, a flood may be expected once in every seven or ten years. The experience of men who have lived in the district for the past thirty or forty years bears out this statement. Therefore, since the district is liable to inundation only at long periods, it may not be necessary to carry out such engineering works as would be required in case of more frequent visitations.

If the line be located on the north side of the Namoi, the connection of Pilliga and trade from the south should be arranged for at once, and the best possible roads of access should be immediately laid out and improved, in order to provide means of communication with the nearest railway station.

Since the statement by the Chief Traffic Manager apparently does not include much return for timber or wheat, and, as already pointed out, only applies to half the distance on the south side of the Namoi, it is difficult to form a comparison; but the Sectional Committee have no hesitation, after full investigation in the district, in recommending the Full Committee to suggest the full consideration of these works by Parliament.

THOS. EWING,
Chairman.

19 May, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM WOOLABRA TO COLLARENDABRI.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

WEDNESDAY, 11 MAY, 1898.

[The Sectional Committee met at Eurie Eurie, at 1.40 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).
JOHN LIONEL FEGAN, Esq. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Woolabra to Collarendabri.

William Sim, licensed surveyor, Walgett, sworn, and examined:—

1. *Chairman.*] The Committee desire to know, in the event of a line being extended from the "green line" shown on the plan, to tap the western country, what portion of the country offers the least objection from an engineering standpoint, to railway construction? In my opinion you might commence to go in a northerly direction from the 315-mile point shown on the "green line"; thence passing below Burren Creek; thence somewhere about the 340-mile point shown on the "red line" in the parish of Christie; thence following approximately the "red line" to Collarendabri, which the Committee will see is adjacent to the travelling stock route. From Collarendabri, going north-westerly, the stock route preserves a fairly good position. Although there will be flooded country at Burren Creek, also in crossing the Thalaba, also near Collarendabri, and also crossing the Barwon, still I believe the line thus located will be in the driest country.

W. Sim.
11 May, 1898.

FRIDAY, 13 MAY, 1898.

[The Sectional Committee met at the Court-house, Collarendabri, at 10 a.m.]

Present:

THOMAS THOMSON EWING, Esq. (CHAIRMAN).
JOHN LIONEL FEGAN, Esq. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Woolabra to Collarendabri.

Edmund Brennan Loughnan, J.P., secretary, Railway League, Collarendabri, sworn, and examined:—

2. *Chairman.*] Have you a statement to make? Yes. Any information I have to give is from statistics gathered by me as Secretary to the Railway League, which will be substantiated by witnesses. We wish to bring under your favourable notice our claim for railway extension to Collarendabri, with a view of a further extension later on to the Queensland border *via* Angledool. In support of our claim we wish to point out the following facts:—That the part that would be served by the railway we advocate to Collarendabri would embrace an area of about 200 miles in length, by about 80 miles in breadth, catching the whole of the New South Wales trade to the Queensland border north of Angledool, none of which is served by the Narrabri-Moree line, and which, without railway communication to Collarendabri, will still continue to go to West Narrabri. Starting from Millie, skirting the northern boundary westward of Malaraway, Minna Minane, Mungyer to the Gwydir River, down the course of that river westward of the Collymongle boundary; thence northwards along the eastern boundary of Collymongle, Caidmurra, and Wirrah runs to Mungindi; thence westward following the Queensland border line to the western boundary of Brenda station; then southward along the eastern boundaries of Brenda, Denman, Dumble, Bangate, Grawin South, Llanillo, and Dungalar to the Barwon River; thence following that river to the N.E. to a point opposite to the western boundary of the Eurie Eurie leasehold area; thence crossing the Barwon and following the southern or south-western boundary of Eurie Eurie leasehold area to and along the southern boundaries of Mercadool, Cryon, and Gorian; thence from the south-eastern corner of Gorian in a straight line to Millie, the point of commencement. [Except in certain seasons these boundaries would fairly include the area from which revenue could be obtained on wool or general goods, inwards and outwards; but a considerably larger area might safely be included (including the town of Walgett) in the matter of passenger traffic, or stock for trucking.] That the area named contains, at a low estimate, 2,701,394 sheep, giving, also, at a low estimate, 40,515 bales of wool, and an approximate tonnage of 6,752 tons, with a return loading equal to 2,195 tons. [Boatman station (Queensland), 190 miles from Collarendabri, sent wool through Collarendabri. This is not included in above estimate. It is largely worked with Wirrah, and has 125,000 sheep, 5,000 cattle, and 300 horses—1,500 bales, 250 tons.] That this line would be the shortest, driest, cheapest, and most practical route to the Queensland border. That the whole of the country passed through is rich country, for either agriculture or grazing, especially the latter, and is already thickly populated with thriving selectors, who, being well to do, and having built comfortable homes, show thereby their *bona fides* and intention to remain. That the route, as surveyed, is readily drained into the Thalaba Creek, from which creek abundance of water is obtainable

E. B.

E. B.
Loughnan,
J.P.
13 May, 1898.

along the line. This creek is the only creek the line would cross until within a few miles of Collarendabri. That at Collarendabri, the Barwon being dammed by a bar of rocks, gives a magnificent sheet of permanent good water for all purposes, while abundance of good gravel is obtainable, suitable for ballasting purposes, a short distance from the town. That, should the Government extend the line, in the future, to Angledool and the Queensland border, there is nearly equally good country from Collarendabri to Angledool, with two Government bores equally dividing the distance. That a through line this way, as proposed, is certain to divert much of the Southern Queensland traffic to New South Wales, as this is its natural outlet. With reference to this matter, I would draw your attention to a notice which appeared in the *Queensland Government Gazette* in December last, which I will read:—

[*Queensland Government Gazette*, 11th December, 1897.]

The Treasury, Brisbane.

THE RAILWAY BORDER TAX ACT OF 1893.

It is hereby notified for general information, that, under the provisions of section 8 of "The Railway Border Tax Act of 1893," permission has been given to the owners of woolsheds situated within the area between the southern border line of the Colony and a line parallel thereto, and 30 miles north thereof, to convey the wool shorn at such sheds across the border without the payment of the tax provided by the said act.

HUGH M. NELSON,
Treasurer.

That, again, favours our getting the wool from a great many stations in Queensland. The statistics which I am about to hand in have been gathered by myself in reply to letters and forms sent to each landholder in the district, asking them to give certain information.

3. Are they within the New South Wales boundary? The majority of them are.

4. Is the tonnage mentioned in these statistics? Yes.

5. Does the aggregate agree with the tonnage you have already quoted? It does. The following are the statistics to which I allude:—

INFORMATION showing justice of claim for railway extension to Collarendabri. This information is subject to the alterations in tenure incidental to the occupation of the land.

Collarendabri						560
Angledool						560

E. B. Loughnan, J.P.
13 May, 1893.

About 19,000 bales passed over bridge at Collarendabri

About 11,000 bales lie between Collarendabri and Mungyer, extending south to Eurie, Cryon, Gorian, and Burren.

About 4,500 bales lie south west of Collarendabri, at present taking other roads, but certain to drain to

Mr B. Benson of Brenda station, in writing to me, says that about 70,000 sheep on the Queensland run, shown in New South Wales, will come this way. I have also letters from managers inside the Queensland country whose statistics are not given in the returns which I have put in. The managers of Manilla and Dungslear state that they will send their wool this way, provided the line is carried through. I may mention that the Sectional Committee inquiring into the Moree line made the following observations—

The Sectional Committee came to the conclusion, that if the whole area of country in this railway question is to be properly served it can only be done by two lines—a northern line following the route submitted to the Committee, and a western line following the driest belt of country, which is apparently south of Thalaba Creek, and eventually reaching Collarendabri. Any attempt to deviate from the direct route, they say, "will entail a permanent disability on the northern trade without conferring a fully compensating advantage on the western trade." They were of opinion, that in view of the importance of the western trade, it would be well if a full exploration and survey should be made of the country towards Collarendabri, apparently the best place to start a survey from, being a point between Narrabri and Edgeroi, thus utilising the bridge which will be constructed over the Namoi on the direct route.

With reference to the statistics I have put in, I may mention that the Merrywinbone return of wool is 240,000 bales. That was the return in the year in which the statistics were obtained. Since that year a great deal of the land has been thrown open, and taken up by selectors. Consequently, there may be a discrepancy between Mr. Langhorne's figures and the statistics.

William Nicholas Wilks, Esq., M.P., sworn, and examined—

6 Mr. Fegan] Do you desire to make a statement? I advocate the proposed line on the same grounds upon which I have advocated other lines in this Electorate. I would suggest that a line be constructed to Collarendabri, to be taken from a point between Woolabra and Narrabri, and go to the Thalaba, and that a line be taken from there to Walgett. If that were done, it would be found that this line, from the figures of Mr Harper himself, would be a paying concern. Mr Harper tells us that if we construct a line from the Moree line to Collarendabri, it will cost £13,000 a year in interest and maintenance. I maintain that if the Walgett line uses 43 or 50 miles of the line, the traffic will help to make that portion

W. N. Wilks, Esq., M.P.

W. N. Willis, Esq., M.P.
13 May, 1898.

portion of the line at least pay, and, instead of costing Collarendabri £13,000, the amount would be a little over £7,000. Mr. Harper admits that the traffic would be about £7,190; therefore, in my opinion, the best thing for the State to do, instead of going from Narrabri to Pilliga over useless country, would be to make one line do for the service of the two places up to a certain point, and then to have a branch from the main line into Walgett, and the other to come to Collarendabri. I do not think there can be any question whatever about the line to Collarendabri paying, because it would get a great slice of the Queensland trade, and that, together with the district trade, would more than pay for interest and working expenses. As has been pointed out, we have a radius of 30 miles from the Queensland border, from which wool can come into this Colony free of charge. The proclamation which has been issued does not refer to a man who has sheep running from 50 or 80 miles from the border, but it simply states that a man having a woolshed within 30 miles of the border may send his wool over free. Therefore the sheep may run from 70 to 80 miles from the border, and if they are shorn within a radius of 30 miles from the border the wool can come here free. That is so with the Australian Pastoralists' Company. They shear 1,000,000 sheep, which means 14,000 or 15,000 bales of wool. As six bales goes to the ton that means a big tonnage of Queensland trade coming in to support the Collarendabri line. I say nothing of the wool that would come from Boatman, where they shear 125,000 sheep. The wool would come from that stretch of country along the Baloon to St. George, and then from St. George south, a distance of 40 or 50 miles, to the border here. The fat cattle trade would be very considerable. The trucking of fat sheep would also be considerable. I may point out that there is no legislation which the Queensland Government can pass which can prevent the fat stock of all that big area coming here, simply because the southern border of Queensland is the only possible outlet for the fat stock or store stock of that great Colony. The Dibbs Government, at one time, attempted to put 3d. a head duty on sheep coming over the border to help to pay for the grass they ate off our travelling stock routes, and for the damage they did to the people of this country; but there was a great outcry in Queensland about it. The papers pointed out that it was their only outlet to New South Wales. Again, if Federation eventuates the line will be the main trunk line to Queensland, and will tap all the great St. George country. The fat stock alone, off a station like that of the Australian Pastoralists' Company, would, if they had railway facilities, amount to 10,000 fats and 100,000 fat sheep. That means a carriage of about 2,000 trucks, which, at £8 a truck, would bring in £16,000. It might be argued by certain officials, that the fat sheep do not come off there. My reply is, that the reason they do not come off there is, that they will not run the risk of taking them far to a railway station. It may be asked, why do not these people send their stock to the Queensland market? My reply is that the Queensland market is simply a sort of financial "death-trap" for a man to send stock to. There is no market there at all. Five thousand or 6,000 head of sheep is quite sufficient for one sale there. They only have a little tinpot market, and the prices do not reach the prices obtained in the Sydney market by at least 1s. or 2s. a head, simply because in the Sydney market we have meat-preserving companies operating, and if the market is flooded at any time, and they see a chance of buying a few thousand sheep at a low rate, they come in and operate. I notice that the Sydney Meat Works the other day bought 26,000 sheep in one day. If that can be done with the Sydney meat market why not with Newcastle, where we have a good scaboard, and where we would save so much extra carriage. It has been pointed out at different times that this country will not be great until we have a better system of export by chilling, freezing, tinning, and canning, and that sort of thing. Why not make the great city of Newcastle, or some of its suburbs, a depot for receiving, killing, and treating this stock, so that large ships may come and take it away to feed the people to whom meat is a luxury. I maintain that the extra trade we would get from Newcastle alone would make the line a paying concern, and should be an inducement to the Government to build it. As has been pointed out, the settlers about here are in a thriving condition. They pay high rents, and deserve some consideration. Another thing which would induce a lot of the Queenslanders to send their wool here is this: that the railway carriage of the wool in Queensland is quite 30 per cent. more for the same distance than it is in New South Wales. Then you have to take it off the trucks, put it into boats, and send it to Sydney. There is no wool market at Brisbane, and the idea of shipping it direct from Brisbane is simply fallacious, because they cannot get the tonnage of vessels there. If vessels go there it is to deliver a portion of their cargo, and then they go back to Sydney or Melbourne to load up. I read the other day of a deputation which waited upon Mr. Byrnes, and which pointed out that large ships would never go to Brisbane until proper wool sales were established. A suggestion was made that they should try and establish wool sales there. They might try, but in my opinion if we build railways of the description under consideration we should simply place further obstacles in their way, as they have always done with us. I should like to emphasise the word "woolsheds" which appears in the proclamation which has been read. The proclamation says:—"Any person having woolsheds within a radius of 30 miles." That, in my opinion, was done to meet the cases of the Australian Pastoralists' Company, and Mr. Tyson, and other persons who have stations 50 or 60 miles from the border, but whose woolsheds are close to the border.

7. Are there any grazing farms taken up in that part of Queensland? Yes; a great number by New South Wales people, and a lot more are to be opened up in September. They have millions of acres of pretty good land there, and it is to be thrown open. There is a lot of the Australian Pastoralists' Company's land to be thrown open too.

8. It might mean that in the event of settlement increasing very largely out there, they will take advantage of the proclamation, and a sort of central shearing-shed might be established amongst them within 30 miles radius? That could be done. What is done now is this: they wanted to charge me up to £1 per ton for the carriage of my wool from Yarmouth station, only 28 miles from Wyandra railway station, the first section of the Charleville-Connamunna line. I put the sheep on the road and brought them into Culgoa, shored the sheep there, scoured the wool, and sent the sheep back to grow another fleece. I did that for two years until they charged me a reasonable rate. But what would be done in nine cases out of ten would be this: one of a family from here would go over there and select, and work the two places conjointly. In my opinion, if the New South Wales Parliament is alive to the interests of the country, this £2 10s. a ton duty on wool cannot last much longer. The people of Queensland are sick of it. It is a short-sighted policy, and if the spirit of retaliation once gets hold of the New South Wales Parliament it will put a border duty of £1 a head on the horses and cattle coming over, and a duty of 3d. per head on their sheep, and allow it to remain until the £2 10s. duty on wool is removed. Again, a great deal

deal of merchandise, such as fencing wire, iron, &c., would come this way, because this is the natural point to which it must come. The people about Angledool, for instance, prefer dealing with the Sydney merchants, because the terms and the goods are better. People who live about here and trade in New South Wales are loath to do business in Brisbane, where—I speak from experience—business is lop-sided and congested. Queensland being a Protectionist country, it would not interfere with the railway carriage of the goods, because these goods would be bought in bond and sent over the border, and the duty paid at these various places. I may say that the tonnage of goods coming into the country to be opened up in the same way as that country has to be opened up—in and about St. George, the Baloon, and those places—would be very considerable. They want fencing wire, galvanized iron, timber, nails, and that sort of thing to improve their places.

W. N. Willis,
Esq., M.P.
13 May, 1898.

9. Have you anything to say of the probable traffic coming over the Queensland border to the Collarendabri railway? No; but I know the stations which would be affected. You might start from the Finger-post and take in the Australian Pastoralists' Company's stations; thence to St. George, or a little bit north of it, taking in Boatman; thence strike a line east about 50 miles from St. George, and then back to the border. I think the trade of the whole of that area would come here.

10. You rely on a certain district to feed the line, and you say that retaliation will make the Queensland Government remove the border duty of £2 10s. per ton on wool, or stop the Queensland stock coming here? Yes.

11. Then if it has the latter effect the stock of the district would cease to come here? They could not go anywhere else.

12. Would not a duty of 3d. per head stop them coming here? It could not. It would simply have the effect of bringing the legislators of Queensland to a sense of their duty, by inducing them to abolish the border wool duty, and allowing the trade to go into its proper and natural channel—to Collarendabri. In other countries, if there is a dispute as to border tariff, the authorities simply meet and discuss it, and come to some proper understanding; but we have done nothing. We have allowed people to be penalised with a £2 10s. border duty, and not tried to help them. Sir George Dibbs did impose a charge of 3d. a head on sheep, but it was not done in a spirit of retaliation, nor had it anything to do with the £2 10s. border duty. I have no fear with regard to the £2 10s. border duty, because Mr. Byrnes was never very sweet upon it. It was Mr. Mathieson, the Railway Commissioner, who suggested it, and it was passed by the Government of Mr. M'Ilwraith. I think the matter only requires to be put before the Queensland Government, and they will take the duty off. At any rate, even with a charge of 3d. per head on sheep, I maintain there will be sufficient coming this way to make the line pay.

13. *Chairman.*] What extent of country would the district you have described embrace? About 6,000,000 acres.

14. How many sheep would that run? I think there are more than 2,000,000 sheep upon it now.

15. What would 2,000,000 sheep clip in tons? They ought to clip 30,000 bales, which, at 6 tons to the bale, means 5,000 tons.

16. Then you think Queensland will furnish 5,000 tons of wool to the railway? I think it will furnish every bit of that, and it will also furnish fat stock. I should like to emphasise what has been said by Mr. Benson, of Brendah, in his letter to Mr. Loughnan. Mr. Benson points out that sheep running in Queensland are shorn in New South Wales, and that is what would happen all along the border.

17. *Mr. Fegan.*] Do you think the Brenda station wool would come to Collarendabri? That station may send its wool this way. Of course, I could not say. I know that if there is a railway to Brewarrina the distance for the wool to travel will be shorter.

18. Upon the supposition that the wool is shipped direct to England will that traffic come to Collarendabri? If you take the mileage and distance into consideration, I do not think it would come here. It would not come here if there were a line to Walgett or to Brewarrina—at any rate it is a matter of only 400 or 500 bales, and it could not make much difference in the calculation. I maintain that Brewarrina would get the trade west of the Narran, and over the border right up to the doors of Connamunna, Woodgeagoowara, and Gundaleer. I maintain that if there were a line to Brewarrina it would get all the Queensland trade right up to the doors of the Connamunna line, so to speak.

19. You think then that the route the Committee were suggesting last night should be adopted? I think the suggested route, which was pointed out last evening by the Members of the Committee, not only the most advisable to serve both towns, but, in the interests of the country, it is very desirable. It would save about 50 miles of construction, which means about £130,000 of the taxpayers' money.

John Theodore Merry, storekeeper and hotelkeeper, Angledool, sworn, and examined:—

20. *Mr. Hassall.*] How long have you resided at Angledool? Twenty-two years.

21. Have you heard the evidence of Mr. Loughnan? Yes.

22. Do you corroborate what he has said? I have not gone into the statistics carefully. I am in a better position to corroborate the evidence given by Mr. Willis as to the traffic which would result from the construction of a line to Collarendabri.

J. T. Merry.
13 May, 1898.

23. Can you corroborate his evidence with reference to the strip of country along the Queensland border over which sheep would be driven to be shorn, thus taking advantage of the proclamation of the Queensland Government? Yes. I should not have been disposed to go as far as Mr. Willis has done in including country 80 or 100 miles from the Queensland border, but I was not aware of the fact that the railway rates in Queensland, as compared with those in New South Wales, were so high. Had I known that, I should have been in a position to state that under any circumstances, even if the rates had been on a similar scale to those of New South Wales, the whole of the traffic within a radius of 50 miles of the border would be brought to Collarendabri, which is its natural destination.

24. As a resident of Angledool will you state your reasons why you support the construction of a line to Collarendabri? When Sir John Robertson was in power he took an active interest in the extension of the main trunk line to Collarendabri. Although he may not have gone to the expense of having a survey made, an estimate was made of the probable cost of construction. He strongly favoured the construction of the line at that time, and a petition containing 1,000 signatures was drawn up in favour of it. Owing to the death of Sir John Robertson the construction of the line remained in abeyance. I may say that I have not the slightest interest in a foot of land in Collarendabri, nor have I any business in connection with

J. T. Merry. with the town, but I look upon the matter from a national standpoint. I take it that there is no railway which could be constructed on such advantageous terms as an extension of the proposed line, with the ultimate object of making it an intercolonial line. The Queensland Government are pushing their lines south, and if it had not been for the unfortunate dispute as to the point from which the railway should be started to connect St. George, one would have been constructed years ago—so I am informed by Mr. Storey. That gentleman has called the people together, and has asked them to come to some decision as to the point from which they would like the line to start. I believe they have now joined forces, and in a short time the line will be at St. George. If the proposed line is constructed to Collarendabri it could be run with advantage towards the Queensland border—say 25 miles on this side of Angledool; and then it would form a main trunk line to the metropolis of Queensland. At the same time it would intersect equally good country as that which exists between Collarendabri and Woolabra.

13 May, 1898.

25. What is the character of the country between here and the point on the Queensland border which you mention? In the biggest flood which has ever been known here you could go over it with a pair of horses and a buggy without touching any water which would inconvenience you. The high ridges can be traversed in any weather. With regard to the fertility of the country, and the closer settlement which would follow the construction of a railway, I may say that, whilst the construction of the line would be of great advantage to the Australian Pastoralists' Company, you will get no evidence from that quarter in favour of it. They see that the advantages that they would obtain from the extension of the railway, and the cheaper freights for their wool would be more than counterbalanced by the enormous amount of settlement which would take place on the enormous pastoral area they have at command. It is more than these men dare do to come here and give evidence in favour of the construction of the line, notwithstanding the immense benefit it would be to them. The land is of a fertile description, and I have no doubt that 10,000 or 20,000-acre blocks would soon be converted into 2,000 or 500-acre blocks if the railway were close to the place. With regard to the probability of growing wheat, I may mention that up to 1884 it cost Eurimbah station £1,600 for forage alone, which means the conveyance of many tons from Narrabri. On one occasion a heavy rain came on, and I saw as fine straw growing in the middle of the track as I have seen in any part of the country. The exact distance between Walgett and Collarendabri is 50 miles.

26. Do you think the pencilled line on the map running from the green line to Merrywinbone would serve the people of Walgett as well as of Collarendabri? Yes, that is if you contemplate running a line to Walgett as well.

Thomas John Sherwin, grazier, Nullawa, sworn, and examined:—

T. J. Sherwin.
13 May, 1898.

27. *Chairman.*] Where is Nullawa? Within 9 miles of the Queensland border.

28. How long have you been a resident of the district? I first crossed the Barwon in 1863 to form the Nullawa station. I have been a resident of the backblocks ever since. I would point out that the Queensland railways are not powerful railways, and they have to charge higher rates for goods and wool than we do. Therefore, if New South Wales came into competition with them she would always get the produce which Queensland would otherwise get if her railways were run on the same terms as those of New South Wales. Again, the fact has to be taken into consideration that the Queensland people wish their wool to go, not only to the best market, but to the best port, where they can obtain competition with regard to freights. I contend, therefore, that even the Queensland people living some distance over the border would prefer to send their wool to Collarendabri, securing thereby the advantage of the Newcastle port for direct export to England, and also securing the advantage of a much larger wool market in Sydney than they would obtain in Brisbane. During the last few weeks there has been a proposal to hold wool sales in Brisbane; but I cannot imagine that anyone within a radius which would enable them to send their wool to Collarendabri, and so get to Newcastle or Sydney, would think of sending their wool to a port like Moreton Bay. After consideration of the port, road, and railway carriage, and the market, I have come to the conclusion that Mr. Willis is not far out in his statement with regard to the area of Queensland traffic which we are likely to get. That traffic, however, may be affected by the Queensland authorities by railway extension in the future. I may mention that the Australian Pastoralists' Company and the Australian Land, Mortgage, and Finance Company are large sheep-owners in this district. They and the Peel River Company export their wool to England for sale. They do not sell in the colonies, and you can, therefore, readily understand that they prefer to ship from Newcastle, because they thus save the steamer or the railway freight from that place to Sydney. With regard to the evidence of Mr. Merry, I may mention that in 1882 Sir John Robertson sent word to the people of Collarendabri to the effect that they ought to agitate for a railway, because he believed that this would be the shortest route to the Queensland border. Mr. Plunkett came into the district and went round with a petition, and I believe he obtained 1,000 signatures. I never knew till the other day that that petition, over which so much trouble was taken, was, owing to Mr. Plunkett's negligence, never presented at headquarters. If there is a direct line from Walgett, as shown by the green line on the plan, and another strikes off at the 310-mile point to Merrywinbone, it will lessen the cost of construction to two given points, namely, Walgett and Collarendabri, and you would have half a line common to both places.

29. Do you desire to express an opinion with regard to the country on the south side of the Namoi? Yes. One of my objections to the line to Walgett has been that the Walgett people have always tried to get a line from Narrabri *via* Pilliga. I have always opposed that, because I think it would be a very expensive line, and there would be no return from it. You would run through brigalow scrub and some of the worst country to be found in New South Wales.

30. Have you any information with regard to the seasons and floods? I can go back to 1863. In that year, when I crossed the Barwon, the drought of 1862 was breaking up. The Barwon was running continuously during 1863 and until the big flood of 1864. In 1865 and 1866 there was a dry period. In 1867 there were floods, but of no great importance. In 1868 there was a severe drought; in May, 1869, the drought broke up, and we had a continuance of wet weather during that year and 1870, when there were fair floods, but not as much as to interrupt traffic. In 1871 the floods were over a considerable portion of the country. The same remark applies to 1872. In 1873 there were high floods again. In 1874 it got dry again, and that state of things continued until 1878. In 1879 the drought broke up and there was a high flood. In 1880 and 1881 there was neither flood nor any particular dryness. In 1882 there was a fair season—not very wet and not very dry. The same thing occurred in 1883, 1884, 1885, and 1886. In 1887 there was a wet winter with freshes down the river. In 1888 there was a short sharp

sharp drought. 1889 was a fair dry season, and then came the big flood of 1890. 1891 was another year with floods. At Angledool it was within 8 or 9 inches of the flood of 1890. In 1892, 1893, and 1894 there was no flood. 1895, 1896 and 1897 were very dry years.

31. Since 1863, then, there have been five periods in which floods might have interfered with railway earthworks? That is so.

32. You cannot say anything about the question of interference? No, because as a rule these floods do not last for any length of time.

33. Is the water still? Yes. I do not think it would affect embankments.

34. According to your statement the country is under water once in seven years, and the water is either still or going away slowly? Yes.

35. Under those circumstances it would not sweep the banks away, but would crumble them? I think so. I might emphasise what Mr. Willis has said as to the stock which will come to Collarendabri if the railway is constructed. The people have been unable to send cattle across the border for some time, but as soon as the tick plague is subdued immense quantities will come over. I do not think we can realise the number of fat stock which would be likely to come to the Collarendabri railway if the tick were not a combating influence. I can endorse what Mr. Willis has said with regard to the travelling stock. We cannot travel stock from the Narran to Narrabri and keep them in anything like fat condition, because they lose so much on the road. On one occasion I started sheep from the Narran, and when I saw them at the Flemington yards I did not recognise them, because of their poor condition. The Australian Pastoralists' Company have country extending from Angledool to the other side of St. George. The whole of that side of the country belongs to them, and to show how they avoid the £2 10s. border duty, I may mention that they have a scouring plant at Dareel, which is within the 30 miles radius. They can shear their sheep and carry their wool to the scour, from which it is carted by teams to Narrabri for shipment to Newcastle. The Australian Pastoralists' Company also have a station at Eurimbah, part of which is in Queensland and part in New South Wales. There is nothing to stop that company from bringing the whole of their sheep from above St. George to a station at Eurimbah and shearing the whole of them in New South Wales, so as to secure access to the port of Newcastle. I think we have rather under estimated than over estimated the wool we should get from Queensland.

T. J.
Sherwin.
13 May, 1898.

John Augustus Robertson, Currawillinghi, sworn, and examined:—

36. *Chairman.*] Where is Currawillinghi? Part of the station is in Queensland and part in New South Wales.

37. How do you get to it? *Via* Angledool.

38. *Mr. Fegan.*] Do you corroborate the evidence of Mr. Sherwin? Yes.

39. Do you wish to add anything to it? I may mention that, although the Queensland Government imposed the £2 10s. a ton duty on wool crossing the border, it still came this way.

40. From how far north? Certainly within the 30 miles radius. The Government tried by means of the duty to force the wool upon the Queensland Railways, but they did not manage it, for every bit of it came to this part of New South Wales; this being its natural outlet.

41. How long have you been in the district? Nearly sixteen years.

42. *Chairman.*] If the £2 10s. border duty did not prevent wool coming, *via* Collarendabri, to Narrabri, the removal of that duty must extend the limit from which the wool will come in the future;—did every landholder within the 30 miles limit send his wool this way? I think so.

43. *Mr. Fegan.*] Did any pastoralist within the 30 miles limit send his wool any other way? I do not think so.

44. Seeing that the duty does not now apply to a certain area, do you think it will be the means of extending the area from which the wool will come to New South Wales? Yes.

45. To what extent? I think the Doondi station would send its wool this way. I do not think that even a railway to St. George would prevent the traffic coming this way, because they would have such a long haulage—500 miles to Brisbane—and the wool would also require a lot of extra handling at Brisbane.

46. From how far north would the wool come to Collarendabri? I should think 50 miles over the border; that is 20 miles beyond the radius of 30 miles.

47. Where do you get your stores from? Sydney.

48. What does it cost you for the carriage of stores from Narrabri? £3 10s. a ton. We have paid as high as £35 a ton; that was in the 1883 or 1884 drought. We have frequently had to pay as high as £10 a ton.

49. What is the average for the last five years? About £7 a ton.

50. Would £2 10s. carry a ton of wool over the border into Queensland, a distance of 125 miles? I do not think so.

51. What would it cost you to get from your place to St. George? I can only give an answer in general terms. From Currawillinghi to St. George—100 miles—a ton of wool in my opinion would be carried for £2 10s.

52. Where do you send your wool? To Newcastle. It is shipped from there to England.

53. How many sheep have you? For the last four years I have averaged about 70,000.

54. What is the weight of your clip? The average for the last five years, including scoured and greased, has been 60 tons.

55. What is the average weight of your fleeces? About 7 lb.

56. What is the extent of your holding? About 160,000 acres. I run about 2½ acres to the sheep.

57. How much scoured wool do you send down? In 1893 there were 144 tons 14 cwt., including about 7 tons of scoured. In 1894 there were 151 tons of scoured, and 13 tons of greasy. In 1895 there were 175 tons of greasy, and 11 tons of scoured. In 1896 there were 149 tons of greasy, and 6 tons 16 cwt. of scoured. In 1897 there were 138 tons of greasy, and 5 tons 18 cwt. of scoured—an average of 160 tons 9 cwt.

J. A.
Robertson.
13 May, 1898.

Daniel Joseph O'Connell, selector, near Collareendabri, sworn, and examined :—

- D. J. O'Connell.
13 May, 1898.
58. *Mr. Hassall.*] How many acres do you hold? 10,000, under family selection.
59. Can you corroborate the statements which have been made before the Committee? I do not know much about the northern side of the Barwon, but I can corroborate what has been said with regard to the country over which my knowledge extends.
60. Do you know anything about the rates of carriage from Narrabri to Collareendabri? Yes; it costs me £3 a ton for the carriage of wool from Narrabri, and £2 10s. for back loading. I have paid as high as £5 a ton.
61. Can you get back loading for £2 10s. a ton if you do not send wool in? Yes; that is when they are coming out for wool.
62. Do you know the country between Pian Creek and the Thalaba? I know the country between Cryon and the Thalaba—that is, the Mercadool country.
63. Can you describe the character of the country as shown in the neighbourhood of the pencilled line on the plan, running from the "green line" to the "red line"? Yes; all the Merrywinbone and the Mercadool country is splendid country.
64. Is it flooded or is it comparatively dry? Back from the Thalaba Creek it is dry. Along the southern side of Thalaba Creek I have never seen a flood during my experience—that is, since 1891. I have been in New South Wales for fifteen years. I came from Riverina, where I had been farming on the Broogong. The same rainfall which we get there, where we grow splendid crops, also falls here. I believe we can grow equally as good crops here as there. I know of a man there who in a dry year cut 12 cwt. of hay to the acre.
65. What is the character of the soil at Mercadool? Black soil.
66. Do you look upon the red country as better than the black soil for cultivation? In Riverina the ridgy country was considered the best, but the crops headed the best on the black soil.
67. What is your experience of the carrying capacity on this part of the country? The first year I shored as many as 10,000 sheep. I find it is too expensive to travel a few sheep to a railway station, but if a railway were within a reasonable distance I should be able to truck them in small lots.

Joseph William Cook Langhorne, grazier, Oreel Station, sworn, and examined :—

- J. W. C. Langhorne.
13 May, 1898.
68. *Chairman.*] Where is Oreel station? Twenty miles east from Collareendabri.
69. What is its area? Including leasehold and secured land, about 70,000 acres.
70. What are you running upon it? I shear 70,000 sheep.
71. Do you send to Narrabri? Yes. The freight is £2 10s. a ton.
72. How long have you been in the district? Altogether, since 1875. I have been on Oreel station for fourteen years.
73. Is the evidence of Mr. Sherwin with regard to freights and seasons correct? Yes.
74. Have you heard the evidence which has been given as to the traffic from Queensland which is likely to seek Collareendabri as a centre? Yes.
75. Do you regard it as correct? Yes.
76. Mr. Willis considers that the area will extend further over the border than does Mr. Robertson? I should be inclined to agree with Mr. Willis as far as the 30 miles radius is concerned, and sheep will be brought 60 or 70 miles beyond it.
77. You think Collareendabri will be likely to obtain the products of Queensland for a distance of at least 100 miles beyond the border? Yes; that is my view of the matter.
78. Do you regard the Barwon as valueless for water carriage? Yes; it is out of consideration altogether.
79. Have you had an opportunity of seeing the line marked on the plan? Yes.
80. Do you think it will suit the country? I think so, if it is practicable.
81. Have you any doubt about its practicability? I have.
82. Do you think the pencilled line running from the "green line" to the "red line" passes over flooded country? No; I think the flooded country would be nearer Woolabra, coming from Boolcarrol. I do not think there would be any difficulty after that.
83. In your opinion the only serious difficulty is contiguous to Boolcarrol? Yes. I have seen the Namoi water out there across the Narrabri-Bulyeroi road.
84. Do you think the country with the Barwon on the west, the Namoi on the south, and the watercourse country on the north will eventually grow cereals? Yes; in my opinion, in a few years, the whole country will be under crop.
85. Will you describe the country over the last 10 miles of the proposed railway into Collareendabri? Four miles out from the Grawin the country is subject to flood. It is not what you would call a swamp—the natural warrambools, of which there are three well defined, and another not so clearly defined. They are quite sufficient in all ordinary times to carry the water off. Only on two occasions have I seen them connected right across—that is, between the Grawin and where you leave the timber. The country between the Grawin and the Barwon has only been under water to my knowledge twice—1890 and 1893. After you get across the Grawin there is no danger whatever of flood.
86. Is it still water? It is. Before the warrambools below Collareendabri run at its head the water will be backed up 10 miles. Therefore it is back water which is mostly in the warrambools, and must therefore be still.

Alfred Blomfield, homestead lessee, Mount Brandon, near Collareendabri, sworn, and examined :—

- A. Blomfield.
13 May, 1898.
87. *Mr. Fegan.*] What area do you hold? I have 10,000 acres of homestead lease and two selections, with a full area of 640 acres with conditional leases attached.
88. How long have you been in the district? Twenty-five years.
89. Do you use your land for pastoral purposes? Yes.
90. Have you tried the cultivation of crops? Yes; I have tried oats, wheat, and barley.
91. With what result? I have obtained a good crop generally every third year.
92. What do you call a good crop? About 2 tons of hay to the acre.
93. How many acres have you tried? Not more than 4 this season, and I have now 12 acres in.
94. What is the capacity of your run? About 3 acres to the sheep.
95. Do you think 7 lb. is a fair average to the fleece? It is a very good average, but in a bad season it is rather too high an average. A fair average is about 6½ lb.

96. How many sheep do you shear? About 6,000. The wool goes to Narrabri, and thence to Sydney. A. Blomfield.
 97. Where do you get your stores from? Sydney.
 98. What does it cost you to take wool to Narrabri? Three shillings per cwt. 13 May, 1898.
 99. Do you know the country in the neighbourhood of the pencilled mark on the plan? Yes.
 100. Do you agree with what Mr. Langhorne has said about it? Yes; I agree that the Boolcarrol end is low, but there is country between the Namoi and the Barwon which thirty years ago was the main track from Walgett to Narrabri. It followed the red ground from Walmar up to the other side of Oreel.
 101. Do you think that route would suit the people as well as a route direct from Narrabri? It would suit the country better. It would tap an immense area of country, and would reduce the cost of both lines.
 102. Do you agree with the evidence of Mr. Sherwin with regard to the floods? Yes. I may mention, however, that we had a flood in 1876, but it was all Queensland water, and it was next in height to the 1864 flood.

William Reed, selector, Collarendabri, sworn, and examined:—

103. *Mr. Hassall.*] How long have you been in the district? Thirty-eight years. When I first came here there was no settlement in the district. The country was held in large areas, and was principally devoted to the grazing of cattle. I was a stockman at Mogil Mogil when I first came here. As time went on the form of occupation was altered from cattle to sheep, and now the district is practically a sheep district, and cattle-stations are few and far between. It was not until the Land Act of 1861 that any selections were taken up. Since then, as the country has been made available for selection and settlement lease, it has been taken up rapidly. W. Reed.
 104. What area do you hold? Two selections of 240 acres, and I have 140 acres under lease. I may state with regard to the country through which the proposed line is surveyed that the railway would follow the highest land in the district, and would be more out of flood reach than it would be if it followed any other route. I was at Collarendabri during the 1864 flood. The water was just over the ground on the plain upon which Collarendabri is now situated. The School of Arts is the highest ground in Collarendabri, and it was slightly covered. 13 May, 1898.
 105. Do you know how far the water extended on the other side of the river? It extended a long way. In some places it went out as far as the Grawin. The next highest flood was in 1890. There was also one in 1870, and another in 1876. The 1890 flood, however, was not so much on the other side of the river, because the Meehi water did not come down. It is only when the Barwon is very high and the Meehi water comes down that we have to fear a very high flood.
 106. Do you know the country towards Angledool? Yes. The 1890 flood extended beyond the big warrambool. The road from Collarendabri to Angledool, along the travelling-stock route, and crossing the big warrambool, is as high as any other portion of the country.

John Charles Humphries, journalist, Collarendabri, sworn, and examined:—

107. *Chairman.*] How long have you resided in the district? Twenty-five years, with one or two short intervals. J. C. Humphries.
 108. Is there any point in the evidence which you desire to emphasise? I should like to state that in the flood of 1879 I left Moree to come to Mogil Mogil. Coming down the Meehi, about 30 miles from Mogil, I had to turn back, because the flood-waters were so high that I was not able to proceed. Mr. Frank Adams at that time was living at Willowlee, and I asked him how I could get to this side of the river, and if there was any possibility of getting across to Mungindi. He said there was no chance at all. On the day that I arrived at Adams' place I had to swim about $\frac{1}{2}$ of a mile across warrambools and creeks. There was no dry land at all. Mr. Adams advised me that my best plan would be to go back to Millie and come down on the Collarendabri side of the Meehi. I was practically hemmed in between the Meehi water on the one side and the Barwon water on the other. Acting on Mr. Adams' advice, I went back to Millie. I came from Millie down to Thalaba Creek, almost over the line along which you now proceed from Collarendabri to Woolabra. I came down without any trouble at all. I crossed the Grawin in a punt. There was no flood-water on that route which would prevent me travelling. I mention these two routes to favour the Woolabra line as against the line which has been suggested from Moree to Collarendabri, or from Moree to Collymongool. I came along the line from Woolabra to Collarendabri, whereas I had been compelled to turn back for a distance of 30 miles when traversing the route from Narrabri to Collymongool. 13 May, 1898.
 109. Do you know the country south of the proposed line from Woolabra to Collarendabri? Seven or eight years ago I made a number of inquiries with reference to that line, and in some of the articles I wrote to the papers I suggested that that would be a good way of connecting Walgett as a branch line from Narrabri to Collarendabri.
 110. Did you hear the evidence of Mr. Sherwin? Yes, and I agree with it. I also agree with the evidence of Mr. Robertson with reference to the Queensland trade. I think Mr. Robertson has, if anything, underestimated the distance in regard to the trade which we will get from the other side of the Queensland border.

Frank Adams, grazier, Myambla, sworn, and examined:—

111. *Chairman.*] Where is Myambla? On the Meehi, about 16 miles north-east from Collarendabri. F. Adams.
 112. *Mr. Fegan.*] What area do you hold? About 9,000 acres, divided between myself and my brother. 13 May, 1898.
 113. What number of sheep do you run? About 5,000.
 114. Where do you send your wool? To Narrabri, and thence to Sydney.
 115. Can you describe the country from Wee Waa to Collarendabri? I think from Narrabri to Wee Waa there would be a good route for a line. From Wee Waa towards Collarendabri there is flooded country, but I do not know how much there is of it.
 116. Do you think the country is good enough to warrant the construction of a line to connect Collarendabri with the main line? Yes.
 117. What does it cost you to convey your wool to Narrabri station? £2 10s. a ton. The return goods cost about £2 a ton.
 118. What is the capacity of your run? Five or six sheep to the acre.

David Hynes, station-hand, Collymongool, sworn, and examined:—

- D. Hynes. 119. *Mr. Hassall.*] How long have you resided in the district? I have known it for thirty-three years.
 120. Do you see the pencilled line on the plan running from the "red" to the "green line"? Yes. I may say I have been across from Merrywinbone, through Cryon, into Wee Waa. Four miles from Merrywinbone a good deal of water comes down. Thence it is dry all the way to Cryon. I have been along there with cattle during a couple of floods, and I experienced no trouble. Travelling from Cryon there is nothing to stop you as far as Wee Waa.
 121. Then you look upon that portion of the country as fairly trafficable in almost any condition of weather? I do, excepting in big floods.

F. Ludlow and W. Pearse. Frederick Ludlow and William Pearse, without being sworn, corroborated, in all general principles, the evidence which had been given.
 13 May, 1898.

MONDAY, 16 MAY, 1898.

[The Sectional Committee met at Millie at 4 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Woolabra to Collarendabri.

John Hannon Murphy, Jews' Lagoon, sworn, and examined:—

- J.H. Murphy. 122. *Chairman.*] Where is Jews' Lagoon? Ten miles from Millie towards Boolcarrol, or about 26 miles from Woolabra.
 123. What area of land have you? Twenty-one thousand acres, including a lease held by my son.
 124. How many sheep have you? Between 15,000 and 16,000.
 125. Do you cultivate anything? No.
 126. What does it cost you to get your stuff to Woolabra? I generally send to Narrabri, which is 40 miles away, and the cost of carriage is about 1s. 3d. a cwt. Generally, however, I use my own teams. The charges fluctuate.
 127. What is the nearest point of any railway to your home? Woolabra.
 128. Does the surveyed line go close to your place? It goes through part of my children's land—4 miles away.
 129. Do you approve of the construction of the proposed line? Yes.
 130. What advantage would it be to you? A year or two ago the Government deprived the public of the main travelling-stock route, and handed it over to Edgeroi station. The result was that we have practically no road at all. I have fat lambs which I could send to Sydney by rail, but if I were to drive them to Narrabri West they would not be fit to forward. If the line were constructed people could send thousands of sheep to Sydney.
 131. Would you grow any crops if the railway were constructed? Eventually we might. With good seasons the country would grow anything. My opinion is that a better paying line would not exist; there will be a large amount of settlement on both sides of it. On Mungyer and Oreel and district over 200 families are settled.
 132. *Mr. Hassall.*] How far is your place from Boolcarrol? About 9 miles.
 133. *Chairman.*] What is the return freight from Narrabri? It depends on the season; a fair average will be £2 10s. per ton.
 134. Does your wool go to Sydney? Yes; to Newcastle by train, and thence by steamer to Sydney.

Roger Boland, selector, Anglefield, sworn, and examined:—

- R. Boland. 135. *Mr. Fegan.*] What is the area of your holding? 2,300 acres.
 136. What will the district carry as a rule? I think it is under a sheep to the acre.
 137. How many sheep do you run? About 2,000.
 138. Where is your nearest railway station? Woolabra, which is 21 miles away by the present road.
 139. Where do you send your wool? To Narrabri, from which place it is taken by train to Newcastle, and thence by water to Sydney.
 140. What does it cost you to send your wool to Narrabri? It has been carried for the last two years at £1 per ton.
