One other point which must be strongly insisted on is regularity of supply. In past seasons we have been in the habit of shipping spasmodically—500 tons one week and 27 the next. This must cease, and the market be regulated so that buyers at the other end can anticipate from week to week what our probable shipments will be. This can only be done by a combination of interests here, and the cold storage arrangements now being made by the Board for Exports will probably be found the best means of balancing our shipments so as to prevent undue surpluses and the corresponding succeeding dearth of supplies.

Cheese.

In this line the delegates only endorse the usual opinion of visitors, that we are not up to standard quality. The kind required for Britain is a mild, nutty-flavoured cheese, with slight acidity, and rich, meaty consistency. It must be so cured as to reach England before any pronounced strong flavour has been developed, as there is a growing liking for mild-flavoured, in place of the strong, rank cheese of the past.

At present rates, it is far better for our farmers to make butter, as the probable price our cheese would bring could not give equal results.

Bacon.

With our wealth of natural food, and the enormously increasing supply of skim-milk, we should soon be able to obtain a place in the market with hams and bacon, but a great deal of our feeding system must be unlearned, and a meat produced with a dense, white, firm fat. This, with our system of offal, maize, and pumpkin feeding, is simply impossible, and Mr. Jones thoroughly agrees with the opinion that until we use more peas, beans, barley, pollard, &c., and less maize in topping-up for the butcher, we will be able to compete only with the corn-fed American goods, which no one cares to eat if he can afford something better.

In shipping home the meat must be either sent as “green” bacon, packed in water-tight boxes, or as frozen pork, wrapped as we do mutton. Experiments might be made both ways, but it is no use sending the class of goods we produce at present, and the sooner we appreciate this fact the better.

The home people are prepared to pay a good price for a good article, but they insist on having just exactly what they want, and it is no use sending anything else.

Leather.

Leather.

Mr. Jones does not profess to speak from an expert acquaintance with this trade, but remarks that he hardly considers the quality of our leather equal to that of some other Colonial samples he has seen. It does not seem so firm and solid, and the general get up and appearance are perhaps not exactly so good.

Although the principal demand at present is for sole leather, there is no reason why we should not ultimately produce harness and upper leathers of good quality. Sides of not under 18 lb. will meet a fair market in Britain, but the quality and finish must be improved to suit the first-class trade.

The present method of branding the cattle on the best portion of the hide is one of the principal objections to our leather. This fault has before been strongly insisted on by our tanners and others, and should be remedied without delay.

Tallow.

The tallow trade is one which the Colony has got a firm hold of, and so long as we keep well ahead of scientific requirements, there is little fear from the competition of other nations.

Honey.

New South Wales honey may be expected to find a fair market in future among British consumers, provided it can be sent of satisfactory flavour. The quality is certainly capable of improvement, but the moderate price may encourage buyers of a certain class.

For export, honey should be packed in strong, new tins of 56 lb. each, two to a case. Thin or second-hand tins must on no account be used. It should be bulked and graded before packing, so as to secure uniformity. This is imperative if satisfactory business is to result. Weights, colour, and consistency must be maintained above suspicion, and all should be inspected and passed by a qualified expert before shipment.

Beef and Mutton.

The Society has not up to the present handled this trade, but the delegates, on their return, will report in such terms as will very likely lead to large business. In this, as in other lines, we must adopt a system of rigid inspection and properly grade all meat before shipment. Great care in handling should also be made a study, as the meat must be landed with the "bloom" on to successfully compete with that of other nations.

Mr. Jones, in conclusion, spoke again in the highest terms of the reception accorded the delegates by Government, public, and Press.

The visitors leave with a kindly feeling which, on their arrival at home, may be expected to bear fruit in the shape of largely increased trade with the mother country.

No better evidence of the growing importance of trade with the colonies can be found than the fact that business men in the United Kingdom are beginning to take an interest in our products, and are sending representatives out to inquire into our possibilities of trade.

The marked improvement in energy shown by our producers during the past few years, and the growing appreciation of our great capabilities of production, are encouraging features which point to rapid and satisfactory development of the Colony's resources in the near future.

XIII.—VISIT TO VICTORIA.

BOARD FOR EXPORTS.

SECRETARY'S REPORT.

Mr. Chairman and Gentlemen,

I have the honor to report that since last meeting of the Board I have visited the Colony of Victoria, and have there obtained certain information, which may be of service to the Hon. the Premier and this Board in their future action.

Proceeding hence on the 3rd inst., I was met in Melbourne by the Hon. S. E. Lees, M.L.C., and Thos. Jessep, Esq., M.L.A., with whom I visited Bendigo, during the Annual Fête and Horticultural Show. As Mr. Jessep will report on that district, I need only remark that many of the exhibits showed the care and attention devoted to fruit culture by growers there—in fact, after inspecting the miserably poor specimens prevailing in certain sections of our own Royal Agricultural Society's Exhibition, it was quite a treat to see fruit so well-grown, and so suitable for export. It must provoke anyone who has the best interests of our fruit industry at heart to find how far behind we are in most of the essentials of successful export business.

There is nothing to hinder this Colony in a few years working up good stocks of exportable fruit of many kinds, but meantime, except for citrus fruits, we have no chance of competing with our neighbours.

As the main object of my visit was to ascertain from the producers of Victoria whether the system of grading, branding, &c., recently inaugurated by the Government, had been of any practical benefit to their industries, I spent little time in the city, but proceeded at once to the producing districts. In the course of my inquiries I visited Warnambool, Koroit, Grasmere, Tower Hill, Terang, Glenormiston, Camperdown, Lilydale, &c., and had satisfactory interviews with many gentlemen representing other districts interested in exports, whose experience I was favoured with the full benefit of. I may summarise their opinions as follows:—

- (1.) The action of the Government in establishing a system of inspecting, grading, and branding produce, has been a distinct gain to the producers, and has enabled them, at an early stage, to create a very favourable impression on the British market.
- (2.) The dissemination of information by Government experts has been productive of great and lasting benefit; enabling even tyros in agriculture to fit themselves with modern appliances, and teaching the best methods of production, the necessity for cleanliness and regularity in all processes of manipulation of dairy and other produce, along with the obvious advantage of scientific system over rule-of-thumb management in the various operations.
- (3.) The chief complaint seems to be that even in Victoria the Government does not go far enough in insisting on regular and expert inspection of live stock intended for export, or whose produce is used for human consumption. Most of those consulted were strongly in favour of efficient veterinary inspection and drastic measures to avoid even the suspicion of disease, filth, or the careless manipulation of food products. There, as here, the present system of inspection seems to be somewhat perfunctory, and further powers will require to be given to inspectors and others administering the Act. The producers themselves are taking energetic measures to effect improvement in this direction, knowing that other nations are straining every nerve to keep hold of the British market.

Some few of those interviewed think Government supervision will not in future be necessary in regard to the produce of some of the better-known butter factories, which have now made a name for themselves in the market; but all substantially agree that stringent measures to prevent mixed and inferior butters being exported under fanciful names, as "Best Victorian Factory," &c., are as necessary as ever.

I was strongly impressed with the sanitary condition of most of the country factories I visited, and with the enthusiasm of the managers, who apparently give a whole-souled attention to their duties and keep an intelligent eye on any possible improvements.

With a few exceptions, the class of dairy cattle in evidence where I visited is of very mixed quality, ranging from half-bred Ayrshires, Devons, and Jerseys, down to the "scrubber" pure and simple. Some care has lately been shown in breeding from cattle of known butter-making strains, and there are now a good many pure-bred and cross-bred herds of the leading milk breeds. Many farmers are doing good work in culling out from their herds all cattle below a certain grade; and now that accurate tests are being made under the "payment by results" system, no doubt improvements will be rapid, but I am of opinion that our own dairy stocks are superior to those of Victoria, and that our best pastures can beat their best. Indeed, the only point in which we lag behind is dairy and factory management, and in this direction there is still great room for improvement in both colonies. It must be taken as an axiom that filthy conditions at any stage of butter or cheese production will inevitably lead to disaster, and it is to be feared that there are careless suppliers to most factories, who fail to insist on proper sanitation in their milking arrangements, much to the detriment of others who are doing their best to attain perfection. Only severe measures and constant inspection will be of any service with such people, and I believe that such a course finds favour with the best class of dairymen and all factory managers. In

In utilising the by-products of dairying, Victoria is probably ahead of us, and in the western district, especially, but little of the skim or butter-milk is thrown away, the larger proportion of it being fed to pigs, of which great numbers of excellent quality are to be seen among the farms.

The variety in general favour is the Improved Berkshire, and, although a good many show a decided strain of "razor back" blood, it is usual to be particular about the breeding and quality of the boars, most of which are models of thrifty, bacon-making excellence. The Yorkshire breed has been tried by some; but, although an excellent type, has found but little favour with the general public. The Tamworth has also been experimented with, but is unlikely to take a very high place in favour, as it is thought to take too long in maturing, and not to be so thrifty as the Berkshire. With our own South Coast people, a cross between a boar of this breed and a good Berkshire sow is considered an excellent bacon animal, although inclined to be slab-sided.

The Victorians seem to take greater pains in "topping up" pigs for slaughter than our people do, one of the secrets of their success being the free use of peas and beans during the last few weeks. These foods being highly nitrogenous, are much superior to maize (containing a large proportion of carbo-hydrates) for finishing off, as they give added consistency to the adipose tissue of the bacon, and produce fat of that beautifully white colour with a faint pink glow, which is so characteristic of well-fed pork.

On the farm of David Mitchell, Esq., of Lilydale, I inspected some remarkably fine specimens of the Holstein cattle. This type is much favoured by Mr. Mitchell as an all-round animal, and I was surprised to learn from him that he places this breed at the head of the list as a paying dairy beast. I am much inclined to think that, while in good rich pasture this cow may give good results, it would not be so well adapted for sparse vegetation and the consequent travelling necessary to keep such a large carcass in condition; probably a cross with a good milking Devon or Illawarra cow would give excellent results.

Mr. Mitchell's pig-feeding and bacon-curing arrangements will be spoken of elsewhere, but I may here say that his farm is a good object lesson to anyone wishing to learn modern farming.

The system adopted by the Victorian Government of encouraging the export of hares, rabbits, poultry, and small goods, seems an excellent one, and there is enormous scope here in a similar direction. It is unnecessary in a short report to deal with the methods of classing, grading, and freezing, but it will be self-evident that the large number of small industries thus encouraged must be of the greatest possible benefit to the smaller land-holders and those who do not fear to face the initial difficulties.

The conclusions I have arrived at may be briefly summarised as follows:—

Butter-making for Export.

• Begin with the bull: Institute a thorough system of inspection of all stock, dairies, factories, and means of conveyance, giving extended powers to the inspectors, to enable them to efficiently carry out their duties.

Give assistance to producers in obtaining for them the cheapest and best means of transit.

Offer the certificate of the Government to all producers of a good article, and carry out a rigid system of inspection to prevent any adulterated article of food being exported, or inferior stuff being falsely represented in any way likely to cause injury to legitimate producers or merchants.

An improvement on the Victorian system of grading might be found in the following scheme:—

Brand.	
FINEST.....	} To include the highest grades of creamery and factory butter, only to be attached after careful inspection of each separate shipment.
PRIME	
No brand	} To include all well-made and sound samples of creamery and factory butter fit for table use and calculated to arrive in prime condition.
PASTRY (Fire brand)...	
	} Second-class factory, dairy, separator, and mixed butters, fit for table, but not up to prime standard.
	} All butter calculated to reach market in a condition unfit for table use.

In case of any factory or supplier habitually failing to produce good butter, offer any advice or instruction required to remove the difficulty, charging only actual expenses in case of a visit of the expert being necessary.

Institute a system of conferences from time to time in producing centres, and encourage the interchange of ideas among producers.

Encourage the utilising of all offal, and urge the immense loss involved in allowing any waste.

Bacon for Export.

Begin with the boar: Secure for each district a regular supply of slips and stores calculated to equal the food supply available, providing for the spring flush of milk by autumn and winter farrowing, thus avoiding waste of food.

Mr. Principal Thompson and others have so fully explained the best methods of pig-culture, that I need hardly touch upon it further than to again strongly commend peas and beans for topping in preference to maize and pumpkins. Much has to be learnt in curing and getting up the bacon, &c., and it cannot but be a source of regret and surprise that, in our splendid climate, we allow Victoria, New Zealand, America, and Great Britain, to supply most of the highest-priced bacon and ham used in our own market. This must be altered, and it is not too much to hope that we will soon see wherein we fail, and not only to be able to hold our own at home, but carry the war into the enemy's lines.

In the export of

Rabbits, Hares, Poultry, &c.,

we are simply nowhere—not because we cannot produce such things, but simply because no systematic effort has been made to get a share of the trade. When in Melbourne I met a Mr. Bailey, who offered, for a consideration, to establish refrigerators in the rabbit-infested areas, to spend thousands of pounds, and employ from 700 to 1,000 men throughout the trapping season. There seems no reason why our own people should not undertake this work, and, with the experience of Victoria as a guide, ship many thousand dozens through this Board next season.

I am of opinion that a pamphlet dealing with the system of trapping, preparing, packing, &c., should be circulated freely throughout the Colony at the earliest possible date.

Poultry-raising as a paying speculation for even the smallest land-holders is an easily acquired business, and involves little hard work. In this, as in most other things, system is the essential point to be observed. We have plenty of good table breeds in the hands of our fanciers, and to raise large stocks of splendid birds need only require one season. In London and other places in Britain there is a practically unlimited market, and with our climatic advantages and abundance of cheap food we should have a large share of the trade.

A project (that of Mr. D. Munro) for making a commercial article of some portion of our surplus skim-milk deserves consideration. I find that his estimate of cost and profit looks rosy—too rosy, perhaps; but at any rate I do not disapprove of the idea, which, if it only gives half the anticipated results, would mean a vastly increased income to the dairymen.

In conclusion, I can only add that there can be no question of the absolute necessity of something being done to galvanise into life our producers, and I return from the neighbouring Colony more than ever impressed with the course of action proposed by this Board, having no doubt that similar action by the Victorian Government has been an unmixed blessing to the producers, and the means of saving many of the small farmers and others from absolute want during the late depression.

I have seen nothing to warrant the least change in the programme mapped out by the Board, which, if carried to its legitimate conclusion, is bound to confer a lasting benefit on those in whose interests it is promulgated, without injury to any existing industry or established right.

I have, &c.,

JAS. STEPHENSON,

Secretary.

Sydney, 22nd April, 1896.

XIV.—FRUIT.
SHIPPING REGULATIONS (FRUIT).

Treasury Department, Board for Exports,
Sydney, 2nd January, 1896.

THE following arrangements having been made by this Board for the shipment of fruit and similar produce to London during the season 1896, are published for the information of intending shippers. Preliminary estimates of probable space requirements should in all cases be sent to the Board at least one month prior to date of intended shipments :—

Applications for Space.

1. As the Board is held liable for the freight on all space engaged, no application for space will be entertained unless made on the form marked A, which renders persons applying for space liable for the freight due on same or on any portion of same which may be allotted to them.
2. Persons acting as agents must apply on Form B, and an authority on Form C from the person for whom they are acting must accompany their application.
3. A separate application must be made by agents in respect of each person for whom they may be applying for space.
4. The necessary application forms are supplied by the Board, and, in the event of the total space applied for exceeding that available, a *pro rata* distribution will be made amongst the various applicants.
5. Notice of the space required must be given to the Shipping Companies by the Board at least ten days prior to the sailing of the vessels from Sydney, and only such space will be secured as the Board may receive applications for at least twelve days prior to the dates mentioned.

Fruit Cases.

6. With a view to economising space in transit it is specially desirable that packages of a uniform size, containing one bushel or half a bushel, should be adopted. Sample cases most in favour with buyers can be seen at the *depôt*. The measurements are :

For Citrus Fruits.—28 inches by 14 inches by 7 inches, inside measurement ; 30 inches by 14 $\frac{3}{4}$ inches by 7 $\frac{3}{4}$ inches, outside measurement.

For Apples, Pears, &c.—28 inches by 12 inches by 8 inches, inside measurement ; 30 inches by 12 $\frac{3}{4}$ inches by 8 $\frac{3}{4}$ inches, outside measurement.

Half-bushel cases can be made of similar design, and based on above measurements accordingly.

Fruit cases to be made of Colonial pine, or other flavourless woods ; no resinous timber to be used. The top, bottom, and sides of cases to be $\frac{3}{8}$ -inch thick ; the ends and partitions, $\frac{1}{2}$ -inch thick ; three laths, $\frac{1}{4}$ -inch thickness, to be nailed on one side of the case to ensure proper ventilation.

7. It is specially desirable that only well-seasoned timber be used for fruit cases, as sweating and decay are probable where imperfectly seasoned timber has been used in the manufacture of the cases. Badly-nailed, indistinctly-branded, second-hand, or soiled cases will not be shipped.

Packing of Fruit.

8. This should, when possible, be done in the orchard, and great care must be used in the preparation, wrapping, grading, and packing of all fruits intended for export. The Expert of the Board will have power to examine and reject all improperly-prepared, wrapped, graded, and packed consignments of fruit. All such rejected consignments must be removed by the owner or agent immediately upon receiving notification of such rejection, otherwise they will be sold by auction at owner's risk, and all expenses incurred will be deducted from proceeds of said sale.

Branding of Fruit Cases.

9. Both ends of each case must be legibly branded with the name of the orchard or shipper. Dark colours only must be used, and the letters should not be less than 1 $\frac{1}{2}$ inch in length (red, pale blue, pale green, and similar colours are forbidden). The net weights or numbers should also be branded on the cases.

Despatching of Fruit.

10. In despatching fruit, care should be taken to see that each case is securely nailed with 1 $\frac{1}{2}$ -inch barbed nails, and properly branded ; and also that a way-bill, giving full particulars of the consignment (numbers, brands, weights, &c.), accompanies it, addressed to the Government Fruit Expert, Export *Depôt*, Sydney.

11. All fruit for shipment by any of the vessels named from time to time must reach the Government Export *Depôt* at least three clear days prior to the sailing from Sydney of the vessel by which it is intended to ship it, when the Board will undertake to carry out all arrangements connected with the receiving, examining, branding, and shipping of same at a cost of 2d. per case, or 1d. per half case.

12. All fruit prior to shipment will require to be examined and approved by some person or persons appointed for that purpose by the Board for Exports.

A.

Application for Space for Shipment of Fruit to London when services of an Agent are not employed.

Sir,
I have the honor to apply for space in the _____ sailing on the _____, for _____ cases of _____ for shipment to London ; and I hereby guarantee to pay the full freight, viz., 2s. 6d. per case on this number if same be allotted to me, or upon any portion of same which may be allotted to me.

I also guarantee that this fruit is the produce of the Colony of New South Wales.

I have the honor to be, Sir,
Your obedient Servant,

To the Secretary, Board for Exports, Sydney.

B.

Application from Agent for Space for Shipment of Fruit to London.

Sir,
I have the honor to apply on behalf of _____ for space in the _____, sailing on the _____, for _____ cases of _____ for shipment to London ; and I hereby guarantee to pay the full freight, viz., 2s. 6d. per case on this number if same be allotted to me or upon any portion of same which may be allotted to me.

Attached is authority from _____ for me to act as his agent.
I also guarantee that this _____ is the produce of the Colony of New South Wales.

I have the honor to be, Sir,
Your obedient Servant,

To the Secretary, Board for Exports, Sydney.

C.

Authority for Agent to act for Person shipping Fruit to London.

I hereby authorise Mr. _____ to act as agent for me in the shipment of _____ cases of _____ per s.s. _____ to London.

I have made no application, direct or otherwise, to the Board for Exports for space for this lot of _____

Dated—
Address—

Published by order of the Board,
JAMES STEPHENSON,
Secretary.

WAGGA

WAGGA EXPERIMENT FARM.

During the year 1896-97 the Wagga Experiment Farm made rapid strides, although the drought, which was one of the worst ever experienced in the district, much retarded the farm operations. The main buildings, consisting of students' quarters, barns, offices, stables, &c., were completed in September, 1896, and afterwards cottages for the manager and farm labourers were erected.

The College.

A portion of the students' quarters was ready for occupation at the end of September, and a start was made with nine students on the 1st October. As soon as the remainder of the buildings were completed the full complement of students were taken on, viz., sixteen. By the end of the year the college had become so popular that it was found necessary to erect additional accommodation, and quarters for eight more students were erected. Even this number was not sufficient, and eventually twenty-seven students were in residence, a number of applicants being refused.

The students were engaged in practical work during the day, and lectures were delivered by the manager two nights a week. Besides this, occasionally, lectures were delivered by the visiting officers. The students were carefully instructed in all branches of practical farming, fruit-growing, dairying, &c.

An examination was held the first week in April; sixteen students presenting themselves for examination. Of these, ten passed very creditably, most of the papers being remarkably well written, showing that the students had taken great interest in their work.

At the end of the session, 23rd June, 1897, ten of the students left, several of them going straight on to the land, and the remainder going to the Hawkesbury Agricultural College for instruction in special subjects.

A portion of the farm lands close to the college was laid aside for a recreation ground; this was cleared by the students, and laid out as a football and cricket ground. A commencement was also made in forming a bicycle track and two tennis courts.

The Visitors.

Large numbers of visitors from all parts of this and the other colonies inspected the farm. Parties of farmers ranging from a dozen to a 100 came from Albury, Corowa, Cootamundra, Junee, Coolamon, Murrumburrah, Young, Cowra, and from every district round, even as far away as Cooma. So great an interest was taken in this farm that an application was made to the Railway Commissioners asking them to grant a reduction in fares for parties of farmers wishing to visit this farm, and a concession was made.

Exhibits.

During the year the following agricultural shows were attended:—Albury, Wagga Wagga, Young, Cowra, Sydney, Bathurst, Dubbo, Wellington, Mudgee, &c. Applications were received for these exhibits from all parts of the Colony, but only a few shows could be attended. The exhibits, which were very numerous, consisted of specimens of all the crops grown on the farm. At some of the southern shows the collection was so large that it occupied more space than some of the societies could provide, and it nearly filled two railway trucks.

The manager attended some of the principal shows, and explained the value and cultivation of the numerous crops. He also acted as judge in farm produce and other sections.

Several of the southern districts were also inspected by the manager, and lectures delivered by him on farm subjects.

Area under Cultivation.

An additional area of about 450 acres of land was cleared ready for ploughing, making 1,250 acres in all. Unfortunately the protracted drought prevented ploughing taking place as early as it should have done, and, as a result, only about 1,000 acres were under cultivation.

The timbered portion of the farm now consists of about 1,250 acres, or a total area cleared and uncleared of 2,500 acres.

The crops under cultivation were as follows:—

Wheat	450 acres.
Oats	180 "
Barley	160 "
Maize	20 "
Sorghum	30 "
Cow pea	15 "
Root crops	10 "
Experiment plots	45 "
Vegetables	10 "
Orchard and vineyard	80 "

1,000 acres.

Land cleared for vineyard	20 "
" crops	230 "

1,250 acres.

Application for a further area of land, consisting of about 850 acres of the temporary common adjoining the farm, was applied for for the purpose of carrying out experiments with stock, &c.

Farm Crops.

Wheat.—Most of the 450 acres under wheat was new land, just cleared of green timber, and therefore the conditions under which this crop was grown were anything but favourable. Besides this, the season was a very bad one, being one of the worst ever experienced in the district. Some thirty varieties were under cultivation in plots ranging from 2 acres up to 50 acres. Of these varieties, the following gave by far the best results:—Australian Talavera, Berthoud, Hudson's Early Purple Straw, Farmer's Friend,

Friend, Steinwedel, White Lammas, Tardent's Blue, King's Jubilee, Allora Spring, and Early Baart. The early sown crops were again far superior to the later sown ones. The drilled crops were again far superior to the broadcast, the thin sown being especially good.

The applications for seed wheats were again very numerous, and long before the sowing season commenced the whole of our stock was sold out. It was estimated at the close of the season that applications had been received for at least ten times as much as the quantity available. There is every appearance of the demand keeping up for these wheats, and with the larger area under cultivation this coming season, there is every prospect of this proving a most profitable section of the farm.

Barley.

The six varieties of barley under trial were sown in large areas.

Of the feed barleys the Skinless and Algerian varieties gave the best results.

Of the malting barleys, Carter's Prize Prolific again stood first. The malting barleys were sown fairly early in April and made a very promising start, but the hot, dry weather experienced when the crops were ripening had a very bad effect on the quantity and quality of the grain. It was intended that this barley should be exported as a trial for malting purposes, but the sample was not considered sufficiently good for a trial lot. As the crops all over the Colony were more or less a failure, there was a large demand for seed, the greater portion of the crop was disposed of at satisfactory prices for that purpose. Skinless barley was also in great demand for seed.

Oats.

Some fifty varieties were under trial, but, owing to the bad season, the yield of grain in most instances was anything but satisfactory. Algerian, Brown Calcutta, Early Red Texas, Carter's Prize Cluster, and Danish were the only ones to make a good show, and although these produced a fair crop of grain, the sample was very light.

Experiment Plots.

Next to the irrigation plots a piece of land some 70 acres in area was cleared and ploughed ready for cultivation. It was then fenced and wire-netted in and laid out for experiment work. It was intended to carry out small experiments of say a single row of each variety in one portion, and from that to work on to 1 acre and 5 acre blocks.

During the past season the crops under trial in these plots were:—

Wheat	14 acres.	340 varieties.	Sugar Beet	2 acres.	4 varieties.
Sorghum	15 "	12 "	Turnips	2 "	10 "
Maize	5 "	3 "	Buckwheat	2 "	3 "
Cow Peas	15 "	4 "	Millet	2 "	10 "
Barley and Tares ...	1 "		Pumpkins		
Rye and Tares ...	1 "		Melons		
Soy Bean	1 "		Squashes		
Mung Bean	1 "	2 varieties.	Vegetable marrows		
Lima Bean	1 "	3 "	Cucumbers		
Mangolds	1 "	6 "			

} 2 acres—160 varieties in all.

In consequence of the drought it was found necessary to cut the greater portion of the above crops with the exception of the wheats, roots, and pumpkins, squashes, &c., for feeding to the stock on the farm, but the following notes on results will be found interesting.

Sorghum.—Of the twelve varieties under trial the following three again proved the most profitable for growing in this district, viz., Early Amber Cane, Planters' Friend, and Black African. In spite of the exceptionally hot, dry season, these varieties each produced upwards of 15 tons of green fodder per acre without manuring. The continued dry season retarded the growth of the second crop so much that it was not thought worth cutting, but the dairy stock were turned on to it and eat it down. The varieties grown for their seed, viz., Milo Maize, Kaffir Corn, Dhonra, and Guinea Corn were also cut for fodder, as the want of moisture did not allow of their maturing.

Maize.—Three quick-maturing varieties, viz., Queen of the Prairies, Early Mastodon, and Ninety-Day, were sown, but as there was no chance of their maturing they were also cut for green fodder.

Cow Peas again proved a most valuable crop for this district, as with a very small amount of moisture they produced a heavy crop of excellent fodder. The black variety still yielded the best.

The root crops were more or less a failure, as in consequence of the dry weather the roots were very small and the plant all went to tops.

The pumpkin and melon beds were again a most valuable standby, producing a good crop, which came in very useful for stock feed and vegetables.

The Orchard.

This portion of the farm promises to prove a most attractive and profitable one. From the first planting (1894) to the present date every attention has been given to the trees in the way of cultivation, pruning, spraying, &c. The result has been highly satisfactory, and I have no hesitation in saying that in a few years this will be one of the finest orchards in Australia. The total area of the orchard is 70 acres, and it contains upwards of 6,000 trees. A speciality has been made of experiment work and fruit drying. In the portion devoted to experiments nearly 2,000 varieties of fruits are under trial, consisting of apples, apricots, almonds, cherries, Chinese raisins, figs, guavas, loquats, mulberries, nectarines, olives, Oriental plums, pears, peaches, plums, pomegranates, persimmons, pecan nuts, quinces, walnuts, &c. These form what is undoubtedly the finest collection of fruits in the Colony. The drying portion is planted with a few of the best varieties of the following, planted on a fairly large scale, viz., prunes, apricots, peaches, and smaller quantities of other fruits.

The Vineyard.

The vineyard, consisting of some 12 acres, is on the eastern side of the farm, next to the orchard. The vines have been propagated from cuttings, about 2,000 being planted in 1894, and upwards of another 2,000 in the years 1895 and 1896. One portion of the vineyard has been devoted to experiment work, and in it there are upwards of 100 varieties of grapes under trial. There are also 2 acres of raisins, 1 acre

acre Sultanas, 1 acre currants, and a quantity of table grapes. The growth of the vines has been so satisfactory that it has been decided to further extend the vineyard, and for that purpose a block of land some 20 acres in area has been cleared for the purpose of planting wine-grapes, it being intended to use this portion for experimenting on wine-making, &c., and for training students in wine-growing and making.

The vines in the present vineyard were planted 10 x 10, so that the land could be worked with pair-horse cultivators, the same as the orchard. Numbers of vine-growers from all parts of the colony, who have inspected the vineyard, expressed the opinion that there was no doubt about the wide system of planting being the best, and from appearances of growth there can be little doubt of the result.

Irrigation Plots.

With the view of carrying out a number of experiments in connection with the irrigation of farm crops, vegetables, &c., an old creek running through a portion of the farm was dammed up. The bed of the creek, for a distance of about 10 chains, was scooped out, taking away a number of little islands, and taking off a number of points, so that when finished the dam was left in a fairly even pear-shaped form, the widest end being at the dam bank. The dam bank was 15 feet deep at the highest point. It was calculated that this dam had a capacity of 40,000 yards, *i.e.*, would hold about 7,000,000 gallons of water.

A piece of land, sloping each way to a large drain leading into the dam, of a little over 10 acres in area, was laid out in two blocks of 5 acres each, and these again subdivided into $\frac{1}{2}$ -acre blocks. One of these 5-acre blocks was at once put into cultivation, the land was ploughed a foot deep, it was then harrowed and rolled, and brought to a fine tilth by working it with a spading harrow. It was then planted with vegetables. The other block could not be ploughed as the weather set in very dry, but it will be brought into cultivation as soon as possible.

A small bank of about 300 cubic yards was constructed on the slope above the plots, and when the dam fills it is intended to pump the water from the dam up to this bank. The water can then be run down through pipes on to the plots. As the plots are on a gentle slope, drills will be opened between the rows of the various crops by means of a horse cultivator, and the water be run from the pipes down these drills.

As crops of all descriptions can be grown successfully through the greater portion of the year in this district without irrigation, it is estimated that the crops in these plots will not require to be watered, except through some of the summer months; and, therefore, the quantity of water which can be collected in this dam should be quite sufficient to keep the 10 acres going right through the year.

About 5 acres of the area under irrigation will be kept for vegetables. The other portion it is intended to use for experimenting on lucerne, grasses, and other fodder crops, and also for nursery work.

A small stable and implement shed has been erected close to these plots for stabling four horses and storing the implements used on the irrigation and experiment plots.

Dairy.

In consequence of the protracted drought the work of starting the dairy was much retarded. A small herd of Jerseys was, however, purchased locally, and a fine young Jersey bull was obtained from the well-known breeder, D. Hyam, of Jamberoo. Only sufficient cows to supply the requirements of the farm were kept, in consequence of the scarcity of feed. For months not a blade of grass was to be seen in the paddocks, and, therefore, the cattle had to be fed at least twice a day. A commencement was also made with the dairy buildings, and everything got ready to give this branch of the farm a fair chance of being pushed ahead as soon as the drought broke up.

A milking shed was erected, and arrangements made for putting up large shelter-sheds for the cattle.

Poultry and Bee Farm.

About 4 acres of land has been set aside for this branch of the farm, and arrangements made for at once erecting the pens and houses. With the large supply of wheat-screenings available, and the suitability of the native flora for the production of first quality honey, this section should also be a very profitable one.

Piggery.

The farm fencer, with the aid of the students, constructed a piggery capable of holding from 300 to 400 pigs. The fencing was composed of three stringybark rails and gum posts. The main portion of the piggery was divided into four $\frac{1}{2}$ -acre runs. Twelve breeding pens and two boar pens were also erected, together with shelter-sheds, feed-room, &c. The total area of the piggeries is about $2\frac{1}{2}$ acres, and land was left on one side uncultivated to admit of extension if required. Six Berkshire sows were purchased from the Hawkesbury Agricultural College and one from a well-known breeder at Bathurst. A pure bred Berkshire boar was also obtained from Mr. Walker, of Tenterfield.

The piggery at the Wagga Experiment Farm will undoubtedly be a most profitable section. In spite of the great heat experienced during the summer of 1896-97, the pigs at the farm kept in thorough condition on a small ration and proved how hardy the Berkshire breed is. With the aid of the large quantity of wheat and barley screenings available on this farm, together with the skim-milk from the dairy and the surplus vegetables of every description, there is every prospect of raising a large number of pigs at a very small cost.

I have, &c.,
GEO. VALDER.

REPORT OF THE TRAVELLING AGRICULTURAL INSTRUCTOR.

I HAVE the honor to submit a report pertaining to my work during the six months ending 31st December, 1897.

As will be remembered, I was appointed to my present position on 1st July; but the Minister particularly desired that I should attend the Agricultural Conference on the 8th, 9th, and 10th July and the Dairy Conference on the 15th, 16th, and 17th, held at the Hawkesbury Agricultural College, and at which I read papers and took part in the discussion; consequently I was not able to commence actual work until Monday, the 19th July. On attached tabulated form you will see at a glance the places I have visited, either to lecture or in other ways give instruction to farmers.

I have great pleasure in stating that I have been received everywhere most kindly, although I had to fight a considerable amount of opposition towards lecturers on agriculture generally. After my lectures, in almost every every case, I was very cordially thanked, with many expressions of a flattering description as to the value of my lecture; also very hearty votes of thanks were passed to the Minister and the valuable work of the Department generally recognised.

Although I have visited a large number of farms in the various districts, I was not able in the limited time at my disposal to do all that was required in this respect, and in almost every instance I was requested to return to the district again after my more pressing engagements were completed, and devote more time to give advice on the farms.

In most parts of the Colony the methods of cultivation, the storing of fodder for food for stock, and the use of improved labour-saving appliances are very much behind the times.

There is, however, a very sincere desire among the occupiers of the soil to improve matters in this respect generally. I may say I am simply astounded to see the very large quantity of agricultural land in this Colony little known of; and I have no hesitation in saying that, with the steps being taken by the Department, New South Wales will far eclipse the other Colonies as far as the production of the soil is concerned.

I have travelled 13,180 miles by rail, water, and coach, besides hundreds of miles in private vehicles, inspecting crops and farms, from the 20th of July to the 25th December, 1897.

I thank you most sincerely for the co-operation and assistance you have always given me in carrying out my duties.

J. L. THOMPSON.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING DECEMBER, 1897.)

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

Offices of the Railway Commissioners of New South Wales,
21st January, 1893.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending 31st December, 1897, upon the subjects specified, viz. :—

I.—STATE OF THE TRAFFIC.

RAILWAYS.	Quarter ending 31st Dec., 1896.	Quarter ending 31st Dec., 1897.
Miles open	2,576½	2,639½
Revenue ... { 1896. 1897. } ...	£909,575	£894,712
{ Passenger ... £289,012 £294,859 } ...		
{ Merchandise ... £620,563 £599,853 } ...		
Expenditure	£426,195	£423,802
Train miles run	2,175,454	2,187,760
Earnings per train mile	8/4¼	8/2¼
Expenditure per train mile	3/11	3/10½
Percentage—Expenditure to earnings	46·86	47·37
Number of passengers	5,810,483	5,912,452
Tonnage of goods traffic	1,094,110	1,087,667
Tonnage of live stock traffic	46,720	41,458

TRAMWAYS.	Quarter ending 31st Dec., 1896.	Quarter ending 31st Dec., 1897.
Miles open	61	62½
Revenue from all sources	£77,027	£78,949
Expenditure	£65,166	£67,848
Tram miles run	759,751	819,961
Earnings per tram mile	2/0¼	1/11
Expenditure per tram mile	1/8½	1/7¾
Percentage—Expenditure to earnings	84·60	85·94
Number of fares collected	18,225,383	18,694,229

RAILWAYS.

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found as an Appendix, page 4.

IV.—STAFF.

These returns are given as an Appendix, pages 5 to 7.

GENERAL REMARKS.

The revenue during the quarter has fallen off to the extent of £14,863, and the expenditure has been reduced by the sum of £2,393.

The passenger traffic shows an increase in every branch, and in the aggregate amounts to £5,847. For the increased earnings 101,969 additional journeys were made.

The Goods Branch shows a falling off of £20,710. Wool shows a reduction of £17,336; and live stock, £10,712. General merchandise increased £3,795; and minerals, £3,543.

The goods tonnage, including wool, shows a reduction of 28,670 tons. Coal and coke increased 4,053 tons, and other minerals 18,174 tons.

The total train mileage has increased 12,306 miles. This increase, however, is after providing additional passenger service to the extent of 58,237 train miles, and making provision for the working of new lines opened subsequent to the corresponding quarter in 1896.

In the Goods Branch the train mileage shows a reduction of 52,700 miles.

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The lines are in good order, and the improvements of grades and curves, and relaying, resleepering, and reballasting continue to make satisfactory progress.

TRAMWAYS.

The earnings have increased £1,922. 60,210 additional tram miles were run, and 468,846 additional fares collected. The working expenses exceed those for the corresponding period in 1896 by £2,682, owing to the additional traffic and a considerable increase in the cost of fuel.

We have the honor to be,

Sir,

Your most obedient servants,

CHARLES OLIVER,
Chief Commissioner.

W. M. FEHON,
Commissioner.

DAVID KIRKCALDIE,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

Report on Condition of Permanent Way and Works for the Quarter ending 31st December, 1897.

Sir, Office of Engineer-in-Chief for Existing Lines, 6th January, 1898.
I have to report for the information of the Commissioners that the Permanent Way and works have been efficiently maintained during the past quarter.

Satisfactory progress has been made with relaying, resleepering, and rebalasting operations. The duplication of the line between Blackheath and Mount Victoria has been almost completed, and deviations to improve the grades between Orange and Mullion Creek have been brought into use. Further grade improvements are being vigorously pushed on between Blayney and Orange on the Western Line, between Jindalee and Cootamundra, at Frampton, and between Bethungra and Illabo on the Southern Line; and between Old Junee and Coolamon on the South-Western Line, portions of these improvements have been brought into use.

A section of the work in connection with the renewal of the Wagga Wagga viaduct has been completed, and a new steel bridge has also been constructed over Ironbark Creek on the Northern Line.

I have, &c.,

THOMAS R. FIRTH,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, Quarter ending 31st December, 1897.

Article.	Rate.	Reason for rate.
Blue black	Miscellaneous class rates and conditions	To equalise rates.
Iron	Eskbank to Sydney in lots of not less than 8 tons per 4-wheeled truck for export beyond the Colony, Miscellaneous class rates.	To encourage traffic.
Ice	To be used on the "Up" journey for cooling milk, cream, or meat will be carried free on the "Down" journey if sent in empty return milk vans or refrigerator cars.	do do
Ice	Ordinary through mileage rates to be charged to all branch lines	do do
Oil (crude in tanks)	Newcastle to Clyde, £4 1s. 4d. per tank of 6 tons	} do do
	Bathurst to Clyde, £5 6s. 3d. do do	
	Goulburn to Clyde, £4 17s. 5d. do do	
	W. Maitland to Clyde, £4 14s. 3d. do do	
	Empty tanks to be returned free	} do do
Rabbits (dead)	Groongal to Sydney in van loads, 1½d. per ton per mile up to 150 miles, and 1¼d. per ton for each succeeding mile—Minimum 5 tons per truck.	
Rail's (150 tons).....	Molong to Sydney at the convenience of the Department B. class rates and conditions.	To secure traffic.
Lead bullion	To be charged at the same rate as for silver bullion	To equalise rates.

APPENDIX III.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS

RETURN, in accordance with Clause No. 44 of the Railway Act, showing the Appointments of Employees from the 1st October to the 31st December, 1897.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING 31st MARCH, 1898.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

Offices of the Railway Commissioners of New South Wales,
Sydney, 26th April, 1898.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ending 31st March, 1898, upon the subjects specified, viz. :—

I.—STATE OF THE TRAFFIC.

RAILWAYS.	Quarter ending 31st March, 1897.	Quarter ending 31st March, 1898.											
Miles open	2,576½	2,691											
Revenue	<table style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: center;">1897.</td> <td style="text-align: center;">1898.</td> <td rowspan="2" style="font-size: 2em; vertical-align: middle;">}</td> </tr> <tr> <td style="text-align: right;">£285,903</td> <td style="text-align: right;">£296,991</td> </tr> <tr> <td style="text-align: right;">Passenger ...</td> <td style="text-align: right;">£406,115</td> <td style="text-align: right;">£420,697</td> </tr> <tr> <td style="text-align: right;">Merchandise...</td> <td></td> <td></td> </tr> </table>		1897.	1898.	}	£285,903	£296,991	Passenger ...	£406,115	£420,697	Merchandise...

TRAMWAYS.	Quarter ending 31st March, 1897.	Quarter ending 31st March, 1898.
Miles open	62½	62½
Revenue	£78,060	£79,964
Expenditure	£56,612	£61,626
Tram miles run	779,129	805,241
Earnings per tram mile	2s.	1s. 11¾d.
Expenditure per tram mile	1s. 5¼d.	1s. 6¼d.
Percentage—Expenditure to earnings	71·75	77·06
Number of fares collected	18,459,834	18,876,523

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

IV.—STAFF.

These returns are given as an Appendix, pages 5 to 7.

RAILWAYS.

GENERAL REMARKS.

The earnings for the quarter show an improvement of £25,670 over the corresponding quarter of last year; a result particularly satisfactory in view of the fact that the March quarter of 1897 gave an increase of £43,036 over the corresponding period in 1896.

The following contributed to the increase for the quarter, viz.:—Second-class passengers, £9,619; general merchandise, £13,675; grain and flour, £23,121; minerals (other than coal and coke), £2,446; miscellaneous, £1,582.

Live-stock decreased £15,582; wool, £8,059; coal and coke, £828; hay, straw, and chaff, £226; first-class passengers, £78.

For the increased revenue, 153,408 additional passenger journeys were made.

The grain and flour traffic shows a large increase, 40,117 tons; and minerals (other than coal and coke), 26,124 tons. Coal and coke traffic shows a decrease of 35,022 tons; live stock, 7,049 tons; wool, 1,703 tons; and although general merchandise shows a net decrease of 10,028 tons, much of the traffic was carried longer distances, and thus produced an increased revenue of £13,675.

Owing to 76,017 additional train miles having to be run to work the additional traffic, the expenditure increased £14,076.

The total working expenses for the quarter represent 54·48 per cent. of the gross earnings, as compared with 54·47 per cent. in the corresponding period last year.

The following new lines were opened during the quarter, viz.:—Nevertire to Warren, 12 miles 33 chains, opened 1st January, 1898; Bogan Gate to Condobolin, 39 miles 22 chains, opened 1st March, 1898.

CONDITION OF LINES AND ACCOMMODATION FOR THE TRAFFIC.

The lines are in good working order. A fair amount of relaying, resleepering, and reballasting has been done, and where necessary additional facilities provided for dealing with the traffic.

'TRAMWAYS.

GENERAL REMARKS.

The earnings have increased £1,904, and the working expenses £5,614; the large increase in the expenditure is owing to the additional traffic and the continued increase in the cost of fuel, owing to the large demand for coke in other directions.

We have the honor to be,

Sir,

Your most obedient servants,

CHARLES OLIVER,
Chief Commissioner.

W. M. FEHON,
Commissioner.

DAVID KIRKCALDIE,
Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

Report on Condition of Permanent Way and Works for the Quarter ending
31st March, 1898.

Sir, Office of Engineer-in-Chief for Existing Lines, 2 April, 1898.

I have to report, for the information of the Commissioners, that the permanent way and works have been efficiently maintained during the past quarter.

Satisfactory progress has been made with relaying, resleepering, and reballasting operations.

The duplication between Blackheath and Mt. Victoria has been completed and brought into use.

Grade improvements have been completed between Jindalee and Cootamundra, between Bethungra and Illabo, and between Blayney and Millthorpe. Good progress has also been made with similar works between Millthorpe and Orange, on the Western Line; at Frampton, on the Southern Line; and between Old Junee and Coolamon, on the South-western Line.

The following extensions (pioneer lines) were opened for traffic during the quarter:—

Nevertire to Warren, 12 miles 33 chains, on 1st January.

Bogan Gate to Condobolin, 39 miles 22 chains, on 1st March.

I have, &c.,

THOMAS R. FIRTH,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, quarter ending 31st March, 1898.

Article.	Rate.	Reason for rate.
Bacon traffic	Nowra to Sydney, 12s. per ton in loads of not less than 4 tons per truck, and provided not less than 2 trucks are sent each week.	To encourage traffic.
Ice	A rate actual weight when used for cooling beer, Sydney to Newcastle, on condition that truck loads of not less than 6 tons per 4-wheeled truck (beer and ice combined) are carried.	do
Keepit	1st class rates and conditions	New article (unclassified).
Paper and paper bags	In truck loads from Liverpool to Newcastle, "A" rates for further period of twelve months.	To encourage traffic.
Wheat	From Northern Line stations to Granville to be charged at the through up journey rate from starting point to destination.	do
Magic wool-wash ..	"B" rates and conditions	New article in classification.
Novo	1st class rates and conditions	do
Soy	3rd class rates	do
Tins (new empty baking powder).	"B" rates and conditions	New rate.
Coal.....	Charge for departmental engine running from Junction between East Maitland and Farley to East Greta Colliery, 1d. per ton on the coal hauled.	do
Drapery in furniture vans to Newcastle.	Sydney to Newcastle, 1st class rates on down journey and "B" rates for empty vans on up journey.	To secure traffic.
Gravel, metal, screenings, and sand.	Emu Plains to Sydenham, 3s. per ton; Emu Plains to Tempe, 3s. 1d. per ton.	do
Mineral water tanks (not exceeding 10 gals.)	Returned empty—free	To equalise rates.
Pork, beef, &c.	In tierces in up transit—"A" rates and conditions.....	To adjust rates.
Pipes (iron)	For Moree Municipal Council—in truck loads from Darling Harbour. If traffic is forwarded in 6 tons per 4-wheeled waggon when trucks are being worked to Moree empty, a reduction of 10 per cent. on ordinary rates to be allowed.	To secure traffic.
Wool	Rate of £4 3s. 8d. per ton for undumped scoured wool from Condobolin to Sydney from squattages that lie to the west of or are intersected by the 145th meridian of longitude.	To adjust rates.

Robert George Dulhunty, Inspector of Stock, Dubbo	51-52, 62
James Andrew Ryan, financier, Dubbo	52-53
William England Morgan, Editor, <i>Dubbo Despatch</i>	54-56
William Mortimer B. Dayrell, manager, Co-operative Flour-mill, Dubbo	56-57
Richard M'Gee, railway station-master, Dubbo	57-58
Craven Hyde Fitzhardinge, solicitor, Dubbo	58
William Ernest Binning, Road Superintendent, Dubbo	58-59
George Augustus Clark, Sub-Inspector, Permanent-way Branch, Department of Railways	59
Edwin Newbald Blacket, auctioneer and land agent	59-61
Edward Charles Ewers, contractor and timber merchant, Dubbo	61
George Henry Taylor, Returning Officer, Electoral District of Dubbo	61-62
John Wheaton, farmer, Dubbo	62
Edmund Henry Utley, timber merchant, Dubbo	63
Thomas Samuel Slack, senior constable of police, Cobborah	63-64
George Paterson, farmer, near Cobborah	64-65
Harry Albatross Patrick, grazier, Digilah	65-66
William Thomas Chapman, farmer, Cobborah	66
James Hogden, farmer and carrier, near Cobborah	66
James Henry Daley, farmer, near Cobborah	66
Christopher Reid Young, storekeeper and miller, Gulgong	66-67
Richard Rouse, junior, grazier, Biriganbil, near Gulgong	67-69
George Steele, sergeant of police, Gulgong	69-70
Edward McCulloch, Council Clerk, Gulgong	71
John Tuxford, Mayor of Gulgong	71
The Hon. George Henry Cox, M.L.C.	71-74
Robert Jones, Esq., M.P.	74-76
Charles Devenish Meares, solicitor, Mudgee	76-78
Eugene Daly, butcher and stock dealer, Mudgee	78

PLAN.

Railway from Warren to Coonamble.—Sketch to accompany the Report of the Sectional Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM WARREN TO COONAMBLE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of Railway from Warren to Coonamble," have, after due inquiry, resolved that it is not expedient the proposed Railway should be carried out, but they recommend that a survey be made of a route for a railway from Dubbo to Coonamble, as shown approximately on a sketch accompanying the Sectional Committee's Report; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

DESCRIPTION OF THE PROPOSED RAILWAY.

1. The proposed railway is an extension of the line from Nevertire to Warren, and is 63 miles 33 chains in length. It commences at a point 353 miles 33·30 chains from Sydney, crossing the Macquarie River at the north-west end of the township of Warren, and, then, after joining the main road to Coonamble 2 miles further on, it runs for 42 miles in a north-easterly direction, mainly within a travelling-stock reserve. Then, leaving the reserve, it proceeds direct to Coonamble, where it ends on the western side of the township and of the Castlereagh River, in a temporary common, 416 miles 66 chains from Sydney.

The line is not taken into the town, because to do so would involve the expense of a bridge over the Castlereagh, a work not considered necessary, as the road bridge across the river is close to the town, and the site of the terminal station is about 20 or 25 chains from the bridge, and 50 or 60 chains from the centre of the town.

To all intents and purposes the railway is a surface line, the rail-level being from 6 to 18 inches above the surface; the ruling grade is 1 in 100; and the curves are easy. It is proposed that the line shall be almost entirely without ballast, and, except where absolutely necessary, unfenced, but cattle stops will be provided where required.

ESTIMATED COST.

2. The estimated cost of the railway, exclusive of land and compensation, is £150,000, or £2,365 per mile, made up as follows:—Earthworks, £12,504; timber bridges and small timber openings, £9,025; steel bridge over the Macquarie River, £6,000; level crossings, cattle stops, and fencing, £2,555; permanent way material, £40,007; freight, £10,137; plate laying, ballasting, and sleepers, £34,596; station works and station buildings, £13,960; water supplies, telegraph, mileage and gradient posts, and miscellaneous, £4,552; and engineering and contingencies, £16,664.

This estimate, the Engineer-in-Chief for Railway Construction regards as ample.

RAILWAY

RAILWAY COMMISSIONERS' REPORT.

3. The Railway Commissioners report favourably on the railway, and their estimates of annual cost and traffic show a balance of £316 on the credit side. Interest on the capital expenditure, calculated at $3\frac{1}{4}$ per cent., amounts to £4,875; and the estimated cost of maintaining the permanent way, and for traffic and locomotive expenses, is set down at £4,900, or together £9,775. The traffic estimate is £10,091; made up of £6,623 for goods, live stock, and agricultural produce, £2,700 for passenger traffic, and £768 for mails.

The opening of the railway, the Commissioners say, "would be of great benefit to the district, and as the line will become the channel which stock and produce of various kinds, now drifting down the Merri Merri and Marthaguy Creeks to the railway system of the Colony at Nevertire and Dubbo, would pass," they think the construction of the line is thoroughly justified.

OTHER ROUTES TO COONAMBLE.

4. Connected with the subject of the proposed railway is the question whether Warren is the proper starting-point of a line to Coonamble; and the Committee have found it necessary to consider two other routes—one from Dubbo, and the other from Mudgee.

LINE FROM DUBBO TO COONAMBLE.

5. The line from Dubbo, according to a survey made by the Railway Construction Department, is 93 miles 45 chains in length, and is estimated to cost £207,285, or £2,215 per mile.

It begins by a back-shunt junction east of Dubbo Railway Station, at 277 miles 49·054 chains from Sydney, and, passing to the west of the hospital, takes a northerly course parallel with the general direction of the Macquarie River, and up to the crossing of its tributary the Talbragar River. Thence it proceeds west of the village of Brocklehurst, and the main road to Coonamble, as far as 285 miles, near which point Sandy Creek is crossed, and further on Moriguy Creek. Beyond this creek, which is followed up to 293 miles from Sydney, the ironbark range or divide between Talbragar and Coolbaggie Creeks is passed over. The line then inclines more to the westward, until the Coolbaggie Creek is crossed at 298 miles 32 chains, from which point it again becomes more northerly, the east side of the Drillwarrina Creek being taken, and the main road from Dubbo to Coonamble crossed at 303 miles 50 chains, and the watersheds between Coolbaggie and Marthaguy Creeks at 305 miles 33 chains. A north-north-west bearing is taken from 308 miles, the Marthaguy Creek being crossed at 314 miles 73 chains, and Gilgandra township passed about 5 miles to the east. At 329 miles the line becomes generally parallel with the Castle-reagh River, which is about 2 miles to the east, falling with the line. The Warren to Coonamble road is crossed at 355 miles 10 chains; and from 365 miles 14 chains the survey is common with that from Warren, the line terminating at 371 miles 14·418 chains as explained in the description of the Warren route.

Except for some work near Dubbo, the line is regarded as nearly a surface one, and the bridge work upon it is light. The ruling grade is 1 in 75, but this is only required at the Dubbo end; the remainder of the route is flat. The sharpest curve is 20 chains radius.

LINE FROM MUDGEE TO COONAMBLE.

6. The line from Mudgee is 147 miles in length, and is estimated to cost £478,936, or £3,258 per mile. It is described as moderately undulating for about 36 miles, and from that point, as the ranges are crossed, and up to 117 miles from Mudgee, it varies from fairly light to ridgy. Thence to Coonamble it is a surface line.

It begins at 189 miles 13·15 chains from Sydney, and for about 8 miles runs close to the main road. The Cudgegong River is crossed at $197\frac{3}{4}$ miles, and Gulgong is reached, on the west side of the town, at 208 miles. From Gulgong the line proceeds

proceeds in a north by west direction, crossing Wyaldra and Tallawang Creeks, after which the Goodiman Range is surmounted at $223\frac{3}{4}$ miles. At $235\frac{1}{2}$ miles Cobbora is passed at a distance of about $2\frac{1}{2}$ miles to the south-west, where the Talbragar is crossed. At $243\frac{1}{4}$ miles the Wallaroo Range is passed over, and 14 miles further on the surveyed line from Dubbo to Werris Creek is intersected. Mundooran township is passed on the south side at $255\frac{3}{4}$ miles, and at 260 miles the Castlereagh River is bridged. Twelve miles further the Wallamburrawang Range is crossed, and a creek of the same name at $279\frac{1}{4}$ miles. For the last 40 miles of the route the line is generally straight, Coonamble being reached on the east side of the Castlereagh River, 336 miles 7.78 chains from Sydney. The ruling grade on this route is 1 in 80.

Other routes by which Coonamble could be connected with the railway system of the Colony are referred to in the evidence given before the Committee, but the three above described have the most to recommend them.

COMPARISON OF THE THREE ROUTES.

7. The difference in length of line, distance from Sydney, ruling grade, and estimated cost of the three routes is shown in the following comparison :—

Line.	Length of line.		Distance from Sydney.	Ruling grade.	Estimated total cost.			Estimated cost per mile.		
	miles	chains			miles.	One in	£	s.	d.	£
Warren to Coonamble	63	32.71	417	100	150,000	0	0	2,365	12	0
Dubbo to Coonamble	93	45	371	75	207,285	0	0	2,215	9	6
Mudgee to Coonamble	147	0	337	80	478,936	0	0	3,258	0	0

These figures indicate that while the length of the line from Warren is shorter than that from Dubbo by 30 miles, and than that from Mudgee by 84 miles, the distance to Coonamble from Sydney by way of Warren is 46 miles longer than by way of Dubbo, and 80 miles longer than by way of Mudgee. In grade, the Warren line is the best, and in total cost the estimate for its construction is the less by £57,285 as compared with the Dubbo line, and by £328,936 compared with the line from Mudgee; but in cost per mile, it is slightly more expensive than the line from Dubbo.

QUESTION OF AN EXTENSION TO WALGETT.

8. In their examination of the official witnesses who gave evidence in Sydney, the Committee endeavoured to ascertain as far as possible the merits of each of the three routes to Coonamble, and also whether connecting Coonamble with the Great Western Railway implied a future extension from Coonamble to Walgett. In the evidence of the Secretary to the Railway Commissioners, and that of the Chief Traffic Manager, these matters will be found very closely dealt with; and it will be seen that, so far as the Railway authorities are concerned, no idea is at present entertained of extending the railway system to Walgett by any route, and that traffic from around Walgett is regarded by them as more likely to find its way to the North-western railway system than to go to the Great Western Railway through Coonamble. But, apart from this, the Committee are of opinion that the question of a railway to Walgett will be more profitably considered in connection with other railway proposals referred to them for inquiry.

SECTIONAL COMMITTEE'S REPORT.

9. Following up the examination of witnesses by the full Committee, a Sectional Committee inspected the route of the proposed line from Warren, and also the surveyed routes from Dubbo and Mudgee, and took local evidence at those places and at other centres in the district.

The Sectional Committee report in favour of the route from Dubbo to Coonamble. Finding

Finding that most of the statements made before the full Committee with regard to the productiveness of the Coonamble district and the possibilities of further development were borne out by the inspection made by them, they concluded that the question whether Coonamble and the district intervening between it and the Western railway system is entitled to railway communication was decided, and they set themselves to discover which was the best route by which a railway to Coonamble should be constructed.

The country between Warren and Coonamble, on the surveyed line, the Sectional Committee say, "is such that a great portion of it, in the immediate future, will furnish only pastoral produce for carriage on the railway"; whereas "a line from Dubbo towards Coonamble, as shown on a sketch accompanying the Sectional Committee's Report, would pass through a class of country in which agriculture is likely to be more extensive, and the rainfall more satisfactory, than would be the case along the line further west as proposed by the Department." The road from Dubbo to Gilgandra passes, speaking generally, they say, through a tract of inferior country; but this does not extend for any considerable distance to the west, and, in their opinion, if the line were located as on the sketch, "probably following the line as surveyed for a few miles, then turning to the west and keeping as direct a course as engineering necessities will permit, and not going too far west from Gilgandra to prevent the land in the vicinity of that place and to the east of it from participating in the benefit of railway communication," it would be the best calculated to serve all local conditions in connection with the development of the district.

Within 15 miles of this suggested line there are 594,000 acres of Crown land a large portion of which will be available at an early date. This Crown land the Sectional Committee say will be readily taken up.

Generally, the Sectional Committee contend "that a line from Dubbo can be located through land more suitable for agricultural settlement, and that a careful investigation should furnish a route through country in which there are no serious obstructions, so as to be in keeping with the cheapness necessary in the construction of lines for the development of our western country."

TRAFFIC ON THE DUBBO TO COONAMBLE LINE.

10. With regard to the question of traffic on a line from Dubbo to Coonamble, the Sectional Committee say it is probable that traffic reaching the Coonamble-Warren road to the south of Bullagreen will continue to go to Warren, even should the line from Dubbo be constructed, Bullagreen being about equidistant from Warren and the proposed line; but to compensate for this there will be the traffic from the country east of the Dubbo line, which should go far to make up the loss. As the line will be located in country much more suitable for agricultural pursuits, returns from it must eventually be considerably greater than can be expected from the Warren to Coonamble connection.

CONCLUSION WITH REGARD TO THE MUDGEES ROUTE.

11. The line from Mudgee to Coonamble did not commend itself to the Sectional Committee. Only very strong local reasons could justify the construction of a railway so costly as this would be, and these the Sectional Committee did not find. The mining returns from Gulgong, which is about 18 miles from Mudgee, are likely to improve, and the land in the vicinity and further west furnishes a considerable quantity of agricultural produce; but neither mining nor agricultural prospects appear to be sufficient to recommend the route from Mudgee to Coonamble as that which should be chosen.

THE COMMITTEE'S RECOMMENDATION.

12. From the results of the inquiry made by the Sectional Committee, and a due consideration of the evidence given in Sydney with reference to the routes by which a railway might be taken to Coonamble, the Committee have adopted the conclusion arrived at by the Sectional Committee, and recommend, as their report does, that a survey be made of the route shown approximately on the sketch accompanying their report, with a view to the construction of a railway from Dubbo to Coonamble.

The

The only matters that appear favourable to the adoption of the Warren to Coonamble proposal are the shorter length of line and the smaller total cost; but against these there are the considerably longer distance to Sydney and the inferiority of the route for settlement and production in comparison with that from Dubbo.

The decision of the Committee is contained in the resolution shown in the following extract from the Minutes of Proceedings of Tuesday, 26th April :—

Mr. C. J. Roberts moved,—‘That, in the opinion of the Committee, it is not expedient that the proposed Railway from Warren to Coonamble, as referred to the Committee by the Legislative Assembly, be carried out; but the Committee recommend that a survey be made of a route for a railway from Dubbo to Coonamble, as shown approximately on the sketch accompanying the Sectional Committee’s Report.’

Mr. Hassall seconded the motion.

Mr. Trickett moved,—‘That the motion be amended by the omission of all the words after the word “out.”’

The amendment was negatived on the following division :—

Ayes, 4.	Noes, 7.
Mr. Ewing,	Mr. Humphery,
Mr. Trickett,	Mr. Hoskins,
Mr. Clarke,	Mr. Roberts,
Mr. Lee.	Mr. Fegan,
	Mr. Black,
	Mr. Wright,
	Mr. Farnell.

The original motion was then passed unanimously.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 29th April, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM WARREN TO COONAMBLE.

TUESDAY, 14 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Warren to Coonamble.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You have a statement to make? Yes.

This is an extension of the line at present being constructed from Nevertire to Warren, and its length is 63 miles 33 chains, the estimated cost is £150,000, or £2,366 per mile, exclusive of compensation.

The proposed line is a light railway, commencing at a point 353 miles 33·30 chains from Sydney, crossing the Macquarie River at the north-west end of the township of Warren. About 2 miles further on it adjoins the main road to Coonamble, and runs for 42 miles in a north-easterly direction, mainly within the travelling stock reserve.

The reserve is departed from at about 399 miles, and the line then goes direct to Coonamble, where it ends on the north-western side of the township, in the temporary common.

The ruling grade is 1 in 100, and easy curves are used.

The flying survey was commenced in September, 1892, and completed during 1893. No important developments took place until June, 1896, when the Railway Commissioners forwarded the following report:—

Office of the Railway Commissioners of New South Wales, Sydney, 23rd June, 1896.

Proposed Line of Railway from Warren to Coonamble—63 miles 33 chains.

In accordance with the provisions of the "Public Works Act of 1888," section 12, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway (exclusive of land and compensation) at about £150,000

Annual Cost—

Capital expenditure, at 3½ per cent. £4,875
Estimated cost of maintaining permanent way, and for traffic and locomotive expenses 4,900

Total annual cost..... £9,775

Traffic Estimate—

Goods, live stock, and agricultural produce..... £6,623
Passenger traffic 2,700
Mails 768

Total annual revenue £10,091

The whole of the land along the proposed route of this railway is of a superior character. Much difficulty is experienced at the present time in getting produce to market, as in wet seasons the roads become almost impassable, and in dry weather there is a scarcity of feed on the road. Many of the holdings are 2,560 acres in extent, and the owners, who would frequently send small consignments of fat stock to market, are unable to do so because of the heavy charges that would have to be incurred for droving, as the expenses of droving small lots are practically the same as for large flocks.

The opening of the railway, therefore, would be of great benefit to the district; and as the line would become the channel through which stock and produce of various kinds now drifting down the Merri Merri and Marthaguy Creeks to the railway system of the Colony at Nevertire and Dubbo would pass, we think that the construction of the line is thoroughly justified.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this twenty-third day of June, one thousand eight hundred and ninety-six, in the presence of,

H. McLACHLAN.

{ E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

R. R. P.
Hickson.

14 Dec., 1897.

On the 2nd July the Minister directed all papers to be prepared for submission to the Public Works Committee.

On the 22nd of the same month Mr. Macdonald, M.P., introduced a deputation to urge the extension of this line, pointing out that residents were anxious to leave the question of route entirely to the Department, and that the line would not compete with any future extension from Narrabri northward. The Minister expressed his sympathy with the object of the Deputation, and promised to submit the matter to his colleagues with a view to having the line referred to the Public Works Committee.

During the following year communications were received in support of the line from the Bullagreen and Coonamble Railway Leagues, and in opposition to it from the Newcastle Chamber of Commerce, which pointed out that the proposed line was likely to prejudice the interests of that port.

In July and September, 1897, the Minister replied in terms similar to those previously made use of to deputations which waited on him at Sydney and Coonamble respectively, stating in the last instance that in view of the fertility of the district and nature of the soil he preferred spending money on a light railway than on roads.

On the 9th December, 1897, the Minister moved in Parliament that the line should be submitted to the Public Works Committee. This motion was carried.

ROBT. HICKSON,
Under Secretary and Commissioner for Roads.

Since the map was previously before the Commission the proposed line from Warren to Coonamble has been shown upon it, and also the distances from Sydney, which are as follows:—From Sydney to Coonamble *via* Warren 417 miles, *via* Dubbo 371 miles, and *via* Mudgee 337 miles. The distance from Coonamble to Walgett is 67 miles, according to Mr. Jones' report. Therefore, the distance from Sydney *via* Warren and Coonamble to Walgett would be 484 miles, from Sydney *via* Dubbo and Coonamble to Walgett would be 438 miles, and from Sydney *via* Mudgee and Coonamble to Walgett 404 miles.

2. In deciding to take the railway from Warren to Coonamble, has the Department considered the rival lines *via* Dubbo and *via* Mudgee, and also whether it would be advisable to connect Coonamble on to the North-western railway? The Department has considered the first two proposals—*via* Dubbo, and Mudgee—but not the other.

3. Would you give us a statement with regard to these two lines, and the reasons why the Department determined to disregard them? I have a statement on the proposed lines from Dubbo and from Mudgee. I will take the line from Dubbo to Coonamble first.

The line begins by a back shunt junction east of Dubbo Station at 277 miles 49·54 chains from Sydney, and, passing to the west of the hospital, takes a northerly course parallel to the general direction of the Macquarie River, and, clearing its flood marks, up to the crossing of its tributary, the Talbragar River, at 281 miles 65 chains. The village of Brocklehurst is situated on its eastern side, and the main road to Coonamble adjoins at 283 miles on its eastern side, up to 285 miles. Sandy Creek is crossed at 285 miles 54 chains, and Mognigny Creek is then followed up to 293 miles, just beyond which the Ironbark Range or divide between Talbragar and Coolbaggie Creeks is passed over.

The line now inclines more westerly, and the latter creek is crossed at 298 miles 32 chains. The direction here again becomes more northerly, and the east side of Drillwarrina Creek is taken, the main road, Dubbo to Coonamble, being crossed at 303 miles 50 chains, also the watershed between Coolbaggie and Marthaguy Creeks at 305 miles 33 chains. A N.N.W. bearing is taken from 308 miles, and the latter creek will be bridged at 314 miles 73 chains, two roads leading to Gilgandra, which township is here about 5 miles eastward, are crossed at 316 miles 22 chains and 317 miles 5 chains, respectively. At 329 miles the line becomes generally parallel with the Castlereagh River, which is about 2 miles to the east, falling with the line. A dam is intersected at 337 miles 10 chains, and the main road is approached at about 3 miles further on.

The line is more or less parallel to the main road on the east and to the river beyond it right into Coonamble. The Warren to Coonamble road is crossed at 355 miles 10 chains and 365 miles 14·25 chains. The trial survey from Warren joins this one at 410 miles 59·30 chains on its mileage, the two being common north of this point, and having therefrom a nearly due north direction. The main road is crossed and recrossed at 369 miles 59 chains and 370 miles 51 chains, and the line ends at 371 miles 14·418 chains, about half a mile from the Castlereagh River bridge leading into Coonamble, at a suitable place for station ground and for extension.

The line in its course intersects unavoidably a considerable portion of private land, especially at the Dubbo end.

The section, except for some light work near Dubbo, is nearly a surface one throughout, and the bridge work is very light, the Talbragar River and Coolbaggie and Marthaguy Creeks only requiring moderately-sized bridges. Some of the line will be subject to flooding.

The ruling grade is 1 in 75, but this is only required on the Dubbo end, the Castlereagh Valley being flat. The sharpest curve is 20 chains radius.

The length of the proposed line is 93 miles 45 chains, and is estimated to cost £2,215 per mile, or a total of £207,285.

4. Is this the position of the Dubbo to Coonamble line: It is a line of easy grades, and of comparatively inexpensive construction—£2,215 per mile. The objections to it appear to be—(1) the severance of a large portion of private land, and (2) the extra length of construction? Yes.

5. And in favour of it is the fact that it is 46 miles nearer to the seaport? Yes. The line from Warren to Coonamble is £150 per mile cheaper, the length of new line to be constructed is 30 miles 12 chains less, and the total cost is £57,285 less than the line from Dubbo to Coonamble; but the distance from Sydney is 46 miles longer.

6. Do you know the country from Dubbo to Coonamble, as compared with that from Warren to Coonamble? I have not that close knowledge which would enable me to express an opinion.

7. You have a statement also with regard to the line from Mudgee to Coonamble? Yes.

This line begins at 189 miles 13·15 chains original mileage, and is close to the main road for about 8 miles, crossing the Cudgong River at 197½ miles, Gulgong being reached at 208 miles at the west side of the town. The line then proceeds in a north by west direction, crossing Wyaldra Creek at 210 miles 32 chains. After crossing Tallawang Creek the Goodiman range is surmounted at 223½ miles descending therefrom by the Tacklan Creek Valley. Cobbarah township is about 2½ miles to the south-west at 235½ miles, when the Talbragar is crossed. The Wallaroo range is crossed at 243½ miles, and the Dubbo to Werris Creek surveyed railway is intersected at 257½ miles. Mudooran township is passed on the south side at 255½ miles, and the Castlereagh River is bridged at 260 miles.

The Wallamburrawang range is crossed at 272 miles, and the creek of the same name at 279½ miles; at 297 miles the direction of the line changes to north-west, and is generally straight to Coonamble, where the line ends at the east side of the Castlereagh River at 336 miles 7·78 chains.

The section is moderately undulating from Mudgee to about 225 miles, and onwards varies from fairly light to ridgy as the ranges are crossed up to 306 miles, from whence to Coonamble the line is a surface one.

The ruling grade is 1 in 80.

Timber is scarce south of Gulgong. Except for this, materials for construction are fairly plentiful.

The length of the line is 147 miles, and the cost £3,258 per mile, or a total of £478,936.

The

MINUTES OF EVIDENCE—RAILWAY FROM WARREN TO COONAMBLE.

The following is a summary of cost, &c., of different routes for railways to Coonamble and Walgett:—

R. R. P.
Hickson.
14 Dec., 1897.

Name of line.	Length.	Estimated cost.	Average cost per mile.	Ruling grade.	Through distance from Sydney to Coonamble.	Through distance from Sydney to Walgett.	Remarks.
	mls. ch.	£ s. d.	£ s. d.	One in	miles.	miles.	
Dubbo to Coonamble	93 45	207,285 0 0	2,215 9 6	75	371	440	
Mudgee to Coonamble.....	147 0	478,936 0 0	3,258 0 0	60	337	406	
Warren to Coonamble.....	63 32·71	150,000 0 0	2,365 12 0	100	417	486	
Coonamble to Walgett	69 0	199,900 0 0	2,897 2 1	150	440½	Via Dubbo.
Narrabri to Pilliga	56 0	128,650 0 0	2,297 6 5	100	
Pilliga to Coonamble	56 approx.	462	No survey, <i>via</i> Newcastle.
Pilliga to Walgett	56 60	462	Survey unrevised, <i>via</i> Newcastle.

The line from Mudgee to Coonamble will cost £271,640 more than the Dubbo line, and £328,926 more than the line from Warren to Coonamble.

8. If it is a surface line from beyond Mundooran, from that place to Mudgee it must be fairly heavy? Yes; that is the heavy portion.

9. It would be something like £5,000 per mile on that portion? I daresay it would.

10. If the average be £3,458 per mile, as you describe, it should not be more than £2,300 per mile from Mundooran to Coonamble? No.

11. Therefore, taking the average, that would bring the Mudgee end up to £5,000 per mile? Yes; that end is much more expensive.

12. The case for the Mudgee line is this: in favour of it, it is 80 miles nearer to Sydney from Coonamble; against it, is the extra cost of construction, and the fact that the grade is 1 in 60, which is a worse grade than on either of the other lines? Yes.

13. Have you any statement to make with regard to the line from Mudgee to Wallerawang? No.

14. You do not know the grades on the Mudgee to Wallerawang line? No.

15. Are you prepared to give an expression of opinion in regard to the class of country from Mudgee to Coonamble? No; I know from Mudgee past Gulgong, nearly as far as Cobborah, it is poor rough country. I do not know the other portion from Mundooran.

16. Is there any local reason for a railway from Mudgee to Gulgong? I should say not.

17. And from Gulgong to Cobborah? I do not know enough of that country to say.

18. The main justification of it would be the shorter distance to Sydney? Yes.

19. Is there any survey from Muswellbrook *via* Cassilis to Coonamble? I do not think so. There was an investigation made by Mr. Jones; but I do not think a survey was made.

20. Is the best information we can get on the question in Mr. Jones' report? Yes.

21. Has any survey been made from Coonamble on to Werris Creek? No.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

22. *Chairman.*] Will you make your statement first with regard to the Warren to Coonamble line? The rainfall at Warren is 20·03 inches; at Nevertire, 21·85; Nyngan, 21·32; Merryanbone, 22·41; Nelgowrie, 21·46; Coonamble, 22·87; Nebea, about 15 miles north of Coonamble, 23·35; Warrana, close to Coonamble, 22·27; Calga, about east of Coonamble, 21·77; Kialgora, south-east of Coonamble, 23·43; Merrigal, due south of Coonamble, 24·29; Bundemar, near Warren, 22·97. These include all of the stations between Warren and Coonamble.

H. C. Russell,
C.M.G.
14 Dec., 1897.

23. The heaviest rainfall is 24½ due south of Coonamble; the lightest rainfall of all is at Warren itself? Yes.

24. A fair average to take would be about 22 inches? Yes.

25. Do these rainfall records extend over any period? From about twelve to fourteen years.

26. A sufficiently long period for you to form a fairly correct opinion? Yes; the period covers dry and wet years, so that it may be taken as a fair mean. Then, at Dubbo, where the record extends over twenty-four years, the average rainfall is 23·57 inches. At Wambangalong, just north of Dubbo, the average is 29·43. I think there must be some local circumstances affecting that, because it is much heavier than at any of the other places. That is the average for eleven years. Almost due west of Dubbo, for about 12 miles, is Dundullimal, with an average of 25·57, over a period of eleven years. Then, The Springs, a few miles due south of Dubbo, has an average of 26·49, for a fifteen-years' record; Terramunganime, 10 miles west of Dubbo, has an average rainfall of 23·91 for a period of eight years; Wellington, south-east of Dubbo, 24·85, the record extends over a period of fifteen years. At Biambil, north-east of Dubbo, the rainfall is 25·72, for a period of eleven years. A little further to the north-east, Mundooran has a rainfall of 28·58; and Gilgandra has a rainfall of 28·36, the record extending over thirteen years. The three proposed lines converge upon one point. If I give the rainfall on this line, right up to Coonamble, I shall be obliged to repeat certain stations already given as part of the Warren to Coonamble line. Therefore, I have stopped at Mundooran.

27. The rainfall in the vicinity of Dubbo, taking such stations as you have given, would be about an average of 24·35 inches? Yes. I will now take the stations from Mundooran to Mudgee. At Ulamanbri, about 30 miles south-east of Coonamble, the rainfall is 32·43, the record extending over a period of eight years; Coolan 31·26, over a period of twelve years; Cobborah 29·65, over a period of nine years; Pine Ridge 26·92, over a period of fourteen years. The latter place is about 20 miles due north of Mudgee. Gulgong has an average rainfall of 28·98 over a period of fifteen years. Mudgee has 27·41 over a period of twenty-three years.

28. In the vicinity of Mudgee the rainfall approximately is between 27 and 28 inches? Yes.

29. Then, going west to Dubbo, it is 25 inches? Yes.

- H. C. Russell, C.M.G.
14 Dec., 1897.
30. And further west to Warren, although at Warren itself the rainfall is 20 inches, a fair thing would be about 22 inches? Yes.
31. Have you any statement to make with regard to the time of the rainfall? The rainfall here is rather better in the second half of the year than in the first. I am speaking of the whole of the area included in the triangular piece of country extending from Warren to Mudgee and concentrating at Coonamble. It takes in about 120 miles.
32. Averaging the rainfall between Mudgee and Warren right through at something between 24 and 26 inches, are you prepared to say what proportion would fall in the second half of the year? I do not remember exactly how it stands.
33. It is a better rainfall in that half of the year, but there is no special difference? No, there is nothing remarkable in the difference.
34. It might be an inch or two? Yes; as far as the rainfall is concerned, the country under consideration should be favourable for the growth of cereals, but I am not prepared to speak with regard to its capabilities otherwise.
35. Speaking of the triangular piece of country already described, you regard the rainfall as sufficient? Yes, it is all favourable taking the average. It is an abundance of rainfall for wheat-growing, and it falls fairly satisfactorily as far as the period of the year is concerned. Perhaps the best information I have with regard to cereals is this: A deputation came from South Australia to consult me, and I was informed by them that anywhere below the 20 inches rainfall cereal-growing was a failure, and those connected with it were eventually ruined, while above the 20 inches rainfall they were able to get along.
36. *Mr. Fegan.*] How is it that in some cases you have a record for over twenty years and in other cases for only eight or nine years? Originally, the squatters as a class did not understand the value of the rain records. I began to try to teach them that in 1871, and I went on for six or seven years, publishing everything and writing to everybody whose name I could hear of; but we got along very slowly, and it was not until I took to publishing what is called a "spot" map, showing the rainfall with the names of the stations on it, that the people came in, and they have been gradually coming in since.
37. *Mr. Hassall.*] Do you not think there was something in the difficulty of obtaining rain-gauges? I have always supplied rain-gauges. The Government gave me a vote for the purpose. Where people were willing to furnish the record I supplied the rain-gauge.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

- C. E. Rennie.
14 Dec., 1897.
38. *Chairman.*] Do you produce a map? Yes. The map shows the country within 20 miles of each side of the projected line from Warren to Coonamble, and 20 miles north of Coonamble.
39. *Mr. Lee.*] Would that include any of the country embraced in your sketch-map connected with the Pilliga line? No.
40. Do the spheres of influence you have shown in the case of the line from Warren to Coonamble and the line from Narrabri to Pilliga meet? No; there will be a gap of some 10 miles between them. But as the line goes on from Pilliga to Walgett (and I take a sphere of influence there) the lines will just touch.
41. Will you explain the map? The blue tint shows the alienated land in the 20 miles limit; that embraces 1,149,200 acres. The settlement leases are shown by blue patches; they embrace 67,110 acres. The reserves, which are shown by the green tint, amount to 232,600 acres. The Crown lands, shown by a brown tint, amount to 475,720 acres. Crown lands comprised in leasehold areas, the leases of which expire between 1898 and 1900, amount to 463,700 acres. The area held under occupation license is 10,720 acres, and the miscellaneous and vacant areas amount to 1,300 acres.
42. Therefore, not including reserves, the area shown on your map, which will be available for settlement is about 474,000 acres? Yes; that is about it.
43. Have you any information with regard to the class of country? No.
44. You do not know anything about the capabilities of the country? No.
45. Are you able to express an opinion with regard to the effect of a railway upon it? No; I do not know sufficient about the country to enable me to say anything as to that.
46. Are you making any surveys for alienation? There are two areas down close to Warren. At the Gillendoon leasehold there are 11,900 acres to be withdrawn on the 17th of this month for alienation. Negotiations are also proceeding to withdraw from the Wonbobbie holding—just alongside the other—22,000 acres for settlement. That is not settled yet; negotiations are now proceeding. In regard to these two areas, the extreme portion would be 20 miles from Warren, and a considerable portion of the land lies within a few miles of the town.
47. What is the District Land Office? Warren and Dubbo is the District Surveyor's office. The District Surveyor at Dubbo is the officer who has charge of this district. The northern boundary is somewhere between Coonamble and Pilliga.
48. Who is District Surveyor at Mudgee? Mr. Crouch. Orange is the head office for Mudgee.

WEDNESDAY, 15 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Warren to Coonamble.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and further examined:—

49. *Chairman.*] You have a statement to make in addition to the evidence given yesterday? Yes.

R. R. P.
 Hickson.

At the request of the Committee I beg to furnish the following further information with regard to the Warren and Coonamble line now under consideration:—

15 Dec., 1897.

(a) The distance from Coonamble, *via* Warren, to Sydney is 417 miles, and the new line to be constructed is 63½ miles, at a cost of £150,000.

(b) The distance from Coonamble, *via* Dubbo, to Sydney is 371 miles, and the new line to be constructed is 93½ miles, at a cost of £207,285.

In dealing with this matter, Mr. R. E. Jones, Assoc. M. Inst. C.E., Assistant Engineer, Public Works Department, reports:—"The country passed through for 40 miles from Dubbo is sparsely populated, and much of it of an inferior character. A good deal of pine scrub is found near Gilgandra; the soil containing too much sand to be of any good, either for grazing or the growth of cereals. The good timber-forest met with on the Mudgee scheme would also be served by this line at Kirba, but the river would need crossing to reach the railway."

(c) Coonamble, *via* Mudgee, to Sydney:—

The length of this route would be 337 miles, and the new line to be constructed 147 miles, at a cost of £478,936.

From Mr. Jones' report I append the following information:—"From Mudgee, for 100 miles, this line passes through undulating country, a large percentage of which could, if needed, be brought under cultivation. The district between Mudgee and Gulgong is well known for its agricultural products and fruit, especially grapes. The Goodiman Hills (the Great Dividing Range of the Colony), lying between Gulgong and Cobborah, are at present unproductive to a large extent, but there is a fair amount of settlement towards Tallowang, with many patches of good land. In the valley of the Talbragar the soil is first class and considerable cultivation exists along the river. Between Cobborah and Merrygoen, for about 43 miles, a belt of rough and poor country is passed through, but some fair timber could be obtained to the right of the line. The country about the Castlereagh River is of varying character, intersected by many creeks. In the neighbourhood of Yarragrin, about 12 miles west of Mundooran, there is on the northern side of the line a strip of splendid land fit for the production of cereals. All that is possible has been alienated and considerable settlement exists—in fact, to Coonabarabran, a distance of about 40 miles. At a few miles beyond Yarragrin the line enters some magnificent forests of ironbark, box, and pine. These belts of timber extend for many miles, and are of great value. The line continues to skirt the southern slope of the Warrambungle Mountains until it reaches plain and salt-bush country at about 40 miles from Coonamble. Here it is nearly all black soil, the plain being broken by belts of budtha, yarran, and other scrub."

(d) Coonamble, *via* Pilliga and the northern system, to Sydney:—

The length of this route is, approximately, 462 miles, and the portion of new line to be constructed between Coonamble and Pilliga and Narrabri is about 112 miles, at a cost of about £260,000.

The portion of this line between Narrabri and Pilliga has already been described; that between Coonamble and Pilliga is, I am given to understand, something of the same nature, but as I have not been over the route I am not able to state this definitely.

(e) Coonamble, *via* Gunnedah and the northern system, to Sydney:—

The distance by this route would be about 424 miles, and the new line to be constructed between Coonamble and Gunnedah would be, approximately, 130 miles. As no examination of this country has been made, it would be misleading to attempt to give even an approximate estimate.

(f) Coonamble, *via* Mundooran, Cassilis, Muswellbrook, and the northern system, to Sydney:—

The length by this route to Sydney, taking Mr. Jones' figures as correct, is 338 miles, and the new line to be constructed 210 miles.

In dealing with this matter, Mr. Jones describes the country as follows:—"From Muswellbrook to back of Denman the Hunter Valley although narrow is very fertile, but in large holdings chiefly used for grazing. The next 20 miles is of a sandstone nature, much of it suitable for vine-growing and agriculture. From the dividing range at 34 miles to Cassilis and beyond, chiefly basaltic formation, and with the exception of reserves the line passes through private property all more or less improved and nearly all forming part of four large holdings. From Cassilis to the Great Dividing Range there is not much settlement or good land. On the western slopes, however, and in the Talbragar Valley there is a rich belt with considerable cultivation."

The remainder of the line has been described in the Mudgee connection.

In the absence of reliable information, it would be impossible without further survey to give an estimate of the cost of this route.

(g) Coonamble, *via* Mundooran, Cassilis, and Jerry's Plains, to Singleton:—

The distance to Sydney by this route, according to Mr. Jones' figures, is 385 miles, and the new line to be constructed is 238 miles.

With the exception of the portion between Denman and Singleton, this follows the same line as the Muswellbrook and Coonamble line. The line between Singleton and Denman follows the valley of the Hunter and Goulburn Rivers, and the land is of the richest description, eminently suited for the growth of cereals and fruit, especially grapes and oranges. It is also a good dairying district, and a railway would no doubt tend to largely increase the acreage under cultivation, both of cereals and fruit; the land is, however, nearly all alienated.

The distance from Walgett to Sydney, *via* Coonamble and Warren, is 486 miles, and the new line to be constructed is 132½ miles, at a total cost of £325,000.

The distance from Walgett to Sydney, *via* Coonamble and Dubbo, is 440 miles, and the new line to be constructed is 162½ miles, at a cost of £382,000.

The distance from Walgett to Sydney, *via* Coonamble and Mudgee, is 406 miles, and the new line to be constructed is 216 miles, at a total cost of £650,000.

The line from Walgett, *via* Narrabri and the Northern system to Sydney is about 460 miles, and the new line to be constructed is 114 miles, at a cost of £262,050.

The country between Walgett and Coonamble is almost entirely flat, and consists of a series of broken plains, with occasional patches of salt bush. Frequent belts of budtha, wilga, box, and yarran scrub are passed through, but almost all the land is of black soil, fit to grow anything with a fair rainfall. As may be expected in this flat country, portions of the line would be subject to inundation, especially near Coonamble and Walgett; the latter place is, however, the most difficult to deal with, the town being situated at the confluence of two great rivers—that is to say, the Barwon and the Namoi.

The country between Walgett and Narrabri has already been described under the Narrabri to Pilliga railway.

R. R. P.
Hickson.
15 Dec., 1897.

50. The line from Walgett, *via* Narrabri, to Sydney, about 430 miles in length—the length of new line to be constructed being 114 miles, at a cost of £262,000—is the only line of those you have mentioned that would not do the dual work of Coonamble-Walgett? Yes.
51. All the other lines would pass through Coonamble, but in the case of the line from Narrabri to Pilliga, in order to pick up the Coonamble traffic, a branch line would be necessary from Pilliga? Yes.
52. The line *via* Narrabri is the only one that would not go through Coonamble? Yes.
53. The line from Coonamble, *via* Warren, to Sydney is shorter by 45 miles than the line from Coonamble, *via* Pilliga and the northern system, to Sydney? Yes.
54. But, if Newcastle be regarded as the port for that district, the distance from Coonamble to Newcastle, *via* Narrabri, would be, approximately, 362 miles—100 miles being taken off as representing the distance between Newcastle and Sydney—therefore, that would be a shorter line by 55 miles than the line *via* Warren? Yes.
55. The line *via* Gunnedah to Sydney would be 474 miles, and therefore 7 miles longer than the line under consideration? Yes.
56. And the distance by that route to Newcastle would be 324 miles? Yes.
57. *Mr. Lee.*] The distance from Walgett, *via* Narrabri, to Sydney is 26 miles shorter than from Walgett, *via* Coonamble, to Sydney? Yes.
58. And the length of line to be constructed from Walgett to the existing northern system would be 19½ miles shorter than the length of line to be constructed from Walgett to Warren? Yes; the distance being respectively 113 miles and 132½ miles.
59. And the cost of construction from Walgett to Pilliga would be £91,260 less than from Walgett to Warren? Yes.
60. *Mr. Wright.*] Do you know the country between Coonamble and Warren? No.
61. Or between Coonamble and Mudgee? No.
62. Do you know anything about the line from Narrabri to Pilliga? Yes; I know something of that country.
63. What is the country like between Pilliga and Coonamble? It is rich country, consisting to a great extent of black soil; but there are several creeks to be crossed, and it is, generally speaking, wet country.
64. You have never been on the Lower Castlereagh? No.
65. Then, I suppose, you are not prepared to give us any information about the country through which a line might be carried to Gunnedah? No; I have not any information on that point.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

H.
McLachlan.
15 Dec., 1897.

66. *Mr. Hoskins.*] The Under Secretary for Public Works has given the Committee information concerning different proposed routes of railway extension to Coonamble—one from Warren to Coonamble, another from Dubbo to Coonamble, and a third from Mudgee to Coonamble;—evidence has also been given by Mr. Hickson in regard to distances, and as to the character of the country between Coonamble and Pilliga, and between Coonamble and Cassilis, as far as Muswellbrook, on the northern line;—can you say whether the Railway Commissioners have arrived at any definite opinion as to the route they would recommend for a railway to Coonamble? I may say that in this matter the Railway Commissioners have taken more than usual care in dealing with the question of routes. I have mentioned more than once that the Commissioners, as a rule, devote themselves to the route put before them by the Government. They are not supposed to go into matters of policy; but in this case they have given a great deal of consideration to the different routes which have been submitted for a line to Coonamble. In their opinion—they have not stated it expressly in their report—the line at present before the Committee is the one that might most reasonably be undertaken. At the same time they do not wish to say that the other lines do not merit consideration. They see that in this case a great deal of consideration is to be given to rival routes, but, in their opinion, the line from Walgett to Coonamble offers the most advantages, and would be the best line to construct.
67. Can you say why they have a preference for a line from Warren to Coonamble above any of the other routes proposed? Because, speaking generally, that line would serve the best country, and it would afford the greatest convenience to the public. Another consideration that weighed with them was that it would be by far the least expensive of the three routes as regards construction. Take, for instance, the line from Mudgee to Coonamble, the one originally suggested and put before Parliament. That line, if constructed, would mean an annual expenditure of £20,000, in the shape of interest and maintenance, beyond the expenditure on the line under consideration.
68. Has any officer of the Department made an examination, from a railway point of view, of the different routes by which it is proposed to reach Coonamble? Yes; not only have the Commissioners had Mr. Harper inquiring into the matter, and obtaining information in reference to the country affected, but they have also themselves held conferences, I think, with the chairmen of the land boards; besides which they had a long interview with Mr. Jones, an engineer who was deputed by the Government some time ago to investigate all these rival routes. I think Mr. Jones was convinced, after hearing their views, that the line which the Railway Commissioners were putting forward had really a great deal to recommend it, Mr. Jones being inclined originally to favour the Mudgee line.
69. In the statement made by the Under Secretary for Public Works, the cost of the line from Warren to Coonamble is estimated at much less than the cost of an extension either from Dubbo or Mudgee? Yes. That is one of the reasons why the Commissioners recommend this line.
70. There was also the further consideration that this railway would be taken for a good deal of its length through a travelling stock reserve, and, therefore, there would be no land to purchase? I am not sufficiently acquainted with land matters to say anything positive on that point.
71. Then we are to understand that the Railway Commissioners strongly recommend the construction of the proposed railway from Warren to Coonamble, not only on the ground that it will cost much less than either of the other proposed routes, but also because, from the reports made to them of the character of the country, that which would be intersected by the proposed railway is the best? Yes. I may add that the Commissioners themselves have been over the line, and have seen the character of the country.

72. Have they also been over either of the lines from Dubbo or Mudgee to Coonamble? Two of the Commissioners have been from Mudgee to Gulgong.

73. There are a good many farmers located in the neighbourhood of Gulgong, are there not? Yes.

74. In the return laid before us, it is represented that the revenue from the proposed railway from Warren to Coonamble would exceed the cost of maintenance and working expenses? Yes.

75. Does that estimate include the amount that will yearly have to be paid as interest on the cost of construction? Yes, that is the first item—capital expenditure at $3\frac{1}{4}$ per cent.

76. Therefore, if the proposed line from Warren to Coonamble were constructed, according to the estimate of the Railway Commissioners, it would be more favourable as regards financial considerations than almost any other line we have had to deal with lately? Yes.

77. *Mr. Humphery.*] Have you had any estimate made of the probable traffic by any other route than that now before the Committee? Not a direct estimate; but Mr. Harper knows what the traffic would be by the Dubbo line, for which he has the figures.

78. What information had the Commissioners before them when they arrived at the opinion that the line from Warren to Coonamble would be the best? They had very full information. They had Mr. Harper going through the district. They had particulars of the traffic from the whole of the districts going into Dubbo, Trangie, and Mudgee, and also of the traffic between Warren and Coonamble. In addition to this they obtained information from the land boards, and they had a consultation with Mr. Jones, who had examined the whole of this country and made a very exhaustive report to the Government.

79. Did they examine the country themselves between Dubbo and Coonamble, and also between Mudgee and Coonamble? No.

80. Only between Warren and Coonamble? That is all, personally.

81. *Mr. Hassall.*] They took Mr. Jones' reports as regards the other routes? Yes; and also Mr. Harper's.

82. *Mr. Humphery.*] The Commissioners, from personal observation, decided to recommend the line from Warren to Coonamble? Yes.

83. Depending upon reports they received for the information which influenced them with regard to the other routes? Yes. They had in view also the difference in the cost to the country, and the difference in the annual charge for interest and maintenance.

84. Looking at the map, it would appear that a line from Mudgee would more fairly divide the country between the western line and the north-western railway system? Yes.

85. Did you take that into consideration? Yes; the Commissioners took that into consideration. As a matter of fact, I think Mr. Jones was rather in favour of the Mudgee line, and put his views before the Commissioners. But, as I have already mentioned, that line would mean an extra annual expenditure of about £20,000, besides an additional cost of £350,000 in regard to construction.

86. Did you make any estimate of the probable traffic on the line between Mudgee and Coonamble before you decided upon recommending the line from Walgett to Coonamble? No.

87. Have the Commissioners considered whether it is desirable now, or whether in all probability it will be necessary in the near future to construct a line from Mudgee? They have not recommended that line.

88. But have they considered it at all? They did consider it some time ago, but I do not think they recommended it. The Public Works Committee inquired into an extension from Mudgee.

89. That was to Gulgong only? Yes. Still, if the line were made from Warren to Coonamble, the Commissioners would never recommend another additional line from Mudgee, especially at a cost of nearly £500,000.

90. Are we to understand that the Commissioners would regard the whole of the country as sufficiently served by the construction of this line between Warren and Coonamble? For the present, yes. Of course they would not discount the future too much, but for all reasonable purposes that would be their solution of the difficulty at the present time.

91. What facilities of transit would be afforded for the whole of the country between the western and the north-western systems? Nothing more than a line to Coonamble, for that would intersect the best part of the country.

92. What would be the furthest distance from a railway station? I think Munderoran would not be more than 50 miles.

93. Then there would be no portion of the country more than 70 miles from a railway station? I should not think so in that intervening belt.

94. We have before us, in connection with this proposal, an alternative line from Coonamble to Pilliga. Assuming that line to be constructed, would it still be necessary, in your opinion, to have a line between Warren and Coonamble? As a matter of fact, that is a matter the Commissioners would not consider, because they think it would be out of the question to make a line from Coonamble to Pilliga.

95. They consider that quite out of the question? Quite out of the question. It is very poor country, and no good would be served by making a railway there. Then again the railway has not yet reached Pilliga.

96. You are aware that there is a proposal before the Committee for the construction of a line between Narrabri and Pilliga? Yes, which the Commissioners have reported against.

97. Having regard to the proposal to take a line between Warren and Coonamble, that would shorten the distance to Walgett by something like 60 miles, would it not? It is from 60 to 70 miles from Coonamble to Walgett.

98. How far from Walgett is the nearest existing railway station? Narrabri, the distance being, according to the survey, I think, about 114 miles.

99. So that Coonamble would be nearly 40 miles nearer by road than from Narrabri? Yes.

100. As to the cost of construction, you have not considered that, I suppose? No.

101. Have the Commissioners investigated the line between Coonamble and Walgett? No, not in detail.

102. Are you prepared to say, on behalf of the Commissioners, whether a line would be more desirable from Coonamble to Walgett than from Narrabri, *via* Pilliga, to Walgett? The Commissioners have already expressed to the Minister their opinion that *via* Coonamble is the direction which a line to Walgett should take, if such a line should be decided upon at some future time. At the present, however, they think that it would be premature to make that line; and there are other proposals which would affect

H.
McLachlan.
15 Dec., 1897.

- H. McLachlan.
15 Dec., 1897.
- affect the question of the Walgett traffic, one of which—a line from Woolabra to Collarendabri—is likely soon to be before the Committee.
103. The Commissioners consider that the possibility of a line from Woolabra to Collarendabri is likely to affect the Walgett traffic? Yes.
104. Have the Commissioners examined the country between Woolabra and Collarendabri? Yes, and they have reported concerning the line.
105. In connection with this matter it is almost necessary to know whether or not the report of the Commissioners is favourable to the construction of that line? They speak rather favourably of the proposal in their report.
106. If that line should be constructed, the Commissioners would not then regard the extension from Coonamble to Walgett as at all necessary? No. In their report to the Minister, dated 19th November, 1895, the Commissioners, referring to this matter, say:—
- The Commissioners would, however, point out that they do not consider that the prospect of traffic to and from Walgett would justify, at the present time, an extension of the railway to that place; but that an extension from Warren to Coonamble, at an estimated cost of £177,500, would meet all the requirements of the near future.
- That estimate of £177,500 has since been reduced.
107. In the event of a line being constructed to Collarendabri, would the Walgett traffic go in that direction? No; but that line would probably intercept traffic that now goes to Walgett. I would not like to speak definitely on that point without going further into the matter.
108. All these lines must, to a great extent, be considered together—they affect each other very closely, do they not? Yes; I suppose they all go into what you may call debatable country. At present the Walgett traffic does not come *via* Coonamble.
109. It does not come that way, I presume, because the nearest point on the railway is Narrabri? The Walgett traffic mostly goes *via* Bourke or Narrabri.
110. Is it the opinion of the Commissioners that the whole of the country between the two railway systems would be sufficiently served by the proposed line from Warren to Coonamble, that eventually a line may be carried from Woolabra, or from some other point north of Narrabri to the Barwon, say, at Collarendabri, and that it would be unnecessary to construct a line to Walgett at the present time. Are the Commissioners of opinion that it would not be profitable to construct a line to Walgett from any of the termini? I think so. But that point has never been referred to them, though it was dealt with, to a certain extent, in their report of November, 1895, in which they said they did not think it was necessary at the present time to extend the railway to Walgett from any point.
111. Are the Commissioners of opinion, that with a railway at Collarendabri, the whole of the traffic would be gathered by one or other of the systems? A railway at Collarendabri would intercept a great deal of Walgett traffic—traffic now passing down towards Walgett.
112. Have the Commissioners fixed any point at which, in their opinion, the Darling should be reached between Bourke and Collarendabri? No.
113. Have they considered that point? Yes.
114. What is their opinion? It is their opinion that it would not pay.
115. Then it is their opinion that no railway should be constructed to reach the Barwon between Bourke and Collarendabri? At the present time, yes.
116. The Commissioners expect that much of the traffic would be drawn to Coonamble from Walgett? No; I do not think Coonamble would get any of the Walgett traffic.
117. Assuming the line to be constructed from Warren to Coonamble, the distance being considerably less than between Narrabri and Walgett, do you anticipate that the Walgett traffic, or much of it, will reach Coonamble? No.
118. *Mr. Wright.*] I suppose the Commissioners are aware that the country is practically impassable? In Mr. Harper's estimate I do not think he has taken credit for any Walgett traffic on the Coonamble to Warren line.
119. *Mr. Humphery.*] Why has he not taken credit? Because the traffic would still follow the existing routes on to Narrabri or to Bourke. I believe Mr. Harper's estimate does not include any of the Walgett traffic.
120. Do you know the reason why he has not taken credit for any portion of the Walgett traffic? Because, I suppose, the other routes would be more favourable.
121. Although longer? For wool reaching the sea-board, especially at Newcastle, Narrabri is the nearer route.
122. Then, in your opinion, the construction of a railway to Coonamble, would not affect the traffic which at present goes by way of Narrabri? I think not to a great extent; but I would sooner leave that question to be dealt with by Mr. Harper, who has gone into all matters relating to traffic.
123. In your estimate of earnings by the railway, have you given consideration only to the local traffic? Yes, I so understood from Mr. Harper.
124. Have the Commissioners satisfied themselves with regard to the probable earnings of the line? Yes. They went into the matter very carefully with Mr. Harper, who furnished them with a report and estimate of traffic. They also inquired into the question of traffic when they were at Coonamble and along the route.
125. Have they gone into this matter so carefully as to be able to confidently recommend this proposal in preference to any other? Yes.
126. And are they able to tell the Committee through you that, in their opinion, instead of there being any loss there would probably be a small profit after paying interest and working expenses? Yes; they think the line will about cover interest and working expenses.
127. What you have said is the result of an exhaustive investigation by the Commissioners? Yes.
128. The Committee are to understand that, upon Commercial lines, this proposal may be favourably entertained? The Commissioners think so and they recommend the line.
129. *Mr. Clarke.*] I think you stated to Mr. Humphery that you thought the Walgett traffic would not go to Coonamble? Yes; that, I understand, is the opinion of Mr. Harper.
130. But that it would rather go to Narrabri? Yes, principally.
131. Still, the Commissioners are of opinion that it is not advisable that a line should be made from Narrabri to Pilliga? Yes; they have reported against that proposal.

132. In that case, how would the people get their produce to Narrabri from Walgett? As they get it to-day.

133. Not by railway? No.

134. Do the Commissioners approve of the line from Woolabra to Collarendabri? I think they rather favour that line in their report.

135. On the whole, the Commissioners prefer at the present time the railway from Warren to Coonamble? Yes.

136. Do you know anything of the nature of the country? No; I have not been over it myself. The Commissioners were over it and were exceedingly pleased with it. Mr. Harper was with them.

137. *Mr. Lee.*] We have now practically four lines before the Committee, all, directly or indirectly, involving the traffic of the Barwon River, namely, a line from Byrock to Brewarrina, one from Narrabri to Pilliga, and ultimately to Walgett, one from Warren to Coonamble and ultimately to Walgett, and one from Woolabra to Collarendabri;—the Barwon River is the terminal point of the whole of these lines? Yes.

138. Are the Committee clearly to understand that the present recommendation of the Commissioners for a line from Warren to Coonamble contemplates that point as the terminus? For the present. They have no idea at present of going beyond that.

139. If the line were constructed to Coonamble, is there any probability that it would be extended to Walgett eventually? If it should be advisable at any future time to extend the railway to Walgett, the opinion of the Commissioners inclines towards an extension from Coonamble. But as I have already said, at the present time they do not think an extension to Walgett from any point would be justifiable.

140. But, viewing the whole question, if at any time it should be advisable to extend the railway to Walgett, then the Commissioners think it should go from Coonamble? Perhaps I might read more fully the opinion they expressed in November, 1895. Writing to the then Minister of Public Works they say:—

With reference to the desire of the Hon. the Minister to have the opinion of the Railway Commissioners in reference to the most desirable route to be taken to connect Walgett with the railway system of the Colony, we beg to state that we have considered all the routes mentioned in the letter from the Under Secretary for Public Works, dated the 11th ultimo, and in our opinion there are only two which should be seriously considered for the purpose, namely, from Warren—to which an extension has recently been recommended—*via* Coonamble; or from Mudgee *via* Gulgong. The estimated costs of these extensions are respectively £385,000 and £734,000; and in view of the large difference in favour of the former it is recommended that it should be selected for the purpose. The Commissioners would, however, point out that they do not consider that the prospect of traffic to and from Walgett would justify at the present time an extension of the railway to that place; but that an extension from Warren to Coonamble at an estimated cost of £177,500 would meet all the requirements of the near future.

141. They are simply there dealing with this line as an extension from Warren to a point where they believe it would be of advantage and would pay? Yes.

142. If this extension is made to Coonamble the question of an extension from Mudgee to Walgett drops out of the question? Yes.

143. Because there would then be practically two lines to the one point? Yes; and the great objection to the Mudgee line is its cost, as the Commissioners point out.

144. Would it not appear that if a line is constructed by this route to Walgett all that large area of country from Brewarrina towards the Western line, and across country where it intersects the Coonamble line, and all the rivers there, would be practically for all time without any railway communication? Still each extension places them in a better position than they were before.

145. What better position would they be in? Traffic by road drifting down along the creeks must help them a bit. Every mile you go westward must help the western country.

146. You mean they would be able to come down the Castlereagh, the Macquarie, the Marthaguy, and those other rivers and touch the railway at a point which would be much closer than Warren? Yes; each mile of extension must help the district. The district itself is not rich enough to warrant an extension being made at the large expenditure that would be required. That is the view the Commissioners take. They would proceed very tentatively in recommending an extension into that far western district.

147. If the Commissioners are satisfied that their present proposal is the wisest, and having in view the fact that the line must ultimately go to Walgett, it would follow, as a matter of course would it not, that all the other proposals for extensions to the Barwon would be, practically useless? So far as Pilliga is concerned, I should say so, and perhaps so far as Brewarrina is concerned; but I am inclined to think rather favourably of the Collarendabri extension.

148. The Commissioners are of opinion that there is no justification for more than one line to go to the Barwon? I should not like to say that. You have the Darling touched at Bourke, and you would have it touched at Collarendabri. You would have it touched at pretty wide distances.

149. But there is an enormous river area between those two points? Yes. At the same time you cannot touch the Barwon at any other point without involving an immense cost to the country.

150. Is it not the country between the two points mentioned that provides all the wool traffic? No; I should not like to say that.

151. But there is little or no traffic above Collarendabri on the river;—Collarendabri, except in very favourable seasons, is at the head of navigation? Collarendabri would drain a very big district.

152. The river-borne produce comes from points between Collarendabri and Walgett, and between Walgett and Brewarrina? There is not a very great deal of river traffic, so far as I am aware, at those points, because the river is not, as a rule, very certain of navigation.

153. If the line is extended to Walgett, as proposed, looking to the future, it would follow that all the traffic from that western country, having Sydney as its depôt, would have to come by the Great Western line? Yes; the Commissioners do not recommend an extension to Walgett. They would like that to be understood.

154. But there can be no doubt that if a line is once made from Walgett to Coonamble it will be taken further? Most likely.

155. As far as we can see at the present time, we must assume that, if this extension is made, it will have to be taken further? Yes; but I think it will be a long time ahead myself.

156. In such an event, the Great Western line would have to carry all that traffic? Yes.

157. Would not that be burdening the Western line very much? I think not. I think we should be able to carry it.

- H. McLachlan.
15 Dec., 1897.
158. You think the Western line would be capable of carrying the additional traffic? Yes.
159. Of course, that would not be the only extension from the western system;—there would be other extensions from the Western line, all of which would mean bringing additional traffic to the Great Western Railway? Yes.
160. Under those circumstances, with the heavy grades over the mountains, do you think it would be possible to carry the whole of the western traffic and the north-western traffic on that line? I do not think we should feel distressed by the additional traffic we would be likely to get. I do not think that should be a factor in the consideration of this question.
161. I suppose it is a phase of the question that has been considered by the Commissioners? If it were a vital question it would be considered, but it is not a vital question.
162. But, as a matter of fact, have you not had to improve your lines very much to enable you to carry the present traffic? Taking the three routes to Coonamble most favoured, namely, from Warren, Dubbo, and Mudgee—either of these would go over the western system, and over the worst part of it.
163. But would not that be avoided if the extension were made to Walgett from Narrabri? Still that consideration is not important enough to turn the scale in favour of a railway from Narrabri to Walgett.
164. But if that country is closely settled in the future, and the produce from it largely increases, will not the traffic be a great tax upon your western system? I do not think that is a matter that would ever have to be feared, because, if the traffic became very great, we could duplicate the line. There are various ways in which you could help to carry the traffic.
165. Has not the western traffic increased to such an extent as to necessitate your altering the grades? That is done as an economical arrangement, even with traffic that is only comparatively heavy, and it pays. That is one reason why we can put more traffic on the line. It will help the carrying power of the line a great deal, and consequently we want some additional traffic to assist us further.
166. Taking the northern or north-western line as against the proposed extension from the western line, the extension from Narrabri to Walgett being shorter, and the distance from Sydney and from Newcastle being less, do you not think the traffic from that portion of the country could be economically carried by that route, thereby giving the producers along the north-western and northern lines a benefit? That is not the only consideration. There are a number of other considerations. In the first place, the traffic to the Walgett district does not warrant a railway at all, nor does the intermediate traffic warrant the extension of the railway. In the case of the proposal under consideration, you have a district in which the Commissioners think the intermediate traffic does warrant the extension of the railway. If, in consequence of that extension, it is found advisable to carry the railway on to Walgett, so much the better; but at present the Commissioners do not recommend a railway to Walgett from any point.
167. The construction of a railway to Coonamble practically determines the route of the extension to Walgett, if such should become necessary? Yes, if necessary; and that is, of course, a very important consideration, because I think that, in the opinion of the Commissioners, it would, perhaps, be a long time before railway extension from Coonamble to Walgett would be considered necessary.
168. If the railway does not go beyond Coonamble, and if the north-western line does not go beyond Narrabri, would you not continue to have that difficult traffic to deal with on the river that you had for so many years? There is very little traffic done on the river at this end below Walgett, either towards Narrabri or towards Collarendabri.
169. There must be a certain amount of traffic that finds its way down to Walgett in seasons when the river is favourable? As a matter of fact, very little traffic by river passes Bourke; so that even if it came down the river, we should still probably get it at Bourke.
170. That is to say, your railway system would get it at some point? Yes; we should take it up at one point or the other.
171. In other words, you are now satisfied that the wool traffic cannot go to Victoria or South Australia by river? Not from above Bourke. That has been the experience for some years past.
172. It used to at one time? Some years ago, perhaps.
173. But of late years it has not? That was the information we had with regard to the Brewarrina line.
174. I suppose you are prepared to say definitely it does not go there? That was the information we had with regard to the Brewarrina traffic.
175. As a matter of fact, you could bring the produce to market so much cheaper and quicker? That seems to influence the people.
176. So far as the Commissioners are concerned, they are satisfied that an extension to Coonamble would pay, and they are satisfied that the best way to take that extension is from Warren, and not from Mudgee? Yes; and the reason is very largely because of the difference of cost, and the greater expenditure the country would have to bear.
177. *Mr. Fegan.*] The objective point of railway extension, either from Narrabri or from Warren, would be Walgett? No; I should not like to say that. The Commissioners do not recognise at present that a railway to Walgett is necessary.
178. But is it not a fact that when the proposal was before the Committee to construct a line from Nevertire to Warren, the opinion given by the Commissioners was to the effect that they had no idea of constructing the line to Coonamble at that time? No. I think they said they had an idea that the line might be constructed to Coonamble. I think that, to some extent, they recommended the extension to Warren as the first section of a line to Coonamble.
179. Were not the Committee told that a line from Nevertire to Warren was desirable in order that a better depôt might be provided at Warren than existed at Nevertire? I think there was also the idea of a future extension.
180. Was it not pointed out that at Warren there would be better water, better feed, and better stock appliances? That was stated, but at the same time I do not think it was represented that, in the future, it was not likely the line would go beyond Warren to Coonamble.
181. Is it the intention of the Department to charge local rates on the line to Coonamble, or the ordinary rates? It is intended to charge what we call through rates.
182. So that you look upon this line as one that will pay from the beginning with through rates? Yes.
183. Do you know the distance between Narrabri and Newcastle? I think it is 250 miles.
184. Pilliga to Newcastle is a much nearer line than the line from Coonamble to Sydney? Yes.
185. Though you say you have not taken it into consideration, do you not think that a line will very soon have to be constructed to Walgett? The Commissioners think not.

186. Do I understand you to say that the Commissioners think it is of so small importance that they have not taken it into consideration? They have considered it, but they do not think it is necessary to construct a line to Walgett. They see no immediate necessity for it.

187. I suppose the line from Warren to Coonamble is much cheaper than the line from Mudgee to Coonamble? Yes.

188. And cheaper than the line from Dubbo? Yes.

189. Is the country from Warren to Coonamble better than the country from Dubbo to Coonamble? Yes.

190. Serving a larger number of people? Yes.

191. *Mr. Roberts.*] Have the Commissioners advised the Government that they do not see any necessity at present to give Walgett the advantage of railway communication? Practically, yes.

192. Is that owing to the fact that Walgett has the advantage of river communication to Bourke? Not so much for that reason as for the fact that they do not think it would be a profitable undertaking. I think that is the consideration which largely influenced them. They do not see any prospect of such a line being remunerative.

193. It is not altogether the competition from the river traffic? No, I think not; and I think the Commissioners had in consideration more recently the probability of a line being made to Collarendabri.

194. They think a connection at Collarendabri would command greater traffic than a connection at Walgett? Yes; it would command some of that traffic at any rate.

195. Is the river navigable between Collarendabri and Walgett? It might be in a favourable year, but I do not think you could call it a navigable river.

196. It would have to be a very favourable year? Yes.

197. Would not the quantity of wool coming from Walgett be sufficiently large to warrant Walgett getting a railway from some point or other? No; the Commissioners think not.

198. Does a large quantity of wool at present go down the river from Walgett to Bourke? I think not.

199. In view of the impassable nature of the country in wet seasons, and the difficulties of transport in dry seasons, would not the construction of a railway to Walgett prevent a large expenditure on roads? I do not think you would save much road expenditure. I do not think there would be such a saving as would warrant the Government in spending money on a railway.

200. Could you tell the Committee where the Walgett traffic goes at present;—does it go mostly to Newcastle? It goes mostly to Narrabri, and is carried over the Northern line to Newcastle and Sydney. A great deal of it is carried by the local steamers from Newcastle to Sydney.

201. Could you tell us the percentage of wool, say from Walgett, that is shipped at Newcastle, and the percentage that comes to Sydney? I know most of it comes to Sydney, but I could not say from memory. We had that particular information worked out, and I think it was given to the Committee in connection with another line. Two-thirds of the wool from that district comes to Sydney.

202. And the other one-third is shipped at Newcastle? It may be shipped from there direct to foreign ports.

203. Would not all of that 33 per cent. come to Sydney by steamer? Most of the two-thirds would come to Sydney by steamer. It would not be carried by railway from Newcastle to Sydney. Two-thirds is the proportion that comes to Sydney, either by rail or by local steamer.

204. Could you tell us how much came to Sydney from Newcastle by steamer, and how much by rail? Not from memory. We do not carry a great deal by rail.

205. Would not a through rate be quoted from Narrabri to Sydney, and would it not be better to pay the through rate than to tranship at Newcastle for Sydney? The through rates exist to-day; but still the steamers cut for the business, and the Commissioners have not thought it worth while to adopt a differential rate. The people at present have the advantage of a through rate if they wish to avail themselves of it.

206. If the line to Coonamble is constructed, do you expect that it will get any of the traffic, or a large portion of the traffic, that now goes by way of Narrabri? No; I do not think Mr. Harper has allowed for any Walgett traffic.

207. It would still go down to Newcastle? It would still go as at present.

208. So that Newcastle would still remain the shipping port? Chiefly so for the Walgett district.

209. *Chairman.*] I want to direct your attention to a comparison between the line from Dubbo to Coonamble, and that between Warren and Coonamble, dealing with the matter on a commercial basis;—you told the Committee that one reason why the Commissioners approved of the Warren to Coonamble line was that it would save £57,000 in initial cost. Calculating the interest for the sake of comparison at 3 per cent., the saving of that £57,000 means, approximately, from £1,500 to £1,600 a year;—that is your credit to start with? Yes.

210. Comparing that credit with the other side of the question, goods from Coonamble, *via* Warren, to Sydney would be carried 46 miles further, and therefore you have 46 miles more haulage for all time? Yes.

211. The length of new line to be constructed is, in one instance, 63 miles, and in the other 93 miles, and therefore there is a wear and tear of 30 miles? Yes.

212. It would practically resolve itself into this: We will take it for granted that 30 miles of the line from Dubbo to Coonamble would serve some local purpose, just as 30 miles of the line from Warren to Coonamble would serve some local purpose. The case, therefore, resolves itself fairly well into the saving on the initial cost of £57,000 as against the extra haulage for all time of 46 miles? Yes.

213. Looking at your statement with regard to the Warren and Coonamble line, the Committee are given to understand that the cost of haulage on the two lines under consideration would be about the same, the grades and curves being about the same, so that we may regard them as equal from that standpoint? Yes.

214. Your estimate of the cost of maintaining the permanent way and locomotive expenses is £4,900—that is, for 63½ miles;—is it reasonable to suppose that the cost of hauling 46 extra miles over country west of Dubbo would be equal to 46-63rds of £4,900? Of course you might take it in that way. I should not like to say it would be exactly the same, but for purposes of comparison I think you might reasonably say so.

215. For convenience of calculation we will take it at 46-63rds of £5,000;—that comes to something between £3,000 and £4,000 a year? Yes.

216. Therefore, in a financial sense, viewed from the first standpoint, it would appear that the figures would rather tell against the Coonamble to Warren line? Yes. That may be so if the only factor in the consideration is the question of reaching the port of shipment; but the local advantages in the way of traffic between Warren and Coonamble are so immensely superior to those existing between Dubbo and Coonamble as to warrant the adoption of the longer route to port.

217.

H.
McLachlan
15 Dec., 1897.

- H. McLachlan.
15 Dec., 1897.
217. Then it follows that a line from Coonamble to Mudgee would show a greater saving in haulage to Sydney, but on the other hand a greater initial cost; while there again, of course, the local considerations come in? Yes.
218. Is the Mudgee line a very difficult one to work;—what are the grades? One in 40 is the heaviest grade.
219. Would it be of greater advantage to the country to connect at Mudgee, or to connect, say, at Wellington? That point has not been considered. We have very heavy grades from Wellington to the top of Mullion Creek. There is a long stretch there of 1 in 40.
220. Is there any practical difference between Wellington and Mudgee? I do not think there is a great deal; the same ruling grade applies in both cases.
221. Then you think we need not bother about the question as between Wellington and Mudgee? I do not think so.
222. What is the freight for wool by steamer from the Hunter to Sydney? Speaking from memory, I think it is about 10s.; but Mr. Harper could give you that information.
223. How far can you carry wool on the railway for 10s.? It depends upon circumstances. You may say that sometimes we carry wool 100 miles for nothing. We carry wool at between 3d. and 4d. a mile; that is what you might call a local charge.
224. What is the charge for wool per mile? We have carried it from Bourke for less than 2d. per ton per mile. On the other hand, our local charge has been as high as 4d. a ton per mile. I should not like to say at what we can afford to carry it, because we are guided by circumstances—the length of haul and the competition.
225. What would be a fair rate for 100 miles, say, between Sydney and Newcastle? We have been charging 15s., but I regard that as a low rate.
226. Could you do it cheaper than that? We could do it cheaper; we carry certain commodities cheaper.
227. Would it be a commercial transaction if done cheaper than that? It would, I think, in this way: that it is an extended rate; but the Commissioners have not been too anxious to compete in that way for the Newcastle business.
228. Therefore, if the steamers do it for 10s., it is reasonable to believe they will carry the wool permanently? They have been carrying most of the wool, yes.

THURSDAY, 16 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LYONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Warren to Coonamble.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

- J. Harper.
16 Dec., 1897.
229. *Mr. Humphery.*] Have you brought with you a statement with reference to the proposal now under the consideration of the Committee? Yes; it is as follows:—

PROPOSED EXTENSION, WARREN TO COONAMBLE.

(Distance, 64 miles; estimated cost, £177,000.)

Distance from Sydney to Nevertire	341 miles.
" Nevertire to Warren	12 "
" Warren to Coonamble	64 "
Total distance.....	417 miles.

The other two routes to Coonamble which have had consideration give the following mileages to that town from Sydney:—

<i>Via</i> Mudgee.....	337 miles.
<i>Via</i> Dubbo	373 "

As directed by the Commissioners, I instructed an officer to make a thorough investigation at the various stations which dealt with the traffic of the district proposed to be served by this line. Copy of his report is attached. I have personally verified, as far as possible, his conclusions and estimate, as far as existing traffic at Nevertire, Dubbo, and Trangie are concerned. The tonnage given is that actually carried, and the live stock traffic is also based upon actual operations. There is no doubt, however, that with railway communication a very large area of valuable agricultural land in the district would be utilised, inducing closer settlement and a corresponding increase in traffic.

The prevailing rates of road carriage are so low that other than through rates could not be obtained for second and third class goods. The cost of these classes of traffic delivered at Coonamble are:—

<i>Via</i> Dubbo—	second-class.	Third-class.
Rail to Dubbo	102/8	142/8
Road to Coonamble.....	45/-	45/-
Total	147/8	187/8
<i>Via</i> Nevertire—		
Applying local rates	153/3	210/3
Applying local rates to Coonamble	153/3	210/3
Through rates by rail.....	139/2	193/9

It is obvious that we could not obtain more than through rates.

Of course it would be possible to obtain local rates on all classes to 1st inclusive, which would probably increase the estimate by about £500.

Credit has been taken for the increased earnings over the main line by the division of the traffic at present falling in at Dubbo and at Trangie.

Wool

MINUTES OF EVIDENCE—RAILWAY FROM WARREN TO COONAMBLE.

Wool Traffic.

There is no doubt it would be quite possible to obtain a higher and arbitrary rate of 10/- per ton or more for wool from Coonamble. J. Harper.

The lowest rates *via* Dubbo are :—

By rail	£3 9 0
By road	£2 10 0
Total	£5 19 0

16 Dec., 1897.

Whilst the rate by rail from Coonamble would be :—

Nevertire to Sydney	£3 15 7
Proposed local rate, Warren	0 3 0
Through Warren to Coonamble	0 5 4
Total	£4 3 11

As, however, the present rate to Cobar (459 miles) is £4 10s. per ton, equal to 2.34d. per mile, or £4 1s. 6d. per ton for the distance (417 miles) to Coonamble, it would perhaps be anomalous to increase it further.

Live Stock Traffic.

The estimate is based on a somewhat bad year for stock and might be safely increased by, I think, at least £1,000. This would be earned on account of increased revenue on the main line from stock at present trucked at Rylstone, Mudgee, and Lue from the Coonamble district, and the inducement to the selectors to fatten for market owing to having ready means of forwarding small consignments which would not pay for droving to the present trucking points.

Including this £1,000 and applying through rates generally, my estimate is :—

Goods, wool, and stock traffic	£6,623 0 0
Coaching traffic—	
2,000 passengers, 30 miles, at 5s. each	£500 0 0
4,000 passengers, 64 miles, at 10s. each	£2,000 0 0
Horses, carriages, parcels, &c.	£200 0 0
Mails	£2,700 0 0
	£768 0 0
Total	£10,091 0 0

I can give details of the estimated traffic as follows :—

ESTIMATE of Traffic, Warren to Coonamble Railway, for twelve months, based on 1894-95 season.

Station concerned.	Miles	Through rates.			Through rates.			Through rates.			Totals.		
		Goods traffic.			Stock traffic.			Wool traffic.			Tons.	Trucks.	Amount.
		Tons.	Rate.	Amount.	Trucks.	Rate.	Amount.	Tons.	Rate.	Amount.

* This represents half the traffic passing through the books.

230. What is the date of that report? 9th June, 1896. The estimated cost of the line stated in that report as £177,000 has since been reduced.

231. Will you please add to the information in that report the rate of road carriage from Dubbo to Coonamble? £2 5s.

232. And from Warren to Coonamble? Somewhere about the same.

233. And from Trangie? No goods come into Trangie, but only stock which follow the rivers down.

234. You have not taken credit for any goods? No; I have only taken credit for stock, in the case of Trangie—stock from Coonamble.

235. Have you examined the district between Warren and Coonamble out as far as Walgett? Yes.

236. Will any traffic come into Coonamble from north in the direction of Walgett? Yes; I have included as far as Wingadee.

237. How many miles would that be from Coonamble? About 45 miles.

238. And from Walgett? I suppose about 20 or 30 miles from Walgett.

239. Then you have included in your estimate the whole of the traffic within about 20 miles of Walgett? Yes, within about 20 miles.

240.

- J. Harper.
16 Dec., 1897.
240. Would any of that traffic which you have included in your estimate be diverted from the Narrabri route? No, not a bale.
241. Will you explain how it is that the traffic from Walgett that now reaches Narrabri will continue to go in that direction? Because the traffic which reaches Narrabri from Walgett is traffic from the north and north-west of Walgett, with the exception of that from Ulumbie which is practically at Walgett.
242. Do you say that the proposal now before the Committee will not give any facilities to Walgett? It will, of course, bring Walgett considerably closer to railway communication than it is at present. It is now 114 miles from Narrabri, and it will then be 67 miles from Coonamble.
243. If Walgett will be 47 miles nearer to a railway, how can it be said that it will not be served in any way whatever? It will be served, but I did not calculate the Walgett traffic. As I explained to the Committee before, in dealing with this group of lines, I have necessarily to consider the claims of each of them, and to be particularly careful to see that traffic which might fall into one is not credited with another. I thought I tried to explain that in connection with the Byrock to Brewarrina line. There is traffic which is really common to both lines. In this case the traffic which has been included in the estimate can scarcely be regarded as being common to both lines.
244. In your estimate of traffic you have carefully excluded any that would possibly be served by an extension from Narrabri or from any other point reaching the Darling? Yes.
245. Therefore any line of railway that may be constructed other than this one will not affect your estimate of traffic? That is the case.
246. Have you taken into consideration in your estimate of the earnings of the line the additional traffic that would be brought on to the main line? No; no additional traffic would be brought on to the main line, unless it be traffic created by reason of the closer settlement.
247. When I say brought on to the main line, I mean the Western line? I have included this much of it: in the statement I have read you will observe that in giving you the traffic that at present comes from that district, and falls in at Dubbo, I have treated it at the higher rate. I have credited it with the increased mileage which will pass over the main line. For instance, to-day coming into Dubbo freight is obtained on the Dubbo distance only; joining the train at Coonamble, of course, freight would be obtained over the whole mileage.
248. Have you considered the competition by road from Dubbo to Coonamble, and allowed sufficiently for it? I have. I have allowed rates which would secure the traffic for the railway, instead of for the road.
249. What rate have you allowed so as to secure the freight that now reaches Dubbo? A difference of 7s. 8d. a ton in one case. The maximum rate which has been taken for rail purposes is 36s. 6d., but that varies down to 7s. 8d.
250. The maximum with what starting point? From Dubbo to Coonamble the road carriage is £2 5s., and the maximum rate allowed here is 36s. 6d., and in the case of wool 11s. 7d.—that is to say, it would cost 11s. 7d. more to send wool from Coonamble right through than it would from Dubbo. But at Dubbo you would, of course, have to add the road carriage between Coonamble and Dubbo, which I have given as £2 10s., which was the rate at the time the report was made.
251. What is the difference between Dubbo and Coonamble by rail and by road for all classes of traffic comprised in your estimate, including passengers? In favour of rail transit, on the highest class of goods, it would be 9s. 6d. per ton. On special and other classes it would be 37s. 4d. a ton in favour of rail transit. In the case of wool it would be 38s. 5d. in favour of rail transit—taking the rates of road carriage as they existed at the time the report was made.
252. Have you observed those differences in making your estimate right through? Yes; those figures are really taken from my estimate.
253. Therefore, in order to put the road carriage on the same footing as the railway carriage, it would be necessary to cheapen it by the figures you have given as the difference? That is so.
254. With regard to the number of passengers included in your estimate, how was that number arrived at? By taking the whole population of the district which would be served by the line, and giving them each one journey per year.
255. How much of the district did you embrace in your estimate with regard to population? About 50 miles due north of Coonamble, about 35 miles west, about 30 miles east, and south by the length of the line to Warren.
256. Would not 30 miles east of the proposed line bring you almost as near to Narrabri? No; it only brings you to Urawilkie, where you would still be 80 miles from Narrabri, with an impassable brigalow scrub between.
257. Would 50 miles north-east from Coonamble bring you close to Pilliga? No. In my estimate of passenger traffic I have included these boundaries:—On the east Wonbobbie, Merrigal, Urawilkie, Terombone, Nebea, and Weetallibar. Direct north—Bogewong, Bimble, Tyrone, Bullorora, Wingadee, Kanimbla, Warrigan, Wangarawallie. North-west—Polybrewan, Carinda, Quabathoo, Warren Downs, Pillingawarrinia, Quambone, and Lower Merri Merri. On the western side—Haddon Rigg, Gradgery, Noondah, Carvell, Mount Harris, the Mole Brigalows, Inglebar, and Narrabone. That will give you a comprehensive boundary of the whole district.
258. Do you regard the estimate you have given of the passenger traffic as a moderate one and likely to be exceeded? Yes. My opinion is that the Walgett people would largely avail themselves of this means of communication with Sydney. There would be about 65 or 70 miles of an infinitely better road than the one they have to travel down the Namoi to Narrabri.
259. Should the Walgett people avail themselves of this proposed railway, what difference in fare would be credited to the line? I could not tell you to what extent they would avail themselves of it.
260. Take an individual journey, and say that instead of going by Narrabri they came by Coonamble? The average would be about 10s. per passenger.
261. There would be a gain to the line of 10s. for every passenger travelling by Coonamble, instead of by Narrabri? Yes.
262. You have had very general experience, have you not, of the whole of that district? Yes.
263. And you are able to speak as to the character of the soil, and the kind of occupation that could be profitably carried on there, either agricultural or pastoral? I think so.
264. Will you give the Committee in general terms the benefit of your knowledge in that direction? My opinion is that it is amongst the best districts in New South Wales.

265. Starting from where? Practically from the starting-point at Warren and extending to Coonamble, and for a considerable distance north of Coonamble; while to the west of the line, on the Mara Creek, the Macquarie, the Marthaguy, and the Merri Merri, the soil is of an exceptional quality, capable not only of carrying stock in large numbers, but capable also of agricultural development. There is a feature about the line I might as well mention now, and that is the large volume of traffic—as I daresay the Committee noticed when I read my detailed statement—which would fall into the line at intermediate points. As a matter of fact, this intermediate traffic is greater in volume than that which would reach the line at Coonamble. It is a line with a prospect of more intermediate traffic than any line I have reported on. That is on account of the character of the soil, and the settlement on these creeks which intersect the line. There is very extensive settlement along these creeks. J. Harper.
16 Dec., 1897.
266. I understand from what you say that it would be more convenient for the settlers to whom you refer to reach the line midway between Warren and Coonamble than to cross the creeks to get on to the western line? Yes. This country to the west is not favourable for travelling, for you have to cross all these streams. You run out into the marshes of the Macquarie. To emphasise what I have said, I should like to draw the Committee's attention again to my revised estimate of traffic. At Tenandra, which would be a railway station on the Marthaguy, the traffic which would come into the line would amount to 1,653 bales of wool. That wool now comes into Nevertire *via* Warren. It comes down the creek along the travelling stock route, and it would join the railway line at Tenandra.
267. You say that 1,653 tons of wool which now finds its way to Nevertire would come to this railway at a point 14 miles from Warren;—how much per ton additional freight would be earned by the Railway Commissioners? I have credited 1s. 2d. for that. Though the actual earning may be small, what I wish to draw attention to is the convenience which it represents to the owners of that tonnage of wool. Although we do not get much out of it, and it does not go far to help our estimate of traffic, still it indicates the settlement of the district and its carrying capacity.
268. I was only anxious at this stage to know if you did not over-estimate? Well, this quantity of wool was actually carried. We know that it passed over the bridge at Tenandra.
269. What would be the additional cost by road from that point? I could not tell. It would be a through rate; but they certainly would not get it down from there for much under 1s. per ton per mile—about 14s.
270. Approximately, what would be the saving in carriage upon the 1,653 tons? From 12s. to 15s. per ton. That would be the saving to the squatter. Then again, take the Merri Merri Creek. Where the line crosses the creek at Bourbah, another railway station would be provided. That would be 40 miles from Warren. At that point 1,373 tons of wool would come in. Perhaps I should take first an intermediate point at Bullagreen, about midway between the two creeks. I am quite sure that even to-day the traffic that would come in at that particular point would be double or treble what we took this year, because during the year a lot of settlement has taken place in the district, a large area of land having been thrown open.
271. Could you say, approximately, what the saving on the wool would be to the sender? The distance from Warren is 30 miles, and he would save about 27s. 6d. per ton. At Bourbah, where 1,373 tons of wool would come in, the saving would be about 35s. a ton, the distance from Warren being 40 miles.
272. Then the Committee are to understand that the whole of the traffic for the district you have now referred to reaches the western railway system? Yes.
273. No new traffic will come into the western system unless it be by reason of the additional production of the district? It is possible that if no extension were made to Walgett or Collarenebri, the traffic from Walgett might come into Coonamble. It is probable that stock traffic would come in from the Walgett district.
274. Would any traffic from Walgett, in your opinion, reach Coonamble? I think it is more than likely that some of the traffic would—that is, assuming that no other line were built.
275. Is there a practicable road? Yes; in fact, it is a drier road than the road between Narrabri and Walgett.
276. Is this your evidence:—That the distance between Coonamble and Walgett is between 30 and 40 miles shorter, and the road is better than between Narrabri and Walgett? Yes.
277. Have you made a comparison without regard to the cost of construction between the suggested railways from Dubbo to Coonamble and from Mudgee to Coonamble, and the railway we have now under consideration? Only in a general way. If a line were built from Dubbo a very large volume of the traffic which I have credited to this line would never find its way on to it. If a line were constructed from Dubbo most undoubtedly the traffic which comes down the Marthaguy would never find its way there. Very nearly 30 per cent. of the traffic which I have credited to the Warren line would never find its way on to the Dubbo line.
278. If you lost 30 per cent. of the estimated traffic from the west of the proposed line, what additional traffic would come into the line from Dubbo to Coonamble from the east? Scarcely any.
279. As to the character of the soil between Dubbo and Coonamble, how does that compare with the district you have just described? There is absolutely no comparison. The land between Warren and Coonamble is infinitely better than the land between Dubbo and Coonamble. The latter is sandy, scrubby, timbered country of a very inferior character. That is until you get as far as Galargambone.
280. The surveyed line from Dubbo to Coonamble is 93 miles in length;—for what distance is the soil of the description you have just mentioned? Fifty miles.
281. How far east from the proposed line, in the direction of the Dubbo-Coonamble line, is the land good? I should think that for about 25 miles east it continues good. There is then a falling off in the quality of the land; it is not as good as it is in the west.
282. How many miles from Coonamble towards Dubbo, on the surveyed line, would be served by the proposed line from Warren to Coonamble? About 30 miles, I should think.
283. That would leave only 13 miles of good land between Coonamble and Dubbo that would not be served by the line from Warren to Coonamble? That is so.
284. Whereas the whole of the land between Warren and Coonamble is good for any purpose? That is so; with the exception of two or three monkeys, or sand-ridges, it is all magnificent land.
285. What is the area of these sand-ridges? I suppose they would represent about 2 miles in the whole distance.

- J. Harper. 286. Does any portion of the line pass through flooded country? No—nothing that would ever do any harm.
- 16 Dec., 1897. 287. Nothing between Warren and Coonamble? Those creeks occasionally overflow, but not to any serious extent.
288. And between Dubbo and Coonamble? I do not know.
289. Between Mudgee and Coonamble? I cannot say; I am not sufficiently acquainted with the country.
290. Will you be good enough to give similar information with regard to the suggested line from Mudgee to Coonamble to that which you have already given? I could not undertake to do that, as I have never looked up the information in connection with that matter.
291. You say you have travelled over the route? The country differs essentially in character. It is practically a mountainous country as compared with open plains of black-soil country. After you pass the Warranbungle in the direction of Coonamble you get into the same class of country, but for over two-thirds of the distance it is absolutely different in character.
292. Is it superior or not? Certainly not.
293. And as to the rainfall? The rainfall is better. The country is more patchy, and not so uniformly good.
294. Is it your opinion that none of the suggested routes to which your attention has been drawn, with the exception of the one now under consideration, would be profitable for railway construction? I do not think so. I am quite sure, speaking from a cursory knowledge of the traffic which comes from the district between Mudgee and Coonamble, that even if local rates were applied such a line would not pay working expenses.
295. Are you prepared to say that, making every allowance for competition, the line under consideration will more than pay working expenses and return interest upon the cost of construction? I have no hesitation whatever in saying it will.
296. In giving that reply have you a full regard for your responsibility as a railway officer? Yes; I only wish a good many of our existing lines were as profitable as I am sure this one will be.
297. So that we may regard it on commercial lines as a proposal that will not involve the Commissioners in loss, but, on the contrary, will leave a certain profit from the time of its opening, and probably an increasing one? Yes; I am absolutely sure of that from my knowledge of the district.
298. You are giving that evidence having regard to every possible adverse influence, and you have not included in your estimate earnings that are at present derived by the Railway Commissioners from the traffic that will probably reach this line? I have not included in the estimate any earnings which would represent traffic or diminished earnings on any other section of the existing lines.
299. Could you say how the additional traffic you expect will be obtained, having regard to the character of the country between Warren and Coonamble? I believe that agriculture will be gone into extensively in portions of that district. There is some magnificent land there. When I was up there, some of the people were growing crops for ordinary station use, and they have been growing them successfully for years.
300. What kind of crops? Wheat and oats. I also saw some magnificent fruit grown in that district. Wherever anyone has attempted to grow anything they have succeeded well.
301. So that your opinion is altogether favourable to the line? Yes.
302. *Mr. Clarke.*] Would the proposed line be better than either the line from Byrock to Brewarrina, or from Narrabri to Pilliga? I have no hesitation in saying it would.
303. You have already stated that the greater part of the country is fit for the growth of cereals? Yes.
304. And the rainfall, you think, is sufficient? Yes—about 19 or 20 inches.
305. At present, I suppose, it is of no use for the people to grow cereals, as they have not means of sending their produce to market? That is so.
306. They only grow sufficient for their own requirements? Yes.
307. Is it intended that this proposed line should go further north—say, as far as Walgett? I do not know; it is hard to say what the intention of the Government may be.
308. Is the country between Coonamble and Walgett good country? Yes.
309. Is it liable to be flooded? Yes; but not to the same extent as is the case on the Namoi. It does not flood up so far. In very big floods, it floods for about from 10 to 15 miles in that direction; but it is not fast water, it is still water.
310. It would not be impracticable to construct a railway at some future time? Certainly not.
311. In the meantime, should a line not be carried from Narrabri to Pilliga, the Walgett people, in order to get their produce to market would still have to use the water carriage down towards Bourke, or land carriage, as at present, to Narrabri? Unless this Committee favourably consider the other scheme submitted to them from Woolabra to Collarendabri. I may say that the traffic at Walgett is not created in Walgett itself. The greater portion of the traffic which comes into Walgett is traffic from the north and north-west of that place, and it would be better served at Collarendabri than at Walgett.
312. If a line from Woolabra to Collarendabri were constructed, a portion of the Walgett people would use that line? The Walgett people, or such of them as would be left, would use the Coonamble line. I do not make that remark in disparagement of Walgett, but in order to convey, as concisely as I can, my opinion about the town. It is an accidental town. There is nothing in its surroundings, or its location, to warrant much development.
313. We have had it in evidence that in the event of the river being navigable a good deal of traffic from Walgett and all that country would go down to Bourke? Walgett is practically the head of the navigation. It is very rarely that steamers go above Walgett. They have been as far as Collarendabri, but that is quite exceptional. There is no doubt there will always be a large amount of river traffic as far as Walgett, but Collarendabri and the district to the north and north-west of that place would undoubtedly be supplied by rail.
314. Can you give the Committee any information as to the character of the land beyond Coonamble? It is chiefly pastoral country—open plains with the ordinary acacia scrub and yarran, and occasionally salt-bush.
315. It is more of a pastoral than an agricultural country? Yes.
316. I suppose, as you proceed further north and west, the rainfall is not so good? No.
317. On that account it would be more suitable for pastoral than for agricultural purposes? Yes; neither would it carry as much stock as the intermediate country between Warren and Coonamble along the creeks I have mentioned. It is not as good country as that.

318. Would the same description apply to the country between Walgett and Collarendabri? Yes; it is all pastoral country. J. Harper.
319. Is it all the same pastoral country from Walgett to Pilliga and on to Narrabri? Between Pilliga and Narrabri there is some country which I do not know how to describe. 16 Dec., 1897.
320. What is the distance from Walgett to Warren? 133 miles.
321. The distance from Walgett to Narrabri being 114 miles, it is shorter from Walgett to Narrabri by 19 miles than it is from Walgett to Warren? Yes.
322. Is it not some 24 or 26 miles shorter from Walgett to Sydney *via* Narrabri, than from Walgett to Sydney *via* Coonamble and Warren? Yes.
323. Therefore if it became a question of getting the river traffic and the Walgett traffic to Sydney, the shorter and cheaper way would be by Narrabri? It might be as regards the traffic at Walgett town; but I should not like to say that the traffic that comes in to Walgett to-day would take the route *via* Narrabri. I am keeping in view the possibility of the Collarendabri line.
324. For what reason? From the centre of production in that district, the distance would be shorter to Collarendabri than to Walgett.
325. If they did not get the trade that accumulated at Walgett, would they lose it because it goes by river? Yes, as I stated in my previous evidence.
326. Then if the Walgett-Pilliga line would not get trade, the Walgett-Coonamble line would not get it? No; and I did not include it.
327. Consequently that is not an argument against one, nor is it an argument against the other? No.
328. But if it were a question of gathering the traffic there, and conveying it to Sydney, then Walgett, *via* Narrabri, would be the shorter route? Yes.
329. You do not base your claim upon an estimate of that character? No.
330. Your claim is that the land is much better in the vicinity of Coonamble, and 20 miles beyond that place, and there is a greater amount of settlement and production? The strongest argument I have—and I wish to emphasise it—is the character of the intermediate district which would be served by the line from Warren to Coonamble. That country is of a better character than any of the country about Coonamble, or north of Coonamble. As a matter of fact, even now the traffic which would come in at intermediate points is nearly as great in volume as that which would come in at Coonamble, and I am quite sure that in a short time it would be, perhaps, double or treble that of Coonamble. The whole of the country west and north-west of the line is of far better quality than any in the neighbourhood of Coonamble.
331. Are you of opinion that the construction of a line to Coonamble would determine, for all time, the extension to Walgett? Yes; I should think it would, assuming that the same common sense view of things were taken in the future as is taken now. But of course it is very hard to speak of the future.
332. If the line were pushed on to Coonamble, it could hardly be expected that the Narrabri line would be extended to Pilliga? Scarcely.
333. Because then there would be two lines competing practically for nearly the same amount of produce? Yes; taking the district north of Coonamble.
334. The nearer both lines got towards Walgett, of course the more those lines would embrace the whole of the traffic? Yes.
335. Therefore, I presume this Committee must consider that ultimately if it is desirable to extend the line to Walgett, and the Coonamble line is made, the extension will take place from Coonamble? Yes.
336. We have the line from Byrock to Brewarrina, which very largely involves the river trade; we have Narrabri to Pilliga, with an ultimate destination at Walgett, which also involves the river trade; there is Warren to Coonamble, also with an ultimate destination at Walgett; and there is Woolabra to Collarendabri;—there are those four lines practically to compete for the traffic in that direction? I do not know whether you would look at it in that light. I do not know that any of these lines are designed to compete for the Walgett traffic, because Walgett itself produces relatively very little traffic. I should rather say in regard to the Collarendabri line that the desire is to extend the line to where the traffic exists, which to-day comes in to Walgett.
337. There cannot be room for all these lines? Decidedly not. If I might make the suggestion, I think it would be as well to have what evidence is forthcoming in connection with the Woolabra to Collarendabri line before the Committee before deciding upon any of these proposed extensions. The Committee will find that the Woolabra to Collarendabri line has an important bearing upon the issue. It will be an important factor as regards the volume of traffic which at present finds its way into Walgett.
338. What will be the rate for scoured wool from Coonamble *via* Warren, to Sydney? For greasy wool the rate would be £3 18s., and if you add 20 per cent. to that it would give you the rate for scoured wool; but it is nearly all greasy wool. The rate for greasy wool from Nevertire is £3 12s. 3d.
339. And Brewarrina? For that we put down an arbitrary rate of 10s. The rates have been reduced since the estimate I made in connection with this line.
340. Has the rate from Narrabri been altered from 53s.? The rate to Sydney is £3 11s., and from Newcastle 53s.
341. Then Walgett, 69s.? That will be the rate from Newcastle.
342. What will it be to Sydney? Add another 18s.
343. Then from Walgett to Sydney it would be 87s., as against 78s. from Coonamble to Sydney, although the distance is shorter in the latter case? That comes about by reason of the relatively lower rate on the Western line, owing to the force of competitive traffic. The rates being lowered at Bourke they have to be lowered proportionately at other places on the line.
344. Have you been over the country from Woolabra to Collarendabri? Yes.
345. And right down the river to Walgett? No; I have not been between Collarendabri and Walgett—I came the other way.
346. You have intersected it again from Narrabri to Walgett? Yes.
347. In fact you know the country almost from the Queensland border to Brewarrina? Yes; I know the whole of that country. I have travelled up the river to Brewarrina, and as far as Walgett. I have travelled between Coonamble and Walgett; between Walgett and Pilliga; from Narrabri to Wee Waa and Collarendabri; and from Woolabra to Collarendabri and the Queensland border.
348. Having the advantage of that personal knowledge, together with very accurate information as to the produce of the district, are you of opinion that the country would be best served by the extension of the

- J. Harper. Coonamble line? Yes; that is my firm conviction. I have no hesitation in giving that as my honest firm conviction to this Committee for its information.
- 16 Dec., 1897. 349. *Mr. Fegan.*] You said that the wool rates have been reduced since you made your report in 1896? Yes.
350. The Chairman asked a question yesterday of Mr. McLachlan, and that gentleman said you could answer it. The question was:—"At what rate can you carry a ton of wool a hundred miles?" I do not think that any one could answer that question, unless you could tell him how much wool you could give. It all depends upon how much you could give.
351. What would you carry wool from Pilliga to Newcastle for? Sixty-one shillings.
352. And to Sydney? Seventy-nine shillings.
353. That would be a difference of 18s. per ton? Yes.
354. So that if a line were constructed from Walgett *via* Pilliga to Narrabri, it would be really cheaper to bring wool by rail to Sydney then to take it to Newcastle and tranship it from there? That is done to-day.
355. It comes down to Sydney? Yes.
356. Could not the Railway Commissioners compete successfully for that trade? They could compete for it, but I do not suppose it would be worth their while.
357. It would not pay to do it? I am afraid it would be said that we were decentralising in opposition to Newcastle.
358. Cannot the same be said of the Commissioners' policy in running omnibuses off and so forth? I do not know what the Commissioners' policy is.
359. You say that the country between Warren and Coonamble is much better than the country around Coonamble? Yes.
360. If that be so why is it proposed to take the line as far as Coonamble where there is inferior country, which would be to a certain extent a drag upon the other portion of the line? It will not be a drag upon it by any means. An acre at Coonamble is worth any 5 acres at Walgett.
361. But why propose to take the railway to Coonamble if the land there is inferior? For the purpose of meeting the requirements of the Coonamble district. It is an excellent district. I only say that relatively the land is not as good there as it is lower down.
362. When you were before the Committee in connection with the Nevertire to Warren line you expressed yourself as doubtful whether it meant an extension a little later on from Warren to Coonamble? I cannot remember exactly what I said. What I most probably said was that I was doubtful whether the extension to Coonamble was in contemplation. As a matter of fact I know it was not, as far as I was concerned.
363. The same thing may be said now with regard to Walgett—that there is no idea of continuing the line from Coonamble to Walgett? I can tell you definitely that when I gave evidence here on the subject of the Nevertire to Warren line, I knew nothing about the extension to Coonamble.
364. Is there plenty of timber along the proposed line? No; there is no timber that would be of any value for railway purposes. You rarely find good timber in really good country. I mean out west. There was some very good timber between Dubbo and Galargambone, but that has been cut out; and east, in the direction of Warranbungle and Coonabarabran, there is good timber.
365. According to your estimate the line will pay as soon as constructed? It will pay working expenses as soon as constructed.
366. And you think that the construction of the line will lead to a development in the growth of cereals? Yes; and, also, that more stock will be carried between Coonamble and Nevertire—that is to say, fat stock. There are a great many small selectors on the creeks in the intermediate country, and it costs them as much to drive 100 or 200 sheep to be trucked at Nevertire as it would cost them to drive 1,000.
367. In the event of either of the rival routes being adopted in preference to this, would not a great deal of the trade east of Coonamble go down the Western line? Yes; but the traffic further west would go into Warren.
368. I suppose the Warren line is not yet completed? It will be handed over to us on the 1st January.
369. There is no doubt about that being a paying concern? No.
370. *Mr. Hassall.*] The whole of the country lying north-west of the extension from Warren to Coonamble right down to the river is of excellent quality? Yes.
371. You have travelled a good deal through New South Wales on your various tours of inspection in connection with proposed extensions, and also in relation to lines already constructed? Yes.
372. Will you give us your definite opinion of the character of the country extending, say, from the proposed railway line to Bourke, and that lying between the Bogan, the Mara Creek, the Macquarie, the Marthaguy, the Merri Merri, and further over on the Castlereagh? My opinion is that it is practically the pick of New South Wales.
373. You think a line constructed from Warren to Coonamble would tap a very large portion of it? I do. The country you have just mentioned is very difficult country to cross in the direction of the Western line, but you can run parallel with the rivers and get comparatively easy travelling.
374. Therefore, a line intersecting that country between Warren and Coonamble would be practically an outlet for all the country lying between the rivers, and when it was not practicable to cross the rivers and get to any other point on the existing railway, say, either at Nyngan or Byrock, the traffic would come down in a south-westerly direction, following the course of the rivers, to the proposed railway? That is practically what the line is to do. The traffic will come down the Marthaguy Creek, the Merri Merri, the Macquarie, and the Mara Creek. This traffic has always had to cross the river at Warren.
375. There is a large amount of traffic coming in there under existing conditions? Yes.
376. Do you think the extension of the railway to Warren has had any effect in increasing the traffic at that point? The line is not opened yet.
377. Have you any knowledge of the country lying between Coonamble and Narrabri? I have been on both edges of it—I have not been through it.
378. How far does the good country extend in a north-easterly direction from Coonamble? About 35 miles.
379. That is out towards Baradine Creek? Yes; and Urawilkie.
380. From there across to Narrabri the country is rugged and scrubby? Yes; chiefly brigalow.
381. And the country from there towards Pilliga is similar in character? Yes.
382. And the country round Baradine is also scrubby? Yes; very bad country.

383. So that in a north-east and north-north-east direction from Coonamble the whole of the country is of a scrubby and inferior character? Yes.
384. And certainly not suitable for small settlement? No.
385. Do you think any extension from Narrabri to Pilliga would serve the Coonamble country? Certainly not. If a line were built to Pilliga to-morrow the traffic from Urawilkie, which is the extreme eastern boundary of the Warren to Coonamble sphere, would, I am sure, come into Warren.
386. And the whole of the traffic would follow the course of the rivers, and come into Warren as it does at the present time? Yes.
387. Do you think any extension to Walgett would serve any great portion of that country? No; the people would not go back to Walgett. The bulk of the production in that district is south of Walgett.
388. The country around Walgett is rather low-lying, is it not? Yes.
389. And I think you said that the traffic on which Walgett practically depends, is from country lying north and north-west of Walgett? Yes.
390. Is the country from the north of the Barwon, out towards the Narran, superior country to that round about Walgett? Yes; it is all fattening country out there.
391. And there is a very large extent of it? Yes.
392. Would a line from Byrock to Brewarrina serve this country as well as a line from Warren to Coonamble? No; I have not included a single station as coming into this system which would come into Brewarrina, were the line built to-morrow.
393. So that practically your estimate is based upon the traffic that must come in to some point between Coonamble and Warren? Yes; it would all come into Warren if a line were built at Brewarrina, and also to Pilliga.
394. *Mr. Roberts.*] Might I ask you to make it a little more clear as to why you do not think it necessary to connect Walgett with the railway system of the Colony? Well, there is nothing in it. As I pointed out just now, the bulk of the traffic which reaches Walgett, and which has created Walgett, is produced in the north and north-west, and not in the immediate vicinity of that town. This traffic has passed through Walgett until recently; but now a great portion of it passes through Collarendabri or goes to Moree. They have had a river, and they have had comparatively cheap freights at Walgett, and these conditions have created Walgett as a centre.
395. I was under the impression that the reason you did not recommend Walgett for railway communication was that you would have to compete with the river traffic? That, of course, was one reason—that Walgett was already supplied with means of communication by river.
396. And if the suggested extension from Woolabra to Collarendabri were carried out, there would still be less necessity for a railway to Walgett? Yes.
397. In regard to the area of country between the Narrabri-Moree line on the one side, and the Barwon River on the other, is the whole of that country similar in character, or is some part of it a better class of country? It is all good country on the north of the Namoi.
398. Is it all similar? Yes; it is all good country.
399. Would a line from Narrabri to Collarendabri *via* Wee Waa, go through the same class of country as the line from Woolabra to Collarendabri? Yes.
400. How many miles north of Coonamble, towards Walgett, does the good country extend? To within about 20 miles of Walgett. It is somewhat inferior pastoral country when you get to Walgett. It is far better country than that between Walgett and Pilliga.
401. *Chairman.*] What is the freight from Morpeth to Sydney by steamer? I think about 10s. or 12s. a ton.
402. And from Newcastle to Sydney? About the same.
403. And the freight by rail from Morpeth to Sydney—for wool, for instance? You can take it as being 18s.
404. And from Newcastle to Sydney by rail? Practically about the same.

J. Harper.
16 Dec., 1897.

FRIDAY, 17 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHEBY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Warren to Coonamble.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

405. *Chairman.*] Have you inspected this line? Yes.
406. You have a statement to make, I presume? I do not think I have anything to add to Mr. Hickson's statement. I can hand in a detailed estimate of cost of the line.
407. *Mr. Clarke.*] Some time ago it was estimated that the line from Warren to Coonamble would cost £177,000; but that estimate has since been reduced to £150,000;—will you explain the reason of that reduction? The later estimate is the revised estimate, after I had gone over the line and compared the prices.
408. Do you think the proposed route from Warren to Coonamble is the best that could be obtained? Yes. The line has the advantage of going through excellent country, and it is the cheapest connection.
409. Can you give us any opinion in regard to a line from Mudgee to Coonamble, and also, from Dubbo to Coonamble, as compared with the line now before the Committee? I have been over the Mudgee to Coonamble

H. Deane.
17 Dec., 1897.

H. Deane.
17 Dec., 1897.

Coonamble route, and the country that line passes through is, for the most part, very excellent in character, but the population is comparatively sparse, and most of the land has been alienated. The length of the line is so great, that on that account alone it would be a much more costly connection. I think Mr. Hickson has given the Committee the figures showing the comparative cost of reaching Coonamble by the three routes mentioned.

410. Are there any great engineering difficulties on the line from Mudgee to Coonamble? No. In Mr. Hickson's report it was stated that the ruling grade from Mudgee to Coonamble is 1 in 60. That is a clerical error; it should be 1 in 80.

411. The line from Mudgee to Coonamble being longer, and through more difficult country, it costs considerably more than the proposed line from Warren? Yes.

412. But would not the distance to Sydney be shorter? There would be a saving in total mileage travelled of about 80 miles.

413. Would that shorter distance compensate for the difference in cost? No; the cost of the Mudgee line would be more than three times the cost of the Warren to Coonamble connection.

414. Can you give us any information in regard to the suggested line from Dubbo to Coonamble, as to the cost of the line, and the country through which it would pass? The cost has already been furnished by Mr. Hickson. The country between Dubbo and Gilgandra is not of a particularly good character. A good portion of the route goes through ridgy ironbark country.

415. Is the distance to Sydney by that route shorter than by the route *via* Warren? You save 30 miles by going *via* Dubbo, as compared with Warren.

416. Would the cost be much greater? The cost is rather more than a third in excess of that of the Warren to Coonamble line.

417. If a line were constructed from Byrock to Brewarrina, would there be any necessity for the proposed line to Coonamble? I do not think it would make any difference. This line would have merits if there were no traffic to come in from any distance beyond Coonamble.

418. If a line were constructed from Narrabri to Pilliga, would it be of any benefit to the people about Coonamble? No, I think not; I do not see how it could.

419. Do you know the character of the country between Narrabri and Pilliga? No; I have only been a few miles beyond Narrabri, down the river. I have not been as far as Pilliga.

420. Do you know whether it is the intention of the Railway Commissioners, if the line is made to Coonamble, to recommend that it should be carried as far as Walgett? I do not think they are at all anxious about it. That may be left to the remote future.

421. Would a line from Woolabra to Collarendabri suit the settlers about Walgett;—do you think that the Walgett people would send to Collarendabri if the line were made? I should not think so. I do not think they would go up the river to take the train at Collarendabri.

422. *Mr. Lee.*] Would you be good enough to give us the details of the cost of construction of this line? The statement giving details is as follows:—

WARREN TO COONAMBLE.

Revised estimated cost of a single line of railway 63 miles 32·71 chains in length with 60 lb.-rails.

Superseding Estimate of 28/4/96.

Description.	Estimated cost.	Average per mile.
	£ s. d.	£
Earthworks	12,504 0 0	197
Timber bridges and small timber openings.....	9,024 16 0	142
Bridge over Macquarie River.....	6,000 0 0	94
Level crossings, cattle stops and fencing.....	2,555 0 0	40
Permanent-way materials.....	40,006 10 0	631
Freight.....	10,137 9 9	160
Platelaying at 1/- = £5,580.....	34,596 0 0	546
Ballasting (½) at 4/- = £5,580.....		
Sleepers at 3/- = £23,436		
Station works including sidings.....	4,900 0 0	77
Station buildings, passenger buildings "B" £1,000; waiting-sheds, £690; station-masters' houses, £1,060; goods-sheds, £1,135; platforms, £600; loading banks, £700; trucking-yards, £1,500; engine-shed, £500; turntable, £450; coal stage, £200; carriage-shed, £200; 5-ton crane £200; 20 ton-weigh-bridges £825.....	9,060 0 0	143
Water supplies.....	1,650 0 0	26
Telegraph.....	951 2 8	15
Mileage and gradient posts.....	951 2 8	15
Miscellaneous	1,000 0 0	16
	£133,336 1 1	
Engineering and contingencies, 12½ per cent. nearly	16,663 18 11	263
Total cost.....	£150,000 0 0	...
Average cost per mile	£2,365 12 0	...

423. Do you think that is an ample estimate? Yes, I think it is quite sufficient. The country is in many places rather wet, but I have allowed more in earthworks than I have done in the case of some of the other lines, so as to provide for that. I have also allowed sufficient for timber bridges and small timber openings. I expect to do almost entirely without ballasting. The price for ballasting is put down at a very low figure, because I anticipate that we might be able to use a little sand, perhaps, here and there where the country is wet. Good ballast would have to come off the main line, probably, and would be costly. But the experience of this class of railway so far has been that ballasting may be almost entirely dispensed with. I should require the sum of £5,580 put down for ballasting, in order to provide for station yards and for some of the soft places along the line.

424. That is equal to about one-fourth of the whole? Yes; it is just a rough estimate of what might be required.

425. Have you satisfied yourself that this is a line that can do without ballast? Yes.

426. You have admitted that it is a wet country, and that you would have to provide extra openings for water-ways; would not that of itself necessitate extra ballast? No, I do not think so. I should put ballast at the bridge ends and in the station yards.

427. If, in the future, the traffic should become so heavy as to necessitate ballasting, do you contemplate that it should be done out of revenue, and not out of loan? I have not provided in the estimate for any future improvement of the line. I think that can very well take care of itself. If the revenue did increase largely, and the line wanted strengthening, it might pay to strengthen it under the circumstances. I think, then, the money should be provided in some other way than out of the original vote.

428. It is estimated that this line will show a small surplus from the date of its opening. The inference would therefore be that the traffic would be larger than in the case of most of the lines of this character, and also that the traffic would grow considerably in the course of years. If that should eventuate, will the class of line you are providing for be sufficient to carry that extra traffic? Yes; it would be quite sufficient to carry a large increase of traffic.

429. Without ballast? Yes.

430. The one difficulty only which you have to provide against is the occurrence of seasons when there might be an excess of rain, or very heavy rain for short periods? Yes.

431. Do you estimate that on the whole it would be cheaper to rebuild any portion of the line that might be destroyed than to make a permanent ballasted line in the first instance? I do not think the question of ballasting is affected by that consideration. The desirability or not of ballasting really depends upon the amount of traffic the line carries, and not upon its liability to floods. The formation level of the line has been raised above flood-level throughout—so far, that is to say, as we have been able to obtain information—and I believe it is perfectly safe, and that the water would not rise up to the top of the formation in any place.

432. Is the country somewhat similar to that between Nevertire and Warren—I do not mean as to its capabilities, but for railway purposes? Yes; it is not at all unlike it.

433. Have you had any experience in regard to rainfall between Nevertire and Warren? Yes; we had some heavy rains about three months ago.

434. Has the result been sufficient to justify you in continuing that class of construction? Yes.

435. That short line, I suppose, would be a good object lesson? Yes.

436. What the Committee would like to be assured of is that they are not entering upon a class of comparatively light line, which, though it might be light in expense so far as initial cost is concerned, might eventually involve very heavy expense to maintain and strengthen it? I should like to say with regard to these light lines that, so far, the maintenance expenses have been, if anything, rather lower than those of the cheapest lines that preceded them. The cost per mile per annum for maintenance is about £30, which is very low indeed. I attribute this, of course, not to the absence of ballast, because ballast renders the maintenance of railway work much easier than the want of it, but to the lowness of the embankments. It is far easier to maintain a road over a low embankment than over a high one. A low embankment has not far to settle; it cannot settle so unevenly as a high embankment, and I think that is where a great saving in maintenance is effected. The line does not get out of order so easily as where the embankment is higher.

437. Which of the light lines now in use do you rely upon as supplying sufficient data to justify the continuance of the system? There are the lines from Narrabri to Moree, Jerilderie to Berrigan, and Parkes to Condobolin as far as Bogan Gate.

438. In all these instances have the estimates been realised;—has the cost of maintenance been in excess of your estimate? I do not think I have ventured any opinion as to the cost of maintenance. I was somewhat doubtful at first as to whether the maintenance would not be really higher; but I think the results have proved the contrary, and that it has been, if anything, lower.

439. Have you had sufficiently severe tests of weather on each or any of these lines to justify you in continuing to adopt the light system of construction for the extension of other lines? Yes.

440. In other words, do you think we have passed the experimental stage in our light lines? Yes; I consider that the advantages of the system have been amply proved.

441. Having experienced that advantage, are you now prepared to tell the Committee that they can adopt the same system in the case of other extensions? Yes; in the western country.

442. In your estimate there is a large bridge provided for over the Macquarie, at a cost of some £6,000? Yes.

443. Is that of timber? No; I have provided for a steel bridge there.

444. For a steel bridge, does not the amount appear to be somewhat low? No; I do not think so.

445. Is the line to be fenced? No; for the greater part of the distance it goes along the travelling stock route.

446. And in that case the adoption of cattle-stops would be sufficient? Yes.

447. Have you found those cattle-stops effective? On the whole they are fairly effective.

448. They are very awkward are they not for the crossing of stock? I have not heard so.

449. Is there not a tendency for the stock to wander out on to them? I have not heard that such is the case; it may be so.

450. You have no reason to suppose, at all events, that the further adoption of cattle-stops will be detrimental to the running of the trains? No; I have had no complaints, and I have not been asked to attempt any improvement in this respect.

451. Do you know whether night traffic has been carried on on any of the lines unfenced, and where cattle-stops have been used? I am not aware of it.

452. So far as you know it has been day traffic, when the danger is reduced to a minimum? Yes; the trains that are run to schedule time are day trains.

453. Do you intend to pursue the same policy with regard to station buildings, and use only those of the cheapest possible character? Yes.

454. Do you think your estimate is ample to cover that item on this line? Yes.

455. Does it not appear very small? I think it is sufficient for a commencement. It makes the line quite workable.

456. How does this line compare in cost with Narrabri to Moree, Jerilderie to Berrigan, or Parkes to Condobolin? It is rather higher.

H. Deane.
17 Dec. 1897.

- H. Deane. 457. What reason do you assign for that? I can show the reason by comparing the items of cost.
- 17 Dec., 1897. 458. As the country is somewhat similar between Narrabri and Moree, perhaps it would be fair to make a comparison with that line? Yes; it is very difficult to make a comparison between any two lines, because the circumstances differ in each case.
459. What is the difference in cost between this line and the Narrabri to Moree line? The cost is cheaper in this case than in the case of the Moree line. That line is estimated to cost £2,409 per mile.
460. *Mr. Hassall.*] Did it cost that? No; it will not cost that sum. The accounts have not been squared up yet; but there will be a considerable saving on the Narrabri to Moree line.
461. *Mr. Lee.*] Then this would appear to be the cheaper line? Yes; and I hope there will be a saving also in this case.
462. In anticipating a saving upon your estimate, of course you include the cost of a steel bridge across the Macquarie? Yes.
463. You do not intend to substitute a steel bridge for that, and reduce the cost in that way? No.
464. You anticipate an actual saving in the cost of the contract? Yes. I do not think there is a very large saving to be effected by the use of timber in this case. The channel of the river is pretty deep, and the piers will be expensive, and as you have to go in for substantial piers, it would be better and very little more expensive to have a good permanent superstructure on the top.
465. Do you think there is any portion of this line of which the cost of construction may, from unforeseen causes, exceed your estimate? That is very difficult to say. I might have to put in more openings, for instance. I might find that the timber bridges and openings, and culverts, were not quite sufficient, and I might have, for those, to draw upon the contingencies. But I think the total estimate is sufficient.
466. Under the Public Works Act you will have a margin of 10 per cent., equal to £15,000, above your estimate;—do you think that margin will be sufficient to enable you to construct this line? I am quite sure it will. I hope to be able to do without that £15,000.
467. Are you prepared to assure the Committee that this estimate, under ordinary circumstances, is not likely to be exceeded? Yes. I may say that it is possible there may be an increase in the item of station accommodation. If it should turn out that the station accommodation provided in the estimate is not sufficient we must, of course, spend more money upon it; but that would really mean an advantage to the line, because it would show that the Railway Commissioners' estimate of traffic had been underestimated. If we should have to spend, say, £2,000 or £3,000 more on station buildings and station works it would be because the returns from traffic were so much greater than was first anticipated.
468. Even if that should happen the additional cost would be, so far as the general cost is concerned, but a nominal amount? The 10 per cent., at any rate, would cover everything. I am sure of that.
469. So far as the additional station accommodation is concerned that, of course, would not run into very much? It might run into a good deal. Station accommodation does not mean merely buildings. It means, perhaps, buildings of a larger character, and it means a good deal of extra length of sidings and road approaches and extra metalling, so that it might easily run into £2,000 or £3,000.
470. In that case you would be well within your mark? Yes.
471. Taking the position of that country from a railway point of view, have you any knowledge in your possession that would lead you to believe that Coonamble could be reached in an easier and cheaper way than from Warren? No; I am sure it could not.
472. Do you think a line if constructed from any other point, such as Dubbo or Mudgee, although longer, could be as cheaply constructed and would be as efficient when constructed? No; I have carefully gone into those estimates. The cost would be very much higher than in the case of the Warren to Coonamble line.
473. Do you view the fact of a line being carried to Coonamble as determining the reaching of Walgett in the future? Not necessarily. I think the natural connection with Walgett would be *via* Coonamble. Of course it could always be made by Narrabri.
474. If a line were constructed to Coonamble, and if it became necessary in the future to give a line to Walgett, would it not follow as a matter of course that that extension to Walgett would be from Coonamble? I think it probably would be from Coonamble. There is very little doubt about it.
475. Are you of opinion that the necessities of that part of the country demand two lines to open it—one from Narrabri *via* Pilliga and the other from Warren *via* Coonamble? That touches a part of the subject that I have not very carefully considered.
476. If, in the future, it should be determined to extend the line from Coonamble to Walgett, could the line between these two points be constructed at the same cost per mile, as between Coonamble and Warren? No; the cost would be greater between Coonamble and Walgett.
477. For what reason? Partly because it is further off, and the freight on materials would be heavier; but largely because a great portion of the country is very liable to floods, and construction would be more costly,—there would be more earthworks and more water-ways to provide for.
478. Then you look upon the cost of construction in the case of the line now under consideration as being one that must not guide the Committee in any consideration with reference to an extension to Walgett? I do not see that it need.
479. As a matter of fact the difficulties are much greater, and the cost will, of necessity, be greater beyond Coonamble? Yes.
480. Do those conditions apply between Pilliga and Walgett? I am not quite certain. I think the estimate for a line between Pilliga and Walgett was £2,200 per mile.
481. That would be about the estimated cost of this line to Coonamble? Yes; but the estimate from Coonamble to Walgett amounts to about £2,500 per mile.
482. Have you had the country explored between Coonamble and the junction of the Castlereagh and Macquarie, for some distance on this side of the Barwon—as to the possibility of railway construction? No.
483. Have you had a line explored, say, between the Marthaguy and the Castlereagh? No; there has been no demand for one.
484. You are not prepared to say at present, whether, if it became desirable to connect with the Barwon River, it would not be better that the connection should be made between the Castlereagh and the Marthaguy, than at Walgett? I do not know that I can express an opinion of any value upon that point. You get into a great bunch of rivers following down between the Castlereagh and the Marthaguy; and I think

think that, at the upper end, railway construction would be a very troublesome matter, as there is so much flood water.

H. Deane.
17 Dec., 1897.

485. You offer no opinion as to the policy of extending this line to Walgett? No.

486. You are quite clear that if the line is decided upon to Coonamble, the conditions are such that your estimate can be relied upon? Yes.

487. And that the provision made would be sufficient for all purposes, and for all the traffic that may come upon the line? Yes.

488. *Mr. Wright.*] Have any of your surveyors reported as to the possibility of inundation in portions of this country. Have you had any report as to the highest known result of any rainfall? The results of the floods are always marked on the sections, and they are given by the surveyors, and the formation level is fixed accordingly.

489. The results of floods known to themselves or known to other people? They always have instructions to make the widest inquiries.

490. So that your surveyors have made all possible inquiry from local residents as to the highest known floods in the district? I believe they have.

491. Could you give the Committee any information as to what area of that country has been covered at any one period by water? No, I cannot.

492. Your inquiries have not extended to that length? No; it has not been put in that way.

493. You simply ask your surveyors to tell you how near the highest known flood has come? Suppose floods reach out from a particular river or creek, across to the route of a line, the practice is to keep clear of that line—keep on the higher ground; and if you have to cross a creek or river which becomes very much flooded you seek the narrowest part of the flooded area. We have invariably done that.

494. And you are satisfied that the level given for this railway is above any chance of washaways—not temporary wash-aways, but those on an extensive scale? So far as it is humanly possible to tell, I think the information is perfectly correct.

495. Your proposed line is, to all intents and purposes, a surface line? Yes.

496. It is laid on the surface, with the exception of a few depressions, and so forth? Yes.

497. Do you give anything above the surface? Yes; from 6 to 18 inches.

498. Suppose you have a stretch of level country a mile or twenty chains not flooded? Then the average would be about a foot—between 9 inches and a foot if the ground were free from flood.

499. So that your rail-level at all times is free from water? Yes.

500. What provision have you made for bridging the Macquarie at Warren? The headway of the bridge over the Macquarie is 32 feet above the bed of the river.

501. Have you any information as to the highest known flood in the Macquarie at this place? We have the information, but I cannot tell you at the present moment.

502. Allowing 32 feet headway, that would give you 6 feet clear above the highest flood level? About 5 feet.

503. You are satisfied that you have made sufficient openings and given sufficient height at all the crossings of the rivers and creeks? Yes.

504. What are you going to build the bridge with over the Macquarie? I propose to have a steel superstructure.

505. And concrete piles? Piles of iron and concrete.

506. Are you going to do the same over the Marthaguy? Yes, I think so.

507. Those are points, I suppose, not yet determined upon? It is rather premature to decide them.

508. If it were determined to substitute steel for wood in any of these important openings would that add anything to your estimate of cost? No; I have provided for that. After all it does not make so much difference as one might expect where the channel is deep, the piers being a very important portion of the cost.

509. I see by the plan that you do not go into the town of Coonamble? No; we keep on the southern side of the Castlereagh.

510. How far is your terminal point from Coonamble? It is close to it. There is a bridge across the Castlereagh into Coonamble, and the railway station will come up almost to the bridge.

511. Why have you not crossed into the town—to avoid the expense of a bridge? Yes. There is no necessity for it; the road bridge is quite close to the town.

512. Do I understand that you contemplate modifying your plan somewhat so as to bring the terminal point of the railway nearer to the town of Coonamble? The site of the terminal station is about 20 or 25 chains from the bridge and about 50 or 60 chains from the centre of the town.

513. So that your terminal point would be something less than $\frac{1}{4}$ of a mile from the centre of Coonamble? Yes.

514. As an engineer can you say whether it would be cheaper for the State for all time to haul goods over 46 extra miles of railway, without any increased rate for haulage, than it would be to spend £100,000 more money in making a more direct route to Coonamble? I could not answer that question without the necessary data. I should want to know the amount of traffic as a basis of comparison, and whether it was to be assumed that the total mileage would be the same in both cases.

515. I assume that the charge to Coonamble is a fixed quantity, so much per ton irrespective of the way the goods are taken. Then I want to know whether it would not be better for the State to spend £100,000 more to make a direct line, and avoid that perpetual extra haulage of 46 miles? I should have to know the traffic and other data.

516. You only deal with the purely engineering aspect of the question? Exactly.

517. You have been asked to report and make trial surveys of this line, and your answer to that inquiry is, that the line can be constructed for a certain sum of money, that it is easy to construct, and that it is good country for railway construction? Yes.

518. As to whether it is the best country or not in the interests of the State, you do not venture an opinion? No; I have pointed out that it is the cheapest way, and that it is very good country.

519. It is the cheapest route by which you could reach Coonamble? Yes.

520. The distance is shorter and the cost is less than in the case of any other projected route? Yes.

521. About the prolongation of the line—have you ever visited Coonamble? Yes.

522. Have you been between there and Walgett? No; I have not been further than Coonamble.

- H. Deane. 523. Have you any report from your officers on the country between Coonamble and Walgett? Yes; there are reports.
- 17 Dec., 1897. 524. Am I right in assuming that the country is liable to very serious inundation? A great deal of it.
525. And therefore railway construction would be an expensive thing? The floods over a good part of the length, I think, are not serious. They are extensive, but would not endanger the stability of the line.
526. But they would necessitate rather costly works, would they not, in comparison with the line under consideration? I have put down the cost from Coonamble to Walgett approximately at £2,500 per mile, which is about £140 per mile more than the cost from Warren to Coonamble.
527. Would you be surprised to hear that the whole of that country, with the exception of a very few miles, is sometimes 7 or 8 feet under water—the country generally? Yes; but I should not go for those places which are 7 or 8 feet under flood.
528. But would you not have some difficulty in avoiding them; I have seen it 25 miles wide? I think the difficulties are somewhat exaggerated.
529. However, so far as your reports are concerned, and basing your opinion on the reports given to you by your officers, your opinion is what you have just stated? Yes. I have not been over the country, and I do not like to express any further opinion than that—except that you can get a safe line.
530. You have been over the Mudgee to Coonamble route? Yes.
531. Have you made an estimate of cost? Yes.
532. Is it long since you made that estimate? No; it was revised, I think, about eighteen months ago, after I went over the line.
533. Do you think any further reduction could be made in your estimate of cost? No; I should not like to say it could. You cross several ridges running at right angles to the line, and it costs money to get up and down those with good grades.
534. In your report you state the ruling grade is 1 in 80? Yes.
535. Is not that, from an engineering point of view, a good enough grade to carry any traffic over? Yes; that is a good grade.
536. There is no difficulty in carrying any traffic over a grade of that nature? Of course it is better to have a grade of 1 in 200 than a grade of 1 in 80.
537. But there is no difficulty in a grade of 1 in 80? No; you can take a long train over it, with heavy engines.
538. So that as far as grades are concerned there is nothing to be said against that particular route? No.
539. And the country, I understood you to say, is fairly good? Yes, for the most part it is very good. I examined the line with the view of seeing whether a grade of 1 in 80 could be substituted for 1 in 60, and I decided that it could; and in going through the estimate I found that, by allowing for an addition to the earthworks, which the adoption of the 1 in 80 grade would involve, prices having gone down in the meantime, the cost of the line would not be increased. Therefore I adhered to the total estimated cost which was previously set down; but I substituted a grade of 1 in 80 for 1 in 60.
540. *Mr. Hoskins.*] Would you like to run a heavy goods train over a grade of 1 in 80 on a light line? No.
541. *Mr. Wright.*] You are aware that there is no interior traffic in New South Wales that necessitates the employment of very heavy trains? I think it is desirable to have easy grades if you can. If the traffic enormously increased, so as to necessitate the use of long train loads and heavy engines, you would of course have to put down heavier rails, but still the earthworks would be there ready for you. The grades would be ready.
542. *Mr. Hoskins.*] And you would use more ballast? Yes; but this is a line that would be capable of improvement at very little expense.
543. *Mr. Wright.*] Is there any traffic conducted at present in New South Wales on any line that could not be carried over that line with a 1 in 80 grade with perfect safety? I am not intimately acquainted with the conditions of traffic.
544. With regard to the surveyed line from Dubbo to Coonamble, the ruling grade there is 1 in 75, and the curves are 20 chains? Yes.
545. You have been over that country? I have not been between Dubbo and Coonamble. I know the class of country, because I have approached it almost to the point where it cuts the Castlereagh in coming up from Dubbo, and I have been a considerable distance out from Dubbo along the road. I have not been right across, but I know the class of country. The estimated cost is given at £2,215, and it is described as a fairly level route.
546. A portion of that route is also liable to inundation, is it not? I do not think so. When you get near the Castlereagh of course you have to look out for floods.
547. In fact, from whichever way you approach Coonamble, there is a certain part of the country subject to inundation to some extent? There is no doubt that wherever you get near a river you have to look out for floods, and the only thing to do, if you can, is to keep far enough back away from the river to avoid them. It is stated in the surveyor's report that some of the line will be subject to flooding; but of course that goes without saying, for you can scarcely get a line anywhere on which some of the land will not be subject to flooding.
548. The cost of the line from Dubbo to Coonamble is about £57,000 more than your estimate of the Warren to Coonamble line? Yes.
549. And the distance from Coonamble to Sydney *via* Dubbo is 46 miles less than *via* Warren? Yes.

MONDAY, 20 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Warren to Coonamble.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

550. *Mr. Lee.*] When you were last before the Committee you gave us the stock returns in connection with the proposed extension from Byrock to Brewarrina, and those stock returns embraced all the district north of Brewarrina? Yes.

G. C. Yeo.

20 Dec., 1897.

551. In preparing your returns in connection with the proposed line from Warren to Coonamble, have you taken care to separate the statistics from those you previously gave? Yes.

552. Can you give us those statistics in detail? Yes; I have a map here showing the area (tinted pink) that will be affected by the proposed railway, and which joins on with the area that will be affected by the proposed Narrabri to Pilliga railway, the particulars of which were given on a former occasion. The area tinted pink and affected by the proposed line comprises about 2,800,000 acres. The boundaries of this area are as follows:—It extends about 50 miles north of Coonamble, 40 miles to the west of Coonamble, and 30 miles to the east of Coonamble.

553. Could you give us the particulars in regard to the stock in the area mentioned? The number of stock in the area tinted pink on map, marked A, from the year 1893 to 1896, inclusive, is as follows:—

Year.	Horses.	Cattle.	Sheep.
1893	6,934	16,989	1,829,205
1894	7,269	21,842	1,882,465
1895	7,131	19,484	1,675,505
1896	7,574	21,252	1,769,095

I have also a return of the sheep shorn in the same area in the year 1896, and it shows the following particulars:—Sheep shorn in the grease, 1,044,105; scoured, 330,000; lambs shorn in the grease, 200,000; scoured, 100,000. The average clip was: Sheep in the grease, 6 lb. 3 oz.; scoured, 4 lb. 2 oz.; lambs in the grease, 2 lb. 2 oz.; scoured, 1 lb. 4 oz. The weight of the clip was 3,737 tons. That was for the year 1896. The next return I have shows the stock traffic passing through Coonamble during 1895 and 1896, inclusive. This represents stock coming from down Walgett way, drifting through Coonamble, and making up the Castlereagh, perhaps to Dubbo, Mendooran, or on towards Mudgee. In 1895, there were 750 horses, 8,000 cattle, and 210,000 sheep; in 1896 there were 680 horses, 6,000 cattle, and 200,000 sheep.

554. Those are stock that have actually passed under the observation of your inspectors for that district in the years mentioned? Yes; the stock went through Coonamble.

555. Is there any particular reason why the stock should drift from the western country towards Coonamble? One of the main stock routes passes through Walgett, and up the Macquarie.

556. Main stock route from where? It would come from the Queensland border—from Brenda; some of the stock might come from Mungindi, down the Barwon, and branch off at Walgett.

557. I presume there is an object in having that stock route;—is that object because the markets lie east of Coonamble? I could not say whether that was the object.

558. But you know pretty well all the routes that stock take to get to market now—to the various depôts in different parts of the country;—Dubbo used to be a very large depôt; is it so now? Yes; Dubbo is a very large depôt at the present time.

559. That would be one reason why the stock come that way? Yes.

560. And the other reason would be because as the lines extend out west the stock would come within the influence of railway trucking? Yes.

561. Do you know of any reason that would lead you to suppose that the route for these stock would be diverted? No; not off that road.

562. It is fairly well watered country, is it not? Yes.

563. And that is one reason why it is good for stock purposes? Yes. After passing Coonamble some of the stock might branch off, and make for Warren or Nyngan.

564. You have also a return giving particulars of the holdings in the area included in your statement? Yes. I have a return giving all the individual holdings in that area [*produced*]. I have also an estimate of the losses in stock in the district for the present year, the figures being obtained from our inspectors. They are as follows:—Horses, 379; cattle, 2,125; sheep, 353,839; lambs, 46,343.

565. How do you account for such a large loss in that district? We account for it by the drought.

566. Does the drought prevail so badly then, even in that country, that the losses are so heavy? Yes; it appears from the returns that it is very bad there.

567. There are no special diseases, I suppose, that would cause the losses? I could not say.

568. So far as you know they are caused through want of grass and water? Yes.

Walter Alexander Smith, District Engineer, Roads Branch Department of Public Works, sworn, and examined:—

W. A. Smith. 569. *Mr. Fegan.*] Have you a statement? Yes; it is as follows:—

20 Dec., 1897. STATEMENT showing Schedule Roads affected by the construction of the proposed Railway from Warren to Coonamble.

Item No.	Mileage.	Roads.	Amount voted.						Amount expended.		
			1892.	1893.	1894.	1895.	1895-6.	1896-7.			
373	41	Coonamble to Combogolong	£ 360	£ 430	£ ...	£ 140	£ 350	£ 300	£ 1,194	5	0
374	15	Coonamble towards Billaroy	75	40	20	40	30	108	0	0
375	28	Coonamble towards Baradine	150	80	80	80	80	317	9	0
376	43	Coonamble to Tunderbrine	55	120	100	275	8	0
377	58	Coonamble to Gilgandra	300	600	700	300	600	500	2,518	17	8
378	65	Coonamble to Warren	500	...	360	700	550	1,808	0	9
380	52	Quambone towards Warren	100	200	150	324	10	7
425	12	Nevertire to Warren	480	...	60	120	120	598	6	5
1372	85	Walgett to Goondabloni	300	185	14	0
1373	105	Walgett and Goodooga to Brenda	555	450	270	500	450	1,647	2	0
1374	29	Walgett to Combogolong	350	350	380	80	150	100	1,017	7	0
1375	70	Walgett towards Brewarrina	70	40	...	280	150	269	8	0
1379	60	Collarendabri towards Angledool	300	110	120	200	200	689	17	11
1382	66	Pilliga to Walgett	700	450	240	400	350	1,488	3	3
1383	60	Pilliga and Bugilbone to Eurie	295	200	100	200	150	610	19	6
1384	49	Wee Talaba and Angledool to Goodooga	125	40	50	80	80	326	6	4
			£ 1,010	4,630	2,490	1,975	4,020	3,610	13,379	15	5

Total amount voted..... £17,735 0 0

Total amount expended 13,379 15 5

The only other road that our map shows under schedule going into Warren is one coming pretty well due south from Quambone, which is about half-way between Warren and the Barwon. The only other road leading directly into Warren is the one from Coonamble. The roads which the Department has under schedule leading into Coonamble are these:—One from Baradine, one from Tunderbrine, one from Gilgandra, one through Bullaroi from a little east of north, and one from Walgett, following for the last portion of its distance along the Castlereagh. This latter road might be regarded as extending across the Barwon to Goodooga, and by a branch to Angledool. Another branch passes up the Barwon to Collarendabri, and then still further northerly up the Barwon. From Collarendabri this road turns westerly through Angledool, joining the other road from Walgett at Goodooga. The two roads I have mentioned from Walgett to Pilliga—one on the north and the other on the south of the river—do not appear to be intimately connected with the proposal, for it does not appear probable that much of their length will carry traffic to Coonamble or Warren under any circumstances. With regard to these remarks, the information given appears to be apparent from the map. My knowledge of the country is not sufficient to enable me to give definite information; that can only be obtained by close personal observation.

Sydney James Pinnington, Acting Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

S. J. Pinnington. 570. *Mr. Hassall.*] Have you a statement? I have taken out the localities in connection with the Coonamble electoral roll. Out of 2,253 electors on the roll, there are 1,188 whom I can locate outside of the 20-mile boundary; 1,028 would be inside that boundary, and 37 I cannot locate at all. Those figures refer to the roll for 1897-8, which is the roll that will be used in the forthcoming general election. The population was last taken by the police in 1896, and comparing the population with the number on the roll at that time, the proportion of population to electors on the roll is as 4 to 1. These are the divisions of the Coonamble electorate, with the figures showing the population and the number on the roll for 1896: Coonamble—population, 2,740; number on the roll, 666. Gilgandra—population, 2,026; number on the roll, 391. Grahway—population, 452; number on the roll, 105. Quambone—population, 650; number on the roll, 180. Warren—population, 2,742; number on the roll, 735.

571. Could you tell us whether the population is increasing or decreasing? The population is increasing, because the number on the roll has since increased by 176, for in 1897-8 the number is 2,253.

572. There has been a gradual increase in the voting power, which means a corresponding increase in the population? Yes.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane. 573. *Chairman.*] You sent in the Book of Reference and plans of the Warren to Coonamble line? Yes.
574. How many pieces of privately-owned line are there intersected? There appear to be about twenty-two.
20 Dec., 1897. 575. Will you look into the question of whether it is necessary to interfere with several private holdings which appear to be severed by the line as shown on the map? Yes.*

FRIDAY,

* NOTE (on revision):—I find it is quite unnecessary. On leaving Warren the line can be kept on the travelling stock reserve between 356 miles and 361 miles. Beyond 399 miles it cannot be helped.

FRIDAY, 22 APRIL, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Warren to Coonamble.

Alexander Wilson, sworn, and examined:—

576. *Chairman.*] Can you make a statement to the Committee in regard to the proposal now under our consideration? Perhaps it would save the time of the Committee if I did so. A. Wilson.

577. You have a thorough knowledge of the country traversed by the various routes shown on the plan? 22 April, 1898.

My knowledge of the country is not, perhaps, so thorough as it might be, but it is considerable. I have made public my opinion that the best route for a line to Coonamble is from Dubbo. Such a line would serve much the greatest population. It would serve a country capable of development, instead of a grazing country, which is probably seen at its best at the present time.

578. *Mr. Hassall.*] You refer to the country between Warren and Coonamble? Yes; that country is more or less grazing country, and in wet seasons a great deal of it is under water. As a whole, it is not capable of considerable development, and would not support a very large population. The country between Dubbo and Coonamble, however, while on the face of it not so attractive, is capable of supporting a very much larger population than is settled there at the present time.

579. *Chairman.*] Do you know the country to the west of the road from Dubbo to Coonamble? Yes; I know the country from Gilgandra to Warren, and all about the Ewenmar Creek. I have had occasion to go across all the country shown on the map, more or less. You will understand that I am not now bringing forward arguments to show that the railway should go to Coonamble. I am assuming that it is agreed that it should go there; but the question is as to the route to be adopted. For a long period I have held the opinion that a line to Coonamble should go from Dubbo.

580. The Sectional Committee say in their report:

The land of the district generally may be divided into (1) alluvial soil along the banks of some of the rivers and creeks; (2) extensive open black-soil plains through which, and adjacent to which, are lesser areas of lighter soil—these plains are interspersed with belts of scrub, and at times extensive areas of low-lying country; (3) timbered country; (4) timbered country with ironbark intrusions; (5) ironbark country; (6) broken lands; (7) sandy areas in which there is not enough body in the soil to sustain agriculture for any length of time.

? I think that is a very business-like description of the country to be met with in the district.

581. The Sectional Committee go on to say:

No. 1, alluvial soil. This may be regarded as suitable for either agricultural or pastoral purposes. No. 2, extensive black soil plains No. 3 timbered country. This is, generally speaking suitable for agriculture.

? That is exactly my idea. You keep more on the edge of the timbered country, where the creeks come down from the Warrumbungle Ranges.

582.—

No. 4, timbered country with ironbark intrusion. A considerable portion of this would be suitable for agriculture.

? Exactly.

583.—

No. 5, ironbark country—the ironbark country pure and simple must be regarded partly because of the poor quality of the soil, and also because of the extensive clearing, as being of very little value except for the timber grown upon it.

? Yes, that is the case. It is worthless but for the timber upon it.

584.—

No. 6, broken lands. These, which include the Warrumbungle Mountains, must also be dismissed from consideration, if the end in view be agricultural settlement.

? I exactly agree with that.

585.—

No. 7, sandy areas. These, though probably in a good season they would furnish a fair crop, are not likely to sustain permanently an agricultural population.

? No; but there is a considerable area of land capable of great improvement—country that is very unattractive at present, but which has considerable capacity.

586. You agree with the description of the country given in the report of the Sectional Committee? Yes.

587. Then the matter becomes simply one of engineering considerations? Yes. I see that you have cut the ground from under my feet to some extent by what you have said about the rainfall. The rainfall becomes perceptibly less every 50 miles you go west, and a poorer country with a better rainfall may produce more than a richer country with a poorer rainfall.

588. The Sectional Committee say:

The road from Dubbo to Gilgandra passes, generally speaking, through a tract of inferior country.

? I do not agree with the statement that the road from Dubbo to Gilgandra passes through a tract of inferior country. A lot of the land which now looks very unattractive is by no means inferior. In the last 20 miles of that 40 there is some very fine land indeed, at any rate on the western side of the route.

589. The Sectional Committee say:

This tract is inferior country and does not extend any considerable distance to the west.

? I do not think there is any inferior country to the west. Most of the timbered country, though it looks unattractive, is good land. The soil there is more or less decomposed trap. It is heavily-timbered country, but in many cases it has a fair capacity for carrying population.

590.

A. Wilson. 590. The idea of the Committee was that we could get pretty well a direct and inexpensive line by going a few miles west of the road, and perhaps go through better country? Yes; I have never had two opinions on this subject. It has always been my opinion that the line should go from Dubbo.

22 April, 1898.

591. Then the question is how to locate the line in the best position so as to make it pass through country best fitted for agricultural settlement? Yes. But I should like the Committee, before they finally decide this matter, to give consideration to the suggestion which I wish to make to them. I wish to prevent a recommendation by the Committee which may interfere with the carrying out of what I regard as a general scheme of some importance. I would suggest that if a connection is made between the Northern and the Western railway system it should be made from Curlewis, a point on the Northern line south from Gunnedah, to a point on the line from Dubbo to Coonamble. So far as I know, there is no reason why a line from Dubbo to Coonamble should not pass close to Gilgandra. A line from Curlewis to Gilgandra would have only one ridge to cross, and that is the watershed between Cox's Creek and the Castlereagh, which is very ill-defined. A line from Werris Creek to either Dubbo or Wellington would have to skirt the foot hills of the Liverpool Range, and would cross all the main spurs, so that it would have to go up and down a good deal. The line I suggest, however, would start on the Liverpool Plains, and by a little altering could be made to avoid anything like a hill until it came to the watershed I speak of, which I think is about 1,800 feet high. The surveyors say that this is the lowest point at which it can be crossed, and people living in the district have told me the same thing. The line would not pass through one large estate. A great deal of the land traversed is Crown land. Some of it has been thrown open during the last few years, and a good deal of it is about to be thrown open.

592. How far would you pass south of Coonabarabran? About 24 miles.

593. You would be south of the Warrumbungles? Yes; we do not touch them at all, nor do we touch the foot hills of the Liverpool Range. Of course, there are several creeks which have to be crossed, and it is all undulating country. I have been through it on business, and I have examined it carefully. So far as I know, there are no engineering difficulties in the way, and the country is nearly all good. While I do not say that the railway should not go to Coonabarabran, I would point out that that town is situated in a sort of pocket, and the Warrumbungle Ranges form a horseshoe around it. To get to Coonabarabran you have to cross them, and there is a considerable area of poor country around the town. The line I suggest would cross the main road from Coonabarabran, close to the junction of Binni Creek and the Castlereagh, about 24 miles from the town. By this route, from the Western line to Werris Creek would be only 16 miles more than by the direct line, though, of course, the length to be constructed would be a great deal less. I have traversed all the country between Werris Creek and the North-western line to Dubbo and Wellington, and I know the whole of this district. From Coolah to Dubbo the country is practically unproductive. I should say that 10 acres of it would not graze a sheep, of course, excepting a little bit of country close to Dubbo. There are some patches on the Talbragar, which are good, but the route of the line from Dubbo to Werris Creek does not touch that land, neither does the route of the line from Wellington to Werris Creek do so. Generally speaking, the country which either of those lines would traverse is very poor. There is a considerable community of interest between the Northern and Western lines, and no doubt there will be a considerable traffic across country, which would vary according to the seasons in the different places. The route which I suggest would go through easier country, and would suit this traffic better than either of the proposed lines. The line from Blayney to Harden gives a very unsatisfactory return, but that is because the mistake has been made of going through heavy country, which might have been avoided by taking the line further to the west, and a great saving effected thereby. All the country from Coolah to Werris Creek is in the hands of about six holders, and, excepting a few reserves, it has all been alienated. The country traversed by the line I suggest is timbered country, and formerly was not considered to be valuable, but people are settling upon it now. I would point out, too, that there has been a tendency in many cases, in carrying out schemes of railway extension, to ignore existing country towns—towns which in England would be country towns. I think these towns should be considered, instead of being ignored, when there is a junction to be made. As the districts develop, people will want to go into the towns to attend meetings of the assizes, to market, and for other reasons. If the line is extended from Warren to Coonamble, that will interfere with the carrying out of my suggestion. I would point out that the line from Dubbo to Coonamble would fairly well serve the people half-way along the line from Warren to Coonamble. A good many people to the west of that line will find their way either to Warren, or to various points on the Western line.

594. *Mr. Roberts.*] Do you think that the people at Bourbah would be fairly well served by a direct line from Dubbo? Yes; they would have only about 14 or 20 miles to go to get to that line. Of course the line from Dubbo must go from the western side of the river to avoid the creeks and gullies.

595. Do you know the country from Coonamble towards Warrumbungle? Yes.

596. That is good country? It is first-class grazing country for about 30 miles. Of course, the moment you get within coo-ee of the Baradine Creek, you get into almost worthless country for many miles. I think that if Coonabarabran has a railway within 25 miles, which will give it communication by way of the Northern line to Newcastle, and by way of the Western line to Sydney, that is all the people there can hope for. I can only say that I approve of the Sectional Committee's report. It coincides with my ideas in regard to railway extension in this district.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM WARREN TO COONAMBLE.

REPORT.

THE Sectional Committee appointed to inspect, take evidence, and report with reference to the proposed Railway from Warren to Coonamble have the honor to report to the Parliamentary Standing Committee on Public Works as follows:—

The Committee, consisting of the Hon. C. J. Roberts, C.M.G., M.L.C., T. T. Ewing, Esq., M.L.A., and T. H. Hassall, Esq., M.L.A., left Sydney by the Western mail on Friday, 18th March, at 8 p.m., and arrived at Warren at noon next day. On Monday morning at 9.30 the Committee opened the inquiry at Warren and examined three witnesses. The Mayor stated that the residents of the town and district, while believing that Coonamble was entitled to railway communication, had no desire to give evidence in the present inquiry. At 11 o'clock the Committee started for Bullagreen en route for Coonamble. After a short stay at Tenandra, where an inspection was made of the Government artesian bore, Bullagreen was reached at 4 p.m. On Tuesday morning the Committee met at 9.30 and took evidence. They left Bullagreen at 1 p.m., and, after stopping at Bourbah and examining several witnesses, they reached Coonamble at 5.30 p.m. They were here joined by Mr. Mocatta, an officer of the Railway Construction Branch, who accompanied them during the remainder of their trip. On Wednesday, the Committee met in the Municipal Council Chamber, Coonamble, at 10 a.m., and were engaged all day in the taking of evidence. Next morning the inquiry was resumed in the same place, and was continued until 5 p.m. An inspection of the country north-east from Coonamble was made on Friday, and on the following day the Committee started for Dubbo *via* Gulargambone and Gilgandra. They reached the former place at 4 p.m., and in the evening held a sitting, at which several local residents gave evidence. Having reached Gilgandra, the Committee on Monday made an inspection of the country in the neighbourhood of that place, and afterwards took further evidence. At 9.30 next morning the inquiry was resumed, and the Committee were engaged till noon in examining witnesses. They left Gilgandra at 1.30 p.m. and proceeded on their journey as far as Yellow Creek, having made a short stay at Balladoran, where they were met by several local residents. The Committee were enabled to inspect portions of the country between Gilgandra and Dubbo on each side of the main road. Starting from Yellow Creek on Wednesday at 9 a.m., the Committee reached Dubbo at 1 p.m., and at 3.30 p.m. held a meeting at the office of the Local Land Board for the purpose of taking evidence. Next day was similarly occupied, and on the following morning (Friday) at 7.30 the Committee left for Mudgee *via* Cobborah and Gulgong. They reached the former place at 5 p.m., and in the evening took the evidence of several persons resident in the district. On Saturday the Committee left Cobborah at 7.30 a.m., and passing through the mining townships of Stringybark and Tallewang arrived at Gulgong at 12.30 p.m. At 2.30 p.m. a meeting was held in the Town Hall, where further evidence was taken. On Monday, at 10 a.m., the Committee met at the Court-house, Mudgee, and examined several witnesses.

Most of the statements made before the main Committee with regard to the productiveness of the Coonamble district and the possibilities of further development were fully borne out by the inspection of the Sectional Committee. The question whether Coonamble and the district intervening between it and the railway system of

of the Colony is entitled to railway communication being at once set at rest. The point for consideration, therefore, is not whether Coonamble should be connected with the railway system, but which is the best route.

In deciding this there are two considerations—one, that of local convenience and development; the other, and possibly greater consideration, the interests of the State. In locating a line for the development of so extensive an area the first matters to be considered from a local standpoint are the present settlement, and the increased quantity of produce likely to result from better means of communication, which latter includes the question of whether the land in the near future will be used for agricultural or for pastoral purposes. The land of the district generally may be divided into (1) alluvial soil along the banks of some of the rivers and creeks; (2) extensive open black-soil plains through which and adjacent to which are lesser areas of lighter soil—these plains are interspersed with belts of scrub and at times extensive areas of low-lying country; (3) timbered country; (4) timbered country with ironbark intrusions; (5) ironbark country; (6) broken lands; (7) sandy areas in which there is not enough body in the soil to sustain agriculture for any length of time.

No. 1—alluvial soil: This may be regarded as suitable for either agricultural or pastoral purposes. No. 2—extensive black-soil plains: It appears improbable that there will be any extensive cultivation of these in the immediate future. The Sectional Committee do not absolutely condemn them for agricultural purposes, but it is improbable, while more easily worked lands are available, and taking into consideration the rainfall, that they will be extensively cultivated, except where the soil becomes of a lighter quality, and is, therefore, more readily worked. Land of the latter description comprises but a small part of the total area of open country. No. 3—timbered country: This is, generally speaking, suitable for agriculture. No. 4—timbered country with ironbark intrusion: A considerable portion of this will be suitable for agriculture. No. 5—ironbark country: The ironbark country pure and simple must be regarded, partly because of the poor quality of the soil and also because of the expense of clearing, as being of very little value except for the timber growing upon it. No. 6—broken lands: These, which include the Warrumbungle Mountains, must also be dismissed from consideration if the end in view be agricultural settlement. No. 7—sandy areas: These also, though probably in a good season they would furnish a fair crop, are not likely to sustain permanently an agricultural population.

The rainfall also plays a very important part in a district where it approaches the minimum at which the growth of cereals is safe. Since the rainfall of the Colony, in the absence of disturbing local conditions, decreases gradually as the distance increases from the seaboard, the proposed line to go through a satisfactory agricultural district should be kept as far to the east as possible. For instance, the rainfall at Gilgandra is 25·8 inches; the rainfall at Bullagreen is about 20 inches. This difference in rainfall is a very vital consideration.

A line from Dubbo towards Coonamble, as shown on the sketch, would pass through a class of country in which agriculture is likely to be more extensive and the rainfall more satisfactory than would be the case along the line further west as proposed by the Department. The country between Warren and Coonamble on the surveyed line is such that a great portion of it in the immediate future will furnish only pastoral produce for carriage on the railway. A line from Dubbo to Coonamble would pass through country which, partly by reason of the rainfall and partly because it is more suitable for agriculture, would bring into existence more satisfactory agricultural settlement. The bulk of the evidence is to the effect that a line traversing the route suggested by the Sectional Committee will preserve the trade relations which have long existed between Dubbo and the Castlereagh and Coonamble districts.

The road from Dubbo to Gilgandra passes, generally speaking, through a tract of inferior country. The contention of the residents is that when cleared this land furnished good crops. In the opinion of the Sectional Committee this statement is correct only with regard to a limited portion of it, and cannot be regarded as applying to the ironbark country, although box country upon which there is also ironbark, no doubt in some instances gives satisfactory returns. The second contention, that there is a quantity of excellent hardwood to be obtained for which there is a large demand, is worthy of consideration.

This

This tract of inferior country does not extend any considerable distance to the west, and, in the opinion of the Sectional Committee, if the line were located as shown on the sketch, probably following the line as surveyed for a few miles, then turning to the west and keeping as direct a course as the engineering necessities will permit, not going too far west from Gilgandra to prevent the land in the vicinity of that place and to the east of it from participating in the benefit of railway communication—such a line, in the opinion of the Sectional Committee, would be best calculated to serve all local conditions in connection with the development of the district.

It might perhaps be possible by leaving the main line a little beyond Dubbo to obtain a shorter length of construction; but unless a less expensive crossing of the river can be obtained than that on the main Western line at Dubbo, it would probably be cheaper to adopt the course previously suggested.

It will be understood that the statement of the Sectional Committee with regard to the location of the route must be subject to further investigation. On general principles their contention is that a line from Dubbo can be located through land more suitable for agricultural development, and that a careful investigation should furnish a route through country in which there are no serious obstructions, so as to be in keeping with the cheapness necessary in the construction of lines for the development of our western country.

On the line as proposed there is a sufficiently extensive ironbark forest to furnish a considerable amount of ironbark for many years to come, and the timber growing along the route at various parts and to the eastward could readily be taken to the railway, being a lesser distance than it is at present hauled to Dubbo.

It is necessary to keep the line off the inferior country referred to, and to so locate it that on both sides there will be a considerable area of land suitable for agricultural settlement. If the line be carried direct from Dubbo to Gilgandra such will not be the case.

Within 15 miles of the line as suggested by the Committee there are 594,000 acres of Crown lands which will be readily taken up. The Committee desire to emphasise the opinion that a serious mistake is being made in the method of the alienation of these Crown lands. A good agricultural area contiguous to a railway is worth considerably more than one remote from a railway. The saving effected by rail carriage would represent in a satisfactory year some shillings per acre of land cultivated. Under present conditions it appears probable that these lands will be leased at a very low yearly rental. If they were set aside as a railway area, and a few pence per acre added to their rental—which the occupiers would gladly pay if furnished with good means of communication—this would provide a sufficient sum of money to make the railway a paying line from the first. It would be necessary that the land should be properly classified, both the quality of the land and contiguity to the railway being taken into consideration. Under such conditions the State would find it possible, without cost to itself, and with infinite advantage to the inhabitants, to settle great areas of country. Without such procedure it is difficult to find a commercial basis for many railways which if constructed would develop valuable areas of land in distant parts of the Colony.

The distance from Sydney to Coonamble *via* Mudgee is 337 miles; the distance from Sydney *via* Dubbo to Coonamble is 371 miles; the distance from Sydney *via* Warren to Coonamble is 417 miles. It is, therefore, at once apparent that the best line for the people of Coonamble (that place being the objective point)—supposing they paid for the carriage of their goods on a mileage basis, would be the first mentioned—*i.e.*, *via* Mudgee. But the cost of construction is so great that in the absence of very strong local reasons the Committee find themselves forced to dismiss this line from consideration.

Gulgong, distant some 18 miles from Mudgee, appears likely to be favoured with more satisfactory mining returns than has been the case for some time past. The land in the vicinity of Gulgong, and further west on the Talbragar, and even still further west, furnishes a considerable amount of agricultural produce. But, as far as Gulgong, the roads are sufficiently good to prevent any serious disability being experienced by the producers; and the extent of cultivated land to the west is not sufficient to justify the Committee in disregarding the great cost necessary to construct a line from Mudgee to Coonamble. The

The cost of the construction of a line to Coonamble *via* Warren is less than by any other route, although it is not less per mile than the cost *via* Dubbo, while the rate of carriage, owing to the greater distance to Sydney, is the most satisfactory in the estimation of the Railway Department; but unless very strong reasons exist why the longest route to the seaboard should be taken, it would be obviously unfair to saddle any community with unnecessary carriage for all time.

The line from Dubbo being 46 miles shorter from Sydney will place Coonamble in a fairly satisfactory position with regard to a through railway rate. The local conditions attaching to this line have already been fully discussed.

The Committee have carefully considered the question of the returns which will probably be obtained from the line from Dubbo to Coonamble. It is probable that any traffic reaching the Coonamble-Warren road to the south of Bullagreen will continue to go to Warren, even were the line from Dubbo to Coonamble constructed, Bullagreen being about equidistant from Warren and the proposed line. There will be, to compensate for this loss, the traffic from the country east from the Dubbo line, which will go far to make up the loss referred to; in fact, it appears probable to the Committee that it will fully compensate for it. In the future, since the line will be located in country much more suitable for agricultural pursuits, returns from it must be very considerably greater than can be expected from the Warren-Coonamble connection. For the reasons stated in this report the Sectional Committee recommend that a survey be made of the route shown (approximately) on the sketch herewith with a view to the construction of a line from Dubbo to Coonamble.

Representations were made by a delegate from Walgett with regard to an extension of the railway to that town. The Committee determined, however, to allow any statement on the subject to remain in abeyance until the line from Narrabri West was being dealt with.

Representations were also made by delegates from Coonabarabran. The Committee believe that there should be a careful inspection of the country between the north-western railway system and Coonabarabran, extending down the valley of the Castlereagh, where it may be possible, by dealing with the Crown lands as a railway area, to give the Coonabarabran district better means of communication than are at present in existence.

Sydney, 21 April, 1898.

THOS. EWING,
Chairman.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM WARREN TO COONAMBLE.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 21 MARCH, 1898.

[The Sectional Committee met at the "Club Hotel," Warren, at 9:30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Warren to Coonamble.

Charles Henry Piggott, Mayor of Warren, sworn, and examined:—

1. *Chairman.*] We are given to understand that, although you believe that an important district such as Coonamble is entitled to railway communication, you regard the matter as one outside the legitimate consideration of Warren at this stage? Yes.
2. You feel that the matter must be discussed outside of any local considerations that you might feel prepared to urge? Quite so.
3. *Mr. Hassall.*] You think that the question of railway connection should be dealt with by the Coonamble people themselves? Yes; I am quite of opinion that Coonamble is entitled to a railway, but I think the question of route should be determined from evidence obtained at Coonamble and elsewhere, so as to decide the best route from a national point of view.
4. *Chairman.*] The people of Warren were aware, of course, that the Committee would visit the town for the purpose of inquiry? Yes; there was a notice from your office, and also a notice published in the local paper.
5. *Mr. Hassall.*] As mayor, representing the opinions of the municipality, and of the residents generally, you think it better that they should practically take up a neutral position? I do.
6. Merely with reference to the particular point of connection with the railway system of the Colony that may be decided upon in extending the railway to Coonamble? Yes.
7. Admitting from your knowledge of the district, and the growing importance of the Coonamble district that it is entitled to railway communication from some point? Yes.
8. *Mr. Roberts.*] Has any public meeting been held to consider the question of railway extension from Warren to Coonamble? Not at Warren.
9. Has the question been discussed by the municipal council? No; except by the members privately.
10. You give it as the opinion of the citizens that they have no desire to offer their views for the consideration of the Committee? Yes.
11. You have come to that conclusion, I imagine, from private conversations with people in different parts of the town and district? Quite so. I do not give it as the opinion of the council itself, but as that of the people and members of the council outside.

C. H.
Piggott.

21 Mar., 1898.

William Robert Rowles, storekeeper and selector, Warren, sworn, and examined:—

12. *Chairman.*] You desire to bring one or two matters before the notice of the Committee? I quite endorse the evidence given by the Mayor; but there are one or two facts I should like to bring under the attention of the Committee. The first is with reference to the difference in carriage. I think it would be well that the Committee should not base the whole of their conclusion on the supposition that if the line were extended from Warren to Coonamble, it would get the whole of the Coonamble traffic. In this I am borne out by a conversation I had with two or three storekeepers of Coonamble, when I visited that place about a fortnight ago. They then stated that if the railway were constructed from Warren to Coonamble, they would still continue to get the bulk of their goods from Dubbo. As a proof of this, I may say that between Warren and Coonamble I passed five or six empty teams returning, and I happen to know that in four cases out of the five the carriers resided in the Coonamble district, and consequently it was apparent that they had no loading. On the other hand, while going from Gulargambone to Gilgandra, which is only a distance of 32 miles out of 100 miles between Coonamble and Dubbo, I passed five loaded teams. I may also mention that I went into the question of railway charges, and I found that for third-class goods the rates from Sydney to Dubbo, as against those from Sydney to Warren, show a difference in favour of Dubbo of £1 9s. 9d., the figures being, Sydney to Warren, £8 12s. 5d.; Sydney to Dubbo, £7 2s. 8d. I found that the difference in road carriage was only 10s., the general rate from Warren to Coonamble being from 30s. to £2 per ton, and from Dubbo to Coonamble from £2 to £2 10s. The difference

W. R.
Rowles.

21 Mar., 1898.

W. R. Rowles.
21 Mar., 1898.

difference in the railway carriage of first-class goods between Sydney and Warren, as compared with Sydney and Dubbo, is 18s. 8d., and for second-class goods the difference is £1 2s. 10d. I have already explained that for third-class goods the difference is £1 9s. 9d. There is also this to be taken into consideration, that although there is this extra carriage of 50 miles to be paid on inward goods, yet the country around Coonamble has a big agricultural future before it, and if the line were constructed from Warren to Coonamble, it would give the Coonamble farmers an outlet for their produce towards Cobar and Bourke, which outlet could not be afforded if a line were taken to Coonamble from either Dubbo or Mudgee.

13. But if the wheat is for export, they would want the most direct route to port? Yes. I do not know whether the Committee intend to go the other side of the Dubbo-Coonamble route and along the Mudgee route. I was rather surprised to find that they had such good country over there. There was more wheat grown about Box Ridge and Tooraweena this year than there was at Warren. Members of the Committee know what wheat is worth in Sydney, and yet the highest price they obtained for their wheat at Coonabarabran was 2s. 8d. Most of them sold for 2s. 6d. They had to accept the miller's price, there being no other market.

Paul Horrigan, grazier, Weenboug, near Tenandra, sworn, and examined:—

P. Horrigan.
21 Mar., 1898.

14. *Chairman.*] Where do you reside? At Weenboug, some miles from Tenandra, on the west side of the Coonamble-road.

15. What area of land have you? 14,300 acres. I shear 15,000 sheep, and have about 20 acres under cultivation.

16. How often have you had your wheat crop in? I have had it in for nine years.

17. How often has it been a failure? Two years out of the nine.

18. Have you any idea what sort of crops you would have got for the other seven years? A fairly good crop, about 12 bushels to the acre.

19. Do you believe that, as a rule, the Warren district with suitable land will give 12 bushels to the acre? I think it would on an average; in fact, more.

20. Do you desire to extend your area for wheat-growing? Yes, I do.

21. If the railway were constructed, would you do so? Yes; I would go in for wheat-growing on a large scale. I am putting down an artesian bore at the present time, as I intend to irrigate.

22. Do you approve of the line from Warren to Coonamble? I do.

23. *Mr. Hassall.*] How far are you from the present railway terminus? The distance to the station is 19 miles.

24. *Chairman.*] How far would you be from the proposed line? About 3 miles, and the bore would be $1\frac{1}{2}$ mile. I may say that I have had applications from different parties to let land for wheat-growing on the halves system, and if the railway were extended I should let land under that system.

25. *Mr. Hassall.*] Relying upon the bore you are putting down as a means of irrigation? Yes. I have a large saw-mill plant on the ground at the present time, and a great quantity of timber, but at the present time there is no sale for the timber, because there is no market. If a line were constructed from Warren to Coonamble I should be able to sell a great deal of it, and send it on to the plains and on to Coonamble. The saw-mill would be about 3 miles from the proposed line. The timber I have is pine.

26. *Mr. Roberts.*] Is there any land being worked for wheat under the halves system at the present time? There is one person this side of Bullagreen who is working on the halves system, but no crops have yet been produced, as they only started last year. They are preparing some country there, and mean to go in for cultivation largely.

TUESDAY, 22 MARCH, 1898.

[The Sectional Committee met at the "Telegraph Hotel," Bullagreen, at 9.30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Daniel McAlary, grazier, near Bullagreen, sworn, and examined:—

D. McAlary.
22 Mar., 1898.

27. *Chairman.*] Do you desire to make a statement concerning the proposed extension from Warren to Coonamble? Yes; it is as follows:—

Cost of Construction.—Mr. R. R. P. Hickson, Under Secretary for Works, in his evidence before the Works Committee, gives the distance to be constructed from Warren to Coonamble as 63½ miles; cost of construction, £150,000, or £2,362 per mile; from Dubbo to Coonamble as 93½ miles; cost of construction, £207,285, or £2,217 per mile. This shows the Warren line will cost £145 per mile more than the Dubbo line. When the estimate of the Warren line was being made, I understand it was considered that the sleepers would have to be got from Dubbo, consequently their extra cost would add considerably to the estimated cost of building the line. As a matter of fact, they can all be got, of red gum, within a few miles of Warren. The contractors for the Cobar line obtained most, if not all, their sleepers on the Macquarie River, about 4 miles above Warren, though they had to pay for the carriage of them by teams to Nevertire, a distance of more than 12 miles, over very bad roads. This carriage cost them more than the carriage by rail from Dubbo would cost, consequently it proves that they got the sleepers at a less cost in Warren than they could in Dubbo.

I believe that a full inquiry will prove that the cost of building a line from Warren to Coonamble will be considerably less per mile than the cost of a line from Dubbo, for, besides obtaining the sleepers quite as cheaply at Warren as they can be got in Dubbo, there are less engineering difficulties on the Warren line, the country being almost level. The extra cost of building the Dubbo line as compared to that of Warren, according to Mr. Hickson, is £57,285, but I feel sure if another estimate of the cost of building the Warren line were made the difference would prove to be much nearer £80,000.

The cost per mile of building the Nevertire to Warren railway is no criterion of what the cost would be from Warren to Coonamble, as I understand the sleepers for the Nevertire line were brought from Dubbo, and were the property of the Government, having been obtained some time previously as a result of finding work for the unemployed, consequently they would probably cost double as much as they could have been obtained for at Warren; and, as I understand, twice as many were used in the construction of the Nevertire line as are used in other lines, this item alone would add considerably to the cost of construction. Again, the line from Nevertire to Warren crosses a lot of low-lying, flooded land, necessitating an unusual

unusual amount of embankments and outlets for the water, while that from Warren to Coonamble is mostly over high and dry land, where a much less proportion of embankments and outlets would be required; consequently, the cost of constructing a line from Warren to Coonamble would probably be much less per mile than from Nevertire to Warren. D. McAlary.
22 Mar., 1898.

Prospects of the line being a paying one.—The line will catch the traffic from all that country bounded by the Macquarie River on the west, Walgett and Pilliga on the north, and Baradine, Tooraweena, Gulargambone, and Collie on the east and south. The country embraced within these boundaries is all first-class grazing and agricultural land. The present traffic from it is ample to ensure the line being a paying one from the start, as the cost of construction will be so small; but there is certain to be a great increase in production, especially in wheat, when the railway is built. The great bulk of the alienated land along the line is in the possession of small holders—the men most likely to develop its resources. Some of them are breaking up land already for the growth of wheat in anticipation of the railway. The leasehold areas of the runs on both sides of the line contain a very large area of Crown lands, all of which is suitable for settlement in small holdings. There is no place west of Orange so well adapted as a site for a flour-mill as Warren is. The Bourke line, from Narromine to Nyngan, passes through splendid agricultural land. The land between Warren and Coonamble is equally good; and, if a railway were built there, Warren being about the centre of this splendid district could collect wheat from any of the lines or send flour along any of them; and, as regards supplying flour locally or to any place north or west, would have an advantage over any other town. The surplus wheat or flour, of course, would be sent to Sydney. The wheat grown in these districts this year, for quantity of yield or quality of grain, will bear favourable comparison with any place in Australia. Besides wheat, many parts of the Warren and Coonamble districts are well suited for the production of maize, millet, sorghum, potatoes, onions, pumpkins, cabbages, turnips, lucerne, tobacco, and many varieties of fruit. As a site for meat-works or a butter factory Warren is the best situated town in the west. A large supply of good artesian water has been found at four places, 20 miles apart, along the line, and, no doubt, can be found anywhere along it. When the people have learned how best to make use of this water, no doubt it will enable them to vastly increase the productions of the district. If artesian water be the great source of wealth which it is said to be in other countries, then the bounteous supply we have indicates a possibility of wealth that would justify the Government in building this railway, even though it benefited but the settlers living within 20 miles of it.

Reasons why we do not support the Dubbo route—Because it is too far from the great bulk of the settlers between Warren and Coonamble to admit of them profitably growing wheat or any of the other products which the fertility of their soil and the bountiful supply of artesian water makes possible to them, quick and cheap carriage being such a necessity in these things.

Because the country on both sides of the line for the first 30 miles from Dubbo, being of a barren worthless nature, will produce little traffic. From there to near Gulargambone the country on the east side is of an equally worthless nature up to within a few miles of the line. Artesian water has been found not to exist at Gilgandra, and probably does not exist anywhere along the line from Dubbo until Gulargambone is passed; consequently there would be no assistance to production from that source. Because the Dubbo route would lose a large amount of traffic from the Macquarie River and Marthaguy which would go to Warren. And because, owing to all these things, the traffic would be much less than on the Warren line, and, as the cost of construction would be much greater, the Dubbo line would probably not pay, and Parliament would not be likely to consent to build it.

28. You gave evidence before the Sectional Committee at Warren on the 11th of May, 1896? Yes.

29. If necessary for the purpose of this inquiry can the statements then made by you be incorporated in this evidence? Yes.

Philip Ralph Robinson, farmer and grazier, near Bullagreen, sworn, and examined:—

30. *Mr. Hassall.*] What is the extent of your holding? 5,120 acres, conditional purchase and conditional lease. P. R.
Robinson.
22 Mar., 1898.

31. To what purpose do you devote your land? Grazing sheep.

32. What is its carrying capacity? It carries about 4,000 sheep.

33. Then, the country is pretty good? Yes.

34. Is that the general characteristic of the country round Bullagreen—exceptionally good grazing country? Yes.

35. I presume the average capacity of your holding is the same as that of nearly every other holding around you? Yes, I think so.

36. Have you tried agriculture at all? I have started. I have only had the place about six months.

37. You are practically a newcomer in the district? Yes.

38. And you intend to experiment in agriculture a bit? Yes.

39. Have you suitable soil? Yes, splendid soil.

40. Has anything been grown near you or in the vicinity which has led you to think agriculture would be profitable? Yes, I think there has been a good deal.

41. You have heard the evidence given by Mr. McAlary; from your knowledge of the district can you endorse that evidence? Yes, I think it is correct.

42. You think the statement put before the Committee was a truthful one, and could be verified upon the strictest examination? Yes, I think so.

43. With regard to road-carriage, what is the freight from Warren to Bullagreen? The rate to my place is £1 per ton.

44. What used you pay for carriage to Nevertire? Twenty-seven shillings and sixpence per ton for wool.

45. Has it been proved that wheat can be grown successfully in this district? Yes.

46. And of good quality? Yes, good wheat.

47. Are you of opinion that the construction of a railway through this portion of the country would lead to the development of the agricultural industry to any great extent? Yes, I am sure it would.

48. If people found it more profitable to go in for agriculture than for grazing, they would, I presume, naturally do so? Yes.

49. And agricultural pursuits mean much more traffic for a railway than pastoral pursuits? Yes.

50. I suppose it is the intention of yourself and, perhaps, other settlers in the district to go in for a mixed system of farming—that is, combining grazing and agriculture? Yes, I have 300 acres now being cleared. It is under contract, and about 60 acres are finished.

51. And you propose to put that area of 300 acres, when clear, under wheat? Yes, I hope to have nearly 200 acres in this year.

52. Do any of your neighbours, that you are aware of, intend to adopt a similar course? Yes, several of them.

53. How far on each side of the surveyed line does the good country extend? There is great extent of it; I have not seen any bad country.

54. I suppose you would consider the country pretty good for 20 or 30 miles on each side of the surveyed line? Yes, I can vouch for that.

55. Did you have any experience in farming before you came here? Yes; I was wheat-growing in South Australia and in Riverina, and I have also a farm at Narromine at the present time. My experience of the land in South Australia was that it was gradually becoming exhausted. 56.

- P. R. Robinson.
22 Mar., 1898.
56. Therefore, you felt impelled to come and look for new country, or country on which you could put your labour to more profitable use? Yes; I was working on my father's farm at that time. I had no farm of my own until I went to Riverina.
57. What was your experience of Riverina? I was growing wheat in Riverina for seven years on my own account.
58. What led you to leave that district? I considered that the land is better up here, and there is more of it.
59. Then your experience leads you to believe that this part of the country will be suitable for wheat growing, and you can obtain and cultivate larger areas? Yes.
60. Do you think your example will be followed by people from South Australia and Riverina, provided railway communication is afforded to the district;—do you think the construction of a railway would have the effect of introducing a large agricultural population? Yes, I feel sure it would.
61. Have you had any experience of what is known as the halves system? Very little.
62. I suppose that system could be initiated here;—do you think the parties holding land would be willing to enter into agreements with intending settlers, who would come here and work under the halves system, the same as has been done at Grenfell and other districts? Yes, I think so.
63. Do you think the soil and the climate, and other natural conditions, are such as to afford sufficient inducement for people to come here and start operations on the halves system? Yes, I am sure they would.
64. In the event of a railway not being built to this part of the country, would you still continue to clear land for farming? Yes, in a small way. I would not under those circumstances go in for farming very largely.
65. How far are you from the present railway terminus at Warren? Twenty-five miles.
66. That in itself is not too big a handicap, is it? No.
67. Do you think that a radius of 25 or 20 miles on each side of the line would be served by a railway? Yes.
68. And men could get along fairly well? Yes.
69. When you first bought your place, how many men had you employed on the 5,000 acres of which you now propose to clear a considerable portion? At first I only had one man employed.
70. Since you have decided to clear the land and go in for cultivation, how many men are employed? I have fifteen now.
71. Then it naturally follows that anyone going in for agriculture must employ a large number of hands, and consequently benefit the labour market? Yes.
72. What is the character of the wool grown here—pretty good? Yes, pretty good.
73. Good staple, good weight of fleece? Yes.
74. Proving that the country is good and sound? Yes.
75. Is the country pretty fairly settled? Yes.
76. The whole of the country lying between Warren and Coonamble is now, I presume, practically in the hands of small holders, compared with what it used to be? Yes.
77. Is there much demand for land when it is made available? Yes, there is a big demand.
78. There are more applicants, I presume, than there are blocks to satisfy them with? Yes. I may say that I have one man on the halves system. He is putting in a crop this year of 50 acres.

Thomas Jones, grazier, Merrigal, sworn, and examined:—

- T. Jones.
22 Mar., 1898.
79. *Mr. Roberts.*] What is the area of your land? 16,000 acres.
80. Is it freehold? 5,000 acres are leasehold.
81. Where is it situated? This side of Tenandra, on Merrigal Creek. It is on the east side of the proposed line.
82. How many sheep do you generally run? About 15,000.
83. How far is your place in a direct line from the proposed railway? About 16 miles.
84. And how far from Warren? Thirty-two miles.
85. Therefore, the railway would save you 16 miles carriage? Yes; but last year I sent all my wool to Trangie.
86. Would you use the railway if it were constructed? I would use the railway if it came to Tenandra, but I do not think I would use the railway at Warren, because Trangie is only 10 miles further, and by going there I should save 35 miles trainage.
87. What is the difference in the cost? I give 1s. 6d. per cwt. to Trangie, and, I suppose, it would be about 1s. to Warren. I have not carted anything to Warren yet.
88. If the line were made from Dubbo to Coonamble, would that be nearer to you? No; it would be a little further away from me.
89. How far would you then be away from the line? About 25 miles—about 20 miles if there were a station opposite Gulargambone. There would be a difference of about 9 miles in favour of the Warren to Coonamble line.
90. Have you formed any opinion as to which would be the better line to construct in the public interest? Yes; I think this would be the better line; it goes through better country and more of it.
91. Would it serve a larger number of people? I think so.
92. Have you been over the country from Dubbo to Coonamble? I know both lines; I was born on the station I am on now.
93. Can you tell the Committee what the country is like between Dubbo and Gilgandra? From Dubbo to Gilgandra it is very bad country—all ironbank country; I do not think it is good for anything.
94. You look upon it as worthless country? Country I would not like to have it if they gave it to me.
95. Then with regard to the country from Gilgandra towards Gulargambone? That is good country—on the western side of the Castlereagh.
96. And then right into Coonamble? From Gulargambone to Coonamble the country is good on both sides.
97. Is it similar country to what we see around us here? Yes; it is about the same country as this.
98. Do people go in for agriculture at all between Warren and Coonamble or anywhere around where you live? I am going in for agriculture myself this year. I am putting in 40 acres of wheat.

T. Jones.

22 Mar., 1898.

99. Whether this line is constructed or not? Yes; I would put it in whether or not.
100. Because you are now within 32 miles of a railway station? Yes. But I have a lot of other country there which I would cultivate if I were near a railway. I have a lot of the scrub country which has been ringbarked, and putting it under crop is the only way to get rid of the undergrowth. Such land is useless for grazing.
101. If this line is constructed, do you think the district will be a large producing district? Yes, I think so, because there is a great deal of land here useless for anything else. All the scrub land the Committee passed through between here and Tenandra is useless for grazing, while it is good for agriculture. If you ringbark it you get an undergrowth that you will never keep down except by cultivating the land; it only grows grass seed.
102. What do you pay for road carriage? I used to pay 30s. a ton to Nevertire, a distance of 45 miles.
103. What do you pay to Trangie? The same; it is about the same distance as Nevertire. You may get it down to Warren for £1; but it is worth a little more to send to Trangie. I sent 115 tons of wool last year to Trangie. I shear for a lot of neighbours, and all that wool went to Trangie last year.
104. Can you state the cost of the carriage of wheat and wool for distances of, say, 10, 20, and 40 miles on the road? For 10 miles you would not get it done under 10s. a ton; 20 miles, about £1; and about 10s. a ton extra for every 10 miles further.
105. The longer the distance the lower the rate in proportion? Yes; when once a carrier gets his load on, he does not mind another few miles.
106. So that the probability is that you would pay just the same for 30 miles as for 40? Yes; I do not think there would be any difference, because when once a carrier has his load on it is no trouble for him to take it another 10 miles.
107. Is there any wheat produced in your neighbourhood? There has been no wheat produced; but there has been a good deal of hay. The difficulty has been to get the wheat to market. There is no mill nearer than Dubbo, and people have been using their wheat crops for hay.
108. Is it because of the difficulty in getting a market that the land in this district is not devoted to agriculture? Yes, I think so. Until the last few years all this country was in the hands of few, and they did not go in for agriculture. But now that the holdings are becoming smaller they will have to do so.
109. Is there a large demand for land? Yes, a great demand. I think there were about 200 applicants for twelve or thirteen blocks available in Warren not long ago.
110. What would you get per acre if you wanted to lease your land, if the railway were constructed? I do not know, but we are asking at present about 1s. an acre for the lease of land for grazing purposes.
111. It is a thing that has not been done? No; except that a lessee may rent from a selector.
112. You would get twice as much as you do now at any rate? Yes.
113. How much wool do you send down to Trangie every year? I sent 115 tons last year, including neighbours' wool shorn at my shed.
114. There would be a large wool traffic along this line? Yes.
115. And you think a wheat traffic would follow? I think so, because there is a lot of this country useless for grazing, and if people pay for it they will have to do something with it. I have a little bit of land in my horse paddock that has been ringbarked and burnt off, and I have to cut the undergrowth about twice a year to keep it down.
116. The land on both sides of the proposed line is very good? Yes, very good. It is good on the eastern side right on to Gilgandra, and then down the Castlereagh to Coonamble, and for hundreds of miles on the western side.
117. That is the land through which the Macquarie runs and the Bogan? Yes.
118. All the way down to the western railway line? Yes; I have been as far as Walgett this way. It is all good country right down there. Of course it is lower country there, and is more flooded, but it is equally as good as this. It is the same country all the way to Walgett.
119. How far in the direction of Walgett does the traffic come to Coonamble? I think it would come from Walgett if there were no other means of getting it away from here—if the river were down. If the river were up the traffic would go by water to Bourke; but, if the river were not navigable, it would certainly come to Coonamble. I think it now goes to Narrabri.
120. Does all the Walgett traffic now go to Narrabri? I think it does when it cannot be sent by water.
121. When do the leases fall in? Some fall in this year and some next year. In the case of those who got an extension for five years, the leases fall in in 1900.
122. In three years a large area will be available? Yes.
123. And do you think the demand is sufficiently great to enable you to say that this land will be taken up? Yes; I think it would all be taken up.

James McCalman, farmer and grazier, near Bullagreen, sworn, and examined:—

124. *Chairman.*] Where do you live? About 3 miles from here, in a south-easterly direction.
125. What is the extent of your holding? About 8,600 acres altogether.
126. What are you running on it? Sheep.
127. Are you cultivating anything? We have been cultivating a little for eight years.
128. Have you had fairly good crops? Yes; we have never had a failure. The crop has always been worth cutting.
129. What do you call a good crop? Of course, we only grow hay. About 2 tons to the acre we reckon a fair crop.
130. Have you grown any wheat? A little.
131. Has that been fairly successful? Yes.
132. Sufficiently so to induce you to believe that this country would grow wheat? Yes; I believe it would.
133. How many bad years would you have had in five? One or two.
134. You think you would have three or four good years out of five? Yes, according to my experience.
135. If, by the construction of a railway, land carriage were saved to the people here, would they be prepared to go in for wheat? Yes; those having scrub country would go in for wheat. Most of the graziers having more or less scrub country they would clear for agricultural purposes if a railway were constructed.
136. That land is useless for any other purpose? Yes. It can be used for grazing; but it is very expensive to keep it in order.

J. McCalman.

22 Mar., 1898.

- J. McCalman. 137. Would you be prepared to grow wheat? Yes.
 138. You heard Mr. Jones' statement with regard to the local conditions of this part of the country? Yes.
 22 Mar., 1898. 139. You believe it is correct? Yes, I do.
 140. What do you pay to get your wool taken from here to Warren? I pay 30s. a ton to Nevertire. I have never sent any to Warren.
 141. I suppose you expect to get it taken to Warren for about 7s. 6d. a ton less? Possibly.
 142. Is £1 a ton a fair thing from here to Warren? That is not a paying rate.
 143. What is a fair thing? I should think 25s. at least. I produce a sample of wheat grown on my own land; I also produce specimens of quinces and oranges. I believe fruit will do very well here, particularly in the scrub country.

James McLeish, grazier, near Bullagreen, sworn, and examined:—

- J. McLeish. 144. *Mr. Hassall.*] What are you? A grazier, residing about 7 miles from Bullagreen.
 22 Mar., 1898. 145. On what water? On no water at all, except what I have made.
 146. What is the size of your holding? About 7,700 acres.
 147. What do you carry? Sheep.
 148. Do you do anything else? Not yet.
 149. Did you hear the evidence given by Mr. McAlary? Yes.
 150. Over what period does your knowledge of this country extend? Eleven years.
 151. Then you are in a position to state whether or not the evidence given by Mr. McAlary is reliable? Yes, it is quite reliable.
 152. Do you endorse the evidence given by him? Yes.
 153. Do you endorse also the description of the country given by him on the Warren-Coonamble route and the Dubbo-Coonamble route? Yes.
 154. The one being pretty good all the way, and the other not so good for a considerable distance from Dubbo? Yes.
 155. You say you have not tried cultivation yet? No, not here. I had enough of that down in Riverina, where I had 25 miles to cart my wheat, and I found it a failure in the very garden of Riverina. I found I could not make it pay.
 156. You would not care, I presume, to go in for cultivation here if you had to cart your wheat 25 miles to the railway? No, I would not attempt it.
 157. You would rather confine your operations to wool-growing? Yes.
 158. Does the carrying capacity of your run compare with that stated in the evidence previously given? Yes, I think so; my land will carry about one sheep to the acre.
 159. That appears to be about the general capacity of the land in this district? Yes.
 160. Which proves that it is uniformly good? Yes.
 161. There is not much waste land, I presume? Some of it is scrub, but if it is well worked up and looked after, even the scrub will carry a lot of sheep; but it is very expensive to keep in order. If the railway were extended to Coonamble I should go in for letting some land on the share system, which has worked well in Riverina.
 162. You think you would be able to get men to come and take up land under that system? I am certain I could get any number of men to come from Wagga Wagga way—men whom I have known in Wagga Wagga. I have to pay £2 a ton road carriage to and from Warren—that is, for wool going in and goods coming back.
 163. Could we average the road carriage from Bullagreen to Warren at 30s. a ton? Yes. I am 7 miles further away.
 164. The rate of carriage, I presume, varies with the character of the season? Yes; sometimes we have to pay £3. I had to pay £3 last shearing.
 165. Do you think the construction of a railway through this district would be beneficial to it generally? I do. I think it would open up one of the finest agricultural districts in New South Wales.
 166. Not only would the people residing here at the present time go in for agriculture, but you think many others would be induced to come and settle here and throw in their lot with you? I feel certain of it.
 167. Do you endorse the evidence given by Mr. Robinson with regard to the demand for land in the district? Yes; there are more applicants than there is land available.

David Munro, grazier, near Bullagreen, sworn, and examined:—

- D. Munro. 168. *Mr. Roberts.*] What area of land have you? Together with my family I hold about 11,000 acres.
 22 Mar., 1898. 169. Is it freehold? No; it consists of conditional purchases and conditional leases, with the exception of about 40 acres freehold.
 170. Do you, like your neighbours, run about a sheep to the acre? Yes; in good seasons.
 171. Where do you send your wool? I used to send it to Nevertire.
 172. What do you pay for carriage? 30s. a ton. The proposed line of railway would pass within a mile of my property.
 173. Briefly stated, what benefit would the railway be to you;—would you get your wool taken down at much less cost? Yes. The railway would be of great benefit to me; I would go in for agriculture.
 174. Have you had any experience in that occupation? Yes; I was twenty years farming in Victoria.
 175. What part of Victoria? At Smeaton, on the Loddon. I was also farming for eleven years on the Yanko.
 176. Are you satisfied that the land all along the proposed line from Warren to Coonamble is well adapted to the growth of wheat? Yes; I am sure of it. I produce a sample of lucerne cut yesterday, and also a sample of hay.
 177. Have you grown any fruit on your land? Yes. I produce samples of peaches and quinces. I have also grown oranges, apricots, and figs.
 178. You regard the district as adapted to the growth of almost every kind of fruit? Yes.
 179. Have you got a large area of land under fruit-trees? No; only an acre. I only grow fruit for my own consumption.
 180. You have heard the evidence given by previous witnesses? Yes. 181.

181. Is there anything you would like to add? I may say that I have been growing a little crop for the last nine years, and every year has been a success except last year. I threshed a bit out one year, and as nearly as I could average it it would have gone about 30 bushels to the acre. D. Munro.
22 Mar., 1898.
182. You think the land would average from 25 to 30 bushels to the acre? Yes; and I am sure there are patches here that would go 40 bushels.
183. If the railway were constructed, do you think that vast areas would be put under wheat? Yes: if we did not go in largely for it ourselves, we would let land on the halves system. You would get a lot more money out of an acre by cultivation than you would get from a sheep.
184. How much would you make out of an acre by sheep-farming, and how much would you make by wheat-growing? Twenty-five bushels of wheat to the acre, at 4s. a bushel, would be £5, and you only get 5s. for a sheep. Deducting expenses, I might say that the figures would be £1 as against 5s.
185. What do you make out of an acre by sheep-farming? Five shillings, and you are lucky to do that.

Michael Quigley, farmer, near Bullagreen, sworn, and examined:—

186. *Chairman.*] Where do you live? About 5 miles west from here. M. Quigley.
22 Mar., 1898.
187. How long have you been here? I have been here about eight or nine years, but I have been in the district about eleven years.
188. Is your country open country, or scrub? Scrub principally.
189. Have you done anything with the scrub land? I have ringbarked it and grubbed it.
190. Will it grow wheat? Yes; it is first-class wheat country.
191. Do you regard the country between here and Warren, through which the Committee passed, as being first-class wheat country—I am speaking of the scrub country? The scrub country is first-class wheat country.
192. Have you any doubt with regard to the growth of cereals being a success in this country? Not the slightest doubt.
193. What do you pay per ton for carriage to Nevertire? I used to pay 30s. when I sent my produce there, and it is about the same to Warren; but I have paid £3 to get goods from Warren out here, and the last carriage I paid was £2.
194. You heard the evidence given by Mr. Munro with regard to fruit and grazing land, and you heard also the evidence given by Mr. Jones and other witnesses with regard to the country generally? Yes.
195. Do you agree with those witnesses, speaking generally? Yes; I quite endorse all they said. I have tried in this scrub country lucerne, wheat, oats, and sorghum, and found cultivation a success, though only in a small way.
196. *Mr. Hassall.*] Do you think that what you have done in a small way you could do on a large scale? Yes; I produce a specimen of the sorghum grown on my land. It would be a wonderful benefit to the district if the railway were extended as proposed, so that we could use the scrub country which, as Mr. Jones pointed out, is almost worthless for grazing, but well adapted for agriculture. I have some scrub that I ringbarked and then grubbed three or four times, and the scrub is coming again now.
197. This would not happen if you used it for agriculture? No; not if it were ploughed every year.

Manus Strain, grazier, near Bullagreen, sworn, and examined:—

198. *Mr. Hassall.*] Where do you reside? About 3 miles from here. M. Strain.
22 Mar., 1898.
199. What are you? A selector.
200. What is the extent of your holding? 2,560 acres.
201. Do you cultivate any portion of it? No; I use it for grazing sheep.
202. Is its carrying capacity equal to that described by previous witnesses—about a sheep to the acre? Yes, it always carries that number of sheep year in and year out, sometimes more, but never less.
203. Then it is exceptionally good grazing land? I think it is about equal to the average run of land about here.
204. Do you think it is suitable for agriculture? Yes, I think the timbered portions are suitable for agriculture.
205. But I presume there is no inducement to go in for cultivation, by reason of its being so far from the railway? That is so; I do not think agriculture would pay under existing circumstances.
206. I suppose you might be induced to let some portion of your land on the halves system? Yes, I would be very glad if anyone would take it on the halves system.
207. Is the wool that is grown here of good quality? Yes, it brings the average price in the Sydney market.
208. Pretty good fleece? Yes, pretty fair. The average weight of the fleece is about 5 or 6 lb. It is fairly clean.
209. Can you endorse the evidence given by previous witnesses with regard to the character of the country? Yes; I have not heard a word to which I could object.
210. Do you know the country between Dubbo and Coonamble? I have been that way twice on the coach.
211. Then you know it only casually? That is all; but it struck me that there was some of the land I would not take as a gift, especially about Coolbaggie. Of course, the land from Dubbo to Coonamble is not all like that.
212. Is settlement increasing very much in this district? It has increased so much that I do not think there is a vacant acre of land about here.
213. And when any land is thrown open, is there a big rush for it? Yes.
214. I suppose you endorse the statement that this country is pretty bad to travel over in wet weather? Yes. I believe it would take more to make a first-class road and keep it in repair, than to construct a light line of railway. The road is not so bad as it was twelve years ago. It has recently been corduroyed. Until recently I never paid less than £3 a ton to bring goods from Warren here. The cost of goods is high, and the advantage of a railway would be felt by every settler in the district.
215. The cost of carriage would be reduced, and the settlers would realise a better price for their produce? Yes.
216. I suppose a railway running through here would enable a man to send away a truck or two of stock, whereas if he has to drive them any distance to the railway it does not pay him to send a small lot away? Yes. If the railway were here all the stock would be trucked.

Malcolm

Malcolm McCallum, grazier, Bullagreen, sworn, and examined:—

- M. McCallum. 217. *Chairman.*] Where do you live? At Bullagreen. This hotel is built on my holding.
 218. What area have you got? 2,336 acres.
 22 Mar., 1898. 219. How many sheep do you run? From 1,500 to 2,000.
 220. Do you cultivate anything? No; I have not put in any cultivation yet. I intend to do so by-and-by. I think the plain country here will grow crops.
 221. What freight do you pay from here to Warren? £2 a ton. I have paid £3, but I have been paying £2 lately.
 222. If we were to average it at 30s. all round, would that be a fair thing? I dare say it would, but I have never got it for that yet.
 223. You have heard the evidence given by the other witnesses? Yes.
 224. Is it all correct? Yes.
 225. Do you desire to add anything to it? No; except that if a railway were extended in this direction, I would go in for cultivation myself; but I would never think of doing so under present circumstances.

George Alexander Munro, secretary, Bullagreen Railway League, sworn, and examined:—

- G. A. Munro. 226. *Mr. Roberts.*] I believe you are Secretary to the Bullagreen Railway League? Yes.
 227. Where do you reside? At Woodside, with my father.
 22 Mar., 1898. 228. Have you prepared any statement that you would like to place before the Committee? I have prepared a list of the landholders within 11 miles of this place, with the areas of their holdings.
 229. Would they all make use of the railway if constructed? Yes.
 230. What is about the average area of the holdings;—would the majority be 2,560 acres? They vary a good deal; they would average more than 2,560 acres. I think some are as high as 15,000 acres.
 231. Would it be a fair thing to say they would average 4,000 acres? I should say about 3,500. The list of landowners within 11 miles of Bullagreen, with the area of their holdings, is as follows:—

		Acres.			Acres.
David Munro, Woodsideabout	8,360	Jos. Welsh, Glenwoodabout	2,560
G. A. Munro, " "	2,560	E. Welsh, Oakview Hill "	2,560
Miss F. A. Munro, Woodside "	620	P. R. Robinson, Pine Grove "	5,000
Manus Strain, Bullagreen "	2,560	John Broomfield, Bullagreen "	1,600
Jas. McLeish, Myall "	7,200	Daniel McAlary, Macville "	15,000
John Hiller, Bullagreen "	300	David McAlary, Emu Park "	8,000
Malcolm McCalman, Bullagreen "	2,300	W. McIlveen, Bullagreen "	2,560
M. Quigley, Erlside "	10,000	W. M. Connell, Avoca Station "
Mrs. Brouff, Roseneath "	5,000	P. Donohoe, Bourbah Station "
Thomas Jasper, Bullagreen "	4,700	Jos. Richmond, Haddon Rig Station "
Jas. Buckley, Pine Ridge "	2,000	Horrigan Bros., Weenboug "	15,000
A. E. Jones, Bullagreen Station... "	Mrs. Hall, Dragon Cowell "	2,560
L. Barrie, " "	670	Geo. McIlveen, Dragon Cowell "
Patrick Welsh, Glenwood "	2,560			

The following settlers had crops in for hay last year:—Jas. McCalman, 10 acres; D. Munro, 10 acres; M. Quigley, 7 acres; Mrs. Brouff, 5 acres; Horrigan Bros., 10 acres; P. Welsh, 8 acres; P. Donohoe, 5 acres.

232. Are these landholders all members of the Railway League, and favourable to the proposed line? With one or two exceptions, they are all members of the Railway League, and they are unanimously in favour of the construction of the railway.
 233. What distance east and west of the proposed line does the list embrace? For about 15 miles on either side, the people, with one exception, are in favour of the line.
 234. In your position as secretary to the Railway League, you have a good opportunity of knowing the views of the people from one end of the district to the other? Yes.
 235. And you have no hesitation in saying that they are all favourable to the proposed line from Warren to Coonamble? I have not the least hesitation in saying so.
 236. In conversations you have had with all these people, has there been a marked anxiety on their part to go in for the growth of cereals? Yes; they seem to be very anxious to go in for growing cereals; in fact the scrub land is no good for anything else.
 237. Have you formed that opinion after having had experience? Yes; my father has some scrub land on his property, and about every twelve months, he has to hoe up the undergrowth; but if this scrub land were put under cultivation for five or six years, it is believed that the undergrowth would be killed.
 238. You have heard all the evidence given by previous witnesses? Yes.
 239. Is there anything you would like to add? Only that I think that if the railway were to come along here, besides agriculture, there would be a good deal of traffic in the way of fat stock.
 240. Is the fat stock pretty well all driven at the present time? Yes; it is all driven to Warren; but if there were a railway, it would be trucked from here to Sydney direct. During twelve months father sold about 6,000 fat sheep off 11,000 acres.
 241. If there were a railway the fattening of live stock would greatly increase? I think so.
 242. Is there a large passenger traffic between Bullagreen and Warren? Yes; there appears to be a good passenger traffic.
 243. Do the residents of the district generally travel by coach, or in their own vehicles? Sometimes they go in the coach; but if the roads are very bad they generally take their own vehicles.
 244. If a railway were running do you think there would be a good passenger traffic? Yes; I have heard it said that the passenger traffic has increased on this road since the railway was extended to Warren.
 245. For how many months of the year are the roads between here and Warren in an indifferent state? I could not exactly say, but the roads are in a very bad condition in the months of May, June, and July.
 246. Do you regard the land in the district as well adapted for the growth of all kinds of fruits? Yes; grapes particularly.

[The Sectional Committee met at the "Merri Merri Hotel," Bourbah, at 2.30 p.m.]

John Blackman Peacock, grazier, Merri Merri, sworn, and examined:—

247. *Chairman.*] Do you desire to hand in a statement to the Committee? Yes; it is an address, signed J. B. Peacock, by fourteen residents of the Bourbah and Merri Merri districts, urging the construction of a railway from Warren to Coonamble by the route proposed. Those signing the address reside within a radius of about 9 miles of Bourbah. 22 Mar., 1898.
248. *Mr. Hassall.*] Are you a grazier? Yes; I reside at Merri Merri station.
249. What is the area of your holding? 18,000 acres.
250. What does it carry? Sheep principally.
251. *Chairman.*] Will you grow any wheat if the railway comes here? Yes; I have tried wheat, and I believe it will succeed. Provided I have a market I believe agriculture will pay me better than pastoral occupation.
252. Do you send your stuff to Warren? Yes.
253. What freight do you pay? The road carriage for wool to Nevertire is £2 2s. 6d. per ton, and the carriage for back loading is £2. That is in shearing time. We have to pay higher rates at other times. Outside the wool season we have to pay £2 10s. for back loading.
254. Is there much live stock sent down? That is principally what I do.
255. The country around Merri Merri is essentially good fattening country, and if a railway were constructed you would have facility for sending your fat stock away, and this facility, you believe, would be largely availed of by the people settled in this district? Yes. It often happens in dry times that we could send a few truck-loads of sheep away if there were a railway, but it will not pay to drive them to Warren.
256. Under existing conditions, unless you can make up a train-load of fat stock, you do not care for the expense of road travelling, and taking the sheep on to Warren to truck them? No; it would not pay.
257. But if the railway were adjacent to you, you could send one, two, or three trucks, and a train-load of fat stock could be made up by the residents of the locality, who, perhaps, like yourself, could each send one or two trucks? Yes. Last year, when stock were bringing a high price, I could have mustered four or five trucks of good stock myself without any trouble. I kept them waiting to improve their condition, but owing to the dry weather they went poor, and I missed the market.
258. When land is thrown open in this district, are there many applications for it? Yes. If a piece of land were thrown open here at present I should imagine there would be fifty or sixty applicants for it. I say this, judging by what has taken place when other land has been thrown open. Settlement has increased very largely during the last ten years, and it has been of a desirable class. The district is progressing.

Robert Charles Byrne, Sydney Myatt, Patrick Donohoe, and William Donohoe, sworn, and examined:—

259. *Chairman.*] You are residents of Merri Merri, near Bourbah; you have heard all the evidence given by Mr. Peacock;—can you corroborate it in every particular? Yes.

R. C. Byrne,
S. Myatt,
P. Donohoe,
and
W. Donohoe.
22 Mar., 1898.

WEDNESDAY, 23 MARCH, 1898.

[The Sectional Committee met at the Municipal Council Chambers, Coonamble, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Herbert Mandeville Nash, licensed surveyor, Coonamble, sworn, and examined:—

260. *Chairman.*] How long have you been stationed here? I have been stationed here for nine and a half years. I have been qualified for twenty-two years. H. M. Nash.
261. Have you a good knowledge of the Coonamble land district? Yes, of the portion comprised within the county of Leichhardt, which is at least two-thirds of the district. 23 Mar., 1898.
262. You have some information you can give us? I am in a position to give you the aggregate area of the Crown leasehold within the Coonamble land district. It is about 934,700 acres. The Crown resumed areas within the Coonamble land district comprise about 204,580 acres. Together with the Crown Land Agent I have been through all the conditional purchase and conditional lease books and every kind of alienation book except that relating to auction sales, and I am able to give the acreage of conditional purchase and freehold land in that part of the Coonamble land district falling within the county of Leichhardt. The aggregate area is about 474,000 acres, included in about 2,010 measured portions, and distributed over seventy-two parishes.* I can give similar information with regard to the conditional leases. Of these, 735 applications stand good for an area of 715,940 acres. There are thirty-two settlement leases, representing 84,150 acres, and there are thirty-five annual leases, representing an area of 35,060 acres. The homestead selections are only on a very small scale as yet, the number being eleven, and the acreage 413. I can give the unimproved value, according to the assessment, of all the taxable lands in the county of Leichhardt, which comprise much the greater half of the Coonamble land district. The aggregate unimproved value of conditional purchase and freehold land embraced in that part of the Coonamble land district falling within the county of Leichhardt is about £581,500. Though this estimate excludes the whole of the town of Coonamble (east side of the Castlereagh River), it covers all other alienated taxable land. The unimproved value of the land in the town of Coonamble is about £47,000.
263. You see a map placed before you coming from Mr. Mackenzie, Acting District Surveyor at Dubbo, and you see certain areas with the quality of the land delineated on the map? Yes. In my opinion the map conveys a fairly correct idea of the quality of the land. The area shown white, represented as first-class pastoral country with belts of agricultural land in it, is, in my opinion, correctly described, though,

* NOTE (on revision):—The 474,000 acres refers to land in the Coonamble district, county Leichhardt, only. The rest of the information applies to Coonamble land district and various counties within it.

- H. M. Nash. I think, the area of agricultural land is somewhat larger than shown by the map. I think that the land from Gilgandra to Coonamble may be regarded as about as good for both agricultural and pastoral occupation as the land from Coonamble to Warren. Going down south from Gilgandra to Dubbo the country is heavily timbered, and is generally regarded as inferior. If a railway went through in that direction a considerable amount of it would be tested, but I am not prepared to express an opinion as to whether settlement would be satisfactory there, and I hold a distinct opinion that the land is not as good as that from Gilgandra to Coonamble, or from Coonamble to Warren. The land from Gilgandra to Mudooran is in my opinion inferior; but when Mudooran is reached there is a very considerable area of good agricultural and pastoral land. At Cobberah, which is about the limit of the country with regard to which I have information, the land is also good. The direct line shown on the map in red from Mudooran to Coonamble passes through a considerable area of land that would be fit for agriculture if the rainfall permitted, but I am not prepared to express an opinion in detail. From Coonamble half way towards Coonabarabran the country is, in my opinion, good. Beyond that the country becomes broken—some of it is good and some bad. The first half, or the first 35 miles, is black-soil country, and, in my opinion, more suitable for pastoral than agricultural purposes. The line shown on the map from Coonamble to Walgett goes through very fine country, but, in my opinion, it must be regarded as pastoral, also the country from Coonamble to Coonabarabran—the first half of the distance. I make this reference to make it clear that, in my opinion, the quantity of land suitable for agriculture is greater south from Coonamble to Gilgandra, and south-west from Coonamble to Warren than it is in an easterly or northerly direction. The country to the west from Coonamble is somewhat similar to that between Coonamble and Warren, and if the rainfall permitted would probably support more people engaged in the growth of cereals. With regard to the road from here to Walgett, for about 15 miles it goes through pretty good agricultural country. The rest of it is nearly all pastoral country.
264. *Mr. Hassall.*] Are you aware when the leases fall in of the 934,700 acres of Crown leasehold? The latest, I think, fall in in July, 1900. The last reappraisal was in 1895, when the leases were extended for five years, and in July, 1900, all that land will be available.
265. The whole of that land will be available between the present time and July, 1900? Nearly all of it. A small portion may be kept open by exchanges.
266. In round numbers, nearly a million acres will be available in July, 1900? Yes.
267. The resumed area, according to your evidence, embraces 204,580 acres. That is a pretty good proof that all the land available on the resumed areas has been pretty well absorbed? Quite so.
268. Can you give the Committee any idea of the value or quality of the 204,580 acres still available? I do not think that on an average it is worth more than 5s. an acre.
269. I suppose there might be some chance of the State getting rid of it if there were a railway within a reasonable distance, and the land were classified? Yes; classification would tend to get rid of it.
270. You could not expect people to give £1 an acre for land like that when they are able to get land in this part of the country for the same price? Exactly; and most of that land is rough country. There is very little probability, I should think, of settlement there, or of facilities being given to induce people to settle there.
271. You think some steps will have to be taken—say, in the way of classification—in order to induce people to take it up? Certainly. I know of part of one run of about 30,000 acres, for which the holders will not pay. They do not consider it is worth paying for. I refer to country up in Gummin Gummin, right under the Warrumbungle Mountains.*
272. *Mr. Roberts.*] Do you regard the land between Coonamble and Gulargambone as the best along the proposed line from Coonamble to Dubbo? Well, I think pretty well all the land up the Castlereagh is fit for cultivation, and I am satisfied that if a railway were constructed there any quantity of it would be cultivated.
273. Is it of a superior quality to the land you find as you approach Gilgandra? I consider it all very good country from here to Gilgandra, and there is not much difference at either end. This end may be, perhaps, a little the better.
274. It is all good agricultural land? Yes; at any rate, adjacent to the river.
275. You would not like to give an opinion with regard to the land between Gilgandra and Dubbo? I might give an opinion, but it would not perhaps be entitled to much weight. I have had an official knowledge of the Coonamble district for nearly ten years, and I have been over the country no end of times; but the country between Gilgandra and Dubbo is out of my jurisdiction. I have been over it several times, and made an inspection or two on it, and I have been over it I suppose twenty times in the coach.
276. When were you last over it? I came up last Wednesday and was all over that country.
277. How would you describe it? For about 8 or 9 miles out of Dubbo the country is very good, but it is then inferior nearly all the way to Gilgandra.
278. Is it sandy country? Sandy country and heavily timbered.
279. And not likely to be taken up for agriculture? Of course if a railway ran through the middle of it, I am certain that a lot of it would be cleared and tried; but, as I have already said, I would not like to give an opinion that it would grow satisfactory crops. I have no doubt that some of it would, but taken all through I should not like to say it would be satisfactory.

Thomas William Medley, Inspector of Stock, Coonamble, sworn, and examined:—

- T. W. Medley. 280. *Mr. Hassall.*] What are you? Stock Inspector for the Coonamble District.
281. What territory does that district embrace? Approximately it is from 75 to 80 miles long, and about 60 miles wide.
282. Have you any returns giving the number of stock depastured in the district? I have the number of stock returned this year. There were 6,990 horses, 18,311 cattle, 1,732,560 sheep, and 235 pigs.
283. How do these returns compare with those of the previous year? There is a very slight difference. There were a few more last year.
284. Do the returns vary much—have they varied much during the last ten years? Not a great deal; there is sometimes a difference of 500,000 or 600,000 sheep. With regard to horses, sometimes they are on

* NOTE (on revision):—I have not quite expressed my meaning here with regard to the 30,000 acres. The facts are that the lessees have fenced off, and do not use that part, though they pay rent for it for the sake of the rest of the country. It is rough and scrubby, and mostly over-run with marsupials and vermin.

- on the increase and sometimes on the decrease, according to the season. Occasionally, when we have a bad season, many horses are sent away for grazing. I have also a return of the fat stock leaving the district during the last twelve months. There were 327,000 fat sheep. T. W. Medley,
23 Mar., 1898.
285. What is the general character of the country for grazing—is it good, sound country? Yes; it is good sound country. Some portions of the country are affected with anthrax or Cumberland, and some with fluke.
286. Is there any foot-rot? Very little.
287. Is Cumberland very prevalent? Yes, in some parts of the district.
288. Do those portions embrace a large area in the district? No; they include some of the small stations of about from 15,000 or 30,000 sheep perhaps. On the station adjoining they would have hardly any losses, while on particular stations, or some of them, they would have very heavy losses.
289. So that it is intermittent in its effect; it may exist in one spot and there may be no sign of it 15 or 20 miles away? Yes.
290. You look upon the district, however, as a fairly sound one? Yes.
291. Have you held the position of stock inspector in any other portion of the Colony? No.
292. I presume you have travelled over other portions of the Colony? Yes.
293. I suppose you could compare the Coonamble district with other portions? Yes.
294. What do you think of it as compared with the best pastoral country you have seen in New South Wales? I think it will compare favourably with any other pastoral district in the Colony. I was a good many years on the Bland and also in the New England country.
295. Is the district fairly well watered? Yes, fairly well. Of course, a great deal of it is artificial.
296. But it is country you think is admirably suited for settlement? Yes.
297. And with every prospect of a man progressing in the world if he settles down here? I think so.

Donald Fletcher, President, Railway League, Coonamble, sworn, and examined:—

298. *Mr. Roberts.*] Do you favour the proposed line from Warren to Coonamble? The Railway League favours no particular route. We want a railway, and we think that the Public Works Committee and the Railway Commissioners are in the best position to tell which is the proper route, and we leave that matter entirely in their hands. D. Fletcher.
23 Mar., 1898.
299. The view your league takes is this: You think the time has arrived when Coonamble ought to be connected with the railway system of the Colony, but as to the route, you are prepared to leave that question to the Government or the Parliament of the country? Yes; that is exactly the position of the league.
300. Have you prepared any statement that you would like to place before the Committee? No; but I have been a resident for over twenty-six years in this district, and I could give some evidence as to its capabilities.
301. What area of land do you hold? About 7,000 acres of freehold and conditional purchase, and about 6,000 acres of leased land.
302. How far are you away from Coonamble? Six miles in a westerly and north-westerly direction.
303. How many sheep do you run? My last return gave about 6,490 sheep, 487 cattle, and 59 horses.
304. In the Coonamble district how many sheep do you think it desirable to run to the acre;—what number do you generally run yourself? A sheep to from 2 to 3 acres.
305. Then, in your opinion, it would be rather an over-estimate to say that you could run a sheep to the acre in fairly good parts of the district? I think some portions of the country, in some seasons, would carry that quantity comfortably; but taking the whole district, and an average season, it would be too much.
306. It would be about one sheep to 2 or 3 acres? I think so, on an average.
307. That is with due regard to safety? Yes.
308. Will you point out to the Committee what, in your opinion, would be the advantages to this district if a railway were brought here? One advantage would be this: There are a great number of small settlers in this district who have a few fat stock at a time—too few to drive to the railway, because it costs as much to drive a small lot as a big lot. If a railway were here they could send these small lots of fat stock in to market whenever they had them. At present a man may have 500 head of fat stock, and he has to hold them until he has a thousand. By the time they should have increased to a thousand perhaps dry weather sets in, and he may then have none at all.
309. You think that if a railway were constructed a large number of fat stock would be trucked? I think so.
310. And the railway would get the benefit of that traffic? I think so. Then, again, I am satisfied from experience that there are very few better wheat-growing districts in the Colony.
311. You can speak from experience? Yes; I have grown wheat several times. Of course, I cut it for hay, because it is no use for anything else.
312. You have grown wheat for home consumption? Yes; I have grown over 3 tons of hay to the acre, and I estimated that it might have yielded over 40 bushels of wheat to the acre if it had been allowed to ripen. This also was the estimate of other practical farmers. Mr. Nash, in his evidence, seemed to consider that the black-soil country was no good for agriculture. I have proved it to be the best. The black myall soil grows wheat better than either the red or sandy soil according to my own experience. It is harder to work, but it grows magnificent wheat.
313. If a railway were constructed either from Warren or Dubbo, or Mudgee, you think that large settlement would take place when the land became available? I am sure it would. I am satisfied that as the land became available it would be taken up if a railway were in existence.
314. Do you know the three routes which the Committee intend to investigate, namely, from Warren to Coonamble, from Dubbo to Coonamble, and from Mudgee to Coonamble? Yes.
315. Have you been over all that country? I have been over a good deal of it. I have a good idea of the class of country along the three routes.
316. You heard the evidence given by Mr. Nash, in which he described the quality of the land in the different districts? Yes.
317. What is your opinion of the character of the country between Gilgandra and Dubbo? It is inferior grazing country. It is heavily timbered country with box.
318. Is it very sandy? Some parts are sandy, and some parts consist of a hard clay soil. A good deal of it is sand.

- D. Fletcher. 319. Do you think anything would grow there? I certainly think a good many portions of it would grow grain crops.
- 23 Mar., 1898. 320. Am I right in saying that you regard it as altogether inferior to the land nearer to Coonamble? Yes.
321. Either for agricultural or for pastoral purposes? Yes; I think it is inferior for both purposes. It is certainly inferior for pastoral purposes.
322. In other words, it is land that you would never think of taking up if you could get the land between Gilgandra and Coonamble;—is that a fair way of putting it? Yes; I would sooner have the land between Gilgandra and Coonamble.
323. Do you send your wool to Sydney? Yes.
324. How much wool do you send annually? About 100 bales.
325. Generally speaking, do you agree with Mr. Nash with regard to the class of country on the three different routes? Yes.
326. Besides the 100 bales of wool, do you send any live stock to Sydney? Yes; I send on an average 1,200 or 1,500 fat sheep and some cattle.
327. Do you send them to the Warren station? I have not done so yet. I have sent to Dubbo and Rylstone. The Warren station was not available last year.
328. Would Warren be the nearest railway station now? Yes.
329. Where do you generally send your wool and live stock? My wool has always gone to Dubbo since the Dubbo railway opened. Live stock I send to Dubbo and Mudgee, according to the road.
330. How many miles is it from your place to Dubbo? 106 miles.
331. What do you pay per ton generally for carriage? I generally contract with Wright, Heaton, & Co. to deliver in Sydney; I do not know what they pay the carrier.
332. *Mr. Hassall.*] What do you pay? I paid £6 12s. 6d. last year for carriage right through to Sydney.
333. Do you know the local rate? It is about £3 per ton to Dubbo.
334. *Mr. Roberts.*] Have you estimated what advantage the railway would be as regards a reduction in the cost of carriage;—you would get freight more cheaply, would you not? I should think so. We should certainly get it done more quickly, and that would be practically cheaper. I also believe that a large quantity of Queensland stock would be trucked here. At present a lot of the south-western Queensland stock travel through here and a large number of them I have no doubt would be trucked at Coonamble. A lot of the cattle that are now trucked at Bourke would be trucked here. They could come here equally as well as they could go to Bourke, and there would be less trainage.
335. From how far in the direction of Walgett would the traffic come to the railway at Coonamble? All the way I should think, and also from the other side of Walgett.
336. Do you think you would get a large amount of traffic from Walgett? I think so, from Walgett and west of Walgett.
337. Anything east of Walgett would go to Narrabri? Yes.
338. Does not all the traffic from Walgett now go to Narrabri? Pretty well all.
339. Unless the river is favourable, in which case it goes to Bourke? Yes.
340. You know all that country pretty well, I suppose? Yes; I have been over a good deal of it.
341. Does the same character of country that we saw about Coonamble extend up to Walgett? Yes, pretty well. There is less timber as you approach Walgett—very few of these belts of scrub, more open country.
342. As you approach Walgett, does not the land become less adapted for agriculture and partake more of pastoral country? I do not think so.
343. Say 20 miles this side of Walgett? I do not think so. There is a farmer named Bell on the Castlereagh, this side of Walgett, who grows splendid crops of wheat.
344. Then you think the land is equally good right through to Walgett? Yes, right to the flooded country on the Barwon.
345. How long has your railway league been in existence? In its present form some five or six years.
346. Railway communication has long been asked for by the people of Coonamble, has it not? Yes. When the late Sir John Robertson was Member for Mudgee he proposed a railway from Mudgee to Coonamble.
347. Was that after the completion of the line to Mudgee? Yes, immediately after.
348. Approximately, about fifteen years ago? Quite that, I should think.
349. Do you regard the country on the east of the line shown on the map from Warren to Coonamble as equal to that on the west? Yes, I think it is fairly equal.
350. In your opinion, which would serve the greatest number of people—a line from Dubbo to Coonamble, or a line from Warren to Coonamble—in view of the settlement that would probably take place if either line were constructed? A line from Dubbo to Coonamble would suit Coonamble better—and Coonamble represents a large proportion of the population affected—because it is shorter and a more direct way to Sydney.
351. The country to the west of the proposed line from Warren to Coonamble is all exceptionally good, is it not? Yes.
352. And if a line were constructed from Warren there would be a very large amount of settlement, and great wheat production would result? Undoubtedly; that is, always provided the price of wheat would stand the carriage to market.
353. If the Dubbo to Coonamble line were constructed it would not be of any use to the settlers in the part of the country just referred to? No.
354. As an old resident of the district and a man of long experience here, which, in your opinion, of the three railway routes mentioned would be the most desirable to construct? Personally, I think the railway from Mudgee to Coonamble would be the most desirable, but as President of the Railway League, and as a resident, I should like to see the railway brought from whatever point the Government determine.
355. Have you come to that conclusion by reason of the difference in mileage between Coonamble and Sydney? That is one reason.
356. What is the other reason? I think the country along the route from here to Mudgee is equally as good as that from here to Dubbo.
357. And how does it compare with the country on the route from Coonamble to Warren? Well, it is not so good. The land between Coonamble and Warren, taking the country right through, is better.

358. The country between Coonamble and Mudgee is more undulating than the country on either of the other lines? Yes. D. Fletcher.
359. And some parts are mountainous? Scarcely mountainous; but it would be more expensive, I should think, to build a railway over that country. 23 Mar., 1898.
360. Is the good country only patchy? There is a patch of inferior country between two patches of good country. The country in the valley of the Talbragar from Cobborah to Coolah is splendid country.
361. Capable of growing anything? I think so.
362. Do you know the country around Gulgong? Yes; it is very good country there.
363. Good country for growing cereals? Parts of it; it is patchy country.
364. Would it grow fruit? Yes; it would grow cereals and fruit. Of course there is an inferior patch of country from Gilgandra to Mündooran.
365. What percentage of the whole country between Coonamble and Mudgee would you regard as inferior? I suppose one-fifth.
366. Do you keep a record of the rainfall? Yes.
367. What do you make the rainfall at Coonamble? The average for a period extending over the last twenty years was from 22 to 24 inches.
368. Is that considered a suitable rainfall for the growth of wheat? It is considered by practical agriculturists quite sufficient for the growth of wheat. Last year was a bad year, and the rainfall was much below the average, and yet one man in the district—the only man that I know of who got his wheat in sufficiently early—had a really good crop. I refer to Mr. Whitney, whose place is 12 miles from here in an easterly direction.
369. I suppose he merely grew wheat for hay? Yes.
370. Is there anything else you would like to add? I would merely like to say, with regard to agriculture, that I am certain that if wheat is put in sufficiently early, a crop would not be missed more than one year in eight. I say this from experience during the last twenty-six years.
371. *Chairman.*] That is for wheat, not hay? For grain. You will get a fair grain crop when it is very little use for hay. If there is a dry spring it might be very short, still there would be a fair head of wheat.
372. *Mr. Roberts.*] Having in view the large wool traffic, and also the large wheat traffic—assuming that your anticipations would be realised—and the large number of fat stock that would be carried, do you think the railway, whichever way it might come, would pay? I think it would pay considerably over working expenses right from the start. The returns would increase every year.
373. Would that remark apply to either of the three lines we spoke of just now? I think so.
374. *Mr. Hassall.*] You say it has been your practice to send live stock to Dubbo or to Mudgee and train from there? Yes.
375. In the event of a line being constructed to Coonamble, would you still follow the same practice? As a rule, I think not. I am one of the small holders, and I would send away a few head, as they were fit. At present I have to wait until I have a sufficiently big mob to drive to either of these places. But if the railway were here I could send one, two, three, or four trucks as soon as the stock were fit.
376. In all probability the extension of a line to Coonamble would have the same effect as the extension of the line from Narrabri to Moree has had? Exactly the same.
377. It would put in the way of small holders facilities for sending away single trucks of fat stock when the market was good, and they had their fat stock available? Just so. This is exactly a similar line, and the circumstances of this part of the country are pretty well the same as those in connection with the line from Narrabri to Moree.
378. Your position in the matter is illustrative of that of hundreds of other settlers in the district who would be able to take advantage of means of transit to a good market when they had anything to send to it? Exactly so.
379. You do not think they would still follow the old practice, even when the roads were good, of driving the stock to Dubbo or Mudgee? I do not think they would, as a rule. Of course, if the market were low they might prefer to hold and send stock in that way, but I think the majority would truck.
380. It would be cheaper to hold them on the station, than to hold them on the road? Yes; but they might hold them on the station until they had a sufficiently large mob and then drive in if the market were very low. As a rule, however, I think they would do just the same as other people do, and use the railway. I notice that the majority in other places, as soon as they get the railway, truck the greater portion of their stock.
381. Do you think that the fact of a railway being in Coonamble would induce more people to travel than travel at the present time? I am sure of it. The fact of the railway coming to Warren has, I think, induced more people to travel here.
382. *Chairman.*] Suppose the line were constructed from Coonamble to Dubbo, instead of from Coonamble to Warren, would not the railway lose the western traffic coming on to the road between Coonamble and Warren, south of Bullagreen? The Dubbo line would lose that traffic; it would go to Warren.

William George Taylor, grazier, near Coonamble, sworn, and examined:—

383. *Chairman.*] What is the area of your holding? 47,250 acres.
384. How many sheep does it carry? 48,694. These figures are taken from the stock returns.
385. Your land is at present devoted principally to pastoral pursuits? Yes.
386. In your opinion, if there were proper means of communication, could cereals be grown here? I believe so. In any reasonably good season you can grow a capital crop.
387. How often would these reasonable seasons occur? I have been here since 1874, and during the whole of that time there might, perhaps, have been an aggregate of seven years when the crops would miss.
388. You believe you would get six crops out of seven? I think so.
389. What would be a fair average crop? The soil is remarkably good, and I believe our average would be from 26 to 30 bushels to the acre.
390. Are you taking plain country or the timber country? The plain country.
391. Do you believe the plain country is as good for the growth of cereals as the timber country? I may not be supported in my opinion by some others, but I believe the plain country will last far longer without manuring or other artificial aid.

W. G. Taylor.
23 Mar., 1898.

- W. G. Taylor. 392. Would you be prepared to go in for agriculture yourself if there were a railway here? I would to a certain extent. I am clearing land now. I have a little, but I am going in for a little more. I am cultivating principally for hay.
- 23 Mar., 1893. 393. Would you devote any of your country to the production of wheat? I would, undoubtedly. I believe that growing crops would pay us better than growing wool.
394. Where do you send your wool at present? For some years past I have sent it to Nevertire.
395. Where do you send your stock? I have sent my stock both to Dubbo and to Mudgee. I am getting two lots of sheep up now from Nevertire, but that is quite exceptional. I send principally to Dubbo and Mudgee.
396. Half and half? Well, not half and half, if the road suits me best I send to Mudgee for the reason that I save a good bit of trucking.
397. If the railway were here would you truck from here? I may say that I heard the evidence of Mr. Fletcher, and I perfectly agree with him with regard to the trucking of stock. It often happens that we have 200 or 300 head of fat stock fit to go to market, and it would suit us remarkably well to send them away; but we cannot send them with a drover for the lot is too small. If we had a railway we would put small lots of stock into the truck at once.
398. Do you know the district thoroughly? I think I do. My opinion with regard to the land between Coonamble and Warren is that there is not an acre which is not fit for the plough. I have been all over New South Wales, and the greater part of Victoria and Queensland, and I say without fear of contradiction that not excepting the Darling Downs, I have not seen in any of my travels a pastoral district so good as the Coonamble district.
399. And with regard to the country between Coonamble and Gilgandra? That is very good, the principal portion of it. As far as Gulargambone it is very good, and from there it is not so bad nearly to Gilgandra.
400. And from Gilgandra to Dubbo? It is very bad. It would, no doubt, all grow wheat for a time when cleared, but the expense of clearing would be enormous; but to the right, going up to Dubbo, and to the left, coming down the country, is very different. Turning towards Berida it is very fine country. There is some timber on it here and there, but it is good country. That is west of the road coming from Dubbo.
401. What do you think of the country east of that road? You have to get on to the river flats before it is any good. That would take in the timber belt I speak of. That is about 5 or 6 miles wide—the worst country. Even that will grow wheat, but it will not last so long.
402. Exactly where the road is located is inferior country? The most inferior country we have got.
403. That, you say, is a belt only a few miles wide? Perhaps it would run on an average 3 miles wide.
404. On either side of that the country is good again? Well, towards the river it is very good, and the Berida country is certainly very good.
405. What is your opinion of the line from Mudgee to Coonamble? I have never been to Coonabarabran.
406. Do you know the line right through to Mudgee? I know the country is very rough. In my opinion the country from Warren to Coonamble is the best on any of the three routes, and the adoption of that line appears to me to be the wisest way of solving the difficulty. What may be done in the future I leave the people of the future to decide.
407. You regard your station as capable of carrying a sheep to the acre? It has done so for a long time. It is usually a sheep-to-the-acre country, and I make that statement because I have been carrying that now for years past. I do not waste any of the land; I use it all.

Daniel Neil McAlary, selector, Weetalibah, sworn, and examined:—

- D. N. McAlary. 408. *Mr. Hassall.*] What are you? A selector. I reside at Weetalibah, about 20 miles from Coonamble.
409. What area of land have you? About 5,500 acres, and I run 5,990 sheep.
- 23 Mar., 1893. 410. Have you tried any agriculture? Nothing more than a little hay for my horses.
411. Is the carrying capacity of your holding equal to that of the rest of the land in this district concerning which we have had evidence? It will carry about one sheep to the acre; I generally carry a little more than that. It is exceptionally well improved.
412. By making the best use of the land, you will be able to carry at least a sheep to the acre? Yes. I kill all the timber, and make the best use of the land.
413. Do you consider the land held by you as a pretty good sample of the land in the district? Yes; a very fair sample.
414. And there are, I suppose, thousands of acres like it? Yes.
415. To what part of the railway do you send your produce? I have always sent to Dubbo.
416. You have not yet made use of the Warren extension? I had sent my wool before that line was opened, otherwise I would have sent it to Warren.
417. In the event of a railway being extended to Coonamble, I presume you would make use of it? Yes.
418. Do you think the extension of the railway would be beneficial to small settlers like yourself, who would be able to send away one or two trucks of fat sheep at a time, and who otherwise would not be able to send small lots to market? Yes; I am certain it would. We are often placed at a disadvantage by having small lots of fat sheep, which we cannot send to market. It will not pay to drive them 100 miles or so, and therefore we have to hold them, and possibly a dry time comes and the sheep lose their condition. It is very rarely that we have a flock of 2,000 fat sheep to send away, and it will not pay to drive less.
419. I suppose sometimes a dealer will go round and buy up a little lot from one and a little lot from another, and so make up a big lot? That very rarely happens. There is another thing: Very often we have fat sheep here, and there is a good price in Sydney, but owing to the roads being bad between here and Dubbo or other places, we cannot get our sheep to market. There is a scarcity of water on the road, or perhaps when you start from here with a lot of good fat sheep, before you get to the railway they will not be even good stores. I have been in that position. It is almost sacrificing them to send them away, unless there is plenty of feed and water on the road.
420. Are there many settlers like yourself in your locality? Yes; a good many.
421. All similarly situated to yourself? Yes; just the same.

422. Do you look upon this as a good district? Yes, an exceptionally good district.
423. Is there a good demand for land whenever it is thrown open? Yes; there is a very good demand.
424. I suppose there are more applicants than there is land to go round? Yes, I have known a great many people who have been waiting for months, and when a piece of land is thrown open there are twenty or thirty applicants for the one block.
425. Mr. Nash said there would be nearly a million acres of land the leases of which will fall in by the 30th July, 1900;—do you think there will be a good demand for that land when it becomes available? Yes, I am sure of it. I am sure there will be more applicants than there will be land to give them.
426. Do you regard the land as equally suitable for agriculture as for grazing? Yes.
427. Do you think the extension of the railway would cause a good deal of land to be put under the plough? Yes.
428. Would you put any of your own land under the plough? Yes; I intend to cultivate at least 500 or 600 acres as soon as there is a chance of getting the produce to market.
429. I presume others like yourself are similarly situated? Yes; many of my neighbours in talking over the matter say the same thing. We are only too anxious to get the chance.
430. Have you had any experience in farming? Not much in this district; only growing a bit of hay, and what I have seen of farming by other people.
431. You would find no difficulty in dealing with the land, if you had facilities? Not the least. I have had experience of farming in other districts, and was brought up on a farm.
432. You have heard the evidence given by Mr. Donald Fletcher and Mr. Taylor? Yes.
433. Can you corroborate what they have said? Yes; I consider they were very accurate in their statements; their evidence was reliable and to the point. I know both gentlemen, and consider they are very good authorities on the subjects upon which they spoke.
434. Since you have held the land which you now occupy, have you always carried a sheep to the acre? I have carried on an average over a sheep to the acre.
435. Year in and year out? Yes.

D. N.
McAlary.
23 Mar., 1898.

Edward Whitney, pastoralist, Nebea Station, sworn, and examined:—

436. *Mr. Roberts.*] What are you? A pastoralist, representing Nebea station, about 12 miles north-east from here.
437. What is the area of your holding? We are occupying about 80,000 acres now. There are about 40,000 acres of secured land—not all freehold, but secured to the station, and the remainder is leasehold and resumed area.
438. Do you devote the whole of that land to grazing? Yes; with the exception of a small paddock close to the homestead where we grow wheat for horse feed. We grow enough wheat for home consumption.
439. In growing wheat, have you been able to form any opinion as to the capability of the land;—how many bushels to the acre do you think the land would yield? Last year was not an exceptionally good one; in fact it was very dry all through the winter, yet most of the farmers who had a look at the crop said they reckoned it would give from 35 to 40 bushels to the acre; but we did not save it for wheat, we cut it for hay.
440. How many sheep have you? We have, besides sheep, about 300 head of cattle, and fifty-two horses.
441. Will your land carry a sheep to the acre right through? I do not think so.
442. What do you think would be a fair estimate of its carrying capacity? We have always proceeded on the principle of being understocked, and we have never run much more than one sheep to $1\frac{1}{2}$ acre or $1\frac{1}{4}$ acre.
443. *Mr. Hassall.*] Two sheep to 3 acres? Yes. From the way the selectors who have selected on our station have been carrying stock, it is possible that we could carry more than we have done, but it has been our policy so far to keep well understocked.
444. *Mr. Roberts.*] When you use the word "policy," I suppose you mean as regards bad seasons? Yes. I do not want any heavy losses. I would rather be a little understocked in a good season than take the full benefit of a good season with the risk of being caught by a bad season.
445. How long have you been in the district of Coonamble? I came to the station in 1881, so that I have had an experience of seventeen years.
446. Have you kept any record as to the good and bad seasons? I know them from memory. 1884 was a bad season; up to 1884 the seasons were very fair. They were good in 1881, middling in 1882 and 1883, and bad in 1884; 1885 was middling, and 1886 was bad again; 1887 was a terribly wet year, and in 1888 there was one of the worst droughts known in this district.
447. How long did it last? It was dry absolutely from October to March. Then from 1889 to 1892 we had a succession of very wet years. There was an abnormal rainfall which reached from 30 to 32 inches; in fact, I think that in one of those years it went as high as 33 inches.
448. What is the minimum rainfall? Ten inches, I think, was the lowest we had in 1888, and the maximum was about 33. When I went to Nebea in 1881, the average rainfall was considered to be 16 inches, and the average from 1881 up to the present time has been 22 inches.
449. Can you account for that in any way? No. For the last ten years the rainfall average has increased. The very heavy rains (1889–92) swell the average very much. There had been no heavy rain previously since the breaking up of the big drought in 1878 or 1879.
450. After your seventeen years' experience, are you able to say whether the droughts are periodical;—could you name any number of years when they are likely to occur—say every three years, or every four years? No; I could not say that. There seems to be no regular rotation, as far as I can see. We only have to be guided by Mr. Russell's idea of a nineteen-years' cycle. That seems to have come out fairly well, as far as I can tell; but it did not help us in 1888.
451. What sort of seasons did you have from 1888 to 1898? They were very wet for the first portion of the time, and then the rainfall kept gradually falling off.
452. I suppose it can never be too wet for you? Yes. Personally, I would rather have a moderately wet season than a very wet season.
453. But compared with drought? Of course, there is no comparison there. But as far as I can gather from experience here, it is not actually the quantity of rain that falls in the year, but the time of the year when it falls.

E. Whitney.
23 Mar., 1898.

- E. Whitney. 454. Which do you regard as your rainy season—winter-time? I can only tell you what the old residents tell me—that when you least expect rain that is the time you will get it. It is quite uncertain. Last winter, which should have been a wet season, was an exceptionally dry one. In other years I have known the road from Nebea into Coonamble to be almost running, say, for nine months.
455. I presume you send a large quantity of wool to Sydney every year? For the last few years the quantity has averaged about 800 bales, this year it is slightly under that, but for previous years it was, I think, 809, 814, and 806; last year it was about 720.
456. To which railway station do you send your wool? We contract with Wright, Heaton, & Co., and leave it to them to decide whether they will send it to Dubbo or Warren.
457. Do you, as a rule, sell the wool in Sydney? No; always in the old country.
458. What do you pay Wright, Heaton, & Co. to take your wool to Sydney? From £7 5s. to £7 10s. for greasy wool, and there is a condition that a pound extra may be charged for scoured wool.
459. Do you get your goods up from Sydney also by contract with Wright, Heaton, & Co.? It is not exactly by contract; they simply charge us with the railway rates, and add on so much for carriage.
460. Do you think the time has arrived when Coonamble should be connected with the railway system of the Colony? I certainly think the district is being kept back for want of a railway.
461. Are you very anxious for it yourself? I should like to see it. I think it will be a great advantage to us. I know we have good land out there, and although I do not suppose the present price of wheat may continue for all time, I think if we had a railway, and the rates were not too high, we should at times be able to send away a large amount of wheat.
462. What is your opinion with regard to the route;—I presume you know the country well on the three routes which have been referred to? I do not know the Mudgee line at all. I have travelled over the other two routes in the coach, but when I came from Dubbo it was nearly always at night time.
463. Have you never been from Coonamble to Dubbo by daylight? Yes.
464. Did you pay any attention to the character of the country? Yes; but I think it is very difficult, when simply travelling along one road, to form anything like an accurate idea of what the country is like 5 or 10 miles away. I do not know enough about the country on the different routes to give a definite opinion. Personally, I prefer the country I saw from the coach going towards Warren to that on the other line. But I have only travelled along the road, and I do not know what the country is like a few miles back.
465. If the land between Warren and Coonamble became available, do you think it probable there would be much agricultural settlement? I should think so, for the simple reason that it is a matter of rainfall. The rainfall there is just about the same as at Narromine, where they have been able to grow wheat successfully, and I think, as soon as the present leasehold areas are thrown open, there will be a very large amount of settlement between Coonamble and Warren.
466. Would that settlement be for purposes of agriculture? Primarily, I should think, for grazing, and no doubt if they had a railway, and if they found it paid them they would very soon go in for agriculture.
467. Is it not a fact that under favourable conditions agriculture gives a much more satisfactory return than sheep-farming? My experience with regard to the paddock of 15 acres on the station is that I get about £100 for the stack of hay, and if I run sheep on the land, even allowing that I might run two sheep to the acre, it would not amount to more than about £1 10s.
468. How much per acre do you make by sheep-farming in twelve months, a clear profit;—would you make more than 3s.? No, I do not think so—not clear profit, after paying all expenses.
469. Would 3s. be a fair estimate? I think it would be too high. I worked it out some years ago, and I think the net return was about 4s. without including interest on freehold land. Prices are lower now than they were then. We were getting then about 1s. 1d. for wool, as against 10d. this year. So that I think 3s. an acre would be rather high.
470. You can safely put it down at 2s. 6d.? Yes, I think so.
471. You said that the wheat you grew for hay would probably have yielded from 35 to 40 bushels to the acre;—is the land around the district capable of giving the same favourable result? I would not like to say that. This land we have ploughed up is close to the home station, and consists mostly of black soil. But our run comprises one-third black soil, one-third sand ridges, and perhaps one-third red soil. Of the latter I have no experience, but they tell me it is the best land for wheat purposes.
472. Is the black soil more difficult to work than the red soil? Yes, I believe so.
473. But is not the yield somewhat similar? From what I can understand you can get a better average return from the red soil.
474. You would not like to say that all the land around Coonamble would be equally as prolific as the land you cultivate on your station? No, I would not like to say that.
475. Do you send much fat stock to market? No; we have gone in mainly for breeding and selling to fatteners. Although we have some country on which we could fatten sheep, I do not think we could put the same condition on the sheep that other people could. Our next neighbours can fatten sheep in a way that we cannot do; they can put a top on them. When we have sent sheep down we have found that by the time they have got to Dubbo and have been trucked they have lost a lot of their condition.
476. Would a railway obviate that? There is no doubt we would send sheep away as fat where we do not send them now. We could send small quantities.
477. If the railway were constructed, do you think there would be a large quantity in live stock;—would it encourage the fattening of stock? I think so decidedly.
478. Would that occur more especially among the small settlers? They would be able to get stock away where they cannot very well do so now. It would not pay a man to travel down 100 or 200 sheep, but he might very easily put them into a railway truck and send them down.
479. Have you any knowledge of the country right out to Walgett? I have been out there once. I think it is the last time I will go there.
480. Why do you say that? Well, I got caught in the rain, and it is a horrible place to get out of.
481. Is the country similar all the way from Coonamble to the Barwon? I do not know about all the way.
482. Where does it change? To the north of Wingadee, when you run into a different kind of country. From here down to that point it is about the best country in the district.
483. How far is Wingadee from Walgett? About 40 miles.
484. Would that country be better adapted for pastoral than for agricultural pursuits? Yes; I should think it would. When I was down there it was pretty well all covered with water. 485.

485. Could you tell the Committee anything as to the traffic that might come from that direction if a railway came to Coonamble? No, I could not. At present I think a good deal of traffic from about Walgett goes down by Narrabri; but there is no doubt that from a point close up to Walgett the traffic would come this way. E. Whitney.
23 Mar., 1898.
486. Do you know much about Walgett and its trade and requirements? No.
487. Where did you reside before you came to this district? I was on a station on the Murrumbidgee, and before that on another station on the same river, below Hay.
488. How does the Coonamble district compare with the other districts of which you have had experience? I like it much better.
489. Do you regard it as an exceptionally fine district? Yes.
490. Well adapted for the purposes of an agricultural population? If they get a rainfall—yes.
491. If it suited an agricultural population one could, of course, be sure that it would be suitable for grazing? Yes.
492. For grazing and farming operations do you regard Coonamble as one of the best districts in the Colony? I do.
493. Taking all the circumstances into consideration, which do you think would be the best route for a railway to Coonamble? I am not well acquainted with the Mudgee route, but I believe it would involve heavy expense for railway construction. Speaking personally, I should like to see the railway from Warren, because if that route were chosen I believe we should get a railway almost at once. If the railway came from Dubbo there might be a saving in the distance to be travelled to Sydney, as compared with the Warren route, but I think it probable that if we were to select the Dubbo route we should have to wait a year longer, and I should like to see the railway at once. As far as the Mudgee line is concerned, I do not think I need bother myself about it, because by the time it was built I should not want to stop here.
494. Do you remember Warren before the railway was brought from Nevertire? Yes.
495. Has the construction of the railway tended to the improvement of Warren and the surrounding district? There seems to be more activity about Warren, but I have only travelled through once since the railway was extended.
496. Are the roads between Warren and Coonamble very bad at times? Yes.
497. Are they as bad as the roads between Warren and Nevertire were reported to be? No, I do not think so. That Warren to Nevertire plain is looked upon as one of the worst in the district. There have been some improvements to the road lately, and it is not nearly as bad as it was four or five years ago.
498. Do you think there would be a large passenger traffic from Coonamble to Sydney and intermediate places if the railway were extended from Warren to this place? Judging by my own case, I should think there would be a very large increase. With a railway I do not see any reason why I should not go down three or four times a year, but at present I never think of doing so unless absolutely obliged.
499. It was stated this morning by a witness that there was not an acre of land between Coonamble and Warren that was not fit for the plough; do you regard that as a correct estimate of the value of that country? I could not say that, because I do not know yet what sort of return that heavily-timbered country—that "monkey" country—would give if it were cultivated.
500. There is certain country between Coonamble and Warren known as the "monkey" scrub? Yes.
501. Do you regard that as the only poor country between Warren and Coonamble? Yes; and when you get close about Warren there is some country there of a similar nature, but I do not know how far it extends. It is timbered country, but for all I know to the contrary it may be excellent agricultural land.

John Landers, grazier, Tourable, sworn, and examined:—

502. *Chairman.*] Where do you live? At Tourable, down the Castlereagh, about 11 miles from here. J. Landers.
23 Mar., 1898.
503. What are you doing? Grazing.
504. What area have you? 21,000 acres. This area is held by Landers Brothers, I being one of the firm.
505. Any agriculture? None, except about 12 or 14 acres for hay.
506. Where do you send your wool? We contract with Wright, Heaton, & Co.
507. Do you know what it costs to take your wool to the railway station? I think Wright, Heaton, & Co. pay the carriers about £3 per ton conveyance to Dubbo.
508. Have you any idea of going into agriculture? No doubt I would do so if there were a railway to take the stuff away, but at present there is no market.
509. What experience have you had in growing cereals? I have tried a few times. I have grown some wheat in the district.
510. Do you believe it will do? I believe it will do well.
511. Do you desire to express an opinion with regard to the route the railway should take? No; I have no particular desire to express any opinion about it. In speaking of the country generally, I regard it as good country from Coonamble to Warren, and good country from Coonamble to Gilgandra. In my opinion the plain country will grow wheat. With regard to the country from Gilgandra to Dubbo, although it is poor adjacent to the road, I think it might be used for farming purposes, and at the back of this poor belt there is pretty good country.

John Rigney, grazier, near Coonamble, sworn and examined:—

512. *Mr. Hassall.*] Where do you reside? Ten miles east from Coonamble. J. Rigney.
23 Mar., 1898.
513. Are you a pastoral lessee? I am a conditional purchaser and a leaseholder.
514. What is the size of your holding? About 11,200 acres, comprising family selections.
515. Is it devoted principally to sheep farming? Yes.
516. You are conversant with the proposal before the Committee to extend the railway from Warren to Coonamble? Yes.
517. Do you approve of that extension? I do not care to express an opinion as to which route the railway should follow.
518. I presume you have heard a good deal of the evidence already given with regard to the character of the country from Warren to Coonamble? Yes.

- J. Rigney.
28 Mar., 1898.
519. As to its suitability for settlement, its excellent carrying capacity, and that also if railway communication were provided a great deal of this country would be put under agriculture? Yes.
520. Do you endorse those statements? Yes.
521. You have also heard it stated that the extension of the railway into the Coonamble district would be very beneficial to small settlers, as it would enable them to get their fat stock away to market whenever the stock were in prime condition and the market was fairly good, that it would practically give them command of a market for their fat stock, instead of the stock losing condition on the road when being taken to the present trucking point at either Dubbo or Mudgee? Yes.
522. I suppose you have not always a couple of thousand sheep to drive to Mudgee or Dubbo, and consequently have often to miss a good market, whereas if means of transit were available, you could send two or three truck-loads by the railway to your own advantage, and with benefit to the railway system? Yes.
523. Is the carrying capacity of your land equal to that of other lands already described as carrying, on an average, a sheep to the acre? Not quite as good.
524. It would appear that at the time you made your return of stock you were carrying a little over a sheep to the acre? Yes.
525. And judging from your own experience, I presume the carrying capacity of your land is pretty well equal to that of the other lands in the district? Yes.
526. I suppose you did not select recently? No.
527. You had a choice when you came here? Yes.
528. You would not pick the worst land, would you? No.
529. You are well satisfied with the progress you have already made? Yes.
530. And is it your opinion that the Coonamble district is a good district to live in, with every prospect of a man who settles down in it succeeding? Yes.
531. But you think your position would be materially benefited if you had better means of communication with the markets of the Colony? I do.
532. Have you tried agriculture? Yes.
533. Have you had any experience of farming? Yes; I am a practical farmer.
534. Do you think agriculture would pay you in conjunction with grazing better than grazing alone? I believe it would.
535. If you had facilities for sending produce to market would you be prepared to put a lot of your land under cultivation? Yes, if I could see my way clear to make a profit.
536. Being a practical man, you think you could deal with it profitably? Yes.
537. I suppose you think, like many others, that the time has arrived when Coonamble is entitled to railway communication? Yes.
538. You are here to support that to the best of your ability? Yes.
539. Are your neighbours of the same opinion as yourself? Yes.
540. You have a few neighbours who are similarly situated to yourself? Yes.
541. They are settled on good country? Yes.
542. Carrying on pastoral occupation at the present time, but hoping for a change in the programme which will enable them to combine agriculture with sheep farming, and so better their position? Yes; I believe that is the idea of most people in that locality.
543. Is your country well watered? Fairly well.
544. Artificially or naturally? Artificially—with tanks.
545. I presume you are under the impression that you could get artesian water if necessary? Yes.
546. And if the present supply failed you are aware that under the provisions of the Artesian Wells Act a group of settlers could make the necessary arrangements for a bore to be put down to serve the lot? Yes.
547. Has the discovery of artesian water in your opinion been of any great benefit to the district? I think so.
548. I suppose it has removed from your minds any anxiety which might otherwise exist as to the failure of the water supply? Yes.
549. And water supply in this country is absolutely necessary to enable a man to carry on? Yes.
550. Do you fatten many stock in the year? Yes.
551. How many? Just according to the season.
552. Do you go in for breeding or fattening? For fattening.
553. Do you buy wethers? Yes.
554. You cut the clip off them, fatten them up, and send them away to market? Yes; I sometimes send them away in wool.
555. You do not waste your country by breeding? No; I do not breed at all.
556. In the case of a man like yourself, the advent of a railway would mean a better command of a market with consequently better prices? Yes.
557. And I presume you would not object to pay the railway rates upon even a longer journey;—even if it were decided to bring a railway *via* Warren to Coonamble you would still use the railway to send your stock away? In some cases. For small lots I should certainly use the railway; but in the case of large flocks, if the roads were good, I should drive them.
558. Where to? Mudgee.
559. In consequence of the shorter distance that the stock would have to be carried by rail? Yes.
560. Suppose the railway were constructed, and the roads were always good to Mudgee, and you could always raise a couple of thousand sheep to send there, it would be no use bringing the railway here, would it? It would be for wool. But there is no fear of that, because the road will never be always good from here to Mudgee. It is only good at certain times of the year.
561. Have you any knowledge of the country between Coonamble and Warren, Coonamble and Dubbo, and Coonamble and Mudgee? Yes: I know the three routes.
562. You have heard the description of the country given by previous witnesses? Yes.
563. Is that description, in your opinion fairly accurate? There are two routes from here to Mudgee; there is a surveyed line about 20 miles north of Gilgandra. I can endorse the statements made by previous witnesses with regard to the character of the country.

William Farrell, grazier, near Coonamble, sworn, and examined :—

W. Farrell,
23 Mar., 1898.

564. *Mr. Roberts.*] What are you? A grazier.
565. How many acres have you? 2,560.
566. Where is it situated? At the back of Bundy, about 14 miles west from here.
567. Do you confine your attention entirely to grazing? At present there is nothing else to do.
568. Did you ever try any wheat? I did.
569. With what result? Very poor. Three years ago was a bad time.
570. Have you not tried any since? No; I have some land broken up this year.
571. You have heard previous witnesses speak of the agricultural capabilities of this district;—do you agree with the statements made, or do you hold an opposite opinion? The success of agriculture would depend upon the season. If we get a fair season, we can grow wheat. I have been here ten years, and I think we could have grown about eight crops out of the ten. I have seen crops growing in the district as good as ever I saw on the Hawkesbury—that is, for straw crop.
572. You have an intimate knowledge of farming? Yes.
573. What is your opinion as to the proposed railway from Warren to Coonamble; do you think the time has arrived when Coonamble ought to have a railway? Yes; I think it ought to have had a railway years ago. We would have been far more advanced if we had had a railway ten years ago.
574. Would you be a customer to the railway if it were constructed? Yes.
575. Where do you send your wool now? To Dubbo.
576. Would you put your wool on the Coonamble station, if there were a railway? Yes.
577. What does it cost you to send it to Dubbo now? Last year it cost £2 17s. 6d. a ton from my shed to Dubbo, and £3 5s. 3d. a ton on the railway from Dubbo to Sydney. I have a contract with Wright, Heaton, & Co. to take it from the shed and deliver it to Dalgety & Co. for £6 odd.
578. Where do you generally sell the wool? In Sydney.
579. What is the carrying capacity of your land;—can you run a sheep to the acre; you can put a sheep to the acre on, but will they live? You would starve them. I run 2,000 sheep, about fifteen head of cattle, and ten or eleven horses. I have now to sell 500 of the sheep off, or else starve the lot and get a bad crop of wool next shearing on account of the dry weather.
580. During the ten years you have been there have you had a good return from the outlay of your capital? In the first year I did not have a good return because of the 1888-9 drought.
581. But, taking the whole time, you have done fairly well? Not as well as many others. When I first began I had a bad class of sheep, which was a drawback.
582. You have made a good living? Enough to eat and drink; that is all.
583. Do you regard 2,560 acres as sufficient to enable a man in this district to get a good living and rear a family? No, not in a proper manner.
584. What would you regard as a sufficient area—4,000 acres? 2,560 acres will do for a single man; but to rear a family properly that area, unless you have the cream of the district, is not enough. All the cream of the district is gone.
585. Do you not regard your holding as portion of the cream of the district? I do not; there is too much bad country on it. I suppose out of the 2,560 acres there are 300 acres with no grass at all on—as bald as this table. It will not grow grass—scalded country.
586. Is there much of that class of country about this part of the district? Any amount of it. What is going to the ballot now is principally that class of country.
587. Did you hear all the witnesses to-day? Pretty well.
588. Do you disagree with anything that was said? I do not hold with everything.
589. On what points do you disagree with the evidence given by other witnesses this morning? In the first place, they talk of the carrying capacity of the country, but what is the good of a man saying it will carry so much stock when he has to cut down scrub four out of five months to keep his sheep alive? There are many who gave evidence this morning who have had to do that.
590. When you heard it stated that certain lands to which reference was made were indicative of the general character of the country, you did not agree with it? No; not all of it. Some of the land about here on the frontage is as good as there is on the face of the earth. Drovers from Queensland reckon Coonamble a paradise, and Gulargambone they consider the best country in the Colony.
591. Do you know the country from Coonamble to Warren? I have been along the road; I have not been over it for any distance.
592. Do you know the country from Coonamble to Dubbo? I have been along the road, and I have heard statements from others who have travelled over that country.
593. Taking the line from Warren to Coonamble, as shown on the map, what percentage of inferior land is there on the west side? I should not say there was much inferior land at all. With regard to the Dubbo route, portion of the country between that place and Gilgandra is good; I saw it as I went along in the coach. I should say it would do for agriculture for a few years; but it would cost a lot of money to clear it. Off the line, where the country is ringbarked, they tell me it is good land.
594. Taking a circle, with Coonamble as the centre, do you regard this district as exceptionally fine country for agriculture? It must be to return so much stock. I suppose the Coonamble sheep district returns more stock than any other district in the Colony.
595. You said there was some scalded country on your holding, and that there was any amount of it in the district? Yes.
596. How far from Coonamble? You need not go 6 miles from Coonamble to find it. You see only the pick of the country along the frontages. You get scalded country and inferior country further back.
597. Holding that opinion, how can you call Coonamble one of the best districts in the Colony? I say from what I have heard.
598. What percentage of inferior land is there within 20 miles of Coonamble? I think 25 per cent. is poor country. I mean country not equal to the other country.
599. Do you hold any opinion as to the best route for the railway to take? I suppose that for the present time the Warren route would be the best in the interests of the district, but for the future there is no doubt the Mudgee line would be the best.
600. Have you been over the Mudgee route? Yes. I have seen the country as I went along, and I have heard from others who farm there that there is a lot of agricultural land between here and Mudgee.

- W. Farrell. 601. Why do you favour the opinion that that would be the best line? Because it would open up a large extent of agricultural country in time to come.
- 23 Mar., 1898. 602. What advantage would you derive from railway communication? I could send live stock away. At present I have to wait until my neighbours have some, and so make up a flock. I endorse all that has been said by previous witnesses with regard to the carriage of live stock.
603. *Mr. Hassall.*] Your acreage is 2,560? Yes.
604. How long ago did you select your land? On the 16th December, 1887; but I did not come here until the following year.
605. You had pretty well a pick, I suppose, at that time? I was a "chum" at the time; a man showed me, and I dropped down where he put me.
606. Perhaps if you had had a little more knowledge you might have got a better piece? Yes; I could have got better country.
607. You say you have 300 or 400 acres not much good? Yes; scalded land.
608. If that land were cleared and made ready for agriculture, it would probably be as good land as the other? Not as good as the plain—not for agriculture.
609. Still, you might make some use of it? You would have to work it up to make it grow grass.
610. It is no good now? No; nothing but roley-poleys grow on it.
611. So that, practically, out of 2,560 acres you have 300 or 400 acres that are no good? Yes; inferior land. I reckon it is worth about 5s. an acre.
612. You could not get along with much less than 2,000 sheep? No.
613. You have 2,560 acres of land, of which you say 300 or 400 acres are no good, and this land carries, besides fifteen head of cattle and ten or eleven horses, 2,000 sheep, so that, practically, it is nearly as good as anybody else's land, and will carry about one sheep to the acre? Yes; the good land will.

William Nott, grazier, Gidgenbah, sworn, and examined:—

- W. Nott. 614. *Chairman.*] What are you? Sheep farmer.
- 23 Mar., 1898. 615. Where do you live? At Gidgenbah, about 12 miles west from Coonamble.
616. What is the extent of your holding? Eight thousand acres.
617. How many sheep do you run? I generally register about 8,000. I do not carry them all through the year.
618. Where do you send your wool? I have sent it to Nevertire and to Dubbo.
619. What is the road carriage to Nevertire? I do not know; I sent the wool right through by agents.
620. You have been sending your wool also to Dubbo? Yes.
621. In future, will you send to Dubbo or to Warren? To Dubbo.
622. How far is it to Dubbo? 112 miles from my place.
623. And how far to Warren? About 100 miles.
624. How long have you been in the district? I have been living in the Coonamble district about fourteen years.
625. Have you seen any wheat grown? I have seen a little hay.
626. Have you seen wheat growing in your neighbours' places in the district? Not in this district; I have only seen it growing for hay. I have never seen a crop of wheat in this district. I have never grown any hay.
627. Do you believe the district will grow wheat and hay? Only one year in every three.
628. You believe there is not enough rainfall? Yes.
629. Suppose there were a sufficient rainfall, could most of the district grow wheat? It would grow sometimes too much; there would be too much straw, and very little wheat.
630. You are doubtful about the agricultural possibilities of the district. Yes, I am. I lived in the Mudgee district for sixteen years. I grew wheat there.
631. Then, the railway question, as far as you are concerned, resolves itself into cheaper carriage for your wool to Sydney and the opportunity of getting away your fat stock in small lots—that would be the benefit of a railway to you? Yes; as long as it was not too far round, and the expense was not too great. In my opinion, the Mudgee line would be far the best, and next to that the Dubbo line. I do not care about the line to Warren at all.
632. What is your reason? It is too far round; it would cost too much in haulage.
633. Do you know how much more it would cost in haulage? No, I could not say. It would be difficult to say what the Government would charge. Where the line is surveyed from Coonamble to Mudgee is good agricultural land all the way. I have been along there and I know it.

Henry Lyons, manager, Wright, Heaton, & Co., Coonamble, sworn, and examined:—

- H. Lyons. 634. *Mr. Hassall.*] I believe you are in charge of Wright, Heaton, & Co.'s business in Coonamble? Yes.
- 23 Mar., 1898. 635. Would you kindly give the Committee as nearly as possible the road rates for the carriage of wool and general goods from Coonamble to Dubbo? I reckon about £3 a ton from Coonamble to Dubbo. From some places it would be less, and from others more, but £3 would be the average from the Coonamble district. Sometimes the rate is cheaper, and in a wet winter it might be dearer.
636. What is the lowest you have ever got for carriage? £2 a ton.
637. And the highest? About £2 10s. or £3.
638. So that you have an average of £3, and the price occasionally comes down to £2 when the season is exceptionally good? Yes.
639. When the rate is £2 a ton, I presume both grass and water are very plentiful? Yes.
640. And, in all probability, when the rate is £2, there is some agreement with regard to back loading? Generally, when the rate is £2 it is in the wool season, and the carriers have loading both ways which enables them to carry goods a little more cheaply than if they had to come back empty. The rate of carriage from Mudgee is about £2 10s., but there is very little carried. The average rate for road carriage from Coonamble to the railway system of the Colony is £2 15s. per ton.
641. Do you care to express any opinion personally about the route of the proposed railway? Personally, I would sooner see the line come from Mudgee, if we could get it.
642. Is that in consequence of the shorter distance to Sydney? Yes.
643. Do you think, from a national standpoint, it would be advisable to adopt the Mudgee route, though it might cost a great deal more? Yes.
- 644.

644. What would be the corresponding advantage? I suppose it would be about 80 miles nearer Sydney, and the line would open up a large extent of agricultural country.

H. Lyons.

645. You know the country pretty well? I do.

23 Mar., 1898.

646. And you know that a line of railway through there would open up a large extent of land suitable for agriculture? Yes; in fact there is a lot of that country settled now—good farming country.

647. What is the country like between here and Mudgee? Where the line is surveyed, and a little off the line, it is very good agricultural country. From Gilgandra into Mundooran it is bad country. The railway line is more to the east, and goes through better country than that.

THURSDAY, 24 MARCH, 1898.

[The Sectional Committee met at the Municipal Council Chambers, Coonamble, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. |

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Clement Dillon, Crown Lands Agent, Coonamble, sworn, and examined:—

648. *Mr. Roberts.*] What are you? Crown Lands Agent at Coonamble.

649. What are the boundaries of your district? It embraces a radius of about 40 miles from Coonamble.

C. Dillon.

650. I understand you have prepared a statement? I went through the books, and I found that there were 1,465 conditional purchases in this land district representing an area of 443,363 acres, and 765 conditional leases with an area of 715,942 acres. There are thirty-two settlement leases with an area of 89,149 acres, thirty-five annual leases representing 35,065 acres, and eleven homestead selections representing 413 acres. These latter lands are suburban areas about the townships of Gilgandra and Gulargambone. In addition, there are the lands embraced in improvement purchases, auction purchases, volunteer land orders, special purchases, and special leases. The area of these lands would amount to some thousands of acres, but we have no record in the local office of the exact figures. Besides these, are the leasehold and resumed areas of pastoral holdings. There is a *Gazette* notice showing the pastoral leases. It does not give the area, but the majority of the leases fall in on the 10th July, 1900. There will then be a good deal of land available for settlement lease and other applications.

24 Mar., 1898.

651. Are the applications for land very numerous? Yes, considering. There have been thirteen settlement lease areas declared, embracing twenty-nine farms, and they have been balloted for by 560 applicants. If Coonamble had been more easy of access, I am sure the number of applications would have been doubled. I have had many inquiries from Victoria, but when the parties ascertain that Coonamble is not on the railway line they do not go any further; they find that it is too expensive to get here, and that the journey occupies too long. There were several Victorians over here, but they did not wait or come here again.

652. Should the railway be constructed, do you think, when the leases fall in, all the available land would be speedily taken up? I am sure it would—that is, judging from the number of inquiries made now, and the number of applicants who come forward when any land is thrown open.

653. Have you any opinion as to the class of the country? There is one area to be thrown open on the 14th April. It is on the road from Coonamble to Warren on the Upper Merri Merri. There are three farms to be thrown open, and one farm comprises 3,022½ acres. The capital value is assessed at £3,777 16s. 3d. That would be at the rate of £1 5s. per acre, and the annual rent charge would be £47 4s. 6d., or about 3½d. an acre. I expect there will be over 300 applications for these farms. I may say that this land is described as in the artesian bore area, and I think there is a bore within a few miles of it.

654. Do you know whether the land is suitable for agriculture? I have no personal knowledge of that country.

655. How does the surveyor describe it? The farm we have just spoken of is thus described in the *Gazette* notice:—

Ewenmar—Level country, with light sandy ridges, black and red soil on plains, and sandy soil in timber; about 1,000 acres of thick forest, timbered with box, pine, oak, budtha, wilga, and belar; also scrub of currant bush, &c., the remainder plain country, with a little scattered myall and box; suitable for agriculture, after clearing, in parts; all well grassed fattening country.

The other two farms are somewhat similar. There is to be a land sale here next Tuesday. The land to be sold is in different parts of the district, and the upset price averages £1 5s. per acre. Some of this land is situated 4 miles from Coonamble, some 26 miles, some 9 miles, some 12 miles, some 21 miles, some 25 miles, some 20 miles, some 19 miles, and other distances from Coonamble.

656. They will all be affected by the proposed line of railway? I think so—at any rate a great number of the portions will. I may say with regard to town and suburban lands, that on the 28th September last at a sale of Crown lands there were sold thirty-one town lots, embracing 13½ acres, which realised £608 5s., or an average of about £44 15s. per acre. That is the land situated round the artesian bore, and is within the municipality. Then there were fifty-five suburban lots of an area of 514 acres, which realised £1,914, or an average of about £3 14s. per acre. Again on the 8th February last, there was another sale, at which nineteen town lots were sold, representing 8 acres, and realising £363 5s., or an average of £44 4s. per acre, and at the same sale, eighteen suburban lots were sold, representing 16½ acres, which realised £797 5s., or about £4 17s. 6d. per acre.

657. Do the prices realised for these lands show a marked increase within the last few years—say five years? Yes; a big increase.

658. What could these town lots, which were sold for over £40 per acre, have been obtained for five years ago? If they had been put up for sale then, I do not think they would have realised half that price.

659. During what period has this marked increase in the value of land taken place—in the last two years, or eighteen months? I should say, the last two years.

C. Dillon. 660. What is the value of the land in the principal street of Coonamble;—is it sold by the acre or by the foot? I do not know of any being sold during the three years that I have been here. I know the owners want a very high price. The land in the main street, I believe, is sold by the foot. I think it is worth about £10 a foot. The amount of money paid through the office for lands is about £40,000 a year. That has been the amount for the last three years that I have been here. That approximately represents the amount paid to the Lands Office and the Treasury for lands in the Coonamble district, and is exclusive of rents for pastoral holdings.

Thomas Dun Bertram, Mayor of Coonamble, sworn, and examined:—

T.D. Bertram. 661. *Chairman.*] You are mayor of the town of Coonamble? Yes.
 662. Can you give the Committee any information with regard to the municipality? The town was incorporated in 1880. It has a municipal area of $23\frac{1}{2}$ square miles, equal to 15,040 acres. In 1897 there were 1,356 inhabitants within the municipal boundaries. The gross unimproved capital value of private lands within the municipality is £30,733. The improved annual value for municipal purposes is £13,145. The rates amount to £623. There is a general rate of 1s. in the £, a water rate of 1s. in the £, and a lighting rate of 2d. in the £. There is a debt of £1,000, and the amount owing to the Government in connection with the water scheme is £5,594, and we have a hundred years within which to pay principal and interest. The annual payment is about £255, and the return on the water shows a clear profit.

Peter Aloysius Polin, storekeeper, Coonamble, sworn, and examined:—

P. A. Polin. 663. *Mr. Hassall.*] You are a storekeeper carrying on business in Coonamble? Yes.
 664. How long have you been residing here? I came here in 1876.
 665. And you have practically seen the district grow up from small beginnings? Yes. I have been here continually since 1876, with the exception of about nine months.
 666. Was there much settlement in the district when you first came here? The settlement consisted only of the squattages; there was no such thing as a selector in those days.
 667. Was the town very large then? No; I do not think the population of Coonamble proper was more than 400 or 500 at the outside.
 668. From your experience, is it a good business district? Yes; if it were not I should not have remained here for twenty-two years. I have brought up a large family here.
 669. I suppose you deal in general merchandise, station supplies, and almost everything in the way of stores requisite for pastoral and agricultural occupation? Yes.
 670. Can you give us any idea of the quantity of goods brought into Coonamble? I can give you the amount I have paid during the last six or seven years for carriage from Dubbo to Coonamble.
 671. Do you get all your goods from Dubbo? Principally.
 672. Do you pay a through rate, or do you pay railway rates to Dubbo and road carriage from thence to Coonamble? We pay the railway rates to Dubbo. From July, 1891, to July, 1897, the amount we paid for carriage from Sydney to Coonamble was £7,364 18s. 11d. That does not include most of the flour we sold, which, of course, would be a very large item. The reason why the flour is not included in the figures just given is that very often we buy the flour landed in Coonamble, so that we pay the miller the carriage.
 673. Practically, the miller pays the carriage and you repay him in the increased price you give for the flour? Exactly so.
 674. Are there any other storekeepers in Coonamble doing anything like the same business that you do? There are other storekeepers, but I cannot say what business they do.
 675. In the event of a railway being constructed from Warren to Coonamble, would you obtain all your goods by that route, or would you still get them by Dubbo? I could scarcely promise that. It would depend on circumstances; but I should think the business people would avail themselves of the railway communication. I cannot say for certain.
 676. Taking the through railway rate from Sydney to Dubbo and the road carriage to Coonamble in round figures, it amounts to £6 a ton; the estimate of the railway authorities is that coming through from Sydney to Coonamble, *via* Warren, the rate would be reduced to about £4 3s. 11d.;—a considerable saving would therefore be effected in carriage if a railway were brought from Warren to Coonamble? Yes.
 677. I presume you will admit that railway carriage must be much cheaper than road carriage? Yes.
 678. And consequently, if your goods could be landed more cheaply here, even if the railway came round *via* Warren, than they can be brought by rail to Dubbo and by road to Coonamble, you would use the cheaper mode of carriage? Certainly; even if the railway were dearer we should have to use it for convenience sake.
 679. But there is no possibility of its being dearer? During the last five or six years teams have competed with the railway right on to Sydney, and goods have been delivered at Coonamble by team for less than we could get them by rail.
 680. How far do your business relations extend round Coonamble? About 30 miles.
 681. Beyond that radius I presume the people are served by Coonabarabran, on one side, and Walgett on the other? Yes, and Warren.
 682. The Western line running through to Bourke would tap the country in that direction? Yes.
 683. This being the distributing centre for the Castlereagh country, and, I suppose, portions of the Merri Merri and the Marthaguy? Yes, the Merri Merri. We do very little business with the Marthaguy; it is too close to Warren.
 684. Do you look upon this as a pretty sound district? I do.
 685. And a progressive district? Yes, certainly. The population is increasing daily. Properties have not depreciated much in value during the last few years.
 686. Has settlement increased largely (say) during the last ten years? Yes; I suppose it has increased fully 50 per cent. during the last few years.
 687. With every prospect of a further increase when more land is made available? Undoubtedly.
 688. Has it been your experience that there has been a great demand for land in this district when it has been thrown open? Yes.
 689.

689. And I presume a desirable class of people has come to settle here? Yes; I reckon that there are some of the finest settlers in the Colony round here. Men came here with a fair amount of capital. P. A. Polin.
 690. Have you noticed any progress in the direction of agriculture? Yes. 24 Mar., 1898.
691. When did that commence? Twenty years ago, if there were a bit of hay grown in the district it was worth from £15 to £30 a ton, and now you can buy it for from £3 10s. to £5 or £6.
692. That is in consequence of the increased quantity that is grown? Just so; in fact, it was not grown at all in those days, except by irrigation.
693. Do you think this country is suitable for agriculture? I do not profess to be a judge, but I think a great portion of it is.
694. You have had business transactions with people who have gone in for agriculture, and would be able to form an opinion? Yes. I think the whole of the country within a mile of the river on either side is well adapted for agriculture.
695. Extending right up as far as Gilgandra? Well, at any rate to Gulargambone, a distance of 30 miles.
696. Do you care to express an opinion as to which is the best route for a railway to Coonamble? I am a member of the Railway League, which is not pledged to any particular route. All we want is railway communication. Speaking personally, at the present time I should prefer to see the railway come from Warren, because I do not expect to live for more than twenty or thirty years longer, and I should like to have a little comfort in my old age, and be able to take my family down to Sydney.
697. You think you would get a railway quicker by Warren than by any other route? Certainly I do.
698. Is about £2 15s. a ton the average rate of carriage from Dubbo? The rate at present from Dubbo to Coonamble is £2 10s. I have paid £15 a ton.
699. Is an average of £2 15s. about a fair thing? Yes; but I think it is a low rate of carriage. Store-keepers look upon £2 10s. as very low. £2 is the lowest I have paid, and the rate has varied from that price up to as high as £15. I suppose during the last twenty years it would average £5 or £6, or perhaps more.
700. If you put it at £2 15s. that would be a fairly low estimate? I should think that would be the lowest. In a dry time it would be impossible for teams to carry for that money.

Arthur Edgar Newton, Road Superintendent, Coonamble, sworn, and examined:—

701. *Mr. Roberts.*] What are you? Road Superintendent. A. E. Newton.
 702. How long have you filled that position? For fifteen years. I have been about one year in the Coonamble district. 24 Mar., 1898.
703. Where were you stationed previously? In different parts of the Colony. Immediately before coming here I was on the Lachlan, where I lived for ten years, and before that I was on the Manning, and in different parts of the Colony.
704. What is the extent of your district? About 100 miles by 100.
705. How far towards Warren does it extend? It joins the Dubbo district at Warren.
706. You know the railway line, as surveyed, from Dubbo to Coonamble? Yes.
707. Do you go over a great portion of that line? I go as far as Gilgandra in that direction.
708. Is the road from Coonamble to Warren very bad unless the weather be very dry? It is very bad except in dry weather. It is all black soil.
709. There are several parts of a road between here and Warren which have been corduroyed? Yes.
710. What is the cost per chain of that kind of road? The cost so far has ranged from 7s. 6d. down to 4s. 6d. per yard, which would be £7 14s. a chain. We have not been constructing that sort of road very long.
711. What would be a fair average for a chain? About £7 a chain, which would include drains. The corduroy, with drains and culverts included, would cost about £716 per mile—say between £700 and £800.
712. How does that compare with the cost of maintenance for ordinary roads? It is about the average I should say, or perhaps a little above; we usually pay 7s. a yard for metal. We cannot do any metalling here, as there is no stone available. The corduroying is cheaper than metal would be in other districts of similar black soil formation to this district, as such country would require $1\frac{1}{4}$ or $1\frac{1}{2}$ cubic yards of metal to the lineal yard of road.
713. Apart from the corduroy, what does the road between here and Warren cost per yard? Without corduroy, we could not make any road that would stand. We could make a road for light traffic by throwing up the soil, but it would be destroyed by the first heavy team going over it.
714. Is most of the money that you spend on the road between Coonamble and Warren confined to the corduroy? Yes; you might say exclusively, including the culverts and drains.
715. How long have you been adopting the corduroy style of roads? About four years.
716. Do you find it answers satisfactorily? Yes, it answers very well indeed. The surface is adzed so that the vehicles run smoothly over it. This is the first district in which I have seen it tried. The old-fashioned corduroy was always condemned by the Department, because it was not adzed on the surface. By adzing it on the surface and using pine, which is very straight, a capital road is made, and it should last at the very least fifteen years.
717. Is there any indication of the white ant? We have not noticed any yet.
718. I suppose your official work takes you about the country a good deal? Yes.
719. Could you give an opinion as to the value of the country for the growth of cereals? I could not from actual experience, but only from observation.
720. There is a good deal of wheat grown here for hay-making? Yes, a good deal.
721. Have you seen it? Yes, I have used the hay.
722. From what knowledge you possess, would you look upon the district as one likely to become an agricultural district? I think so. Of course, the whole point is in the rainfall. It is sufficient, I believe, but the success of wheat-growing depends upon the season at which the rain falls.
723. Assuming that the rainfall is all that could be desired, do you regard the soil as admirably adapted for cultivation? I think so. Along the river towards Gilgandra very good wheat is grown, and that is about the poorest of the soil, being of a sandy nature. It grows very good wheat.
724. How does this district compare with other districts you have been in, say the Lachlan;—in what part of the Lachlan were you? At Forbes, and I used to follow the Lachlan for about 120 miles. I should say this was better pastoral country than the Lachlan, although the flats on the Lachlan are richer than the richest land here. Still, on the average, I should say the land is a great deal better here.

- A. E. Newton. 725. You have been over the line, I suppose, from Coonamble to Dubbo, or, at any rate, as far as Gilgandra? Yes.
- 24 Mar., 1898. 726. How do the two lines compare—that from Coonamble to Warren and that from Coonamble (say) to Gilgandra? I should say that the Warren land was very much superior to the Gilgandra country. In wet weather the Warren road is almost impassable, because there is so much black soil, and the other road is fairly good, owing to the quantity of sand.
727. As a country suitable for cultivation, do you prefer the Warren route? Yes; I should say it was very much superior to the land on the other route for any purpose.
728. Do you know the land between Gilgandra and Dubbo? I have been through it in the coach, that is all; I do not know very much about it.
729. Would you care to give an opinion as to which line would suit the greatest number of people;—have you been to Mudgee? I have crossed that part of the country at different points; but I have not been along the route as much as I have along the other two routes.
730. Do you know it sufficiently well to draw a comparison? No; I do not think I do. Some of the country is good; but there are belts of bad ironbark in the country I have seen.
731. From your knowledge of the various facts that come into one's consideration when thinking over which line it would be best to construct in the interests of the country, would you like to give an opinion as to which line you think would best serve the interests of the people? I should have thought the Mudgee line would have been better, although it could not be a light line. I say this only from what I have heard. I cannot say it is the best from having seen the country. But if a light line were built I should say a better line of country could not be found than the Warren line.
732. Do you prefer the Warren route to the Dubbo route? The Dubbo route would, of course, be shorter, and there is more present settlement along it; but it could not be a light line. I think whichever line were constructed it would take about the same amount of traffic. The traffic would find an outlet by railway even if the distance were a little greater, especially in wet weather, when all the roads are practically impassable.
733. Are the Committee to understand that you would prefer to see the line from Dubbo rather than from Warren? Personally I would agree with the evidence that has been given, and with the view of getting a line at a comparatively early date I should favour the Warren line, because there is a shorter length of construction, and it would be a cheap and easy line to make.
734. Do you regard the Coonamble district as an exceptionally fine district, and one well adapted for settlement? Yes; I should call it a very rich district from my experience of other parts of the Colony.

George Charles Arthur Cobb, Coonamble, sworn, and examined:—

- G. C. A. Cobb. 735. *Chairman.*] You are a resident of the town of Coonamble? Yes, I have been here for thirty years.
- 24 Mar., 1898. 736. Does Coonamble require railway communication? I think Coonamble has now come to a stage when it does require railway communication. I think every town of the size and importance of Coonamble should have railway communication, for several reasons. As a rule in the winter time when there is heavy traffic on the roads, they are very wet and it is difficult to get along. In the next place the cost of bringing produce to the district in a dry season is very considerable, and would be very much lessened by railway communication. I think that is one of the most important points, because this is a large pastoral district, and there is a large amount of stock requiring sustenance in dry weather. This cannot be procured in the district, and a railway is necessary to bring it here. In my opinion the railway should be the nearest that could be constructed to Sydney.
737. You regard the trend of trade to be from and towards the metropolis? Certainly.
738. Would you regard the western trade of as much importance? Certainly, the western trade is to be considered as well.
739. And in view of the western trade it appears probable that the Warren and Coonamble line would be the most satisfactory? In one way it would and in another it would not. When I say I consider that we should be connected with the nearest point to Sydney, and should go the straightest way, the object is to provide against any competition which might arise between road carriage and rail carriage. If a railway is constructed the carriage on which will cost 10s. or £1 per ton more than the road carriage, it is natural to assume that the latter would have the preference, because people as a rule do not throw their pounds away in that way.
740. Is the western trade from Coonamble-Warren out towards Bourke of any value? Out towards Bourke it is of very little value indeed. Nothing goes from Coonamble to Bourke. I am doubtful, although hopeful, with regard to the agricultural possibilities of the Coonamble district. If it be proved that cereals and hay will do satisfactorily in the district, there will be some benefit in our having the most direct route to the west; but weighing the matter carefully, in my opinion that is of less importance than a direct route to the Sydney market. I desire to say also that I think it improbable that it will pay to take wheat to Dubbo or to Sydney. I do not think we could compete with nearer districts.
741. It appears that a through rate on the longest route to Sydney, that *via* Warren, would be about 4d. per bushel on your wheat—would that be prohibitive? No, it would not. The only thing is that the cost of production would be so much higher here, that it would be a question whether at that rate of carriage we could compete with districts having larger areas and better conveniences for cultivation, including cheaper labour.
742. You think we should take the Mudgee line, with its 337 miles to Sydney, as against 470 miles by the proposed route? Certainly, if it be possible; but if not, then I would take the next nearest route. I am not confined to any one route. My argument is that the shorter the railway line the less chance of competition by road carriage. In my opinion, the most direct route to market—in other words, to the metropolis—is the right line to be constructed for this district. I understand, however, that the question of construction has to be taken into consideration. Still, having weighed the case fairly, I should take first of all the line from Mudgee to Coonamble. If I could not get that, then the line from Dubbo to Coonamble; and, if I could not get that, I would take what I could get.
743. Would you like to make a statement with regard to the possibilities of the district? As a pastoral district it cannot be beaten in the colonies. There is no doubt it contains also any quantity of really good agricultural land. The only deficiency is in the season of the rainfall. If you get a fair average rainfall
you

you will get good crops. The difficulty is, that we generally get the rain here when it is not required for agricultural purposes. Our principal rains should come in February. We have been getting them a little earlier lately, and later in winter. With regard to the carrying capacity of the land in the district, I am aware that a run close to Coonamble has been carrying a sheep to the acre, and perhaps the returns show this; but, in my opinion, to be safe the limit of one sheep to 2 acres should not be exceeded. I desire to state that the cost of getting goods from Dubbo to Coonamble by road at present rates is less than the cost is likely to be of bringing them to Coonamble *via* Nevertire on the railway. A good portion of the traffic now going to Nevertire would compete with the Northern line *via* Narrabri.

744. How far is it from Coonamble to Narrabri? About 130 miles. The Northern rates are much lower than the Western rates. Wool consigned through Narrabri to Newcastle is sent at a much lower rate, and a bonus of 7s. a ton is given by the Department.

745. Do you ever send wool away? Yes, I send wool to Nevertire. I send 8,000 bales every year.

746. You do not send it *via* Dubbo? No.

747. Still, Dubbo could be reached for a few shillings less than Nevertire? Yes; the reason why it goes to Nevertire is not a trade reason.

G. C. A. Cobb.
24 Mar., 1898.

Mark Herrmann, storekeeper, Coonamble, sworn, and examined:—

748. *Mr. Hassall.*] How long have you resided here? Twenty-eight years in Coonamble, and about thirty-five years in the district.

749. You have heard of the proposal to connect Coonamble with the railway system of the Colony? Yes.

750. Have you reasons to offer why such a thing should be done, or why it should not be done? My reason for opposing the Warren line is that the distance to Sydney is too far. If a line came here from Dubbo we should save 40 or 41 miles trainage, and if it came from Mudgee we should save 80 miles trainage.

751. You do not object to a railway coming to Coonamble? No; not in the least. But we, as storekeepers, will make very little use of it according to the present rates. Our goods will still come from Dubbo.

752. Your objection is to the proposed route by Warren? Yes; there would be too much trainage to pay.

753. Taking the nearest point, and the most direct route to Sydney, which would be the Mudgee route, and considering that the cost of constructing that line would amount to nearly half a million of money, and considering also that the ruling grade on that line is 1 in 60, does it not stand to reason that the cost of carriage over that length of railway must be greater than the cost over a length of railway that could be constructed for about £2,200 per mile, and over which you could draw nearly double the load? Yes.

754. For the reasons just stated, is it not likely that the rates over the longer route would compare favourably with those over the more direct route? It would all depend upon the rates the Commissioners would fix. If they adhere to the present rates, then carriers must compete with them, and our goods will still come *via* Dubbo. It all depends upon the Railway Commissioners.

755. You give the Commissioners credit for being smart business men? Yes.

756. If they found that road carriage was competing against them successfully, it is not likely that they would allow the railway to remain idle when, by granting certain concessions, they could secure all the traffic? No. I sent carriers from here to Sydney three years ago. The same carrier went twice all the way to Sydney and back again.

757. Perhaps he owed a store account? No; but I gained over £100 by sending him.

758. *Chairman.*] Did he gain anything? Yes; he did very well out of it. He did two trips between the months of October and January.

759. *Mr. Hassall.*] Taking wool down, and returning with back loading? Yes; and he brought his horses back in first-class condition.

760. Though in the case of non-perishable goods you could do that, yet in the case of other goods requiring rapid transit, you could not afford to send them by road? No.

761. What is your road carriage from Dubbo? £2 10s. a ton, and in the wool season we get it done for £2.

762. I presume you could not get it done at £2 except for the wool and the return loading? Last year carriers went in from here and brought loading back several times for £2. They went in empty.

763. Your opinion of the district, I presume, is a favourable one? Yes.

764. Otherwise, I suppose, you would not have stayed here so long? No.

765. You are perfectly satisfied it is a sound district and admirably suited for closer settlement? Yes.

766. And it is a district which in your opinion is bound to progress very much? Yes; it all depends on the land laws I suppose.

767. Is your volume of business pretty considerable? My average trainage since the railway opened to Dubbo has been about £600 or £700 per annum.

768. Your business transactions, I suppose, extend over a radius of 30 or 40 miles from Coonamble? Yes.

769. This is evidently the distributing centre of a very large district? Yes.

770. Do you think it would be a payable speculation to construct a railway here, judging from the knowledge you have of the district, and the settlement that has taken place? It all depends upon the rates which the Commissioners may impose. If they stick to the present rates the carriers will compete against them.

771. If they would land the stuff at Coonamble for a little more than they charge to Dubbo it would be all right? Yes. The present rate of carriage for third-class goods is £8 5s. 5d. *via* Mudgee, and £8 19s. 5d. *via* Dubbo. The rates for second-class goods is £6 8s. 11d. to Dubbo, and first-class goods £5 3s. 8d. Then the B rates are £2 9s. 3d., and A rates £1 8s. 6d., and then there is the miscellaneous class of goods the rate for which is the lowest, viz., £1 4s. 2d. The rate for third-class goods *via* Warren is £9 15s. 3d.

772. Have you heard the evidence of any of the previous witnesses? I heard that of Mr. Cobb, and Mr. Polin.

773. And you can practically endorse their statements with regard to the capabilities of the districts and so on? Yes. I have heard people give evidence here that the country will carry a sheep to the acre. The same people, when they go to the Land Court for their assessment, say it will take 10 acres to the sheep.

M. Herrmann.
24 Mar., 1898.

- M. Herrmann. 774. What do you think it will carry? On an average about a sheep to 3 acres. We have to reckon the droughts, because we suffer very often from want of rain. If you over-stock, of course, the sheep must die but if you do not stock your land very heavily—say, on an average a sheep to 3 acres—then you can stand it. The best agricultural land in the district is between here and Mudgee, this side of the Warrumbungle Mountains.
775. There is some good agricultural land in the vicinity of Coonamble along the river, is there not? Yes; along the river. Of course, when you go back further to the black soil, though it is good grass country, it is not good for agriculture.
776. Why did you not keep the carriers going? I would have kept them going, but they were too lazy to go. I would keep them going all the year if they would only go. It was a good season at the time.

James Denny, farmer, Coonamble, sworn, and examined:—

- J. Denny. 777. *Mr. Roberts.*] What are you? I am a farmer, residing within 3 miles of Coonamble in a westerly direction. I am a tenant of Mr. Herrmann.
- 24 Mar., 1898. 778. How much land do you hold? One square mile.
779. What rent do you pay? For the square mile as it stands I pay a rental of £78 per annum, or about 2s. 6d. an acre.
780. To what use do you put the land? Grazing and agriculture at present.
781. How many sheep do you run? I do not run any sheep; I graze horses and cattle, which I take on agistment.
782. What area of land have you under agriculture? Fifty acres.
783. What do you grow? Wheat, barley and oats.
784. Have you been successful? This last year I have been. With regard to hay and oats, for hay purposes these crops have been successful this year. In the previous year, owing to the excessive drought they were not successful. For wheat-growing the land could not be excelled in the colonies.
785. Have you had much experience of farming? Yes; in the valley of the Murray I had an experience of twenty years—farming largely too.
786. Was that anywhere near Berrigan? Nearer to Deniliquin and Echuca.
787. That country down in Riverina enjoys quite a reputation for the excellence of the wheat produced? It does.
788. How does this country compare with that? I have not very long been a resident here, but from what I can learn as to the amount of rainfall and the nature of the soil, this is superior country for wheat-growing and general agricultural purposes to the country, generally speaking, in the valley of the Murray. Undoubtedly the character of the soil is superior; it will make a more extensive growth when the season is suitable.
789. How many years have you been growing wheat here? I have only been in the district between three and four years. I have been growing wheat for one year.
790. Out of those three or four years have you had any failures? One last year. I have only had three years proper experience.
791. Do you attribute the failure of the crop entirely to the insufficiency of the rainfall? Entirely so.
792. Did you put the crop in at the usual time? My crop went in rather late, but other crops that were put in much earlier were very little better, so that I consider the failure of that year was entirely due to the want of rain.
793. Does the rain in this district fall in months most favourable to the farmer? My experience here has not been sufficiently long to say. This last season the rain fell at a very favourable time, and the result was a very favourable year for hay-growing. Wheat-growing is not carried on to any extent, simply because there is no outlet for wheat, and it can only be grown for hay to supply the local demand. This year there was but a moderate amount of rainfall, and I saw the largest and the heaviest crops of hay that I have seen in my experience, and I have had experience in South Australia and the southern portion of the Colony for twenty years, with the same amount of rainfall.
794. How many bushels do you get to the acre? Within 20 miles of here some of the crops are averaging up to 30 bushels to the acre. I could show you as fine a sample of wheat as you ever saw, grown last year within 20 miles of this place.
795. How many bushels to the acre do you get? Last year was a failure. This year I allowed a little to go for wheat, and I have not threshed it, but I reckon, from the look of the crop, that it will go from 20 to 30 bushels to the acre.
796. Do you find a good market for all the produce off the 50 acres that you cultivate? We do not; we can grow in excess of the demand. The town can be supplied by a few farmers growing hay, and hay is the principal product, for the simple reason that there is no outlet.
797. How many inches of rain would you consider to be absolutely necessary for successful wheat-growing? A good deal depends upon how the rain falls during the year—that is, whether it is necessary for grain-growing. A rainfall of less than 20 inches will not produce successful crops either in South Australia or in this Colony.
798. Are you able to get along? Well, fairly only, on account of the seasons we have passed through lately. There has been rather a difficulty all over the colonies in that respect, but otherwise I have no reason to complain.
799. You get a fairly good living for yourself and family? Yes, so far.
800. Have you felt the want of a railway? Very much. I have at present any amount of hay to dispose of, and if I could have turned that hay into wheat I could have sent it along the railway to the centres of population. At present, however, on account of the over-supply of the product, I cannot dispose of it. If I could have turned it into wheat I could have gone on extending my operations until I made the farm a good agricultural farm, as I intend to do.
801. Have you formed any opinion, from your knowledge of the district and the class of country, as to which would be the best route for a railway? I think most of the people in the district interested have formed some opinion of their own. Some, of course, may be interested by having land on the various routes. I have none on any of the routes, and I look upon the question entirely from an agricultural point of view. It is important to take into consideration the fact that a very small difference in tariff makes

- makes a great difference in grain carrying. If this district is to compete with other places a very cheap rate will be necessary to enable you to reach the Sydney market. J. Denny.
802. You regard Sydney as your market? Certainly; it must ultimately become the market for every part of the Colony. 24 Mar., 1898.
803. Are the Committee to understand that you favour the route *via* Mudgee as being the nearest? I favour it, undoubtedly, for more reasons than because it is the nearest.
804. Do you know the country? I know some of it; I have been out on it a good deal. Between here and Coonabarabran, round the Warrumbungle Ranges, which is the route the railway to Mudgee would take, the land is eminently suited for agricultural purposes, especially wheat growing. I refer to the western side of the Warrumbungles.
805. You think a large farming population would become settled all the way from Coonamble to Mudgee? I should think so, as there are hundreds of farmers there already struggling under great difficulties to produce wheat, and there are thousands of bushels of wheat produced there at the present time. I heard a gentleman say that this year 5,000 bags of wheat were grown between here and Toorawheena.
806. How do you view the route from Warren to Coonamble? Not favourably.
807. On account of the extra haulage? Yes; and the number of people likely to be benefited will be much greater on the other route.
808. If the shorter line from Warren to Coonamble were constructed, would it have beneficial results with regard to the settlement of an agricultural population? It would, undoubtedly, to a considerable extent. No matter what line was made that would be the result.
809. The land is all very good is it not? The land is all good in this district. The land is very good on the Warren line for grazing sheep; but it does not always follow that the best grazing land is the best agricultural land.
810. What is your opinion of it for agriculture? I think the land between here and Warren is all very fair agricultural land, but I do not think it is equal to the land in the direction we have been speaking of.
811. Are you able to form an opinion as to what would be the yield per acre from the land between Warren and Coonamble best adapted for agriculture? When you take averages for agricultural districts, if you look at some of the best districts in the Colony, you will find that the average yield is not so large as is supposed. A district which for a particular year would average 20 bushels to the acre, would not, perhaps, give a general average of more than 14 bushels, and I reckon that this district would be exactly like the other districts. In a good year we might produce 30 or 40 bushels on the average, but taking an average extending over a number of years, it would not be, perhaps, more than 14 bushels, as in other western districts.
812. From what you know of the land and its capabilities, you think there would be a large population settled here, and that agriculture could be combined with grazing? Undoubtedly. I think there will be a large population, no matter in what way the land is dealt with.
813. Did I understand that you were storekeeping also? Yes; I have a store in town, and my sons and myself work the farm.
814. What sort of goods do you generally buy in Sydney? We send for corn and oats occasionally, and we send for a variety of other things.
815. Which way do you get them? From Dubbo.
816. Did you hear the evidence of the previous witnesses who are engaged in storekeeping? Yes.
817. Do you endorse the evidence given by them? Yes; I think they were correct. I was asked as to what line I would favour most. I would favour the Mudgee line, provided we could get it constructed, but if not, I would favour the Dubbo line. Along that line there are hundreds of farmers already engaged in agricultural pursuits. The valley of the Castlereagh is much better adapted for wheat-growing than anywhere else. I have been along the surveyed line from Dubbo; half of the country is suitable for agriculture, the other half is very medium grazing land.
818. Then it is not good country on the whole? It is not what you would call first-class country. I produce samples of barley and wheat grown on my land.

James Colley, manager, Commercial Banking Company of Sydney, Ltd., Coonamble, sworn, and examined:—

819. *Chairman.*] You are manager of the Commercial Bank at Coonamble? Yes. I desire to inform the Committee that I have been three and a half years in the district, and have had an ample opportunity of forming an opinion as to its suitability for settlement, and its agricultural and pastoral potentialities. In my opinion, it is a first-class pastoral district. There should also be a considerable amount of land placed under cultivation for the growth of cereals. The people are in a solvent state usually. The town I regard as sound financially. The district compares favourably with any other district I know of in the Colony. J. Colley. 24 Mar., 1898.

Sidney Richard Skuthorpe, solicitor, Coonamble, sworn, and examined:—

820. *Mr. Hassall.*] What are you? A solicitor, residing at Coonamble. I have been in the district since its infancy. S. R. Skuthorpe. 24 Mar., 1898.
821. I suppose you have seen the district progress almost from its infantile state to its present condition? Yes.
822. You have heard of the project to construct a line from Warren to Coonamble;—are you in favour of that proposal? I should like to see a railway extended here, but, like a number of other gentlemen who have just been examined, I belong to the local railway league, and we are pledged not to advocate any particular line; but we want railway communication.
823. Do you know the country pretty well on the various routes proposed? Yes; I have been along each of them.
824. On which of the routes is the best country situated? There is less bad country on the Warren line than on either of the others, and less on the Dubbo line than on the Mudgee line.
825. It is admitted that the connection *via* Mudgee would afford the shortest route to Sydney? Yes; and from my knowledge of the country I think that is the only recommendation in its favour.
826. Its disadvantages would be the heavier grades on the line and the much greater cost of construction? Yes. 827,

S. R.
Skutkorpe.
24 Mar., 1898.

827. Have you any samples of what has been grown in the district? Maize, a sample of which I produce, has been grown within 30 miles of Coonamble, at Gulargambone, during the present year.

828. Was there a pretty good crop? There was only a small area under crop. There was a fair crop, considering the season. There was an exceptionally unfavourable season for maize-growing, and the yield was at the rate of about 30 bushels to the acre. At Gulargambone, where that maize was grown, I have known over 40 bushels of wheat to be grown to the acre. In 1881 there were 6 or 7 acres under wheat, and a patch of it was kept for grain, and it went at the rate of over 40 bushels to the acre. The wheat was a better sample than that submitted to the Committee by Mr. Denny.

829. That proves that wheat can be grown successfully and profitably? Yes.

830. Even if there were no cultivation carried on in this district at all, do you think the importance of the district, taking into consideration the settlement which has taken place here during the last twenty years, and the rapid advancement of the district, should warrant railway communication? Yes; I think there should be a railway, independently of the agricultural prospects of the district.

831. Do you think the traffic on the railway from pastoral occupation would be sufficient to pay interest on the cost of construction? I think the railway would induce closer settlement.

832. And would lead to still larger settlement in the district, with the result that any available land would be readily taken up? Yes.

833. I suppose you would have some experience of the demand for land in this district? I know that where land which has been thrown open lately—and in the majority of cases it has been balloted for—there has been a large number of applications for each piece, with the exception of two or three areas of country which is practically worthless, but there is not much land of this latter description in the district. The portions referred to are away to the eastward of the Castlereagh, out from Gilgandra. There is a patch of bad country there—sandy scrub country.

834. But where good land is made available there is a decided rush for it? Yes.

835. Having heard the evidence given by previous witnesses during this inquiry, can you corroborate their statements? Yes; I generally endorse what has been said.

836. Is there anything you might wish to add? There is one thing with regard to getting stock away from here. Nevertire and Dubbo are the points generally sought to be reached. The stock routes to these places are unprovided with water, and after a few weeks' dry weather there is practically no water for travelling stock. Last Christmas there was no water available between here and Gulargambone—a distance of 30 miles; and water was only obtainable at Gulargambone on sufferance. The water there was surrounded by private lands, and stock were only allowed to get it on sufferance. After leaving there they had to go to Gilgandra—another 30 miles, and there is only a small supply there. On the other route from here to Warren or Nevertire, since the bore has been running, they would get a little water at Bourbah—that is very nearly 30 miles, and there is a tank at Bullagreen for stock. I believe stock has to be watered there from troughs, and paddock stock are shy of drinking at troughs.

837. The main stock route to Dubbo, although it traverses the bank of the Castlereagh River, is practically waterless? Yes.

838. Because, although it is called a river by courtesy, in a dry season it is a bed of sand? That is so.

839. There is plenty of water underneath? Yes; water can be obtained by sinking; still, paddock stock are shy of drinking from troughs.

840. Your inference, then, is this: that the construction of a railway to this district would materially assist those who have to send fat stock away to market? Yes.

841. And you think the railway would be largely availed of as a means of transit for fat stock? I think so.

842. In view of the difficulty of obtaining a water supply between here and the trucking points at present in existence at Dubbo and Warren? Yes.

843. I presume you are also of opinion that a railway would be of great advantage to small holders in enabling them to send away small consignments of stock, which they are unable to do at the present time, in consequence of the expense of droving to trucking points? Yes. I know something about that because my brother earns his living by droving. I know something, therefore, about the stock that would go away. They do not go away now unless there are pretty large mobs. It often happens that a small lot will be fit to be sent away, but they get poor while they are being kept waiting for the others to fatten.

844. So that very often the market is lost for a small number of stock, which would not be the case if the railway were running into the town? That is so. There is one thing with regard to the construction of the line from Warren. I think we are more favourably situated so far as rainfall is concerned than the district away to the west—Cobar, and out there. I am of opinion that in the future that district will support a pretty large mining population. It must be rich in minerals, and if the railway were constructed from Warren, trade would probably spring up with that district, which we could supply with produce and stock.

845. In that case the line from here to Warren would be the better line to construct? Yes; I think there is that in its favour. Against that, the line to Dubbo would benefit a larger number of present settlers. I do not, however, wish to be understood as advocating any particular line. I think the extension of a railway to the district, no matter where it came from, would be a general benefit.

846. No matter what route were adopted, you think the line would be used by practically everyone in the district, and would be largely availed of for sending away produce? Yes; and there would also be a passenger traffic.

847. There is at present a considerable passenger traffic between Coonamble and both Dubbo and Warren? Since the railway has been extended to Warren the passenger traffic is principally with that place.

848. The passenger traffic on the railway would, you think, be a considerable item in the revenue? Yes.

849. And with greater facilities I suppose more people would travel than now travel by coach? Yes; there would be a considerable increase.

Donald Fletcher, President, Railway League, Coonamble, sworn, and further examined:—

D. Fletcher.
24 Mar., 1898.

850. *Mr. Roberts.*] Have you any information you wish to add to the evidence you have already given? I am not quite sure that Mr. Medley gave correctly the figures relating to the stock. The acreage of the district, including Crown lands, is 2,770,644, and the stock depastured comprise 6,990 horses, 18,311 cattle, and 1,732,562 sheep. With regard to the carrying capacity of the district, taking those figures, and reckoning eight sheep for one head of cattle and eight sheep for one horse, which is an absurdly low estimate,

estimate, the result is 1,900,000 sheep to 2,700,000 acres. That is equivalent to one sheep to about $1\frac{1}{2}$ acre. Those are the official figures showing what the land actually carried last year, which was not a good year. Mr. Dillon's figures as to the revenue derived from the Lands Office of Coonamble sufficiently prove that we are entitled to a railway, and the figures of Mr. Newton, as to the cost of road-making, show that a railway could be built almost as cheaply as a road. Then again there is another point in what Mr. Skuthorpe said—that in a dry time there are practically only two drinks of water between here and Dubbo. I should like to endorse what Mr. Skuthorpe said on that point. Three months ago there were two 30-mile stages from here to Gulargambone and from there to Gilgandra, and then one stage of 40 miles to Dubbo.

D. Fletcher.
24 Mar., 1898.

Thomas Clarke, secretary, Railway League, Walgett, sworn, and examined:—

851. *Chairman.*] You are an accredited representative from Walgett? Yes; I am secretary to the Walgett Railway League, and my business is that of an auctioneer. T. Clarke.
852. Where do the people of Walgett desire to be connected with the railway system of the Colony? At Narrabri. 24 Mar., 1898.
853. If you were given a preference, which line would you take? From Narrabri to Pilliga, and thence to Walgett, through Come-by-Chance and Goangra.
854. What are the reasons why you prefer that line to one *via* Coonamble? On account of the larger amount of traffic that would accrue, and also because a line from Walgett to Coonamble would be a continual tax upon the persons who would use it.
855. Have you the lengths? The line *via* Coonamble is 24 miles further round than from Walgett, *via* Narrabri, to Sydney. The people of Walgett and the district look upon Narrabri as the natural outlet for their produce, and by that route it would be 124 miles nearer the seaboard.
856. It would be 124 miles nearer to Newcastle, *via* Narrabri, than it would be to Sydney, *via* Warren? Yes.
857. And it would be 78 miles nearer, if the line went *via* Dubbo; and 44 miles nearer, if it went *via* Mudgee? Yes.
858. The Committee would like to hear your views with regard to a line located on the northern side of the Namoi between Narrabri and Walgett? My opinion is that although the country there is as good as that on the southern side of the Namoi, it is more subject to floods. There are really three creeks to cross; you cross Pian Creek twice, and another creek not far from Wee Waa. There are about 30 miles of country almost always subject to flood. On the southern side of the Namoi there is not a mile that is always subject to flood. There was some length of country that was under water during the 1890 flood, but that was the only occasion within the recollection of one of the oldest residents of the district.
859. Your first objection then is that the cost of construction would probably be greater on the northern than on the southern side? Yes.
860. What is your next objection? Another objection is that the traffic would not be so great on the northern as on the southern side.
861. Suppose bridges were to cross at the various centres such as Pilliga and Come-by-Chance? It would merely mean a question between Coonamble and the stations on the other side of the river.
862. If the railway is on the southern side, the wool from the stations on the north, and the productions from the north will have to come across the Namoi? Yes.
863. If it is on the northern side, the productions from the south will have to cross the Namoi? Yes. At the same time there are one or two very large stations who would very likely send to Coonamble in preference to sending across the Namoi.
864. Therefore you think there would be less freight for a line located on the north of the Namoi than for one located on the south of that river? I think so.
865. Now take the case of Walgett itself;—would it affect Walgett? I do not think it would affect the town itself in any degree, unless there might be such a thing as local jealousy, such as one person saying, "The railway being on the other side of the river will make your country a bit better than mine."
866. But if it were located on the northern side of the Namoi, as close to Walgett as possible? I do not think it would then make the slightest difference to the town of Walgett, nor to the people on the far side of Walgett from here.
867. You have another outlet—by the Barwon River down to Bourke;—will you describe that? I thought we had already knocked the bottom out of that. The Barwon River I believe has been navigable seven times in fourteen years; therefore you could not call that a factor in the transport of any kind of produce. It has been said that the people of the district of Walgett would prefer to send their goods down the Barwon River to Bourke in preference to paying the railway carriage from Walgett to Sydney; that is to say, they would prefer to send them 500 miles at the very least by river, and thence by rail from Bourke, which would be at the least 40 miles by rail further to Sydney. I have it from Mr. Scott, part owner of Gingie, that under no circumstances would he send another bale of wool down the river Barwon. This year the whole of his clip went *via* Narrabri, and whether the railway goes to Walgett or not, he will never send another bale down the river. Then again, Mr. Wiseman, of Mourabie, states that Rich's man was at him several times this year to get his wool, and the carriage is not only so uncertain, but it is actually dearer. Mr. Wiseman can bring his wool 30 miles into Walgett, and send it thence to Narrabri at a cheaper cost than he can send it down the river, notwithstanding the cheap carriage to Bourke which they speak of. These are two gentlemen who have told me themselves, and I can assure you that there are at least a dozen others who are of the same opinion. Then again, as a means of transit for stock the river is absolutely worthless; you can never get stock away by the river. I have been in Walgett myself for five years, and during that time the river has been navigable for two seasons.
868. The Walgett stuff now goes to Narrabri? Yes; almost all of it.
869. What is the rate of carriage? £2 a ton. The highest I have known it during the last five years has been £2 10s. I reckon £2 10s. a very fair average.
870. I believe you have an estimate of the cost of construction, working expenses, and returns on a line of railway on the south side of the Namoi, from Narrabri to Walgett;—can you give us particulars? The total cost per annum, including working expenses and interest, is £18,172. The total revenue, including all items that in my opinion would contribute to the railway revenue, is £19,543; this is calculated on through rates. The profit, therefore, to the railway system of the Colony will be £1,371 per annum. The area I now intend to describe is comprised in the land district of Walgett. The area of freehold land

T. Clarke. is 392,612 acres, and the area of rented land is 65,731 acres. This last is included in the first area. The area of the Crown lands is 4,315,981 acres, giving a total area of 4,774,324 acres held by 340 persons. These figures are taken from official returns. The number of stock in the Walgett district according to the returns of 1896 was—sheep, 1,978,088; cattle, 13,244; horses, 8,418; and the acreage was 5,024,047. Between Narrabri and Pilliga there is a large tract of excellent ironbark timber which would supply the whole of the sleepers for that line; it is about 20 miles wide. With regard to the Crown lands open for settlement, in the Walgett district, there are 171,607 acres available for application under the Conditional Purchase clauses, 8,167 acres for homestead blocks, and 2,638 acres for settlement lease farms, making a total of 182,412 acres; and in Walgett north there are 33,740 acres available for homestead lease. During the next six months there will be available 59,000 acres on Bugilbone, 22,000 acres on Bogewong, and 31,000 on Euroka, making in all 112,000 acres.

Kenneth Murchison, land-owner, Coonabarabran, sworn, and examined:—

- K. Murchison. 871. *Chairman.*] Where do you live? At Coonabarabran. I desire to place before the Committee certain information with regard to the Coonabarabran district for the year ending 31 March, 1897. 24 Mar., 1898. The number of holdings in the district from 1 acre upwards is 366. The area alienated is 563,999 acres, and the Crown lands occupied, 1,364,260 acres. The total area cultivated is 4,302 acres. The area under wheat is 2,029 acres, and the yield last year was 27,268 bushels. The area under maize was 730 acres, and the yield 8,841 bushels, and the area under other grains was 24 acres, and the yield 983 bushels. There was under lucerne 263 acres, potatoes 63 acres, grapes 5 acres, other fruits 53 acres, all other crops 52 acres. The figures relating to stock show the following: horses, 4,986; milch cows, 1,683; ordinary cows including calves, 13,200; sheep including lambs, 891,265; swine, 658. These apply to the police district of Coonabarabran. The agricultural statistics showing the increase from 1894 to 1897 give these results—in 1894, the area of alienated or freehold land was 57,000 acres, and in 1897 the area was 63,000 acres. In 1894 the area of the rented land was 4,658 acres, and in 1897 it had fallen to 2,000 acres. In 1894 the Crown lands embraced 347,000 acres, and in 1897, 292,000 acres. The area under cultivation in 1894 was 2,214 acres, and in 1897, 3,102 acres. The area under wheat for grain in 1894 was 1,154 acres, and in 1897, 1,743 acres. The total yield of wheat in 1894 was 16,872 bushels, and in 1897, 27,512 bushels. The years between may be regarded as proportionately dividing the amount. Although the area under cultivation does not seem very large it is divided among a good number of small holders. The area under wheat does not seem very large, but we occupy an isolated position, being situated so far from the railway; we are placed in a kind of central position between the Western line and the Narrabri line. There are two mills at Coonabarabran which are not kept constantly going; they could grind more wheat than we can grow. The proprietors had to cease buying this year, with the result that the settlers are thrown on their own resources. They have had to send either to Dubbo or to Gunnedah because the local production has overgrown the demand. The cost of road carriage of wheat to Gunnedah is £2 10s. a ton, and to Mudgee £3 10s. a ton. Therefore, the freight per bushel is 1s. 3d. for road carriage to get to the North-western line, and 1s. 9d. to get to Mudgee, while to get to Quirindi the cost is 1s.
872. Does 1s. a bushel represent your cheapest outlet? Yes.
873. What is the rainfall at Coonabarabran? About 30 inches.
874. What would be the return of the wheat crop under ordinary circumstances? The returns go as high as 40 bushels; I suppose a fair average return would be about 14 bushels.
875. From your experience of twenty years, do you believe that the district of Coonabarabran is suitable for the growth of cereals? It is suitable, especially on account of the climate.
876. And the people are prepared to go in for the growth of cereals if they can get means of communication? To any extent. They are now ready. We had a fairly good season last year, and we got good crops. We look upon the district as one in which the crops of wheat will never fail. Sometimes when drought occurs the returns are not so good, but on account of the character of the climate the district is very good throughout, and we look upon wheat as a certain crop. This year, however, the people do not know what to do, simply because they cannot get their wheat away, having more than is required for local consumption. Fruit is wasted in the district for want of proper means of communication. The climate renders the district especially suitable for fruit.
877. What is your idea of an outlet? The idea that brought us here, as representing the people of Coonabarabran and the farmers of the surrounding districts, is that our best way to get to the coast is to go to Newcastle, and that our outside market, other than the local market, is Coonamble and Walgett, and the country in that direction, because we grow wheat and they do not.
878. Take your eastern outlet first—your outlet to the seaboard? The line we propose would give us the choice of Newcastle or Sydney.
879. With regard to the outlet from Coonabarabran, easterly or southerly, will you give your views and describe the route? The easterly route is the one we ask for.
880. *Mr. Hassall.*] To run on to Werris Creek? Yes; with perhaps a line coming from the other end to deviate from the proposed Werris Creek to Dubbo line somewhere about Bomera, and to come somewhere near Coonabarabran. It would come north-westerly from Bomera, and would necessarily come near Coonabarabran in order to get through the gap in the Warrumbungle Mountains, and it would then come down to Coonamble.
881. *Chairman.*] What kind of country is there between Coonamble and Bomera, and between Bomera and Werris Creek? From Coonabarabran to Bomera, where we think the proposed line should run, and on the south of it, the larger part is agricultural land.
882. With brigalow scrub to the north? No, it is not brigalow scrub; it is poor country to the north—it is ironbark? The brigalow is nearer to Narrabri.
883. And what is the country like from Bomera to Werris Creek? It is mostly the Liverpool Plains country. I desire to emphasise the fact that although the country north from Coonabarabran is inferior, still there is very valuable timber there, principally ironbark, which is even now coming into use at Coonamble, 70 miles distant.
884. Do you know the country from Coonabarabran, going down the Castlereagh and on to Mudgee? Yes.
885. What is the country like due south from Coonabarabran, down the Castlereagh? It is good country. There are patches of pine and poor country, but on the whole it is good country down to Mundooran on the east of the Warrumbungle Ranges. 885.

886. And further into Mudgee? There is fairly good country.

887. From Mudgee on to Coonabarabran, therefore, the country would be fairly good to Mundooran, and from Mundooran north the country on the whole would be good and suitable for agriculture? Yes.

888. But with patches of inferior country? Yes.

889. Would the line from Mundooran to Coonabarabran be a heavy one to construct? It would be a heavier line than the one we propose.

890. Much heavier? Perhaps not much heavier. But it is surveyed, and there is a report upon it to Mundooran from Mudgee. So that from Mundooran up to Coonabarabran it would not be heavy; it would be a heavier line than the one we propose.

891. There is another possible extension from Coonabarabran joining on to the line at Muswellbrook or Singleton; do you regard that as so costly as to be not worth considering? Yes; Mr. Jones has reported that it would be likely to cost £650,000, and therefore we leave it out of consideration.

892. Why does a man at Coonabarabran desire to get to Coonamble, and further on to Walgett? Because those districts would afford an outlet for our products—for our wheat and flour, and all other things we can produce, and for the production of which we have special advantages. These places are our markets now. When coming here to-day we passed five or six loads of flour on Coonabarabran teams, some going to Coonamble, and some going to Walgett. The construction of a line from Warren to Coonamble, by bringing the Coonamble market within reach of the flour produced on the main Western line, would take away from Coonabarabran what it regards at present as a market for its surplus flour. I want to mention the distances to show the length of the line from Coonamble to Newcastle, the natural port of Coonamble and Coonabarabran. From Newcastle to Werris Creek the distance is 154 miles; from Werris Creek to Bomera it is 45 miles, and from Bomera to Coonabarabran 41 miles, making a total of 240 miles from Newcastle to Coonabarabran, and from Coonabarabran to Coonamble the distance is 69 miles. Therefore it is 309 miles from Newcastle to Coonamble, or 409 miles from Sydney to Coonamble, as against 417 miles, *via* Warren, to Sydney. Some of the leading pastoralists between here and Coonabarabran, including the Messrs. Ryder, of Calga station, 25 miles from here, have told me that if the line be constructed from Warren to Coonamble they will not send their wool by it because of the extra haulage; they will send their wool, as they do now, by team to Dubbo, Mudgee, or Quirindi. I would like to point out that fruit, maize, wheat, and other agricultural products give a larger return per acre to the railway than does wool, say 6 lb. of wool to 600 lb. of wheat.

William Nash, grazier, near Coonabarabran, sworn, and examined:—

893. *Chairman.*] Where do you live? Seventeen miles from Coonabarabran.

894. You have heard the evidence given by Mr. Murchison? Yes.

895. In general principles is it correct? Yes.

896. The statements made by him should convey to our minds a fairly correct view of the Coonabarabran district and the difficulties you are suffering from in the way of isolation and the different modes of approach to the district? Yes.

897. Is there any other point that you think you might do well to emphasise? The country round Coonabarabran, and from there on to Werris Creek, is more suitable for wheat and fruit-growing than any country on this side, on the plains; and by reason of our climate, the character of the soil, and the number of small holders, the settlers must be compelled to go in for farming. The figures given in the official returns show the great bounds that wheat-growing has taken within the last few years. The farmers around me and right on have just grown themselves out. This year, for the first time, the millers have closed their doors and ceased buying. The consequence is that the people who held back for a higher price have to send their wheat to Quirindi or Dubbo. I know it has gone to both places, that being the cheapest way they can get to a market, though it is at a cost of at least 1s. a bushel. A railway from Warren to Coonamble would shut out the Coonamble and the Walgett districts from Coonabarabran as a market for its produce. Adjoining my place there are twelve selectors. I feel sure that when once a train goes round from Warren to Coonamble, and on to Walgett, these men, being deprived of their market, will be willing to let me have their homes at my own price within seven years. They must perish. They cannot live except by agriculture. I am quite satisfied, from the money the farmers have made within the last three years, and the ploughs and machinery they have purchased, that they have been successful, and will continue to be successful if they can find a market. The other night I was talking to a person, and it was said that it was not advisable that we should encourage the mill, as it was only helping the selectors against us. I pointed out that two years ago I started the halves system. I gave a man 20 acres of land partly cleared. He said one day that he wished he had that 20 acres to grow a crop of grain. I said, "Certainly, you can have it. It wants fencing; I will find you the wire, give you the teams and ploughs and you can cultivate it." He did so, and made £75 out of it. Since then, everybody has been inclined to go in for the halves system, and I am sure that all my neighbours as well as myself would be glad to let every acre of land they can on the halves system. I pointed out to Macmasters Brothers that if they were willing to let their land on the halves system they would find hundreds of young fellows, who, perhaps, might not have the brains to go in for cultivation for themselves, but who, if they had someone to steer them, would do very well. If you start these men with four horses and a three-furrow plough, find them seed and plant to the amount of about £50, and give them 100 acres of ringbarked timber, they will soon burn the timber off, and get under weigh. Let them have the land for ten or fifteen years on the halves system. Assuming a man grows 10 bushels to the acre, and sells it at a profit of 1s. a bushel, that would give him 5s. an acre. You would never graze sheep if you could get 5s. off the land in that way—putting it at a very low estimate. So that I am satisfied that the greater portion of Coonabarabran, and further on towards Quirindi, will be a large wheat-producing district. But this is not possible unless the State furnishes us with cheap carriage. This year we have overdone production. Fruit is now rotting in the gardens. At the Coonabarabran show there was some of the best fruit I ever saw in the Colony, and I came from the Hunter. Coonabarabran is a good district for wine-making.

898. *Mr. Roberts.*] What is the nearest railway station? Gunnedah; but the road is bad. It is about 90 miles to Quirindi, and the carriers prefer going that way. If the railway came through Coonabarabran to Coonamble there would be a great advantage by reason of the wool going to Newcastle instead of to Sydney. We do not allow that connection with Sydney is any advantage to us. Newcastle would be the outlet for our produce.

K. Murchison.
24 Mar., 1898.

W. Nash.
24 Mar., 1898.

- W. Nash. 899. *Chairman.*] You think you would export from Newcastle? Certainly.
 24 Mar., 1898. 900. *Mr. Roberts.*] Do you send your wool to Newcastle? No; it goes to Mudgee, as a rule. I desire to emphasise the fact that the extension of agricultural operations is impossible in the district of Coonabarabran with the present cost of road-carriage. There can be no such extension with better means of communication.

SATURDAY, 26 MARCH, 1898.

[The Sectional Committee met at the "Castlereagh Hotel," Gulargambone, at 7:30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

John Thomas Skuthorpe, Gulargambone, sworn, and examined:—

- J. T. Skuthorpe. 901. *Chairman.*] How long have you been resident in the district? About thirty years.
 26 Mar., 1898. 902. Have you had an opportunity of seeing the surveyed railway-line from Coonamble to Mudgee? Yes. For about the first 50 miles it passes over pretty well the same kind of country as you find east and south from Coonamble, until you reach the foot of the Warrumbungle Mountains, near Toorawheena. Then you pass through rough ironbark country for a distance of 15 or 16 miles. This country I regard as pretty well valueless except for the timber. Then you find yourself on a table-land for about 8 miles, which is good country. Leaving the table-land, the country to Mundooran, a distance of 12 miles, is rough ironbark country, similar to that between Toorawheena and the table-land. Further on, to Cobborah Gap, a distance of about 18 miles, there is rather good country, suitable for agriculture, or almost anything. Further on to Cobborah there is rough, ridgy, country, and in some places small flats, on to the Talbragar River. After that, for 3 or 4 miles, you get good, sound country again, and then you get into broken country with ironbark ridges, with flats here and there. This description of country extends for about 14 miles, until you get to the foot of the Goodaman Range. Then there is rough, ridgy, country for about 8 miles with small flats intervening, and further on to Gulgong the land is of fair quality. Further on to Mudgee there is broken country again with ridges. Some of it is fairly good, and in other places the ridges are rough, and the slate reef comes to the surface in a good many places.

John Kearney, Gulargambone, sworn, and examined:—

- J. Kearney. 903. *Chairman.*] You are a resident of Gulargambone? Yes.
 26 Mar., 1898. 904. How long have you been here? Twenty years.
 905. The Mudgee line as surveyed lies about 12 miles to the east? Yes.
 906. The line to Warren lies about 13 miles to the west? Yes.
 907. The line to Dubbo lies about 2 miles to the west? Yes.
 908. Would you like to make a statement? I consider that a railway from Warren will do us here on the frontage of the Castlereagh and east of the Castlereagh no earthly good whatever. We could not use it. This opinion is also held by my neighbours. The country lying to the south and east from here as far as Mundooran could make no use of the line *via* Warren. We prefer the Dubbo route.
 909. How many small holders are there within 10 miles of where we are now sitting—(say) holders under 3,000 acres? I believe there are one hundred, holding under 3,000 acres within 10 miles of here.
 910. Are there any farmers cultivating in the district? Yes. I can give you one instance of a successful farmer in Mr. S. Organ. Off 200 acres of land, after reserving a sufficient area for his horses and milch cattle, he has been able to send 500 bags of wheat to market. The farmers have not been able to grow wheat, because unless the prices are very good they cannot afford to cart their wheat 75 miles to Dubbo. But up and down the creeks there is a considerable area of land suitable for the growth of cereals, and, in my opinion, a great portion of the plains at the back are also suitable for cultivation. Another resident, Mr. W. Zell, also grew wheat satisfactorily last year. Our isolated position tells against us. In my opinion, wheat would succeed in five years out of seven. I wish to impress upon the Committee the fact that the inhabitants of this place desire the Dubbo line, that being really the only one that could be of any value to them. I desire also to emphasise the great fertility of the flats on the Castlereagh River. I speak from my own personal experience. To give the Committee an idea of how fertile the land is, under favourable circumstances, I may mention that I got 100 bushels of wheat off 2½ acres of land, and also 5 bushels of fowl wheat. Not only will cereals grow here, but also maize, lucerne, and such crops, and fruit will thrive well. I produce samples of fruit grown in the district, including quinces, peaches, and apples. From my personal experience I am able to state positively that oranges, grapes, plums, and, in fact, almost any fruit can be grown in the district.

John Murphy, hotelkeeper, Gulargambone, sworn, and examined:—

- J. Murphy. 911. *Mr. Roberts.*] How long have you been residing here? About seven years in the town.
 26 Mar., 1898. 912. Have you had any experience in farming? Yes; I have done a little farming and grazing.
 913. Are you the holder of any grazing property now? No, not personally.
 914. What farming have you done? Just merely growing hay; there is no market for anything else. I have grown corn and wheat and always used it for hay.
 915. Has the distance from a railway precluded you from going extensively into farming? Yes.
 916. What are your views with regard to railway communication? I think the line from Dubbo to Coonamble is the one that should be constructed. I do not approve of the proposed line from Warren to Coonamble.
 917. How far are you from Bourbah? About 14 miles.
 918. If a line were constructed from Warren to Coonamble passing through Bourbah, would you not regard 14 miles as being sufficiently near to enable you to go to and from the railway with a load in a day?

- day? Yes; but you have to cross the Castlereagh River. There is no bridge, and the river is very bad to cross. J. Murphy.
 919. Though that is the state of things at present, is it not fair to assume that if a railway were constructed from Warren to Coonamble, and the traffic warranted such a course, the authorities would give you a bridge to get over the river? I suppose it would come to that in time. 26 Mar., 1898.
920. If the Dubbo to Coonamble line were constructed, you would still require a bridge to get to the railway station? Yes.
921. So that, as far as the approaches to the railway are concerned, the difficulties would be the same in both cases? Yes.
922. Having heard the evidence given by the previous witness, do you endorse what he said in regard to the capabilities of the district? Yes; I am quite certain about the capabilities of the district.
923. How long have you been living in the district? About thirty years in the vicinity of Gulargambone.
924. Out of those thirty years, for what period were you grazing? About fifteen years.
925. Where did you reside on that grazing property? About 8 miles from Gulargambone on the road to Coonamble.
926. What area of land did you occupy? About 1,400 acres altogether.
927. And you devoted your attention to sheep-grazing and also to farming in a small way just for home consumption? That is so.

George Joseph Skinner, butcher, Gulargambone, sworn, and examined:—

928. *Mr. Hassall.*] What are you? At the present time I am a butcher in the town of Gulargambone. G. J. Skinner.
 929. How long have you known the district? I remember it for the last twenty-five years. 26 Mar., 1898.
930. At that time there was very little settlement? Not much.
931. There was not a fence for hundreds of miles? No.
932. At that time the settlement was exclusively pastoral, and the country was under lease to the squatters? Yes.
933. When did you see settlement commence in this district? Twenty years ago, I suppose.
934. That was some little time after the 1861 Act of Sir John Robertson came into force? Yes.
935. But the settlement was only scattered at that time? That is all.
936. When did the district become thickly settled—during the last eight or ten years? During the last ten or fifteen years, I suppose.
937. What is the principal occupation of the people residing here—the smaller settlers? Sheep-farming, principally.
938. I suppose none of them are farming on a large scale? No.
939. Practically, their farming operations are confined to a small area of ground, and what they grow on it is principally for local consumption? Just so.
940. Have you command of a market in Coonamble? No; unless in a dry time for a bit of hay.
941. So that there is no outlet for any farm produce, even if you grew it at the present time, in consequence of the distance that you have to carry it to market? Yes.
942. What is about the general carrying capacity of the land;—taking the district around Gulargambone, what sheep will it carry? About one sheep to the acre.
943. Do you think it would carry two sheep to 3 acres, taking one season with another? Yes; it would do that.
944. Do you think that would be a fair average? Yes.
945. As a business man, I suppose you can form an opinion as to the soundness of the district;—are the people in a fairly good position? Yes; they seem to manage to make a living.
946. Where do your supplies come from? Dubbo.
947. That is your nearest point to the railway? Yes.
948. Is Dubbo nearer to you than Warren? Warren, I think, is a little nearer, but the line has only recently come there.
949. Warren would be a little nearer than Dubbo, but you think it just as well to send to Dubbo for what is required, as to go to Warren and have to make a circuit by the railway? Well, the goods would cost you more by the time they went round by Warren.
950. So that, practically, it is cheaper to go to Dubbo than to Warren? Yes.
951. If the line were extended from Warren to Coonamble you would be brought within 12 miles of a railway? From 12 to 14 miles.
952. Suppose the railway were carried that way, would it be of any service to you? It would be better than where it is at present.
953. It would be of some service, but certainly not of as much service as a line from Dubbo to Coonamble would be? Exactly.
954. But in any case, if either line were constructed, you would require a bridge across the Castlereagh to enable you to get backwards and forwards to the railway? Yes.
955. With regard to the Mudgee line, you know the surveyed line through there? I have crossed it.
956. It is about 12 miles to the east, is it not? Yes.
957. Would a line there be of any service to Gulargambone? Well, it would not be necessary to construct a bridge in order to reach it.
958. But I presume it would not be of as much service to the district as the line to Dubbo? No; still there are a great many farmers on that route; it is nearly all farming country that way.
959. If a line were constructed through there it would be a great benefit to those farmers? Yes.
960. And would to some extent be of service to the Gulargambone people? Yes.
961. You have heard the evidence by Mr. Kearney and Mr. Murphy? Yes.
962. Do you agree in the main with what they have said? Yes.
963. As residents of long standing in the district you think they are able to convey the opinion of the people residing in and around Gulargambone? Yes.

William George Tupper, Gulargambone, sworn, and examined:—

- W. G. Tupper.
26 Mar., 1898.
964. *Chairman.*] You have been a resident of the district of Gulargambone for sixteen years? Yes.
965. You have heard the evidence given by the three last witnesses? Yes.
966. In general principles do you agree with it? Yes.
967. Do you think there is anything vitally wrong with it? Nothing at all.
968-9. Would you like to say anything further? No.

Edward Henry Holland, Gulargambone, sworn, and examined:—

- E. H. Holland.
26 Mar., 1898.
970. *Chairman.*] You heard the evidence given by the first three witnesses? Yes.
971. Do you approve of it? Yes.
972. Do you believe that in general principles it is correct? Yes.
973. How long have you been here? About 30 years.

Henry Harvey, sworn, and examined:—

- H. Harvey.
26 Mar., 1898.
974. *Chairman.*] What are you? A road-maintenance man. I travel through the whole of the Coonamble district on the roads.
975. How long have you been in this district? Four years.
976. You heard the evidence given by the first three witnesses? Yes.
977. Do you believe it to be correct? Yes.

MONDAY, 28 MARCH, 1898.

[The Sectional Committee met at the "Gilgandra Hotel," Gilgandra, at 8 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Alfred Arthur Mudie, auctioneer and commission agent, Gilgandra, sworn, and examined:—

- A. A. Mudie.
28 Mar., 1898.
978. *Chairman.*] How long have you been here? I have been at Gilgandra for about three years.
979. Do you know the district generally? Yes.
980. For how long? Well, I was born in the Coonamble district. I have been here for thirty-one years.
981. You are also secretary to the Gilgandra Railway League? Yes.
982. You desire to hand in a petition? Yes; the petition states:—

We, the undersigned residents of the Curban, Gulargambone and Coonamble districts respectfully urge that the connection with Dubbo and Coonamble by railway be made *via* Balladoran, Gilgandra, Curban, and Gulargambone, where there is a very large extent of land highly suitable for agricultural purposes. A line has been surveyed between Dubbo and Coonamble which would suit all requirements.

To that petition are attached 166 signatures. With the exception of some half a dozen, the signatures are those of people within 15 or 18 miles to the west, and perhaps 25 miles to the east, and north-east of Gilgandra.

983. How many are resident on Gilgandra and west from Gilgandra? There would be over 100.

984. Therefore, two-thirds live at Gilgandra and west from Gilgandra? Yes.

985. Then the present population is down the river, or rather towards the west, and not to the north and the east? That is the case as regards those signing the petition. I desire to give the Committee some statistics showing the importance of the district of Gilgandra. The first is with reference to the revenue of the local Post and Telegraph Office. The revenue for 1897 is not obtainable; but for the year 1896, the official return shows a revenue at this office of £728; that includes post and telegraph returns as well as postal notes and money orders. I have some figures also with reference to the rainfall. I have taken an average for seven years, from 1891 to 1897 inclusive. The average rainfall at Gilgandra for that period was 25·8 inches. For the months of January and February of this year the rainfall has been 9·83 inches.

986. What is the rate of carriage for goods from here to Dubbo? About £2 a ton, or probably a little more.

987. Is that for wool? I think the average for wool would be rather higher. Store goods would average about £2. The rate ranges from 1s. 6d. a hundred, which is very rare, to 3s.

988. The approach by road to any part of the railway system of this Colony represents, roughly speaking, £2 per ton? Yes, I think that is about a fair average.

989. With such variations as the seasons, back loading, and such things permit? Exactly.

990. Do you know how much stock passes through here? No.

991. And you do not know the volume of traffic going through? I notice a great deal of it, but I can hardly give an estimate. It is considerable in the wool season. Dubbo is the *dépôt* for everything passing through this district except stock. Some of the stock finds its way to Mudgee. I am not able to say the proportion. The number of stock going to Dubbo would greatly preponderate. I should like to point out that the farming operations in this district have increased considerably within the last three years, and the residents are now about to form a company to build a flour-mill. I believe if the land-carriage of 6d. per bushel were reduced by the existence of a railway the people would put their land to the best use, namely, agriculture.

Sydney James Barden, grazier, near Gilgandra, sworn, and examined:—

- S. J. Barden.
28 Mar., 1898.
992. What are you? A grazier, residing within 8 miles of Gilgandra, down the river, towards Coonamble.
993. How long have you resided there? Since the 9th December, 1875.
994. What is the area of your property? About 7,400 acres.
995. Is it devoted wholly to sheep-farming, or do you keep some for cultivation? I cultivate a certain amount.

S. J. Barden.

28 Mar., 1898.

996. Sufficient for your own use? More than that. Last year I cultivated about 100 acres.
997. How many sheep do you run? About 7,000.
998. Any cattle? Yes, about fifty head—just a milking herd.
999. Can you run 7,000 sheep on your land with a feeling of perfect safety that you are not overstocking the run? Yes, on that country.
1000. Is that a fair indication of the carrying capabilities of the district, or is yours exceptionally good country? I think it is exceptionally good country.
1001. What crops do you cultivate? Generally wheat.
1002. For how many years have you devoted land to that purpose? On a small scale, I have been growing stuff for about twenty years.
1003. And how many failures have you had? During the whole of that period I cannot call to recollection one total failure; that is to say, if we did not produce grain there was a certain amount of hay crop during the whole time.
1004. What would be a fair estimate as to the number of years the crop would fail, judging from the experience you have had? I consider you would get four seasons out of five; there would be one failure in five years.
1005. What would be the yield per acre? Not less than about 17 bushels.
1006. In saying that you are not giving what would be the average yield in the district, but are speaking from your own personal experience? I am speaking from my own personal experience, as regards my own property, and that of the neighbours around me.
1007. Holding land favourably situated like yours? Yes.
1008. Have you been gradually increasing the area under cultivation? Yes; the first year I put in 4 acres. That was about twenty years ago, and I have since increased the area until I have now about 100 acres under crop. This year I expect to have 300 acres.
1009. How many acres of cultivation are necessary for the use of the station—I mean for fodder? About 12 acres.
1010. That would leave 88 acres, the product from which you sent away to market? Yes.
1011. Where did you send it? To Dubbo.
1012. Is that the nearest railway-station? Yes.
1013. Was it sold in Dubbo, or did you send it to Sydney? It was sold in Dubbo.
1014. Is there a fair market for it in Dubbo? Yes; very fair.
1015. Is there a mill there? Yes; a co-operative mill.
1016. When you get the 300 acres under crop will you still send wheat to the mill at Dubbo? Yes; I have no other market.
1017. Would it not pay you better to send it to Sydney? I think not.
1018. Before sending it to the mill at Dubbo for sale I suppose you went into a calculation as to whether you would get as good a price there as if you sent it to the Sydney market? Yes; but judging from the ruling prices I did not see that there was anything to be gained by sending it to Sydney.
1019. You think the average price at Dubbo would be equal to what you would get at Sydney after paying all expenses? Yes; and taking into consideration the risks.
1020. And what would you get for it in the Sydney market? In the Sydney market the price was about 4s., and in the Dubbo market about 3s. 8d.
1021. What was the freight up? I think about 8d.
1022. What would it cost for cartage from your station to Dubbo? Wheat is being carted for 6d. a bushel.
1023. Did you sell it delivered at Dubbo? Yes.
1024. What did you pay for the delivery of it? 6d. a bushel.
1025. And you got 3s. 8d.? Yes.
1026. What would be the net price after paying all expenses? About 3s. 2d.
1027. What do you consider is the cost of producing wheat—how much does it cost you? I do not know, because it was mostly done with our own labour.
1028. What would be the price at which a man in this district would get a living growing wheat on land like yours? Three shillings—that is with the facilities we now have for getting to market; but it would be 2s. if we had a railway.
1029. Do you think a man could get a living at 2s. if you had a railway? Yes, I am sure he could—farming on a large scale.
1030. You would not like to give an estimate of what the wheat for which you got 3s. 2d. per bushel cost you? No; I could not say exactly.
1031. Have you ever made an estimate of what an acre of ground under wheat would return as compared with an acre devoted to sheep farming? Yes; I reckon that the acre under wheat would give 100 per cent more. As against 5s. an acre out of sheep, you would make 10s. out of wheat.
1032. You estimate that you clear 5s. per acre out of sheep? Yes, taking everything.
1033. Would that be net after paying all expenses? Yes; and reckoning the increase to the wool and everything. They would be very bad sheep if you could not. I think there is no comparison between sheep and wheat.
1034. Having had some years' experience, in the event of a railway being constructed from Dubbo to Coonamble, would you go in for a marked increase in cultivation? Yes; if we had the luck to get railway facilities, instead of having 300 acres under wheat, I should in a very short time have 2,000 acres. Every acre of land that was available for cultivation I should devote to wheat-growing.
1035. Feeling assured that you would make 100 per cent. more out of your land in that way than by sheep-farming? Yes.
1036. Is that the prevailing opinion of men in the district? That seems to be the opinion throughout the Gilgandra district—that if they had railway facilities they would utilise all the land they could for the purpose of growing wheat.
1037. Do you grow corn or any other crops? Yes; I have grown all kinds, including corn, oats, wheat and lucerne. I have grown wheat principally.
1038. Do you grow much fruit? Yes; I have an orchard of about 2 acres.
1039. Do you grow the fruit for sale, or just for home consumption? Just for home consumption, and I give some away to my neighbours.
1040. It would not pay you, I presume, to grow fruit for sale? No.

- S. J. Barden. 1041. Do you think the land is admirably adapted for orchards? Yes.
- 28 Mar., 1898. 1042. If a railway came this way, would there be a market for the product of the orchards in many of the large towns between here and the metropolis? I could not say.
1043. Do you send much wool down to Sydney? I send the whole of the clip. I have had from 5,000 up to 11,000 sheep. I generally have, on an average, 7,000 sheep, and about 120 bales of wool. That would be 20 tons per annum.
1044. What is the carriage on that? £2 a ton to Dubbo.
1045. You know that the line referred to this Committee for its consideration is one from Warren to Coonamble? Yes.
1046. If that line were constructed, would it be of any use to you? No; it would be injurious to us.
1047. In what way? We could not send our stuff to it, and it would debar us from getting a railway here.
1048. How many miles from your property would the line from Mudgee to Coonamble be, taking the surveyed route? I think about 18 miles to the north-east.
1049. Do you know the country well between here and Mudgee? I have travelled over it several times.
1050. What is your opinion as to the Mudgee and Coonamble line? If I were to give my opinion with regard to that line I should say that on national grounds the Mudgee-Coonamble line was the proper one.
1051. You are putting personal interests, I suppose, on one side? Yes; I say on national grounds.
1052. If the Mudgee-Coonamble line were constructed it would be of great advantage to you? It would be an advantage, but not nearly so much advantage as the Dubbo-Coonamble line. There would be no comparison between the two.
1053. Is the character of the country such as to cause the construction of a railway from Mudgee to be much more expensive than a line from Dubbo to Coonamble? Very much so; it would be a very expensive line.
1054. On what portion of the line would the heavy cuttings be? It would be necessary to cut the dividing range between Cobborah, and to go through this side of the Warrumbungles, and it would also be necessary to put a bridge across the Castlereagh. On the eastern side of the Warrumbungles the country gets better as regards construction.
1055. There is a large amount of very fine land on the route? Yes, agricultural land.
1056. Extremely fertile? Yes.
1057. Capable of growing anything? Yes, good land.
1058. If the Mudgee line were not constructed you would favour the Dubbo-Coonamble line? As far as I am personally concerned I favour the Dubbo line; but from a national point of view I must admit that the line from Mudgee is the proper one.
1059. The line from Warren to Coonamble would be of no use to you personally? No.
1060. What is your opinion as to the desirableness or otherwise of constructing a line from Warren to Coonamble? In the first place I think it would be a non-paying line for all time, and in the next place there is very little settlement on it, and there is no land there that would offer inducements for people to settle and engage in agriculture. There is very little agricultural land between Warren and Coonamble.
1061. Do you know the country well. Yes; I know every inch of it.
1062. Do you know it not only along the line, but for any distance on either side? Yes; I have been all through the district, and have known it for years.
1063. Is there not some very fine agricultural land along that line? There may be patches, but only patches.
1064. Is it more patchy than along the line between Gilgandra and Coonamble? There is no comparison between the two as regards agricultural land.
1065. Do you regard the country between Gilgandra and Coonamble as far superior for cultivation to the country on the line from Warren to Coonamble? Yes; I think there is no comparison as regards agriculture. For grazing purposes, I think the land between Warren and Coonamble is quite equal to any of the land between Gilgandra and Coonamble.
1066. If the Committee have had evidence from people who say that from long experience they believe the land between Warren and Coonamble to be admirably suited for the growth of cereals, you would beg to differ from those witnesses? Yes.
1067. And you regard it only as good grazing land? With the exception of a few patches here and there.
1068. How do you regard the country around Bullagreen? As grazing land.
1069. Would it not be suitable for agriculture? No; I should think not.
1070. What are your reasons for that opinion? I have worked similar ground.
1071. Where? Down here, and at Yalcogrin.
1072. Do you think there will ever be an agricultural population settle around Bullagreen? I do not.
1073. Could you compare the character of the soil on the Warren-Coonamble line with that on the Dubbo-Coonamble line? Nearly the whole of the land between Warren and Coonamble is myall country, and if you touch that land at any time while it is moist it goes together like a brick, so that you cannot work it in dry weather. Of course, it will not go together while it remains dry, but immediately rain comes on the soil sets like a brick, and then a very short time afterwards it all opens in great cracks. One can almost shove one's leg down in many places.
1074. Now tell us how you regard this country as compared with that? Nearly the whole of the country between here and Coonamble is rich agricultural land, consisting of yellow box, apple-tree, and kurrajong.
1075. *Mr. Hassall.*] You are dealing with river frontages? Yes; the whole of the river frontages.
1076. *Chairman.*] The line on the western side of the Castlereagh virtually follows the road from here to Coonamble? Yes.
1077. Since the railway is on the western side of the Castlereagh River, and you describe the country as fit for agriculture, it will be necessary to construct bridges to enable those on the eastern side to reach the railway? There are roads and good places to get up and down the river every few miles.
1078. How wide is the flat on the Castlereagh—what you regard as good agricultural land on the bank of the creek? I should say, on an average, three-quarters of a mile on both sides.
1079. That is your best land? Yes.
1080. How wide is the agricultural land on the Marthaguy? I should say only about a quarter of a mile on either side. That is the river frontage land—the best land. Between the Marthaguy and the Castlereagh, at Gilgandra, the distance is about 6 miles, and it gradually widens, since one river runs
north-west,

- north-west, and the other pretty well west. Between the two rivers lies what is known as the Monkey Scrub. Some of this I regard as useless, but in places it is firm, and, in my opinion, fit for cultivation; but as you go further to the west of the Monkey Scrub there is splendid land suitable for cultivation.
1081. Between the Monkey Scrub and the land you have described as the best land in the district, having a frontage to the Castlereagh, what intervenes? That is all high-class agricultural land, right to the river flats.
1082. What kind of country is Collie? Good country.
1083. Fit for agriculture? Yes.
1084. Is it fit for agriculture only on the banks of the Marthaguy? No, there is a large area of good agricultural land.
1085. And Berida—is it good agricultural land? Yes; parts of it.
1086. Going due north from Berida, say about 6 or 8 miles west from the surveyed line, what sort of country would you go through? High class grazing land—grazing land right along the line.
1087. As good as that at Bullagreen? Yes; it is a similar country to that which the Committee saw to-day.
1088. *Mr. Hassall.*] This being a proposal to construct a railway to Coonamble, in the event of the State not being willing to stand the expense of a line from Mudgee, and also, perhaps, thinking that a line from Dubbo might cost rather too much, looking upon the extension from Warren to Coonamble as the cheapest, would you object to the Coonamble people getting the line from Warren if you did not get the railway this way? If it were in my power I would in the interests of the country.
1089. You consider that the only outlet for the Castlereagh country, failing the connection with Mudgee, is Dubbo? Yes.
1090. The agricultural country you think is better between Dubbo and Coonamble than between Warren and Coonamble? Yes.
1091. And the grazing country is quite equal? Yes. I consider that the grazing land from here to Coonamble is equal to the very best grazing land on the Warren to Coonamble line; and as regards agricultural land, I think there is no comparison between the two routes.
1092. What is about the average wheat yield per acre in this district? My yield has been from 14 to 30 bushels.
1093. What is the extent of agricultural land on the eastern side? There are thousands of acres of good agricultural land on towards the Warrumbungles. The river flat towards the Warrumbungles is many miles in width, and consists of high-class agricultural land.
1094. Is it a fact that the sandy portion of the Monkey Scrub disappears altogether a few miles from Gilgandra? Yes.

S: J. Barden.
28 Mar., 1898.

John Francis, grazier and farmer, Gilgandra, sworn, and examined:—

1095. *Mr. Hassall.*] What are you? A grazier and farmer, residing about 2 miles from Gilgandra, on the banks of the Castlereagh. I am president of the Railway League.
1096. What area do you hold? About 1,000 acres.
1097. How much of that is devoted to grazing, and how much is under cultivation? About 60 acres are under cultivation, and the rest is devoted to sheep.
1098. Is your country equal in its carrying capacity to that described by Mr. Barden? It is not quite as good as Mr. Barden's land.
1099. Not quite a sheep to the acre? It is in some seasons, but I would not say it would carry that every season.
1100. Would it be better to put its average carrying capacity down at 2 acres to the sheep? I think we can carry one sheep to the acre.
1101. How long have you been resident of the district? About sixteen years.
1102. Then you have seen settlement increase in the district? Yes.
1103. Was there much settlement when you came here first? Very little.
1104. I suppose Gilgandra was only a small town then? There were about two houses in the place, I think.
1105. The growth of the town and the increase of settlement in the district, I suppose, afford the strongest proof you could have of its suitability for settlement? It is one proof, a very strong proof.
1106. Do you look upon this as a prosperous district? I do. It would be more so if we had a railway.
1107. Your drawback is want of better means of communication? Want of transit for what we grow.
1108. You heard the evidence given by Mr. Barden? Yes.
1109. Do you corroborate his evidence? I do in every respect.
1110. You can endorse the opinions he has expressed with regard to the character of the country and its suitability for agriculture throughout almost the length of the Castlereagh valley? I can more than endorse the statements of Mr. Barden, because it appeared to me that he only spoke about one side of the river. He omitted reference to the capabilities of the eastern side of the river.
1111. What is your experience of the eastern side of the river? I am on the eastern side myself, and I know from what I have seen, and from the experience I have had, that there are a hundred thousand acres out there equally as good as the land I occupy.
1112. That is the land lying between the river and towards the Warrumbungle Mountains? Yes, all of it is good agricultural land.
1113. Is the grazing capacity of that land equal to what has been stated? No, it is not, because it is all scrub land.
1114. But you think, if the land were cleared, it would be better, or quite as good, as any of the land on the river bank? If that land were cleared, it would be as good for carrying crops as any land you can find on the river. It is perfectly useless now; in fact, it is only a harbour for noxious animals.
1115. How far up the river does that land extend—right up to where the river leaves the Warrumbungle Ranges? Of course, there are patches of good land, cleared land, but the scrub land extends nearly from here to the Warrumbungles.
1116. With regard to a line from Dubbo to Coonamble, how far distant would the farms in that portion of the country be from the railway? The distance would vary, of course, but I should say they would be from 15 to 20 miles away.
1117. You think they could reach the railway within 15 to 20 miles? Yes; I do not think the whole of them could, but a very large number would be able to do so.
- 1118.

J. Francis.
28 Mar., 1898.

- J. Francis.
28 Mar., 1898.
1118. Those on the river, at any rate, for some considerable distance, would be within 15 miles? Those on the river would only be about 7 or 8 miles away.
1119. How far is Balladoran from the river? About 8 miles.
1120. Then a railway running near Balladoran, which is 12 miles from here in a southerly direction, would be only 8 miles from the Castlereagh? Yes.
1121. So that you could go back from the Castlereagh for another 7 or 12 miles, and still be within a radius of 15 or 20 miles of the railway? Exactly.
1122. Is the country lying between the road from here to Berida and the river good agricultural country? The whole of it is good agricultural country.
1123. So that you think that in that stretch of country you have a strip (say) 25 miles in width, running eastward, suitable for agricultural settlement? Yes.
1124. Is much of that country taken up? Very little of it.
1125. And it is not likely to be, I suppose, until you get better means of communication? No.
1126. Then, practically, it resolves itself into this—that you have at the present time a large tract of valueless land, a harbour for vermin, and consequently a menace to everybody settled near it, and you think the construction of a railway line would be instrumental in bringing that land under occupation, to the benefit of the State and of the individual? I am positive of it. I should like to say that I think it is of more advantage to the State to construct a railway through an agricultural district than through a pastoral district.
1127. What do you estimate to be the cost per bushel of producing wheat? I estimate the whole cost of the production of wheat, if you have to employ labour, at from 30s. to £2 an acre. If you have your family employed, of course, it does not cost you so much. That estimate includes all the work required in order to place the article on the market.
1128. What does it cost you per acre to clear the land ready for the plough? It depends on circumstances. If you clear land that has been rung for several years the work is easier, and you can clear it at a cost of from 15s. to 20s. an acre. If you have to deal with green timber the cost will be from 30s. to £2 an acre.
1129. Land that you can get cleared for from 30s. to £2 an acre is not very heavily timbered? Labour is cheap, and if land is fairly heavily timbered you can get it cleared at from 30s. to 40s. an acre.
1130. Is there much land ringbarked in this part of the country? No large quantity has been ringbarked for any length of time. All the river flats have been ringbarked, because that has been the only country that has been occupied for any length of time, and all the stations have done a large amount of ringbarking.
1131. But the country you speak of is practically in its natural state? Yes.
1132. Heavily timbered and scrubby? It is heavily timbered, but the scrub is heavier.

Arthur Frederick Garling, storekeeper, Gilgandra, sworn, and examined:—

- A. F. Garling.
28 Mar., 1898.
1133. *Chairman.*] How long have you been resident here? I have lived in the district about four years and in Gilgandra township for about one year.
1134. Do you know the district sufficiently well, and the occupation of the people, to corroborate the statements made by Mr. Barden? Yes; especially as regards the eastern side of the Castlereagh.
1135. And you believe it to be correct in every way? Yes.
1136. What does it cost you to get store goods from Dubbo to Gilgandra? Generally about 2s. a cwt., according to the quantity of loading we make up. Sometimes it is as high as 3s., and sometimes as low as 1s. 6d., but generally it is about 2s. The railway freight during ten months paid to Wright, Heaton, & Co. in Dubbo amounted to £412 6s. That represents freight paid by Wright, Heaton, & Co. for the carriage of goods on the railway from Sydney to Dubbo. The amount paid to teams for carriage between here and Dubbo was £250. I estimate the total tonnage at nearly 160 tons. During the past eight months I have had about 36 tons of flour from Dubbo, for which I paid from 1s. 6d. to 2s. a cwt. carriage.
1137. What proportion of the trade of the district as a distributor do you think you had? I could hardly say, but I should imagine that quite three or four times the quantity mentioned came from Dubbo this way. With regard to the Mudgee line, I should like to mention that on the eastern side near Gummin Gummin there is a deposit of kerosene shale which seems to be of good quality. Its extent is not known, but the distance from a railway prevents anything being done with it. There is a very large deposit of tripolite in the Warrumbungle Mountains, within 12 or 14 miles of the proposed Mudgee line. This would find a ready market if there were cheap freight, but the team carriage of 100 miles to Mudgee prevents anything being done. In my opinion the right line for the country to construct is the Mudgee-Coonamble line. It would pass through the largest area of good country and the greatest amount of settlement, and, besides that, the distance to Sydney, *via* Mudgee, would be considerably less than the distance *via* Warren. That would be a very great consideration in getting goods to market and in sending stock away. If sent *via* Warren the stock would be so many hours longer in the train, and the greater cost in freight would be a big item to the inhabitants of Coonamble and the people in the surrounding districts. Then again, the line from Mudgee would pass through better country—country that could be cultivated perhaps from Mudgee to within 30 miles of Coonamble. It would be better to have a line running through that would be within easy distance of many of us, though it would not suit us quite as well as the line from Dubbo. At present some of our goods come through Mudgee to this place. I am speaking from a national point of view. I produce seven samples of wheat grown contiguous to the Mudgee line north-east from Gilgandra. The market for that wheat has been Dubbo, and it has been sent through Gilgandra. Most of it is being grown within 5 or 6 miles of the proposed Mudgee line, and the country from here to there is good with the exception of a few strips. With regard to the cost of wheat production, having done a little farming I can give you an approximate estimate. Much depends upon the manner in which the work is undertaken. The total cost of production would be about £1 per acre, leaving a good margin. I do not include the cost of clearing, which is a permanent improvement. The average yield of wheat in this district for the present year has been 20 bushels, and I do not regard it as a first-class year. We have practical evidence that the land here is suitable for the growth of tobacco, and oranges and other fruits can be seen growing.

Thomas Gardiner, blacksmith, Coonabarabran, sworn, and examined:—

1138. *Chairman.*] What are you? A blacksmith. I am a native of Coonabarabran, in which district I have resided all my life. T. Gardiner.

1139. Will you describe the country in the Coonabarabran district likely to be affected by the proposed railway construction? Coming down from Coonabarabran a valley nearly 30 miles wide extends from the river until the Warrumbungle Range becomes too abrupt for cultivation. On the eastern side the area of land suitable for cultivation is still wider. From Coonabarabran, coming right down towards Gilgandra, there is a belt of country that I believe to be 60 miles wide, which is fit for cultivation. The flat narrows up very much towards Coonabarabran.* 28 Mar., 1898.

TUESDAY, 29 MARCH, 1898.

[The Sectional Committee met at Hitchen's Hall, Gilgandra, at 9:30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The HON. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Archibald Campbell Berry, senior police constable, Gilgandra, sworn, and examined:—

1140. *Chairman.*] What are the boundaries of your district? My boundaries for the purposes of the statistics which I collected are these:—On the western side of the Castlereagh, 10 miles past Curban; to the west, as far as Berida; to the south-west as far as Bundemar; on the south-east by the Coolbaggie Creek up to Runter's Creek; thence by that Creek downwards to the Castlereagh River at Breealong. I start from Breealong, and go as far as Toorawheena, which is about 27 miles from Gilgandra; thence I go down the Terrible Creek to the Castlereagh. I hand in statistics relating to land and cultivation:— A. C. Berry.

County Ewenmar, Police District of Dubbo, 1896-97.

Number of holdings.	Alienated lands.		Crown lands.	Total area under cultivation.	Area under wheat for grain.	Total yield of wheat.	Remarks.
	Freehold.	Rented.					
47	Acres. 93,324½	Acres. 5,280	Acres. 262,676	Acres. 187½	The major portion of these Crown lands is far better cultivation land than grazing land.
42	80,090½	5,400	248,440½	231	48	908	The reduction in land this year from last is caused through sales, and the areas being taken in another police district.
County Ewenmar, Police District of Coonamble, 1896-97.							
32	47,601	990	63,233½	479	75	1,052	
1897-98.							
31	42,239½	2,898½	82,432	518½	241	4,787	A much larger increase of cultivation will be shown next year.
County Gowen, Police District of Coonamble, 1896-97.							
46	14,816½	780	79,641	276½	77	920	A very large portion of these Crown lands is more suitable for cultivation than grazing.
1897-98.							
49	18,852½	1,364	69,881½	567	222½	4,337	A much greater increase in wheat cultivation will be shown next year.

These holdings in both counties are within 40 miles of Gilgandra, and would all assist in supplying produce for the proposed railway.

There is an estimated population of between 1,500 and 1,600 within the boundaries of the district as previously given. Going up and down the river the distance would be 27 miles, and right across from south-west to north-east the distance would be between 60 and 70 miles. I hand in figures giving the revenue in connection with the Court:—

		1896.		£ s. d.
Total receipts all classes	130 19 6
Actual revenue	87 9 10
Public moneys	£43 9 8
		1897.		
Total receipts all classes	272 2 1½
Actual revenue	124 15 8
Public moneys	£147 6 5½
		1898.		
Total receipts to date	31 13 7
Actual revenue	14 7 10
Public moneys	£17 5 9

James

* NOTE (on revision):—I did not mean to say that the whole of the area between the Warrumbungle Ranges and the river was fit for cultivation, as there are belts of scrub and mountainous country between the main range and river which would not be fit for any cultivation. Some of the best wheat-growing land in the Coonabarabran district is found to be at the foot of the main range, while lower down it again becomes, in places, too mountainous for agriculture. I think about one-third of the area mentioned would be fit for cultivation.

James Barling, grazier, Bongeabong, near Gilgandra, sworn, and examined :—

- J. Barling.
9 Mar., 1898
1141. *Mr. Hassall.*] What are you? A grazier, residing at Bongeabong, about 6 miles from Gilgandra.
1142. How long have you resided in the locality? About three years.
1143. What is the extent of your holding? About 28,000 acres including leasehold.
1144. How much longer has the leasehold to run? About two years; it falls in in 1900.
1145. I suppose your land is devoted principally to grazing? Yes.
1146. What number of sheep do you carry? At present I am understocked, but 14,000 is about the carrying capacity.
1147. Would you carry 14,000 in all seasons? Yes.
1148. Of what does the land principally consist? Forest chiefly—a little plain, box, and buddha.
1149. Is there much scrub? In portions of it there is a good deal of scrub.
1150. But it is essentially good pastoral country? Yes.
1151. I suppose it is sound country, there is no disease? I have not known disease of any sort since I have been here.
1152. You look upon it as country admirably adapted for grazing pursuits? Yes, and also for agriculture.
1153. It also contains agricultural land? Yes; a large proportion of it—nearly the whole of the scrub land—is suitable for agriculture.
1154. Have you tried cultivation on a small scale? Yes, on a very small scale, and it has answered admirably.
1155. Practically it has been mainly experimental work? Yes.
1156. Do you find the scrub land or the plain land the better adapted for cultivation? As far as I have had any experience, I should say the scrub land was the better—the timbered country at all events.
1157. The soil, I presume, is more loamy than is the case on the plain? Yes; the plains consist of black soil, myall country; not so suitable, I should say, for agriculture as the timbered country.
1158. You heard the evidence given by Mr. Barden in that respect, and your experience, I presume, would corroborate his evidence with regard to myall country being difficult to deal with? Yes.
1159. Do you find it is good fattening country? Yes; portions of it consist of very good fattening country.
1160. Do you send fat sheep to market? Yes.
1161. Where do you truck? At Dubbo.
1162. Forty miles by road? A little over 40.
1163. I presume the construction of a railway from Warren to Coonamble would be of no use to you? None whatever. It would, in fact, be an injury, because it would prevent the construction of a line anywhere else.
1164. You would be as far away from the nearest point on the Warren-Coonamble line as you are from Dubbo? Quite as far, or very nearly so. I should never think of trucking sheep on any portion of that line, or sending goods of any sort there.
1165. Are there many settlers around you? Yes; a considerable number.
1166. Do they confine their operations chiefly to sheep-farming? Yes; but they are all more or less going in for agriculture.
1167. They are adopting mixed farming? Yes.
1168. In the event of a railway being constructed from Warren to Coonamble, that would be of no service whatever to you, or to the residents along this portion of the Castlereagh? None whatever.
1169. So that they could expect no increase of traffic from this quarter on that extension? None whatever.
1170. Which line would suit this district in your opinion? The Dubbo-Coonamble line; that would be the best, and it would be the nearest for myself and others here.
1171. It would be the shorter distance to Sydney than going round by Warren? Yes.
1172. In the event of an extension of the railway from Dubbo to Coonamble, a result that might naturally be expected in this grazing country would be that settlers upon the smaller areas (say) 2,560 acres, and family selections of 5,000 acres, would be able to send away one truckload of fat sheep or fat cattle? Yes; where it would not pay to do so at the present time on account of the cost of droving.
1173. No man cares for the expense of droving 100 sheep to Dubbo, or eight or ten head of cattle? No.
1174. Although they may have fat stock they may not have a sufficient number to justify the expense of droving to Dubbo, and, consequently, they have to let their stock remain on the place, and sacrifice them? Yes.
1175. Or wait till the middle-man comes along? Yes.
1176. There can be no doubt that the extension of the railway through this country would be very beneficial to the small holders as well as to the large holders? Most certainly.
1177. Are there many large holdings about here; what is the largest holding in the vicinity? I could not say, but I think Berida would be the largest. I think they shear 50,000 or 60,000 sheep.
1178. What quantity of wool do you send away? Last season I sent 120 bales and the season before 160 bales. The quantity varies according to the season.
1179. Your wool is sent to Dubbo? Yes.
1180. And the station supplies come back *via* Dubbo? Yes.
1181. You look upon Dubbo as your point of departure from here on the railway? Yes.
1182. How many fat stock do you send away in the year? I could hardly give you the number; I sent away 1,200 a week or two ago.
1183. In a good season, I suppose, you would send 4,000 or 5,000 fats away? I could do so, if I went in for fat stock.
1184. This country is too good for breeding, is it not? I do not think so.
1185. Judging from what you have seen of the country, do you think it is suited for what is termed closer settlement; when the land becomes available as the leaseholds fall in, do you think there will be any great demand for it? I believe there will.
1186. Which is the nearest land office—where do you transact your land business? A portion of my property is in the Dubbo district, and the other portion is in the Coonamble district. The Marthaguy Creek is the dividing boundary between Dubbo and Coonamble. The country on the western side of the Marthaguy is in the Coonamble district, and the country on the eastern and southern sides is in the Dubbo district.

1187. So that the land business transacted in this district is distributed between Dubbo and Coonamble? Yes. J. Barling.
1188. Is there any great demand for land here, when it becomes available? I can hardly answer that question. There is very little land available at the present time, I believe; but when the runs were divided some years ago there was a great rush for land. All the land that was worth taking up was immediately rushed and taken up. 29 Mar., 1898.
1189. That was when the marked increase in settlement took place in this district? Yes.
1190. And that, you think, would be a pretty fair guide as to what might occur in the future, when the present leaseholds fall in? Yes; seeing the way in which land is rushed wherever it is available now, I think the rush is likely to be even more marked than it was formerly.
1191. Have you any idea as to whether those who have already settled in the district and taken up land on a small scale are doing fairly well? Yes; I think as a rule they are doing fairly well.
1192. Any careful, steady man can get along? I think so.
1193. You have not had a sufficiently long residence in the district to form an opinion as to whether the seasons will be disastrous to you, or whether they will be fairly favourable? I think we had rather a hard time since we have been here. We have had unfavourable seasons, but we have managed to pull through fairly well. I am in hopes we have seen the worst.
1194. The present season is fairly good? Yes; I think the Coonamble district fares better than a great many other districts—better than Bourke.
1195. Do you think the Castlereagh country will stand a drought fairly well? Yes, as far as I have had experience.
1196. Judging from your experience of cultivation, do you think that agricultural and grazing pursuits might be profitably combined? I think so.
1197. That considerable quantities of land might be put under wheat with advantage, and the straw saved for fodder for the stock in dry times? Yes.
1198. With regard to water supply, have you sunk for water? I have sunk in one of the paddocks. I sunk over 80 feet for water, and I got a good supply. I watered all the sheep I had in the paddock in the dry time—about 1,200 sheep.
1199. Then there is a possibility of water being found at a reasonable depth by persons of small means, who might come and take up the country when it was available? Yes.
1200. So that they need have no fear on that score? I think not the slightest; and the rainfall is sufficient at all times to enable a supply to be maintained by means of dams.
1201. There are other wells sunk in the district? Yes; I believe so. I believe that water is found at depths varying up to 80 feet—a good supply of good water.
1202. With regard to the proposed line from Mudgee to Coonamble, have you given any thought to that proposal? No. I know nothing of the country, and know nothing about it except from looking at the plans.
1203. Summing up your evidence, you believe that the best way in which this district could be served would be by an extension of the railway from Dubbo to Coonamble? Yes; I believe that would benefit the greater number of people in the district, and would be the best line.
1204. The extension from Warren to Coonamble would be of no service to this part of the country, and certainly of no service to the country between here and Dubbo? None whatever. As far as agricultural pursuits are concerned, though I have only a limited area under crop at present, I am preparing about 120 acres, which I hope to get in this season.
1205. In the event of a railway being constructed through the district, I suppose there is no doubt you would cultivate a much larger area? Yes, much larger; all the land available, eventually.
1206. How many men would you employ in preparing the 120 acres which you hope to get in this season? It is to be done by contract. I think the contractor has five or six men working at it now.
1207. It will mean the employment of a few hands in ploughing and sowing, and in harvesting the crop, and so on? Certainly. It will mean one or two hands extra, at all events, for the working of the place.
1208. And the larger the area put under cultivation of course the greater number of hands employed? Yes.

Richard Hitchen, butcher and farmer, Gilgandra, sworn, and examined:—

1209. *Mr. Roberts.*] Have you resided in the district for a long period? Nearly twelve years. R. Hitchen.
1210. Has the district around Gilgandra made any marked progress during that period? Yes; wonderful progress. 29 Mar., 1898.
1211. Was there much settlement when you came here twelve years ago? Very little; there has been a great deal of settlement since.
1212. You heard most of the evidence given before the Committee? I have heard that given by Mr. Barden and Mr. Garling.
1213. Do you approve of the gist of that evidence? Yes.
1214. Are you prepared to endorse all that Mr. Barden said? Yes.
1215. You know the three lines which are under the consideration of the Committee? I do not know a great deal about the Warren line; I know the country about Bullagreen and towards Merri Merri.
1216. Have you formed any opinion as to the quality of the soil at Bullagreen, as compared with what you see around you in this district? Yes.
1217. What conclusion have you arrived at with regard to the two districts, and their suitability for the growth of cereals? I do not think there is any comparison between the land about here and the Bullagreen land for farming purposes.
1218. You know the country very well between here and Gulargambone? Yes.
1219. Do you regard that as good agricultural country? Yes; a great deal of it.
1220. Have you never heard it mentioned as being too sandy? No; far from it. There are only very odd patches of it that are sandy. It is mostly very good soil right through, especially down along the river. There are just odd patches of myall in places.
1221. Do you purchase much live stock yourself? Yes; a good deal.
1222. Do you purchase locally? Yes.

- R. Hitchen. 1223. Is there much stock fattened in the district? Yes; there is a good deal of both sheep and cattle fattened about here.
- 29 Mar., 1898. 1224. That stock would be trucked at Dubbo? Yes.
1225. Is there a large passenger traffic through from Dubbo to Coonamble? Yes; pretty good.
1226. Has it fallen off at all since the line from Nevertire to Warren was constructed? I could not say. Some of the plains, in my opinion, are unsuitable for agriculture. The black soil would be no good at all for farming, because it bakes and cracks.
1227. *Chairman.*] What plains are good for agriculture? What they call the Buddtha Plains. At Berida there is a considerable area of agricultural land. Going north from there to Merrigal you are on the plain country. I have about 30 acres under cultivation, and next year I expect to have from 130 to 150 acres. If we have a railway that area will be increased to from 400 to 500 acres. In my opinion, wheat can be produced in this district at a cost of from £1 to 25s. per acre.

Peter O'Neill, farmer, Gilgandra, sworn, and examined:—

- P. O'Neill. 1228. *Chairman.*] Where do you live? About 2 miles from here, towards Dubbo.
- 29 Mar., 1898. 1229. What is your occupation? Farming.
1230. How long have you been farming? About fifteen years.
1231. In this district? Yes.
1232. What are you growing? Wheat, corn, and sometimes potatoes and oats.
1233. What kind of country are you farming? River flats.
1234. In your opinion, is that the best land in the district? I think it is; I believe there is some quite as good out from the river.
1235. What is your area? 660 acres. I have about 60 acres under cultivation.
1236. What yield do you get in wheat? An average of from 15 to 20 bushels.
1237. Over what period? Fifteen years.
1238. The same country? Yes; except that the area has been gradually extending.
1239. How many failures have you had in the fifteen years? One absolute failure.
1240. What was the next worst year? About a quarter of a crop.
1241. That would be about 4 or 5 bushels? Yes.
1242. And the next worst year? I do not think I had any other bad seasons.
1243. After those two you went on pretty well, with an average of 15 bushels? Yes.
1244. Do you think these plains will grow wheat? Some of the plains around here will grow wheat.
1245. The red plain will, and the black plain will not—is that right? Yes; open forest country will grow wheat. Generally speaking, we divide them into red or chocolate plains, and black plains. The black, in my opinion, will not grow wheat. Patches of the land at Bullagreen will grow wheat.
1246. Do you know Berida? Yes.
1247. What is your opinion of that from an agricultural standpoint? There is a lot of good agricultural land there.
1248. And Merrigal? That is more for grazing.
1249. Do you know Kickabil? There is a lot of land on Kickabil that will grow wheat.
1250. Do you know the line as surveyed from Gilgandra to Dubbo? Yes; I know pretty well the way the survey goes.
1251. From Gilgandra to Dubbo what do you think of the country as a rule? I think it is nearly all good wheat land. There might be odd patches, but most of it I am quite positive is good wheat land.
1252. What would it cost to clear? It is fairly heavily timbered. It might cost in green timber about 30s. an acre, and if ringbarked about £1. I produce a sample of wheat grown 2 miles from here along the Dubbo road on the edge of the Monkey Scrub. The maize I produce was also grown there. This is land which was at one time considered unfit for cultivation. A great many large land-owners are commencing to go in largely for wheat, but I do not think the undertaking will be a success without a railway.

Edward Maher, selector, near Gilgandra, sworn, and examined:—

- E. Maher. 1253. *Mr. Hassall.*] What are you? A selector.
- 29 Mar., 1898. 1254. Where do you live? Ten or 12 miles from Gilgandra, adjoining Berida on the west side of the Castlereagh River.
1255. How far back from the river? Four miles.
1256. You are practically out in the dry country? Yes.
1257. What area of land do you hold? 2,000 acres.
1258. What do you do with it? I use it principally for grazing sheep.
1259. Wool-growing? Yes.
1260. You do not send any fat lambs away to market, I suppose? No.
1261. Can you fatten sheep there pretty well? Yes.
1262. What do you do with the fats? Send them to Sydney, or sell them locally to the butchers.
1263. Have you a sufficient number to truck from Dubbo? Sometimes.
1264. What is the largest number you ever sent away? 800.
1265. Then you must have pretty good country? Yes.
1266. How many sheep will it carry? It carries about two sheep to 3 acres—that is about the average.
1267. You run about 1,600 sheep altogether? Yes; sometimes more, and sometimes less.
1268. How long have you been residing there? Twenty-two years.
1269. On the same place? Yes.
1270. I presume when you selected, you had this advantage, that you could select almost anywhere—there was not much settlement when you first took up your land? I think I was the second selector in the district.
1271. You have practically seen the settlement grow up around you? Yes.
1272. Did you not get more than 2,000 acres? No; I was hemmed in. At the time I selected, I could only get a conditional purchase of 320 acres, and before I could increase my area, I was hemmed in.
1273. Have you tried any cultivation in the back country? A very small portion.
1274. How do you find it acts? Splendidly.
- 1275.

1275. Then you have some good cultivation land on your holding? Yes; I have grown as much as 3 tons of hay to the acre in a good season. E. Maher. 29 Mar., 1898.
1276. Have you cultivated wheat at all? It is wheat that I grow, but I make hay of it, because there is no market for wheat.
1277. Have you had any experience of farming? Yes; I have been a farmer all my life.
1278. Having found that your land is suitable for agriculture, I presume if you had the means of sending your products away you would put a considerable portion of your land under the plough? I should do so if I only had the chance of getting the stuff away. It would pay me better than the work I am now engaged in.
1279. How far is your place from Dubbo? About 50 miles.
1280. How far would you be from the nearest point on the Warren to Coonamble railway? I think 40 miles. I am not acquainted with that district.
1281. Do you know anything of the country on the eastern side of the river, out towards the Warrumbungles? Yes.
1282. Did you have a good look around there before you selected? I did not know it then, but I have seen a lot of it since.
1283. Do you look upon that as good agricultural land? Yes, splendid land.
1284. As good as you have yourself? Just as good as you could find in the Colony—parts of it.
1285. So that you look upon the country on both sides of the Castlereagh as suitable for agriculture? Most certainly.
1286. Do you think there will be any great demand for the land when it becomes available? I believe that as soon as ever it is available every acre of it will be taken up. That has been my experience since I came to this district.
1287. Do the people who come and settle down here stick to the district pretty well? A number of people who came here about the same time as I did myself are here now. Some who selected have sold and others have remained.
1288. But there are a considerable number of the old hands still remaining on the land they selected years ago? Yes, a lot of them.
1289. That speaks well for the district? Yes; I think the district is as good as any we have seen, only we want an outlet.
1290. I suppose a railway coming in this direction from Dubbo to Coonamble would be of great service to you in enabling you to send away small lots of fat stock which you cannot send away at present? Yes. It would not pay me to incur the expense of sending 100 at a time.
1291. You might have perhaps a couple of hundred sheep pretty prime? Yes. The local butcher can certify that I sold him 100 sheep a short time ago; but it would not pay me to send them to Sydney.
1292. Had you been able to send them to Sydney you would have reaped the benefit? Yes.
1293. You think the whole of the selectors about here would use the railway as a means of sending their stock to market? I do.
1294. And they then would be able to realise better prices? Yes, we would have a better chance of a market.
1295. You heard the evidence given this morning? Yes.
1296. Can you, of your own knowledge and from your acquaintance with the district, corroborate the statements of previous witnesses? I can.
1297. Do you think the Warren to Coonamble railway would be no good to you? Yes.
1298. And an extension from Mudgee to Coonamble would not be of any great benefit to you? It would be a benefit to us, but not so great a benefit as the Dubbo to Coonamble line; that is the one that would suit us best.

George Park Barnet, grazier, South Balladoran, sworn, and examined:—

1299. *Mr. Roberts.*] How many miles is your place from Dubbo? Thirty miles north from Dubbo. G. P. Barnet. 29 Mar., 1898.
1300. That would be about 10 or 12 miles from Gilgandra? Yes.
1301. Is it on the road between Gilgandra and Dubbo? Yes.
1302. What area of land have you? About 7,000 acres.
1303. Is it all devoted to grazing? It is at the present time.
1304. Is any of the land suitable for agriculture? Yes.
1305. Why have you not devoted it to the growth of cereals;—seeing that it was within 30 miles of Dubbo it struck me that agriculture might possibly have paid you? The reason is partly want of means, and partly want of facilities for sending the produce to market. I am going to try it this year in any case.
1306. It is not because you doubt the capability of the soil for the purpose? Not at all.
1307. Do you regard it as fair wheat-growing country? Yes.
1308. Is it anything like as good country as that which we see around us? It is similar country to what you have seen about here—a little better, I think, for wheat-growing.
1309. Is there any wheat growing there? Yes; on land adjoining my place about 20 acres were cultivated last year, and the yield was 23 bushels to the acre. About 12 acres were devoted to hay, and the result was 2 tons to the acre.
1310. Was this produce sent to market? It has not been sent yet.
1311. You will send it to Dubbo, I suppose, where there is a mill? Yes, if there is a favourable market for it.
1312. How would you describe the country between here and Dubbo? It is timbered country.
1313. What is it fit for? It is more suitable for agriculture than for grazing; it is box-timber country, principally.
1314. Would it be expensive country to clear? Fairly expensive.
1315. What would probably be the cost per acre? It would depend upon the length of time it had been ringbarked—from 12s. to 30s. or £2 per acre.
1316. Is most of the land between here and Dubbo taken up? A good deal of it is not taken up.
1317. Would that be on account of the difficulties in the way of clearing and so forth, or because better land can be procured further north? A lot of it has not been open for settlement. What has been open for selection has been pretty well taken up.

1318.

G. P. Barnet. 1318. Have you given the question of the construction of a railway to Coonamble much consideration? Yes.

29 Mar., 1898. 1319. Will the proposed line from Warren to Coonamble be of any use to you? No, not a bit.

1320. Would the suggested line from Dubbo to Coonamble go through your property? It would go through the stock reserve along my frontage on the Dubbo to Coonamble road.

1321. Is there much settlement in your neighbourhood? Yes.

1322. Even from the start a good many people would be served by that line if it were adopted? Yes; all along the route.

1323. Do you think the land in your district is of a sufficiently fertile character to warrant you in saying that if the line from Dubbo were constructed, and the land between here and Dubbo were available for settlement, such settlement would quickly take place? Yes; I have no hesitation in saying that.

1324. I understand you wish to hand in a document? As secretary to the Balladoran Railway League I desire to hand in a petition similar to that presented to the Committee last evening; it contains ninety-three signatures. I also hand in statistics collected in the Balladoran district giving particulars as to the area under crop, &c.—

RETURN showing the area of land, stock, and cultivation in the district of Balladoran.

Alienated Lands.	Crown Lands.	Number of Sheep.	Woolfor 1897.	Actual carrying capacity.	Area under crop 1896.	Area under crop, 1897.	Total yield, 1897.		Area for 1898.	Remarks.
							Hay.	Wheat.		
acres.	acres.		bales.		acres.	acres.	tons.	b'sh'ls.	acres.	
2,560	...	1,500	17	2,500	
400	...	300	2	300	...	2	4	...	20	To be increased to 100 acres.

1,600	...	500	...	1,300	22	38	30	460	90	Will increase cultivation to 200 acres.
8,160	...	1,500	70	10,000	...	6	18	...	40	400 acres for cultivation.
2,560	...	1,600	21	2,500	...	3	5	...	4	Area of cultivation will be increased.
5,120	...	3,000	30	5,000	60	300 acres cultivation if line be constructed.
5,120	...	600	10	3,500	Railway would be inducement to farm.
5,000	...	1,500	21	4,000	12	Would extend area of cultivation with a railway.
109,755	70,160	76,660	803	124,400	32	101	122	780	821	

NOTE.—The foregoing statistics have been collected by the Balladoran Railway League, and are for that portion of the proposed line between the Coolbaggie Creek and the Marthaguy Creek, west from Bobberah, and due east from Bobberah to the Castlereagh River.

The alienated land includes freehold, conditional purchases, and conditional lease lands. The Crown lands mentioned do not cover anything like the full area in that part of the district described above, a large portion of the Crown lands being attached to holdings outside the district. There are also unoccupied lands and reserves not specified, also the railway reserve, which is 2 miles wide, the Coolbaggie, and the Marthaguy Creeks.

The figures with reference to the cultivation show that the 60 acres cut for hay yielded 122 tons, an average of a little over 2 tons per acre; 4 acres cut for grain yielded 780 bushels, an average of 19 bushels per acre.

There is an extensive forest reserve from which large quantities of sleepers are taken every year, besides bridge and other railway timber. There are about a dozen selectors along the road between Gilgandra and Balladoran.

1325. What freight do you pay to Dubbo? One shilling and sixpence a cwt.

Charles William Brown, grazier, near Dubbo, sworn, and examined:—

C. W. Brown. 1326. *Chairman.*] Where do you live? Twenty-two miles from Dubbo, on the north side of the Coolbaggie.

1327. How far from Gilgandra? About 24 miles.

29 Mar., 1898. 1328. In point of fact, you are half-way between Gilgandra and Dubbo? Yes.

1329. What do you do? Principally grazing; I have been farming.

1330. What area have you? 10,000 acres; it is a family holding.

1331. Are you close to the surveyed route of the railway? My land abuts on it.

1332. How far are you from the bridge over Coolbaggie Creek? Three miles.

1333. What sort of country have you got? Partly open box country, pine, oak, and a little ironbark in places.

1334. Is it suitable for the growth of wheat? Yes.

1335. Have you tried it? I have had about 10 acres in during the last seven years.

1336. How often has it been a failure? I have never had a failure. The smallest crop was $\frac{1}{3}$ a ton of hay to the acre. I saved a small portion for wheat, and I reckoned in a rough way that the yield was 25 bushels to the acre, approximately.

1337. What freight do you pay from your holding to Dubbo? £1 a ton.

1338. Of what value would the railway be to you? I should probably go on increasing my area under agriculture up to 400 or 500 acres. Saving the road carriage would enable me to do this. The railway would be a great help. C. W. Brown.
29 Mar., 1898.

1339. Have you any neighbours? Yes.

1340. Would they do the same? Yes; many of them are making preparations for cultivation.

1341. Some of the land in the vicinity of your holding is at present being prepared? Yes.

1342. Are you preparing any yourself? Yes; I have now 60 acres ploughed. I may add that I have grown fruit at my place to perfection—fruit of almost all kinds, and particularly apples, oranges, and quinces.

Ernest Joseph Wheble, grazier, Everton, sworn, and examined:—

1343. *Mr. Hassall.*] Where do you reside? At Everton, 4 miles from here, on the Marthaguy. E. J. Wheble.

1344. What is the size of your holding? Where I live I have 6,500 acres. I have another holding which I work in conjunction with that. One is all Crown land, and the other is secured. There are 32,000 acres of Crown land, and 6,500 acres of purchased land. I am holding altogether about 38,500 acres. 29 Mar., 1898.

1345. What do you use it for principally? Grazing sheep and a few cattle.

1346. Have you tried any agriculture? Only just a little for hay.

1347. Do you find the country good sound country for sheep? Yes.

1348. No disease? No.

1349. And what is about the carrying capacity? The purchased land will carry a sheep to the acre.

1350. In the event of any settlement taking place in the district when the land becomes available, what will be the carrying capacity of the land? It takes 2 acres to the sheep.

1351. So that on 32,000 acres leasehold you would carry about 16,000 sheep? Yes.

1352. Your trucking depôt, I suppose, is Dubbo? I have never trucked any, but that would be the depôt.

1353. Have you been residing here long? Seventeen years.

1354. What do you do with your fat stock? Any fat stock I have had I have sent to the boiling-down establishment at Dubbo.

1355. You have not tried the Sydney market with any fat stock? No.

1356. Of course you sent them by road? Yes.

1357. If the railway were here would you still send them by road? It would depend on the grass. If there were any grass on the road I should send them in; it does not take very long to do that distance.

1358. You have heard the evidence given this morning by the other graziers? Yes.

1359. From your seventeen years' experience of this district can you substantially corroborate that evidence? Yes, I can.

1360. As to the character of the country? Yes, except that I have never been out towards Bullagreen. I can corroborate the evidence given with regard to the country between here and Dubbo,

1361. And I suppose you can corroborate the evidence given that the Warren to Coonamble extension would be of no use to you? It would be of no use at all to me.

1362. Of what advantage would the extension from Dubbo to Coonamble be? It would enable people here to go in for farming.

1363. What advantage would it be to you? It would mean all the difference between my going in for farming and not doing so. I do not think it is possible without a railway to go in for farming.

1364. What proportion of your land is suitable for agriculture? Most of it.

1365. Is the purchased land suitable for agriculture? Yes, it is more suitable than the other; nearly the whole of it is suitable for agriculture.

1366. But you would not take up agricultural pursuits unless there were a railway conveniently situated? I do not think so.

William John Berryman, grazier, Curban Creek, sworn, and examined:—

1367. *Mr. Roberts.*] Where do you reside? Eight miles from Curban—up the Curban Creek towards the ranges. W. J. Berryman.
29 Mar., 1898.

1368. What area have you got? Nearly 12,000 acres.

1369. How many sheep do you carry? The whole of the area is not yet improved, but we have about 8,000 sheep at present.

1370. If it were improved would it carry one sheep to the acre? Yes, I believe it would.

1371. Do you intend in the near future to improve it so that it will carry that amount of stock? Yes, we are improving it every year—ringbarking more and scrubbing more.

1372. How long have you been there? Seven years.

1373. Would the line from Warren to Coonamble be of any use to you? It would be utterly useless to our part of the country. It would pay us better to send to Dubbo by team.

1374. How far distant would you be from the Warren to Coonamble line? As nearly as I can ascertain we should be between 30 and 40 miles away.

1375. How far is it from your place to Dubbo? Between 50 and 60 miles. On account of the extra railway haulage, by the Warren route, we should continue to make Dubbo our head-quarters.

1376. Is that where you get all your goods from now? Yes.

1377. Do you send your wool to Dubbo? Yes.

1378. How much do you pay for the carriage of it? For the last two or three years we have paid £2 a ton. We paid more previously.

1379. And with back loading you get all your goods from Dubbo? Yes. The winter roads are heavier than the summer roads. Back loading in the wool time is slightly easier than at other times. Back loading costs from £2 to £3 a ton.

1380. I suppose the rate of carriage would vary according to the weather and the state of the road? Yes; the winter rates are higher on account of the state of the roads.

1381. What advantage, if any, would the suggested line from Dubbo to Coonamble be to you? It would give us an inducement to grow wheat, for which we think our land is well adapted.

1382. Have you made any experiments in that direction? We have been cultivating a few acres for hay ever since we have been there, and the result has been very satisfactory.

1383.

- W. J. Berryman.
29 Mar., 1898.
1383. So satisfactory that if you had the means of carriage by rail, you would go in for agriculture? Yes; we have been used to agriculture in Riverina, and we would adopt it here if we had railway facilities, and we fully intend to do so.
1384. Have you had much experience in farming? Yes; we were farming for twenty years on land about 12 miles from Moama.
1385. It is very fine agricultural land down there, is it not? Yes, it is a splendid wheat district.
1386. How would you compare the land on your property with the land down near Moama? We consider it equally as good, and we have some land out towards the mountains better than any we had in the Moama district, especially for root crops. We have tried potatoes and maize there, crops which we could not grow on the Murray. It is a light sandy soil out here, and very similar for wheat-growing to the land we had in Riverina.
1387. What was a fair average yield on your farm in Riverina? I should think 15 or 16 bushels.
1388. And you think you could realise that here? Yes; we have no doubt about it, from what we have seen.
1389. Is the rainfall about the same in the two places? There is a better rainfall in this district; there is more summer rain.
1390. Is not the annual rainfall about the same? It is better here. The rainfall map shows an average of 15 inches for the Murray, and 22 inches for this district; and our experience during the last seven years has been favourable in regard to rainfall.
1391. Does the rain fall here when it is most needed, or does it fall at a time when it is of no use to a man growing wheat? Our little experience in growing wheat has been so successful that we consider it falls favourably to the growth of wheat.
1392. For how many years have you tried wheat-growing? I have grown wheat six years out of the seven, successfully.
1393. Without any failure whatever? Well, the year before last was a slight failure owing to the dryness of the season, which was general. The crop was much below anything we had previously.
1394. What was it? I should not think it went more than half a ton of hay to the acre.
1395. And that is the worst year you have had in six? Yes.
1396. Do you intend to put any more land under wheat at present? We are not likely to do so under present conditions, and not unless there are some facilities for getting it to market. We consider it would not pay to grow wheat under present conditions.
1397. How far are you from the surveyed line from Dubbo to Coonamble? About 12 miles.
1398. That distance would enable you to cart your wheat to the railway and get back again the same day? Yes, about that.
1399. Have you many neighbours? Yes, there are several selectors through that district.
1400. Do they all hold the same views with regard to the country as yourself? As far as I know, they all consider it is well adapted for wheat-growing.
1401. In your opinion, would there be a very large area under wheat soon after the railway came? I have no doubt of it whatever.
1402. Is there anything else? I hand in a petition similar to that presented from Gilgandra and Balladoran. Over 100 signatures were obtained from Curban towards Coonamble. The Gulargambone people all signed.

Timothy Marchant, farmer, Curban, sworn, and examined:—

- T. Marchant.
29 Mar., 1898.
1403. *Chairman.*] What area of land do you occupy? 1,000 acres.
1404. How much do you cultivate? About 75 acres.
1405. Where do you live? At Curban.
1406. Have you heard the evidence given by other witnesses with regard to the suitability of the soil in the district for the growth of cereals? Yes.
1407. Do you agree with it? Yes.
1408. How many crops have you had in at Curban? About twenty.
1409. How many failures have you had? I have not had a total failure, though the crop has been very light in several seasons.
1410. What freight do you pay from Curban to Dubbo? £2 a ton.
1411. What line do you approve of? The line from Dubbo to Coonamble. I came here with Mr. Berryman, as a representative of the Curban people, and therefore my view of the question is very much the same as that expressed by him.

James Alfred Berryman, Hillside, Curban, sworn, and examined:—

- J. A. Berryman.
29 Mar., 1898.
1412. *Mr. Hassall.*] You have heard the evidence given by your brother? Yes.
1413. Have you anything to add to it? I do not think I could add much, except about the surrounding country. I have travelled about it more towards the mountains, and I think there is a great deal of land there very suitable for agriculture; I mean in the direction of the Warrumbungles.
1414. Has much of that land been taken up? Yes; there are a number of selectors all round that country.
1415. What do they principally go in for? They combine grazing along with growing a little wheat, potatoes, and corn.
1416. What do they do with their crops? I think most of the wheat grown about Toorawheena goes to Coonabarabran, where there is a mill.
1417. What effect would the construction of a railway to Coonamble have upon these selectors? I think it would induce them to very much increase the area which they now cultivate.
1418. In the hope of getting the produce away to a central market? Yes.
1419. Would the Warren to Coonamble line be of any service to you? No; I think it would be quite useless.
1420. I presume the Mudgee-Coonamble line would suit them better than any other? Yes; the people out there would favour that line, I think, because it is nearer to them than Dubbo.
1421. There is a large extent of agricultural land towards the mountainous country, is there not? Yes; nearly the whole of it there is suitable for agricultural purposes.
- 1422.

1422. You refer to the land lying between the Warrumbungle Mountains and the Castlereagh River? Yes. Of course there are some patches of plain country that would not be so good; but the greater part of the land is timbered country, suitable for agriculture.

1423. How far distant would these settlers be from the Dubbo connection? I think from 15 up to 30 miles.

1424. Do you think they would be able to traverse that distance with their produce? I think so. I know they do in other parts. In Riverina, for instance, which is a large district, farmers cart their wheat 20 and 30 miles.

1425. And here you have this advantage: that the roads being practically level, farmers could bring a decent load in to truck at any point near Gilgandra, and, with a bridge across the river, there would be nothing to prevent them getting through? Exactly.

J. A.
Berryman.
29 Mar., 1898.

Stephen Chandler, farmer and grazier, Yalcogrin, sworn, and examined:—

1426. *Mr. Roberts.*] Where do you reside? At Yalcogrin, about 7 or 8 miles down the river from Gilgandra. It is on the eastern side of the river from Coonamble.

1427. What is the area of your property? About 16,000 acres.

1428. How much of it is secured? 3,526 acres.

1429. How many sheep do you run? I have not many sheep at the present time; I have been selling off.

1430. What are the capabilities of the property? It will carry about 14,000 sheep.

1431. Would it run nearly a sheep to the acre? Yes; just about that.

1432. Have you gone in for much farming? Not a great deal; I am getting 100 acres cleared, and I intend to farm.

1433. Have you had any experience in farming? Yes, a great deal.

1434. Where? In the Carcoar district, the Molong district, near Cowra, and the Forbes district.

1435. Do you regard the land in this district as equally as good for farming as that to which you were accustomed in the districts you mention? Yes; every bit, if not better.

1436. Do you intend to go in for wheat cultivation, whether the railway comes or not? Yes.

1437. Would it pay you to cart the wheat to Dubbo? It would pay better than growing wool, I think.

1438. What yield do you estimate to get from the land? The lowest yield I have had has been about 16 bushels to the acre. I should say from 16 to 30 bushels of wheat.

1439. For how many years have you cultivated wheat? Five years.

1440. How long have you been residing here? Between five and six years.

1441. Have you ever sent any wheat to market, or have you only grown it for your own use? Only for my own use.

1442. And you are satisfied now, from the experience you have had, that it will pay you very much better than sheep-farming? Yes.

1443. What will be the cost of the carriage from your place to Dubbo if you have to send the wheat to the Dubbo market? The carriage from here is generally about 30s. a ton.

1444. You would be able to grow wheat and make it pay at that? I think so.

1445. Do you have to pay a carrier, or do you employ your own team? I have my own teams, but 30s. a ton is generally what we pay for wool.

1446. In any case, whether you did the work yourself or employed others, the carriage would be worth 30s. a ton? Yes, about that.

1447. Do you regard this as an exceptionally fine district, destined to be one largely devoted to wheat-growing? I do. I think it is as good a district as any I have been in, and I have been in a good many. I produce four different samples of corn grown on my place on the bank of the river.

1448. Does it pay to grow corn? Yes; there is a sufficient local demand at remunerative rates.

S. Chandler.
29 Mar., 1898.

George Lithgow, farmer, near Gilgandra, sworn, and examined:—

1449. *Chairman.*] Where do you reside? Six miles north of Gilgandra, on the bank of the river.

1450. What are you? A farmer. I produce three pumpkins which I grew this season on my land, and also a vegetable marrow. The pumpkins weigh about 28 lb. each, and the vegetable-marrow weighs 17½ lb. I had a little wheat in last year, and it went 22 bushels to the acre. I have only been resident in the district three years.

G. Lithgow.
29 Mar., 1898.

WEDNESDAY, 30 MARCH, 1898.

[The Sectional Committee met at the office of the Land Board, Dubbo, at 3:30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

William Makin Thomas, staff surveyor, Department of Lands, Dubbo, sworn, and examined:—

1451. *Chairman.*] How long have you been in the district? Nearly two years.

1452. What position do you occupy? Staff surveyor.

1453. You are acting to day on behalf of the District Surveyor? Yes.

1454. You know his views fairly well? Yes.

1455. And the information you will give to the Committee will be such as is disclosed by Departmental records and maps? Yes.

1456. In addition to your personal experience? Yes.

1457. If you look at the map before you, you will see a line marked "A" which represents the trial line as surveyed from Dubbo to Coonamble. It goes pretty well north from Dubbo, and a little west of Gilgandra on to Coonamble? Yes.

W. M.
Thomas.
30 Mar., 1898.

1458.

W. M.
Thomas.
30 Mar., 1898.

1458. You will see also a line marked "B." This line leaves the main north-western railway about midway between Dubbo and Narromine, crosses the Macquarie just below the junction of the Coolbaggie, runs almost direct north to the Marthaguy, crossing it about 2 miles east of Berida station, and meeting line "A" 9 miles further north? Yes.

1459. Then you will see on the map line "C," which leaves the main line 10 miles east of Narromine, running north-west until it crosses the Macquarie, and travelling thence 12 miles approximately parallel to that river, and about 3 miles distant from it, thence nearly due north crossing the Marthaguy, 4 miles east of Collie, and then going nearly due north and striking the trial survey, or line "A," approximately opposite Gulargambone? Yes.

1460. Then you will observe that line "D" on the map represents the proposed line from Warren to Coonamble? Yes.

1461. Taking line "A," will you describe the country, and give your views as to its pastoral and agricultural possibilities, and anything else you may think pertinent to the question. You might observe a margin of 10 miles on either side of the line? Line marked "A" leaves Dubbo near the township, and passes through 10 miles of good agricultural and pastoral country. Then for 15 miles the country is poor. On the eastern side it is in close proximity to a big State ironbark forest, into which it was proposed some years ago to construct a tramway for the purpose of carrying sleepers. At 36 miles from Dubbo the line enters what may be considered as the valley of the Castlereagh, having crossed the Marthaguy just before. From there to Coonamble it traverses plain country, rich pastoral land, and parallel generally to the course of the Castlereagh.

1462. Any of it fit for agriculture? All the land near the banks of the Castlereagh is fit for agriculture, and the red-soil plain and timbered land on the other side is also fit for agriculture. I am now describing the eastern side of the Castlereagh, and by the other side I mean the western side of the line. The area of agricultural land is practically only limited by the rainfall.

1463. How wide is the agricultural land on the western bank of the Castlereagh;—would you say a mile? The soil itself is fit for agriculture for 8 or 10 miles from the Castlereagh. Speaking approximately, the land suitable for cultivation is 10 miles wide from Gilgandra to Coonamble.

1464. Now take the other side of the Castlereagh—the eastern side; how wide would you say the agricultural land was there? To within 30 miles of Coonamble the cultivable soil is not more than 4 miles from the river.

1465. You get then into the open plains? You get then into poor land.

1466. Poor agricultural land? Yes.

1467. Good pastoral land? No; it is poor land. A large area, say half, of this poor land, when cleared, will produce medium crops. I am referring now to the land lying immediately north from Gilgandra, and a little east and west of a line north from that place.

1468. Going still down the river after passing Curban, what have you got then? Beyond Curban you have agricultural flats on the banks of the river 3 miles wide.

1469. And behind that? First-class pastoral country. In my opinion, a line passing a little west from Gilgandra, keeping on the western side of the Castlereagh down to Coonamble, would pass through and adjacent to as good an area of land for the cultivation of wheat as any I know in these districts.

1470. And on the eastern side, immediately north from Gilgandra, half of the country could probably be used for the growth of cereals? Yes. To the east of the country I have described there is good pastoral country.

1471. And to the west of the country you have described—that is to say, 8 or 10 miles back from the Castlereagh? That is first-class pastoral country.

1472. From the Marthaguy to Balladoran—what is your opinion of the country? That may be described as mixed country—about half of it good, and half fair, patchy country.

1473. To the east of line "A," (say) about the parish of Eurah, what is the country like? For 30 miles it is poor ironbark country with only patches fit for settlement.

1474. Going then towards the south, taking the southern boundary of the parish of Donnelly, and going straight on to the line due east, what is the country like? Very poor, except within half a mile of the Coolbaggie Creek.

1475. Caledonia, immediately adjoining the line, is what? Fairly good. Goonoo may be described as fair.

1476. And at the back of these two parishes eastward? Very poor.

1477. Therefore, a line going from Dubbo to Gilgandra, following the surveyed line, would have on the east of it, after leaving the road for a short distance, a considerable area of country only valuable for timber? That is correct.

1478. Now, go to the western side of the line;—what is your opinion of the country going down the Marthaguy, taking Bungey and south from Berida? That is good pastoral country, and there is a fair amount of agricultural country.

1479. Taking the parishes of Balladoran and Drillwarrina and parishes to the south, as far as the south boundary of Daley, what is your opinion of that country? Those four parishes are all poor with little settlement.

1480. What is the nature of the country? Ironbark, box, wattle, pine, oak, and wait-a-while. A great deal of it is ironstone, gravel, and white clay country.

1481. Is none of that, in your opinion, suitable for settlement? It is generally unsuitable for settlement.

1482. Would a fourth of it be suitable for settlement? A fourth of it would be suitable for the growth of cereals, but in no circumstances would it be likely to be first class.

1483. If it were first-class it would only be a patch? Yes.

1484. You are speaking now, keeping in mind a comparison with the class of country you get going down the Castlereagh? Yes, that which I described as first-class country.

1485. Taking line "B" marked on the map, and going west, do you see Eiraban and Kickabil;—then going down to the parish of Coolbaggie, and thence on to the line somewhere about Minore siding, will you describe that country, that is going down from Kickabil? Kickabil is fairly good for agricultural or pastoral purposes. Good genuine settlement is possible at Kickabil. Cobboco is more than half ironbark country; there is a good ironbark forest reserve there. The residue of the parish is fair country—fair to good for agriculture. Emogandry and Moonul are fair country. Coolbaggie is good country, thickly settled. Minore is very poor.

1486. And what is the country like going north from Kiekabil through Berida and through Merrigal to where you intercept the line going down the Castlereagh? Fair to good.

1487. Good for agriculture? Agriculture or grazing.

1488. You could easily get people to take it if it were thrown open? What remains of it will be taken immediately it is thrown open.

1489. You have marked on your plan also line "C," starting about two-thirds of the way to Narromine, and going in a northerly direction to Collie; will you describe that country up as far as Collie? That line runs for 18 miles parallel to the course of the Macquarie, and within about 3 miles of it, through good pastoral and agricultural country. Then for 4 miles it passes through scrub—fair country. From there to Collie it is first-class pastoral country, and fair agricultural country. In all probability, if the line were constructed marked "C," the Gilgandra trade would come to Dubbo, rather than go to that line.

1490. In your opinion, will there be any serious engineering difficulties on a line constructed approximately as marked "B" on the map? As far as I know the district there will be no engineering difficulties except that there is the river to cross.

1491. Is there much Crown land on line "A"? Within reach of the line—that is 10 miles on either side—there are about 100 square miles of Crown lands—640,000 acres. But the greater part of that is poor land—three-fourths of it.

1492. And the quantity of Crown land on line "B," not going beyond the Marthaguy? There are 90 square miles of country, or roughly speaking, one-half a million acres of Crown land. These will be available in 1900.

1493. What is the quality of this land? One-half of it is fair to good—agricultural and pastoral.

1494. What would the other half be? Poor country; it will produce light crops, and carry sheep.

1495. And as to the Crown lands on line "C"? The area is about 40 miles, or a quarter of a million of acres.

1496. The same proportion of good and bad? No; the greater part of that is good. Three-fourths of that is good for agriculture or grazing.

1497. And the other fourth? Inferior.

1498. Do you believe that all the Crown lands on line "A," 10 miles on either side, will be taken up? No; it will not. A large portion of it is forest reserve.

1499. Would 100,000 acres of the land you describe as fair to good along line "A" be taken up if it were thrown open? 50,000 acres would be taken up at once if the line were constructed, but I would not go beyond that in estimating the area which would be taken up immediately.

1500. What proportion of the half a million acres on line "B" would be taken up if it were thrown open? 300,000 acres of it—three-fifths of it.

1501. And the rest, perhaps, some day? Yes, some day.

1502. And the proportion on line "C"? The whole of it.

1503. Take line "D," which is the line from Warren to Coonamble, what is your opinion of the country? Line "D" passes wholly, or almost wholly, through plain country.

1504. What is your opinion of that country from a pastoral and agricultural standpoint? On the eastern side about one-third is fit for agriculture.

1505. How far from the line have you taken it? That would apply to 10 or even to 20 miles.

1506. And on the western side? It is chiefly pastoral country—the very best pastoral country. Not more than, perhaps, one-fifth of it is suitable for agriculture. In my opinion, although the land from Warren to Coonamble from a pastoral standpoint is first-class soil, I do not believe that more than one-fourth is suitable for agriculture. That line apparently traverses close to the eastern edge of the artesian water-basin. The bores much east from that line have failed to get water, while there are now four successful bores close to that line.

1507. Would you make a statement with regard to the rainfall? On the country east from the line from Dubbo to Gilgandra the rainfall is from 23 to 25 inches, the rainfall at Gilgandra being approximately 25 inches. West of that line, coming to Narromine, the rainfall is from 20 to 23 inches. Line "A" would run through country with a rainfall at one end of 22 inches, and at the other 25 inches. Line "B" would go through country with a rainfall at one end of 23, and at the other, 22 inches. That is a little to the east of Berida. On line "C" the rainfall would be from 21 to 23 inches. East of line "D" it would be 20 to 23 inches, and west of line "D," 18 to 21 inches. Coonamble is 21 inches. A fair average for line "D" would be about 20½ inches.

1508. Taking a fair average for "B" and a fair average for "D," what would be the difference in the rainfall? About 2½ inches in favour of "B."

1509. Is that vital? That opens up a big question. It is not so much the rainfall that affects agriculture as the period when the rain falls, or the manner in which the rain is diversified through the year. A rainfall of 20 inches is sufficient to produce splendid crops if you have it properly diversified. Country near the mountains where the ranges are, though the rainfall may not be very much greater than in the plain country, will give you better crops of wheat, because the rain is more constant. In my opinion, with the conditions obtaining in this district, the difference of 2½ inches is vital to agriculture.

1510. If a line were constructed somewhere, as marked "B" on the map, would wheat-growing adjacent to that line, in your opinion, be a success? Yes.

1511. You have no doubt? I have very little doubt about it. I have given the question of rainfall considerable thought, and my opinion is that wheat-growing through that district will return good crops two years out of every three. I have gone through the rainfall averages for the months as taken at a number of the stations, and that is the opinion I have formed.

1512. What is your idea of a good crop? A good average crop—15 bushels to the acre. I hand in a brief report which I wrote, and also some statistics:—

Surveyor W. M. Thomas, to the Chairman of the Parliamentary Standing Committee on Public Works, reporting upon the character of the country and the settlement on proposed railway lines from Dubbo to Coonamble, Warren to Coonamble, and Mudgee to Coonamble, within the Dubbo district.

Sir,

Dubbo, 29 March, 1898.

In compliance with instructions from the District Surveyor of Dubbo, I have the honour to furnish you with the following report upon the character of the country and the settlement that will probably furnish the carrying trade for each of the proposed lines, Dubbo to Coonamble; Warren to Coonamble; Mudgee to Coonamble, within the limits of the Dubbo District, and until that source of probable trade becomes the same for all three proposed lines.

*1 (a)—G

The

W. M.
Thomas.
30 Mar., 1898.

W. M. Thomas.
30 Mar., 1898.

The plan furnished with Mr. Surveyor Mackenzie's report to you in December last, on this subject will, I submit, serve as an illustrative reference for this report.

1.—Dubbo to Coonamble.—The first 50 miles from Dubbo—The total area that will be drawn from on the eastern side of this proposed line is about 1,300 square miles. Of this area, about 300 square miles consist of good agricultural and pastoral land, undulating, and either now or before it was cleared, timbered with yellow box, apple-tree, belar, and white box; and situated in the valley of the Castlereagh and Talbragar Rivers, the Coolbaggie Creek and their feeders.

2. About 220 square miles are State forests reserves, chiefly ironbark. Into this forest, so large is the supply of valuable timber, the Railway Commissioners at one time proposed to construct a tramway from Dubbo, and the necessary land reservation was made for that purpose. This tramway, I understand, was to carry railway sleepers to the main line.

3. About 350 square miles are oak, pine, and wattle scrub, and open box country, fair grazing-land when ringbarked, and when cleared, capable of producing fair crops of wheat and hay.

4. The remainder is poor scrub country.

5. All the good land and part of the fair land within this area are now settled; the Castlereagh, Talbragar, and Coolbaggie frontages thickly so.

6. The rainfall is from 23 to 25 inches per annum.

7. On the western side of the 50 miles of proposed railway line, it will draw traffic from about 600 square miles. Of this area about 150 square miles are open pastoral and agricultural land. About 250 square miles are fairly good timbered agricultural land, and the remainder is poor sandy or ironstone gravel country.

There is one ironbark and pine forest of 12 square miles. The average rainfall is from 20 to 23 inches. On the good and fair country an average holding is about 2,000 acres.

8. Of the remaining 40 miles of this Dubbo to Coonamble line the country within the Dubbo district from which it can draw is chiefly first-class pastoral plain country interspersed with timbered and dry ground which forms shelter and refuge for stock in wet seasons.

It will carry a family to about 3,000 acres. The average rainfall is from 20 to 23 inches. The portion of the timbered and red-soil plain country that lies in the district of heaviest average rainfall within this area will probably be found suitable for agriculture.

9. Warren to Coonamble.—On the eastern side this line will draw trade from about 2,000 square miles, chiefly open and plain, red and black soil, myall and white-wood country, interspersed with belts and patches of scrub and timbered lands. The timbered country and the red-soil plains are suitable for agriculture. The remainder is first-class pastoral country, except about 100 square miles of poor scrub lands.

This area contains three successful artesian bores at Tenandra, Bourbah, and Coonamble respectively. The average rainfall is from 20 to 23 inches, and the area capable of supporting a family will average about 2,560 acres.

10. On the western side the subject line will draw from about 1,200 square miles of country almost wholly red and dark-soil plains separated by only narrow belts of timber, except where the monkey scrub runs through it about a mile wide. The average rainfall is from 18 to 21 inches. A small portion of this contiguous to a railway line may be cultivated, but probably the major portion will for many years be chiefly used for grazing for which it is eminently adapted. This area would appear to be wholly within the artesian water supply basin limits.

About 3,000 acres are requisite to support a family.

11. Mudgee to Coonamble.—About 100 miles from Coonamble this proposed line enters the Dubbo district and runs for 30 miles across one corner through generally fair to poor country, undulating and well timbered. The good land in this area is immediately adjacent to the banks of the water-courses, has an average rainfall of about 26 inches per annum, and is very suitable for cultivation.

For about 30 miles further the trial line lies outside the Dubbo district, and passes over rough and broken country. From thence to Coonamble, about 40 miles, it passes through about 15 miles of timbered heavy dark-soil, undulating country, and afterwards traverses rich pastoral plains very suitable for sheep-farming.

I have, &c.,
WILLIAM M. THOMAS,
Staff Surveyor.

		100	
		1,650	850	450	350	100	350			

A comparison of the above figures with those in the previous table for the first 50 miles of the "A" line, viz., the trial line from Dubbo to Coonamble, will show that this "B" line is fairly well out in the good country; for while the proportion of fair and poor country on the eastern side of the "B" line is about the same as on the eastern side of the 50 miles of the "A" line, the proportion of such country on the western side of this "B" line is very much less.

1513. In your opinion will the ironbark country be of any value after the timber has been removed? Perhaps half of it will produce fair crops—an average, say, of 9 to 11 bushels. The other half, I am afraid, will produce nothing but ironbark.

W. M. Thomas.

1514. And a bit of grass? Well, it is question whether that grass is not even injurious to the sheep. It produces what is locally known as No. 9 bearing a black seed which injures the wool, and also the sheep's body.

30 Mar., 1898.

1515. Have you seen cereals grown in the ironbark country? I have seen some wheat crops grown on the edge of the ironbark country. To show the demand there is for land in the Dubbo district, I desire to state that for twenty-eight settlement leases offered in January last on Burraway and Euromedah there were 118 applicants. The average rental was 3½d. an acre.

Robert George Dulhunty, Inspector of Stock, Dubbo, sworn, and examined:—

1516. *Mr. Hassall.*] You are Inspector of Stock for the Dubbo district? Yes.

1517. How long have you been stationed here? Twenty years; but I have been here for forty years.

1518. You know the district thoroughly? Yes.

1519. You heard the description given by Mr. Thomas of the country on the three railway routes marked on the map "A," "B," and "C"? Yes.

R. G. Dulhunty.

30 Mar., 1898.

1520. Can you personally vouch for the accuracy in the main of the description given to the Committee? Yes; except that I think Mr. Thomas very much underrates the country on line "A." A great part of the ironbark country which Mr. Thomas calls useless is now being cleared and put under crop, and it is growing very good crops. I know from personal knowledge of one crop that has gone over 25 bushels to the acre. This was from country that had been cleared from ironbark. It is not actually in the ironbark country, but on the edge and with ironbark on it.

1521. Then it amounts to this, that the area of country described by Mr. Thomas as ironbark country contains, in your opinion, fairly good belts of country not so heavily timbered? Yes.

1522. And, therefore, you are of opinion that a larger area of available country might be embraced in the description given by Mr. Thomas? Yes, a very much larger area. All through that ironbark country there are large belts of box country.

1523. The country you allude to is probably box and ironbark? Yes; there are large patches of box all through it, and wherever the box is the country is good for agriculture.

1524. In your opinion a considerable area of what Mr. Thomas termed ironbark country will be available for settlement? Yes; I am quite sure of it. I am satisfied that there is not an acre of it that would not be rushed to-morrow if it were thrown open, and there was a probability of a line being built there.

1525. With regard to line "B," can you corroborate the statement made by Mr. Thomas, that it contains more available country than line "A"? Yes, I think so; but there is some very poor country to get to it from Dubbo.

1526. No worse than that on line "A"? Yes—no good at all. When you get near the river it is good; but the ironbark hills in that locality are no good; they are all rock.

1527. On line "B" what is the country like between Coolbaggie Creek and Kookaburra Creek? It is very thick scrub; but it is not bad country. It would be good agricultural land if it were cleared.

1528. Good soil? Yes.

1529. Would "B" be a better line than "A," in your opinion? I think there would be better country on it right through.

1530. Then that practically corroborates the statement of Mr. Thomas with reference to the character of the country on the various lines; you agree with his description of the country on line "C"? Yes.

1531. Do you agree also with Mr. Thomas' description of the country from Warren to Coonamble? I think Mr. Thomas has a liberal idea of the agricultural land on that line? It is some of the best pastoral land that I know of in the Colony; but I think there is very little agricultural land there.

1532. I suppose you might describe the line from Warren to Coonamble as passing through first-class fattening country? Yes, first-class.

1533. Is it sound? Yes; it is some of the best pastoral country I know of in Australia.

1534.

- R. G. Dulhunty.
30 Mar., 1898.
1534. Would you class it as first-class pastoral country with very little agricultural land along the route? Very little, I think.
1535. Practically, I suppose, till you strike the river near Coonamble? Yes.
1536. You might just describe lines "A," "B," "C," and "D," in your own words, as concisely as possible? If I were going to build a line myself from Dubbo, I would build it to Gilgandra by line "A." There is no doubt that line "B" would go through very good country, but the difficulties of building it would be greater and it would not be so good a paying line. "C" is the same. When you get down to "D," the country below that is hemmed in by the Mole and the Macquarie, and there is not much settlement down there.
1537. And that settlement would drift into Warren? Yes. The settlement can never be very great there, because there is a large piece of country that is all water—all swamp—and it can never be other than pastoral country. Pastoral country is no good to a man unless he has a great deal of it. On line "A," as regards a great part of the land, 320 acres will support a man, but down the Mole you must have 5,000 or 6,000 acres, for you can only grow sheep there.
1538. Then lines "A," and "B," are practically similar except that "B" carries more available land for settlement? More good land.
1539. Line "C," you think, is too far west, and draining the traffic which would go towards Warren; and you think the line from Warren to Coonamble passes through, essentially, pastoral country? That is so.
1540. And must be dependent upon pastoral products for the traffic that goes through it, with back loading for the stations? Yes. Line "A" would drain a large piece of country up towards Cobberah, and up the Castlereagh towards Coonabarabran. That traffic would all come to line "A," and it would come from good country.
1541. Has there been any marked increase in the number of stock in the district during late years? There has been a very marked increase in the number of holders. There is a decrease of stock this year all round. We have just gone through a dry season. But with regard to the number of holders, in the last four or five years the names in my book have increased from about 600 to 1,300. They are all owners of land and stock.
1542. Do you find there is a good demand for any land thrown open for pastoral or agricultural purposes? There is a tremendous demand. Every Land Court day here, when there is any land offered, there are thirty or forty applicants for every piece.
1543. In travelling about you would be able to form a correct opinion as to the demand for land? Yes.
1544. Even although no railway were constructed, I presume the demand for land would still continue; but, in the event of railway construction, do you think the demand would be largely increased? Very largely increased. I am satisfied that every acre of land on Line "A," which Mr. Thomas describes as so poor, would be taken up instantly if it were open.
1545. Do you know whether there are any arrivals from other colonies coming into this district? Yes, a very large number from Victoria. Only the other day a farmer from South Australia bought a property just beyond Coolbaggie, and he is clearing 200 acres with the intention of putting it under crop, and this is where it is said that the land will not grow wheat.
1546. I suppose the district is sound and free from disease? Yes. There has been some anthrax during the last year or two, but it has been treated by Pasteur's system, and they are keeping it down. We have had more disease this year than we have had for a good many years.
1547. With regard to the demand for land, is there not a good deal of Crown land within 10 miles of Dubbo available for settlement? I do not think so, unless it is poor land between here and Minore which no one would have.
1548. What about the land on the road between here and Gilgandra? There is a good deal of land there. A great deal of it is in the travelling stock reserve.
1549. But within 10 miles of Dubbo? Yes, there is a good deal of land all round, but I do not know much about it.
1550. Do you think, if land were available within 10 miles of the railway, it would be taken up for agriculture if it were suitable for that purpose? I am quite sure of it. I do not think there is much Crown land available within 10 miles of Dubbo on the line to Gilgandra.

James Andrew Ryan, financier, Dubbo, sworn, and examined:—

- J. A. Ryan.
30 Mar., 1898.
1551. *Mr. Roberts.*] What are you? I am a financier, living in Dubbo, but I have been a resident of the Dubbo district for thirty-two years. I have been a selector. I have lived upon the land and worked on it for a number of years in the neighbourhood of Dubbo.
1552. Do you still reside on your selection? No, I let it. I get a rental for my land now.
1553. Where is your land situated? Between 5 and 6 miles from Dubbo.
1554. Do you desire to make a statement? I think it would be desirable in the interests of the country that railway connection with the Castlereagh River should be at Dubbo.
1555. Could you compare the three lines;—Warren to Coonamble, Dubbo to Coonamble, and Mudgee to Coonamble? In my opinion, a line equal in length to the distance from Warren to Coonamble, if run out in this direction, would pay better than a line from Warren to Coonamble—even if the railway were just built to that point and no further.
1556. You prefer the Dubbo route? Yes; from my knowledge of the country in both places, and my opinion of what the settlement of the future will be. It will be farming and grazing combined. The produce from the land will be wool, stock, fat sheep, or cattle and wheat. Hay can be grown there; but it is so far from the sea-board that it will not be as profitable as wheat or stock. I know that this country is suitable for that kind of combined holding. With regard to the character of the country, I have heard the evidence of Mr. Thomas and Mr. Dulhunty, and from my knowledge of it, I can say that the land is nearly all arable land. Land that was rejected years ago by the graziers as being worthless, is the very land that is now being taken up for agriculture and giving the best returns. It was only a question of capital and the expenditure of money. In the old times the holders of the land would not spend money to improve it. But the class of people who are coming here now are spending money to improve the land, and are getting returns which could not be got from the plain land; that is, they are getting better returns from their labour than on the grazing land. The character of the soil through here is largely volcanic. There is only a very small portion with sandstone outcrops. All this land is arable, and, if the timber is removed from it, will give a good return to those who work it.
- 1557.

J. A. Ryan.
30 Mar., 1898.

1557. What is the area of the land you selected? My brother also selected, thirty-two years ago, and our properties have been worked together, embracing in the one area about 1,600 acres.
1558. Is it all improved? Yes; it is fenced and partly cultivated.
1559. Where is it situated? Near the Brocklehurst post-office; it fronts the Macquarie River. I let a farm the other day on which there are about 400 acres of timbered land, and the tenant intends to clear the whole of it, and put it under crop. Hitherto it has been used as a grazing property.
1560. How many miles is it from Dubbo? Between 5 and 6 miles, on the road to Coonamble. The surveyed line goes through the property.
1561. Did you farm the land there yourself? Yes, some years ago; but there was not a good market here in those days for wheat. I did grow wheat. That is over twenty years ago. The tenants now go in largely for farming, and get heavy crops.
1562. What do they grow, and what do they get per acre? They get from 20 to 30 bushels of wheat to the acre, and up to 4 tons of hay an acre.
1563. How much have they under crop? One man cultivates 100 acres. This year he is going to put in a much larger quantity. Another tenant has cultivated about 30 or 40 acres; but he was a carrier, and did not work his farm all the time. I may also state that a pre-lease which I had several years ago, and for which the Government charged me £2 a section for rent, has since been taken up as a conditional purchase and farmed, and this year the holder has taken 32 bushels to the acre off land from which ironbark timber and pine were taken. That is adjoining my land at the Mogruguay. This farmer advertises his seed wheat for sale. That proves that this land, on which ironbark grows, where the soil is good, will be more productive after the timber has been taken off. If the railway were built north from here it would give us an opportunity in Dubbo of having railway sidings for any industries that might be established, such as flour mills and boiling-down works, and dairy factories requiring access to the railway. At present we have no chance of getting sidings. When we built the boiling-down works we had to go on a hill on the other side of the river, and the water supply was very expensive. We had to go to great expense in laying down pipes from the town supply. We cannot get water on the other side of the river by sinking. We have to depend on the river supply, and any works in Dubbo in the future must depend on the river.
1564. Your property being only a short distance from Dubbo, your tenants would probably not use the railway? No, it would be of no benefit to them. As far as I am personally concerned it would be no benefit to me.
1565. Do you know the country all the way from here to Coonamble—you are speaking, I suppose, from your knowledge of the country? Yes; and my knowledge of the people and their desires and ambitions.
1566. And owing to the adaptability of the soil for agriculture, you think the Dubbo-Coonamble connection would be far better in the interests of the country than the connection at Warren? Decidedly.
1567. That is what you wish to impress upon the Committee? Yes; that the Dubbo line would be better in the interests of the State. There is another thing:—In the future, no doubt the railway will go beyond Coonamble and extend to Walgett, and, perhaps to the Queensland border. Such being the case, the question of where the junction of such an important line should be, is a very serious one for the Railway Department—whether it would not be better to have the junction at Dubbo, a town with an unlimited water supply, and all the advantages of a good location, or to make the junction at a place like Nevertire, out on the dry plains, where they have no water, and no shelter of any kind. The junction town of such an important line would necessarily carry a comparatively large population, and its location, therefore, is a very important matter. In view of these considerations, I think, Dubbo will be a far more desirable place than Nevertire. I feel sure, also, that the settlement along the Dubbo line would be much closer than would be the case between Warren and Coonamble.
1568. How long a lease did you give to the tenants of your land, situated within 4 or 5 miles of Dubbo? Five years.
1569. Have they the option of renewal? They generally take the land for a five-years term, and carry on the tenancy from period to period.
1570. They have the option of renewal? No.
1571. When did you first lease the land? Over ten years ago.
1572. For how long was the lease? Five years. A second term will run out at the end of this year, and the tenant is arranging for another five years.
1573. And did you get an increased rent from it? A little increase this last time. On condition that he is allowed to cultivate more land the tenant has promised to pay a little more rent. I limited him before to grazing.
1574. Is there a clause in the lease providing for giving the tenant the option of renewal, or is it left entirely to arrangement? It is left entirely to arrangement.
1575. You can get either a higher or a lower rent, according to circumstances? Yes. If the line from Dubbo were constructed, I think branch lines would be taken to serve other districts. Branch lines would probably be constructed to tap such country as Toorawheena and Gummin Gummin, and also into Collie on the Marthaguy. That is, when population became thicker.
1576. Is the traffic on the Coonamble road from Dubbo increasing from year to year;—is there any great traffic? I know the traffic has increased very much from the settlement that is going on, even without the railway, and I am sure it will increase tenfold if there is a railway there to carry the stuff to market, because the land in this part is very prolific.
1577. What opportunity have you of judging of that? By travelling over the ground.
1578. You are constantly travelling over the ground? No, but I have travelled at various times. I meet the people from there and know what is going on.
1579. You have formed the opinion that traffic is increasing between Coonamble and Dubbo? Yes. With regard to the valuable timber supplied on that line, it is a very good item in the construction of a railway, because timber could be brought on to the line and supplied to all parts of the Colony.

THURSDAY,

THURSDAY, 31 MARCH, 1898.

[The Sectional Committee met at the office of the Land Board, Dubbo, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

William England Morgan, Editor, *Dubbo Despatch*, sworn, and examined:—

W. E. Morgan.
31 Mar., 1898.

1580. *Chairman.*] How long have you been resident in this district? For thirty-two or thirty-three years.

1581. You are aware of the various schemes to connect Coonamble with the railway system of the Colony? Yes.

1582. Have you formed any views with regard to the matter? I should like to make a statement giving a history of the agitation in connection with the railway to the north-west. So far back as 1874 and 1875 an agitation was started at Coonamble for the purpose of having constructed a travelable road between here and Coonamble, the commercial traffic having become so great that the road was unable to carry it, and the storekeepers and settlers along the route complained of the delay in the transit of goods. This agitation was continued until 1878 or 1879, when, on the resignation of the Farnell-Fitzpatrick Government, Sir Henry Parkes came into office, with Mr. (now Sir) John Lackey as Minister for Works, and Mr. Watson as Colonial Treasurer. A deputation from Coonamble then waited upon Mr. Lackey, and he remarked that, in view of the approaching completion of the Western line from Orange to Dubbo it would simply be a waste of money to macadamise the road between here and Coonamble, because in the natural course of events it was absolutely certain that a railway would be built from Dubbo to Coonamble. Consequently, beyond allotting a few hundred pounds for the purpose of repairing very bad places on the road, Mr. Lackey would not do anything. But he directly promised that, the moment the exigencies of the public business allowed, he would place before the Cabinet a proposal for the construction of a railway from Dubbo to Coonamble. When Mr. Watson, in 1881, just previous to the defeat of the Parkes Government, on the land measure brought in by Sir John Robertson, made his Financial Statement, he told the House that, the Government were about to put before Parliament a Loan Bill for the construction of certain railways, and amongst these railways was one from Dubbo to Coonamble. Political events did not allow this to be carried forward. The Parkes Government was defeated, and the Stuart Government came into office. The agitation was renewed, and Mr. Wright, who was then Minister for Works, included in his railway policy, the construction of a line from Mudgee to Coonamble. The line from Wallerawang to Mudgee was then, and I believe is now, a non-paying line, and more a burden than a support to the railway system; and, in order to make that line profitable, it was determined by the then Government to extend it from Mudgee to Coonamble. At that time, I might remark, the Mudgee line had not developed the character it has since earned of being a very dangerous line, unfit to carry any heavy traffic; we had had very dry seasons, and no slips, or anything of the sort had occurred to interfere with matters. We in Dubbo, as well as the people of Maitland and the Hunter valley and the Northern districts generally, and the majority of the Coonamble people, objected to this proposal. There was a very warm agitation throughout the Western districts generally, and also in the Northern districts, with the result that when the matter came before Parliament the whole of the Members from the Western and Northern districts combined together with the other Members of Parliament who understood the matter, and pointed out very clearly that, if a railway were built from Mudgee to Coonamble it would confine the whole of the Castlereagh people—and the objective point of the railway was Walgett—to one market, the Mudgee market; whereas if the railway went from Dubbo to Coonamble, the people of the Castlereagh and the Barwon—that is, supposing the railway were extended to Walgett, and that was never a point of our agitation, for we always held that the traffic of Walgett, the Bree, Culgoa, and the back creeks subsidiary to the Walgett district, should go to Newcastle, that being the nearest port, as well as for the purpose of maintaining the old trade relations which, from the settlement of that country, had existed between the Hunter valley and these particular districts, the whole of that country north and north-west of Walgett having been originally settled by Maitland people; in fact, many stations there are now held by people who came from the Macdonald River—the head of the Hawkesbury—and the Hunter valley would have a choice of markets and be able to get their supplies from well-known agricultural centres. We pointed out that a railway running from Dubbo to Coonamble would be, according to the surveyed line, much shorter than a line from Mudgee; that it would cost infinitely less; that the cost of construction, at the prices which then ruled, would be, for the last 40 miles of the route, £4,000 per mile as against £9,000 per mile, and also that all the markets of the west—Dubbo, Orange, Carcoar, Bathurst, and other places—would be open to the people of those districts. As I have said, the proposal was defeated. The Stuart Government, like most Governments when they are defeated, got their backs up and would not do anything further in the matter. Then there were political convulsions, caused by the discovery of what is now known as the “Dibbs Deficit,” and matters ended by Mr. Lyne coming in as Minister for Works, and promising a deputation that waited upon him that the request of the Dubbo and Coonamble people would be favourably considered, and at the opening of Parliament the Governor’s Speech contained a paragraph announcing that in the railway policy which the Government intended to place before Parliament would be included a line from Dubbo to Coonamble. It is not necessary to tell how the matter never went any further. There was an internal disruption of the Government, and the whole thing went smash. We still kept on the agitation, and Mr. Bruce Smith, who subsequently became Minister for Works, said he had had the whole question considered, but, as railway construction was not a matter to be dealt with in any patchwork or piecemeal fashion, he would call for a report from an experienced officer on the whole question of railway construction in the north-west. That brought out the report of Mr. Jones which the Committee have before them. At this time, and, in fact, for a considerable time later, there was no talk of the extension from Nevertire to Coonamble. That simply cropped up after the construction of the cockspur line from Nevertire to Warren. Then the financial crisis occurred, and all agitation regarding railway matters calmed down, because people very naturally and sensibly thought it would be almost superfluous if not nonsensical for any Government to build

build fresh railways when there was no possibility of their being able to borrow the necessary money at anything like a reasonable rate of interest. The commercial disturbance had caused such an amount of distress and unrest that, notwithstanding the excellent state of the credit of the country, there was very little hope of getting an investor to lend his money at a rate of interest, which, through the exertions of Sir George Dibbs, had been reduced from 5, originally, to 4, and then to 3½ per cent.—now, I believe, it is 3 per cent. However, Mr. Young came into office, and we waited upon him on several occasions; but his utterances were like those of the gentleman in "Pinafore"—like all official utterances—unanswerable—and at the same time inscrutable. We never could understand what he meant. But he promised one thing, at all events—that before any final steps were taken with regard to railway construction he would place one line before Parliament for submission to the Public Works Committee. We then said, as we say now, that so long as he offered us the opportunity of allowing the Public Works Committee to inquire fully, not only into that particular route, but into all alternative routes, we would be perfectly satisfied to let the case stand on its merits. At first Mr. Young thought it was impossible for him to do that—that the Public Works Act would not allow him that opportunity. It was pointed out to him that it had been done in a certain case, and he made a promise to that effect. Subsequently—last year during a visit of the Minister to Dubbo—we renewed our request, with the result that the Member for Dubbo conveyed a request to the Chairman of the Public Works Committee to hold a sitting here for the purpose of taking evidence with regard to these particular lines. I might point out that in anything we are doing with regard to this matter it would be ridiculous to say that there is not a certain amount of local feeling. But apart from that our views in connection with this railway question—I certainly speak for myself—are induced more by a desire to see constructed the line that will do the greatest good to the greatest number, and give the largest return possible to the public revenue. With regard to the Warren to Coonamble line, the Dubbo to Coonamble line, and the proposed line from Mudgee to Coonamble, we recognise that whatever railway is made, it will not be a railway for to-day, it will not be a work for to-day, it must be a work for some time to come. When a railway does not suit, as the experience of the Mudgee line unfortunately proves, you cannot tear up the rails, and let it stay at that; the railway has to go on for all time, either a burden or a support to the railway system of the Colony. Our contention is that the Dubbo-Coonamble line is the best, notwithstanding that, compared with the Mudgee to Coonamble line, it may perhaps be the longer one from the metropolis; that it will serve the greatest number, that it will serve a large part of the country that would be served by a Mudgee line, and that if a Warren to Coonamble line is constructed a large tract of country which must eventually be served by a railway will be left out of consideration. A reference to the map will show that the Warren-Coonamble line runs at right angles to settlement, whereas the Dubbo or the Mudgee-Coonamble line would run parallel with settlement. The country between Warren and Coonamble is as yet almost in a virgin state. Settlement is mostly of a pastoral character. There are no townships with the exception of Bullagreen and Bourbah, if they can be dignified by that name. There is really no settlement there. It is a tract of plain country fitted principally for pastoral purposes, and the distance is 62½ miles. The Dubbo to Coonamble line, though on account of the extra 32 miles it may cost more money for construction, will give a better return to the Department. As long as I have been in the district, as long ago even as forty years, intimate trade relations have existed between Dubbo and Coonamble, and the country that will be served by this railway, including the Merri-Merri and the Marthaguy. If a railway were built from Dubbo to Coonamble, at no part of the route from Warren to Coonamble would the people be above 30 miles away from railway communication. The majority of them would be closer—those towards Coonamble and those towards Warren. But if a railway were built from Warren to Coonamble the people of Gilgandra and Mendooran and those who would be served by the line from Dubbo to Coonamble would be shut out from railway communication altogether. They would still come to Dubbo. They would not go to the Warren-Coonamble line because of the extra haulage and freightage on the elbow bend *via* Nevertire to Dubbo. A great deal of this traffic which is looked forward to by the Railway Department, and has unquestionably been considered by Mr. Harper in his report to the Commissioners, would come to Dubbo by road.

1583. Anywhere north of Bourbah it does not matter which line is built? No; the traffic from Bourbah, or say from Gulargambone, would come to Dubbo in preference to going to the Warren line; and south of those points towards Dubbo, towards Curban and Gilgandra, the traffic would necessarily come to Dubbo, because the distance would be shorter, and the railway freightage would be less. The railway from Dubbo to Coonamble would serve a purpose which a railway from Mudgee to Coonamble would serve. That is to say, Gilgandra is only 20 miles at the most from Mendooran, and in a straight line, I think, about 15 miles from the mountains; so that this railway would not only serve what we consider the Castlereagh district—that is, Gilgandra, Collie, and those places—but it would also tap the resources of some of the finest agricultural country in the world, running along the foot of the Warrumbungle Mountains, and towards Coonabarabran. That is a district which it would be impossible for the Warren to Coonamble line to serve. With regard to the traffic between Coonamble and Warren, which has developed somewhat largely during the past few years, I think it necessary to make an explanation. The traffic consists principally of wool, and the history of its diversion is very simple, and rather suggestive:—A few years ago there was a Carriers' Union in Dubbo, and I do not think it is necessary to tell any of you gentlemen that wherever there is a union of that character there is generally friction immediately following between the parties to the contract. Friction occurred, and a strike on a small scale was set up, with the consequence that Mr. Tobin, of Wingadee, who sends away 1,000 or 2,000 bales of wool, and one year sheared 250,000 sheep, instead of sending that wool through Dubbo, as had been the custom from time immemorial, to show that he was perfectly independent of the Carriers' Union, sent it on to Warren. It was a dry season, and it would have been impossible to have sent the wool to Warren, if it had been a wet season. However, that has nothing to do with the railway, because the railway would carry the wool every year. I am only mentioning it to show how the diversion of traffic occurred—that it was not because Nevertire was the nearer railway station (for in that respect there was really very little difference, as it was only a matter of a few miles) nor was it because the road was better travelable or the carriage cheaper, but simply because of friction brought about between the residents of the district and the Carriers' Union. In the whole of this agitation we have never had the objective point at Walgett. We think that Coonamble should be the terminus of the railway, and

W. E.
Morgan.
31 Mar., 1898.

W. E.
Morgan.
31 Mar., 1898.

and that Walgett should be the terminus of a railway from Nanah, tapping the country north-west of the Barwon, towards the Queensland border, and gathering up all the traffic which must follow from the increasing settlement on the fine grazing lands along the various creeks which intersect that country, between Walgett and Goodooga. With regard to the Mudgee line, we have really given it very little consideration, for the simple reason that we think the stupendous and costly character of the work in the present circumstances of the country will not warrant its construction. We admit that, so far as reaching the metropolis is concerned, the route from Coonamble *via* Mudgee is shorter. At the same time, in order to reach Coonamble from Mudgee, 146 or 147 miles of construction are necessary; and if I remember correctly, the estimate of Mr. Whitton, or the officers who made the survey in the first instance, for the first 40 miles of the route from Mudgee to Cobborah was about £9,000 a mile, though probably it could be built cheaper now. We have not for a moment considered the possibility of that line, because a very high authority in railway matters lulled whatever alarm we might have felt with regard to it by informing me on one occasion that it was quite unnecessary to consider the line, because, as the line from Wallerawang to Mudgee was a white elephant, the Railway authorities—I do not mean the Construction Department, but those who carry on the existing lines—did not want to add another white elephant to it. That, of course, is only a figurative expression. We certainly have never considered the Mudgee line, but we have always held that a line *via* Dubbo would be the cheapest and best means of reaching Coonamble. I want to particularly impress upon the Committee that we make Coonamble the objective point. Mr. Alexander Wilson, formerly a Member of the Legislative Assembly, wrote to one of the newspapers the other day pointing out that it was possible to connect the Northern and the Western system by a cross-line from Gilgandra to some place called Curlewis, a few miles north-west of Werris Creek, on the North-western line. I think it would be as well to state that a former Public Works Committee had before them some years ago the question of the extension of the Mudgee line as a first section towards Coonamble, in connection with the proposal, I think, by the Parkes Government, to extend the railway from Mudgee to Gulgong. A report is in existence, and it will be found that the Committee then declined to recommend that line in view of future contingencies—I think that was their reason; that other lines had to be considered, and it would be a very foolish thing to build a few miles of railway as proposed without considering the whole question of railway construction in the west and north-west.

William Mortimer B. Dayrell, manager, Co-operative Flour-mill, Dubbo, sworn, and examined:—

W. M. B.
Dayrell.
31 Mar., 1898.

1584. *Mr. Hassall.*] How long have you been in the district? Over thirty years.
1585. You have seen the progress and development of the district since that time? I have.
1586. Can you give the Committee any information as to the progress of agriculture in the district—what it was, say, ten years ago, what it is at the present time, and what are the prospects of its ultimate increase? Ten years ago there were not 30,000 bushels of wheat grown in the district, and this year I suppose there have been fully 400,000 bushels. That is an approximate estimate, judging from what has left the district, and what still remains. That embraces the district around Dubbo, including Narromine, but not going as far as Gilgandra, and under the mountains to Coonabarabran, where there is a good deal of wheat grown.
1587. That wheat has been sent to the Coonabarabran mills for some years past? Yes; and they get it for a very small sum, inasmuch as the carriage is very heavy from Coonabarabran to the railway. We are getting some delivered now. Yesterday we had 6 tons in from Coonabarabran way.
1588. Judging from your experience of the wheat produced, do you think this district is suitable for growing good sound grain of marketable quality? Undoubtedly.
1589. Such as would sell in any market of the world? Yes.
1590. Of what quality is the flour made from it? It is very good. We can always top the market in Sydney. We have just finished delivering several hundred tons to Mr. William White and others.
1591. Your principal supplies at present are drawn from the immediate vicinity of the town, or within a radius of 30 or 40 miles? Between Geurie and Nyngan.
1592. Where is the principal market for flour? West from here.
1593. What portion of the Colony west is supplied? Every town along the line—Nyngan, Cobar, Coolabah, Byrock, and Bourke; every town in the west that is reached by rail.
1594. I presume you supply numerous orders in that direction? Yes; we truck every day.
1595. And I presume the flour is sent even still further? Yes; it goes away to Queensland.
1596. Does your demand exceed your supply? The company has not been long formed. This is the first season during which we have been able to run night and day. We have no difficulty in placing our flour without sending any travellers out.
1597. In addition to your western market you also have the Sydney market available? Yes.
1598. So that you can compete successfully down there? Yes; as long as we have wheat on the spot.
1599. I understood you to say that you do not have much wheat coming in from Gilgandra, Mendooran, and down there? Not a great deal; we have had about 300 tons.
1600. Do you get any wheat in from between here and Gilgandra? Yes.
1601. Of what quality is that? Very good.
1602. Will it compare favourably with any other wheat in the district? Yes.
1603. And make equally as good flour? Yes.
1604. Have you any knowledge of the country between Warren and Coonamble? I have.
1605. Do you think that would be a wheat-growing country? No; a great deal of it would not, and some of it would. Take the country between Bullagreen and Bourbah. You go along there in wet weather and you cannot see the track; it is just like a stream. I have been seven or eight hours going from Bullagreen to Bourbah in winter time.
1606. You think that is country in which it would be almost impossible to grow wheat successfully? You could not do it.
1607. You might grow wheat in patches or in suitable seasons, but to grow it successfully you do not think it is possible? No.
1608. Do you know the country between here and Gilgandra, down the Castlereagh? Very well.
1609. What do you think of that? Of course, there is a lot of bad country, but then, again, there are some very good patches when you get in off the road a bit, especially in on the western side of the line from here to Gilgandra.
- 1610.

1610. You consider that country eminently suitable for wheat-growing? Yes; there is some very good wheat country through there.
1611. Have you any wheat from that locality? Yes; small quantities come in.
1612. The country is not yet sufficiently developed to send in any large supplies? No; a good many selections have been taken up there, and the holders are clearing the land, preparing for wheat.
1613. With regard to the country lying to the east, running from Gilgandra up towards Mundooran, and in that direction, I presume it would be supplied with flour from Coonabarabran? We send a good deal of flour there. For instance, some farmers of Toorawheena bring their wheat in here for gristing. We supply nearly all Gilgandra and Toorawheena. We do not supply Cobberah; they get their flour from Mudgee or Gulgong.
1614. But with regard to the whole of that country from here to Gilgandra, and a little distance on the eastern side of the Castlereagh down by Coonamble, and also the country lying west practically right through to Warren, and down the river to Bourke and the intervening townships and stations;—I suppose you have an outlet for flour in that direction? Yes.
1615. If any considerable quantity of land were put under cultivation for wheat, do you think the market would be overstocked;—do you think the wheat supply would be greater than the demand? It will be, locally; but we would have to export, and the price then would be regulated by the London market, less freight.
1616. You think the outlet would be sufficient to induce people to go in for the cultivation of wheat on suitable soil? I think so; because wheat is about the only grain you can grow up here with advantage.
1617. And the only grain that will bear the cost of carriage? Yes, and it does not require a very great deal of rain.
1618. Have the seasons been fairly favourable and the crops fairly successful from year to year to your knowledge? For the last two years. This season has been a very good one for quantity, although the quality was not A1. Still in quality it was far better than the southern wheat. The northern wheat has beaten us this year for quality, for they had more rain, but the quantity here has been very large.
1619. You heard the statement made by Mr. Morgan? Yes.
1620. Can you endorse that statement? Yes.

W. M. B.
Dayrell.

31 Mar., 1898.

Richard McGee, railway station-master, Dubbo, sworn, and examined:—

1621. *Mr. Roberts.*] Have you prepared a statement for the Committee in reference to the local traffic? I have a couple of newspapers in which statements were published for the years 1896 and 1897, the figures being taken from our books. There is a summarised statement of inward goods giving the totals. The total tonnage inwards for 1896—that is goods received at Dubbo—was 10,392 tons. These goods would come from all quarters, including Sydney.
1622. What other places would the goods come from besides Sydney? We receive wool and grain—grain from Narromine, Trangie, and other places, to the mill at Dubbo, and also grain from Maryvale and Guerie, and also from Murrumbidgee and Wellington. The figures given include merchandise from Sydney. The inwards traffic for 1897 shows a tonnage of 11,494 tons. The outwards traffic for 1896 was 9,916 tons, and for 1897 13,130 tons. The passenger traffic for 1896 comprised 12,224 passengers, representing in gross receipts £9,609. For 1897 the number of passengers was 8,797.
1623. Can you account for that falling-off in the passenger traffic? No; except by the ordinary fluctuations that occur. I think the heat-wave was on, and they were running a number of cheap excursion trains. The receipts for 1897 amounted to £9,226, so that they were very nearly as much as the receipts for 1896. Apart from the traffic mentioned there is a large traffic in sleepers.
1624. Is Dubbo a depôt for sleepers for railway purposes? Yes.
1625. And you send large quantities away annually? Yes.
1626. Did the sleepers for the Nevertire to Warren line come from here? Yes.
1627. Do you notice any difference in the traffic since the Nevertire to Warren line was opened? No; in fact, there is rather an increase of traffic just now as compared with last year.
1628. With regard to the passenger traffic, do you notice whether very many passengers who used to go by way of Dubbo now go by way of Warren? I think the fact of the line being extended to Warren has had the effect of rather increasing our returns in regard to passenger traffic. This year we had an increase of passenger traffic, as compared with last year, amounting to about £80.
1629. I think you said you were unable to give any information as to what traffic came from Gilgandra and other places along the suggested line? I could not give you any definite information. I am under the impression that the greater part of the traffic received here comes from that direction. We do a fair business with Coonamble through the agents. That is why I am not in a position to speak definitely on the matter. A large proportion of the goods received here comes through on truck rates consigned to Wright, Heaton, & Co. and other agents who distribute the goods.
1630. Does not a large amount of the Coonamble traffic go down to Mudgee? I do not know.
1631. Is there much live stock sent from here? The figures for 1897 show that we sent 152 horses, 2,736 cattle, 19 calves, 106,048 sheep, and 71 pigs. I have not the figures for 1896, but 1897 shows an increase. For 1897 we received inwards 48 horses, 864 cattle and calves, 18,963 sheep, and 55 pigs.
1632. Did you receive any wheat? Yes, but I have not the records.
1633. How many tons of wool did you receive here to be forwarded to Sydney during the years 1896–97? The 1897–8 season has not yet terminated, but up to date we have an increase on last year of 214 bales. That was notwithstanding the decrease in the flocks. Most of the stations had a decrease in their wool last year; owing to the drought; but there has really been an increase in our traffic.
1634. Did you get wool from some places where hitherto you did not? Yes; we got a clip or two.
1635. At the usual rates? Yes.
1636. Dubbo is a flourishing district? Yes; I look upon it as such.
1637. And has a good future before it? Yes; I think so. It seems to be more than holding its own, according to what I have seen.
1638. The people do not appear to be leaving the district—the people are well to do? Yes. I look upon the district by comparison as a good one. I have only been here three years, and by comparison with other places it seems to be a go-ahead place. Additional settlement appears to be taking place almost

R. McGee.

31 Mar., 1898.

- R. McGee.
31 Mar., 1898.
- every day. This year we are doing a considerably increased business in wheat and other cereals. For the month of January we had an increase of about 900 tons, as compared with the month of January of the previous year, and for February about 800 tons, as compared with February of 1897.
1639. Are potatoes grown here? No; I do not think we do much in the potato business.
1640. What is the produce confined to? Hay, straw and chaff, and wheat and flour.
1641. From your knowledge, and such information as you are able to gather in your railway transactions, do you think farming is progressing in the Dubbo district? Yes; and it seems likely to progress.

Craven Hyde Fitzhardinge, solicitor, Dubbo, sworn, and examined:—

- C. H. Fitzhardinge.
31 Mar., 1898.
1642. *Chairman.*] How long have you been here? Twenty-seven and a half years.
1643. You have a full knowledge of the district? Yes; I have travelled at different times from Dubbo to Coonamble, *via* Gilgandra; from Dubbo to Coonamble, *via* Curban; from Dubbo to Coonamble, *via* Haddon Rig; from Warren to Coonamble, *via* Haddon Rig and Inglegar. I had to go down by way of Inglegar, because at that time there had been a heavy fall of rain about Coonamble, amounting to some 10 inches, and I was advised that I could not cross the boggy plains at Bullagreen. Then I have also gone from Dubbo to Cobberah and *via* Merrygoen to Coonabarabran. I have studied the country, and am of opinion that for the benefit of the Colony and the railway system any railway communication with Coonamble and Walgett should be *via* Dubbo. This route would be easy of construction, there being no engineering difficulties, and all the requisite materials, such as timber, wood, stone, clay for bricks, and gravel would be obtainable on or near the line. This line would run not across the watershed but with it. There would be no great expense in bridges or large culverts until near Coonamble, when there would be a bridge over the Castlereagh. The country is sound for railway construction except near Coonamble, when black chocolate soil would be met. The proposed Warren route will not be easy of construction, and great engineering difficulties will be met with by reason of the line running across the watershed, Warren itself, at flood-time, being almost covered with water from the overflow of the Macquarie River. Starting at Warren, there would be great expense in construction, as considerable lengths of bridges would be necessary over the Macquarie River and the Bemunual Creek. The country at Warren being all alluvial, it would be difficult to get a hard and sound bottom. Ten or 15 miles out from Warren black and chocolate plains will be met, and from experience of the Nyngan and Bourke line, railway construction and maintenance across these plains will be most expensive and difficult, and probably dangerous. This kind of chocolate soil in dry winters, and in summer months, in fact even soon after rain, shrinks and cracks, and during sudden tropical storms, which are of frequent occurrence, these cracks serve as drains. The storm-water runs into them, and then 6 or 7 feet underneath the surface, rendering the whole country boggy, unstable, unsafe, and dangerous for railway construction. As this route from Warren would run across the water-shed the effect would be that in time of flood, or a visitation of tropical rains, which sometimes fall at the rate of 10 inches in a few days, the embankment of the line would act as a dam across the country, forcing the water back from its natural outlet. This might probably result in a serious loss such as occurred on the Nyngan to Bourke line in, I think, 1894, when miles of that line were washed away, and railway connection was suspended. This could only be remedied by large and expensive culverts. Such a state of things is not likely to occur on the line from Dubbo to Coonamble, as it would run almost with the water, and not dam up its natural get-away. The Dubbo route runs through good agricultural country, and last season, which was not a good one, showed that for wheat-growing there is no better country in the Colony. With regard to the rainfall for the last two years—1896-97—it has been 24·13 and 24·15 inches respectively. The rain has fallen at such times as to be of little benefit to the crops. It has fallen in the summer and winter months, and not at the time when we wanted it, and consequently we have had inferior crops. And last year also, although we had good yields, still the grain was all so pinched from the want of rain, that we lost considerably. The Warren line, with very few exceptions, runs through purely grazing country, and not through agricultural land. Where 100 acres on the Dubbo route would support a family, 500 acres on the Warren route would not keep a family by grazing. All the land recently thrown open on the Dubbo route has been rushed by applicants, and there were fifteen or sixteen applicants for one block. There is no land now open for selection. The Mudgee route is one offering great engineering difficulties and involves a much greater length of construction. The Dubbo route is the original overland route from the North, and from Queensland. That is what really made Dubbo originally; it is on the direct route from Queensland and the North. It was found out in the olden days that the route followed over the mountains was the best for a railway line, and so ought this route to be the best for a railway line, as it is the natural route. It is still used as the natural route, and although the railway has gone out further west, the stock continues to come in here from Coonamble and up the Marthaguy. With regard to the rainfall, the returns at Dubbo show that, in 1894, there were 31·83 inches; in 1896, 24·66 inches; in 1896, 24·15 inches; in 1897, 24·13; and for January, February, and March, 1898, 12·72. Although we have had a very good rainfall this year still is not as much benefit to the farmer except that it allows him to get on his land and plough during the summer. If we had had some of this rain in the early spring we should have had better crops.
1644. The rainfall is sufficient for the growth of wheat? Yes, ample. Sometimes we have tropical rains about March, when about 10 inches of rainfall in two or three days. Warren seems to be treated in that way very often, and that would cause trouble in constructing a line across the water-shed.

William Ernest Binning, Road Superintendent, Dubbo, sworn, and examined:—

- W. E. Binning.
31 Mar., 1898.
1645. *Mr. Hassall.*] How long have you been here? Eighteen months.
1646. You have travelled through the district a good deal in the discharge of your duties? Yes; I am always travelling.
1647. Are you able to give the Committee some information with regard to the traffic running out of Dubbo towards the Castlereagh country? I think I can safely say that a greater amount of traffic comes in on the Coonamble road than on all the other roads leading into Dubbo put together.
1648. Of what does the traffic principally consist? Timber and wool principally.
1649. Any wheat? I think not a great deal of wheat.
1650. The outgoing traffic, I presume, goes *via* Coonamble and the district generally? Yes; most of the stores go that way.
- 1651.

1651. Do you judge of the traffic by what you see yourself on the road? Yes, and by the cost of maintenance.
1652. Does much stock come in? Yes, a good deal of stock.
1653. Do you look upon the district as a progressive district? Certainly, it is going ahead very fast.
1654. Is settlement increasing to any great extent? Yes, very rapidly.
1655. More particularly in which direction? Well, all round.
1656. I suppose wherever land is available they make application for it? Yes.
1657. What would it cost per mile to make a good road through the Castlereagh country;—what did the metal road cost between here and Talbragar? It averages about £1,000 per mile—that is, where metal is available.
1658. What amount is available for maintenance between here and Gilgandra? £40 a mile.
1659. You are not able to do a great deal with that? No; it takes a terrible lot of money to maintain existing works on that road.
1660. Is it pretty sound country? Except in one or two places.
1661. Suitable you think for railway construction? Yes.
1662. Did you hear Mr. Fitzhardinge's evidence? Yes.
1663. Have you a sufficient knowledge of the country to corroborate what he said? No; I only know the country as far as Gilgandra.
1664. But you can corroborate the statements made by Mr. Fitzhardinge as applying to the country you know? Yes.

W. E. Binning.
31 Mar., 1898.

George Augustus Clark, Sub-Inspector, Permanent-way Branch, Department of Railways, sworn, and examined:—

1665. *Mr. Roberts.*] What are you? Sub-Inspector in the Permanent-way Branch, Department of Railways.
1666. Do you reside at Dubbo? Yes; and I have done so for about fifteen years.
1667. What are your duties? My duties consist in keeping buildings, bridges, and similar works in repair between Mullion Creek, Bourke, Cobar, and Warren. I do not leave the railway.
1668. Is it part of your duty to procure timber and forward it to these different places? It has been part of my duty to inspect and pass timber that has been supplied here for the Railway Commissioners in the form of sleepers, girders, piles, and fencing stuff.
1668. Does all that timber come from the Dubbo district? The sleepers, fencing stuff, and piles all come from the Dubbo district. A large quantity of the girders are supplied from Sydney.
1670. Is it any part of your duty to select the country where the sleepers should be obtained? No.
1671. You only criticise them after they are brought in for inspection? Yes.
1672. In what part of the Dubbo district is this timber generally obtained;—how many miles from here? At present the timber is brought from a distance varying from 15 to about 40 miles.
1673. In which direction? I can only say what I have heard the carriers state—that the timber comes from out Balladoran way, and that part of the country in a northerly direction between here and Gilgandra, but not on the western side of the Macquarie.
1674. For how many years has the timber been obtained from this district? Ever since I have been living here the timber has been obtained from this locality for the construction of different lines.
1675. Is it of excellent quality? Yes; it is of splendid quality for what it is used for, viz., bridges, sleepers, and piles.
1676. It wears well, and is really better than can be obtained in many parts? I am inclined to think it is better for local work than the coast ironbark. It is not so liable to be attacked by the white ant, and it stands the sun better.
1677. Is ironbark the only timber you get? That is the only timber I have any dealings with. We use the cypress pine for repairing buildings and other structures that have been attacked by the white ant which seems to be a great scourge here.
1678. Has it often become your duty to condemn the timber? There is always a certain percentage condemned. A great deal rests with the contractors; if they are inclined to bring in fairly good stuff there is less timber condemned.
1679. Is there any information you think would be useful to the Committee? Most of the timber used for the Cobar line and the Warren line, and on the line from here to Bourke, was obtained from Dubbo. The timber is of excellent quality and a number of the local bridges and roads are supplied from the Dubbo bush.
1680. Has any large quantity of sleepers gone east from this district? A large number of sleepers have in the past gone east from Dubbo, but I could not give any idea as to the actual quantity.
1681. How far towards Sydney do you send sleepers? We have sent them as far as Granville and further to the south, but, of course, only in exceptional cases. A considerable quantity of sleepers go from here to Forbes, Mount Victoria, and to the Mudgee line.

G. A. Clark.
31 Mar., 1898.

Edwin Newbald Blacket, auctioneer and land agent, Dubbo, sworn, and examined:—

1682. *Chairman.*] How long have you been resident here? I have been engaged in that business for seventeen years in Dubbo. Previously I was for eleven years in commercial business in Dubbo, making a total residence of about twenty-eight years.
1683. Would you like to make a statement? I was a resident of Coonamble for three years before I came to Dubbo. It is not my intention to attempt to give any information applying to any part of the country beyond Gilgandra, as, I presume, that has been already obtained. In my capacity as a land agent I can describe the class of country between here and Gilgandra, the manner in which it is held, and the prospects of profitable settlement in the event of a railway being constructed. I can describe the character of the country from the Talbragar Bridge, 4 miles from Dubbo near Brocklehurst. The parish of Terramungamine consists of about 23,000 acres. It is all taken up in small holdings varying from 100 acres to 300 or 400 acres and in some cases 2,550 acres. The greater part is agricultural land which has been profitably farmed for years.
1684. How far from Dubbo is the nearest boundary of the parish of Terramungamine? About 10 miles.
1685. Therefore, this country is fairly well served by Dubbo? Yes. I then come to the parish of Daley.

E. N. Blacket.
31 Mar., 1898.

It

E. N.
Blacket.
31 Mar., 1898.

It consists of the leasehold area of Terramungamine, comprising about 17,000 or 18,000 acres. The lease will expire in 1900, and people are anxiously waiting for an opportunity of settling upon it when it becomes available. This land, I presume, will be thrown open principally in homestead selection areas, as it is pretty close to the township, and it will be settled upon by a good many families. The balance of the area in the parish of Daley consists of the travelling stock reserve. There are only two or three alienated portions of land in the parish of Daley; the land has not been available for settlement. In reference to this parish, starting from 10 miles out on the Coonamble road, at a place called Midway, a road branches off from Coolbaggie Creek to a place which has usually gone by the name of Fish's, and which leads on further to Bourbah, and opens up some of the best country we have in the Colony about Bundameer, Kickabil, Bundigoe, and various other places. A very short time ago a bridge was erected and opened for traffic across the Coolbaggie Creek, about 18 miles from Dubbo, which has given an outlet to all that country in the direction I have indicated. It is considered a great boon to the residents of the district, nearly every inch of which is taken up by *bona-fide* selectors who are using their best endeavours to go in for agriculture.

1686. What is your opinion of the country over the bridge? From this 10-mile point at Midway, where you leave the Coonamble road and branch off to the Coolbaggie, I suppose for about 2 miles through, it would frighten anybody to go there at all. I do not suppose that 2 miles after you leave Midway, until you get to the country going to Coolbaggie, you could find better country for agriculture. The parish of Goonoo lies due north from Terramungamine. The railway line goes through the western portion of it. About 7,000 acres are locked up in the railway reserve, and will be available for settlement when the reserve is cancelled. The balance of the parish is principally selected by small holders.

1687. Briefly, what is the class of country? I am not in a position to state exactly, except by hearsay; but I take it to be good country from the fact that the small holders are there. I have been through it on several occasions. I should say that the greater part of it was ordinary fair wheat-growing land. I then pass on to the parish of Caledonia, which is about 20 miles from Dubbo. It is bounded by the Coolbaggie Creek. The railway runs through the western side of it, and occupies about 5,000 acres which is locked up from settlement. It is intersected by the Coolbaggie Creek. There are farmers on it who, to my own knowledge, are now growing cereals. I have selected several portions there for different people. It is very much the same class of soil as Goonoo—reddish soil, fairly timbered. Pretty well all of it is pretty good agricultural land. Of course, there are some bad patches, as there will be in any part. I come next to the parish of Eumungerie. The road and railway line run through this parish. About 7,000 acres of Crown land are locked up by the railway reserve. On the Terramungamine leasehold land will be available for settlement in 1900. It all has a frontage to the Coolbaggie Creek. The balance of the parish is taken up by about seven full areas. I had the pleasure of selecting every inch of it. I selected for Messrs. Brown, Bell, Trypp, and others, who are now, I believe, carrying on a profitable occupation on their holdings.

1688. What is your opinion of the western portion of the parish of Eumungerie? I am informed that it is very fair grazing and agricultural country. The parish of Balladoran, which is the next, is bounded on the east by the Marthaguy Creek to its whole extent. It is selected by about eight holders, and about 6,000 acres are embraced in a railway reserve. One of the first families settled in the parish of Balladoran, on beyond the borders of the parish of Drillwarrina, is a family named Johnstone. Their sons and daughters have all selected land in that neighbourhood, and I believe they have all occupied it very profitably. I passed through from Coonamble on the 24th January on a business trip down there, and I brought in a sample of wheat from Johnstone's, of Balladoran, which I was commissioned to sell, the quantity being about 200 or 300 bags, and it was considered by good judges, purchasers in the town, as one of the best samples of wheat produced this year. All about the neighbourhood of Balladoran there was an impression years ago that you could not grow a grain of wheat. Now it is a totally different thing. I come to the parish of Drillwarrina—the road and rail run through it. There are about 7,000 acres of a railway reserve, and about 10,000 acres leasehold area of Balladoran, which falls in 1900. I believe there are actually about 17,000 acres awaiting settlement in that parish. At present there are four holders in the parish. I selected land in that parish for two or three members of a family named Berryman, who came, I think, from Victoria. These selections are in close proximity to those of the family of Johnstone of whom I just spoke as going in for wheat-growing. A gentleman from South Australia, named Wheaton, about three or four months ago, came over here with the object of purchasing a property. He travelled over a considerable portion of the district, and he returned and purchased a property from Mr. Berryman consisting of 2,560 acres, which he said was better wheat-growing land than any he had passed over. The next parish is that of Bungey. There is a railway reserve, and a leasehold area on Bongeobong which has the reputation of being good country. Mr. Wheble's property is in the parish of Bungey, and his leasehold expires in 1900. There are about 10,000 acres, all of which has a frontage to the Marthaguy Creek, and which awaits settlement. Messrs. Wheble, Humphries, Eddy, and Crockett, and various other holders occupy a great portion in this parish. All their holdings are close together, and contiguous to the proposed railway line. The parish of Breelong, in the county of Ewenmar, has a frontage to the Castlereagh River. I cannot speak of the eastern side of the road in the parish of Breelong in the same terms as I can of the western side. It is generally forest country, and it is held under forest reserve No. 22,722. There are about 12,000 acres altogether, consisting of ironbark forest, which is reserved for timber purposes. It was reserved several years ago for the purpose of the construction of a tramway, and it has been standing as a reserve on the parish map up to the present time. This forest reserve extends into the parishes of Eurah and Donnelly. I cannot say what the area of the forest reserve is, but it is of immense area, and reaches pretty well from that part of the country to Munderooran. The tramway, if it had been laid down, would have tapped that immense forest from which sleepers have been drawn for the railway lines between here and Bourke, and other parts of the railway system. These ironbark forests have given employment for years and years to hundreds of families here, and they are pretty nearly in immediate contact with the Coonamble to Dubbo road. Interspersed through this timber reserve are found belts of agricultural country; but I am not in a position to say of what area. In the parish of Donnelly you find Ranter's Creek, a very well-watered creek, on which there are three or four full areas of land held. I selected the whole of that part of the country myself for these holders, and their description of it is that it is as good box country as you could possibly find, the greater part of it being fit for agriculture. Between their boundary and the Dubbo-Coonamble road, I believe the country is not so good. You go through a station which

which has the reputation of being rather rough and thick. I am not in a position to say much about it as I have not been through it. Passing thence on towards Gilgandra, there is a bad piece of country there, there is no denying that. If you travel in a buggy over that corduroy road you find it out. That sand-belt, I believe, is about $1\frac{1}{2}$ mile wide in some places, and perhaps $1\frac{3}{4}$ or 2 miles in other places. It takes a north-westerly direction, and works round the outside of Gilgandra, near the Monkey Scrub, and out towards Berida, where I think it finishes. On either side of that scrub I believe the country is very fair. I believe a wrong view has been taken as to the real value of some of our lands. Because they were not valuable in the first instance for pastoral purposes they have been classed as useless lands, whereas if labour were expended on them they would give frequently the best return.

1689. If the land were thrown open in 1900 would there be a demand for it? Most decidedly. This morning there were thirty applicants for 109 acres of land offered in the local Land Office.

E. N.
Blacket.
31 Mar., 1898.

Edward Charles Ewers, contractor and timber merchant, Dubbo, sworn, and examined:—

1690. *Mr. Hassall.*] Have you resided here long? For about twenty years.
1691. Have you been in business the whole of that time? I have been in business for about five years.
1692. Can you give the Committee any information with regard to the timber industry? The business which I have followed has been chiefly in relation to the ironbark, which is used for sleepers, piles, and girders for railway construction and maintenance.
1693. Where do you get the timber from chiefly? Chiefly from the direction in which this railway is proposed to run. It comes from Kickabil, Balladoran, and further north. That would be in towards Cobborah way; but the greater part of the timber for the last three years has come from Balladoran way.
1694. Practically, from the country lying between the Macquarie and the Talbragar? Yes.
1695. Along a line north to the Castlereagh? We have drawn timber from the Castlereagh.
1696. How is that belt of timber standing—is it getting pretty well worked out? For the first twenty-five miles from here it is getting thinned to some extent, but beyond that we have a bush from which, I suppose, we shall be able to get timber for the next half century. We have been getting timber within a distance of 20 or 25 miles for the last eighteen or twenty years, since the construction of the line to Dubbo. We have been getting timber now within 10 miles of Dubbo—ironbark of various kinds.
1697. A line of railway running from Dubbo to Coonamble would tap this apparently inexhaustible supply of timber lying near the Castlereagh River? Yes; it would tap the timber on the Castlereagh and on the other side of it. Timber can be obtained cheaper on the Dubbo line than on the Warren line.
1698. With regard to the question of the cost of producing sleepers, I suppose the price at which they are delivered here depends on the distance which they have been brought? Yes.
1699. Taking a radius of 10, 15, 20 and 25 miles, what would sleepers cost delivered in Dubbo? Within a radius of 10 miles the carriage charged is generally 1d. per mile, and it is proportionately less per mile as the distance increases.
1700. So that I suppose they would be carried 25 miles for about one penny half-penny? Yes.
1701. What are sleepers worth in Dubbo? At the present time large sleepers are worth 6s. 6d. and small sleepers 4s. 6d.
1702. Do you think the fact of a railway being constructed through that country would make the sleepers cheaper? Undoubtedly it would, because it would save at the very least from 15 to 20 miles carriage. If we had a railway constructed to Coonamble we should only have to draw sleepers a distance of 5 or 10 miles for years to come, whereas now we are drawing them a distance of from 15 to 40 miles.
1703. It would mean practically reducing the price of the sleepers by a shilling or eighteen-pence each? Yes.
1704. Is there any other timber used in your business—do you use much pine? Yes, there is a great deal of pine used.
1705. Where do you get it? It comes chiefly from the same direction—the Castlereagh—with the exception of what comes from Narromine and other places by train. But the pine chiefly comes from that direction.
1706. You know that there is a very large timber forest in that direction with practically an inexhaustible supply of timber available? Yes.
1707. *Chairman.*] Do you know the big timber reserve down Kickabil way? Yes.
1708. Is there much timber there? Yes; there is a great deal.
1709. A very large quantity indeed? Well, not such an immense amount; but still there is a large quantity.
1710. It will last for some time? Oh, yes, last for years. We have been cutting on the edge of it now for a number of years. We have not got into the forest yet amongst the best of the Kickabil timber.
1711. How far do you draw? About 25 miles.
1712. If a railway went through, it would furnish you with a very fine supply of timber? Yes.

E. C. Ewers.
31 Mar., 1898.

George Henry Taylor, Returning Officer, Electoral District of Dubbo, sworn, and examined:—

1713. *Mr. Roberts.*] Have you any official information in connection with your office which would be of value to this Committee? I received a letter from the Chairman asking me to prepare a return, which I have done. It relates to the last Federal Election and the last General Election. I produce a copy of the electoral roll. There are 300 odd new names to be added.
1714. Have any been erased? I could not say; the revision has not taken place. At the last Parliamentary election there were 1,358 votes recorded, and there were 2,042 electors on the roll. Of these 1,358 votes 1,077 were recorded in the Dubbo Division, 188 in the Narromine Division, and 93 in the Trangie Division.
1715. How long have you been resident in Dubbo? Thirty-five years.
1716. Carrying on business as a stock and station agent? Yes. I know the country very well. Previously I was for six years on the Merri Merri, adjacent to Coonamble, and I know that country very well right into Warren. It was my duty as manager of a station—they were all cattle-stations then—to be continually on the move about that part of the country.
- 1716½. You know all the country, I suppose, traversed by the three proposed routes? Yes. I can endorse the evidence given by Mr. Blacket and Mr. Dulhunty. I think Mr. Thomas, in describing the ironbark country, described the very worst portions. There are different portions of ironbark. Some consist of sandy

G. H. Taylor.
31 Mar., 1898.

G. H. Taylor. sandy loamy soil, which, as Mr. Dulhunty said, will yield 25 bushels of wheat to the acre. On the other hand, there are some very bad descriptions of ironbark country—hard stone and white gravel. There are patches of that which are very bad; but the general run of ironbark country is of a sandy loamy kind, which, if cleaned and cultivated, would give a good yield.

31 Mar., 1898.

1717. You have heard the evidence given by Mr. Brackett and Mr. Dulhunty? Yes.

1718. Do you agree with what these gentlemen said? I agree chiefly with Mr. Brackett's very able and graphic description, which I can endorse from my knowledge gained riding along the road and going off it after stock, and looking for horses between here and Gilgandra; and I know that the country between Coonamble and Warren, as stated by Mr. Thomas, is splendid pastoral country and cannot be beaten; but it was never considered during my time (and I resided there for six or seven years) good for agricultural purposes, except in patches.

1719. You are aware that there are large areas of land which were not considered suitable for agriculture a few years ago, but which are now regarded as adapted for that class of occupation? I am aware of that, and an instance is afforded both at Narromine and Dubbo. That land was not considered good agricultural land at one time, and yet I suppose there is no finer agricultural country going.

1720. What do you think of the country between Bullagreen and Coonamble, on the Warren line, for the growth of cereals? Part of it would be good and part not good. I know it is greatly inundated with water during flood time. I have seen the whole of the country almost from the Macquarie to Coonamble under water during flood. It is low flat country, and I am sure that there would be great engineering difficulties about Warren in the event of railway construction from that place. One of the principal settlers in the Bullagreen told me only yesterday that if a railway were constructed from Warren to Coonamble the people at Bullagreen would still send their wool and produce to Dubbo rather than send it to the railway, involving extra trainage round *via* Nevertire.

1721. You favour the Dubbo-Coonamble route yourself? Most decidedly. In the interests of the country it is far and away the best line.

1722. What do you think of the Mudgee to Coonamble route? I do not think any Government would go to the expense of building 50 miles of railway over mountainous country at a cost of £500,000. The Goodaman Range and the Cudgegong River offer serious engineering difficulties going into Mudgee.

1723. Knowing that undulating country you think it would be far better in the interests of the State to run a line from Dubbo to Coonamble? I have no doubt about it. There should be a main trunk line from here to Coonamble; it would go through perfectly level country.

1724. Do you think a greater number of people would be served by that line than by a line from Warren to Coonamble? Yes, a far greater number.

John Wheaton, farmer, Dubbo, sworn, and examined—

J. Wheaton. 1725. *Chairman.*] You are a resident of the Dubbo district between here and Balladoran? Yes, on the western side of the road.

31 Mar., 1898. 1726. You recently came from South Australia? Yes.

1727. You have been farming for a considerable number of years? Yes, all my life.

1728. You know what land is fit to produce? I am not sure of that. My opinion is altered with regard to land. There is some land that has been condemned this side of Gilgandra. I have seen land like that condemned in South Australia, and when it has been cleared it has been found to have been as good as the other land. I have seen sandy land grow good crops—land which after it was ploughed would almost blow away. Any land that will grow pine will produce a crop of wheat.

1729. You have been growing wheat in South Australia? Yes.

1730. Will you be able to grow wheat on your present holding as satisfactorily as you were able to do in South Australia? Yes.

1731. You have no doubt of that from the fertility of the soil and the rainfall? Yes, and from my experience of what I have seen of wheat grown here during three years; last year I saw the wheat grown and this year.

1732. What have you got? Box country, with a few ironbark trees mixed.

1733. But not real ironbark country? No.

1734. In what parts of New South Wales did you look for a farm before selecting your present holding? I travelled to the south of Dubbo for about 10 miles, and within that radius; then I went 40 miles north of Dubbo, and to the west of that road.

1735. You went towards Berida and Bungey? Yes.

1736. And after looking over that country you came to the conclusion that you had better settle down where your present homestead is? Yes.

1737. Do you believe that more South Australians will come to the Dubbo district to grow wheat? I am sure of it. There are several in communication with me at the present time who, as soon as they can get rid of their farms, will come over here. They are satisfied that where I have come to must be a good place, because I left one of the best districts in South Australia.

Robert George Dulhunty, Inspector of Stock, Dubbo, sworn, and further examined:—

R. G. Dulhunty. 1738. *Chairman.*] You have prepared some information for the Committee? Yes; I hand in a list of stock-owners who reside at the furthest 12 miles on either side of the line "A," with the number of stock,* according to the sworn returns. The totals show 92 owners, 1,323 horses, 3,300 cattle, and 346,830 sheep. That embraces a part of the country not more than 14 miles wide. With regard to the annual traffic, I estimate that the traffic both ways on line "A" would be 1,000 horses, 10,000 cattle, and 1,000,000 sheep. It is one of the most important stock routes in my district, and my district is a very important one. From my knowledge of the district out there, and that ironbark country, I know it to be first-class fruit country. One man has a magnificent orchard, and makes his living by driving in to Dubbo with fruit. This land is on the very edge of the ironbark country.

31 Mar., 1898.

* NOTE (on revision):—The area for 12 miles on either side of the line "A" and the ninety-two owners, 1,323 horses, 3,300 cattle, and 346,830 sheep, only applies to the line from Dubbo to Gilgandra, as the opposite side of the Castlereagh River is not in any sheep district, and I could not give the return. There are large numbers of holders within a mile of the proposed line, in the Coonabarabran and Coonamble districts.

Edmund Henry Utley, timber merchant, Dubbo, sworn, and examined:—

1739. *Chairman.*] What are you? I am a timber merchant, blacksmith, and wheelwright. I have carried on business in the district for thirteen or fourteen years, particularly in the timber trade. I send timber to all parts of the country, east as well as west, but particularly west. The country from here out is rather deficient of valuable timber, such as is required for bridge work, railway work, and mining work. We send a large quantity of timber from here to the mines at Cobar, and I think in the future as the mines in that part of the country develop there will be a large demand for our hardwood timbers to be used in the mines as props for which purpose our hardwood is specially suitable by reason of its strength. A railway from Dubbo to Coonamble for the first 40 miles would probably go through the worst portion of the country along the route. At the same time the railway would be revenue-producing and would be a great benefit to a large number of people and to trade generally in the west and also in the east, because I think you will find that there is no timber of any value between the coast and the belt of timber that runs along the western slopes of the Dividing Range. The Dubbo district is probably the tail end; it runs more north from Dubbo. It seems to me from what I know of the country that the hardwood in the south is inferior to that grown in this neighbourhood. The river Macquarie cuts the valuable hardwood forest off, and it runs from here to Narrabri. It is contained in a belt of country that runs 40 miles wide right through to the northern railway system. I quite endorse what has been said with regard to sleepers. From my boyhood, Dubbo has supplied the western railway system and to the east also with all the sleepers, piles, girders, and other valuable timber required for public works in this part of the country. The timber is durable. If the matter were referred to the high officers of the Railway and Public Works Departments they would say that the ironbark on the western slopes of the mountains is the most durable timber we have in the Colony. If a railway goes within a few miles of that country the timber will be available at a cheap price. Intervening between that country there is a great deal of agricultural land. Fifteen years ago we would not look at scrub land, preferring plain and open country. But some of this scrub land has been cleared and has grown heavy crops of wheat. I have seen as much as 40 bushels to the acre grown in a fair season where a man was careful and tilled and worked his land well. Farmers who came here first put in a few acres of wheat at any time and the result was not very good. But more recently our settlers have been going in for systematic farming, following the example shown by men who have come from other places. The result is that they are successful both as regards quality and quantity. I think it would be advantageous in the interests of the country at large that a railway should be pushed through the country with such great resources—country where grazing and agriculture can be combined, and where there are other natural products, such as timber, which could be utilised at seasons of the year when the wool and wheat are not coming in. In regard to the claims of the line from Dubbo to Coonamble, as against those of the Warren to Coonamble line, we should consider the great distributing power of this centre of population. The natural get-away to the north and north-west from here has been in the direction of Coonamble. There has always been a great deal of traffic on that road, and there is no district through which railway construction would be more justified. Along the banks of the Castlereagh I saw this year crops of wheat that would yield at the very least 30 bushels to the acre. A railway running parallel to the banks of the Castlereagh—the country being rich from Gilgandra to Coonamble—would serve the greatest number of people. It would be a revenue-producing line, and would serve a large district whose inhabitants would otherwise be at a great expense in getting their produce to market. The people are taking up land and going in for farming all along the banks of the Castlereagh and east of the Castlereagh, towards the Warrumbungles and through Toorawheena on to Coonabarabran. At present there is not a good market for the settlers at Coonabarabran, who have to sell their wheat to the local mills. If a railway were constructed they would be able to send their wheat to the open market, and get the ruling price for it.

E. H. Utley.
31 Mar., 1898.

FRIDAY, 1 APRIL, 1898.

[The Sectional Committee met at the "Cobborah Hotel," Cobborah, at 7:30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Thomas Samuel Slack, senior constable of police, Cobborah, sworn, and examined:—

1740. *Chairman.*] What are you? Senior constable of police stationed at Cobborah, which position I have occupied for the last thirteen years.

1741. Consequently you have a full knowledge of the district? Yes.

1742. I believe you have prepared a statement? Yes. The Committee being desirous of conserving the public interests in its recommendation as to railway extension, keeping also in view future possible extension, I respectfully submit that the extension should be from Mudgæ to Coonamble, for the following reasons:—The line would open up grand country, and the railway from Dubbo to Werris Creek, if constructed, would junction with it at or near Cobborah. The extension now suggested is desirable in view of the congestion of traffic on the main Western line, especially between Orange and Lithgow, caused by the branch lines, Murrumburrah to Blayney, Condobolin to Orange, Cobar to Nyngan, and Warren to Nevertire. If the congestion is now so great, what will it be in three or four years' time, when the country between Dubbo and Nyngan, and out back on the Bogan at Dandaloo, are brought under cereal cultivation. If we had a few good seasons no single line could cope with the increased traffic. But if the Mudgæ line is extended, then a portion of the Werris Creek line from Dubbo, with a junction at or near Cobborah, would carry all the traffic between Dubbo and Bourke, *via* Mudgæ, to Wallerawang, thus relieving the traffic between Wellington and Lithgow. In the near future a line will be made from Rylstone, *via* Colo Valley, to Sydney, and from the report of Mr. Townsend it would appear that that line would be almost level, and an engine could take as many trucks as can now be taken from Dubbo to Nyngan;

T. S. Slack.
1 April, 1898.

T. S. Slack. Nyngan; so that it would be a continuation to fit in with future railway extension and give another route to the metropolis. All traffic between Dubbo and Bourke could be sent this way, the route being shorter. Again, vast deposits of coal exist in the vicinity of Cobborah and along the Talbragar as far as Ballimore, and also at Spicer's Creek. This is a fact which should be taken into consideration with a view to a saving in the haulage of coal. The Colo line would be the means of opening out and bringing to market vast deposits of coal, making Sydney and the country districts independent of Newcastle. The statistics in reference to land under cultivation for 1896-97 are as follows: Freehold land, 43,902 acres; Crown land, 174,520 acres; under cultivation, 3,427 acres; wheat, 2,420 acres, yielding 26,350 bushels. For the year 1897-98 the area under cultivation was 3,881 acres, of which the area under wheat was 2,813 acres, giving a yield of 30,550 bushels. In 1891 there were 1,874 acres under cultivation, of which 1,186 were under wheat, and the yield from which was 14,811 bushels; there were 6 acres of grape vines, with a return of 656 gallons of wine; there were 11 acres growing table grapes, and the yield was 18 tons of fruit; there were 32 acres devoted to fruit-orchards, the value of the product being £575; there were 12 acres not bearing. The butter produced amounted to 8,974 lb., cheese, 600 lb., and bacon 18,656 lb. The stock returns show a total of 2,000 cattle, and 200,000 sheep. The number of travelling-stock in my returns—stock going to Mudgee and to Dubbo—is 50,000 sheep, and 2,000 head of cattle. I should say that as many again pass through which I do not see. The population is 1,100. These statistics do not include the north side of the river Talbragar, where the returns were collected by the Muntooran and Coolah police.

1743. Over what area were these statistics collected? Over an area extending 12 miles east from Cobborah, 25 miles south, 25 miles west, and 25 miles north.

1744. Since your returns do not embrace the whole of your police patrol district, by how much should those returns be increased to give us a fair idea of the quantity of wheat produced, area under cultivation, and other matters;—would you increase them by half? Yes.

1745. Therefore we may take it that in your police patrol district within the limits you mention, there would be perhaps 45,000 bushels of wheat, and the cultivation would probably be between 5,000 and 6,000 acres? Yes; the figures I have given are approximate.

1746. The leases of the Crown lands amounting in area to 174,000 acres, mentioned in your statement, will fall in within, say, three years? In July, 1900.

1747. What is the quality of that land? The most of it, or three parts of it, is very good.

1748. Suitable for the growth of wheat? Yes; it consists of yellow box, white box, and a few ironbark ridges. There is one main ironbark ridge which runs right along to Muntooran.

1749. What proportion of the 174,000 acres would be suitable for the growth of cereals? About one-third. Speaking approximately, I should say that of the Crown lands there are fully 60,000 acres suitable for the growth of cereals, and 25,000 acres which may be regarded as worthless for the purposes of settlement, but on which there is very good timber. The residue may be regarded simply as fair land for pastoral purposes.

1750. Would this land be taken up as soon as it was thrown open? Yes.

1751. Almost the whole of it, with the exception of the 25,000 acres of worthless land? Yes; as fast as it is thrown open there are people ready to take it up.

1752. What is the country like from here to Muntooran? The distance is 22 miles. For the first 10 miles the country is very indifferent; but beyond that it is very good.

1753. And from Muntooran to Binaway? There is some splendid land up that way.

1754. Is this a good district for wheat? Very good.

1755. Does a man, as a rule, get a good crop? Yes, a very good crop.

1756. How many years out of five? Three or four.

1757. There would not be much more than one failure in five years? No.

1758. Is the district progressing? It is. The population on the 31st December last was 1,100. That is in my patrol district. Five or six years ago it was 900.

1759. *Mr. Hassall.*] What is the nearest land office? The whole of the land business is transacted at Dubbo, 50 miles distant.

1760. Are there any newcomers here? Two years ago the Stringybark gold-fields broke out, and that has caused an increase of population.

1761. And with regard to the farming population? That has increased as fast as the land has been available.

1762. Has that land been applied for by people residing in the district who have grown up here, or by fresh arrivals from different parts of the Colony or from other Colonies? There have been no fresh arrivals, the land has been taken up by local people.

George Paterson, farmer, near Cobborah, sworn, and examined:—

G. Paterson. 1763. *Mr. Roberts.*] Have you resided in this district for any length of time? About twenty-seven years.

1 April, 1898. 1764. What area of land do you hold? 320 acres.

1765. Where is your farm situated? Seven miles from Cobborah up the river, east from here.

1766. What do you cultivate? Chiefly wheat, as well as maize, and other produce.

1767. Is the whole area of 320 acres under wheat? I have cultivated about 50 acres of wheat. I run a few sheep and cows. I have a few acres under corn.

1768. Do you utilise the whole of the 320 acres? Not for cultivation purposes.

1769. How many sheep do you run? About 200.

1770. Is that about a sheep to the acre? Quite a sheep to the acre, where the sheep run. Sometimes there are two sheep to the acre.

1771. What would be a fair estimate of the carrying capacity of the land for sheep? On the Government land, on the runs, I suppose, about a sheep to 2 acres. On the ringbarked timber the land would carry a sheep to the acre with safety, taking one season with another.

1772. How many bushels of wheat do you get to the acre? Last year my crop averaged 28 bushels.

1773. How long have you been growing wheat? About eighteen years.

1774. Where do you send it? I send it chiefly to Gulgong now. About fifteen years ago we had to go to Dubbo, but since there has been a mill at Gulgong that has been our chief market, and occasionally Mudgee.

1775. How long is it since the mill was erected at Gulgong? About five years. The distance to Gulgong is less than that to Dubbo by about 20 miles. G. Paterson.
1776. As a rule, do you get a fair market price for wheat at Gulgong? Yes, about the general average. 1 April, 1898.
1777. What does it cost you to take wheat to Gulgong? At one time we paid 2s. a bag; but recently the carriers with big teams have been charging slightly less.
1778. What did you pay last time? I took it in myself last year.
1779. What is the ruling rate? 1s. 6d., 1s. 9d., and 2s. a bag.
1780. And what did you pay to send it to Mudgee? I never paid carriage from my place to Mudgee; but I suppose it would be about another shilling a bag. That would be a total of 8d. a bushel.
1781. What do you reckon a bushel of wheat costs you to grow? It is difficult to say, as together with members of my family, I do a lot of my own work, and I keep no accounts which would enable me to give this information.
1782. If you got 3s. a bushel for your wheat I suppose you would do fairly well? Well, not too well. At any price under 4s. the farmer has very little to come and go upon. He has to cut things very fine to make wheat-growing pay at anything under 4s. I consider that 4s. would be the minimum price at which it would be worth while to grow wheat. Sometimes I have to be satisfied with 2s.
1783. What are the wishes of the people with regard to railway communication? It has been their earnest wish for many years to get railway communication out here.
1784. Do you agree with the evidence of Sergeant Slack as to the desirableness of railway communication? Yes.
1785. How often in the eighteen years has your crop failed? I have had three failures in the eighteen years—two years owing to dry weather, and one owing to rust.
1786. When Sergeant Slack said that the proportion of failures would be two out of five, you think he erred on the side of caution? Yes.
1787. Do you regard the majority of the land round here as well adapted for wheat-growing? Yes; the majority is good wheat-growing country, and with favourable seasons, we can grow wheat.
1788. Do the people here feel the want of a railway? Yes; that is what we require to send the district ahead. The progress of the district is greatly retarded for want of railway communication. We have no market outwards.
1789. You think that if the railway were brought here, and land thrown open, a large agricultural population would be sure to follow? The land would be taken up as soon as it was thrown open.
1790. *Mr. Hassall.*] Has the country which would carry a sheep to the acre much grass seed? Before the country is ringbarked it carries a great deal of grass seed.
1791. Does ringbarking improve the quality of the grass, and do away to a great extent with the grass seed? Yes.*

Harry Albatross Patrick, grazier, Digilah, sworn, and examined:—

1792. *Mr. Hassall.*] Where do you reside? At Digilah, about 16 miles from here.
1793. What is the character of your holding;—is it leasehold area or selections? My brother and I in company hold a leasehold area, three occupation licenses and annual leases, and about 5,000 acres of freehold land, making an area, approximately, of nearly 60,000 acres. H. A. Patrick. 1 April, 1898.
1794. Is that country up on the Castlereagh River or near it? It commences within about 2½ miles of the Castlereagh River and extends across the Talbragar to within 16 miles of Gulgong.
1795. It is devoted principally I suppose to sheep-farming? Yes.
1796. Have you gone in for agriculture at all? Only for station use.
1797. You have heard the statements made by Sergeant Slack and Mr. Paterson with regard to the capabilities of the district? Yes.
1798. Can you endorse those statements from your own personal observation and knowledge? Yes, I agree with the statements generally, though not as to every item.
1799. Where do you differ? I think there is a greater area of valueless land included in the Crown lands than was stated.
1800. The sergeant said that out of 174,000 acres about 25,000 acres were valueless? There is a greater area of valueless land than 25,000 acres. At least one-fourth of the 174,000 acres would be valueless, except for the production of timber and minerals, the timber being principally ironbark and pine of excellent quality.
1801. Is the estimate of 60,000 acres of land suitable for agriculture a pretty fair estimate? No; I would not estimate the area at so much as that. I would reduce it to 40,000 acres. The balance of 80,000 acres would be fairly good grazing land, hilly—stony.
1802. But improved, would carry a fair number of stock? Yes.
1803. About a sheep to 3 acres? Yes, if improved by ringbarking.
1804. With regard to the value of this country, the extent of which you put down at 40,000 acres, although it may be practically valueless for either agriculture or grazing, it might still be a valuable asset to the State, on account of the timber it contains, which would be a source of great revenue, and afford employment for labour? Decidedly so.
1805. In fact, it is one of the best ironbark forests in New South Wales? Yes.
1806. You know the country very well, say, from Dubbo, in the direction of Werris Creek? Yes; I know the country very well lying between Dubbo and Werris Creek. A line between those two points would traverse good country, following the valley of the Talbragar to Cobborah, and on to the Castlereagh River. Thence it would go through the ironbark belt, previously alluded to, on to Coonabarabran through fair country, and from Coonabarabran, after leaving the Warrumbungle Ranges it would traverse the Liverpool Plains, with first-class country, right through to Werris Creek.
1807. Would a line running through there be of any service to this district? It would be of some service, but it would entail a great deal more haulage. It would be a very expensive way of sending produce. 1808.

NOTE (on revision):—Through lack of railway communication and extension, the settlers here are seriously handicapped in the matter of many crops, such as potatoes, onions, hay, and other produce. Such crops cannot now be profitably grown because the local consumption is too small, and the road-carriage too expensive. Should railway extension be made through the district, the farming industry would be revolutionised and considerably augmented, and farm productions at present proscribed would be cultivated and despatched to outlying districts, such as Coonamble, &c., where climatic influences retard cultivation.

* 1 (a)—I

- H. A. Patrick. 1808. A cross line of the character thus indicated would not, in your opinion, serve this district so well as a line running through from Mudgee to Coonamble? No; it would not benefit this part of the country nearly so much.
- 1 April, 1898. 1809. Would it be of any benefit at all? I believe it would. It would open up the country and give more speedy means of communication north and south, but not direct with the metropolis, nor into the interior.
1810. How long have you known this district? About twenty-five years.
1811. Have you seen the growth of settlement in it? Yes.
1812. You can corroborate what has been previously said in that respect? Yes.
1813. That the land, when available, is greedily taken up? Yes; there is a great rush for the land as soon as it is thrown open. There are from twenty to sixty applications for every block.
1814. The principal pursuit of the people is grazing? Grazing, combined with agriculture.
1815. Do the people around here seem fairly prosperous? Yes; there are very few failures. They are not rich, but they all seem to get a fair living. The industrious settler seems to be fairly snug.
1816. I suppose your information with regard to the carriage paid for wool is practically the same as that given by previous witnesses? Yes.
1817. You send your wool to Mudgee? Yes; that being the nearest railway-station.
1818. Is there a good road from your place to Mudgee? Yes; there is a very good road from Mudgee to within 6 miles of my station. In my opinion, some of the otherwise worthless country in the district bears minerals of various kinds, and some of it contains good deposits of coal. Prospecting operations have been carried on, with good indications of gold, silver, copper, and other minerals. There is a good coal deposit of 6 feet in the Buthow Creek near here, which I have just reason to believe is equal in quality to the best Newcastle coal. This should have the attention of the Government, as, in my opinion, it is a valuable treasure for the future of the Colony, being on Crown lands.

William Thomas Chapman, farmer, Cobborah, sworn, and examined:—

- W. T. Chapman. 1819. *Chairman.*] What are you? A farmer, residing at Cobborah, and a member of the Progress Association.
- 1 April, 1898. 1820. Having heard the evidence already given, do you believe that in all the main principles it is correct? Yes.
1821. Do you agree with Mr. Patrick with regard to his estimate of the proportion of Crown lands fit for cultivation? Yes; I think he is very near the mark. The country through which the railway line passes from Mudgee to Coonamble is nearly all very good. A good deal of it is first-class country, and three parts of it are good for cultivation.

James Hogden, farmer and carrier, near Cobborah, sworn, and examined:—

- J. Hogden. 1822. *Chairman.*] What are you? A farmer and carrier, residing 5 miles from Cobborah. I am a member of the Progress Association.
- 1 April, 1898. 1823. You have heard the evidence given this evening;—do you agree with it in the main? Yes.

James Henry Daley, farmer, near Cobborah, sworn, and examined:—

- J. H. Daley. 1824. *Chairman.*] What are you? A farmer residing about 2 miles from Cobborah.
- 1 April, 1898. 1825. Have you heard the evidence given? I heard that given by Mr. Patrick and Mr. Paterson.
1826. Do you agree with it? Yes; I think it is very fair.
1827. Fairly represents the position of Cobborah? Yes. I consider we are greatly shut out from railway communication. It does not pay to carry vegetables and similar produce to Mudgee, as the distance is too far, and the local consumption is not sufficient to justify much cultivation of the sort.
1828. *Mr. Roberts.*] How far from Cobborah is there any mining going on? There is mining at Stringybark, about 12 miles in the direction of Gulgong, and also at Hughey's Waterhole, about 10 miles in the same direction. It is all gold-bearing country from here to Gulgong.
1829. Are the men working there doing fairly well? Some of them are doing fairly well. The biggest drawback here until lately was the want of water.

SATURDAY, 2 APRIL, 1898.

[*The Sectional Committee met at the Town Hall, Gulgong, at 2:30 p.m.*]

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

Christopher Reid Young, storekeeper and miller, Gulgong, sworn, and examined:—

- C. R. Young. 1830. *Chairman.*] What are you? Storekeeper and miller, carrying on business at Gulgong. One great reason why the people of Gulgong felt that it was desirable to extend the railway from Mudgee to this place was, that the Mudgee railway was not paying, and therefore the more traffic that could be brought on to it the better for the State. The people of Gulgong felt that the construction of the railway would develop their district and create greater traffic. I have had an opportunity of looking at the statistics that were furnished eight years ago to a Sectional Committee of the Public Works Committee with regard to the Mudgee to Gulgong railway, and so great has been the extension that, in my opinion, the statistics then given with regard to agricultural development might be increased fourfold. Another point that I regarded as important was, that the agricultural products of this district could be better sold to the west than to the east at times; that there was a certain population there to whom we believed we should be the nearest agriculturists, and that would mean virtually the extension of the line from Mudgee *via* Gulgong to Coonamble. I desire to emphasise the effect which, in my opinion, a railway would have on the development of a district such as this by bringing the land under cultivation. As an example of this, I would direct attention to a statement made by me when giving evidence before a former Committee on the 24th March, 1890 (Question No. 1673). I then stated that I purchased that year 10,000 bushels of wheat. This year I have purchased up to date 75,000 bushels, and the wheat is still coming in freely. My transactions may all be regarded as having since that date increased fourfold.

1831.

1831. Is the quality of the wheat grown here very good? The very best.
1832. What is the cost of bringing a ton of wheat from Cobberah, a distance of 32 miles, to Gulgong? About 20s. C. R. Young.
2 April, 1898.
1833. What does it cost you to send a ton of flour from here to Cobberah? In round figures about £1.
1834. What does it cost to send a ton of flour from here to Mudgee? About 7s. 6d.
1835. And how much would it cost to send a ton of wheat from here to Mudgee? Seven shillings and sixpence—approaching 2d. a bushel. With regard to the quality of wheat, I am proprietor of the Commercial Mill at Gulgong. The flour I produce is the best. In proof of this I may say that I obtained the Government prize of £25 the year before last at the Bega show, and my flour took first and second prizes at the Agricultural Association's Show. In 1895 I obtained first prize in Mudgee, and one year I got first prize at Gulgong, beating the flour that took the £25 Government prize at Mudgee. The flour stands first class on the Sydney market. Because it is dryer than any other flour it is picked out for export to Fiji and other South Sea Islands. A good upland farm in this district should yield from 25 to 30 bushels per acre. The river flats are not so good. The crops fail less frequently than in any other wheat-growing district of the colony. There has only been one failure since I have been here, which is nearly thirty years. I desire to explain to the Committee what may be the future of the growth of cereals in this district. The wheat going west for the supply of the markets either north or west may be ground in Gulgong and go as flour. The wheat going to the metropolis will go partly as flour and partly in grain for blending purposes, possibly. The export trade for the shorter distances, including such places as Fiji and the other South Sea Islands, will probably be done in the shape of flour. But when the wheat goes to the market of the world it will go in grain, since it is blended in England. The wheat to South Africa will go principally in grain. Our surplus will be exported. We should sell all we can in the west and export the surplus to Sydney. The reason why I state that the surplus products of the fields here would go abroad in the shape of grain is that for many markets it is necessary to blend the grain, and generally speaking the grain carries better than the flour.
1836. Would it be possible to increase the production of wheat? Yes; it would double again in two or three years.
1837. How much wheat do you get from between Gulgong and Cobborah, or about Cobborah itself;—how many bushels do you buy in the year? The bulk of the wheat comes from between Gulgong and Cobborah. On the other side it principally goes to Mudgee. The bulk of our wheat comes from the Talbragar, about to the right and left hand of Cobborah. There is a great amount of farming away on the right-hand side.

Richard Rouse, junior, grazier, Biraganbil, near Gulgong, sworn, and examined:—

1838. *Mr. Hassall.*] What are you? A grazier, residing at Biraganbil, about 6 miles from Gulgong. R. Rouse,
jun.
2 April, 1898.
1839. You have an intimate acquaintance with the Mudgee district? Yes; I know the country all the way from here to Coonamble almost as well as it is possible to know it. I have travelled it with stock, and have frequently ridden and driven backwards and forwards over it. My father having held properties for many years situated along the survey of the proposed route from Mudgee to Coonamble, I am in a position to speak with regard to the character of the country.
1840. Will you give the Committee a description of the country from Gulgong to Cobborah, running as nearly as possible along the surveyed route, and taking a strip of country, say, 20 miles in width on each side of it that would be served by the railway? Leaving Gulgong, and crossing the Wyaldra Creek, the land on each side of the surveyed line for a great extent between here and Cobborah is fit for agricultural purposes when we get as far as the Goodaman Range. This range divides the water from the Cudgegong River and the Talbragar. The waters on this side run into the Cudgegong, and on the other side into the Talbragar. There are some belts of country—small belts—between here and Cobborah, which are not suitable for agriculture, but they contain very good timber, in the shape of ironbark, gum, and box, which would be very useful for the construction of railways; and there is a saw-mill on the Goodaman Range, from which nearly all Mudgee is supplied with hardwood.
1841. Is the land along the Goodaman range suitable for agriculture? A great deal of it is. Of course, there are some portions which are not suitable for agriculture; but the lands extending right along the surveyed line from here to Cobborah, including Tallewang, are highly suitable for cultivation, and there appears to be a desire to develop that industry in this district to a much greater extent than heretofore. We have had many applications to take land on terms such as we never had previously. During the last twelve months this has been particularly the case. There seems to be more anxiety now to take these lands for agricultural purposes.
1842. Working on what is called the share system? Yes; we have had several suggestions of that sort made to us, and we have entered into some such arrangement. There is also the Cudgebegong country. That is highly suitable for agriculture, and is being largely taken up for that purpose.
1843. What do you call the Cudgebegong country? It is on a creek known as the Cudgebegong Creek, which rises up near the Goodaman Range, and runs down into the Cudgegong River.
1844. Running parallel nearly with the surveyed route? Yes, pretty nearly so, and within a few miles.
1845. What percentage of the country lying between Gulgong and Cobborah would you say was suitable for agriculture? I should say fully one-fourth.
1846. And what would the balance be good for? Pastoral purposes.
1847. How much? I think nearly the whole of it. There are a few belts of scrub, but they are not of very great extent.
1848. What would be the extent of valueless country; I suppose there is some nearly valueless? Yes; there is some about Blackheath, coming from Cobborah, and that way.
1849. Bad scrub, infested with dogs? Well, not so badly infested with dogs. Selectors and others are able to run their sheep without shepherding them. Then at Cobborah both up and down the Talbragar there is a large extent of agricultural land which is daily being developed for agricultural purposes.
1850. River flats? They run considerably back from the river, and consist both of black and red soil.
1851. Running across further to Mundooran,—do you know that country? After leaving Cobborah you get into rather barren country but with splendid timber, including ironbark, box, and pine. The pine and ironbark are especially good.

- R. Rouse,
junr.
2 April, 1898.
1852. There is practically a portion of country lying between Cobborah and Merrygoen that would be only valuable for the timber which it contains? Yes, practically so.
1853. Then from Merrygoen on to Mundooran the country is suitable for pastoral purposes? For both pastoral and agricultural purposes (say) about one-third for agricultural and two-thirds for grazing.
1854. I presume you have occupied your properties out there principally for grazing purposes? Principally for sheep and cattle. We have recently let some areas at Cobborah on the share system and we are about to dispose of our Yarragrinn property, about 12 miles from Mundooran. The greater part of the land about there has been alienated from the Crown; I think it would be highly suitable for agriculture.
1855. That country is practically the country lying on the western slope of the Warrumbungles? Yes.
1856. With a gradual fall to the west? Quite so. Some small crops that we have grown there have been highly satisfactory. There has been got as much as 40 bushels to the acre on parts of that country.
1857. How much of that land about Yarragrinn do you think would be suitable for agriculture—thousands of acres? Yes. In one block near Yarragrinn, with a few exceptions, I think we could get from 30,000 to 40,000 acres. Most of that has been alienated from the Crown. The 72,000 acres of land which we held on Yarragrinn under occupation license has all been alienated in the form of settlement leases with the exception of 14,000 or 15,000 acres.
1858. It is probable that extensive agricultural operations will be carried on there, the soil being so suitable? I think the soil is very suitable, but in the hands of those to whom it has passed I do not think it will be devoted to agriculture.
1859. Is there not a possibility of their finding out that agriculture pays better than grazing? I should think so.
1860. From your own experience you seem to think that agriculture will be a more profitable occupation than sheep-farming? I have no doubt of it, especially after having obtained such information as I have done from Mr. Mack and several others in the Dubbo district as to the amount of revenue they receive from land let on the share system.
1861. So that there is every possibility of an enormous area of land being put under cultivation? I should think so. It is only reasonable to suppose so.
1862. It is only natural to suppose that if the occupiers of land in suitable positions found that by cultivation they could very largely increase their annual income they would make every effort to do so? Quite so.
1863. In that case the market which you in Gulgong now have in the north and north-west country might be taken away from you by residents nearer to that market? I do not think that is at all improbable, and that they may supply Mudgee with grain, and also Coonamble and Walgett. We have only recently sold Wallumbrawang. This property consists of about 3,000 acres, and we sold it to Mr. James Yeo, of Cobborah. I was not aware, until Mr. Yeo placed a memo. in my hand just now, that he was likely to go in for agriculture there, but the land is highly suitable for that purpose. Out of the 3,000 acres I do not think there are 100 acres of bad land. This property is 12 miles further on than Yarragrinn, and consequently nearer to Coonamble. It is on the slope of the Warrumbungle. I may add that below Cobborah, on the Talbragar River, and Sandy Creek, there is a large area of agricultural land which is being well developed. Passing on from Wallumbrawang, you go by Toorawhena, and further on to Tondaberine *en route* to Coonamble. All that country is chiefly black soil. You get on to plains. You leave the Warrumbungles behind you, and pass on to Coonamble.
1864. Through first-class pastoral country? Yes, all good country.
1865. Excellent fattening country? Quite so, and I think that under favourable circumstances, say by irrigation, you could grow anything there. It is generally admitted that the black soil will grow anything so long as you have sufficient moisture.
1866. Does your wool go to Mudgee? Yes.
1867. What do you pay from the furthest out-station for carriage? Our furthest out-station is Yarragrinn, and we pay from £2 10s. to £3 a ton.
1868. Coming nearer to Cobborah? We pay about £1 from Cobborah.
1869. And from Gulgong to Mudgee, I presume you pay the ruling rate? Yes; about 7s. 6d. a ton. Very often, when we have no return loading from Mudgee, we pay 10s.; but when we have loading both ways for the teams we pay 10s. one way, and 5s. the other, making an average of 7s. 6d.
1870. Having heard the evidence given by Mr. Young;—can you, from your knowledge of the district, and your long residence here, corroborate that evidence in every material respect? Yes; in every material respect I think Mr. Young is right.
1871. You think there is a great future for this district with regard to agriculture, on account of the soil and climate being favourable? Yes, I think so, provided we have means to convey our grain to market. Without that our district will be isolated.
1872. How far could you carry grain by road profitably;—what would be the furthest distance away from a railway at which you could grow grain, and carry on farming operations? It would depend upon circumstances. In some years, when grain has failed in other portions of the Colony, and prices are more remunerative, it would pay to carry a longer distance, and so on.
1873. If a line were constructed through the country you describe, would it serve the land 20 miles on either side of it? Yes, I think so. I think it would serve the country for a distance of fully 30 miles on each side.
1874. You think they could carry on farming operations? I think under favourable circumstances they could. I endorse the statement of Mr. Young, that our average rainfall is from 24 to 25 inches. We have never suffered in this district from the extreme drought to which many other localities are subject. In the very worst of seasons, when we have had our stock dying outside through starvation, we have been able to bring in a considerable number of them to this district, and maintain not only those already on the country, but a good many others. This country does not cut up as much as the country further west. It is not as rich, but it stands better. It is not as fattening, but it is a healthy sound country. We do not suffer from fluke, or anything of that sort.
1875. The country does not suffer from drought in anything like the way the north-western country does? No, nothing like that. We have owned stations down on the Macquarie and on the Barwon, and we have suffered very much more from drought there than we have ever done here.
1876. In fact, as far as the Mudgee district is concerned, you hardly know what drought means? Nothing like

- like what we have experienced at Warren. We had a station on the opposite side of the river to Warren, and we experienced very much greater droughts there, and also on the Barwon, than we have ever done here. In reference to the question of railway extension and the advisability of opening up the country between the north-west and western lines, with a distance of about 100 miles between the two, if that country were intersected, it would tend to make the Mudgee line pay, instead of being the white elephant it now is.
1877. The objective point is Coonamble. You know the district, and you think it is entitled to railway communication from its present importance, and its possible future development? I quite think so.
1878. Do not you think that even in the event of no agriculture being carried on in the vicinity of Coonamble it would almost pay to run a light line of railway there for pastoral products alone? I do.
1879. The Coonamble district and the country beyond is wonderfully good fattening country? You could not get better.
1880. I presume the bulk of the fat stock sent away comes to Mudgee to be trucked? Yes, to Mudgee and Rylstone. They leave Mudgee to the right and go on to Rylstone.
1881. So that this is practically the stock route for the whole of that north and north-western country? Yes.
1882. They prefer to come here rather than go to Dubbo? They have a longer trainage journey from Dubbo, and the lines have not been fenced off through this district to such an extent, and they have a better chance of getting the stock to the trucks in good condition.

R. Rouse,
jun.
2 April, 1898.

George Steele, sergeant of police, Gulgong, sworn, and examined:—

1883. *Mr. Roberts.*] What are you? Sergeant of police in charge of the Gulgong district.
1884. Over what area of country do you patrol? About 15 miles in a north and westerly direction from here, about 10 miles in a southerly direction, and about 15 miles easterly.
1885. How long have you been stationed here? About eleven years.
1886. You have an intimate knowledge of the district and the people? Yes.
1887. Do you regard it as a progressive district? Yes.
1888. The people are doing fairly well? Fairly well.
1889. Do you think it would be in the interests of the State to make a railway from Mudgee to Coonamble, or, if not to Coonamble, to some other point in a north-westerly direction;—have you any evidence to offer on that point? I know the country pretty well all the way to Coonamble, and I know there is a vast extent of country between here and Coonamble that is fit for agricultural as well as pastoral purposes. I lived at Mundooran for a few months, and I was a couple of years at Coonabarabran.
1890. What is the country like between Mundooran and Coonabarabran? There is some very fine agricultural country all along the Castlereagh from Mundooran up to Coonabarabran and to the Warrumbungles.
1891. Is it wide, or confined to the banks of the river? Out from the river a considerable distance there is good agricultural country. The Warrumbungle Mountains are some distance off the river. Yarragrin is about 12 miles away from the river, and Curban is the same distance further on in the direction of Coonabarabran.
1892. Have you any point in your mind's eye where this line ought to go to from Mudgee;—say it came from Mudgee to Gulgong, to what point do you think it should be taken in order to serve a large agricultural population? I think it should go through Tallewang, cross the Talbragar near Cobborah, and thence, *via* Mundooran, to Coonamble. I think that is the best route the line could take in the interests of the country generally.
1893. I suppose the traffic by team from Coonamble to Mudgee goes through Gulgong? Yes; but there is not much team traffic now from that direction, as Dubbo is nearer. Most of it goes to Dubbo.
1894. Where would Dubbo cease to have an effect upon the traffic of the West? At Mundooran. I think from Mundooran the trade would come on to Gulgong and Mudgee.
1895. Would you suggest a line from Mudgee to Mundooran;—would that meet the case from your point of view? Yes; but not to stop at Mundooran.
1896. You think it ought to go on to Coonamble? I think so. You could carry a line from Mundooran to Coonamble through good country, a great deal of it being Crown lands.
1897. Is there much traffic to Mudgee from Coonabarabran? No; the traffic from Coonabarabran goes to Gunnedah or Quirindi.
1898. Do you know the country between Warren and Coonamble and between Dubbo and Coonamble? Yes; I have travelled over that country.
1899. How long ago? Eighteen years ago.
1900. Are you able to speak as to the settlement or the class of country? From Gilgandra to Dubbo I do not think the country is particularly good. It is ironbark country and oak country, if my memory serves me right.
1901. With regard to the mining prospects of Gulgong, can you tell the Committee whether the production of gold has increased during the last few years? It has increased. There was a very large increase last year over the year before, and the year before that over the previous year. I can give fairly accurate returns in reference to mining.
1902. Is the mining development at Gulgong improving every year? Yes. Up to the end of 1897 it has improved very much.
1903. Is much capital brought here? I understand that one gentleman brought capital to the extent of £20,000, and a lot of money has been expended by a company who have obtained good machinery to work wet ground. There is another mining venture just started, called the Shellback, and some machinery has been landed on the ground. Mr. Thompson, of this town, has floated the Happy Valley Company, and has just landed a battery on the ground for the purpose of crushing; they have tried to develop quartz reefs. Hitherto the mining has been principally alluvial, but now they are turning their attention to quartz.
1904. Is the increase in the annual yield of gold owing to new ground being opened or to the further development of old claims? Last year and the year before there was some new ground opened. A rush down the river at Yamble produced a fair quantity of gold.

G. Steele.
2 April, 1898.

1905.

- G. Steele.
2 April, 1898.
1905. Is Gulgong languishing for the want of capital to develop its mining resources? Yes, I think so. I believe there are properties about Gulgong that would pay if we could get capital to develop them.
1906. For what purpose? Quartz-reefing. They have found gold in quartz, lately, associated with pyrites, rather refractory to deal with.
1907. Have any reports been obtained as to the character of these refractory ores? Some parcels have been sent away for assay and have returned 2 ounces or thereabouts to the ton. Other stone that I have seen I am quite certain would yield a better return than that.
1908. Is it the opinion of persons on the field qualified to speak on the subject, that Gulgong would make rapid strides in mining if a large amount of capital came to the rescue? Yes; that is the view of those qualified to express an opinion.
1909. Are the majority of the mines dividend-paying;—are they owned by joint-stock companies or syndicates, or are they owned individually? Just now there is only one company at work—the Star Company—that has had any return. The others—the Shellback and the Happy Valley—are only just about starting, and have had no opportunity of proving whether the mines are payable or not.
1910. Are there any mines at all on Gulgong that are dividend-paying? There are no public companies.
1911. Have you reason to believe that those who own these mines are being remunerated in a satisfactory way for their labour and capital? The only company that has worked has not been remunerative.
1912. Is there only one mine that is regarded as what I might term first-class? There is only one in working order—that is one that has been any time at work. There are others just starting. They have never paid a dividend, and are working now in deep ground, at a depth of 180 feet. That is the lowest depth at which gold has been found at Gulgong.
1913. What other mines are there that help to make up the annual increase in the production of gold? There have been several claims at Helvetia.
1914. What course ought to be pursued with the view of extracting gold from this refractory ore;—I mean is it merely a question of want of capital, or is the *modus operandi* sufficiently clear for you to say that if capital were forthcoming you feel satisfied the annual production of gold would show a marked increase? With regard to the refractory ore to which I have referred the gold could be extracted by machinery similar to that at work at Mitchell's Creek, because I understand the stone is similar, except that the stone here shows free gold, and at Mitchell's Creek it does not.
1915. Do they deal with it successfully at Mitchell's Creek? Yes.
1916. Would it involve the purchase of expensive machinery to deal with this ore? Yes; it would have to be done by the cyanide process, I understand.
1917. How many ounces of gold to the ton of quartz are obtained with the improved machinery at Mitchell's Creek? I am informed that the return is from 1 to 2 ounces; but I do not know of my own knowledge. The stone previously found here was not refractory.
1918. Can you say how many ounces of gold per ton will pay? I think that depends on the quantity of stone.
1919. Do you regard yourself as an authority on mining matters? No.
1920. What is the exact distance between Gulgong and Mudgee? About $17\frac{1}{2}$ miles.
1921. Is there much cultivation between here and Mudgee? Yes, in the direction of the Canadian there is cultivation all the way to Mudgee. That is one road, the distance by which is 18 miles.
1922. How far after leaving Gulgong does the cultivation commence in the direction of Mudgee? The cultivation is right up to the town, or less than a mile out.
1923. If a railway were built from Mudgee to Gulgong do you think the people along the road between Mudgee and Gulgong would make use of it? Yes; I think so.
1924. Would not a railway from Mudgee have to go in the direction of Cobborah and on to Dubbo and Coonamble to be of any great service to Gulgong? Yes, I should say it would; it would have to go west or north-west.
1925. A railway coming from Mudgee to Gulgong, and no further, would be of no great value to the Gulgong people? No; it would make a difference of 17 miles; that is all.
1926. All the local produce that comes from Gulgong comes from the direction of Cobborah? The greater portion of it. Of course, it would improve Gulgong considerably if the railway came this far, and if this were the terminus.
1927. But it would be no good for the farming population at Gulgong unless it went a considerable distance in a north-westerly direction? It would serve the purpose much better by going north and north-west. I hand in the following statistics with regard to wheat cultivation and mining:—

TABLE showing the area under wheat, and the yield for the years 1895, 1896, and 1897, within a radius of about 12 miles from Gulgong:—

Years.	Area under wheat for grain.	Yield.
1895.....	1,740 acres	13,849 bushels.
1896.....	3,044 "	34,000 "
1897.....	3,525 "	52,875 "

MINING Business transacted at Gulgong, and gold won during the years 1894, 1895, 1896, 1897.

Years.	Number of Miners' Rights issued.	Number of Gold Leases applied for.	Area of Leases.	Gold won.
			acres.	oz.
1894.....	237.....	10.....	76.....	1,436
1895.....	385.....	4.....	22.....	2,298
1896.....	487.....	54.....	425.....	4,000
1897.....	653.....	30.....	212.....	7,000

The approximate population of district is about 3,000. There are several thousand acres of private and Crown lands about Gulgong suitable for agricultural purposes, still in its virgin condition. The prospects for the profitable development of mining are very encouraging.

Edward

Edward McCulloch, Council Clerk, Gulgong, sworn, and examined:—

1928. *Chairman.*] You hand in some statistics with regard to the population of the district and other matters showing its development? Yes; they are as follows:—

E.
McCulloch.
2 April, 1898.

MUNICIPAL DISTRICT OF GULGONG.

Parishes of Gulgong and Guntawang, county of Phillip, area 20,480 acres. Incorporated February 6th, 1876. Approximate population, 2,000. Dwellings, about 500. General rate only of 1s. Fair average annual rental of improved land with buildings thereon, £8,500. Capital value of all ratable property, £200,000. Roads and streets, about 60 miles, of which over 40 miles are metalled.

Statistics as to live stock, yield of grain, and area of land owned, these are collected by the police, who will furnish them, the municipal district being included in the police district.

As one of the council's valuers for some years past, I can state that each year the assessment increases. Wooden buildings will soon be a thing of the past. I have regularly attended the land sales here, at which the bidding was spirited; and at the last auction sale, in July, 1897, the few pieces not bid for were secured after auction under the 1895 Act. During the past year or so thirty homestead selections have been taken up within the municipal boundaries, which, besides the town, includes Guntawang, Canadian Lead, and Springfield. On the road from Gulgong through Canadian there are 6 miles of farms on each side of the road.

John Tuxford, Mayor of Gulgong, sworn, and examined:—

1929. *Mr. Hassall.*] You have been a resident of the district for a considerable number of years? For about twenty-four years. J. Tuxford.
2 April, 1898.

1930. Were you in the town of Gulgong when evidence was taken by a Sectional Committee inquiring into a proposed railway from Mudgee to Gulgong in 1890? Yes.

1931. On this occasion you have heard the evidence given by Mr. Young, Mr. Rouse, and Sergeant Steele; can you, from your own knowledge of the district, corroborate the statements that have been made by these gentlemen? I certainly can.

1932. You can swear that, to the best of your knowledge and belief, the statements are reliable and truthful, and give a correct idea of the district and its surroundings, and also its suitability for agricultural purposes, and in comparison with pastoral pursuits? Yes.

1933. You are perfectly satisfied with the prospects the district holds out? Quite satisfied.

1934. Not only to yourself, but also to others who come to reside in it? Yes, I am quite satisfied.

MONDAY, 4 APRIL, 1898.

[The Sectional Committee met at the Court House, Mudgee, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Warren to Coonamble.

The Hon. George Henry Cox, M.L.C., sworn, and examined:—

1935. *Chairman.*] You are a Member of the Legislative Council of New South Wales? Yes.

1936. Would you like to make a statement? Many years ago, when the Mudgee people were agitating for a railway, their proposal was that a line should be made from Wallerawang to Walgett, and they ignored the idea that it was a mere branch line. They contended that it was a main trunk line—no doubt branching off from another main line, but a trunk line to connect with the great north-west. The Bourke line was supposed to be the Western line. After some considerable trouble which we had with the Government they at last authorised the construction of the line. The estimated cost from Wallerawang to Mudgee was £680,000. On observing the route, they found that they could not get down very readily into the Mudgee Valley; so instead of coming direct to Mudgee by the coach road, which would have been much the shorter line, they turned off at this side of a hill, called Cherry-tree Hill, to go to Rylstone, making a turn almost at right-angles, and increasing the length of the line. When we saw the plan we suggested that it seemed to be an extraordinary thing to make this great angle. Why could they not go by a more direct route. We saw Mr. Whitton, and he said it seemed possible, and proposed another route. He accordingly sent the surveyors up again, and, unfortunately for us, they did get across this angle; but they went into the valley of Capertee, and thus commenced all the trouble. Whatever was the cause and who was to blame we do not know, but in the new specifications drawn up for the construction of the line there was a remarkable omission. This line over the Capertee Valley crossed a series of little hollows, just under the rocky wall of the mountains. The formation was a jumble of rock, clay, sand, and gravel all mixed together, and falling over the mountain side at an angle of about 45 degrees. There was a series of little ridges and gullies. The specifications stated that these rocks, or solid matter, had to be pierced through and the valleys had to be filled up from the cuttings through the hills. Unfortunately they forgot to put in the specification any provision for culverts, and the contractor had merely to cut through one hill and fill up the next valley, and so on. It would have been a series of dams between each of these hills. It was discovered that they had made some blunder, but the man had already taken the contract, and consequently he had got the Commissioners "on toast," and could do what he liked. That caused very great expense. Then these so-called hills supposed to be rock, were tested. They were to a certain extent rock. They were not soil, but instead of being solid rock they were just a conglomerate of rock, sand, gravel, and rubbish. The cuttings were to be perpendicular, but it was found that they would not stand if perpendicular, and the contractor had to make the usual slope. But the usual slope was no use, a much greater slope was necessary. It was like tilting over a load of sand on the street—you take away a portion of the sand and down comes the other sand to fill up the place. So with this. When wet weather came, no sooner did you cut the foot of the slope, than the earth slipped in and filled up the space again. That went on for some time, and various other mishaps occurred. The consequence was that, instead of this railway costing £680,000 it cost over £1,200,000. We are losing about £20,000 a year by this railway. But that loss is attributable

Hon. G. H.
Cox, M.L.C.
4 April, 1898.

Hon. G. H.
Cox, M.L.C.
4 April, 1898.

attributable to the fact that this extra expense was incurred. If the railway had been constructed at the original cost it would have been a paying line. But when you have spent £500,000 or £600,000 more than you ought to have done, that amount at 4 per cent. makes up the £20,000 for which we are deficient. So that we are actually losing money in consequence of the extraordinary expenditure that took place on this line, only 84 miles in extent. It was a cruel thing to do, because it has given the Mudgee railway a bad name, and for a long time it was a losing concern. The expense incurred in removing the slips in this wretched piece of country was something enormous.

1937. Do you regard the half a million extra expenditure as attributable to ignorant engineering? Yes, absolutely. Since then the line has been made suitable, and it is now, I think, thoroughly good. I do not think there will be any danger in the future. The Commissioners are fully satisfied that the line is not likely to cause any expense in the future. I need not dwell at any length on the evidence I now wish to give, because it is pretty well all down in Mr. Jones' very exhaustive report. But there are one or two matters to which I should like to draw attention. On page 2 of his report Mr. Jones states:—

The most valuable factor, however, for consideration is the enhanced value given to all unalienated land within a reasonable distance of a railway—entirely due to the speedy and valuable transit facilities afforded by the latter. Why should persons on the usual conditions obtain land, the value of which is often doubled or trebled by the existence of a railway, and the State be expected to make and maintain such line at a loss? I certainly think that all unalienated lands within 20 miles of pastoral railways should be valued and converted into special areas, the increased amount over the payment that would be received were the line non-existent could be easily ascertained, and, if deemed advisable, credited to the cost of constructing the railway. This is no new idea, as may be seen by the following extract from the Railway Commissioners' Report, dated December, 1888:—

In connection with the Grafton to the Tweed Railway, the Commissioners reported as to the necessity of retaining unalienated lands for the purpose of writing off a certain amount of the capital spent upon the railways. I think it is an exceedingly desirable plan to adopt, but, unfortunately, the suggestion of the Commissioners has not yet been carried out. I think it would be most desirable to impress this matter again and again upon the Government, pointing out the necessity of the adoption of the plan proposed. When we make railways at great expense, and the country benefits by the increased value given to its land, those lands ought to be used in reduction of the expenditure upon the railways. Then, again, there is another remark in Mr. Jones' report which is applicable to all the roads now being constructed in the far western country. I refer to the last paragraph on page 2, in which he speaks about the black soil. The Members of the Sectional Committee must be quite aware, from the experience gained in their various trips to different parts of the country, that it is easier and cheaper to make a railway over black soil than it is to make a road. There is no metal available in this black soil country, and it is almost impossible to make a road, and even if it were possible, the expense of maintaining the road would be so great that a railway would be cheaper, besides which, of course, we get a revenue from a railway but get no revenue from a road. On page 8, we come to Mr. Jones' report on the Mudgee to Walgett railway:—"Length, 210 miles; estimated cost, £943,300." A more recent estimate has been made which, I think, has reduced that amount by about one-half. If I do not mistake, the amount now set down for that line is about £628,000. I wish to draw particular attention to the figures given in this report. It was drawn up in the year 1891, and since then there has been a considerable increase in the various items, and especially in regard to the land under cultivation. On page 10, I find, "The total trafficable area includes 12,473,887 acres, of which 9,473,720 acres remain unalienated." The area of the land under cultivation is given at 6,000 acres, but in the last seven years I am quite sure this has increased at least 50 per cent. Then we have the population set down at 15,777, and with regard to the stock traffic, we have 55,000 cattle, and, say, 5,000,000 sheep. I daresay there is some little discrepancy as regards these latter figures, because, instead of an increase, I am sorry to say they are now somewhat reduced. Then, as to the distribution of traffic, Mr. Jones says:—

At present the traffic from the district through which this line passes is distributed as follows:—The first 100 miles—to Mudgee; Coonabarabran and Baradine districts—to Gunnedah.

I wish to make a remark here as to the country between Coonabarabran and Baradine. That traffic does not go to Gunnedah. From 30 miles beyond Coonabarabran the traffic comes here. There are two large stations—Goorianawa and Calga. All the wool from these stations comes to Mudgee, a distance of 170 miles, in preference to going to Narrabri, a distance of 78 miles. Then Mr. Jones goes on to say, on the same page:—

In trying to form some idea of the traffic for a line to Mudgee, I find the wool tonnage for existing sheep would be 2,044 tons, to be carried an average of 50 miles; 4,613, 143 miles; and 4,994 tons from Walgett, 210 miles.

This in the aggregate, of course, means a very large trainage. I notice that in the evidence given, I think, by Mr. Harper of the Railway Department, that gentleman ignores all this traffic, and says that the traffic from Coonamble to Mudgee would be inappreciable. No doubt it would be inappreciable, because now we have these contending routes. Nevertire, Dubbo, Narromine, and various other places all receive wool from the Castlereagh River, and if a railway were carried from here to Coonamble, down the Castlereagh, it would get the whole of the traffic which is now to a large extent diverted by the Western line. Then, in the event of the railway being extended to Walgett, it is not Walgett that we think so much about, because Walgett itself is only a poor place, but it is the centre of a very large trade on to the north-west towards the Queensland border. There is some of the finest pastoral country in Australia beyond Walgett, on the flats of the various rivers which come down from the Condamine in Queensland—the Narran, the Birie, and the Culgoa. The traffic from this country would all centre towards Walgett. At present a good deal of it goes down to Bourke, but Walgett would save a certain distance of land carriage. On page 11 we come again to the question of the increment on the 7,000,000 acres. Mr. Jones says:—

Assuming, therefore, that 7,000,000 acres will be increased in value, averaging 10 per cent. over the whole area, the sum realised would be £700,000, included in which would be the greatly enhanced price likely to be obtained for allotments in the various townships passed through and served, also the value of timber forests now almost worthless, and the sum obtained for land, which, without a railway, would never be occupied or taken up.

This bears upon my opening remarks with reference to the opinion of the Commissioners. The chief thing we wish to bring under your notice is explained a little lower down on the same page, where Mr. Jones says:—

The projected railway, as may be seen on the map attached, fairly divides the present unserved country lying between the western and north-western lines, and is the shortest and most direct route from Walgett to Sydney.

This is a matter to which we strongly urge your attention. The whole of the country from the Bogan on
one

one side, and the Namoi on the other, is now left out in the cold. It has no railway communication whatever, and it embraces an enormous and very valuable tract of country. It is only fair that the whole of the inhabitants of that very large tract of country should be served by the proposed railway to Coonamble and Walgett. Then Mr. Jones says in the next paragraph:—

Hon. G. H.
Cox, M.L.C.
4 April, 1898.

It will bring into full use the present costly line from Wallerawang to Mudgee, which has recently been improved at a large expense, and is now fitted to carry any extra traffic which may be brought on to it.

It will be seen on looking at the map how large is the extent of country that would be served by this railway. The existing Western line runs on the west side of the Bogan, and leaves the whole of the Macquarie, and the whole of the Castlereagh, and the other various creeks out in the cold; and you can easily observe what an enormous extent of country would be served by the proposed extension from Mudgee to Coonamble and Walgett. On the other hand, the railway from Warren to Coonamble would merely tap a very small portion of that country; it would leave all the better portion, the more agricultural portion, out, because between Mudgee and Coonamble is to be found the agricultural portion—beyond Coonamble the country is purely pastoral. With regard to the extensive area of plain country in the west which would be affected by a line from Warren to Coonamble, in my opinion, except in patches, where the soil becomes red, or where there is a certain class of timber growing, it is not suitable for the growth of cereals. In support of this opinion, I would point to the present state of accessible land somewhat similar on Liverpool Plains. Black soil country is not suitable for agriculture. In 1890, I happened to be a Member of the Public Works Committee, and at that time the Sectional Committee was sent up to Mudgee to enquire into a proposed extension from Mudgee to Gulgong. I did not come up to Mudgee myself, because, being a local man, I thought it desirable I should not appear; but when the Sectional Committee made their report in Sydney, I moved the following resolution, which appears on page 11 of Mr. Jones' report:—

That, in the opinion of the Committee, it is not expedient the proposed railway from Mudgee to Gulgong, as referred to the Committee by the Legislative Assembly, be carried out, they being of opinion that any extension of the Mudgee railway should form part of a more comprehensive proposal, the consideration of which should be deferred until after a suggestion for a connection of the Northern and Western systems by a line between Dubbo and Werris Creek has been dealt with.

The line between Dubbo and Werris Creek was put in the resolution because it was thought that was the proper way to word it, that line being then under discussion. My wish was to have a line from Mudgee to Coonamble or Walgett. However, that resolution was carried and the proposal to construct a railway from Mudgee to Gulgong was negatived. In speaking of the merits of the Mudgee line, I do not wish to say very much about the other lines, because it is not my place to depreciate other lines, except in a very cursory way, and I will merely state that the line between Warren and Coonamble is very subject to floods, and I believe it will cost more than the sum estimated. Although it is a very level line, you have to cross a number of creeks, as will be seen in Mr. Jones' report, the last paragraph on page 11.

Between Nevertire and Coonamble the following rivers and large creeks have to be bridged:—Beleringar and Crooked Creeks, near Warren; the Macquarie River at same; Ewenmar, Marthaguy, Merrigal, Wemabung, Bullagreen, Merri Merri, and Nedgery creeks.

So that the estimated cost of £150,000 would, I am afraid, be very far short of the actual expenditure. It is all very well to say that you can make railways on these plains. No doubt you can; but with all these various creeks and the flooded plains, the cost would be very large, and in many seasons it would be impossible for the railway to carry the traffic. It would be necessary to have no less than eleven bridges on the line. The next important question is the difference in the distance. I notice by the evidence of the railway authorities that they favour the Warren to Coonamble line, because it would cost less to the country. But they altogether ignore the fact that if that line were constructed the unfortunate people of Coonamble would have to pay for all time on an extra haulage of 80 miles. Of course the Railway Commissioners do not care how much haulage is put upon the unfortunate people—it all means money in their pockets; but is it fair to the Coonamble people to charge them some 80 miles extra haulage for the benefit of the Railway Department. I say we are not to serve the Railway Commissioners; our duty is to serve the community, and the greatest number, and I contend that the greatest number would be served, not by the Warren to Coonamble line, but by the Mudgee to Coonamble line. I do not mention anything about the Dubbo to Coonamble line, because I think that is pretty well out of the question. From what I know of it and the country it goes through, I do not think it probable that it will excite much attention. With regard to the country between Mudgee and Coonamble, the Members of the Sectional Committee have themselves seen the country between Mudgee and Cobborah. Beyond Cobborah there is a piece of country that is not first-class—certainly rather a poor piece of country—going towards Merrygoen. But when you once get on to the Castlereagh you get first-class country, although there are one or two patches even on the Castlereagh that are not first-class, but they are very very small.

1938. And from Merrygoen to Mundooran what is the country like? It is all fair country. The only really poor part is after you leave the Talbragar, when you get into some poor country, towards Merrygoen.

1939. And from Mundooran to Gilgandra? That is also rather shady country, this side of the river. The good country is on the opposite side. You get into very good country at a place called Caigan, and further on you get very good country. Of course, there are little patches here and there somewhat inferior; but taking it all together, it is really good country. One of the arguments against the railway being extended from Mudgee is that we are cutting our own throats—we are giving facilities to the people in the country round by the Warrumbungles to grow wheat in opposition to ourselves. That may be the fact; but it is a very paltry, selfish way of looking at the matter. I am a very large agriculturist here with tenants, but that does not weigh with me at all. I contend that the people who are settled out there have as much right to railway communication as have the people about Mudgee. The railway has given a great impetus to farming operations in Mudgee, and I contend that people in other districts should have the same facilities given to them, and if we cannot hold our own, so much the worse for us. At the time when Mr. Jones made his inquiry and visited the various places, the consensus of opinion was, he said, all in favour of the Mudgee to Coonamble railway. He said that at Dubbo they did not seem to care very much about it; at Coonamble there was a strongly expressed preference for the Mudgee route, and at Coonabarabran the same, and he said that at various other places which he visited they expressed a similar view. Again, on page 22 he says "At Warren little interest appears to be taken

Hon. G. H. Cox, M.L.C.
4 April, 1898.

in the railway proposals." In giving his conclusions, Mr. Jones, in paragraph 6, expresses his opinion very freely, and evidently he had quite made up his mind on the matter. If you look at what he says in that paragraph you will see that he had reason for the very decided views he adopted. In paragraph 7 he lays particular stress upon the fact that a line from Mudgee to Walgett—

Will divide almost equally the unreserved country, so that on either side nearly all will be within the influence of existing or proposed railways.

Will serve a present population of nearly 16,000.

Will pass through the following important towns—Gulgong, Coonamble, and Walgett, while Coonabarabran will be well served, also many other smaller townships, and the rising mining centre of Stuart Town.

Will develop the important agricultural resources of Gulgong, the Talbragar Valley, Warrumbungles, and Coonabarabran.

Will have a large fat-stock traffic, embracing as it does within its influence close upon 5,000,000 sheep, exclusive of any from Queensland; and as the Mudgee line is the shortest and most direct route to Sydney, it is not too much to assert that it would be taken advantage of more so than any of the other projects, all of which have a longer mileage to the metropolis.

Includes within its trafficable sphere about 12,000,000 acres, of which 9,000,000 are still unalienated.

I may mention that the railway from Wallerawang to Mudgee has but one train a day, and, unfortunately (Mudgee occupying only a confined area), we are not able to extend the traffic, which, of course, is to the detriment of the railway and the whole community. If the line could carry two or three trains a day, which it would do if it were extended on towards Coonamble, it would become a paying railway. As I have already said, it would be paying now but for the unfortunate expenditure originally occurred through official blundering. But if, having only one train a day, the railway pays to a certain extent, how would it pay if it had only cost what it ought to have cost, and if we had three or four trains a day instead of one. If you will look at the Appendix relating to population and cultivation on page 30, you will see that the Mudgee line would serve a population of 16,000 people, and on page 31 you will find that within the sphere of the proposed railway there are 2,203 school children, that number being infinitely in excess of the number of school children on any of the other proposed routes. These figures were compiled six or seven years ago, and, of course, the population is a great deal larger now.

1940. *Mr. Roberts.*] Which would be the nearest station on the Western line to tap Mudgee—Wellington or Dubbo? Wellington. It is only 60 miles from Mudgee to Wellington, but it is 90 miles to Dubbo.

1941. Are the people settled on the country through which a line to either of these places would pass equally favourable to railway communication, or do you think one route would be better than the other? I think both these towns of Wellington and Dubbo are anxious to be connected with the Northern line. I do not think they care twopence about this line. I think their great idea is to be connected with the Northern line. There is great rivalry between Wellington and Dubbo to be connected with Werris Creek; anything else they look upon as immaterial.

1942. In the event of the Mudgee to Coonamble line not being constructed, would it be of any great advantage to Mudgee to be connected with Dubbo or Wellington? No; we should then prefer to be connected with the line that would connect the Western with the Northern line. That would be about Cobborah. It would be hardly worth our while to be connected with either Dubbo or Wellington; but, in the event of our not getting a railway to Coonamble, it would be very desirable that we should be connected with a line that would connect the Northern with the Western system. I may mention one fact to show the necessity of railway communication. Sydney, of course, is the great centre, but Sydney would not be our best market. In the year 1888 there was a very great drought through the whole country, and the interior suffered very seriously. It so happened that that year we had very fair crops and large crops of hay. Coonamble, of course, was suffering from the drought terribly. Hay at Coonamble was fetching £20 a ton, and in Mudgee it was only 30s. a ton, and we could not send it to Coonamble. The intervening country was a mere desert, and it was not possible to send our surplus produce to Coonamble; so that district would be a grand market for us as well as Sydney. We should have two markets instead of one, and although they can grow crops about the neighbourhood of the Warrumbungles—no doubt, they have a better rainfall than we have even here—yet it would only be a fair competition. We can compete with them, and if they can beat us, so much the worse for us.

1943. How far would the line from Mudgee have to go to tap most of the agricultural lands? In the neighbourhood of Mundooran and Coonabarabran; that is the best country for agriculture. They have a fine rainfall there, and although the country about Coonabarabran is very poor there are some parts very good. Some of the river flats there are remarkably good, and would grow anything in the world, and there are a large number of people in that neighbourhood. With a good rainfall, people can live on a small area, but in the great western interior a man cannot live unless he has a very large area.

Robert Jones, Esq., M.P., sworn, and examined:—

R. Jones, Esq., M.P.
4 April, 1898.

1944. *Chairman.*] You represent the Electorate of Mudgee in the Legislative Assembly? Yes.

1945. You have heard Mr. Cox's evidence;—would you like to make a statement? In reference to the railway from Wallerawang to Mudgee, the line was constructed in two sections—first, to Capertee, and then from Capertee to Mudgee. The deviation, as I call it, that was taken from the originally-intended line from Capertee made the line for that 50 odd miles 11 miles longer than it would have been had it been taken from Capertee by the direct road over Cherry-tree Hill, where, I am thoroughly satisfied, knowing the country, there would have been a much sounder and better line. Cherry-tree Hill is on the southern side of the present line. For all time there are 11 miles extra construction and maintenance, which, in my opinion, is a very important item, besides having to encounter the difficulties that were met between Capertee and Ilford station. The heaviest grades on the line are from Brogan's Creek to Capertee, so that they did not ease the gradients nor did they get a better line, but, in my opinion, a very much worse one. This has since been proved, and the line was a great source of expense, until the Railway Commissioners at last determined to alter it, and they put the line out as much as 2 chains in places from the original line. Instead of keeping to the foot of the hills, where the rock was in a sliding position, and where the line cut through the toes of the hills, they kept away out from it altogether and made a new line, and they have never had any trouble since. The Commissioners in their evidence admit that the line will now carry any extra traffic that may be brought on to it. If it will carry one train a day, I take it, it will carry five.

1946. Is the annual loss of £20,000 a year the average loss since the line was opened? No; it has been as high as £33,000. 1947.

1947. Are you able to say whether the loss is annually decreasing? It has decreased very materially, and it is annually decreasing. It is now £20,000 odd as against £30,000 odd formerly. Had the line been brought over Cherry-tree Hill direct from Capertee, though it would not have gone through as good country, a great deal would have been saved by reason of its running through Crown lands, whereas on the route through which it was taken a great deal of the land was private-land, requiring compensation for resumptions and severance.

R. Jones,
Esq., M.P.
4 April, 1898.

1948. Of what does the extra traffic consist that has caused the annual loss on the line to decrease; has more settlement taken place? Yes; there is very much more settlement. When the line was first constructed there was very little agriculture beyond Mudgee. Nine or 10 miles beyond Mudgee agriculture was very little known when the line came here first. Our greatest area of agricultural land was about Gulgong and Tallewang. But they are now cultivating further west from Cobborah; they are going right up on the Warrumbungle Mountains and to Curban. This traffic comes down to Mudgee. They are growing wheat there now extensively. A line from Mudgee going north-west would serve a population estimated by Mr. R. E. Jones in his report at nearly 16,000, including Walgett, and that population has increased considerably since Mr. Jones made his report. The railway would go through the rising and important town of Gulgong, the population of which is increasing. It is a settled population, an agricultural population, and not a mining and migratory population such as existed there some years ago, although a good deal of gold is still being obtained there.

1949. Is not the mining industry at Gulgong languishing somewhat for want of capital? They have entered upon a new era in mining at Gulgong. The field was supposed to be worked out some years ago, but recently reefs have been found which I think will turn out more gold than the alluvial ground ever did. They have had crushings which have gone as high as 50 oz. to the ton.

1950. What is supposed to be a fair average crushing? It is merely in its infancy. They have just one reefing mine going there. They have got a great deal of gold there lately, and apparently the lode is of enormous width—it is yards and not feet wide. The ore is refractory, and they will have to adopt the latest scientific mode of extracting the gold. I have no doubt from what I have seen personally that Gulgong will come again as a gold-field, and produce more gold than it has ever done before.

1951. You are of opinion that any extension of the Mudgee line should go through Gulgong? I am of opinion that it should serve Gulgong and go beyond there; the route it would take, I imagine, would be south and west of Gulgong—of course going to Gulgong.

1952. What you wish to recommend is that it should go all the way to Coonamble? Yes. I do not think it would be a proper thing to construct it piece-meal. I reckon that the railway has only just tapped the commencement of the good country—the best country, such as the Burrundeula flats—than which there is no better in the Colony.

1953. You claim that if a line be constructed from Mudgee to Coonamble, not only will a large agricultural settlement take place, but an admirable market for the produce of the Mudgee district will be found in and around Coonamble? Yes. At times starvation prices have been known to prevail at Coonamble. I have myself paid in Coonamble £20 a ton for chaff, and 20s. a bushel for grain. I had a contract to build a bridge over the Castlereagh, and it cost me £600 odd to feed one team, and at the same time I bought the same class of horse feed in Mudgee for £6 a ton, and grain at 6s. a bushel.

1954. You would look upon the north-west country—Coonamble and beyond that place—as a market? Certainly; they cannot grow wheat on the salt-bush plains. One reason is that wherever you sink for water you invariably get salt water. I have known stations to sink as many as eight or ten wells, one after the other, and get salt water in every one of them. In Coonamble they got salt water. They had to dam it back and go deeper till they got fresh water. In all these plain countries, when the water is first tapped, it is unfit for human consumption. Stock will use it after it has been drawn away for a time, but human beings cannot use it—it is too brackish and salty. This will show that the soil there would kill any vegetation foreign to its nature. I have seen gardens in which, no matter what the rainfall was, or how much water was available, everything would perish. This occurs on the Barwon, the Castlereagh, the Macquarie, and all those rivers.

1955. You heard Mr. Cox describe the class of country between Mudgee and Coonamble; do you agree with what he said? I think the country is even better than as described by Mr. Cox. It is very much better in places.

1956. Will you describe the country from Mudgee to Gulgong, and on to Cobborah, Mundooran, and Collarendabri? From here to Gulgong there is some very good land, especially between here and Slasher's Flat. The country is exceptionally good on the right hand side along by Spring Vale to Gulgong. At Wilbertree, Canadian, and Home Rule, some of the very best land you will find anywhere exists. That brings you close to Gulgong.

1957. The country is undulating, is it not? Yes; there are no ridges of any consequence. It is on these sidings where heavy rich red soil exists that the very best wheat is grown in this district.

1958. Would it be well adapted for vine-growing? None better. Some very fine vineyards, planted within the last ten years, are growing on some of this soil. Mr. Lewis Roth, Mr. John Worth, and Mr. Snelson are all vine-growers, and make wine extensively. They send the wine to Sydney, and some of it has taken first prize. A great deal of this wine goes back Coonamble way, besides being supplied to the surrounding districts. It can be sold as fast as it is made. Then, at Tallewang, the land is exceptionally good. You encounter then a little bit of rougher country, but you again drop on to the valley of the Talbragar, and you get exceptionally good land there. It would be a difficult matter to find better land than that about Redbank, Denison Town, Pine Ridge, and down the Talbragar for a considerable distance.

1959. Can you tell us anything about the mining at Stringybark? Stringybark is handicapped very much. It is thought by the miners that it will develop into a gold-field, but they have been handicapped very much for want of water. There has not been sufficient water to enable them to carry on mining operations as they might otherwise do.

1960. How many miners are now located at Stringybark? The number varies very much. I understand that there are about 500 people there at present, or there were a short time ago. They are a very migratory population just there, on account of the difficulty about water, for although the Government sunk a tank for them, it has not been a very great service.

1961. Are they all making good wages? I do not think I could say that. It is really a prospecting field so far; but a good deal of gold has been got at what is known as Upper Tallewang. Besides serving the town

R. Jones,
Esq., M.P.
4 April, 1898.

town of Gulgong, the line would go through Cobborah and Mundooran. The land around Cobborah is very good wheat land. Thousands of acres of it would grow very good wheat. This is a class of country which extends on to Mundooran. In addition to the town of Gulgong, the line would serve centres of population which you can hardly call towns, but where close settlement has set in, such as Tallewang, Merrygoen, and Redbank. It would also serve the township of Denison Town, Coolah, Coonabarabran, and Baradine—these would be on the north of the line. I have a list of stations the traffic of which would come by the proposed railway to Mudgee, to which place it now comes by road, notwithstanding all the disadvantages. The stations are Biragambil, Weetalibah, Ulindah, Pine Ridge, Binnia, Goorinawa, Gummin Gummin, Logan Downs, Tenandra, Cobborah, Oakey Creek, Biamble, Yarragrinn, Gundare, Baradine, Toorawheena, Tucklan, Browie, Belar, Kanoona, Cullengoral, Mundooran, Bourbah, and Coonabarabran.

1962. Have you prepared any figures, showing the possibility of the line paying if constructed? I have read the report of the Railway Commissioners, which is adverse to this line as far as figures are concerned. They seem to have placed their whole reliance upon a line from Warren to Coonamble.

1963. At present you are cut off from a valuable market in a north-westerly direction? Yes.

1964. You are aware that the estimated cost of a line from Mudgee to Coonamble is £1,000 a mile more than the cost of either of the other lines;—is not this excessive cost owing to the undulating character of the country as you approach Mudgee? I do not think that is a correct estimate, with due respect to those who made it. I think they have very much understated the cost of constructing the Warren to Coonamble line. Mr. Cox in his evidence said that on this line nine bridges would be necessary; but, as a matter of fact, there are eleven bridges, nearly every one being exceptionally heavy.

1965. Do you know that country? Yes; I have travelled over it repeatedly. I have driven stock over it, and know it well, and I have no hesitation in saying that at times it would not be trafficable, either for a railway or anything else.

1966. Do you regard it as a flooded country? It is a flooded country, and the Macquarie and the Castlereagh, which would have to be bridged, are big rivers. Then the Merri Merri will take as big a bridge as either of these two rivers.

1967. Do you regard the Warren to Coonamble country as purely pastoral? I do not think it would be suitable for anything else; I do not think it would grow cereals. It is naturally a salty country; myall and budda timber on it as well as salt-bush. It is a style of country on which I never knew cereals to grow. Very little vegetation will grow on it except what is indigenous.

1968. Have you had experience in farming? Yes; I was brought up on a farm and have had experience since.

1969. You feel quite justified in expressing an opinion as to the value of the land for agricultural purposes? Yes.

1970. Are the people of Mudgee and the surrounding districts unanimous with regard to the extension of that railway? No, they are not unanimous. Where personal interests are concerned, where they think it will interfere with their present calling, some say, "Better leave it as it is." But they are in a great minority. Carriers, for instance, do not want a line constructed anywhere; they desire that the traffic should be left to horses and bullocks. I am satisfied, however, that the majority of the people of the district are anxious, in the interests of the country, for an extension of the railway. Owing to the line not having been taken beyond Mudgee, we are now at a disadvantage, and are left, as it were, behind. We are back a considerable distance towards Sydney, as compared with the starting points of the other proposed routes, and this handicaps us. To reach the same destination as that of the other two lines we are handicapped by the cost of construction over a much greater length of line; but because we have been neglected in the past, I do not think that should go against us now.

1971. By this route the people of Coonamble would have to pay for less haulage, and, I suppose, you look upon that as a very important matter? Yes, it is important.

1972. Is there anything else? Apart from the fact that the line from Mudgee would open up so much good country, it will reach the best timber forest in New South Wales, not excepting the forests of the northern rivers. It will touch Wangan, Pilliga, Therenbone, Killinewi, and Urawilkie, extending right down to Bullarora. There are thousands of acres of some of the finest ironbark country in New South Wales. I have fallen bridge timber there where we have had as many as thirteen or fourteen logs touching each other in falling—all of the very best description of ironbark.

1973. Admirably adapted for sleepers? It is a pity to cut them into sleepers, they are so good.

1974. All the material required for the construction of the railway is available in that belt of country? Yes; sufficient not only for the construction of this railway, but also hundreds of miles of other railways.

1975. Could you tell the Committee anything about the resumption of land and severance? Not a great quantity of land would have to be resumed after leaving Gulgong; there are reserves all the way. After you leave Bellinfante and approach Gulgong you are on a reserve all the way. For the first 9 miles from here to Gulgong it is private land, and for the next 9 miles the land is nearly all in railway reserves.

Charles Devenish Meares, solicitor, Mudgee, sworn, and examined:—

C. D. Meares. 1976. *Mr. Hassall.*] You have been residing here, I believe, for a considerable number of years? Twenty-two years.

4 April, 1898. 1977. You heard the statement made by Mr. Cox, with regard to the line from Wallerawang to Mudgee, and the proposed extension towards Coonamble? Yes.

1978. Do you agree generally with that statement? Yes.

1979. Have you anything to add to it? Mr. Jones, the last witness, was asked if he had any figures to show what the probable earnings would be of a line from Mudgee to Coonamble. I had an opportunity last night of reading the evidence given in Sydney by the railway officials, as to the probable earnings on the Warren to Coonamble line. They estimated these roughly at £10,000 a year; the length of the line being 63 miles. They were then asked what about the Mudgee-Coonamble line, but they had not considered that at all. One gentleman—Mr. McLachlan, Secretary to the Railway Commissioners—was asked (Question 67):—

Can you say why they have a preference for a line from Warren to Coonamble above any of the other routes proposed? Because, speaking generally, that line would serve the best country, and it would afford the greatest convenience to the public. Another consideration that weighed with them was that it would be by far the least expensive of the three routes

as regards construction. Take, for instance, the line from Mudgee to Coonamble, the one originally suggested and put before Parliament. That line, if constructed, would mean an annual expenditure of £20,000, in the shape of interest and maintenance, beyond the expenditure on the line under consideration. C. D. Meares.
4 April, 1898.

I want to show that that is an incorrect answer. Of course it was roughly given—he had no data—but he made that statement. Now, this is the comparison I make: According to the estimate of the Railway authorities the earnings of the Warren to Coonamble line, 63 miles in length, would be £10,000 a year. The Mudgee to Coonamble line is 147 miles long, which is exactly two and a third times longer than the Warren to Coonamble line. Taking it in the same ratio, if the country through which the Mudgee to Coonamble line passes would produce traffic equal to that on the Warren to Coonamble line, then it should earn two and one-third times as much. That would make its earnings £23,300. Then we will take the expenditure. On the Warren to Coonamble line this is the estimate: Capital expenditure, at $3\frac{1}{4}$ per cent., £4,875; estimated maintenance and other expenses, £4,900. This item of maintenance and other expenses, for 63 miles, would be at the rate of £78 per mile. Assuming that the maintenance and other expenses on the line from Mudgee to Coonamble would be at the same rate, then 147 miles at £78 would be £11,466, and interest at $3\frac{1}{4}$ per cent on the capital expenditure of £180,000, which they say the line will cost, would be £15,600, making the total interest and expenses on the Mudgee line, £27,066; and the earnings, £23,300. Of course, we have no data—the railway people did not make any data for our line—so that I can only make the comparison I have just drawn. If the Mudgee to Coonamble line be two and a third times longer, and if the traffic be equal to that on the Warren to Coonamble line, we should earn two and a third times more, and our expenses being on the same basis, there would be a total loss on the Mudgee line of only £4,000 a year. From Mr. R. E. Jones' report, and from evidence given to-day, the country from Mudgee to Coonamble is just as likely to provide traffic as that from Warren to Coonamble, and by Mudgee is 80 miles shorter. If we could save the Coonamble and Western people 80 miles for all time—that is, one-fifth of the total distance—if we could save them one-fifth in haulage, and one-fifth in the time occupied on the journey, which for the extra 80 miles would mean five or six hours—I say, if by a loss of only about £4,000 a year, we could save all this to the people of the north-west, and, at the same time, open up an enormous area of country which would not be served if the line went from Warren—then the money would be well spent. I contend that the traffic on this line would be greater than that on the Warren to Coonamble line. From what I have seen of this route through Gulgong and out back—I know it as far as Cobborah, at any rate, and I have heard a great deal about the population along the line—it is pretty well populated right through. A good deal of the country from here to Coonamble, I understand, is unoccupied, and there is no doubt that within the last few years it has been very much more closely settled, not only for agriculture, but also for small sheep-farming. There is now a great deal of small sheep-farming going on. The selectors, in the main, are men with, perhaps, 1,000, 2,000, or 3,000 sheep, who require supplies, and also to send their wool to Sydney. In two years, I think, nearly all the leased land about Coonamble, where there is some splendid country, will become available, and will probably be thrown open for selection, and, devoted either to wheat-growing or stock-raising, it will make traffic for the line. This line would open up a tract of country about equi-distant between the western and northern lines.

1980. Having some knowledge of land matters, Mudgee being the land office for the district about Gulgong and Cobborah, do you think that any land made available for settlement would be greedily taken up? Yes.

1981. Over applied for? Yes.

1982. Do you know whether any overtures have been made by people conversant with farming operations with a view to taking up land in this district on the share system? That is being done in this district. Mr. White is doing it.

1983. So that, in all probability, if railway communication were provided further out, land held by private owners would probably be worked on those terms? Yes; I am sure of it. There is a small area on the Talbragar being let, and Mr. Rouse is also willing to devote some of his land to a similar purpose. I could not help being struck with the unfairness of a great deal of the evidence given in Sydney. For instance, Mr. Hickson, Under Secretary for Roads, speaks of the country as being very poor all the way from Mudgee to Cobborah. He also said that the grade on the Mudgee line was 1 in 60. Of course, he found out that that was wrong. He is asked (Question 15):—

Are you prepared to give an expression of opinion in regard to the class of country from Mudgee to Coonamble? No; I know that from Mudgee up past Gulgong, nearly as far as Cobborah, it is poor rough country.

The Railway Commissioners, in view of what they considered the small cost of construction on the Warren to Coonamble line, completely ignored the Mudgee to Coonamble line. They had no figures to submit with regard to the latter, and that is why I have had to make the rough calculations I have done. As to the character of the country, although Mr. Hickson condemned it in terms just quoted, Mr. Deane, the Engineer-in-Chief, gave this evidence (Question 539):—

And the country, I understood you to say, is fairly good? Yes; for the most part it is very good.

He did not even say "fairly good," but went beyond that, no doubt thinking that the word "fairly" did not adequately express the character of the country. He said:—

I examined the line with the view of seeing whether a grade of 1 in 80 could be substituted for 1 in 60.

That bears out the evidence you have had here to-day, and also the statement of Mr. R. E. Jones, who took great trouble over his inquiry and spent considerable time in travelling over the country. I should like to draw attention to this evidence given by Mr. McLachlan (Question 71):—

Then we are to understand that the Railway Commissioners strongly recommend the construction of the proposed railway from Warren to Coonamble, not only on the ground that it will cost much less than either of the other proposed routes, but also because, from the reports made to them of the character of the country, that which would be intersected by the proposed railway is the best? Yes. I may add that the Commissioners themselves have been over the line, and have seen the character of the country.

The Commissioners recommend the Warren to Coonamble line as that which goes through the best country, and in the next sentence they admit that they have not been over the country from Mudgee to Coonamble except as far as Gulgong. One reason given by Mr. McLachlan for preferring the Warren route was because reports made to them of the character of the country showed that that which would be intersected by the proposed railway from Warren was the best. If that is the reason I submit the reason fails, because the evidence shows that the country from Mudgee to Coonamble is equally as good as that from Warren to Coonamble. Another reason given by the Commissioners is that the latter line will cost much less.

C. D. Meares. less. We all admit that; but you have to think of something beyond the mere cost. You have to think what the earnings will be in proportion to the cost; and when there is only a loss of £4,000 a year, the great advantages of bringing the railway direct greatly outweigh that loss, more especially as it would probably soon be made up by the increased traffic that would gravitate to the line. Of course, the Commissioners would like this traffic to go to Warren. They would get 80 miles more railway carriage, and, consequently, a larger amount of freight for all time. It is only natural that they should try to persuade the people of Coonamble to travel the longer route, seeing that they would make one-fifth more revenue out of them than if they came *via* Mudgee. Twenty or thirty years hence, all the country between Mudgee and Coonamble will be thickly settled, and what question will there then be as to which was the better route. If the line from Warren to Coonamble is constructed, people looking at the map twenty or thirty years hence will wonder how such a thing ever came to happen. Mr. Harper, in his evidence (Question 294) is asked:—

Is it your opinion that none of the suggested routes to which your attention has been drawn, with the exception of the one now under consideration, would be profitable for railway construction? I do not think so. I am quite sure, speaking from a cursory knowledge of the traffic which comes from the district between Mudgee and Coonamble, that even if local rates were applied such a line would not pay working expenses.

I submit that it is a grossly exaggerated reply. I do not care how you take the figures the line must pay working expenses. If Mr. Harper knows anything about the matter he must know that a great deal of this traffic now goes to the Western line. He may be calculating upon what comes to Mudgee, but the greater portion of the traffic that would come to the Mudgee line if we had an extension to Coonamble now goes to the Western line.

Eugene Daly, butcher and stock dealer, Mudgee, sworn, and examined:—

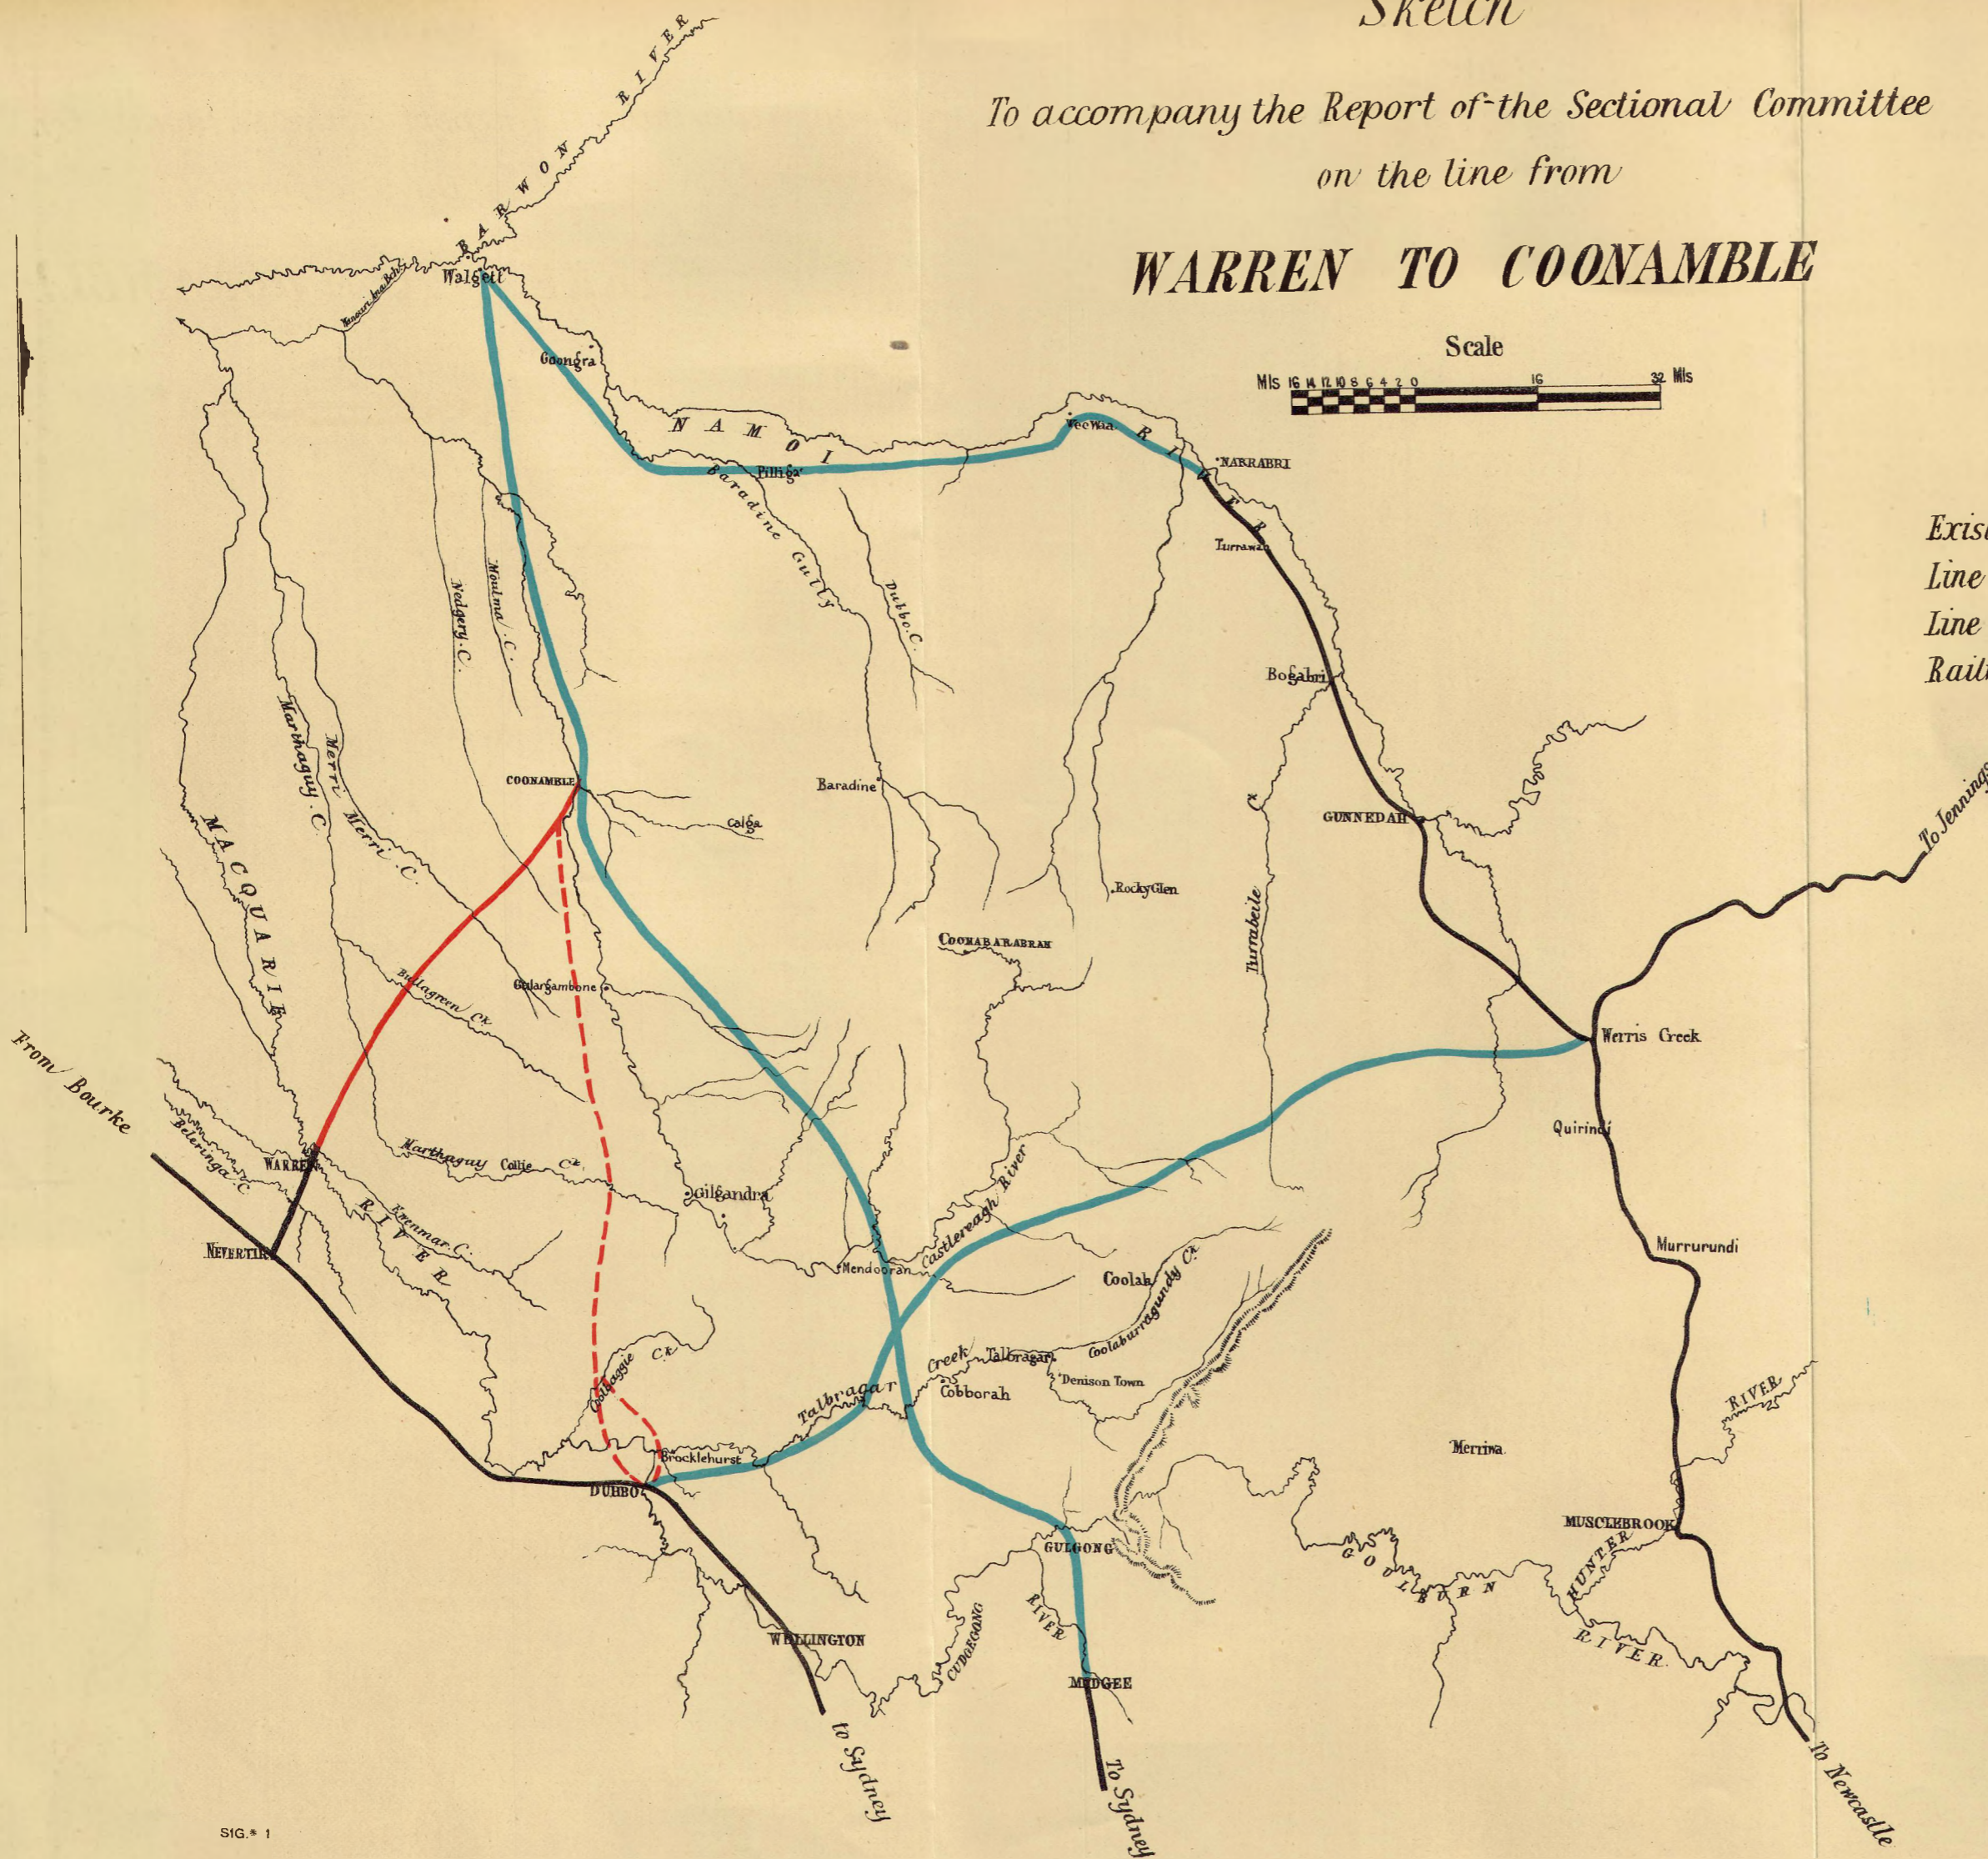

- E. Daly. 1984. *Chairman.*] What are you? A resident of the district—a butcher and stock dealer.
 4 April, 1898. 1985. How long have you been here? About forty-three years.
 1986. Will you describe the class of country between Mudgee and Coonamble? From Mudgee to Gulgong the description given by Mr. Cox and Mr. Jones is accurate. The country is all good. Their description of the country to Cobborah is also accurate; but they have rather under-estimated the value of the country from the Talbragar on to Cobborah. From Cobborah to Merrygoen there is very good land, but when you come to Merrygoen you begin to get into country not quite so good. From Merrygoen to Mundooran the country is not so good, being more of a sandy and sour character.
 1987. How far is it from Mundooran to where you get on to the plain country? You get a little plain country on Yarragin, but not much. Then when you go on to Caigan you get on to plain country. It is all splendid land.
 1988. For the first 20 miles past Mundooran is it suitable for wheat? Yes.
 1989. And when do you get on to the western plain country—40 miles from Coonamble? Yes, this side of Coonamble. That is first-class fattening country.
 1990. Fit for agriculture? It is not so good for agriculture. You get off the red soil there and you get on to the black soil.
 1991. Going from Mundooran to Coonabarabran, what is the country like? You go through Caigan.
 1992. Good country? Yes; a little sandy in some places.
 1993. Is it good country on the whole? Yes, very good country.
 1994. First-class country for the first 30 miles from Mundooran? Yes.
 1995. Does it get a bit inferior as you approach Coonabarabran? Yes; it gets a bit sandy and ridgy.
 1996. But on the whole it is not bad country? It is all good country.
 1997. Do you know the country from Coonamble to Warren? Yes.
 1998. What is your opinion of that? It is all very good country, but for pastoral purposes.
 1999. What about agriculture? I do not think it is good for agriculture.
 2000. Do you know the country about Collie? Yes.
 2001. What do you think with regard to Collie? It is very scrubby at Collie. The land is good about there.
 2002. Would it grow wheat? I should think it would.
 2003. What about Bungey? I was never there.
 2004. And Berida? I do not think that Berrida would grow wheat. It is only patchy. Some of Berida is on the plain, and some is not. That part that is on the plain I am doubtful about.
 2005. What about Kickabil? I have never been there. The country between Warren and Coonamble is very much subject to floods, and I should expect to hear of the line being washed away some day. A line from Mudgee out west would be useful for the transit of stock in dry seasons. It is now almost impossible to get stock from Coonamble in a dry season. I have a return of the number of stock trucked from Mudgee for the year ending 31 March, 1898. It shows these figures:—Horses, 321; cattle, 2,123; calves, 175; sheep, 58,684; pigs, 219; total, 61,522. That only represents the stock trucked at Mudgee, and does not include the stock sent to Rylstone from Cassilis and other places. With reference to the stock coming Mudgee way, now that there is only a travelling stock route from outside, the grass is so poor and bad in time of drought that it is almost impossible to get cattle in; but if the railway went out there, the cattle could come in, and the railway would realise a larger revenue by the traffic.

LIST OF WITNESSES.

	PAGE.
Robert R. P. Hickson, M. Inst. C.E., Under Secretary and Commissioner for Roads, Department of Public Works	1-3
Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works.....	3-12, 91-94, 95-96
Isaac Chapman, Manager, Rosehill Railway	12-15, 19-22
Hugh McLachlan, Secretary to the Railway Commissioners	15-19
Thomas Rhodes Firth, Engineer-in-Chief for Existing Lines, Department of Railways	23-26
John Harper, Chief Traffic Manager, Department of Railways	27-32, 80-83
William Thomas Wright, J.P.	32-35
John Charles Hunt, fruit-grower, Dural	35-38, 97-99
John William Foster, fruit-grower, Castle Hill	38-39
Christopher John Moore, fruit-grower, Castle Hill	39-40, 99
John Speir Heron, fruit-grower, Castle Hill	41
Luke Gallard, fruit-grower, Kenthurst.....	42-44
Samuel Fagan, fruit-grower, Dural	44-45
George Henry Werth, fruit-grower, Glenhaven	46
Henry Thomas Johnston, Mayor of Dundas	46-47
David Scott, fruit-grower, Arcadia	47-48
James Purser, fruit-grower, Castle Hill	49-51
Walter James Black, fruit-grower, Glenorie	51-53
John Purser, fruit-grower, Carlingford.....	53-55
Rev. Henry Robert Pigott, Kellyville	55-58
Henry Jenkins, Mayor of Ermington and Rydalmere	58
James Tamsett, fruit-grower, Baulkham Hills	59

PLAN.

Rosehill to Dural Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM THE TERMINUS OF THE ROSEHILL RAILWAY TO DURAL.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a railway from the terminus of the Rosehill Railway to Dural," have, after due inquiry, resolved that it is not expedient that the proposed railway should be constructed; and, in accordance with the provision of subsection IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

THE ROSEHILL RAILWAY.

1. The Rosehill Railway was constructed under Bennett's Railway Act of 1886 and Simpson's Railway Act of 1893, and consists of 1 mile of double line and 4 miles 48 chains of single line, or 5 miles 48 chains in all.

Under the first-named Act the railway was carried to the Parramatta River, the object of the promoters being, as stated in the Act, to give "better access to the public to the Parramatta River and to the racecourse and recreation-ground near thereto, known as the Rosehill Racecourse and Recreation-ground." Under Simpson's Act power was obtained to extend the railway in three sections to Dural, and the construction of the first section carried the line 3 miles 28 chains further on, to the point north of the Pennant Hills-road where it now terminates. The second section would traverse Dundas and Castle Hill, and extend 5 miles 24 chains from the end of the first section; and the third section would carry the line to a point in the district of Dural 3 miles 41 chains from the termination of the second section. Under this Act, therefore, provision was made for extending the railway 8 miles 65 chains beyond where it at present ends.

Care was taken by Parliament, in each Act, to safeguard the public interest. While authority was given for the construction of the railway, and for the conveyance upon it of passengers and goods, the construction and working of the line were to be in accordance with the methods followed on the Government Railways; and, with regard to carriage rates, while passengers were not to be charged for travelling over the railway more than a certain fixed sum, the charges for goods and merchandise were to be the same per mile as those on the Government Railways, for which purpose the railway was "deemed to be a continuation of the Government Railway between Sydney and Parramatta." This provision, though in Simpson's Act amended so far as to permit of an increase of the rates if the Railway Commissioners should approve, had, it was subsequently found, an important effect upon the prospects of the line, as—the Committee are informed in evidence—it prevented the railway from being profitably worked.

The

The construction of the proposed railway is contingent upon the Government becoming the owners of the Rosehill Railway, and that is offered by the Bank of New Zealand, the present owner of the line, for £25,000. In 1895, £50,000 was asked, but that offer being declined, the price was reduced by one-half. At this sum the purchase was approved by the Cabinet, subject to confirmation by Parliament, and an amount of £25,100 to cover the purchase was placed upon the Loans Estimates for 1896. The item was not, however, passed, and the negotiations between the Bank and the Government were then considered to be at an end.

In connection with this, it may be pointed out that Simpson's Railway Act contains the following provision, under which, apparently, it needs only a proclamation by the Governor, with the advice of the Executive Council, to place the extension authorised by that Act in the possession of the Government without the payment of any purchase money or compensation:—

“If the railway hereby authorised shall cease to be worked as a railway for the conveyance of passengers and goods by the said Benjamin Crispin Simpson, his heirs, executors, administrators, or assigns, for twelve calendar months, the land, site, and permanent way there shall, on proclamation by the Governor, with the advice of the Executive Council, vest in and become the absolute property of the Crown, without making any allowance or compensation, or paying any consideration in respect thereof to the Company, its successors or assigns.”

The extension constructed under Simpson's Act was completed in February, 1896, but has never been worked.

The Rosehill Railway is substantially constructed, and in that respect is approved by both the Engineer-in-Chief for Railway Construction and the Engineer-in-Chief for Existing Lines. Its value, without land, is estimated by the former at £42,000. It is said to have cost £110,000.

THE PROPOSED RAILWAY.

2. The proposed railway commences at the end of the Rosehill Railway, at a point north of the Pennant Hills-road and in the neighbourhood of Carlingford, and proceeds in a northerly direction to Dural. Following the Pennant Hills-road for some distance, the line crosses that road about a mile and a quarter beyond the Pennant Hills Post-office, and then diverging north-easterly to the main Northern Road, it continues in the vicinity of that road—crossing it four times on the way—to its terminal point on the east side of the road at Dural, 9 miles 6 chains from the end of the Rosehill line, and 26 miles 43 chains from Sydney. The ruling grade on the line is 1 in 40. On the existing Rosehill railway, from the Parramatta River to the end of the line at Carlingford, the ruling grade is 1 in 35.

ESTIMATED COST.

3. The Engineer-in-Chief for Railway Construction estimates the cost of constructing the line, exclusive of land and compensation, at £57,100, or £6,292 per mile. Of this amount, £20,581 represents earthworks; £4,397 culverts and box-drains; £4,549 over-bridges; £3,782 level crossings, road-diversions, and fencing; £5,612 permanent-way materials; £160 freight, &c.; £6,468 plate-laying, ballasting, and sleepers; £2,432 station works and buildings; and £2,772 water supply, gradient and mileage posts, telegraph, and miscellaneous. Engineering and contingencies are calculated at 12½ per cent., and are set down at £6,343.

The estimated cost of land resumption in connection with the railway is £9,900, if a width of 2 chains be taken, and between £6,000 and £7,000 if the land resumed be 1 chain wide. The details of this estimate are: Twenty-nine blocks of orchard, containing an area of 69 acres 3 roods 19 perches, thirty-two blocks of cleared land ready for the plough, with an area of 70 acres 3 roods 26 perches, and six blocks of unimproved land, containing an area of 18 acres 29 perches, or in all sixty-seven blocks, with an area of 156 acres 3 roods 34 perches, valued at £7,500; buildings estimated at £750; severance, £3,000; forced sale, £800; cost of transfer and conveyance, £550; or a total of £12,600, from which betterment to the extent of £2,700 may be deducted, and the cost thus reduced to £9,900.

The

The estimated total cost of the proposed railway, with land resumption, would therefore be:—

Cost of construction	£57,100
Cost of land resumption	9,900
					<hr/>
Total	£67,000

RAILWAY COMMISSIONERS' REPORT.

4. Though favourable to the purchase of the Rosehill Railway, the Railway Commissioners do not recommend the construction of the proposed extension. They estimate the annual expense of working the extension at £2,791, which added to £1,710, the interest on the capital expenditure—£57,000 at 3 per cent.—makes the total annual cost £4,501; and the traffic they set down at £1,025. This leaves a debit balance of £3,476, which, if the capital expenditure be taken at £67,000 (the estimated total cost of the line including land resumption), is increased to £3,776.

The purchase of the Rosehill Railway for the sum mentioned, the Commissioners say, is one which could without much risk be completed, but the extension to Dural cannot be viewed with favour at the present time. The traffic, they consider, has been liberally estimated, and as there is no prospect of its increasing in the near future to any extent, they are convinced that the extension would prove unprofitable. They also state that, in their opinion, there is no public necessity for the construction of the line.

EFFORTS TO OBTAIN RAILWAY COMMUNICATION FOR DURAL.

5. The question of railway communication with Dural appears from the evidence to have been first brought forward in 1881, when a deputation urged upon the Minister for Public Works the construction of a light railway to connect Parramatta with Castle Hill, Seven Hills, Dural, Pennant Hills, and Windsor Road. At that point the matter rested until 1884, when a second deputation urged the construction of a light railway to Castle Hill. In 1887 a survey from Parramatta to Dural was made from three points of junction—Westmead, Parramatta, and Rosehill,—and in 1888 an estimate for a line from Westmead (this route presenting advantages over the others) was prepared. Upon this the Railway Commissioners were asked to report on the line, and in March, 1889, they reported that there was “nothing to indicate that the earnings of the proposed line would pay working expenses, and certainly there would be no margin of profit to meet interest on capital.”

For these reasons, and particularly because of the close proximity of the proposed railway to existing lines, the railway from Westmead could not be recommended.

In 1890 a survey was made of a line to connect Dural with the Great Northern railway at Pennant Hills, though such a connection did not meet with the approval of the Engineer-in-Chief for Railway Construction; and in 1891, the Minister for Public Works, having directed that a railway to Dural should be submitted with the next railway proposals, the Railway Commissioners again reported on the subject, and saw no reason to modify their previously expressed views with regard to it. A proposal for a tramway from Parramatta to Dural was also regarded with disfavour. Later on the Minister held out no hope of the Government taking up the matter, but promised to support any private Bill introduced with the object of giving Dural railway communication; and in 1893, Simpson's Railway Bill was passed.

THE COMMITTEE'S INQUIRY.

6. In carrying out their inquiry the Committee have afforded to those interested in the proposed line full opportunity to state their views in the matter, and the evidence taken fairly represents each side of the question. In addition to this, witnesses have been examined who are of opinion that, instead of constructing a railway to Dural, communication with that place should be obtained by means of

a tramway from Parramatta. Further, the Committee made two visits of inspection to the district, during which they personally acquainted themselves with its nature and resources, and examined the existing Rosehill Railway and the route of the proposed extension.

EVIDENCE IN SUPPORT OF THE RAILWAY.

7. The evidence in support of the railway relates to the nature and productiveness of the district, and the traffic which would be contributed to the line, and also to the increase in production and population that it is stated would be brought about by the railway communication proposed.

The district is devoted almost wholly to fruit-growing, and in that respect is one of the largest and finest in the Colony. From Parramatta to Glenorie, which may be considered the northern limit from which any traffic would come to the railway, the distance is 15 miles, and the fruit-growing land extends east and west almost from the Great Northern Railway to the Windsor and Richmond line. The orchards are numerous, well kept, and many of them full bearing, and the profitability of the occupation to which the residents have devoted themselves is indicated by substantial and comfortable homesteads.

Several localities are included in the district. North and north-west of Dural are Glenorie, Arcadia, Galston, and Kenthurst; and south and south-west are Glenhaven, Kellyville, Castle Hill, Pennant Hills, Baulkham Hills, and Carlingford. Statistics furnished to the Committee, and sworn to, represent the total population to be 4,424, and give the area of holdings as 44,464 acres, the area under cultivation 7,132 acres, the area of bearing trees 7,438 acres, the area of non-bearing trees 24,382 acres, and the area under other tillage 967 acres. The figures relating to the different localities are shown in the following table:—

Locality.	Population.	Area of holding.	Area under cultivation.	Area of bearing trees.	Area of non-bearing trees.	Area under other tillage.
		acres.	acres.	acres.	acres.	acres.
Glenorie	295	4,842	760	454	22,214	84
Castle Hill	507	4,276	1,200	868	177	154
Glenhaven	79	857	128	73	49	5
Pennant Hills	534	3,261	1,161	855	267	38
Galston	283	2,216	668	482	239	26
Kenthurst	323	7,584	750	427	266	56
Dural	343	5,250	1,018	603	279	136
Carlingford	685	2,070	1,010	925	59	26
Arcadia	187	2,944	437	302	80	54
Kellyville	521	5,784	1,356	225	307
Baulkham Hills ...	667	5,380	1,093	527	81
Total	4,424	44,464	7,132	7,438	24,382	967

It is also pointed out that there is a considerable quantity of Crown land in the district suitable for fruit production which would be taken up if the railway were constructed.

Locally, it is estimated that the carriage of fruit upon the railway would give to the line a traffic amounting to about £3,000 per annum, in addition to which there would be a large return from the carriage of manure for the orchards—the quantity estimated being about 3,000 tons each year—and from passenger traffic. The advantage to fruitgrowers from a railway close at hand, it is urged, would be very great. Under present circumstances so much time is occupied in reaching the railway before the fruit can be despatched to market that both grower and consumer suffer—the former in the lesser return he receives, and the latter by the inferior condition of the fruit he purchases. A portion of the fruit sent to the Sydney market ripens in the case; to allow it to remain on the tree till ripe and then to send it by road and rail to Sydney would be to destroy all chance of selling it profitably. Such communication as the proposed railway would afford would enable the fruitgrower to let his fruit ripen on the tree, and be of other advantage to him, for the despatch to market would be so rapid that ripe fruit would reach the consumer uninjured, and the time now spent in carting the fruit over the roads to the railway line would be devoted to the greater improvement and productiveness of the orchards.

Another

Another source of traffic mentioned by the advocates of the railway is stone from the Pennant Hills quarry, which it is said would be sent over the line in large quantities, and add materially to the traffic earnings.

The railway would also, it is considered, attract a residential population to the district, who would be drawn there by the salubriousness of the climate and the beauty of the scenery.

A few of the landowners in the district are disposed to give the land required for the railway from their holdings free of charge to the Government; but others are so opposed to such a course, that, in the absence of unanimity on the subject, a subscription list, the Committee were informed, had been opened for the purpose of compensating those not disposed to part with their land without payment.

EVIDENCE AGAINST THE RAILWAY.

8. In opposition to the evidence favourable to the construction of the line is much that goes to show that the railway would not be a profitable undertaking. As stated in their report the traffic estimate of the Railway Commissioners is £1,025. This estimate, which was prepared by the Chief Traffic Manager, is made up as follows:—

150,000 cases of fruit at 1d.	£625
2,000 tons special class goods at 1s.	100
Sundries	100
Passengers	200
				Total...
				£1,025

The total charge for conveying the fruit to Sydney would be 2½d. per case, for, added to the 1d. on the proposed line, would be 1½d., the cost of conveying the fruit over the Rosehill line and the Government Railway from Clyde to Sydney.

Compared with this the freight per case to Sydney from any station on the Great Northern line, as far north as Thornleigh, is 1d., and from Hornsby 1¼d.

Witnesses expressed to the Committee their willingness to pay 3d. per case, which they said would compare favourably with the cost and inconvenience now incurred by them in having to cart their fruit to the Northern Railway; but the railway authorities doubt the statement. The more distantly situated of the fruit-growers, they admit, may be prepared to pay a higher rate than at present, but they are confident that the majority would send their fruit to market as cheaply as they could possibly do it. With a lower rate and a better service on the main line, the preference, they are convinced, would be given to that line. Experience has taught that those interested in the construction of a new line of railway are quick enough to assert their readiness to pay special rates as an inducement for the line to be constructed, but once the railway has been opened an agitation is begun to have the rates reduced. In the present case it would not be difficult, after the construction of the proposed railway, for the fruit-growers to press for a reduction of rates by resuming their present method of carting their fruit to stations on the Northern line.

Notwithstanding the very considerable difference between the traffic estimate of the Commissioners and that of the local residents, the Chief Traffic Manager maintains that his estimate is by far the more reliable. The carriage of fruit returns so little to the Railway Department that a fruit-growing district does not afford a commercial basis for a railway; but, in this case, allowance has been made for all the traffic that appears possible. The Chief Traffic Manager has taken into account every case of fruit going at present by railway, steamer, and road, and so liberal has he been in calculating the traffic possibilities of the extension that the 150,000 cases given as the quantity likely to be carried are really the figures representing the full extent of the fruit traffic which now comes to the railway at one or other of the stations on the Great Northern line, or at Parramatta. In all probability, therefore, the quantity of fruit sent over the proposed railway would be less than 150,000 cases. From much of the district the distance to Sydney would be shorter by way of Pennant Hills than by the proposed railway, a circumstance certain to attract traffic to the

Pennant

Pennant Hills station. The Mayor of Ermington and Rydalmere informed the Committee that two-thirds of the fruit from those places is carted to Sydney, and this practice will probably continue. To the Committee it appears doubtful whether any traffic from Arcadia or Galston would go to the proposed line, or that the line would be of any service to Baulkham Hills or west of Castle Hill; and if that should be so, the local estimate would, by these circumstances, be reduced fully one-third. The road from Galston to Dural is described as bad in wet weather, whereas that from Galston to Hornsby is through hard country, and has been thoroughly well drained and metalled. To make a good metal road from Galston to Dural would require an expenditure of £3,800.

But whether all, or only a portion, of the total quantity of fruit now conveyed over the Government railways to Sydney, were sent by the proposed railway, whatever the number of cases might be, to that extent would the Great Northern line and the railway from Parramatta to Sydney be deprived of traffic.

This fact brings into view another objection to the proposed extension. For a considerable portion of its length the line would run parallel with the Great Northern Railway, and adjacent to it. It is evident, therefore, that if constructed it must be in the position of a competitor against the main line, and to the extent to which it attracts traffic will reduce the earnings of the other line, the two lines being in operation to do the work which the one now in existence does very well alone. This effect upon the traffic earnings of the main line would be met in some degree by the special rate charged upon the extension.

From the carriage of manure the railway officials anticipate very little return; and passenger traffic, they are of opinion, is certain to be small.

As for traffic from the Pennant Hills quarry, they regard it as more than doubtful, from the fact that nearly all the road metal used in and around Sydney is brought by sea from Kiama, where it is obtained much more cheaply than it can be got at Pennant Hills. But, even if stone from the quarry were a possible source of traffic earnings, the situation of the quarry is such that, to bring the stone to the line, it would be necessary to construct a branch railway or a good metalled road.

ROADS IN THE DISTRICT.

9. The district which would be traversed by the proposed railway is well provided with roads, upon which, according to a return published with the evidence, £16,114 has been spent since 1892. The metalling has not been completed, and some of the roads, it is said, are difficult in wet weather; but, on the whole, they are, undoubtedly, good, and meet very well the requirements of the traffic. Compared with roads in most other districts of the Colony they are superior.

SUGGESTED TRAMWAY FROM PARRAMATTA.

10. In opposition to the proposed railway to Dural the residents of Parramatta advocate the construction of a tramway from Parramatta to Dural, by way of Castle Hill, Baulkham Hills, and Kellyville, and, if such a tramway cannot be obtained, that matters shall remain as they are. The object in this is to, as far as possible, draw additional trade to Parramatta, which is regarded as the district's commercial centre, or, if no more than the present amount of trade can be attracted thither, to prevent the existing trade from going elsewhere.

At the present time most of the fruit traffic from Castle Hill, Baulkham Hills, and Kellyville comes into Parramatta, but the business and other relations between the fruit-growing centres generally and Parramatta justify, it is contended, the claim to the whole of the trade of the district.

A tramway from Parramatta to Dural is practicable, and would be within touch of a large portion of the fruit trade, but while that is the case it would probably attract to itself only little traffic, and, as a profitable concern to the railway authorities, it would be in the same position as the proposed railway.

Several

Several routes for the tramway have been suggested. The best, in the opinion of the Engineer-in-Chief for Railway Construction, is one from the Parramatta Railway Station down Taylor-street to Macquarie-street, and along that street to Marsden-street, where it would turn off to the river, which would be crossed by a separate bridge below the dam. Thence, after reaching Villiers-street, it would turn off at the back of the King's School into O'Connell-street, and follow the road until nearly out of Parramatta, where it would take a bend on to the main Dural Road, and keep that road almost entirely to the tramway's terminal point. The line would be a tramway pure and simple, with two or three chain curves, and grades of 1 in 30 or 1 in 50 against, and 1 in 20 with, the load. The estimated cost is about £28,000.

Such a line would be suitable for the carriage of fruit from Dural to Parramatta; but to get the fruit to Sydney transshipment would be necessary from the tramway rolling stock to the rolling stock on the railway, and this transshipment would add to the working expenses of the tramway, and therefore to the freight charged to the fruit-growers.

In the consideration of any proposal for a tramway to carry, in conjunction with the railways, goods as well as passengers, the Campbelltown-Camden tramway naturally comes into view, and in the present inquiry the question arose, why, if the goods traffic on the Camden tramway can be worked with the railway, without transshipment, a similar thing cannot be done with a tramway from Parramatta to Dural. The reason for the difference is to be found in the fact that the Camden tramway has, to the required extent, been reconstructed as a railway, and is worked as one of the railway lines of the southern system. Both the rails and the curves are suitable for the rolling stock used on country railways, and there is no necessity for the transshipment of goods sent from the district to Sydney. A tramway is practically a separate service, for the usual tramway rails and sharp curves make it difficult to use thereon the rolling stock of a railway.

The construction of a line from Parramatta to Dural, suitable for ordinary railway rolling stock, would necessitate the adoption of a route outside the town of Parramatta, for it would be undesirable to run trains through the streets, or to resume the private property necessary for the requisite curves; and, as far as the evidence before the Committee indicates, the best route for such a line would be the surveyed railway route from Westmead to Dural, the estimate of cost in connection with which, with 10-chain curves, is £57,000, and with sharper curves somewhat less. Such a line from Parramatta to Dural would be much more costly, because of extensive resumptions necessary to reduce the grades, and of a difficulty in junctioning at Parramatta with the main railway.

The railway authorities do not, however, approve of either a tramway or a railway from Westmead or Parramatta to Dural, as, in their opinion, neither would pay. The Camden tramway, though worked as economically as possible, shows a considerable annual loss.

OTHER ROUTES TO DURAL.

11. It is possible to construct a railway to Dural by two other routes than those mentioned, but the cost would be so considerable, and the traffic returns so small, that neither of them could be recommended. A branch railway could be made from Pennant Hills to Dural, rather more than 8 miles in length, with a 1 in 40 grade and 10-chain curves, for £53,800; or from Carlingford to Dural, 10 miles long, with the same grade and curves, for £63,000; but neither would be an undertaking profitable to the railway system of the Colony. No railway connection with Dural can, at present, be made, it appears, with any prospect of the line paying expenses.

RESOLUTION PASSED.

12. After a careful consideration of the evidence, and looking at the question before them from all points of view, the Committee are of opinion:—

- (1.) That the traffic upon the proposed railway extension would not be sufficient to make the line profitable;

* 7—c

(2.)

- (2.) That whatever the traffic might be, a large proportion of it would be traffic withdrawn from the Great Northern Railway ;
- (3.) That the district is so situated in regard to road communication with, and distance from, the existing railways, that fruit-growers can, without further railway expenditure, find reasonable transit for their fruit to market.

The resolution passed by the Committee is shown in the following extract from the Minutes of Proceedings, of Tuesday, 15th February, 1898 :—

“ Mr. Farnell moved,—‘ That, in the opinion of the Committee, it is expedient that the proposed Railway from the Terminus of the Rosehill Railway to Dural, as referred to the Committee by the Legislative Assembly, be carried out.’

“ The motion was seconded by Mr. Clarke, and negatived on the following division :—

Ayes, 5.	Noes, 8.
Mr. O'Connor,	Mr. Ewing,
Mr. Clarke,	Mr. Humphery,
Mr. Lee,	Mr. Hoskins,
Mr. Fegan,	Mr. Roberts,
Mr. Farnell.	Mr. Trickett,
	Mr. Hassall,
	Mr. Black,
	Mr. Wright.”

PROPOSED PURCHASE OF THE ROSEHILL RAILWAY.

13. The question of the purchase of the Rosehill Railway by the Government has been prominently before the Committee during their inquiry, as it was in the expectation that this line would become the property of the State, and be controlled by the Railway Commissioners, that the proposal to extend it to Dural was made.

The Committee find that, up to the present, the traffic upon the railway has been chiefly passenger traffic obtained in connection with the Rosehill Racecourse, and that the section of the line beyond the river, or what is known as Simpson's line, has never been worked. This latter circumstance is due, it is explained, to restrictions in Simpson's Railway Act which prevent the owners from charging rates for carriage which would be profitable. The Rosehill portion of the railway has returned, on an average, £543 per annum to the owners of the line, and, to the Railway Commissioners, for that part of the journey to Rosehill which takes place over the Government Railways, an average of about £2,000 per annum. A certain fare is charged for the journey from Sydney to Rosehill, and out of that, the owners of the Rosehill Railway are paid 4½d. per head. In addition to the passenger traffic in connection with the racecourse, there is a goods traffic amounting to about £120 per annum.

It will, therefore, be seen, that as an inducement to the purchase of the Rosehill Railway, there is offered to the Government a continuation of a traffic which brings in locally £663 per annum, and assists the main line from Sydney to the extent of £2,000 per annum.

This return from the line would probably be increased, the Chief Railway Traffic Manager reports, by the carriage of live stock, mutton, sheep skins, and coal in connection with the works erected near Rosehill by the Stockowners' Meat Company of New South Wales, and by the carriage of fruit and the conveyance of a few passengers. The Chief Traffic Manager's estimate, which he describes as very full and probably beyond what would be realised, is as follows :—

	£	s.	d.
Rosehill Racecourse	543	0	0
A. K. and O. Company	120	0	0
Stockowners' Company	146	0	0
Fruit, 30,000 cases at ½d. each	62	10	0
Manures and other low-class traffic, 1,000 tons at 6d....	25	0	0
Passengers	150	0	0
Sundries	100	0	0
	£1,146	10	0

The interest at 3 per cent. on £25,000, the sum asked for the railway, amounts to £750, and, in addition to this, there would be the expenses of working and maintaining the line. What the working and maintenance expenses would amount

to

to is not definitely stated, but they are mentioned as about £500. This shows a slight balance on the losing side, and the traffic estimate, as has been stated, is an extreme one. It might, however, be judicious on the part of the Railway Commissioners to keep the Rosehill Railway and its traffic in existence, as the main line to Parramatta is so largely interested in it. Though it is probable that the Rosehill Railway will continue to exist if the Government should not purchase it, in that case it may be in the hands of some other purchaser, and a railway so close to Sydney and joining the Government system cannot be so satisfactory to the Railway Commissioners while it is in the hands of private individuals, as it would be if it were entirely under their own management.

The end of a tidal estuary, such as the head of the Parramatta River, in connection with which there are opportunities of development, should, if possible, be in the hands of the State. At the point where the Rosehill Railway crosses the stream towards Carlingford, the river is virtually the terminal point of the navigation of Port Jackson. At present the depth of water there is not considerable, but that is capable of improvement.

Evidence given before the Committee goes to show that there is every probability of the Rosehill Racecourse being a permanent place of resort, and that the factories erected near the Parramatta River will contribute to the returns from working the line. Consequently, there would be in connection with the railway an assured traffic, and, in addition, as much more as the Commissioners, in their enterprise, may be able to secure.

The value of the line to the Government lies in the retention of the Rosehill Racecourse traffic, and the goods traffic in connection with the Australian Kerosene and Oil Company's Works and the works of the Stockowners' Meat Company of New South Wales; in what can be done to increase the earnings of the railway; and in preventing private individuals from becoming possessed of advantages which, in the public interest, should be wholly under State control.

On these grounds the Committee are of opinion that it is advisable for the Government to acquire possession of the railway, provided the line, and everything connected with it, as indicated in the subjoined resolution, together with all rights under Bennett's Railway Act of 1886 and Simpson's Railway Act of 1893, can be purchased from the present proprietors at a price not exceeding £20,000. That sum would represent to the present owners of the railway the full value to them of the earnings upon the line capitalised; and, having regard to the views expressed in evidence on behalf of the Railway Commissioners, the purchase at this price should be advantageous to the country.

The opinion of the Committee on this matter is expressed in the following resolution taken from the Committee's Minutes of Proceedings, of Tuesday, 12 April:—

“Mr. Farnell moved,—‘That, if the Rosehill Railway from Clyde to Carlingford, including the branch line to the Parramatta River, the timber wharf at the terminating point of the branch line, with the loading appliances upon it, the turntable, all land, and station, platform, and siding accommodation, and everything else provided or carried out in connection with the railway under Bennett's and Simpson's Railway Acts, can be purchased by the Government for a sum not exceeding £20,000, the Committee recommend that the purchase be made.’

“The motion was seconded by Mr. Hoskins, and passed on the following division:—

Ayes, 9.

Mr. Ewing,
Mr. Humphery,
Mr. Hoskins,
Mr. Roberts,
Mr. Trickett,
Mr. Clarke,
Mr. Lee,
Mr. Fegan,
Mr. Farnell.

Noes, 2.

Mr. Black,

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM THE TERMINUS OF THE ROSEHILL RAILWAY TO DURAL.

WEDNESDAY, 5 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a Railway from the Terminus of the Rosehill Railway to Dural.

Robert R. P. Hickson, M. Inst. C.E., Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You have a statement to submit with regard to the proposal before the Committee? Yes; it is as follows:—

Department of Public Works, Sydney, 16 December, 1897.

RAILWAY FROM ROSEHILL TO DURAL.

THE line now under consideration is an extension of the Rosehill Railway, commonly known as Simpson's Railway. It begins at the end of Simpson's Railway about 17 miles 37 chains from Sydney. It at first follows the Pennant Hills Road, which it crosses about a mile and a quarter beyond the Pennant Hills Post-office. It then converges to the main road from Parramatta to Dural, which it crosses four times, and terminates at Dural on the east side of the Parramatta to Dural Road, about 26 miles 43 chains from Sydney. The undulating nature of the country will make the works rather heavy. The total length of the line proposed to be constructed is 9 miles 6 chains, and its estimated cost £57,100, or about £6,292 per mile, exclusive of compensation.

The railway, of which this is an extension, consists of two portions.

The first portion was constructed partly under Bennett's Railway Act of 1886, and partly under Simpson's Railway Act of 1893, and consists of—

Double line	1 mile.
Single line	4 miles 48 chains.
Total.....	5 miles 48 chains.

This part of the line, which it is said cost £110,000 to construct, is under offer to the Government by the Bank of New Zealand for the sum of £25,000.

The portion constructed under Bennett's Act starts as a double line, leaving the main suburban line near the western end of Clyde platform, and crosses Duck and A'Beckett's Creeks to a platform at the western side of Rosehill Race-course, one mile from the point of commencement. Thence it curves eastwards as a single line, crosses the Parramatta tramway, and ends at the river wharf near the Graziers' Meat Export Company's premises, about 2 miles 20 chains from Clyde.

The portion of the line constructed under Simpson's Act begins by a junction with Bennett's line at about 10 chains from the Rosehill platform. It then crosses the Parramatta River by a steel bridge, crosses Victoria, Kissing Point, and Ermington Roads, and passes under Pennant Hills Road, ending about 30 chains further on, or about 3 miles 25 chains from the point of junction with Bennett's Railway.

The question of railway communication with Dural was first brought forward in 1881. A deputation waited on the Minister for Public Works, the Hon. John Lackey, to urge the construction of a light railway to connect Parramatta with Castle Hill, Seven Hills, Dural, Pennant Hills, and Windsor Road. The Minister promised to have an examination of the country made as soon as a surveyor could be spared.

Nothing was done, however, until May, 1884, when the residents of Castle Hill, Baulkham Hills, Dural, and Pennant Hills held a meeting to arrange for a petition to be presented to the Minister for Public Works asking for a survey to be made to ascertain the best route for a light railway from Parramatta to these districts. As an outcome of this a deputation waited on the Minister for Public Works, the Hon. F. A. Wright, presented a petition, and urged the construction of a light railway to Castle Hill. Mr. Wright referred the matter to the Railway Commissioner, Mr. Goodchap, who pointed out that the Traffic Manager estimated the freight at 3,000 tons instead of the 10,000 mentioned in the petition, but thought that, even at the higher figure, the line would have no chance of paying. In June, 1884, the Premier, the Hon. G. R. Dibbs, decided to consider this line with the railway policy, but no steps were taken to bring the matter before Parliament.

In September, 1887, the Hon. John Sutherland ordered a survey from Parramatta to Dural to be made, which was accordingly carried out, three points of junction, Westmead, Parramatta, and Rosehill being investigated. An estimate of the Westmead-Dural line, which presented advantages over the others, was furnished in December, 1888; grades, 1 in 40; length, 11 miles 7 chains; cost, £50,000, equal to £4,522 per mile. This estimate appears to have been too low.

R. R. P.
Hickson,
M. Inst. C.E.

The Railway Commissioners were asked to report, and the following is a copy of their report :—

19 March, 1889.

Proposed line of Railway from Westmead to Dural, 11 miles 7 chains.

IN accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under :—

Cost of Construction—

The Engineer-in-Chief estimates the cost of construction of the line (exclusive of land and compensation) at £50,400

Annual Cost—

Capital expenditure at 3½ per cent. 1,764
Expense of working the line, permanent way, and traffic departments 3,400

Total annual cost £5,164

Traffic Estimate—

Coaching and mails £1,300
Goods traffic 1,200

£2,500

The country through which the proposed line passes is fertile and is extensively devoted to fruit-growing. The population, however, is limited.

The goods traffic would be almost wholly confined to fruit which, owing to the low rate of carriage, produces but a small return when considered in connection with the expenses of a railway.

The population is unlikely to be increased to any material extent by the construction of the line, and even if a considerable increase follows, the revenue derivable from this source would be limited. Further, the line does not go in the direction of any large centre of population. At present the country upon each side of and surrounding the line is well served by the Western line and Northern line. On the former is Parramatta, distant about 11 miles from Dural, and between these places there is an excellent coach service three times per day. Seven Hills on the same line is about 8 miles from Dural. On the Northern line there are Hornsby and Pennant Hills districts, distant respectively from Dural 4 and 4½ miles.

There is nothing to indicate that the earnings of the proposed line would pay working expenses and certainly there would be no margin of profit to meet interest on capital. Generally for these reasons and particularly upon the ground of the close proximity to existing lines the construction of the proposed line cannot be recommended.

The Seal of the Railway Commissioners of New South Wales was hereto affixed, this nineteenth day of March, One thousand eight hundred and eighty-nine, in the presence of—

}	E. M. G. EDDY,	(L.S.)
	Chief Commissioner.	
	W. M. FEHON	(L.S.)
}	Commissioner.	
	CHARLES OLIVER,	(L.S.)
	Commissioner.	

HUGH McLACHLAN.

In August, 1889, referring to the application from Mr. Nobbs, M.P., for the survey of a line from Rose Hill to Dural, the Acting Engineer-in-Chief for Railways, Mr. Deane, pointed out that this would be 2 miles longer than a line from Westmead, and would necessitate a bridge over the Parramatta River; he recommended instead the survey of a line to Dural, suggested by Mr. F. Farnell, M.P., to start from the Great Northern line about 16 miles from Sydney, and join the proposed Westmead to Dural line about 22½ miles from Sydney.

It having been suggested that a junction should be effected with the Northern line, an examination of the country was made by one of the surveyors with that view, the result of which seemed to show that it was impossible to lay out a line from Dural to junction with the Great Northern line at any point nearer than Pennant Hills Station (17½ miles), that there would be no shortening of the distance by this route, and that Castle Hill would be left out altogether. In March, 1890, Mr. Deane minuted that in his opinion this would be a great mistake. A survey was, however, made connecting with Pennant Hills Station.

In April, 1890, Mr. Deane having, under instructions from the Minister, met the late Mr. Hugh Taylor and some other gentlemen and examined the district in their company, furnished a report in which he stated that he considered that if any improved means of communication were provided it should be a railway and not a tramway. He thought, however, that if the road were placed in proper order the necessity for either would disappear.

A further suggestion having been made in May, 1890, to connect with Hornsby, the impracticability of this scheme was pointed out.

In reply to a deputation which Messrs. Nobbs, Ritchie, Farnell and Stevenson, Ms.P., introduced on the 29th August, 1890, the Minister for Public Works pointed out that the line they proposed from Rose Hill to Dural involved 2 miles more construction than that from Westmead, which the Railway Commissioners thought it would be premature to construct, but promised to have the merits of the proposal considered. The matter had also in July, 1890, been referred to the Examiners for Public Works, Messrs. Gilliat and Alexander.

In August, 1890, the Examiners submitted a report, which cannot now be found, stating that a line to Dural would not be self-supporting, and that one starting from the Rose Hill line should not be entertained. They could not recommend a line from Pennant Hills Station, and did not see any advantage in starting at Parramatta instead of Westmead. A railway, however, would undoubtedly foster the fruit industry and encourage settlement.

In November, 1890, Mr. E. B. Price, Assistant Engineer, Public Works Department, who had been asked to make further investigations, pointed out that a railway would not pay for many years, and that he considered the district would be best served by a system of tramways, say from Parramatta to Castle Hill, from Pennant Hills to Dural, and from some point near Ryde to develop the parts of the district not served by these; but he could see no immediate necessity for any accommodation of the kind. The Acting Engineer-in-Chief for Railways could not recommend Mr. Price's proposal, as the lines suggested would be 15½ miles long, and would cost £46,500. He suggested a through tramway to Dural, which would not require fencing; but he thought that the owners should give the land through which the line passed. Mr. Bruce Smith then directed that a "cursory and inexpensive survey" of this be made, sufficient to enable a rough estimate to be prepared.

This matter was reported upon by Mr. Deane on 2nd April, 1891, and two estimates submitted, as follows :—

- (1) For £61,000, which would make a good suburban line.
- (2) For £59,500, which had the advantage of not interfering with the Park.

Mr. Bruce Smith then inquired as to the state of the road to Dural, and the cost of putting both it and the road to Hornsby in good condition.

The first road was reported as being of clay, good in dry weather, but impassable in wet—to metal it would cost £11,260, and to do the same to the Hornsby road about £7,600.

Mr. Bruce Smith directed the line to Dural to be submitted with the next railway proposals.

The Railway Commissioners reported at this time—13th August, 1891—that they saw no reason to modify their previously expressed views with regard to the line.

In January, 1892, the late Mr. Hugh Taylor, M.P., proposed that a tram line be constructed from Parramatta at a cost of £19,284. The Engineer-in-Chief for Railways pointed out that the proposed line could not be used for goods, as the railway trucks could not be run over it; the bridge then being constructed at Parramatta was not strong enough to carry a tram-line; and the cost was much under-estimated, as drainage, buildings, bridges, compensation, and land resumptions were not provided for.

On 18th August, 1892, Messrs. J. Garrard, Dale, and Farnell, Ms.P., introduced a deputation to the Minister on the subject.

Mr. Bruce Smith held out no hope of the Government taking the matter up, but promised to support any private Bill which might be introduced during the session.

A private Bill introduced (Simpson's) was assented to in June, 1893, and the first part of the railway constructed to near the junction of the Pennant Hills road and the Pennant Hills wharf road. On

On the 14th June, 1895, Mr. Wilson, Manager of the Bank of New Zealand, approached the Premier, the Hon. G. H. Reid, with regard to the purchase of the constructed lines by the Government, and on the 23rd August, 1895, the assistant manager of the Bank of New Zealand wrote, asking for an interview.

The manager, Mr. Wilson, saw Mr. Reid on the 29th August, and on the 4th September wrote, stating that he was authorised, on behalf of the bank, to negotiate for the sale of the property, and offered to accept payment in funded stock or bonds at a price to be agreed on. On this letter the Railway Commissioners reported as follows:—

R. R. P.
Hickson,
M. Inst, C.E.
5 Jan., 1898.

Office of the Railway Commissioners of New South Wales, Sydney, 10th October, 1895.
The Hon. G. H. Reid, M.P., Minister for Railways.

Rosehill Railway.

We beg to report for the information of the Hon. the Premier and Minister for Railways, in response to his minute of the 4th instant, upon the letter of the Manager of the Bank of New Zealand, requesting that the Government of this Colony should purchase the Rosehill railway and the extension thereof now being constructed, that the purchase cannot be recommended. The line is not one which the Railway Commissioners could have reported favourably upon if its construction had been contemplated by the Government.

As regards the remarks of the manager on the subject of the extension of the line into the Dural district, we beg to point out that under date the 19th March, 1889, the Railway Commissioners reported adversely on a proposal to construct a line from Westmead to the Dural district, and nothing has since transpired to change the opinion then expressed.

With reference to the observations as to the diversion of traffic to the Parramatta River, it may be that this will occur, though it is doubtful; but if it does the prospect of a remunerative traffic is so limited that it needs no consideration as bearing upon a large expenditure such as would be involved in the purchase of the railway line.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

On the 22nd November Mr. Wilson wrote offering to accept £50,000 on behalf of the bank.

The bank then appointed Mr. R. Amos as their agent, and the Colonial Treasurer asked the Railway Commissioners to treat with him, and after many interviews it was agreed that the whole line should be placed under offer to the Government for £25,000, the property to be handed over free of all claims of every kind. The purchase was approved by the Cabinet subject to the confirmation of Parliament. The Crown Solicitor was asked to investigate the vendors' title. A sum of £25,100 was placed on the Loan Estimates for 1896, but not passed by Parliament, and in November, 1896, in reply to a question by the Under Secretary for Finance and Trade, the Colonial Treasurer said the negotiations were now at an end.

On 24th June, 1897, the Minister for Public Works directed that the Railway Commissioners be asked for their report in terms of the Public Works Act; this was supplied, and is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 4 November, 1897.

Proposed Extension of Railway, Carlingford to Dural (9 miles 6 chains).

In accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of the line (exclusive of land and compensation) at £57,000

Annual Cost—

Capital expenditure at 3 per cent. £1,710
Cost of maintaining permanent-way, and for traffic and locomotive expenses 2,791

Total annual cost..... £4,501

Traffic Estimate—

Goods and coaching—Total estimated traffic £1,025

The proposed line in reference to which our report has been requested is an extension of the present Rosehill and Carlingford line, which is the property of the Bank of New Zealand, and at present under offer to the Government for the sum of £25,000.

The purchase of this line at the figure mentioned has already been recommended by the Railway Commissioners, and we are still of opinion that it is one which could without much risk be completed.

The extension from Carlingford to Dural is, however, a proposal which cannot be viewed with favour at the present time. As already stated, the estimated traffic is £1,025 per annum, which falls short by £3,476 of the estimated charge for interest and working expenses, and the former charge is exclusive of interest on the cost of land which it will be necessary to resume for the railway. In this connection, too, it requires to be specially mentioned that the resumption will be costly, as severance will be created along about 8 miles of main road frontage without it being possible to provide any corresponding advantage.

As regards the traffic, we are of opinion that it has been liberally estimated, and that there is no prospect of its increasing in the near future to any extent.

We are of opinion that the extension would prove unprofitable, and that there is no public necessity for its construction, and therefore do not recommend it.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this fourth day of November, One thousand eight hundred and ninety-seven, in the presence of—

} CHARLES OLIVER, (L.S.) Chief Commissioner. W. M. FEHON, (L.S.) Commissioner. DAVID KIRKCALDIE, (L.S.) Commissioner.	H. McLACHLAN.
--	---------------

On the 9th December, 1897, the Minister submitted to Parliament a motion for the reference of this line to the Public Works Committee, and this was passed.

The various methods of improving the communication with Dural have lately been investigated by the Engineer-in-Chief, Mr. Deane, and details will be furnished to the Committee for their information.

2. *Mr. Humphery.*] Have you any information with regard to Simpson's railway? I know that it has been offered to the Government for £25,000. You will find the powers of the proprietors specified in the Act.

3. *Mr. Black.*] Is the sum of £25,000 you have mentioned the purchase money for the whole of the constructed line amounting to 5 miles 48 chains? Yes, the whole of Simpson's and Bennett's line.

4. Including the deviation to Rosehill? Yes.

5. I presume it would include the right of construction elsewhere? Yes.

6. According to the statement of the parties interested the line which they propose to sell to the Government cost them about £20,000 a mile? £110,000 for the full length. That is their estimate of the cost. Of course, I cannot vouch for it.

7. The proposal is now made to sell to the Government for £25,000 which would be approximately £2,804 per mile? Yes.

8. What would be the cost per mile of the proposed extension from Carlingford to Dural? £6,292, exclusive of compensation.

Henry

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- H. Deane.
5 Jan., 1898.
9. *Mr. Humphery.*] Have you a report with regard to the proposal under the consideration of the Committee? I believe Mr. Hickson's statement contains all that I need say in the matter.
10. Have you seen Mr. Hickson's statement? I prepared the material for it myself, so that I am aware of what he has said.
11. Have you any information as to the constructed portion of the line between Clyde and Carlingford? No further information than is contained in the report which Mr. Hickson read.
12. Do you know the cost to the owners of that portion? £110,000 is said to have been the cost of the whole of it.
13. Do you know how that amount is made up? I have no idea. I have received no particulars whatever.
14. Can you give the Committee an opinion as to the present value of the line between Clyde and Carlingford? I think it would be very cheap at £25,000.
15. What is the steepest grade? One in 35. With regard to construction there is only one point which I may perhaps mention about the extension from Rosehill to Carlingford. The line was constructed under Simpson's Railway Act, and before it was completed Mr. Simpson asked me to look at the bridge over the Parramatta River. I looked at it and I examined the drawings. I had some calculations made, which I partially checked myself. I found that the bridge was not quite stiff enough. Mr. Simpson undertook to put the matter right, and I believe that some material was ordered for the purpose. I think it is right to mention that to the Committee. In regard to the expense of the alteration, that would be a comparatively trifling matter.
16. The line between Clyde and Carlingford has been constructed under two Acts of Parliament, one being known as Bennett's Rosehill Railway Act and the other as Simpson's Railway Act? Yes.
17. The proposal of the Government is to purchase the whole length to Carlingford for £25,000—to include all rights under the existing Act,—that is what you understand? That is what I understand.
18. *Mr. Black.*] Including the deviation to Rosehill? Yes.
19. *Mr. Humphery.*] As there appears to be some doubt in the minds of the Committee as to what is intended by this proposal, I might ask you whether you distinctly understand that the proposed purchase for £25,000 will include the whole of the line as shown in black on the map before the Committee as far as Carlingford? Yes.
20. *Mr. Black.*] Will it also include the purchase from the Bank of New Zealand of the rights of construction to Dural given under one of the two Acts mentioned? I presume it would, but that is not actually stated.
21. *Mr. Humphery.*] Is the line between Clyde and Carlingford in every respect of the character that you would pass as constructing engineer? Yes, with the exception of a deficiency in the bridge.
22. Which you say can be remedied for a small sum of money? Yes. It is very likely that since I saw the line it may have gone a little out of repair; there may be a little subsidence here and there, but there is nothing in that.
23. When did you last inspect the line? It is some time ago since I was over it. I should like to state that when these negotiations were pending I was not consulted at all in the matter. I was not called upon to report, and I made no report at the time. I was upon the line previous to the completion of the bridge.
24. That would be how long ago? It must have been some time towards the close of 1895, over two years ago.
25. And you have not since inspected the line? No.
26. Where is the grade of 1 in 35 of which you speak? Rising from the Parramatta River to the end of the line the ruling grade is 1 in 35.
27. Do you regard that as a satisfactory grade for a line of this description? It is certainly workable; I would prefer a better grade. The main Northern line has grades of 1 in 40, as you are aware.
28. Will you mention the grades between Carlingford and Dural on the proposed extension? The ruling grade is 1 in 40 on that section.
29. What would be the worst parts of that line? Soon after leaving the end of Simpson's Railway, the line would rise with a grade of 1 in 46. That would be for 28 chains. The next steep grade commences at 19 miles 23 chains and is 1 in 40. That continues up to 20 miles 24 chains, nearly three-quarters of a mile. There is a grade of 1 in 50 for about 20 chains, including the 21 miles. There is a grade of 1 in 55 down from 21 miles 20 chains to about 21 miles 60 chains. There is also a little piece of 1 in 40 at about 24½ miles, but it is only 8 chains in length. Those are the worst grades on the line.
30. The highest grade is 1 in 60 is it not? I have not given you the flatter grades. There are also some level portions.
31. About what length of the line approximately would you regard as being of a severe grade? The worst part of the line as regards traffic is that which I have mentioned as a down grade of 1 in 55, because that would be against the heavier traffic from Dural to Sydney. It is nearly half a mile in length.
32. If you were placing before the Committee an estimate of the cost of a line between Clyde and Carlingford, how much per mile would you regard as fair provision to make for its construction? I do not think it could be constructed for less than the average per mile for the new portion, namely £6,292. You might put down the total cost at £30,000. This is of course a very rough estimate.
33. That is exclusive of compensation to land owners? Yes.
34. Would that include the construction of the bridge? Yes.
35. You say that the bridge can be rendered absolutely safe for a very small outlay? Yes.
36. If it has not been already incurred? I do not think it has been incurred.
37. What would be the approximate cost? It depends upon what class of traffic you want to carry over it.
38. You have a fair idea of the nature of the traffic that would pass over the bridge? Yes; it would be, I presume, comparatively light. The work necessary to be done would cost, I think, from £200 to £300. In my estimate of the cost of the total length, I am supposing a single line from Clyde to the Parramatta River. The price proposed to be paid includes a double line, station works, and a branch running easterly to the river.
39. Leaving that portion of the line for the present, have you made a careful calculation of the cost between Carlingford and Dural? Yes.

40. Have you details of your estimate of the extension from Carlingford to Dural? They are as follows:—

L. Deane.

26th July, 1897.

5 Jan., 1898.

ROSEHILL TO DURAL.

ESTIMATED cost of a single line of railway from end of Mr. B. C. Simpson's present Terminus to Dural. Length, 9 miles 6 chains; 60-lb. rails; ruling grade, 1 in 40; sharpest curve, 10 chains radius.

Description.	Estimated cost.	Average per mile.

Total cost.....£	57,100 0 0
Average cost per mile	£ 6,292 0 0

41. Is that estimate for first-class construction? It is good construction.

42. But not of the highest class? It is of the best class with the rails—they are only 60-lb. rails.

43. Do you see your way to reduce that estimate of cost upon any of the items you have given? No; I have cut it down to the lowest figure.

44. The Committee, therefore, may regard your estimate as the lowest for which the line can be constructed? Yes.

45. What severance will there be, and what area of land will it be necessary to resume? I am getting a return prepared which I hope in a few days to be able to hand to the Committee. It is not yet ready. It will show what is orchard, what is pasture, and what is unimproved land.

46. Will you describe the grades between Carlingford and Dural? I have already mentioned the principal grades.

47. That is all you have to say at present in regard to the proposed extension? Yes; I have prepared for the Committee some comparative costs and lengths of the various schemes that have been proposed.

48. You have a comparative statement of the cost of other proposals which have come before you to connect Dural with either the western or the northern system? Yes.

49. The first proposal mentioned is that under consideration? Yes.

50. The next proposal is a line from Pennant Hills station to Dural, which is shown on the map by a dotted red line? Yes.

51. Will you give particulars of that? It is a connection which has been surveyed from the Pennant Hills railway station to Dural. It meets the proposed line at about 3 miles 21 chains, and from that point on to Dural it coincides with that line.

52. Three miles 21 chains is the length of the cross line? Yes.

53. From that point what is the distance? From that point it is 5 miles 6 chains to Dural.

54. So that the total length of the line would be—what? Eight miles 28 chains.

55. It would be less than the length of the proposed extension from Carlingford? Yes, about 60 chains less.

56. Would it be a more difficult line to construct than that under consideration? No, about the same.

57. Would the grades be easier along that line? No; they would also be about the same. About 1 in 40 would still remain the ruling grade.

58. Would that line serve the district as far as you know as well as the proposed line from Carlingford? I would rather not, if the Committee would excuse me, express an opinion as to how these lines would serve the country.

59. We may take it that the line from Carlingford to Dural, and the line from Pennant Hills to Dural would present about the same difficulties, and may be estimated at a similar cost? Yes; in one case the total is less because the distance is less.

60. You observe from the map that the dotted line joins the broad red line about 3 or 4 miles north of Carlingford? Yes.

61. Would the cost of construction from that point on to Dural per mile be the same? Yes; it is all the same class of country. The features are similar.

62. Have you considered that you would probably be obliged to avoid the route mentioned in Simpson's Act if Simpson's Railway were not resumed? You cannot make two lines of railway to Dural. You cannot go to Dural and avoid going near the route proposed by Simpson's line. Simpson's line, from the point where it meets the dotted line, right on to Dural, is practically the departmental line which was surveyed before.

63. Are we to understand that it would not be possible to construct the line shown from Pennant Hills to Dural without interfering with Simpson's line as it appears in the schedule to Simpson's Railway Act? No; it would not. If the Act gives Simpson the right to construct along that full red line, you could not get to Dural by railway without interfering with that right.

- H. Deane. 64. Could you give us any other route which might be practicable at a similar cost? No other route is practicable. The line goes along the crown of the ridge. There is no other way of taking it. You might, perhaps, deviate a little from one point or another, but practically it would be the same line.
- 5 Jan., 1898. 65. Then do you say that, assuming that under Simpson's Railway Act the right exists to construct a line as far as Dural, it would be necessary to arrange with the present owners for the right of construction? I think their right of construction has lapsed, but I am not sure of that.
66. Simpson's Railway Act was assented to on the 13th June, 1893, four years ago, and the termination of the extension from Rosehill is Dural, so that practically the terminal point would be the same as that contemplated by the dotted line from Pennant Hills? Yes.

THURSDAY, 6 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 67. *Mr. Humphery.*] I believe you desire to refer to some statements contained in your evidence of yesterday? I was asked a question as to the cost of constructing a single line from Clyde to the end of the constructed portion of Simpson's line. I said I thought about £30,000. I adhere to that statement; it is about correct. That would include the bridge, which I should say could be constructed for about £10,000 to carry the heaviest engines; but it is to be pointed out that in the £25,000 proposed to be paid for this line and the Rosehill line, there is the double line from the junction to Rosehill. There are sidings, cross-over roads, and there is a long platform of about 900 feet at Rosehill, and the branch line down to the river. So that when you add the extra value of that double line and the station accommodation, and so on, as compared with the line beyond, I think the value of the works, so far as actual construction is concerned, between the junction at Clyde and the end of Simpson's roadway would be something between £40,000 and £50,000; added to that there would be the value of the land. If the £25,000 is paid for the lot, of course the land would come in as well. I am not aware what price has been paid for the land on the original line or on Simpson's line, but it must no doubt have amounted to something considerable judging from the experience we have had of railway resumption.
68. It may be put in this way—at the present time if the Government were to undertake the works which have been performed under the two Acts of Parliament, Bennett's Act and Simpson's Act, it would cost not less than £50,000? I believe it would cost between £40,000 and £50,000 for construction alone.
69. That would be exclusive of very heavy claims for compensation? Yes. The original cost of the Rosehill railway no doubt was far in excess of present value. I do not know that it was, but it probably was because at the time that railway was constructed prices were so much higher than they are now.
70. In your estimate you are dealing with the work as if undertaken at the present time? Yes; I may say that I have looked into Simpson's Railway Act and I find that the Act was assented to on the 13th June, 1893. In clause 1 there is provision that "The whole of the said railway shall be completely constructed and brought into use within five years of the passing of this Act." That would be as far as Dural. I cannot find that any extension of time has been given. I do not think any amending Bill has been introduced, consequently any rights for construction as far as Dural have practically lapsed because it would be quite impossible to construct almost any portion of the line within the five years.
71. *Mr. Hoskins.*] Is there not a provision in the Bill to the effect that if the line be not completed within a certain time the whole is forfeitable to the Government? No; the only mention of forfeiture is in connection with the deposit. Clause 1 says "Provided further that the said Benjamin Crispin Simpson should, within four months of the passing of this Act, lodge the sum of £3,000 with the Colonial Treasurer, and within twelve months from the passing of this Act spend at least £10,000 in the actual work of construction, to the satisfaction of the Minister. In the event of the latter sum being expended then the said sum of £3,000 shall be returned, but in default of the expenditure of £10,000 then the said £3,000 shall be forfeited." The clause also contains this provision: "Provided that the first section of the said railway should be completely constructed between the points above indicated, and brought into use within three years, and that the whole of the said railway should be completely constructed and brought into use within five years from the passing of this Act."
72. *Mr. Humphery.*] What is the penalty for non-completion? There is no penalty apparently except the lapse of rights. I understand that the Bank of New Zealand in offering to sell this line and the Rosehill line, cede with them all rights and privileges.
73. You produce a report by the Railway Commissioners dated 29th May, 1896? Yes; it is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 29 May, 1896.

The Hon. G. H. Reid, M.P., Premier and Minister for Railways,—

Rosehill railway, authorised by "Bennett's Railway Act of 1886," and an extension of that line to Carlingford (part of the line authorised by "Simpson's Railway Act of 1893" to be constructed to Dural).

We beg to report that the negotiations in regard to the offer of the Bank of New Zealand for the sale of the above lines have resulted in the lines and all appertaining thereto being placed under offer for a sum of £25,000.

We have inspected the property, and consider that the lines which have been constructed at a cost of about £110,000 could be advantageously taken over at this price. The interest on the purchase money at 3 per cent. per annum—the rate at which money can now be raised by the Government—would be £750 per annum. The proportion which has been paid to the Bank of New Zealand in connection with the Rosehill race traffic for the past five years has averaged £543 per annum,

annum, and there is a goods traffic at the present time which brings in about £120 per annum, a total of £663 per annum. No additional expense beyond what is now incurred by the Department would be necessitated in the working of this business, and a new traffic could be created over the railway by providing an economical service on the new section beyond to Carlingford. This extension, which has not yet been opened for traffic, has cost about £35,000.

H. Deane.
6 Jan., 1898.

The lines appear to have been well made, and only a small expenditure would require to be incurred before opening. We advise the purchase of the property on the terms named.

Attached hereto is a full description of the property, as well as notes of interview that preceded our examination of the line.

In the Act which we presume will have to be passed authorising the acquisition of the lines we would suggest that a clause should be inserted repealing the Acts under which the lines were authorised and giving the Commissioners the same powers under all conditions which they possess in connection with the Government Railways now vested in them.

In connection with the purchase it should be clearly understood between parties that the whole of the property is handed over free of all claims of every kind.

E. M. G. EDDY, Chief Commissioner.
CHARLES OLIVER, Commissioner.
W. M. FEHON, Commissioner.

Cabinet approve subject to the approval of Parliament.—G.H.R., 7/7/96. Inform Mr. Amos. Mr. Galloway.—F.K., 7/7/97. Done.—F.G., 8/7/96. The Secretary to the Commissioner for Railways. Please return.—F.K., 9/7/96. Seen.—E.M.G.E., C.O., W.M.F., 9/7/96 The Under Secretary Finance and Trade. Records.

I have also Mr. Firth's report. It is not very clear whether the full description of the property referred to is Mr. Firth's report or not, but I think it very likely that it is.

74. Is there anything which would lead you to suppose that that is not the document referred to in the Commissioners' report? I made inquiries this morning, and I found that Mr. Firth had reported to the Commissioners.

75. *Mr. Trickett.*] In the document you just read you mention £35,000 as being the cost of the railway. In a minute paper read to us yesterday it was stated that the line had cost £110,000;—is the difference between the two amounts made up by land resumption? I cannot say. The statement of the owners is that the line cost £110,000. That would of course include the racecourse line.

76. You cannot explain the difference between the two amounts? No; but I should take it that the cost of Simpson's railway, £35,000, included land, because I am quite sure that I could construct it for very much less than that. With the exception of the bridge, there is no work of any importance. The cuttings are light, and the only important embankment is the one between the racecourse and the river.

77. *Mr. Black.*] How many miles is the portion referred to as having cost £35,000? Three miles 24 chains.

78. The bridge cost about £15,000, you think? I believe it could be constructed for about £10,000.

79. That would leave £25,000 for 3 miles of construction? Yes.

80. Then it is probable that the estimate includes the cost of resumption? Yes.

81. *Mr. Hoskins.*] Would you run ordinary luggage trains over the bridge? No; it could not be used at the present moment—it wants stiffening.

82. *Mr. Humphery.*] Will you read Mr. Firth's report that has been referred to? Yes; it is as follows:—

Description of the branch line, Clyde to Rosehill, and extension towards Pennant Hills.

The Rosehill branch which is a double line to Rosehill, starts from a junction with the main Suburban line 4 chains west of Clyde platform; curves away in a northerly direction, and the country being generally level, very easy grades are obtained with light earthworks. The level nature of the country entails all roads intersected by the line being crossed on the level, and level crossings have therefore been provided at Clyde-street, the Great Southern Road, Parker-street, and Aston-street.

The lines are carried over Duck Creek and A'Beckett's Creek by substantially constructed bridges, the piers of which are of concrete, and superstructure of iron plate girders, with open transom deck, to which the rails are directly fastened.

At Rosehill Racecourse, 1 mile 14 chains from the junction, a platform (the face wall of which is concrete) about 950 feet in length and 40 feet wide is provided, and the station yard is well arranged for the shunting and quick despatch of trains.

From Rosehill a single line is carried on to the Parramatta River, a distance of 1 mile; the line curving sharply in a north-easterly direction. At the river a substantial wharf of timber, 50 feet by 20 feet, is constructed, and on the wharf a travelling steam jib crane of a capacity of about 10 tons has been provided. A goods platform (the walls of concrete) 200 feet in length, and siding accommodation sufficient to deal with a considerable goods traffic, have also been provided. A 50 feet turntable has also been constructed at this terminus.

The land resumed for railway purposes has a full width of 90 feet, and the boundaries parallel with the centre line of railway are fenced with wire fencing, the posts being spaced at 8 ft. 3 in. centres.

All level crossings are provided with well made gates, and the road approaches are in good order.

The drainage of the line is satisfactory, and I observed no places where the formation had been damaged by flood waters.

That portion of the branch between Clyde and Rosehill is laid with 71½ lb. steel T rails on sleepers 8 ft. x 9 in. x 4½ in., generally ironbark, spaced 2 ft. 9 in. centres, but the extension from Rosehill to the Parramatta River is laid with 70 lb. T iron rails on sleepers 8 ft. x 9 in. x 4½ in., spaced 2 ft. 9 in. centres. The line throughout is ballasted to a depth of 5 inches below the sleepers and well boxed up with sandstone ballast, and has been kept in very good order.

Extension towards Pennant Hills.

The Rosehill to Pennant Hills Branch connects with the Rosehill line at a point about 1 mile 20 chains from the junction of the latter with the main Suburban line, and takes a northerly direction in continuation of the main portion of the Rosehill Branch. This extension is a single line and well constructed, the permanent way being 71½ lb. steel T rails in 30 ft. lengths, on sleepers 8 ft. x 9 in. x 4½ in. (generally ironbark), spaced 2 ft. 10 in. centres. Sandstone ballast is placed under the sleepers to a depth of 5 inches, and the road is boxed up with similar stone to the top of the sleepers.

From Rosehill to Parramatta River the grades are easy, the maximum rise being 1 in 66, and this for only a short length of 7 chains; but from the river to the terminus the country rises rapidly, and to obtain reasonable earthworks and as direct a line as possible, gradients of 1 in 35 to 1 in 39 have been adopted. From the river to the terminus the total length is 2 miles 67 chains, and the length of steep gradients is as under, viz. :—

1 in 35.....	59 chs.
1 in 37½.....	61 „
1 in 39.....	31 „

Total..... 1 m. 71 chs.

These grades are, however, with the load on the up journey.

The land resumed for the purposes of the railway is 1 chain in width, except where station accommodation is required, and at such points extra land sufficient for the purpose has been taken. A good seven-wire fence with posts at 10 feet centres has been erected throughout to properly enclose the railway.

One important road only is crossed on the level, viz, Victoria-road; in all other cases under or overbridges having been constructed at road crossings.

With the exception of the bridge over the Parramatta River the whole of the under and overbridges are of timber, and are well finished and of good design. Over the Parramatta River an iron bridge of the through type in three spans of 100 feet each has been constructed. The girders are lattice type—rather shallow for the span—and are carried at the extreme ends on brick abutments; the two intermediate piers being piers of cast-iron cylinders filled with concrete.

Station

H. Deane.
6 Jan., 1898.

Station buildings with passenger platforms and sidings for goods and other traffic are provided at Victoria-road, 2 miles 6 chains from Clyde; at Kissing Point road, 2 miles 43 chains from Clyde; and at the terminus at Pennant Hills road, 4 miles 36 chains from the main line junction. The platforms are about 200 feet in length, loop siding at the terminus is 200 yards over the points, and at other stations the loops are 150 yards over all.

The station buildings are of timber with iron roofs, and in all cases general and ladies' waiting rooms, ticket office, and latrine accommodation for gentlemen are provided. At Victoria-road, in addition to the accommodation for the public, a cottage has been erected which would be suitable for a gate keeper or officer-in-charge.

Brick culverts are constructed, where necessary, to carry off flood water, and side drains to keep the formation free of water are also provided.

T. R. FIRTH,
Engineer-in-Chief for Existing Lines.

83. You were examined yesterday with regard to the cost of various proposals which have been made for railway connections with Dural. You spoke yesterday of the cost of the proposed connection between Pennant Hills and Dural; the next connection proposed, I believe, was from Carlingford to Dural; I presume that would be from the Carlingford railway station? Yes.

84. What would be the length of line from the Carlingford railway station to Dural? Ten miles 3 chains.

85. And the probable cost? There is no actual survey over portion of the route; no actual sections have been taken, but I have assumed that the cost per mile would be the same as in the line submitted to the Committee. The total cost runs out at £63,156.

86. With regard to that proposal, have you personally examined the route between the Carlingford station and the road to Dural? I know it very well. I have often been over that country.

87. Would that be the most expensive portion of the line? No; it would be the least expensive portion, but to be on the safe side I have put it down at the average cost per mile of the proposal submitted.

88. Do you regard the estimate of £63,000 as a very full estimate? Yes.

89. Are you of opinion that the probable cost would be less than that? I am of opinion that it would be less than that.

90. At present you are not prepared to give any other than approximate figures? No.

91. Take the proposed route from Westmead to Dural which is shown on the map by a dotted red line, passing through Baulkham Hills and Castle Hill—what would be the length of that line? Ten miles 77 chains. It is estimated to cost £57,475, or £5,243 per mile. A survey of that line has been made, and sufficient data have been obtained to make an estimate with accuracy.

92. Have you examined that line personally? Yes.

93. Are you prepared to say that the probable cost would not be more than £57,000, everything included? Yes, but not including lands.

94. Is the country less difficult for railway construction than in the case of any of the other proposals with which we have been dealing? The first part of it is easier. You do not get into sharply undulating country until you get a little way out. The country is not so lumpy until you get to Castle Hill. The road from Parramatta to Dural runs on the top of the ridge. The country is a series of hillocks; the roughest part of the country is just beyond Castle Hill, where you see the sharp curve in the line.

95. It is between Castle Hill and Dural? Yes; especially for a mile or two beyond Castle Hill.

96. Can you make a comparison in any way between the cost of resumption in connection with these various proposals? I am afraid I am not in a position to do that. I have some information which I can hand you presently with regard to the country cut through on the Rosehill-Dural line and on the Parramatta-Dural tramway proposal. When I have more time I can obtain for you a description of the resumptions on the Westmead to Dural route.

97. Are we to assume that it would be necessary to resume land upon the whole length between Westmead and Dural? The line would first go through a reserve after leaving Westmead, but after passing the river it would go through private property nearly all the way; the class of country being the same, I should suppose that the resumption would be about the same per mile.

98. The resumption will be considerable in connection with any other proposal with the exception of the Clyde-Dural line? The resumption in that case is considerable.

99. But has not the resumption been paid for as far as Carlingford? Yes; but from Carlingford you take resumption into consideration. There would be less resumption by the tramway route.

100. Have you a list of the properties through which the railway would pass, between Carlingford and Dural? I have a Book of Reference which I could hand in, and I have a summary showing the different classes of land passed through. The total length of line is 726 chains, and the following are the particulars of the land:—

ROSEHILL TO DURAL RAILWAY.

From the end of Mr. Simpson's line as now constructed to Dural, the state of the land may be described as—

Orchard land	276 chains	=	38·00 per cent.
Old orchard	7 "	=	1·00 "
Grass land	320 "	=	44·00 "
Cultivated (crop)	24 "	=	3·30 "
Bush land (standing)	79 "	=	10·90 "
Roads	14 "	=	1·90 "
Held by Mr. Simpson's Co.	6 "	=	·90 "
Totals.....	726 "	=	100·0 "

5th January, 1898.

G. V. M.

101. Have you had any estimate made of the value of the land? No; I thought the Committee would get the information from another source.

102. Has any officer of the Department been instructed to obtain the information? I am not aware of it.

103. Do you know whether it is intended that Dural should be the terminus of the line or whether it is in contemplation to have an extension beyond? The line has not been surveyed beyond Dural and I am not aware of the matter ever having been under consideration.

104. Can you say in what direction the line would probably be extended? I should think it would probably be extended through Galston or on the Wiseman's Ferry Road towards the Hawkesbury.

105. That would be through Kenthurst? Yes; the good land divides there. When you get beyond Dural it becomes more patchy. Between Galston and the Wiseman's Ferry Road there is a gully. It is rough country along there generally. There is some good land, but it is more divided up. It is not so compact as it is between Dural and the Parramatta River.

106.

- H. Deane.
6 Jan., 1898.
106. The whole of the land in that direction is used chiefly for fruit-growing? Yes; all the good land.
107. In dealing with the several proposals to which reference has been made, it would appear that the cost of construction on the line from Westmead to Dural would be considerably less than that of any of the others without regard to the cost of compensation? The cheapest line would be that from Pennant Hills to Dural, the cost of which is estimated at £53,000.
108. I am speaking of the cost per mile? Per mile, the cheapest line would be the Westmead line, because the portion at the Parramatta end is much easier to construct.
109. The Westmead-Dural line would be 10 miles 77 chains compared with 8 miles 28 chains on the Pennant Hills route? Yes.
110. A proposal has been placed before you for the construction of a tramway from Parramatta to Dural? Yes.
111. Have you any particulars as to that? Yes; I had that proposal examined with a view to the getting at the cost of it as a tramway, not as a railway. It would be a tramway pure and simple with sharp curves.
112. A steam tramway similar to that in Sydney? Yes; very like that running out to Randwick, which goes partly along the road and partly off it. In order to get the grades you want, it would be necessary in a few places to leave the road.
113. Will you give us an idea of the route? I might make the preliminary remark that I have considered the question in two ways with different grades. As regards Parramatta, the line in both cases would follow the same route; but further on, when you get into the country, if you want to get the better grades, you will have to diverge more from the road.
114. At an increased cost? At a slightly increased cost. There is more in the way of resumption. You cut into more land. With 1 in 30 against, and 1 in 20 with the load, the total cost comes to £27,851, but with a grade of 1 in 50 against, and 1 in 25 with the load, the cost would be £1,100 more; but as against that you have to take more land. In the one case you have to go on to private property for 2 miles 59 chains, and in the other case 4 miles 2 chains.
115. Are you in a position to give us approximately the cost of resumption? I am not.
116. Upon what part of the line would resumption be necessary? In various places.
117. In the town of Parramatta would any resumption be necessary? Yes; but most of the resumption would be in the country. An example may be given at Castle Hill. There is a steep hill just beyond the centre of Castle Hill, where Pennant Hills road joins. That is one of the places where you must depart from the road if a tramway is to be made.
118. What is the length of the proposed tramway? Twelve miles 12 chains. That would be for the line with the steeper grades. The length of the line with the lighter grades would be 12 miles 14 chains. Practically they are the same length. The difference in cost is £1,100. There have been several routes proposed for going through Parramatta with a tramway. One proposal was to go along O'Connell-street and to cross the river by means of an existing timber bridge, just alongside the Parramatta Park, but the bridge is not constructed to carry a tramway, and it would be necessary to make a separate bridge; the river there is somewhat wide, and possibly the foundations would be deeper than lower down. I do not think that would be the best route to take. It has also been proposed to traverse Church-street, and go over the stone bridge. That, I think, is objectionable also. Then it has been proposed to run along Smith-street, and to cross the river more or less diagonally, and get into Sorrell-street; but the route which I consider would be the best would be from the station down Taylor-street until you get to Macquarie-street; then along that street, turning off at Marsden-street, until you get to the river—crossing the river on a separate bridge below the dam. Here it is all hard rock, and the foundations would not be troublesome. The line after getting to Villiers-street, would have to turn off at the back of The King's School, and get into O'Connell-street. That is where the principal resumption in the town of Parramatta would occur on that route. From there on the line would follow the road until you get nearly out of Parramatta. It would then take a bend on to the main Dural road. At each of the bends it would be necessary to make resumptions to get the curves. The line would then follow almost entirely the main Dural road.
119. Can you distinguish the grades upon different portions of the line—that is the severe grades and the easy grades? I will have a return prepared. I have not the information here.
120. Would the annual cost of the tramway be greater than the annual cost of the railway? I have not gone into that matter; but I can do so if required.
121. You have not considered the question whether a tramway would serve the people equally well with a railway; but can you say, from your experience, and from your knowledge of the district, whether a tramway similar to that at Camden, would carry all the produce and passengers of the district? A tramway, no doubt, could be made to carry the produce of the district; unless the rolling-stock could be made so as to be suitable for running over the suburban lines, the fruit cases would have to be shifted from one truck to another. There is, of course, that objection.
122. Could not the fruit trucks be similar in design to those used on the suburban lines? It is a question of wheels—of gauge and flanges.
123. What is your opinion, having in view the fact that the district is essentially a fruit-growing district, and that it would be necessary for the people there to find their markets chiefly in Sydney? I think that if it were decided to make a tramway in preference to a roadway, some arrangement could be made by which the transshipment of the fruit cases could be properly and safely effected without damage to the fruit.
124. *Mr. Farnell.*] Could it not be done without transshipment at all? Not unless you could shift the bodies of the waggons or the boxes in the same way that coal is shifted from one truck to another.
125. *Mr. Humphery.*] Are you quite clear upon that point, that it would not be practicable to use the tramway trucks on the suburban railway line;—how is that managed on the Camden tramway? That really forms part of the railway system.
126. If it can be done at Camden, why is it not practicable to adopt the same system in this case? It is a question of rolling-stock. You could adapt the rolling-stock which would run on a tramway, if you had no guard-rails, so that it would run on a railway; but you could not, on a tramway with sharp curves, take the ordinary rolling-stock of a railway.
127. Are the curves on the proposed line of a character which would render it impracticable to adopt the system which at present obtains at Camden? I think so. In working the tramway scheme out I have assumed that curves of 3 chains radius may be used.

- H. Deane. 128. What is the sharpest curves on the Camden line? I am not sure; but I think it is much flatter than that.
- 6 Jan., 1898. 129. Do you think it would be practicable to so construct a tramway line as to render it suitable for railway trucks similar to those in use at Camden? I do not see that it would be practicable to construct a tramway passing through the town of Parramatta so that it would take the ordinary rolling-stock of a railway. You could not get it to pass round the curves of the streets without a considerable amount of resumption at the corners to get the proper curves in.
130. Therefore the Committee, in considering the various proposals, must regard the tramway proposal as an entirely separate service? It is practically a separate service.
131. Necessitating the transfer of all produce at the railway station at Parramatta? Yes.
132. *Mr. Hoskins.*] Even if you had a light line of railway, such as they have in France? Even then you would have to tranship. That is the disadvantage under which a tramway labours.
133. *Mr. Humphery.*] Have you considered whether it would be practicable to construct rolling-stock suitable both for a tramway line and for a suburban railway, so that you might be able to carry goods and produce without transferring them from tramway trucks to railway trucks? I have given the matter a good deal of consideration, but I must confess that I have not arrived at a definite conclusion. I can scarcely see why some arrangement should not be made, provided always that you could make your tramways through the town with guard-rails. If you have to fix guard-rails to your tramway it means that the wheels have to have small thin flanges, which would not be suitable for running at speed over a railway; but if you can leave out the guard-rails, as I certainly should do outside the town of Parramatta, you could use the ordinary type of railway rolling-stock, and only the question of curves would come in. It resolves itself into a question whether suitable rolling-stock could be used for the tramway which could be safely run over a railway.
134. What would be the cost of constructing a tramway, instead of a railway, from Carlingford to Dural? I have not gone into the matter; it is a question of curves; but I should think it would probably be constructed for a little more than half; but then you would lose all the advantages of a railway.
135. *Mr. Farnell.*] And there would be the same difficulty of transhipment at Parramatta? Of course, if you use tramway rolling-stock.
136. *Mr. Humphery.*] What difficulty would there be in bringing your tramway into Parramatta station, from Carlingford? Over the bridge there would be no difficulty.
137. Is this the position—that the cost of the tramway from Parramatta to Dural would be less than half the cost of the cheapest railway communication between the existing line and Dural? No; not quite; it would be rather more than half the connection with the Pennant Hills station, on the northern line.
138. From your knowledge of the district, could you say that it would be fairly served by a tramway? That is a point upon which I should prefer not to speak. It would serve it of course in a different way. It is likely that there would be some passenger traffic springing up. If the transhipment of fruit could be properly effected, I should say that a tramway would serve the district fairly.
139. Is settlement fairly close at any of the points along the proposed route? The country is settled all the way along, but the houses are not close together.
140. *Mr. Trickett.*] Are you able to say whether the running of the tramway between Campbelltown and Camden is satisfactory? I am not in a position to say that. The Railway Commissioners do not now give any details in their reports of the working of that tramway.
141. I see that in the minute the Railway Commissioners laid before us, this paragraph occurs:—
The purchase of the line at the figures mentioned has already been recommended by the Railway Commissioners.
? That is the line from Rosehill to Carlingford.
142. Do you know why it is considered desirable to do so? The report of the Railway Commissioners read this afternoon I think explains that.
143. Are trains being run upon the line from Rosehill to Carlingford? No.
144. It has not been used? No.
145. Have you reported upon the condition of the line? No; Mr. Firth reported for the Railway Commissioners.
146. And since then it has not been reported upon? No.
147. What is the date of Mr. Firth's report? There is no date to the report, but it must have been made shortly before the Railway Commissioners' letter.
148. Some time in 1896? About April or May, 1896, I think.
149. It is stated that the line from Rosehill to Dural would cross the Parramatta Road four times;— would there be level crossings at those points? Yes.
150. That would involve gatehouses in each case? I should not think gatehouses would be necessary. Cattle pits might be necessary. I do not think it would be necessary to have a gatehouse unless the line approached the crossing with a sharp curve in a cutting.
151. You have not gone into that in your detailed estimate? Not so far as to give a final decision as to what is required.
152. If gatehouses and gatekeepers were required, that would considerably increase the annual cost? Not very much; I think by about £150 a year.
153. Judging from your answers to Mr. Humphery, you do not favour the tramway proposal? I see that there are many objections to a tramway. The great advantage lies in its cheapness.
154. As against that, there would be the transhipment of goods and passengers? Yes.
155. Are you prepared to say which of these proposals you would recommend? I should have to give a conditional recommendation. I should say that if it be worth while to spend £25,000 for the existing line, the best line to Dural would be undoubtedly the continuation of the line; but if that line had never been built I should recommend the branch line from Carlingford on the northern line, because, although it is a little more costly than the connection with Pennant Hills, it would, I think, give a better junction and would also give a shorter distance to Sydney.
156. *Mr. Clarke.*] It is stated in the report before us that the line known as the Bennett and Simpson's line cost £110,000. Is not that an excessive cost? The work could be done for very much less than that now.
157. Material and everything is cheaper at the present time than when that line was constructed? It is cheaper now than when Bennett's line was built.

158. The Commissioners report in favour of purchasing the existing line for £25,000? Yes.
159. Would that be a good bargain for the country? It depends upon the returns which are expected.
160. But if the proposed line is not carried out, what would be the utility of a line costing £25,000? The Railway Commissioners show in their report of May, 1896, what they propose to do with the line if purchased. They recommend the purchase of the line independently of any extension.
161. What use would it serve? I suppose they would have the Rosehill traffic and some little traffic from the residents beyond.
162. *Mr. Lee.*] According to the return you have furnished, it would appear that if the Rosehill line were purchased and the extension were carried out to Dural, it would give a length of 13 miles 54 chains between Clyde and that point? Yes.
163. The cost, exclusive of compensation, being £82,100? Yes.
164. The line from Westmead to Dural is estimated to cost £57,475, and the line from Carlingford to Dural £63,156; the first estimate, therefore, shows a large increase? Yes.
165. In the case of the Westmead line you have a distance of 10 miles 77 chains, estimated to cost £57,000, whereas in the proposal under consideration you have 9 miles and 6 chains, also estimated to cost £57,000? Yes.
166. How is the difference made up;—is it represented by probable compensation? The cost per mile is greater in one case than in the other.
167. Westmead is about 1 mile west of the Parramatta railway station? Yes, nearly that.
168. Has there been any exploration made of that country since 1887;—it would appear from the general report that Mr. Sutherland ordered a survey of that line in 1887;—has anything been done since? Yes; the country has been examined since.
169. Do you happen to know whether there has been any advance in settlement along that route since the survey was made in 1887? I do not fancy there has been very much.
170. We have an estimate of the probable traffic in 1887, but we have nothing to show whether the population or traffic would show any increase at the present time? There has been a great deal more land turned into orchards, although it is possible that the population has not largely increased.
171. But the conditions in the direction of settlement must have changed in the ten years? Yes; there would be a considerable increase in produce.
172. I presume the Committee would be safe in assuming that they cannot rely upon the estimate of traffic in 1887 as applying to the present time? Yes.
173. Apart from the existence of this piece of private railway, are you of opinion that that portion of the county of Cumberland could be more equally divided by another railway than by an extension of the private line? What suggests itself with regard to that line, is that it runs almost into close competition with the northern line; it will go very close to it.
174. What would be the distance at the nearest point? Not more than 1 mile. I do not think it would be more than a mile straight across.
175. That in itself is a proof that the western portion of the fruit-growing country would be very little better served than it now is by the northern line? Yes.
176. Which of the centres in that direction do you think it is desirable to touch? Supposing this line had not been made at all and that it was desirable to make a railway to the district, I think there can be little doubt but that it should come through Castle Hill.
177. To what point? To Parramatta.
178. You think that that would be the proper way to penetrate that fruit-growing country? That is, always provided that you want to serve it, but if you want to make the shortest and cheapest line and the best connection with the country beyond Castle Hill, I should recommend, if this line had not been constructed, a branch from Carlingford railway-station on the northern line.
179. Touching Dural only? Yes.
180. Have you made an estimate for a railway from Parramatta to Dural? No. A survey was made of a route junctioning with the main line on the Sydney side of the Parramatta station, but I have not done anything with it myself, nor have I recommended that the estimate should be revised, because I do not see that it has very much to recommend it. It would not come into Parramatta station. You would want a separate junction.
181. The question of railway communication direct between Parramatta and Dural has not received much consideration? No; it has been considered that the Westmead junction would be the best with Parramatta.
182. The Department appears to have confined its attention to the estimated cost of a tramway from Parramatta to Dural? Yes, that has been considered.
183. For some reason the estimate of a railway between these two points has dropped out altogether? You cannot conveniently get into Parramatta station by a railway. The only way of getting into Parramatta by a railway is to junction with the line on the Sydney side of the station. If you junction with the line on the Penrith side to make use of the Parramatta station, bringing the traffic in the right direction, you would have extensive viaducting across the town.
184. You cannot connect immediately with the station at Parramatta? Not without serious expense.
185. If you wish to do so you must come on the east how far? On the east the junction would be somewhere about Harris Park and on the west side at Westmead.
186. That the Department accept as final? Yes. Of course if you junction at Westmead you could run your trains into Parramatta.
187. But those are the two points on the main line where the take-off must be? Yes.
188. *Mr. Gilliat* and *Mr. Alexander* reported upon this question some years ago—I think in 1890? Yes. A great deal of valuable information was contained in that report, and it is a pity that it is not to hand. It could be easily supplemented and brought up to date, but *Mr. Alexander* has not his notes and he has no draft copy of the report. The report is valuable more from the information it contains than from the conclusion it draws.
189. *Mr. Roberts.*] In answer to *Mr. Trickett* you expressed the opinion that in the event of the line from Rosehill to Carlingford not being purchased, or in the event of your commencing *de novo*, you would favour a line from Carlingford Station, on the northern line, to Dural? If it were wanted that is the junction I should adopt if the other line were non-existent.

H. Deane.
6 Jan., 1898.

- H. Deane. 190. In expressing that opinion, have you compared the estimated cost of a connection by way of Pennant Hills with the cost of that line? Yes.
- 6 Jan., 1898. 191. The cost of the Pennant Hills connection is estimated to be £53,000? Yes.
192. Whereas the estimated cost of the Carlingford connection on the northern line is £63,000—a difference of £10,000? Yes.
193. Having that increased cost in view, do you still adhere to the opinion you have expressed? I have explained that the estimate I gave for the Carlingford-Dural line is undoubtedly excessive. I have no actual survey of the cross country connection, and I have, therefore, put it down at the average cost of the Rosehill to Dural line, but I am quite sure that it could be made for much less than that. Probably the cost would be brought down £2,000 or £3,000, but it would still be more costly than the Pennant Hills to Dural line. On the other hand, there would be a saving in distance, and it seems a more direct and better route on the whole than the one involving the Pennant Hills connection.
194. When you say a better route what do you mean? It is a more direct route.
195. But is not cost one of the chief items for consideration;—there is a difference of £10,000 in the estimated cost of the two lines? That might, perhaps, be reduced to £6,000 or £7,000.
196. From an engineering point of view you still prefer the junction at Carlingford on the northern line? Yes; on account of its giving a shorter and more direct line.
197. Have you any idea as to the earnings of the line from Clyde to Rosehill? No.
198. You have been over the line which has been offered for sale to the Government? Yes; I have been over the whole line up to Carlingford.
199. Is the same area of land reserved on each side of the line as is usual? There is enough. I think it is a chain and a half on the Rosehill line and a chain on the line beyond, with a little more for stations.
200. Is the line fenced? Yes.
201. Is the line in what I might term good working order;—would any expenditure worth mentioning be necessary to fit it for immediate use? No; it is in fairly good working order. I should insist on a little expenditure on the bridge. That would be all.
202. Have you any knowledge as to why the line from Rosehill to Carlingford has never been used for traffic? No; I do not know anything about it; it has never been passed by me. The owners have not applied for the line to be passed.
203. Is the line fenced all the way? Yes.
204. Are there any station buildings upon it? Yes; there are some small station buildings.

FRIDAY, 7 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY,

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the expediency of constructing a Railway from the Terminus of the Rosehill Railway to Dural.

Isaac Chapman, Manager, Rosehill Railway, sworn, and examined:—

- I. Chapman. 205. *Chairman.*] What is your position? I am a company manager, and manager of the Rosehill Railway. I was in the employ of the Bank of New Zealand up to the 31st December. For various reasons I resigned at that date. I have taken up other business, and it suited me better to leave their service.
- 7 Jan., 1898. 206. *Mr. Trickett.*] You were with the Bank for a number of years? For twenty years.
207. Therefore, you were with them at the time the private railway under the consideration of the Committee was originated? Yes.
208. When was that? I think in about 1886.
209. What position did the bank hold with regard to that railway at the start? The first Act was in the name of John Bennett, and is known as Bennett's Railway Act.
210. That was the Act enabling John Bennett to construct a railway from near the Clyde railway station to a point opposite Old Redbank? Yes.
211. Did he construct the whole of that line? Yes.
212. Then there was another Act known as Simpson's Act, authorising the extension of the railway known as the Rosehill railway, from a point at the north end of the Rosehill railway station, crossing the Parramatta River and terminating at Dural? Yes.
213. Under the first Act the railway was constructed to a point opposite Redbank? The terminus is a little lower down the river, owing to engineering difficulties. The line was built $\frac{3}{4}$ of a mile further than Redbank.
214. Under the second Act the line was continued as far as Carlingford? Yes; the first section.
215. How much of the railway has been worked regularly since its construction? The promoters have not themselves worked the railway. The Rosehill line has been worked under an arrangement with the Railway Commissioners which exists at the present time. The Commissioners run trains carrying passengers and goods to the Rosehill Racecourse, and to the terminus at the wharf.
216. Are trains run every day? I think three or four times a week for goods traffic down to the wharf.
217. As far as Rosehill is concerned trains are run on the day of the races, and on the occasion of great public gatherings? Yes.
218. The powers under the two Acts to which I have referred are now held by the Bank of New Zealand? Yes.
219. By mortgage or absolute transfer? By mortgage, I think.
220. Is the Bank in possession? If I remember rightly, the Rosehill railway stands in the name of the Bank of New Zealand; the extension of that railway stands in my name. It did stand in the name of Mr. B. C. Simpson, who promoted the railway, but it was transferred from him to me.
- 221.

221. At any rate the Bank, if it has not foreclosed, is now the possessor of any benefits derivable from these two railways? Yes. I. Chapman.
222. Can you tell us what the arrangement is between the Bank and the Government, as to the running of these two lines, is it for a certain sum of money, or for a percentage? The arrangement shortly is this:—for passenger traffic the Department runs the trains and provides the staff, and we maintain the railway; the Commissioners allow us 4½d. per passenger irrespective of class. 7 Jan., 1898.
223. That is on all occasions? Yes; unless in connection with the Eight-hour demonstration, when the Commissioners make a lower charge with which we have to fall in. We charge for Eight-hour Day a lump sum of £20 for the use of the line.
224. Is there a similar arrangement with regard to goods? In regard to goods we get a percentage on the basis of mileage according to the Commissioners' schedule, and in addition to that we make a charge of our own for shunting purposes to the Kerosene Oil Company of 8d. per ton. We make a charge to the Graziers' Meat Company at the terminus of 2d. per ton. That is a shunting charge in addition to what we get out of the Department.
225. Have you any statement showing us what has been the yearly profit upon this line? The total earnings from traffic from the 1st January, 1888, when the line was opened, until the 30th November, 1897, were, for passengers, £5,611 11s. 11d., and for goods traffic, £302 2s. 1d., or a total of £5,913 14s.
226. That would be for nine years? Yes.
227. An average of about £600 a year? That is about it.
228. Is that profit? No; that is the total earning. The maintenance charges for the same period amount to £3,846, more than one-half the amount. I should like to mention the disabilities under which we labour in connection with the Act. We tried to get these disabilities removed when the late Mr. Eddy was in office. We brought under his notice an Amending Act which we proposed to bring before Parliament; but he would not approve of it, and it did not therefore go any further. In the first wording of Bennett's Act, in reference to the rates, it is said that the rate should be the same as on the Government Railways between Sydney and Parramatta. That is a peculiar wording, because the railway has been constructed beyond Parramatta. Still, it is in the Act, and under that Act we have been advised legally that we cannot claim for more than the ordinary mileage rate; we cannot claim any terminal rate. We had no minimum rate under that Act, and the Commissioners have a minimum rate under all their Acts. As you are aware, they can make a minimum charge for 10 or 15 miles. We cannot do that under our Act. Under Simpson's Act I think there are two minimums, and when we asked the late Mr. Eddy to allow us to put before Parliament an Act to amend it, he stated that we had already two minimums, and he said there would then be a third minimum if we liked to enforce it against the public. We should not have done so, because the rate would have been too high; still we should have had the legal right to do so; therefore he objected to the amendment. Of course, if the Government were operating a railway of which they were the owners, they would get their minimum and terminal charges under their own Act.
229. The seventh section of Bennett's Act is in these terms:—"The said railway shall be open to public use upon payment of the tolls or charges as follows—that is to say,—for passengers, a sum not exceeding 6d. per head, each way"; you do not complain of that? No.
230. The section continues,—“For goods, the same rates per mile as are charged on the Government railways, and for this purpose such railway shall be deemed to be a continuation of the Government railway between Sydney and Parramatta”; will you explain how that operates against you? I will mention an instance: The Kerosene Oil Company had a considerable traffic from Joadja Creek to Rosehill. We could only charge under the Act the actual mileage basis. Supposing the class was 1d. per ton, per mile (the distance from Clyde to Rosehill terminus is 2 miles 20 chains), you could therefore only charge 2½d. The Commissioners brought the loading from Joadja to the Junction, and it would pay no company to transfer the goods out of the Government waggons at Clyde, take them to the terminus, and unload them again at 2½d. a ton; whereas the Commissioners having brought the loading the whole way (70 or 80 miles), had a consolidated charge for the whole distance, and the terminal shunting charge at the other end, which would pay them. That has been our difficulty all through. We have had large inquiries for wheat,—some thousands of tons of American wheat we could have conveyed over the line to Mr. Brunton's mill. It could have come out of the ship on the river, and could have been taken direct by us to his works. The Commissioners said,—“You can bring it so far, and no further; directly you bring it to the Clyde Junction we want our rights.” Mr. Brunton would have gladly paid us 6d. per ton to bring the wheat from the terminus to the Clyde station; but when the Commissioners had to handle it a short distance, they wanted their minimum, which was probably 1s. 6d. a ton; therefore I went so far as to suggest to Mr. Brunton that, to get over the difficulty, we should bring the wheat and flour to our terminus at Clyde, and cart it across the street, which we could have done for 5d. or 7d. a ton. That would have been a saving of 1s. upon the Commissioners' charge. Mr. Brunton was willing to do this; but, as it is not a secret, I suppose I may say that he was frightened of falling foul of the Commissioners over his other country business. Therefore the arrangement fell through. Those are two examples of how the wording of the Act has spoilt the Rosehill Railway. It has been quite impossible to work the goods traffic profitably.
231. In order to make the matter intelligible to outsiders will you just state where Mr. Brunton's mill is situated? Mr. Brunton's mill adjoins Hudson Brothers' works at Clyde. There is a narrow lane or street between the two works. The Clyde Railway Station is right opposite. Mr. Brunton's works are on the south side, and the station is on the north side.
232. The wheat could have been brought by lighter up the Parramatta river to the wharf, and could have been taken by your railway to Mr. Brunton's works, which would have been a cheaper way than bringing it all the way up the railway line? Yes. The Government levy a wharfage charge at Darling Harbour, and they had 13 miles of carriage as against, in this case, the lighterage up to the wharf, and a nominal charge for taking the wheat over our line to the works. The saving would have been considerable, probably 1s. a ton. Owing to Mr. Brunton's larger business with the Railway Department he could not afford to enter into the arrangement with us.
233. And although you interviewed the Commissioners you could not get the Act altered? No. A great deal of correspondence has gone on during the last few years in an endeavour to get the matter remedied because the unfortunate wording of the Act has practically killed Rosehill.
234. The figures you have given us showing the gross returns do not agree with the statement which was laid before us yesterday under the hands of the Railway Commissioners, dated 29th May, 1896, in which it

- I. Chapman. it is said "the proportion which has been paid to the Bank of New Zealand in connection with the Rosehill race traffic for the past three years has averaged £543 per annum, and the goods traffic at the present time is bringing in about £120 per annum, being a total of £663 per annum? I should think that would be correct. The figures you have there would be the gross amounts; you have to take off the maintenance charge.
- 7 Jan., 1898.
235. Could you let us know how much per annum the Bank of New Zealand is to the good in respect of this railway—I mean as regards net profit? I can do so. No interest has been charged since 1894, but I can give you the difference between the net receipts and expenditure.
236. Will you produce a tabulated statement showing how the matter stands? Yes.
237. I suppose the Railway Commissioners did not furnish you with a statement of what they received in connection with this line? No; they merely handed us our proportion.
238. Is the bank the original mortgagee of both these properties, or have they fathered the concern from the start? They advanced money.
239. I suppose that in case of necessity the Bank has full power to sell these railway lines, or any portion of them? Yes.
240. Can you tell us what amount is owing to the bank? The Rosehill railway proper, on the 30th September, 1894, the last date upon which any interest was charged, showed a debit balance of £53,837; the extension railway showed a debit balance of £43,174; together, about £99,000.
241. Is that merely in respect of the railway line? Yes; the racecourse has nothing to do with that.
242. The land is in a separate account? Yes; the racecourse has nothing to do with the Bank of New Zealand; it was floated into a company some years ago.
243. We understand from papers submitted by the Department that the Bank, a little while ago, was willing to sell the property representing this £99,000 for £25,000? Yes.
244. That is for the two lines of railway? For the whole thing as it stands.
245. That would include all the land required for railway purposes? Everything complete.
246. What is the width of these lines of railway? Upon the Rosehill railway, from Rosehill to the station, there is about 100 feet between the fences. It has been placed under supervision by the Railway Commissioners, and is, of course, of their gauge, and up to their usual standard. Up to the racecourse it is a double line, with a third siding on the racecourse station for shunting purposes. There are all the necessary cross-over roads, and that sort of thing. There are signals at the station at Rosehill, and there is a marshalling station there for the traffic officer of the Department. From that point to the wharf terminus it is a single line; I think the width would be 66 feet. I might add that at Rosehill there is a platform 1,000 feet long, with crush gates similar to those at Flemington Race-course. At the river terminus there are three sidings, or station platforms. There is a substantial wharf where the steamers can come up and unload; and there is also a crane for lifting goods into or out of barges or lighters. There is no shed; but there is a turn-table for the engines.
247. As to the wharfage rate? We pay the Government £20 a year for a wharf license.
248. Then as to the line on to Carlingford? It turns away to the left just after leaving the Rosehill racecourse and crosses the Parramatta River near Rydalmere Asylum. It crosses alongside the Asylum and Subiaco Convent at Rydalmere to the Kissing Point Road. It then passes through some bush land and some ordinary orchard settlement up to Carlingford at a distance of 3 miles 22 chains.
249. Is it a finished line? Yes. There are the ordinary station buildings. There are three stations. One at Kissing Point road, another about 1 mile further on, and a third up at Pennant Hills. They are substantial station buildings with platforms and all the convenience similar to those upon the ordinary suburban stations on the Government railways.
250. Are the lines of rail laid the whole way? Yes.
251. At a 4-feet 8½-inch gauge? Yes.
252. Is the bridge which you pass shortly after leaving Rosehill the property of the company? Yes; it is a steel bridge on steel cylinders across the Parramatta.
253. It is not built for heavy traffic? It is built for ordinary 60-ton engines.
254. Have you had any 60-ton engines over it? We have had a 60-ton engine over it frequently; but I believe, as far as we know from our own engineer, Mr. B. C. Simpson, that it will carry any traffic.
255. Can you give us in detail what the two works cost—the line down to the wharf and the extension to Carlingford? The total cost of the Rosehill line from Clyde to the Parramatta River is, exclusive of interest, £41,894, and of the other line, £43,174.
256. That is the actual expenditure upon the works? Yes.
257. Then there would be the land resumption? I think the figures I have given include that.
258. Can you furnish the Committee with the cost of the land resumption apart from the actual expenditure upon the work? I will do so.
259. Can you tell us how it is that the extension from Rosehill to Carlingford has never been used as a going concern? It is partly because we could not come to any terms with the Railway Commissioners. That is where the trouble comes in again. We should have to carry the traffic over the Rosehill line, and under that Act we are precluded from making certain charges. From inquiries we made there would have been a freight of 51,200 cases of fruit last year. The Department have a low charge from Parramatta, and we could not compete at that rate, carrying the fruit over both lines and allowing a percentage upon it.
260. At the rate provided for under section 7 of the Act it would not have paid? No; but it would pay the Commissioners if they had the handling of the whole of it.
261. But it would not pay to work the line separately as a branch line? No. Mr. Simpson reported as to the probable traffic upon the railway before it was built. He thought that under certain conditions the extension would yield about £1,900 a year, but taking matters as they stand at present my estimate is about £800. I am referring now to the first section.
262. I suppose the reason why the line has never been extended beyond Carlingford by the promoters is because of the failure up to that point;—I suppose it was thought that it was of no use to carry the line further? It was not that altogether. I might mention that the negotiations with the Government for the purchase of the railway have been going on for a considerable time. I should think it is quite twelve months since Mr. Reid made an offer to the Bank of New Zealand to purchase the line. As an officer of the bank I have seen a letter from Mr. Reid offering to purchase the line for £25,000. I think it is quite twelve

twelve months since that offer was made. While the negotiations for the purchase were proceeding the proprietors did not see any use in going to the expense of putting on engines and trucks, because, when Mr. Reid made that offer, we assumed that within a month or two the line would be the property of the Government. However, the proposal was thrown out in the Lower House, and it is now before you. The matter has been hung up, and we have felt that it was of no use to go to the expense of engines and trucks if the system were to be run only for twelve months. I have recommended the Bank of New Zealand ever since the offer was made to do nothing.

I. Chapman.
7 Jan., 1898.

263. What did you estimate that the goods-traffic would amount to up to Carlingford? My estimate was 60,000 cases of fruit, which I reckoned would yield, at the Commissioners charges, £375. Including the shunting charges, I estimated a total receipt of £750. If we started the line to-morrow with all the disabilities and with all the trouble in the district at the present moment owing to the drought, I reckon that it would pay for itself straight away—that the receipts would just about pay working expenses, that is, running our own engines and employing the Commissioners' waggons to carry the stuff, and allowing them certain percentage.

264. We have not an estimate by the Commissioners of what the earnings would be as far as Carlingford, although we have their estimate for goods and coaching as far as Dural;—have you gone into that question? No.

265. They put down the probable earnings as far as Dural from Clyde at £1,025 per annum? I think the traffic is very much under-estimated.

266. Are you in a position to say that the probable earnings of a railway between Carlingford and Dural would be quite as much as the earnings of the railway between Carlingford and Clyde? I should think quite as much. The best part of the district is from the present terminus out to Dural.

267. It is a larger fruit-growing district? Exactly. The area affected would be between Beecroft, Hornsby, and Dural to Parramatta. We estimate from Eastwood, 80,000 cases; from Carlingford, 85,000 cases; from Beecroft, 33,000 cases; from Thornley, 95,000 cases; from Hornsby, 39,000 cases and from our side of the Parramatta district, 180,000 cases.

268. In your estimate with regard to Hornsby you go only midway between Hornsby and Dural, I presume? Yes; because you cannot say how much would go to Hornsby and how much to Dural. A good deal would depend upon the road; it might be handier to go to Dural than to Hornsby; we have taken the traffic up to a point midway between the two places. I estimate that about one-third of the total I have given would be sent by steamer down the river from Ryde, Ermington, and other places.

269. Taking one-third off your estimate for the river traffic, you think that a railway to Dural would bring down to Clyde, and to your wharf at Redbank, how many cases? From 90,000 to 100,000.

270. What would be the value of that freight? Our proposed charge was about 1½d. a case, or about £500 in round numbers. Of course we are in the unfortunate position of having to work under an Act of Parliament which gives us no latitude in any way. The Commissioners can make charges which we cannot make.

271. This £500 from the area you have named does not seem to come up to the amount you said you would get from Carlingford? I said there would be 60,000 cases up to Carlingford. It is hard to say authoritatively what the quantity would be between Carlingford and Dural. The estimate of 180,000 cases in the case of Parramatta is based upon the quantity going through the Parramatta station. How much of that would come from beyond Dural and how much from between Parramatta and Carlingford I could not say.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

272. *Mr. Clarke.*] Have you any statement to make with regard to the proposed railway from Clyde to Dural? The Commissioners have made a report upon the proposal which I believe has been already laid before the Committee.

H.
McLachlan.
7 Jan., 1898.

273. You have nothing to add to that report? No.

274. Are you aware that two lines of railway—first Bennett's railway and then Simpson's railway—have been constructed between Clyde and Carlingford? Yes.

275. It is proposed now to extend those lines from Carlingford to Dural? Yes.

276. Do you think that extension would pay? In the opinion of the Commissioners the line would not pay, but would involve a heavy loss.

277. Have you any reasons to urge in support of that conclusion apart from those mentioned in the Commissioners' report? Nothing further. The Commissioners went over the line and carefully looked at it. Mr. Harper was over it beforehand.

278. The Commissioners have recommended the purchase of the lines already completed for the sum of £25,000? Yes.

279. Can you give any reason for the proposal to purchase this railway if it is not intended to extend it towards Dural? The Commissioners think that the purchase is one which might be made in view of all the circumstances.

280. *Mr. Hoskins.*] But they do not recommend the extension of the present lines? No.

281. *Mr. Clarke.*] Is it not rather strange that the Commissioners should favour the purchase of the line which has been constructed to Carlingford, and that they should not recommend its extension? One reason in favour of the purchase which, perhaps, if not mentioned in the report, I might now mention, is that there is already a certain amount of traffic on the Rosehill line. The Commissioners mention in their report that the amount paid to the company for passenger traffic has averaged £543 for some five years past, and for goods traffic £120 in addition. There is also to be considered the benefit which the main line has been receiving. Supposing the company declined to keep open the Rosehill line and we lost the whole of the race traffic, a good deal of traffic would be lost to the main line. In 1895 the proportion we received for the Rosehill race traffic was £2,300. Last year the amount was very much smaller, standing at £1,300; but it was an exceptional year. The average for the last five or six years has been about £2,000. In 1895 the amount was £2,300, and in 1896, £2,100; but last year, owing to the smaller number of race meetings, and less interest in the meetings, the amount fell down to £1,300. We get a certain fare for the race-course traffic to Rosehill, and we have to pay to the Rosehill Company out of that fare 4½d. per head; their proportion came to £543 for the years I have named. Our proportion, in a good year, would come to over £2,000. There is a certain amount of traffic upon the line already, and as it is being

H.
McLachlan.
Jan., 1898.

being obtained at a very cheap rate, the Commissioners thought it would not be an undesirable thing for the Government to effect the purchase. There has also been, for some few years past, the Eight-hour demonstration. We should not have had that traffic but for this railway. In 1896 we carried 13,000 passengers to Rosehill in connection with that demonstration. Last year the demonstration was not so good, and we carried only 5,000; but in previous years the demonstration has been a big success, and we have carried a large number of persons to it. These are some of the reasons which have led the Commissioners to recommend the purchase of the line.

282. What has been the greatest number which you have carried on the occasion of an Eight-hour demonstration? In 1896, which was a fair year, the number carried was 13,000.

283. Do you know anything of the proposal to construct a tramway from Westmead to Dural? The Commissioners reported against that line some years ago.

284. Another proposal was to take a line from Pennant Hills to Dural? That proposal has not been before the Commissioners.

285. Supposing Bennett's and Simpson's lines were not in existence, do you think that a line from Pennant Hills to Dural would do what is required as well as would the proposed line? I do not think any of them would pay; but Pennant Hills is a good centre because a large quantity of fruit traffic comes in there. Only within the last week the district has been fairly inconvenienced by the opening of a siding at Pennant Hills. Previously they had to send a mile further—to Thornleigh.

286. In the report before us, Mr. Price, an officer of the Department, recommends a system of tramways from Pennant Hills to a point near Ryde;—do you know anything of that proposal? I do not recollect the Commissioners considering it. I do not think it has been before them.

287. *Mr. Lee.*] You say you pay 4½d. per passenger to the owners of the private railway on account of the Rosehill race-course traffic? Yes.

288. What is the rate charged? It varies according to the first or second class; then, again, the passenger rates vary according to whether the ticket-holders are going to the grand stand or to the flat.

289. Is not a rate fixed in the Act? Yes.

290. It is a sum not exceeding 6d. each way, is it not? I think so.

291. What is the rate charged by you from Clyde to Rosehill? We have no local business; the arrangement is this: we book passengers from Sydney to the Rosehill race-course at charges varying from 1s. 6d. Out of the 1s. 6d. we should get 1s. 1½d., and the company would receive 4½d.

292. Can you give us an idea of what the railway earns between Clyde and Rosehill? We earn nothing, because we pay so much out of every fare. The 4½d. which we pay to the company has averaged, according to the Commissioners' report for five years, £543. The amount which we have paid the company has been the earnings of the local railway. The company has received £343, and we received in one year, as I pointed out, £2,300.

293. I presume your Department regulates the whole of the traffic to and from Clyde and Rosehill and down to the works? Yes.

294. What have been the gross receipts? I do not know that I can give you any more particulars than those already given. The local earnings are what we have paid to the Rosehill company.

295. But they would be no criterion of the actual earnings? There is no other way of showing them. We have not taken credit for anything out of the 1s. 6d. We have simply taken the earnings upon the main line, and in one year they amounted to £2,300. I am under the impression that at one time we paid the company only 3d. instead of 4½d. I do not know at what date the change was made.

296. There is no means of obtaining data showing the actual earnings of the short piece of railway to which I refer? There are none further than I have given you.

297. The amount paid to the Bank of New Zealand during the five-year period you have named would be insufficient to pay 2 per cent. upon £25,000;—are you prepared to show that the railway if purchased for £25,000 would earn sufficient to pay interest and working expenses? No.

298. Not even if it were extended to Dural? No.

299. I presume no revenue has been obtained upon the length from Rosehill to Carlingford? No.

300. Supposing it were worked, it would bring in some additional revenue? Yes, at an additional cost for maintenance and supervision.

301. Supposing there were additional revenues from that source with a small revenue from the branch down to the river, do you think that in the aggregate it would give a return large enough after deducting working expenses to pay interest? I do not think that at the present time the line would be a remunerative one.

302. But the Commissioners have recommended the purchase of the line? Yes.

303. In their report it is shown that the return would not be sufficient to pay interest. We should like to know upon what grounds therefore the purchase is recommended? You will find the Commissioners give their reasons in their report, dated May, 1896, and, as I have already pointed out, there is the traffic which is at present brought to the main lines to be considered.

304. As a matter of fact, the Rosehill Race-course, owing to this private railway communication, is a source of revenue to the Department? Yes.

305. I suppose it may be taken with the question that the £25,000 would be below the actual cost of the line? It is reported to the Commissioners—and they have no reason to doubt the *bona-fides* of the statement—that the line cost £110,000, and it is offered to the Government for £25,000.

306. Admitting the £110,000 to be an extravagant estimate, would the £25,000 be an amount less than that at which the line could be actually constructed at the present time? Much less, from what the Commissioners understand.

307. Is there any other use to which the Commissioners could put this branch line? I do not know of anything further; new meat-works are being established in that direction, and we expect to have a fair traffic from them.

308. Could that line be utilised as an additional storage for empties similar to the depôt at Granville? I do not think that point would come into consideration at the present time.

309. Supposing the line fell into the hands of the Commissioners, do you think the traffic from the extension to Carlingford would justify them in working the line up to that point? I think they would give it a trial to see what the receipts were.

310. It is only a short distance from the terminus to the Northern railway? Yes; about 2 miles I believe.

311. Therefore at that point you would have the two lines competing for the same traffic? Yes.
312. There is no doubt that the Great Northern line would to a certain extent be robbed of traffic which it is now taking? Yes.
313. Apart from that, do you think the present terminus would be a *dépôt* for fruitgrowers to the north? No, I do not think so.
314. Why? Because I think they would to a large extent come to Pennant Hills, which is within $1\frac{1}{2}$ mile of Thompson's Corner. It would be nearer to Sydney by the established line *via* Pennant Hills than by the proposed railway. That circumstance would at once deter us from making local charges on the proposed line.
315. Fruit has to be carried at a very low rate? Yes.
316. Would you be able to make special concessions to the fruitgrowers if they used this line as far as Carlingford? No. If you charged a lower rate you would simply divert the traffic from an alternative line.
317. The anticipated fruit traffic, then, would be of little advantage to the Department if carried upon this short extension? There would be no considerable new revenue.
318. Is the Great Northern line congested during the fruit season? I think not; we had no complaints.
319. There would be no reason for the construction of the proposed new line from that point of view? No.
320. The extension from Carlingford would still further rob the Great Northern line? Yes.
321. Since you are of opinion that you could not make the line from Clyde to Carlingford pay under the most advantageous conditions, do you see any possibility of the proposed extension paying, especially seeing that it would be in competition with the Great Northern line? No; the Commissioners report that there would be a heavy loss upon the extension.
322. There has been several references to the Commissioners for extensions into this fruit-growing district? Yes.
323. It would appear that the Commissioners do not favour any extension? Quite so.
324. Has there not been a development in the district, during the last seven or eight years, which would fairly warrant the extension of a light line of railway to it? The Commissioners think not.
325. The investigation into the proposal for a railway from Westmead to Dural was made some eight years ago? Yes.
326. Considerable settlement has taken place since then? Yes.
327. Although it was shown at that time that the revenue would be small, it is reasonable to suppose that it would be considerably larger now? The Commissioners' report is based upon the experience of a few weeks back; their report is up to date, having in view all the extra development to which you refer.
328. Do you now think that if there were railway communication into the heart of this great fruit-growing district considerably more traffic would be induced than exists at the present time? You might get some more, but you would not get enough to make the line pay. No doubt the line would be a great convenience.
329. Would it not induce persons to send more fruit into market than is sent at the present time? The question is, whether there is a market for such an increased supply of fruit.
330. You have no difficulty in carrying that which is now sent? No.
331. The summing-up of the Commissioners' ideas is this—that it is advisable to buy this private line at the price stated, and to open it for traffic as far as Carlingford? Yes.
332. The Commissioners think that that is as far as they can go at the present time? Yes.
333. *Mr. Wright.*] I think you said that the gross receipts from the Rosehill railway were last year £3,000? I took the year 1895 as being a fair year; that would include the traffic over the main line.
334. Do you think you would be justified in taking £3,000 as the average? Yes.
335. That is obtained from a comparatively small expenditure by the Department? Yes.
336. That would be running passenger trains only on holidays and race meeting days, and goods trains when they are asked for? Yes.
337. If the Commissioners took over this railway, I presume they would run two trains a day? Probably.
338. That would largely increase the expenditure? Yes.
339. Do you think there is a probability of the revenue being increased? I do not think so at the present time; there might be some diversion of traffic from the Parramatta River.
340. While the expense would be largely increased, you have considerable doubt as to the earnings being increased? Yes.
341. I suppose, as far as Rosehill itself is concerned, it is quite certain that the earnings would not be increased? I do not think the racecourse traffic would be increased; there has been no increase within the last few years.
342. Have you been over the country between the river and Carlingford? Not for the purpose of inspection; I have driven over it.
343. You are aware there are no orchards there worth speaking of? I do not know the country intimately; I have driven over it.
344. You know that the great fruit-growing district is beyond? I believe that Galston is about the best part of the district for fruit.
345. You do not think there is any probability of remunerative traffic of the existing line? Not on that section considered by itself.
346. Whom did the Commissioners send over the proposed line between Carlingford and Dural? I think Mr. Harper went over it, and that Mr. Usher went through the district in advance of him.
347. The Commissioners largely rely upon Mr. Harper's estimate of traffic in every case? Yes; they themselves went over this particular line.
348. Has anyone inspected the route from Parramatta through Baulkham Hills? I think the Commissioners went over that country some years ago when the Westmead route was under consideration; I do not think they have been over it since.
349. They disapproved of that proposal on the ground that there would be no traffic to justify the outlay? Yes.
350. Have the Commissioners any data as to the probable number of passengers between Parramatta and the Baulkham Hill and Dural districts? Mr. Harper made an estimate, but I do not know upon what he based his figures.

H.
McLachlan.
7 Jan., 1898.

H.
McLachlan.
7 Jan., 1898.

351. *Mr. Roberts.*] According to the evidence of the Under Secretary for Public Works, the Government requested the Railway Commissioners to meet the agent of the Bank of New Zealand with a view of possibly purchasing the Rosehill line? Yes.
352. Were any figures submitted for the consideration of the Commissioners showing that the line would be a profitable undertaking? The figures were before the Commissioners, as to the amount we had paid the Company in respect of traffic. They had, also, of course the estimated value of the line, and they were acquainted with its general character.
353. Were the figures of such a favourable character that the Commissioners felt justified in recommending the Government to purchase the line? Yes; the Commissioners thought it desirable to purchase it at the cost stated.
354. What percentage of profit was shown upon the figures considered by the Commissioners? I do not think any percentage of profit on the actual section was considered by them.
355. Had the Commissioners a desire to obtain the line; did they think they could work it more profitably than it is now worked:—in other words, had they any difficulty in dealing with the private owners? There was no difficulty as far as the private owners were concerned, and the Commissioners had no particular desire in the matter, but the question was referred to them by the Government, and their opinion was that it was advisable to purchase at the cost stated, which is a small part of the original cost of the line.
356. In round figures it is estimated that it will cost £6,000 per mile to construct a railway from any point to Dural? Yes.
357. Have the Railway Commissioners asked the Engineer-in-Chief whether it would be possible to construct a line at one-half of the proposed cost to serve that fruit-growing district? I do not think it would be possible to do that; the works would be too heavy;—but it is an engineering question.
358. *Mr. Farnell.*] The Commissioners do not feel inclined to recommend an extension of the existing railway, because they are of opinion that it would not be a commercial success? That is their opinion.
359. You have not had an opportunity to gather statistics? The Commissioners have gathered them, and have gone to a great deal of trouble. Mr. Harper will show you the figures upon which the Commissioners' opinion is based.
360. Their estimate is based upon the present condition of things? Quite so.
361. Have they taken into consideration the possibilities of future development in the district? The Commissioners have done so; but they do not think the increased returns are likely to be so immediate as to warrant them in recommending the railway at the present time.
362. What is the limit of your suburban division at the present time? We have a suburban limit of 22 miles, and a further reduced suburban area to Penrith. The direct suburban area would extend in the direction of which you are speaking to Hornsby, the suburban limit being 22 miles. Dural would be about 26 miles from Sydney.
363. The major portion of the proposed line would be within the limit of the suburban area? Yes.
364. Do you think there is a probability of the district becoming a favourite one for suburban residences? I do not think it will become so for many years to come. You can judge that from our experience in regard to (say) Carlingford and Beecroft. Those places possess advantages in the way of trains which do not exist upon the proposed line, yet settlement in that direction is comparatively slow from a railway point of view.
365. You do not think suburban settlement is likely to take place in that direction immediately? Certainly not to an extent to influence the consideration of the railway.
366. Would there be any justification for taking over the section already constructed without extending it to Dural? I think so.
367. *Mr. Hoskins.*] Did you not say in reply to Mr. Lee that the Commissioners did not believe that the present line from Clyde to Carlingford would pay? Yes; I do not think it would pay the cost of construction and working expenses.
368. The Commissioners see no probability of the receipts increasing to such an extent as would enable the line to pay interest? Not in the immediate future.
369. Is it not probable that there would be some settlement in the neighbourhood of Rosehill if the Commissioners took over the line? I do not think there would be much settlement there for other than local purposes; that is for people engaged about the district.
370. Do you not think that the running of a train a day would induce people to settle in that neighbourhood? I do not think there would be any big increase in settlement.
371. Would it not attract people from the neighbourhood of Parramatta? There might be a limited increase, but I should not be sanguine as to there being any big increase of traffic following upon the taking over of the line.
372. Do you know whether, since the branch line has been taken to the river, the Meat Company has patronised it? I think a month or two will elapse before the company is in full working order.
373. Have they indicated to the Commissioners that they intend to use the train? Yes; that they will use the train.
374. They will be employing a large number of men? When they are in full swing.
375. Would not the Kerosene works also furnish loading? They would give a certain amount of traffic.
376. They have 100 men employed? Yes; and most of their coal and shale would be conveyed by rail. I think Mr. Harper's estimate shows that that traffic would help the line to the extent of £150 a year in direct products.
377. *Mr. Humphery.*] Have the Railway Commissioners considered the construction of a tramway to serve the district to the north of Parramatta? I do not think they have considered anything more than the line referred to them from Westmead. They have had under consideration the question of working the Rosehill extension by tram motors, but I do not think they have absolutely decided what they would do.
378. What has been your experience of the Camden tramway for the carriage of produce? Fairly satisfactory.
379. Mr. Deane thought it would not be practicable to have a small system from Parramatta to Dural owing to the sharp curves;—have you given any consideration to that subject? I do not think the Commissioners have considered that matter.
380. You will see from the wall map that one or two proposals must have been considered by the Commissioners or by the Minister; are you familiar with them? The two proposals considered by the Commissioners

Commissioners have been that from Westmead and the one now before you I do not think the Government tramway proposal has been considered by them.

381 On that subject you are not prepared to give the Committee any information? No.

382 You do not know whether the Commissioners are of opinion that either a railway or tramway service would be satisfactory from Parramatta? No, I am pretty certain they have not considered the tramway question

383 *Mr. Trickett*] If this line of railway from Rosehill to Carlingford were not in existence, and were not offered to the Government at apparently a very tempting price, do you think the Government would contemplate the construction of a line to Carlingford? I do not think the Commissioners would recommend it

H
McLachlan.
7 Jan, 1898.

TUESDAY, 11 JANUARY, 1898

Present.—

THOMAS THOMSON EWING, Esq (CHAIRMAN).

The Hon FREDERICK THOMAS HUMPHERY

The Hon JAMES HOSKINS

The Hon. CHARLES JAMES ROBERTS, C M G

The Hon. WILLIAM JOSEPH TRICKETT

The Hon DANIEL O'CONNOR

HENRY CLARKE, Esq

CHARLES ALFRED LEE, Esq

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq

FRANCIS AUGUSTUS WRIGHT, Esq

FRANK FARNELL, Esq

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Isaac Chapman, Manager, Rosehill Railway, sworn, and further examined —

384 *Mr. Trickett*] You were requested to furnish the Committee with some particulars as to expenditure upon the line of railway from Clyde to Carlingford? Yes. I have prepared, at the Committee's request a statement showing the total expenditure at date for construction, resumption, &c, of the Rosehill Railway from Clyde to the Parramatta River, also showing the traffic returns on the same length of railway I have also a summary of the expenditure to date for construction, resumption, &c, of the Carlingford and Dural Railway from the Parramatta River, first section The following are the particulars of the expenditure —

I. Chapman.
11 Jan, 1898

SUMMARY of Total Expenditure at date for Construction, Resumptions, &c, of Rosehill Railway from Clyde to Parramatta River

	£	s	d
1 Paid contractors	18,407	1	4
2 Paid Hudson Bros (Limited) for supplying and erecting bridges, as per Schedule	2,933	16	2
3 Paid engineering staff, for original surveys, preparing plans, and superintending construction	3,059	3	1
4 Paid Commissioner for Railways—Permanent way materials, erecting signals, interlocking at Clyde Junction, and freight and turntable	6,030	1	10
5 Paid property owners for land resumed for railway purposes, as per Schedule No I	9,902	2	6
6 Paid for crush gates on platform at racecourse	89	18	11
7 Paid for buildings, caretaker's cottage, &c	248	8	7
8 Paid crossing road, Parramatta tram	192	13	0
9 Steam crane appliances for use at wharf	455	0	0
10 Paid for coal stage	46	4	8
11 Paid sundries, as per Schedule II	12,573	0	3
Grand total of cost	£53,937	10	4

I—LAND RESUMPTIONS—CLYDE TO RIVER SECTION

Actual cost of land resumed from various owners for railway purposes

NOTE—One claim yet to be settled Dr Manning's, on account of the Asylum—claim about £600

Attached to the summary in each case is the schedule asked for by Mr. Farnell, showing the resumptions and the amounts paid to each property-owner through whose property the railway passed. It will be seen that the amount paid on the first section of the Pennant Hills Dural line was £5,774, and in the case of the line from Clyde to the Parramatta River £9,902. There is one claim which has yet to be settled. It is a claim of £600, which we are resisting as exorbitant, in connection with the Rydalmere Asylum.

385 *Mr Farnell*] The whole of the claims were made and settled upon the betterment principle? Yes, I think we went to arbitration in nearly every case.

386 *Mr Trickett*] The amount you have put down for land resumption does not extend, I understand, beyond Carlingford? No, that is the terminus.

387 You have no title to any part of the land beyond there? No.

388 I suppose you have no estimate of what it would cost to acquire the necessary land between Carlingford and Dural? We had an estimate made. I think that roughly it was estimated that the cost would not exceed £50 an acre.

389 What would that total up? It is a question of 9 miles in length by 66 feet in width.

390 And you think £50 per acre would be an average price? Yes, I have no doubt Mr Simpson will be able to give you the necessary information on that point.

391 Have you a title to all the properties you have enumerated, with the exception of that at Rydalmere? Yes.

392 You mentioned some summaries of traffic returns upon the line from Clyde to the Parramatta River? Yes, I have a summary of traffic returns and a summary of maintenance charges. The total receipts from

from December, 1888, to November, 1897, were £5,913, and the total maintenance charges for the same period were £3,846 19s. The maintenance has averaged about £420 per annum. As I explained the other day, the goods traffic has been really nil owing to the difficulty we have had in working under the conditions of the Act. The particulars are as follows:—

SUMMARY of Traffic Returns, Clyde to Parramatta River, Rosehill Railway, from 1st January, 1888, to 30th November, 1897.

	Passengers.	Goods.	Total.
	£ s. d.	£ s. d.	£ s. d.

£3,846 19 3

393. Of course the passenger traffic varies according to the amount of entertainment offered at Rosehill racecourse? Yes.

394. Do you know what interest the returns represent upon the capital outlay for that part of the line? No; but I should think it would be about $\frac{1}{2}$ per cent.

395. In the particulars you have given you have not charged anything for interest on the outlay? No; and, of course, it is only fair to remember, in connection with the question of maintenance, that it has cost us a good deal more to maintain the line than it would cost the Railway Commissioners. We have had to keep on a permanent gang, whereas the Commissioners would have sent in a flying gang once a month, who would have picked up the road and have gone out again. As I pointed out the other day, upon the 2nd-class fare, 1s. 6d. to Rosehill, the Commissioners have received 1s. 1 $\frac{1}{2}$ d., and we have received 4 $\frac{1}{2}$ d.; so that the Commissioners have taken the bulk of the profit out of the Rosehill line, and have paid little or nothing for it.

396. But even if it were otherwise the line would not be a paying concern, having regard to the amount which it cost? Not upon the amount it has cost; but at the price at which it was offered to the Government it would be a bargain. I think railway officers would tell you that they can make a very handsome return on £25,000.

397. The figures you have given us represent what you have got out of the line; but have you any means of letting us know what the line really earned;—you have received only a certain portion of the passenger money, and a certain portion of the goods receipts? Mr. Harper would give you the earnings by the Government, and if you add their total earnings to those which I have given you, you would have the total earnings of the line. The Chief Traffic Manager would show what the cost of maintenance would be. The £3,800 to which I have referred would disappear. The line would be worked in conjunction with the main line, and the cost of maintenance would be very small. I have also prepared an estimate of present traffic on the Rosehill railway and the Carlingford extension. It is as follows:—

ESTIMATE of present Traffic on Rosehill Railway and Pennant Hills Extension:—

ROSEHILL earnings average (say) £650 from (1) Rosehill Race-course traffic; (2) Goods traffic—Australian K. O. and M. Co.; (3) Goods traffic—Sandown Meat Works.

With regard to the latter item, I need hardly add that, as the works are not finished yet, I am not able to gauge the probable earnings; but as the Company has spent over £40,000, and intends developing a very large business in live stock and canned goods, &c., I anticipate receipts will materially enlarge when the Company gets to work. With reference to the expected traffic from Rosehill to Pennant Hills road, Mr. B. C. Simpson, the engineer, made careful estimates of the paying capabilities of the line to Pennant Hills road, with the probable traffic to be expected from the present population along its route. For the latter purposes the gross receipts from the four most similar stations on the Government railways, viz., Parramatta, Granville, Richmond, and Camden, were taken from the Railway Commissioners' last return, and the populations of the districts served by these stations from the census returns of the Government Statistician, and it was found that the average gross railway receipts per head of population was £4 0s. 4d., or say £4. According to the same authority, the population of the district which is served by the line was 2,733, and assuming the same gross revenue per head, the total gross receipts with only the present population would be £10,932.

The gross revenue payable to the Company would be, therefore.....	£3,644 0 0
And of this 25 per cent. must be paid to the Company as <i>pro rata</i> proportion for running over their line.....	911 0 0

Leaving a balance of gross receipts of	2,733 0 0
From which must be deducted for maintenance and station expenses 30 per cent. ...	820 0 0

Leaving a net revenue of	1,913 0 0
--------------------------------	-----------

Mr.

I. Chapman.
11 Jan., 1898.

Mr. B. C. Simpson proposed that the traffic should be run by the Railway Commissioners with their own rolling stock, and thus only a portion of this revenue would be due to the Company.

As against this estimate I had occasion recently to consider the matter myself, and gathered the following estimate that might be expected at the present moment:—

60,000 cases of fruit, at average price of 1½d. per case	£375
Parcels, &c.	100
1,000 tons of manure.....	20
Passengers	225
Shunting charges	25
	£745

Necessarily the estimate is limited for the first year until the public had become used to the line and experienced its advantages over the road haulage to Parramatta, and low also, owing to the dry season of last year when the estimate was made. I am confident that with good seasons a revenue of over £1,000 would be secured.

With regard to the estimated cost of the extension from Pennant Hills road to Dural of £60,000: The Rosehill railway and the first section of the extension comprise altogether about 5½ miles of railway, which represents to the Company about £90,000. The 9 miles from the end of the first section to Dural are estimated to cost £60,000. If, therefore, the railway stops at the end of the first section, the heaviest outlay will have been incurred; but it will not tap the district where it will have a monopoly of the traffic, and where consequently the greatest returns may be expected. The orchard districts of Dural and Galston will be untouched.

I am unable to give any detailed estimate of the probable traffic from Pennant Hills road to Dural, but I have every reason to believe, in view of the facts touched upon in the previous paragraph, that I am within the mark of estimating the total earnings at £1,500.

Total earnings	£1,500
Add earnings, 1st section	1,000
Add Rosehill Railway	650
	£3,150

I am of opinion, with fair seasons, that the estimate is a reasonable one, and I am disposed to think that after awhile the railway being in daily use would naturally materially increase settlement in the districts. We have been assured that at a small expense a short siding could be connected at or near the second station on the first section, connecting with a valuable stone quarry from which additional earnings would be forthcoming.

I should explain that there is a large quarry close to the second station. We were asked to connect with it. The stone is represented to be excellent, and it is stated that it would materially assist the revenue.

393. What do you put down as the total estimated earnings of the whole line? From Clyde to Dural, £3,150. Mr. Simpson taking four stations, and considering what the Government earn under such circumstances—and he considers his estimate reasonable—shows a revenue of £10,000.

399. The total revenue of the extension from Carlingford to Dural is estimated by the Commissioners to be £1,025? Yes; but that is not taking account of the Rosehill line, in respect of which they would receive from £2,000 to £3,000 a year.

400. Are you able to say whether the bank would now sell the property for £25,000? Yes; they would.

401. That sale would represent their interest in the whole concern? Yes; and I estimate that there are £25,000 worth of moveable plant. There are £11,000 or £12,000 worth of rails there which are all new.

402. It would be not only the railway extension to Carlingford which the bank would be prepared to give up for £25,000, but also the line of route from Carlingford to Dural? We would give you all our rights—the whole thing, lock, stock, and barrel.

403. As far as you know, have the bank as mortgagees of the property ample power to give a title to it, should the Government purchase it? Yes; I have looked into that matter, and I find that the whole of the properties are registered in my name.

404. There would be no possibility of the original proprietors coming in and preferring a claim? No; they have all conveyed to me, and I should simply transfer to the Department. They have transferred to my name. The bank preferred that my name should be used, as I hold all their Australian property under a letter of trust to them.

405. As far as you know the titles of all the resumed properties are valid and effectual? Yes.

406. Are they also in your name? Yes; the whole of them.

407. You do not know of any contract which would prevent the sale to the Government? No; the only transaction outstanding is the resumption of land at Rydalmere; but that is a Government matter, and it is in course of settlement.

408. Is the permanent way between Rosehill and Carlingford in a good condition? Yes; it is all in first-class condition.

409. How long is it since you have had an engine running over it? No engine has been on the line since the Railway Commissioners were there last, and they were there two or three months ago.

410. You cannot speak as to the present state of the line? I was over it a fortnight ago in a trolley, and it then seemed to be in good order.

411. Is it a steel-rail line? Yes; I think the rails are 74 lb. to the yard. They are very heavy rails.

412. With regard to any lands which have been sold adjoining this railway line, have the owners of it any rights with regard to a railway which would prejudice the sale? None whatever. I should like to make one matter quite clear to the Committee on account of statements which have been made from time to time in Parliament with regard to the Rosehill racecourse. It has nothing whatever to do with the Bank of New Zealand or with this railway. From time to time it has been said that the Rosehill Racecourse and Rosehill Railway were one property; but the railway has nothing to do with the racecourse. The racecourse was sold, and is owned by different people altogether. The railway belongs to the Bank of New Zealand, whereas the racecourse belongs to the Rosehill Racecourse Company (Limited), in which the bank has no interest. The bank owns the platforms within the railway fences.

413. So that the railway can be run entirely irrespective of the Rosehill Racecourse? Yes. There is a platform at the racecourse, but you will notice that the fence goes along the racecourse boundary. Therefore, the platform is the bank's property. The platforms belong to us, and are in our deed.

414. *Mr. Hoskins.*] Have the persons whose land has been acquired been paid for it? Yes; in cash.

Thomas Rhodes Firth, Engineer-in-Chief for Existing Lines, Department of Railways, sworn, and examined:—

415. *Mr. Lee.*] You know the two private lines of railway, known as Bennett's and Simpson's lines, between Clyde and Carlingford? Yes; I was over them nearly twelve months ago. T. R. Firth.
416. I believe you then went over the lines for a special purpose? Yes; I examined the line to report upon it to the Commissioners. 11 Jan., 1898.
417. You furnished the Commissioners with a report, which has been placed before this Committee? Yes.
418. You have since seen it? Yes.
419. Is it correct? I believe it is.
420. Upon one portion of the line—that is, upon the extension from the river to Carlingford—the grades are pretty heavy? Yes.
421. You point out in your report, that those grades are with the traffic? Yes; the traffic on the up journey would be downhill to Sydney.
422. Presuming that freight came from the Carlingford end, it would have an easy grade to run upon? Yes.
423. Did you inspect the whole of the line, including the branch to the Parramatta River? Yes; down to the wharf.
424. Did you find it constructed in accordance with the rules generally laid down in the Railway Department? Yes; it was similar in construction with the ordinary construction under the Government.
425. Were you of opinion that the line was in a state in which it could be used at once for traffic without any large expenditure for renewal? Yes; at that time it could have been used without any further expenditure.
426. Were you satisfied with the system of drainage adopted? Everything seemed quite sufficient to carry off the water, so far as I could judge.
427. Quite sufficient to preserve the line from washaways? Yes; I did not see any signs of flood-marks, or anything likely to cause any floods.
428. What waterways are there, with the exception of the bridge over the Parramatta River? I cannot give you a list of them, but I think there are generally 3-ft. culverts. There are no large watersheds; they are only of small area in each case.
429. The only waterway of note is the Parramatta River? Yes.
430. And over that there is an iron bridge? Yes.
431. What was the condition of that? It was a new bridge in good condition.
432. Was it sufficient to carry the traffic which would pass over it? I think quite sufficient to carry the traffic. I am not sure that it would be sufficient to carry a heavy traffic with heavy engines; but that is not likely to be required upon that line.
433. Was there a single or double line over it? A single line.
434. Was the bridge built for a single line? I cannot recollect; I think the double line only goes to the racecourse.
435. You were satisfied as to the construction of the bridge? Yes.
436. You think it was sufficiently strong to carry the traffic which might pass over it from that part of the country? Yes.
437. Of course it is not the sort of bridge you would put on the main line for heavy traffic? No; I think I should make it stronger.
438. But considering that the line is a branch line for only medium traffic, you think the bridge is ample? Yes; we ran over one of our ordinary engines—not a heavy one—at the time, and the bridge was perfectly satisfactory as far as that was concerned, although I never tested it.
439. Before there was any talk of the sale of these lines to the Government—before, in fact, the railways were completed—was the bridge tested by your Department? Not to my knowledge. I remember that the drawings were sent in to the Construction Branch. It was during Mr. Deane's absence, when I was Acting Engineer-in-chief. I had the calculations of the stresses made in the office; I remember that now. They were satisfactory so far as light engines were concerned, and that was what they were really calculated for.
440. Were the promoters not required under the Act to build a bridge to the satisfaction of the Railway Commissioners? I think not; I think it was to be built to the satisfaction of the Public Works Department.
441. Then, so far as your Department was concerned, no test was made? Not that I am aware of.
442. When you were inspecting the line for the purposes of your report, did you make any test of the bridge? No; I did not. I remember that the calculations of the stresses had been made in Mr. Deane's office before the bridge was constructed, and from that I took it that the bridge would be strong enough to carry the traffic. Supposing the bridge then talked of were decided upon, I assumed that they would make tests to see what it would carry.
443. Providing it were carried out according to the design and specification, it would be sufficient? I have no doubt it would carry all it was designed to carry.
444. If the bridge were carried out according to the design submitted to the Department, there would be no doubt about that? No; but we test all bridges, although we know pretty well what they will carry. We always test them to see that they will carry far beyond the quantity they are supposed to carry.
445. If it became a question of the Railway Department taking over this line, one of the inquiries made would be as to the state of the bridge? Undoubtedly.
446. I observe that in your report you say that the whole of the under and over bridges with the exception of the Parramatta River bridge are of timber;—that would lead one to suppose that there are other bridges? There are over and under bridges in the case of roads. I am not sure that there is not a watercourse some distance up, in connection with which there is a timber bridge. I may say that these bridges were built from the same designs as those in use in the Construction Branch. Mr. Simpson obtained copies of the plans before he commenced work, and I think he pretty well followed them out.
447. You made a close inspection of these over and under head bridges when you were about to report to the Commissioners? I cannot say that I inspected everyone of them.
448. Do you happen to know what state of repair they were in? I know the general design of them, and that was the principal thing I examined. I saw that the work was very well carried out.

- T. R. Firth. 449. Your report on that date was to the effect that the bridges were in good order? Yes.
- 11 Jan., 1898. 450. And that is only twelve months ago? Yes.
451. They may want screwing up? They are almost sure to require that.
452. The woodwork might require painting? Scarcely, in twelve months.
453. You were perfectly satisfied that the bridges were in a good state of preservation? They were, at that time.
454. You would look upon them as having a life of ten years? As regards the bridges themselves, I should give them from twelve to fifteen years without repairs; but they would require a coat of paint in that time.
455. I suppose that as far as the bridge over the Parramatta River is concerned, that might last 100 years if the foundations were properly put in? Yes; it depends entirely upon that.
456. Which Department tests the bridges? The Construction Department always tests them. I think that latterly an officer from the Existing Lines Branch has made the tests, but not in all cases.
457. For some years past there has been an arrangement between the private owners of these lines and the Railway Commissioners as to the running of trains;—could you tell us whether this portion has been under the supervision of the maintenance branch? Yes; the portion from Clyde to Rosehill. Our men have been doing whatever repairs were necessary.
458. At whose expense? At the Commissioners' expense, I think; I cannot say whether any other arrangement was made.
459. Then, so far as that portion of the road is concerned, the private owners have nothing to do with it? I cannot say what the arrangement is between the Commissioners and the private owners. I know nothing about it; but to the best of my belief our men go over the road occasionally to see it is all right, and I presume if any repairs were required they would make them.
460. The Department is in this position: If they made an arrangement to conduct the traffic they would necessarily have the control of maintenance? They must see that the road is kept in order for traffic to go over it.
461. It is not likely that the Commissioners would commit themselves to running traffic over the road unless they were satisfied that the line was in a proper state? Certainly not.
462. Have any trains been run beyond the wharf on one side and Carlingford on the other? None beyond inspection trains, I think.
463. There has been some little traffic upon the Carlingford portion by the private owners? I cannot say. I was only over the line once—when I went through to inspect it. I did not go over it before nor have I been over it since.
464. Has the Department used the line for the conveyance of material or goods? I cannot say. It is possible that they may have used it from the wharf. It has never once come before me in any shape or form.
465. Are you of opinion that the area of land fenced in for railway purposes from Clyde to Carlingford is sufficient for the purposes of this particular railway? I think it is a chain wide—that would be sufficient.
466. If the line were taken over by the Department, do you think it would be necessary to resume any more land in the vicinity of the racecourse platform for the carrying on of the traffic? I do not think so.
467. In other words, if the line were to come into the hands of the Department, the Government would not be involved in a large expenditure for increasing the accommodation;—you think the accommodation provided is enough for all purposes? Yes; but I do not think my opinion upon that point is of any value, because I have never been over the line to see the traffic. I understand the Traffic Department have reported that the siding accommodation is sufficient.
468. You reported upon the length of the platform? Yes; I gave the length of the platforms and sidings.
469. You are aware that at certain seasons of the year a large number of persons frequent Rosehill, and particularly upon Eight-hour Day;—do you think that under conditions of that sort the platform accommodation would be sufficient? I think so. If I remember rightly the platform is 900 feet long by 40 feet wide. It has been up to requirements, I think. I have never heard of any complaint or of any trouble in regard to it.
470. Supposing the platform became the property of the Railway Commissioners, would they have to embark in any very large expenditure to enable them to safely carry on the traffic to and from the racecourse? Most certainly not.
471. If the line came into their hands to-morrow could they conduct the traffic at once without further expenditure? Certainly, so far as the racecourse is concerned.
472. If the place became very largely frequented on occasions such as Eight-hour Day, the question might arise whether it would be wise to provide further platform accommodation? That question might arise.
473. Would there be room upon the land which the Commissioners would receive with the line for the extension of the platform accommodation? I cannot remember what land there was. I know that it was reported that the sidings were pretty well arranged for the traffic, but as to their exact shape or whether there was room to increase them or not I do not know.
474. We want to know whether, if there is going to be an extension of traffic in this direction necessitating extra accommodation, there would be room for its provision? I could not answer that question. The traffic officers would be better able to tell you whether such a thing was probable. I daresay the Commissioners would be very glad for the traffic to increase to such an extent as to necessitate the acquisition by them of additional land.
475. Is the railway of the same capacity as the suburban line? So far as the permanent way is concerned, yes.
476. The rails are of steel and of the same weight as are ordinary rails? Yes; beyond the river. They are iron rails up to the racecourse, but they are quite strong enough. They are 70-lb. rails. We have some of the same kind of rails now on the main Southern line.
477. Were they new when they were put down? I cannot say.
478. The line would be in all respects equal to your suburban line for running purposes? It is of the same character; but it is not equal to the suburban lines.

479. It would be good enough for medium traffic? It approaches the Illawarra line, for instance. No doubt it would be good enough for medium traffic. T. R. Firth.
480. Such as passenger traffic to and from the racecourse? Yes. 11 Jan., 1898.
481. Supposing it were considered desirable to extend traffic beyond Carlingford to Dural on the same basis, would it not be possible to run lighter rolling-stock over the line? Yes; it would be possible to do so, but you would have to have a certain weight of engine according to the traffic. The engines must be strong enough to pull even light goods uphill.
482. Supposing that in the course of a short time the motors and tramcars were displaced from our tram-lines in the city, could they not be made use of as rolling-stock upon such a line as we are speaking of? They could; but I do not think it would be advisable.
483. What would be the objection? They would not pull enough. I do not think they would pull any traffic at all. They are not strong enough; they are not built for it. They do not carry coal and water enough.
484. Therefore, it would not be economical to use them? I do not think so.
485. What about the tramcars themselves? They could be used, but they would have to be run at a slow speed. You could not run them at more than 8 or 10 miles an hour. That would be quite as fast as it would be advisable to run them.
486. Would it be advisable to increase the speed beyond that upon this particular line? I do not know whether it would be advisable or not; but you would very soon hear of it if it were not done.
487. You know of the line between Morpeth and East Maitland, over which tramcars are run? Yes.
488. They are the only passenger cars on that line? I believe they are now.
489. Hauled by what sort of engine? Small tank engines.
490. At what rate of speed are they run? I suppose they would run at about 12 miles an hour.
491. If that rate of speed is sufficient between Morpeth and East Maitland, surely it would be good enough upon this line between Clyde and Carlingford? I daresay it would; but you would have buses from Parramatta competing with you, and beating you.
492. The traffic would come from a different quarter, in which there are no omnibuses? If there are no omnibuses there might be covered waggonettes.
493. It has been represented to the Committee that if light rolling-stock were required, special rolling-stock would have to be specially made for the purpose, but since tramcars are at work upon existing lines we want to know what objection there would be to their use upon a line of this sort? If you took the tramcars away from the city, you would have to replace them with other cars, and I do not see where the advantage would be, therefore, in getting them. You could build light rolling-stock which would suit your purpose.
494. If the speed were only 12 miles an hour, it would not matter very much whether you ran light or heavy cars? It is a question of cost.
495. You would raise no serious objection to the use of such cars as are in use upon the tram lines in the city if they would suit the traffic? No; I do not see any objection to their being used under certain conditions; but I think it likely that if it were advisable to use light rolling-stock, it would be specially made so as to suit the platforms. The tramcars would not suit the platforms.
496. If the line were open for traffic to Carlingford that would probably become a depôt for the fruit traffic, and if it went on to Dural that would still be a depôt for the fruit traffic;—in your opinion, what would be a fair maximum load to allow for the line? I should hardly like to answer that question.
497. You are aware that fruit has to be carried very cheaply in order that any profit may be derived from it—it must be carried in large loads;—what load would this line be capable of carrying? In regard to fruit, you would have to use ordinary rolling-stock, because it would not stand transhipment. You would have to use the ordinary waggon. I daresay a train once a day would bring down all the fruit very well.
498. You think the line would carry any ordinary train-load? Yes.
499. At a low rate of speed? Yes.
500. In carrying goods a short distance it is not necessary to have a high rate of speed? I do not think there would be any trouble in bringing 300 or 400 tons down the line you were speaking of.
501. Therefore, it is sufficiently strong to carry any traffic likely to be taken over it? I have not the slightest doubt of that.
502. *Mr. Roberts.*] Have you been over the various routes shown upon the plan now before the Committee? No; I have not. I was only over the line from Clyde to Carlingford after it was finished. I also went along the main road to Dural.
503. Have you been along the road from Dural to Parramatta? No.
504. Do you know the nature of the country? Yes; it is very undulating country.
505. The whole country there is of an undulating character? Yes.
506. After leaving the river the grades appear to be very steep? Yes, there is a rapid rise all the way; it is undulating and rising as well.
507. I suppose that accounts for what I might term the high estimated cost of the line, about £6,000 a mile? Yes; it is the undulation chiefly that has caused that. The earthworks are heavy.
508. Does it not appear to you that if a good case could be made out for giving to Dural and the surrounding district a better means of getting its produce to market, the question of tramway communication might be worth considering? A tramway would answer the purpose for all the traffic down, but it means transhipment, and that would lead to expense in both money and time.
509. Where would be the best connection if tramway communication were favourably considered? I think the Pennant Hills connection would be about the most suitable; it is pretty well on the top of the range if I am not mistaken. It would keep pretty level high ground all the way along. I think that from Carlingford also you could keep on pretty level ground.
510. A tramway could be advantageously constructed there? I think so.
511. Could not the difficulty of transhipment be got over? That is a problem which has been considered for the last twenty or thirty years, and it has not been perfectly solved yet. There are hundreds of different schemes of transhipment, changes of gauge, and so on, but none have been satisfactory so far.
512. If a tramway were constructed could not the gauge be similar to that on the railways? Yes; but you would not be able to take ordinary trucks on a tramway unless it were made as a railway. You would

- T. R. Firth.
11 Jan., 1898.
- would have to make a railway strong enough, that is, with sufficient sleepers, to carry heavy traffic. When you say a tramway we understand light rolling-stock.
513. Do you tranship in the case of the Campbelltown to Camden tramway? No; that is a railway-railway-cum-tramway. It is more than a tramway. The passenger traffic tranships, but the goods go right through. We have been relaying it with heavy rails to allow that to be done.
514. Do you not regard that line as a tramway from the ordinary point of view? It is called a tramway.
515. What is the difference between the Campbelltown to Camden line and the line you have in your mind, where it would be necessary to tranship? I do not know but that you could make a similar line from Pennant Hills to Dural, or from Carlingford to Dural, as that in existence between Campbelltown and Camden. It would be a question of cost, whether you would have a line at a cheap cost with light sleepers, or a railway with heavier grades and heavier sleepers.
516. What would be the cost per mile, roughly speaking, of a light line such as you are referring to? A light line might cost anything from £2,000 to £3,000.
517. I mean a light tramway similar to that in existence between Campbelltown and Camden? I have never been over the line of country to which you are referring, so that I really cannot say; but from what I know of the lay of the country, the line might be laid from £3,000 to £4,000 a mile.
518. It appears from a document which has been put before us that a line of tramway from Dural to Parramatta is estimated to cost about £2,200 a mile? I do not know what is proposed to be done in that case. I should be sorry to say that a tramway could be taken along any of the roads in the district to which you refer for £2,000 a mile.
519. Is the country in that direction more undulating than between Campbelltown and Camden? I think it is.
520. Do you know what the cost of the line from Campbelltown to Camden was? No; I am not sure whether it was £8,000 or £10,000 a mile. I can furnish the Committee with the exact amount; but I do not think it would be an index to what such a line would cost now.
521. Do you know in what year the Camden line was constructed? No.
522. It was before the advent of our light railways? Yes.
523. Would it not be more heavily ballasted than a line at the present day would be? I do not know that it would be. They only intended to run light rolling-stock over it so that they would not put down much ballast.
524. You are of opinion that the line cost about £8,000 a mile;—what would be the reason for that expenditure? The rates at the time the line was made, for one thing; material was much more expensive, and there are some fairly heavy earthworks on the line.
525. Allowing for all that, we have since built light lines of railway for £2,000 a mile? Yes, with no cutting in 60 miles, besides you can easily put in £1,000 a mile in ballast. If lines were properly ballasted they would cost nearly £2,000 a mile for the ballast alone. Upon the light lines you have been making for £2,000 a mile there is no ballast at all.
526. You think a light line of railway might be put down between Carlingford or the Pennant Hills Station and Dural, for how much? Say, £4,000. I give that estimate without knowing very much about the country.
527. Such a line would be so constructed as to avoid transhipment? Yes.
528. If a line such as we have been contemplating were constructed, could the present tramway rolling-stock be utilised in view of the probable transformation of our steam tramways into electric tramways? Some of the rolling-stock might be used up in that way. Of course if they had to get new rolling-stock for such a line as you are speaking of they would not get that particular kind of stock; they would get stock of a different class for approximately the same money.
529. But the tramcars could be used with advantage upon such a line? They could be used, and I dare say that in the event of the cars not being required for use in the city, and this line being made, they would be so used.
530. Is the gauge of the steam tramways the same as our railway gauge? Yes; exactly the same.
531. *Mr. Hoskins.*] Supposing the Government acquired the line between Clyde and Carlingford, before you sanctioned the working of it for ordinary traffic would you not require to thoroughly inspect it? The Commissioners would not commence to work it until I had reported that it was fit to be worked.
532. You are not prepared to do that now? I should have to go over the line again, of course.
533. Are there not timber culverts and box-drains between Clyde and Carlingford? Yes; there are several box-drains about 3 feet in width.
534. Does not your experience show the timber drains require frequent inspection as well as tarring or painting? Yes; all bridges require screwing up, especially new ones.
535. Does it not frequently occur that you find white ants destructive to wooden culverts? Yes.
536. Therefore, you do not think it would be safe to work the line from Clyde to Carlingford until all the bridges had been thoroughly inspected and put into good condition? Yes; I believe some person is inspecting the line to-day in view of the Committee travelling over it to-morrow.

THURSDAY, 13 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	}	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.		CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.		THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.		GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.		FRANCIS AUGUSTUS WRIGHT, Esq.
		FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

537. *Mr. Wright.*] You have prepared a report with regard to the railway now under consideration? J. Harper.
Yes; it is as follows:—

1st November, 1897. 13 Jan., 1898.

ROSEHILL-DURAL RAILWAY LINE.

As directed by the Commissioners, I have made careful inquiry as to the possibilities of traffic on this proposed line.

As submitted it is, I understand, intended to include the portions already built as well as the proposed extension from the termination of Simpson's line at Carlingford. For the purpose, therefore, of gauging the relative merits of each, it is perhaps desirable to deal with the various component parts of the line separately.

They are as follows:—

- (1) Rosehill Racecourse and Parramatta Park line. Length 2 miles 20 chains.
- (2) Simpson's line to Carlingford, terminating at 17 miles 37 chains from Sydney. Length 3 miles 28 chains.

The above stand under offer to the Government for the sum of £25,000.

- (3) To be constructed:—

Carlingford to Dural, 9 miles 6 chains, terminating at 26 miles 43 chains from Sydney. Estimated cost, exclusive of land resumption, £57,000, or £6,292 per mile.

As far as No. 1 portion is concerned, it is possible to estimate the traffic somewhat accurately as the returns which have been kept during the series of years of its administration by the Proprietary Company are available. Quite recently, however, the erection of extensive works for the treatment of beef and mutton by the Stockowners' Meat Company of New South Wales having connection with this line gives promise of increased traffic.

I gather from the secretary, Mr. Fetherstonhaugh, that the intention of the company is to carry on slaughtering of directly consigned stock, as well as that purchased at Flemington, on a large scale. In addition to this, selected portions of the sheep dealt with at the country establishments of the company will be forwarded to Sandown Works for canning purposes. The items of traffic which will be rail-carried to or from the works are:—Live-stock, mutton, sheepskins, coal.

Assuming that the establishment has an average season of work, and that a charge of 6d. per ton, or about 2d. per ton per mile, were made for all dead weight, and 2s. per truck for stock, the revenue from this source would be:—

Skins.....	350 tons	} @ 6d. per ton	£96 5 0
Mutton to Sydney	1,500 "		
Mutton, ex country ...	1,000 "		
Coal	1,000 "		
Stock	500 trucks	@ 2s. each	50 0 0
			£146 5 0

As pointed out by the Commissioners in their minute of May, 1896, the average earnings paid to the owners of the line by the Department on account of passengers carried to Rosehill during the years from 1891 to 1895 amounted to £2,715, or an average of £543 per annum.

The A. K. and O. Co. pay us, in connection with services rendered, £120 per annum. Were the present shunting charge made to this company altered to a through rate of 6d. per ton, the earnings would be about £20 per annum.

The total revenue, therefore, of this portion of the proposal would amount to:—

Rosehill Racecourse	£543
A. K. and O. Co.	120
Stockowners' Co.	146
£809	

It is not possible to so accurately forecast the possible revenue from the extension constructed to Carlingford, owing to the circumstance of river competition, and the proximity of the areas occupied and under cultivation to Parramatta and the North Coast line.

The distances from the terminus at Carlingford are:—

To Sydney, per rail, 17½ miles.	
To Parramatta, per road, 4½ miles.	To Sydney, per rail, 14 miles.
To Eastwood, per road, 2½ miles.	To Sydney, per rail, 13 miles.
To Ermington Wharf, per road, 3 miles.	

Of course, in a district such as this, the producing areas cover a great deal of country, and whilst the above distances are from a central point and the termination of the existing line, a very large percentage of the population and production lies closer to Parramatta, Eastwood, Carlingford, or Ermington Wharf, and those so situated would most probably continue to use these points for trading purposes with the metropolis, more especially, if any rate were imposed on the new line which would compare unfavourably with those existing on the present trade routes.

The total population of the districts of Dundas, Carlingford, Rydalmere, and Ermington—which practically comprise the trafficable area of Simpson's line—is 1,500; and the estimated production of fruit 120,000 cases per annum.

A large proportion of the residents are engaged in fruit-growing, the district not at present being residential for Sydney business people to any extent.

The passenger traffic, which, as may be gathered from the character of the population, is not an extensive one, is carried from the various points indicated, but chiefly by river, the fares by steamer being 9d. single and 1s. return. The railway fares from Eastwood (13 miles) are 1s. 4d., 1st class, and 10d., 2nd class, for the single journey. Even were the ordinary suburban area fares charged from the terminal point of the line to Sydney—say, 18 miles—the single fare would be 1s. 9d. and 1s. 1d. and return fare 2s. 8d. and 1s. 8d., 1st and 2nd class respectively.

It is, I think, apparent that the line would only divert a comparatively small proportion of the passenger traffic at present carried by the more expeditious and cheaper routes. There is, however, no doubt that in time to come, when increasing population demands expansion for residential purposes, this district, with its climate and elevation and soil, will undergo great expansion. At present, however, there would be no warrant, I think, for constructing an expensive line for such small prospects of traffic as are apparent.

As

J. Harper.

Goods Traffic.

3 Jan., 1898 *i.e.*, Sydney, are against the prospects of any great development in this extension. At the present time, of the 120,000 cases of fruit produced 90,000 find their way to Ermington wharf, and are carried by steamer to Sydney at the rate of 2d. per case.

Our rates for fruit within a radius of 54 miles of Sydney are :—

15 to 20 miles	1d. per case.
21 to 25 "	1½d. "
26 to 30 "	1¾d. "

Were ordinary extended rates charged on the line, the rate from Carlingford would be 1d. per case or the same as to Thornleigh (20 miles). In view of other means of carriage, including our own main Northern and Western lines, it is exceedingly doubtful if any local rate could be imposed, and even if it were I do not think it could exceed ½d. per case for a limited quantity of the production.

Mr. Chapman, of the Rosehill and Dural Co., has furnished me with the following estimate prepared by him with a view to running a train service with the Company's rolling stock :—

60,000 cases of fruit at 1½d per case	£375
Parcels, &c.	100
1,000 tons of manure	20
Passengers	225
Shunting charge	25
	£745

That the users of the line would not pay 1½d. per case in addition to the 1d. from Clyde I am confident, especially in view of the fact that the most sanguine of the Dural people only suggest 1d. per case additional as the rate they would be prepared to pay the Commissioners.

The estimate of quantity is also, in my opinion, too sanguine. Most of the fruit growers employ horses on their holdings; then employed labour is relatively cheap, and cartage for several miles extra, which is all that is involved, would be amply compensated for by the difference between the present railway rate of 1d. per case from all North Coast stations except Hornsby in the district and 2½d. per case *via* Rosehill. The difference amounts to 5s. per ton, which is nearly equal to the ordinary rate paid for a man, horse and cart for the whole day.

As far as general goods are concerned, we could not look for a higher rate than the extension of our main line rates in view of the same set of circumstances of competing routes.

For 18 miles our rates are :—

Miscellaneous.	A	B	1	2	3
1/10	2/8	3/6	7/7	8/11	11/4

and these are the Pennant Hills rates also, whilst the all-round rate per steamer is 3s. 6d. per ton. Heavy goods, such as sugar, &c., are delivered by road from Sydney.

There are very few stores in the whole district, the disposition of most of the residents being to purchase personally in Parramatta or Sydney, or from supply carts which canvas the neighbourhood.

We might possibly carry a certain quantity of low-grade traffic, such as manure, timber, &c., but I do not think this would bear more than the through rate.

My estimate of the earnings of this section would be :—

	£	s.	d.
Fruit, 30,000 cases at ½d. each	62	10	0
Manures and other low-class traffic, 1,000 tons at 6d.	25	0	0
Passengers	150	0	0
Sundries	100	0	0
	£337	10	0

No. 3.

Proposed Construction from Carlingford to Dural, 9 miles 6 chains.

It seems to me that very much greater considerations are involved in this proposed expenditure on construction than in the acquisition for a considerably reduced amount of a line which already has an assured traffic.

Although the estimated cost of construction only is given as £57,100, the fact that the proposed line is so located, owing to the broken character of the country as to run practically parallel with the main road of the district, severing approaches to the latter for a distance of nearly 7 miles, must materially increase the capital cost of the line.

The same set of circumstances as have already been referred to in connection with Simpson's extension to Carlingford will more or less operate to render an estimate of the traffic to a certain extent speculative. The only factor which is absent is the alternative river route.

The residents of the district claim that the following settlements are within trafficable area of the proposed line, viz. :—Pennant Hills, Castle Hill, Kenthurst, Galston, Dural, and Kellyville; the united population being about 2,000, almost exclusively engaged in fruit-growing. At present the business is done with Hornsby, Thornleigh, and Parramatta. The following table, giving the distances by rail to Sydney from the principal points on the proposed line as, also, the distance of existing stations, will serve to illustrate the position :—

New line.	By rail.		By road to	Distance.
	Miles.	Miles.		
Dural	27	..	Parramatta	12
Kellyville	23	2½	Pennant Hills	6½
Rogan's	22	½	Parramatta	10
Thompson's	20	..	Pennant Hills	9
Hornsby	21	..	Parramatta	7
Thornleigh	18	..	Pennant Hills	3½
Pennant Hills	18	..	Pennant Hills	1½

During last year the following fruit was forwarded from the districts claimed :—		Cases
Castle Hill and Kellyville to Parramatta		26,000
Galston to Hornsby		33,000
Pennant Hills, Castle Hill, Kenthurst, and Dural to Thornleigh		191,000
Total		250,000

Were the line built there is no doubt a portion of the fruit would be forwarded by it. As already stated, the rate for 20 miles is 1d. per case. The rate from Dural would be 1½d., and from the intermediate points 1¼d.

Assuming that 150,000 cases were carried at 1½d. and 100,000 cases at 1¼d., the increased revenue would be £208 6s.

The residents would say that they are prepared to pay a higher rate than at present. This may be true of those who reside in those portions of the district more distant from the existing line, but for reasons already stated it is very doubtful if the majority would be willing to do so.

Assuming, however, that a certain number of producers were willing to pay 1d. per case more than at present, and that 150,000 cases were so despatched, the revenue from this source would amount to £625.

With

With regard to general merchandise, the same conditions as to source of supply occur as in the Carlingford section of the line, minus river carriage, as do also the remarks as to passengers. J. Harper.

With regard to the latter, an excellent coach service runs to Parramatta connecting with four trains per day, the through fare from Pennant Hills being 1s. In addition to this, most of the residents have their own vehicles, and when business requires them to travel, would most undoubtedly take advantage of the more frequent, cheaper, and better service of the main line over shorter mileage rather than have recourse to such an intermittent and mixed service as the traffic requirements of the branch line would demand. 13 Jan., 1898.

I do not think, taking all circumstances into consideration, that this section of the line would produce more than the following traffic:—

150,000 cases of fruit, at 1d.	£	
2,000 tons special class goods, at 1s.	625	
Sundries	100	
Passengers	100	
	200	
	£1,025	

Of course, were this section built, the already-constructed portion would require to be credited with the carriage of the above traffic over its mileage.

	SUMMARY of traffic estimate.		
	£	s.	d.
No. 1—Rosehill line.....	809	0	0
No. 2—Simpson's line to Carlingford	337	10	0
No. 3—Line proposed to be constructed to Dural	1,025	0	0

General Remarks.

The impression I have formed in dealing with this matter is that in view of the assured traffic on the Rosehill portion of the line, and the fact that Simpson's line is necessarily involved in any negotiations for its acquisition, the circumstances warrant its being purchased at such a reasonable amount as will not burden its earnings with too heavy interest on its capital cost.

There is no doubt that in the hands of the Commissioners it can be economically worked, and that it will operate to a certain extent in the development of an excellent district.

With regard to the Dural extension, I am firmly convinced that many years must elapse before such expenditure as that proposed would be warranted in the construction of a railway, and that it is certainly premature to call upon the country to bear the heavy annual loss which must be sustained in interest and working expenses.

Relatively to many other portions of the Colony, the district is well served both by existing lines of railway and road approaches thereto, whilst in no case is the distance to rail communication so great as to impose an impracticable or even serious barrier to the industry of the settler. I, however, quite agree with Mr. Burge, of the Construction Branch, that something might be done to ease the road grades and metal the remainder of the main roads.

538. What is the cost, do you suppose, of obtaining the £800 from the Rosehill section of the railway? I think you would be able to obtain that from the Commissioners' report.

539. Do I understand you to say that the £543 paid by the Railway Commissioners to the Rosehill Racecourse Company is the net amount after deducting the expenses of working the section? That would be the net profit.

540. The amounts of £120 and £146 are on the other hand the gross receipts from which subsequently working expenses will have to be deducted? Yes.

541. In estimating the traffic upon this line—both that on the line already constructed and that on the proposed extension—have you considered the effect which it would have upon the existing traffic on the Main Northern line;—I should like to know what proportion of the total tonnage you estimate would be withdrawn from existing railways and what proportion would be entirely new traffic? In making my estimate I assumed that those who live close to Carlingford would pay the additional $\frac{1}{2}$ d. over the present rate. Out of the traffic coming to the line, some would be withdrawn from boat, and some from those who cart into Sydney at the present time.

542. But the bulk would be traffic upon existing lines? Yes; a great portion of it we are already carrying by rail.

543. Then while obtaining a certain amount of traffic for the new railway, you would be depriving existing lines of a portion of their traffic? Yes.

544. Have you considered that in making your report? I have dealt with the line as it stands. I am assuming that in getting $\frac{1}{2}$ d. a case more we should get no less in quantity than we are getting from Pennant Hills at 1d. a case. I assume that we should get traffic from Carlingford at 1 $\frac{1}{2}$ d. a case. I am crediting the line with $\frac{1}{2}$ d., and am leaving the 1d. out of the question.

545. So that your estimate could not sensibly affect the returns from existing lines? No. The returns from passenger traffic may be affected a little; but you cannot consider a matter of that kind.

546. While you are obtaining a slight increase of traffic, the Department would be saddled with the additional capital cost and the working expenses of the proposed railway? Yes.

547. You think it desirable for the Government to take over the line from Clyde to Carlingford, including the branch to the racecourse? I think it would be desirable. Certain interests have been created there. The Rosehill traffic is an important item as far as that itself is concerned.

548. But that passenger traffic is obtained only at certain periods—on the occasion of race meetings and things of that sort? Yes.

549. It is obtained at a minimum cost, because you run the trains only on particular days? Quite so.

550. Whereas if the line were taken over by the Commissioners one or two trains would have to be run per diem, whether there were traffic or not? There would be a couple of trains per diem at least.

551. That would increase the working expenses? Yes; I think the Commissioners have shown that.

552. Do you think there would be any corresponding increase in the traffic to justify the outlay? I have shown in my estimate that we expect to get from the section beyond Rosehill £300 odd.

553. Taking Rosehill itself, is there any possibility of the passenger traffic being largely augmented if two trains a day are run? No.

554. So that in order to obtain the same passenger traffic which you are receiving now you would have to considerably increase your wear and tear and wages? Yes; I might explain that as far as the Australian Kerosene Company's works and the new meat-works are concerned, their traffic would be made to fit in with the service to Carlingford. The same engines and men would do that work. To-day it has to be done by shunting the engines.

555. What would be the total rate per ton to and from Sydney for the meat-works and the Australian Kerosene Company? Three shillings a ton.

J. Harper.
13 Jan., 1898.

556. On the top of that, when the products reach Sydney, they have to be shipped, and there will be cartage to be paid? The traffic to Sydney would be meat offered for sale there. The export traffic would be shipped by river; we do not expect to get that. That is not included in my estimate.
557. Is it not possible that the construction of the line may lead to the traffic being bigger than you have estimated? I do not think so. I think I have estimated quite enough.
558. You estimate 2,000 tons of mutton? We shall not get all the mutton from there. All the case stuff would come by river, and also the tallow. The meat we should get would be the selected portion coming down frozen. You may take my estimate as being a very careful one. I have altogether excluded everything which would go by river.
559. This is your second report in regard to this district? No. About two years ago I gave some figures to the Commissioners which I have practically repeated in the present case.
560. Prior to drafting your report of November last, did you go over the district yourself? Yes.
561. You carefully inspected it? Yes; in addition to that I have had one of my most reliable officers engaged for a fortnight in the district collecting information for me.
562. You had three sources of information—the railway returns, the report of your own confidential officer, and the results of your own personal observation? Yes.
563. So that you have no doubt in your mind that your estimate is absolutely correct? None whatever. I have not the least doubt of it.
564. The Commissioners' report is a fairly liberal one? Yes.
565. The Commissioners say that their estimate of the traffic is based upon a liberal scale? It is liberal. The Committee have been put in possession of the report, and they will see in what directions it is so.
566. Do you think the expected revenue from passengers is also a liberal estimate? I do not think people will go all round the world to get such a service as will be given in this instance.
567. In respect of the two sections you anticipate a total revenue of £2,500? Yes.
568. How is the land held—in large or small holdings? Speaking relatively, I should say in comparatively small holdings.
569. Did you inquire whether the holdings were leasehold or freehold? I know that there are no leaseholders from the Crown.
570. Do you understand that the bulk of the fruit-growers are leaseholders or freeholders? I could not speak as to that.
571. Would the difference in tenure affect the returns in any way? Not a bit.
572. What is your impression in regard to the development of the fruit-growing industry in the district? I should say that with an increasing population such as there is about Sydney, and with intelligent cultivation there ought to be a good prospect before the district.
573. Is there plenty of land still available for cultivation? Yes.
574. Is there likely to be any other traffic upon a railway? I think that by and bye the district will be sought after for suburban residences to a greater extent.
575. Are there not considerable areas of timbered land in the neighbourhood of Dural? There were, but nearly all the good timber has gone now.
576. You see no probability of a building timber trade springing up? I certainly do not think there is any probability of it.
577. Fairly good timber is drawn from some portion of the district for railway sleepers is it not? Not that I know of.
578. You saw nothing in the district to lead you to believe that any new industry apart from fruit-growing will eventuate? No; and I think the district is an admirably served district judging from my experience of other districts concerning which I have given information.
579. How would the district be served by a connection with Pennant Hills? It would be served by almost any connection; but the country would not be well served by the expenditure. I do not think the position of any part of the district warrants railway construction.
580. What is the nature of the country about Kellyville? Very good.
581. It is close to Seven Hills? Yes, at the extreme end; you would be getting near to the Windsor and Richmond line. I hope the Committee will understand that I do not denounce the district. I merely speak of it relatively to other districts.
582. Have you been over the country between Westmead and Castle Hill? I am a native of the district, and I therefore know something about it.
583. Would you report favourably upon railway extension in that direction? No.
584. Or from Parramatta? No.
585. What is your opinion of the proposed tramway from Parramatta to Castle Hill along the Windsor road? It would be ornamental, I daresay.
586. Would it serve the district better than the proposed railway? I do not think it would serve portions of the district better.
587. Do you think it would pay? I cannot say as to that; I am not dealing with that matter now.
588. We are informed that there are four omnibuses a day between Castle Hill and Parramatta, and that the passenger traffic is considerable? Probably.
589. You do not think there would be enough to warrant a railway or tramway? No.
590. You do not think that either a railway or tramway beyond Carlingford would be justified? No.
591. I suppose I am right in assuming that were it not for the fact of this line being already constructed, and being offered at a low rate to the Government, you would not favour a railway in that direction? I should not, certainly.
592. You think that the railway being offered to the Government at a cheap rate, it will be advisable for the Commissioners to take it over? My opinion is that, apart from other considerations and assuming that it would not directly pay, it is not a desirable thing to have a private line close to the metropolis in the hands of a company.
593. Would you recommend the construction of a railway from Clyde to Rosehill if this line were not constructed? I should not like to speak on that subject. Of course there are a lot of interests there.
594. Considerable manufactures are springing up at the head of the Parramatta River? Yes; but the object in going there was to get cheap water-carriage.
595. You think the line at the price at which it is offered would probably give working expenses and interest?

- interest? My view is that it would be well for the Crown to acquire it at the price named, or for less if they could get it. J. Harper.
596. Do you think the line will pay at the quoted price? I think there is a fair prospect of it paying. 13 Jan., 1898.
597. *Mr. Roberts.*] You think the purchase would be a wise one at £25,000? Yes.
598. I understand you to say that the annual profit from that portion of the line would be £809? That would be the earning.
599. Does that £809 include all charges whatsoever? The £543 on account of the Rosehill Racecourse would be net gain.
600. Is that after providing for the payment of interest on the capital? No; decidedly not. It will not be absolute profit; it would go towards the payment of interest. It will be 4½d. per passenger more than we get to-day, and out of that return the only expense we should incur would be maintenance of the 2 miles to the Rosehill racecourse. We do not maintain that length to-day. We work the traffic, and out of the amount paid to us we hand over 4½d. to the owners of the line for every passenger carried. If the line were the property of the Crown, administered by the Commissioners, that 4½d. would not be paid. Therefore, £543 per annum would be saved; but out of that sum it would be necessary to maintain the 2 miles of railway—that is to fettle it. Outside of that there would be no more expense incurred in connection with the line than is incurred to-day.
601. You would have to provide the interest on the outlay? Yes.
602. That would come to £750 per annum? Yes; but that would be right through to Carlingford.
603. What would be the net profit on the £25,000 after providing for the maintenance of the line and the payment of interest? That I could not say; probably the Commissioners have informed you.
604. Can you ascertain the amount? I will ascertain if the Commissioners are prepared to give it.
605. You would not recommend the extension of the purchased line from Carlingford to Dural? No.
606. You think the line ought to go no further in a northerly direction? No.
607. Would you recommend a connection from Dural to any point on the Northern line such as Pennant Hills? I do not think the circumstances of the district or of the Colony warrant the expenditure which would be incurred.
608. The undulating nature of the country would make the line an expensive one? It would be an expensive line to construct, and I do not think the people engaged in production in the district are labouring under great disabilities as compared with the districts in the rest of New South Wales.
609. Having been over the district did it not strike you as being the home of what I may term a very prosperous people? Yes; and that to my mind is strong evidence that they are not suffering under great disabilities in their production. They look as if they were doing fairly well without a railway.
610. But with the railway would not things be still more prosperous, and would there not be a larger settlement of population? Probably things would be more prosperous for the people there, but not for the general community who would have to pay for the railway.
611. Having regard to the great expenditure involved? Quite so. There is a doubtful prospect of traffic being picked up owing to the competing points I have mentioned in my report.
612. If the Northern line did not run where it does, the question might be looked at from a different aspect? Decidedly. As a matter of fact the Northern line was designed where it is to serve the interests of that district. It might have been a great deal better in the general interests of the community had the line been carried to some other point.
613. What is the furthest distance of any well-known orchard from a railway station? Sixteen miles would be the extreme limit from a railway station of cultivation in that direction.
614. Throughout New South Wales, when railways are under consideration, any distance within 20 miles is regarded as fairly convenient? Yes; even when heavy bulk has to be shifted in the shape of wheat or wool. One strong point in connection with this line is the severance which would be created. The map before you shows it more or less. As a matter of fact the line means severing the whole of the properties from one end of it to the other, and that would be an important element in the cost. I do not think you can deal with the capital cost of the line without getting at what the resumption would mean. I never knew of a line where that consideration was of more vital importance unless, perhaps, it is the city line. The severance is very great. Along the whole length the line runs parallel with the existing main road, and cuts off the whole of the frontages.
615. Have you been out as far as Galston? Not for four or five years; but I obtained a return of all the present traffic from that point.
616. Leaving Dural, is the country very good? There is very good country about Galston—some of the best in the district.
617. It is as good as the country round about Kellyville? Equally as good.
618. Do the Galston people bring their fruit to Hornsby at the present time? Hornsby is their station.
619. Would the freight be the same from Dural to Sydney by the proposed line as it is from Hornsby to Sydney? It is a 1½d. from Hornsby, and it would be a 1½d. from Dural; but I think persons would pay a half-penny a case more to come from Dural on account of the ascent to Hornsby.
620. Is the road from Galston to Hornsby more level? It is a better road; it is not so rapid in its ascent.
621. Where do the people of Dural send their fruit? Some go to Parramatta and some go to Thornleigh.
622. When once you reach the railway line the rate of carriage is the same from Thornleigh to Sydney as it would be from Parramatta to Sydney? Yes, as I pointed out in my report.
623. You have given an estimate of £120 of traffic from the Australian Kerosene Company's works? Yes.
624. Would it not suit the company to avail themselves of the river traffic? My estimate is for crude oil which would be brought from the mountains.
625. You could make pretty sure of £120? Yes; it is a question whether we should not reduce the existing charges, in which case the estimate would be reduced.
626. You estimate a revenue of £146 per annum from the Sandown Meat Company? Yes.
627. Are not their works on the banks of the river? Yes. What they propose to do is this: Stock will be brought from the country for treatment at the works. In the first place, therefore, stock will be carried there. After that, a certain portion of the slaughtered mutton will be treated by chilling for shipment or for sale in the Sydney market. That will have to be carried by rail. Sheepskins are also carried by rail on account of the more rapid despatch and the saving of sweating. There will also be the carriage of coal to the works from the mines. 628.

- J. Harper.
13 Jan., 1898.
628. From the southern area you pointed out that there would be 130,000 cases of fruit, 90,000 of which go by water;—is not the water freight 2d. a case? Yes.
629. Would it not suit the growers better to take it to the nearest station on the northern line, from which place they could get it conveyed to Sydney for a penny a case instead of paying 2d. for water carriage? They prefer the other means of transit. I suppose they have their reasons for it.
630. If the line from Clyde to Carlingford were acquired by the Government, what portion of the 90,000 cases would it be fair to assume the railway would get? I have credited that section of the line with 30,000 cases.
631. You still think that 60,000 cases would go by water? Or by some other means. Some is carted in. I think that from the immediate vicinity of the terminus of the present line the fruit would go by rail, otherwise it would not.
632. Would the fact of the fruit being landed at King-street instead of Redfern influence the fruit-growers in sending it by water? That might have something to do with it. I fancy, however, that the fruit is landed at Bathurst-street, at the head of Darling Harbour.
633. That would be pretty well to the same point to which it would be conveyed by the Railway Commissioners? Yes; there is a certain amount of co-operation at work in the matter, and of course the return loading has also to be considered.
634. Do you think it would be wise to connect Dural with the Pennant Hills station? Perhaps I speak rather strongly on the subject from my knowledge of the requirements of the country generally, but in view of that knowledge I cannot see that this district requires a railway or a tramway from any point. I think the more pressing needs of other districts in the country should receive consideration before any is given to this district. That is my personal opinion.

FRIDAY, 14 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

William Thomas Wright, J.P., sworn, and examined:—

- W. T. Wright.
14 Jan., 1898.
635. *Chairman.*] You are resident on the Windsor-road at Baulkham Hills? Yes.
636. *Mr. Roberts.*] How long have you resided in the district? About four years and nine months. I am a native of Victoria, and prior to going to the Windsor-road, I was living for about seven and a half years at Marrickville.
637. How many acres are there in your estate fronting the Windsor-road? One hundred and seventy-five and a half acres.
638. How many acres are under cultivation? I have 58½ acres under citrous and summer fruits. About 7 acres are under hay.
639. It is freehold property? Yes.
640. Had you any experience as an orchardist before acquiring your present holding? Yes. When I came down from the back country I purchased a property at Kellyville. I had a man looking after the place during my residence at Marrickville.
641. Did you devote that property entirely to fruitgrowing? Yes. I had 164½ acres, of which I think 52 acres were cultivated.
642. Did you purchase the property with the view to making money out of fruit-growing? Yes.
643. Did it turn out a profitable investment? Yes; it was a good little property. There were about 25 acres under citrous fruits. It gave me a fair percentage.
644. How long did you hold the property? Somewhere about eight years. I then sold it and made £2,000 odd out of it. I sold it in August 1892. I have heard that it has since been sold again for about one-fourth of the price I obtained for it. I bought the property from Batt, Rodd, and Purves. There was a mortgage on it of £2,500, and at the mortgagees sale I gave £2,450. I bought the place without seeing it. I had a great ambition to become possessed of an orchard property, as I had heard so much about the returns from that class of holding. I determined to buy this particular property if it went at a reasonable price. I eventually sold the property for £4,500 cash. When I got the property I put it under Torrens Act. The property was sold to Mr. Edward Pierce, who has property immediately opposite me at Kellyville. I am told that he sold it for £1,250 or thereabouts, about eighteen months ago.
645. The value of properties in the district has depreciated? Considerably, as compared with their value a few years ago.
646. During the eight years you held this property at Kellyville, did you get a fair return from fruit production? I received about £160 clear of paying the man in charge and his son. It paid me very well. I got from eight per cent. out of fruit growing.
647. I suppose you seldom visited the property? Very seldom. I paid the man so much a year and a commission on sales. We grew citrous fruits with a little summer fruit.
648. Where did you find a market for the fruit? The man and his children used to pick the fruit and I allowed him so much for it. The fruit was brought down to Parramatta by cart or was sometimes taken to Seven Hills. The road to Seven Hills is, however, very rough.
649. Would not the Thornleigh or Pennant Hills station be nearer? No; it would be about 8 miles to the Pennant Hills station and the same distance to Thornleigh.

650. How far would it be from Kellyville to Parramatta? That is also about 8 miles; the road is much better.

651. I understand you have prepared a statement for the Committee? I have statistics which have been collected by various fruit-growers who asked me, if I had an opportunity, to read them to the Committee. The statistics deal with three districts—Baulkham Hills, Castle Hill, and Kellyville. It is estimated that from Baulkham Hills there would be 97,290 cases of fruit per annum. There are 1,093 acres of trees bearing, and a population of 667. From the Castle Hill district it is estimated that there would be 58,000 cases of fruit, and there are 585 acres of trees bearing giving about eighty-five cases to the acre, and there is a population of 386. From Kellyville there would be 64,240 cases of fruit; 1,356 acres of trees are bearing. The trees, as a rule, are younger, and give about forty-five cases to the acre only. The population is 521. The total of population of the three districts is 1,574. The total number of cases of fruit would be 219,530, and taking thirty cases of fruit to the ton, there would be 7,317 $\frac{2}{3}$ tons. The total acreage of trees bearing is 3,034. I have added to that 300 tons for hay and other produce. In estimating the passenger traffic upon a railway I have assumed that 5 per cent. of the population would travel every day, or about seventy. At 1s. 3d. per head, that would give a revenue of £1,574 1s. 3d., taking account of the three districts—Kellyville, Baulkham Hills, and Castle Hill. I have also put down 1,000 tons of firewood. A great deal of firewood passes my place in Kellyville. The total tonnage would therefore be 12,117 tons. Of manure and other loading required, there would be 3,500 tons, bringing the total up to 15,000 tons. The country is very healthy. It has a fine climate, and I believe that with railway communication it would soon be taken advantage of by people in the city for suburban residences. I think another effect of a railway would be that thousands of acres more fruit trees would be planted. With the small acreage now under cultivation, I do not think there is another part of the Colony of New South Wales supporting so large a population as does the district between Parramatta and Kellyville. If you notice the number of acres cultivated, and compare it with the population, you will see that it gives about 2 acres to each person. If there were a line from Parramatta to Dural I believe that about 14,000 acres would be cultivated, supporting a population of from 20,000 to 50,000. If the Rosehill line were carried on to Dural, in my opinion the people on the northern side would take advantage of the Great Northern Railway. In estimating the value of a traffic on a line from Parramatta to Kellyville, I have taken the carriage of 12,117 tons at 3s. 6d. a ton. That would give £2,120. I add to that amount the passenger traffic, £1,574, giving a total of £3,694. I have no doubt that if there were a railway through those districts a number of persons who have not seen citrus fruits growing would take advantage of the cheap ride out there. In holiday time you might safely assume that about 100 persons would go to the district. That would bring to the line another £1,000. I think you would be safe in putting down the total revenue at about £4,500. I read the other day the evidence given by the Under Secretary for Public Works before this Committee. He pointed out that the line from Carlingford to Dural would only cross the main road from Parramatta to Dural four times. I find that a line crosses that road no less than six times, and, assuming that gate men might be required, that is a great consideration. Mr. Hickson estimates the cost of the proposed continuation of Mr. Simpson's railway at £57,000. He put down the annual cost of the line at £4,501, and the total earnings at £1,025. You have to add that £57,100 to the £25,000 proposed to be paid for the Rosehill line, showing about £82,000 for a total earning of only £1,025. The same witness pointed out that the alternative line from Westmead to Dural, 11 miles 7 chains in length, would cost £50,400, involving an annual cost of £5,164, or £1,000 more than the annual cost of the other line. The traffic is estimated to be £2,500. You would, therefore, have double the earnings for an expenditure of about £40,000 less, according to this witness.

652. Mr. Hickson estimated the cost of the line from Westmead to Dural at £57,000? I am quoting the figures which have appeared in the *Sydney Morning Herald*. So far as the Rosehill line is concerned, I believe that if it were taken over it would be found that there was not sufficient land for shunting purposes, and I have no doubt that as soon as the line was taken over the 90 acres at the racecourse would be cut up and sold if buyers could be obtained. We have a number of racecourses in the Colony, and only one or two of them are, in my opinion, paying expenses. I have no doubt, therefore, that this particular course would be cut up. Instead of starting from Westmead a line might start from Parramatta running along the present railway bank to O'Connell-street, traversing that street and coming out in front of the Gaol, where it would pick up the Windsor-road at Murray's Mills. That would save bridging and the purchasing of land at fabulous prices.

653. You think that route would be an improvement upon the Westmead route? Yes.

654. Do you suggest a railway or a tramway? I think there might be a light line after the style of the line from Campbelltown to Camden. It might be of the same gauge as our railways. Of course, a tramway is not as expeditious a means of transit as is a railway, but perhaps a tramway would be sufficient to convey the traffic of the district for some years to come. The Government say that a mistake was made in the course taken by the line to Newcastle, and I do not see why it should be repeated in this instance. If a railway were constructed from Parramatta towards Dural it might afterwards be continued to Singleton.

655. Although it would be running alongside the Northern line? There would be somewhere about 14 miles between the two lines. The line I have in view might go to Wiseman's Ferry and across the Wollombi Mountains, where there is splendid country which would pay for railway construction. You have not only to consider Dural in this matter, but you must consider all the country round about Wiseman's Ferry. Ultimately the line might be extended to Singleton, thus shortening the distance to Sydney.

656. What is the value of land in the district round about Baulkham Hills? I have heard persons say that if a railway passed through their property they would expect to receive about £25 an acre for it; but as far as I am concerned, if I could obtain railway or tramway communication I should be willing to give up the land required without any consideration. Taking over the Rosehill line, and the extension to Dural, will involve a loss to the country of about £3,000 per annum. I think the people of Baulkham Hills and Castle Hill are quite justified in asking for some improved means of getting their produce to market, irrespective of the proposed Dural line. The route I suggest would pay about 6 per cent. In very many cases it is said that a railway will not pay. For instance, it was said that the Cobar line would not pay. We do not expect many of these lines to pay at the start.

657. You do not favour the purchase of the Rosehill line? I think it would be a great mistake.

658. I suppose you know what it cost? I have heard that it cost £160,000.

659. You know the character of the line? I have been along it; but I have not passed over it in a train.

660. Have you been over the line from Rosehill to Carlingford? No; but I have driven over that country.

W. T.
Wright.
14 Jan., 1898.

661. You think it would be a mistake for the Government to purchase that railway, even for £25,000? I think so, unless the line is used in any way to relieve the Great Northern line. In that case the money might be well laid out.
662. In what way would it advantage the Great Northern line? It might relieve it of some of its heavy traffic in cattle and sheep. It might pay to give £25,000 for the line if it were to be connected with the Great Northern Railway.
663. If the Rosehill line were purchased, would not its present terminus at Carlingford be of advantage to fruit-growers there? I do not think so. Some of them are at no great distance from the boat traffic and others are at no great distance from the Great Northern Railway.
664. What does it cost to get produce from Ermington to Sydney by boat? I think about 10d. a dozen cases—a little less than 1d. a case.
665. What is the railway charge? At Parramatta they charge you 1s. for twelve cases, or 1s. if you have only two or three. Over twelve it is 1d. a case.
666. What is the rate on the Great Northern line? About the same.
667. Is not the boat charge about 2d. a case? I do not think so, but I am not positive. Even if it were 2d. a case it would be cheaper for many persons to convey their fruit to Sydney by that means.
668. Why do persons pay 2d. a case to get their fruit brought to Sydney by boat from Ermington when they can get it brought to Sydney by rail at 1d. a case? Well, in the first place the fruit is not knocked about, and then again it is not kept standing out in the sun for three or four hours, as sometimes happens at Parramatta or Thornleigh.
669. The fruit, when conveyed by boat, is taken to a more convenient place in Sydney? I think it goes to the same market at Darling Harbour.
670. Is there any advantage in back loading? I could not say.
671. Have you sent any of your fruit to Sydney by boat? Never.
672. How many miles is it from Parramatta to Ermington? I think by Brush Farm about 5 miles.
673. It would not pay you to send your fruit to Ermington? No.
674. How far is it from Parramatta to your residence at Roxburgh Hall? About $5\frac{1}{2}$ miles.
675. What time is occupied by your men in getting your fruit to the railway station? It should take about half a day, but as a matter of fact some of the men do not get back until 11 o'clock at night. If we had steam communication I should not object to pay 6d. a case. I am sure the people out my way would be quite satisfied to pay a special rate.
676. You have some knowledge of the back country, and you know the disabilities under which many producers labour in getting their produce to market? Yes. From a district from which it used to take me four months to get my produce down it is now brought down in seventeen hours.
677. When property in most country districts is 20 miles from a railway it is considered to be fairly well served. Persons at that distance can get to the railway station and back on the same day? That is a fair distance where you are dealing with cereals, but at times fruit has to be sent in every day, and then the conditions are somewhat different.
678. In the fruit-growing district to which you have been referring are any orchardists 20 miles from a railway? I think 15 or 17 miles would be the limit of the cultivated land.
679. You yourself are within 5 miles of a railway? Yes.
680. Do you know the Dural and Galston districts? Yes, I know the whole district fairly well.
681. Do you think that district could be served by a connection with the main Northern line at Pennant Hills? Yes, that might be done; it would be $4\frac{1}{2}$ miles from Dural to Pennant Hills.
682. Still you prefer a railway from Dural to Westmead or Parramatta? Yes. It would bring in a big revenue and would pay from the start.
683. Have you any figures showing that the line would pay? I have no information beyond Kellyville. The figures I have given you apply to the districts of Castle Hill, Baulkham Hills, and Kellyville. Supposing the line were constructed to Dural at a cost of £50,000 it would give a return of about $5\frac{1}{2}$ per cent. gross taking the traffic only up to Kellyville. If you take into consideration the Dural and Galston traffic I should think you would have a revenue of between £7,000 and £8,000.
684. You are not allowing for interest on capital and working expenses? No. I suppose that if you took the line on to Dural you would have a net return of £3,000 upon an expenditure of £50,000.
685. Where would you get your £7,000 of traffic? Chiefly on the carriage of fruit at the same rate as is charged from Parramatta.
686. Would not a number of persons within a few miles of Parramatta cart their fruit into that town? I do not think so. They do not care about their fruit being knocked about more than can be helped. Once you get the fruit on the train a lot of handling is saved.
687. But the proposed railway would not go past everyone's door, and do you not think that the growers having once got their fruit on the cart would prefer to cart it into Parramatta;—would it not pay them to do that? I do not think so.
688. What would be a fair charge from Kellyville to Parramatta? From 1d. to $1\frac{1}{2}$ d. a case; I myself would not mind paying 6d.
689. What would you consider a fair charge from Baulkham Hills to Parramatta? About $\frac{1}{2}$ d. a case.
690. Where would you first pick up the fruit traffic from Parramatta, going out? About $2\frac{1}{2}$ miles, I think.
691. Do you think the fruit-growers would cart their fruit there, and pay $\frac{1}{2}$ d. a case by rail to Parramatta rather than cart it direct to Parramatta? I think they would take advantage of the train that would be waiting for their fruit. It would pay them to give the $\frac{1}{2}$ d. extra. They would have the advantage of quicker despatch.
692. Why? Because the fruit is so often delayed at Parramatta. The trucks picking up fruit for Parramatta would be loaded by the time they reached that place, and there would not, therefore, be the same delay.
693. Does not all the fruit from the district to which you are referring come to Parramatta at the present time? Yes.
694. Then why should there be any delay? I do not know why there should be; but, as a matter of fact, there is tremendous delay in the despatch of fruit from Parramatta. They wait, I think, until the trucks are full before despatching them.
695. Do you estimate taking the route you suggest you would catch any fruit which now goes to Ermington? No; that would still go by water. A little from the other side of Castle Hill might go to the Carlingford station on the Great Northern line.

696. Can you vouch for the accuracy of the number of cases you have given from the three districts to which you have referred? Yes. Mr. Tamsett, Mr. Moxham, (the Mayor of Parramatta) and I myself—five or six of us altogether—have had a hand in their collection.
697. Have you compared your figures with those in possession of the railway authorities? No.
698. Is Kellyville one of the best parts of the district? It is one of the finest places in the Colony for fruit-growing.
699. How far is it from Kellyville to Dural? Five or 6 miles.
700. Why do you suppose that the traffic between Kellyville and Dural would be equal to the traffic between Parramatta and Kellyville? I have no figures, but I should think that would be the case. There are some very fine trees at Dural, and they bear more than do the trees at Kellyville.
701. Do you think the people of Dural would pay 1½d. a case into Parramatta? They say so, but I do not think all of them would do so.
702. Your estimate of 220,000 cases between Kellyville and Parramatta would give a revenue of £915 per annum at a penny a case? Yes.
703. Then how do you account for your estimate of £2,120? That is the tonnage rate—3s. 6d. a ton on 12,000 tons.
704. The whole of the 220,000 cases of fruit would not pay a penny a case? No.
705. Therefore, the revenue from fruit upon that section would be even less than £915? Yes. I have perhaps made a mistake in taking the tonnage rate.
706. It would appear then that your suggested line from Parramatta to Dural instead of being a profitable undertaking would involve a loss? It might do so for a time, but a large area of the country which is now unoccupied would be cultivated. There are 500 odd people at Kellyville now as against 30 or 40 a few years ago. That shows that the district is a favourable one for fruit production.
707. Do you think a tramway such as that between Campbelltown and Camden would meet the requirements of the district? Yes. I think it might be carried right through to Wiseman's Ferry.
708. Does the country become more fertile as you go to the north? Yes; the climate is cooler. You are 800 or 900 feet above sea-level in that direction.
709. And you think that the construction of a tramway through that district would lead to a rapid increase in population? Yes.
710. Do you think the present landowners would part with their land at a cost which would enable persons to make a reasonable living out of it? I have only one-third of my land cultivated, and I find that quite enough. I should be quite willing to sell part of my land at a reasonable price. I suppose that, generally speaking, land there would be worth from £20 to £22 per acre. About four or five persons I know of would be willing to give the land required for railway purposes.
711. Through how many properties would the railway you suggest pass? I should think it would go through 200. Before you reached Baukham Hills it would go through quite 100 properties.*

TUESDAY, 18 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

John Charles Hunt, fruit-grower, Dural, sworn, and examined:—

712. *Chairman.*] You are a resident of Dural? Yes; I have resided there for about thirty years.
713. *Mr. Farnell.*] You know the proposal before the Committee? Yes.
714. Have you read the official reports in regard to the proposed railway? Yes.
715. You have a thorough knowledge of the district affected by it? Yes.
716. How are you occupied at Dural? I am fruit-growing there; I have about 140 acres under cultivation.
717. That would be one of the largest areas cultivated there? Yes.
718. Taking your holding as the centre of Dural, what would be the radius of the district? It would be 3 miles east and west, about 3 miles south, and 26 miles to the Hawkesbury on the north.
719. You have collected statistics within that area? Yes; the Dural statistics will apply to that area. I have prepared statistics, however, with regard to the whole of the districts affected. Glenorie has a population of 295; the area of holdings is 4,842½ acres; the area under cultivation, 760 acres; the area of bearing trees, 454 acres; of non-bearing trees, 22,214 acres; and under other tillage, 84 acres. In the Castle Hill district the population is 507; the area of holdings, 4,276; under cultivation, 1,200 acres; the area of bearing trees, 863 acres; of non-bearing trees, 177 acres; and under other tillage, 154 acres. The population of Glenhaven district is 79; the area of holdings, 857 acres; the area under cultivation, 128 acres; the area of bearing trees, 73 acres; the area of non-bearing trees, 49 acres; and under other tillage, 5 acres. The population of the Pennant Hills district is 534; the area of holdings is 3,261 acres; under cultivation, 1,161 acres; the area of bearing trees, 855 acres; of non-bearing trees, 267 acres; and under other tillage, 38 acres. The population of the Galston district is 283; the area of holdings, 2,216 acres; under cultivation, 668 acres; the area of bearing trees, 482 acres; of non-bearing trees, 239 acres; and under other tillage, 26 acres. The population of the Kenthurst district is 323; the area of holdings, 7,584 acres; under cultivation, 750 acres; the area of bearing trees, 427 acres; of non-bearing trees, 266 acres; and under other tillage, 56 acres. The population of the Dural district is 343; the area of holdings, 5,250 acres; under cultivation, 1,018 acres; the area of bearing trees, 603 acres; of non-bearing trees, 279 acres; and under other tillage, 136 acres. The population of the Carlingford district is 685; the area of holdings, 2,070 acres; under cultivation, 1,010 acres; the area of bearing trees, 925 acres; of non-bearing trees, 59 acres; and under other tillage, 26 acres. The population of the Arcadia district is 187; the area

J. C. Hunt.

18 Jan., 1898.

* NOTE (on revision):—I would like to say that after going over the route suggested by me I find that not more than about twenty properties would be interfered with, and then only a few feet of those holdings would be encroached upon.

J. C. Hunt.
18 Jan., 1898

of holdings, 2,944 acres; under cultivation, 437 acres; the area of bearing trees, 302 acres; the area of non-bearing trees, 80 acres; and under other tillage, 54 acres.

720. You have no statistics from Kellyville? No, we did not take those statistics, as there appeared to be some objection to it on the part of those we asked, Kellyville would be within 3 miles of the proposed railway, and the residents there would certainly use the line.

721. How far do the boundaries of Carlingford extend for the purposes of the statistics you have collected? I have only taken statistics from the area which will probably come within the influence of the proposed railway.

722. You have not included any products which would go to the Northern line or which would be within the influence of the suggested line from Westmead to Dural? We gave instructions that only a fair average should be taken between the two lines.

723. A great deal of the statistics you have given apply to traffic which is already within the influence of the Northern line? Yes; it is within the influence of that railway at present, but if the proposed line were constructed it would go down to Clyde.

724. What would be the distance between Dural and, say, the centre of Galston? About 3 miles.

725. What is the distance between Hornsby and Galston? From $7\frac{1}{2}$ to 8 miles.

726. So that if the Dural line were constructed to Galston people would save 5 miles in coming to Dural? Yes.

727. Do you think it reasonable to suppose that if the line were extended to Dural the districts of Galston and Arcadia would patronise it instead of sending their produce by road to the line at Hornsby? I have no doubt whatever that the residents of Galston and Arcadia would patronise the new line.

728. What would be the probable traffic from Carlingford? I have put Carlingford and Pennant Hills together. The acreage is 1,739, and reckoning 100 trees to the acre that would give you 173,900 trees; a case to the tree would give the same number of cases, and there would therefore be, at 1d. a case, a revenue of £724 11s. 8d.

729. At the present time what is the charge from Parramatta? 1d.

730. You have allowed 1d. between Pennant Hills and Clyde? Yes.

Glenorie, Kenthurst, Dural, and Arcadia as separate districts, and from them I estimate a traffic of £1,823 6s. 8d. At Glenorie there are 454 acres of bearing trees; at Galston, 402; at Kenthurst, 427; at Dural, 603; and at Arcadia, 302; giving a total of 2,188 acres or 218,800 cases. That, at 2d., gives the revenue I have named.

731. So that the charge would be from Pennant Hills to Sydney 2d. a case? Yes. I have taken

732. Have you not allowed for any increase of rate between Carlingford and Pennant Hills? I have reckoned 1d. a case from Dural to Carlingford, and another 1d. a case from Carlingford and Clyde. The total charge to Sydney would be 3d. a case.

733. You think the people would be prepared to pay that rate? Yes; they are paying 2d. a case to Hornsby. You may put down a load on that road as twenty-five cases. You would require a good horse to take twenty-five cases to the Hornsby station. At 2d. a case that would be only 4s. 2d., and it would take the best part of the day to get the fruit there.

734. It would be better to pay 3d. a case right through, and have the man's labour available for the day? Yes.

735. What is the charge from Hornsby to Sydney for a case? I think it is a fraction over 1d.; we pay 1d. over from Thornleigh.

736. What is the charge from Thornleigh to Dural? About 3d. a case.

737. What is the condition of the road generally between those points? It is a good road in dry weather; it is almost impassable in wet weather.

738. Take the Castle Hill district;—where does the traffic at present go to? The lower end of Castle Hill would go to Parramatta. We have taken in our statistics a little beyond Foster's, leaving about 2 miles in favour of Parramatta.

739. Where do the Galston people send their fruit at the present time? Chiefly to Hornsby.

740. I suppose the Kenthurst people send to Thornleigh? Yes.

741. Has there been any marked increase in the area under cultivation within the last few years? Yes; it has increased considerably. Take the district of Glenorie—twelve or fourteen years ago the population consisted of four families, and there were four holdings. Now there is a population of eighty-four families, or in all 295 persons, and eighty-four holdings. In Kenthurst, fourteen years ago, there were five families, now there are 104, or a population of 323. In Galston and Arcadia, at the same time, there were six families, now there are 112; the population of Galston being 283, and of Arcadia 187.

742. Do you think the want of facilities for getting produce to market has affected the growth of the district? I am sure it has.

743. Is there plenty of land available for settlement? Beyond Glenorie there are some large areas which no doubt would be taken up if there were a railway in the district.

744. You are referring now to Crown lands? Yes.

745. Would those lands be suitable for fruit-production? Yes.

746. There is good timber growing there? Yes; there is forest land for 20 miles, and it is all suitable land for orchards.

747. There would probably be a good trade in timber? Yes.

748. Have you taken that into consideration in drawing up your statistics? We have not been able to estimate the timber trade, but there are thousands of acres of forest containing all kinds of timber.

749. Where is Glenorie? Between Kenthurst and Galston.

750. There is a considerable area of unimproved land which you think would be converted into orchards if railway facilities were given to the district? Yes, the whole of the land was surveyed, but it was reserved from selection.

751. I suppose that in the districts of Dural and Kenthurst there are private subdivisions? Yes; Mr. Black's land is subdivided into orchard blocks, blocks of something like 20 acres.

752. Would the price be reasonable enough to admit of a person engaging in farming pursuits? Yes; some of Mr. Black's land has been bought within the last two or three years, and some of it is being cultivated. There are orchards upon it.

753. It was obtained at a price which would lead to profitable occupation? Yes.

754. What would be the price of land in the district? Unimproved land is worth from £6 to £15 per acre, according to the position.

755. Where is Hudson's land situated? That is at Galston, I think he had 500 acres. It was cut up into farms, and there are orchards upon it now.

756. What do you estimate would be the gross receipts of a railway from the districts of which you have referred? For the carriage of fruit about £3,000.
757. You have put nothing down for timber? No.
758. What have you estimated with regard to the inward traffic? The chief inward traffic would be manures, and I have estimated that for Dural and surrounding districts there would be about 3,000 tons of manure. It would be profitable to every grower to use about half a ton to the acre, and that would give you about 3,000 tons. Every ton of manure from Dural to Thornleigh would cost 8s. at the present time, and to small holders far more.
759. There would be revenue in excess of the receipts Mr. Harper estimated from the railway? Yes.
760. Have you made any estimate in regard to the passenger traffic? No. I can only say that there are three lines of omnibuses running at the present time.
761. Are they run at a profit? Yes. The charge from Dural would be 2s. 6d. a single fare.
762. What would be a fair rate to pay upon a railway? I do not think 3s. return on the section from Clyde to Dural would be too much.
763. Supposing a line were constructed to Dural, do you think any traffic is likely to be created beyond that you have mentioned? In connection with the Dundas district, I think there would be a large passenger traffic.
764. You think new suburban areas would be opened up and settled upon? Yes. I think Dundas will be a considerable suburb in the course of a few years.
765. Do you think it likely that many areas round about Pennant Hills would be used for residences? I can only judge from persons from Sydney coming to live in the district. There are several residences now round about Pennant Hills. People come from the city now to Dural. There is a boarding-house there in which there are boarders all through the year. They appear to come to the district for health's sake.
766. What does it cost you to send your fruit to Sydney, taking into account cartage charges and the railway freight to Thornleigh? About 10s. a ton. I generally use packing-cases, and they would go 40 cases to the ton. Gin-cases, on the other hand, would go about 30 cases to the ton. To a small grower the cost would be about 12s. 6d. a ton, allowing 10s. a day for the horse and cart and 2s. 6d. for the carriage to Sydney. The large grower, by sending 3-ton loads, would do the cartage at a cheaper rate; there would be only one driver for the 3 tons.
767. Is there much fruit grown in your district sent to Sydney *via* Ermington by water? None at all from my district.
768. I suppose the Ermington traffic would be from Carlingford and Rydalmere and places in that vicinity? Yes.
769. What time have you to allow to catch your train at Thornleigh? From three and a half hours to four hours.
770. So that the whole time occupied by the journey from Dural to Sydney would be about five hours? Yes.
771. If a line were constructed to the district there would be a great saving of time in the getting of your fruit to market? Yes.
772. You regard the proposal before the Committee as the most expeditious way of getting increased facilities? Yes.
773. You are not antagonistic to the Westmead-Dural line, but you think this is the most likely way of getting a railway? Yes.
774. You have heard of the proposal to construct a tramway to Dural;—would that answer the purpose? I think the transhipment from the tramway to the railway would be altogether against that proposal.
775. The less handling the better for fruit? Yes.
776. You want facilities which will enable you to run your fruit right through to market? Yes.
777. You think the railway officials have under-estimated the traffic upon the proposed line? I think they have greatly under-estimated it. In regard to the estimate I have given of the cost of conveyance from Dural to Sydney I should point out that I am nearer to the line than are many of the growers in the Dural, Kenthurst, and Glenorie districts, so that it would cost me less than it would cost many others. In some cases it would take the best part of a day or a day and part of a night to deliver the fruit.
778. You do not think that if the roads were improved or metalled it would answer all the requirements of the district? Of course the district would be all the better for having good roads, but we want to save time in getting the fruit to market. At present the greater part of our time is spent on the road, especially in the case of the small growers. They are about half the year on the road.
779. Is there anything you would like to add to your evidence? I desire to point out that the carriage of fruit would be going on all the year round. It is not like the produce from some forms of cultivation. It is not a case where you can wait for the roads to improve or where you can lay your stock by. When the fruit is ready it has to go, and at present it is necessary for the fruit-grower to be upon the road about one-half of his time nearly all the year round. If he spent on his farm or orchard the time that he now spends in travelling he would make the land more productive than it now is. There are many growers with small holdings who work their own land, and you can easily see that their being away from their holdings so much is detrimental to their interests—in other words, to the production of fruit. Although we have not the Kellyville statistics, if the Committee look at the map they will see that Kellyville lies at such a short distance from the proposed line that we are entitled to take into consideration a large proportion of its traffic.
780. *Chairman.*] Supposing the line were not extended beyond Carlingford, would it be easier for a man at Dural to get to Thornleigh than to get to Carlingford? It would be easier to get to Thornleigh.
781. Why? The distance is 3 miles shorter. I understand you refer to Carlingford, the terminus of Simpson's line. I wish to impress upon the Committee the benefit of a railway as a means of communicating for fruit-growers, as compared with a road in the matter of time. A railway would enable the grower to spend upon his holdings time which is now occupied in taking the fruit to market. Then in the matter of damage, although it is not great in the case of citrus fruits, it may be estimated that the damage in the case of summer fruit from road-carriage is fully 3d. a case. If the roads are in a rough state the fruit when it gets to market is hardly fit to be seen. It is of great benefit to the fruit-growers to have their fruit landed in the market at the earliest possible moment. Sometimes if we lose a certain market it means a loss of pounds upon a load of fruit. I can give you an instance of that. Last year something delayed fruit catching a certain steamer, and the loss of the market meant a loss of several pounds in the case of that one shipment.
782. *Mr. Trickett.*] In answer to Mr. Farnell, you estimated the probable fruit revenue to the proposed railway at about £3,000? Yes.

J. C. Hunt.
18 Jan., 1898.

- J. C. Hunt. 783. Have you included in your estimates the fruit which is at present sent from Thornleigh for instance? Yes.
- 18 Jan., 1898. 784. *Mr. Humphery.*] Then from what orchards do you think the new traffic to which you have referred will come? The statistics I shall leave with the Committee will give you the holders names. The traffic at present reaches either the Parramatta or the Northern line. My estimate is based upon an increased charge down as far as the Clyde terminus. The fruit would of course travel upon the existing line from Clyde to Sydney.
785. The traffic at present reaches the railway at one point or another, but your estimate refers to additional earnings? Yes.
786. At what points does the traffic reach the railway at the present time? The Galston and Arcadia traffic would go to Hornsby.
787. Can you give us the number of cases of fruit? No; we have not access to the railway books, but we estimate so many trees to the acre and one case to the tree.
788. *Mr. Trickett.*] I understand you to base your estimate on these grounds; at present the charge is 1d. from Parramatta to Sydney—a distance of 14 miles, and you contemplate a payment of 2d. from Dural to Clyde, a distance of 9 miles? Yes.
789. How long do you think that state of things would last? As long as it would pay us. It costs us 3d. now, and if we can get the work done for 3d., we should be only too glad to pay it. No one but a person who has had experience in fruit-growing can estimate the value of a railway to a fruit-growing district.
790. Is it not a fact that a large proportion of the profit of fruit-growers goes to the agents in Sydney? In some cases it may do so. I certainly do not allow my profit to go to them. I should like to add in regard to damage to fruit in transit on the railway, that the growers load and unload their own fruit, so that if there be any damage it is not the fault of the railway servants at all. The only instances in which we have asked for compensation have been where cases of fruit have been lost from the different stations.
- John William Foster, fruit-grower, Castle Hill, sworn, and examined:—
- J. W. Foster. 791. *Mr. Black.*] You are aware that according to the statements of an eminent traffic authority the proposed railway would not pay for the carriage of the traffic now grown in the district? I have read a report to that effect.
- 18 Jan., 1898. 792. Do you think the construction of the proposed railway would increase the fruit output from the district? I believe it would considerably.
793. Is there much idle land there? Yes; I should think that two-thirds of the land is now idle, unless for grazing purposes. There is also a good deal of forest land.
794. You do not anticipate that there will be any great amount of passenger traffic upon that line at first? I do not think it will be very great at the present time.
795. Possibly you are inclined to think that the railway like other suburban lines will pay when the district is more thickly populated? We have some criterion in what has happened upon the northern line, and you cannot compare the two districts.
796. You think a railway should not follow population, but should go ahead of it? That would be my principle.
797. You do not think the district to which you are referring would be too far from Sydney to become a place of residence for persons engaged in business in the city? No; I do not think so.
798. You think its height and fine climate would take people there? You have an elevation of nearly 1,000 feet in Dural. The hill to which the Committee drove the other day is 800 feet above sea-level, and there are two or three higher points further on.
799. We have been informed that unimproved land can be bought in the district at from £6 to £15 an acre;—what would be a fair average price? £10 or £12 would be a fair average.
800. What would be a good price for orchard land—land already planted? It varies very much. It would average from £25 to £35 per acre. There are orchards you could not buy for £100 an acre. I know of one case where a man obtained a great deal more than £100 an acre from the fruit in one season. Of course, the fruit is very good.
801. One of the reasons why you desire a railway is that quicker communication with market is wanted? Yes. At the present it is almost impossible to travel on the roads in bad weather. You get up to the axle-trees in mud.
802. Is the fruit much damaged by cartage? Some of it is materially damaged. Ripe summer fruit is often totally spoiled.
803. If the proposed railway were constructed, more land would be put under cultivation by orchardists, and there would be an increase of settlement by residents from Sydney? Yes.
804. *Chairman.*] Do you think 2d. a case is the correct statement of the cost of carriage by road from Galston to Hornsby? Yes; I think that would be a fair thing.
805. And from Dural to Thornleigh, 3d.? Yes.
806. Supposing the railway were left at Carlingford, and that a Dural man desired to reach some point upon the railways, would he more readily reach Thornleigh or Carlingford? He would go to Thornleigh. You might almost as well go to Parramatta as go to Carlingford.
807. You heard the statement by Mr. Hunt that a railway would save 3d. a case in damage to the fruit? I think that is an under estimate because if fruit is badly damaged it is not fit for sale.
808. Will you give us an approximate estimate of what it would be worth by case to have a railway adjacent to your orchard? I believe it would be worth 6d. a case.
809. Do you agree with the estimate that orchardists will be prepared to pay 3s. a ton from Clyde to Dural for manure? Yes.
810. Is 8s. a correct estimate of the cost of cartage of manure from Thornleigh to Dural? Yes.
811. You believe the statistics given by the last witness in regard to the cases of fruit from the various districts are correct? Yes.
812. You think that if the proposed line were constructed from Carlingford to Dural the number of cases referred to would pass over it? I believe the whole number specified would travel by it.
813. *Mr. Wright.*] You have estimated a saving of 6d. a case to fruit-growers by the construction of a railway? Yes.
814. Would you pay 6d. a case to the railway authorities for the carriage of your fruit for ten years if a railway were made in the district? I think that would be rather excessive.
815. Supposing 3d. a case were charged where 1d. is now charged would the fruit-growers be satisfied with that charge? I am sure they would. I do not think a local rate would be objected to. 816.

816. The Railway Commissioners say that if they charge you an extra penny it would not pay working expenses, so that you would have to pay more than an extra penny;—do you think the fruit-growers would be willing to do that? I think they would be glad to do so. Anyone who has travelled over our roads would confirm my statement. J. W. Foster.
18 Jan., 1898.

817. *Mr. Hoskins.*] As to the alleged damage to fruit by being carried over the roads, is it not a fact that the consignors are constantly making application for rebate to the Government for damage done to their fruit? The damage is done in a large measure by the way fruit is knocked about by the porters at the various railway stations. The way in which it is handled is shameful.*

Christopher John Moore, fruit-grower, Castle Hill, sworn, and examined:—

818. *Mr. Hoskins.*] You are a resident of Castle Hill? Yes.

819. Are you in favour of the Government purchasing the line from Clyde to Carlingford and extending it to Dural? Yes. C. J. Moore.
18 Jan., 1898.

820. You prefer that mode of supplying the Castle Hill district with railway communication? Yes.

821. You think it would be better than the proposed railway or tramway from Parramatta? Yes.

822. The principle industry in your district is fruit-growing? Yes.

823. That is about the only product sent to Sydney? Very little else is sent away.

824. Is not the fruit-growing industry a declining industry in this Colony? Certainly not.

825. Are not persons constantly complaining that fruit-growing does not pay? Some may do so, but in the district affected by the proposed railway persons are enlarging their holdings and new men are coming in.

826. How far are the stations on existing railways distant from the districts concerning which we have been furnished with statistics? Pennant Hills would be the nearest railway station to Castle Hill and Thornleigh would be the nearest station to Dural. From Castle Hill to Pennant Hills would be about 4½ miles and from Dural it would be about 8 or 10 miles.

827. What would be the average distance from the Dural district to the nearest railway station? It would be something like 10 miles to Thornleigh.

828. Do you consider that distance excessive from a railway in a new country? It is not altogether excessive, but we have such rough roads. In bad weather it is almost impossible to get along them, and the cartage damages the fruit to a great extent.

829. That would be in the winter-time? It generally happens in winter-time and autumn. The roads just now are in very good condition.

830. What are your principal reasons for wishing to have the line extended from Carlingford to Dural? I think it would improve the district and benefit the fruit-growers as a whole.

831. Would it induce many persons to buy land there at £25 per acre? Yes, and it would improve the transit of the fruit. That is the principal consideration.

832. It would not do away with the liability of damage to fruit in transit? To a certain extent the fruit would be damaged; but it would not be so much damaged on a railway as it would be in carts on a bad road.

833. *Mr. Lee.*] You are aware that if the proposed line is carried out to Dural there will, according to the estimate of the Railway Department, be a loss per annum of nearly £3,500? I saw a report to that effect.

834. If the fruit-growers at the present moment cannot afford to pay more than from 1d. to 1½d. a case for transit from the nearest railway station to Sydney, how will they be able to pay double that amount if the railway is extended over the 9 miles from Carlingford to Dural? There would be a great saving of time, and they have to pay so much wages away to men on the roads. Some of the growers themselves spend half their time on the road.

835. That might apply to the growers of Dural, but would it apply to yourself at Castle Hill? Of course the conditions in my case are not so severe.

836. How far are you from Carlingford railway station on Simpson's line? From 6 to 7 miles.

837. If there were a train on that line every day it would be of little benefit to you? It would be of no benefit whatever running only as far as Carlingford. I am already nearer to a station on the Great Northern line.

838. If the proposed line were made how far would you be away from it? It would pass close by my door.

839. To you personally the line would be of great advantage, but taking the area from where the fruit is to come, would not some of the people have to reside from 3 to 4½ miles from the railway line? Yes.

840. They would be in the same position then that you are in. The question therefore arises whether that when they had to put their fruit into a cart to take it over the 4 miles of road it would not pay them to cart it into Parramatta? That would mean being a whole day on the road, and that means money. The growers would be better employed on their own property improving it. They would have a greater quantity of fruit to put upon the railway in the following season.

841. How is the fruit usually carried? It is carried partly in spring carts and partly in spring lorries.

842. How many cases would they put on to a spring cart? Generally from twenty to thirty. They could put on about a ton. You have to do that at a pinch.

843. Does your fruit suffer much damage in transit from your orchard to the Pennant Hills station? Not as a rule; there is a pretty fair road a greater part of the distance. I do a great deal of the driving myself and I am pretty careful. Upon that distance not much damage could be done; there is some damage of course.

844. Then those who have to cart their fruit 3 or 4 miles to the nearest railway station would still suffer some damage? Yes.

845. So that the question of damage to fruit is one which should receive consideration? Well, of course, some persons have to cart the fruit 14 or 15 miles.

846. There are times when the roads are pretty bad, not only in the winter, but in the summer season? Yes.

847. It would appear that the only possible way of relieving the country of a heavy loss from this line would be to charge an extra rate for the transit of fruit;—do you think the fruit-growers are in a position to pay 3d.? I should think 3d. from about Dural would be a fair thing.

848. Could they pay that price and compete with yourself and others living closer to market, and having less carriage to pay? There would be 3 or 4 miles between us. I can only say that all I have spoken to on the subject have expressed themselves as quite willing to pay the extra charge.

849. The people in your immediate locality would be quite willing to pay an increase upon the present charge? Yes.

850. Can a matter of a penny a case be of such importance to the fruit-growers, if they had the advantage of getting their stuff to market so quickly, and if they saved entirely the dray carriage? It would not be of very great importance.

851.

* NOTE (on revision):—I wish to correct question 817 regarding damage to fruit. It is not done by the porters, but by careless shunting.

- C. J. Moore. 851. How many cases do you send away annually? Something like 2,000.
852. That would be about 50 tons of fruit Yes.
- 18 Jan., 1898. 853. How long does it take you to cart? It takes me half a day to load, to cart to the station, to get my empties, and to get back again.
854. Would it not pay you to pay 3d. a case, and have a railway? I would rather pay 3d. a case and have a railway.
855. You think, then, that the estimate of the railway authorities, showing a loss upon the proposed line, is far too low? Yes; I think so.
856. If the receipts were based upon your estimate, they would pay for working expenses and interest approximately? Yes.
857. *Mr. Humphery.*] Supposing you had to pay for the cartage of your fruit, what would it cost you per ton? About 5s. or 6s.
858. Would it not take you more than half a day to go to the station and return? It would take half a day; but no one would take a ton of fruit over for less than 5s. or 6s.
859. Do you think it probable that the fruit-growers would prefer to pay 9s. a ton by railway to 4s. or 5s. a ton by road? It might not cost 9s. There are times when you are only sending small lots, and then it would pay much better to give 3d. a case by railway than to pay 4s. or 5s. for road cartage.
860. *Mr. Wright.*] You heard Mr. Foster say that the railway knocked the fruit about a great deal;—is it not a fact that the fruit is much more damaged by rough handling on a railway than by rough handling in the local carts? Not in a general way.
861. Is it not a fact that the railway officials pitch the cases about, and that great damage is done to the fruit in that way? In some cases.
862. The carrying of fruit in a spring cart for 10 or 12 miles would not damage it very much? We have to pull the fruit green instead of waiting for it to ripen. If the fruit were ripe a good deal of damage would be done.
863. Under any system of railway extension some of the orchardists would have a certain amount of road carriage to pay? Yes; but to the extent to which you bring the railway nearer to them you give them more time to devote to their holdings.
864. Have you much land? About 40 acres.
865. Are there many large holdings round you? They are fairly large.
866. Do you think the holders would give to the Government, free of charge, such land as might be required for railway construction? I can scarcely say. I rather fancy they would; but I do not know their opinion.
867. The roads in your district are bad at times? Yes.
868. You state that you can carry a ton in a spring cart with a single horse? Yes.
869. But you could not do that upon a bad road? No; it would take two good horses to take a ton even from my place when the roads were bad. The Traffic Manager of our railways has been over this district and knows the produce of the orchards in it. One of his officers has also been through the district. He says emphatically that there would be a loss of £300 a year upon the proposed railway.
870. Do you think he ought to be a better judge of that than you yourself, or your neighbours? He may be a good judge in some ways, but he does not know what we are likely to produce in the district when there is a railway.
871. You think your knowledge of the capabilities of the district is greater than his? Yes.
872. And you think the district is capable of much more fruit production? Yes; there is a good deal of Crown land beyond Glenorie.
873. What proportion of land suitable for fruit-trees is now cultivated? I do not think more than one-fourth.
874. So that if all the suitable land were cultivated there would be an increase of 75 per cent. upon the present produce of the district? Yes.
875. *Mr. Trickett.*] I suppose you work your own orchard as well as use labour? Yes.
876. Can you tell us how much you generally get per case for your fruit? We get all prices—early in the season big prices, and mid-way through we have to take low prices.
877. What would be the average? Summer fruit would average from 4s. to 5s. a case.
878. How much does it cost per case to produce, reckoning packing cases, freight and everything? I do not keep accounts. It would be very difficult to say. You would have to include all family requisites.
879. Do you sell your fruit through a commission agent? Yes.
880. What rate of commission do you pay? 6d. a case.
881. Is that the general charge? It is about that.
882. Does it include anything but commission? It includes market dues and carriage from the railway.
883. Do you know what they come to? No.
884. *Mr. O'Connor.*] How far are you from a railway? My orchard is 4½ miles from Pennant Hills.
885. With regard to the damage alleged to be done to fruit by the railway officials and by railway carriage, do you not think you are largely responsible for the continuance of such a thing since you do not complain? Personally I have not complained much.
886. Do you think that the alleged damage could be avoided by greater care on the part of railway officials? We load our own fruit in the trucks from our vehicles, and any damage done afterwards is done by shunting. I have seen cases thrown half the length of a truck by jolting. I do not think the damage is done by the porters.
887. But do you not think that by greater care on the part of the railway officials, some of the damage could be avoided? Yes.
888. If the proposed line were extended to Dural, would there be much development in the fruit-growing industry there? Yes.
889. You think that in course of time the line would pay working expenses and interest? Yes; if not at present.
890. *Mr. Farnell.*] How long is it since you had to pay 4d. a case for the conveyance of your fruit from Parramatta to Sydney? I could not say.
891. You were satisfied to pay that charge instead of having the inconvenience and loss of time incidental to the carting of fruit by road? Yes.
892. That may be accepted as an indication that the fruit-growers would be glad to pay a local rate of 3d. upon this particular section? Yes.

John Speir Heron, fruit-grower, Castle Hill, sworn, and examined:—

893. *Mr. Humphrey.*] You are a fruit-grower? Yes; at Castle Hill, on the border of Pennant Hills. J. S. Heron.
 894. Do you know the proposal now under consideration? Yes. 18 Jan., 1898.
 895. You know the various proposals which have been considered? I have been resident in the district for only seven or eight years, so that I know little or nothing about some of the former proposals.
 896. What is the extent of your holding? About 50 acres. About 40 acres are under cultivation.
 897. Is the whole of that area under fruit-trees? Yes, excepting perhaps half an acre.
 898. Is the orchard in full bearing? About one-fourth is in full bearing.
 899. Where do you send your fruit? To Pennant Hills and Thornleigh.
 900. At what distance are you from those points? About 3 miles.
 901. Then you are not under any very serious disabilities at the present time? No.
 902. Personally you are not interested in the proposal to the same extent as are many other persons who are obliged to send their fruit a greater distance? Not to the same extent.
 903. Have you seen the statistics presented to the Committee by Mr. Hunt? Yes; I was one of those who collected the statistics for the Pennant Hills district. I can confirm the figures given by Mr. Hunt from my own knowledge.
 904. The Committee may accept those figures as a fair estimate of the probable production of the district, and the earnings of a railway? Yes, as far as my district is concerned.
 905. Do you think the fruit-growers of the district would be prepared to pay 3d. a case, for the conveyance of their fruit? I cannot say that I live at the minimum distance of any witnesses who have been before you from the existing line. The conveyance would be worth from 1½d. to 1d. to me. I should be less than half-a-mile from the nearest station.
 906. But it would be impossible for you to get fruit to the line, without putting it on a cart? Quite so.
 907. Would it be worth your while to pay 1½d. a case additional, with a station half-a-mile away, instead of taking it 2½ or 3 miles away, at present charges? On a large load it would be worth 1d., and on a small load 1½d. Very much depends upon the number of cases one has to cart.
 908. Do you think the estimate of 3d. a case should be modified? I do not think it was made with regard to Pennant Hills or Castle Hill.
 909. Would it be more convenient for you to use the proposed line to Dural, than the proposed railway or tramway from Westmead or Parramatta to Dural? Yes.
 910. Or a line from Pennant Hills to Dural? That would be about the same, as far as I know the route.
 911. It is a matter of indifference to you which route is adopted, as long as it is in the direction of Dural? A Parramatta tramway, or a railway from Westmead, would be of no use to me.
 912. Would the proposal before the Committee be more profitable to you than any of the proposals to which reference has been made? I should think so.
 913. Have you considered what the earnings of some of the other proposed lines would be? I have not gone into those statistics at all.
 914. You think the proposal before us would best serve the whole of the district between Carlingford and Dural? Yes.
 915. You think that no other proposal with which you are acquainted could so effectually serve Galston, Dural, Kellyville, and Castle Hill? I do not think any of the other proposals could serve those districts as effectively.
 916. *Chairman.*] You have heard the evidence of the previous witnesses to-day? Yes.
 917. And you agree with it? Yes, in the main.
 918. Which place can you more readily approach from your residence—the terminus of Simpson's railway at Carlingford, or the Pennant Hills station, on the Northern line? The Pennant Hills station.*

* NOTE (on revision):—With reference to the cost of carting fruit per case, I should like to add the following to my evidence:—My orchard is 3 miles from Thornleigh station. My orchard contains 40 acres, more or less, about 17 acres of which is old orchard, the rest from 1 to 6 years old. It is a mixed orchard, *i.e.*, contains citrus fruit trees and a large variety of summer fruit trees, so that I am sending fruit in moderate quantities to market all the year round. Last year I marketed nearly 1,600 cases—1,560 to be exact—of fruit, in 2,108 packages. This is, I think, above the average for one grower, though many produce considerably more.

My average load would be about fifteen cases, I should think. It takes a quarter of a day to go from here to Thornleigh station with a load of fruit and return. At 10s. per day for man, horse, and cart, this costs 2s. 6d. This is what I have to pay per ton, or load, for cartage from Thornleigh to my property also. I have never got carting done for less; and in the case of bricks have paid 10s. per 1,000 for 7-lb. bricks (equalling 62 cwt. per 1,000), to be delivered from Thornleigh.

The builder of Mrs. Heron's house on land adjoining mine, three years or so ago, when wages were exceptionally low, paid 7s. and 8s. per 1,000 for the carting of 140,000 bricks, I believe, this distance. Owing to the number of carts employed, the men could help each other to load and unload, but the price paid was considered exceptionally low.

I think the price paid by a contractor for the cartage of bricks over any given distance a fair criterion of what such labour is worth.

I, therefore, think I may safely put down 2s. 6d. per load as the lowest rate at which carting can be done over these roads for 3 miles. I think fifteen cases the average load for a moderately extensive grower of summer fruits, or a "mixed" orchard. This brings the average cost of carting a case of fruit 3 miles to 2d. Allowing ½d. per case for loading and carting on the farm—collecting a load from two or three parts of the orchard, perhaps—this leaves 1½d. for carting 3 miles, equal to ¾d. per mile.

Of course, growers of citrus fruit only can always, if they have orchards of any size, make up a load by pulling oranges or lemons. Their average one-horse load would probably be twenty or twenty-five cases, which would lessen the rate somewhat; but from the prices usually charged for carting fruit, I think my figures are not far wrong, even for citrus fruit; and then again, in wet weather the loads must be less in consequence of heavier drawing. The greater the distance the smaller the loads also, per horse. Two horses are often put to draw a one-horse load when the distance runs to 8 or 10 miles.

With regard to the use of stable manure within a short distance of a railway, Mr. H. C. L. Anderson, in his pamphlet on "Orchard Manures," issued by the New South Wales Department of Agriculture in 1890, values stable manure at 4s. to 10s. per ton. The average manure obtainable from Sydney stables may be valued at 6s. per ton on the farm, being mixed with litter, and fresh, therefore containing, as a rule, a large percentage of moisture.

It now costs, on truck at Darling Harbour, not less than 2s. per ton—10s. to 15s. per truck. Trucks do not, I think, hold more than 5 or 6 tons of stable manure.

Freight to Thornleigh is 10s. or 10s. 6d. per truck of, say, 6 tons. This makes 3s. 8d. per ton on truck at Thornleigh. Cost in Sydney, 2s. per ton; freight, 1s. 8d. per ton; total, 3s. 8d., which leaves 2s. 4d. per ton for carting to the orchard, equals cost of carting 2 miles only.

I believe large quantities of stable manure are brought annually to Thornleigh, Carlingford, Ryde, Hornsby, &c., and nearly all is used within a radius of 3 miles of these stations.

WEDNESDAY, 19 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Luke Gallard, fruit-grower, Kenthurst, sworn, and examined:—

- L. Gallard. 919. *Mr. Trickett.*] How many miles do you reside from Dural? About $4\frac{3}{4}$ miles. I am on the road that runs from Kenthurst to Rouse Hill.*
- 19 Jan., 1898. 920. So that if a railway were constructed to Dural you would have to cart your produce $4\frac{3}{4}$ miles? We expect that there would be a station handier than that for us—about midway between Dural and Castle Hill—perhaps not at present, but in the future.
921. How many miles would that be from Dural terminus? Between 3 and $3\frac{1}{2}$ miles.
922. At the present time where do you take your fruit? To Thornleigh, about 9 miles distant.
923. Could you tell us what it costs you a case to take your fruit there? From our place to Thornleigh it would cost at the present time somewhere about 3d. a case.
924. How many cases would go to the load? I reckon about twenty or twenty-five cases to the load. Some large growers, of course, would cart for less. If they used four horses and a large lorry, of course there would be some saving.
925. What is the area of your holding? About 40 acres.
926. Is it all cultivated? About 10 acres are cultivated. Half of it is under summer fruits, and half under citrus fruits.
927. How long have you been there? About $6\frac{1}{2}$ years.
928. Do you find that fruit-growing pays? I find that the district is better adapted for fruit-growing than it is further this way. I have an orchard at Pennant Hills now; but my orchard at Kenthurst is better adapted to fruit-growing, especially to citrus fruits.
929. Can you make any comparison between your orchard at Pennant Hills and that at Kenthurst, in regard to paying? The better paying one is at Kenthurst.
930. Is that through the soil being better? The soil is of a different nature. It is not a stronger soil, but the fruit does better. You can grow a better quality of fruit than you can at Pennant Hills.
931. We were informed yesterday by Mr. Hunt that the fruit-growers about Dural and Kenthurst would be prepared to pay 2d. per case for the transit of their fruit from those localities to the Clyde Junction;—do you think that is so? Yes. I think they would be quite prepared to pay that. I know I should, and I think that all the other residents in the district are in a similar position.
932. Seeing that you already pay 3d. by road, you will be prepared to pay 2d. by railway? Yes.
933. But, independently of that, there would be the cartage of your produce to the platform you indicate on the Dural line? Yes. I reckon it is worth 3d. to cart it to Thornleigh, and we should certainly be prepared to pay the 2d. on the railway.
934. The cartage would bring the cost up to about the present figure? Yes.
935. What are the advantages of railway carriage for fruit, carrying it over a long distance, as compared with cart or waggon? We would gain greatly by being able to pull our fruit, load it into a truck, and send it down to Sydney in the same day. If we had a railway into the district we should pull our fruit to-day, for instance, and send it down to Sydney to-night. It would be in the market the first thing to-morrow morning for sale. Under present circumstances we have to start pulling this afternoon, for instance, to get a load ready for to-morrow. If I had to get fifty cases ready I should have to start to pull this afternoon. Part of the fruit would be lying in the shed to-night. I should pull the rest to-morrow, and bring it to the station. That would mean that the fruit would have to lie in the truck another night before it reached the market; it would be lying two nights before being put upon the market. If we had railway communication it would have to lie only one night in the case, and it would reach the market in better order than it does at the present time.
936. And I suppose would fetch a better price? It would bring, in many cases, 6d. or 1s. a case more. We have to pull the summer fruit almost green to get it into market in good order.
937. Is not most of the fruit which finds its way to the Sydney market ripened in the case? Yes.
938. That is a disadvantage to the consumer? A great disadvantage, especially as regards apricots, peaches, nectarines, and plums.
939. They are much better to eat if they mature on the tree? Much better. A railway would confer upon us other advantages. There would be a great saving of time. We should have three hours more to pull in the day. We have to start from our place at the present time about 2 o'clock, or half-past at the latest. It is not safe to leave it later. If we had railway communication we should be able to pull till about 4 o'clock, and the evening train would bring the fruit down, just as it does at the present time. We should gain two and a half or three hours; that would be a great consideration. There would be a saving of 5 miles in haulage.
940. Could you name any other advantages which would be conferred by railway communication? Over and above what we should gain in respect of the fruit, there would be the convenience to passengers; that is worth a shilling or two.
941. Have you any figures which would guide the Committee in forming an opinion as to the revenue of the proposed line? I have some figures as to the probable increase of our district, and also some figures showing the probable revenue of the proposed railway at the present time. 942.

* NOTE (on revision):—I would like to add that though I myself live only about 9 miles from Thornleigh, two-thirds of the people of Kenthurst live from 9 to 14 miles from the station.

942. What would be your district? It would be from Glenorie to Castle Hill, leaving out Pennant Hills, which has a good service on the Northern line already. The population in the area I have named I find to be 2,017. I have reckoned two trips per annum per head. L. Gallard.
19 Jan., 1898.
943. What distance are you taking in to the north and south? From Thompson's Corner I do not go on the right-hand side at all. I go from the store at Castle Hill through Glenorie, Glenhaven, Kenthurst, Dural, Arcadia, and Galston.
944. Coming down to the western side of the Northern line? Yes. I have reckoned two trips per annum for everyone at 2s. return; that amounts to £403 8s. I have taken the Carlingford traffic on the same basis. We cannot reckon it fully, because part of it on the right-hand side of the line would be served by the Northern line pretty well, but the portion we take I have reckoned at two trips per annum, as in the case of Kenthurst and Dural. There are 680 people between Pennant Hills and Clyde, and they would give a total of £529 8s.
945. Have you reckoned the nearer passengers at 2s.? Yes; but then, on the other hand, 2s. would be cheap for Dural. Then there is the revenue from fruit carriage from Glen Haven and all the other districts, amounting to the produce of 2,278 acres; reckoning 100 trees to the acre and one case per tree, you have a total of 227,800 cases, and I have estimated that at 2d. a case, but we are prepared to pay more than that, if required. It is 1d. more than we are now paying at Thornleigh. The total would be £1,898 16s. 8d. I have left Carlingford and Pennant Hills out of that calculation. I am taking one-half from those two districts and Castle Hill, allowing for the other half to go to the other line. That would give a revenue of £732 10s. The revenue from wood carriage, allowing three trucks a day, would amount to £421, at 1s. 6d. per ton, but that is far lower than we should get it at. I am referring now to firewood. Then there will be the back carriage of manure. I reckon a quarter of a ton of manure per acre for all the land under fruit-trees, and the carriage of that will amount to £142 10s. 6d., at 2s. 6d. a ton from Sydney; that is the rate we have to pay to Thornleigh now. We do not get nearly as much manure now as we should get if we had the railway through.
946. The Department allows for 1,000 tons of manure at 6d. a ton upon the extension;—is that enough? I have allowed for 1,141 tons. Then there is horse-feed amounting to £51 2s. 6d. I have put that down at 2s. 6d. a ton for the whole distance from Sydney. The total earnings I estimated to be £3,246 3s. 8d. In respect of the fruit carriage, I am reckoning only 2d. a case, but we should be fully prepared to pay 3d. a case. I think you will find my figures under the actual revenue.
947. Does it not seem strange that, if you are paying only 1d. a case from Thornleigh to Sydney on the Northern line, you would be prepared to pay 3d. a case to Sydney on the new line; do you not think when the new line is opened there will be an agitation to get the rate reduced? I think we should be perfectly satisfied with that rate for some time. Of course as the district improves we may be justified in applying for a reduction, but at present, and for some time, the people will be perfectly satisfied with the rate I have named.
948. Are the difficulties of road carriage between Kenthurst, Kellyville, Dural, and Thornleigh so great that people will be prepared to pay three times the ordinary rate on the Dural line instead of carting their produce to Thornleigh and sending it from that point for 1d.? I think so. We have a rough road taking the short road to Pennant Hills known as the Rocks-road. It is a terribly steep road and is very rough.
949. It is the saving in road carriage that will enable you to pay the increased rate on the railway? Yes.
950. Is the fruit-growing industry in your district an increasing one? Very much so. I have a few figures to show the increase which has taken place in Kenthurst. There are three ridges, and the area of holdings is 7,548 acres. At the present time there are 750 acres under cultivation, 427 acres are bearing trees, and 266 acres of non-bearing trees; of other tillage there are 56½ acres. Sixteen years ago the population of Kenthurst was about twenty, four families being represented. The area under cultivation was about 60 acres, 30 acres of bearing trees, and 30 acres of non-bearing trees. About a year after that, in 1883, we got a school started at Kenthurst with fourteen children, that being all they could muster. At the present time there are sixty-eight children on the roll; Kenthurst was nearly all Crown land, which has been selected. A number of persons came out from Balmain and Sydney, and settled down there on conditional purchases, and started to improve their selections, with the result that there are now 750 acres cultivated, and a population of 323. On the road upon which I live another small school has been started during the last two years, and it has an average attendance of sixteen. During the last five years there has been an increase of twenty children in the school, at which the attendance is now sixty-eight.
951. You grow both classes of fruit in your orchard? Yes.
952. Which is the better class to grow, summer fruit or citrus fruit? Citrus fruit is the best for our district. It seems to grow there of a better quality, and it hangs longer on the trees than it does in the black soil of Pennant Hills and Carlingford.
953. Has the production of citrus fruits in this district increased or diminished of late years? It has diminished of late years. The trees do not seem with any amount of care to do now as well as they did some years back, when they had but very little care at all. At the place I have at Pennant Hills we had as fine a bed of orange-trees as there is in the country. Now they are dying out and we cannot save them. The young trees do not do nearly as well.
954. Is not the reason known? Some property seems to be wanting now in the soil, or there is something in the climate which will not allow them to do as well as they did some years back. Settlement may have had something to do with it; the country is more open now.
955. The Agricultural Department has not been able to solve the difficulty? No.
956. As a matter of fact, we used to export large quantities of citrus fruit, whereas we are now importing it? We still export a lot of citrus fruit.
957. Are not any of the trees destroyed by a well-known disease—red scale? That finds its way everywhere, no matter where you go. It does not trouble us as much out there as it does in other places. You do not find it in the bush as much as you do close to the river, and in more open parts.
958. How do you send your fruit to market now? I cart it to Kenthurst and Thornleigh station.
959. What is the carriage from Pennant Hills to Thornleigh? It would be about 3½ miles from my place in Pennant Hills to Thornleigh. It would not cost us from there more than 1d. to 1½d. We can go two trips a day easily.

- L. Gallard. 960. From your place to Kenthurst it means a day's journey? Yes; if you get away you cannot get back to do anything. If you send a man to Thornleigh you can get very little more out of him that day.
- 19 Jan., 1898. 961. We were informed yesterday that the commission in Sydney on the sale of fruit is 6d.—is that true? Yes; I pay 7d. a case, including railway carriage, cartage at Sydney, and market dues.
962. Many persons seem to think that the fruit industry is not at all remunerative;—do you consider that it is of a sufficiently remunerative or permanent character to justify you in saying that this special charge from Dural to Clyde would be one which would not absorb your profit to any extent? I think so. I do not think we should be the losers; we should be no worse off than we are now; in fact, if anything, we should be a little better off.
963. You would be none the worse off, pecuniarily, and there would be the advantage to you of having quick transit to market? Yes.
964. *Mr. Lee.*] You think there is room for a large increase in the production of fruit? Yes.
965. I presume there is room for at least four times as much as is now produced? Yes; I think that in Kenthurst four times as much could be produced, because there is a large area not cultivated.
966. But if the extra quantity were produced, would there be a market for it? I think so. We are labouring under difficulties at the present time through the want of organisation. We are just about starting a co-operative society, which will make fruit-growing more remunerative than it has been in the past. When the system is in full swing we shall grow fruit to greater advantage.
967. Have you any difficulty in finding a sale for what you do produce? There are certain classes of fruit in regard to which we have a difficulty sometimes. We have not any means of disposing of or utilising surplus fruit of poor quality.
968. There must always be a certain quantity of poor quality fruit? Yes.
969. If a larger area of land is to be brought under fruit-trees, will not the successful operation of the fruit-growers depend largely upon the demand for fruit? We estimate that the demand for fruit will increase with the production.
970. You think the increased demand will necessitate the quadrupling of your produce? We think so.
971. *Mr. Wright.*] You pay 3d. to get your fruit taken into Sydney? Yes.
972. Would you continue to pay that 3d. upon the new line if the people of Pennant Hills were paying only 1d., as they are doing now? I take it that the line would be constructed upon the basis of a double rate or something of that kind. We should be quite satisfied with that. We would rather have that than take our fruit to Pennant Hills.
973. You think that the bulk of the fruit-growers would submit to the extra charge? Yes; a meeting of fruit-growers agreed to pay it.
974. You do not think there would be an agitation for a reduction of the rate three months after the line had been opened? No.
975. There are some 7,000 acres of conditionally-purchased land in your district, of which 750 acres have been cultivated? Yes.
976. How much more land there is suitable for orchard purposes? Quite four times as much as is now under orchard.
977. Suppose there were grown in the neighbourhood of Sydney four times the quantity that is now grown, would there be a local market for it? Not under the present system of disposing of it.
978. You are calculating upon an increase of population causing increased consumption? Yes.
979. Have you any system of canning or preserving surplus fruit, in operation? We tried to form a large company some time ago, but we did not succeed. The co-operative system is now a going concern.
980. You think that if the growth of fruit overtakes the demand there will be no difficulty in disposing of the surplus by canning or preserving? Or it might be exported. Working individually, we cannot export satisfactorily. Working as a body, we can export satisfactorily.
981. You think then there is a reasonable prospect of a co-operative society coming into existence? It is a going concern now, only it is confined to certain lines.
982. You see no prospect of a fall in the demand for all the fruit which can be grown in your district? Not if the sale is worked well under a system of co-operation.
983. *Mr. Hoskins.*] Under the system of co-operation to which you refer would you have sufficient money to carry out your proposal? Yes; I do not think there will be any trouble once persons see the benefit of co-operation. I think the system will widen out, and will take in canning and preserving and the utilisation of all surplus produce.
984. Is there not some difficulty in getting in the necessary money? I think the work under co-operation would be easier done than through a joint stock company.

Samuel Fagan, fruit-grower, Dural, sworn, and examined :—

- S. Fagan. 985. *Mr. Clarke.*] In what part of the district affected by the proposed railway do you reside? In Dural, almost on the boundary, between Galston and Dural.
- 19 Jan., 1898. 986. What area of land have you under fruit? I and my brother are working together. We have about 160 or 170 acres.
987. The present rate of carriage from Parramatta to Sydney is 1d. a case? Yes.
988. It is said that the fruit-growers in your direction, if the railway were extended to Dural, would be willing to pay 2d. extra, making in all 3d. to Sydney;—would you pay that amount? I would, and I think it would be a great advantage to us to do so. At the present time there is a great deal of inconvenience and expense attaching to the getting away of the fruit when we have been unable to cart our own, and have had to put on extra horses and drays, and it has cost us 8s. and 9s. a ton. One great advantage of a railway would be that we should be able to pull the fruit so much later in the day and have it on the market much fresher and in much better condition.
989. It would bring a better price? I am quite sure it would. At present we have to pick much of the fruit before it is fully grown, to ensure it getting to market in good condition.
990. If the proposed line is constructed, would the people of Castle Hill and to the north continue to send to Parramatta? I do not think so. None of us like travelling when we can get served in a more handy way. No one would travel the longer distance for the sake of saving a penny.
991. You would still have to cart your fruit to the railway? Certainly. 992.

992. But there would be a considerable saving in the cost of cartage? There would be a wonderful saving. Carting 4 or 5 miles is much better than carting 10 and 11 miles.
993. The roads are in pretty good order now? Yes; but if you were on them in the wet weather you would be surprised. It is nearly impossible to get along in wet weather. It then takes two horses to do decently what one horse will do in dry weather. Where the road is metalled it is very good.
994. I suppose your present market is confined to Sydney? We ship a great deal of fruit to New Zealand through Sydney.
995. Do you ship any to Great Britain? We have not done so of late years. Some ten or twelve years ago we tried a shipment which proved fairly satisfactory. But at that time the cost was very heavy. It almost consumed what the fruit realised.
996. You know that large quantities of fruit are shipped from Tasmania to the Old Country? Yes. Some fruit was shipped from our district last season which gave a very satisfactory return. Mr. Hunt shipped 53 cases, and they returned him half a sovereign a case clear profit. The fruit was shipped privately.
997. You have no reason to doubt that if a proper system were in existence it would be possible to ship fruit from here as profitably as it is shipped from Tasmania? There is no doubt about there being a market if the matter is taken up and handled properly. Our district is almost the best in the Colony for growing citrus fruit. If the thing were set going properly there would be a great future for our district in the shipment of citrus fruits for the Home market.
998. Have you any fruit-preserving industries in the district? No.
999. According to the last witness you intend to start a co-operative society? I believe that in the near future we shall have establishments started upon the co-operative principle. A great many of us are willing to go into the matter.
1000. There are several fruit-preserving establishments in the neighbourhood of Sydney? Yes.
1001. Are they large buyers of fruit from your district? Yes. Some of the jam factories buy very largely.
1002. Are the jams equal to the imported jams? That is a question I could not answer. We use our own jams. I heard that one of the factories turned over between £35,000 and £36,000 a year. That speaks well for it.
1003. Is there not likely to be an increasing demand for fruit for jam? Yes, and there is no doubt about the probable increase of fruit from the district. The greatest increase will be in the citrus fruits, which will be a great success. It would be a splendid thing if we had the Home markets opened to us.
1004. The last witness stated that at Pennant Hills he had an orchard which two years ago was successful and which is now not successful;—can you give any reason for it? I think that the reason is to a great extent that the country is more opened up. The wind plays upon the citrus fruits with bad results. On some of the hills they catch the wind very severely. That has a great deal to do with it.
1005. I suppose you know that as a general rule when country is opened up in regard to other kinds of crops better results are obtained than when the crops are surrounded by bush? In many cases no doubt that is so, but it seems to me that the hills in our district are much better suited for building sites than for fruit-growing.
1006. Is there any large area under cultivation for wheat or oats? No, there is not much farming out our way. It is nearly all fruit-growing.
1007. Mr. Wright expressed the opinion that a great deal of land would be put under cultivation for the production of other things than fruit? I do not know what crops he could be referring to. There is certainly no good prospect for farming in the district.
1008. You think that if the line were extended to Dural the people of the district generally would support it? Yes, I have every reason to believe they would. The whole district would be benefited.
1009. *Chairman.*] You have heard the evidence of previous witnesses? Yes.
1010. You agree with it in the main? Yes; but there is one matter which I should like to mention. It is in regard to the carriage of manure. I think Mr. Gallard under-estimated the revenue from that source. I have had a good deal of experience in the carrying of manure for the convenience of ourselves and a few neighbours. During the last year I put through some 182 tons. Being busy part of the time with our horses we had to pay 8s. to 10s. a ton for delivery to my place from Hornsby Junction, a distance of 7 to 8 miles over a very heavy road.
1011. If the railway were constructed as proposed you would get it carried at a lower rate? Yes; we should be prepared to pay anything in reason.
1012. Would you be prepared to pay 2s. 6d.? I have put the amount down at 3s. or 4s. A railway would be a great convenience, because we should get the manure when we required it.
1013. What is the railway freight upon manure from Sydney to Hornsby? By taking a full truck it costs 2s. 2d. a ton.
1014. In addition to the cartage to your residence? Yes.
1015. *Mr. O'Connor.*] How many acres have you under cultivation? 160 or 170 acres.
1016. Is the other part of your land as good for fruit-growing as that which is under cultivation? A great part of it is.
1017. Would railway communication induce you to put more land under cultivation? I have no doubt it would. If it would not help us to do that, it would give us a chance to give more attention to the land we have under cultivation, causing it to produce more fruit.
1018. Is there much land round about you available for cultivation? Yes, there is a reserve on the other side of Arcadia of some thousands of acres. It is about 5 miles from where I live.
1019. What is the nearest station to Arcadia? Hornsby, about 11 miles distant.
1020. What sort of road is there between the two places? In good weather it is a fair road. In bad weather it is a very heavy one.
1021. Is the reserve to which you refer suited to the production of fruit? It would be very well suited to the production of citrus fruit and passion fruit. There is a great area of country to be taken up there, and I am sure a great many persons will be willing to settle upon it. With regard to horse feed and produce one witness said he thought it likely that a good deal could be grown in the district; I can only say that last year we had to buy it in Sydney and send it up. Last year we brought 50 tons over the railway and carted it out to our place. In our small business alone the horse feed and manure amounted to from 230 to 240 tons.

George Henry Werth, fruit-grower, Glenhaven, sworn, and examined:—

G. H. Werth. 1022. *Chairman.*] You reside at Glenhaven? Yes.

1023. Where is that? It turns of on the top of the hill, between Castle Hill and what is called Round Corner, to Kenthurst.

19 Jan., 1898.

1024. You are between Castle Hill and Kellyville? Yes.

1025. How far are you from the railway? A mile and a quarter.

1026. You are a fruit-grower? Yes.

1027. By which road do you send your fruit to market now? Sometimes by Thornleigh, sometimes by Parramatta. I have only a small orchard now, and a great deal of my fruit is sent into Parramatta for convenience sake. The distance to Thornleigh would be 9 miles, and to Parramatta 10½ miles. I keep no horse, and a neighbour carts my fruit into Parramatta with his.

1028. A railway within 1½ miles of you would be a very great convenience to you then? Yes.

1029. The advantage to you personally would be very great? Yes.

1030. That being the case, would you be prepared to pay a higher rate of carriage by rail than the rate now charged on the Great Northern line? Yes, considerably higher.

1031. What rate could you afford to pay? Threepence a case from my place to Sydney. I have to pay 4d. to Parramatta, and a 1d. from there to Sydney. I am at present charged 5d. It would pay me to pay 3d. or 4d.; but I think 3d. is quite sufficient.

1032. Have you found that your fruit has suffered very much damage from being carted into Parramatta? Yes, some fruit is considerably damaged.

1033. Would that be obviated if there were a railway? Yes.

1034. Does not fruit suffer from being carried on a railway—that is, being handled and discharged? I have not found that it suffered much from being on the railway. I have known cases, when the trucks had not been full, to be knocked out in shunting; but when the cases are properly packed in the trucks they generally arrive in Sydney in fair order. Summer fruit will sink sometimes 2 or 3 inches below the lid from jolting in a cart on the way to the railway station.

1035. If you had your own horse could you not take your fruit to Parramatta for less than 4d. a case? Not for less than 3d. for a single load.

1036. You could go to Parramatta and back in a day? Yes.

1037. And you could take a ton? No; if I took twenty cases it would be as much as I could do.

1038. That would be 6s. 8d. a day;—would not that pay you if you had your own dray? No.

1039. It would pay you to pay double railway rates, and even then you would save money? Yes.

1040. Are there others in the district in a similar position to yourself? Yes.

1041. Supposing the proposed line were constructed and the local rates were imposed, do you not think the first thing you would ask for would be to have the rates reduced to those existing on the northern line? If the line paid something over and above interest and working expenses we should certainly ask for it, but not otherwise.

1042. Suppose that with the increased rates the line still showed a loss, do you not think you would feel dissatisfied and that you were being hardly dealt with? No; we should take things as a matter of course, feeling that we should be better suited than we are at the present time.

1043. You do not think that under such circumstances you would prefer to cart your fruit to the train at Pennant Hills? No; I do not think that anyone would take to the road again once they had a railway.

1044. You do not think drays would be brought into competition with the line in the same way that they are brought into competition with the railways for general goods? I do not think so.

1045. You think a saving in the quality of the fruit and the quickness of despatch would make it worth your while to pay the increased freight? I do not think there would be any more carting by road.

1046. On the map you will see north-east from Castle Hill junction there are two roads, one going east to Thornleigh and the other south to Parramatta,—what would be a fair price from that junction to, say, Thornleigh or Pennant Hills? I should say about 2d. a case.

Henry Thomas Johnston, Mayor of Dundas, sworn, and examined:—

H. T. Johnston. 1047. *Chairman.*] You are Mayor of Dundas? Yes.

1048. The municipality of Dundas lies between Parramatta and Eastwood? Yes.

1049. *Mr. Fegan.*] Do you as mayor represent the opinion of the people of your municipality? I represent the opinion of the people in the west ward who are interested in the railway.

19 Jan., 1898.

1050. Is there a difference of opinion in your municipality in regard to the railway? There is no difference of opinion. The east ward is served by the northern railway and the west ward would be served by the Rosehill Railway.

1051. Are you a fruit-grower? Yes.

1052. You have heard the evidence of the previous witnesses? Yes.

1053. Do you agree with that evidence so far? Entirely, knowing the district.

1054. How will the proposed railway affect your district? Not so much from the fruit-grower's point of view as from a residential point of view.

1055. You think a railway would be a means of inducing fresh population to the district? Yes, considering that the line runs entirely through residential sites.

1056. What is the area of the municipality? About 2,000 acres. The population is about 850. We have a revenue of £410 and the expenditure is ditto.

1057. You think the proposed railway would make your railway of greater importance than it now is? Yes, and I desire to draw attention to a quarry in the municipality. It is an old blue metal quarry which has been worked for the last eighty years. It is in the centre of the west ward, within a mile of the Rosehill Railway.

1058. Do you supply other municipalities with metal? Yes; all the surrounding municipalities.

1059. I suppose the opening of the Rosehill Railway would give that work an impetus? Yes. Ten years ago 18,000 tons were turned out from the quarry. At the present time, through increased means of transit given to other localities, we have not been able to enter into competition with them. I refer now to Kiama and other districts. We have no other transit than drays, and the consequence is that the output has fallen to 6,000 tons.

1060.

1060. Do you think you would get more orders if you had better transit? It would mean 1s. difference if the Rosehill Railway were opened.
1061. How much do you charge on the quarry? Six shillings a ton.
1062. Would much railway revenue be derived from the quarry? I could not say what the revenue would be, but we could easily double the present output. Kiama can under-sell us owing to cheaper transit.
1063. What is the area of quarry? About 5 acres.
1064. To what depth have you gone? Seventy feet.
1065. Has the metal been tested any deeper than that? I think so. They are still going down.
1066. There is no deterioration whatever? No; the metal is just as good as it was fifty years ago.
1067. What is the depth of the stone from the surface? Within 10 feet from the surface you get into pure blue metal.
1068. How much of the 5 acres has been worked? I suppose there is an opening of about 3 acres.
1069. You think it would be well to have it tested deeper? It depends upon the depth, how long it will continue to bring in a revenue not only to the municipality but to a railway? Yes. The cartage of the quarry to Ryde Station is 2s. 3d., but we could land the metal at the nearest station on the Rosehill line for 1s.; that would make a difference in tendering.
1070. Have you had many houses built lately in your district? Yes. I suppose that during the last three years the increase would be about 10 per cent.
1071. I suppose the extension of the railway would not only give an impetus to the sale of metal and to the fruit industry, but would induce persons to reside in your municipality? In my opinion fruit-growing in that particular locality is deteriorating. What we are looking forward to within the near future is being a suburb of the city. We are within 11 miles of it.
1072. How are you supplied with water? By wells. Portion of the borough is supplied by the Water and Sewerage Board. The part served by the Rosehill Railway is supplied by wells.
1073. How far are you from Parramatta? Our western boundary adjoins the eastern boundary of Parramatta.
1074. None of your municipality is supplied by the Parramatta Water Supply? No.
1075. The Sydney Water Supply is nearer? Yes.
1076. Then you have every facility for a closer population? Yes. I may say there has been a proposal to erect a tank in the west ward for the supply of water from Hornsby. I think a sum of money has been put upon the Estimates.
1077. You have some particulars as to the west ward of Dundas Municipality? Yes. They are as follows:—Population, 450; holdings, 109; residences, 82; area of holdings, 1,030 acres; under cultivation, 450 acres; not cultivated, 580 acres; bearing, 300 acres; not bearing, 125 acres; other crops, 25 acres; number of cases of fruit, 25,000; value of produce, £10,000; quarry, 6,000 tons in 1897, 18,000 tons in 1887.
1078. Your quarry is already near a constructed line? Yes; the Rosehill line. We should benefit by the opening of the railway. There would be a saving of 1s. 3d. as compared with the present charge for cartage to Sydney.
1079. All that you require is the opening of Simpson's line? Decidedly.
1080. *Mr. Farnell.*] With regard to the land taken for the construction of Simpson's line, do you know the conditions under which it was acquired? I believe it was acquired under the betterment principle.
1081. The people therefore are anxious for the opening of the railway? Yes: they feel aggrieved at the delay which has taken place in the opening of the section. They consider that they have a claim upon the Government.

H. T.
Johnston.

19 Jan., 1898.

David Scott, fruit-grower, Arcadia, sworn, and examined:—

1082. *Chairman.*] You are a resident of Arcadia, which lies between Dural and Galston? Beyond Galston; it is in the direction of Berowra Creek.
1083. *Mr. Wright.*] You are a fruit-grower? Yes.
1084. Have you a large area under cultivation? Between 6 and 7 acres at present; the area is increasing.
1085. Have you any information to give the Committee as to the proposed railway? Merely as to my own district; there is no doubt in my own mind that the extension of the railway to Dural would be to our advantage, inasmuch as it would reduce the distance to a railway station, and would enable us to take a larger load by reason of the better road. It would also tend towards increased settlement, more particularly in our neighbourhood. We have a considerable area of vacant land there—I should say from 4,000 to 5,000 acres.
1086. It is suitable for agriculture? A great deal of it is. It is partly broken country. Our great difficulty lies in the lack of facilities for getting our produce to market. We have to take the fruit from 10 to 10½ miles to the Hornsby Junction—our nearest railway station at present. We have to go over what is known as the "Zigzag Road." The grades are very steep, necessitating small loads, and making a long day's journey. It would be testing a horse to take him to Hornsby two days running. He would want spelling between the journeys if he had anything like a load.
1087. What would it cost to bring in 30 cases from Arcadia to Hornsby? The charge for gin-cases is 6d. a case; for half-cases 4d. a case; and for what are known as packers 5d.
1088. Are the men carrying regularly? No. The orchardists make up loads between themselves. One goes in to-day and another to-morrow, and so on. They cart one another's fruit, making up a decent load on every occasion. This is done by the growers themselves. I do not know of any outside carriers.
1889. What is the quantity of fruit sent from Galston and Arcadia? I have not the information with me; but the particulars were included in the return handed in to you by Mr. Hunt, yesterday. I assisted to make up the return, and I know as far as my own part is concerned it is absolutely correct. I assisted to make up the part known as the Bay-road district. I believe that the whole of the return is not in any way exaggerated.
1090. How far are you from Galston? I have so far spoken of the centre of the district. You may take the school-house as practically the centre. That would be about 3 miles from Galston and 6 miles from Dural. There would be a saving of from between 4 and 4½ miles as compared with Hornsby.
1091. And you would have a comparatively level road? Yes.
1092. The road itself is a good one? It is fair; portions of it are being improved. The bush-track is being improved as we can get money to do so.

D. Scott.

19 Jan., 1898.

1093.

- D. Scott.
19 Jan., 1893.
1093. There is a stiff rise out of Berowra Creek which makes the carriage to Hornsby difficult? Yes; the grade is 1 in 13.
1094. You heard the previous witnesses examined in regard to charges;—do you think there would be any objection to paying 3d. a case to Sydney? No doubt the saving by railway would be worth something. In my own case I am not prepared to say it would pay us to give 3d., because we would still have a considerable haulage. Of course the residents of Dural would save the whole of their haulage. They would save the whole of their 10 miles into Hornsby or Thornleigh. In our case we would have 6 miles to Dural as against 10½ miles to Hornsby. The saving would be worth something; but whether it would be worth as much as 3d. a case I am scarcely prepared to say. I should think it ought to be worth 2d. a case.
1095. You think the people at the northern end should be asked to pay a less rate than those on the railway itself? I do not say that; I am merely stating how the matter would affect us. The concession you might get in the cartage would probably be an equivalent for the extra 3d. on the railway.
1096. It costs you 7d. at the present time to send in gin-cases? Yes.
1097. If you could get those cases taken to Dural for 3d., and if there were a further charge of 3d. to Sydney, that would be 6d. as against 7d.? Yes; we should still be in pocket if we could get it carted over the 6 miles for 3d., even if the cartage to Dural cost 4d. There would be a distinct gain if the railway charge were 2d.; but we should not be anything out of pocket if it were 3d.
1098. You think the people there would be perfectly satisfied to pay 3d.? I should not like to guarantee that; but I think it would be a fair thing.
1099. Even supposing the charge remained at 1d. at Hornsby? Even if that charge remained at 1d., they would prefer to cart to Dural, and pay 3d., I think.
1100. What is your view of the district? I believe in its future. I think its capabilities are not yet known. I, myself, sunk some money in it, and am devoting myself to it. I do not look for a fortune; but I believe that there is a big future in front of the district. I do not think the value of the ground there is yet known. Although it does not look rich, we have some of the finest orchards in New South Wales, and there are some thousands of acres of the same class of soil. The whole parish of Berowra is a railway reserve. The reserve, I believe, was made when there was some talk of taking the Northern line in that direction, and it has not since been cancelled. If the line were taken on to Wiseman's Ferry it would open up a large area of first-class land. I think there would also be a large timber trade.
1101. The best of the timber now standing would be a long way beyond Dural? I think you would strike heavy timber within 2 miles of Dural at the present time; certainly within 3 miles you would strike very heavy forest land. Among fruits the passion fruit is grown to perfection in the district—in fact we challenge the Colony in the growth of passion fruit.
1102. Have you been long an orchardist? It is two years since I purchased my orchard.
1103. You know that some of the good orchards in the neighbourhood of Parramatta are upon the sandstone formation;—would not that class of soil soon wear out? Any soil would wear out unless it were kept up to a certain standard; but a sandy soil seems to form a better standard to work upon than does a heavy clay soil. It is a better soil for the roots of trees to work in. The natural drainage is also better.
1104. We have to look at the question from the point of view of the entire Colony;—do you think the Colony would be justified in expending £60,000 or £70,000 in the construction of a railway through this district? I should think so. It would open a large district which, without better means of communication, cannot well be utilised. The district is suitable for only one thing, and that is fruit-growing; and the majority of fruits will not pay for long cartage. I believe there is a big future before our fruit, especially the citrous fruits, for which the district is especially adapted. We have the whole of the export trade to the old country before us, and if we can get the "hang" of the thing there is no reason why the same thing should not be done here as has been done in California. I believe that in the sandy loamy soil of the county of Cumberland, we have the very thing necessary for successful fruit production.
1105. You have heard of the proposed co-operative society? Yes; a co-operative society is being started which may settle the whole question for us.
1106. I gather from what you say that although the proposed line may not pay at present, the great impetus which it will give to this district will eventually make the expenditure justifiable? I feel quite sure of that. It may take a little time to develop; but there is a big future in front of the district.
1107. *Mr. Hoskins.*] You are strongly in favour of the construction of the proposed line to Dural? I am in favour of anything which will give us better facilities for reaching market.
1108. You know that according to the Departmental estimate that line will cost £7,000 a mile? I have heard so.
1109. Do you think the people affected will be willing to give such land as may be required for the construction of the line free of charge? Of course, I cannot answer for other persons; but speaking for my own district we should be only too pleased to place the land at your disposal.
1110. *Mr. Farnell.*] Is not the inferior land in your district being used for vine growing? I have not a great knowledge of the grape vine, but the district is the home of the passion vine. I believe that a Frenchman went into the grape vine industry there and did fairly well, but I cannot speak positively of that.
1111. I suppose there is a lot of surplus fruit in the district? Yes. If you are not very cautious in dealing with summer fruit—if you do not get it away before it is too ripe—you are bound to lose it. The only way to remedy that state of things would be to treat the fruit locally.
1112. Do you think a canning industry is likely to be established in the district? I should say that it is quite within the bounds of possibility. If jam factories were started by the co-operative society they would, no doubt, be put down locally as a matter of economy in preference to having central factories in Sydney. I believe some sort of factory was started last year, and it did fairly well, although it fell through at the end of the season.

THURSDAY, 20 JANUARY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.	

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

James Purser, fruit-grower, Castle Hill, sworn, and examined:—

1113-14. *Mr. Humphery.*] You are a fruit-grower at Castle Hill? Yes.

1115. *Mr. Hassall.*] Have you been long resident in the district? I was born there fifty-six years ago, and it has been my home ever since.

J. Purser.
20 Jan., 1898

1116. I suppose you have some knowledge of the proposal under the consideration of the Committee? Yes.

1117. How far would you be from the proposed railway? It would pass within a few yards of my property.

1118. What area have you? About 120 acres.

1119. How much of that is cultivated? I have about 60 acres of trees. I also grow a little hay and corn for my own use. There are altogether 65 acres under cultivation.

1120. Your main crop would be the fruit crop? Yes.

1121. What is the cost of clearing and planting an acre of fruit-trees? About £20. Of course a good deal would depend upon the timber upon the land. In some cases it costs £10 an acre to clear the land, and in other cases only £6 or £7.

1122. Then it would cost you from £15 to £20 an acre on the average to clear and plant? Yes, reckoning between 80 and one hundred trees an acre.

1123. You have seen the district from its start? Yes; it is about forty years since fruit-growing was started there upon a large scale. It has since improved every year.

1124. Fruit-growing is the chief industry of the district? At the present time. Prior to the forty years period to which I have referred the land was cultivated mostly for corn, but fruit was found to be profitable, and small areas of from 1 to 4 or 5 acres were planted. As time went on these areas were increased. About twenty-five years ago fruit brought exorbitant prices, and since then planting has been increased year by year. About ten years ago, when the industry was being encouraged by the Government, the land was more largely settled, and the farmers distributed their land among their families, each of whom put a certain area under fruit. Farming was then given up almost entirely, except for purely local purposes. In this way the land shortly became very valuable. It was originally worth £1 per acre, and as fruit has become more valuable so has the land increased in price. I have known from £40 to £60 an acre to be given at Castle Hill for land upon which to plant fruit-trees.

1125. That may be accepted as a proof that the industry is a profitable one? Yes. Some seven or eight years back people began to settle more extensively in the district of Castle Hill, Baulkham Hills, and Pennant Hills. Some land was selected, and others bought land. Within the past few years there has been a great increase in the population of the district, especially having regard to the adverse circumstances with which the people have had to contend. In wet weather the roads going out to Dural are a disgrace to the Colony. I have travelled over many districts in Victoria and South Australia, and have had opportunities of seeing the condition of the roads there, and I can only say that the roads in the adjoining colonies are kept in a very much better condition than are the roads in our district. The metalling of the roads has been carried out at the rate of a few hundred yards a year. People have settled upon the land, knowing that they would have to cart fruit from 5 to 20 miles in order to reach a railway. In wet weather the roads are so bad that it takes two or three horses to haul a load of fruit. I am not appearing before you to-day from any personal or selfish motives. Personally, I would rather remain as I am without any railway. I have a very large orchard containing about 7,000 trees, some of the best in the Colony. I am in a sheltered place where I am in no way interfered with, and I have good neighbours. I know perfectly well that when the railway is built there the country will be opened up, and that that may bring a larger number of persons round me, but I am liberal in my views, and I am satisfied that it is for the benefit of the Colony generally that the railway should be constructed through the district. It would lead to a large increase in the population.

1126. Is there still plenty of land available for fruit cultivation? Yes; there is a number of persons who, like myself, have made a living out of fruit-growing, and who have put by something for themselves. Having now reached a period of life at which they cannot work so well, I think they would be willing to give up a portion of their holdings. In that way I think a fair area of land would be sold from various estates. Since the Committee went over the proposed line there has been a local sale of land, and the auctioneer could scarcely believe his ears when he heard the prices offered. The land was bought in the hope that the railway would be constructed. Persons of course know that if they waited until the line was absolutely constructed they would have to pay far more for the land. The railway would open up one of the most beautiful spots in New South Wales, or indeed in these Colonies. Having travelled a great deal I am able to make comparison. In Rutherglen, in Victoria, about twenty years back, the residents agitated for a railway line from the Springs, near Albury. The land was taken up for the planting of grape-vines, and to day there are 15,000 acres of vineyards in that one district. The Victorian Government at first laughed at the idea of laying down a line to Rutherglen. At that time there were very few residents there. To-day I am told that the line is one of the best paying lines in the Colony of Victoria. That district is not to be compared with our district for the production of fruit. We have a climate which I believe to be unrivalled for the production of deciduous and citrus fruits. The capabilities of the land are astonishing.

1127. There is a belt of good soil? Yes; I have seen no part of this Colony or of the Colonies of Victoria or South Australia which is better adapted to the production of fruit. We have an elevation of

J. Purser. from 500 to 800 feet above sea-level. My son, who is a medical man, says that the climate, from the point of view of health, is superior to that of any other part of New South Wales. I myself would use the line extensively. I am sending away something like 200 tons of fruit annually, and next year there is every prospect of a very heavy crop. The trees are recuperating after the drought, and are looking splendid.

20 Jan., 1898.

1128. How far are you from a railway station? I use the Parramatta line because the road is down hill. It is 7 miles away. The Thornleigh station is a little nearer, but the road is much worse.

1129. You would use the proposed railway for the despatch of your fruit? Yes; and in time I should be sending away more than I am now sending.

1130. What does it now cost you to get your fruit away? I pay 2d. a case to Parramatta, and the rate is 1d. from Parramatta to Sydney. The knocking about of the fruit over the 7 miles to Parramatta does not do it any good.

1131. Would you be willing to pay 3d. a case putting your fruit on to the proposed railway instead of hauling it to Parramatta? Yes; I should be willing to pay even 4d. a case.

1132. You would reap a great deal of benefit through the fruit not being knocked about and being therefore more saleable? Undoubtedly I should. I should be quite willing to pay 3d.

1133. I suppose your case is similar to that of many other persons in the same locality? Yes.

1134. It costs them what it costs you to get their fruit to market? Yes.

1135. Do you think that other persons would be willing to pay 3d. a case to Sydney by the proposed railway? Yes; I believe they would prefer to pay 3d. to carting the fruit to Parramatta.

1136. There is also the loss of time occupied in carting to be considered? Yes.

1137. What is the average value of fruit per case—mixed fruit? It is difficult to say. I keep my oranges back until Christmas. I store them away, and by keeping your fruit in that way you can sometimes realise as much as 15s. or £1 a case. I got from 16s. to £1 a case for lemons in Sydney market last year. I think you might put down the average at 5s. a case.

1138. Does 3d. cover the whole of your present cost into the Sydney market? Yes.

1139. Then you have the charges of the commission agents? Yes. We pay by the case here. In the other colonies there is a percentage charge.

1140. The return you get upon your produce depends upon the market? Yes.

1141. How many dozen of good peaches would you put in a gin-case? I do not think you would get in more than twenty dozen.

1142. Could you get in sixteen dozen of the very best peaches? They would be a very large peach.

1143. What would they be worth? They are selling very well this year—about 4s. to 10s. Good peaches have brought from 6s. to 8s.

1144. That would be from 3d. and 6d. to 9d. a dozen? Yes.

1145. Have any steps been taken to bring about a system of co-operation under which the fruit could be distributed direct by the grower to the consumer? An agitation has been going on for some time, and I believe that eventually a co-operative society will be formed.

1146. In that case the fruit-growers would reap a largely increased profit? Yes. I send a great deal of my fruit out of the Colony. Last year I sent 3,600 cases of stone fruit to New Zealand.

1147. The effect of the system would be this—that the public could rely upon obtaining a supply of first-class fruit at a reasonable price, while the growers would at the same time derive more from its sale? Yes.

1148. It is the middleman who gets the most benefit now? Yes.

1149. You think that any estimate which might be formed of traffic upon the proposed railway would be largely increased from the additional number of persons who would profitably occupy the soil? Yes.

1150. The fruit would be conveyed more directly to market, and the fruit-growers as well as the public would be benefited proportionately? Yes. I believe a railway would increase the produce of the district threefold.

1151. If the quantity of fruit increased very much you would have to look outside Sydney for a market? Yes. I send the greater portion of my stuff away now.

1152. You have established a connection in New Zealand, Victoria, and Queensland? Yes.

1153. But in any case fruit-growers would have to use a railway to get their fruit to the port of shipment? Yes. I may mention that all the heads of the Agricultural Departments of the other colonies have visited my orchard, and have expressed their surprise that such a good fruit producing district should have no railway conveniences. The Speaker of the Legislative Assembly recently visited the district, and was surprised when he saw that such a magnificent locality was without a railway. Every stranger who comes into the place notices the same want, and wonders how we get along without a line.

1154. What is the country like going on from your district to the Hawkesbury? From Glenorie to the Hawkesbury there is some good land. Almost all the land of any value at Glenorie has been taken up, but people have so far done very little with it because they find it so difficult to get their produce to market. There is a good deal of Crown land in that direction. There is also splendid timber in some of the gullies. It has been lying there for years on account of the inconvenience attending the getting of it to market. If there were a railway to Dural the whole of that timber would be utilised. It would be from 6 to 12 miles from the terminus. I do not know of any place near the city where you could find a better supply of wood for fuel. There is ironbark, oak, box, black butt, and all kinds of good timber. The Commissioners estimate a revenue of only £1,400 for the proposed railway. I bring the return from fruit at only 2d. a case up to £1,000. The passenger traffic would be far more than the general public imagine. The inhabitants of the district will largely use the line. It is not at all likely that with a railway in the district persons would drive 14 miles to Parramatta. There is not one in ten who would do so. Where they use a buggy once now they would use a railway five times. It would also be a good line for excursionists, pleasure-seeking, or sight-seeing, and I believe that eventually it would pay splendidly.

1155. You think that facilities for travelling into the district would be availed of by the people of Sydney desiring to see a fruit-growing district, and that the estimate of the Railway Commissioners in regard to passenger traffic would be largely increased? Wonderfully increased.

1156. Do you know of any persons through whose land the railway would pass? I know a few of them.

1157. Do you think they would be willing to give free of cost land which might be required for the railway? I could not say definitely, of course, but I believe they would.

1158. I presume that any unimproved land which might be required would be given free of charge? I believe that it would, but I am not in a position to say. In regard to improved land I think the

Government

Government would be able to get it at the cost of the improvements, and the probability is that the people would be quite willing to give the unimproved land.

1159. *Mr. Hoskins.*] Have you heard any persons say that they would so appreciate the advantages of a railway from Carlingford to Dural that they would be willing to give to the Government any unimproved land which might be required for the construction of the railway? I have heard that opinion expressed, but I cannot remember by whom.

1160. The estimated cost of the line, exclusive of land, is £6,292 per mile. The average cost of railways constructed lately in the Colony has been between £2,000 and £3,000 a mile? I can hardly understand the line costing £6,000 a mile. I should think it could be laid for much less than that.

1161. Assuming that the line would pass almost entirely through private property the expense of the land is a serious consideration? Yes. As regards the expense of the line I think there is too great a discrepancy between the estimated traffic and the cost of working the line.

1162. Do you not think that having regard to all the circumstances the people through whose property the line passes should be prepared to give free of charge such unimproved land as might be required? I do not think so. I believe that if the matter were put to the people in that way they would be found willing to give the land. If the construction of the railway were made conditional upon the giving of the land I quite believe the land would be given.*

Walter James Black, fruit-grower, Glenorie, sworn, and examined:—

1163. *Mr. Roberts.*] Where do you reside? At Glenorie, 5½ miles to the north of Dural.

1164. How many miles would it be from Galston to Glenorie? As the crow flies, about 3½ miles.

1165. Is there not a good road from Glenorie to Galston? No.

1166. Where do you put your fruit on the railway? At Thornleigh, a distance of 13 or 13½ miles. I come down to Dural, and go thence east to Thornleigh.

1167. Can you land your fruit there and get back in a day? Yes, I get home on the same day; but in wet weather it takes four horses to draw a two-horse loading. I generally take from 30 cwt. to 2½ tons.

1168. Is it a fairly good road in fine weather? Yes, except about 3 miles of it, where the grade is very steep. In some places the grade is what you might call one in nothing.

1169. In wet weather the road is a very indifferent one? Yes; they are talking of making a bridge, which would make the grade to which I have just referred 1 in 13, so you can just imagine how steep it is without the bridge. There is a good road ordinarily from Dural to Glenorie, but in wet weather it is very bad.

1170. How many acres have you? I and my mother own about 280 acres.

1171. How many acres have you under cultivation? Sixty-four.

1172. Is it all under fruit? Yes.

1173. What kinds of fruit? Principally citrus fruit; but we grow a good deal of summer fruit.

1174. How long have you resided in the district? Thirty-four years; I was born there.

1175. Do you find the fruit-growing industry a profitable one? Yes; but we are at a great disadvantage. We live at a good distance from the railway, and it takes me all day to get in a load of fruit, whereas other growers can get in two loads; we are, therefore, very heavily handicapped.

1176. The load would not be of the same value as if you were in close proximity to a railway line? It makes the carting a little bit dearer.

1177. Is the land all taken up in your direction? No; there is plenty of it to be had.

1178. What is the value of improved land? Land which has been planted for a few years, and which is fruit-producing, would cost from £28 to £40 an acre. Unimproved land would run at from £6 to £18 an acre.

1179. Has all the Crown land been alienated? Pretty well all of it.

1180. Do you know the country about Galston? I am not thoroughly acquainted with it.

1181. Is the land there as valuable and as fertile as at Glenorie? Yes.

1182. Is all the land in your neighbourhood well adapted for fruit-cultivation? Yes, thoroughly.

1183. You are acquainted with the proposal which has been referred to the Committee? Yes.

1184. Looking at the matter in the interests of the public, do you think it would be wise to extend the line from Carlingford to Dural? I should say that it would.

1185. You think it would bring more prosperity to the district—that more land would be cultivated? Yes. Five years ago there were practically no orchards in our district. Now there are orchards all over the place. There are from eighty to ninety orchards.

1186. Is there a great demand for land out there? Yes.

1187. If the line were extended from Carlingford to Dural, instead of putting your fruit on to the railway at Thornleigh you would put it on at Dural? Yes.

1188. You pay only 1d. a case from Thornleigh? Yes.

1189. Would you be prepared to pay an extra 2d. from Dural? I would sooner pay 3d. from Dural than cart to Thornleigh, where the rate is 1d. You see the man would be at home, and in that way a great deal of money would be saved.

1190. It would mean a saving of half a day? My man could be home at half-past 9, after leaving a load at Dural; whereas at present he is not home until 6 or 10 o'clock at night, according to the weather. It occupies the whole of the day, and in wet weather a great part of the night as well. Besides that, there is the wear and tear of the horse. Horses are not fit for anything the next day after making the journey to Thornleigh with a load.

1191. Is the country more undulating between Dural and Thornleigh than between Glenorie and Dural? Yes.

1192. The fruit gets more knocked about in going over that kind of country? Considerably more.

1193. That is one of the reasons which prompts you to say that you would sooner pay 3d. from Dural than a 1d. from Thornleigh? Yes.

1194. Would it not pay you to put your fruit on to the railway at Hornsby? It would be 10 miles as against 13; but the road is worse. There is a short cut into Galston, but we could not send the fruit over it. The journey down to Dural and up to Hornsby would be the same distance as the journey to Thornleigh.

1195.

* NOTE (on revision):—I would like to add that from the proposed terminus of the line under consideration there is much good country right through to Singleton, via the Macdonald River, Wollombi, and bordering on Merriwa. Much of the land is splendidly situated for the production of all kinds of fruits, and there is also on the route much first-class land for agricultural and grazing pursuits, and then I believe it would shorten the distance from Singleton to something like 50 miles.

J. Purser.

20 Jan., 1898.

W. J. Black.

20 Jan., 1898.

- W. J. Black. 1195. Where do the Galston people put their fruit on to the railway? Some at Hornsby and some at Thornleigh. If the railway came to Dural their fruit would be taken there. The journey is less and the road is better.
- 20 Jan., 1898.
1196. *Mr. Hoskins.*] How far from your property would the proposed railway be? $5\frac{1}{2}$ miles.
1197. *Mr. Humphery.*] Had you an opportunity to check the estimate of earnings presented to the Committee by Mr. Hunt? Yes.
1198. Did you assist in the collection of statistics? Yes; I gathered the Glenorie statistics.
1199. Then, as far as the return relates to Glenorie, you could vouch for its accuracy? Yes; if anything, we have under-estimated the traffic.
1200. Therefore, we may accept the statistics relating to Glenorie as trustworthy? Yes.
1201. *Mr. Fegan.*] In the event of the line being constructed, I suppose you would not be inclined to cart your produce to the Hornsby Station or the Hornsby Junction, seeing that the charge from that point to Sydney would be only 1d. a case? No. Going to Hornsby would mean a day's work, whereas we could make the journey to Dural in 3 hours.
1202. What is the difference in mileage? The distance to Hornsby would be 13 miles; besides it would be all good road going to Dural.
1203. There is a large number of persons whom it would pay better to cart to Hornsby? No; they would send every case to Dural. They would not entertain the notion of going to Hornsby.
1204. Do you think a guarantee could be obtained from the people that they would send their produce to Dural instead of *via* Hornsby? Yes. They would gain immensely in the better condition in which the fruit would be put upon the market.
1205. What does it cost to clear land in your district? From £8 to £14 an acre. I might also mention that there is a great deal of timber there—oak, ironbark, and white mahogany.
1206. *Mr. Wright.*] Is there good marketable timber in your neighbourhood? Yes; the ironbark and white mahogany. I have some valuable timber on my own property. The timber on the Crown lands is not so good, although there is good timber there. A good deal of it has been cut out, but there is a lot of private property with good timber on it.
1207. Could the railway authorities look with confidence for a certain amount of traffic in timber? Yes; especially in firewood.
1208. Do you think there would be any traffic in timber for building purposes? Yes.
1209. You think the distance is not too long for the haulage of that class of timber? No.
1210. Is it possible to get firewood in the immediate neighbourhood of Dural? Yes; each week there is a tremendous lot of firewood going away. Persons can get their land cleared almost for the price they get for the wood.
1211. Then there would be some addition to the freight estimated by the Commissioners, inasmuch as there would be the freight upon wood? Yes.
1212. Is it possible that any other industry might be developed in the district? Well, there are a good many vegetables grown. I myself grow from 1,500 to 2,000 bushels of green peas every year for sale in the Belmore Markets. My fruit is all sent away to Victoria or New Zealand, or to the country districts.
1213. Do you think the land in your district is suitable for market-gardening? I think there is every prospect of some of the land being used for that purpose. We can grow cauliflowers and cabbages admirably.
1214. You know that Sydney is at present largely supplied with those vegetables from Victoria? Yes.
1215. You think that if there were a railway in the district it would compete successfully with Victoria in the production of those vegetables? Yes; there are a lot of vegetables brought in from Dural.
1216. You think that that is further traffic, then, which has not been taken into consideration by the railway authorities? Yes.
1217. Can you give the Committee any idea of the probable expansion of the district in the event of a railway being constructed through it? At our end it would go ahead in leaps and bounds.
1218. What is the price of unimproved land suitable for orchard purposes or for market-gardening? From £6 to £14 or £15 an acre. It would cost on the average about £9 to clear the land.
1219. Would it pay anyone to purchase land at £20 an acre for fruit-growing? If the man had experience, not otherwise.
1220. You think there is a large future before the district? I do.
1221. You do not anticipate a glutted market, as far as fruit is concerned? I might mention that I used to send all my apples to Brisbane, but this year they have legislated in reference to the codlin moth, and now we cannot send our apples there. If anything like that were to come about in the other colonies it might bring about a glutted market here. Apart from that, I do not think there is much fear of a glut.
1222. The Committee have been informed that a co-operative society is in process of formation at the present time for the sale of fruit, and for the preserving and canning of that portion of the produce which cannot be sold locally, or which cannot be exported? Yes; I think the society ought to be a great success.
1223. Do you think the fruit-growers in your district will subscribe the capital necessary to establish such a society? Yes; I am sure that all the people who can afford to subscribe will do so.
1224. If you are successful in establishing a society of that kind all fear of a glut will be removed? I think so. If we make a success of the preserving and canning industries we need not fear a glut.
1225. You are aware that New South Wales imports canned and preserved fruits to the value of a quarter of a million? Yes.
1226. If the proposed society is established a large amount of money which is now sent to foreign countries for canned fruits will be paid to our own growers? Yes; I quite believe that.
1227. You think the proposed railway would help largely to develop your district? Yes.
1228. *Mr. Trickett.*] Are you sure that it would pay anyone to give £20 an acre for orchard purposes? Yes.
1229. Suppose a man bought land in a state of nature at that price, how long would he have to wait for any return? He would get a small return in three years; he would get a fair return in four years; and in five years he should get a handsome return.
1230. So that anyone starting in the fruit industry must have a certain amount of capital? I do not say that that is absolutely necessary, because men have come to Glenorie within the last five years without
any

- any capital. Formerly they were glad to go out labouring at 5s. or 6s. a day. They do not want to work to-day. Before they started with their orchards they were actually poor men. W. J. Black.
1231. Do you export both citrus and summer fruit? I send my summer fruit chiefly to New Zealand, and the citrus fruit to Victoria. 20 Jan., 1898.
1232. Which is the more profitable? The citrus fruit, because it is less risky; it does not get knocked about so much on the railway; it is not so perishable.
1233. We hear that the citrus fruit-trees suffer from disease? Yes, especially in cases where the orchardists do not try to cope with it.
1234. What is the nature of the disease? White aphid and red scale.
1235. Are you able to cope with it—to keep it under? We are not able to thoroughly eradicate it; but we can keep it from injuring the fruit, so that the trees will bear a regular crop every year or second year.
1236. Are not a number of oranges and lemons imported into New South Wales? Yes. There is a considerable importation of Sicilian oranges and lemons. They do us a lot of harm.
1237. You export your fruit because you get a better market for it in the adjoining colonies than you would have in Sydney? Yes.
1238. Do you export through an agent? No, I send direct. I have my agents in Victoria and New Zealand. I do not sell more than five cases in every hundred in Sydney.
1239. Are there many diseased orchards in your district? They are not thoroughly diseased; people are able to cope with the disease.
1240. What price do you get for your fruit, taking all the year round? I sometimes get from 15s. to 16s. a case, but for the next consignment I may get as low a price as 2s. 6d. or 2s. 9d.
1241. Would that be from deterioration or from a glutted market? Sometimes it is due to a glut, and sometimes it is owing to the fruit being carried on the hatches on the steamer and being landed in bad condition. When the fruit is landed in good condition we always get a good price. I get more for a quarter case in New Zealand than I should get for a full case in the Sydney market.
1242. Did you say that 5s. a case would be a fair average? Yes.
1243. It pays you better to export your fruit than to sell it locally? Yes.
1244. *Mr. Humphery.*] How long has your orchard been in full bearing? Part of it for about thirty years.
1245. What has been your experience of the exportation of fruit—has it been satisfactory? Yes; although I had some hard knocks.
1246. Have you been able to pay all the expenses of production and receive a reasonable return for your outlay? Yes.

John Purser, fruit-grower, Carlingford, sworn, and examined:—

1247. *Mr. Humphery.*] You are a fruit-grower at Carlingford? Yes; I live $1\frac{1}{2}$ mile from the railway terminus at Carlingford, between Carlingford and Pennant Hills. J. Purser.
1248. *Mr. Hoskins.*] As a rule, are there many orchards about Carlingford? Yes; there is no other industry there. 20 Jan., 1898.
1249. What is the extent of your holding? My own property is about 12 acres; but I lease about 80 acres.
1250. Do you use the whole of that for fruit-growing? No; only 12 acres.
1251. Is there a good demand for the fruit you grow? Yes.
1252. Do you frequently have failures in your fruit crop? Yes; this year we had a failure, in lemons especially.
1253. Where do you send your fruit generally? Generally to the Sydney market.
1254. What does it cost to send your fruit to Sydney from Carlingford? Twopence delivered at market. One penny from Parramatta to Sydney, and 1d. from Darling Harbour.
1255. Are you in favour of the construction of the proposed line? Yes; I think it would be of great benefit to the district.
1256. Seeing that your property is only $1\frac{1}{2}$ mile from the present terminus at Carlingford, the proposed railway line would not affect you very much? The proposed line would go within $\frac{1}{4}$ mile of my land.
1257. Have you heard many persons express an opinion in favour of the proposed line? Yes; I myself collected at Carlingford the statistics which were handed in by Mr. Hunt.
1258. Are the majority of persons there in favour of the construction of the line? Yes.
1259. You have heard the estimated cost of construction? Yes.
1260. Have you heard any persons say that they would be willing to give, free of charge, such unimproved land as might be required for the construction of the railway? Not in my own district, but one man at Castle Hill told me that he would give the land required free. I refer to Mr. A. Fuller. He has about 100 acres. The line passes through his land.
1261. Do you know whether the land was given free of charge to the promoters of Simpson's railway? They had to pay. I do not know what was paid for the land, but I fancy they had to go to arbitration to save litigation. I think they paid a great deal more than they ought to have paid.
1262. You are aware that many persons frequently ask for a railway simply on account of the prospect of getting from the Government three times as much for the land required as that land is worth? Yes.
1263. Do you think the Government would have to pay a heavy price for the land in this instance? I could not say how much per acre they would have to pay for the improved land, because I have never heard anyone say how much they would take; but I do not think they would have to pay anything for unimproved land.
1264. Has any land lately been sold in the neighbourhood of Carlingford? Yes; land was sold three months ago at £29 an acre; it was partly orchard land and partly unimproved land. Blocks can be bought at £14 an acre.
1265. Do you not think that in this instance, as in others, the Government ought to insist that if a line is made, the persons through whose property it passes should give, free of charge, the required land? Yes; if the land is unimproved.
1266. Have you read the report of the Chief Traffic Manager as to the probable traffic on the proposed land? I read his report as printed in the Parramatta *Argus*, and I think he made a great mistake. He put down

- J. Purser.
20 Jan., 1898.
- down the population of the district from the Parramatta River to Dural at 1,500, whereas it is 3,226. These are Mr. Hunt's figures. He obtained them from the various persons who collected throughout the district. I myself collected at Carlingford, and I made the population of that district 685. I did not go more than a mile on the northern side of the proposed route, or more than a quarter of a mile on the side near the northern side of the line.
1267. The statistics are not official statistics? No.
1268. Do you think a majority of the people owning land between Carlingford and Dural would give the land required for the railway? I believe a good many would give any unimproved land which might be required.
1269. Are there many vehicles carrying passengers between the districts to which you have been referring and Parramatta? A coach runs from Pennant Hills into Parramatta making four trips a day. One also runs from Carlingford Hill making three trips a day; one also runs from Castle Hill twice a day.
1270. Do you think if the proposed railway were constructed that that traffic would be diverted to it? The whole of it.
1271. Even although Pennant Hills and Castle Hill would be a considerable distance from the railway? Yes; there would be more traffic among the fruit-growers. Some of the fruit-growers at times find fault with their agents in the market, and where one fruit-grower goes to market now ten would go if there were a railway. They would go down in the morning, sell their fruit and return at night. That would account for a good deal of passenger traffic.
1272. Do you know if there is any valuable timber about Dural? There used to be, but I have not been there for a number of years.
1273. You know the expense of getting timber to Sydney for firewood? Yes.
1274. Do you think there would be a large traffic in the firewood from the districts to which you have been referring? Yes. There are thousands and thousands of tons of wood lying in that district. It is not now fit for anything, because it would not pay to cart it to Parramatta, to Hornsby, or to Thornleigh.
1275. I suppose all the fruit-growers use a good deal of manure? Yes; besides, none of the fruit-growers grow their own corn, and stuff of that kind. All that they use is carted from Parramatta or Thornleigh. If there were a line through the district it would all be carried by it, and dropped at the different stations. Some of the fruit-growers grow a little hay, but that is all.
1276. There would be a return to the railway then in respect of manure, and in respect of agricultural produce? Yes. I suppose three-parts of the people of the district get the things they require in Sydney. They can be obtained there more cheaply. There would be a good deal of passenger traffic arising from persons coming down to Sydney to make purchases.
1277. What does it cost on the average to cart manure in the districts between Dural and Carlingford? I could not say what it costs; but it involves a great loss of time.
1278. The railways carry manure cheaply? I believe 3s. 9d. a ton is charged from Sydney to Thornleigh.
1279. If a railway were constructed through the district, manure could be obtained very much more cheaply than it is obtained at the present time? Yes; and there would be more manure used. A number of persons would like to use it, but they have not the means of carting it themselves. They have to pay for the carting, and it is then expensive. If they could go to the stations and pick up the manure there, it would come easier.
1280. I suppose the crops are generally improved when manure is used? Yes; but if you use too much manure for the citrous fruits you make them rough-skinned. It is very good for lemons.
1281. Do you, as a citizen, think the Government would be justified in making the proposed line at a cost of £10,000 a mile, exclusive of the purchase of land, in the present state of the Colony? Yes. I would not look to the line to pay at once. But there is no finer district in the Colony than that through Carlingford and Castle Hill for residential purposes. There is plenty of fine land, and there are good views.
1282. Are not those advantages to be found on the Milson's Point line? No; there are not half the views there which are to be found on this line, and notwithstanding that fact Beecroft and Carlingford are now almost little townships.
1283. *Mr. Lee.*] So far as you are personally concerned, if the line already laid to Carlingford were opened for traffic it would meet your requirements? Yes. I had an estimate of the traffic that would go from Carlingford; allowing three-quarters of a case to a tree, there would be 69,000 cases.
1284. The districts of Dundas, Carlingford, Rydalmere, and Ermington are said to be the areas which would afford produce for Simpson's line? Yes.
1285. It is estimated that that there would be some 120,000 cases from those districts? I think there will be a great deal more than that.
1286. Which is the largest fruit-growing district of the four I have mentioned? Carlingford and Dundas take the lead.
1287. It is said that 90,000 cases are sent away from Ermington? I should think it would be so. I am estimating 313,000 cases, averaging three-quarters of a case to the tree. That of course applies to the whole district through from the river to Glenorie.
1288. Do you think the existence of the proposed railway would divert any of the boat traffic from Ermington? Nearly the whole of it. I know plenty of fruit-growers who pass the terminus of the line to put fruit on to the boat. If the railway were opened I am sure they would not go past the terminus. Five or six of my neighbours pass the terminus. If the line were opened they would not have to cart the fruit more than 1 mile; they now cart it 5 miles. The reason they use the boat is, that the road to the Carlingford railway station is such a hilly one.
1289. Supposing the line from Carlingford to Dural were constructed, do you think that if the existing railway were taken over and run as an ordinary line, it would be of any considerable advantage to your portion of the district? Yes; but there would not be the advantage in it which would exist if the line were extended further.
1290. At the Carlingford end are you not already served by the nearness of the Great Northern line? No; I use the Parramatta Station; the road to Carlingford is too bad. It is half-a-mile further to Parramatta than to Carlingford.
1291. The cost of taking the fruit to Parramatta is the same as to Carlingford? Yes.
1292. If the line were extended as proposed, would it not rob the Great Northern line, on the one hand, and the Parramatta line, on the other, without increasing the produce of the district? There would be

more carriage to be paid for the fruit from Carlingford than from Parramatta. Most people would sooner pay 2d., putting their fruit on at Carlingford, than 1d., putting it on at Parramatta.

1293. The extra price might make the line pay, at the same time it would be taking traffic away from the Great Northern line and from the Parramatta line? Yes, there is no doubt about that.

1294. Do you think that there is a possibility, in the near future, of the orchards so largely increasing in number as that the extra fruit produced would more than compensate for the loss which the Great Northern line would sustain? I do think so. There will be one township, so to speak, along the whole length of line in the course of ten years.

1295. There are no townships in that direction at all? You might say there are villages.

1296. Are there any village reserves? No; but it is a beautiful district for residential purposes.

1297. Do you base your estimate of increased production upon the fact that at the present time there is a large area of virgin land? Yes.

1298. You think that land is suitable for fruit cultivation, and that if there were proper facilities for getting the fruit away its production would be largely increased? Yes.

1299. Where would there be a sale for the fruit if its production were quadrupled? What we could not sell in Sydney we should have to ship to the other colonies.

1300. Can you sell what you already produce? Yes; we do not suffer from over-production of fruit, but from the shortness of money, in the city and elsewhere, with which to buy it. It is the landlords in Sydney who make the fruit dear. Fancy a man with a little shop paying £6 to £10 a week rent; he must charge a big price for his fruit to make up his rent.

1301. But, notwithstanding, fruit-growing is a remunerative industry capable of large extension? Yes.

J. Purser.
20 Jan., 1898.

FRIDAY, 21 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Rev. Henry Robert Pigott, Kellyville, sworn, and examined.—

1302. *Chairman.*] You are a resident of Kellyville? Yes.

1303. *Mr. Farnell.*] How long have you been resident there? About eight years.

1304. During that time you have had a good opportunity to watch the development of the district? Yes.

1305. You are acquainted with the proposal before the Committee? Yes.

1306. You have prepared a statement with reference to the proposal from the point of view of the residents of Kellyville? Yes. It is as follows:—

Rev.
H. R. Pigott.
21 Jan., 1898.

KELLYVILLE.

A Statement by Henry R. Pigott, Orchardist, &c., for the information of the Parliamentary Standing Committee on Public Works.

Kellyville—A comparatively new but important settlement, situated on the main road from Parramatta to Windsor, at a distance of from 8 to 12 miles from the Parramatta Railway Station.

1. The orchards at Kellyville are chiefly situated on the Kellyville and the Elphinstone estates: The former, a property of 1,500 acres in extent, was opened up in 1885; the latter, a block of 150 acres in extent, was opened up more recently. Six hundred acres in 10-acre lots, belonging to these estates, are still unsold. There are also 3,296 acres of waste land in private hands,—the greater part of which would, doubtless, under the stimulus of railway communication, be brought into cultivation, thus raising the total area of cultivated land to over 5,000 acres.

2. The proposed Rosehill-Dural railway, in consequence of the distance from Kellyville of the nearest point on that line—some 8 miles from the more distant orchards, and also, in consequence of the roughness of the country lying between the proposed line—would be utterly useless to this settlement, and would never be used. For these reasons we oppose that scheme. We also oppose it on the ground that its adoption would shut out Kellyville from the hope of obtaining railway communication for all time.

3. Kellyville, having in view also the interest of the whole of the inhabitants of this great district—extending from the boundary of Parramatta to distant Galston—asks for “steam communication,”—meaning thereby a railway *via* Baulkham Hills, Kellyville, and Castle Hill, to Dural. We shall, however, if necessary, be satisfied with a tram-line, provided that it is constructed to carry railway trucks, so as to avoid the danger of damage to ripe stone-fruit, which would arise were it necessary to transfer the cases from the tram to the railway trucks.

4. An estimate of revenue expected from the line from Kellyville to Parramatta:—

(1) Passenger traffic—20 persons per diem, at 1s. per return ticket	£365
(2) Freight on 64,240 cases fruit, at 1d. per case	267
(3) „ 500 tons of hay, at 2s.	50
(4) „ vegetables, poultry, eggs, firewood, &c	100
(5) „ goods from Parramatta, 1,000 tons at 2s.	100
(6) „ manure	50
(7) Carriage of parcels	50
(8) Saving on carriage of mails (say)	70
Total	£1,052

NOTE—The official estimate given is evidently far too low, and most probably omits the Kellyville revenue altogether.

5. The benefit of a railway to the fruit-grower—

- (1) His fruit would reach the market more expeditiously and safely, travelling as it would at a high rate of speed over a smooth railway line.
- (2) His fruit, in consequence of this advantage, would reach the market in better condition, and would realise better prices than it does now.
- (3) The cost of transport at 2d. per case to Sydney would be lower than it is at present, as fewer horses would be needed.

(4)

Rev.
H. R. Pigott.
21 Jan., 1898.

- (4) He could also either reduce the area of his cultivation-paddocks, planting up the difference with fruit-trees, or find a profitable market per rail for his surplus horse-feed.
- (5) He could procure manure at a low rate per truck from Sydney and the suburbs. He could thus avoid the danger to his land and to his trees of the use of costly artificial manures. The net result would mean less money spent for better results in fruit, both as regards quantity and quality.
- (6) He would live longer and more happily, as his anxieties and that "worry which kills" would be reduced to a minimum. He and his family could travel about more, and would thus cease to "vegetate" and commence to live.
- (7) He could, if either for personal or family reasons a change of residence became necessary, more readily and to better advantage realise on this property than at present.

For convenience of reference a tabular statement of Baulkham Hills, Lower Castle Hill, and Kellyville statistics is appended:—

	Baulkham Hills.	Lower Castle Hill.	Kellyville.	Total.
Population	667	386	521	1,574
Area of holdings	5,380	3,057	5,784	14,221
" in bearing	1,093	583	1,356	3,034
" not bearing	527	87	225	839
" of other tillage	81	87	307	475
Cases of fruit per acre.....	72	51	40
Cases or fruit per annum	97,090	58,000	64,240	219,330

NOTE.—In adding up the general statistics, the figures given in this Table for Lower Castle Hill must be deducted from the grand total, as they are also included in the figures for Castle Hill, as supplied by the Dural Railway League.

1307. What kind of fruit do you grow principally at Kellyville? All kinds—summer and citrus fruits.
1308. I think you said in your statement that some hundreds of acres were still available for cultivation? Yes.
1309. Can that land be obtained at a reasonable figure? The Kellyville Estate is selling at £18 an acre. That is the only criterion I have.
1310. Do you think that purchasing land at that price a man could occupy it profitably for orchard purposes? Yes.
1311. Is the land which is still available of as good quality as that which has been taken up and settled upon? It varies. Of course the orchardists with large blocks of land have picked out the best portion of it. I could not say how many acres are good, and how many are not; but I imagine that the majority of the acres unoccupied are as good as any we are occupying.
1312. Do you contend that the people living beyond Kellyville—the people of Dural, Kenthurst, Glenorie, Galston, and Arcadia—would be served equally by the construction of a tramway or railway from or near Parramatta, as by the extension of the Rosehill line? Quite so.
1313. You said that an under-estimate had been made of the traffic likely to be carried upon a railway or tramway? Yes.
1314. Are you aware that the cost of a railway from Parramatta is set down by the Railway Commissioners at over £50,000? Yes.
1315. And you know also that it is said that it would show a loss of £3,000 a year? Yes.
1316. It is estimated that a tramway could be constructed at about one-half the cost of a railway? Yes.
1317. Taking the estimated cost of the tramway at £25,000, and given facilities for the use of rolling-stock which would admit of the traffic being taken right through on to the railway system without transshipment, you think the line would pay? I do.
1318. You are aware that one difficulty in connection with a tramway lies in the use of rolling-stock which could also be used on the railway? The official report said the curves were very sharp. If the line could be made without sharp curves there would be no difficulty in the matter. It is only 2 miles on this side of Dural that the sharp curves come in.
1319. But if a tramway were constructed without the possibility of using its rolling-stock upon the suburban line it would be useless? I do not say that it would be useless; but it would be less desirable.
1320. Supposing the consignors of the fruit still had to tranship at Parramatta, where would the advantage arising from the tramway come in? Apart from the drawback of transshipment, we should have the advantage of quicker transit and many other conveniences. The disadvantage of transshipment would depend largely upon the persons who handled the fruit. If it were handled carefully the transshipment would not very much matter.
1321. But as regards inward traffic, you would be in the same difficulty that you are in now? Yes; our men now put the fruit on to the truck, but subsequently it is not handled so carefully, and the consequence is that a great deal of the fruit is spoilt. You might arrange for greater supervision. The difficulty lies in other people handling your fruit. If you could so arrange that the rolling-stock and the tramway would run right on there would be no difficulty, because we should put our fruit on board and it would not be touched until it was taken off the railway by the agent, who is our servant.
1322. You are speaking to-day more particularly from the standpoint of a resident at Kellyville? Yes.
1323. Kellyville is situated from 8 to 12 miles from Parramatta? Yes.
1324. Have they good roads of access to Parramatta? Yes. The main road to Windsor, which the Committee were on the other day, runs along the borders of Kellyville proper. From the 8 to the 10-mile post there is the main road, but about the 9-mile post the road turns off, and from that onwards there are just the ordinary country roads, which are very rough indeed. I do not think any Government money has been spent on them. Now and then little grants of money may have been given to do various things.
1325. They would be by-roads? Yes.
1326. At the present time most of your fruit, if not all of it, goes to Parramatta? Yes; except sometimes to Melbourne, when the fruit is put on to the Parramatta tram and is shipped on to the steamer. I know of one orchardist at Castle Hill who does that.
1327. If the proposed extension from Carlingford to Dural were carried out, what would be the nearest point at which Kellyville would touch the line? If the line is carried out according to the survey, it would cross Castle Hill a little beyond Baily's store, and that I believe would be the station for Kellyville. It would be 8 miles off and all up hill. The nearest part of Kellyville would be about 5 miles distant.

1328. You are taking it for granted that the station would be established at Castle Hill—but supposing there is a platform at the nearest point? The point I have given you is the nearest point, as far as I can make out. Rev.
H. R. Pigott.

1329. The official report with regard to that route states that Kellyville would be within the influence of the line, and that at its nearest point it would be $2\frac{1}{2}$ miles from a station? It is 2 miles along the Show-ground road, so that that statement must be wrong.* 21 Jan., 1898.

1330. No portion of Kellyville, you think, would be served within a distance of 5 miles? Certainly not, unless new roads or bridges were built. I do not know what might happen then.

1331. Do you favour a railway from Westmead to Dural, or a tramway from Parramatta to Dural? Being under the impression that a tramway will be insufficient to carry the produce of the whole district, we held out for a railway; but given that a tramway would carry our produce, it would suit us equally well, and we should be satisfied with it.

1332. Even suppose it were impracticable to run the rolling-stock on the suburban line? We should be so glad to get the communication that we would swallow even that; but I think the difficulty to which you refer might be overcome.

1333. What does it cost you per case to send your fruit to the Parramatta station? I cannot tell. I use my own cart, and I have not averaged the cost. The man has to knock off other work in order to take in the fruit.

1334. You think it would be more economical to you to pay 1d. a case on a line between Kellyville and Parramatta than to continue the present system? Yes. I should get more work out of both man and horse; I should save labour.

1335. I think your total estimate of the revenue was £1,052? That would be the revenue from Kellyville alone.

1336. Supposing a tramway were so constructed that it would not admit of the rolling-stock being used on the suburban line, you have to deduct a great many of your sources of revenue—for instance, the carriage of manure and hay? The hay and everything except the manure could be transhipped.

1337. Have you made any approximate estimate of the traffic likely to come from Dural, Kenthurst, and those places? No; I do not know enough of the country.

1338. You think the Committee will be justified in applying the evidence which has been given in regard to the Rosehill extension to the railway you suggest through Kellyville? I take it that the evidence you have received is in favour of the route referred to the Committee; but that it would be equally favourable to the alternative route I suggest.

1339. You are not forgetting that the people of Dural, Castle Hill, and Glenorie are equally in need of the railway communication? The people there are so anxious to get railway communication that they are afraid to spoil their chances by adopting any other suggestion.

1340. You think they look upon the proposal before the Committee as the most expeditious way of getting railway communication, and that is why they are supporting it? Yes.

1341. What hand have the Parramatta people taken in this agitation? I was away on duty elsewhere when the Kellyville committee was formed and they put me on. I understood that Kellyville, Baulkham Hills, and Lower Castle Hill represented the fruit-growers alone. On attending the general committee meeting of the three bodies I found that Parramatta was also included. I objected to that, and I got into hot water by saying that they did not come into the matter with clean hands. They seemed to think that the Parramatta people going with us would be a help, but I thought it would be otherwise. Seeing that we were fighting for the same thing I did not object to their fighting with us, and I therefore continued in my position.

1342. The Parramatta people are fighting for “steam communication,” but they are more particularly directing your attention to the construction of a tramway? I may say that steam communication was merely a catchword which happened to fall from Mr. Wright, who was examined here the other day. Up to that time one party were for a railway and the other for a tramway, but it was thought that the words “steam communication” might mean anything, and they were therefore adopted.

1343. Do you think the Parramatta people desire things to remain as they are in preference to your having a railway which would bring you into direct communication with the city of Sydney? Judging from the remarks which were made before the Minister, I imagine that that is so.

1344. Is there anything you would like to add to your evidence? There is only one point. Railway communication would have the effect of saving very valuable time. I had to start to-day at 11 o'clock in order to be here at 2.

1345. A railway or tramway would give you further time in which to pack your fruit for market, and it would arrive in better condition? Generally the orchardists would be able to pack all day, and still have their fruit on the market the next morning, whereas having to start off in the morning at the present time we cannot do that. In some cases that makes a lot of difference to the quality and price of the fruit.

1346. *Mr. Wright.*] Your idea is that the tramway might be carried along the Old Windsor Road? That was my original idea, but I was informed that such a tramway could not be taken along that road.

1347. It would save a large amount of land resumption if the line could be taken along the road? Yes. I do not see why it could not be taken there.

1348. There are no steep grades there? There is a hill near Roxburgh Hall, which is the first steep grade of any consequence. The other is at the Cross Roads, but it is not very steep.

1349. The cost of the tramway would be about one-half of the cost of the proposed railway? Yes.

1350. It is estimated that the tramway would cost £28,000, and that the cheapest railway would cost £52,000? Yes.

1351. And do you think the tramway would serve the district equally with the railway? A tramway to serve the three districts of Baulkham Hills, Kellyville, and Castle Hill, and going on to Dural, if it took a middle course, would require resumption, but if it ran on the road there would have to be a branch up to Kellyville of $4\frac{1}{2}$ miles. The other part will be on the main road to Dural. If that were done, so far as our district is concerned, we should prefer a tramway to a railway; it would be more convenient.

1352. The suggested tramway would run closer to you than the proposed line from Carlingford to Dural? Yes. 1353.

* NOTE (on revision):—These are the exact measurements:—From the most distant orchard to the main road near the 9-mile post, 3 miles; from 9-mile post to corner of Show-ground road, $1\frac{1}{4}$ mile; length of Show-ground road, 2 miles; from Castle Hill corner of Show-ground road to top of hill, a little beyond Bailey's store, $1\frac{1}{4}$ mile; total, 8 miles.

- Rev. H. R. Pigott. 1353. Taking the districts 10 miles west of the existing Northern line, which would serve them best, the proposed extension from Carlingford, the tramway from Parramatta, or the railway from Westmead? I think a line from Parramatta or Westmead would benefit the whole population.
- 21 Jan., 1898. 1354. Both the eastern and western side would be well served? Yes.
1355. You know that the proposal before the Committee would take a line close to the Great Northern line? It would run parallel to that line for some miles.
1356. The country beyond the Windsor road would not be served at all? No.
1357. Do you think that if a tramway were run at 12 miles an hour it would meet your requirements? Yes.
1358. What you want is a ready means of transit at a comparatively cheap rate? Yes; we do not care very much about speed. If our fruit is started off at night it will surely get to Sydney by the morning.
1359. Parramatta is not affected by the question at all? Not in my mind, except that we deal there for groceries and things of that sort.
1360. Any railway or tramway coming through Parramatta would serve you better than the proposed line, and would at the same time preserve the existing relations between the fruit-growers and business people? Yes. I might also mention that there are several saleyards there which are very convenient; a good deal of business is done in that way there.
1361. Parramatta is one of your markets? Yes.
1362. I suppose it is second in importance only to Sydney? Yes.
1363. Then railway or tramway communication with Parramatta would be of decided advantage to the fruit-growers in your district? Yes.

Henry Jenkins, Mayor of Ermington and Rydalmere, sworn, and examined:—

- H. Jenkins. 1364. *Chairman.*] You are Mayor of Rydalmere and Ermington? Yes.
- 21 Jan., 1898. 1365. *Mr. Black.*] Have you any statistics with reference to your district? Yes. The line which would benefit our district would be the line from Rosehill. The number of inhabitants benefited by that line would be 1,240. There are 600 acres under cultivation in our district, and 1,700 uncultivated. The number of holdings is 180; and I estimate that the number of cases sent away each year is 60,000, taking one case for each tree. I am referring now to Rydalmere and to a part of Ermington. I might also mention that we have blue-metal quarries in our district.
1366. You think your district will be benefited by the opening of the Rosehill railway, and that that line is not likely to be opened unless the Government takes it over? Just so.
1367. You have not formed any opinion as to whether the line would be payable if it were opened? I think the district would become very thickly settled. The land there is not too suitable for orchards. There are some nice little spots, but not many. There are, on the other hand, several splendid building-sites, and a large number of new buildings have gone up during the last five or six years.
1368. You think that the opening of the railway would make the district a favourite place of residence? Yes.
1369. I suppose that is true not only of the constructed portion of the line, but of the portion which it is proposed to construct? Yes; even if the line is not extended beyond Carlingford it will attract a great number of new residents.
1370. Have the people who reside there now any difficulty in getting to the city? They have a great difficulty in getting their fruit in. From Rydalmere to Sydney it is 12 miles. A great many send their fruit by road, and the others by steamer. We estimate that if the Government takes over the line it will charge from Rydalmere what it costs us now from Parramatta to Sydney. The charge by boat is 2d. a case. If the fruit is taken by road the charge is 7d. or 8d., including commission and market dues. The road carriage saves handling, as compared with the boat traffic.
1371. How do the people of your district make for Sydney or for their business places? They go to Parramatta or Ryde, and there is a steamer at Ermington wharf. There is a wharf between Ermington and Rydalmere—the Dundas wharf—but it is very seldom that the steamers can come in there on account of the depth of water. The steamers used to come to Rydalmere, but owing to the silting up of the river that has become impossible.
1372. *Chairman.*] You stated just now that a considerable number of persons in your locality carted their fruit to Sydney? Yes.
1373. How far would they have to cart it? From the centre of Rydalmere to the post-office is 12 miles.
1374. What proportion of the fruit is carted? So far as Rydalmere is concerned two-thirds of it, and the same with regard to Ermington. None of the growers there have very large places, and they try to make as much as they can by carting their own fruit. I do not know what the market dues and commission amount to.
1375. *Mr. Hoskins.*] What is the distance of the average resident at Rydalmere from the existing Carlingford station on Simpson's line? Three miles.
1376. How far have the people generally to cart their fruit down to the steamer at Ermington? Four or 5 miles.
1377. *Mr. Wright.*] Is any fruit in your district sent to Eastwood or Ryde? Yes.
1378. The great portion of it goes by river? More goes by road.
1379. Does any go to Parramatta? Very little.
1380. Do you think that if the Rosehill line were opened it would be largely patronised by fruit-growers in your district? Yes. I went with a petition two years ago, asking them if they would patronise a luggage-steamer at Rydalmere wharf; they distinctly told me they could not guarantee their fruit to the steamer, as they had already promised it to the Rosehill railway.
1381. *Mr. Hoskins.*] Do the larger number of the residents live nearer the line than to the steamer? Nearer the line.
1382. *Mr. Wright.*] How far back from the river does Rydalmere extend? Back to the Kissing Point-road.
1383. How have you compiled the statistics you have given to the Committee? From the rate-book, which shows how many acres are under cultivation. We average 100 trees to the acre.
1384. *Mr. Farnell.*] Suppose the Rosehill line were opened for traffic, would it to a certain extent obviate the necessity for a vehicular traffic bridge over the Parramatta River? Yes.

James Tamsett, fruit-grower, Baulkham Hills, sworn, and examined :—

1385. *Chairman.*] You are a resident of Baulkham Hills? Yes.
1386. *Mr. Humphery.*] Are you a fruit-grower? Yes.
1387. How long have you resided in the district? A little over fifty years.
1388. What is the area of your holding? I have about 21 acres; about 12 acres are under fruit.
1389. You are familiar with all the proposals shown upon the wall map? Pretty well.
1390. I suppose your evidence would not be favourable to the extension of the Rosehill line, but would be favourable to the Parramatta extension? Yes.
1391. You desire to corroborate Mr. Pigott's statements? Yes; and I might add that there is a great quantity of firewood which would be brought down by the proposed railway to Parramatta. A great deal of building material goes out from Parramatta. I live on the roadside, and I see every day great quantities of building stuff going out. Immense quantities of bricks go out every day. All that traffic would go by railway.
1392. You do not think the proposed extension from Carlingford would serve your district? It would be of no advantage to Baulkham Hills or Kellyville.
1393. What line do you advocate? I think a line might pass through on the lower side of Castle Hill, by Glenhaven. Of course we should be satisfied with the tramway if it were strong enough to bring in our produce. It must be capable of bringing in 80 or 100 tons at a time. If that quantity could be brought in without transhipment to Parramatta there would be no objection to a tramway. There is a certain amount of haulage to be done, and we do not mind whether it is done by a railway or tramway.
1394. *Chairman.*] Which would pass through better country—the proposed Westmead line, or the proposed Dural line? The Westmead line. There is very good land to the west of that line. There is also good fruit-growing country from Pennant Hills to Carlingford. From Carlingford to Clyde the country is not uniformly good, although there are good patches in it. On the Westmead line the whole of the land is good.

J. Tamsett.

21 Jan., 1898.

William Henry Smith, fruit-grower, Castle Hill, sworn, and examined :—

1395. *Mr. Trickett.*] What is your occupation? I am a fruit-grower, at Castle Hill. I have 81 acres W. H. Smith. there, of which 22 acres are cultivated. I grow both summer and citrus fruits.
1396. How long have you carried on your present occupation? At my present place about twenty-two years, but I have had some thirty years' experience as an orchardist.
1397. Do you find the district a good one for fruit-growing? Yes.
1398. Upon your present holding, have you used the same piece of cultivation continuously? Yes.
1399. And it is still in good going order? Yes.
1400. You know the proposal to construct a line from Carlingford to Dural? Yes; when a private company asked for permission to construct that railway, running, as it did, parallel with the main Northern line, I said that if any Member voted for it it ought to be his last vote. If the Government are inclined to take over the Rosehill railway the matter may be viewed somewhat differently; but it seems somewhat extraordinary that £6,000 should have been voted for the construction of a bridge from Hornsby to Galston, and that in the face of that a private company should have been given permission to construct a line within 3 miles of Galston. I may say that I have taken no active part in the present agitation. I am so situated that it is immaterial to me personally which line is constructed. Either will have to form a station of within a mile of where I reside.
1401. Either the line from Westmead to Castle Hill or the line from Carlingford to Dural would serve you? Yes.
1402. Looking at the matter from the public point of view, which line do you think would be the better one? I prefer the Westmead line through Baulkham Hills and Castle Hill—where the route was first surveyed for the Northern railway.
1403. Why do you think that the better route? Well, Parramatta is the capital of the district. Our law courts were there, and our doctors, until lately, were there; and it also contains a hospital and other institutions. If the other routes were adopted, Castle Hill and Baulkham Hills would be left out in the cold for a number of years. For the first 3 miles of addition to the present Rosehill line the people have a railway within a moderate distance. Any fruit-grower who is within 2 or 3 miles of a railway is not badly off for means of communication.
1404. The last witness expressed the opinion that the country on the line from Westmead to Dural was better than that on the proposed route? It may be as good, but it is not better. I look upon the strip of country from Carlingford to Pennant Hills as being one of the most valuable spots in the country for the growth of fruit; but it would be an expensive way to take a railway, on account of the land resumption.
1405. What about the part of the district between Carlingford and Rosehill? That has borne a bad name lately for fruit-growing. There are several nurseries there, and there has been a great objection to purchasing trees there.
1406. I suppose another reason you have for advocating the line to Westmead is that it would be somewhat cheaper to construct than would the line from Carlingford? I think it would be cheaper. The hilly country in the other direction would naturally make the line somewhat expensive.
1407. It is estimated that the line from Carlingford to Dural would cost, with the amount which it is proposed to pay the private company, £63,000, whereas the line from Westmead to Dural is estimated to cost only £57,000? I am aware of that, and of course it is an element in the case.
1408. What do you do with your fruit? I send it to Sydney for sale.
1409. Both soft and hard fruit? Yes. I send it now to Thornleigh, on the Northern line. It costs me 1d. a case to send it there.
1410. What do you suppose it costs you to cart your fruit from your orchard to Thornleigh? About 2d. a case, and the railway freight from Thornleigh is 1d.
1411. How many cases do you put on a cart? About thirty.
1412. How much does it cost you to send your fruit to Westmead? I have never sent any fruit to Westmead; there is no direct road to that place from here.
1413. Why do you send your fruit to Thornleigh instead of to Westmead? It is only about half the distance. Lately the Government erected a platform at Pennant Hills which has saved us some distance. I am 4 miles from that platform.

1414.

- W. H. Smith, 1414. From a monetary point of view you would be no better off than you are now if the Westmead line were constructed? We should have the convenience of a railway into Parramatta.
- 21 Jan., 1898. 1415. What good would that do you as regards the carriage of your fruit? By having a railway to receive the fruit late on the day on which it had been pulled we should save quite 2d. a case? The fruit would be fresher when put upon the market.
1416. A witness said yesterday that a great deal of the profit went in agents' charges? I think that as a rule they have the better end of the stick. For my own part, I send to market only fruit of good quality. The poorer quality I bury for manure.
1417. If you send a good article to the Sydney market you find fair prices? Yes.
1418. Those cases in which fruit is sold for less than the railway charges and commission are cases in which the fruit is an inferior article? I should say so. If the fruit-grower studied his own interest he would never allow poor fruit to leave his orchard.
1419. *Mr. Lee.*] What is likely to be the future of your district? A railway would cause it to grow very fast.
1420. But your orchard will wear out in time;—how is the freight then to be supplied for a railway? Those who have the land must re-plant, as I have done.
1421. We must look to fruit as furnishing a large proportion of freight for a railway? Yes; I might also mention that there are many places suitable for building which would be cut up and sold if there were a railway.
1422. There is plenty of new land which could be brought under cultivation? Yes.
1423. The reasons the fruit-growers urge the construction of the line is that it will be a great convenience to them, not that it will make their carriage much cheaper? Quite so.
1424. Since the railway is dependent upon fruit for freight, what would be the state of things if there were a bad season and fruit failed? There might occasionally be a failure, but I urge the construction of railways into all parts of the country where there is any probability of their paying. I blame the Government for not making the lines pay by increasing the goods charges and passenger fares.
1425. Do you think the districts affected by the proposed railway extension are capable of carrying a population four times greater than their present population? A population ten times as great.
1426. Suppose the output of fruit is materially increased, will there be a market for it? It will not do to increase the output of fruit while you have free ports.
1427. But do you not grow more fruit in a good season in the county of Cumberland than can be consumed in the city and suburbs of Sydney? Yes.
1428. As a matter of fact, a large quantity of fruit goes to waste;—you cannot get any price for it? Yes; perhaps one-twentieth.
1429. It is only in seasons when the trees produce about one-half of their ordinary crop that there is a good demand? Yes.
1430. *Mr. Farnell.*] It is quite possible, however, to utilise the fruit which now goes to waste by canning and preserving it? Yes.
1431. *Mr. Black.*] You spoke just now of burying inferior fruit, but can you not feed pigs with fruit of that kind? No. It is only at certain times that we have summer fruit to bury; and the pigs will not eat oranges.

MONDAY, 24 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Edwin Doudney, L.R.C.P., E., &c., Castle Hill, sworn, and examined:—

E. Doudney,
L.R.C.P., E.
24 Jan., 1898.

1432. *Chairman.*] You are a resident of Castle Hill? Yes.

1433. *Mr. Lee.*] Have you been long resident there? I have been there over three years.

1434. Upon what points do you desire to give evidence concerning the proposal before the Committee? I thought it my duty to place several matters before you. I do not know of any large city like Sydney which has such a beautiful district as ours within such a short distance. As far as I can see, the hills there have all the advantages of a residence up higher on the Mountains, such as at Springwood, without the inconvenience of the great distance. Having lived in several parts of the world, I have no hesitation in saying that the climate of the district is the most beautiful I ever lived in. It is much cooler in summer than lower down in Sydney, while in the winter it is not so cold as it is upon the Mountains. When it has been 108 or 109 degrees in Parramatta, upon my back verandah, which is exposed to the sun, the thermometer has never been higher than 98. On the hottest day I never remember seeing the temperature higher than that. Another point is that the whole district is absolutely free from anything in the shape of epidemic diseases. I have never seen but one case of typhoid during the three years I have been there, and that case was imported. I have no personal interest in the matter. I have no land to sell; but, having regard to the settlement which has taken place at Wahroonga and at Turramurra ever since the opening of the Milson's Point line, I cannot but foresee that there would be most extensive settlement upon the fringe of the hills round Castle Hill and on the road to Dural. All that is wanted is rapid communication with the city. I do not consider that Turramurra and Wahroonga can be mentioned as residential sites on the same day with Castle Hill and the road to Dural. The elevation of Castle Hill is the same, but the scenery, as you know,—although you saw it under the great disadvantage

disadvantage of dust,—is, with the exception of the mountain scenery, unsurpassed in the Colony. At Wahroonga, at the same elevation, there is nothing to see but gum-trees. Then there is the great advantage of the drainage in the neighbourhood of the hills; they have a natural drainage which is not to be found at Chatswood and Wahroonga. Indeed, if they do not look out, they will soon be having typhoid there. I have been in New York, and in all the large seaport cities, and I do not know of any one of them which has, within such easy distance, such a magnificent district for residence as is to be found on the fringe of these hills. I do not know very much about the question of fruit-carriage; I am not interested in it, but from the evidence I have read I cannot but come to the conclusion that the quantity of traffic has been under-estimated. One of the Government railway officials I see gave evidence to the effect that the probable return of the railway would be about £1,000 odd. To my knowledge the coaches take more than that at the present time. There are two coaches running to Parramatta—one from Castle Hill and one from Pennant Hills. The Castle Hill coach runs through Dural to Galston, and, to my certain knowledge, those coaches make more than £1,000 a year. There will be an immense quantity of building going on immediately a railway is opened, and the place will very soon throw Wahroonga and Turramurra completely into the shade. I do not think anyone with any judgment would think of building a house at Wahroonga if he could get railway accommodation at Castle Hill.

E. Doudney,
L.R.C.P., E.
24 Jan., 1898.

1435. Castle Hill would be only midway between Clyde and Dural? About that.

1436. Would your remarks apply to the Dural country as well as to Castle Hill? Yes, right away to Dural; within less than a mile of that place there is a whole series of sites. They extend along the fringe of the hills.

1437. You think that if there were railway communication with the city it would be taken advantage of by business men to reside in your district, adding largely to the present settlement there? Yes, I am confident of that.

1438. That class of settlement would make use of the railway every day? It must.

1439. And it would be a good class of settlement, inasmuch as only persons having money with which to build would reside there? Yes, quite so.

1440. The district, I suppose, possesses another advantage over the Blue Mountains, in that it has a certain area of agricultural land? I think so. There are so many persons who like to have a few acres of orchard, or something of that kind.

1441. I presume the class of residents you contemplate are those persons who would like a country residence, and who would at the same time farm sufficiently to pay expenses? To a certain extent, I think that would be the case. Some of the residents you would get would be of the same class as those now going to Wahroonga and Turramurra—those who like to live in a cool atmosphere where there are no mosquitoes, or no flies or fogs, such as you find on the Mountains,—the place being at the same time within an hour's run of Sydney.

1442. You think, for these reasons you have given, the railway officers have under-estimated the probable traffic? Yes.

1443. Have you any choice of route? Since Simpson's railway has gone so far, to my mind it would be the wiser course to continue it; but the surveyed route to my notion is too much upon the hills. There was a survey in connection with Simpson's line which came about halfway down Rogan's Hill. If that route were adopted it would accommodate a large part of Castle Hill, and also people in Kellyville, who are now crying out against the present survey, and who have to go about 8 miles to Parramatta. If the route I suggest were adopted they would be able to bring their fruit over a good road, a distance of 3 miles. The route would serve them better than would any other; but it would not be of any advantage to the Baulkam Hills people, who are within $3\frac{1}{2}$ miles of Parramatta, with a metalled road there. One of our chief points is, that there can be no settlement in the district while the roads are in such a condition as that in which you now find them. Mr. Hardie (of the firm of Hardie and Gorman) comes into town every day, and on a wet day it is quite painful to see him floundering in the mud to catch his train. After two or three days' rain you cannot get out of a walk. I have been four hours going to a broken leg, in Dural, a distance of 8 miles. I could not get out of a walk. It was difficult to get along at all. As to the inwards traffic, I constantly see drays coming back with loads of manure.

1444. There would be a certain amount of traffic all the year round in summer and citrus fruits? Yes; outwards.

1445. But it would be only in the winter-time that there would be heavy back-loading in the shape of manure? They seem to always have back-loading.

1446. In winter-time the roads cut up more quickly than at any other time, and you then find it very inconvenient to travel? Yes; they cut up sometimes as much as in the summer, but they dry more quickly then.

1447. Suppose the roads were metalled throughout, would that increase settlement? I do not think so.

1448. You think that nothing short of direct communication with the city by railway would bring much additional settlement to the district? I have heard many persons say that if there were only railway communication with the city they would gladly live out that way. I desire to lay special stress upon the coolness of the climate. It is always cooler in the summer than in the city, and there are not the heavy frosts which you have on the Mountains in the winter time.

1449. *Mr. Hoskins.*] How far would it be for residents at Castle Hill to go to the terminus of Simpson's line? They would be about 5 miles away; whereas the Pennant Hills station would be $3\frac{1}{2}$ miles.

1450. The residents of Castle Hill could reach the Pennant Hills station you say in $3\frac{1}{2}$ miles? Three miles and a half of shockingly bad road.

1451. *Mr. O'Connor.*] Is the district of Castle Hill well settled at the present time? There is a good deal of uncultivated land, but it is mostly cultivated.

1452. You think that a lot of the land which is at present idle would be cultivated if a railway were taken through the district? Yes; there is a great deal of beautiful land on the right of the railway. The Bank of New South Wales has a great many acres of the highest class of land there, which is not yet cleared, and the railway would go through it.

1453. You think that land could be readily sold by the Bank if there were a railway? Undoubtedly.

1454. *Mr. Farnell.*] You occupy the place lately occupied by Mr. Tuckwell;—how far from where you are living would the survey of the proposed line from Westmead and to Dural pass? The station is just at the bottom of the hill, 200 yards away. I have a little holding of 12 acres of meadow land in which I run my horses, and I believe the proposed railway would touch a corner of that land.

1455.

E. Doudney, L.R.C.P., E. 1455. Have you given any consideration to the construction of a tramway from Parramatta through Castle Hill to Dural? I am no judge of such matters; but I am told by fruit-growers that the gradients would be too heavy for a tramway to pass along the existing roads. They would have to make the tramway off the existing roads; and if they do they might just as well make a light railway as a tramway.

24 Jan., 1898.

1456. Has it struck you that some inconvenience would follow if it were not possible to use on our suburban railways the rolling-stock which would be used on the tramway? The tramway would be of no use unless the rolling-stock could be run on the railway. It would be most unwise to contemplate transshipment.

1457. You think the proposed route of Simpson's line, if it were extended further to the west towards Kellyville, would meet the requirements of the district equally with the railway from Westmead? Equally well; the residents would be at the same distance from it.

1458. *Mr. Black.*] What is the height above sea level of the highest points of Castle Hill and Dural? The height at Baily's Corner is about 800 feet above sea level. Higher up, towards Dural, you would be about 1,000 feet above sea level; but the highest point in the district would be beyond Upper Dural.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

W. A. Smith. 1459. *Chairman.*] You desire to submit to the Committee a statement showing expenditure upon various roads in your district? Yes; it is as follows:—

24 Jan., 1898.

Department of Public Works, Account Branch, 7 January, 1898.

STATEMENT showing scheduled roads affected by the construction of the proposed Railway from Rosehill to Dural.

Item.	Mile-age.	Name of road.	Amount voted.					Expenditure.	
			1892.	1893.	1894.	1895 (½-year)	1895-6.		1896-7.
1178	3	Kenthurst Post-office to Porter's	£	£	£	£	£	£	£ s. d.
1006	4	Galston-road to Berowra Creek	150	150	50	30	75	75	530 0 0
1007	3	Galston to Dural	30	60	50	25	60	60	238 10 0
1008	3	Galston to Fagan's	30	30	20	10	30	60	170 0 0
1010	7	Hornsby to Galston	1,742	2,997	1,500	350	330	6,864 7 6
1013	6	Mobb's Hill to Rogan's Hill	180	240	240	120	240	300	1,276 14 4
1017	4	Pennant Hills to Mould's Corner	150	150	130	65	130	210	650 14 0
1020	2	Pennant Hills-road to Beecroft station (Murray-road).	...	60	40	20	40	40	178 2 0
1023	20	Round Corner at Dural to Wiseman's Ferry (Old North-road).	75	150	150	75	330	330	972 10 9
1072	1	Parramatta to Pennant Hills road.....	120	150	100	50	50	75	452 17 10
1074	6	Baulkham Hills to Round Corner at Dural.....	330	440	400	200	300	300	1,756 19 0
1078	4	Broken Back Bridge to Pennant Hills-road.....	160	160	160	100	200	180	619 16 7
1080	1	Castle Hill road to Old Parramatta-road.....	30	30	20	10	20	20	110 0 0
1088	2	Old Castle Hill-road to Government Reserve...	20	20	15	10	20	20	105 0 0
1089	2	Old North-road at Castle Hill to Government Reserve.	20	20	15	10	20	20	101 0 0
1093	8	Round Corner at Dural to Rouse Hill	120	120	70	35	80	100	525 0 0
1185	6	Rouse Hill and Dural-road, via Kenthurst to Fisher's.	75	75	72	50	60	90	422 0 0
1173	5	Cattai Creek, at Pearce's, to Great Northern-road at Black's.	50	60	110 0 0
SCHEDULE A II.									
23	1½	Parramatta to Pennant Hills*	60	60	60	30	60	60	330 0 0
26	½	Bettington's-lane*	32	32	32	16	32	32	176 0 0
1014	5	Pearce's Corner to Pennant Hills	60	65	60	31	65	60	306 15 0
1021	3	Ray's-road, Carlingford	60	60	98 5 8
			£ 1,642	3,784	4,701	2,397	2,302	2,512	16,114 12 8

* Roads within municipality of Dundas. Votes expended by Council.

Total amount voted £17,338 0 0
 Total amount expended £16,618 16 4
 Radley Creek Bridge £504 3 8

1460. *Mr. Hassall.*] In the event of the proposed extension being carried out the roads to which your statement refers would still have to be used in bringing produce to the railway? Yes; the whole of them.

1461. The extension would not cut out any of them? No; they would still be used as approach roads.

1462. The roads have been made for developing the district? Yes.

1463. The railway extension would give greater facilities for getting produce into market in conjunction with the roads already made? Quite so.

1464. Would any large sum of money be required per annum to keep in repair the roads to which you have referred? The metalling has not been completed, and I think it will be advisable to keep up the present schedule rate until it has been completed. All of the roads to which I have referred are in course of construction.

1465. When the metalling is completed the annual expenditure will be considerably less? Yes.

1466. Have you any idea how long the completion of the metalling will take? In the case of some roads it will take a matter of three or four years. In the case of the road to which Dr. Doudney referred as being so bad, we metal about ½ mile a year. We can do that out of the annual grant.

1467. Are you receiving applications for more roads? We are always receiving applications.

1468. Have you any knowledge of the proposal before the Committee? I know the route.

1469. Do you know Parramatta? Yes, very well.

1470. Which route do you think would best serve the district, the proposed extension, or a tramway connection between Parramatta and Dural? I have not considered the relative merits of the two proposals. Of course a railway would offer greater facilities for the conveyance of fruit.

1471.

1471. Suppose a tramway were constructed, and that no transshipment were necessary, do you think it would serve the locality? I think a tramway from Parramatta to Dural would go through more cultivated land than would the proposed railway. The population is already well served, but the line would immediately tap a greater area of cultivated land. W. A. Smith.
24 Jan., 1898.

1472. You think there would be more traffic on that route than on the other? Possibly.

1473. Is the district progressing? I think the lower parts are about stationary. It is progressing further back towards Arcadia, Galston, and Kenthurst. Centres such as Castle Hill and Baulkham Hills are about stationary.

1474. Are these districts at a standstill because the residents cannot at present increase their operations? They have all as much land as they can cultivate individually, and they do not care to go in for the larger operations.

1475. Do you think the population of the district is likely to increase? Yes; the district beyond Dural is improving well now.

1476. And you think that any railway or tramway extension to that point would be of great advantage not only to people on the route but beyond the terminus? Yes; it would benefit them to the extent of giving them less road-hauling. They would have 3 miles less over which to haul their fruit than they have at the present time. From Galston it is 6 miles to Hornsby and 3 miles to the proposed terminus. There is a perfect road to Hornsby. The road is metalled the whole of the way up from the valley to the high lands, because all the heavy traffic is to the station. The Galston side is being gradually metalled.

1477. I suppose the bulk of the produce from Galston goes to Hornsby at present? Yes.

1478. And a railway at Dural would divert the traffic on the Northern line to that point? Yes.

1479. It would save road haulage? Yes; 3 miles.

1480. You think there would be a larger settlement at Dural if there were a railway? It is all private land there, but there is plenty of land which could be cultivated.

1481. You think the land would be utilised if there were a railway? If it would pay to cultivate the land I think it would be cultivated now, because there are at present sufficient facilities for the taking away of the produce. The probability is that a great many of the residents at Castle Hill having once put their produce on to a cart or dray would be quite content to take it to Parramatta and save the extra haulage on the railway.

1482. *Mr. Hoskins.*] Do you think that if Simpson's line were extended no further than Carlingford it would be of much benefit to the fruit-growers in that locality? I do not think it would benefit them to a very great extent.

1483. The roads from the Carlingford station on Simpson's railway to the surrounding districts are very bad? No; they are very good just at that particular point. The road from Parramatta to Pennant Hills would be the chief one used by the persons in the vicinity of the railway station to which you refer.

1484. Are the roads from that point pretty good in every direction? No; they are bad in some directions, but the Parramatta road is in very fair condition.

1485. Do you think that if the line were open to Carlingford persons in that neighbourhood would still send their fruit to Parramatta? I think some would do so, because they dispose of their fruit there.

1486. Is there plenty of good road material in the district? Until lately there was practically no metal, except at Pennant Hills; but lately a white metal quarry has been found which will be of assistance in metalling the roads of the district at less than half the price they have hitherto cost.

1487. Is not the stone from the Pennant Hills quarry of good quality for road making? It is of excellent quality.

1488. Is it dear? It used to be very dear. Now you can get it for about 8s. a cubic yard.

1489. On the quarry? No; it is carted on to the road for 8s. or 10s. White metal can be obtained for 5s.

1490. But does it not pulverise very easily? No. It is vitrified sandstone—not the ordinary sandstone.

1491. You think that a tramway would be more extensively patronised than is the proposed railway; but how is access to be had from the railway station to the tramway at Parramatta, seeing that there is such a great difference in the levels? As I have already said, I have not considered the relative merits of the schemes, but if there be a great difference in the levels I should require to consider the proposal before expressing an opinion.

1492. Do you think a tramway from Parramatta to Castle Hill feasible? If the railway is very much higher than the tramway I should not care to give you an answer without looking further into the matter. I have not studied it at all from an engineering point of view.

1493. I suppose a tramway would be of very little use if the ordinary rolling-stock could not be used upon it? I should say it would not pay under those circumstances. If the producers had to tranship their goods the line would not be used at all.

1494. *Chairman.*] Assuming that the line stopped at Carlingford, and went no further, should we then be justified in taking the districts north from Pennant Hills, that is, the districts of Castle Hill and Baulkham Hills, as being outside the range of its influence? They would certainly be outside the range of its influence.

1495. Why? Because all the traffic coming from Dural, Kenthurst, Glen Haven, and Pennant Hills would have to come through Pennant Hills, and when it reached that point it would go to the Pennant Hills station more easily than to Carlingford. In the one direction there is a level and metalled road, and in the other direction the road is bad.

1496. Would the road to the Pennant Hills station be the shorter road? The two roads are about the same distance.

1497. As to the Castle Hill and Baulkham Hills districts, will they be affected by the line if it goes only as far as Carlingford? I do not think so, because the road from Baulkham Hills into Parramatta is as good as any road in New South Wales. It is slightly descending the whole way from Baulkham Hills; it would be as near to Parramatta as to Carlingford, and there would be no object in the producers going back to Carlingford, and increasing the railway haulage, when they can come into Parramatta.

1498. Take now the Castle Hill district? Although it is a shorter distance from Castle Hill to Carlingford than to Parramatta, in order to reach Carlingford the producers would have to pass through Pennant Hills, and the reason for their choosing the northern line at that point instead of Carlingford, I have already stated.

1499.

- W. A. Smith. 1499. Is the road good from Castle Hill to Parramatta? It is a fair road. I think Dr. Doudney exaggerated its condition.
- 24 Jan., 1898. 1500. Suppose the line were extended from Carlingford to Dural, would the Baulkham Hills people be benefited? No, I do not think Baulkham Hills would be affected at all, because it is so close to Parramatta.
1501. *Mr. Hoskins.*] How far is it from Pennant Hills to the Carlingford station on Simpson's line? From $1\frac{1}{2}$ to 2 miles. That line would naturally be used by the quarry, on account of its business with the different municipalities.
1502. What kind of road is there from the Pennant Hills quarry to the Carlingford station? It is a very rough one.
1503. *Chairman.*] Suppose the line were extended from Carlingford to Dural, would it be used by any of the people at Castle Hill? A portion of the Castle Hill people would use the extension. My opinion as to the Castle Hill traffic is that 2 miles south of Castle Hill the produce would go to the proposed railway, and that from a point 1 mile to the north of Baulkham Hills, the traffic would follow the Baulkham Hills traffic to Parramatta.
1504. Have you considered the freight of the proposed railway if constructed? No; I am simply telling you, from my knowledge of the district, what I believe the people would do.
1505. Would the Kenthurst, the Kellyville, the Glenhaven, and the Dural people, and the people generally on the road to Glenorie, use the proposed extension? Yes certainly.
1506. Would the Galston people use it? I do not think so, under present conditions, because Hornsby is becoming a rather important business centre. The Galston people go there to do their business, and I think they would still go across.
1507. It would be 6 or 7 miles from Galston to Hornsby, and some 3 miles from Galston to Dural? It is 6 miles against 3, but the road from Galston to Dural is a very bad one in wet weather. It is a rough bad country for road-making, whereas on the other route there is hard country, and the road has been well drained and metalled.
1508. How much would it cost to make a good road from Galston to Dural? I should say about £3,800. There would be a bad cutting, and a lot of formation would be required. I am reckoning $3\frac{1}{2}$ miles right up to the turn of the Galston-road.
1509. If that expenditure were incurred the Galston people would use the Dural extension? Yes.
1510. That applies to Arcadia? It would apply to nearly the whole of those districts.
1511. Do you know of the strength of the competition offered by the Parramatta River to such a line as that shown on the map to Carlingford;—how far would that competition reach north of the Parramatta River? I think the traffic within a radius of $1\frac{1}{2}$ mile of the wharf would trend towards the Parramatta River. I do not know exactly what the rates are, but I believe they are cheaper.
1512. Would the quarry have any effect upon the railway traffic;—would any ballast go from there? Mr. Vanderstegen cuts the other quarries very close in all competitions for blue metal. If the railway were constructed there, I have no hesitation in saying that large quantities of metal from his quarry will be conveyed by it.
1513. *Mr. Hoskins.*] If the line were opened to Carlingford, do you think the owner of the quarry at Pennant Hills would be able to supply, not only the suburban municipalities but also the Sydney Municipal Council, more cheaply than they can now be supplied from the southern quarries? He competes now in any tendering from the metropolitan office.
1514. With better means of communication he would be able to supply the stone cheaper? Yes; at present there is long cartage, and they have to rise to great height.
1515. Is there much metal there? Yes; there is a very large deposit. I will have levels taken, and will endeavour to supply you with the approximate quantity.

Dowell Philip O'Reilly, Esq., M.P., sworn, and examined:—

- D. P. O'Reilly, Esq., M.P.
24 Jan., 1898.
1516. *Chairman.*] You are the representative of the electoral district of Parramatta in the Legislative Assembly? Yes.
1517. *Mr. Fegan.*] Have you a statement to make with regard to the proposal before us? Yes. I think that a good deal of the evidence so far given, as far as one can judge from the reports published in the newspapers, has been based on the erroneous supposition that the main purpose of any new line would be to benefit the terminal point. The whole of the evidence, including that of Mr. Deane, which, of course, is exceedingly important in an inquiry of this kind, seems to deal with this proposition as if it were solely with the view of ultimately benefiting Dural, the terminal point. But it has always seemed to me that any line constructed by the Government should, as far as possible, benefit the most thickly-populated districts and the most fertile area. I think the very capable Government officers who have given evidence before this Committee have put themselves in a very peculiar position in suggesting a line connecting Dural with one of two points on the Northern line. It stands to reason that if you connected Dural with either Hornsby or Pennant Hills you would benefit Dural, and Dural only. You would be absolutely ignoring the claims of the equally fertile districts of Kellyville, Glenhaven, Castle Hill, and Baulkham Hills. I think that, in any railway extension of this sort, the first thing should be to tap the different centres of population, and you will see that that can only be done by striking north from some point on the Western line. Personally, I do not think the hills districts will ever, or should, have a railway. Take the district between Woy Woy, on the Northern line, Richmond, on the branch Western line, and Parramatta. That large triangle of very fertile district would, I think, be benefited by a tramway from Parramatta to Dural, and I think Mr. Deane also has not quite followed the ordinary policy of the Department of which he is an officer, in saying that such a tramway would not have direct connection with or be part and parcel of our railway system. That is a perfectly new idea to me—that it is impossible for a tramway to be constructed so that its rolling-stock may pass freely over the main lines of railway. I think Mr. Deane might well be asked to revise his report, and to let us know what the construction of a tramway similar to the Camden tramway would cost. His only objection was in the difficulty of transshipment of fruit, but all that difficulty was based upon the particular report he saw fit to lay before this Committee, dealing with a tramway of more abrupt curves than the Camden tramway. I think that any feasible proposal would of necessity arrange for the trucking of fruit from Dural, for instance, direct to the

the city market. I do not know how far Mr. Deane's proposal has been carried; but it seems to me quite beside the question, and if the Committee could see their way, in view of the importance of the question to a large number of fruit-growers, to ask Mr. Deane to revise his report dealing with the feasibility of a tramway which would give direct communication by rolling stock between Dural and Sydney, I think it would be found that the additional cost of providing for that contingency would not be very great.

D. P.
O'Reilly,
Esq., M.P.
24 Jan., 1898.

1518. Do I understand that you are not in favour of a railway, but that you rather favour a tramway-line? I am in favour of as much as we can get. On public grounds I express my disapproval of the proposed railway as being utterly outside the requirements of the district. I am in favour of a tramway from Parramatta; but I should be opposed to it, if it did not give the fruit-growers direct communication with the city market. I should like now to make a statement with regard to the remarks of the Secretary to the Railway Commissioners, as published in the Press. I notice that he based his attitude on the question upon the annual income from the Rosehill Race-course, and pointed out what a loss it would be to the Government if the race-course were closed, and the Government lost the traffic to it; but there is another side to the question: The Rosehill race-course is a proprietary race-course, and the district on the Parramatta River and Duck Creek, through which the Rosehill line passes, is admirably adapted for manufacturing industries;—as you know it is already being largely availed of in that direction. With this increasing district, it is quite possible that it might pay the proprietors of the race-course to cut it up into building allotments for a large number of workmen who will shortly be required in the different industries there. That at once would sweep away £600 odd per annum of the total which the Railway Commissioners estimated they would get from the line. Personally, I regard the claim of the whole district as well worthy of consideration, on the ground, among others, of the facilities which would be offered for suburban residence. Owing to the fertility of the soil, and the rapid increase of population, which I think the Railway Commissioners have not taken into full consideration, I think that the district has an undeniable claim to tramway communication. I think all the evidence is in favour of a line running in such a way as to tap Castle Hill, Baulkham Hills, and Kellyville. A line from Dural to Parramatta would benefit all those districts to a greater or less extent, whereas the other proposal would benefit only Dural. I absolutely fail to understand the object of the Railway Commissioners, so far as Mr. Eddy's report in 1896 goes in advocating the resumption of the Rosehill line, at a cost of £25,000, except upon one supposition, which has not yet been elicited, and which would entirely alter my views of the Commissioners' attitude; and it is, that Mr. Eddy had in his mind the idea of ultimately connecting the line with the Northern line, to provide for shunting or the marshalling of the northern goods traffic. That is now done at Darling Harbour, to a great extent. I can understand that being of great use to the railway authorities, but it is a question solely for them to decide. That proposal is not mentioned in the Commissioners' report. From an intimate knowledge of the district already served by this extension, so far as it goes, to Carlingford, I am convinced that the purchase of the line would be an absolutely worthless speculation on the part of the Government.

1519. Do you know the area of the Rosehill Race-course? I cannot speak authoritatively; but I think it is about 60 or 70 acres.

1520. That would settle a fair population, cut up into building allotments? Yes; there is likely to be a steadily increasing demand for such accommodation as the number of manufactories increases in the district.

1521. Do you not think the cutting up of the race-course would ultimately be the means of bringing as great a return to the railway in other ways? It might in the long run; but I am taking the Commissioners' report on their own figures. I do not think those figures are such as would warrant the proposed expenditure.

1522. Although you are in favour of a tramway line being constructed you are entirely opposed to any extension of Simpson's line? Yes; for the simple reason that I wish the largest number of inhabitants to be considered.

1523. Which is the most fertile area in that direction? Baulkham Hills, Castle Hill, Kellyville, Dural, right out to Kenthurst and Galston. My proposal would benefit those districts just as much as the others.

1524. You do not think a tramway line constructed from the terminus of Simpson's tram would suit the district equally as well as the tramway which you suggest? Certainly not.

1525. Do you think its construction could be as cheaply carried out? I know the country well, and I do not think the engineering difficulties would be great. The grades would be about the same in both cases.

1526. Do you know whether there is much ground available for settlement on the route you suggest? I think there are immense possibilities of development not only for fruit-growing but also for residential purposes.

1527. *Chairman.*] Do you know the produce which it is estimated would go over the rival line? I should readily defer in a matter of that sort to the very laborious work done by Mr. Tamsett, Mr. Moxham, and one or two other fruit-growers who went over the whole district and collected the statistics which have been handed in by Mr. Wright. I believe the figures are substantially correct.

1528. Do you know if there is much Crown land on the route you suggest? There is not; it is a very old district.

1529. *Mr. Hassall.*] The Northern line is within easy distance of the fruit-growing districts round Pennant Hills and Carlingford? Yes; and they have the river as well.

1530. You think a tramway from Parramatta would serve a large extent of country which is now practically isolated? Yes.

1531. How far does the fruit-growing country extend to the west of Baulkham Hills and Kellyville? As far as the Windsor and Richmond line. All the land is capable of production although it is not opened up yet. I might point out also that the connection of Parramatta and Dural would be of enormous advantage to the traffic between those two points as compared with the traffic between Dural and Clyde where there are no centres at all. It must be to the advantage of any line to have large centres of population on its route. A large local trade between these districts and Parramatta has been going on for many years past and would be facilitated by the tramway I suggest.

1532. You think the tramway you suggest would serve a larger population than would the line from Carlingford to Dural? Yes; every mile of the Parramatta to Dural tramway would produce a return, but the first 2 or 3 miles of Simpson's railway would be practically useless.

D. P.
O'Reilly,
Esq., M.P.
24 Jan., 1898.

1533. How long has Simpson's line been constructed? About four or five years.

1534. Do they run traffic along it at all? No, I do not think so.

1535. Then the extension from Rosehill to Carlingford is a white elephant? I presume the Bank, whose property the line is, would extract anything they could out of it, but they do not run it at all. There is no regular traffic between Carlingford and Clyde.

1536. Which route do you favour for a tramway;—should it go from Parramatta or should it go from Westmead? I think, undoubtedly, that the proposal to go from Parramatta is the best one. The land resumption at the corner, and the expensive bridge across the river might be avoided by bringing the line straight down O'Connell-street to Macquarie-street. You might utilise the present O'Connell-street bridge—which is now practically worthless—for a tramway; but that is a question purely for engineers to decide. It does seem to me, however, that if Mr. Deane could strengthen the bridge upon the present Simpson's line, as he said he could, he might also strengthen the O'Connell-street bridge, and utilise it for tramway purposes.

1537. *Mr. Lee.*] It would be used by the townspeople as far as the old toll-bar;—the Westmead line on the other hand would go through a good agricultural district? I do not think there is very much agriculture a small distance out. I do not think the receipts would be nearly equivalent to the traffic which the line would receive in the town. With the exception I have pointed out, I think a tramway route is the best as far as the town goes.

1538. After leaving the Windsor toll-bar, if the tramway were confined to the road, it would have to follow its contour;—under those circumstances, would not the grades be too heavy? I am always supposing that the necessary detours would be made where hills and steep grades had to be circumvented.

1539. You do not advocate a tramway adhering to Windsor-road? No, I should say that the tramway should leave the road at such places as might be found necessary.

1540. Supposing that course were adopted and that Simpson's railway were taken over by the Government and opened for traffic as far as Carlingford would there not be a big clashing between the two lines? I do not think there would be any traffic from Carlingford to Clyde under any circumstances. I cannot see what traffic a Parramatta tramway would take from the present Carlingford and Clyde lines for the reason that all the Baulkham Hills and Castle Hill people would far rather use the projected tramway than convey their produce over a rough road down to Carlingford terminus; and then again some of the Pennant Hills people are nearer to Beecroft than they would be to that terminus.

1541. The idea you intend to convey is that there is a large area of fruit-growing country and that it is difficult to plot any line which will serve the whole district? It seems to me that the only way out of the difficulty is to tap the centres of population and the richest and most fertile parts.

1542. You think that the tramway line, if carried out as indicated by you, would serve a much larger area than would the extension to Dural? Yes; and it will avoid clashing to a certain extent with the Parramatta line and with the traffic on the Parramatta River. The traffic on the Parramatta River is considerable now. Every night there are four or five ordinary railway trucks—I saw five last night—running down George-street, Parramatta, with a passenger carriage. I might also draw the attention of the Committee to the fact that we have the ordinary railway trucks in the town. I gather from Mr. Deane's evidence that the main trouble was that a railway within the township itself would have to have guard-rails. I think the very sharp curves which Mr. Deane had in his first report to the Committee might be avoided by coming down O'Connell-street towards the bridge. It is an utter mistake to suppose that there is not a take-off to the Parramatta station. The carts drive up an easy grade to the railway siding where they are level with the station.

1543. How long have you been living in Parramatta? About eighteen years.

1544. You know the district personally? I have not been beyond Dural.

1545. There has been a steady increase in the district? Yes.

1546. You formed that opinion in spite of the statements we see published from time to time to the effect that fruit-growing is not a lucrative business? In spite of all complaints—and they have undoubtedly had one or two bad seasons through hail-storms and things of that kind—I think the district has been steadily prosperous.

1547. Are you of opinion that the district is of sufficient importance to warrant communication by rail to any point? Always presuming that the communication will pay expenses.

1548. With the prospect of a railway to the district paying in the near future you think it is advisable to open up that part of the country? Yes.

1549. *Mr. Fegan.*] You think a railway would give an impetus to settlement there? Yes. I might add that there can be no doubt that the Parramatta commerce with the hills district has been largely affected by the Northern line, and while it would be further affected by the construction of the alternative route that of itself is not so serious a matter as some persons might think, because the town has already lost much of the trade with Castle Hill.

John Judah Barnett, fruit-grower, Arcadia, sworn, and examined:—

J. J. Barnett. 1550. *Chairman.*] You are a resident of Arcadia? I have an orchard there; but I reside in Sydney.

1551. You desire to point out to the Committee in what way the proposed extension to Dural would be beneficial to you? Yes. I have an area of 24 acres, which is planted with mixed fruits, and with my neighbours I find it very inconvenient to take the fruit into Hornsby. If we had a railway nearer than Hornsby, the quantity of fruit sent out of the district would be largely increased. I expect next year to send away between 2,000 and 3,300 cases of fruit. It takes my man at the present time a day to go from my place to Hornsby and back again. That, of course, is a great expense. If there were a railway to Dural he could make two trips in the day. Personally, I hope that the line will be brought on as far as Galston, which, in my opinion, is the proper terminus for a railway. At the present time my orchard has not paid me by reason of the expense which I am under; but I think that if the line were brought to Dural or Galston, I should be able to recoup myself the money I have lost.

1552. *Mr. Lee.*] Which route do you advocate? It is immaterial to us which route is adopted, so that we get the railway. The whole of the residents of Arcadia agree that the line should come, not to Dural, but to Galston. I, myself, would be willing to pay 1d. or 2d. a case more than I am paying. At the present time it would pay me well to do so, because I should be under less expense.

1553.

1553. If a railway were taken to Dural from any point, would it suit you? It would suit us far better than a continuance of the present arrangement. I wonder there are not more accidents than have occurred on the road between Galston and Hornsby—it is a two-horse road—particularly when it is wet. It is bad enough in the daytime, but at night it is absolutely dangerous. My man has often been a whole day and part of a night in going to and coming from Hornsby. He can scarcely go there and back in a day. 1554. What prospect is there of a railway to Galston giving a return upon the outlay? You would have to look to the fruit-growing industry.

J. J. Barnett.
24 Jan., 1898.

1555. That is a large one now? It is large at the present time, and I think it would increase if we were not under such a great disadvantage in carting our stuff. Strawberry and grape growing would pay handsomely, and would be largely carried out in the district if we had handy railway communication. We cannot grow strawberries and grapes at the present time, because the distance to Hornsby is too great, and the road is too rough. I might mention that the line to Dural and Galston would be along a level road.

TUESDAY, 25 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

James Whitmore Hill, architect, Parramatta, sworn, and examined:—

1556. *Mr. Roberts.*] What is your profession? I am an architect, residing at Parramatta.

1557. I understand that you have prepared a statement in reference to the proposed railway, which you desired to submit to the Committee? Yes; it is as follows:—

J. W. Hill.
25 Jan., 1898.

Re THE PROPOSED ROSEHILL-CARLINGFORD RAILWAY EXTENSION.

My purpose in giving evidence at this inquiry is to show that, between what is known as the Hills district and Parramatta, there is a community of interests that cannot be ignored in considering any traffic facilities the district in question is entitled to. To realise this, the relationship between the town and district must be fully understood. Lying in a basin at the head of Port Jackson, Parramatta has the whole of the surrounding districts under consideration, as a watershed, and is, therefore, its geographical centre. The very fact of the downward grades focussing in the Parramatta basin, facilitates traffic and thus makes it also the commercial centre of the district, a position still further emphasised by the fact that it has both water and rail communication with the metropolis. These natural conditions made Parramatta the mother of surrounding settlements, and there has ever continued an interdependence mutually advantageous. Under it the town has gradually increased its population to 9,000 persons (excluding 3,000 asylum inmates) while the district has been strengthened and nourished by the town. Indeed, for the last 100 years, Parramatta has been the one business, banking, legal, medical, and social centre of the whole district, and has a distinctly prior and superior claim to continue so. Break up these associations however, by diverting the natural traffic as proposed by the Rosehill-Carlingford extension, and not only would the Hills population receive a severe wrench; but the 9,000 persons who have sunk one and a half million pounds sterling of capital in the connection, would be practically ruined,—for although the Hills population could, and ultimately would, readjust themselves to their new conditions, it would be quite different with the town, which depends almost entirely upon its country connection for support. As yet its factories are inconsiderable, and its position as a suburb too remote to be of value; its prosperity entirely depends upon its continuance as a receiving and distributing centre. Destroy it in this regard, and an injury will be done the town that would almost be regarded by its inhabitants as a crime, while the country will also suffer without compensating advantages. That the people of Parramatta feel strongly upon this point is evidenced by the numerous public meetings, deputations, and petitions, that have occurred upon the question; while the country has spoken by similar means no less strongly against any severance. Although the town's feelings remain unquestioned, recent evidence appears to challenge the views here expressed as to the unity of the country. I desire therefore to submit a few extracts from publicly expressed opinions of leading Hills residents, as to the Parramatta connection.

At a meeting held in Dural, in April, 1890, to advocate a line from Pennant Hills to Dural, Mr. J. C. Hunt moved as an amendment—"That this meeting pledges itself to agitate and go in for no other route but that which leaves Westmead or some point near, or actually from Parramatta, *via* Baulkham Hills, to Castle Hill, on to Dural, as it will open up a far larger area of country, and will meet the wants of a far larger number of residents, and will be a source of great revenue to the country." Mr. Hunt spoke warmly in favour; and in seconding the amendment, Mr. J. Purser said, "that this route would take 20 tons to 1 of the other." Messrs. G. R. Tuckwell, J. Shields, and others, supported, and the amendment was carried with only three dissentients.

Later in the same month Mr. J. C. Hunt wrote to the *Cumberland Mercury*, strongly condemning the Rosehill line, and supporting one from Parramatta or Westmead as infinitely better.

In May, 1890, a meeting was held at Baulkham Hills, when Mr. J. C. Hunt seconded a motion in favour of a line from Parramatta, which was carried; and in the following June a similar motion was carried at Dural, upon the advocacy of Messrs. T. T. Gray, W. E. Williams, G. H. Hunt, J. Purser, and F. H. G. Rogers.

At a monster meeting held at Castle Hill, in July, 1890, there were present among others—Messrs. G. T. Hunt, J. C. Hunt, G. Rogers, W. Tuckwell, G. Roughley, C. J. Moore, S. Moore, and J. Purser. A motion was submitted and unanimously carried which emphatically declared "that the only satisfactory route is the one proposed to pass from the Parramatta station;" and the meeting pledged itself "to agitate for the construction of such a line only."

Mr. James Purser wrote to the local press in October, 1890, insisting upon the Parramatta route, and in January, 1894, he presided over a meeting at Castle Hill to claim a tramway from Parramatta, the motion being carried unanimously; there being present among others, Messrs. J. Bennet, J. Carollan, J. W. Foster, C. J. Moore, S. J. Moore, sen., W. H. Tuckwell, F. Black, S. J. Moore, jun., J. C. Hunt, E. P. Fuller, and E. Purser.

In March, 1894, Mr. J. Purser wrote strongly denouncing the "Simpson's" line in favour of a tram from Parramatta, and later, in April, wrote again in the same strain.

Although these extracts do not by a good deal cover the whole advocacy of the Hills people in favour of the Parramatta ties, they are sufficient to prove that the inhabitants are convinced that their best interests would be served by it. Further, the independent opinions given by Government experts at this and other inquiries are distinctly against the proposed

J. W. Hill. proposed Rosehill-Carlingford extension, and, added to lay evidence, prove that it would be a greater wrong to a larger body of people and interests than it could possibly benefit; in other words, the proposed extension would produce a maximum of wrong for a minimum of benefit. Indeed, it is safe to declare that everything said in favour of the extension may be repeated with added force in favour of the Parramatta alternative. Neither the distance, engineering difficulties, cost, or compensations are greater, and for a tram service would be much less, while the route is equi-distant between the Northern and Western lines, would serve a larger, finer, more productive and populous district, would not compete with any existing line, and is the only natural and legitimate route for steam communication to Dural, and beyond. What the nature of the "steam communication" we so earnestly desire to have should be, I am not in a position to judge, having no knowledge of the safe minimum earnings of a railway, or the maximum powers of a tram service. Whatever experts decide the traffic proved justifies, it is safe to say will be acceptable to the people of both town and country; nor, so far as Parramatta is concerned, will serious exception be taken to either of the proposed points of junction with the Western line, viz., Westmead or Parramatta. The essential point is that Parramatta should be en route, for although as a matter of choice preferring that the town should be the junction, it is clearly recognised to be a minor point that must not be made to jeopardise the best interests of the Hills people, upon whose prosperity so much of our own depends.

The remark of a Minister for Public Works to a deputation from Parramatta that a serious objection to the junction there was that land would have to be purchased by the foot in town instead of by the acre at Westmead is more imaginary than real, for the greater part of the town route may well be the boundary of the Parramatta Park and Asylum reserves, while in the case of a tramway no resumption need take place.

In view of all these facts, therefore, it is earnestly hoped that this Committee will fully recognise the very serious wrong that would be done to a large and important town without advantage to anyone without, by forcing its natural business elsewhere. That the town and country are to all intents and purposes one in this matter I trust to have shown. A few recent defections in favour of the Carlingford extension can only be taken to have occurred on the principle that a bird in the hand is worth two in the bush.

1558. Have you been over the line from Clyde to Carlingford? I have not been over it, but I know it well from having crossed it at different points.

1559. You know that that line has been offered to the Government for £25,000? I understand so.

1560. You are aware that the line cost £110,000? Only by report.

1561. Do you think it would be wise under the circumstances for the Government to purchase the line? Upon that point I think I can hardly be considered a competent judge, but I should suppose from the traffic which would accrue from the race-course and the meat-works that on that score alone it would be worth the money. The continuation of the line to Dural would, as I have endeavoured to show, inflict an injury upon some 9,000 persons.

1562. Supposing the line were purchased it would at once give communication as far as Carlingford;—do you think it would induce any settlement? I have no doubt but that it would induce settlement, but it would do so in no greater proportion than would a line from Parramatta. The district of Carlingford is undoubtedly a fine district, but so is the whole of the Hills district. The Carlingford district has no special advantages over the other spots there.

1563. Do you think the extension from Carlingford to Dural now under consideration would in any way rob the Northern line of traffic? I do not think there can be any doubt but that it would do so. The average distance between the two lines would not be more than 2 miles. The Carlingford line would depend entirely for its revenue upon its southern side, the northern side being already served by the Northern line.

1564. You think that the Westmead line being further west would serve a greater number of people? Yes, distinctly. There can be no doubt of it to those who know the lay of the country and the population distributed over it. The line from Westmead would go through the centre of a district which is not at present supplied with railway facilities.

1565. If a line were constructed from Westmead to Castle Hill and on to Dural would not a sum of money require to be provided for land resumption? Upon that point I know nothing. I assume that there would be no greater proportion of resumption in that case than there would be on the other route. There would be resumption in either case.

1566. Do you know whether those persons through whose land the line would pass would be inclined to give the required land to the Government free of charge? I have heard that stated by different orchardists, but I think the statements should be taken with a large amount of caution.

1567. It would be only those persons some distance out who could be expected to give their land? That would be about all.

1568. I suppose there would be resumption for pretty well the whole distance? So far as I am aware, going out of Parramatta there would. But it is not absolutely necessary to go across land which would require to be resumed in the town, because there is the park, and you could make either its western or eastern boundary the railway route almost right along the park.

1569. Would there not be an encroachment upon the park, and would there not be a great objection to that? Not on the part of the Parramatta people.

1570. Are you fully satisfied of that? I feel satisfied that the Parramatta people would be quite willing to allow the boundaries of the park to form part of the railway.

1571. The railway would really be on park land? Yes.

1572. Having in view the possibly large amount required for land resumption in the case of a railway, are you inclined to look more favourably upon a tramway? I cannot well answer that question. Our desire is to get just exactly that which, and no more than the traffic justifies. If a tramway would not carry the produce which would be brought in or taken out, then we should consider ourselves entitled to a railway. But that is a point we do not wish to press. We prefer to leave it entirely to the judgment of experts.

1573. You know that the construction of a railway even without land resumption would be a much more expensive work than would the putting down of a tramway? Undoubtedly.

1574. You know enough of the district to say whether a tramway could be constructed without any land resumption? I think so. For instance, could it go along the main road, for I understand that with perhaps one small exception somewhere near Castle Hill, where it would be necessary to get round Rogan's Hill, the tramway line could follow the road entirely.

1575. How far north of Parramatta is the country within what you might call Parramatta influence? As a matter of fact, we do trade right out to the Hawkesbury.

1576. As far north as Wiseman's Ferry? Yes.

1577. What possibility would there be of the 9,000 persons being ruined if the line did not come through Parramatta? We are receiving and distributing centre for the whole of the district. We have been in that position from the birth of the town and the district itself. Certain relations have sprung up, between
the

the town and the district, and it would be very difficult thing to ignore them. The people of Parramatta have spent somewhere about one or one and a half million, (that is capitalising their assessments at 4 per cent.) in view of the trade which they do with the district, and if you cut that trade off, or make it easier for that trade to go somewhere else than to Parramatta, you do the town an injury to that extent. J. W. Hill.
25 Jan., 1898.

1578. Suppose a line from Carlingford to Dural were an absolute fact, a large portion of trade would still go into Parramatta, would it not? No doubt a portion of it would go there, but it would be a very much smaller proportion than goes there now. The line would take away some of our natural traffic. When I speak of natural traffic I refer to traffic which tends down where the fruit-growers find it easier to go on account of the easy grades. Parramatta focusses all these downward grades. If you continue the line to Dural you sweep along the inner edge of the basin, and you would therefore rob Parramatta of a great deal of the traffic.

1579. There are a good many orchardists round about Baulkham Hills? Yes.

1580. Would the produce of those orchards go on to the Rosehill line if it were purchased by the Government, or would it come straight in to Parramatta as at present? I think that from Baulkham Hills the traffic would go into Parramatta. It would begin to steal away from us at Castle Hill.

1581. What would be the extreme point from which the traffic would still come into Parramatta, even if the line under the consideration of the Committee were carried out? It would cut everything off from Parramatta beyond Rogan's Hill.

1582. You would get all the traffic south from Castle Hill? Yes.

1583. For a distance of how many miles along the road into Parramatta? For a distance of about 8 miles.

1584. What additional traffic do you suppose would come on to the tramway if it were constructed? In constructing a tramway you would go right through the centre of the district instead of going on one side of it. You would have a feeder on each side of the line about 8 miles in breadth, whereas the proposal before you would give you a feeder on only one side, the other side being already supplied with communication.

1585. You know the Kellyville district pretty well? Yes..

1586. Of late years it has developed into rather an important fruit-growing district? Yes.

1587. Does the whole of its produce come into Parramatta? That I am not prepared to say; a great proportion of it does, I know.

1588. You think the construction of the line from Carlingford to Dural would be inimical to the best interests of Parramatta? I think it would be a gross wrong to the town.

1589. Have you looked at the matter from what I may call the public interest, *i.e.*, the point of paying in the near future? It cannot possibly pay in the end to injure a district of 9,000 persons for the sake of 2,000 or 3,000 persons on the outskirts. The proposal before the Committee may be a big advantage to a few persons who would benefit by resumption and a railway against their door; but it cannot pay the country to crush out the business of so many persons, as I have indicated.

1590. Would the taking away of the fruit traffic from Parramatta, between Castle Hill and Dural, have such a terrible effect as you indicate;—remember you would still get the fruit for a distance of about 8 miles along the road? I grant you that; but a certain amount of trade is necessary to keep Parramatta going, *i.e.*, to pay the interest on the outlay, and the trade you indicate would not be anything like enough to do that. You must remember that it is not only fruit traffic which Parramatta obtains, but the banking and professional business of all sorts, for which the Hills district now depends upon the town. There is a certain amount of trade which we do with them in return, Parramatta, as far as fruit is concerned, being only a receiving depôt. The whole of the benefits of the returns from the fruit trade come to us at present. If you make it easier for that business to go elsewhere, it will of necessity go there, and to that extent Parramatta will be injured.

1591. If a tramway were constructed as you suggest, do you think it would lead to a large influx of population? I do not think there can be any doubt about its increase. The present traffic may be gauged from the coaches; and there is an objection to travelling by coach, first, on account of the dust and confinement, and also on account of the cost. Those conditions would hardly obtain in the case of a tramway.

1592. How far is the road metalled out of Parramatta, going north? I think as far as Castle Hill, a distance of about 8 miles.

1593. The roads are bad when you get further north? When I went out there it was springtime, and the roads were in good repair.

1594. Are they impassable in wet weather? Not to my knowledge.

1595. *Mr. Farnell.*] You spoke of Mr. Hunt having moved an amendment at some meeting in connection with affording railway communication to the district;—do you recollect whether at that time Simpson's line had been constructed to Carlingford? Mr. Hunt wrote against the Rosehill line, and in favour of the Dural-Westmead line, on the 26th April. He then said:—

I think I can show that the Westmead is preferable to the Dundas route, as it will benefit a district equal in fertility, and very much larger in area. The greater part of the Dundas district is within a reasonable distance of the Northern line, and should their proposed line be constructed, at least half of the country between it and the Northern line would naturally be a feeder for the latter, only leaving a narrow strip on that side as a feeder for the proposed line, and at the same time leaving most of the country on the western side, which really requires a railway, as distant from it as they are at present. On the other hand the Westmead route would pass through an equally important district, as large as Dundas and Rydalmere combined. Would not any sensible person, in constructing a railway between two parallel lines—the land being equal—rather construct it equi-distant between those lines than from 3 to 5 miles from one, and 12 to 14 from the other. Should any other route than Westmead be adopted, the greater part of Castle Hill, and all of Baulkham Hills, Kellyville, and places beyond, will be compelled to cart their produce, as at present, to Parramatta.

1596. But, as a matter of fact, the section to Carlingford was not in course of construction then, nor had the Bill authorising its construction been passed by Parliament? It was agitated for.

1597. It was agitated for as an alternative to the Westmead-road;—it was against the proposal for the survey of the Rosehill route that Mr. Hunt wrote at that time? I cannot speak as to that. The proposed Simpson's line was then under consideration, but how far it had progressed I do not know.

1598. In what way would the 9,000 persons of Parramatta, to whom you have referred, help the railway or tramway, if one were constructed thence to Dural? Simply by their business relations, and the business relations of 9,000 persons must be quite as considerable as those of the 3,000 persons whom the proposed line is intended to serve. If you adopt the tramway proposal you would not only get the business of the 3,000 persons but you would get the business of the 9,000 persons, and you would lose the business of the latter by the adoption of the proposed railway. 1599.

- J. W. Hill. 1599. If the Westmead line were adopted the whole of the trade would go right through to Sydney? Yes.
- 25 Jan., 1898. 1600. The necessity for transhipment at Parramatta would be done away with? Yes.
1601. Suppose a tramway were constructed, it would perpetuate the inconvenience which now exists? No. I trust it will be clearly understood that, as far as we in Parramatta are concerned, we want the Hills people to have that to which they are entitled, whether it be a tramway or a railway. So far as the goods going through Parramatta to Sydney are concerned, that does not much matter to us. The greater facilities the Hills people have to get to market the more prosperous they will become, and so long as you do not take their trade away from Parramatta, we should benefit by their prosperity in the trade done between us. We have nothing to do with the fruit trade, except that it has to go through the town, and the fact of its going through to Sydney direct would not injure us in any way whatever.
1602. Do you think that if the fruit went through direct from Parramatta to Sydney, the relations of the Hills people with Parramatta would still be maintained? Undoubtedly.
1603. You do not think that the fact of the fruit going through to Sydney would lead to the Hills people doing their marketing there? No more than they do now.
1604. You do not think the fact of their sending their carts into Parramatta, and that the carts would have to come out empty if they did not bring commodities for their use, has anything to do with the question? I do not think so. People would come to the shortest and most convenient spot to do their business,—that would be Parramatta, if it were *en route*.
1605. You said the proposed line would rob the parent lines of the traffic which they now receive? Yes.
1606. Supposing the residents were prepared to pay a local rate in addition to the rate charged upon the parent line, would not that do away with your contention? That is a matter upon which I am not prepared to express an opinion. I do not know what the charges would be, or to what extent they would compensate the Railway Department.
1607. You have made an estimate of the probable traffic upon the line from Westmead to Dural? Only as regards the Parramatta trade with the Hills. I have been round to all the business people of Parramatta and have collected the quantity of mixed goods which is sent out to the Hills. The traffic amounts to about 3,500 tons a year. That is sent out from the Parramatta to the Hills district. What is sent in I do not know.
1608. Do you think the Kellyville district would be served by the Westmead line? I can only take their word for that, allowing them to be their own judges. They say that that line would serve them well, and that the proposed extension would not serve them.
1609. They are distant 9 or 10 miles from Parramatta? Some of the residents there would be from 7½ to 8 miles.
1610. Supposing a railway ran within 3 miles of the centre of Kellyville, do you not think that would be a reasonable distance from which to expect traffic? As I have explained to Mr. Roberts, I know very little of the geography of the district. I do not know what difficulties there might be in the way of getting produce to the railway.
1611. You do not know what road access there is? I know nothing about that.
1612. *Mr. Black.*] Do you think that Parramatta has a lien for all time upon the trade of the Dural and Castle Hill districts? It has as much a lien on those districts as Bathurst has upon its surroundings, or as Sydney has upon New South Wales.
1613. Do you not think that in the course of natural development Parramatta will lose that trade in any case? If development takes place in the direction of the proposed extension.
1614. I am referring to the natural development of the place—to the growth of new centres throughout the Hills district? In that case I do not think Parramatta would lose the trade.
1615. Supposing there were a growth similar to that which we have seen on the suburban line; suppose that suburbs like Ashfield and Burwood were to spring up;—would they not become themselves the centres of trade and supply? I do not think it would be possible for any suburbs to become equal to their parent, Parramatta. Any growth outside Parramatta it seems to me must tend to augment the business done with Parramatta.
1616. Persons who formerly went into Sydney to spend money on Saturday night, for instance, now spend it in the suburbs; do you not think a similar state of things may exist as between Castle Hill and Parramatta;—might not the trade from Parramatta be taken away by the creation of new centres of supply? I do not think Parramatta will suffer any more than Sydney has suffered from the growth of suburbs. The trade comes originally from Sydney; it is distributed from Sydney. The larger the surroundings of Parramatta the greater will be its distributions. Parramatta is a further distributing point. I do not think it will be possible for the districts outside Parramatta to grow without doing Parramatta good. I do not think you can get away from the natural centre.
1617. Only by the construction of a railway, you think? You may do an unnatural thing, which we protest is being attempted now.
1618. *Chairman.*] You have spoken of the Hills district;—does that include Galston, Kenthurst, and Kellyville? Yes.
1619. Where does the produce of Galston go at present? I speak subject to correction, but I understand that it comes to Parramatta. I understand that the business of the whole of the watershed gravitates to Parramatta.
1620. Do you know where the Arcadia produce goes? No.
1621. And except from hearsay you cannot say definitely where the Galston produce goes? No.
1622. Where does the Dural produce go? A great deal of it at present goes to the Northern line, either to Thornleigh or Pennant Hills.
1623. Do you know where the Kenthurst produce goes? No.
1624. Where does the Pennant Hills produce go? Undoubtedly to the Pennant Hills station. The view we take of the trade of the district is that we have lost a considerable quantity through the Northern line, and what we ask is that we may not be deprived of the balance left to us.
1625. Is not this the correct view of the question: That Parramatta originally did trade over the Hills district, but that the construction of the Northern line brought railway communication so close to it that you lost, at all events, some of the new outward trade of Arcadia, Galston, Kenthurst, Dural, and Pennant Hills, and that now you are making a protest against a further curtailment of your trading operations which you believe would result from the extension from Carlingford to Dural? That is exactly our position.

Reginald Bowman, M.B., M.R.C.S., Chairman, Parramatta Progress Association, sworn, and examined:—

1626. *Mr. Farnell.*] How long have you been resident in Parramatta? Nine years.

1627. You are acquainted with the proposal before the Committee? Yes.

1628. You have had an opportunity to look into the figures submitted by the railway officers? Yes.

1629. Have you a statement to make in regard to the proposal? I have heard the latter part of the evidence of Mr. Hill, with which I fall in. I suppose, therefore, there is no need for me to repeat the points he has brought out; but there was one special point to which I do not know whether he referred, and it was this: That the whole district between Simpson's line and the Northern line is already well served, from the fall of the ground and from its nearness to railway communication. The growers in that district have no trouble in landing their fruit in sound condition at the Northern line, and by that means into market. So that at present the proposed railway will not be of any additional use to the railway system. I am speaking now of the district from the river up as far as Carlingford. Another point I wish to lay stress upon, is that a line proposed to run in or any way near Parramatta would not injure the Dural people. It would practically be as convenient for them, while it would confer a benefit upon the large business population of Parramatta. We do not wish to deprive the Dural or Galston people of anything to which they are entitled. All that we ask is that the railway which should serve them should also serve us. There are at Kellyville between 14,000 and 15,000 acres of unalienated land. This now has a comparatively small population. In the course of another ten years, when this land is opened up, it will sustain a large population which will not in any way be assisted by the line proposed. Kellyville, I take it, has a strong lien upon the Castle Hill route, because if, later on, population justifies it, a feeding-line might be run out from the centre tramway-line, or light railway-line whichever it may be deemed expedient to construct.

1630. Could not that be done in connection with the proposal before the Committee? Yes; but you would be taking the natural surroundings from Parramatta, and you would be isolating a considerable population—leaving a large centre without the means of transacting business in a natural way.

1631. Have you considered the proposal to construct a line from Westmead to Dural, in all its aspects? Yes; I have considered it as a better alternative than Simpson's line. As far as Parramatta itself is concerned, of course it will be more benefited by a line running right into the town.

1632. A tramway or a light railway? That must rest with the Department. If a tramway is constructed it must have rolling-stock suited to run on the railway line, the same as is done on the Camden line, so that there may be no transhipment of goods; that is an all-important point.

1633. Suppose that is found to be impracticable? Then we must fall back upon the Westmead line.

1634. Suppose you cannot get that? Then we must go without.

1635. You would leave things as they are? What could we do.

1636. You are not inclined to afford the people of Dural a means of railway communication except through Parramatta? We do not grudge them their means of communication, but, while not interfering with them, we want to benefit the district as much as possible.

1637. You maintain that it is a more expeditious way of getting railway communication for the district to advocate the Parramatta route as against theirs? Yes; because it serves a larger population and a larger trade in every way.

1638. How are the business relations of Parramatta to be kept up if the railway runs through to Sydney? Exactly as at present.

1639. You think the hills people will still come to Parramatta to do business? They will go to the nearest point at which they can get their things.

1640. You do not think they are likely to go right through to the Sydney market to get the things they require there, since they will be sending their produce direct? Some will, perhaps, do so, but I do not think the majority will as long as they can get properly served at a nearer point and have conveniences to get there.

1641. You do not think that the fact of people having to come to Parramatta at the present time with their carts, and to unload their fruit there has anything to do with the business relations of Parramatta? I do. I think it is a large help to the district. They must make use of their vehicles, and they take back what they want.

1642. Is it not natural to suppose that when the Hills people have facilities for getting right through Parramatta direct to the metropolitan market, Parramatta will be deprived of their trade? It will rest with the business men themselves. If they are keen enough in their business to supply public requirements, then as long as they are not placed at too great a disadvantage they will get the trade.

1643. What do you consider a reasonable distance to be within reach of railway facilities? It depends upon the lay of the country. If you have a rough steep hill to cross, a mile or two miles might more than equal four or five miles in another direction upon good roads. It is a question of haulage.

1644. You know the route of the proposed line from Carlingford. Suppose a deviation were made so that the Kellyville people, instead of being $3\frac{1}{2}$ miles from the line, were brought within $1\frac{1}{2}$ mile of it, do you think that would meet the difficulty in any way, especially seeing that the line would also be taken closer to Castle Hill? Then you would be at the disadvantage of lengthening the line to serve those particular people, and you might make the distance to Dural too far. I do not know whether it would pay to add to the expense of construction to that extent.

1645. I suppose that while you contend that the business people of Parramatta must have their interests considered, you are also willing to allow the interests of the fruit producers to be considered? Certainly.

1646. Do you know where the Galston and Arcadia people now send their produce? They send it to the Northern line; but they still do business with Parramatta.

1647. And the Kenthurst and Dural people? They strike in at Pennant Hills; but the Dural people are also doing business in Parramatta. They are not cut off from us yet, although they have the Northern line. There is both passenger and goods traffic to Parramatta from that point.

1648. Do you think the proposed railway will act as a feeder to the main line? After it leaves Castle Hill.

1649. To what extent would the Northern line and the Parramatta line be affected by the taking away of traffic? The traffic would reach the Parramatta line eventually; but the Northern line would lose some of the traffic which now goes to Pennant Hills. A proportion of that would go to Carlingford. Of course, a great deal would depend upon the state of the roads.

R. Bowman,
M.B.,
M.R.C.S.

25 Jan., 1898.

- R. Bowman, 1650. The charge from Hornsby to Sydney is 1d. a case, and from Parramatta to Sydney 1d. a case;—if the Galston and Arcadia people are prepared to pay an extra 1d. or 2d. a case for facilities to reach market, what becomes of your contention that the Northern line would be robbed? I doubt whether the Government would get interest upon the line, whereas it could be clearly shown that it can get interest in the case of the Westmead line. Mr. Wright, I think, gave you the particulars.
1651. Would not those particulars be equally applicable to the Rose Hill line? Beyond a certain point, but not until you reached that point. From the river to either Pennant Hills or Castle Hill there is not the local business and trade that there is between Westmead and Castle Hill. That business will not be got except by a line from Parramatta or Westmead.
1652. You see from the map that the Westmead line leaves Kellyville at a greater distance from railway communication than does the proposed line from Carlingford to Dural? Yes.
1653. Do you propose to meet that difficulty by a branch line from the Westmead line to Kellyville? That, I think, is the idea.
1654. Do you think there would be sufficient traffic to warrant the construction of such a line? That depends upon the population which may settle there.
1655. As far as the actual routes are concerned, the proposal under consideration would suit the Kellyville people better than would the proposed line from Westmead to Dural? No; I do not think it would suit them as well. It would take them away from their centre of business, and that would be a distinct disadvantage.
1656. But the nearer station would be upon the Carlingford and Dural line? According to the wall map; but I do not know whether the Westmead line as shown there takes the course agitated for by the local people.
1657. Have you any statistics? A committee was appointed to go round the district and ascertain the actual amount of trade and business done. Mr. Wright handed in the particulars to the Committee.
1658. You think those particulars will be borne out by results if the line you suggest is constructed? Yes; I think that, if anything, the traffic has been under-estimated.
1659. Had you any connection with the agitation in Parramatta for what has been called "steam communication"? That term was adopted so that we might not tie the advocates to either a railway or tramway. It was thought that otherwise the question of a railway might not be considered.
1660. It was not adopted with the object of preventing the Dural and Kenthurst people from getting railway communication? Certainly not. The object of the Parramatta people is not to interfere in any way with the Dural or Galston people. We simply want to share in the advantages they get, and not to be cut out of them.
1661. Are the Dural people in favour of the Westmead line, or do they favour the line which can be got most expeditiously? I think they have committed themselves to the extension of Simpson's line. I believe they are supporting that.
1662. They would readily accept the Westmead line, you think? I think there can be no doubt but that it would serve them in exactly the same way.
1663. What is your opinion of the district from the standpoint of health? All the Hills district from Dural to Wiseman's Ferry, until you begin to fall to the river, is a healthy district. There is beautiful scenery and surroundings upon all sides. People will be induced to go there for the pleasure of living.
1664. It is a great sanatorium for the whole district? Yes; it is well elevated, and if there were railway conveniences the district would eventually be a keen competitor with the North Shore heights.
1665. You think that railway facilities will lead to the speedy erection of suburban residences there? Yes; the conditions are better as regards health. The district is further from the sea, and the north-easters are not felt there as they are on the North Shore heights.
1666. *Mr. Wright.*] You know the district intimately? Yes.
1667. Which line do you think would go through a greater area of good country—the Westmead line or the Carlingford extension? The Westmead line.
1668. There is more good land to the west than there is on the Rosehill line? There are comparatively few good orchards down from Carlingford to the river; they are either worn out or not planted.
1669. The Westmead line would open up a larger area of good country? Yes.
1670. *Chairman.*] You are here to-day as the representative of the Parramatta Progress Association? Yes.
1671. Their views are those which you have put before us to-day? Yes. The Progress Association was authorised at a public meeting to place its views before the Committee, and I have done so to the best of my ability to-day.

THURSDAY, 27 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

John Thorpe, Parramatta, sworn, and examined:—

- J. Thorpe, 1672. *Chairman.*] You are a resident of Parramatta? Yes.
1673. *Mr. Black.*] Have you any evidence you specially wish to bring before the Committee? Nothing further than this, that I have always been a strong advocate of a tramway line to serve the whole of the district concerned. I do not think a heavy line could be made to pay for many years to come.
1674. Where would you have your tramway terminus? At the Parramatta station. I think the line should run through Baulkham Hills and Castle Hill to Dural, and that at the "Baulkham Hills Hotel" there should be a branch off to Kellyville. I have driven over the road scores of times.
1675. You think a tramway line would pay? It would serve the whole of the Hills district and would pay from the jump. It would serve from thirty to fifty years. 1676.

J. Thorpe.
27 Jan., 1898.

1676. Do you think a tramway would be adequate to the requirements of the fruit traffic? I do.
1677. What is the opinion of the people in the districts concerned? In the Hills district, of course many persons are anxious to get a railway, if it can be got; but there are many who say that if they cannot get a railway they will have a tram-line. If they had been contented with a tram-line they would have had one before now. It is only some persons who want to get rid of their land who have all along been agitating for a railway.
1678. Would not the construction of the tramway involve a double handling of fruit, to its disadvantage? I think far too much has been made of that. I do not think the damage to the fruit would come to more than 1d. a case, if it were properly handled; but I believe a plan could be devised by which the whole of a truck-load of fruit could be transhipped from a tramway-truck into a railway-truck in a very few seconds, without the slightest damage to the fruit.
1679. Have you formed any opinion as to what would be a fair charge to make for the carriage of fruit over such a line as you suggest? Ten years ago I went thoroughly into those details with Mr. Hugh Taylor; but I forget now the conclusions at which we arrived. I think that if a tramway line were constructed, fruit could be brought down to Parramatta and sent on to Sydney for a very much less sum than it costs at the present time.
1680. You think that the construction of a tramway would lead to an increase of occupation? Yes; the occupation of both cultivation and residential sites.
1681. You think there would also be a considerable increase in the number of residents in the district? I do think so.
1682. That would give the line a better chance of paying? It would.
1683. Have you formed any opinion in regard to the proposal before the Committee? I think it would be a great waste of public money. It would serve one place only, and the fringe of some of the others. It could not serve Castle Hill or Kellyville. A tramway line, such as I indicate, would not only serve the district named, but it would serve a portion of Seven Hills. In regard to many of the districts, it would pay persons better to take their goods to Parramatta, by cart, than to take them to the proposed Simpson's line. Then again, I believe a tramway line could be constructed to suit the whole district for about one-half the money that a heavy railway line would cost, from the junction with Simpson's terminus.
1684. *Mr. Farnell.*] Would the tramway you suggest serve Kellyville? Yes; with a branch from "Baulkham Hills Hotel."
1685. Do you know whether the proposed line from Westmead would serve Kellyville? I do not think it would.
1686. The railway referred to the Committee would probably be in a better position to serve Kellyville than would either of the other suggested routes? I do not think the proposed railway would serve Kellyville under any circumstances. In order to reach that line from Kellyville you would have to cross the Cattai Creek. It is a most difficult road to pass over under any circumstances, to say nothing of taking fruit over it. You could not get across there by any decent sort of road.
1687. But there are bridges across the Cattai Creek and roads giving access to the Castle Hill-road? There are roads, but none of the orchards bounded by the Windsor-road would be able to get to that line at all. It would be only those persons on the other side of Cattai Creek who would be able to get to it. It would pay most of the people in the district better to take their fruit to Parramatta. Only a very small portion of the people of Kellyville would be served by the line you mention.
1688. If a railway were constructed from Westmead you would also require to make a branch line from it in order to serve Kellyville? I think it would be madness to attempt to construct a heavy line to the Hills.
1689. Do you think a tramway line could be so constructed as to make it possible to use the tramway rolling stock upon the suburban line? You would have to have special trucks constructed for the conveyance of fruit from the Hills. That would meet the difficulty. You would require engines such as those which go to Woollahra now on the tram-line. I think they would serve the district well.
1690. Do you think a system like the Camden tram-line would serve the district? I think it would serve remarkably well. It would serve the district for many years to come. I believe the line would pay interest on the outlay from the jump.
1691. *Mr. Hassall.*] How long have you known the Parramatta district? Fifteen years.
1692. You know the locality through which the proposed railway passes? Yes.
1693. Do you know the country from the terminus towards Dural? Yes.
1694. And you also know the country from Parramatta out to Dural? Yes.
1695. Which line would you say would serve the greater population—a tramway line from Parramatta or the proposed line from Carlingford? There is no comparison between the two proposals. A tram-line would serve the whole district. Simpson's line would serve only one district and the edge of the others.
1696. Supposing a tramway were on the same gauge as on the railway system, so as to avoid transshipment of produce, you think the district would be served as well as it could be served? Yes; but I am afraid that rolling-stock such as would be required for a railway would be too heavy for a tramway line for the Hills district. It would be far better to tranship the goods than to haul heavy trucks upon the line merely in order that the same trucks may be run upon the suburban line.
1697. Could they not run the light trucks on the heavy line? I was told not some years ago. I was told that the light trucks suitable for haulage through the Hills district could not be hauled on the heavy lines without damage to the trucks.
1698. On national grounds you advocate a tramway from Parramatta in preference to the proposed extension of Simpson's line? Yes; very little land would require to be resumed. I recommend the tram-line on account of the smallness of cost of construction, the low cost of working, the absence of stations, and because the line would pay from the jump. It would serve a much larger population and would do four times the service which could be rendered by an extension of Simpson's railway.
1699. If you, as a business man, had an opportunity to invest money in the extension from Carlingford, or in the proposed tram-line from Parramatta, you would invest it in the tram-line? Yes.
1700. Which is the better tract of country—that along Simpson's line, or that along the tramway you suggest? For residential purposes the land upon the tramway line is decidedly better. It would also be better for cultivation generally. The return upon the tramway would be five to one as compared with the railway.

Joseph William Withers, Parramatta, sworn, and examined :—

J. W.
Withers.
27 Jan., 1898.

1701. *Chairman.*] You are a resident of Parramatta? Yes.
1702. *Mr. O'Connor.*] You were at one time mayor of Parramatta? Yes.
1703. How long have you lived there? I have been connected with Parramatta for fifty-six years.
1704. You know the country well then? Every inch of it.
1705. You are acquainted with the proposal before the Committee? Yes.
1706. What do you think of it? I concur with a great deal of what the last witness has said, more particularly in regard to the tramway line. If I had money myself to put into such a thing, I would certainly go in for the tramway line as a speculation of my own, because I believe that the work would pay from the jump. I blame the Parramatta people for not taking the Westmead line when they had a chance of taking it. I believe the tramway line would serve more people, and be more beneficial to the country generally. If you had a tram-line you could stop more frequently to pick up or set down passengers. I am sure that a tramway line would lead to a large increase of population in the district. It is a good climate and growing district. I know of several persons who have left the district on account of the inconvenience of getting into town. I very often go to the district to stop there from Saturday until Monday, and I myself am personally acquainted with the inconvenience attending the present means of getting to and fro. The orchardists also are at a great disadvantage in getting their produce into market. It takes a man a whole day, starting early in the morning, to get into Parramatta with fruit, and to get home again.
1707. Is there much land available for settlement in the district? Yes; the land is suitable for the production of almost anything. There is good timbered land round about Dural.
1708. Do you know the Rosehill line? Yes.
1709. What do you think of the country upon that line? The line touches only the borders of the orchard country. It is all good land; but at the same time, if I had my choice I would put money into the tram-line, and I am sure I should make something out of it.
1710. What you have said in favour of a tramway line from Parramatta would in no way affect the proposed purchase of the Rosehill line by the Government? Personally, I would not purchase it. If the railway were offered to me for £25,000 I would not look at it. I would much sooner have the tramway line.
1711. Suppose the traffic between Sydney and Rosehill justified the taking over of the line? I am sure that the tramway I suggest would pay more than that railway would pay.
1712. *Mr. Hoskins.*] Where do you propose that your tramway should start from? From the present railway station; it would run down O'Connell-street.
1713. How would you get from the railway station down there? I am not an engineer; but at the same time I think the work could be done—in fact, the line could not be taken any other way, unless the line went down Smith-street.
1714. You are not in favour of a tramway line from Westmead? Some years ago I was in favour of a railway from Westmead, and I think it is a pity that the line was not constructed.
1715. How would you propose that the tramway line should go from O'Connell-street? It would cross the new bridge.
1716. Would that bridge carry a train? Under present conditions I should think it ought to carry a tramway.
1717. Suppose it was called upon to carry an engine of from 50 to 100 tons? I would not advocate the use of that sort of engine upon a tram-line. I should think that motors such as are run on the Sydney tram-lines would be quite heavy enough.
1718. Do you think those motors would be able to haul trucks loaded with metal, manure, or large quantities of fruit over the severe grades of the line you suggest? I do not see why they should not; upon the line which comes up to Parramatta from the steamer wharf I have often seen four or five truck-loads of produce.
1719. But that is a level road almost all the way? Yes.
1720. When you got out of Parramatta, would you take the tramway line along the main road? I should think so, where possible.
1721. But would you not be compelled to resume a good deal of private land in order to avoid sharp curves? I do not think so.
1722. Do you think an ordinary goods truck could be worked on a tramway such as you suggest, with sharp curves such as would be necessitated if you followed the road? No.
1723. Then how would you carry your loading? There would require to be special trucks.
1724. How would you carry manure and other traffic of that sort upon the proposed tramway? I should not think that there would be any more weight in a truck of manure than in a truck loaded with fruit.
1725. Do you think the ordinary goods truck with straight axles could be worked on a tramway with sharp curves? I cannot express an opinion as to that.
1726. You are aware that the Camden tramway departs from the roads and goes through private land? Yes.
1727. There there are no sharp curves, and ordinary goods trucks can be run? I am aware of that; but I do not think it would do to run ordinary goods trucks on a tramway from Parramatta to Baulkham Hills; I think they would be too heavy.
1728. You have no data upon which you have founded an estimate of the probable traffic? No; but I know from the orchards that there would be a large traffic upon the suggested tramway line.
1729. *Mr. Humphery.*] Is this your evidence as to a tramway;—that the Galston, Dural, and Hills districts generally would be equally served if a tramway were constructed from Westmead, as if it were constructed from Parramatta, but that it would be better from Parramatta if the terminus were Parramatta railway station? Yes.
1730. Would there be any difficulty in constructing a tramway from Westmead to Dural? It would go through more private property than the other line.
1731. Would there be more difficulty in constructing a tramway than a railway? There would be no main roads to run on; you would have to buy property.
1732. You heard Mr. Thorpe's evidence as to a branch line to serve Kellyville;—do you think that would be necessary? Yes.
1733. For how many miles would it be necessary to carry that branch? It would depend upon the way the country is opened up; at present you would have to go about 2 miles.
- 1734.

1734. You think the district would not be as effectually served by a railway from Carlingford to Dural? I believe it would not be.

1735. You think that Kellyville, at all events, could not be served by that line? I do not think it would.

1736. Baulkham Hills and Castle Hill would be some distance away from it? It would serve some parts of Castle Hill.

1737. The tramway you suggest would serve a larger district than it would be possible for the proposed railway to serve? Yes; and it would be more convenient for traffic—passenger traffic particularly.

1738. Would the tramway, as shown on the wall map, serve Kellyville any better than would the proposed railway? Yes; it would be more convenient for the people there. But after all I do not think it would make much difference, as far as Kellyville is concerned. I had in my mind the Baulkham Hills, Castle Hill, and Seven Hills people.

1739. *Mr. Trickett.*] With regard to the engineering questions asked you by Mr. Hoskins, you do not wish to set up your opinion against the opinions of the officials of the Department? No; I certainly would not put my opinion against that of engineers.

1740. You know that the estimated cost of a tramway is considerably less than that of any of the other schemes proposed? I should think so.

1741. The cost of a tramway, according to the official estimates, would be £28,000, while the next cheapest line would be that from Pennant Hills to Dural, at a cost of £33,000;—you think that the tramway would be the cheaper and the better line? I think so; it would be more convenient, and much cheaper.

1742. The evidence of the Department is that all loading on the tramway would have to be taken off at Parramatta, and would have to be put there on to ordinary railway trucks;—what do you think of that? I do not see any objection to that course, provided the fruit were properly handled.

1743. *Mr. Wright.*] I believe that some four years ago a private company sought Parliamentary authority to construct a tramway to Castle Hill? Yes.

1744. That Bill was thrown out? Yes.

1745. It was for a tramway from the Parramatta Railway Station to Castle Hill? Yes; in conjunction with the present tramway.

1746. You know that the survey then made showed that there would be no difficulty in connecting with the railway system at Parramatta? Yes; there was no difficulty of that kind, but the Parramatta company wanted us to take over the present line running from the steamer wharf up to Parramatta. I believe that is what broke up the movement.

1747. Is it within your knowledge that the whole cost of construction from Parramatta to Castle Hill, according to the advice of scientific men, would not exceed £15,000? I think that was about the estimated cost.

1748. The tramway was to be capable of carrying the ordinary rolling-stock of the railways with light engines? Yes.

1749. The proposal was that the tramway should be worked with light tank engines? Yes.

1750. The promoters proposed that the ordinary rolling-stock of the railways should run over the line? Yes.

William Alfred Brodie, property auctioneer, Parramatta, sworn, and examined:—

1751. *Mr. Hoskins.*] You are a resident of Parramatta? Yes.

1752. Do you wish to make any statement embodying your views upon the proposal now before the Committee? I think that from my long experience in the district I should be in a position to give some information concerning the district, which would be of service to the Committee.

1753. What is your occupation? I am a property auctioneer, and during the time I have been in business I have sold about £1,500,000 worth of property in the district. I am therefore able to speak as to the value of property there. I know that a number of properties upon the Rosehill line were sold for residential purposes, and would have been so utilised had the line been open. The non-completion of the line, and the fact that the completed portion remains closed, has driven purchasers to other localities. If the line were opened and extended I am satisfied from my experience and from inquiries which I am constantly having that the country served would be very largely utilised as a place of residence by people from the city.

1754. Do you think then that the country beyond Carlingford, on Simpson's line, would become more largely settled if the railway were extended? I am quite satisfied that it would. People who go on to the Northern line go there to get altitude, but they find that they cannot get land unless it is of a poor character. They are compelled to go there for health's sake. If the proposed railway were made they would go on to that line because it runs through some of the best country in the county of Cumberland.

1755. You do not think the opposition to the proposed line should have any weight, seeing that it would intercept good land, and attract settlement? I most undoubtedly think that the line ought to be constructed.

1756. Do you think its construction would injure Parramatta seriously? Whatever damage could be done to Parramatta was done years ago by the Northern line, and by the bridge erected near the Gasworks over the Parramatta River. If the Parramatta people catered properly for the public the public would go there just as readily as they go to Sydney. The people in the district are so closely identified with the town that I do not think the extension of the Rosehill railway would make any difference to the business relations of Parramatta.

1757. Do you know the Pennant Hill quarry? Yes.

1758. Do you think the proposed railway would lead to a great deal more stone being taken out of that quarry? Judging from the traffic to the wharfs and adjacent municipalities, I certainly think that would be the case.

1759. Would not the quarry then be in a position to supply metal more cheaply than it can be supplied from the Southern quarries? Yes.

1760. Is settlement increasing in the districts intersected by the proposed line;—have people occupied land there recently? The district is really stationary from the want of railway communication. Once it were known that the railway would be opened, buildings would be very soon run up. A great deal of land has been sold there in anticipation of the construction of the proposed railway.

1761. Between Carlingford and Dural? Yes.

1762.

J. W.
Withers.

27 Jan., 1898.

W. A. Brodie.

27 Jan., 1898.

- W. A. Brodie. 1762. The promoters of the Clyde-Dural railway were led to commence its construction in consequence of representations made to them that the district would be settled? There is no doubt about that.
- 27 Jan., 1898. 1763. It is said that the proposed line would go away from the best parts of the district such as Kellyville? A part of Kellyville would not be further than 2 miles from the line, and a new road has lately been opened up from Castle Hill to Kellyville. In my opinion, it will be necessary in time to come to construct a tramway to Kellyville from Parramatta.
1764. We have been told that the land on the proposed railway is inferior to the land more to the west? I do not think that is the case.
1765. *Mr. Humphery.*] You see the route of the proposed railway on the wall map? Yes.
1766. Will you point out what portion of the district would not be served between the dotted red line and the Northern line? The country running in the valley between Rydalmere and the western side of the ridge.
1767. What would be the greatest distance between the Northern line and the proposed tramway line? About 5 or 6 miles.
1768. Therefore the greatest distance of any occupied land from means of communication would be not more than 3 miles? That is so; but in some cases people might be compelled to go a long way round. The distance from Parramatta to Castle Hill would of itself be about 6 miles.
1769. Would the tramline you indicate serve an equal number of people with the proposed extension of the Rosehill line? I do not think people would go to live there if there were only tramway communication. I do not think they would care about shifting from the tramway into the train. The tram would suit Parramatta, but it would not suit persons who wanted to go into Sydney every day.
1770. You think a tram service would not suit the fruit-growing districts beyond Baulkham Hills? It might suit them to get their produce to that station, but it would not suit the district from a residential point of view.
1771. You think it is more important to provide a service to suit the residents than to provide for the removal of the produce? I do think so at the present time. As I have already said, I think a tramway must eventually go to Kellyville from Parramatta.
1772. Do you think a tramway as shown upon the wall map would do? Yes; with a branch line to Kellyville.
1773. But in order to properly serve the entire district, you think the railway should be extended from Carlingford to Dural? Yes.
1774. And in regard to the route of a tramway you prefer a line taken along the Windsor-road to Baulkham Hills, with a branch to Kellyville? Yes. I might also point out that there is a goods siding at Clyde, and it is possible that the connection of the Rosehill line with the Northern line at Pennant Hills would relieve that line of some of its traffic, and take it direct to the Clyde station.
1775. How do you think the proposed line from Westmead to Castle Hill, and on to Dural, would serve the fruit-growing district? I do not think it would serve them as well as the extension from Carlingford.
1776. Why? Well, in the first place, there is not the land available on that side that there is on the other side, and you must also remember that the railway at Seven Hills would be only 3 miles away from the Baulkham Hills orchards.
1777. Is the available land to which you have referred suitable for fruit-growing? Yes; as suitable perhaps as any part of the county of Cumberland.
1778. Where is the available land to which you are just now referring? On the heights of Pennant Hills.
1779. Can you explain why persons went out to Kellyville for land, in preference to taking the available land to which you refer, in close proximity to railway communication? Land could be obtained at Kellyville for £20 or £30 an acre. In the other direction persons were asking £100 per acre.
1780. Would that be the explanation with regard to the available land at Dural? Yes; there would be a great enquiry for land there, supposing there were access to a railway; but at present the place is at a comparatively great distance from a railway station.
1781. The only reason the available land to which you have referred has not been used for fruit-growing purposes is to be found in its price, you think? Yes; and in its distance from a railway station. I have sold land for residential sites there as high as £200 an acre.
1782. Not recently? No.
1783. *Mr. Wright.*] Do you think persons merely look upon the construction of the proposed railway as a means of speculation, or do you think they are agitating for it because they think it will really be of service to the district? I think it will be a means of bringing people to the district.
1784. Do you regard the proposed railway as a ready means of bringing produce to market, or as a means of disposing of land for residential purposes? The residents who would go there would have small orchards, and they would have a certain quantity of fruit to send to market as well as the bigger man.
1785. You think the Sydney merchant who bought land there for residential purposes would also use it for fruit-growing? Yes.
1786. Do you know the land about Brush Farm? Yes.
1787. Is it good land? Very good land.
1788. Do you know the land at Hornsby Junction? Yes.
1789. That is also fairly good land? Yes, in parts.
1790. The land at Pennant Hills is also fairly good orchard land? On one side of the line.
1791. Has there been any great rush for residential sites along the heights on the Northern line? The poorness of the land has restrained persons from purchasing in that direction.
1792. Have not the Government offered some good land there? I am not aware of any particularly good land having been offered for sale there by the Government. It is mostly poor sandy soil.
1793. Where would you locate the best land in the district? I should say that the best land in the district would be on the ridge between Pennant Hills and Baulkham Hills.
1794. The high land upon the Northern line has been upon the market for sale, and no one is going there;—if the land is required in the district for residential purposes, how do you account for that? I do not know of any cheap land there.
1795. What would you call cheap land? I do not know of any land cheaper than £60 an acre. I have buyers for anything cheaper than that, and I cannot get it.

1796. Supposing the proposed line were constructed, at what price do you suppose people would be able to get land there? At from £25 to £30 an acre. I know of land which could be sold there at that price; and persons would give that price for the land if they had railway communication. W. A. Brodie.
27 Jan., 1898.
1797. Could you sell me 50 acres of first class orchard land there at £25 an acre. Yes.
1798. Is the dearness of land the sole reason why the high land on the Northern line has not been utilised for residential purposes? The quality of the land has also to be considered. Persons want residential sites, but they want good land at the same time.
1799. Is there not good land at Carlingford and Beecroft sold recently by the Government? I am not aware of any good land sold by the Government.
1800. You advocate the construction of the proposed railway, and you think that ultimately there will be a tramway connection between Parramatta and Kellyville? Yes.
1801. Supposing there were no chance of that connection, which line would you recommend? I should advocate a direct line from Parramatta in the direction of Castle Hill.

Peter Parfitt, Manager, Bank of New Zealand, Sydney, sworn, and examined:—

1802. *Mr. Humphery.*] You are manager of the Bank of New Zealand in Sydney? Yes. P. Parfitt.
27 Jan., 1898.
1803. Are you familiar with the correspondence which has taken place in regard to, and the expenditure in connection with the construction of, the railway from Clyde to Carlingford? I am not very familiar with the details or with the earlier correspondence. I have been in Sydney only two years.
1804. Have you seen Mr. Chapman's evidence? Yes.
1805. Briefly, are you in the position to corroborate that evidence from the documents in your possession? So far as my records go that evidence is correct. I have not seen Mr. Chapman since he gave it, and I was away from Sydney at the time. Although in the main it is correct as far as I know, I could neither confirm nor contradict any special item.
1806. Is the Bank prepared to sell to the Government the railway with all the rights in connection with the Acts known as Bennett's Act and Simpson's Act for £25,000? Yes.
1807. The railway, inclusive of all the rights in the Acts to which I have referred, has been offered to the Government for that price? Yes.
1808. Would the £25,000 include the whole of the land resumption? The offer was to include everything within the railway fences. Whether there is anything outside of them or not I cannot say at this moment.
1809. Everything from the Clyde station to Carlingford? Yes.
1810. Including the Rosehill platform? Yes; and all the other platforms and stations, together with all the land contained within the railway fences.
1811. Everything owned by the Bank of New Zealand in connection with the railway? Everything belonging to the railway proper. There may be land outside the fences. I am not sure on that point. If there is any land there it is not included.
1812. I assume that the offer is still open to the Government? Yes.
1813. *Mr. Hoskins.*] I suppose you know that the Government Engineer for Existing Lines has represented that the bridge over the Parramatta River forming part of Simpson's line would require to be strengthened considerably to make it safe for traffic; also that the wooden bridges and culverts on the line would require to be screwed-up, painted, and put in proper repair? I was not aware of that. I understood that the Commissioners were quite satisfied with the railway. I thought the Commissioners had passed it.
1814. Does the Rosehill Race-course belong to the Bank of New Zealand? No; the Bank has nothing whatever to do with it.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and further examined:—

1815. *Chairman.*] You hand in a document in reference to the Pennant Hills quarry? Yes. It is as follows:— W. A. Smith.
27 Jan., 1898.

Department of Public Works, Sydney, 27 January, 1898. 27 Jan., 1898.

DURAL RAILWAY INQUIRY.—PENNANT HILLS QUARRIES.

As requested by the Parliamentary Standing Committee on Public Works, I have the honour to report that, after a careful inspection this afternoon of the Pennant Hills quarries, I would estimate the amount of basalt suitable for road-making and concrete works, now available from the present faces of the quarries, at 52,800 cubic yards; while by working the quarries to a lower level of 10 feet—as the present lessee is about to do—another 57,600 cubic yards of excellent stone is available; so that, with the quarry appliances now in use, 110,400 cubic yards of stone in the solid, or about 220,800 cubic yards of stone broken to a 2½-inch gauge, could be raised. The present market value of this stone, delivered on roads in the vicinity at 8s. 6d. per cubic yard, would, therefore, be £93,340. Assuming that 200,000 cubic yards of this stone was, in course of time, carried by the railway for a distance of, say 15 miles, at the current rate of 1s. 6d. per ton,—taking 24 cubic feet to a ton,—the total amount receivable in railway freight would be £16,875. This statement refers only to what may be called the "old quarries," the extensive faces of which are at sight and have been heavily worked for the past 68 years; but beyond this the quarries possess further possibilities of development.

WALTER A. SMITH, M.Inst.C.E.,
District Engineer.

1816. Do you regard the quarries as valuable? They would be if there were some easier means of getting the stone away.
1817. How far are they from Simpson's line? About $\frac{3}{4}$ of a mile. If a wire tramway were built—and I understand that the present lessee intends to do that if the railway is constructed—otherwise the distance would be much longer, the elevation of the railway is so much greater than that of the quarry that it would be necessary to go a long way round.
1818. Does the lessee intend to dump the blue metal into the trucks on the railway? It would be brought up by the wire tramway and dumped into carts at about an equal elevation with the railway. The metal would then be carted about $\frac{1}{2}$ a mile along the road.
1819. Would $\frac{3}{4}$ of a mile of line enable the lessee to dump the metal into trucks which would run on to Simpson's line? If there were $\frac{3}{4}$ of a mile of line he could, by means of a wire tramway, dump the stuff from the quarry into the trucks. It would not be an expensive operation providing there were no engineering difficulties; but as to that I cannot speak, because I have not been over the route. An expenditure of £500 would bring the metal within about $\frac{1}{2}$ a mile from the railway by road. 1820.

- W. A. Smith. 1820. At the end of the wire tramway would it not be possible to construct a running-road from trucks to join Simpson's line? So the lessee informs me; but I have not been over that route.
- 27 Jan., 1898. 1821. Would £1,000 make the railway accessible to the quarries? I could not say; I have not been over the road, and there may be gullies intervening. I am informed that there will be no difficulty in carting the stone; but a cart-track is a very different thing from a railway-track.
1822. *Mr. Hoskins.*] Could stone be used for ballast on the railways? Yes; it would be a perfect stone for ballast.
1823. What is the average price of bluemetal in the county of Cumberland? Eight shillings and sixpence on blue-metal roads within 10 miles of the place.
1824. It is nearly as cheap as the blue metal from other quarries? It is very nearly as cheap now; but it is the long cartage which is killing it. The lessee is about 6d. ahead of other merchants; if the cartage were done away with he could compete favourably with all the other blue metal merchants.

FRIDAY, 28 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

William Charles Hill, Chairman, Rosehill Race-course Company (Limited), sworn, and examined:—

- W. C. Hill. 1825. *Mr. Trickett.*] You are chairman of the Rosehill Race-course Company? Yes.
- 28 Jan., 1898. 1826. What is your share-list? I could not say from memory. It is a limited company, having an office and a secretary.
1827. Carried on in conformity with the Companies Act? Yes.
1828. The object of the Committee in calling you was in order that you might give us some idea as to the permanence of the Rosehill Race-course property and recreation-ground? I can see no reason why it should not be carried on for some considerable time to come—no reason whatever.
1829. Is the race-course carried on of itself, or in connection with surrounding property? Entirely by itself.
1830. It has nothing to do with the railway, or with any surrounding property? It has nothing to do with either; it stands on its own bottom.
1831. Taking the property upon the basis of a race-course only, has it been payable? It rather more than holds its own. It has not paid dividends for some time; but it did so formerly.
1832. How long has it ceased to pay a dividend? It is five years since it paid a dividend.
1833. Independently of race-meetings, the Eight-hour demonstration is held upon the ground? Yes; and several other meetings of that kind. We let them have the ground for almost a nominal sum.
1834. How many race-meetings do you hold a year? About thirteen.
1835. Have you any contract with the Government as to the charges upon the railway from Clyde to Rosehill? There is a contract.
1836. Is it for any term, or from year to year? I do not think there is a contract for any special time; I presume it will be from meeting to meeting.
1837. Do you have to make a fresh arrangement from time to time? No; the original arrangement stands good.
1838. Out of the passenger fares the Railway Commissioners get a certain proportion, and you get another proportion? Yes.
1839. Could you tell us what the traffic is worth? I could not say. Our secretary would be able to give you every information of that kind.
1840. Supposing the railway became the property of the Government, and they gave you nothing out of their receipts for passenger fares, would not that seriously affect the income of the race-course? I do not think it would do so seriously. It would affect it in some measure.*
1841. Have you a copy of the last balance-sheet? No.
1842. I suppose you hold the race-course in freehold? It is freehold; but it is not fully paid up yet.
1843. What is its value at the present time? I could not say.
1844. Have you recently taken into consideration the advisableness of cutting up the race-course and selling it in allotments? We have not thought of doing that up to the present time.
1845. You do not contemplate that? Not that I am aware of.
1846. The proposal has never been submitted at a meeting? Never.
1847. You attend meetings more in the capacity of chairman of the company than in any other capacity? Only in that capacity; in no other. Mr. O'Mara is the secretary.
1848. I suppose the property without the railway would be almost useless? I would not say that altogether, because people could get from Granville to the race-course very readily. They did so formerly. There were race-meetings before the railway was opened there.
1849. Still, the absence of the railway would affect the attendance largely? It would, certainly.
1850. I suppose your company has no interest in the platforms adjoining the race-course? None whatever.
1851. They are used by the railway authorities as a means of landing people at the race-course? Yes.
1852. You have no title to anything outside your fences? No.
1853. There are a number of entrances and exits on to the platform;—are they controlled by any right or deed? Not the platform.

1854.

* NOTE (on revision):—The only amount the Rosehill Race-course Company receive out of the railway fare is a sum, which is added by them to the amount agreed upon by the Railway Department and the Rosehill Railway proprietary, to be charged for the conveyance (only) of the public to the course.

1854. No right has been established in that direction? Not that I am aware of. I do not know whether the platform was built by the Rosehill Race-course Company or by the Government. The ground was a race-course before we purchased it, and was used as a race-course. W. C. Hill.
28 Jan., 1898.
1855. At present, as far as you know, the two things, the railway and the race-course, are managed by a mutual agreement for mutual benefit? Yes.
1856. When did the Rosehill Race-course Company buy the race-course? They purchased it about eight or ten years ago.
1857. Very shortly after the railway was constructed? Yes.
1858. Have you been making any improvements upon the course lately? We always keep it in first-class order.
1859. Do you intend making any further improvement? We do not require any further improvements. Those already there are very extensive.
1860. The present improvements are sufficient for the purposes of the course? Quite sufficient.
1861. *Mr. Hoskins.*] There is no permanent arrangement between the race-course company and the Government in respect of the fares to be charged? There may be; but I do not know of any.
1862. Supposing the Railway Commissioners and the company disagree, it will be quite possible for the company to arrange with the owners of the steam-boats on the river, and on the tramway, to convey people to the course, independently of the Government railway? They could do that.
1863. At a lower rate? I do not know what the rate would be; but they generally run such trips at low rates.
1864. *Mr. Humphery.*] Have the Railway Commissioners any right to in anyway interfere with the operations of the present owners of the railway? No.
1865. Can you say whether the tickets issued in Sydney include the right of entrance to the race-course? Persons purchase a railway-ticket without purchasing an entrance-ticket to the race-course. The ticket issued in Sydney may or may not include entrance to the course. There is a charge for the platform and an entrance-fee besides.
1866. The charge of 1s. 6d. to Rosehill, for instance, would not include the right of entrance? No.

Henry Harris, sworn, and examined:—

1867. *Chairman.*] You are one of the directors of the Rosehill Race-course Company? Yes; I am a shareholder, and I am also a director. H. Harris.
28 Jan., 1898.
1868. How many committee-men have you? I think there is a committee of five.
1869. Do you meet regularly? Yes.
1870. *Mr. Trickett.*] You heard Mr. Hill's evidence? Yes.
1871. Do you agree with it, as far as it went? Yes, to a great extent.
1872. Is it the intention of the company, as far as you know, to preserve the race-course as a recreation-ground? Decidedly. I may say that I have an interest of 9-20ths of the whole—nearly one-half.
1873. Do you regard it as a satisfactory investment? I have seen more satisfactory investments, and also many much worse.
1874. Do you think there is a good future before Rosehill? I do. Rosehill is to Randwick what Caulfield is to the Melbourne course.
1875. At what does the property stand in your books? My interest is about £30,000.
1876. Do you know what the property stands at in the company's books? No; the secretary could give you that information.
1877. You heard Mr. Hoskins suggest to the last witness that if the Government took over the railway arrangements might possibly be made for persons to be brought up by river and tramway to the course? No doubt it could be done, but it would be a very isolated idea, and for this reason that you could not get accommodation to put a sufficient number of persons on to the ground? Prior to the railway being constructed steamers used to run there from Sydney; also persons who wanted to visit the course went as far as Clyde and took a conveyance over to it. I do not think it is at all probable that such a thing as you suggest would occur.
1878. Excepting on public holidays and race-meetings, the race-meetings generally begin between 12 and 1? Between 1 and 2 o'clock.
1879. Under those circumstances would it be reasonable to suppose that persons would take steamers from the head of Darling Harbour to Parramatta, and would go thence by tramway seeing that they could be conveyed there and back by railway for eighteenpence? No; I do not think the idea is feasible.
1880. What has your attendance been on your best race days? I could not say, but we have had a very large attendance.
1881. Have you ever suggested that the race-course should be cut up into building allotments? Never; that was never my intention.
1882. Do you think it probable that that will be done at any time? I do not think it is at all probable.
1883. Do you think that the holding of the race-course, as at present, for race-meetings and occasional large popular gatherings is the best use to which it could be put? I do, decidedly. There is no doubt that with regular communication the ground would be availed of for many things besides race-courses.
1884. Apparently at the present time the means of access to the course are of a somewhat complicated character, it being a matter of arrangement between the Government and Rosehill Company? Do you think that if the whole thing were in the hands of the Government it would be more advantageous? I think so. I think there would be more traffic. I think numbers more would travel.
1885. Every time you want to utilise the race-course a regular form has to be gone through with the Government? No; there is a stated arrangement between the company and the Government. The Railway Commissioners run the trains to suit the company, and after the race-day they settle with the company.
1886. Do you think that if trains were run daily upon the line to Rosehill, and also on the Carlingford line, the regular running would lead to the more frequent use of the Rosehill race-course as a place for large gatherings? I cannot answer that question; we are subject to the conditions of the A.J.C. We have to conform to their allotment in regard to race-days.
1887. Your fixtures are subject to the approval of the A.J.C.? Yes.

H. Harris. 1888. Is there anything you would like to add to your evidence? I should like to impress upon the Committee that if there were constant communication there would be far greater traffic upon the line than there is at present, independently of the race-course. My impression is that many people would reside there, especially trainers of horses. If there were regular communication they could come to town whenever there were races elsewhere. If they were to take up their residence at Rosehill at the present time they would be isolated, and they could only travel on race-days. It is necessary that trainers should be able to travel on any day. If there were fixed hours for daily communication the traffic would greatly increase.

28 Jan., 1898.

1889. Is the whole property, including the grandstand and enclosures, in thorough order? Yes; I suppose it is one of the most compact race-courses in any part of the world. It is a miniature Randwick. A large amount of money has been spent there. We have to do all that is necessary to keep the place in proper repair and up to the times.

1890. *Mr. Hoskins.*] Do you think it probable that if the Government acquired the railway the Rosehill Race-course Company would endeavour to exact better terms from them for the conveyance of passengers? I do not think it is at all probable. Most of the men connected with Rosehill are business men, and are quite satisfied to do their business on fair lines. I think the present rate is a fair thing. I do not think the company would want anything more than they are getting.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

J. Harper.
28 Jan., 1898.

1891. *Mr. Roberts.*] Have you had an opportunity to read the evidence tendered to the Committee since you were last here? I have seen references to the evidence in the newspapers, but I have not had time to go through it.

1892. You have no statement to add to your former evidence? No; I made my first statement as full and explicit as I could make it.

1893. From what you have since heard and read about the question are you inclined to modify your opinion in any way? No; I do not form opinions to modify them as you suggest. I feel that I have an important mission entrusted to me, and when I make a report upon a question of this kind I exhaust every source of information. In this instance the result of that information has been laid before the Committee.

1894. You have not seen the evidence of Mr. Chapman? No.

1895. You will see Mr. Chapman estimates that if the line were taken to Dural there would be a return of £3,150;—that is an increase of £1,000 upon the estimate you put before the Committee? I do not think the Company would want to sell the line if they could realise the revenue indicated by Mr. Chapman.

1896. But the Company labour under a certain disadvantage in working the line as compared with the Railway Commissioners;—have you considered that? Yes; if they could get a gross revenue of £3,150, it would not be bad interest, paying all the costs they would have to incur upon £25,000, the sum for which they offer the line. I should characterise the estimate you mention as a ridiculous one.

1897. Even if Mr. Chapman's estimate were realised there would still be a loss of over £1,000 a year? I have not worked out those details, but I am sure that the estimate would leave a loss. My report practically traverses Mr. Chapman's estimate upon the Carlingford portion. He allows £745 as the traffic of that section. My estimate is £337 10s. Mr. Chapman assumes that the people of Carlingford would pay 1½d. a case more for the carrying of their fruit on that line than they have to pay for the carriage of their fruit from Thornleigh, Pennant Hills, Beecroft, Carlingford, or Parramatta, or any other points on the existing lines. He assumes that they would pay 1½d. from Carlingford to Clyde, and a further 1d. from that point to Sydney.

1898. Your argument is that they would not do so? That is my argument.

1899. *Chairman.*] The question is whether you could get across on to the Northern line where the penny rate to Sydney obtains for less than the 1½d. contained in Mr. Chapman's estimate? I must leave the Committee to draw their own conclusions as to that. The Committee have been over the district, and they are acquainted with the relative distances. They are also aware of the principal centres of fruit-production.

1900. *Mr. Roberts.*] Are you bearing in mind the undulating character of the country? Every circumstance.

1901. We are informed that in wet weather the roads are almost impassable? I have never come across a road yet which was impassable in wet weather.

1902. Have you also considered the loss of time involved in carting fruit to the Northern line,—have you considered that the fruit could be taken in a few hours by the proposed railway, where, as in many cases, it takes more than a day to convey it to the Northern line? I have considered that so much that I have given credit for every case of fruit from the district coming on to the proposed line.

1903. Are you aware that there are blue-stone quarries in existence a short distance from the Carlingford station, on Simpson's line? Yes.

1904. Have you estimated any revenue from the carriage of metal? No; I am satisfied that the quarry at Pennant Hills could not possibly compete with the natural quarries on the South Coast. I know that even at Emu Plains we could not compete with the blue-metal merchants conveying the metal from Shell-harbour by water.

1905. Do you not think that if the owner of the quarries were to put down a tramway-line connecting the quarries with the line at Carlingford he would be able to compete with the Southern quarries? I am sure he could not. I know that from our own experience. We do not carry very much metal now by rail—that is, anywhere about the suburban areas. Besides that the quarries are absolutely different in their nature to those on the South Coast. In the one case you have to contend with clay bands and things of that kind, whereas in the Southern quarries there is one mass of stone. It is hardly likely that the Railway Commissioners would supply the suburban district from the Illawarra quarries if they could have obtained the supply advantageously from the Pennant Hills quarries.

1906. Since you were last here the Committee have had before them several witnesses who have expressed their willingness to pay 2d. a case, and even 3d. a case to Sydney, rather than convey their produce by cart to stations on the Northern line? I am never surprised to hear things of that kind. I am quite used to it now. You hear a similar thing in connection with all new lines.

1907.

J. Harper.
28 Jan., 1898.

1907. Can you point to any instances where promises of that kind have not been carried out? I do not know of a single branch line where a promise of that kind has been kept. We thought that the Berrigan people would adhere to their promise to pay 2s. 6d. a ton. Now they are approaching the Commissioners to get an extension of the main line rates. In the case of every other branch line we have built, within from a week to three months after opening we have received representations against local rates. The Berrigan people are the last example, they say they are going to send all their wheat to Victoria unless we charge them through rates.

1908. What would the through rate be in their case? Twopence a ton, instead of 2s. 6d. I have no doubt in that case a large number of persons could be found in the district, who expressed their willingness to pay 2s. 6d. a ton. I do not mean to say that the people of that particular district are worse than are the people of any other district. But I am speaking generally from an experience extending over a great many years.

1909. It does not follow that because persons ask for a concession of that kind the Commissioners will grant it? It depends upon circumstances. In the case of the Berrigan line they would not grant it. In some other cases they might find it expedient to grant it.

1910. *Mr. Hoskins.*] Then, according to your statement, the Berrigan line will be a failure? It will not be a failure.

1911. Would your observations in regard to the Pennant Hills quarry apply to the delivery of stone at Granville, Homebush, Strathfield, or Burwood? They would apply. As far as most of the western suburbs are concerned, they are to-day being supplied from the southern quarries; and you must also have regard to this fact—that where those suburbs are supplied with metal from those quarries it is rail-carried. It is a question of distance, and of the carriage of the stone by rail from one line to another.

1912. But does not much of the stone come by vessel? It is transhipped at Darling Harbour, and carried to the western suburbs by rail. The rate would be practically the same as that from the suggested point on the Carlingford line.

1913. It has been said by the Engineering Branch that if the Government took over Simpson's line the bridge over the Parramatta River would require to be considerably strengthened, and that the culverts and wooden bridges would require to be screwed up and painted;—that being so, and having regard to your estimate of traffic, do you not think that £20,000 would be quite enough to pay for the line? I said on a former occasion that I thought that if the line could be bought for £25,000, or as much less as it could be obtained for, it would not be a bad speculation. As regards the strengthening of the bridges, I presume that is a question of maintenance.

1914. *Mr. Humphery.*] Are you quite clear that within a very reasonable time 3 per cent. upon £25,000, that is £750 a year, would be earned between Clyde and Carlingford? Yes, including the earnings of the Rosehill line. Apart from that there is the question of maintaining existing interests, which mean more or less suburban traffic, and other traffic over the main line.

1915. What is your estimate of the probable annual cost of a line between Clyde and Carlingford? It could be worked cheaply by the shunting engines from Clyde. It is hard to say what the exact cost would be. The engines engaged in shunting at Clyde would do the service to Carlingford; I do not think the cost would amount to more than £200 or £300 a year. You might add to that maintenance at the rate of from £30 to £40 a mile—say about £250. I should think that £500 would cover the cost of working.

1916. Beyond that amount all the earnings between Clyde and Carlingford would be profit, and would go against interest? Yes.

1917. What are the prospects of the line? I do not regard them as very bright. I fancy the estimate I have given of the traffic is a very full one.

1918. Your estimate of the working expenses and maintenance being £500 a year, you would be left with £646 towards interest, which, at 3 per cent. on £25,000, would amount to £750? Yes. I might add that, from the fact of the line being in close proximity to the city, and in connection with the main line, unless we were able to continue working the traffic under favourable circumstances upon the section as far as it goes, we might suffer an indirect loss in traffic upon other suburban portions. For instance, there is the traffic in connection with the Rosehill Racecourse which, of itself, represents a certain amount of profit; and there would also be the traffic from the Australian Kerosene and Oil Co.'s works, and from the Sandown meat-works.

1919. Does your estimate of £500 include salaries of station-masters, and expenses of that sort? There would be no station-masters upon that line.

1920. Your idea appears to be that it would be a satisfactory transaction to take over the constructed railway to Carlingford for £25,000, and not to construct the proposed extension to Dural? Yes. I wish to emphasise this as my personal opinion—that the great value of the line would be that a portion of it would be in touch with the Rosehill Racecourse, with the Australian Kerosene and Oil Co.'s works, and with the Sandown meat-works. I do not attach much importance to the rest of the line.

1921. Will you give a reason for that? I think the traffic obtained will be very limited.

1922. Take the proposed tramway from Parramatta to Baulkham Hills;—do you think that that would serve the district up to Dural and Galston, as well as would the proposed line from Carlingford? I do not think it would serve the Galston district as well. I observe that one of the newspapers represented Kellyville as $5\frac{1}{2}$ miles away from the projected line; Kellyville extends 10 miles, and a portion would not be more than $2\frac{1}{2}$ miles away. The Galston district would not be benefited by any tram-line to Kellyville. They would continue to send in to Hornsby.

1923. But if the line were extended on from Kellyville to Dural, would not that serve the district? Under certain circumstances, the freight charges being favourable, the Galston traffic would come to Dural. No matter how Dural was approached, the Galston traffic would come there if the freight charges were not too high.

1924. Even if Dural were approached by a tramway, and not by a railway? If it were approached by a tramway the charges would have to be higher than if it were approached by a railway, because it would cost more to work the traffic. It is a mistake to suppose that by having a tramway you can work the traffic cheaply.

1925. What is the difference, approximately, between the annual cost of working a tramway and a railway? It would depend upon the volume of traffic you have to shift. I do not know what a tramway in this case would mean. If it meant a 1 in 18 or a 1 in 20 grade, it would be a very expensive process to shift the number of cases for which I have given credit. But I do not know what sort of tramway is projected.

- J. Harper.
28 Jan., 1898.
1926. In a general way, would the cost of maintenance and the extra working expenses of a tramway be greater than those of a railway? Decidedly, with heavy loading to shift.
1927. Therefore, although the initial cost might be less, the annual charges would be much more for a tramway than for a railway? Yes.
1928. Would your estimate of the probable earnings of a railway from Carlingford apply equally to a tramway? The earnings would be the same. We should lift the same traffic as far as that is concerned, but the working expenses would be more. As I mentioned just now, we should work the traffic on the Carlingford line with the shunting engines from Clyde. There are four or five of them employed there, and we should work them upon the Carlingford line in their spare time.
1929. Can you see no prospect of the estimated earnings upon the proposed line being increased within a reasonable time? I do not know how they could be. The district might grow twice as much fruit as it does, but the fruit would not pay working expenses.
1930. You think you have fully estimated the traffic as far as produce is concerned? I have considered every case of fruit going by railway, steamer, and road at the present time.
1931. You have estimated the traffic at so much less than the local people say they are prepared to pay—the discrepancy is very large;—could you not modify your evidence upon that point—for instance, fruit-growers at Galston and Dural say they would be prepared to pay 2d. or even 3d. a case, but you have not allowed anything approaching that? I have allowed 1d. a case, which is practically double what they are paying to-day. I am sure that with the alternative of a 1d. rate against a 2d. rate, and with a better service such as they would obtain on the main line, the preference would be given to the main line and the lower rate.
1932. How do you make out that the 1d. is double what they are paying to-day? I have given them 1d. from Dural in addition to the present charge.
1933. We are told that the cost now is over 2d. by road? I daresay you have often heard persons say that it costs about £3 a ton to carry wool from 40 to 60 miles, but immediately we wish to charge them 5s. a ton they begin to cry out.
1934. Your estimate of 1d. a case is as high as your experience will permit you to place it at? Yes.
1935. As to the quantity you have estimated as coming to the proposed extension, you have taken account of all produce within reasonable limits;—is that so? Yes.
1936. You think you have made, if anything, an excessive allowance? Yes; I have allowed 150,000 cases, and that represents every case of fruit which is rail-carried from any point.
1937. Your estimate may be regarded as a maximum one rather than otherwise? Yes.
1938. *Mr. Hoskins.*] Do you think that if the Government took over the line as far as Carlingford and opened it, a considerable fruit traffic would be attracted to the Carlingford station? I do not think there would be much. I have not credited it with much, because at Carlingford and Ermington there is a disposition still to go to the river; and between Carlingford and the existing main Northern line the disposition would be to go the main line in order to take advantage of the better service offered by the main line communication.
1939. *Mr. Trickett.*] Let me direct your attention to Questions 230, 259, and 261. You will see that Mr. Chapman, the manager of the Clyde to Rosehill Railway line there gives reasons why the line has not paid. It would appear that the Company have never been able to work in with the Railway Commissioners. They could not carry goods along this short length of railway at a price which would pay. For instance, the Commissioners said that they might bring the traffic so far and no further, and that directly they brought it to the Clyde junction they would want their rights;—does not that seem a very feasible position? What the Company would like would be half our earnings over that length. They would like us to work it, and for the use of it they would like to get half the charges we impose for the sending of engines and shunters to do the work. The Act provided that they were simply to get an extension of the main line rate as their proportion of the charge upon the traffic hauled over the line. There was not enough to warrant a daily service at the existing main line rates over the line, and the Commissioners imposed an arbitrary charge for shunting. The proprietors of the Rosehill line would like to get one-half of our charges. That is really the whole position.
1940. They say that in present circumstances a lot of traffic is diverted down the river which would otherwise come by railway? Quite so. I think you can realise that the Commissioners are not likely to run upon the line at a nominal rate in order that goods might be brought to their wharf to the detriment of the main line. We would not alter our position of to-day. That is to say, we should not play off one section of the line against another.
1941. But there is some traffic upon the river? Yes; some of it goes up Duck River, and there is other traffic there. Hudson Brothers get timber there; but I cannot conceive of any circumstances under which we should get it.
1942. You think, then, there is no force in Mr. Chapman's statement? None.
1943. In reference to the answers to the questions to which I have referred, including the reference to the cost of conveying wheat from the wharf to Mr. Brunton's mill, what do you say is the position of the matter? It was a question of carrying Mr. Brunton's wheat from Sydney or from the wharf on the Rosehill line, on the Parramatta River. In the one case the rate mentioned by Mr. Chapman is 6d. a ton from the Parramatta to Clyde, and in the other case the rate is half a crown a ton from Darling Harbour to Clyde. In each case the occupation and use of the rolling stock would be the same. I will add this—that owing to the precarious nature of the service the charge for hauling would probably have been greater from the wharf on the Parramatta River than if the traffic were hauled by ordinary trains from Darling Harbour to Clyde.
1944. So that given that the Government acquired the railway at the price at which it is offered, the traffic suggested by Mr. Chapman as likely to be carried from the Parramatta River to Clyde would not be remunerative traffic? Not upon those terms. If Mr. Brunton wished the wheat brought there, the Commissioners would probably request him to pay the Darling Harbour rate.
1945. *Mr. Clarke.*] Is the metal from the Pennant Hills quarries a good material for making roads? Yes; it is a good metal.
1946. It was used for many years upon the roads before cheaper metal could be obtained? Yes.
1947. How is the metal brought-up from the Kiama quarries? Ninety-five per cent. of it is brought by sea. Of course, we bring our own metal for ballast up in our own hopper trucks.

1948. What is the rail charge from Kiama? About 4s. 3d. a ton. It is brought by sea for about half a crown. J. Harper.
1949. What would be the cost of carriage from the Pennant Hills quarries to the proposed line, some-where about Carlingford? I cannot say; the station would be some distance from the quarries; the railway charge would be about 2s. 8d. a ton. 28 Jan., 1898.
1950. That is less than the charge from Kiama? Yes; but it costs about three times as much to get the stone at Pennant Hills as it would cost to get it at Kiama. When the Railway Commissioners go 50 miles from Sydney to get their supplies, you may depend upon it that they have studied the question.
1951. In the event of the proposed line being constructed, do you think the produce from Castle Hill, Baulkham Hills, and Kellyville, would be attracted to it, or would it go to Parramatta? I think the Baulkham Hills traffic would still go to Parramatta. The Castle Hills traffic, up to a certain point, would go to the proposed line, but it would be dependent largely upon the freight charges.
1952. I suppose you know that within the last few days the Australian Kerosene and Oil Company's works have been closed? I have seen the statement made, but it has been denied by one of the men who is principally interested.
1953. If the works were closed, the estimate of traffic you have given would require to be reduced? I think you will find my estimate will be realised, and that supposing the works to have been closed they will be opened again.
1954. *Mr. Lee.*] In your estimate of traffic, you struck a rate of 1s. 6d. a ton upon manure from Clyde to Dural;—what would be the through rate from Sydney to Dural? 2s. 9d.
1955. What would be the rate from Sydney to Pennant Hills? 1s. 10d.
1956. Why were not arrangements made to run traffic along Simpson's line to Carlingford? I fancy it would not pay to do so.
1957. When the line was finished had the Rosehill Racecourse Company any rolling stock or engines? No.
1958. As a matter of fact, did they not go to the Railway Commissioners to endeavour to make arrangements with them? It was a matter of arrangement after the line had been built.
1959. Did they endeavour to make an arrangement with the Commissioners to work the line as far as Carlingford? I do not think they did; I have never heard of it. I have been through the correspondence and I saw no indication of it.
1960. Do you know that the Commissioners refused to do so? I have been through the whole of the correspondence and I saw no suggestion of it.
1961. In the event of the line going as far as Carlingford only, would it not intercept a certain amount of traffic which now finds its way to Ermington and to the Northern line? It would intercept a certain amount of traffic which finds its way to Ermington for which I have given credit, and it would to a limited extent divert traffic from the existing main Northern line, but it would not amount to much, because I cannot conceive of any set of circumstances which would create as good a service between Carlingford, on the Simpson's line, and Clyde, as the service, which is an improving one, on the main Northern line.
1962. If Simpson's line became the property of the Commissioners, would they open it for traffic as far as Carlingford? It would be opened, but it would be run under conditions which suited us. I regard the extension beyond Rosehill as practically an excrescence upon the whole thing.
1963. Under any circumstances the line is certain to be opened to Carlingford sooner or later, if not by the Commissioners by other persons; looking at the matter from that point of view, there is a certain amount of traffic to be secured;—would it not be better for the Commissioners to secure it? No one could work the line more economically than could the Railway Commissioners. They are working the portion of the line to the south of the Parramatta River to-day, and it would take, perhaps, an additional half-hour's time per trip to work the rest of the line with shunting engines.
1964. Supposing the promoters of the line obtained Parliamentary sanction to extend it to Dural, would not that extension operate disadvantageously to the Northern line? No; I have not the least fear of that.
1965. But if the line went into the heart of the fruit-growing district, would it not pick up freight? If the Company were prepared to stand a continuous loss upon working expenses, decidedly it would.
1966. You think you hold the key at Clyde? We try to do so.
1967. *Chairman.*] Would it be possible for any fruit district at the rates you are charging for fruit to afford a commercial basis for a railway? I do not think so.
1968. No matter how much fruit came along the railway, it would be traffic which would not pay? Quite so.
1969. Then in extending a railway into any fruit district we must not look for a commercial basis? No.

TUESDAY, 1 FEBRUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

John Bennett, sworn, and examined:—

1970. *Mr. Clarke.*] Have you any statement to make as to the origin of the Rosehill railway? I was interested, equally with Mr. Holt, in its construction. We first called for tenders for a single line. Mr. Goodchap said, "If you will make it a double line, and do certain things which I require—construct a large platform, for instance, and have it under Government supervision,—we will take it over on completion." Prior to that a Bill was passed giving the right to construct; but Mr. Goodchap inserted a clause which rendered the railway useless to us by making it a part of the main line. J. Bennett. 1 Feb., 1898. 1971.

- J. Bennett.
1 Feb., 1898.
1971. It was formed by a company in the first instance? Yes; by Mr. Holt, the manager of the Bank of New Zealand, and myself.
1972. I suppose the Rosehill Race-course was opened and races were held upon it prior to the railway being constructed? Yes.
1973. What arrangement was there between the Government and the company as to what each should receive? We got so much for first and second-class passengers. I think we got 6d. for first and 4d. for second-class passengers; but that I believe was reduced.
1974. Is there any other means of getting to the race-course without this branch railway? We could get by water or by land from Clyde. The extraordinary thing is that we made more money before the railway was constructed than we did afterwards. We did not sell the Rosehill Race-course until after the railway was completed.
1975. Is the railway to the race-course now in hands of a company? Yes.
1976. Is it a limited liability company? I think it is.
1977. Did Mr. Goodchap make the promise to which you have referred in writing? No; I took his word, and it was not his fault that the Government did not take the line over. I think the Bank was to blame. Sir Henry Parkes, at the request of Mr. Goodchap, wished the line—that is, from Clyde to the Parramatta River—with the wharf and steam crane, to be placed under offer for £50,000. The Bank said they would not take less than £60,000. We were at that time in the hands of the Bank, and were compelled to do as they wished.
1978. Then, virtually, this and Simpson's line are in the hands of the Bank of New Zealand? Absolutely.
1979. Are you aware that it is under offer to the Government for £25,000? Yes; when the news came to me that they had offered it at that I thought it was an act of insanity.
1980. Are you aware that it was agreed by the present Government to purchase the line subject to the approval of Parliament, and that Parliament refused to sanction the purchase? Yes.
1981. Do you think it would be a good purchase for the Government to make? I think if I had to manage it from to-day, at a value of £20,000, I could make 10 per cent. out of it.
1982. In what way? Take the passenger traffic from part of Granville, and then from the west part of Harris Park. Rosehill could be made infinitely more of by getting picnic parties together there, the same as we do on Eight-hour Day. Then, I think, you could intercept a large amount of the Parramatta River goods traffic.
1983. How do you account for the race-course paying better prior to the formation of the railway than it has done since? There is no accounting for it, excepting that there is more competition now in racing.
1984. Is it not more convenient for the people going to the race-course to have a line there? Yes; it would be useless now, I think, without the railway.
1985. Still the race-course could be carried on without it? I doubt it very much.
1986. You think that the purchase by the Government of what is called Bennett's line and Simpson's line, as far as Carlingford, would be a good purchase? I am quite sure of it. We once tested the passenger traffic by boats. I went to Mr. Brunton, the miller, and he said "We will give you all our stuff." It was the same with the Shale and Oil Company. There are three or four steamers constantly going to Parramatta with goods, and I think you would intercept the bulk of that.
1987. Independently of the line being carried, as proposed, from Carlingford to Dural, do you think it would be a good purchase? I am sure that even if it remained as it is it would pay 10 per cent. on a capital of £25,000.
1988. *Mr. Lee.*] Are you the person who obtained the Railway Bill in 1886? Yes.
1989. By what year was the line under that Bill finished? 1887 or 1888.
1990. In 1893 Mr. Simpson obtained a Bill to extend the line to Carlingford;—is your Company amalgamated with his? It is one and the same thing.
1991. What was your object in going to Carlingford? Sir Henry Parkes sent some experts from the Railway Department to the line. He said, "If you will attach to it a payable end we will take it over, as it is the only private line." After careful consideration, we said, "We will go to Cox's Corner." The money was obtained in England at a low rate of interest to do it.
1992. At the time you contemplated the Carlingford extension, did your estimated revenue show a profit over expenses? Yes; that was on a much larger capital.
1993. Was any written agreement entered into with Sir Henry Parkes? No; simply a verbal statement.
1994. Are we to understand that you constructed the extension to Carlingford on the good faith of the promise made by Sir Henry Parkes that the Government would take it over? Undoubtedly.
1995. Had it not been for that promise, would you have extended it? No.
1996. Notwithstanding the fact that there would have been sufficient revenue to recoup you? It did not show that there would have been sufficient. It would have shown about 4 per cent. clear, and that for private enterprise is not sufficient.
1997. Was that above working expenses and maintenance? Yes; but we were always handicapped by this being part of the main line. We had no terminal charges.
1998. No matter what charge you fixed upon from Carlingford to Clyde, you had at that point to contend with the Railway Commissioners on their own line? Exactly.
1999. As a matter of fact, they held the key of the position? Yes.
2000. And in point of fact, they regulated your trade for you? Yes.
2001. Did your company ever possess any rolling-stock or locomotives? No.
2002. After you had made the line to Rosehill, had you any rolling-stock? No; but under the Bill granted to me, the Commissioners were compelled to grant rolling-stock; but the line was then to be considered a part of the main line.
2003. Are you sure that the wording of the Act was so emphatic as that? It was very emphatic.
2004. Did it not rather give the Commissioners power to run over the line at any time upon giving your company certain notice? Yes, undoubtedly.
2005. They were not compelled to find the rolling-stock to run over your line? I think so. I may be wrong on that point; but the impression in my mind is that they were compelled to find it.
2006. If you refer to section 13 of the Act of 1886, you will find that the Commissioners took power—but not a compulsory power—to run trucks at any time by giving you notice, and probably that is what you are alluding to? I think it is.
- 2007.

2007. That being the case, you were to come to some arrangement with the Railway Commissioners? Yes. J. Bennett.
2008. To run as far as where? As far as the Parramatta River. We put up a wharf and a steam crane there, thinking to take the Parramatta River traffic as well. 1 Feb., 1898.
2009. And the Commissioners allowed you so much per ticket per passenger? Yes.
2010. Did you endeavour to make an arrangement with the Commissioners to run as far as Carlingford? No; I saw Mr. Eddy many a time to see if we could not get over that particular section of the Act, and he said, "I cannot go outside the Act of Parliament."
2011. That is to say, the power that was given in the Act of 1886 to run to Rosehill was not given in the Act which gave the company the power to extend to Carlingford? That is so.
2012. In process of time, I suppose the company became financially straitened, and the railway eventually fell into the hands of the Bank of New Zealand? That is so.
2013. Are we to understand that if the original intention of the company had been carried out they would have run their own rolling-stock over the line both to the Parramatta River and to Carlingford? Yes, in their own interest.
2014. I suppose it was some time after you had undertaken the construction of the line to Rosehill that your company discovered that it was not the financial success it was supposed to be? We, in ignorance, made arrangements with the Shale and Oil Company, with Brunton, and Hudson Brothers, to take whatever they could give us from the Parramatta River. Then we found that under the Act we had to consult with the railway people, and it was not worth doing at 1d. per mile per ton.
2015. That neutralised your profits? Absolutely.
2016. Then the promise came from Sir Henry Parkes that if you extended the line as far as Carlingford it would be taken over? Yes; so much so that the whole thing was constructed under Government superintendence. We had Mr. Cowdery's brother in the first instance. Everything was done in accordance with their approval.
2017. Do you happen to know what those lines cost? I think the first contract for the river came to between £40,000 and £50,000. I think in the Bank books it must now stand at a debit of between £90,000 and £100,000. We took every precaution to do everything as cheaply as we could. We called for tenders for the bridges over the Duck River Creek. Hudson Brothers were the cheapest, and they did it, and everything was done very well.
2018. Do you know whether your company ever held land outside the railway fences? We did.
2019. Do they still hold it? Yes.
2020. Where is it situated? To the west of the platform at Rosehill. We had a good deal of land there. It branches off to the Parramatta River, taking a north-easterly direction.
2021. After selling out of the company, did you still have land there? Yes.
2022. And that land is now in the possession of the Bank of New Zealand? Yes.
2023. Have you any interest at the present time, directly or indirectly, in this railway? No; not to the extent of a farthing.
2024. *Mr. Hassall.*] With regard to the proposal of the Government to take over the Rosehill railway, I believe that it was in 1886 that the Act was passed? Yes.
2025. Do you know that at that time Mr. Lyne was away, and that Mr. Fletcher was discharging the duties of his office? Yes.
2026. Mr. Goodchap at that time was Commissioner for Railways? Yes.
2027. Do you know whether any letter was written by Mr. Fletcher, acting on behalf of Mr. Lyne, with regard to the taking over of the railway? I never saw one. It would have been addressed to me, and I never had any letter.
2028. Then you think there is no such letter in existence? Yes.
2029. Has your own interest in the matter died out altogether? Yes; we made a large profit on the sale of the Rosehill Race-course proper.
2030. Has the Rosehill railway at the present moment anything but the Rosehill Race-course traffic to depend on? Nothing else. We have taken merchandise to the Shale and Oil Company and other people, but it never paid.
2031. In fact, beyond Rosehill the district is sparsely settled? I believe in the extension, because you take a large traffic from Rydalmere, which contains two churches, a public-house, and a large population. Rydalmere is $\frac{1}{2}$ mile from the Subiaco platform.
2032. If this railway would be a good investment at £25,000 is it not strange that the Bank of New Zealand do not try to make better use of it? The Government, under the Act, have stuck them up completely. It has no value outside the Government as long as this clause to the effect that it shall be considered part of the main line exists.
2033. Whilst you were in possession, did you make the line pay on a large capital? No, it never paid; but with this, and with the addition to Cox's Corner, you have an immense adjunct. As I said before, I could make it pay 10 per cent. on the whole of the line.
2034. Do you not think the traffic of the railway must be limited by reason of the proximity of the Northern line? Around Cox's Corner there is a large area under cultivation, and a larger population than there appears to be at first sight. Then you have Rydalmere, and then you intercept the traffic from the Parramatta River. I also think a good deal more could be made of Rosehill if trains were run regularly.
2035. Practically the only revenue which can be relied upon is the revenue received on race days? And the Eight-hour demonstrations. Then the place is admirably adapted for picnicking.
2036. But you will always have a strong competitor in the river for picnics? I do not think so. I think the river would be a source of revenue. They could go there by river or by rail. We used to have a large traffic by river when the railway first opened.
2037. Had the river traffic to make use of part of the railway system to Rosehill? It had to make use of the tram.
2038. Was it run in connection with the Rosehill property? No; but we arranged with the tram proprietors to make it do so.
2039. Then, practically, the tram is outside the control of the Rosehill railway proper? Yes.
2040. Would there not always be a fear of competition by river and tram as against the railway? I never fear that. It takes so much longer that people take the railway in preference.

- J. Bennett. 2041. Do you think there is any prospect of the Rosehill race-course ever being utilised for any purpose other than horse-racing? It should be, if land became very valuable. But I think it is improbable, as there has been so much money spent upon it.
- 1 Feb., 1898. 2042. It would only be a question, I presume, of the interest in horse-racing dying out, which might induce the present proprietors to put it to some other use? But what could they do with it.
2043. The fact remains that you could not make it pay, and you think the only chance is for the Government to take it over? I am sure it would be a good thing.
2044. Do you think a private company could make it pay? Yes, if section 7 of the Act, which makes it a part of the main line, were removed.
2045. Would you have to charge a local rate in order to make the line pay? Yes.
2046. *Chairman.*] And you say that under the Bill you have not power to charge that rate? That is so.
2047. *Mr. Humphery.*] It means this: that if you are going to use your line in conjunction with the Government line the same rate should be charged all through; and you have no power to charge a special rate between Clyde and Carlingford? That is so.
2048. *Mr. Hassall.*] You were debarred from imposing local rates, and consequently could not make the line pay? That is so.
2049. If you had had the power to charge special rates could you have made the Rosehill railway and Simpson's railway a profitable speculation? I do not think that Bennett's railway could be made to pay without the addition.
2050. *Mr. Roberts.*] Do you know the district north of Carlingford? Yes.
2051. Are you acquainted with the district known as the Hills? Yes.
2052. In your opinion would it be a desirable thing to purchase this railway for £25,000? Yes.
2053. Do you think the time has arrived when it would be desirable to continue the line in a northerly direction to Dural? I believe the Dural district is the best citrus fruit district in the Colony; and in view of the fact that 10 per cent. could be made out of the present line, I think it might be extended and made to pay well.
2054. Did you contemplate going further on? We did not. The truth of the matter is, that we thought we had a paying end at Cox's Corner.
2055. Do you think the line under consideration, from Carlingford to Dural, would serve the people better than a line from Westmead, or a tramway from Parramatta, along the main road? We have always had to contend with a good deal of jealousy from Parramatta. From Westmead to Dural there is some splendid land, and then you get patches of very bad land. Of course, I look upon it in this light: a railway exists to a certain extent, and by constructing it to Dural you develop a large district.
2056. A proposal has been spoken of for making a tramway through Parramatta from Baulkham Hills on to Dural? That would meet the present traffic; but I look upon Dural as a place which must go ahead.
2057. Have you been beyond Dural? Yes. I think that eventually it would go to Wiseman's Ferry. Then you would take all the Macdonald River traffic as well.
2058. With regard to the line from Clyde to Rosehill;—did you make any calculation as to what rate would have paid? When we put the boats across the river to take the traffic, it was a primitive way of doing it; but every week our returns increased. We made out, I think, that we should have something like £2,000 or £3,000 a year gross, but there was really nothing to boast about. The Government, having their own appliances, could, by charging a fair price, increase the revenue in every way.
2059. You think the Government would be able to make it pay? I am sure they would.
2060. You say that if a certain section were omitted from the Act, the line would be able to pay? Yes.
2061. What rate? Four per cent.
2062. Have you any figures to show that? I do not think, on a capital of £100,000, it would pay any private person; but it is a different thing if you get it for £25,000.
2063. Do you think a daily train down there would pay at any time? Yes. Take, as an illustration, the Northern line. They started with two trains, and now look at the traffic. It is creating its own traffic.
2064. Do you think a large amount of settlement would take place if the line were in existence? I am sure it would.
2065. *Mr. O'Connor.*] Has the Rosehill Race-course Company a claim on the large platform at Rosehill? No; that is given in with this purchase, if the Government make it.
2066. Had you any special reason for carrying the railway to the river? Yes; it was upon the promise made by Sir Henry Parkes.
2067. Could you, under Bennett's Act, make terminal charges? No.
2068. How did that affect you? Materially.
2069. What caused you to extend the line to Cox's Corner? It was on the suggestion of Sir Henry Parkes.
2070. From what portion of the extension did you expect the largest increase of traffic? Rydalmere and Cox's Corner, intercepting the traffic by river.
2071. What is your opinion respecting the passenger traffic on the line? I think it could be very much improved.
2072. Before you completed the line, did you offer it for sale to the Government? Yes; we were asked to place it under offer for £50,000, and the Bank would not accept it.
2073. How long is that ago? About two years after the completion of the line.
2074. Are both sides of the platform given in with the railway? Yes.
2075. According to the evidence which has been given, one side is unfinished? Yes.
2076. How is that? We stopped that, thinking we had quite enough when we could land 50,000 to 60,000 people there. We found one platform so very expensive that we stopped making a second.
2077. How came you to experiment with boats? To get the Rydalmere traffic. It was a suggestion of Mr. Eddy's, to see what we could do in the matter.
2078. What is your opinion about that experiment? We had not the money to put on a proper punt, and we had to abandon it.
2079. Who were the contractors for the bridges across the creek? Shand & Co., I think.
2080. Was the work well done? Splendidly done.
2081. Can any of the land which was resumed for the purpose of constructing the line be sold? I think the side you refer to—the unfinished part—could be sold.
2082. What profit did you made out of the sale of the railway to the race-course? I think £25,000.

2083. What kind of land is there between Cox's Corner and Dural? Very good—all suitable for fruit-growing.
2084. Does that answer apply equally to the land at Castle Hill? It is all good at Castle Hill.
2085. Was much land taken up in anticipation of this railway? I think a good deal—more than people think.
2086. Evidence has been given to the effect that there is a large quantity of land still unoccupied;—do you think if the line were extended it would lead to its occupation? I certainly think so.
2087. What extent of land was resumed for the railway originally? Two chains; I think in some instances we had to take more.
2088. Although you as a company have been crippled financially, nevertheless if the Government purchase the line at a nominal price it can, you think, be made a payable asset to the State? Yes.
2089. *Mr. Black.*] Did I understand you to say that Sir Henry Parkes promised to purchase the line if it were completed to Carlingford? Yes; he sent an expert over it, and he considered that was a payable end to put the Rosehill line.
2090. *Mr. Hoskins.*] Did not Sir Henry Parkes say that he was favourably impressed with the line, but that he would have to obtain the approval of Parliament for its purchase? No; there was no reservation of that kind.
2091. Did he say he would buy the line? He wanted me to place it under offer for £50,000. I thought it a good thing and I at once said to the Bank, "Let us get rid of it." They replied, "We will not take less than £60,000." The matter fell through.
2092. You say that you think a large goods traffic may be carried over the line;—from what source are the goods to come, and where are they to be taken? First of all, the terminus one way would be Clyde. You have Hudson Brothers, Brunton's, and the population round there. The Parramatta River would be a feeder to it. Brunton's cargoes of wheat would come there in the small craft, and would be landed and put into his mill. Then there are the fruit-growers. You have all that they produce, and then you have the return freight for what they require.
2093. Do not Brunton's get their wheat and send their flour by railway to Redfern? Yes; but how much cheaper would it be for them to get it in this way. There would be no transshipping.
2094. Then, according to your view of the matter, this line would be extensively used for carrying Brunton's flour, and would be in opposition practically to the main line at Redfern? It must take from that to a certain extent.
2095. Do you not think that the Commissioners would make charges which would favour the use of the line to Redfern instead of to the Parramatta River? I can always see the danger of having to compete with the Government, but there is another thing they do not compete with. There are four steamers carrying goods to and from Parramatta. The bulk of that could be intercepted by the Rosehill line and taken to Sydney from Rydalmere, Cox's Corner, and other places. The traffic from Parramatta to Rosehill is a mere bagatelle. It commences after you leave there.
2096. You do not expect to get any traffic from the river boats loading at your wharf? No, that is taken to the different wharfs up to as far as Ryde, but you would get it as far as Ermington.
2097. The fruit-growing district is some distance above Carlingford? No; there is a large district from Rydalmere up to Cox's Corner. Subiaco is the worst part of the land there.
2098. Has it ever occurred to you that it might be to Brunton's interest to patronise the railway in preference to the Parramatta River and the branch railway, because the Government can make favourable rates for the conveyance of their products? Undoubtedly.
2099. Do you think it is likely that the Commissioners would do anything to prejudice the receipts of the main line? If this were a Government line they would have no occasion to come into competition.
2100. How much land is there outside the Rosehill railway fence which has not been acquired by the Rosehill Race-course Company, but which originally belonged to you, and which is unsold? About 10 acres.
2101. Yourself or the New Zealand Bank sold a good deal of land in allotments about the Rosehill Race-course? Yes; but that is not debited to the railway. It is a distinct account.
2102. Do you think, if the Government acquired this railway and worked it, that that 10 acres of land could be sold advantageously? I do not think it is included with the railway.
2103. But do you think that the Bank could sell it advantageously, and by selling it contribute to the traffic of the railway? Undoubtedly.
2104. Is not there some portion of Parramatta out towards the Rosehill Race-course where the people have purchased land;—and would it not be more convenient for them to go over the railway in question? Yes; you would get a good deal of the Harris Park and the Elizabeth Farm traffic.
2105. *Mr. Humphery.*] We have been told that the average earnings of the Rosehill railway in goods traffic during the past ten years have been £30 a year;—how do you think it would be possible to so increase those earnings as to give your estimate of 10 per cent.? I do not look upon that £30 as anything. I think you will see at once that that £30 must have left almost a loss. There was no attempt to force traffic that did not pay.
2106. You say the railway should earn 10 per cent.;—how could the Government increase the goods-traffic on the line to bring up the earnings to your estimate? I take the passengers as well. For instance, you would have two stations between Clyde and the Parramatta River. You would intercept a lot of the traffic which goes to Parramatta and Harris Park.
2107. The earnings of one line would be lessened to increase the earnings of the other? You have a very large flat for occupation, and it would be occupied if you had facilities for people getting to town. You would be astonished at the population around that district which would use the railway. I think the Rosehill people alone would induce more traffic. Then you come to the people at Rydalmere who are almost entirely dependent on the river.
2108. Your view is that the line would come into more general use than it does at present? At present it is a dead letter.
2109. Why should it not be used to a larger extent than it is at the present time? Because it does not pay.
2110. If by running more frequent trains it would pay, why is it that they have not been run more frequently? Because the Government takes the lion's share. The Government has its own rolling-stock, and if it possessed this line it would make its own arrangements.

J. Bennett.
1 Feb, 1893.

- J. Bennett. 2111. What portion of the passenger rates did the company receive? 6d. for first-class, and 3d. for second-class passengers.
- 1 Feb., 1898. 2112. What is the length of the line? About 2 miles.
2113. Is not that a very high charge, compared with the charges which prevail at the present time? That is the trouble on a small line of railway.
2114. Have you not been complaining that you were not allowed to charge enough? Yes.
2115. And now you say you have charged far too much in proportion to the length of the line? This is allowed from Sydney to Rosehill. There is a very large traffic on race-days and other days.
2116. But you get 6d. for every passenger carried to Rosehill? Yes—that is, 6d. out of 2s. 6d.
2117. But did not the 2s. 6d. include admission to the race-course? No; there was a charge of 10s. for the course.
2118. Did every person visiting the course have to pay 10s.? Yes, in the best part, and 5s. elsewhere. One part of the flat is free. Admission to the flat is included in the railway ticket, and you receive 6d. from the first, and 3d. from the second-class passengers.
2119. How could it pay the Government to carry at a lesser rate than that, when it did not pay you? Because the line was not used often enough. Of course, it would pay handsomely if you could use it two or three times a week, instead of once in six weeks.
2120. Does not that mean that at the present time there would not be sufficient traffic to make it profitable to run the line? There would be sufficient traffic to run on the line twice a day.
2121. Where would the earnings come from, assuming there were to be a service of that character? The big returns would come at present from Rydalmere to Sydney, both in goods and in passengers.
2122. Where would they get into the Rosehill train? At the first station—the main road beyond Subiaco—which is $\frac{1}{2}$ mile from the Rydalmere Town Hall.
2123. Have you any statistics to show what the probable traffic would be? I spent two weeks over it, and gave all the information to Mr. Chapman. I do not think I have been to the Bank for three or four months, so that I have to give my evidence from memory.
2124. Your contention is that there would be a large new traffic coming to the Rosehill Race-course—that is to say, a traffic which at present goes by steamer? Yes.
2125. Therefore, the use of the Rosehill line would not diminish the earnings of the Parramatta line? No.
2126. *Mr. Trickett.*] I suppose you are aware that Rosehill is under the regulations of the A.J.C., and they have to sanction any extra racing? They apportion the days of racing.
2127. The 16th Section of Bennett's Railway Act provides that you are to make by-laws and regulations with regard to the railway;—do you know whether any were made? Yes, and printed.
2128. When? Before we ran the first tram.
2129. *Chairman.*] The railway was constructed subsequently to obtaining the Bill? Yes.
2130. How is it that you did not discover, before constructing it, that the rates were unsatisfactory? One was theory and the other practice. We never noticed it until we came to put it into practice, and then we were completely blocked. I may say that at that time the A.J.C. were not so despotic, and we got twice the number of race-days.
2131. You thought, when you constructed the line, that it would be taken over subsequently? Yes; otherwise we should not have touched it.
2132. Why did you decide to make your terminus at Carlingford? Because there is a large district around there, which the line must benefit.

Thomas Moxham, Mayor of Parramatta, sworn, and examined:—

- F. Moxham. 2133. *Mr. Lee.*] Are you acquainted with the route of the proposed line? Yes.
- 1 Feb., 1898. 2134. Are you aware that some years ago a survey was made from the western line from Westmead to Dural? Yes.
2135. Also, that there was a temporary survey for a tramway from the Parramatta Railway Station, Windsor Road, to Dural? Yes.
2136. Of the three routes which do you favour? The route starting from Parramatta.
2137. Do you think there is any necessity to take a railway through that country? Most decidedly.
2138. Then you are here to advocate the extension by way of Parramatta? Yes.
2139. We should be glad to hear your views? First of all, I consider Parramatta is really the capital of the Hills district, and a line starting from there to Dural would about equally divide the distance between the Northern line and the Richmond line. There is country out there which is unsurpassed for producing citrus fruits. There is a large quantity of land which is not put to the use to which it should be put, on account of the inconvenience and loss of time in getting to the market. At present there is a serious loss to those who follow the raising of fruit in summer-time, owing to the long distance they have to cart it to market. In many instances it is better to allow it to go to waste than to bring it to market.
2140. Are you a native of the district? Yes, of Parramatta.
2141. Have you seen the progress of the fruit-growing district during the last fifteen or twenty years? Yes.
2142. Do you think the fruit-growers, situated as they are, are served as well as they could be served for getting their fruit to market? Certainly not.
2143. Have you ever seen the roads beyond Pennant Hills impassable in bad weather? Almost impassable—in such a state that I would not like to drive a load of fruit over them.
2144. I suppose the fruit is conveyed in drays and spring-carts? Mostly in spring-carts—lorries are being used now; but it is only since the road has been macadamised to Hornsby.
2145. Do you advocate the extension more from a Parramatta point of view than in the interests of the orchardists? I think it would be in the interests of the country.
2146. The line to Carlingford is already constructed, and it is a long way out towards Dural? I think you will agree with me that the present starting-point from Parramatta to Dural would be no further than from the present terminus to Dural. That being so, I claim that if the line were not already constructed there would be no opposition at all to the line from Parramatta; and if that is so, I do not think that Parramatta, with 9,000 inhabitants and a sunken capital of £1,500,000, should be made to suffer because some private individuals have constructed a line which they are anxious to get rid of. I do not think it is fair to Parramatta, because this line has been constructed, that Parramatta should be made to suffer by taking it over.

2147. In what respect would Parramatta suffer if the line were made? We would lose a large trade which rightly belongs to Parramatta and which it now receives. Further, the portions which are quite as much entitled to railway communication—between Parramatta and Dural—would not be touched if this line were continued, except by a branch line, which would cost a considerable amount of money. T. Moxham.
1 Feb., 1898.

2148. The traffic Parramatta at present receives is the dray traffic? Yes.

2149. But if a line were made from Parramatta over the route indicated, would not you lose that traffic also? It is just questionable.

2150. If it came in by tram to the main line the town would lose it? But we would bring the producer into town.

2151. In any case when the fruit reaches Parramatta it comes by train to Sydney—do you not think that the people would pass beyond Parramatta to do their business? No; the business connection with Parramatta and the hills at the present time is so interwoven that I do not think that the people would break it away.

2152. Supposing the line is made, would not the length prevent the possibility of much residential settlement? I think the opposite. I think the facilities for getting there would be quite sufficient to enable us to say that there would be a large residential population springing up there on account of the healthy condition of the hills.

2153. But the people who would go there would be chiefly city people? Perhaps so.

2154. And would not the distance by way of Parramatta be too great? In many instances they go to the Mountains now, and it would be a lesser distance than to the Mountains.

2155. Do you advocate a tramway through the town or a railway by way of Westmead? I prefer to see a tramway through Parramatta, along O'Connell-street, in front of the gaol, up the centre of the road, up to Baulkham Hills.

2156. You are aware that it would not be possible to run a tramway the whole of the distance to Dural on account of the heavy grades? That is so. A population has sprung up so quickly that we can only anticipate that if it goes on that township itself will be entitled to consideration, and if the line is constructed it should be constructed from Parramatta.

2157. Do you think a line in that direction will serve the greater number of people;—would it not be on the outskirts of Carlingford, Pennant Hills, Dural, and those places? I think a line from Parramatta will serve the greatest number, inasmuch as the present Northern line is a feeder to a large extent. They are at present supplied with a line, whilst those people who have been the pioneers in establishing the citrus fruits are to be passed by.

2158. Have you gone into the financial aspect of the question? Yes; the Committee went into it carefully.

2159. Were you associated with Mr. Wright? Yes.

2160. Are you aware of the nature of the figures supplied to the Committee by him? To some extent, I am.

2161. Can you say whether Mr. Wright's figures are correct? The Committee endeavoured to keep the charges down as much as possible, in order that it might be seen that we were honestly disposed in compiling them. I think we rather under-estimated.

2162. What is your opinion of the possible expansion of fruit-growing in that district? I would expect with railway communication a difference of four times the quantity of land at present bearing fruit.

2163. Would not the supply be in excess of the demand? We are endeavouring every year to find fresh markets, and they will be found. At present the importation of Italian lemons and Californian oranges into the city is very large, notwithstanding the local supply.

2164. Have you noticed that there has been a steady and continuous increase in the development of the fruit-trade of that district? That is so. Of course if we were to attempt to raise fruit as we did in the old days it would not pay. It is only because of the different methods adopted that we are able to do so well.

2165. You are aware that the growers have suffered from bad seasons, pests, and so on, which have made fruit-growing, for the time being, unprofitable? That is so.

2166. In spite of that, do you think the fruit-growers on the hills are able to grow fruit at the prices ruling and make a living out of it? Decidedly. I think it is prolific. We ourselves have only completed laying out about 70 acres for an orchard.

2167. Are there many old residents there who first took up the business under the difficulties which existed? Yes.

2168. Is it not a fact that their sons and relatives have remained in the district and followed the same occupation? That is so in nearly every case.

2169. Do you look upon the district as being fairly well off, or do you look upon the settlers as living from hand to mouth? I do not think there is any more comfortable class in New South Wales than the fruit-growers of Central Cumberland. I think it is the most certain means of getting a sure living, and a free, independent living.

2170. You have noticed no appearance of the industry going back? No; we have certain failures, of course, but I think the industry is going ahead.

2171. I suppose it will be next to impossible for outside countries to compete with you in summer or stone fruits, because they are of a delicate nature and must be got into the market very quickly? Yes.

2172. What you have to contend with is the importation of citrus fruit? Yes, and with proper care and storage we will be able to compete against that.

2173. Are you of opinion that if the estimate is 360,000 cases of fruit a year, in ten years' time it is likely to be doubled? I should think more than that. There is a constant looking after orchard property, and a constant extension every year.

2174. And the virgin land is there? Yes, and almost every man with an orchard endeavours to enlarge it year by year.

2175. You are of opinion that the district would be better served in a general way if a line were taken direct from Parramatta? Yes; I should look upon it as a cruelty to the people of the hills if the Rosehill extension were gone on with in preference to an extension from Parramatta. Supposing both points were equal, I think the number of people in Parramatta should be sufficient to weigh with the Committee in favour of the Parramatta route. Independently altogether of that, however, Parramatta has a prior and first

T Moxham. first claim, inasmuch as that route will serve a greater number of people and open up better country and more of it than the other line can possibly do. The other line will certainly rob the Northern line to a very large extent.
1 Feb., 1898.

2176. In any case, a line going out to that district must rob the Northern line? To some extent; but a line through Parramatta will not rob it to the same extent as the Rosehill line.

2177. Do you think the increased traffic brought in would more than compensate the Northern line for its loss? Much more.

2178. You seem to take it for granted that tramway communication from Parramatta will be possible? Yes; I think so. I know there are some steep grades, but I do not think they are so bad that the engineers will not be able to get over them.

2179. At the present time the freight on fruit from Parramatta to Sydney is 1d. per case? Up to twelve cases. If you send less than twelve cases it will be 1s. all the same.

2180. If the line were taken from Parramatta to Dural, what could the Dural people pay from there to Parramatta? They could afford to pay what they pay now by road. They could not think of delivering their fruit to the nearest point under 3d. per case.

2181. Do you think it probable that the Dural people would be satisfied to pay 3d. a case from there to Parramatta, whilst they could get it from parts along the line to the main Northern line, from which point it would be carried at 1d. per case? They certainly would take the cheapest mode, all things being equal; but it must be remembered that getting the fruit speedily and fresh into the city of Sydney, means an additional freight. You might get a wire, for instance, to say that the market in oranges had gone up, in which case it would pay them to incur additional cost in getting their fruit to market. If the people of Dural get their fruit to market at a certain cost, it is only at a great cost to the Colony of New South Wales, inasmuch as the road from Galston to Hornsby has cost the Colony £30,000 or £40,000 to construct.

2182. If the line were run out, the people would still have to load up and convey their produce from their orchards to the line;—therefore do you not think the rate of 3d. per case would be too high? I do not advocate a sum of 3d.; but it would be as fair for them to pay 3d. to the Government as it would be to spend it on the road.

2183. Do you think a charge of 1d. to 1½d. per case from Dural to Parramatta could be depended upon? I think that would be extraordinarily cheap. I think 2d. would be fair to the Government and to the grower. I do not think any grower would object to pay 2d.

2184. Has there been any public meeting in Parramatta with regard to the matter? Yes; from time to time. We have had one recently. I should like to make reference to the evidence of Mr. Brodie. Meetings have been held at Parramatta and Castle Hill. The whole of these meetings were held in 1890. On May 12 a large meeting was held at Castle Hill. Mr. J. C. Hunt moved for a line from Westmead to Dural; Mr. Brodie, in seconding it, said he was very strongly impressed with the necessity of constructing a line which should branch from Parramatta. Two days earlier—on May 10—a large meeting was held in the Parramatta Town-hall in favour of a line from Parramatta to Dural. Mr. Brodie then moved that a petition be forwarded to the Minister in which the following words occur: "That this meeting is of opinion that it is desirable that residents of Castle Hill and Dural should have railway communication with Parramatta, and pledges itself to urge upon the Government the construction of a line of railway connecting those places with Parramatta." In the course of his remarks he spoke strongly against the proposal for a line from Rydalmere or Rosehill, and urged the adoption of the petition of the meeting. At a meeting on 2nd July, Mr. Brodie spoke strongly in the same terms, advocating the Parramatta line. That is the Mr. Brodie who gave evidence before this Committee.

2185. *Mr. Farnell.*] Was not that prior to the construction of this line? I think not.

2186. *Mr. Lee.*] What other points do you wish to bring before us? I think the line should go further even than Dural; it should touch the Northern line at Singleton. The country people would be saved a distance of 49 miles travelling, which would mean a lesser cost in the transit of goods, and enable the people to get quickly to market.

2187. That would apply to any route either by way of Parramatta or Westmead? That is so. We have splendid land along the Macdonald River, also at Putty and Wollombi. In addition to the carriage of fruit, some weight should be given to the different materials which the Parramatta district could supply. For instance, we ourselves would run a tramway into our freestone quarries, which would convey at least 3,000 tons of stone per year.

2188. Where is the quarry situated? Two miles from the Parramatta Railway Station, on the Windsor road, about a mile on the other side of Murray's Hill. In addition to that large output, we could expect increased traffic. Further on, again, on this side of the Public School, we have a white-metal quarry which is being opened-up, and is producing first-class material; but unfortunately the carriage is so far that we are shut out from the market. Further on, again, we have another white-metal quarry on Government land which, for the same reason, cannot be utilised. We have three quarries there, which under ordinary conditions would mean a large output on the railway. We ourselves would send at least 3,000 tons of stone away every year. At the present time we have to cart a great portion of that stone to Rookwood, a distance of 8 miles. If the line passed our quarries, instead of costing us 6s. or 10s. a ton, we could get it landed in the yards at Rookwood for about 2s. 6d. a ton.

2189. Then of course it would have to travel over the main line? Yes, which it never sees at the present time.

2190. Would it be possible to run railway rolling-stock over the tramway? If it will not carry 6 tons of stone it will not carry 6 tons of fruit.

2191. But unless the rolling stock is common to both the line and the tramway, it will necessitate transshipment at the Parramatta station? You will have to run rolling stock to meet the requirements.

2192. *Mr. Farnell.*] Did you mention about the stock coming from Kellyville? That has a great future.

2193. You know the proposed route of both the tramway and railway from Parramatta and Westmead to Dural? Yes.

2194. Do you know how close the nearest point would be from the centre of Kellyville? No; The proposed line is closer to Kellyville than either of the others.

2195. You do not advocate a branch to Kellyville? It would be too costly.

2196. Supposing it is practicable for the rolling stock used on the tramway to be used on the main line, do you think a tramway of that description would meet the requirements of the district? I do.

2197.

2197. *Chairman.*] You think fruits deteriorate by road carriage? In wet weather, when the roads are bad, the summer fruit is to a great extent deteriorated.

2198. Do you believe that, generally speaking, a grower would give 3d. to have the fruit taken away by rail, whereas he would not be prepared to give more than 1½d. to have it taken away by cart? It would pay him better to give 3d. to have it taken by rail than to have it carted free. At the present time the inconvenience to the people at Kellyville and Dural is so great that many of them have to leave home in the middle of the night to get to market by 5 o'clock in the morning.

T. Moxham.
1 Feb., 1898.

WEDNESDAY, 2 FEBRUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

2199. *Chairman.*] You are aware of the points upon which the Committee desire information? Yes. I wish to add to my evidence two statements showing the lengths of each description of land passed through by the Westmead to Dural railway and the Parramatta to Dural tramway. They are as follows:—

H. Deane.
2 Feb., 1898.

WESTMEAD TO DURAL RAILWAY.

Roads	20½	chains or	2·32	per cent.
Bush land	193½	”	22·06	”
Orchards	208½	”	23·75	”
Grass land	362½	”	41·29	”
Cultivation (other than orchards)	37½	”	4·25	”
Crown land	55½	”	6·33	”
	877·0	”	100·00	”

Total lengths—10 miles 77 chains.

PARRAMATTA TO DURAL TRAMWAY.

No. 1. Grades 1 in 25 and 1 in 50.

Streets and roads	8 miles 12 chains or	66·9	per cent.
Town property	0 ” ’09	”	1·0
Bush land	0 ” ’61	”	6·3
Orchards	1 ” ’07	”	9·0
Grass land	1 ” ’55	”	13·8
Cultivation (other than orchards)	0 ” ’30	”	3·0
	12 ” 14	”	100·0

No. 2. Grades 1 in 20 and 1 in 30.

Streets and roads	9 miles 33 chains or	77·5	”
Town property	0 ” ’09	”	1·0
Bush land	0 ” ’34	”	3·5
Orchards	1 ” ’16	”	9·8
Grass land	0 ” ’51	”	5·3
Cultivation (other than orchards)	0 ” ’29	”	2·9
	12 ” 12	”	100·0

With reference to the question of making a deviation from Carlingford to pass through Castle Hill, I might say that that is quite impossible. The present line follows a spur or ridge, and when you leave it, to the right or left, you get into unmanageable ground—the ground falls away too much. I was asked on a previous occasion to state what the saving of cost would be by the use of sharper curves. On the Camden tramway there is a curve of 5 chains radius. There were several, but they have all been cut out but one. Some time ago I had an estimate got out of the effect which would be produced on the Dural railway line by adopting 6-chain curves. It would mean a saving of £1,200 per mile; the aggregate saving would be £10,800. Six-chain curves are undesirable; at the same time most of the rolling-stock would go round them. We have a number of engines—the suburban engines, for instance—which would go round a 6-chain curve, but I do not recommend it. Five-chain curves would not be unworkable, as shown by the example of the Camden tramway, but they have much less to recommend them.

2200. *Mr. Hoskins.*] Where is there a 5-chain curve on the Camden tramway? Near to Campbelltown.

2201. *Chairman.*] Is the 6-chain curve the least permissible? I should not like to say that. I should say, from the example of the Camden tramway, that 5-chain curves would be workable.

2202. But there is a difference between workable and desirable? I should say that less than 10 chains for a railway is undesirable. We have, or had, 8-chain curves on the Mountains, and most of them have been cut out, and 12, 14, and 16-chain curves substituted.

2203.

H. Deane.
2 Feb., 1898.

2203. *Mr. Hoskins.*] The goods trucks have straight axles, as a rule, and are therefore difficult to work around curves? Yes, they do not turn readily, and a 6-chain or 5-chain curve would be most objectionable on an ordinary railway. A 10-chain curve is objectionable where there is express traffic to work.

2204. If a 6-chain curve were objectionable on a railway, would it not be much more so on a tramway, which is generally a rougher road than a railway, and which cannot be kept in such good order? I do not see that there is any objection on that account; the tramways are kept in good order.

2205. With the ordinary road traffic going over it? Yes; you can keep a country tramway in as good order as a railway. There is a difficulty about keeping the tramways in the streets in good order, because you have the surface of the street to take up every time you want to lift the road; but a country tramway which is off the traffic road is as easy to keep in order as a railway.

2206. *Chairman.*] If you put in any sharp curves you cannot expect to get the speed on your lines which you would get with easier curves? That is so. I would add that if 5-chain curves could be substituted instead of 10 the saving would, roughly speaking, be about £300 per mile greater, so that the saving in total cost would be £13,500. I should like to add that, in my opinion, it would be a great mistake to try and effect a saving in that way. My estimate only applies to the cost of construction. The resumption would also probably be somewhat less; but without making a detailed survey and careful estimate it is impossible to say exactly. With a line having the grades proposed, and 5-chain curves, you would still be a good way off from the cheapness of a tramway which has steep grades, and follows pretty nearly the course of the road, and thus avoids resumptions. I do not think the lessening in the cost of resumption would be so very great merely from the adoption of the 5-chain curves. It would be something, but not very large. With regard to the Camden tramway, which I was asked to give some information upon, I find that the ruling grade is 1 in 19 in one direction, and 1 in 20 in the other. It is 1 in 20 rising from Campbelltown, and 1 in 19 falling from the crest of the hill down towards Camden. I am not quite sure which curve has been left, but I think it is the second curve at the top of the hill, between the aqueduct and the main Southern line. There is a good deal of information about the construction of the Camden tramway and the working of it, in the inquiries of the Public Works Committee regarding the Culcairn to Corowa line, pages 13 and 16, and the Goulburn to Crookwell line, page 47.

2207. *Mr. Hoskins.*] You have told us you could make a line at a cheaper rate with a 5-chain radius;—but would not that be at the expense of haulage? There is a little more resistance on the sharp curves; but where the curves are regulated so as not to be on the steepest grade they make very little difference. If you have a sharp curve, it is a short one; if you have a flatter curve, it is a long one. The resistance of curves is shown to be very nearly in proportion to the curvature, and as the length of the curve would be inversely in proportion to the curvature the total resistance would be approximately the same. The work done on the Camden tramway is this: The engines that are used there will drag up three "D" trucks; but the ordinary load, as allowed by the Railway Commissioners' regulations, is to carry a passenger car and two "D" trucks. A "D" truck weighs about 4 tons, and carries from 6 to 8 tons.

2208. *Chairman.*] What would two "D" trucks fully loaded weigh? About 24 tons. The engine on that line is a tank-engine—a sort of superior tramway motor.

2209. What would its power be in comparison with one of our ordinary tramway motors? The Camden engine would do about 50 per cent. more than the Sydney tramway motors. It would be quite possible to have stronger engines. When the Camden tramway was first laid it was laid with 40-lb. rails, and recently the Railway Commissioners have had the road re-laid with 60-lb rails, so that it is capable of carrying as heavy traffic—that is to say, the road is strong enough to carry as heavy traffic—as is carried on the country branch lines.

2210. Therefore, if you required to double the number of "D" trucks, you could put an engine on capable of carrying them? Yes.

2211. Has your estimate of cost between Carlingford and Dural been made with the same weight of rails? Yes; 60-lb. rails.

2212. What grade have you from Carlingford to Dural? One in 35 on Simpson's line, and 1 in 40 beyond.

2213. Do you see any advantage in reducing that? No; there would be no real advantage.

2214. The saving in the initial cost would be too dearly paid for in the subsequent cost of working? That is so, and you would have a very ugly, humpy line, which would be very awkward to work, and the saving after all would be comparatively small.

2215. It is possible to extend the line from Carlingford to Dural with the same grades which you propose, but making the curves 5-chain curves at a lessening in the total cost of £13,500, and on this line it will be possible to put an engine which would be able to deal with any trade which would be likely to come to Dural? Yes; I do not think there is any doubt about that. Of course, the district is not capable of indefinite development.

2216. What speed would you get on the line? I do not think it ought to exceed 15 miles an hour.

2217. With regard to the saving in resumption, you are not prepared to express an opinion excepting that it will be a little less with a 5-chain curve? Yes.

2218. *Mr. Hoskins.*] What is the sharpest curve in the original estimate of the Dural railway? I think 10 chains was the limit.

2219. *Chairman.*] You might make a statement in general terms, giving a comparison between the Camden tram line and this? The class of country is very different. The soil is somewhat similar, but the country is much rougher between the Parramatta River and Dural. There are long stretches of flat on the Camden line. It is a tolerably level country which lends itself to good grades, a condition that is almost entirely absent from the Rosehill to Dural line.

2220. If you made a tramway with a 5-chain curve could you take your "D" trucks up? Yes.

2221. But you would not effect a saving? If you have 5-chain curves you can get the four-wheeled trucks over the line, but you cannot cut down the expenditure below a certain figure.

2222. Any lessening of the 5-chain curves means transshipment where it reaches the main line? Yes; it means manipulation of some kind.

2223. Are we justified in believing that £13,500 is the extreme amount which you can take off the cost of construction if the rolling-stock which goes to Dural has also to go to Sydney? Yes.

2224. Is this a reasonable inference—the distance from Carlingford to Dural being 9 miles, and the distance from Parramatta to Dural being 12 miles, the cost of the tramway from Parramatta to Dural being

being £29,000, therefore the cost of a tramway from Carlingford to Dural would be £22,000? No; I should not like to undertake to make a tramway from Carlingford to Dural at the same rate per mile as from Parramatta to Dural. I think a tramway from Carlingford to Dural on the same lines as the Parramatta to Dural tramway would certainly cost £3,000 per mile, that is £27,000.

H. Deane.

2 Feb., 1898.

2225. To all intents and purposes it would be as expensive to get from Carlingford to Dural with a tram as from Parramatta to Dural with a tram? Yes, within £2,000 difference; that is for construction alone.

2226. And is it not probable that you would have larger deviations between Carlingford and Dural than between Parramatta and Dural? There is no doubt about it, because the country is more uneven.

2227. Therefore the deviations and severance would make up the £2,000 which you particularise? I think it is very likely.

2228. *Mr. Lee.*] With regard to the estimate of the cost of the tramway from Parramatta to Dural, was that tramway to carry tramway rolling-stock only, and thus necessitate transshipment to the main line? Yes.

2229. That tramway would not carry ordinary rolling-stock? No; on account of the curves chiefly.

2230. Could the Parramatta tramway be altered to a 5-chain curve without necessitating very much larger resumptions? No. You would get into larger resumptions, and you would have much difficulty on that account, especially in the town.

2231. Would you be able to adopt the route as shown on the town maps? The curves in the town, instead of avoiding a good deal of resumptions, as they do, would cost a great deal.

2232. But that tramway, as designed, is intended to carry tramway rolling-stock only, which means that there must be a transshipment on to the railway trucks at the junction? Yes; it means that the tramway rolling-stock could not run on the main line.

2233. The reason why the ordinary railway rolling-stock could not be run on that tramway line is the sharp curves? Yes.

2234. But if it were devoid of curves, like the Camden line, the railway stock could be run upon it? Yes.

2235. *Mr. Hoskins.*] What would be the difference in the estimated cost of a tramway from Parramatta to Dural if you laid out a tram-road which would carry the ordinary rolling-stock? If I had to consider that question I should follow an entirely different route, because it will be undesirable to bring trains like that through the streets of Parramatta. In any case, I think the most convenient way of carrying traffic of that class would be to carry it along the route of the Westmead to Dural line. That has been laid out with 10-chain curves, and was estimated to cost £57,000. If you reduce the 10-chain curves to 5-chain curves, as in the case of the Carlingford to Dural line, you will get probably the same proportionate reduction. I should suppose, without going into the matter any further, that as the £57,000, the cost of the Rosehill to Dural line, can be reduced by £13,500 if you put in 5-chain curves, the Westmead to Dural line could be reduced to the same extent; but without going into the question in detail, I should not like to say so definitely.

2236. Would not there be a larger resumption of private land on the Westmead to Dural line than on the other? I am rather doubtful whether there would. The line is longer, but at the start from Westmead it goes through a good lot of Crown property, and further on, after passing the first hill, the country is not so rugged as on the other route, and probably the line could be kept nearer the road, and so avoid a good deal of resumption.

2237. *Chairman.*] Is the minimum cost of the construction of a railway from Westmead to Dural, upon which rolling-stock suitable for utilisation on the main line could travel, £44,000? Yes.

2238. What would be the cheapest cost of a line from Carlingford to Dural? About the same thing. I believe that is how it would work out; but I wish the Committee to understand that it is a rough estimate—rather a guess than otherwise.

2239. *Mr. Hoskins.*] In respect of the 3-chain tramway which you say would have to go through the streets of Parramatta, would it not have to cross the river by a bridge? Yes; we should have to build a new bridge.

2240. What would that cost? About £1,700 for a tramway.

2241. *Mr. Lee.*] Is that included in your estimate? Yes.

2242. *Chairman.*] To make any running-road on which the rolling-stock could go right through from Sydney to Dural, you cannot approach Dural under £44,000, and it would cost pretty much the same amount to go to Carlingford? Yes.

2243. Would Westmead be the cheapest approach if 5-chain curves were to be made? Yes. If you adopt 5-chains through the town you have a good deal of resumption; you cut off a good many corners.

2244. *Mr. Lee.*] What would be the estimated cost of the line from Parramatta to Dural constructed precisely on the same lines as you would construct one for £44,000 from Westmead to Dural? It would be a good deal more than £44,000, because you would have to junction with the main line.

2245. You have told us what the cost would be from Westmead to Dural;—what would be the cost of a line of precisely the same character from Parramatta to Dural—that is, a line with 5-chain curves? You cannot do it at all if you have the same grades; you cannot get up to the railway station. The tramway through Parramatta has steeper grades than the Westmead railway—1 in 25.

2246. Would that be prohibitory—you have 1 in 19 on the Camden line? Yes; but if you put it on the same lines exactly with Westmead, if you want the steep grades, I suppose it can be done, only you would have considerable amounts for resumption. You would have to cut off corners in the town.

2247. Do you think it would exceed £44,000 exclusive of resumptions? No; I daresay it would not.

2248. *Chairman.*] Do you think you could get out of Parramatta with a line such as you suggest? If you adopted the steeper grade you could get down Taylor-street. You would have some resumption there, and some houses to pull down. You might go along Macquarie-street until you got to O'Connell-street and then turn round and go straight ahead. You would have heavier resumptions further on again, and you would have considerably more works than you would have on the tramway to carry the heavier rolling-stock and to preserve the flatness of the curves.

2249. *Mr. Lee.*] It appears from the estimate of the land required that for the tramway purposes only about 1 per cent. of the length of the line would be resumed? Yes.

2250. How could that be so largely increased if you went for a line which gave you a 5-chain curve? I think it is clear that if you have to put flatter curves at the corners you will run very considerably into property.

2251.

H. Deane. 2251. Along the proposed tramway route there is 66·9 per cent. of the route which would be over streets and roads, whereas on the Carlingford extension there would be resumed land the whole of the distance;—you do not favour any extension from Parramatta—either tramway or railway? I am only describing engineering features of the different schemes. I am not making any recommendation. I have endeavoured to show the advantages and disadvantages of each.

2 Feb., 1898.

2252. *Chairman.*] The two lines, one starting from Parramatta and the other from Westmead, become practically the same $1\frac{1}{2}$ miles out of Parramatta;—what you did, in searching for a railway to Dural, was to go to Westmead, utilising the western line for a mile or so, and then turning due north to save resumptions? The thin red line on the map shows the position of the tramway, following generally the main road; but the line from Westmead, as shown in the thick dotted line, is not on the road at all. You have to keep off the road in order to get the curves and grades desirable for a railway. If you want to adapt the route of the Parramatta tramway to the railway rolling-stock by putting in 5-chain curves—still adopting the same grades—you would not adhere to the road, as you would with a tramway. You could follow the road in places where it does not curve very much, and so avoid a good deal of resumption, but you would not be able to get away from resumption almost entirely, as you do with the tramway.

2253. *Mr. Lee.*] In other words, you would be compelled to leave the road for grade purposes at more points than you would with a tramway, and that would mean increased resumptions? Yes. I should like to refer the Committee to the 1887 Report of the Railway Commissioners, pages 80 and 120, and to the Supplementary Report, 1887–8, published, I think, in October, 1888, page 17. Under Mr. Goodchap, the Camden line always appeared in the Railway Reports as the Camden tramway; it was treated separately. Up to 1888 a profit was shown on the working of the tramway. Since the Railways Act of 1888 came into force, the Commissioners have incorporated the Camden line into the Southern system, and I understand that not only has there been considerable expenditure in the way of improvements on to the line, adding to the capital, but that the rates have been lowered, so that were a separate report made of the Camden working at the present time, it would not show the profit which was shown in the time of the late Mr. Goodchap. I understand that there used to be special rates, and Mr. Goodchap showed a profit on working, in 1888, of something over 4 per cent., but I am informed that now there is no such profit. The rates having been reduced, and the interest on capital expenditure having increased, there is now a loss in working. The other point I wish to mention has reference to the Rosehill to Carlingford lines. I have calculated the value of the present line—that is the Rosehill line and Simpson's line—in round figures at £42,000. That is to say, in my opinion, the works could be constructed, as they stand at present, for about that amount. They have, no doubt, cost more, especially at the Rosehill end. My estimate does not include resumption. I was asked a question as to the value of the materials to be removed; it would be very little. I put down the rails and fastenings on the Simpson's railway at £1,650 to move; sleepers, £495; and other materials about £500; a total of £2,645. Then there is the bridge to consider. If that bridge had to be removed there would be a lot of waste, because the piers and the abutments would be useless. The best thing to do, I think, would be to convert it into a road bridge. The value of the materials which could be removed would probably not be more than £1,800.

2254. Is there any need for a road bridge there? I do not think there is much demand for it.

2255. *Mr. Black.*] What did the O'Connell-street bridge cost? About £3,000, I believe.

2256. Did I understand you to say it would not carry a light railway? Yes; it was not designed for a railway.

2257. Would it cost much to strengthen it so that it would carry a railway? It is too narrow for a railway.

2258. What would it cost to widen it? It would cost as much as to build a new bridge.

2259. *Chairman.*] You have told us that the Simpson's railway bridge will carry traffic;—do you desire to modify that statement? I said I should want to stiffen the bridge up before it carried traffic.

2260. What does the stiffening process mean? The expenditure of a few hundred pounds.

2261. Do you know where the Pennant Hills quarries are? Yes.

2262. Can you express an opinion with regard to the cost of making railway connection with them? I have seen what Mr. Walter Smith has said about the matter. I think, probably, the railway could be carried out for the amount which he mentioned—that is, simply the railway connection. He has not provided for any extra sidings; but that would not amount to very much.

William Edwin Tunks, Land Valuation Branch, Department of Public Works, sworn, and examined:—

W. E. Tunks

2 Feb., 1898.

2263. *Chairman.*] You were asked to find the cost of resumption of the land on the railway route from Carlingford to Dural? I have inspected the land from beginning to end. I find there are twenty-nine blocks of orchard taken, containing an area of 69 acres 3 roods 19 perches. There are thirty-two blocks of cleared land ready for the plough taken, containing an area of 70 acres 3 roods 26 perches. There are six blocks of unimproved land, containing an area of 18 acres 0 roods 29 perches. That means sixty-seven blocks altogether, containing an area of 156 acres 3 roods 34 perches, which I value at £7,500. Then there are buildings taken which I put down at £750; severance, £3,000; forced sale, £800; cost of transfer and conveyance, £550; that makes a total of £12,600. Against that betterment could be deducted, amounting to £2,700, making a total cost of £9,900.

2264. What width have you taken? Two chains right through, and an additional width for two stations 5 chains wide.

2265. What width has Simpson's railway taken, from Carlingford towards Clyde? I think 2 chains right through, with the exception of the station portion.

2266. If you lessen the width by one-half, does it mean that all your items remain the same with the exception of the £7,500, which could be lessened by one-half? Yes.

2267. In other words, instead of the resumptions being about £10,000, we might reduce it to between £6,000 and £7,000 if we had it 1 chain wide instead of 2? Exactly so.

THURSDAY, 3 FEBRUARY, 1898.

Present:—

THOMAS THOMSON, EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and further examined.

2268. *Chairman.*] You hand in a statement with regard to the possibility of access to the Pennant Hills Quarry? Yes, as follows:— W. A. Smith.

Department of Public Works, Sydney, 31 January, 1898. 3 Feb., 1898.

DURAL RAILWAY INQUIRY.

I have the honor to report that at the request of the Parliamentary Standing Committee on Public Works I again visited Pennant Hills Quarries on the 29th instant, with a view to ascertain the practicability of constructing a line of railway, and as an alternative a road to connect these quarries with Simpson's line at Bowman's lane crossing—2 miles 10 chains.

Railway.

A line of railway 61 chains long and presenting no engineering difficulties could be constructed with a ruling grade of 1 in 35 at an approximate cost of £2,400, added to which would be the resumption of about 5 acres of orchard land and 3 acres of bush land, which, with compensation for severance, might be put down at £900, thus bringing the total estimated cost of the line up to £3,300.

Road.

A metalled road 50 chains long with a ruling grade of 1 in 15 could be constructed with the same terminal points as the railway at a cost of £312. This low price is accounted for by Mr. Vanderstegen's offer to supply the necessary broken metal free at the quarries, but added to this would be the cost of resuming 5 acres of land which, with compensation for severance, could be put down at £300, making the total estimated cost of the road £612.

WALTER A. SMITH, M. Inst. C.E.

DETAILS OF ESTIMATES FOR RAILWAY AND ROAD CONNECTING PENNANT HILLS QUARRY WITH SIMPSON'S LINE.

<i>Railway.</i>		£	s.	d.
Formation—61 chains at £5 10s.		335	10	0
Timber bridge of 30-ft. span and approaches (say)		450	0	0
Laying road, 61 chains, at £1,600 per mile		1,220	0	0
Culverts		80	0	0
Junction with existing line		100	0	0
Fencing—488 rods at 5s.		122	0	0
Supervision and contingencies (say).....		92	10	0
		£2,400	0	0
Add for resumption and severance (say).....		900	0	0
Total		£3,300	0	0
<i>Road.</i>		£	s.	d.
Clearing—50 chains at 6s.		15	0	0
Forming—50 chains at £1		50	0	0
Culverts and approaches.....		110	0	0
Metal—1,100 cubic yards at 2s. 6d. (say).....		137	0	0
		£312	0	0
Add for resumption and severance (say).....		300	0	0
Total		£612	0	0

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

2269. *Chairman.*] Do you wish to make a further statement? Yes. The proportion of the length of the Rosehill line up to Thompson's corner to the length from Westmead is as 5½ to 8. I was asked what it would cost to construct a line from Clyde to Dural, and I stated it at between £40,000 and £50,000. I think I gave the estimate yesterday as £42,000, confirming, therefore, what I had said before. I was asked by the Committee to separate the Rosehill portion from the other, and I now supplement my evidence by saying that Mr. Simpson's portion of the railway I should put down as £27,000. That includes the bridge. I have gone roughly into the question of the cost of bringing a line similar to the Camden line to Parramatta, and the following is the result: Outside Parramatta itself the line would correspond very nearly to the location of the tramway. The substitution of 5-chain curves would make very little difference, the grades being the same—1 in 20; but from the northern boundary to Parramatta into the station it would make considerable difference, and I would add £10,500. That would be for a railway running through streets with 5-chain curves—£38,500. I have shown on the map how there would be more resumption than with a tramway because the curves would not fit in as well. H. Deane.

2270. Does it mean this—that a line such as the Camden railway going into Parramatta would, mile for mile after it reaches the boundary of Parramatta, cost £10,500 more than one going into Westmead? No, £10,500 more than a tramway. Supposing that railway, instead of being brought into Parramatta, is to be brought into Westmead I find that it would cost very little more than the tramway itself—only about £3,500. Of course the Committee understand that these are very rough estimates. The map of

H. Deane. of Parramatta shows the lines coming in. The dotted red line is the proposed Westmead to Dural railway with 1 in 40 grades and 10-chain curves. The estimated cost of that is £57,400. If those curves are reduced to 5 chains in radius, and the grades remain the same—1 in 40—the cost is reduced to £44,000. The Parramatta-Dural tramway coming on the full red line is estimated to cost £28,000. That has grades of 1 in 20, and sharp curves of 3 chains. I made a mistake yesterday—it is 2 chains in the town. If, as suggested, this tramway were made on the same lines as the Camden tramway, with 5-chain curves instead of the sharp curve shown on the map, there would be more work involved. At the outside limit of the town, where we cross the creek, a deviation would have to be made, and in crossing the Parramatta River in the town itself, O'Connell-street would have to be preserved, and a curve made round into Macquarie-street, so that there would be two bridges instead of one. There would also be some work to do at the station, and I think altogether it would be found extremely difficult to make proper arrangements at the present station. Probably some extra resumption would be required in order to put in the necessary roads and platforms. The cost of that line would, roughly speaking, be £38,500. If, instead of coming right into the town, as indicated, a line were taken along the thin red line, or somewhere near it, the cost would be very much reduced. There would be about a mile in length of the tramway which would be cut out, and the bridge over the Parramatta River in the town would also be cut out. There would be a bridge over the Toongabbie Creek, and that would be all. I reckon that such a line on the Camden railway principle, with 1 in 20 grades and 5-chain curves, could be made for about £31,500. It would junction on the Parramatta side of Westmead station. I have included in that amount a certain sum for junction arrangements.

2271. *Mr. Hoskins.*] Do you know on what route would be the largest amount of land to be resumed? I should think it would be on the Rosehill line; but I do not think that would make much difference.

2272. *Mr. Roberts.*] Having in view that 5-chain curves have been taken up on the Camden tramway, it seems hardly the correct thing to get a price for a line having 5-chain curves upon it? I think they are workable; but they are certainly objectionable. I do not recommend 5 chains; but if the district is languishing for want of a railway, it might be desirable to put them down.

2273. *Chairman.*] You have given us an estimate of £31,500 for a line with a 1 in 20 grade eastward from Westmead;—if we determine not to have a grade under 1 in 40, should we be justified in adding on, as we have in the other instance, about £14,000? £12,500 is the amount.

WEDNESDAY, 9 FEBRUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from the Terminus of the Rosehill Railway to Dural.

Robert Vernon Saddington, Secretary, Australian Kerosene Oil & Mineral Co., sworn, and examined:—

R. V. Saddington: 2274. *Chairman.*] The Committee desire to know the grades, curves, and the work you can do on the Joadja Tramway? We have a 3 ft. 6 in. gauge and curves of 5, 6, 8, and 10 chains radius. The grade is 1 in 22, 1 in 24 in several places, and a lot of 1 in 30. There are between 30 and 40 chains of 1 in 22; the other grades are short. We have a grade $1\frac{1}{2}$ mile long averaging between 1 in 24 to 1 in 30. The line is 16 miles long. The engines are 10 and 12 in. cylinders and weigh about 20 tons. We carry between 60 and 70 tons of shale to a load. Each truck carries about $2\frac{1}{2}$ tons. The trucks themselves weigh a little under 1 ton each. The gross weight of a train will be about 82 tons. On the 1 in 22 grade we have to use another engine to push the train up, but it happens that the 1 in 22 grade is near the terminus, and we sometimes take a few trucks off there. Except on this particular length the engines carry a load of from 70 to 80 tons over the greater part of the line. At the Joadja end we have a steep pull and 5-chain curves, and there we only carry seven to eight trucks at a time.

2275. Have you any passenger traffic? No. We have small passenger carriages which we put on occasionally.

2276. How long does it take you to cover the 16 miles without a load? About an hour, and one and a half hours with a full load.

2277. *Mr. Hoskins.*] Is the Joadja line at work now? Yes, but we are not very busy.

2278. *Mr. Wright.*] What is the greatest number of tons you have hauled in a day? I think we have carried 300 tons in from twelve to fourteen hours.

2279. With one engine? No, when we are busy we work with two engines. The line is not so well laid as are the Government lines. It is not metal ballasted all through. If it were better laid we could run faster, but the curves are too much for fast travelling.

2280. Presuming you were fully engaged, what would be the working expenses of a train per day? I could not say. Shale should be brought through for about 4s. a ton.

2281. What is the daily consumption of fuel? That depends on what load you carry, and how much you work the engines. When we are in full work we consume about 2 tons of coal a day.

John Charles Hunt, fruit-grower, Dural, sworn, and further examined :—

2282. *Mr. Farnell.*] You stated on a former occasion that you had obtained some information with regard to the feelings of the people in the district as to whether they would give the land on the proposed route? I have prepared a statement on the several questions asked by the Committee, and I will read it :—

J. C. Hunt.
9 Feb., 1898.

At the request of the Chairman of the Parliamentary Standing Committee on Public Works I have the honor to report on the following questions :—

- 1st. The cost of cartage of fruit from 1 to 14 miles.
- 2nd. Damage to fruit caused by cartage and loss from delay in placing it on the market.
- 3rd. The probability of the land through which the proposed railway would pass being given.

At a meeting of fruitgrowers called for the purpose of considering these questions, it was decided, from information obtained, that the cost of cartage would be for 2 miles, 1d. ; and for 14, 5d. per case. One of the growers present said that he was now paying 6d. per case for the cartage of his fruit from Kenthurst to Thornleigh—a distance of 12 miles ; and instances were given of several growers paying 5d. per case for from 7 to 8 miles.

In discussing the second question it was considered difficult to arrive at an estimate of damage done by causes named. In cases where fruit was unripe, very little damage, if any, would arise, but where fruit is packed in anything like a ripe state and fit for immediate use the damage is considerable—in many cases the fruit so packed has been found, on reaching the market, to be almost unfit for consumption. Under the present mode of transit fruit from Dural and surrounding districts is closed down for two nights and a day, and in some cases for three nights and two days before reaching the market. On this account much of the fruit is found to be damaged and brings much less than it would if it could be placed on the market the day after being pulled.

In reference to the probability of the land through which the proposed railway would pass being given, I have to report that in interviewing landowners it was found a few were willing to give their land or part of it, but in other cases the owners considered it unfair that they should be asked to give land, whilst residents who would be equally benefited would not contribute. In order to test the feeling of the district, as regards the purchasing of part of the land required, a fund for that purpose was started, and although all landowners were not waited upon, about £1,500 was promised to the fund.

It is desired to bring under the notice of the Committee the fact that there are large areas of Government land which would be enhanced in value by the construction of a railway. In the Carlingford district, and within a short distance of the proposed route, there are about 300 acres. In Dural, about 2 miles from the proposed terminus, there is an area of several hundred acres of fair orchard land. At Arcadia there are large tracts of land suitable for orchards. Part of this land is surveyed into blocks averaging 35 acres each, and described as being good. It is considered that this land would fetch £5 per acre. The greater portion of the whole of the Government land is reserved from selection.

The tract of country between Glenorie and Wiseman's Ferry has already been brought under the notice of the Committee, but it is desired that the Committee's attention should again be drawn to its importance. In proof that these lands would be settled upon, I beg to say that in the districts of Glenhaven and Arcadia inferior lands to these have been selected and are now supporting a considerable population.

2283. Are those the conclusions arrived at a meeting held the other day? Yes.

2284. Did that meeting represent the districts which will be affected by the construction of the railway? It represented most of them.

2285. *Mr. O'Connor.*] The principal centres of population? Yes, from Castle Hill out.

2286. *Mr. Farnell.*] Have you formed any opinion as to the quantity of land necessary to be taken between Carlingford and Dural? Seventy-two acres if the line is only a chain wide, and double that quantity if it is 2 chains wide.

2287. With regard to the cases in which you met with a refusal—are they cases in which the land is improved? We did not meet with any actual refusal. Nearly every one was willing to subscribe, but in many instances it was impossible to get at the owners.

2288. Have you formed an estimate of the value of the land? I think the Government valuation is over-estimated. If you were to take the valuation of the owners for taxation purposes you would find that it would be a great deal under what it is for railway purposes. I think the valuation with the improvements would not reach within £2,000 of the amount mentioned by Mr. Tunks. I think the estimate of £9,900 is excessive.

2289. If only 1 chain in width were required we might reasonably reduce the amount to one half? I think so.

2290. Have you thought out the question of adopting another route by which there would be less expense incurred in regard to land resumptions? There would be very little difference in the cost of resumption on any of the proposed routes. The land in the two districts is about of one value, excepting that in some distances it might run along frontages, and in others it might be further back on the holdings.

2291. *Mr. Wright.*] What particular districts were represented at the meeting to which you have referred? The districts of Castle Hill, Dural, Galston, Pennant Hills, Kenthurst, Glenorie, and Glenhaven.

2292. Were Baulkham Hills and Kellyville represented? No; we were advocating the Carlingford line. The league is formed for the purpose of advocating that line, and we are not connected with the other portions of the district.

2293. All the districts from Carlingford to Arcadia are on the route? Yes.

2294. *Mr. O'Connor.*] Could these two districts have been represented if they had chosen? It was not necessary to have any but a number of fruitgrowers together, because the questions to be considered were any which two or three fruitgrowers could answer.

2295. *Mr. Wright.*] All the places which would be affected by this proposal, from Carlingford out, were represented? Yes.

2296. *Mr. Lee.*] At the meeting of fruitgrowers held the other day, did you discuss the question whether the fruitgrowers would be willing to pay a larger train freight from Dural to Clyde than is proposed to be charged by the Railway authorities? Yes; and evidence has been given here to the effect that it would be to their interests to pay the amount stated—2d. per case.

2297. That would be 2d. from the extreme point? Twopence from Dural to Clyde.

2298. What about the points nearer to Clyde? I gave evidence in regard to the whole of the different districts.

2299. But that evidence has not been fully supported by other witnesses;—I understand you are representing the back districts generally as the secretary of the league? Mr. Harper touches on that question, and I wish to refer to it. Mr. Harper says he very much doubts whether the fruitgrowers would be willing to pay the amount stated. He went on to say that as soon as the line was constructed there would be agitations for a reduction. He also stated that he would be willing to take on the cartage of fruit at those rates all the year round. It is evident to anyone who understands the cartage of fruit that Mr. Harper knows nothing at all about it. We have given instances in which it costs 6d. a case, and it is impossible to get it down for less. If the Committee would take the trouble to add up the

J. C. Hunt. amount which would be earned in a day, they would find that at the rates we give only a fair day's wage could be earned by a man with his horse and cart if these extreme rates were paid. I wish you to understand that the charges are for the cartage of fruit to the railway station and the return of the empty cases. These statements can be verified, and I can give the names of the gentlemen who are now paying these rates from Kenthurst to Thornleigh. Mr. Tuggles is paying 6d. a case for that distance—12 miles. There are several small growers in the district who bring their fruit from the extreme north end—from Glenorie to the district of Dural. It is there drawn by larger growers to the Thornleigh station, and the whole of the charge for the selling and the cartage of the fruit is 1s. per case. The charge in the market is 6d. a case for selling and 1d. for trainage, which will leave 5d. for the cartage. That is done in many instances. There are fully twelve growers who send their fruit in this way from either Galston or Glenorie, and if they pay anything like this rate it will be to their interest to pay 2d. a case for the whole of the district at that end of the line. Those districts will embody Galston, Dural, Glenorie, and Kenthurst.

9 Feb., 1898.

2300. How many cases at 2d. would there be carried? 218,000.

2301. The points between Dural and Clyde would expect a proportional reduction? I think so.

2302. So that the fruit from Carlingford would be brought down at about 1d. per case? Yes. From there they now pay 2d. a case by boat; and 1d. extra with the 1d. on the old line would be about the fare.

2303. Then you have 1d. per case to divide between there and Dural? Except at one point—the point where Kenthurst would join the line.

2304. You reckon that if 3d. per case were charged from Dural to Sydney and there were a corresponding increase between there and Carlingford it would meet the figures you have already submitted? My calculations are based on a reduction as the line comes towards Carlingford.

2305. Of course these calculations are in excess of the Departmental estimate? Yes.

2306. Would the fruitgrowers agree to pay that amount as an inducement towards the construction of the line? I think so.

2307. Would they agree to do so for a number of years? I could not tell unless I visited the district. But if a promise were made that the railway would be constructed if they would agree to pay that amount for so many years, I think they would agree to pay it.

2308. Do you think, under any circumstances, they would set up a dray competition for the Northern line if they could save a trifle in the cost of carriage? If anyone tried it they would not last long because it would not pay.

2309. It would be cheaper to send the stuff by the line at the prices stated by you? Yes.

2310. *Chairman.*] What is the distance from Galston to Hornsby? Seven to eight miles.

2311. And what is the charge? 3d. per case.

2312. What is the charge from there to Sydney? 1½d. per case.

2313. For railway purposes the charge from Clyde or Parramatta is the same as from Hornsby? It is 1d. per case from Parramatta.

2314. Therefore to cause them to use the main Western line and the railway from Dural you would have to get on the main line for 2d. per case from Galston? That is so.

2315. What is the distance from Galston to Dural by road? Three and a half miles from the turn off.

2316. The question arises as to whether the fruit carried from Galston to Dural by road, and then by rail, will be delivered better than it would be delivered if carried by road to Hornsby? It is a saving of 7 miles in favour of the Dural terminus.

2317. Against that you have the freight from Dural to Clyde? Yes, of 1½d. or 2d. per case. If you take the road from Galston to Hornsby you will find that it is a steep road. I think you could do three journeys to Dural and back whilst you did two journeys to Hornsby.

2318. That appears in the road carriage, which you say is a fair thing at 3d. per case? Yes.

2319. And if it costs you 1d. per case to get from Galston to Dural and 2d. per case to get to Clyde, you are in exactly the same position as if you went from Galston to Hornsby? But I do not think I have given evidence to the effect that 2d. per case is a fair charge by road from Galston to Hornsby.

2320. I took the charge to be 3d.? That would make it 4d. to Sydney.

2321. From Hornsby to Sydney the charge is the same as from Clyde to Sydney with the exception of ¼d. per case? With the advantage of the trip in. There is also the saving of time. The cartage to Hornsby and trainage to Sydney would be 4d. a case. The cartage to Dural would be 1d., then 2d. to Clyde, and 1d. to Sydney, which would also make 4d., and balance the two accounts; but they would save one journey in three by coming to Dural.

2322. Supposing the Carlingford line were taken as far as Pennant Hills to where the road turns to go to Beecroft or to Thornleigh, what would the effect on the fruit districts be? It would not benefit them very much.

2323. What I mean is this: If a line were constructed as far as Pennant Hills would people ship at Pennant Hills rather than use the road for the main Northern line,—you have told us already that it is worth about 1d. per case to do that 2 miles? Yes.

2324. If the line is constructed to Pennant Hills, since it costs 1d. per case to get from Pennant Hills to the main Northern line, it would pay a man to pay 1d. per case to go to Clyde, where he would get the same rate to Sydney as he would get from the Pennant Hills station? In some cases it would; in others it would not. Supposing you were already loaded, and that was not taken into consideration, perhaps 1d. would not pay for the 2 miles; but if you take the loading and preparing to start into consideration, I think it would. If the Rosehill line were extended to Dural on the Northern line as far as Mr. Moore's on the Great Northern Road, it would be a great benefit to the district.

2325. Do you think if the line were extended as far as where the main Northern road crosses the proposed railway there can be any doubt that they will use it from there instead of using the road to the main Northern line? No.

2326. How far is that point from Pennant Hills station? About 4½ miles.

2327. How far is it from Carlingford? About 6½ miles.

2328. Therefore, it is 2½ miles south from Dural? By road the distance would be greater than by the railway. It is nearly 9 miles by the proposed railway. It would be 2 or 3 miles further by the road.

2329. Is this what you mean—that the line from Clyde to Carlingford would be extended as far as the intersection

intersection of that line with the main Northern road before it would intercept the road traffic coming from Kenthurst and Dural? I think so.

J. C. Hunt.

2330. If it stopped short of that the people would prefer to go on the main Northern line? Under any circumstances they would.

9 Feb., 1898.

2331. The people at Ermington and Rydalmere, notwithstanding the fact that they have the main Northern line and the Western line in fair proximity, and are quite adjacent to the Parramatta River, prefer to cart their produce, passing by the river and the two lines of railway, into Sydney. Mr. Jenkins was asked the following questions:—

Chairman.] You stated just now that a considerable number of persons in your locality carted their fruit to Sydney? Yes. How far would they have to cart it? From the centre of Rydalmere to the post-office is 12 miles.

What proportion of the fruit is carted? So far as Rydalmere is concerned two-thirds of it, and the same with regard to Ermington. None of the growers there have very large places, and they try to make as much as they can by carting their own fruit. I do not know what the market dues and commission amount to.

Can you explain that? These men sell their own fruit in the market, and being within a certain distance, they can, by travelling in the night, get into the market in the early morning. Having perhaps only a little and ripe fruits they prefer to hurry it into the market and sell it themselves. The people around Rydalmere largely sell their own fruit in Sydney. I cannot understand Mr. Harper's evidence with regard to the amount of fruit governed by boats. He stated that 90,000 cases went by boat from Ermington. If two-thirds of the fruit grown goes by road—as stated by the mayor—there must be a very much larger production in proportion than in any other district, and yet Rydalmere is only a small district.

2332. You only claim the produce of Arcadia, Galston, Kenthurst, and Dural at 2d. per case? Yes.

2333. After that it is 1d. per case? Yes.

2334. Do you desire to add anything further to your evidence? Mr. Hill in his evidence has given the Committee to understand that some few years ago the residents of Castle Hill and district advocated a tramway. That tramway was not in connection with the Government system at all. It was a private concern started by the Parramatta Tramway Company. I have never yet attended any meetings to advocate the construction of a tramway; but I have attended to oppose it. There is a report in the local newspaper to the effect that I attended a meeting, but I certainly was not favourable to the proposal.

2335. *Mr. Hoskins.*] Would you prefer, in the interests of the district named, to have a railway constructed to Dural rather than a tramway from Parramatta to Castle Hill? Certainly. The evidence given by Mr. Hill appeared to discount the evidence given by other witnesses.

Christopher John Moore, fruit-grower, Castle Hill, sworn, and further examined:—

2336. *Chairman.*] What is your object in attending to-day? To deny Mr. Hill's evidence. I have been mentioned as one of those who attended a meeting in favour of the construction of a tramway from Parramatta to Dural. I attended that meeting, but I always opposed the construction of the tramway.

C. J. Moore.
9 Feb., 1898.

Elijah Ford Fuller, fruit-grower, Dural, sworn, and examined:—

2337. *Mr. Black.*] Is there anything you particularly desire to state to the Committee? I only wish to deny Mr. Hill's statement that I attended a meeting in support of the construction of a tramline from Parramatta to Dural. I have always been opposed to the construction of a tramway, and am in favour of the construction of a railway from Carlingford to Dural.

E. F. Fuller.
9 Feb., 1898.

2338. That is the scheme before the Committee? Yes.

2339. How long have you lived in the district? All my lifetime.

2340. How many acres of land have you? Ninety-one, of which 25 are under cultivation.

2341. Where do you send your fruit to? I truck it at Pennant Hills or Thornleigh.

2342. What saving would you effect if the railway came to Dural? It costs me now at the rate of 5d. or 6d. per case to cart my fruit from Dural or Pennant Hills or Thornleigh. If the line were constructed and the charge were 3d. per case, I would save 2d. per case. Besides that there would be the haulage back of manure, &c. It costs me 8s. to 10s. a ton for the haulage of manure from Pennant Hills or Thornleigh to Dural and the railway charge would be considerably under that.

2343. Would you also save the destruction of fruit? Yes.

2344. *Chairman.*] Where do you live? In the centre of Dural.

2345. And you pay 5d. a case? I do not pay it. I draw my own fruit, but I reckon that it costs me that.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from the Terminus of the Rosehill Railway to Dural.

APPENDIX.

A.

[To Evidence of T. R. Firth, Engineer-in-Chief for Existing Lines.]

12 January, 1898.

Cost of Line from Campbelltown to Camden.

In accordance with the request of the Public Works Committee I have the honor to supply the above information, as follows:—

	£	s.	d.
Construction of Line, including materials, buildings, surveys, and all charges ...	35,802	10	7
Land	3,334	14	3
Total	£39,137	4	10

Length, 7 miles 65 chains=£5,009 11s. 5d. per mile.

THOMAS R. FIRTH,
Engineer-in-Chief for Existing Lines.

The Secretary, Public Works Committee.

B.

[To Evidence of H. McLachlan, Secretary to the Railway Commissioners.]

PARTICULARS RESPECTING CAMDEN TRAMWAY.

Sir,

Office of the Railway Commissioners, Sydney, 4 February, 1898.

In compliance with the request of the Public Works Committee for information as to the financial result of the working of the Camden Tramway, I am directed to inform you that the particulars in regard to the transactions of the line are as under:—

	1896.	1897.
Length of line.....	8 m. 5 ch.	8 m. 5 ch.
Capital cost.....	£42,465	£42,675
Interest	1,486	1,494
Working expenses.....	2,761	5,107
Earnings	2,954	3,042
Loss after providing for working expenses and interest	1,293	3,559

It may be added that the expenditure for 1897 was exceptional, as extensive relaying was carried out, the cost of this service during the year being £2,468, as against £15 under the same head for the previous period.

I have, &c.

H. McLACHLAN,
Secretary.

The Secretary, Parliamentary Standing Committee on Public Works.

C.

[To Evidence of H. Deane, Engineer-in-Chief for Railway Construction.]

ESTIMATED COST OF LINES OF RAILWAY TO DURAL.

Railway Construction Branch, Public Works Department, Sydney, 5 February, 1898.

Rosehill to Dural Railway.

I AM directed by the Engineer-in-Chief to forward herewith tables showing particulars of the cost of different classes of lines. I am to state that it must be understood that the estimates are very rough, and that, to make them reliable, additional information would have to be obtained from the field.

The Secretary, Parliamentary Standing Committee on Public Works.

E. HUNGERFORD.

PLAN.

Koorawatha to Grenfell Railway—Plan to accompany Sectional Committee's Report.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM KOORAWATHA TO GRENFELL.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a railway from Koorawatha to Grenfell," have, after due inquiry, resolved that it is expedient that the proposed railway be constructed; and, in accordance with the provision of subsection iv, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

OFFICIAL DESCRIPTION.

1. The proposed railway is officially described as the first portion of a proposed line to Wyalong. Commencing at Koorawatha, on the Blayney to Harden Branch railway, it runs chiefly in a westerly direction, crossing the Crowther Range and the Tyagong Creek, and terminating at Grenfell in a Government reserve between the two main roads from Young to Grenfell. The length of the line is about 29 miles 60 chains.

The idea of constructing a line of this nature originated, the Committee are informed, in October, 1896, in a suggestion made by a Sectional Committee in their report upon the proposed Railway from Condobolin to Broken Hill. In that report it was stated that the Sectional Committee favoured a line from Cowra, or thereabouts, *via* Grenfell and Wyalong, to Hillston, and the Full Committee recommended the suggestion as one worthy of consideration, but pointed out that the fullest investigation was necessary before the State finally committed itself to any work entailing large expenditure. With the approval of the Minister for Public Works, a surveyor explored and reported on the country between Wyalong and Cowra, with a view to selecting the best route for a railway junctioning with the line between Cowra and Young; and the result of this survey was that, owing to formidable difficulties to be encountered in crossing the Browla Range, Cowra was reported to be unsuitable for a starting-point, and a recommendation was made that the line should commence at Koorawatha.

ESTIMATED COST.

2. The estimated total cost of the line is £89,250, or an average cost of £3,000 per mile. Earthworks are set down at £14,233; timber bridges and openings, £6,109; level-crossings, cattle-stops, and fencing, £3,951; permanent-way materials, £18,952; plate-laying, ballasting, and sleepers, £15,904; station works, £5,568; station buildings, &c., £6,295; the balance being made up of the cost of freight, water supplies, gradient and mileage posts, telegraph, miscellaneous, and engineering and contingencies. The last mentioned item calculated at 12½ per cent. represents an estimated expenditure of £9,917. Since this estimate was made the Engineer-in-Chief for Railway Construction has visited Grenfell, and decided that the railway station there should be near the town, instead of, as first proposed, 1¼ mile outside. This alteration can be carried out for £3,100, thus increasing the estimated total cost to £92,350.

RAILWAY

RAILWAY COMMISSIONERS' REPORT.

3. The Railway Commissioners report favourably upon the line, though their estimate of expenses and traffic returns shows an annual loss of £1,949. Interest on the capital expenditure they calculate at 3 per cent., which amounts to £2,667; and the estimated cost of maintaining permanent-way, and for traffic and locomotive expenses is £3,232, making the total annual cost, £5,909. The traffic estimate is £3,960, made up of goods, live-stock, and agricultural produce £2,650, passenger traffic £950, and mails £360. The Commissioners point out that while, according to the present estimate of traffic, there would be an annual loss of £1,949, the returns will more than meet the working expenses of the line, and that it is fair "to assume that the increased facilities afforded by railway communication will tend to increase traffic by stimulating the extension of cultivation and settlement, and thereby in time meeting in full both working expenses and interest." Nothing but a favourable impression, they say, can be formed as to the future prospects of the railway.

TRAFFIC PROSPECTS.

4. The traffic estimate stated in the Railway Commissioners' Report is based upon the following figures prepared by the Chief Traffic Manager:—

	£	s.	d.
Goods—1,000 tons, at 10s.	500	0	0
Wheat and hay—2,500 tons, 15 miles, at 2s.	250	0	0
" 2,000 " 20 " 2s. 6d.	250	0	0
" 4,500 " 30 " 3s. 6d.	787	10	0
Wool—1,350 tons, at 5s.	337	10	0
Stock—500 trucks, at 15s.	375	0	0
Passengers—5,000, at 3s. 9d.	937	10	0
Sundries	150	0	0
Mails	360	0	0
Total	£3,947	10	0

The rate for grain is an arbitrary one, similar to what has been adopted on the Berrigan railway, and the stock rate is an arbitrary rate based upon what is charged on one or two of the existing branch lines. The other rates in the list are extension or through rates.

There is a fair amount of settlement within the traffic area on either side of the route of the proposed railway, and the soil being good and the average rainfall satisfactory, the district is one in which, with railway facilities, settlement should increase considerably. Many of the farmers work the land on the share or halves system, and the success attained under this system indicates that the practice is likely to extend. The Sectional Committee, who visited the district, learned from the evidence given before them, that adjacent to the route of the line there is a very considerable area of land under cultivation, and that preparations are being made to greatly enlarge that area. Of three station properties in the neighbourhood, one, with an area of 30,000 acres, has 5,000 acres prepared for the plough; another, of 30,000 acres, has 17,500 acres in a similar condition; and the third, with an area of 16,000 acres, has 9,000 ready for cultivation.

Though the settlement is not, at present, what may be termed close, "there can be no doubt," the Chief Traffic Manager reports, "that, with the exceptionally favourable circumstances of soil and rainfall, the facilities for marketing produce associated with railway communication would bring about a large development in agriculture." The district, is also, he points out, "one so well suited for stock that the improved carrying capacity which invariably accompanies clearing and tillage would add very materially to the wool and fat stock production of the trafficable area of the line."

According to statistics furnished from the office of the Government Statistician, the area cultivated in the Grenfell district in 1896 was 23,000 acres, and the yield 213,171 bushels; but, taking the Grenfell and Bimbi districts together, the area was 28,375 acres, the principal crop being wheat—the area under wheat 24,815 acres, and

and the yield 229,402 bushels. For the past season the estimate for the two districts is 29,546 acres under cultivation, and the yield 344,556 bushels. Of these figures Grenfell is credited with 27,300 acres, yielding 327,600 bushels. The Chief Traffic Manager is confident that in a very short period the production of wheat in the district around Grenfell, and between Grenfell and Koorawatha, will be doubled,—a condition of circumstances which will very considerably reduce the deficiency shown in the traffic estimates of the proposed railway, and still further add to the earnings on the main Southern Railway.

THE SHARE SYSTEM.

5. The share system, practised in connection with a large proportion of the farming in the Koorawatha-Grenfell district, is, by some persons, regarded as somewhat uncertain. To these there appears, under the agreement between landlord and tenant, an absence of permanency in the occupation of the land, and a possibility of, in a few years, exhausting the productiveness of the soil. But the evidence before the Committee does not bear out this idea. The system is simple, and apparently satisfactory to both the parties concerned. Though occupiers of some of the holdings may, at their own instance or that of the landlord, leave the land, others will take their places, and cultivation will not cease. As fast as the land can be cleared for cultivation there is no difficulty whatever, the Committee are informed, in finding tenants.

CROWN LAND IN THE DISTRICT.

6. Among the circumstances regarded by the railway authorities as favourable to the construction of the proposed railway is that, within the traffic area of the line, there is a large extent of Crown land.

Evidence given before the Committee by the Chief Draftsman, Department of Lands, shows that within an area of 20 miles each side of the route of the line, converging to a point at Koorawatha in order to exclude the area under the influence of the existing line from Cowra to Young, there are 92,820 acres of Crown land, 142,330 acres of reserves, 17,260 acres of settlement and improvement leases, and 531,960 acres of alienated land. The Crown land consists of 55,680 acres of leasehold areas, expiring during the period 1898 to 1900, 33,120 acres held under occupation license, and 4,020 acres untenanted.

MINING.

7. Grenfell has been an important gold-mining centre, and the Chief Inspector of Mines was examined with regard to its future as a gold-field. That officer expressed the opinion that sooner or later Grenfell will again become one of the leading gold-fields of New South Wales, as it is probable the reefs will yield payable returns at a greater depth than that at which they have been tested up to the present. Witnesses examined by the Sectional Committee were equally favourable in their evidence regarding the mining possibilities of the district.

COMPENSATION FOR LAND.

8. The compensation which will have to be paid for land taken for the railway is said to be about £1,000. On one estate the land would be given free of cost; and, in other cases, arrangements can be made for an exchange, Crown land or roads being given in lieu of the area taken. It is where the line passes through small properties that a money compensation must be paid; but, although no definite statement can be made, it is believed the total amount will not exceed the sum stated.

A RAILWAY FROM YOUNG TO GRENFELL.

9. A railway from Young to Grenfell has been advocated before both the Full Committee and the Sectional Committee, on the grounds that a line between the two places has been twice surveyed, with the result that the latest survey known as the "white line" has been adopted by the Department; that settlement has taken place in consequence of these surveys, and is now of such an extent that the holdings
along

along the route are much more numerous than between Koorawatha and Grenfell; that the population between Young and Grenfell is greater than between Koorawatha and Grenfell; and that Grenfell is naturally a point of connection for a federal railway between Young and Werris Creek, 24 miles of which line are already laid between Forbes and Parkes.

The Sectional Committee explain in their report that the route for this line leaves the present railway system at an acute angle, by reason of which it remains for a greater length than is desirable within the influence of an existing railway. For the first 12 miles or more, out of a total distance of 32 miles, the residents between the two lines would be not more than 6 miles from one route or the other. The land along the route is suitable for either pastoral or agricultural settlement; but, while they found that small holdings are more numerous than on the Koorawatha route, cultivation is less. There is, however, a larger population. The cost of the line from Young would be slightly larger than that of the line from Koorawatha, the estimated difference being £177 per mile; and the distance from Grenfell to Sydney, *via* Young, would be longer by 41 miles than it would be *via* Koorawatha. The distance from Koorawatha to Sydney, *via* Blayney, on the Western railway, is 236 miles, and *via* Harden, on the Southern railway, 277 miles; and, although, when convenient, the Commissioners might work the traffic over the Southern line, they would not charge for the longer distance.

Before the Sectional Committee, it was contended by residents of Young that the Koorawatha to Grenfell line would reduce their present trading limits; but, as explained in the Sectional Committee's report, it was found that the utmost Young can lose in this way is the trade from an area of about 12 by 16 miles, part of which trade is at present uncertain. Though impressed with the importance of Young, and the possibilities of the district, it did not appear to the Sectional Committee that either town or district would be materially injured by the construction of the line from Koorawatha. From a traffic point of view, a line from Young is not so satisfactory as one from Koorawatha, for it is pointed out by the Chief Traffic Manager that if the Young connection were made there would be little traffic on the line, as, taking the shorter distance to Cowra by rail from Sydney, the haulage of goods between Cowra and Grenfell would be done at a less cost than that at which the Railway Commissioners could carry the goods, charging a rate through from Sydney to Grenfell.

A LINE FROM COWRA TO GRENFELL.

10. Reference has been made to a route for a railway from Cowra to Grenfell. Though such a line would bring Grenfell within a shorter distance of Sydney, it would be some miles longer than that proposed from Koorawatha, and would not serve the same extent of country; but the strongest reason against it is stated by the Engineer-in-Chief for Railway Construction, who explains that a very awkwardly situated range between the two places would make it difficult and costly, if not impossible, to obtain the necessary grade.

AN EXTENSION TO WYALONG.

11. Communications were received from Cootamundra and Barmedman on the subject of railway connection with Wyalong. The Cootamundra District Council are of opinion that the proposed line from Koorawatha to Grenfell will eventually conflict with the interests of the district in regard to an extension to Wyalong and Hillston, and the Barmedman Railway League were anxious to be heard in relation to any proposal relating to Wyalong. The District Council at Cootamundra do not oppose a railway extension to Grenfell, but they view the fact of starting from Koorawatha as directly affecting the question of an extension of the Cootamundra-Temora railway to the west, which they consider was contemplated when the railway to Temora was constructed. They and the residents of Barmedman were informed by the Committee that it had been decided that the question of a railway from Koorawatha to Grenfell was not necessarily connected with that of an extension beyond Grenfell towards Wyalong, and therefore it did not appear to the Committee that the interests of Cootamundra were materially affected by the Koorawatha-Grenfell proposal.

CONCLUSION

CONCLUSION ARRIVED AT BY THE COMMITTEE.

12. From the evidence before them, the Committee are of opinion that the proposed railway should be constructed. Though for some time it will be worked at a loss, there are strong indications that ultimately it will pay both working expenses and interest. The Chief Traffic Manager expresses the opinion that it will reach this point within five years. The Railway Commissioners unmistakably favour its construction, and the inspection by the Sectional Committee of the route, and of the district the line will serve, supports the view taken by the Commissioners. The conclusion arrived at by the Committee is shown in the following extract from the Minutes of Proceedings:—

“Mr. Fegan moved—‘That, in the opinion of the Committee, it is expedient the proposed Railway from Koorawatha to Grenfell, as referred to the Committee by the Legislative Assembly, be carried out.’”

“The motion was seconded by Mr. Clarke, and passed.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 1st April, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM KOORAWATHA TO GRENFELL.

MONDAY, 20 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANK FARNELL, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Koorawatha to Grenfell.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement with reference to the proposed Railway from Koorawatha to Grenfell? Yes. H. Deane.
20 Dec., 1897

This line is the first portion of a proposed railway to Wyalong. It joins the Blayney to Harden Branch railway at Koorawatha, and running chiefly in a westerly direction crosses the Crowther Range and the Tyagong Creek, and ends at Grenfell in a Government reserve between the two main roads from Young to Grenfell.

The district traversed by the line supports a large and growing agricultural population.

The length of the line is about 29 miles 60 chains, and its estimated cost which is somewhat high owing to several stations being required, is £89,250 or £3,000 a mile, exclusive of land and compensation.

This proposal originated in October, 1896, in a suggestion made by the Parliamentary Public Works Committee in their report upon the proposed railway from Condobolin to Broken Hill, and by Mr. Greene, M.P. With the approval of the Minister, Mr. Surveyor Jamieson was sent to explore and report on the country between Wyalong and Cowra, with a view to selecting the best route for a railway junctioning with the line between Cowra and Young. Mr. Jamieson reported that Cowra was unsuitable for a starting point, owing to the formidable difficulties to be encountered in crossing the Browla Range, and recommended that the line should commence at Koorawatha.

On the Engineer-in-Chief's recommendation the Minister approved of a survey being made, and in January, 1897, Surveyors Little and Lloyd were instructed to start it.

On the 11th January, 1897, Mr. W. H. Bradey, Secretary to the Wyalong Railway League, wrote stating that the League would support a line *via* Grenfell.

On the 10th May, 1897, the President of the Grenfell Railway League furnished statistical information as to the products of the district.

On the 23rd June the Engineer-in-Chief forwarded a report in which the direct route to Grenfell from Koorawatha is pointed out as being preferable to another which joined the abandoned survey of a line from Young to Grenfell.

On the 27th July, 1897, Mr. Greene, M.P., forwarded undertakings from residents undertaking to give, exchange, or sell any land required for the line.

On the 14th October, 1897, the Engineer-in-Chief reported that the plan and estimate of line from Koorawatha to Grenfell would be ready for submission in a week.

Early in December, 1897, the plans and estimate of the line as far as Grenfell were submitted by the Engineer-in-Chief to the Minister, and the Railway Commissioners were asked to furnish a report in terms of the Public Works Act. This report was submitted on the 6th December, and is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 6 December, 1897.

Proposed line of Railway, Koorawatha to Grenfell, 29 miles 60 chains.

In accordance with the provisions of the "Public Works Act of 1888," Section 13, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief estimates the cost of construction of a single line of light railway (exclusive of land and compensation) at £89,250

Annual Cost—

Capital expenditure at 3 per cent. £2,677
Estimated cost of maintaining permanent-way, and for traffic and locomotive expenses 3,232

Total annual cost £5,909

Traffic Estimate—

Goods, livestock, and agricultural produce £2,650
Passenger traffic 950
Mails 360

Total estimated traffic £3,960

* 3—A

It

H. Deane.
20 Dec., 1897.

"It will be observed from the foregoing figures that the estimated traffic more than meets the working expenses of the proposed railway; but taking into consideration the interest charged, there will, on the present volume of traffic, be an annual loss of £1,949. It is, however, fair to assume that the increased facilities afforded by railway communication will tend to increase traffic by stimulating the extension of cultivation and settlement, and thereby in time meeting in full both working expenses and interest.

In dealing with the line as submitted it appears to us some reference should be made to the general aspect of the question. Apparently the line could not remain permanently at Grenfell, but must eventually be extended westwards to Hillston. Consequently the question arises whether it should not, *en route*, connect with Wyalong. This would involve the consideration of the previously urged connection of this place with Temora.

On these matters we have not been asked to report, and therefore only refer to them as questions worthy of notice before any final decision is arrived at.

As regards the line Koorawatha to Grenfell, in itself, nothing but a favourable impression can be formed as to its future prospects."

The Common Seal of the Railway Commissioners of
New South Wales was hereunto affixed, this
sixth day of December, one thousand eight
hundred and ninety-seven, in the presence of—

J. S. SPURWAY.

{ CHARLES OLIVER,
Chief Commissioner.
W. M. FEHON,
Commissioner.
DAVID KIRKCALDIE,
Commissioner.

On the 9th December, the Minister tabled a motion for the submission of the line to the Public Works Committee which was carried.

2. The Railway Commissioners have expressed no opinion with regard to the question whether the connection should be from Temora to Wyalong, nor did they express an opinion as to the Young-Grenfell connection *versus* Grenfell-Koorawatha? No.

3. *Mr. Roberts.*] Have you been over the proposed line? Not yet. I have gone very carefully into the plans and estimates, and the reports of the surveyors, but I am not satisfied to appear before the Committee on the engineering question until I have had an opportunity of going over the line, which I intend to do some time in January.

4. What is the total length of line from Koorawatha to Grenfell? Twenty-nine miles 60 chains.

5. And the estimated cost? £3,000 per mile.

6. What is the reason of the increase as compared with other light lines of railway that have been submitted to the Committee? The country is altogether different. It is of a much more undulating character; in fact there is a low range to go over which necessitates grading and earthworks. Then the line not being a long one the station work, divided over the length, adds considerably to the cost per mile.

7. Are you able to tell the Committee whether the Minister for Public Works has submitted this line to the Committee after having given every consideration to other routes, such as one from Young to Grenfell or from Temora to Wyalong. I ask you this question, understanding that Hillston is the objective point? It is understood that this line will be extended westward; in fact, a survey has been practically completed as far as Wyalong.

8. By way of Grenfell? Yes. This route has been selected as being the best to serve the country required, that is the wheat-growing district between Grenfell and the Cowra and Blayney line.

9. Understanding that you are speaking now on behalf of the Under Secretary of the Department, are you able to say that it has been decided that the line shall ultimately reach Hillston? No, I cannot say that.

10. But you can say positively that it is decided to go to Wyalong? No; I cannot say that it has been positively decided to go to Wyalong, but it has been decided to have a survey as far as that point, so that the scheme can be submitted to Parliament. I believe I am right in saying that if the survey had been finished as far as Wyalong before, and the plans prepared, the whole of the line would have been submitted with the present proposal.

11. When I say "decided to go to Wyalong," I mean decided to submit the question to the Public Works Committee? The Minister intended to do that if the plans were ready, but unfortunately they were not.

12. What is the estimated annual loss on the proposed line? £1,949 as estimated by the Railway Commissioners.

13. After providing for interest and including all charges? Yes. I think it is only fair to say that the Railway Commissioners make a point of never over-estimating traffic.

14. Does the estimated traffic more than pay working expenses? Yes.

15. By what amount? The working expenses amount to £3,232, and the estimate of traffic is £3,960, leaving a margin of £728.

16. Is it not a fact that if a line will more than pay working expenses the Railway Commissioners, as a rule, feel justified in recommending it, if the prospects are favourable as to future traffic? I think they have frequently done so.

17. Have the claims of the people of Temora for a line from Temora to Wyalong by way of Barmedman received every consideration from the Department of Public Works? I think so. The line has been submitted twice to the Public Works Committee.

18. Do you know of any request being recently made by the Temora people that they should be afforded an opportunity of putting forward their claims for railway communication before any decision is arrived at? I am not aware.

19. Is the rich part of the country to be found as you get near to Grenfell? It is between about one-fourth and one-third of the distance out from Koorawatha.

20. Have you any report describing the country between Koorawatha and Grenfell? No; but I can furnish the Committee with the surveyors' reports if desired.

TUESDAY, 21 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Koorawatha to Grenfell.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

21. *Mr. Black.*] Have you prepared any statement? A report has been submitted by the Railway Commissioners in accordance with the Act, and I understand it has been laid before the Committee.

22. Have you anything to add to that? No.

23. I see that the charge for interest on capital expended is put down at 3 per cent. In the case of other lines, that from Warren to Coonamble for instance, the charge has been $3\frac{1}{4}$ per cent., and sometimes it has been $3\frac{1}{2}$ per cent. What is the reason for this dissimilarity in the charges for interest? I think you will find that the charge varies according to the date. In the case of the Warren to Coonamble line, the report was made nearly eighteen months ago. The money market having since become easier, the Commissioners estimate the interest at 3 per cent.; they think that is about the present value of money. Even if you put it at $3\frac{1}{4}$ per cent., that would only make a difference of a couple of hundred pounds. In all recent cases, the charge for interest has been put down at 3 per cent.

24. The report of the Commissioners on the Warren to Coonamble railway is dated 23rd June, 1896;—do you think money was a quarter per cent. dearer then than it is now? The rate of interest sometimes alters in a period of eighteen months, and the Commissioners think that, in this instance 3 per cent. is a reasonable estimate. In the case of the city railway, the charge is put at 3 per cent.

25. Do you think that the money, with all the charges for brokerage, interest, &c., would cost only 3 per cent.? Yes; the Commissioners think that 3 per cent. would be a reasonable sum.

26. Do you think that would sufficiently cover this item? Yes; the Commissioners think so.

27. Have you any personal knowledge of the proposed railway? No; I have not been over the line.

28. Then you have no knowledge as to its merits, compared with any other suggested route? Not personally.

29. *Mr. Hoskins.*] Do you happen to know whether the Commissioners are favourably disposed towards the construction of a railway from Koorawatha to Grenfell? Yes.

30. Do they recommend the construction of the railway; and, if so, on what grounds? The Commissioners in their report estimate the cost of construction at £89,250. Under the head of "Annual cost" they put down interest on capital expenditure at £2,677, and the cost of working the line at £3,232, and they estimate the traffic at £3,960. Then they make these remarks:—

It will be observed from the foregoing figures that the estimated traffic more than meets the working expenses of the proposed railway; but taking into consideration the interest charged, there will, on the present volume of traffic, be an annual loss of £1,949. It is, however, fair to assume that the increased facilities afforded by railway communication will tend to increase traffic by stimulating the extension of cultivation and settlement, and thereby, in time, meeting in full both the working expenses and interest. In dealing with the line as submitted, it appears to us some reference should be made to the general aspect of the question. Apparently the line could not remain permanently at Grenfell, but must eventually be extended westward to Hillston. Consequently the question arises whether it should not, en route, connect at Wyalong. This will involve the consideration of the previously urged connection of this place with Temora. On these matters we have not been asked to report, and therefore only refer to them as questions worthy of notice before any final decision is arrived at. As regards the line, Koorawatha to Grenfell, in itself, nothing but a favourable impression can be formed as to its future prospects.

31. Speaking of this short length of 29 miles the Commissioners are favourably disposed towards it? Yes.

32. And they think that ultimately it will become a paying line? Yes.

33. Do you know whether the Commissioners have travelled over the country between Koorawatha and Grenfell? Yes.

34. Do you know whether the Commissioners have ever considered whether it would not be better to take the railway from Young to Grenfell rather than from Koorawatha to Grenfell, seeing that that would be the means of taking such traffic as the Grenfell district would produce over the southern line instead of the western line? Yes, they have considered it. The only reference to them was the line from Koorawatha to Grenfell, and they, therefore, did not go over the line from Young to Grenfell. But there are a number of advantages in favour of Koorawatha. That, of course, is the nearest route to Sydney. Sydney must be the centre. Although it would be about 12 miles further to work the traffic over the southern line, still the Commissioners think the public, to be served by the railway, should get the benefit if possible of the lower rates. The Commissioners would, when convenient, work the traffic over the southern line, but, at the same time, they would not charge for the longer distance. There is another advantage—you would have the double connection. You would have the shorter connection as well as the southern line connection. It is shorter by way of Koorawatha, and the Commissioners think the public should have the cheapest way of getting to market where it can reasonably be given. They would only charge such rates as would apply on the shorter distance, so that really it would be a public benefit to the district. The Commissioners might find it more convenient to work the traffic along the southern line, but they would only charge the public for the shorter distance, and in that way the public would get the benefit of a better rate. There is also this advantage: west of Grenfell there is an important mining district which would, no doubt, have some bearing on the question. There would probably be some ore and coal traffic between the western coal-mines and this mining district, and, consequently, it would be of advantage to have the nearest connection with the western mines. Apart from that, the Commissioners, although they have not gone specifically into the question, because it has not been referred to them, are of opinion that a better district would be opened up by the line from Koorawatha to Grenfell.

H.
 McLachlan.
 21 Dec., 1897.

H.
McLachlan.
21 Dec., 1897.

35. What is the extensive mining district to the west to which you refer? Wyalong.
36. I suppose you are aware that the Public Works Committee has, on two previous occasions, reported against the construction of a railway from Temora to Wyalong? Yes; and the Commissioners have reported against it also.
37. If the extension to Grenfell were made from Koorawatha there would be a shorter distance to take the Lithgow coal to the mining districts of Wyalong and Temora than would be the case if the other route were adopted? Yes.
38. Can you say whether the country between Koorawatha and Grenfell is more difficult for railway construction than that between Young and Grenfell? I believe neither line presents any engineering difficulties. The information we had from the engineers was to the effect that both of these lines are comparatively level, the worst grade being 1 in 75.
39. *Mr. Lee.*] The Commissioners take up the position that if this line is sanctioned, it is not reasonable to suppose it will remain at Grenfell? They do not say there is likely to be an extension at once; but, looking into the future, they are inclined to think the railway would go further westward.
40. Do the Commissioners, or do they not, recommend this line as a short line only? For the present, yes.
41. But with the view of its capability of being extended into a profitable country? Yes; but even as a local line they recommend its construction.
42. Even if it were adopted as a cockspur line, they see every possibility of its paying? In future, yes.
43. But they do not adopt the policy of recommending it as a cockspur line;—they say that it has an ultimate extension before it? Yes.
44. I believe your Department has been considering for some time the question of opening up the western country to Hillston? Yes.
45. Would it appear, from the present report, that they favourably entertain the idea of connecting Hillston across country by means of this route? That project has not been definitely referred to them.
46. But they say in this report that this line must eventually be extended westward to Hillston? Yes; that is their opinion.
47. Should we not be justified in inferring from that that they consider that if the line is to be taken to Hillston it should be extended by that route? That is their present opinion. They went over the line from Grenfell to Wyalong, but they did not go from Wyalong to Hillston.
48. There was a proposal to go from Condobolin to Euabalong, and the Commissioners condemned that; some time ago there was a proposal to go from Temora to Wyalong, and the Commissioners were opposed to that; therefore they have not been in agreement with any previous proposal to reach the western country under the references that have been made? That is so.
49. Would it not appear that they are favourable to an extension of the line to Hillston, that being a westerly point, by means of the route of which Koorawatha to Grenfell would be a portion? Yes; that is the opinion they entertain—that, as far as they can see, the best extension would be from Grenfell west towards Hillston.
50. If this Committee should commit the country to an extension to Grenfell, and that should involve a further extension to Hillston, would not that serve the purposes of the western country, if it were carried out? That is the opinion of the Commissioners. They do not like to state it absolutely; but so far as they can see they incline to an extension westward, towards Hillston. The matter not having been referred to them, it would be beyond their function to recommend an extension beyond Grenfell; but they say incidentally that they think the line will not stop at Grenfell, but it will be found advantageous later on to go westward.
51. The line would appear, at first, to show a loss of some £2,000 a year? Yes.
52. I presume the Commissioners are of opinion that the agricultural prospects between Koorawatha and Grenfell, and the vicinity, are sufficient to justify the belief that this loss would be made good in the course of a short time? Yes. You have the general feeling of the Commissioners, that where a line more than pays its working expenses, and goes into an agricultural district, they would, under certain circumstances, be prepared to recommend the construction of a branch line, which line should be considered on its merits. In addition to the purely local traffic, there must be a certain advantage to the parent line which it is difficult to set out in figures; and the Commissioners are assured that if this line were made, there would be a considerable increase in the cultivation of the district. You are very often told, in dealing with a proposed railway, that if the line were made, cultivation would follow; but in this case the cultivation actually exists, and development has already taken place to a large extent. So that it is not a matter of experiment; you have already a very fair earnest of success.
53. In other words, the produce of the Grenfell district, which is at present carried by dray to the nearest railway station, would be borne by the railway if constructed? To a large extent, yes.
54. And if that produce were carried, together with the incidental trade, the deficiency on the line would be about £2,000 a year; but the Commissioners are of opinion that the district offers such advantages that, with the increase of agriculture, a very few years will be sufficient to convert that loss into a profit? Yes, that is their opinion.
55. *Mr. Wright.*] Can you give the Committee any idea what the grades are between Blayney and Koorawatha? No, not from memory.
56. I understand you to say that the Commissioners favour the Koorawatha route in preference to the Young route, because the former is nearer to Sydney? Yes. As I have already mentioned, the Commissioners have not reported on the Young route; but, judging from conversations I have had with them, I may say that in a general way they are in favour of this route, although they have not been asked to express any opinion in regard to the rival route.
57. They are in favour of this as being the shorter route to Sydney? Yes; the public will get the advantage of the cheaper rates.
58. Are the Commissioners always dominated by that idea in recommending the construction of railways? They are always dominated by the desire to do the best they can for the country.
59. The difference between the distance from Grenfell to Sydney, *via* Young, and from Grenfell to Sydney, *via* Koorawatha, is about 12 miles? Yes.
60. What about the traffic; would that be easier of accomplishment on the southern than on the western route? Yes; it would be more convenient for us to take the traffic on the southern line as a general rule.

H.
McLachlan.
21 Dec., 1897.

61. As a matter of fact, the haulage on the southern route costs less? That would be very difficult to say. The greater traffic is taken over the western line; we could more conveniently carry this traffic over the southern line.
62. Have the Commissioners been over the road between Grenfell and Wyalong? Yes.
63. Recently? Yes.
64. And they think that this railway should be constructed as a portion of the line to tap the western country lying between the Lachlan and the Murrumbidgee? That is what they have indicated.
65. *Chairman.*] Does not the proposed line going from Young to Grenfell pass away from Young gradually over the Blayney to Murrumburrah line? Yes; 4 miles of the existing line would be used on the route from Young.
66. In going away on a route such as that under consideration from a line like the one from Blayney to Murrumburrah, it is well to go right away, or to go away at an angle? I should say it would be better to go away at a right angle.
67. What would be the advantage? If you went away parallel with the existing line, it would not be of so much advantage as if you ran at right angles into a country where you have to reach a certain point.
68. How far is Grenfell from Young? Thirty-four miles; but 4 miles of that would be part of the existing line.
69. Therefore, the length of the line to be constructed would be 31 miles, as against 29 miles and 60 chains from Koorawatha to Grenfell? Yes; it is practically 30 miles in each case.
70. Therefore, if there were a railway station at Grenfell, there being one at present at Young, anyone living midway between those two places, directly on the line of route, would be within 17 miles of railway communication? Yes.
71. And the same thing applies between Grenfell and Koorawatha? Yes.
72. But if the line were brought from Young to Grenfell as shown by the dotted line, then anyone between Koorawatha and Grenfell would be within 17 or 15 miles of a railway station? Yes.
73. And the same thing applies on the other route? Yes.
74. It is just a question between the two routes as to where you get away quickest into new country? Yes.
75. *Mr. Humphery.*] Will much of the Wyalong traffic be diverted from the Temora line to the Grenfell line? I do not think so.
76. Have you taken that into consideration in your estimate of the probable earnings of this line? No; nothing has been allowed for any traffic so diverted.
77. Will the loss be increased by the traffic being diverted from the Temora line? Of course the earnings of this line would be increased if we diverted traffic from Wyalong; but nothing has been allowed for Wyalong traffic on this local line.
78. Would you not think that that should be taken into consideration in estimating the probable loss—you say that there will be a loss on this line? Yes.
79. The earnings of the Temora line will be diminished? The Commissioners do not anticipate that there will be any alteration in the direction of the present traffic, and they have not allowed for the Wyalong traffic in the estimate for this line.
80. They think the whole of the Wyalong traffic will still go by Temora? Yes, practically the whole of it.
81. Although the difference in distance would be very slight? It is 20 miles.
82. What is the distance from Wyalong to Grenfell? From Temora to Wyalong the distance is 40 miles. From Grenfell to Wyalong by the most direct route the distance is $57\frac{1}{2}$ miles—that is, *via* Bimbi. So that it is practically 40 against 60.
83. Therefore, until the Koorawatha to Grenfell line is extended the Temora line will not be affected? I think not.
84. Can you say to what extent it will be affected by the extension of the line westward from Grenfell? I should think if the line were so extended, it would take, practically, the whole of the Wyalong traffic, because then the distance from Wyalong, *via* Grenfell, to Sydney would be shorter than the distance *via* Temora. This is the shortest route to Wyalong.
85. Can you say what percentage of the whole of the traffic on the Temora-Cootamundra line comes from Wyalong? I could not say.
86. Is it not possible to distinguish between the earnings of the railway line from Temora as compared with the earnings from Wyalong and beyond? It could be worked out; but it would be necessary to send an officer into the district to go through the station books, and he would have to take out the consignments.
87. Could you not say approximately? Not off-hand.
88. It is a question you would have to consider as between the Koorawatha and the Cootamundra line? It is a question you would have to consider if you had an idea of an extension to Wyalong; but as that was not before the Commissioners, they did not go into the question.
89. Did I understand you to say you had in view the possibility of a continuation of the line towards Hillston? Yes; the Commissioners think that will occur some day.
90. If that should be the case, you would touch at Wyalong, would you not? You would take a very big portion of the Temora traffic.
91. Do you think you would take 50 per cent.? I would not like to say without going into the matter.
92. *Mr. O'Connor.*] I think you said that the distance from Wyalong to Sydney, *via* Koorawatha, was shorter than by the other route? The distance from Sydney, *via* Grenfell, to Wyalong would be 325 miles, and from Sydney, *via* Temora, to Wyalong it would be 331 miles; so that there are 6 miles in favour of Grenfell. You may say that for all practical purposes the distance is the same, and the same comparison would apply to Hillston. There is one thing that would strike the Committee as peculiar in examining into this matter, and that is that by the western route, by the intermediate route, and by the southern route the distance from Sydney is practically the same.
93. Have you travelled personally over these different routes? No.
94. Do you know that there is a great difference between climatic influences in both places, and that the country to Wyalong is subject to inundation from time to time, rendering construction very expensive? That would be a matter for the engineers.
95. What you say is that one is 6 miles nearer than the other without any regard whatever to engineering questions? Yes.

H. McLachlan. 96. *Mr. Humphery.*] Can you say from memory if the Cootamundra-Temora line is paying expenses and interest upon the cost of construction? No, it is not. For the year ending 31st December last, that line entailed a loss of £2,100, and in the previous year there was a loss of £3,100.

21 Dec., 1897. 97. So that the loss last year diminished very considerably? Yes.

98. Can you speak as to the prospects of the present year? The figures are not worked out, the year not having closed; but judging from the monthly returns, the line does not seem to show any better return this year.

99. *Chairman.*] Have you a list of distances in connection with the proposed line? Yes; it is as follows:—

Young to Sydney (<i>via</i> Harden)	249 miles.
Koorawatha to Sydney (<i>via</i> Harden)	277 "
" " (<i>via</i> Blayney)	236 "
Blayney to Harden	113 "
Temora to Sydney	291 "
Young to Grenfell (includes 3¼ miles of constructed line)	33¾ "
Koorawatha to Grenfell	30 "
Grenfell to Wyalong, direct	57½ "
" " (<i>via</i> Bimbi)	59½ "
Temora to Wyalong	40 "
Wyalong to Hillston (<i>via</i> Rankin's Springs)	114 "
Harden to Sydney	228 "
Harden to Melbourne	348½ "
Sydney, <i>via</i> Grenfell, to Wyalong	325 "
" " Temora "	331 "

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

J. Harper. 100. *Mr. Hoskins.*] Have you been over the tract of country between Koorawatha and Grenfell? Yes.

21 Dec., 1897. 101. Is it a tract of country favourable for the construction of a railway, inasmuch as there would be no rough country to traverse? Yes; a comparatively easy line can be got. It is not absolutely level.

102. Is the land good? Very good.

103. Are there any people settled between Koorawatha and Grenfell, and does there appear to be a disposition on the part of people to go into that district and settle? There is fair settlement, but not dense settlement. There appears to be a strong disposition on the part of people to settle there. The average rainfall is about 28 inches, and the nature of the soil and its comparative proximity to market appear to render this country a desirable district for people to settle in.

104. There are a good number of farmers in that tract of country? Yes.

105. And the number is increasing? Yes.

106. Are not a good number of these settlers working the land upon which they are located on shares, the profits being divided between the landowner and the farmer? Yes.

107. Is there much Crown land available in that tract of country between Koorawatha and Grenfell, or land other than that which belongs to large landed proprietors, and which would probably be held on shares? The area of land given by the Lands Department, which we consider within the trafficable area of the line is between 340,000 and 350,000 acres.

108. Are the people who are clearing the land, and commencing to cultivate it in that district, men who have come over from Victoria and from other districts? Yes; there is a large percentage of Victorian farmers there.

109. Then they farm according to modern ideas? Yes; there are a lot of very good farmers in the district.

110. How long is it since you were in the district? About a month.

111. Is there any evidence that the number of farmers and intending farmers is increasing? I could only speak from hearsay. I have no means of comparison with anything I knew before; but it is about six years since I was previously in that district, and, on the occasion of my last visit, I saw a marked difference. Everything indicated that a very large expansion had taken place in settlement and cultivation.

112. Was there much clearing going on? Yes.

113. Are you acquainted with the class of country between Young and Grenfell? Yes.

114. Is the country between Young and Grenfell equally as good in quality as that between Koorawatha and Grenfell? There is not very much to choose between the two; they are somewhat similar in character. There is more settlement between Young and Grenfell, as it is the old coach road—it is the old highway really.

115. Are there many farmers located in the tract of country between Young and Grenfell? Yes; there are more houses, and possibly more farmers, on the road between Young and Grenfell than are to be found on the tract of country between Koorawatha and Grenfell.

116. Did you make an inquiry with a view of ascertaining on which route the larger quantity of wheat was produced? I cannot say that I went thoroughly into that phase of the question. The duty relegated to me was simply to ascertain the probable traffic on the line from Koorawatha to Grenfell.

117. From your experience and observation, having travelled over a great deal of the Colony generally, do you consider that the prospects of the district between Young and Grenfell are quite as favourable, from an agricultural point of view, as those of the district between Koorawatha and Grenfell? Do you mean as far as future development is concerned.

118. As far as their present development is concerned? Taking the railway aspect of the question in conjunction with the agricultural one, I do not think they are, for reasons which I shall explain. You will observe that between Koorawatha and Grenfell the proposed line is at right angles to the existing line. In the other case, the proposed line is not at right angles, but at an angle, and, consequently, would not assist, to any extent, in developing the area of country embraced in the triangle, neither would it assist in developing the land to the south and west of Young. On the other hand, the line from Koorawatha being at right angles to the existing line, it would practically serve the whole of the district through which it passed.

119. Has not the tendency of settlement been greater in the tract of country affected by the Young to Grenfell line than in the tract of country between Koorawatha and Grenfell? No; not from my observation. There has been more development between Koorawatha and Grenfell. Settlement has increased more. J. Harper.
21 Dec., 1897.

120. Do you account for that by the fact that the large landowners between Young and Grenfell are not disposed to offer inducements to people to take up land as compared with the landowners between Koorawatha and Grenfell? I could not say what the reason would be; I did not go into that. I simply inquired into the question of a line between Koorawatha and Grenfell.

121. Have you considered the question whether the circumstances of the country between Young and Grenfell are as good, as regards probable settlement and progress, as between Koorawatha and Grenfell? I should not like to answer that question as an officer of the Commissioners, but I should prefer to answer it personally; and I would answer it, as I attempted to answer it just now, in this way: that a line built in the direction of the proposed line would better serve the district by developing the country generally. There is another phase of the question—as I am now giving my personal opinion—and that is, that between Young and Grenfell you have a macadamised road which has cost a great deal of money, while between Koorawatha and Grenfell, and intermediate districts, you have absolutely no road. Those engaged in farming operations between Koorawatha and Grenfell have to depend absolutely upon bush roads, and in some cases sufferance roads, in order to get to the existing railway-stations between Koorawatha and Young.

122. If no railway were constructed between Young and Grenfell, what would be the average distance which farmers living contiguous to the road between the two places would have to haul their wheat to the railway station? In about 12 miles they either get on to the Young road or on to the Grenfell-Koorawatha line.

123. Looking at the matter as an officer holding a high position in the Railway Department, do you consider it would be more in the public interest to construct a railway from Koorawatha to Grenfell than from Young to Grenfell? Yes. There is a phase of the question which I might, perhaps, put before the Committee. Assuming that a railway were constructed from Grenfell to Young, you would be practically asking the Grenfell people, and all the intermediate people, to pay a longer haul for all time between their point of production and what must always, I suppose, be regarded as the chief point of consumption or distribution.

124. Will you kindly read to the Committee your report on the proposed line? Yes; it is as follows:—

As directed by the Commissioners, I have made careful inquiry as to the probable traffic on this proposed line of railway. The district through which it passes is a pastoral and agricultural one possessing excellent soil and a rainfall of about 28 inches. A large portion of the land is alienated, but there still remain about 350,000 acres in possession of the Crown. The settlement is not at present close, but there can be no doubt that with the exceptionally favourable circumstances of soil and rainfall the facilities for marketing produce associated with railway communication would bring about large development in agriculture. The district is also one so well suited for stock that the improved carrying capacity which invariably accompanies clearing and tillage would add very materially to the wool and fat stock production of the trafficable area of the line.

At present connection with the existing line of railway is made by road to Cowra, 35 miles, and Young, 32 miles, and sidings intermediate between these two centres. The former is the more favoured owing to its distance from Sydney, being only 219 miles as against Young 250 miles.

The existing rates of road carriage are:—

	Wheat per ton.	Wool per ton.	Goods per ton.
Grenfell to Cowra	10s.	25s.	25s.
„ Young	9s. 6d.	25s.	25s.

Stock is trucked at Forbes, Temora, Stockinbingal, and, in small quantities, at Young. The Cowra route is not favoured owing to the road being narrow and unprovided with reserves for the purpose of facilitating travelling.

Although it is manifest that this line is not intended to be a local one to Grenfell only, I have framed my estimate of traffic on the present production of the area within trafficable distance of Grenfell and intermediate points on the proposed line.

As circumstances would fully warrant it, an arbitrary rate has been adopted for the carriage of grain and stock.

The population of the district, which has been taken for passenger purposes, is 5,000.

	Estimate of traffic.		£	s.	d.
Goods—1,000 tons, at 10s.			500	0	0
Wheat and hay—2,500 tons, 15 miles, at 2s.			250	0	0
„ 2,000 „ 20 „ 2s. 6d.			250	0	0
„ 4,500 „ 30 „ 3s. 6d.			787	10	0
Wool—1,350 tons, at 5s.			337	10	0
Stock—500 trucks, at 15s.			375	0	0
Passengers—5,000, at 3s. 9d.			937	10	0
Sundries			150	0	0
Mails			360	0	0
Total			£3,947	10	0

In explanation I may say that the arbitrary rate for grain is a rate on the same basis as that which has been adopted for the Berrigan line, and which I used the other day in connection with the line from Coolamon to Ariah. The stock rate is an arbitrary rate based upon what we have existing on one or two other branch lines. The other rates are extension or through rates.

125. *Mr. Wright.*] Is the wool rate a through rate? Yes.

126. *Mr. Hoskins.*] Is the tract of country between Koorawatha and Grenfell pretty well watered? Yes, it is fairly watered; there are numerous watercourses.

127. Is it as dry a tract of country as that between Cootamundra and Wyalong, *via* Temora? No; the rainfall is about 8 or 10 inches more.

128. And there are more watercourses? Yes.

129. Therefore the land being good and water being pretty abundant, the country offers great facilities for pretty close settlement? Yes.

130. If a railway were constructed from Koorawatha to Grenfell, would not that be the best way of commencing a railway to tap the valley between the Lachlan and the Murrumbidgee Rivers? I should have some delicacy in expressing an opinion on that point. I should think it would be a very excellent way of reaching that district.

131. The country between the Lachlan and the Murrumbidgee Rivers is at present unprovided with railway communication, is it not? I should not like to commit myself to the statement that that is the best way of

- J. Harper.
21 Dec., 1897.
- of reaching the country mentioned, because I do not know what other schemes might be promulgated. But I have no hesitation in saying it would be a very good way of reaching that country.
132. Taking all the circumstances into consideration, looking at the railways we have already constructed in the Colony, do you consider that the tract of country between Koorawatha and Grenfell, having regard to the nature of the soil, the rainfall, and the popularity of the district, possesses advantages which entitle it to railway communication? Yes; the line is one which I have a good deal of confidence in recommending, as far as my personal judgment is concerned, to the favourable consideration of the Committee.
133. *Mr. Clarke.*] I understand that the distance from Young to Grenfell, and from Koorawatha to Grenfell is about the same? Yes; there is a difference of 2 miles.
134. Is the land on the proposed line from Koorawatha to Grenfell freehold or leasehold? I think the greater portion of it is freehold.
135. And I suppose in the hands of a few individuals? That I could not say. The Lands Department could give you that information.
136. You have already said there is a large population in the district, and would not that indicate that it is fairly well settled? It is fairly well settled, but many of the people may be farming on the halves system.
137. A good many of the farmers have come from Victoria? Yes; there are a good many Victorians in the district.
138. Is there a large area under cultivation about Grenfell? Yes, about 35,000 acres.
139. Are you of opinion that, as a rule, it is good country for the growth of cereals? Yes.
140. I suppose occasionally in very dry seasons there might be a failure of the crop to some extent? Yes; it has not failed to any great extent this year. They will have a very good average in the district. Their rainfall is fairly regular.
141. Can you give us any opinion whether this line from Koorawatha to Grenfell might be ultimately extended to Hillston? In my report I have taken the liberty of saying I could not regard it as a local line, especially in view of the fact that there is so much excellent country to the west of Grenfell.
142. The loss on the working of the line is estimated by you at about £2,000 per annum? Yes, including interest on the capital cost.
143. Do you think that loss would be ultimately reduced? Yes; I am very sanguine that it would be, because from my observation I should say that fully as much land as that at present under cultivation is cleared and waiting for cultivation.
144. Then you think that an additional 35,000 acres would be put under cultivation in a very short time? From what I observed while in the district I should expect that under ordinary circumstances.
145. And taking everything into consideration, you think that this is a line which should be constructed? Yes.
146. *Mr. Lee.*] Whereabouts are those 35,000 acres of cleared land in the neighbourhood of Grenfell? The good land extends to the west of Grenfell. There is excellent land both north and west—practically extending north-west as far as Lake Cowal.
147. Would you kindly describe to us where the lands are in the neighbourhood of Grenfell from which you expect the estimated railway return, and where the cleared lands are which you expect will double that return? They are all mixed up together; but I could give you the radius within which they are situated. The boundary would start at 4 miles from the existing line at Koorawatha, and would run due west to the foot of the Weddin Mountains, and from thence to Marsden; from Marsden it would extend back in a north-easterly direction to the parish of Warraderry, and from thence due south to the point of commencement.
148. How far west from Grenfell would the agricultural land extend? Thirty miles.
149. That would be a point equally as distant from Grenfell as Grenfell is from Koorawatha? Yes.
150. Do you estimate that the people in that direction will be able to cart their stuff to Grenfell, that being the terminus of the line? If the people at Grenfell to-day are able to carry their stuff to Koorawatha, I take it that people in the locality referred to would be able to carry their stuff 30 miles to Grenfell. I mentioned the fact rather in connection with the proposed extension.
151. Or it might be read the other way—lands that are now 60 miles from Koorawatha could not be successfully cultivated for wheat, whereas they could be cultivated if they were 30 miles from Koorawatha? They are cultivating the land to-day and successfully cultivating, relatively.
152. I presume that for 30 miles west of Grenfell their road to Young would be equally as good as from Grenfell to Koorawatha? They are carting 55 miles now to Young; in some cases they are carting to Temora, and in others to Forbes—that is from the point mentioned.
153. Where is the land situated that is going to produce the traffic to the railway? The land is spread all over this district until you reach the plain country—until you reach the Bland district. Until you get into open plain it is all agricultural country.
154. I think you will admit that any country under cultivation within 15 or 20 miles of a railway is very fairly served? I should not like to admit that in view of the decision of this Committee in the case of the Green's Gonyah line.
155. But as a matter of fact, if there is much of this agricultural land lying close to the existing line, that could be no reason for the proposed extension? No. I should like it to be understood that I am not pressing this extension.
156. So far as you put the case, if the line is made to Grenfell you feel satisfied that there will be sufficient traffic to make it pay? Yes; that is my position.
157. Do you think it will have the effect of bringing under cultivation a large area of land west of Grenfell which is not under cultivation at the present time? Yes.
158. If the line were carried from Young to Grenfell, it would have precisely the same effect, would it not? You would have to have regard to the increased distance.
159. The distance between Grenfell and Koorawatha and Grenfell and Young is practically the same? Yes.
160. The only difference being the base on the main line between Young and Koorawatha;—what is that distance? About 20 miles.
161. That is the only difference in point of distance? Yes.
162. If a line from Koorawatha to Grenfell would develop the land west of Grenfell, a line from Young to Grenfell would do the same? It might develop the land, but I do not know to what extent it would develop

develop the railway. The position would be this: Taking the shorter distance to Cowra by rail from Sydney, we should certainly get no goods traffic on the line at all, because the 35 miles of haulage between Cowra and Grenfell would be accomplished at a less cost than we could carry the goods for, charging a rate through from Sydney to Grenfell. J. Harper.
21 Dec., 1897.

163. But a distance of 30 miles in the carriage of wheat would be a very small matter? I am talking about the traffic generally. I am certain that if a line were built from Young to Grenfell, the wool and stock, which at present finds its way to Cowra, would continue to find its way there. The position is this: To-day Cowra is 35 miles from Grenfell; its distance from Sydney is 219 miles. Young is distant 250 miles from Sydney, and it is 32 miles from Grenfell.

164. Young is 31 miles further from Sydney than Cowra is? Yes; that is the position.

165. Is a distance of 31 miles going to control the carrying of wheat, considering that you carry it at such low rates? I am sure that if that line were built to-morrow not a bushel of wheat grown between Young and Grenfell would find its way on to the line unless it might be at Grenfell itself. It would find its way to platforms on the main line.

166. Grown how far from Young? I should say if it were grown to the north-east of the existing line it would find its way on to the existing line between Murrumburrah and Blayney.

167. Would not the same thing happen in the case of the Koorawatha line? No; for the simple reason that the latter would be built at right angles to the existing line.

168. You expect to take up your traffic at a point 4 miles from the existing line? Yes.

169. Would you not get more traffic between Grenfell and 4 miles of Young than between Grenfell and 4 miles of Koorawatha? I should not like to say that we would. As I said before, there is a macadamised road between Grenfell and Young, and I do not know to what extent that might be used for traffic purposes. I may say that I have not compared the merits of these two lines.

170. You have been over both? Not with the view to report on them both.

171. But you know the country? Yes.

172. You make a point of the fact that Koorawatha is much closer to Sydney? Yes.

173. I presume the object of the Railway Department is to bring the traffic as far south as is possible on to the main line—as far towards Sydney? All other things being equal, the closer you can get to Sydney the better.

174. In other words, is it the policy of your Department to make railway connections so that traffic will come nearer to Albury or towards Victoria? No.

175. You want to take your connections as close to the metropolis as possible? Consistent with properly developing the district which the line is supposed to serve.

176. Looking upon the metropolis as being the chief market of the Colony? Yes.

177. Did you in your estimate of revenue fix a special rate? Yes; the same rate that obtains on the Berrigan line—1½d. per ton per mile.

178. Has that rate proved satisfactory to the growers using the Berrigan line? So far as it has been in operation, yes.

179. How does the Berrigan line compare with other extensions as regards the earnings of the line? I have not looked at the matter with a view to comparison. The revenue is a good deal better than on other lines.

180. And lower in other cases? It is not as good as the Moree line, and it is a good deal better than the Lismore-Tweed line.

181. What will it cost to convey grain from Grenfell to Sydney? Fifteen shillings and fourpence per ton—that is *via* Koorawatha.

182. What is the rate from Koorawatha to Sydney? Eleven shillings and tenpence.

183. And what is the proposed local rate? Three shillings and sixpence.

184. If the same local rate were charged from Grenfell to Young as from Grenfell to Koorawatha, the through rate from Grenfell *via* Young to Sydney, would be 15s. 4d. also? Yes; I would draw attention to the fact that grain is not the only thing I have estimated for.

185. What are the rates for wool? From Grenfell to Sydney *via* Koorawatha adopting the local rate, the charge would be £3 2s. 6d., and it would be the same *via* Young.

186. Are there any items of traffic on which the rates would vary? Yes, every item, but the two mentioned.

187. Are they of importance? Yes; they embrace live-stock, passengers and goods of every other description except agricultural produce and wool.

188. Will you enumerate the articles on which there is a difference, and let us have the information at a subsequent stage? Yes.

189. I presume the only other competing route, with the two routes we have been considering, is that from Cootamundra *via* Temora to Wyalong? Yes.

190. From your knowledge of the country, and believing it to be desirable to reach Wyalong, which of the routes do you think is the best for the purpose? *Via* Grenfell, most undoubtedly.

191. Presuming Hillston to be eventually the objective point, are you of opinion that an extension could be made from Wyalong to Hillston that would fairly divide the country lying between the Murrumbidgee and the Lachlan, and give the settlers there a reasonable access to market? I should think it would be practicable, but I should not like to express any pronounced opinion about it.

192. You have not had an opportunity of going through that country? I have been through the country, but I have not been through it for that purpose.

193. Do you hold the opinion that if a line is constructed to Grenfell it must of necessity go beyond that point? I should most undoubtedly think it would. I think the country beyond would be found to have a good many recommendations.

194. And should that be the case, presumably Wyalong would be the first connection? Yes; I take it that Wyalong would be the objective point, because it carries a comparatively large population to-day; and apart from that, fairly good country would be got for railway purposes between the two places. It would be 10 miles closer from Wyalong by Grenfell and Koorawatha than it would be by Temora.

195. Wyalong, of course, would be the most important settlement after leaving Grenfell? Yes; that is the centre of population.

196. Although you have reported upon the proposed line, you have not reported upon it as a short extension only—as what you might call a cockspur line only—without having any future before it? As I have indicated

- J. Harper. indicated in my report the figures submitted deal absolutely with the extension to Grenfell; but I have incidentally referred to the possibility of an extension further west.
- 21 Dec., 1897. 197. If there were no future, if there were nothing beyond Grenfell, it would then be a consideration whether it would be desirable to make an extension to that place or not? I should think it would be.
198. You have arrived at your opinion with reference to this line in view of the fact that it will show a loss to start with, and that it has the possibility of an extension in the future? Yes.
199. And although there may be a loss at first, you are strongly of opinion that that loss will be more than compensated for? Yes.
200. *Mr. Wright.*] Can you give the Committee any information as to whether the crops in the district within the last two or three years have been a success or a failure? Last year they had a fairly good crop, and I think the year before. I do not think the crop has been less than 10 bushels.
201. Are you quite sure that you have not included within the radius that will come under the influence of the proposed railway any portion of the wheat-growing country served by the railway at Forbes? Yes.
202. You have visited the country in Riverina, and the country in the district under consideration where a great deal of farming is done on the halves system? Yes.
203. Would you have any objection to give the Committee the benefit of your experience, and state what are your views as to the possibilities of the halves system? I have not gone into the matter very critically lately in Riverina; but it appears to me, as far as I can gather, that this system is on a far more solid basis than it was some four or five years ago.
204. It appears to be a growing system? Yes.
205. What effect will it have on the country, in your opinion, with two classes of men, one owning the soil and the other cultivating it, and both naturally anxious to get the greatest possible result from it, without returning anything to it;—what effect do you think that system will have on the soil in the course of a few years? It will depend upon whether it is intelligently worked. For instance, at Barooga, a system was introduced by Mr. McFarlane, which I believe has been imitated in Riverina, by which the tenants for the time being are given the option, after they have taken three crops off the land, of shifting on to an adjoining block and spelling the land, or sowing it with lucerne. As a matter of fact, the frontages are let out now on Barooga in 10-mile frontages and about 250-acre farms, with accommodation, such as water, &c., common to all occupiers all along a line, extending, say, for 5 or 10 miles. After three crops have been taken off the land, the farmers have the option of shifting on to the other side of the frontage, and cultivating there.
206. The land is let out as in alternative farming? Yes; and it is not necessary for the farmers to shift their buildings or to provide water. If the share system is carried out on a plan of that kind, I think it is likely to be permanent and successful.
207. Does it strike you that the system which now prevails in this district must, in a very few years, lead inevitably to the complete exhaustion of the soil? There are portions of the district which are said to have produced crops for the last twenty years or more without exhaustion. I take it that every year we are improving in our methods of cultivation; and with improved machinery and better knowledge on the part of the cultivators, a good many of the evils which resulted in the past from bad tillage and bad judgment in farming will disappear.
208. Do you know if the experience in Victoria has been that very large areas of land which produced wheat under the halves system have become exhausted, and have gone again into the hands of the pastoralists for grazing purposes? Yes; but the mistake that was made there was that the land was let in areas that were too small. Every acre of it had to be cropped. There was no opportunity of giving the land a rest, and it became too dirty for successful cropping. The same thing has occurred in the Cowra district. The Cowra district was practically abandoned for cultivation on account of the dirty character of the land.
209. Am I right then in concluding that, as far as your experience and observation go, you think the present system of farming on halves is likely to be a success to both tenant and owner, and will not exhaust the soil? I think so, if it is intelligently carried out. Of course there may be exceptions to the rule.
210. Is it your experience that the bulk of the farming in this country is intelligently carried out or carried out in the greedy manner I have indicated? The latter has been the experience in the past.
211. Do you think that if that system is pursued it will lead eventually to the exhaustion of the land, and to its going back into pastoral occupation? I am sure it will mean that it will become so exhausted or so dirty as not to be fit to compete with virgin and better tilled land.
212. And hence the desire of the Victorian farmer to immigrate to New South Wales for a couple of seasons to work new land? I think a lot of them have come here for more than two seasons.
213. *Mr. Fegan.*] Are there other local rates than those proposed for this line? Yes; we have them on a number of branch lines.
214. Are there any local rates similar to those on the Berrigan to Finley line? No. That is the only existing line on which such a rate exists.
215. That is the highest rate? Yes.
216. And that is the rate you wish to apply to the proposed line? Yes.
217. If the route from Young to Grenfell is more thickly populated, and there are a larger number of holdings than on the route from Koorawatha to Grenfell, do you not think that is a consideration to which this Committee should give some weight? I think the Committee ought to weigh everything in connection with the line. I think it due to the district that the Committee should give consideration to the fact you have mentioned.
218. I think you will admit that where there is a population, and more especially such as you speak about, they contribute more largely to the expense of a line than in localities where large stations are to be found? Not always. They do not contribute so much to the revenue of the line.
219. But there are so many more consumers, and more small farms and so forth? Yes; no doubt every living soul means traffic.
220. The area you gave as coming within the influence of the proposed line included the Bland country? Not as regards agriculture, but only as far as wool is concerned. For wool traffic I included the country as far as Lake Cowal.
221. Do they not grow wheat in the Bland country? Not to any extent. It is pastoral country.

222. Where is Calderwood's holding? That is a long way from the Bland. I should think the really good agricultural country extends a distance of from 25 to 30 miles due west from Grenfell.
223. There is some good country south of the Weddin Mountains? Yes.
224. Would the traffic from that country come to the railway if a line were constructed there? I am not sure.

J. Harper.
21 Dec., 1897.

WEDNESDAY, 22 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Koorawatha to Grenfell.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

225. *Mr. Fegan.*] Have you prepared a statement showing the railway rates on goods, &c., from Sydney to Koorawatha, as compared with the rates from Sydney to Young? Yes; it is as follows:—

J. Harper.
22 Dec., 1897.

Goods and Livestock Rates.

From Darling Harbour to—	Dis.	Mis.	A.	B.	1st.	2nd.	3rd.	Truck.	Wool.		Grain, up-journey in truck loads, per ton.	Hay, straw, and chaff, per truck.	Livestock.
									Scoured.	Greasy.			
Koorawatha..... (via Blayney)	237	18/-	20/8	35/1	73/10	91/8	127/3	£29 14s. Od.	76/9	57/6	11/10	53/6	109/7
	30	3/1	3/11	5/6	11/9	14/2	18/8	10s. Od.	5/-	5/-	3/6	10/-	15/-
Young	267	21/1	24/7	40/7	85/7	105/10	145/11	£30 4s. Od.	81/9	62/6	15/4	63/6	124/7
	250	18/9	21/5	36/4	76/6	95/1	132/-	£31 0s. Od.	76/9	57/6	11/10	53/6	113/4
		30	3/1	3/11	5/6	11/9	14/2	18/8	10s. Od.	5/-	5/-	3/6	10/-

226. Yesterday you stated that the Bland country was not fitted for wheat-growing? Yes; the greater portion.
227. But I suppose you cannot get better country for fattening purposes? No; it is splendid pastoral country.
228. If a railway were constructed to Grenfell that would be the nearest route for trucking stock—nearer than Temora? Yes; the greater portion of the stock would be trucked at Grenfell.
229. What is the distance from Grenfell to Marendula, a station between Bimbi and Barmedman? I cannot say, but I can tell you where the wool from that station at presents finds its way. I have a list of the stations showing the wool traffic credited to the proposed line at Grenfell. Wool at present delivered at Young-Craggobilly, 803 bales; Tregalama, 186 bales; Lake Cowal, 1,278 bales; McCullum, 41 bales; Bimbi, 132 bales; Bogolong, 302 bales; Euroka, 63 bales; Weddin, 38 bales; Landria, 161 bales; Armagong, 100 bales; Bald Hills, 430 bales; small lots, 150 bales; total, 3,684 bales, weighing 1,614 tons. The wool that at present comes to Cowra is as follows:—Pinnacle, 557 bales; Tinpot, 124 bales; Grenelg, 564 bales; Wheoga, 628 bales; Oma, 858 bales; Brundah, 496 bales; Melyra, 64 bales; small lots, 321 bales; total, 3,605 bales, weighing 669 tons. The quantity of wool that finds its way at present to Monteagle is 400 bales, weighing 66 tons.
230. The figures you have given represent the wool that has been credited to the proposed line, and which at present finds its way to Cowra, Young, and Monteagle? Yes.
231. You have not the slightest doubt that all this wool would go to Grenfell? It would all find its way on to the line at Grenfell, or some intermediate point.
232. Have you been through the Bland country? Yes.
233. You have never been through it, I suppose, in flood time? No.
234. Have you ever heard that a great extent of it is flooded? I have heard its general character described as being very boggy, and I expect it is so. There is no doubt it is liable to flood. I do not know enough about it to give an opinion of any value.
235. There is plenty of ironbark for railway construction south of the Weddin Mountains, is there not? I do not know. It is very hard to say. There is ironbark and ironbark.
236. That is a great consideration in railway construction? Yes. We are getting plenty of good ironbark at Temora now; I do not know where it comes from.
237. *Mr. Hassall.*] In dealing with the question of traffic, have you taken into consideration the choice that would be offered to residents of the west who might wish to remove their stock in bad times and who would have an opportunity of bringing them by the railway to Koorawatha;—who would, in fact, practically have the choice of two routes? Yes; I do not attach very much importance to that, because our experience has not indicated that very large quantities of stock are ever moved, no matter what concessions are made. We moved very little stock last year.
238. So that the argument that a more direct route to the mountains would have a bearing upon the question of traffic as regards stock does not, in your opinion, carry much weight? No; our experience does not teach us that the opportunity for the transport of stock in the manner suggested is availed of to any extent.

- J. Harper. 239. You find, as a rule, that people prefer to let their stock perish on the run—at least, they leave them to the last moment, hoping for a change? Yes; or else we take feed to them. We carried enormous quantities of forage last year at reduced rates to districts where feed was required for stock.
- 22 Dec., 1897. 240. By having the junction at Koorawatha you would practically command both the Southern and Western lines for the supply of forage to this part of the country? Yes.
241. So that if there was nothing coming from the Southern district there would, perhaps, be something from the Western, and *vice versa*? Yes.
242. It would give a choice to the people of Grenfell and the district beyond of finding their supplies either in the west or in the south? Yes.
243. Have you taken into consideration the fact that, by taking the line to Koorawatha, Grenfell would be brought 40 miles nearer to Sydney than by the Southern route? Not 40 miles, but the difference between 267 and 280 miles. It is 237 miles from Sydney to Koorawatha and 250 miles from Sydney to Young.
244. Then Koorawatha is 13 miles nearer to Sydney than Young is? Yes, by the Western line; but Young is nearer to Sydney by the Southern line.
245. The distance from Sydney to Young by the nearest route is 250 miles, and the distance from Sydney to Koorawatha by the nearest route is 237 miles? Yes.
246. And what is the difference between Young and Koorawatha? Twenty-seven miles.
247. Then the difference between the distance from Koorawatha and the distance from Young, going by the Southern district, would be 40 miles? Yes, 27 and 13.
248. Have you travelled over the country lying between Grenfell and Wyalong? Yes.
249. And between Wyalong and Hillston? Yes.
250. You have traversed the whole of that country? Not the surveyed line, but I have been through it approximately.
251. What is your opinion of the country in regard to its suitability for agriculture? A lot of it is very excellent country.
252. You think that that country might be utilised for settlement if means of communication were provided? Yes; I think it is probable it would be.
253. Do you think that a line from Grenfell, no matter from what point, would be the first step towards an extension to the west? I should think that was contemplated. Of course I cannot tell what the object is, but that is what I should imagine to be the object.
254. From what you have seen of the country, and from what you know of it, do you think it would be justifiable to extend the railway further west from Grenfell? I do not know that I am in a position to express an opinion on that point.
255. You have travelled the road from Grenfell to Young? Not with the view of reporting on that line. It is five or six years since I was over that route.
256. Is there any great difference between the character of the country on the two routes? No very material difference.
257. Have you any idea of the grades between Young and Grenfell, as compared with those between Koorawatha and Grenfell? That is a question that I have never had submitted to me.
258. There has been a trial survey, I suppose? I believe so.
259. Have you travelled the country between Grenfell and Cowra? It is all more or less hilly country—broken. There are not very many great difficulties, I imagine.
260. It is not a fact that the point of departure was made at Koorawatha on account of the easy nature of the country? Yes; I think they were able to get through the gap in the mountain range from there.
261. The only difficulty in the range near Koorawatha, is it not? Yes.
262. And the grade up that is 1 in 75? Yes, I think so.
263. You have seen that country, and the enormous areas under wheat? Yes.
264. And you base your support to this proposal practically on what you have seen of the productiveness of that part of the country? Yes; on what I have seen of the area actually under cultivation, which, from the returns given at the various railway-stations where the wheat in the district would be delivered, shows, approximately, 10 bushels to the acre on 35,000 acres. Those figures correspond very closely with the returns actually obtained at our stations.
265. So that the one corroborates the other? Yes.
266. And that is traffic you can rely upon? That is the traffic I have placed before the Committee.
267. In addition to that, you expect a much larger area to be put under cultivation, giving a corresponding increase in the traffic? Yes; I fully expect a very considerably increased area will be placed under wheat in that direction.
268. The very fact of it being made convenient for them to dispose of their produce by rail induces people to put their land under cultivation, instead of growing wool? Yes; they would grow wool as well.
269. I believe you said they found it more profitable to grow cereals than to grow wool? Yes—or in combination.
270. But it naturally follows that if people saw that growing wheat was a more profitable occupation than growing wool, they would gradually turn their holding into wheat cultivation? I should think they would.
271. *Mr. Roberts.*] I notice from the Commissioners' report that the traffic on the proposed line is expected to more than pay working expenses? Yes.
272. And the report goes on to say that in time there is every reason to believe that it will not only pay working expenses, but also interest on the capital expended? Yes.
273. Within what period of time do you think the line would become a paying one? I scarcely like to undertake to say that; but from present indications I should think it should pay in the course of four or five years.
274. You think it would not only pay working expenses, but interest on the outlay? Yes.
275. You see the two areas marked on the map as representing the wool and the wheat traffic that would come to the railway? Yes.
276. Having been over the country, do you regard those areas as being correctly shown? Yes; I do not regard them as in any way extravagant. There is country more to the west which might claim to be included; but

but I purposely left that out in case at some future time we might have to deal with another stage of the line.

277. What area is represented on the map as being wheat-producing? I could not tell the actual acreage.

278. Taking Grenfell as the centre, would it extend 25 miles round? Yes; I should think that would be a fair estimate, speaking generally; though as to the portion due south of Grenfell, I will not speak definitely.

279. Going down south from Grenfell there is a ridge marked on the map; is not the land south of that ridge, towards Young, good wheat-growing country? Yes; there is some good land there.

280. Would it not be a fair thing to show that country on the map, as coming within the influence of this railway? No; I think the traffic from that portion of the country would come in by the existing road to Young. They would not go back to Grenfell, but would go on to Young by the road.

281. Is there much settlement between Koorawatha and Grenfell? The population is scattered; the settlement is not dense.

282. It is not to be compared to the settlement between Young and Grenfell? I do not know what settlement there is between Young and Grenfell; but six years ago that country was not very densely settled. There might, perhaps, have been forty or fifty settlers on the road, as far as I can remember.

283. Is not the settlement there sufficiently large to warrant favourable consideration being given to a line from Young to Grenfell, in preference to one between Koorawatha and Grenfell? I could not say. I do not know sufficient of the Young to Grenfell route to express an opinion on the subject.

284. Are both routes equally favourable for railway construction? That I do not know. I have not seen any engineers' reports which would enable me to speak as to the grades or cost of construction.

285. Where is the wheat-growing going on at the present time—east of Grenfell? Yes, and between Young and Grenfell; and also, to the west and to the north and to the south of Grenfell—in fact, in all directions.

286. And between Grenfell and Koorawatha? Yes.

287. Is much difficulty experienced at present in getting produce to market? There is no proper public road between Koorawatha and Grenfell. The road is a very broken one, going through lanes, and there are sufferance roads, and roads through selections.

288. Are you in touch with the extremely sanguine nature of the report, as to the line being a probable paying one shortly? I ought to be; I prepared the estimate for the Commissioners.

289. Would you mind telling the Committee what caused you to be so extremely sanguine as to the probability of this line being a paying one in the near future, seeing that at first it will show an annual loss of nearly £2,000? The character of the soil; the rainfall; the large quantity of undeveloped land which lies on the route of the line, and within a trafficable radius of Grenfell.

290. Is the land better adapted for the production of wheat than land in other parts of the Colony? I should not like to say it is the best in the Colony, but it is certainly very good.

291. You regard this as one of the best districts? Yes.

292. What is the difference in the character of the country between Koorawatha and Grenfell, and thence to Wyalong, and the country between Temora and Wyalong? Speaking personally and generally, I would rather have 1 acre of the land between Koorawatha and Grenfell, and about 25 miles west of Grenfell, than I would have 10 acres between Temora and Wyalong.

293. For what reason? Simply on account of its superior character. There is a better rainfall, and the land is free from the noxious scrub that prevails to a large extent in the district between Temora and Wyalong. That is a personal view; I do not know whether an agriculturist would agree with it.

294. What is the difference in the character of the country between Grenfell and Wyalong, as compared with that between Temora and Wyalong? For a distance of from 25 to 30 miles west of Grenfell the land is of an excellent agricultural character; then you open out on to the rich pastoral country of Bland until you get within a few miles of Wyalong, when you get into mallee and somewhat inferior country—practically the same country as that between Wyalong and Temora.

295. Do you not regard the country between Temora and Wyalong as good wheat-growing country? Where they had no better it might be good; but I cannot conceive the possibility of that land being used for wheat production for a long time.

296. Talking about mallee, do you not think it possible that that land will be eagerly sought after in the near future? I do not think it will in the near future. When we have no other good land it may be taken up; but I do not think it is likely to be rushed at present.

297. Not while people can get other land? No.

298. Have the Railway Commissioners been over the line, not only from Koorawatha to Grenfell, but as far as Hillston, *via* Wyalong, and Cudgellico? I do not think the Commissioners have been between Wyalong and Cudgellico.

299. In their report the Commissioners say that this line should be extended westward to Hillston? The question has never been officially before them to require their examination of that suggested extension, but I have no doubt the Chief Commissioner knows the character of the country.

300. Could you say upon whose report this opinion expressed by the Commissioners was formed? I should take it to be the personal opinion of the Commissioners, because they know that Hillston has been constantly kept in view—that Hillston and its neighbourhood should be an objective point for a railway, as it is a point where a divergence of traffic takes place to the southern colonies.

301. *Mr. Black.*] I am not quite clear as to whether you have stated definitely that you consider the country between Koorawatha and Grenfell equal to that between Young and Grenfell? Yes; I consider that there is very little difference—it is inappreciable.

302. I understood you to say that the distance from Grenfell to Sydney, *via* Young, would be 280 miles, and the distance from Grenfell to Sydney, *via* Koorawatha, 267 miles, or a difference of about 15 miles? Yes.

303. I understand from what you have said that one of your reasons for preferring the Koorawatha route, is, that it provides an alternative route to Sydney by either the Southern or the Western line? I was asked the question whether that would not be one reason.

304. If the communication to Grenfell were *via* Young, by which route would the traffic be taken to Sydney? By the southern line.

305. And if the communication were *via* Koorawatha, what would be the direction then? By Blayney and Bathurst to Sydney.

306. That would go over the Blue Mountains? Yes.

J. Harper.
22 Dec., 1897.

- J. Harper.
22 Dec., 1897.
307. Is there any appreciable difference between the grades on that line and the grades on the southern line at Moss Vale? No; by the time the improvements in the grades, which the Commissioners have in contemplation, have been made there will be very little difference in the two routes in the matter of grades. The Commissioners now have under consideration a number of alterations in the grades which will practically balance the two routes.
308. In this connection has the possibility of an extension to Forbes been taken into consideration? No.
309. Is there any likelihood of the area which lies between Young and Temora ever being tapped by a line which would be carried from Young towards Temora, and thence perhaps in the direction of Ariah—have the Commissioners ever considered that? No.
310. Looking at the map there is what might be called an isosceles triangle formed by the lines from Young to Koorawatha, by the projected line from Koorawatha to Grenfell, and the surveyed route from Young to Grenfell. If the line were made from Young to Grenfell, would it serve all that internal area surrounded by the triangle? I should imagine it would serve approximately about the area midway between Young and Grenfell. The portion beyond would continue to come into the main line.
311. Looking at the line from Koorawatha to Grenfell, about how far from Koorawatha would the traffic make for the new line? I have not estimated for anything within 4 miles of the existing line—that is to say, I have not credited any portion of the new line with traffic from the portion 4 miles from Koorawatha, because that traffic would either go into Koorawatha or to some other station on the main line. The estimate given practically represents traffic that would find its way on to the new line from the other side of the range.
312. You make the range your boundary? It is not so absolutely, but it is practically.
313. It is the boundary that operates against cartage? Yes.
314. According to the map there is a range extending on both sides of the line which is outside the area marked yellow? Yes.
315. Would not that range, which you say would operate against the cartage of goods to Koorawatha in the event of the line being constructed, also operate against the cartage of goods to the new line from places beyond the range to the north, south, and west? No; the traffic north between the range and the Cowra-road will come to a point where the surveyed line crosses the Cowra-road. North of that it would come into Grenfell.
316. But the range would cut it off, would it not? No; it would come into Grenfell.
317. Is there a good opening in the range there—a good road through? Yes.
318. Then how about the influence of the range westward; would it not cut off the traffic in that direction? No; it is not a very formidable range at any point, except when you come to the Weddin Mountains themselves.
319. Is there likely to be any development of the mining industry in the locality? Some people there speak confidently about it. I do not attach very much importance to it. It is always very difficult to tell in a district like that what developments may take place, especially with the improved methods of treating refractory ores.
320. It has been suggested by the Chairman that if there were any likelihood of mining development the connection with Lithgow would be valuable to the industry? Mr. Vaughn, an old resident of the district, who has a very good knowledge of mining matters, is confident that developments will take place there, chiefly in connection with refractory ores.
321. *Mr. Humphery.*] Is your evidence to this effect: that the maximum loss, by the most careful calculation, will be less than £2,000? Yes.
322. But you are confident that in a very short period the cultivation of wheat will be doubled? Yes.
323. The result of that cultivation will be to double your estimate of freight on wheat, making it £2,600 instead of £1,300, and thus reducing the deficiency from £2,000 to £700 on that item alone? Yes.
324. And that is without reference to the additional earnings on the main line by reason of the increased production in the district around Grenfell and beyond? Yes, and the additional traffic carried to the increased number of producers.
325. So that, although shortly after construction it may be a non-paying line, within a very short period it will be taken out of the list of non-paying lines, and will appear among those earning not only expenses but full interest as well? Yes, that is my view.
326. You are confident that that will be the result of the construction of this line? Yes.
327. *Mr. Wright.*] What do you think of a possible connection between Young and Forbes, *via* Grenfell, by the old trial-survey line? I must confess I do not see that many advantages would be derived from it.
328. Would that serve the whole area of country? No; it would not serve it in the same way that a line running west would serve it.
329. Would it not bring the great bulk of the country closer to the railway? It might have that effect as regards the country between Forbes and Grenfell, but it would not provide for the immense area to the west which is to-day without railway communication.
330. But it would provide for all the area you have marked on the map in connection with the Koorawatha line. I am dealing with the Koorawatha-Grenfell line as a line in itself? Decidedly. There is no doubt that this traffic would be taken to Grenfell, no matter how the line was built.
331. But a railway from Forbes to Young, by the route I have indicated, would provide all the country we are now considering with railway communication? Yes. Of course it would be practically a competing line, with one already in existence.
332. Your objection to that line is that it would not give any increased facilities to the west, and it would not offer any particular chance of extension? No. Some day or other it might be necessary to make the connection; but I cannot conceive it to be necessary now.
333. Have you ever thought where the population is to come from that is going to utilise the enormous areas of wheat land we have recently been asked to open by railway communication? I should imagine from indications I see all around me, that there would be no difficulty in obtaining the population if there were facilities for growing wheat.
334. Where is the population to come from? The people would come from the other colonies.
335. *Mr. Humphery.*] Having regard to Mr. Wright's question as to the desirableness of a connection between Grenfell and Forbes, what is the distance between those two places? The distance from Young to Forbes is 89 miles.

336. What is the distance from Young to Grenfell approximately? I should think it was 32 miles.

J. Harper.

337. Assuming the line from Koorawatha to Grenfell to be constructed, what would be the greatest distance of settlement between Grenfell and Young from the nearest railway station? Twenty-five or 26 miles in either direction.

22 Dec., 1897.

338. So that the district would be fairly served without making a connection between Young and Grenfell? Yes.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

339. *Chairman.*] Will you give the Committee a statement showing the rainfall in the district affected by the proposed railway? The average rainfall at the stations on the line from Koorawatha to Grenfell is as follows:—At the Glen, 25·98 in.; Warrengong, 27·39 in.; Cowra, 28·86 in.; Brundah, 26·35 in.; Grenfell, 27·85 in.

H. C. Russell,
C.M.G.

22 Dec., 1897.

340. These are stations east from Grenfell? Yes.

341. Therefore, the land lying between Young and Koorawatha and Cowra, and to the west towards Grenfell, has a rainfall of about 25½ inches, roughly? Yes. On the line from Young to Grenfell, going north, the average rainfall is as follows:—Berthong, 29·79 in.; Young, 27·95 in.; Warrengong, 27·39 in.; Nestle Brae, 27·74 in.; Brundah, 26·35 in.; Grenfell, 27·85 in. On the line from Cowra to Wyalong the average rainfall at the different stations is as follows:—Cowra, 28·86 in.; Mount McDonald, 29·59 in.; Brundah, 26·35 in.; Grenfell, 27·85 in.; Bogolong, 26·52 in.; Pinnacle, 22·99 in.; Bland East, 20·02 in.; Marsdens, 20·59 in.; Lake Cowal, 20·75 in.; Wyalong, 21·40 in.; Bolygamy, 20·66 in.; Blow Clear, 19·70; Morangarell, 23·79 in.; Barmedman, 21·02 in.; Mandamah, 21·41 in. These stations are all within a radius of 20 miles of the line specified.

342. Over what period do the records extend? In the case of Cowra, twelve years; Grenfell, seventeen years; and Young, twenty-four years. Taking the square degree in which Condobolin is situated, the average rainfall is 20·75 in., and that average is continued in the next square degree in which Wyalong lies. In the degree in which Forbes is situated, the average is 24·25 in., and the degree in which Young and Cootamundra lie shows an average rainfall of 26 inches. Cowra lies within the 24·25 degree. At Errowanbang, 15 miles north-east of Cowra, the average rainfall is 31·42 in., and at Carcoar it is 32·08 in. The land falls rapidly towards the west, which accounts for the much lower rainfall in that direction.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

343. *Chairman.*] You have a statement with regard to the population in the district affected by the proposed railway? Yes. The Cowra division of the Cowra electorate contains a population of 6,206, and this embraces much of the district around Cowra. At Koorawatha, which is on the southern boundary of the Cowra electorate, according to the electoral roll there are only 14 electors, which, taking the proportion at 4½, would represent a population of 60 or 70. The Young division of the electorate of Young, which includes the town of Young, has a total population of 5,260. The Grenfell division of the electorate of Grenfell contains a population of 5,142. That represents the country around Grenfell, and takes in a large area. The red line on the map is approximately the boundary between the electorates of Young and Grenfell.

W. McIntyre.

22 Dec., 1897.

344. So that around Grenfell and Young, and for a certain distance between those places, you have a population of 10,000? Yes. Between Grenfell and Koorawatha the population is sparse. I do not know the number of inhabitants, but I will supply the Committee with the information at a subsequent stage; and I will also give the Committee similar information with regard to the population between Grenfell and Young. There is a large population in Wyalong, which is included in the Barmedman division of the Grenfell electorate. The population there is 6,735. That takes in Barmedman, and I suppose 20 miles south and west, including Yalgogrin. Marsden division, which is between the Barmedman and the Grenfell division, contains a population of 1,338.

Charles Edward Rennie, Chief Draftsman of Lands Department, sworn, and examined:—

345. *Chairman.*] Do you produce a map? Yes; the map shows the land within 20 miles on each side of the proposed line from Koorawatha, *via* Grenfell and Wyalong, to Hillston and 20 miles beyond Hillston. At the eastern end it converges to a point at Koorawatha, allowing for the influence of the existing line from Cowra to Young. Within those limits the land alienated is shown by a blue tint and comprises 1,705,990 acres. Settlement and improvement leases, which are shown by blue hatching, amount to 276,730 acres. The reserves, which are shown by a green tint, embrace an area of 864,110 acres, and the area of the Crown lands is 1,981,140 acres. The reserves and Crown lands together amount to nearly 3,000,000 acres. The Crown land is held as follows:—Leasehold areas, expiring between 1898 and 1900, 951,310 acres; leasehold areas, expiring in 1918, Western Division—that is, west of the Lachlan River—106,160 acres. The land held under occupation license amounts in area to 366,310 acres, and the lands untenanted represented about 557,360 acres.

C. E. Rennie.

22 Dec., 1897.

THURSDAY, 23 DECEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Koorawatha to Grenfell.

William Henry John Slee, Chief Inspector of Mines, Department of Mines, sworn, and examined:—

- W. H. J. Slee. 346. *Chairman.*] In your opinion, are there any possibilities of mining development between Koorawatha and Grenfell? There may be, but not a great deal. The country is more agricultural than mining.
- 23 Dec., 1897. 347. As far as mineral resources are concerned between Koorawatha and Grenfell, until you approach close to Grenfell, you may dismiss that particular country from consideration? Yes.
348. Take Grenfell itself; will you describe Grenfell from a mining point of view? My opinion is that sooner or later Grenfell will again become one of the leading gold-fields of New South Wales. I have known Grenfell from its infancy. I was one of three who marked out the first allotments there, and I have been through every quartz-mine that has been worked at Grenfell. I have every reason to believe that sooner or later the Grenfell reefs will yield payable returns at a greater depth than that at which they have been tested up to the present time. The greatest depths at which the reefs at Grenfell have been tested is 720 feet. At one time Grenfell sent 8,000 oz. of gold per week to the Sydney Mint; but, as in the case of all our mineral fields, the alluvial or individual miner has disappeared and the company has taken his place. Companies in those days meant promoters and shareholders with very little capital, and that is the reason why Grenfell is in the position in which it stands to-day.
349. You believe there has been no real test of the lower levels? I believe if the Grenfell reefs were tested to a greater depth, they would turn out payable to a very large extent. There are a large number of reefs at Grenfell.
350. And you believe that Grenfell, by reason of its mining resources alone, has an important future? Yes, a very important future. There will be a large number of consumers, and the agriculturists will, of course, be the producers.
351. Coming down from Grenfell to Young, what is your opinion with regard to the possibility of mining development there? Between 7 and 9 miles from Grenfell, on the direct route to Young, there is a place called Tyagong, and it is very probable that the reefs there will be developed at a lower level.
352. Is there anything between the Tyagong Reefs and Young? There will be very little mining there. It is all agricultural country.
353. In speaking of the Grenfell mining district proper, will you state over what area it extends? In a south-easterly and north-westerly direction the quartz reefs of Grenfell may be said to extend for about 15 miles, and they are about 2 miles in width. Within the whole of that belt there is one mass of reefs which have been worked to a certain depth.
354. Do they pass through Grenfell going in a north-westerly direction? They go in towards Tyagong in the direction of Young; they do not go in the Cowra direction.
355. They extend pretty well north and south? Very nearly so.
356. Then, an area 7 miles south and 7 miles north of Grenfell, and approximately 2 miles wide, covers what you speak of as the mining district of Grenfell proper? Yes.
357. Therefore, for some miles in the direction of Young there would be some mining settlement, while no such settlement would exist east from Grenfell towards Koorawatha? That is so.
358. Going west from Grenfell towards Wyalong, is there anything until you get to Wyalong? There would be a little, but not a great deal of mining on the Bland.
359. Any mining development on the Bland is small? There is one place called Sandy Creek, 25 miles from Grenfell, almost on the road towards Wyalong, but that is the only place where anything payable has been obtained, and that has not been much.
360. Until you reach Wyalong? Until you nearly reach Wyalong.
361. What is your opinion of Wyalong from a mining standpoint? I have given my opinion frequently. I still think Wyalong is a permanent gold-field, and will maintain a mining population of 1,500 for many years to come.
362. That is in accordance with evidence previously given? Yes; in accordance with evidence I gave here in 1894 and since.
363. From Temora to Wyalong, what mining development is it reasonable to expect? There is Reefton, and also Barmedman; but I feel confident that sooner or later there will be a field between Wyalong and Barmedman.
364. Comparing the line between Grenfell and Wyalong, and that between Temora and Wyalong, you believe that in the vicinity of Barmedman, on the latter line, there will be an important mining centre the like of which will not exist between Grenfell and Wyalong? Yes; I believe that at what is known as Woodtown, and right across, there is an auriferous area running right through Yalgogrin. In fact, before Wyalong was opened, I reported to the Government that there was more likely working auriferous country between Yalgogrin and Barmedman than at Yalgogrin itself, and we see that Wyalong has since been opened. I am sure that between Wyalong and Barmedman sooner or later payable minerals will be discovered.
365. *Mr. Wright.*] Do you know where Bongongolong is? Yes, that is 7 miles from Grenfell on the road to Forbes.
366. Would you call that auriferous country? There is auriferous country between Forbes and Grenfell. At the Pinnacles, for instance, the reefs were worked thirty odd years ago. They remained unworked for some twenty-five years or more, and now they are returning payable gold.
367. The bulk of the country between Forbes and Grenfell is more or less auriferous, is it not? There is no doubt that we shall have a goldfield between Forbes and Grenfell in the future, and we should have had one there before had it not been for the freehold property. The Mining on Freehold Lands Act will overcome former difficulties.

368. *Chairman.*] Why do you think the railway should go from Temora to Wyalong? My opinion is that it would be in the public interest to open up that part of the country. It is a very dry area of country, and I believe that gold and other minerals will be found there if the country is once properly opened. Under the Mining on Private Lands Act we can get on to the land now where we formerly could not do so, and I believe that sooner or later we shall have a prosperous mining population between Temora and Wyalong. W. H. J. Slee.
23 Dec., 1897.

369. Which you do not expect between Grenfell and Wyalong? No; that is an agricultural district.

370. You do not expect any mining development there? No; but I regard Grenfell as one of the best mining districts in New South Wales, if properly handled.

371. *Mr. Humphery.*] What is the present mining population of Grenfell? I do not think the population actually engaged in mining at the present time exceeds between 200 or 300.

372. Were there as many in 1894, as at the present time? There was just the same number, and there has been for years; but Grenfell at one time had a population of 15,000.

373. There has been no increase in the mining population during the last three years? There has been no decrease. Recently, mining companies have taken up land there, and there is a probability of a great increase in the population.

374. Upon what do you base your expectation that there will be in the future a large mining development at Grenfell? I speak from an experience of forty-two years in mining. At one time I made a report on Cobar when only three men were at work in the Cobar copper-mine, and I stated then that Cobar would be a great copper-mining district. We see now that Cobar is going ahead as a mining district. Grenfell would do the same, only it has not had the capital, and it has not been developed. It has always been in the hands of poor parties who could not afford to go down to the lower levels.

375. Has there been no inducement for the investment of capital during the past few years at Grenfell? The inducement is there; the reefs are open for anybody, except perhaps where they are taken up under lease by someone.

376. Has there been any difficulty in the past in acquiring control of a sufficient area of ground to encourage the investment of capital? I do not think so. I think large areas in the shape of leases have been granted there without any trouble.

377. Then to what do you attribute the neglect of Grenfell? The men who have taken up these leases have, generally speaking, had no capital at their back, and when they got a capitalist they wanted to get too much out of him. Instead of being satisfied with fair prospects and fair treatment they wanted to get everything out of the capitalist, so that nothing was left to work the mines.

378. If there was a reasonable prospect of the realisation of the expectations which have been expressed to-day, do you not think the necessary capital would be forthcoming? It might be, sooner or later; but there has not been much capital available lately. There are some Victorian parties there now.

379. With regard to Wyalong, has there been any increase in the population since you gave evidence in 1894? The population of Wyalong, in 1894, was between 8,000 and 10,000. I suppose it is now between 2,000 and 3,000.

380. Then are we to understand that the population of Wyalong has diminished by 7,000 or 8,000? Yes. But at first there was a rush, such as commonly occurs. At Peak Hill, for instance, there was a population at first of 10,000, but in less than three months there were only about 2,000. It was at the height of the rush when the larger population was there.

381. You have been frequently to Wyalong? Yes.

382. What was the population, as far as you can remember, in 1895? In 1895, I suppose, it had fallen to 4,500 or 5,000.

383. And in 1896? About the same.

384. And now you say the population is between 2,000 and 3,000? Yes; and that is a population which is likely to be there for years to come.

385. Can you explain why the population has so rapidly diminished? Yes; I can easily explain that. On a new rush, perhaps the district or the zone, or part of an alluvial tract of country, may be prospected or worked for 10 or 12 miles, of which, perhaps, only 3 or 4 miles may be payable. Gradually, but surely, all the outside parties have to leave. There is no inducement for them to stop. Such was the experience at Gympie, for instance, and Charters Towers. At one time there was a very large population, but it has gone down, though there is still a large payable gold-field.

386. Can you explain the sudden loss of population between 1896 and 1897? That is explained by the fact that nothing new was found. Another reason is that formerly the claims were worked under the miner's right system, by which one man could only hold 60 feet along the line of reef, which would mean 480 feet for eight men. Leases are now granted, and the requirement as regards labour is not so great.

387. Do you consider that the present population is likely to continue there, or to increase? I hold that from 1,500 to 2,000 people are likely to be there for many years. I speak of a mining population, apart from agriculture.

388. Do you know the total population of the Wyalong district? I believe last year it was 3,000 or 4,000.

389. What has been the output of gold from Wyalong since 1894? I think you might reckon that 30,000 oz. of gold per annum has been got out of Wyalong from, say, the end of 1894 to the present time. That has been the average.

390. Do you think Wyalong is yielding that at the present time? Yes.

391. Are you speaking of the district of Wyalong, or do you include Yalgogrin, and other places lying between Young and Barmedman? Yalgogrin is 24½ miles distant from Wyalong, and I have always regarded it as separate. Yalgogrin was discovered before Wyalong.

392. Then you are speaking of Wyalong only when you say that the average annual output of gold has been 30,000 oz. I refer to the country surrounding Wyalong.

393. Upon what are your expectations based as to the development between Wyalong and Barmedman? I believe that sooner or later we shall have a gold-field between Wyalong and Barmedman.

394. Why do you believe that? From the auriferous indications along the surface. I was over that country before Wyalong was opened.

395. Has not the whole of the country been very closely prospected? No; although a population may have been there, the country has not been prospected.

- W. H. J. Slec. 396. Has the country between Barmedman and Temora been prospected? It has been prospected to a great extent, but not prospected fully. They have just gone on one particular line; they have not allowed for anything there might be on the one side or the other.
397. Are there any surface indications to lead you to suppose that there would be a great development in the area you have described? There are surface indications right through from Temora to Wyalong and Yalgogrin which make me believe that sooner or later we shall have as good finds of gold or other minerals there as we have had anywhere.
398. Are these surface indications unknown at the present time to the mining population of Wyalong and Temora? That I could not say. They might be known to some of them.
399. Have you in any of your reports indicated the existence of these surface indications? Yes; I sent in a report the last time I was examined here on the proposed railway to Wyalong, in which I indicated that gold would be discovered between Yalgogrin and Barmedman, and again, that gold would be discovered between Barmedman and Hillston, and right along the line on to Woodtown.
400. Have you made that public? Yes; the Government always publish these reports.
401. And still there has been, so far as you know, no investment of capital in that district? No. I may say, as far as that goes, that in 1883 I reported on the back country districts in regard to a place called Restdown, and last week the Member for Cobar suggested that I should visit there, because gold had been found. Although I reported in 1883, 1884, 1887, 1892, 1895, and 1896 on some of the districts, and my reports were published, it is only this year that gold has been discovered.
402. So that you have done your best by your reports to show the extent of the auriferous country you have described? Yes.
403. Have you travelled from Wyalong in the direction of the Lachlan? Yes; I have been from Wyalong right on to Hillston, and from Hillston on to Hay.
404. Will you point out on the map the auriferous country between Wyalong and Hillston? The auriferous belt extends west from Wyalong through Yalgogrin and then goes north through Ungarie. The range that is shown as intersected by a line running direct for Wyalong to Lake Cudgellico is also auriferous. Going towards Lake Cudgellico, any discoveries there have been in short shoots. In my opinion there is not a very great future for the mining enterprise adjacent to Lake Cudgellico. From Lake Cudgellico, going down the Lachlan towards Hillston, I do not expect very much. From Hillston towards Rankin's Springs, I have no knowledge that enables me to express an opinion favourable to the mining industry. Going south from Rankin's Springs towards Yalgogrin, I have no very great hope of a mining future.
405. Within how many miles of Wyalong in the direction of the Lachlan River, do you regard the country as auriferous? After you go from Wyalong you get into the metalliferous country for about 50 miles here and there. You can depend upon it that you will get similar reefs such as are now worked at Yalgogrin, some 25 miles further on.
406. Have any of the reefs at Wyalong been tested to any depth? One shaft has been sunk to a depth of 500 feet. That is the Light-house shaft, a prospecting shaft. They have certainly not as yet got any payable gold. In fact they have not got the reef. During the last month they got down to a depth of 500 feet from the surface through solid granite, and they are now cross-cutting to see if they can get the reef. The deepest payable gold so far at Wyalong is between 250 and 300 feet.
407. Who are the owners of the claims to which you refer? There are several claims about that depth. There is the Blue Jacket, the Mallee Bull, Bolter's, and the White Reef.
408. What has been the result at that depth? The reefs are still keeping on, only, as is quite natural, when the hard rock is encountered and water is met with, the ore becomes refractory. On the top where the atmospheric action has any power the ore is oxidised and becomes free, but as soon as we get below the water level, oxidation ceases, and the ore becomes refractory.
409. But has payable gold been obtained at the depth you speak of? It has been obtained at a depth of between 250 and 300 feet.
410. What is the width of the reef? The reef at Wyalong has at no time been very wide, but in some cases it is about 18 inches.
411. Is that the widest? I think the widest reef worked at Wyalong is, on the average, about 18 inches. At Grenfell the reefs were as much as 15 feet in width.
412. Have many claims gone down to a depth of 250 feet? There must be a dozen or more claims which are down to a depth of over 200 feet.
413. Are they still being worked? Yes.
414. Do you know whether the whole of these claims are payable? They are considered payable. The crushings have turned out well. Of course, the cost is greater below the water level than above it.
415. Do you look upon these claims as likely to be permanently payable? I think so. I think they have as good a prospect there as in some of the Queensland mines. At Charters Towers the formation is identically the same, and the reefs there were, to a certain extent, similar, being in granitic formation. It is a characteristic of the reefs in Australia that we have complete blanks in them.
416. *Chairman.*] Bearing in mind the future developments at Grenfell, and in the auriferous country you have described between Yalgogrin, *via* Wyalong, and Barmedman and north again of that, is it important that these districts should be as close to coal-fields as possible, or is that a matter of little importance? As far as gold-mining is concerned it is a matter of very little importance. In this case I do not think we shall have to deal with a large area of copper country. We might, perhaps, get a silver lode or so in the Tyagong district, but otherwise the country would be auriferous. The chlorination works would not use much coal. One establishment would do for the whole field.
417. Then the contiguity of coal is not of much importance? I do not think so.
418. Where does the bulk of the 30,000 oz. per annum, which you say is the product of the Wyalong district, come from? From the Wyalong reefs. It is only during this year that the Yalgogrin claims have really given any yield. They gave no yield before, because they were never worked and prospected.
419. *Mr. Humphery.*] Have you any figures to show the output of Yalgogrin and places other than Wyalong? Barmedman has very little at present. This information will not be available until the end of the year.
420. In expressing the opinion that a railway should go from Temora to Barmedman to Wyalong had you simply in view the probable development of mining there? Yes; I have always held the opinion that the Temora line should go by way of Barmedman on to Wyalong.
- 421.

421. Would not Barmedman, and the whole of the district to which you refer, be equally served by an extension from Grenfell to Wyalong? That may be. W. H. J. Slee.
23 Dec., 1897.
422. What distance would Barmedman be from the nearest point on the line between Grenfell and Wyalong? From 15 to 20 miles.
423. If that line were constructed, would not Barmedman be as well, or nearly as well, served as by a line from Temora to Wyalong? Yes, that may be; but I believe there will be more gold got between Temora and Barmedman, and the districts right through there, than will be got between Grenfell and Barmedman.
424. *Mr. Fegan.*] In reply to Mr. Humphery you said that mining at Grenfell was at a standstill? It is, to a certain extent; they are still working. I said that they were not developing the lower levels.
425. I suppose you are aware that in 1895 there were only fifteen leases; in 1896, twenty-five leases; while in 1897 there are thirty leases—that in other words, the number of leases has doubled in two years? Yes. I have already stated that lately Victorian companies have come and taken up land.
426. In your report you use these words: "The richness of the Grenfell quartz reefs is now a matter of history, several of which gave several thousands of pounds sterling to the working shareholders. In my opinion it only requires energy and perseverance, combined with an economical system of prospecting the deeper levels, to once more place Grenfell in the first rank of quartz-reefing districts of New South Wales." Do you still express that opinion? Yes.
427. Do you think a railway would give any impetus to gold-mining there? The machinery and everything would cost less to bring on to the field, and the transport of refractory ores for treatment might be reduced in cost.
428. In view of the treatment of the ore locally at Wyalong, and the consequent large consumption of fuel there, do you not think the question put by the Chairman as to the carriage of coal to the field is not an important one, in considering the route of the proposed railway? In my opinion it is of very little consequence. I am quite certain that as long as you or I live, Grenfell will never have to look abroad for a coal supply.
429. In 1895 the value of gold in the Grenfell field was £3,578, in 1896 it rose to £6,978? Yes; that is what I say—it only wants prospecting and developing.
430. In 1895 you made a report, in which you made reference to Victorian capitalists coming in to develop these mines;—does the influx of that capital partly explain the increase of gold? At the latter end of last year and the beginning of this year, the Victorian companies commenced to sink. They are now beginning to sink main shafts, and intend to develop the reefs to a greater depth than has ever been done before.
431. Can we attribute any increase in the yield to the fact of this capital coming into the field? I think so.
432. But you say they are only sinking now? They are taking out the old stopes as well.
433. Therefore, you attribute part of the progress made in the Grenfell mining district to the influx of Victorian capital? Yes.
434. And you say that with a greater amount of capital, and deeper sinking, the Grenfell mining district will be as great as ever? I think so.

William Henry Patrick Cherry, Chief Compiler, Government Statistician's Department, sworn, and examined:—

435. *Chairman.*] Will you give the Committee some information regarding the agricultural statistics in connection with the proposed railway? Taking the district of Grenfell first: It consists principally of these parishes—Brundah, Weddin, Kikiamah, Coba, Tyalong, Iandra, Cudymaguntry, Bumbaldry, Yambira, and Bungalong. Then on the other side there is the district of Bimbi, which at one time formed part of the Grenfell district. That consists of the following parishes:—Bimbi, Euroka, Berendedda, Caragabal, and Barbingal. Taking Grenfell and Bimbi together, the number of holdings is 287. The area alienated is approximately 360,000 acres, and the area of Crown lands occupied is 369,000 acres. The total area cultivated in that district, taking the figures for 1896, was 28,375 acres, the principal crop being wheat, of which the area was 24,815 acres, and the yield 229,402 bushels. In the Grenfell part of the district, the area cultivated was 22,907 acres, and the yield 213,171 bushels. In the Bimbi portion—that is, on the other side of Grenfell—the area cultivated was 1,808 acres, and the yield 16,231 bushels, or an average of over 9 bushels to the acre. For the past season the estimate for the two districts mentioned—Grenfell and Bimbi—is 29,546 acres under cultivation, yielding 344,556 bushels. In the Grenfell part of the district the area cultivated is estimated at 27,300 acres, and the yield at 327,600 acres, the figures for Bimbi being—area cultivated 2,246 acres, yield 16,946 bushels. These figures show an average for this season of 12 bushels to the acre, and I am inclined to think the actual yield will be a little more than that. W. H. P. Cherry.
23 Dec., 1897.
436. What is the ordinary average yield for Grenfell? I think 10 or 11 bushels. I will obtain accurate information on that point for the Committee. We have had information which would lead us to believe that the yield this year would be more than 12 bushels, because in some parts of the Grenfell district the crop this season is 14 and 16 bushels to the acre. Taking one year with another, 12 bushels would be very good for the Grenfell district.
437. What about other crops in the Grenfell district? The other crop is principally wheaten hay. The statistics show about 60 acres of grape vines and about 50 acres of fruit trees, which is proof that these products can be successfully cultivated.
438. Can you give any information showing the comparison between the present productiveness of the country between Young and Grenfell, and that between Koorawatha and Grenfell? I can give figures as regards the district between Young and Tyagong, which would be three parts of the way to Grenfell. Within that limit the number of holdings is 397, the area alienated is about 150,000 acres, and the Crown Lands occupied amount to about 5,000 acres. The total area cultivated is 15,000 acres, of which 10,698 acres consist of wheat, the yield being 101,842 bushels. Of these figures I would not regard more than two-thirds as applying to a railway from Young to Grenfell. Taking two-thirds the result would be:—Number of holdings, 260; area alienated, about 95,000 acres; Crown lands alienated, 3,000 acres; total area cultivated, 10,000 acres; the area under wheat being 7,130 acres, and the yield 67,895 bushels.
439. By how much would you increase those areas if you went as far as Grenfell? I am not prepared to say, because from Tyagong to Grenfell is included in a portion of the area which I have already given as belonging

W. H. P.
Cherry.
23 Dec., 1897.

belonging to the Koorawatha to Grenfell line; but it appears to me that a line from Young to Grenfell, when it got halfway to Grenfell, would serve the greater part of the district that would be served by the Koorawatha line. I think a line from Young to Grenfell would serve more people and a larger agricultural area than a line from Koorawatha. The figures with regard to the Wyalong district, taking the country which I consider would come under the influence of the railway from Grenfell to Wyalong, are as follows:—Area alienated, 161,000 acres; area of Crown lands occupied, 222,000 acres; total area cultivated, 4,745 acres; total area under wheat, 2,418 acres, yielding 45,000 bushels. For the present season it is estimated that the yield from 605 acres at Wyalong will be 9,680 bushels, which is about 13 bushels to the acre. I should like to make a comparison between Wyalong in 1896 and Wyalong in 1897. In 1896 there were only 136 acres, yielding 847 bushels. This year the area jumped from 136 acres to 605 acres. It is therefore evident that they can grow wheat at Wyalong, and if they can grow wheat at Wyalong and in the Bimbi district I have no doubt they can grow wheat in all the intervening country, with fair seasons.

440. *Mr. Hoskins.*] How do you account for the statement that there is a larger population to be served by a railway and a larger area of land under cultivation between Young and Grenfell than between Koorawatha and Grenfell? Between Young and Grenfell the distance is greater. It covers a somewhat larger tract of country, and the number of small holdings between Young and Grenfell is greater than on the other route. I can say from my own knowledge that the country between Koorawatha and Grenfell is splendid agricultural land.

441. And from Young to Grenfell? I do not think there is much difference.

TUESDAY, 4 JANUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Koorawatha to Grenfell.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and further examined:—

C. E. Rennie.
4 Jan., 1898.

442. *Chairman.*] You were requested to furnish the Committee with some further particulars? Yes; I was asked for particulars of the land within 20 miles of the proposed line from Koorawatha to Grenfell giving the details of the tenure. They are as follows:—Alienated land, 531,960 acres; settlement and improvement leases, 17,260 acres; reserves, 142,330 acres; Crown land, 92,820 acres. The Crown land is thus more fully described: Leasehold areas, expiring from 1898 to 1900, 55,680 acres; held under occupation license, 33,120 acres; untenanted, 4,020 acres. The area of country I have just described is within 20 miles of each side of the proposed line converging to a point at Koorawatha to exclude the area under the influence of the existing line from Cowra to Young. In addition to the above particulars, the Committee asked me to give the particulars as to the land between the Young and Grenfell line, the Young and Koorawatha line, and the limits of the area just described. The area is as follows:—Alienated land, 79,860 acres; reserves, 2,860 acres; Crown lands, 1,000 acres. That is to the north-east only of the Young to Grenfell line. I have also particulars of the area south-west of the line from Young to Grenfell and east of the area before described within the 20-mile limit of the Grenfell to Koorawatha line. The particulars are—alienated land, 40,740 acres; reserves, 1,900 acres. I have also particulars as to the land within 20 miles on each side of the line from Young to Grenfell converging to a point near Young, so as to exclude the country served by the Cowra-Young line. The particulars are as follows:—Alienated land, 613,980 acres; settlement and improvement leases, 17,260 acres; reserves, 134,380 acres; Crown lands, 88,040 acres. The tenure of Crown lands is as follows:—Leasehold areas, expiring from 1898 to 1900, 59,420 acres; held under occupation license, 28,620 acres; untenanted, nil.

John Christian Watson, Esq., M.P., sworn, and examined:—

J. C. Watson,
Esq., M.P.
4 Jan., 1898.

443. *Chairman.*] You represent the electoral district of Young in the Legislative Assembly? Yes; I should like first of all to make a statement to the Committee. I may say that I do not favour the construction of a line from Koorawatha to Grenfell, believing that preference should be given one from Young reaching Grenfell by what is known as the White line, that is the latest survey made by the Department. In support of that view I should like to give the Committee a few particulars which have been collected by the railway league formed a little while ago at Young. A former Government proposed a line from Young to Grenfell; it is permanently surveyed; the land, 40 chains on either side, being within a railway reserve which has existed since 1883. That railway reserve, I presume, would only have the effect of precluding any claims for damage on account of severance to land which has been alienated since the reservation was made. I do not think any claims would extend further than that, but I may be mistaken.

444. Is the reserve in existence now? Yes; right through to Grenfell the reserve still exists, although it has not been kept from occupation. The land has been occupied, but I presume that in view of the reservation there could be no claim in respect of severance. Some of the land is leased; there are various titles. I am informed, and I believe credibly, that, in the alienation of land passing across this reserve, for railway purposes the State has preserved a sufficient area upon which to construct a railway. Therefore there would be very little cost on account of resumption. In any case the cost of resumption would be minimised. I mention the matter now in order that the Committee may look into it. The present settlement along the line is, no doubt, largely due to this promise. The construction of a line from Young would be warranted presently by settlement and trade along the route. The Committee at Young have interviewed fifty-eight landholders on the line, representing 102,122 acres; fifty-six holders asked for the line;

line; four holders, representing 17,900 acres would give the land required for railway purposes; three holders representing 10,520 acres would make concessions, and one other would probably do the same. 10,342 acres on the said holdings are under permanent farm crop; thirteen holders are increasing their areas under cultivation by 5,443 acres; twenty others are also increasing their areas. The annual sales from the above named holdings are—wool clip, 1,605 bales; wheat, 116,000 bushels; stock, 31,570 sheep; 1,077 cattle. The present population on these holdings is 445—that is upon those immediately contiguous to the surveyed line between Young and Grenfell. There are five public schools on the route, and three a few miles from it; whereas on the Koorawatha-Grenfell route there is only one school on, and one other near, the route. The arguments in favour of the construction of this line may be summed up as follows:—The country can be easily cleared at a low cost, there is ironbark timber for sleepers in the Weddin ranges, 10 miles west of Grenfell, with good box, and pine timber near Bimbi; ballast at suitable points; clay for bricks along the route, and plenty of water for locomotive purposes at Bulla Creek, Tyagong Creek, and Burrangong Creek. The distance from Young to Grenfell is 32 miles, over 3 of which are laid. The distance from Koorawatha to Grenfell is 30 miles. The line from Koorawatha would principally traverse private property in large estates thinly populated, whereas the Young-Grenfell line would pass through splendid agricultural land on which there are probably more farmers than on any 30-mile track anywhere in or around the districts of Young or Grenfell. The line to Grenfell should also be a section of what may be termed the federal route from Young to Werris Creek, of which 24 miles are already laid between Forbes and Parkes. It may also be mentioned that the Harden-Blayney line shortens the distance between places west of Blayney and the Victorian capital by no less than 375 miles; also by connecting the southern and western line, it enables residents of the Western districts to travel south, and residents of the Southern districts to travel west, without crossing the mountains or passing through the metropolis, and thus shorten the journey in either case by 115 miles. In the same way, the federal line would shorten the distance between Werris Creek and Demondrille Junction by 150 miles. The sphere of usefulness of the portion of the Harden-Blaney line, between Young and Demondrille, will not be complete until it is part of the federal line connecting Queensland and Victoria, which will further not only various local interests but also those affecting the Colony; by connecting the three great colonies it will be of advantage to Australia. The conveyance of fat and store stock from Southern Queensland and Western New South Wales to the Wagga, Albury, and Victorian markets, is of obvious advantage to the Colony. The chief points in the statement of the case submitted by the Young Committee seem to me to be these—that in the first instance, the line between Young and Grenfell has been twice surveyed; the latest survey, known as the White line, being adopted by the Department; that in view of these surveys settlement has taken place since 1883, in the expectation that the line would be constructed within a reasonable time. The holdings are also of smaller extent, and are very much more numerous than upon the other route, averaging only somewhere about 2,000 acres. Those would be the holdings immediately touching upon the surveyed line. Then further, there is at present just as much cultivation on the route between Grenfell and Young, as on the route between Koorawatha and Grenfell. The land is admitted to be equally good in both cases, and in view of the fact that the Railway Commissioners anticipate a loss of nearly £2,000 per annum upon the proposed line between Koorawatha and Grenfell, it seems to me that the extra population now existing between Young and Grenfell would go a long way towards making good that loss. I think some stress should be laid upon this extra population. Another point is, that upon the Young-Grenfell route there is a larger number of public schools, which in itself points to the existence of a larger population. I think the statements made by the Young Committee in regard to the existence of suitable railway material upon the Young-Grenfell route may be relied upon as correct. The material, in my opinion, would be more easily obtainable upon that route than upon the Koorawatha-Grenfell route.

445. The arguments you are now bringing forward are in the direction of cheapness of construction? Yes. Respecting the grades I cannot speak as an engineer; but in view of the fact that the line from Young to Grenfell would follow generally the course of the Burrangong and Tyagong creeks, I think it must follow that the grades would be pretty easy; either one or other of those creeks is never departed from until near Grenfell. The route also avoids the range which is passed, although at a low elevation, between Koorawatha and Grenfell. That range has to be crossed about 5 miles out of Koorawatha, whereas on the other route it is avoided.

446. On the Young route you pass over the toe of the range where it sinks into the creek? Yes; the line follows generally the line of the Burrangong and Tyagong creeks. As to freight charges, I think it would be found that they will amount to about the same in either case in respect to nearly all the goods sent over the route. I admit that the distance to Sydney, *via* Young, would be an extra 13 miles for passengers and freights; but, I think, the Committee will recognise that in some instances it is advisable to travel a greater distance, if by avoiding a heavy grade you can carry freight and passengers at a lower rate. That I think is evident from the decision in the case of the Moree to Inverell line.

447. You are taking for granted the grade? I am speaking not of the grade between Young and Grenfell, but of the grade as impinging on the extra distance between Grenfell and Sydney. I am referring to the grades on the southern line as compared with the grades on the western line.

448. *Mr. Hoskins.*] There is a longer continuous grade on the southern line between Picton and Mittagong than any grade on the western line, is there not? I know there are some heavy grades on the southern line, but the possibilities of cutting down the grades on that line are much greater than those which exist in the case of the western line. I think it would be preferable for the Commissioners to bring their produce a few miles further round to Sydney than to take it by the western line, as would probably be done if the railway were made *via* Koorawatha. The main point I would urge in that connection as against the extra distance *via* Young, is that the line would give the Grenfell people a better chance of using the two markets of Sydney and Melbourne than they would otherwise have. This brings me to the federal aspect of the case, and it seems to me that in laying out a railway you must provide for anything which seems to be a fair contingency. Inasmuch as there is the possibility of our having Federation within a reasonable time, I think the circumstance should guide us in projecting our railway lines, and certainly if the people of Grenfell desire to have connection with the two markets the best way of affording it is *via* Young. Another point I would urge upon the Committee is that between Koorawatha and Grenfell the line would pass through only large freehold estates, and although no doubt large areas of those estates are under crop the land is being so utilised with no intention on the part of the owners to sell any portion of it. The system upon which cultivation

J. C. Watson,
Esq., M.P.

4 Jan., 1898.

J. C. Watson, Esq., M.P.
4 Jan., 1898.

is now being carried on on all these large estates is known as the "halves" system. The men farming under that system do not live upon the estates; they merely go there to plough and put the crop in and afterwards to take it off. They have their homes away from the estates altogether. In fact they are not settlers at all in the ordinary sense of the term. It must further be recollected that a fair proportion of land which has been already cropped upon the "halves" system has gone back to its original state—that is, to the carrying of sheep, in the terms of the agreement entered into by several of the large landowners and the "halves" men, in which it was stipulated that lucerne should be sown after three years. The "halves" men go off the land under the terms of that agreement and the land reverts to the carrying of sheep only, which, as the Committee are aware, would not mean the same amount of traffic for a railway as would farming in the ordinary sense. It seems to me, therefore, that a large proportion of the land at present under crop between Koorawatha and Grenfell upon these estates will in a reasonably short space of time revert to its original pastoral condition, mainly because the land will not stand continuous cropping and because the "halves" system at present in operation gives the cropper no permanent interest. He would naturally take all he could out of the land within a short space of time, and it is to the interests of the owner that this should be done. He can afterwards sell the land, and it is found that the land will carry more sheep than it formerly did, before cropping was started. I fancy, therefore, that it would not be wise to build too much upon the possibility of the whole of the area now cultivated between Koorawatha and Grenfell being retained under cultivation. The holdings upon the Young-Grenfell line being smaller, it follows that the settlers there must continue to cultivate, otherwise they could not live, the holdings not being large enough to enable them to make anything out of them by running sheep alone, they must cultivate more intensely than need be done on the holdings on the other route. One other point concerns the federal aspect of the line from Werris Creek to Young *via* Dubbo, Parkes, Forbes, and Grenfell. That line has been projected for a long time past, and although I would not myself advocate the construction of the whole of it now, I do think it would be wise to keep that project well in view in connection with railway construction. It is well known that right down from Werris Creek at about the same distance inland there is a continuous belt of good country, and independently of the federal aspects of the line, I fancy that the local traffic from that splendid wheat-country, right through, would pretty well pay for the construction of a railway. I merely mention the matter to direct the attention of the Committee as closely as possible to that aspect of the case. I think it is one which will repay some consideration. Coming to another aspect of the proposal, I believe the Committee in considering the line to Grenfell, will have to consider the propriety of extending it on to Wyalong. I have not been over the whole of the country between Grenfell and Wyalong; but I have been over a good part of it, and from my knowledge of it, I do not think you can compare the extension from Grenfell to Wyalong with the extension from Temora to Wyalong, and thence on to Hillston. The land out of Grenfell to the west, for about 25 miles, is good wheat-growing land; but the same argument applies to the land 20 miles to the north-west of Temora towards Barmedman. There is good wheat-growing land there. You approach inferior country, in either case, within 20 miles of Wyalong; but it may eventually prove good country within that radius for a variety of purposes. The mallee country, for instance, may prove to be good country for the growth of grapes and other things; but at the present time it is so far from market that it is not available for those purposes. To get from Grenfell to Wyalong you have also to pass the Bland country, which, as everyone knows, is not fit for agriculture, and which is also liable to periodic inundations, from the backing-up of the Bland Creek. I believe that the cost of construction across the Bland country would be materially increased from the liability to floods. There would be a necessity for viaducts similar to those at Wagga. As against that, you have on the Temora line an easy grade all the way, and when it is contemplated to extend the line to Hillston, it seems to me that there is a still further argument in favour of the Temora connection, because the distance between Hillston and Sydney, whether *via* Temora, or *via* Grenfell, is practically the same,—with this additional advantage in favour of Temora, that there is only 40 miles of construction between that point and Wyalong, as compared with 57 miles between Grenfell and Wyalong. That is a material point when you have between your two termini about the same distance whichever route you undertake. The great advantage, having regard to the connection between Hillston and Wyalong, is, that there would be no loss of distance in getting to Sydney, while there would be an immense gain in reaching Melbourne; and there again the federal aspect of the question comes in. Independently of that there is the possibility of our sending goods to Melbourne when the crops there are a failure, and when our people have good seasons. I may also mention that between Temora and Wyalong there is a great possibility of mining development. There are at the present time at Reefton, about 12 miles from Temora, quite a number of good reefing claims at work. There is a sort of loop road which at present goes to Reefton, which lies a little to the east of the main road, and of the surveyed line to Barmedman. At Barmedman also there are two or three companies which have recently re-organised. I may mention especially the Fiery Cross. A considerable amount of work is being done there. They are endeavouring to strike the lode at a deeper level than that at which it was previously worked. In addition to that there are, I do not know how many thousand tons of tailings to be cyanided. That of course would not be a permanent industry; but there is good mining country between Wyalong and Temora with the possibility of development at any time, and I think that circumstance might be taken into consideration. I might also mention, that in the event of the railway being taken from Temora it would extend the area from which ironbark can now be obtained at a payable rate for use by the Railway Commissioners for our railways generally. The Committee are probably aware that the distance at which ironbark can be profitably obtained is limited to within about 20 miles of a railway. When you get beyond that distance the cartage becomes too heavy to admit of its paying. If the route I suggest were adopted it would be practicable to get ironbark carried 20 miles further than it can at present be carried. It is a noted district for ironbark and will be so for many years to come. I might also point out that Temora has been accustomed to trade over the area of which Wyalong forms the centre, and I think that relation could be preserved. Another factor in the case is that a line from Wyalong to Grenfell would take a large amount of traffic away from the existing line from Cootamundra to Temora. The last report shows a certain amount of loss upon that line, and I think that any reduction of the present traffic would be a very big mistake. No doubt that reduction would take place if a line were made in the other direction. With the exception of a few tons which are carted from Young at the present time to Wyalong, the whole of the traffic is from Temora.

449. I understand you to say that a great deal of the information with which you have furnished the Committee is given by the Young railway league? Yes, they have collected the facts.

450. I gather that the people of Young are opposed to the proposed line from Koorawatha to Grenfell? J. C. Watson,
Esq., M.P.
Yes.
451. Have you heard the opinion of the people of Grenfell on the subject? I have not heard it expressed as from the body of the people of Grenfell; but the attitude of individuals from Grenfell who have spoken to me on the subject, has been that they did not care where the railway came from so long as they obtained it.
452. The Committee have been informed that the people of Grenfell are in favour of the Koorawatha line? As to that I cannot express an opinion. Individuals have told me what I have mentioned.
453. I suppose you will admit that in the construction of a railway in that district the opinion of the people of Grenfell, seeing that they have not a railway at present, whereas the people of Young are already served by one, ought not to be overlooked? I quite think so; but I think also that the interests of the people between Young and Grenfell, who were induced to settle there upon the promise of a railway, should not be overlooked either.
454. Can you tell me when a definite promise was made that the railway should be constructed from Werris Creek across the country to Young? I do not think any promise has been made in regard to the line from Werris Creek. It has been merely advocated from time to time by a number of persons.
455. Do you think it is likely that it will be constructed within a reasonable time? I do not think it will be completed within a reasonable time; but possibly sections of it may be constructed.
456. You mentioned, among other things, that the line you advocated would be part of a federal system, facilitating the conveyance of produce to Victoria? Yes.
457. Is there not such a railway in existence at the present time in the line from Blayney to Harden;—is it not possible to convey fat stock to Melbourne by that line if necessary? Yes; but it is anticipated that a greater proportion would be carried by a line right down from Werris Creek. That line would admit of a more direct connection with Queensland.
458. What proportion of stock, do you think, would come from that direction? I could not give you an estimate.
459. What would the traffic consist of chiefly? It would be mostly stock.
460. Do you not know that the Darling District, the Bogan District, and the Macquarie District are more heavily stocked than is the Werris Creek District? I do not anticipate that whatever stock came from Werris Creek would come from the immediate locality; it would come from the north—possibly from South Queensland.
461. Do you know that the Blayney and Murrumburrah line was constructed and is actually used for the conveyance of stock from the Western districts, and of course for the conveyance of passengers to the south, and that that line does not pay or do anything approaching it? I am not able to say whether it pays or not; this year's statistics are not available.
462. But it has not paid since it was opened? I believe it has not paid well; but that is largely because they adopted a bad route. Instead of picking out the easiest grades, they chose some of the worst.
463. But the grades from Blayney to Harden are for more than half of the distance comparatively easy? Yes; but between Harden and Young they chose grades which have added immensely to the capital cost. At the other end also it is a badly laid out line.
464. Is not that argument rather against your proposal to take the line from Young to Grenfell? The grades are all easy coming this way, but the line might have been constructed at a less capital cost if easier grades had been selected in the first instance.
465. You say it is anticipated that there will be a serious loss upon the line from Koorawatha to Grenfell; do you know that the Commissioners favour that line? I am quite aware of that; but they had not an opportunity, or did not think it their duty, to report on any alternative line; they simply reported upon that one route.
466. Do you know that Mr. Harper has travelled over every portion of the district, and is still in favour of the Koorawatha-Grenfell railway, because that line would be at right-angles from the existing railway, and would therefore give a larger amount of accommodation to people who have not the benefit of railway communication at the present time? I understood him to admit his inability to form an opinion as to the propriety of the alternative route, and to say that he had not been for some years over the route between Young and Grenfell. I also understood him to say that he had not been instructed by the Railway Commissioners to make any comparison between the two routes.
467. Mr. Harper said that he had been over the district from Young to Grenfell, and that he favoured the construction of a line from Koorawatha to Grenfell, because it was at right-angles to the existing line, and would therefore provide greater accommodation? I happened to be here when Mr. Harper gave his evidence, and I understood him to say that he did not care to express his opinion upon an alternative route.
468. You said that the line between Koorawatha and Grenfell would traverse large estates, the owners of which were farming their land upon the "halves" system with the intention that it should afterwards revert to its pastoral condition? Yes.
469. Are you aware that the Committee have it in evidence that many of the farmers upon that route come from the colony of Victoria, and have purchased land from the proprietors of the estates? I should like to know of a case; I have not yet heard of one. I have taken a great deal of interest in the "halves" system, and I know a great number of those who are engaged in it, and I know that until last year very few were able to keep themselves going. They had a little good fortune last year on the whole, and they managed to clear a little money; but I have not been informed of any one case where the farmer has bought land from the proprietor; and had that been done I think I should have been informed of it by persons who are anxious to let me know what is going on.
470. The Committee have it in evidence that not only is the land being taken up on the "halves" system, but that other persons have taken up land in the neighbourhood and are still taking it up and cultivating it? There is none available between Grenfell and Koorawatha any more than there is between Grenfell and Young. There are only a few reserves left.
471. Would not a railway from Koorawatha to Grenfell, as a national work, be preferable, seeing that it would extend railway communication ultimately to the people on the Lachlan; down towards Hillston? I suppose it might be said that Koorawatha would be the better starting place if it were intended to go on
to

J. C. Watson, Esq., M.P.
4 Jan., 1898.

to Hillston; but knowing as I do the character of the country between Grenfell and Wyalong, over which it is likely the line would be constructed, I do not advocate railway construction in that direction, nor do I think it likely that that railway would be made. In any case, having regard to possible traffic to the south, people would still prefer Young as the point of connection.

472. What traffic are you referring to? In some years there would be traffic in wheat to Melbourne; but there is always a certain amount of stock traffic in that direction from the northern colonies.

473. Do you know that wheat cannot be carried that distance at a profit at the rates charged? I do not know that.

474. *Mr. Humphery.*] Were you here when Mr. Harper gave his evidence as to the settlers between Young and Grenfell being served by the construction of a line from Koorawatha to Grenfell? Yes; I cannot coincide with him in the opinion he expressed; because if you can argue that the people between Young and Grenfell would be as well served by the Koorawatha line, you might just as well argue the other way about—that the people between Koorawatha and Grenfell would be as well served by a line from Young to Grenfell. A large quantity of wheat at present grown within the suggested influence of the line from Koorawatha to Grenfell goes to Monteagle, on the Harden-Blayney line.

475. Would not similar conditions exist for a certain distance upon the Young-Grenfell line;—for a certain distance, would not the produce within that distance be still brought to Young? Yes; no doubt in either case that condition would exist.

476. Take the line you indicate between Young and Grenfell,—how many miles outside of that route would be served by the construction of the line? I should think that from 10 to 15 miles would be benefited. Of course those nearest would be benefited most.

477. What is the distance from Young to Koorawatha? Roughly, about 28 miles.

478. As far as you can estimate, what would be the greatest distance of settlement between Young and Grenfell, from one or other of the systems, assuming the line from Koorawatha to Grenfell to be constructed? I should think about 25 miles; but you must bear in mind that, notwithstanding the conditions you establish in constructing the line from Koorawatha to Grenfell, on the north or north-east, as far as the influence of a railway is concerned, you would gain on the other hand towards the south-west by the influence of the Young to Grenfell line. Either route would influence a similar area of country.

479. Your contention is, that as large an area would be served to the south-west of the Young-Grenfell line as would be served to the northward of the line from Koorawatha to Grenfell? Yes.

480. Your further contention is, that settlement is closer on the line from Young to Grenfell? Yes; the settlement is much closer on that than on the other lines.

481. Does it occur to you that a greater area would be within a shorter distance of the Grenfell-Koorawatha line than of the Grenfell-Young line? No; I cannot see it in that way. By taking the Young to Grenfell route you make up what you lose at Koorawatha; I am speaking now of what you would gain to the south-west of the Young connection.

482. With regard to the distance from Grenfell, it would not be affected appreciably by the route either from Koorawatha or Young; an area within 25 miles may be regarded as suitable for agriculture; it is a question between Young and Koorawatha as a starting point? Yes.

483. Would not the shorter distance from Koorawatha, to some extent, influence construction, leaving out of consideration the federal aspect? Leaving the federal aspect out of consideration, I do not think the extra few miles of distance to Sydney would be any disadvantage, because they would have, even at present, the possibility of a market in the south, in regard to which there would be a material advantage in coming from Young. The Grenfell people would have a better chance of attacking the markets to the south, while they would be at no disadvantage as regards the Sydney market, because their stock and produce—anything of material importance—would be carried at the same rate, whichever route was taken.

484. What would be the difference in distance? As between Grenfell and Sydney, there would be about 12 or 13 miles in favour of the Koorawatha route.

485. I am speaking now of the southern market? There would be a difference of about 28 miles in favour of Young.

486. What produce may be expected from Grenfell which would be marketable to the south of Young, and which would not come to Sydney? In the case of wheat, I admit, there is only an occasional market in the south; but stock might go in that direction at any time, owing to the possibility of getting to the Monaro country in the heat of summer. A large proportion of stock from within a distance of 15 or 20 miles of Young last year went towards Monaro owing to the drought.

487. Do you lay much stress upon that argument? Not a great deal.

488. It is an open question whether the starting point should be Young or Koorawatha; but as far as Grenfell is concerned it would be equally well served by a branch from either route? Yes.

489. *Mr. Trickett.*] I suppose you recognise that neither route to Grenfell presents any engineering difficulties;—they are on even terms in that respect? Speaking as a layman, I think the route from Young would be the better one—that is, judging from the outward contour of the country.

490. The evidence of engineers is that both lines are comparatively level, the worst grade being 1 in 75? I should imagine that that would be correct.

491. Do you regard this line, either from Young or from Koorawatha to Grenfell, as a local line, or do you regard it as a line having possibilities of extension? As I have indicated, I think the only desirable extension would be towards Forbes. I would not favour the extension towards Wyalong, but I think that even as a local line it would pay.

492. If the line is one capable of extension, does it not seem rather an objection that for all time there should be the extra haulage involved in going from Young? It depends where you want to go to. If you have within a few years from now a market in Melbourne without any border duties, it is probable that a large proportion of the traffic would go in that direction. Then the line *via* Young would represent a big saving.

493. You advocate the extension from Young from the point of view of the southern market? That is one reason.

494. But if the market should continue to be at Sydney, as at present, people would labour under the disadvantage of the extra 10 miles or so of haulage? But under the zone system they would pay no more on their goods. The extra traffic from the increased population on the Young route would make up to the Commissioners more than they would lose by the extra haulage.

495. Would not persons have to pay for the extra haulage? On all the larger lines of stock and produce they would pay no more. You will see that Mr. Harper, on page 11 of his evidence, gives a detailed statement respecting that matter. J. C. Watson,
Esq., M.P.
496. Except with regard to wool and grain there would be slightly varying prices? Yes; and hay, straw, and chaff are on the same basis as wool and grain. 4 Jan., 1898.
497. But on other commodities there would be a charge for extra haulage? Yes; there would be a slightly extra charge on a number of things.
498. Looking at the map, does not the line from Koorawatha to Grenfell, assuming that it is extended, or even *per se*, present the appearance of a much more equal division of carriage between the other parallel lines, the Molong-Parkes line and the Junee and Coolamon line? No doubt it does look so; but you have to consider the conditions as well as mere appearances, and one condition is the extra population on the Young route. For instance, it has been held advisable in some cases to take a line to a town with population rather than go straight past it, even though it has necessitated an extra distance.
499. Independently of mere appearance, does not a line starting at right-angles, such as the line from Koorawatha, supply a bigger district than would a line starting from Young which for 4 miles would run along the existing railway, and which would afterwards run at a small acute angle for a considerable distance? I admit that the line at right-angles, other things being equal, would be the best; but, of course, I do not see that things are equal in this instance.
500. Have you considered the fact that there is already between Young and Grenfell a good macadamised road the whole way? It is not macadamised the whole way, but it is a very fair road. Of course there has never been a road constructed on the other route, because there has never been any population to serve.
501. But between Koorawatha and Grenfell a considerable amount of cultivation already exists? Yes.
502. Is that not a large factor in the way of feeding a railway? There is sufficient road to enable the people there to get an outlet for their produce, viz., in the direction of Monteagle, the nearest railway station, or at Young. Mr. Green's wheat goes from Iandra to Monteagle.
503. There is considerable development between Koorawatha and Grenfell? Yes, on the "halves" system.
504. More than between Young and Grenfell? I do not think there is. There is not so much development as far as produce is concerned. There would be a greater amount of produce along the Young-Grenfell line than along the Koorawatha-Grenfell line.
505. Is there not more settlement along the Koorawatha-Grenfell road? No; it is all on the Young-Grenfell road.
506. Has not the settlement on the Koorawatha-Grenfell road increased very rapidly? There has been a spurt lately on account of the introduction of the "halves" system by Mr. Green and Mr. Woods.
507. Are you aware that Mr. Harper, in his evidence, stated that the area of land within what he considered would be a trafficable distance on the Koorawatha to Grenfell line was between 340,000 and 350,000 acres? Yes.
508. Do you agree with that statement? I have not had an opportunity to make minute inquiries; but I should fancy that that statement would be pretty nearly correct. A similar influence would exist on the other route.
509. You say that between Young and Grenfell there would be no expenditure on land resumption? I do not say that; but in 1883 a railway reserve, 40 chains in width, was proclaimed on the surveyed route; and I believe that reserve is still in existence, and that its existence would minimise the cost of resumption. In addition to that, I think a fairly large number of holders, considered in relation to area, on that route are willing to give their land free. The railway league has ascertained that.
510. I believe the land-owners on the other route have given a similar promise? I believe that is so.
511. *Mr. Clarke.*] You are thoroughly acquainted with both routes? Fairly so; I have not been over the whole of the country between Grenfell and Wyalong.
512. But you say that the population is denser on the Young-Grenfell route than on the other route? Yes, much more so.
513. Is there not a large area of land under cultivation on the "halves" system in the neighbourhood of Grenfell? Yes; on the estates of Mr. Green and Mr. Woods, and one or two others, a large area has lately been put under cultivation, but a great portion of that land would be equally served as far as carriage is concerned by either route.
514. You say that the farmers who have come to the district from Victoria do not settle there, but are merely birds of passage? They are what we used to call "croppers"—men who take off a few crops and then shift to another place.
515. How long does it take to exhaust the land? It varies very much in different districts. I know some land which has been under wheat for thirty years and which is still producing fair crops; in other cases five of six years will exhaust the land for wheat. You must then either spell or rotate. Our climate does not allow of rotation as one would wish to see it carried out.
516. Would not what you say about "cropping" apply whether the land was held in large or small areas? Persons with a smaller area can rotate crops. They can grow a greater variety with a chance of success. Persons with a small area always carry a certain number of sheep, and the land can then be brought back to a condition for growing crops.
517. Your opinion is that farmers on a small scale can do more with their land than can farmers on a large scale? I think small holdings are more likely to give remunerative employment to a railway.
518. You say that some of the land between Koorawatha and Grenfell which has been cropped for a few years is now being laid down in lucerne? Some of it is already under lucerne. Some of the land on Mr. Green's estate is now under lucerne and is being depastured.
519. After a few years it would be possible to grow wheat again upon that land? In all probability the greater portion of the land now under crop will be under lucerne for pastoral purposes within a reasonably short time. It may be put under wheat again at some distant period.
520. You think the Young route would be the better route for farmers so far as the Victorian markets are concerned? Yes.
521. Are the Victorian markets equal to the Sydney markets? It depends upon local conditions. If they have had a failure and we have not, our people can send their stuff there profitably. If the converse conditions prevail they have to send up our way.

- J. C. Watson,
Esq., M.P.
4 Jan., 1898.
522. Is it possible now for wheat or flour to be sent to Victoria at a profit? I do not think so with the duty they have; but I have in view the possibility of the duty being abolished within a reasonable time.
523. *Mr. Lee.*] You see on the map, marked yellow, the area which Mr. Harper relies upon to supply the projected line with wheat? Yes.
524. I suppose that a portion of the land lying to the eastward of Grenfell would also be served by a line from Young? Practically the whole of the area coloured yellow on the map would be served by a line from Young. All, with the exception of a small part of the south-eastern section in yellow, would be served by it, with the addition of an area to the south-west of the Young-Grenfell line that would more than make up for what would be cut off in the other direction.
525. Is there much agriculture on the western side of Grenfell? No; very little at present.
526. You know the railway authorities rely upon some 25,000 acres being brought under cultivation in that direction? With the extension of a line to Grenfell, from whatever point it comes, I believe that for 25 miles to the westward a large area would be brought under wheat.
527. The development taking place now between Koorawatha and Grenfell is because that land has become available of late years, whereas the development between Young and Grenfell took place earlier, because the land was available earlier? That is hardly the case. The land between Koorawatha and Grenfell was available just as early as was the other land, but it unfortunately fell into the hands of a few individuals who still retain it. It was available for them to cultivate previously, but it is only lately that some of them have gone into the "halves" system.
528. What I meant was that the land between Young and Grenfell had been largely alienated under conditional purchase? Yes; that is correct.
529. You are clearly of opinion that the district is entitled to railway extension? I am fully convinced that the line to Grenfell will pay, in any case; but I think it would be better to construct it by the route I suggest.
530. Apart from whether the connection should be made from Koorawatha or from Young, do you think the country in the vicinity of Grenfell—that is to the westward—would justify extension in that direction? I do not think the country between Grenfell and Wyalong would justify an extension of a line to Hillston, in that direction. The area shown in yellow on the map by Mr. Harper, as likely to give wheat to a railway, is, I think, practically the limit of cultivable land. Between that point and Wyalong, on the Bland country, you get a lot of low-lying land, which is known to be only pastoral country. On the other side you rise again towards Wyalong; still the land is comparatively poor, and I do not think it would be wise, from an engineering point of view, to take the line from Grenfell to Wyalong.
531. You do not agree with that extension? No.
532. Are you of opinion that Wyalong should be connected with the railway system? Yes; from Temora.
533. Then you think the line under consideration should be treated as a cockspur line only? For the present I would treat it as a cockspur line; but later on it may be advisable to extend it to Forbes, as part of the cross-country line from Werris Creek.
534. Would that be a judicious division of that part of the country? Yes; a large area of the country in the basin of the Lachlan would afford traffic. Even as a local extension, as between Forbes and Grenfell, the line might be justified; but taking the broader view of the work—that is considering it as part of the line from Werris Creek—there are additional reasons for constructing it at a later period. In present circumstances I should regard Grenfell as the terminus; the line would pay, even if it stopped there.
535. *Mr. Wright.*] You paid some attention to farming on the "halves" system? Yes.
536. Do you look upon it as merely spasmodic? I regard it as a temporary expedient.
537. You think the land so treated will again become grass land? Yes; the experience of large holders is that growing stock and wool and so on offers the least resistance in the way of worry and trouble. Most large owners therefore, prefer it. I think that the main inducement leading to the present development of the "halves" system is that the land after being cleared of all timber, whether dead or green, will carry a great many more sheep than before.
538. Your impression is that the landowners will be content to allow the exhaustion of the land by wheat crops out of which they make a large profit, and that they will then allow it to revert to grass? Yes; there is no inducement to them to conserve the soil by allowing it to lie fallow.
539. Do you know the country between Koorawatha and Grenfell? Yes.
540. You are aware that there is no cultivable land within a few miles to the northward of that line? Yes; there is a range of mountains when you get a short distance out to Koorawatha. The range runs right up towards Cowra.
541. You would not call that land cultivable? No; but at Cowra there is splendid land.
542. The land likely to be brought under cultivation is mainly on the southern side and at the north-western extremity? Yes; but not to the north-east.
543. Do you know the land immediately to the westward of Grenfell? Yes.
544. How far in that direction is the land fitted for the growth of wheat? I think you might say for 25 miles—nearly to the Bland Creek. I am speaking now of the line between Young and Grenfell.
545. Would it extend as far as Memagong? Yes; the reason you can go nearer to Yeo Yeo in that direction is that the Bland country opens out towards Lake Cowal, whereas towards Memagong it narrows to a comparatively small plain.
546. Considering that the area to the north-east of the proposed line from Koorawatha to Grenfell suitable for cultivation is limited, would not the line from Young to Grenfell open up a larger area of land fitted for settlement? Yes; I think it would, because most of the loss occasioned through going at rather an acute angle to the existing Blayney-Harden line would be made up by the area which you would gain to the south-west. What I mean is that you would take in more in that direction than the other line would take in to the north-east.
547. Is the land at Memagong likely to be cultivated to a great extent if a line were made from Young to Grenfell? Not to any greater extent than the land between Koorawatha and Grenfell; it is held much in the same way—that is in rather large holdings. I dare say they will go in for cultivation as they are doing now; but it will not be permanent unless the holdings are cut up.
548. Is there not a larger number of conditional purchases in that direction? Yes; and from that source there is the likelihood of more permanent cultivation.
549. I suppose you are of opinion that a large area of land west and north of Grenfell would be cultivated whether a railway were taken there from Young or Koorawatha? Yes; the same influence would operate from whichever point the railway started.

550. Have you been across the country between Grenfell and Wyalong? Not between Grenfell and the Bland. J. C. Watson, Esq., M.P.
551. A large area of that country is simply pastoral country? It varies very much. At the point I usually cross the Bland, near Morangerell, the purely pastoral country would not be more than 12 miles wide; but further down, where the line would cross the creek, the belt of pastoral country would be wider. 4 Jan., 1898.
552. You think the width of land not suitable for cultivation is greater towards Marsden than it is at Morangerell? Yes.
553. And it is in that direction that the proposed line would cross? Yes.
554. You advocate the connection between Temora and Wyalong? Yes; in either case for the first 20 miles you get good wheat-growing country: but in going from Temora you would have shorter construction, and would be about the same distance from Sydney.
555. Do you know the country between Wyalong and the Bland Creek? Yes; it is similar to the country between Barmedman and Wyalong; by whichever route you reach Wyalong you pass through much the same class of country.
556. Mr. Harper said that if a line were constructed from Young to Grenfell instead of from Koorawatha to Grenfell the people to the south and west of that place would for all time to come be subject to additional haulage of their produce? Yes; going to Sydney he is correct. There are a few miles extra haulage, but he demonstrated from the return he presented that there would be no extra charge to Sydney, whereas, going to the south, there would be a considerable saving.
557. The produce of the district is exclusively wheat and wool? Yes; but hay, straw and chaff would come under the same rate. It would make no difference so far as those things are concerned, whether the line went from Young or Koorawatha.
558. There would be a little extra haulage upon the stores back? Yes; supposing Sydney to be the objective point, but there are also the interests of the people on the road to Grenfell to be considered.
559. Those persons have been induced by the Crown to take up land on the supposition that a railway would be made in that direction? All those who have taken up land there since 1883 have taken it up upon that understanding.
560. For many years it was contemplated that the connection with Grenfell would be made by Young? Yes; no other route has been talked of until within the last eighteen months.
561. The Koorawatha route is a new idea? Yes, comparatively.
562. *Mr. Hassall.*] As to the connection with Young, would it not take away a certain amount of trade from Young which now comes into it? Yes; some persons have the idea that Young will lose a little trade which it now gets. Some of the business people say that persons who now come to Young and who are within 15 miles would go by the morning train to Grenfell, do their business there, and return. It is not a matter which concerns me particularly.
563. The point I wished to elucidate was this;—that Young is now a distributing centre for a considerable area which is now under cultivation? Yes.
564. And the probability is that an extension from Young to Grenfell would take away a considerable portion of that trade? It might do so, but as against that you must consider the people between Young and Grenfell; they would get a corresponding advantage.
565. They would be benefited by the extension? Yes.
566. That would more than counterbalance any loss of trade? In the interests of the country it would more than counterbalance any loss of trade which Young itself might suffer.
567. With regard to the southern markets, you say that the line from Grenfell to Young would give people access to the southern markets;—would not the line from Koorawatha also give them a choice of markets? It would be 28 miles further south *via* Koorawatha, and it would be only 13 miles nearer Sydney by the western line.
568. Do you know the exact distance between Young and Grenfell by road? Thirty-two miles; the line follows the present road for 3 miles, leaving 29 miles to be constructed.
569. The distance between Koorawatha and Grenfell is about 30 miles? Yes.
570. So that the distance as between Koorawatha and Grenfell, and Young and Grenfell is practically the same? Yes.
571. In coming to the south there would be the additional 28 miles between Young and Koorawatha to be traversed? Yes.
572. As to cultivation on the "halves" system, do you know that many men who are not in a position to start for themselves are enabled by that system to cultivate land and gradually acquire a little money enabling them to start upon their own account? I admit that it gives men without capital an opportunity to find employment for themselves; but I do not admit that there are any men in my district, and I have taken a great deal of interest in the matter, who have been able to make a start for themselves on account of any profit they have made out of the "halves" system. I have not known of one instance where they have made sufficient money to enable them to do that.
573. It is an advantage to a man possessed of farming knowledge to be able to put it to profitable use by obtaining land? It has been an immediate advantage to such people, but I do not think it is a desirable system from the point of view of settlement. It has been an immediate advantage to some persons to have this way of employing themselves temporarily, and that is all one can say for the system. I admit at once that it is better to have land cultivated under "the halves" system than that it should not be cultivated at all, but it is not a thing to be encouraged if we can do without it.
574. It has been proved in evidence that men have been able under the system to start upon their own account; that they have been enabled to get land, and to live fairly comfortably upon it? Yes; but there is one point which has been overlooked in evidence of that description, and it is an important one: What were these people charged by way of interest on the advances made to them to cover their machinery and rations. In some cases men have been known to get a fair return for their work, but have been charged up to 12 per cent. interest, which practically swallowed up everything they got, and left them nothing. I know of several cases in the district where men are now engaged upon their fourth harvest; they have made nothing in three years.
575. Still they have been enabled to live? Yes; but it would be hard luck if they could not make their "tucker" somehow.
576. You know that the country round about Koorawatha is very good? Yes; there is good country in the district whichever route you take. 577.

- J. C. Watson, Esq., M.P.
4 Jan., 1898.
577. Does the country between Grenfell and Young compare favourably with that between Koorawatha and Grenfell? It is as good, and, probably, better country. The whole of that tract of country, except where the ranges jut out, is good wholesome country for either cultivation or grazing.
578. The country on the slopes of the Weddin Mountains is similar? Yes; no doubt on the slopes of the Weddin Mountains, and below them for some distance, there is splendid country; but from whatever point you start that country would be tapped equally well.
579. They have discovered an easy grade running through the Weddin Mountains, instead of coming round them in the direction of Bimbi; you are aware of that? Yes; I have nothing to say against the construction of a line towards the Bland; but beyond the Bland the country is not so good.
580. And you say that settlement on the Young-Grenfell route is more extensive than upon the Koorawatha-Grenfell route? Undoubtedly.

THURSDAY, 3 FEBRUARY, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Koorawatha to Grenfell.

George Henry Greene, Esq., M.P., sworn, and examined:—

- G. H. Greene, Esq., M.P.
3 Feb., 1898.
581. *Mr. Fegan.*] Have you any statement to make? I have no written statement.
582. You gave evidence before the Committee which visited Grenfell some time ago in connection with the Euabalong railway as to the necessity of a line to Grenfell? Yes; on the first occasion I gave evidence on the 7th September, and also on the 21st October, 1897. I desire my evidence on those occasions to be incorporated with my evidence in connection with this matter, as printed and published with the proceedings of the Committee in their inquiry respecting the proposed Railway from Condobolin to Euabalong. It is as follows:—

TUESDAY, 7 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

George Henry Greene, Esq., M.P., sworn, and examined:—

568. *Chairman.*] You are the Representative of Grenfell in the Legislative Assembly? I am.
569. *Mr. Clarke.*] Have you any statement to make? I have no statement in writing, but I should be very happy to answer any question which may be put to me.
570. You do not wish to make any statement of your views except in answer to questions? I am hardly prepared to make a statement until I know the exact point which has to be illustrated. At present I really do not know what is before the Committee.
571. It is the consideration of the proposed line of Railway from Condobolin to Euabalong, as marked on the plan? Yes, I know the locality.
572. You have been long resident in that neighbourhood? Yes; for nearly twenty years.
573. Have you a good knowledge of the country? Yes.
574. What is your opinion of the proposal to carry that railway from Condobolin to Euabalong? I am decidedly unfavourable to the carrying of that line from Condobolin to Euabalong, because I think there is a very much better line which is being surveyed now which would answer all possible purposes better than the prolongation of the line from Condobolin to Euabalong, and which would open up an altogether fresh field of rich agricultural land, and would be the easiest and shortest way of reaching Hillston, which I conceive to be about the most westerly point at which cultivation could be profitably carried on.
575. Would you describe to the Committee the route which you approve of? The route which I approve of is that starting from the Harden and Blayney line, leaving at Koorawatha, and proceeding thence westerly to Grenfell, from Grenfell on to Wyalong, and from Wyalong to Hillston.
576. That line would not touch Temora, would it? No.
577. Is the country to which you refer thickly settled? A portion of it is thickly settled, and on the rest the population is increasing very rapidly.
578. You say the line should commence at Koorawatha? Yes.
579. What would be your next section? You wish me to describe the line from Koorawatha to Grenfell.
580. Yes? It passes through what I consider the best wheat-growing country in New South Wales, or what is equal to the best. The whole way from Koorawatha to Grenfell the country has been making most enormous strides in the way of acquiring a larger population, and an enormous extent of improvement in the way of clearing for cultivation. Where there were only, we will say, ten men employed five years ago, there is work now found on properties which are being transformed into huge farms for at least 100 men. The work has been increased, I say without fear of contradiction, over tenfold, and the production has increased at an even greater ratio.
581. Have you any statistics? I can only give the statistics of three properties which are almost adjoining. The others would be so very numerous and in such small areas that it would take time to compile the statistics in respect to them, but those statistics can be very easily furnished.
582. You might furnish the Committee with those statistics at a future time? I should be happy to do that. I believe that they are at this moment in readiness, but they are not in my possession.
583. Are those farms worked on shares, or how? On the large properties they are nearly all worked on the shares system. The owner of the property clears the land thoroughly, provides the seed, does what fencing is necessary, assists the farmer pecuniarily in many ways, and in getting machinery, and then the produce is equally divided in the field.

584. *Mr. Hoskins.*] Where do they sell the wheat? It has been nearly all sold locally, at Young, Bathurst, and Goulburn, G. H. Greene, Esq., M.P., but chiefly in Young.
585. *Mr. Clarke.*] The farmers have to cart the wheat a considerable distance to the railway station? Yes; that is the great difficulty we are labouring under. We can only cultivate within a certain distance of the railway, otherwise the waggon carriage kills the profit. 3 Feb., 1898.
586. If there were railway communication to any point near the land, is it likely that in the course of time that land would be cut up into smaller farms and sold to settlers? It is certain that it would be so—in fact, I should be prepared myself to part with a large amount, more than half of my holding, to the men who are at present cultivating it.
587. Would that be the case with other properties which are now under the share system? I have not the least doubt that that is the course which would be adopted.
588. Then the land if sold in that way would conduce to larger settlement and increase the population? Certainly.
589. The great drawback is want of communication by railway? Yes; that limits and is the only limit to the production of wheat and other cereals in that district.
590. Is the rainfall sufficient in ordinary seasons for carrying on farming? I think it is quite so. Our average rainfall is about 28 inches—that is taken from observations extending over from twenty-one to twenty-five years.
591. I presume that there are times when, as in other parts of the colonies, there is dry weather in that district, and a failure of the crops? Yes, we have had droughts; but we certainly suffer much less than they do further out west and north.
592. Would there be any other description of produce, such as wool, that would come to the railway as you have described there? A very large amount of traffic would be given to the railway, chiefly in fat stock and crossbred lambs. I myself sold every crossbred lamb I had last year, and sent them to Sydney with very good results. I am prepared to state that there is scarcely an assignable limit to the work that I could carry on profitably on my own estate, if we had railway communication close enough. On different occasions statements have been made to Ministers with regard to what probably would be done in the district in the way of enlarging farming operations, improvements, and clearing, and I have now to say that those promises have not only been fulfilled, but a great deal more has been done in that direction than even those who made the promises ever contemplated, and that a greater impetus was given to this work by the Minister for Works last year, at Grenfell, when he promised to submit the Koorawatha-Grenfell line to Parliament. Thousands of acres have been cleared since.
593. But the Minister has not done so up to the present? The trial survey is not complete, but on the faith of that promise we are working, and hundreds of men can be seen now at work in all the operations attendant upon clearing. Of course farming is practically all over for this season, and the crops are all in, but there is a very large amount of clearing being done in every place which is within reach of the railway.
594. Do you know the nature of the country from Condobolin to Euabalong, both north and south of the proposed line? I know it in the way in which people used to know it before they looked so closely into the value of the land for agricultural purposes, and, to my mind, it is in every respect inferior, both as regards rainfall and being subject to severe periodical droughts, when nearly all the stock are lost. I can see nothing to warrant the construction of a line from Condobolin to Euabalong.
595. The chief articles to be shipped there would be wool? Yes, and, I should think, very little else.
596. The railway will soon be completed to Condobolin, and if there is any land fit for agricultural purposes in that district, would not the produce go to Condobolin? Yes, within any reasonable distance which it would pay the farmers to cart. Condobolin terminus would suit them fairly well. But I think that when you get 10 or 12 miles beyond Condobolin the rest of the country, with the exception of small frontages, would be very poor land for cultivation. I do not think that farmers could make a living out of it.
597. The Railway Commissioners say there would be a loss on the line of something like £3,800 a year;—do you think there would be any probability of that loss being reduced if the extension were carried out? I do not think it would be remunerative or pay working expenses for a large number of years.
598. Then the only justification for making this line would be to take it towards Broken Hill? Yes; that is the only object which I can see—viz., going out west.
599. You are of opinion that the proposed line would not pay? I am sure it would not.
600. And that it would not be as suitable for the general public as the line which you have sketched out in your evidence? I think not. I think that line would pass through infinitely better agricultural land.
601. *Mr. Lee.*] Would you be good enough to tell us about the locality of the suitable land for wheat-growing, starting (say) from Koorawatha, on the track that you have indicated? The whole of that land is good, and it could be seen by anyone who takes the trouble to ride over the route.
602. You are of opinion that the greater part of it is suitable for wheat-growing? Ninety-nine one-hundredths of it is. There is none of it unsuitable, except, possibly, some small stony spurs.
603. Is there any Crown land there? I do not think there is any Crown land between Koorawatha and Grenfell, except, possibly, some small reserves. Of late years all the Crown land has been alienated to small holders who are on their land, and who are prepared to clear it and go in for farming as soon as a railway is brought within such a distance that they can convey their produce to it.
604. What is the mileage from Koorawatha to Grenfell? I think it is about 34 miles by the line as surveyed.
605. What are the prospects of agriculture round about Grenfell? Immediately about Grenfell the country is a little bit rugged, but on the eastern side the agricultural country is sufficiently close to Grenfell on the route between Koorawatha and Grenfell.
606. Will you describe the country towards Wyalong? The line leaving Grenfell would pass over one barren spur, and that is the only barren place that it would pass over, and having passed that, which can be negotiated at a grade of 1 in 75, all the rest of the land to the Bland plains is held by farmers, a well-to-do class of men who are living on their own land. The whole of the land on the north side of the Weddin Mountain is suitable for cultivation.
607. Do farmers from Bland Creek cultivate wheat? The Bland plains I do not consider would be suitable for cultivation, but they are amongst our richest pastoral lands, and interspersed with it are considerable areas of timber land which are fit for cultivation. You can lay down, as a rule, that timber land is fit for cultivation.
608. As you approach Wyalong you get into the mallee country? Yes. I have seen mallee land which I consider an extremely superior class. I had considerable experience of the mallee country in Victoria, and the large area that Mr. Lascelles has been cultivating, but I have not seen any mallee land there as rich as this mallee on the east of Wyalong.
609. Could it be brought under cultivation? Without a shadow of a doubt.
610. Profitably? Yes, because there is a large local population there.
611. Are the capabilities of the soil such that it can be used for wheat-growing? Not all of it. There is some mallee country which is very poor.
612. I want to find out the limits of the wheat-growing country there;—could you give it from there to Hillston, showing where you get out of the wheat-growing country? I think we might look upon the whole of the country as far as Hillston, which is the limit in a westerly direction, as wheat-growing country—that is, where wheat can be grown with tolerable certainty.
613. I suppose the bulk would be produced somewhere between Wyalong and Koorawatha? Yes.
614. At present I suppose the wheat grown in the neighbourhood of Grenfell has to be carted to Young? They have a mill at Grenfell.
615. That would be only for local requirements. If all that land were brought under cultivation it would become a necessity to export a large quantity of wheat? Not the least doubt of it.
616. Therefore, the consuming power would not be in comparison with the producing power of the district? Oh no, we should soon outstrip local consumption.
617. Can they send their wheat by dray from Grenfell to the nearest railway and dispose of it at a price that will leave them a reasonable profit? Hardly in ordinary seasons.
618. What would be the carriage from Grenfell to the Western railway? It would have to go to Koorawatha or to Cowra, a distance of 34 or 35 miles.
619. What would be the rate per ton or per bushel? I think it would be about 4½d or 5d. a bushel.
620. That would be equal to about 16s. 8d. a ton? That is a very low rate for carriage.
621. If grain can be carried in other parts of the country 26 miles for 2s. 6d. per ton, and if this line were made by way of Grenfell and for 34 miles 5s. a ton were charged, would that act as an inducement to the increase of agriculture? Yes, if it were reduced as you say. 622.

- G. H. Greene, Esq., M.P.
- 3 Feb., 1898.
622. If there were a railway and the carriage from Grenfell was 5s. a ton, would not that be considered a very low and satisfactory rate? I think it would be very satisfactory.
623. Would it admit of wheat being grown in the district and sent away by that means? Yes, no doubt.
624. At present you are paying 16s. 8d a ton? Yes, it would make the difference between the practical abandonment of agriculture and an enormous output.
625. What other portion of that district is largely used or could be largely used for wheat-growing? Nearly the whole of the country that does not lie so far north and south of the line as to make the carriage too heavy. The railway would cause a large cultivation on each side of the line for a very considerable distance.
626. Is the land of such a character that it will admit of large areas being cultivated? Yes, unquestionably.
627. It is not too heavily timbered? We do not use any land for cultivation except the timbered land. We soon clear it. It is country that could be cleared cheaply.
- 627½. If the railway were taken across from the point you mention, towards Hillston, do you think it would capture a certain proportion of the wool traffic which it is estimated would go by the Euabalong line? It would take it nearly all. It would capture, I imagine, the whole of the trade which the extension to Euabalong would carry.
628. In that respect you think it would have precisely the same effect? I think it would serve the purpose of giving access from the southern districts to the market, quite as well as, or better than, the extension to Euabalong.
629. One of these routes is on one side of the river and the other on the other? They are both on the river. Of course the produce would go to the nearest station. If the extension went from Wyalong to Hillston the produce would go by Hillston. That nearer Condobolin would of course go to Condobolin if there were no railway at all.
630. Briefly summarised, your argument is that if a line were made from Condobolin to Euabalong it will have to be dependent entirely on wool traffic from that district and goods going to that district? Yes.
631. But if it were taken from Koorawatha *via* Grenfell and Wyalong to Hillston it would open up a very large wheat-growing country, a country which is already producing large quantities, and which can be made capable of growing still larger quantities, and it would obtain the wool from the western country quite as well as the Euabalong line? Yes, that is exactly my argument.
632. Therefore you argue that in the interests of the country, a line of that character would serve a far better purpose although longer than the proposed line from Condobolin to Euabalong? I have no doubt whatever of that.
633. I suppose you hold that whether the Euabalong extension is made or not, sooner or later there will have to be an extension to Grenfell and that country? Certainly. I do not think the claims of that district could be resisted.
634. The people are there and the produce is there, and those are the attractions for a railway? Yes, our work is to be seen.
635. Therefore you say that that is the proper way to take the line, and that it would open up a large area of country which is waiting to be served? Yes.
636. *Mr. Wright.*] Do I understand you to say that you are familiar with the Lachlan country? I was some years ago; I have not been there for some years.
637. When you travelled through that country I presume that you travelled with your eyes open? Yes.
638. Are you aware that it is said to be very rich all the way from Forbes to Euabalong? For about 10 miles down the river from Condobolin there is some good land on the frontage, but I should not look upon it as an agricultural district like the country between Wyalong and Hillston.
639. Is it not all red soil back from the river? There is a great deal of plain country that dries up very much, and some forest. But I do not look upon it as the same class of country for agriculture as the country further south.
640. By reason of its less rainfall? Less rainfall and the nature of the soil. Things seem to burn up and wither away there in a way in which they do not do in the forest country.
641. Do you know the south side of the river? Yes, fairly well.
642. Have you crossed the country from Condobolin to Lake Cudgellico? I have not been there for ten or twelve years.
643. What class of country is that? There is some fine country about Lake Cudgellico, but I understand that of late years it has become overgrown with fine scrub.
644. Is there not some good land about Bygallorie? There is some very fine land there.
645. All that country from the Dundoo Ranges is fairly good country? Yes, there is some good country there.
646. That is where the line would cross from Wyalong, is it not? It is already surveyed.
647. The route is through Wyalong, Bygallorie, and the Dundoo Hills? Yes, so I understand.
648. What is the distance by road from Cowra to Grenfell, and from Young to Grenfell? From Cowra to Grenfell is about 35 miles. I think the distance from Young to Grenfell is about 32 miles.
649. You say it is 34 miles from Koorawatha to Grenfell? Yes, by the line as at present surveyed.
650. If you look at the map you will see that Grenfell, Cowra, and Young form three points of a triangle? Yes.
651. It must be less than 34 miles to Koorawatha? Yes. The railway line has been made to accommodate itself to the levels. If a railway line were constructed from Cowra to Grenfell it would be much longer than the mark on the map indicates.
652. Suppose there is a railway to be made through Grenfell, what amount of mountainous country would it have to go through? Scarcely any to speak of.
653. Would there be 5 or 6 miles of it? I do not think so. But that is a matter about which absolute evidence can be given by the surveyor.
654. Does that go through the Eualdrie run? No; that is to the west of the line several miles west or south-west of Grenfell.
655. Where does the survey come down to the Bland country? Through Gibson's run, about 8 miles south of Marsden.
656. And it would cross at Marsden? No. It crosses the Bland, considerably south of Marsden.
657. It crosses the Bland somewhere near Chisholm's property? I suppose it would be to the north of Chisholm's property and it would go partly through the Oakhurst property.
658. Do you consider the Bland country suitable for wheat? Not the plain country.
659. What width is the plain country? I can scarcely say. The plains are irregular in shape and the timber juts in in places in long points.
660. Would it be 20 miles across? No, nothing approaching to that; perhaps about 5 or 6 miles.
661. How far is it from the Bland to the Weddin Mountains? I think it would be nearly 20 miles.
662. And about half that country is plain country is it not? No, not half.
663. Going west from the Bland what is the country immediately round Wyalong? It is chiefly mallee.
664. You are aware that there is a considerable extent of stone ridges in the neighbourhood of Wyalong? There is no doubt that about Wyalong there is some very poor, barren country.
665. About Hiawatha is very poor country? There is a great deal of good agricultural land when it is cleared of the scrub and timber.
666. After you leave Wollongough you have practically good land all the way to the lake and from the lake to Hillston? Yes, I think so.
667. Looking at this line from a productive point of view you are of opinion that a large area of country and a better area would be served by connecting Koorawatha and Hillston than by any other route taking Hillston as the objective point? Yes.
668. You think the country should be traversed between the Lachlan and the Murrumbidgee in the direction which you have indicated to serve a larger area of country and better country than on any other projected route? Yes.
669. Do you know the country from Temora to Wyalong? Yes.
670. A line along there would serve a good stretch of country? Yes; there is some very fair country there.
671. Picking up your route at Wyalong and connecting it at Temora instead of going through to Grenfell? Yes.
672. But that would have the objection that the land round Grenfell would be still isolated? Yes.
673. Do you think that Koorawatha is the best point of departure? I think so. It is the only possible point, from an engineering point of view, that can be got between Young and Cowra.
674. What difficulty is there about running a railway from Cowra to Grenfell? There is the Broula Range, which, at the lowest point, is about 800 feet high.
675. You think that Koorawatha is the best point of departure inasmuch as it is nearly the most direct route, and has the easiest grades? Unquestionably.
676. But the quality of the country is pretty much the same? The country about Koorawatha is unquestionably the best between Young and Cowra.
- 677.

677. *Mr. Hassall.*] With regard to the country lying west from Koorawatha, *via* Grenfell and Wyalong to Hillston, how is it watered? The water in the neighbourhood of Koorawatha is very good. There are some natural springs between there and Grenfell, but the country is naturally very poorly watered; but it is now practically secured by a great number of tanks and dams. Grenfell has its own supply, which is just fairly good.
678. Where does that supply come from? Wells and springs which do not run over the ground, but are easily tapped. At Bogolong, 6 miles out of Grenfell, there is a permanently running creek, but only very small, rising from a spring. From that to the Bland there are some small creeks which appear to answer all that is required, but there is no large stream of any kind.
679. Is the Bland Creek permanent? It is permanent in places. There are some waterholes close to Lake Cowal never, I believe, known to fail.
680. From Wyalong to Hillston there would only be an artificial water supply? I think that is all; it is a dry country.
681. The range shown on the map between Koorawatha and Grenfell;—is there any difficulty in getting over that? It has been got over. The line is surveyed for a distance considerably beyond Grenfell, and the steepest grade is only 1 in 75.
682. *Mr. Roberts.*] Do you reside in the neighbourhood of Grenfell? Yes; at Landra.
683. Would that be on the road to Young? No; it is about 8 miles east of the direct road from Grenfell to Young.
684. Have you any land under cultivation? Yes.
685. How many acres? About 12,000 acres under cultivation this year; only about 9,300 under wheat, the rest is under lucerne.
686. What is the extent of your property altogether? About 31,000 acres.
687. Is that all freehold? It can all be made freehold. About half of it is freehold, and the rest is conditional purchase and conditional lease lands.
688. Have the returns from the land under cultivation realised your expectations? Quite; if we had had rain early enough this season I could have disposed of 13,000 acres on the share system.
689. Is that system largely in operation in the Grenfell district? Yes; amongst those who have large areas.
690. And has it worked with advantage to both landowners and agriculturists? Yes, it has given very great satisfaction; but I may mention that the only large holdings in that neighbourhood are Worrangong (*Mr. Suttor*), Landra (my own), and Brundah (belonging to *Mr. Wood*). I should also mention that we are still going on with clearing, and on those three properties I think there are now about 33,000 acres cleared fit for the plough.
691. You think that if Grenfell had the advantage of railway communication a great impetus would be given to farming? A very great impetus; even the idea of a strong probability of our getting the line has put increased zest into the work which is going on now.
692. I should like your opinion on the three different routes for tapping Grenfell; according to the map which you see before you Grenfell could be reached by the construction of a line from Young, by a line from Koorawatha, or by a line from Cowra;—which in the interests of the country would you recommend? Unquestionably Koorawatha; the route from Cowra is simply impossible.
693. For what reason? On account of the range of hills and because the distance would be very much greater than by Koorawatha. The route was inspected by *Mr. Jamieson*, who was sent up by the Works Department, and it was at once abandoned, the cost being absolutely prohibitive.
694. What would be the grade on that line? I do not think the Department would sanction a grade steeper than 1 in 75, but it would have involved going a distance of some miles round to get it. There is a range which has to be crossed and, where the gap is, the road is 800 feet high.
695. The mountainous character of the country renders it unsuitable? Yes; and besides that the land north of the hills shown on the map is barren country, while on the southern side it is all good. From Young to Grenfell I do not think there are any engineering difficulties.
696. What would be the advantages of a route from Koorawatha to Grenfell, as against one from Young to Grenfell? It is supposed that the country is better on the Koorawatha line. It gives the best approach to the Southern and Western railways, and makes a better line than going to Grenfell and then turning almost at right angles to Wyalong, and it would serve more country.
697. And the distance is shorter from Koorawatha to Grenfell than from Young to Grenfell? It is by road, but I do not know how it would be by the line because it must follow the contour of the country.
698. Is the character of the country similar in each case? Fairly similar. The land about Koorawatha is superior to the land about Young. The land about Young, although pastoral, is not fit for cultivation on a large scale, and the land all the way from Koorawatha to Grenfell is very good except in some isolated spots.
699. Can you tell us anything as to the stability of Wyalong as a settled population? I have every reason to believe that the population will increase. I know men who have erected very large works there and spent a great many thousands, and from what they show me, and from the opinion I hold of them, I believe there is every promise of permanency. And so far as I can see, each year the prospects from deeper sinking have become more indicative of permanency.
700. Has the population shown any increase during the last two years? I do not think so. In new rushes there is always a nomadic class that come at first and soon go away, but when they have left, as in the case of Wyalong, the population may be looked upon as permanent.
701. Would it be a fair thing to say that it has been stationary during the last eighteen months? Yes, I think so. The population is about 5,000 now.
702. With a view of reaching Hillston would you recommend a line touching at Cudgellico, or could a line with advantage, be taken direct from Wyalong to Hillston? I could not give an opinion on that, as it is some years since I went over the country; but I should very much like to see Cudgellico brought within the sphere of railway usefulness because there is splendid land there.
703. Have you heard that the land towards Cudgellico, or I might say Hillston, is better country than that from Barmedman to Hillston? I could not say. I do not know the line from Barmedman to Hillston. I have been all over that country electioneering, but never noticed any particular route laid down for the railway.
704. From what you know of Cudgellico, you would like it to have the advantage of railway communication? I should.
705. Is the land fairly fertile about there? There is some magnificent agricultural land about Lake Cudgellico.
706. Then it would be very good from Lake Cudgellico to Hillston? I do not know so much about that piece of country.
707. Then in the interests of the country you think the line over which I ventured to take you would be the best way of reaching Hillston. I am perfectly certain of it, and it would serve a greater portion of the country, a larger population, and induce more settlement than any other line that could be made.
708. You are altogether opposed to the extension of the line going westward from Condobolin? I am.
709. *Mr. Hoskins.*] Would not a railway constructed from Koorawatha to Grenfell cost more than the proposed line from Condobolin to Euabalong? I do not know; I have no doubt that it would be a cheap line from Condobolin to Euabalong, but that is a matter to be decided by expert evidence.
710. Is nearly all the land between Koorawatha and Grenfell alienated from the Crown? Yes.
711. Are you aware that the land that would be affected by the proposed railway from Condobolin to Euabalong is Crown land and that they would have to pay nothing for it? I do not think they would have to pay anything for the land from Koorawatha to Grenfell.
712. Are you of opinion, from your knowledge of the people who are very anxious to have this railway constructed, that they would be prepared to give sufficient land to enable the Government to take the railway from Koorawatha? Yes, I have promised my land.
713. I know you have, but what about your neighbours? Some of them have thought that they might be given land from unused and unnecessary roads to make up for the land taken for the railway; but I am certain that if the choice were given to them whether the railway should be made and they should give the land, or they should give no land and have no railway, they would willingly give the land to get the railway.
714. I suppose you know that people petition to have railways made for the purpose of getting paid twice as much for their land by the Government as other people would pay them? I think I have got my constituents well in hand on that score. I knocked that out of their heads. I have always scouted that from the beginning.
715. I suppose you know that the policy of the Government, and the opinion of Parliament and the people is in favour of constructing light lines of railway? Yes.
716. The proposed Railway from Condobolin to Euabalong, you know would be a light line? Yes

G. H. Greene,
Esq., M.P.

3 Feb., 1898.

- G. H. Greene, Esq., M.P. 717. Do you think that a light line, costing not more than £2,500 a mile, could be constructed from Koorawatha to Grenfell? Yes. I am told that there will be no cuttings worth mentioning, and that there is plenty of timber and ballast in the neighbourhood.
- 3 Feb, 1898. 718. We have before us the propriety of constructing a Railway from Condobolin to Euabalong, but now you have brought in another matter? I am sure the line which I recommend could be constructed at a very cheap rate on account of the nature of the ground, the supply of timber, and the ease with which the ballast could be got.
719. Are the majority of the farming population between Koorawatha and Grenfell persons who are cultivating on shares? Yes; but there are a large number of farmers irrespective of those men.
720. Is it not the intention of the large landowners to let their land out on the share system to get it cleared by cultivation, with the view of ultimately turning it into grazing land? They will make use of the land in the ways that pays them best. If there is a demand for the land they will sell it, or a large portion of it.
721. Does it pay better to let the land on shares, in the way you have described, than to graze stock on it? It pays very much better to let it on shares.
722. I suppose you are aware that the selectors are continually complaining that the cultivation of wheat does not pay;—will it pay the farmers and landowners to sell wheat at 3s. a bushel? Yes. The best farmers that I have are men who own land adjoining the land that they have taken from me on the half system. I can explain the apparent strangeness of that. No farming will pay under the old conditions. A man must work on up-to-date conditions and upon large areas. The selector who has got land that is timbered cannot devote the necessary capital to the clearing of that land, and he will come to me and take 200, 300, 400, or 500 acres, and with my assistance he will put that into cultivation. Selectors who clear 30 or 40 acres, working badly with bad implements, cannot make it pay, and they will die out. One man that I have is putting in 800 acres, and last year he paid me £700 off his indebtedness to me out of his crops. He has been working on the half system for four years, and is going on again.
723. Then the cultivation of wheat really does pay? It does with good workmen. But there are farmers under exactly similar conditions that I never could get to pay their store accounts, or to repay the advances which I made to them.
724. As a Member of the Legislature, do you think it would be better in the interests of the country to construct the railway from Koorawatha to Grenfell, instead of a railway from Condobolin to Euabalong? I have no doubt of it.

THURSDAY, 21 OCTOBER, 1897.

The Sectional Committee met at the Court-house, Grenfell, at 10 a.m.

Present—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN.)

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

George Henry Greene, Esq., M.P., sworn, and examined:—

4282. *Chairman.*] You were examined on the 7th Septe^r last by the main Committee in reference to this proposal? Yes.
4283. Have you any additional evidence to give? I have evidence to show the extra amount of expenditure in wages and material and the extra results gained by working the share system as it is worked here, as contrasted with the working of properties under the old system.
4284. You were not in possession of particulars when you were last examined? No. Originally I was working the Iandra estate as a pastoral property. I then employed about five men looking after the stock, and since we have had the partial assistance of a railway—because we are a long way from it, the nearest point being the Monteagle siding 12 miles distant—the average number engaged in ploughing, that is during the past four or five years, has been 120.
4285. How long would you be employing that 120? From the end of March until the end of July. During the harvesting, which you may say extends over about two months, there are 160 able-bodied men employed, representing forty families. On the share system on Iandra, there are forty families supported, and the station-hands and employees, instead of being five in number as under the old system, are twenty. The contractors employ on the average all the year round—at times the number is greater—fifty able-bodied men. During the drawing of the wheat and the carting to the railway there were employed last year sixty men with fifty waggons, and I trucked to Sydney 6,500 sheep; up to that date I trucked only a very small number, because I was not in a position to fatten them. This year I expect to truck, in spite of the disastrous drought, about 7,000 fats to Sydney. The amount I paid for cartage of wheat last year—I have not taken into consideration wool, or any other produce—was £1,015, sending to the nearest station. This year I expect it will cost from £1,500 to £2,000. During this time I had to keep and feed about 600 head of foreign horses and cattle belonging to the carriers, which was an enormous tax.
4286. Without any compensation? Yes; that is an expense in excess of the £1,015. Great injury was also done to the tanks on account of the low condition of the water, and the large number of stock to be watered. This year I would at this moment give a contractor £1,500, and take my chance, to cart my wheat to the nearest station, but I do not expect to get it done for £1,500. The work done between 1892 and this present year—say, five years—in clearing fit for the plough, amounts to the extent of 3,000 acres per annum. The amount of tonnage sent by me to the train, and upon which I paid freight for wheat alone, not counting anything brought up from Sydney, machinery or anything else, was between 2,500 and 2,600 tons; that was for train alone, irrespective of road-carriage, and the estimated value of the machinery and harness used in farming is £12,000, most of which, if I have not exactly supplied it myself, I have become security for; otherwise the men could not in many cases have purchased. I estimate that there are 500 farm horses at £15 a head, or £6,000. As showing the terrible loss we are put to in the face of this enormous expenditure, in not being able to utilise the straw (which, if we had a means of sending it away, would be cut with reapers and binders, and the wheat having been thrashed, would be sent to Sydney), I may mention that we lost on that item alone £7,000—that would be the straw off 10,000 acres. Considering that some of my men who do cut with reapers and binders have sold their straw at as high a figure as £5 a ton, the £7,000 I have given is a low estimate. It would, of course, apply to an ordinary season and not to a season of drought. You will see that, in making my estimate. I have taken the straw at a low price. With regard to the pastoral aspect of the question, I may mention that I have proved beyond doubt now that land which has been cropped for four or five years is in a thorough condition for growing lucerne. I have spent hundreds of pounds in the purchase of lucerne seed, and have spent large sums in getting it put in. I have at this moment about 500 acres which has been recently sown with lucerne, and by the help of this system of utilising the ground after it has been cropped for some years, there is absolutely no waste period in the history of the ground. It is turned at once from a productive wheat paddock into an almost equally productive grazing paddock, with the results that, whereas two months ago stock were on the point of death, I have lambs now ready to go to Sydney—cross-bred lambs—which will average 45 lb.; they are being shorn to-day. Under these circumstances, I claim that no fear need ever be felt of the farming industry being abandoned, and the country being allowed to go back to its natural waste condition, as it has been conclusively proved that the ground can be utilised in the way I have suggested. The area of improvement I should put down at the very least, if a line should be constructed from Koorawatha to Wyalong, at 15 miles on each side. Practically, the improvement would extend much further than that; but putting it down at that short mileage distance from the train, people would be enabled to send wheat to different places. Probably out west would be our best market in a time of drought. I calculate that the areas improved by a railway running from Koorawatha to Wyalong, and extending 15 miles on each side, would be 1,440,000 acres; and I should say probably nine-tenths would be fit for cultivation in some form or other. I give these figures to show that the holders of land, when they start upon this work, must go on, there is no stopping; it simply amounts to this: that whereas there are hundreds of capable men in this country who have not the means to till their own land, when they are put in possession of land cleared for the plough, and when they are supported by capital, become, I think, the most thriving class of farmers in this district. Where men are given the very best land, and have to work it without capital, they can never overtake the deficiency in their banking account; they live from hand to mouth a life of oppressive toil; perhaps they get in a small area each year; but the area they can deal with is so small that they become disheartened; whereas with a large area a man under the share system has no responsibility excepting that of work. All his pecuniary arrangements are made for him on a much more satisfactory basis than he himself could arrange them with the bank. It is said that figures can be made to prove anything; the figures I give, and the statements I am making, are derived from the facts; the facts have not been made to suit the figures, but are there, and can be seen. There are numbers of men who can give you similar evidence

evidence to that I am now giving. My argument in brief is this: that the statements made by myself and others with reference to the probable outcome of railway communication, and the efforts that would be made in the district to prove it worthy of the assistance of a railway, have been amply guaranteed. The work is there to show for itself; it will be permanent, and it will continue to increase. It must be left to the intelligence of those who have heard the evidence, and who can see for themselves what has been done, to decide the matter. We have now given hostages to the country for the due performance of everything which we have said can be done. If the results all through the district were only one-tenth of what can be shown to-day, the volume of traffic by rail would be larger than anyone would care to say.

4287. You have no doubt that railway extension to Grenfell would very soon pay? I am perfectly certain it would.

4288. But you think that, if anything, a line from Koorawatha would be the better paying line? Yes; but I shall be perfectly satisfied, now that our claim has been investigated, with any line the Government would choose to adopt. With regard to a question which was asked in Sydney, if I thought that the share system would lead to closer settlement on account of the large shareholders selling their land, I said then I thought it would. I have now to state that, having spoken to friends of mine who are in the same position as myself, the universal feeling seems to be that the holdings some of us have are too large, and that we should be willing to sell some of the land. I myself have for a long time past been in treaty with some of my own men, who came to me without one farthing, and whom I hope to see in a position to buy their own land in the course of a very short time.

583. Have you anything to add to that evidence? Yes; I should like to run through the evidence of Mr. Watson and correct some of his statements. I find it stated in Mr. Watson's evidence on the 4th of last month that the railway reserve along the line known as the "white line" is still intact. Some of that, which was in my own property, has recently been surveyed for sale. Great stress is laid on the fact that in 1883 the Government were favourable to the "white line." I wish to draw attention to the fact that that is almost ancient history, long before the discovery of Wyalong.

584. In other words, since 1883 circumstances have altered? Yes; Wyalong at that time was never heard of, and wheat-growing has been carried on in Grenfell for some years, and that was never thought of before. The "white line" branches off from Young $3\frac{1}{2}$ miles from the town, and for several miles runs almost parallel with the existing line. The construction, therefore, of the first portion of the "white line" would be through country already served. Of necessity the "white line" would, if constructed, rob the existing line of a portion of the traffic which it now takes as far as Monteagle. Taking it for granted that the statistics furnished by Mr. Watson are correct, the benefit accruing to the railway system through the use of that part of the "white line" would be almost infinitesimal, the distance being so short and access being afforded to the producers by the Murrumburrah to Blayney line. Mr. Watson argues that the "white line" can be more cheaply constructed, but any opinion of a layman on the matter is useless in view of the fact that all the resources of the Works Department are at the command of the Committee. I claim that either of the lines—the "white line" or the Koorawatha to Grenfell line—must be viewed as the portion of a system. The construction of the "whiteline" to Grenfell would, in the opinion of its supporters, necessarily be carried on to Forbes and ultimately to Werris Creek. Should the construction take place from Grenfell to Forbes, it would inevitably rob the Harden to Blayney line to a great extent. As it is claimed that the line from Koorawatha to Wyalong would rob the Temora-Cootamundra line, I think the extra traffic given thereby to the Harden-Blayney line, which likewise is a non-paying line, would be a fair set-off. A statement has been made by the advocates of the "white line" that the projected line from Koorawatha to Grenfell would only pass through the estates of large owners. I wish to give that an absolute denial. It does pass through three moderate estates, but when it emerges from the Brundah holding it goes into Grenfell through as populated and well cultivated a district as is to be found anywhere on either of those lines.

585. *Chairman.*] What is the distance from Brundah to Grenfell? About 12 miles.

586. *Mr. Black.*] What are the names of the three largest holdings? Woorangong, Iandra, and Brundah. It is claimed also that the holdings on the Young to Grenfell line being smaller, it follows that the settlers there must continue to cultivate, otherwise they could not live, their holdings not being large enough to enable them to make anything by running sheep alone. The argument is deduced from this that in the large holdings all the land will cease to be cultivated in a short time, that the share system will break down, and that the country will lapse into its original condition, or be laid down with artificial grasses. I am greatly obliged to those gentlemen who have told the public how I propose to manage my land; but I can say for myself with certainty, and I think I can speak for the other land-holders, that we believe the failure of the share system to be practically impossible. It is also stated that those men working on the share system have not been successful. I have a very large experience of these matters, and I state that the men on the properties working on the share system have thriven in every way better than the same class of men would have done on their own holdings. I have letters from several men who have been indebted to me, begging me to give them land on halves, and these letters were from men having land of their own. I, and those of my friends working on this system, have more applications now for land than we can satisfy. Men who came to me five years ago without a farthing, are now almost in a position to buy their own holdings. I have been for some time making arrangements to cut up my land and sell it, and so have my friends adjoining me. The statement that the system is likely to break down, and that the men farming on shares are not a success, is simply the result of gross ignorance. Another argument in favour of the construction of a line from Koorawatha to Grenfell is this: I am informed by the storekeepers in Young that under the present rate of freights charged by railways it would be impossible for them to make use of the line from Young to Grenfell at all, should it be constructed; that under the present tariff it will be cheaper for them to get their goods by the Western line, and cart by horse and waggon teams. I have seen a calculation showing that certain classes of goods required to a large extent in the stores can be landed in Grenfell at 5s. a ton cheaper than if the ordinary rates be persevered with, and a line constructed from Young to Grenfell. I claim that there is no method by which Hillston can be so easily reached as by the extension from Grenfell to Wyalong. Considerable stress has been laid on the fact that it is a shorter line—that it is only 40 miles from Temora to Wyalong, whilst it is 57 miles from Grenfell to Wyalong. That I consider is no argument whatever as long as fresh and suitable country for agriculture is being tapped all the way, and with a very trifling exception it is good agricultural land, or can be made so all the way from Grenfell to Wyalong. It has been said that this land, held under the share system, will go back into its natural state or grasses; but I can inform the Committee that such a state of things is scarcely possible, unless the Committee believe that those who started this vast industry are extremely foolish and short-sighted. We shall work the land in our best interests. I have proved by experience that it will not suit me to keep my land for too many years under one particular crop. Although it has been stated that the land will run out for wheat-growing in five or six years, I know of land which has been cultivated fairly successfully for nearly twenty-six years, and has not run out. I know of other

- G. H. Greene, land which gave a fair crop last season, although it had been cultivated nineteen times in twenty-two years. When the land wants a rest it may be beneficial to us to lay it down in artificial grasses, but only for a limited period. It has been stated in evidence that the small holders will improve their land, and prevent it being worked out by a system of rotation of crops. I would like to ask any gentleman interested in the matter to go to those places where these concerns are dealt with in a large way. You can get no fair system of averages by dealing with isolated or exceptional cases, and I state that to preserve the fertility of our land fully, we must, after cultivating it for a certain number of years under wheat, grow rape, cow-pea, lucerne, or other produce over which we can depasture large quantities of stock which recuperate the ground by manure. Then the land will, as sure as night follows day, be used again for growing wheat. It will be admitted by everyone who knows, that the farming on every one of these large properties is done in a much more economical way than the small properties can be worked. It is the only practically successful system with which I am acquainted, for this reason: that the man who has nothing but his own labour, can come to any one of us, get the machinery he requires on credit, and work it out. If he does not work it out we are never paid for it, so that we shall stand to lose. We see, however, that the money is properly expended,—that up-to-date machinery is used, and up-to-date methods observed, as well as all the conditions which are essential to good cultivation.
587. *Mr. Fegan.*] Have any of those who have made agreements with you thrown up their land since? No men have left me except those I was anxious to get rid of, because they were either dishonest, incapable, or unpleasant to work with.
588. The majority have worked the land successfully? Yes.
589. How many applications have you now for land from men who wish to work on the halves system? I could scarcely tell you. When I left the station I asked my manager whether there would be any difficulty about finding men to work the additional land which I have cleared and am still clearing, and he said that there were more applications than we could supply.
590. How many men have you on your estate on the halves system? Over thirty.
591. What is the average acreage? About 300 acres.
592. Have you cropped during the last bad season? Yes.
593. How many bushels did you get? About 12. If the season had kept good we should have got over 20 bushels per acre.
594. Has any land of yours gone back to grass after growing wheat? Some of the land which has been cultivated five years I am letting go back, with a view to putting in rape or cow-pea, or one of those kinds of fodder which recuperate the ground; and when it has been sufficiently rested it will go back under cultivation.
595. You think it proper to give the land a spell? Yes.
596. Have you made provision for that in your agreements? The agreements are yearly agreements.
597. Why are they yearly agreements? Because I found some of the men were not worth keeping; and whilst I was bound by an agreement for three years, and they could force me to keep up to my agreement, I could not force them to keep theirs. I had no control over a man who could carry all he had in the world on his back.
598. What is the nature of the agreements? I clear the land thoroughly, do whatever fencing is necessary, supply grass paddocks and water for the working stock, and then I find the seed. I also become, where they are not able to do it themselves, security for the payment of the agricultural implements they purchase. I keep them going, and find them with rations from the store. Then I act as agent for them as far as possible. They have come to the conclusion that I can transact their business better than they themselves, and it is a great saving of time for them. They have to harvest the crop, and we divide the produce equally. Where it is possible their wheat is sold with mine. It goes away in the same lump and I get the account sales of it. Then the produce is equally divided. Then they pay me whatever they are able to afford out of their earnings towards my account. The account is balanced and squared up, and they go on the next year.
599. And you superintend the operations during the year? As far as possible, with the view of making them do good work. The essence of co-operation in this matter is that men for their own sakes will work hard. When they will not I tell them that if they cannot do better work it will not pay either of us and they had better go.
600. Do you enforce living on the land? No; on the contrary. Most of these men have land of their own which has been worked out or been so badly worked that they cannot grow crops. When men have no homes of their own we make an arrangement outside of the agreements altogether.
601. Have any applications been made to you by some of the lessees on the halves system to buy their own holdings out? No definite proposals have been made yet, but they all know that I am working with a view of enabling them, not necessarily, to buy their holdings, but holdings of a similar character on the estate.
602. Can you tell us how many men have left you? I think I have got rid of seven or eight. A great deal has been made out of this point—that although this industry has led to an immense amount of employment in the neighbourhood of these three large estates, it is only a temporary one. It is only temporary in this respect, that they have other homes, but practically their working life is spent on the land. I may state that our clearing operations have begun again within the last few days, and I daresay within the last week or so forty or fifty fresh men have been put on to work in clearing. Under those circumstances I will ask the Committee not to believe any evidence to the effect that we are such fools as to spend this money with the object of doing nothing with the land. I may mention the case of a good farmer who came to me up to his eyes in debt to the Bank. He held another selection, and offered to give up the whole of it and all his stock if the Bank would give him a clearance and let him work on Iandra. The Bank would not do it. They wrote to me and I guaranteed his overdraft. He has now paid off the Bank and got his land clear or almost clear, and he is now carting wheat with one of the finest teams in the district. I do not think he owes anyone in the world the sum of 6d. He has taken on 200 acres of virgin land in addition to what he cultivated last year.
603. If this system is successful a greater number of selectors will be placed on those estates? No doubt.
604. The proposed railway will run through large holdings and very little Government property;—do you know whether the owners of the land will give what land is necessary for the construction of the line? I understand that all the land is likely to be given. There may be one or two small men who would make some

some little objection. I have been taunted with bribing the Government by offering my land for this line, but as a matter of fact I made the offer some nineteen years ago when Mr. Lackey was Secretary for Works. If we get no railway from Koorawatha we shall be in a most terrible dilemma as regards roads. I was ashamed to drive Mr. Deane over the road when he visited the district, for he was almost smothered in dust. On the "white line" there is a macadamised road nearly every yard of the way between Grenfell and Young.

G. H. Greene,
Esq., M.P.
8 Feb., 1898.

605. Have you ever tried cultivation and allowed it to go back again? Yes.

606. How many acres to the sheep were there when you first went there? When I first went there the whole of the run—36,000 acres—would not carry 6,000 sheep, but then the timber had not been killed. But when the ground has been cultivated and allowed to go back to pasture it is better for pasture than previously.

607. To what extent? Almost half as good again.

608. *Mr. Roberts.*] The line shows an estimated annual loss of £2,000 a year;—have you made any calculation as to the correctness of that estimate? We are only on the fringe of our work, and if the line is constructed the volume of traffic must increase enormously. I may say that the town of Young never moved in favour of the "white line" until they knew I was advocating the proposed line. In the neighbourhood of the "white line" and west from that no disposition has been shown to render the district worthy of the line. There is no work being done worth mentioning. There are small farms worked out, and men in a half-starving condition.

609. Is it not a fact that there is a larger population between Young and Grenfell than there is between Koorawatha and Grenfell? Yes; but practically there is not that difference inasmuch as five families, without having permanent residences on the land, practically spend their lives upon it. I do not think there are as many people working on the land between Young and Grenfell as there are on the three properties alone to which I have referred.

610. Are there not a number of settlers holding about 2,000 acres each between Young and Grenfell? I daresay.

611. It has been mentioned that there are five schools on the Young and Grenfell route? I do not know where they are. There is one close to Monteagle which the "white line" might claim. There is also one on land which I gave, and they might claim that, but nearly all of the scholars live on Iandra.

612. Is there good timber available to the west of Grenfell? Yes; the timber on the Weddin Mountains would be equally available for the Koorawatha as the Young line. In addition the ranges to the north of the Koorawatha line are nearly all iron-bark.

613. Would the fact of the line from Koorawatha to Grenfell being at right angles to the main line be the means of serving a larger area of country? Yes, because it would be tapping new country all the way.

614. Is the area described on the map as wheat country a fair estimate of the wheat country which would be served by the proposed line? Yes, I think it is a very fair description.

615. What about the area marked "wool"? I should have thought the wool area would have been much larger.

616. If the Koorawatha to Grenfell line were constructed, would you favour its continuation to Wyalong and thence to Hillston? Yes.

617. By way of Cudgellico? I do not know about that.

618. When did you first put your holding under wheat? About five years ago.

619. How many holdings are there between Koorawatha and Grenfell? I do not know. There are a number of small holdings, and the proposed line would be available for a considerable portion of the country served by the other line.

620. Is the production of wheat increasing yearly? Yes, enormously.

621. Would there be any land available for settlement if a railway were constructed between Koorawatha and Grenfell? I do not think there would be much.

622. Do you think the present owners of the land would be likely to lease or sell it to intending settlers at a reasonable rate? I think so.

623. What would be the price per acre? I could sell land now cleared for the plough at £3 10 per acre, and give good terms. On the Murray the same land would fetch £6 an acre.

624. Would there be a fair amount available at that rate? A very large amount.

625. What is the population of Grenfell and district? About 5,000.

626. Would the people from Grenfell and district get all their own stores from Sydney? They would if the line came *via* Koorawatha. If it came *via* Young they would cart from Cowra.

627. *Mr. Hoskins.*] Do you know what are the opinions of the people of Grenfell in regard to the matter? They are in favour of the line from Koorawatha.

FRIDAY, 4 FEBRUARY, 1898.

Present:—

THOMAS THOMSON EWING Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Koorawatha to Grenfell.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane. 628. *Mr. Hassall.*] Since furnishing information in connection with the proposed line have you traversed the route? Yes. I have made myself personally acquainted with the district. I beg to hand in the following information in regard to the cost of a single line of railway from Koorawatha to Grenfell:—

26 October, 1897.

KOORAWATHA TO GRENFELL.

Estimated cost of a single line of railway 29 miles 60 chains in length, with 60-lb. rails. Ruling grade, 1 in 75. Sharpest curve, 10 chains radius.

Description.	Estimated Cost.			Average Cost per mile.
	£	s.	d.	
Earthworks	14,233	5	0	478
Timber bridges and small timber openings.....	6,109	14	0	205
Level crossings, cattle-stops, and fencing	3,951	0	0	133
Permanent-way materials	18,952	4	0	637
Freight	3,926	5	0	132
Platelaying at 1s. = £2,618	15,904	7	0	535
Ballasting one-quarter at 3s. 6d. = £2,290 15s.				
Sleepers at 3s. = £10,995 12s.	5,568	15	0	187
Station-works, including junction and sidings	6,295	0	0	212
Station-buildings, waiting-sheds, £525; passenger platform, £200; loading banks, £550; goods-sheds, £480; grain-sheds, £500; 5-ton cranes, £400; weighbridges, £550; station-master's houses, £400; trucking-yards, £740; engine-shed, £500; carriage-shed, £200; coal stage, £150; turn-tables, £1,100				
Water supplies	3,000	0	0	101
Gradient and mileage posts	446	5	0	15
Telegraph	446	5	0	15
Miscellaneous.....	500	0	0	17
Cost of works.....	£79,333	0	0	...
Engineering and contingencies, 12½ per cent., nearly	9,917	0	0	333
Total cost	£89,250	0	0
Average cost per mile	£3,000	0	0

In my evidence on the Condobolin to Euabalong line I gave a number of comparative distances, and estimated costs of lines which traverse the country between the Southern and the Condobolin line. There are one or two small corrections to make, because since that time the surveys in one or two cases have progressed; consequently we have accurate distances instead of estimated ones. I may mention that when I was at Grenfell I examined the town and the lines surveyed in and out of it, with a view to deciding whether the station site was the best which could be obtained or whether something better was possible. It struck me at the time that it would be possible to bring the station nearer into the town, but it was not until I got back from Sydney that I was enabled, by means of the levels that had been taken in connection with this and other surveys, to prove what I now state, namely, that a station site can be provided which will be within the township of Grenfell instead of 1½ mile away, as previously proposed. The improvement is effected by lowering the grade of the proposed terminal station site at Grenfell, and crossing the small valley or creek into the western side of the town of Grenfell, and joining there the survey which was made from Young to Grenfell. The continuation of the line beyond follows for a short distance the surveyed line from Grenfell to Forbes. It gets through some gaps in the range, and, after crossing, it turns off to the left and proceeds towards Wyalong. The total cost of the two lines, from Koorawatha to Grenfell and Grenfell to Wyalong, will probably be the same; but the cost of the line from Koorawatha to Grenfell will be added to, to the extent of £3,100. There will be an extension of the same of 1½ mile, which will cost that amount. I recommended strongly that the line should be extended in this way into the town of Grenfell. I have reported the matter to the Minister, and he has expressed himself as desirous of doing as much as possible to suit the residents of Grenfell.

629. What grade do you get in crossing the range to the west of Grenfell. 1 in 75.

630. If the recently-surveyed route were followed, it means that Bimbi would be left 8 miles to the south? Yes; it means that the more northerly route to Wyalong would have to be adopted, unless you turned back on the same line to get to Bimbi.

631. Is the survey to Wyalong completed? Yes.

632. So that you are able now to give the distance? Yes.

633. In your former statement the distance between Koorawatha and Grenfell is given at 29 miles; now you give it at 29 miles 60 chains, which would include the extension to the proposed terminus? No, it would

H. Deane.
4 Feb., 1898.

would not. The line from Koorawatha to Grenfell, as shown in the report, is somewhat lengthened, and the line from Grenfell to Wyalong is shortened to the same extent. I will give you the distances. I am assuming that the two stations are 1 mile apart, although in reality it is close on $1\frac{1}{4}$ mile. Koorawatha and Grenfell I have taken as 30 miles—it really is 29 miles and 60 chains—that is to the station site originally proposed. If you take the line into the town, as I now recommend, it makes the distance 31 miles. Grenfell to Wyalong, as surveyed, from the previously proposed station, is 57 miles, but by the suggested alteration it is 56 miles.

634. Did you traverse any country beyond Grenfell? I went as far as the Caragabal station which is on the plains. I did not think it necessary to traverse the Bland country into Wyalong, as I have been at Wyalong before. I returned from Caragabal station *via* Bimbi into Young, and the day before leaving I went over the greater part of the Young to Grenfell survey, so as to be in a position to make a comparison between the two routes.

635. Were you far enough out on the Bland country to form an opinion as to whether there will be any difficulty in constructing a line across there which will carry all your traffic? There will be no difficulty whatever, excepting that care will have to be taken in crossing the Bland, so as to be safe from flood. The Bland, I understand, spreads out to the extent of several miles in very wet weather, but I do not think there will be any difficulty on that account. I do not think that, even providing for all the flooded waters of the Bland, the estimate will be exceeded.

636. Will you give your opinion as to the possibilities and probabilities of one route over the other? As regards the distance to be constructed they are almost exactly the same. As regards the cost of construction the Young line would be a little more, and that is due partly to earthworks and partly to culverts and bridges, and also, in a minor degree, to crossings and cattle-stops.

637. What will be the difference? The estimated difference is £177 per mile.

638. So that the Young to Grenfell line will be £3,177 per mile? Yes, and the total £94,357, as compared with £89,250. Of course if you add the £3,100 to the Koorawatha to Grenfell line you bring that up to £92,350, which is nearer to the Young to Grenfell estimate, so that I think the Committee may reckon that, as regards cost, they are practically the same.

639. In traversing the two routes, which one struck you as carrying the most population? I did not observe the country with the intention of making any comparison. Of course the character of the holdings may be said to be somewhat different. On the Koorawatha side you have stations of large size with farms let out on the halves principle. On the Young to Grenfell route you get the country not so much cultivated, but what there is is in smaller holdings.

640. The character of the country is practically the same? Yes, it is all very fine country.

641. Do you know what view the Commissioners hold with regard to the junction at Young or Koorawatha? I believe the view of the Commissioners is that the best junction is at Koorawatha. One strong reason in favour of that is that it taps country and serves agricultural areas which are already there, and it gives the option of taking the traffic either to the Western or Southern line, as most convenient to the carriers, that is to say, to the Railway Commissioners. In order that the Committee might be in a position to judge what is meant by taking goods by the Western line and by the Southern line, I have had a table prepared [*vide Appendix*] which will show that, although it might be expected that on the Western line the rise to be surmounted is very much greater than on the Southern line, it is not so in reality. The Southern line consists of such a series of rises and falls that the total rise on the line towards Sydney is not very much less than on the Western line. The total rise proceeding from Grenfell to Sydney *via* Young, Harden, and Goulburn, is 6,841 feet; the total rise from Grenfell by the Western line—that is *via* Koorawatha, Blayney, and Eskbank—is 7,598 feet, or a difference only of about 757 feet.

642. With the very probable growth of traffic from the interior it might be of some moment to the Commissioners to be able to command the two routes from the most accessible point? Very likely.

643. Naturally, if a line went from Young towards Grenfell, they must bring the traffic in on the Southern line? It would naturally go that way.

644. In the event of any large traffic growing up in the western country, it might result in the overcrowding of the Southern line, or make it inconvenient to work at times;—do you think it is an advantage to have a junction at that point, which will enable the Commissioners to command either the Southern or the Western line? Yes. If you want to get on to the Southern line, you would have to go 25 miles further round if you come to Koorawatha than if the junction were at Young.

645. Do you wish to express any opinion with regard to a line coming from Dubbo, Parkes, Forbes, and Grenfell to Young, that being a line which might, some day, knit together the railway system in that part of the Colony? Yes; it is clear that there will be a loss made if a person coming from the Southern line, on reaching Young has to turn and go a little north and east to Koorawatha, and then turn into Grenfell. There would be a loss of distance of 25 miles; but if there be an extension west to Wyalong, traffic coming down the Blayney line would have the advantage of some 31 miles, inasmuch as it would turn off at Koorawatha instead of going to Young. Therefore, the question resolves itself pretty much into one of one line compensating for the other. There is also this to be said, and it will be seen in the table which I am handing in, that the actual distance from Grenfell to Sydney, *via* Young and Harden, is 282 miles, and *via* Koorawatha and the Western line 266 miles. [*Vide Appendix.*]

646. Touching the question of traffic, the probability is that the bulk of the traffic will be the traffic from the western country to Sydney, as compared with the traffic which might eventuate on a line running across from Werris Creek to Dubbo or to Harden? Yes.

647. Therefore, any gain in the length of the line from Dubbo *via* Peak Hill, Parkes, Forbes, and Grenfell to Young, would not benefit so many people as the gain the other way, running direct from Grenfell to Koorawatha? No.

648. So that the advantage practically is in that direction? Yes; it seems so.

649. After inspecting the locality, you have arrived at the opinion that Koorawatha is the better point of departure for a line of railway towards Grenfell? I have not drawn any conclusions. I have stated the facts. I should like to say that I do not think any serious mistake would be made if either of them were adopted. But so far it would appear that the Government proposal is, on the whole, the most advantageous.

650. Practically, the cost and distance are about the same, and it is a matter for consideration as to which will be the better point of departure? Yes.

H. Deane.
4 Feb., 1898.

651. Have you any opinion to offer as to the wisdom of an extension from Grenfell to Wyalong, or from Temora to Wyalong? I should say an extension from Grenfell to Wyalong would serve better country and would give better returns per mile for the distance traversed.

652. There is not much difference in the country to be traversed, as far as engineering difficulties are concerned? Not very much. I think that the Temora-Wyalong line was put down at £2,300 per mile, and the line from Grenfell to Wyalong at £2,500 per mile. As I say the estimate is not yet ready. It is not very long since the surveyors completed their work, but I think, if anything, the cost will turn out to be less than £2,500 per mile.*

653. The country from Grenfell out to the Bland is good agricultural country? Yes.

654. And the Bland country is practically a pastoral country? Yes; you get rather more than one-half the country in the agricultural area. Then you get on to the plains 33 or 34 miles out from Grenfell towards Wyalong.

655. It has been emphasised that the line from Grenfell to Wyalong will experience great difficulty in floods coming across the Bland;—you have taken that into consideration in your estimate? Yes. At the same time I shall be prepared to give the revised estimate to the Committee at a later date.

656. We can take £2,500 as a maximum? Yes.

657. *Mr. Roberts.*] Could a line from Cowra to Grenfell be as easily constructed as one from Koorawatha to Grenfell? No; you cannot easily construct a line from Cowra to Grenfell. There is a range which is very awkward. You pass the same range two miles out of Koorawatha, but the altitude there is low. From Cowra to Grenfell it would be difficult, if not impossible, to get the grade you want—at any rate it would involve considerable cost.

658. How many stations do you propose having between Koorawatha and Grenfell? I think there are four.

659. What is the cost of the proposed stations? I have them lumped together, including some cost at the junction of the terminal station—£6,295. That also includes two turn-tables at £1,100.

660. Does that include the station in the town of Grenfell? Yes. Of course they are all of an economical character. It has been the practice of the Department to erect economical stations for some time past, and as the Commissioners see the traffic increases they are in a better position to judge what improvements are necessary. They will be erected of wood.

661. Is there plenty of timber in the district for sleepers and other purposes connected with railway construction? There is pine in the district, and some of the ranges, within easy distances of the line, carry ironbark, but we should no doubt have to go some distance for the bridge timber. I have put down 3s. each for sleepers, which will allow for their coming some distance. The ironbark forests of the country are getting very much depleted, but still I think we can get out our sleepers for 3s. each.

662. And you would probably get them west of Grenfell? I think we shall have to get them where we can, but I do not think there will be any difficulty in getting them.

663. What are the sharpest curves on the proposed line? 10 chains.

664. The line, if continued to Wyalong, would be constructed at a lower price than the proposed line? Yes, because we get on to easier country after passing the little range to the west of Grenfell.

665. Do you know the country sufficiently well to draw comparisons between the country between Grenfell and Wyalong, and Wyalong and Temora,—I mean as to the revenue which might be derivable? Speaking generally, there is a much larger area of suitable country for agricultural and pastoral purposes between Grenfell and Wyalong. When you go from Temora to Wyalong you notice that the ridgy country is very much closer, and good land is much scarcer.

666. *Chairman.*] Would you turn with a sharp curve round from Grenfell to continue to Wyalong? There would be no difficulty about it; it would avoid a back shunt. You can come round.

667. Therefore, as far as the extension *via* Bimbi or the northern route is concerned it is immaterial; you could get out either way? Yes.

668. But the best get-away is to keep going north? Yes; it is shorter and the country is more taken up.

669. Do you think the line *via* Bimbi, or the northern line, is the better from an engineering point of view? It does not make much difference; they are both fairly easy.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and further examined:—

W. McIntyre.
4 Feb., 1898.

670. *Mr. Roberts.*] You promised on a former occasion to give the Committee some information with regard to the population between Young and Grenfell? Yes; I have taken out the number of electors within 10 miles on each side of the proposed line from Koorawatha to Grenfell, and also on the route from Young to Grenfell. There is a small piece common to the two at the Grenfell end. On the Young to Grenfell route there are 1,759 electors, which would represent a population of about 7,000. On the Koorawatha to Grenfell route there are 717 electors, which would represent a population of 2,800. The principal part of that population is located close to Grenfell. At the Koorawatha end the population is very slight.

* NOTE (*on revision*):—The work of estimating has proceeded so far as to enable me to state that the cost will not exceed £2,300 per mile.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Koorawatha to Grenfell.

APPENDIX.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM KOORAWATHA TO GRENFELL.

REPORT.

THE Sectional Committee, consisting of Mr. T. T. Ewing, M.P., Hon. D. O'Connor, M.L.C., Mr. H. Clarke, M.P., and Mr. J. L. Fegan, M.P., appointed on Friday, 11th February, 1898, to inspect, take evidence, and report with reference to the proposed Railway from Koorawatha to Grenfell, have the honor to report to the Parliamentary Standing Committee on Public Works that they left Sydney by the 9 p.m. train on Friday, the 18th February, and arrived at Young at 8 a.m. on the following day. During the afternoon of the same day the Committee obtained such information as was obtainable at the Local Lands and Roads Offices, and subsequently visited the Co-operative Roller Flour-mills, the Meat Chilling and Freezing Works, and the Butter Factory.

On Monday, 21st February, the Committee left Young at 8.30 a.m., and arrived at Koorawatha at 10.30 a.m., and heard the evidence of all local witnesses. On Tuesday, 22nd February, the Committee, accompanied by Mr. Little, Engineer, Railway Construction Branch, Public Works Department, left Koorawatha by special conveyance, and inspected, as far as practicable, the route of the proposed railway to Grenfell. The Committee also visited Warrangong, Uppinham, Iandra, and Brundah, and drove through a large portion of the wheat-growing districts. The Committee took evidence at the Court-house, Grenfell, on Wednesday, 23rd February, and Thursday, 24th February. On Friday, 25th February, the Committee left Grenfell for Young, *via* Arramagong and Bulla Creek. Local witnesses were examined at the latter place. The Committee took evidence in the Court-house, Young, on Saturday, 26th February, and Monday, 28th February.

In the Report of the Railway Commissioners it is stated that, although there will probably be a loss of nearly £2,000 per annum on the proposed railway, the resources of the Grenfell district, aided by better means of communication, will, in all probability, soon make the line pay all reasonable charges. From a comparison of the statistics of a year ago with those now furnished, and also from their personal investigations, the Sectional Committee are of opinion that the anticipations of the Railway Department with regard to the transitoriness of the loss is correct. The area under cultivation is rapidly increasing, and it is reasonable to suppose that soon after the railway is completed there will be a sufficiency of traffic to render the line reproductive.

Even the opponents of the proposed line concede that Grenfell is entitled to railway communication. The real question at issue is the route by which that district should be approached.

Koorawatha, the junction of the proposed Grenfell line with the Blayney-Murrumburrah railway, as a trading centre need not be considered. The township consists of but a few buildings. The direction of the proposed line is practically at right angles to the existing railway. For a great part of the length the land is suitable for the growth of cereals, but here and there rough country obtrudes, which must be regarded as of very little value either for agricultural or pastoral purposes. Still this does not materially affect the statement that the district between Koorawatha and Grenfell may be regarded as a tract of country eminently suitable for carrying

carrying a considerable population and for the production of a large quantity of wheat and wool. The line appears to have been well located. The rough country previously referred to is not continuous, and all the ranges can be approached by easy grades. The map which accompanies the report of the Sectional Committee shows that the line crosses several creeks, none of which should necessitate any extensive works. The termination of the line on the western side of Grenfell, as suggested by the Engineer-in-Chief, will be more satisfactory than the terminal station previously approved by him.

The evidence taken before the Sectional Committee shows that adjacent to the line there is a very considerable area of land at present under cultivation, and preparations are being made to further extend it. The nearest station towards Koorawatha is Warrangong, which, with an area of 21,000 acres, has 5,000 acres prepared for the plough. Iandra, having a total area of 30,000 acres, has 17,500 acres prepared for the plough. Brundah, with an area of 16,000 acres, has 9,000 acres prepared for the plough. These three stations furnish, in the opinion of some, a serious objection to the construction of the proposed line. Although these holdings are of considerable extent still the amount of labour employed upon them is very considerable, and those interested in the production of wheat thereon form a considerable population to whom reference will presently be made.

From Brundah to Grenfell the land is held in smaller areas, and on this portion of the proposed line the charge that it will be constructed for the benefit of the large holders cannot be maintained. The statement referred to has been so frequently brought under the notice of the Committee that a reference to the positions of the larger estates engaged at present in farming on the share system is necessary.

Under the conditions which obtain in the district, whether wheat be grown by a large or a small holder the same amount of labour will be employed in its production. If the growing of cereals on a large estate impoverish the soil the same result must follow on smaller holdings. Since the amount of labour employed, and the question of impoverishment of the land apply fairly well in either case, *i.e.*, whether the land be farmed on large or small holdings, the question resolves itself into one of the ownership of the wheat. Under the share system a certain proportion of the heat, in accordance with agreement, is given to the landholder for the use of the land, for the expense of clearing, and for other incidental services.

Although it is certain that with a good price for wheat, and reasonable crops, the owner of the land under the share system will receive a very large return for his expenditure, still the popularity of the system, under present conditions, is proved by the extension of operations, for where carriage by team is not too far to the railway station the large holders have no trouble in obtaining tenants on the proposed terms. It no doubt is a fact that in bad seasons, or if wheat fell materially in price, there would require to be some alterations in the agreements under which the land is leased. The parties interested in the growth of wheat will no doubt be able to come to an agreement mutually satisfactory when a new state of things has to be faced. At present the tenant farmer is prepared to pay in kind to the extent, at times, of half the crop, and during last season he apparently prospered under these conditions. The Sectional Committee do not, by quoting evidence, desire to unduly extend the length of this report, but the statements on oath by share farmers will show many instances of the profitable results of the operations to them. It will not be seriously contended that because men are unable to obtain land of their own the State is under a less obligation to carry their produce than that of the freeholders. It is not material to the railways as a commercial concern by whom the produce is grown; the main question from a carrier's standpoint being the proper development of the country so that a sufficient amount of produce is available to render the line productive. The matter really resolves itself in principle into one of the respective value to the State of tenant farmer and freeholders. With regard to this question—especially in view of recent land legislation—the Sectional Committee believe no expression of opinion can be expected from them.

The obligation to the State to carry the produce of the soil is not determined by the question of tenure of the land, but it has been suggested that wheat-growing will be less permanent on a large estate than on a small holding. After full investigation it has not been proved to the Committee that there is any likelihood of wheat
farming

farming being a success on small areas and a failure on large holdings. If on a large estate the land be exhausted by wheat, such also must be the experience of smaller holdings. If, by laying down his land with lucerne, and feeding sheep upon it, a pastoralist obtains the largest return per acre from his land, such procedure would also give the best return on the smaller holdings. With regard to the permanent occupancy of land on shares there is certainly a greater probability of an alteration in the personnel of the tenants than of the freeholders; but, if wheat growing continue to be more profitable than the production of wool, there will be permanent agriculturists occupied on the land, although it may be under easier agreement; and if wool give a larger return per acre than wheat there will be the same tendency to revert to its production on a small estate as on a large one.

The line known locally as the "white line" from Grenfell to Young leaves the former town from the same station site as station No. 2 proposed by the Engineer-in-Chief. Right through to Young the country presents no important engineering difficulties. For the first 18 miles the engineering difficulties would appear to be even less than on the line from Koorawatha to Grenfell, but the Engineer-in-Chief explained that the creeks require rather heavier construction, and therefore his estimate of the total cost of the line will be some £12,000 greater than that from Koorawatha to Grenfell. Although as Young is approached the country becomes rather hilly, and at times broken and stony, still the whole area must be regarded, generally speaking, as suitable for the production of cereals and wool. From the Committee's investigations, which were, however, limited to the vicinity of the line in each instance, there appears to be less improvement on the "white line" than on the line from Koorawatha. But, although the population cannot be regarded along the "white line" as other than sparse, still there is no doubt from the evidence that there are more landholders between Grenfell and Young, than between Grenfell and Koorawatha. For the first dozen miles or so after the "white line" leaves the existing railway, all residents situated between these lines would be not more than 6 miles from one route or the other. This serious defect in the "white line" has already been emphasised before the full Committee. If fair access by road were given to the Blayney-Murrumburrah line—from such places as Bulla Creek and *via* Monteagle—these localities would be well served.

The cost of constructing a road capable of carrying the produce of the district *via* Brundah to Koorawatha is estimated by the local road officer to probably necessitate the expenditure of not less than £14,000.

Summarising the local merits of the two routes, it may be stated that the Koorawatha route leaves the present railway system almost at right angles, and the Young to Grenfell route at an acute angle, thus remaining for a greater length than is desirable within the influence of an existing railway. The land in both cases is suitable for pastoral or agricultural settlement. The cultivation on the Koorawatha to Grenfell route at present is greater than on the route from Young to Grenfell. The small holdings are greater on the route from Young to Grenfell than on the route from Koorawatha to Grenfell. The permanency of agriculture on either route is controlled by conditions already explained. The cost of construction will not differ materially.

It appears probable that arrangements can be made which will reduce to a minimum the cost of any resumption for railway purposes between Koorawatha and Grenfell, and although most of the land originally reserved on the route from Young has been alienated, possibly for two-thirds of the distance to Grenfell, by the "white line," the land can be obtained free for the purposes of railway construction.

It was contended by residents of the town of Young that they had been accustomed to trade over a large area of country, and since capital had been invested in the centre of the district it was unfair to curtail its trading limits unless there were some great national end to be served. It, therefore, became necessary to determine the present district over which Young trades, and make clear the loss of area which would probably be experienced by that town from the construction of a railway from Koorawatha to Grenfell. The existence of a line of railway from Young to Cowra on the east, and from Cootamundra to Temora on the south, makes it unnecessary to refer to any portion of that district immediately to the north-east or west of Young. The construction of the Koorawatha to Grenfell line cannot
materially

materially affect the trend of traffic in either of those directions. The description of these areas must be regarded as approximate, but they are sufficiently close for all practical purposes. Young at present trades about two-thirds of the way towards Grenfell, *i.e.*, as far as the range dividing the Tyagong and Burrangong Creeks. Some store goods are supplied beyond this line from both towns, but this boundary is sufficiently accurate. Wheat comes to Young from beyond that point. The mill at Grenfell is not sufficiently powerful to deal with any great amount of wheat, and there is no good road by which the railway can be reached from the country south from Grenfell except *viâ* Young. A very large proportion of the stores for Grenfell and district do not come *viâ* Young, but *viâ* Cowra, therefore Young cannot sustain a claim that Grenfell lies within its present trading area. The northern boundary of the trade limit of Young is from the junction of the Tyagong and Burrangong Creeks, following down the Burrangong Creek to Bimbi; thence north along the Bimbi-road until it strikes the Caragabal Creek; thence down that creek to Marsden—(from about here there will be a tendency to go to Forbes)—thence up the Bland Creek until the influence of the Temora and Stockinbingal railway connection is felt. If the railway be extended to Grenfell, the trading area of Grenfell will, in the opinion of the Committee, not go much further to the south than the range between the Tyagong and Burrangong Creeks previously referred to, and it will remain fairly well in the same position as far west as Bimbi, but, perhaps, passing a little south of that place, and extending westerly to Williams' Crossing; thence north beyond Marsden, and on to the north extending approximately half-way between Grenfell and Forbes.

This shows that the trading area of which Young will be deprived is bounded on the east by a line from Bimbi to the Caragabal Creek, west almost to Marsden, south along the Bland Creek to Williams' Crossing, and thence approximately east to Bimbi. Therefore the utmost that Young can lose from its present trading limits is an area of about 12 by 16 miles direct, of which the northern portion is at present uncertain. It will be understood that there are deliveries from Young, and trade to that place, at times, beyond the defined limits, but for general purposes the defined areas are sufficiently accurate. If the Koorawatha-Grenfell line be constructed it will pick up traffic almost into Koorawatha.

If the "white line" be constructed it will be of advantage to the country tinted blue to the west.

Generally speaking, the country developed by either line is equal in area. If the connection be *viâ* Young the trade of the whole tinted area will pass through that town; if Koorawatha be the starting point of the railway, the yellow and red areas will have a shorter and cheaper route to the metropolis and the seaboard. The advantages in the shortest connection to the west and south by the rival routes may be regarded as equalising each other.

The full Committee desired that the inquiry of the Sectional Committee should be limited to the question of a terminus for the time being at Grenfell, and a statement whether the trading area of Grenfell, if a line be constructed, is sufficient to make the line self-supporting should there never be any extension to the west. Therefore, it was not necessary to inquire into the question of the western traffic beyond those points from which it could reasonably be expected to come by team to a terminus at Grenfell.

In the construction of new lines it is, at times, justifiable to sacrifice direction or route to large vested interests such as were claimed to exist in Young. The wheat produced in the past can be obtained from a very small portion of the trading area which belongs to Young under any circumstances, and the produce transhipped at that place, if the development anticipated locally be realised, will rapidly increase and be infinitely greater than has been the experience of that town in the past. If in Young there were large mills capable of dealing with the produce of a great area of country, and if the substitution of a new trading area interfered with their operations and rendered the money expended in their construction a wasted quantity, the matter would have considerable weight with the Committee; but the co-operative mill in Young deals with a quantity of wheat which would be grown in an average season on 25,000 acres of land, therefore the milling plant in Young, being able only to

to deal with wheat coming off an area between 6 and 7 miles square, represents a very small proportion indeed of the available country the produce of which must still come to that place, and there will be no abandonment of machinery consequent upon an extension from Koorawatha. But if a fair proportion of the wheat grown in the Young district be milled locally there must be an extension of mill power. If the wheat simply passes through the Young station this fact cannot have a very material effect upon the prosperity of the town.

The situation of Grenfell makes it certain that that town will trade with Sydney for all time, and, therefore, it requires the shortest route to the metropolis. The distance from Sydney, *viâ* Koorawatha to Grenfell, is $265\frac{3}{4}$ miles; *viâ* Young, it is $277\frac{3}{4}$ miles. The cost of railway carriage, *viâ* Koorawatha, is, therefore, less than *viâ* Young. The traffic from Grenfell should go east of Koorawatha, not south to Young, and the rates quoted by the Commissioners show that by this route the district of Grenfell will have the least costly land carriage. If the produce were sent *viâ* Young, it means that for all time the producers in the Grenfell district would be penalised to maintain Young as a trading centre. It may be contended that it might be cheaper to bring the goods by the Southern line. The Committee have always refrained from expressing an opinion as to the rates laid down by the Railway Commissioners, which are presumed to be significant of the service rendered by them, and since the Commissioners have informed the Committee that they can deliver goods *viâ* Koorawatha cheaper than they can *viâ* Young, this statement must be regarded as representing the facts of the case.

The Sectional Committee were impressed with the importance of the town of Young, and of the possibilities of the Young district, and have endeavoured to fairly weigh the contentions urged by the residents of that place.

The statement from the Chairman of the Young Railway League, which shows that much intelligent attention has been devoted to the question, emphasises several considerations, as follows:

1. The proposed line from Koorawatha to Grenfell.
2. The proposed extension from Grenfell to Wyalong and Hillston.
3. The proposed line from Young to Grenfell.
4. The proposed direct federal line from Werris Creek to Demondrille.
5. The proposed federal and commercial line from Temora to Wyalong, Hillston, Broken Hill, and Adelaide; in conjunction with—
6. The proposed line from the vicinity of Moss Vale or Exeter to the Illawarra district.

Nos. 1 and 3 have already been dealt with in the statements with reference to local conditions.

No. 6 may be dismissed as being too remote to be intimately connected with the railway under consideration.

No. 2. It was determined by the full Committee that the extension to Grenfell did not necessarily finally decide the route of a railway to Wyalong. The case for a railway to Grenfell rests on the importance and possibilities of the Grenfell district, and is limited by lines laid down in the sketch herewith. Very little, if any, of the country only affected by an extension *viâ* Temora to Wyalong is included within the area presumed to be benefited by the construction of a railway from Koorawatha to Grenfell.

It is conceded by the advocates of the Temora-Wyalong line, even if it be constructed, that a line from Young to Grenfell must also be made. Therefore, the connection of Grenfell with the railway system is not antagonistic in itself to the Temora-Wyalong line.

No. 4 federal line. It is not within the scope of the Sectional Committee to express an opinion with regard to the wisdom of the location of the Orange-Forbes or Blayney-Murrumburrah line, but it is apparent that these lines may have complicated the design of a direct line from Dubbo to Young.

Again, the disadvantage entailed on travellers from the Southern line along this federal railway, if one section be from Koorawatha instead of from Young, will be at least partially compensated for by a shorter journey from the vicinity of Blayney and of traffic east therefrom.

In other words the distance is shortened from a portion of the main Western line by the amount it is increased from the Southern.

No. 5 line to Broken Hill and Adelaide. The commercial aspect of this line is fully set out in the Public Works Committee's Report on the proposed Railway from Condobolin to Broken Hill.

The Sectional Committee recommend that the line from Koorawatha to Grenfell be carried out.

THOS. EWING,
Chairman.

Sydney, 10 March, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM KOORAWATHA TO GRENFELL.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 21 FEBRUARY, 1898.

[The Sectional Committee met at the Public Hall, Koorawatha, at 2 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).
 THE HON. DANIEL O'CONNOR. | HENRY CLARKE, Esq.
 JOHN LIONEL FEGAN, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Koorawatha to Grenfell.

George Barr, farmer, Koorawatha, sworn, and examined:—

1. *Chairman.*] Do you desire to give the Committee the benefit of your experience in connection with wheat-growing? Yes. I am a share farmer of three years' experience. The first year I put in wheat at Warrangong. I was late in starting harvesting operations, and I just about cleared expenses. In the second year I had 100 acres under crop, and got a return of £222 as my share. In the third year I made about £1 6s. 8d. per acre as my share, and I had 167 acres under crop. G. Barr.
21 Feb., 1898.
2. Then you have increased your area this last year by 67 acres? Yes.
3. Have you included your labour in the return for the third year? No; I have given you the gross return.
4. What would be the net return after paying for the labour? I have not gone into that matter.
5. Do you desire to express an opinion with regard to sheep-farming? My experience is that sheep-farming would not give as good a return as wheat-farming.
6. What do you think sheep-farming would give you per acre? About 5s.
7. Therefore, the substitution of wheat for sheep means an increase in the value of the products of about fivefold? Yes.
8. How far will you be from the proposed railway, if constructed? Between 6 and 7 miles north.
9. What does it cost you to get your wheat to Koorawatha? 6d. per bag, or 5s. per ton.
10. How far have you to carry it? About 10 miles.
11. If the line were constructed you would intercept it a few miles out? Yes.
12. What are the rates in this district for carrying wheat 10, 20, or 30 miles? For 10 miles the rate would be 6d. per bag; for 20 miles it would be 1s. per bag; and for 30 miles it would be 1s. 6d. per bag.
13. Is that a fair rate? Yes.

William Allen, farmer, near Koorawatha, sworn, and examined:—

14. *Mr. Clarke.*] Where do you live? Two miles north of Koorawatha, towards Cowra. W. Allen.
21 Feb., 1898.
15. Are you farming on your own account? Yes.
16. What area of land do you hold? 893 acres.
17. Do you work it all with your own labour and that of your family? Yes.
18. Do you pay for any outside assistance? A little during harvest time.
19. Do you do any dairying? Yes.
20. How many cows do you milk? About forty-five at present.
21. Would you be able to milk more in good seasons? Yes; I have milked as many as fifty-five.
22. Do you separate the milk yourself? Yes. I send cream into Young, and I also churn a little at home. I supply the store at Koorawatha.
23. Does the butter factory at Young buy the milk from you, or does it churn it for you on your own account? The Company are supposed to churn each lot separately, and we get a return of what butter is taken from the cream. I may say that for eighteen months I have sent the cream to Denham Bros., Sydney.
24. How much of your property is under wheat? I had 90 acres under crop this year, and I have cleared another 90 acres for next year.
25. Where do you sell your wheat? Generally in Young.
26. If the proposed line were constructed to Grenfell, would you derive any benefit from it? I would if it went further out—to Wyalong.
27. Would you get a better market for your butter in that direction than you would for wheat or flour? I think so. I had to send wheat to Wyalong, *via* Temora, for about nine months. It was carted from Temora

- W. Allen. Temora to Wyalong. Two years ago I had an application from Hay for the whole of my butter all the year round.
- 21 Feb., 1898. 28. If the proposed line were constructed, would you get a better market for your butter or produce? Yes.
29. Would you be able to extend your area for wheat-growing or dairying? Yes; I am clearing a little every year. I intend to put the whole of my holding under crop eventually.
30. Is not a great deal of the land between Koorawatha and Grenfell worked on the halves system? Yes.
31. Is there much land being worked on the halves system about Koorawatha? The Warrangong Holding is the nearest, and that is about 2 miles from here.
32. Do you consider that wheat-growing on the halves system is profitable to those engaged in it? Those who are engaged in it seem to stick to it.
33. It has been said in evidence in Sydney that small farmers or settlers carry on the cultivation of wheat more profitably on their own account than on the halves system? They might do so, if they had money with which to clear their own land; but people who have no capital cannot do so.
34. Have not those who are working on halves to find horses and farming implement with which to carry on operations? Yes; but I think that those who are working on halves assist, in deserving cases, in finding both food and horses to carry the tenants through to the next harvest.
35. Does wheat-growing pay as well as dairying? You can make a living out of dairying. I have been working at dairying since 1854—including thirty years in Victoria.
36. For what number of years will the land continue to grow wheat without deterioration? If a person is going to work it right out, about six years will cook it, but I would not attempt to farm more than three crops, at any rate.
37. By giving the land a rest, by putting sheep upon it, ploughing it up, and laying it down with grass, it will, I suppose, in a few years time be again profitable for wheat-growing? Just as good as ever.
38. What kind of grasses do you consider the best in this neighbourhood? Lucerne is considered the best, where it will grow. If lucerne will not grow the next best is burnet grass.
39. Do you think lucerne would grow to advantage on any except rich alluvial land? It will grow almost anywhere in this neighbourhood. I do not think, however, that it will be a success on cold clayey land.
40. What do you call a success—for making hay or for grazing? Both.
41. What quantity of lucerne should you get per acre? There is very little grown in this neighbourhood, but down on the creek it is grown to advantage. They have cut about 2 tons to an acre there.
42. I suppose the yield would depend a great deal on the quantity of rain? Yes. In dry seasons the yield might be a ton to the acre, but if there be plenty of rain it would largely exceed that.
43. Do you think the construction of the proposed railway would benefit the inhabitants generally? I think so. I also think that when the Crown lands towards the west are thrown open there will be a further influx of Victorians.
44. Is there much Crown land available for settlement? I think so.
45. I presume there are some large holdings between Koorawatha and Grenfell? Yes, including Brundah, Iandra, and others.
46. Do you think, in the event of the railway being constructed and settlement increasing, that those large areas are likely to be cut up and sold by the proprietors? I should think so, particularly in view of the large holdings which are being cut up and sold in Victoria.
47. Do you think a railway from Grenfell to Young would be more profitable or convenient to the people than one from Grenfell to Koorawatha? That I could not say.

David Anderson, farmer, Koorawatha, sworn, and examined:—

- D. Anderson. 48. *Mr. O'Connor.*] Where is your holding? About a mile north from Koorawatha.
- 21 Feb., 1898. 49. How long have you been in the district? About seven years.
50. What land do you hold? 5,000 acres.
51. How many acres have you under cultivation? 100 acres.
52. What do you grow? Wheat only.
53. What do you do with the balance? It is lying idle.
54. What advantage would a railway between Koorawatha and Grenfell be to you? It would enable me to get something for my produce from the market. If we had a railway to the back country, we could send our produce there. I have sent chaff to Sydney, and all I got for it was 2s. 3d. per cwt.
55. How would a railway from Koorawatha to Grenfell help you? I should get a better market out in the west.
56. Do you know the country between Koorawatha and Grenfell? I have been over it.
57. Is there a lot of land in the district free from cultivation? Yes, lots.
58. Do you think, if the proposed line were constructed, any considerable quantity of that land would be occupied? I think so.
59. You have only 100 acres under cultivation at present? Yes; but I have 325 acres cleared.
60. Do you consider the present prices for wheat are fair prices? Yes; wheat-growing will pay at the present time.
61. Having so much land, how is it you do not utilise it? The season was so bad last year that I had to look after my stock.
62. What stock have you on the land? About 3,000 sheep.
63. Have you any cattle? I had some—about sixty head—but twenty-five died. I have still thirty-five.
64. Does sheep-rearing pay you? Yes.
65. Would the opening of a railway enable you to put more land under cultivation? Yes; I would clear a lot more.
66. *Mr. Clarke.*] What do you think would be a paying price for wheat? If you had 300 or 400 acres in, 3s. per bushel would pay.
67. Would 2s. 6d. a bushel pay? It might, if you had a good quantity in.
68. Would it pay you to employ labour at that price? No.

John Murray, Manager, Iandra Station, sworn, and examined :—

69. *Mr. Fegan.*] Have you any land of your own? Yes, 120 acres.
70. How far is your land from Koorawatha? About 17 miles—near Iandra.
71. How long have you been manager for Mr. Greene? About four years.
72. Then you have had a good deal to do with the cutting up of various portions of land for wheat-growing? Yes; I may say I have been in Mr. Greene's employment for ten years, but only as manager for four years.
73. Has the halves system on Mr. Greene's holding been a success? It has been a decided success.
74. What are the largest holdings you have under the share system? About 800 acres.
75. Who holds that amount? A man named Ritchie.
76. When did you cut it up for him? Four years ago. He has had four crops off it. From a portion of it he has had five crops. Four years is the term during which the halves system has been in vogue there.
77. How many acres had he under wheat? Almost the whole, with the exception of about 20 acres.
78. How many bushels to the acre has he obtained? I think he averaged for the five seasons about 9 bushels to the acre. 1895 was a very bad year, and he was permitted to keep the entire crop.
79. Has that paid him? Yes, well.
80. Was he in this district before he commenced work on halves? Yes; he was in this locality. He had been a railway contractor, and was tank-sinking.
81. Had he been a farmer prior to that? He had been some years ago, but not for any length of time.
82. Practically speaking, then, taking into consideration the new methods of farming, he was almost new to farming? Yes.
83. How long did it take him to get the 780 acres under crop? I could scarcely say. He had not that amount of land for the whole of the five years. He only got that amount last year, and owing to the dry seasons he worked piecemeal. He started ploughing, and then had to knock off for want of rain, and so on.
84. Do you know the conditions under which the men on the halves system get their land from Mr. Greene? Yes.
85. Is there anything in those conditions intimating to those who take land from him that at the end of four years it must go into lucerne? No; there is nothing of that kind. The leases are for three years, and in almost every case the lease is continued for another year, and in some instances for two years. In some instances, land taken up for three years has been cultivated for five years, and if a tenant wished to put it in crop again for the sixth year, he would be quite at liberty to do it.
86. Have you had any instructions to stop men from growing for more than four years? No; on the contrary, my instructions have been that whilst the men are willing to keep on cultivating the same land they are to be allowed to do so.
87. Then, if there has been a report to the effect of what I have stated, it is not true? It is not.
88. Have any of the farmers on the Iandra estate allowed their land to go back to grass or lucerne? A few of them have; a few of them gave up their land last year—after having been there for four seasons—and took up fresh land.
89. Was any compulsion used? No; the land had become foul, owing to bad seed being used—it had got dirty. It was the tenants' own fault. They could have sown the land if they had wished; but, of course, they could see, and Mr. Greene could see, that it would not pay to cultivate the land again, but that it would be better to give it a rest, and get it clean again for the following year or the second year.
90. In what capacity have you worked for Mr. Greene other than as manager? As boundary-rider and stock manager.
91. Prior to the halves system being introduced, how many men were permanently employed on that large estate? From four to five, with the exception of the shearers. If there was any special work to be done, more hands, of course, were employed.
92. How many permanent hands are employed upon it now? In the busy part of the year, fully 200.
93. I do not refer to the busy part of the year? About 150 to 160.
94. Can you express an opinion as to the prosperity or otherwise of the settlers? I think they have done very well—far better than if they had been farming on their own land. As a matter of fact, a great percentage of the farmers' own land in different parts of the country. There are a great many from Cootamundra.
95. Do they prefer to work on the halves system? Yes.
96. What is the reason? The chief reason is that they have only small holdings, and have not the means to get them ready for the plough. They prefer to come where there is an unlimited scope to operate upon. Apart from that it gives their own land a rest.
97. Am I to understand from that that these people are not here permanently, but will soon leave and go back to their own homes after their land has obtained the rest it requires? I think that probable that some of them would not be permanent—that is, the men who own land of their own.
98. Therefore, to a certain extent, the increase of population under the halves system is only a fictitious growth? Men may come for two or three years, and then go back and work their own land. I believe that that is the intention of some of the tenants.
99. You have stated that you will have other people making applications? Yes.
100. Have such applications been made already? Yes; far more than we can supply land for.
101. How many applications have you? At least twenty have applied for land this year whom we have not been able to supply.
102. Did they know the conditions? Yes.
103. How did they get to know them? They wrote for copies of the lease.
104. Did you give them the conditions of the lease without having vacant allotments for them? Perhaps. It is early in the season before we are able to finally settle what lands we will have for tenants.
105. Do you send the conditions to men when you have no ground for them to take up? We send it before we have decided, or before we know exactly what amount we have. We do it at their request.
106. If you have eight or nine allotments, and there are twenty applications for them, Mr. Greene, I suppose, exercises his own judgment in dealing with those applications? Yes. The man who is in the best position—and if we know anything to his advantage—of course gets the preference.
107. Has any of that which has been cultivated been put under grass and lucerne? Yes, some of it.
108. With what results? Very good results.
109. Do you know the condition of the pasture in former years? Yes.

J. Murray.
21 Feb., 1898.

- J. Murray.
21 Feb., 1898.
110. How many sheep were there to the acre then? At times, as a breeding establishment, it would only carry about one sheep to the acre—that is, the ewe and the lamb.
111. Would it carry that all along? I believe it would.
112. Where crops have been taken off and the land has been allowed to go to grass, what would it carry? We have not been able to give it a fair trial, but it will carry a great number of stock for a short time. Until the lucerne and other grasses were sown, there were practically no fat stock.
113. Then you formerly used the runs which have since been used for wheat as fattening runs? Only a small portion. All the ground which has been laid down has been chiefly new ground.
114. But where you have taken the crops off, and allowed the land to go to grass, you use it for the purposes of fattening? Yes. Of course the land will in the course of a few years go back again into cultivation—that is, the land that is being allowed to grow lucerne or grass—or it will spell and go back to natural pasture.
115. Do you know Mr. Greene's intentions so far as that matter is concerned? Of course there will be some land falling out of cultivation and being spelled, and after a certain number of years it may be broken up again and cultivated with wheat.
116. What experience have you had as a farmer? An almost unlimited experience—twenty years.
117. Have you known wheat to be grown successfully for ten, fifteen, and twenty years? I have.
118. Why do you allow so many acres to go back every year;—is it because the land is inferior? No. The land is not impoverished in any way, but it becomes foul and dirty, and it pays better to let it go back to natural pasture for a year or two and to heavily stock it, and thereby get it into such a condition that it will grow another crop.
119. Have any of the men offered to buy out the portions of the land which they are working? Yes.
120. With what result? There has not been anything definitely done about it.
121. For what reason? I could not say exactly. I do not think there has been any direct proposal to Mr. Greene; it has only been talked about. I know that some of the men have been willing to make offers, but I could not say whether any offers have been made.
122. Do you know whether Mr. Greene is willing to sell his land to the present workers? Yes; I have heard him say that he is willing and anxious to do so.
123. Do you know the route of the proposed railway? Yes.
124. How far is Koorawatha from Iandra? About 14 miles. The distance from Iandra to Grenfell is about 20 miles.
125. What sort of a road have you from Iandra to either Young or Koorawatha railway station? Very fair.
126. Are there any conditions attaching to the use of any of these roads? No.
127. Have you a free road? Yes, to Monteagle.
128. Where do you send your wheat to? To Monteagle.
129. Does none come this way—to Koorawatha? No; simply on account of the bad state of the road.
130. Do you not send any wheat to Koorawatha station? No. The principal objection is the bad state of the roads.
131. Do you know of any other reason why people do not send wheat to Koorawatha? No.
132. Is there a fairly good public road from Grenfell to Koorawatha? I believe there is, but I have never been right through it.
133. If there were any exceptional conditions attached to the use of that road, would you know of them? I do not know of any.
134. Have you to come through private property to get to Koorawatha? I believe so. We have to come through some part of Warrangong.
135. Whose holding is that? Mr. Suttor's.
136. Do you know of any conditions attached to the use of the road? I do not.
137. Is any charge made for its use? I do not know.
138. What is the gross tonnage of the wheat sent from your estate? Last year we sent away 25,000 bags.
139. What is the charge for carriage from the estate to Monteagle? Eightpence and 9d. per bag.
140. How many miles is it to Monteagle? About 12.
141. What did you pay last season? 7d., 8d., or 9d.
142. Where did you send your wheat to? Last season the bulk of it went to Young.
143. What was the freight per bag to Young? About 2d.
144. And you sent away 25,000 bags? 20,000 bags went to Young, and the other 5,000 to Murrumburrah, and some to Sydney and other places. Very little went to Sydney.
145. What good would the construction of the proposed line do the people between Koorawatha and Grenfell? It would do a great amount of good. It would enable the people to send their produce out west, as well as along existing lines.
146. Would it enable some of the landowners to open up more land on the share system? It would.
147. What hinders you at present from keeping pace with the applications? We have not been able to get the land cleared.
148. Are there any other reasons? A good deal of the land we are now clearing is on the furthest end of the run. The further you go north, of course, the dearer is the carriage.
149. How far is the furthest north end of the holding from Young? 28 miles.
150. I suppose you know that there is a counter proposal to connect Grenfell with Young? Yes.
151. Why, in your opinion, should one route have preference over the other? In my opinion a good portion of the "white line" would go through inferior country. It is not such good agricultural country.
152. Has it been tried? It has; but a good deal of it is broken, rocky, and steep. There is also a lot of scrubby country, and some of the properties do not seem to have been worked with a view to their improvement. It would cost a lot to put the land there into such a state that it would be fit to grow crops.
153. Would it not cost a lot of money to do the same in the Koorawatha district? Yes; but not so much. This part of the country has been better improved and looked after.
154. What is the difference in the cost of clearing on the two routes? The difference would be double.
155. Have you not as heavily timbered country between Koorawatha and Grenfell as you have between Grenfell and Young? Yes; but the bulk of it between Koorawatha and Grenfell has been well attended to, and all the timber is dead.
156. Is not that the case between Young and Grenfell? Not on a great portion of the route. I know of 10,000 acres which the "white line" would pass through which is in a wild state.

157. Would not the Young connection serve a larger population? I think not, if you take into consideration the number of tenants who will be on the land under the halves system.
158. Have you any good ironbark in the district? There is some near Grenfell.
159. How far from the route of the proposed railway? The railway would pass through a small portion of it.
160. I suppose that none of the people working on the halves system have tried dairying? No.
161. Do you know whether, under the agreement with Mr. Greene, they could try it if they found it more profitable? I believe they could.
162. Are you not sure about it? It is a thing which has never been proposed.
163. *Chairman*] What is a fair rate for the carriage of wheat and wool per ton for a distance of 10 or 20 miles? For wheat, a distance of 10 miles, the charge would be 7s. 6d per ton; for a distance of 20 miles it would be 11s. per ton; and for a distance of 30 miles it would be 15s. per ton. For wool, a distance of 10 miles, the charge would be 12s. 6d. per ton; for a distance of 20 miles it would be 16s. per ton; and for a distance of 30 miles, 18s. per ton.

J. Murray.
21 Feb., 1898.

John Campbell Pease, saw-mill proprietor, Koorawatha, sworn, and examined:—

164. *Chairman*] How long have you resided at Koorawatha? Ten years.
165. How will the construction of the proposed railway extend your business? If the line is constructed, I have to supply 2,500 feet of pine timber a day to Cowra, Young, Murrumburrah, and Blayney. It is my intention, if the line is constructed, to move to Grenfell, and I shall send along the line 2,500 feet of timber a day.
166. How far is the timber from Grenfell? About 16 miles away. I should draw it from the west of Grenfell. I should cut it up in the forest.
167. What timber do you intend to truck? Pine principally, and ironbark. Of course I could not compete against Narromine and Coolamon without the line. I may mention that other mills might supply double the quantity I refer to as well.

J. C. Pease.
21 Feb., 1898.

Walter Sydney Suttor, farmer and grazier, Warrangong, sworn, and examined:—

168. *Mr. Clarke*] I understand that you are a large landholder in the immediate neighbourhood of W. S. Suttor. Koorawatha? Yes.
169. Can you supply the Committee with any information as to the advantage which would accrue to yourself and the district from the construction of the proposed railway? It would give us a further market out towards Grenfell, and it would also assist us to get our produce the other way. It would enable us to clear more land, and would induce farmers to cultivate it.
170. On the share system? Yes.
171. Is much of your land let out on the share system? Yes; about 5,000 acres.
172. If the line were constructed, would you be able to increase your area under cultivation? Yes; in fact, I have applications now for 10,000 acres from men wishing to work on halves.
173. So that as fast as you can clear the land you have no difficulty in finding tenants? No.
174. Do you consider the share system to be beneficial to both landlord and tenant? Certainly. I know of one man who has put in 570 acres for me this year, and his share—I settled with him to-day—came to £825.
175. Is that the gross amount? That is his gross half-share.
176. That is the amount he will have for his labour and everything else? Yes.
177. How many hands would he employ? Four, and there are three extra men at harvest-time to work the machinery.
178. What does it come to for each? Over £100 a year.
179. How many horses would be employed on that area? About 20.
180. What would be their probable value? £200 or a little more.
181. Do they use reaping machines? No; they use the stripper, which they find themselves.
182. Would not that also have to be taken from their earnings? That would be taken from their earnings the first year they started—four years ago. The same men, on 312 acres last year, had a gross return of £633. Another man, this year, on 160 acres, had a gross return of £208. Another man, on 192 acres, had a gross return of £154 10s.; and another man, on 57 acres, had a gross return of £115 17s. 3d.
183. Do you sell your produce at Young? No; at Sydney and Bathurst.
184. Who pays for the cartage from the farms to the railway station? Each farmer pays his own share. It costs about 1d. per bushel.
185. That will also be another reduction from their earnings? Yes.
186. Do you think it would be profitable to continue to grow wheat at as low a price as 2s. 6d. a bushel? I think it would be possible to grow it at 2s. a bushel.
187. Would it be possible to grow it under that amount? It depends on the machinery. If they could get over a larger area of ground they might do so.
188. Has wheat been at a high price this year? It was higher last year.
189. Why was it higher last year than in previous years? I think it was caused by the bad season the year before, and the shortness of supply all over the world. Of course our prices are fixed by Mark-lane, London.
190. If a railway is constructed to Grenfell, in what way will it benefit the farmers? It will enable them to have an extra market to which to send their produce. Two years ago I sent about 200 tons of chaff to Grenfell by team.
191. Independent of the Sydney market, I suppose you would also have a market for your wheat, chaff, and hay, and other produce, out to the West—Wyalong for instance? Yes; in all probability the construction of the line would induce someone to erect a mill here, this being a central position.
192. Is the cost of cartage to Young a heavy item? Yes.
193. And that would be saved to a considerable extent? It would.
194. How many men have you working for you now, compared with the number you had before you commenced the halves system? Before I started on shares I think I had myself and three men on the place. Since I have been farming I have had about seventy. A good number of my farmers are permanently situated on the land. They have not farms elsewhere.

- W. S. Suttor. 195. Have any of the farmers working on shares come from Victoria? Yes; there are also some from Bathurst.
- 21 Feb., 1898. 196. Do you think it will be to the greater benefit of the people between Koorawatha and Grenfell to have the proposed line constructed than one from Young to Grenfell? I think so.
197. Is there a good road from Grenfell to Young? Yes.
198. What kind of a road have you from Grenfell to Koorawatha? Very poor; it was hardly passable a fortnight ago.
199. Then the carriage alone would be a considerable item? Yes.
200. What is the carriage from the various farms to Koorawatha? The carriage in my case was divided into two different districts. In one part we paid 3d. a bag, and for the longer distance 4d. to 4½d. a bag, and as high as 5d. That is a little over 1d. per bushel.
201. Would that be saved to any great extent by the construction of the proposed railway? It would if we had a siding on our paddocks.
202. Still you would have to cart a short distance to any railway? Yes; the proposed line goes right through my cultivation paddock, and if I had a siding there it would make a great deal of difference.
203. What is your opinion of the share system? My opinion is that it is more profitable to the farmers than working on their own account.
204. If a man does not work his land properly, I suppose in self defence you get rid of him? Yes; but I have not lost any since I started.
205. *Mr. Fegan.*] Does not a great deal of wheat come from Brundah? Yes.
206. Has it to come through your land? Yes.
207. Is it possible for the people from Brundah to get here by any other road than that? Yes; by going a long way round.
208. In what condition is the road which goes a long way round? It is in bad order.
209. Are there any bridges over the creeks? No.
210. If the creeks are full, how can the wheat be got from Brundah? They must wait until the creeks are down.
211. Is it a fact that under certain conditions it is impossible to get to Koorawatha except through your land? Yes.
212. Do the teams come through your land free of charge? No.
213. What arrangements do you make? The teams camp in my paddock two nights and water their bullocks. I am paid a certain sum for the accommodation—1s. 6d. a night for each team.
214. Then a railway to Grenfell would assist that portion of the district, inasmuch as it has no public road which is passable if the creeks are up, and under present circumstances there is a charge upon the teams coming through your land? Yes. Of course, I do not charge the teams for coming through the land, but for camping in the paddocks, and for the feed and water for the cattle.
215. Do you not think it strange that there should be no proper road for the cartage of produce to market? I do.

John Quayle Wood, pastoralist, Brundah, sworn, and examined:—

- J. Q. Wood. 216. *Mr. O'Connor.*] Have you any statement to make to the Committee? Yes. I hold a twofold position in the district—first as a landholder, and then as Chairman of the Railway League. In order to show the importance of share-farming, I have made out a statement of the value of the plant on our property. We have 6,000 acres under cultivation, and a further 3,000 acres arranged for for next year. The value of the plant used in working the 6,000 acres is £10,437. I mention that to show the importance of the industry, because it has been stated in the public press of an adjoining town that the share system is only likely to last for two or three years—in fact, until the railway is constructed. This industry had its birth before the railway was thought of—before anyone dreamt of a railway to Grenfell—and was really the result of necessity. The Crown lands having been absorbed by selection, our areas were so reduced that it was necessary to resort to some other form of working the ground than grazing. In other words, it was a case of adaptation to environment. There were sixty-one teams employed this year in moving the crop to the train, at a cost of between £800 and £900, and there was often great difficulty in getting teams at any price. That does not take into account any charge for grass and water for the 800 head of stock engaged in carrying. The season being very dry, we were enabled to get our produce here with far less difficulty than we expected. Still, it is necessary to point out that, if we reach the limit of production in an ordinary season, we shall not be able to move here without a metalled road. The question has been asked in evidence as to the number of men employed on adjoining holdings. With respect to Brundah, I find that I originally employed two men, at a cost of about £150 a year for the two. This last season, fifty-four men were employed in putting in the crop, and 147 in taking it off. That is exclusive of carriers, and takes no account of the men engaged in clearing. With respect to the question of routes—the route to Koorawatha is the only one which would be of any use to myself, or to the settlers living anywhere on this side of a line drawn about north and south, and, say, about 10 miles east of Grenfell. To the people living on the eastern side of that line no other route would be of any use at all, for the stuff would still come to Koorawatha or Monteagle. When I gave evidence before a Sectional Committee in Grenfell, on a recent occasion, it was stated that there was an area of about 46,000 acres, which included the Bimbi return; but exclusive of the Bimbi returns, 40,000 acres were under actual cultivation. It was stated at the same time that the land-owners were prepared to clear a further 60,000 acres in the event of a railway being constructed to Grenfell. In redemption of that promise we find now, from the returns lately collected, that there are actually 21,601 acres of new land ready for cultivation, which, added to the 43,969 acres under crop this last season, leaves a total cultivation area of 64,670 acres ready for this season's cropping, within 15 miles of each side of the proposed railway.
217. When will operations commence? As soon as rain comes. Some have started already. The yield last season throughout that area was an average of 12 bushels of wheat to the acre. There is a promise that in the event of the railway being constructed there will be a further 93,985 acres put under crop. I dwell on that, because when the settlers previously promised that they would put 60,000 acres under crop, within twelve months they had cleared 21,000 acres, so that it may be reasonably inferred that they meant what they said. Of fat sheep there were actually 34,000 sent to Sydney market last year, and there is a promise

promise of 80,000 fat sheep per annum being sent, in the event of the railway being constructed. 9,205 J. Q. Wood.
 bales of wool were despatched in 1896 from the area to which I have referred. The wool goes from a little further west than 20 miles, and includes what is sent from Mr. Gibson's station, Caragabal. 21 Feb., 1898.
 That wool must of necessity come to Grenfell, for it comes to Cowra now. The amount of butter made last year was 9,232 lb., a small amount, due to the drought. I now come to the question of rates, which is a very important matter as regards the townspeople, and I beg to hand in the following return:—

	Railway Rates.			Team- age.	Cost landed at Stores, Grenfell.		
	1st	2nd.	3rd.		1st.	2nd.	3rd.
Sydney to Young—250 miles + 34 to Grenfell = 284 miles	£4/3 8	£5/4/-	£7/4/6	2/-	£4/5/8	£5/6/-	£7/6/6
Sydney to Cowra—219 miles	£3/10 -	£4/6/11	£6/0/7	20/-	£4/10/0	£5/6/11	£7/0/7
Sydney to Koorawatha—237 miles + 30 to Grenfell = 267...	£4/0/1	£4/19/6	£6/18/3	2/-	£4/2/1	£5/1/6	£7/0/3
Sydney to Young—250 miles	£3/16/6	£4/15/1	£6/12/-	2/-

218. *Chairman.*] Do the Grenfell goods come *via* Cowra, and not *via* Young? Yes; they come *via* Cowra now. It costs 10s. a ton more to get them by way of Young than by way of Cowra. In the event of the line being constructed, the cost of first-class goods delivered at the store in Grenfell would, as the return shows, be £4 2s. 1d. per ton from Sydney. These goods, if brought by way of Cowra, cost £4 10s. a ton. It would be distinctly cheaper to bring them by way of Koorawatha, and no teams could compete in that section. The figures will show that the Koorawatha line could easily beat both the Young line and the teams from Cowra. The third-class goods is the only class where there is any closeness of carriage. There is, however, this difference—that for only the first-class goods teams could scarcely get sufficient inducement to keep on the track, and if they had not sufficient haulage they would go off; but if they had the second and third-class goods as well, that would be an inducement for them to keep on the track.

219. Your statement has reference to imports;—what about the produce? If a line were constructed to Young, I think that about 50 per cent. of the agricultural produce would be lost to it, because it is sent to the western and northern market; and, unless it could go by way of Cowra, it would never pay to truck it at Grenfell and send it to Young, and bring it back to Cowra. I do not think the wool rates would make much difference; whether it went by way of Grenfell or Koorawatha, it would all go by the train, just the same. It is the loading from Sydney which makes the difference, because the storekeepers in Grenfell are very strong about the Koorawatha connection. I desire that the evidence given by me on the Euabalong to Condobolin railway should be incorporated with my evidence on the present occasion. It is as follows:—

Chairman.] You are distant how far from Grenfell? Twelve miles from Grenfell in an easterly direction.

Your station lies between here and Koorawatha? Yes.

What is the extent of your holding? 16,000 acres.

You are running sheep? Yes; and I am also cultivating.

You have heard of the proposed railway from Condobolin to Euabalong, and you are here to give evidence in favour of an alternative route? Yes.

How long have you resided in this district? I was born in it, and I have lived in it ever since.

You have practically seen the district grow up? Yes, from a wild bush. It was scarcely settled in my early days.

I suppose settlement in those days was confined to pastoral occupation? Yes.

You have devoted some attention to farming pursuits? Yes, of late years.

Your areas have been restricted by the resumption of certain portions of the runs, and you now find it necessary to engage in agriculture in order to work your holdings profitably? Yes.

What area have you under cultivation on Brundah? I have under actual crop 6,500 acres, and I have 2,500 acres prepared for cropping next season.

You will then have 9,000 acres under crop? Yes.

What has been your experience as to the success of agriculture on a large scale? Up to the present time we have had to contend with the worst drought ever experienced in the district; but, notwithstanding droughty conditions, the crop last year paid better than the land would have paid under a pastoral occupation.

Is it your intention to still further increase your area under crop? Yes; up to 14,000 acres.

Out of your 16,000 acres you intend to have 14,000 under crop? Yes; I do not think I could say more than that. It would be necessary to save 2,000 acres for our working stock. I think I could be sure of keeping 14,000 acres under constant cultivation if we had the railway here.

What is your difficulty at the present time? The want of railway facilities.

How far are you from a railway? From our place, taking the homestead as the central point, it would be about 15 miles to Koorawatha; but there is difficulty in moving the produce. Last year the road carriage, from the drought, was very expensive. The cost of carrying the wheat over the 15 miles to Koorawatha was greater than the railway charges from Koorawatha to Sydney.

Do you convey your produce by team? Yes; we had great difficulty last year in getting sufficient teams to take it away.

What is your annual return per acre from wheat? The best return we have had from a crop has been 32s. 6d. per acre.

The average last year would be about 9 bushels; it was a bad year.

What has been the yield in a good year? The best yield we have had has been 42 bushels.

Taking the whole of the crops since you started cultivation, what has the average been? About 16 bushels would be a fair average, balancing the bad years with the good.

At what price could you afford to sell wheat profitably? It depends on where the railway is. I have calculated that with the railway close at hand we could make it pay at 1s. 6d.

The market would have to be very low when you could not realise 1s. 6d. a bushel? Yes; we do not expect to see that for many years.

Any price from 2s. upwards would be a good price? Anything above 2s. we should consider good.

If there were a railway here many settlers would be induced to increase their areas under cultivation? Yes.

Is your annual rainfall sufficient to enable you to rely upon the crop? Yes. I only know of two failures, and they would be in an experience extending over thirty-six years. The average rainfall, extending over a long series of years, has been 29 inches.

That would be more than would be required for the successful production of grain? Yes. Our crops at the present time are the most promising I have ever seen, and we have not had 15 inches of rain, but it has come at the right time.

The land you have put under crop was ringbarked for a number of years? Yes.

What was the original cost of the ringbarking? The ringbarking, clearing, and suckering would average about 5s. per acre. After being ringbarked the land is allowed to lie idle for some few years? In our case we waited about fifteen years. The cost of clearing would not be more than 10s. an acre.

The full cost would be 15s. an acre, spread over a good many years? Yes.

The best course for a farmer of limited means, who could not well afford to clear the country right out, to adopt would be to clear the lightest timbered portions of the land and to ringbark and sucker the other portion as you have done, allowing nature to assist him? Yes.

After a few years had elapsed he would be able to gradually increase his cultivated area every year? Yes, without being too heavily handicapped by expenses.

Upon

J. Q. Wood. Upon your holding of 16,000 acres, what is your expenditure in wages under cultivation as compared with pastoral pursuits? I formerly had two permanent hands at £1 per week, apart from the house servants; they were the only employees I had. You might put down £150 a year under the heading of wages. For the past three years my average payment in wages has been over £1,500 a year.

21 Feb., 1898.

In place of the two hands you formerly employed you are now employing how many? The average for three years would be seventy-two. That does not touch the share-farming.

By putting land under cultivation and providing employment for people who would not otherwise obtain it, you put a certain amount of additional money into circulation in the district? Quite so.

In addition to the area already farmed by yourself you are dealing with an area under the share system? Yes.

Does the share system apply to the 7,000 acres you have already under cultivation, or to the 2,000 acres you are preparing for the plough? That applies to the whole of it. We find the system a most satisfactory way of working the land.

What number of share farmers are there upon your land, and what number of men do they employ? The number on the land actually under crop is twenty, and they employ fifty-three hands, apart from their own labour.

So that, in addition to your own seventy-two men, there are seventy-three employed in connection with the share system? Yes; that was last year, with a poor crop. With a better crop this year there would be a large addition to that number of men. There is a great deal of difference between dealing with a 20-bushel crop and an 8 or 9-bushel crop; this year it is all guess-work. We cannot tell now what number of labourers will be required.

With regard to the share system, do you yourself prepare the land for cultivation? Yes; we clear it thoroughly and find the seed-wheat.

You have the land ready for the plough? Yes.

The division of profit is a matter between yourself and the farmers? Yes.

Are the men working upon the "halves" system doing fairly well? Very well; they are all extending their areas under cultivation every year. Some of our men who two years ago had 200 acres under crop have arranged for 1,000 acres this year.

Do the share farmers continuously take the one crop off the ground? Up to date we have done so, but we shall alter that later on. This land was heavily stocked with sheep for many years, and for another three years it will be quite strong enough for wheat; the first year it is too strong. In about six or seven years from the time the land was first put under wheat we propose to put it under lucerne for two years, and then put it back into wheat again; we shall practically be farming on the principle of rotation of crops. The margin of 2,000 acres which I mentioned before will admit of our doing that without reducing the area of 14,000 acres under actual cultivation.

Can you give the Committee any idea of the total area of land under cultivation in this district? I can. I should like first of all to compare the area with the area in 1895. In that year there were 27,248 acres under crop in the whole police district of Grenfell. Last year the area under crop in the small portion which would be served by a railway from Koorawatha to Grenfell was 46,573 acres.

So that there has been a large increase in two years? Yes.

That would seem to prove that both soil and climate are eminently suited for the growth of wheat? Yes. My opinion is that if a railway were constructed through this district it would be one of the biggest wheat-growing centres in the Colony, if not in Australia.

You know the land pretty well between here and Wyalong? Yes.

Is it of similar quality to that you have described upon Brundah? Yes; it is much the same right through.

Do you think the Bland country would be as suitable for agriculture as would the country on each side of it? Yes; I know the general opinion is that that would not be the case; but the best crop I ever saw in my life was at Oakhurst, on the Bland Plains, thirteen years ago. I saw the crop growing and I saw it cut. It yielded 4 tons to the acre on a black soil. Of course, it is difficult soil to work. The work is not done easily; you want proper appliances for it.

The land must be thoroughly tilled before you can deal with it properly? Yes; but the potentialities are in the soil, and it would not be so quickly exhausted as would the soil in the timbered country.

Can you give us an idea of the number of sheep and cattle depastured in the district? In 1895 there were 730,000 sheep, 11,000 cattle, and 3,927 horses. The production of butter in 1895 was 17,156 lb. I point that out to show you the extent to which the dairying industry would be likely to be developed if there were a railway here.

Where was the butter principally manufactured? In the immediate neighbourhood of Grenfell. 13,000 lb. of it was produced principally on the Brundah Creek, within a few miles of the town.

Was that butter despatched to the Sydney market? I think the bulk of it would be consumed locally. Dairying would be one of the most important industries of the district. There was a factory near Koorawatha, and they did a splendid business over there.

As to fat stock cattle, can you give us an idea of the approximate number of sheep and cattle which would be available for transit every year? I should like first of all to refer to the probable development in agriculture which would accompany railway construction. Those who have 46,000 acres already under cultivation have promised to increase that area by an additional 61,702 acres in the event of a railway being constructed, making a total of 108,275 acres. In fat stock there would be 84,200 sheep and 2,156 cattle available.

That would be the number trucked to the Sydney market annually if there were a railway at Grenfell? Yes.

Do your returns embrace the land district of Grenfell? The returns apply to that particular part which would be served by a railway from Koorawatha to Grenfell. They do not cover the whole of the Grenfell district. The whole of the returns are not in from the district which would be served by the railway. I might give more, but have kept upon the safe side.

The returns you have given practically deal with a railway from Koorawatha to Grenfell? Yes; about 15 miles to the west of Grenfell.

They do not take account of the traffic which would be induced by the extension to Wyalong? No.

Do you think that the fact of the small farmers being able to get away small numbers of fat stock would bring about a large quantity of fat stock traffic which does not now exist? Yes; I am perfectly sure of that. I know of one case this year where a small farmer had fat stock which he could not get away, and a number of them died upon his hands.

Do you know what land will be available for settlement? Taking the route from Koorawatha to Wyalong, upon which Mr. Little is engaged, to the north of the Wedden, there are 400,680 acres of reserve, and 468,890 acres of Crown land.

Within what distance of the proposed railway? Within a radius of 20 miles. Upon the southern route, which Mr. Lloyd is surveying, there would be 386,980 acres of reserve and 450,170 acres of Crown land.

That would not embrace any portion of the land affected by the route which Mr. Little has surveyed? I do not think so.

If the figure apply to a distance of 20 miles on each side of either route they would overlap at some point? Yes.

Do you think a railway westward would open up an additional market to the producers of this district? Yes; I think that it would be almost equal to the connection with Sydney.

Where would you look for a market out west? In the Darling country and the district round about Hillston. Wyalong has had large supplies from this district. From the west, in dry time, there has been a demand which could not be supplied in this way. Another great use for a railway in that direction would be to convey stock to this district in time of drought. We have nearly always had grass here at such times.

The railway would enable pastoralists in that direction to get their stock to the mountains? Yes; and at Koorawatha they would have the choice of the Western or Southern lines.

Do you think that if a railway were constructed in this direction the large land-owners would be induced to sell some portions of their holdings? I am sure they would. Only last week I was consulted by a big financial institution as to the possibility of a railway coming through the district, with a view to the sale of property which they had had to take over under mortgage. I know of other cases where there is a likelihood of that being done.

Do you think the land would be sold on terms which would compare favourably with the terms offered by the Crown? As a matter of expediency the owners would have to bear in mind the terms the Crown was offering.

They would be guided in their operations by the terms offered by the Crown? Yes; and I am sure many of them would be willing to sell.

You think the payments for the land might be extended over a term of years? Yes; the occupiers would make money off the land with which to pay for it, although they might not have any money at the time of starting.

Is there anything you desire to add to your evidence? Yes; a considerable quantity of potatoes has been grown in the district, and it is also suitable for fruit-growing, and for the wine industry.

Is the district progressing or is it at a standstill? It has progressed wonderfully since the present agricultural development started.

Until

Until that development started the district was comparatively at a standstill? Yes; no one was doing well and everything J. Q. Wood. seemed going backwards. Since you have discovered the profit attaching to cultivation everyone has taken heart, and the district is going ahead again? Yes; from the top of any of the hills here you can see fires all round at night, showing that people are clearing the land in readiness for the plough. 21 Feb., 1898.

A line easterly from Grenfell to strike the Blayney-Murrumburrah line at Koorawatha would be a most suitable line for this district. In a short time we shall be growing wheat for export, and the shortest route to the sea-board is, of course, a most important matter. There will be less chance of selling wheat locally than there has been. It will have to be dealt with in the same way as wool, and shipped away. A good part of our wool has been sold to the west. All the Warrangong wool this year went by the western line. 220. Do you know whether the people are willing to give the land free of charge to the Government on the route of the proposed railway? With regard to the land turning off on the Young side of Koorawatha as far as Crowther Creek, compensation would require to be paid. From Crowther Creek through portion 97 compensation will be required. It will, however, be possible to re-adjust matters in this instance by means of an exchange with some adjacent Crown land. With regard to the Warrangong estate, an adjustment can be made by arrangement in respect of the land required by the railway. Roads can be given in lieu of the area which will be taken. On the Iandra estate the land required will be given. Near that holding, however, is a property held by Mr. Fruvenstein. This property is traversed by the proposed railway for about a mile, and the owner refuses to make any arrangement. Then the line is clear of compensation until Chas. Wood's homestead selection is reached. He requires compensation, but not a large amount—about £80 or thereabouts. From there for a considerable distance, to about 300 miles from Sydney, the line passes through the Brundah holding, and there the land can be arranged for by giving roads in exchange. From this point several small holdings are entered, and some compensation will be required—I think, in some instances, about £3 an acre; at any rate, it will not be material. Between portions 78 and on to portion 109—what is known as Ipswich farm, the property of the Bank of Australasia—arrangements can be made by giving unnecessary roads in lieu of the area taken. Thence to Grenfell, although there is one narrow holding where as much as £10 an acre will require to be paid, the area taken will be small. In respect of Graham's holding, there may be some difficulty, but the extent of land is not great. From there to Grenfell most of the line passes through Crown land until you approach the station site, to reach which you have to come through some suburban allotments south of the town. There will be some compensation required here.

221. What will the whole compensation amount to? About £1,000. I have not carefully considered the matter, but I have come to the conclusion that £1,000 will cover the whole amount.

222. What is the freight from Young to Grenfell? About £1 per ton, and it would be £2 per ton from Grenfell to Koorawatha. I may state that I could not get my carrier to bring my wool here at any price. With regard to the evidence given as to freight by Mr. Murray, I wish to state that I think the rates for wheat are as follows:—For 10 miles, 6s. 8d. per ton; for 20 miles, 10s. per ton; for 30 miles, 12s. 6d. per ton. The rates for wool are:—For 10 miles, 12s. 6d. per ton; for 20 miles, 18s. per ton; for 30 miles, 20s. per ton.

223. Mr. Clarke.] You have mentioned the number of men employed on your pastoral holding, and also the number you have employed since you commenced wheat-growing;—does that include the number of men employed in clearing? No; it is exclusive of that.

224. Chairman.] Will you make a general statement with regard to the ultimate position of wheat lands in this district? If a farmer were careful on his ground, he could take seven or eight crops right off, one after the other. I have ground which I rented to a tenant, off which he took eleven successive crops of wheat in eleven years, and the ninth crop gave him 33 bushels to the acre. When the ground gets dirty, it should be ploughed and laid down with pasture—lucerne or burnet grass. One advantage in respect of lucerne is that it puts back into the soil the nitrogen which the wheat takes out. The ground, after growing lucerne for two or three years, can be ploughed up again for wheat.

225. And that process could be repeated *ad infinitum*? Yes; that is the experience in America on wheat-sick lands. They used to put in clover, but latterly they have put in lucerne. It puts back into the soil the properties which the wheat plant takes out of it. I beg to hand in the following statement showing the cultivation, live stock, &c., over a radius of 15 miles on either side of the proposed line:—

Cultivation.														Future Cultivation.		Live Stock.										Dairy Produce.		All other Commodities.					
Wheat.				Maize.		Other grains.				Hay.		Area under		Area cleared but not under crop.	Further area that would be cultivated if railway is constructed.	Horses.	Cattle.				Sheep.						Amount of Butter made for year ending 31st Oct., 1897.	Amount of Cheese made for year ending 31st Oct., 1897.	Weight received or dispatched for year ending 31st Oct., 1897.	Estimated further weight to be received or dispatched yearly if the district were cultivated.			
Area.	Expected yield.	Yield last season.	Area.	Expected yield.	Yield last season.	Area.	Expected yield.	Yield last season.	Area.	Expected yield.	Yield last season.	Potatoes.	Grape vines.				Orchard.  43,069 acres, total area cultivated, 1897.
 21,601 ,, cleared for cultivation, 1898.
 64,670 ,, for this year, exclusive of Bimbi } 198 holders.

John McKervy, stationmaster, Koorawatha, sworn, and examined :—

J. McKervy.
21 Feb., 1898.

226. *Mr. Fegan.*] How long have you been at Koorawatha? Since the 10th of January, last.
227. Have you the returns showing the traffic during the period you have been here? Yes. The inwards, principally from Young and Cowra, with small consignments from Darling Harbour, would come west. The outwards traffic would be for Young, Murrumburrah, Bathurst, Darling Harbour, and Newtown. The outwards traffic constitutes the grain. The following are the particulars :—

COMPARATIVE STATEMENT of Traffic and Revenue from Koorawatha.

Date.	Goods Traffic.			Live Stock.				Wheat.	Wool.		Coaching Traffic.

Increase 19,063 bags.

WEDNESDAY, 23 FEBRUARY, 1898.

[The Sectional Committee met at the Court-house, Grenfell, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Koorawatha to Grenfell.

Thomas Bembrick, storekeeper, Grenfell, sworn, and examined :—

T. Bembrick,
23 Feb., 1898.

228. *Chairman.*] On the 20th October, 1897, you gave evidence before the Sectional Committee in reference to the proposed railway from Condobolin to Euabalong;—have you had an opportunity of seeing that evidence? Yes.

229. Is it correct? Yes; and I should like to incorporate it in my evidence to-day, and supplement it. It is as follows :—

Mr. Fegan.] How long have you been in the district? About eighteen years.

You have watched its growth, and can speak as to the gradual increase in the area under cultivation? I was here when every ounce of flour had to be imported into the district.

It was purely a grazing country? Yes.

Now it is a large farming district? Yes.

I suppose the population of the district has steadily progressed? Yes. I find from looking up some official returns that there was no material increase in the population between 1881 and 1891; the explanation given is that in 1881 we had a large percentage of mining population, which is usually shifting. In 1891 (ten years afterwards), although no great increase was shown, the actual increase represented a permanent population; the increased population represents settlement by farmers and selectors. I find, according to the last census, from 1891 to 1895 the increase was very considerable. That is accounted for largely by the discovery at Wyalong. I am taking now the electoral district of Grenfell.

Can you speak as to the town of Grenfell? As far as the town is concerned, in 1891 the municipality numbered about 750, and there were within the population area 1,100. The estimated population of the municipality to-day is 900, and there are within the population area 1,700.

So that there has been a gradual increase? Yes; taking the electoral district as a whole the population has increased considerably.

Being a storekeeper, you can speak as to the quantity of goods which come into Grenfell, the cost of haulage, and so forth? So far as the business of Grenfell is concerned, I have some information which I think is fairly accurate. I have no particulars relating to the squatters and farmers who obtain goods, but as far as the storekeepers and those in business in Grenfell are concerned, I find from the figures which I have taken from them personally that the aggregate would be about 850 per year. That is the gross tonnage inwards. I have no data as to what is sent out in the shape of milled flour and produce of one kind and another.

What is your nearest railway station? Young is 32 miles away, and Cowra is also about 32 miles away. Our chief station is Cowra, and that is sometimes given as 34 miles from here.

What is the rate of road carriage from Cowra here? It would range from 25s. to 27s. 6d. per ton. I have paid as high as 35s. and 40s. and as low as 1l.

That would be in a fair season? Yes.

Does the price increase in time of drought? It fluctuates from 10s. to 15s. per ton.

The average would be about 30s. per ton? Yes.

What do you have to pay on the railway? I get potatoes from Carcoar to Cowra at the rate of 4s. 4d. per ton by rail; for the same distance on to Grenfell I pay an average of 25s. a ton.

Do you think the same proportion would obtain as regards other goods? Other goods would cost on the railway from 5s. to 10s. more. Potatoes can always be brought at a cheaper rate than case goods.

That means a largely increased cost to the consumer? Yes.

Are you well acquainted with the district between Koorawatha and Grenfell? Yes.

What kind of road is there? It is a fair road in good weather.

How many miles is it to Koorawatha? Twenty-four miles.

And you say it is 34 miles to Cowra? Yes.

Why do you take the longer road? Because it is a made road; and then there are the creeks to be considered; there are no bridges or crossing-places made for teams to pass over.

There is no town of importance at Koorawatha, that would be another reason? Yes.

When carriers can be sure of back-loading they do not charge as much? Quite so.

If

If you cart to Koorawatha, you have to pay more? Yes; but of course a considerable amount of wheat has gone to T. Bembrick. Koorawatha from the farms round about here and adjacent to the platform.

A great deal of agricultural produce leaves this district? Yes.

23 Feb., 1898.

I suppose it is chiefly wheat? Yes; and when we have our mills running here there is a considerable quantity of flour, bran, and pollard.

Why have the mills been stopped, if wheat-production in this district is increasing? The only way in which I can account for it is, that one mill got into financial difficulties, and the other was in the hands of men who did not seem to progress with the time. We have mills in the adjoining towns with very complete plants, and for the time being the trade was drawn to them. One of our mills has now undergone a complete overhaul, and I am informed by those who know, that it will now be able to turn out flour equal to any plant in the Colony.

Do I understand that both your mills are stopped? At present.

Seeing that this is likely to be a permanent wheat-field, the mills are being put into working order again? Yes; and I hope at an early date to see others moving in the same direction.

I suppose there was an idea at one time that wheat was simply put in as a trial crop? When I first came to the district it was debatable whether wheat would be successful here.

It has been? Decidedly.

Have you any idea of the area under cultivation? I have heard from reliable sources that last year it was 45,000 acres, and the area which has been given to me for this year is 60,000 acres.

Do you buy wheat and sell it? I handled about 7,000 bags last year. I bought the greater portion of it as an agent. I bought 5,000 bags, extending over the period from the 25th January to the end of February, at 4s. 3½d. per bushel. I should like to mention that I bought the first parcel on the 5th January, and I could not move it until the 26th January, although I sought teams in every direction. Such enormous quantities were being moved in other directions that it was difficult to get a team. The teams had been secured earlier. I had to wait until after the 25th January before I could get a team. The team I then got came from near Murrumburrah.

On account of your not having any facilities to get to market, you were unable to lift your wheat? Yes. I lost 1½d. a bushel through not being able to get the first purchases of wheat away within the stipulated time. I should have got 4s. 5d. There were 900 bags in this lot.

Then you sustained a considerable loss? Yes.

Even if your flour-mills were fitted with the latest appliances they would be unable to take all your produce? Yes. It would take half a dozen mills to handle the grain in this district.

Under present conditions you have to look further for a market? Yes.

Where do you get it? In the metropolis or in towns in that direction.

Chiefly in the metropolis, I suppose? Yes.

You are under a great disadvantage in having to cart your wheat 34 miles? Yes. You may put down 4d. a bushel as an average rate of road carriage for the district. In some cases, the rate has been as high as 7½d. I have known wheat to be carted at 1s. and at 10d. a bag; but taking the district all round, 1s. 4d. or 1s. 3d. would be a fair amount to allow per bag.

What are your rail charges to Sydney? Those charges are paid at the other end; we, as buying agents, have nothing to do with them.

What has been the lowest price you have paid for wheat here? I cannot remember paying lower than 2s. 3d.; but I believe that at one time the price was below 2s.

You do not know whether it pays the farmers here to grow it at that price? No.

Will you give us the road carriage on the different classes of goods from here to Cowra, and from Cowra to Sydney? Wheat, 1s. 3d. per bag of 4 bushels; flour, bran, and pollard, 15s. per ton; wool, tallow, and skins, 20s. and 25s. per ton. To Sydney, I cannot say without reference to the rate-book.

Seeing that the farmers here are prospering, they would be purchasing the best farming implements? Yes.

Then the road carriage is a matter of great importance to the district? Yes. I represent one or two firms here—for instance, Massey Harris, of Toronto, Canada. They do a large business in binders and ploughs, and implements of that kind.

Is there a steady demand in the district? There is. Five years ago, when I took up the agency, you could almost give away the implements. In the next year I sold one; and in the present year I have eight actual orders—two of them are only subject to approval of the principal. I am speaking now of reapers and binders. I had a letter from the company the other day, in which they say that they look upon Grenfell as becoming one of their best agencies in the Colony.

Are you selling any other machinery? I am selling quite a number of their make of ploughs. This year I have sold five; I did not get any off last year or the year before.

You are not the only agent for agricultural implements here? No, I am only one of a number.

How many agents are there? I think all the stores in town have an agency. Quite a number of men went down to the exhibition in Sydney some months ago, and bought direct. I also represent James Martin & Co., of Gawler, South Australia. The output of their winnowers and strippers this year will be four times the output of last year.

Will you give the Committee an idea of the benefits accruing from the construction of a railway from Grenfell to Hillston via Wyalong? Speaking from an agriculturalist's point of view, it would benefit us greatly in giving us cheaper carriage. There would be a trade in the direction of Hillston, as well as towards Sydney, if the market suited.

You would then be able to send to the Sydney market under more favourable circumstances? Yes.

And the Wyalong market would be open for a portion of your crop? That is so. In the first year Wyalong opened, ten or fifteen teams were going constantly, and the produce would be going again if we had easy transit.

You think a railway would bring about closer settlement, which would mean that a greater volume of business would be done in Grenfell? Yes.

The construction of a railway from Condobolin to Euabalong would not serve this district at all? Not at all.

Do you think this district is a sound one? I believe it is.

You think that farming has come here to stay? Yes; it is certainly beyond the experimental stage.

You think mixed farming could be profitably carried on here? Yes.

With a fair rainfall you could hold your own with any portion of New South Wales in wheat-growing? Yes; we can compete with any part of the country.

230. We will limit your evidence to such changes in the district as there may have been since you gave evidence on the former occasion? The first matter to which I wish to refer is in regard to the machinery which I mentioned in Question 3871. I mentioned there that I am agent for one or two firms which supply harvesting and agricultural machinery. In answer to the next question, I stated that I had eight orders for binders up to that date, but that two of these orders were conditional. I wish to state now that the result of the year's transactions was thirteen instead of eight sales. Up to date, for these firms, including binders, strippers, chaff-cutters, and ploughs, I have actually sold thirty-six implements. In answer to Questions 3853 and 3854, I gave a reason why the mills were stopped. One of the mills, which was at that time being put in order is now in order, and is doing a fairly large business. As a seller of the flour, I can say that the mill is catching on with the people. The proprietor informed me only the other day that the reports from Sydney as to the quality of the article he is sending down are very favourable indeed. The other mill is still in the same state as it was when I last gave evidence. I should like to say something with regard to the probable construction of a railway from Koorawatha to Grenfell, as against the construction of a railway from Young to Grenfell. The first advantage a line from Koorawatha to Grenfell is that it is the shorter and cheaper route. With regard to the question of freights, I may state that I had an opportunity of seeing the statement submitted by Mr. John Quayle Wood, and I think that statement is correct. It is a compilation from the official statement of the Railway Commissioners. I desire to state that the point at which the storekeepers have touched the railway system of the Colony has in the past been Cowra, and not Young.

In

T. Bembrick. In my opinion, out of 850 tons of store goods reaching the storekeepers of this town, not more than 25 tons came *via* Young from Sydney. I make this statement in order to impress upon you the fact that Young has not been the trading centre for this district. Of course statistics may show that more is actually received from Young, but the great proportion comes from Albury or Tumut in the shape of corn, and it sometimes suits us better to get it from there than from Sydney. Tumut is a corn-growing district beyond Young. I should like to say, as against that, that there may be considerable parcels coming from Sydney to Young. The parcels system is grouped every 50 miles, and Young and Cowra stand on an equality with regard to charges. There may be a large number of parcels sent in a year, but the weight is not great. I make this statement because it has been said that a considerable number of parcels are continually being sent from Young station to Grenfell. I believe the greater number of packages come by the mail train, and as the mail train does not charge for actual mileage it is a matter of convenience as to whether a storekeeper has anyone going over to Young for them or otherwise. It is a matter which does not benefit the receiver or the railway. For instance, if I have a man going to Young to-day or to-morrow, and I want a parcel brought up, it perhaps suits me to order it to Young; but the charge is the same to me. As a business man who takes an interest in the progress of the district, I should like to state that I firmly believe that the halves system, which is largely in operation in this district, has come to stay. Even comparatively small men who farm 300 or 400 acres are beginning to see that as they have cattle and sheep and other business to look after, it would pay them as well to give the farming to others. I believe that the halves system will keep on increasing every year. With regard to implements and that kind of thing, my prospects for the coming year are 100 per cent. better than they were this time last year—I refer to future orders. I have already on my books fifteen prospective orders for reapers and binders alone, and this time last year I had not more than two.

231. When you gave evidence on the proposed railway from Condobolin to Euabalong you stated that the rate of road carriage from Cowra to Grenfell ranged from 25s. to 27s. 6d. per ton, and that you had paid as high as 35s. and 40s., and as low as £1;—is that statement correct? The bulk of the goods are now coming from Cowra at 20s. per ton.

232. What is the rate from Young? I can only speak in regard to flour and corn, and the rate for them is the same.

233. Is there any material difference in the character of the roads? No; the Cowra road is the best because of the chance of getting loading back. There is no certainty of a man getting a load from Young unless one has been specially procured for him.

234. *Chairman.*] How far from Grenfell towards Young do you supply stores of any kind? The farthest regular customers I have are 14 miles on the Young road. In my opinion, the Tyagong Creek is the division between the trading area, which at present belongs to Grenfell. The distance from Grenfell to the Tyagong Creek is 11 or 12 miles. Young is accustomed to trade over 20 miles, and the residue is traded over by Grenfell. Of course, we might get nearer Young south-west, and perhaps south-east.

235. If a railway were constructed to Grenfell, how far would you trade then? I think our area would be increased.

236. You think, then, that if the railway were in Grenfell you would fairly well split the difference between Young and Grenfell? Yes.

237. In other words, you would increase your area 4 miles? Yes.

Steel Caldwell, pastoralist, Lower Belabla, sworn, and examined:—

S. Caldwell. 238. *Mr. Clarke.*] I believe you gave evidence before the Sectional Committee sitting here on the 19th October, 1897, in reference to the proposed railway from Condobolin to Euabalong? Yes.

23 Feb., 1898 239. Have you had an opportunity of seeing that evidence? Yes.

240. Is that evidence correct? Yes. I wish to incorporate it in my present evidence. It is as follows:—

Chairman.] How long have you been in this part of the country? About forty years.

What is the area of your holding? Including Crown lands, about 20,000 acres.

You use it principally for grazing? It is principally under sheep, but we have some cattle and horses. I am carrying at the present time 12,000 sheep, 100 head of cattle, and about 40 horses.

What is the average carrying capacity? The average, taking good and bad seasons together, would be about one sheep to the acre.

You are acquainted with the proposal to construct a line of railway from Condobolin to Euabalong? Yes.

You have formed an opinion as to the ultimate destination of that railway? Yes; I think that it must go on to Hillston.

Do you think a better route to Hillston might be adopted? Yes; but I should say that I am not thoroughly acquainted with the Condobolin and Euabalong country.

You wish to point out some advantages to be derived from the construction of a line in this direction to Hillston? Yes.

Will you give the Committee some reasons for the construction of a railway in this direction? This district is now languishing from the want of a railway. We find it next to impossible to make grazing alone pay. All the land-owners in this neighbourhood are anxious to embark in farming, and we are positive that fully 20,000 acres would be under crop here in the first season after the construction of the railway. I should like to direct the attention of the Committee to the fact that the line would pass through a splendid wheat-growing land. Where alienated it is held by men who are anxious to turn their holdings into farms. In the next place there is an absence of all engineering difficulties, and the low cost at which the line could be constructed must also be considered. For instance, there is plenty of suitable timber available, and there is also an abundant supply of good water which would be easily obtainable along the line. The country is next to a dead level, and during a wet season the roads are impassable. It would cost as much to make them as to construct a railway.

Then again, our position as producers and employers of labour cannot possibly advance in the absence of a railway. There are 74,000 acres of Crown land, including timber reserves, directly on the proposed line between Bimbi and Williams' crossing. There is a large area beyond that which would be thrown open. It is intended to crop 5,642 acres in the district during the present season, and, except under adverse conditions, there would be 2,631 bales of wool to go away from the district within a radius of 8 miles of the line. There would be also an annual output of 37,950 fat sheep and 1,700 head of fat cattle.

Have you any of your land under cultivation? 100 acres.

How long have you been cropping it? I have cropped only 40 acres within the last ten years.

Does your land grow good crops? It has grown as much as 13 or 14 bushels to the acre. I often stripped for grain and cut a portion for hay.

Has the land been under continuous crop for ten years? Not continuously.

Can you rely upon a crop every year? I think so, if it is put in early. I have never been disappointed in a crop if it has been put in in April.

The April rainfall may be relied upon to produce a crop? Yes.

The seasons in which the crops fail would be exceptional? Yes.

Are there any settlers in this locality? Yes. The majority of them have the maximum area allowed in the Central Division—2,560 acres.

The

S. Caldwell.

23 Feb., 1898.

- The land about here is exceptionally good for fattening? It is.
 And in your opinion it is also suitable for agriculture? Yes.
 Do you think the farmers in this locality could pursue mixed farming with benefit? Yes.
 I suppose that if there were a railway here they would also rear fat lambs and sheep for market? Yes.
 You have found it advisable to combine agriculture with pastoral pursuits? Yes.
 But your distance from market has prevented you from cultivating extensively? Yes.
 You think that any available land would be greedily snapped up if there were a railway here? Yes. I think everyone who has not got land here would take some up. It is taken up already directly it is available. I know of several persons now who are anxious to obtain land here.
 Would a railway at Grenfell be of any service to this district? To a portion of it.
 How far is it from Grenfell? Twenty-two miles, and from Young, 32.
 Young is your nearest railway-station? Yes.
 What kind of a road is there? There is a bad road. It is dead-level country from here to Young. You may call the road bad up to within 7 miles of Young. From that point the road has been made.
 For what distance to a railway can produce be advantageously carted? I believe something over 20 miles.
 I suppose the settlers would be served by a railway through this district in proportion to the area they hold? Yes.
 What area would support a settler who followed farming alone? Not less than 540 acres.
 All the available land between here and Grenfell has been taken up and is fairly well stocked? Yes.
 Is the "halves" system followed at all in this district? It has been attempted, and it would have been carried out this year had the season been favourable. I intend myself to give out a number of acres on the "halves" system. The land has already been prepared.
 Do you think land here could be farmed profitably on the "halves" system if it were necessary to convey the produce by road to Young? I do not think so.
 Is the whole of the land between here and Grenfell suitable for agriculture? It is.
 Is any of the Bland country suitable for agriculture? The higher portion would be.
 The soil upon the lower-lying portion would be too heavy? Yes; although I understand that a great portion of the country is similar to the Berrigan country.
 Do you know the surveyed country from Grenfell to Wyalong? As far as Bland Creek.
 How far from Bimbi would the line pass? It would pass through Bimbi.
 Is the country between this point and Back Creek liable to inundation? Not to an extent which would jeopardise a railway. The creek overflows its banks in places.
 Does the Back Creek also overflow? No; it is swampy in parts, that is all. There is no serious overflow.
 You have not seen any flood in this district sweeping everything before it? Nothing except watercourses, which sometimes injure our fences.
 With a knowledge of the district extending over forty years, you can give us some information as to the floods on the Bland. For instance, how long has traffic been suspended in consequence of floods on the creek? The traffic would not be suspended except at the creek itself. It may have been suspended for three or four days while the water has been subsiding. I have not known it to be suspended a week.
 Is the creek bridged? At Morangarell, Grogan, and Marsden.
 Can the creek be crossed at time of flood? Yes.
 Can you get to the bridges? Yes, unless you are intercepted by watercourses.
 Sometimes the water prevents you from getting to the main creek, but in no case have you known traffic to be suspended for longer than a week? No, I have not.
 What does it cost you here to prepare the land for the plough? It would cost from 12s. 6d. to 15s. per acre to properly clear land which has been already ringbarked. It would cost £1 an acre to clear green country.
 A good deal of the country here is open plains? Yes.
 The bulk of the timber country is ringbarked? Yes.
 Is the district progressing? It is at a standstill at the present time, I think, for the want of railway communication. We want to embark in farming.
 From that point of view a railway would materially assist those who are already settled on the land? Yes; and it would have the effect of giving a vast amount of employment.
 There would be employment for a large number of men in clearing and fencing, and in doing what may be necessary to render the land fit for the plough? Yes; and there would also be employment in connection with the "halves" system.
241. Have you any further evidence to give? No; but I have some statistics, which have been collected as follows:—The following statistics, showing the number of land-owners of Bimbi, have been collected by the Bimbi Railway League, and not by the Grenfell League, viz.:—Number of holders, 41; area cultivated, 3,300 acres; number of fat sheep sent to market, 35,519; number of cattle, 1,764; number of bales of wool, 1,075.
242. I believe that farming is carried on between Grenfell and Koorawatha, and between Grenfell and Young, on a pretty large scale? Yes.
243. Are any operations besides wheat-growing being carried on? Yes; the land is being cleared for the purpose of bringing it under cultivation.
244. Is farming carried on to a great extent under the halves system? Yes; not so much in the district from which I come as in the Grenfell district.
245. I believe a good deal of farming is carried on by small settlers? Yes.
246. Can you say which is the better system of farming? I should say the halves system.
247. Why? Because a larger area can be put under cultivation.
248. Does the system of farming on halves require so much capital to work the land? No.
249. Would there be any increase in the farming operations of the district if the proposed line were constructed? Yes, a large increase.
250. It has been stated in Sydney that about Grenfell there is an area of about 35,000 acres under cultivation; do you think that statement is correct? Yes.
251. With railway communication do you think a larger area would be put under wheat? Yes; larger areas are now being prepared.
252. Which route do you think would be in the interests of the people of this district and general public? The Koorawatha route.
253. Why do you prefer the Koorawatha to the Young route? Because it is more direct, and nearer to our markets—Bathurst and Sydney.
254. Where is the greater portion of the wheat grown in this district sold? In Sydney, I believe.
255. Is any sold at Young? Yes, large quantities have been sold at Young.
256. Does any go to Bathurst and Cowra? Yes, I understand so.
257. Has not the bulk of last year's wheat, for instance, found a market at Young? Large sales have been effected to the Mill Company there, which is near and convenient, and a market to hand. I understand, however, that the quantity which has been sent there this year is limited.
258. Where has it gone? It is still in stock, or has gone elsewhere.
259. Is there a good road from here to Young? Yes.
260. Do you think there will be more under crop throughout the district this year than there was last year? Yes.

- S. Caldwell.
23 Feb., 1898.
261. More especially, I suppose, in the district in which you reside? Yes.
262. You have stated that the halves system is beneficial even to the small farmers? Yes, where they cannot work their own holding.
263. Do you know how many men are employed on the large areas on the share system, in comparison with the number employed when the land was held as sheep and cattle runs? Fully 20 or 30 to 1. Take landra, Brundah, and Warrangong, for instance.
264. How long have you been wheat-growing? Only during the last twelve months.
265. Are you working on your own account? Yes.
266. How did you employ your time and energies previously? Principally in sheep-farming. I have made several attempts on the halves system, but many people think it too far from the railway—35 miles.
267. Do some of the smaller farmers in the district in which you live work on the halves system? Not in that district.
268. Do you think the halves system will induce people to come here from other parts of the Colony? Yes; it has already induced people to come from Victoria and other places.
269. *Chairman.*] You contend that the Bimbi district would be better served by a railway station at Grenfell? I do.
270. How did your wheat turn out this year? Twelve bushels to the acre, and it was not a good season.

Hugh Gault, farmer and grazier, and saw-mill proprietor, Bimbi, sworn, and examined:—

- H. Gault.
23 Feb., 1898.
271. *Mr. O'Connor.*] I believe you gave evidence before the Sectional Committee on the proposed railway from Condoblin to Euabalong on the 9th October last? Yes.
272. Do you wish to have that evidence incorporated in your evidence to-day? Yes. It is as follows:—
Chairman.] You desire to give some evidence as to the timber resources of the district? Yes; I did not hear the other witnesses mention the timber industry here. There are 52 square miles of timber reserve on the Weddin Mountains. It was laid out, I think, as a State forest.
Where do you send your timber? To Young; or I sell it locally.
Is there any great quantity of timber on the reserve you speak of? The colonial pine has been pretty well cut out of it; but there is a great quantity of ironbark along the foot of the Weddin Mountains.
Would it be suitable for railway sleepers? Yes.
Is it being cut out? Yes; a number of young trees, which are easy to split, have been cut out on the other side; but the trees on this side are, some of them, 5 and 6 feet through.
They are practically too large to handle? Yes.
Is this ironbark forest of any extent? Yes; it runs about 8 miles along the mountain on each side, and is about 2 miles wide at the bottom.
Then any quantity of timber would be available for sleepers? Yes; but the introduction of vertical saws would be necessary.
Would a railway give you any additional market for your timber? Yes; hardwood is largely used in Young, and they can get it cheaper there than we can send it to them by road carriage—32 miles. Nearly all the hardwood used in Young is obtained from Sydney. I sent some timber from here to Wyalong when the field first broke out.
You think that a railway would bring you additional business? Yes; I could sell timber a great deal cheaper than it is being sold at the present time at several places. I sent some timber last summer to within 8 miles of Wyalong, to the Back Creek station, cheaper than they could get it in Wyalong.
273. Is there anything new which you desire to tell the Committee? On the former occasion I merely touched on the timber industry of the district.
274. Do you know the route of the proposed line from Koorawatha to Grenfell, and the survey from Young to Grenfell? I know more about the "white line" than the Koorawatha line.
275. What is your opinion about it? The "white line" runs almost parallel to the Cowra line for a certain distance out of Young. I should like to see a cross line. I think we ought to open up fresh country. I strongly favour the Koorawatha line. There is any amount of Government land for settlement in the Grenfell country.
276. Would you rather draw to Young from Bimbi or to Grenfell? I would rather draw to Grenfell.

Duncan Angus Cameron, manager, New Zealand Land Association's Pinnacle Station, sworn, and examined:—

- D. A. Cameron.
23 Feb., 1898.
277. *Mr. Fegan.*] Where is Pinnacle Station? Sixteen miles north-west from here.
278. To what use is the station put at present? It has always been used for pastoral pursuits purely, but we have got a great deal of land cleared ready for wheat-growing.
279. Have you any idea of letting the cleared land on the halves system? It has been cleared for the purpose of share farming.
280. How many acres have you cleared? There are 1,000 acres now ready for the plough.
281. Have you drawn up any conditions under which you intend to work the land? Yes.
282. Have you a copy of them with you? No; but I have been a party to an agreement which has been drawn up by Mr. Wood and Mr. Greene.
283. How many acres have you altogether? 32,500, including 20,000 acres of secured land, and the balance leasehold.
284. How many sheep have you been accustomed to run upon it? Over 30,000, but we have lost a great deal of land since the new Act came into force, and now we shear about 25,000 sheep. We carry about a sheep to the acre on the cleared land. It is highly-improved country.
285. Was the land cleared under your supervision? Yes; about 800 acres.
286. What did it cost per acre to clear it? About 10s. per acre; that is clearing it 10 inches deep. That is only the cost of clearing.
287. What would it cost altogether from its virgin state? Not under 15s. or 18s.; £1 at the outside.
288. How far are you from Young station? Forty-eight miles.
289. You are further away from any connection by the Young route than you would be by the Koorawatha route? Undoubtedly.
290. Therefore the construction of the line interests you considerably on account of its bringing you nearer to market than would the other line? Yes; it is a nearer connection with the seaboard, and a line from Koorawatha to Grenfell would open up the western markets as well.

291. Have you had any applications for the 1,000 acres of land which you have cleared? I have only succeeded in coming to terms with one applicant this year, for 150 acres.
292. Of course, the cleared land will be useful, even if you do not get more applications? Yes; it is greatly improved for sheep-carrying. I consider the money well spent in clearing it for grazing purposes.
293. How do you get the applications? I have advertised for farmers. I have had many applications, and after the men have inspected the ground they have been satisfied with it, but they have said they can get ground close to the railway, and therefore will not take it.
294. What is your nearest railway station? Forbes; 30 miles away.
295. Were the majority of the men who came to look at the land practical farmers? Yes.
296. Did they say where they could get land nearer to the railway? Yes; at Iandra and Brundah, and other places.
297. How many men do you employ as ordinary station-hands? Seven at present.
298. How many allotments will you be able to make out of the 1,000 acres? The largest area I would like at present would be one paddock of 500 acres.
299. Then, if a line is constructed to Grenfell, you will be able to divide the 1,000 acres into three or four paddocks? Yes.
300. Would you still have to employ the same number of men after letting that ground? Yes.
301. Do you think the construction of the railway would induce people to become permanent settlers in this part of the country? Yes.
302. And take up land on the halves system? Yes.
303. How long have you been in the district? Three years.
304. Can you compare the two routes? No; excepting to say that one is shorter than the other, and the carriage is cheaper. I think the western line—that is, the Koorawatha line—would suit the people best.
305. Why? Because it is 17 miles shorter.
306. Why do you prefer the Koorawatha route? Because I am nearer Sydney by the Koorawatha route a distance of 17 miles, and I have a chance of sending my produce by that line to Bathurst or to the seaboard. I can also get my goods hauled cheaper to Sydney by Koorawatha than by Young.
307. What was your clip last year? 250 bales. Our average clip is 300 bales.
308. What is your average rainfall? From '82 to '97, it has been 24 to 25 inches. Last year we had only 15 inches, and the year before that 18 inches, and the year prior to that 16 inches. The last three seasons have been the worst we have known since 1888.
309. Do you think the construction of the proposed railway will assist the sheep and cattle rearers to send fat stock to market? Undoubtedly.
310. What do you do with your fat stock? We try to sell them off the shears, and some we sell as stores. I may say we have 400 or 500 acres of land laid down in lucerne.
311. How does the lucerne grow here? I grows very well with us.
312. If the proposed line were constructed to Grenfell, would you extend your area under cultivation? Yes. I understand that the wish of the owners of the station is to persevere with agriculture until they get the whole of the available land under crop.
313. That is 20,000 acres? It would not be quite so much as that. Some of the land is not fit for cropping—(say) 15,000 acres.

D. A.
Cameron.

23 Feb., 1898.

John Smith Purdie, storekeeper, Grenfell, sworn, and examined:—

314. *Chairman.*] Do you desire to make any statement? There is no question that the Koorawatha line will suit Grenfell better, on account of the fact that goods can be landed cheaper *via* that route than the other. It is cheaper for Grenfell to get its produce *via* Cowra than *via* Young.
315. What is the road carriage to either place? Heavy goods pay 20s. a ton to Cowra. There is only one team on the Young road. The Koorawatha route would shorten the distance to Sydney, and the construction of the line would benefit all the people on the Cowra road. There is a good population 8 or 9 miles out. The Koorawatha route appears to me to be the most natural route to take the line, making a better division of the country.
316. Did you hear Mr. Bembrick's evidence? Yes.
317. Do you agree with him? I do.

J. S. Purdie.
23 Feb., 1898.

Thomas Goonan, farmer and grazier, Bimbi, sworn, and examined:—

318. *Mr. Clarke.*] Do you wish to make any statement as to which you consider the best line to make? The route is much shorter from Grenfell to Sydney *via* Koorawatha than it is *via* Young. The proposed line would greatly benefit the people of the district. That part of the country in which I live is very much handicapped by not having facilities to get produce to market.
319. To what market do you generally send? Young.
320. Are you engaged in wheat-growing? Yes; and Young has been the best market they had.
321. If a railway were constructed from Koorawatha to Grenfell, would you still continue to send your produce to Young? No; I should send it to Grenfell.
322. Why? Because I should be able to find a better market. It is also a shorter distance.
323. What market could you find better than Young market? I presume Sydney would be a better one.
324. Then you would be able to send your produce to Sydney, Young, or any other places where you could get the best price? Yes.
325. Would you send to the Bathurst district? Yes; I should send to where I should get the most money for my produce.
326. Would you have a market out towards Wyalong? Yes; a very good market.
327. The statement of the Railway Commissioners is to the effect that the loss on the proposed railway would be £2,000;—do you think, by the increase of cultivation of produce, a larger quantity would be available for carriage on the railways than there is at present? Most decidedly.
328. *Chairman.*] Supposing you had a lot of wheat at your place, would you prefer to draw it to Young or to Grenfell? It would be less trouble to draw it to Grenfell, because it is much nearer, and there is a better road.

T. Goonan.
2 Feb., 1898

Patrick Alfred Madden, farmer and grazier, Piney Range, near Grenfell, sworn, and examined:—

P. A.
Madden.
23 Feb., 1898.

329. *Mr. O'Connor.*] I believe you gave evidence on the 20th October last on the proposed railway from Condobolin to Euabalong? Yes.

330. Do you wish to incorporate that evidence in your present statement? Yes. It is as follows:—

Chairman.] What is the distance from Grenfell to your property? I am $17\frac{1}{2}$ miles to the west. My land is close to the surveyed route to the north of the Weddin.

What is the size of your holding? 2,520 acres. I am carrying on mixed farming.

You are grazing sheep and cultivating? Yes.

What is the carrying capacity of the land? About two sheep to the acre.

You have improved that land by ringbarking and scrubbing? Yes; I can carry 3,000 sheep upon it year in and year out.

What area have you under cultivation? 140 acres this year; I cultivate wheat principally.

Are you able to get your wheat to market? I could not get it carted this year. I could have sold it at Forbes at 4s. a bushel, but on account of the season becoming so bad I could not get it carted. The wheat was left on my hands, and I have not sold it yet.

Do you grow any feed for your sheep? After the crops are off we put them on the stubble.

How long have you been farming? Twelve years.

Cropping the same piece of land year by year? Until this year I cropped the same piece of land.

Do you grow wheat all the time? Some years for hay and some years for grain.

What has been your average yield? About 12 bushels. It was not a very suitable piece of land for wheat-growing. Being a stranger in the district, I took the land to be similar to that at Albury, where the low flat land is always the most productive; but here I found afterwards that the rising ground was the best.

You had some farming experience in the Albury district? Yes.

Have you found the timbered land here, when cleared, good land? It is the best, I think. I am only getting an average of 12 bushels to the acre off my piece of land.*

It has been cultivated continuously, and it therefore offers good proof of the fertility of the soil? Yes.

Does it show any signs of exhaustion? No.

As a practical farmer, do you not think it would be advisable to give the land a rest occasionally? I intend to do so as soon as we can get enough land cleared to make up a certain output.

Is all the timber on your land ringbarked? Yes.

What did it cost you to get it ready for the plough? It costs me 15s. an acre. I have a contract let now for 100 acres.

What land have you under crop this year? 140 acres.

And you are clearing another 100 acres? Yes; it will be done before next summer. I am anticipating the construction of a railway to Grenfell.

If you were certain of a railway to Grenfell what area would you cultivate? I intend to put in 1,000 acres in 1900 if a railway comes here.

Are there many farmers in your locality who are similarly situated? Yes.

What would be the average size of their holdings? They would be about the same size as my own.

Do they, like yourself, carry on mixed farming? Yes.

They are also anticipating the construction of a railway in the district? Yes. I am not the only one who is getting his land cleared.

The area under cultivation is increasing in all directions? Yes, from year to year.

How would a railway to Grenfell benefit you? I should have so much shorter road-carriage. It is over 51 miles from my place to Cowra, and a little further to Young. I send down a considerable quantity of fat stock every year to Sydney, and I have to drove them to Cowra, which takes eight days. If the railway were at Grenfell there would be only one day's driving, and the sheep would not go off in condition as they do. Besides, it is no use sending less than 300 sheep to truck at Cowra or Young; you have to send a man in charge of the stock. I very often have 200 fat sheep, and eight or ten head of cattle, but it would not pay me to drove them the distance I have named.

If there were a railway here, a number, similarly situated to yourself, would assist in making up a load? Yes; I have spoken of it to several persons.

Is your country good fattening country? Magnificent.

Do you think that if there were a railway here there would be a big trade in lambs for the Sydney market? Yes. At the present time I have some as good as any in Australia; I do not think they could be fatter.

A railway, then, would assist and encourage small holders of land? Yes.

It would enable them to make more profit and to live more comfortably? I know it would in my case, and what a railway would do for me I suppose it would do for others.

What do you think of this district as compared with the Albury district? It is far ahead of it in stock-carrying capabilities, and for fattening, and it is quite equal to, if not better than it for cultivation.

Speaking of the locality to which you have referred, how much of it do you know? From 30 to 35 miles out from the town, running westerly.

The country is all of a similar character? Yes; it is part of the Bland.

You are on the edge of that country, and on the other side of the Weddin? Yes.

All the country round about you is as good as yours? Every bit as good as mine.

It amounts to this, that there is, in the district, a large area of grazing and fattening country of first-class quality, also a large area suitable for agriculture? Yes.

Do you know anything about the timber along the route? Yes; I can speak with authority as to that. The ironbark referred to by the surveyors this morning is some of the finest ironbark you could find. I am referring now to the ironbark on the forest reserve about $1\frac{1}{2}$ mile south of the route surveyed to the north of the Weddin.

How far does that ironbark country extend? It is about 5 miles square. There is good pine there, but the saw-mill has cut out a good deal of it.

Is the pine large? Yes; I have some very fine pine on my land.

Would it be marketable? Yes.

Do you think that you and your fellow settlers would find a market for your produce in a westerly direction? We might do so at Wyalong. It was from this part, two or three years ago, that the principal supplies were sent there.

You think there is every chance of Wyalong being a permanent field? Yes.

And you would be able to send the population fat sheep and cattle? Yes; I am sure we could get a market there for stock.

Do you think you would be able to send them further west than Wyalong? No; and I would not rely upon Wyalong as a fat stock market, because the country there is pretty well pastoral.

You have confined your attention entirely to grazing and agriculture? Yes; I have grown a little lucerne, and potatoes only for my own use.

How did potatoes do? Fairly well. I know a number of men closer to the mountains who have grown splendid potatoes. Do root crops grow well here? Yes, and vegetables also.

How does the fruit grow? Splendidly; we shall have a splendid fruit crop this year.

What about grapes? Grapes grow splendidly, but you cannot get very much for them.

At what distance from a railway line do you think an agriculturist can carry on his occupation? He should not be over 20 miles distant.

You think the railway would materially increase the production of the district, and encourage many persons to go in for fruit-growing and dairying? Yes; this would be a splendid part of the country for dairying.

Do you think there would be an opening for a butter factory here similar to that on the South Coast? Yes; I believe there would be, about 30 miles out from here, on the Bland country.

The district is admirably situated for dairying operations? Yes.

331. Have you any further statement to make? No; I do not think I have anything to add. I do not think the rival route should receive any consideration, seeing that those whom it would benefit are within 20 or 25 miles of a railway already.

332. How long have you been in the district? Twelve years.

333.

333. How many miles are you from Young? Fifty-two, and $17\frac{1}{2}$ from Grenfell.
334. Do you know the Koorawatha to Grenfell route? Yes.
335. Do you know the country between Young and Grenfell? Yes.
336. What do you think of the route of the proposed railway from Koorawatha to Grenfell, and the survey from Young to Grenfell? Certainly the Koorawatha line would be a lot better for me, because it means less carriage for all time, and cheaper fares. I truck a good many sheep to Cowra and send my wool there; it is 3s. 9d. a ton cheaper from Cowra. I have trucked sheep from Young when I thought the road was better for me to go there with them, and they cost me 7s. 11d. more a truck from there than from Cowra.
337. If there were a line between Koorawatha and Grenfell how would you send your produce? Undoubtedly by the western line.
338. Would it be a great advantage to you and to many others if there were a railway from Grenfell? Undoubtedly. I do not think any consideration should be paid to the rival route.
339. What is chiefly cultivated in the district in which you reside? Wheat. The people have gone in for it more strongly during the last year or two than formerly.
340. Do you think the construction of the proposed line would increase the productiveness of the district? Yes.
341. How many acres do you hold? 2,520.
342. How many acres have you under cultivation? I am putting in 250 acres this year; last year I had 140 acres under cultivation.
343. If the proposed railway were constructed, how many acres would you put under crop? I would go on until I had 1,000 acres.
344. Would your neighbours also put more land under crop? They would.
345. Is the line between Koorawatha and Grenfell specially adapted to wheat-growing? Yes; I do not think there is any better to be found.
346. What was your production last year? Fifteen and a half bushels to the acre.
347. How long will the land stand cultivation of wheat? I have been cultivating it with wheat for the last twelve years, and I have had a good crop every year.
348. Is equally good land held by others? Yes; when the Railway Commissioners were in the district they said they had not seen better country during their travels.
349. How far are you from Bimbi? Nearly 20 miles north.

P. A.
Madden.
23 Feb., 1898.

Michael McCue, farmer and grazier, Woodlawn, sworn, and examined:—

350. *Mr. Fegan.*] Where is Woodlawn? Eight miles to the west, between Grenfell and Bimbi.
351. How many acres do you hold? 740 acres under conditional purchase.
352. Have you cultivated any of your land yet? Yes.
353. How many acres? Where I am now, I have only got 120 acres in; but I have not been there long.
354. How long have you been there? Eighteen months. I came from the boundary between Brundah and Landra.
355. Was that good country? Yes.
356. Equal to what you have now? Yes.
357. Did you farm there? Yes; I grew wheat, potatoes, and other things.
358. Why did you give it up? Because there was no more land available there. I sold out in order to get more.
359. How many acres had you under crop last year? 160.
360. What was the result? About 10 bushels to the acre; but it was a very dry season.
361. How many sheep do you graze? About 900. I have two farms.
362. How many acres have you under crop on your present holding? Sixty-five acres, and I have 900 sheep.
363. How many acres of your present holding do you intend to put under cultivation? About 500.
364. Does wheat-growing pay better than sheep-farming? Yes, a long way.
365. Where is your nearest railway station? Cowra.
366. Do you carry your produce there? I have to pay carriage.
367. What do you pay? This year I cannot get carriers to deliver at all; but I have to pay 1s. per bag, and sometimes 10d. per bag.
368. For a distance of how many miles? Twenty-six.
369. How much have you ready for market? 200 bags.
370. Do you offer as good a price for carriage as any other farmer in the district? Yes, just as good.
371. And yet you cannot get your produce to market? No; I believe a good deal of that is due to the fact that there is no feed or water on the road.
372. Do you know the proposed route and the rival route of railway? Yes.
373. Which do you favour? The one from Koorawatha.
374. For what reason? In the first place, I think there are less engineering difficulties on the Koorawatha route than on what is known as the "white line." There are only one or two little creeks. On the "white line" there are a number of deep creeks, and there would have to be a good deal of cutting. Besides that, the proposed line is shorter. I may state that from where I am now I have to carry 40 miles to Cowra. The construction of the proposed line would bring me within 8 miles of railway communication.
375. Have you tried any fruit-growing since you have been in the district? Yes, and it has done fairly well.
376. Do you think that, if the line were constructed, so much land would be put under cultivation that the railway would soon give a fair return? There is no doubt of it. If we had a railway there would be three times as much land under cultivation.

M. McCue.
23 Feb., 1898.

Alfred Shackel, storekeeper, Grenfell, sworn, and examined:—

- A. Shackel. 377. *Chairman.*] Where do your goods come from? Cowra.
 23 Feb., 1898. 378. Have you heard the evidence of Mr. Bembrick and Mr. Purdie to the effect that out of 800 to 900 tons of goods received by the storekeepers in Grenfell, not much more than 25 tons came from Young? Yes.
 379. Do you agree with that statement? I think it is a fair approximate estimate. The reason of goods coming *via* Young is that Young is shown by the freight book to be the nearest station to Grenfell, whereas such is not the case. I may add that there are squatters who trade with Sydney firms direct. They send their wool to Sydney and get their supplies, and, of course, that is a considerable item. A large number of squatters and farmers go for their goods direct from here to Cowra or Young.
 380. How far south do you supply goods towards Young? I have some customers 16 miles on the road.
 381. Mr. Bembrick gave the Tyagong Creek as a fair trading limit from here? Yes; that is a fair trading limit. All the people between the Tyagong Creek and Grenfell come to Grenfell, but individual storekeepers may have individual customers further along.
 382. You believe the Tyagong Creek is a fair trading limit? Yes.

Ralph Halls, storekeeper, Grenfell, sworn, and examined:—

- R. Halls. 383. *Mr. Clarke.*] I believe you were examined on the 20th October in regard to the proposed railway from Condobolin to Euabalong? Yes.
 23 Feb., 1898. 384. Do you wish to have your evidence given on that occasion incorporated with your present evidence? Yes; it is as follows:—
Mr. Fegan.] How long have you been resident in the district? About thirty-eight years.
 You have seen the district grow into a town? Yes.
 I suppose it was merely a gold-digging when you came here? Yes.
 You are well acquainted with the requirement of the town and district in the matter of carriage? Yes.
 What is the carriage in your own case? About 300 tons a year approximately—some years more, some years less. 800 tons of goods are brought to the town a year, to say nothing of the goods taken to people outside—pastoralists and others who get their goods direct from Sydney.
 You use the Cowra railway station? Yes.
 Why do you not take advantage of the railway station at Koorawatha? It is not much nearer, and there is a better road to Cowra. There is a difference in the trackage.
 I suppose also that Cowra being a fairly large town the teams can get back-loading more frequently than at Koorawatha? Quite so.
 Have the people of Grenfell ever requested that better road accommodation should be given them to Koorawatha? I do not think so.
 Do you buy wheat from the farmers? Yes; last year I bought nearly 2,000 bags for gristing and seed supply. We generally buy about that quantity every year. I have never sent any of it away from the district until this year.
 Do you think there is a good opening for an enterprising man to open a mill here? Yes; there is no better opening anywhere in the country.
 The area under cultivation is increasing every year? Yes; there will be more this year, and I have no doubt that if the producers had a railway the area would shortly be doubled. I know a number of landowners who are prepared to cultivate larger areas next year. If a farmer at a long distance from the railway puts 500 or 600 acres under wheat, it takes him a good part of the year to get the grain taken away; I am assuming that he has to draw it 30 or 40 miles.
 What would you, as a business man, consider a fair distance for a railway from agricultural settlement? I should say from 15 to 20 miles.
 The construction of a railway would induce many other persons to come to the district to settle? I am sure of it. I know of some landowners who are preparing land for the plough for next year. They have little or no cultivation now, and they are 30 or 40 miles from a railway line. If they had a railway within a reasonable distance they would cultivate a great deal more than they are cultivating now. There is a great deal of trouble in getting the wheat taken away.
 Did you find any trouble in getting your 2,000 bags taken away last year? We have part of it this year. We buy the wheat and grind it, and sell it as flour.
 The greater part of the land in the district is freehold? A great portion is.
 Therefore, it would not be thrown open to settlers? Quite so. If the settlers have 2,560 acres they can combine pasture with agriculture. A number who are cultivating from 300 to 600 acres have as much as they can do to get their stuff away, they have to draw it so far.
 Cultivation would involve the employment of a larger number of men than are employed in grazing pursuits? Yes; and anyone who clears 15s. an acre from wheat is better paid than he would be by running stock.
 The settler must obtain a reasonable price for his wheat to do that? Farmers can profitably grow wheat here in ordinary seasons for 2s. 6d. a bushel. I know the circumstances of a good many farmers. They have to pay from 3d. to 4d. a bushel for the cartage of their wheat from the farm to the railway.
 Your evidence amounts to this:—that the bulk of the land being freehold, although a railway might bring a larger area under cultivation, it would not mean closer settlement? The whole of this district is agricultural. The climate, soil, and rainfall are all suited to the growth of wheat. The district has given the best averages in the Colony, taking fair seasons. The mining industry has gone down; still some gold is yet being obtained here.
 Has your business increased since 1891, or since wheat-growing was taken up so extensively in the district? Our business has not increased. The railway at Temora, Forbes, and Cowra takes away a certain portion of it. In mining matters nothing is being done, through the want of capital. At the same time I feel certain that some of the mines will be as good as ever they were. Several large mines here are sure to be worked at some future time; but they require capital. They cannot be worked without machinery.
 385. Where do you get your goods from? Cowra.
 386. Which of the routes do you prefer for a railway to Grenfell? The route from Koorawatha. It would be shorter, and there would be less haulage. It would cost us less money to send goods from Koorawatha than from Young.
 387. Is there a mill working at Grenfell? Yes; and there is also one idle. Until we get a railway we cannot compete with other mills.
 388. How far do you send your goods towards Young? Twelve or 15 miles.
 389. Would not wheat find a market in Grenfell even if the mills were working? Yes; there would be a market for wheat here. Millers could manufacture it into flour which they cannot do now on account of the extra carriage they have to pay for teams carting it to the railway.
 390. In any case, a railway from either place would increase the area to be put under cultivation? Yes.
 391. Would it increase trade generally? Yes.

Henry

Henry Fitch, miner, Grenfell, sworn, and examined:—

392. *Mr. O'Connor.*] Where is your mine situated? On O'Brien's Hill.
393. Are there any men working there now? Yes.
394. How long have you been in the district? Thirty-three years.
395. Have you been connected with mining the whole of that time? Nearly the whole of it.
396. What is your opinion of the proposed railway? In 1896 the Young O'Brien's, in which I hold interests, had 800 tons of stone at the surface, and we came to the conclusion that we would send 35 tons of it to the Clyde as a trial. It went 13 dwt. to the ton. The remainder, treated at the ordinary batteries here, went 7 dwt. to the ton. It would not pay us to send the stone to Sydney under these conditions, because the haulage by teams to Cowra cost 11s. 6d. a ton, and then we had to pay 16s. 6d. a ton from there to Sydney. The consequence was that we would rather lose the 6 dwt. than send the stuff way. At present we have two local batteries which are shut against any stone we may raise. At present there are two heaps of stone awaiting crushing, one at Homeward Bound and the other at Young O'Brien's, and we cannot get them tried, and we are doubtful whether it would pay to send them to Sydney. Our returns from Grenfell will, I think, compare well with the Victorian mines. If we had proper machinery here, which could get through a quantity of stuff, our mines would be in just as good a condition as those of Victoria. Directly we can go in for proper reefing, I believe mining in this district will revive, and will overtop anything in this Colony. The prospecting I am doing at present is done with my own capital. I and another have been prospecting for three years, and we intend to prove one mine, and when we do, I believe that the whole of Grenfell will be proved. If we had cheap carriage from here, and could get rid of our stuff, I believe the result would be a benefit to the Colony in general. In 1893, 1894, and 1895 we sent 60 or 80 tons of blanketings to Sydney, and the average return was 2½ oz. to the ton.
397. Which of the two routes of railway do you think would be the better? The Koorawatha route, because it would be the shorter, and give cheaper haulage.

H. Fitch.
23 Feb., 1898.

Ashby Frederick Osborn, Road Superintendent, Cowra, sworn, and examined:—

398. *Chairman.*] Does your district embrace Grenfell? Yes.
399. I presume your boundaries do not extend within municipal limits? No.
400. What is the length of the road from Cowra to Grenfell? 34½ miles from the Cowra railway station to the Grenfell Post Office.
401. How much metalling has been done on the Government road? 23 miles 18 chains. There are in addition 2 miles of metalled road within the municipalities, making a total of 25 miles 18 chains of metalled road.
402. Therefore there are from 9 to 10 miles of unmetalled road? Yes.
403. What would it cost to metal that extent of road? It will cost about £5,200 to form, metal, and blind.
404. What do you estimate it will cost to maintain a metalled road in this district? Ninepence per mile per annum.
405. What is the present condition of the road between Grenfell and Koorawatha, *via* Brundah? The first 5 miles are a good road, forming part of the metalled road to Cowra. The next 4½ miles of road are in a fair condition to Brundah village. Some portions of this are metalled. There are two bridges over the worst of the creeks. From there to Koorawatha, until you get close to Koorawatha, no road has been established.
406. What would it cost to construct that portion of the road between the turn-off of the Cowra road and Koorawatha? I estimate that it would cost £14,000 altogether. That is a rough approximation. The maintenance would cost £9 per mile per annum.
407. Have you any knowledge of the development of the country between Koorawatha and the turn-off to which you have referred? Yes.
408. Is the development of the country such as to necessitate the construction of a road if a railway is not made? Yes.
409. If a railway is not constructed should the £14,000 to which you have referred be spent? Yes, in my opinion it should, and soon.
410. Can you say anything of the through traffic to Koorawatha? No; I know there is a great deal of traffic; but I cannot state the quantity. The railway officials could do that. Of course, it has increased very rapidly during the last two years.
411. Can you express an opinion as to where Grenfell gets its supplies from? Yes, mainly from Cowra.
412. Have you any idea of the amount of traffic on the road from Cowra to Grenfell? I estimate it to be about 1,600 tons a year. It is heavy traffic. During the dry season last year there was far more traffic coming towards Grenfell than you would expect.
413. Does your district extend south towards Young? To half way to Monteagle.
414. Does it extend along the road from Grenfell to Young? No; but I have travelled the road.
415. Can you express any opinion as to the relative importance of the approaches to the railway. The Cowra road is more important.
416. Does the statement we have heard with regard to the supplies of the town also apply to the station supplies coming to the district? No, I think, to the stations between Grenfell and Koorawatha. I think their loading would come through Koorawatha.
417. What about the stations immediately to the north? Their loading comes from Cowra.
418. What about the stations south and west? Their loading might come from Young. I know there is a good deal of traffic into Monteagle and Young that way.
419. It is, I suppose, merely a question of road and distance? Yes.

A. F. Osborn.
23 Feb., 1898.

Patrick John Cleary, farmer and grazier, Fairview, sworn, and examined:—

420. *Mr. Fegan.*] How far is Fairview from Grenfell? About 20 miles due west.
421. What is the extent of your holding? 2,560 acres.
422. How many acres have you under crop? I had 60 acres under wheat last year.
423. What did you do with it? I have it yet; I could not get teams to carry it away.
424. How many sheep have you? 2,000.

P. J. Cleary.
23 Feb., 1898.

- P, J. Cleary. 425. Have you been able to get them to market? No, owing to the want of water on the road to Cowra.
 426. How many miles are you from Cowra? About 54.
 23 Feb., 1898. 427. Is that your nearest railway-station? Yes; Cowra and Young are about the same distance away.
 428. Have you been a great loser on account of not being able to get your stock to market? Yes; I was offered a good price for wheat, and could not get teams to carry it away.
 429. What were you offered for it? Four shillings per bushel.
 430. Do you regard that as a good price? Yes, it is a fairly good price for the season. I think it is about the average price for this year.
 431. Which of the routes of railway would suit you better—the proposed line or the “white line”? The proposed line.
 432. Why? Because we should be nearer to Sydney and we should have a market to the west.
 433. How is it you have only 60 acres under cultivation? I have 200 acres ready for this year.
 434. Do you think the construction of the proposed line will give an impetus to wheat-growing? Yes; I think all the country will be under wheat.
 435. Will you put more under wheat than you have at present? Yes.
 436. How many acres do you think you will be able to put under wheat in the course of time? About 1,000.
 437. Have you carefully considered what price wheat must bring to make it pay a little better than sheep farming? Yes, 2s. 9d. per bushel.
 438. If the price of wheat drops lower than that will it pay? It depends. If you have your own family to assist you it makes a great difference.
 439. But if you have not your family to assist you what then? I think a man can do with 2s. 6d. per bushel.
 440. How many sheep have you on your holding? About 2,500. I have run about one and a half sheep to the acre.
 441. Then sheep-farming will pay you better than wheat-growing if wheat goes up to 2s. 9d. a bushel? No; I think wheat will pay better.
 442. How much per pound would you get for wool? Last year I got 7d.
 443. What is the average clip? About 5 lb; that makes 3s. 4d.
 444. Do you not think that under these circumstances it would pay better to rear sheep? It depends. I got six bags of wheat to the acre last year, and it was a bad year.
 445. But the average in the district is about 12 bushels to the acre? It might have been last year, but I think it is more, as a rule. Twelve bushels is a low average.
 446. Wheat, then, if you have a market for it, pays better than wool? Yes, even if you only get 2s. 6d. per bushel for it.
 447. Do you think there is a desire on the part of those who are asking for a railway to put their land under wheat? Yes, I think the country will all go under wheat.
 448. Then, the Railway Commissioners can look forward to a large increase in the carriage of wheat? Yes.

William Richardson, grazier, Bogolong, sworn, and examined:—

- W. Richardson. 449. *Mr. Clarke.*] I believe you gave evidence before the Sectional Committee on the proposed railway from Condobolin to Euabalong? Yes.
 23 Feb., 1898. 450. Do you wish that evidence incorporated in your present evidence? Yes; it is as follows:—
 You are a grazier, residing at Bogolong? Yes; 5 miles west of Grenfell.
 You are acquainted with the proposal to construct a line from Condobolin to Euabalong? Yes.
 Do you know that country? Yes; I have travelled from Condobolin, *via* Euabalong, to Hillston. I had a station at Dundoo Hills for 8 years. It is 50 miles south of Condobolin. It is very droughty country, generally speaking.
 Would the railway from Condobolin to Euabalong be of any assistance to this district? Certainly not.
 You have come here this afternoon to advocate a route to Hillston which would serve a greater number of people? Yes.
 You are merely grazing? Yes. Up to last year I had 13,083 acres of secured land and a lease of 10,000 acres of Crown land.
 Up to last year you used all your holding for grazing purposes? Yes, except a small portion upon which I grow hay, and which is not worth speaking about. Seeing the success which Mr. Greene and Mr. J. Q. Wood have made of farming on the “halves” system, I made a trial of it last year in a small way. I put in 50 acres of wheat, and it gave me a return of 12 bushels to the acre. Encouraged by that, I put in this year 550 acres of wheat and corn—350 acres of wheat and 200 acres of corn. I have already arranged for the clearing of 1,000 acres of land for wheat this year, and if there were a railway to Grenfell I should continue to increase the area, because I estimate that 10,000 acres of my holding are fit for growing wheat. I should like to say that, commencing a mile and a half west from Grenfell, and following Mr. Little’s routes for a distance of 30 miles, taking a radius 10 miles to the north and south of the line, you will have an area of 380,000 acres; allowing for 80,000 acres of inferior land which you could not cultivate, you would have close to Grenfell an area of 300,000 acres of wheat-land which, I am sure, would be put under crop if a railway were constructed.
 Why do you include such a large area of inferior land? I include the Weddin Mountains. The country through Bogolong and Melyra is splendid for the growth of all kinds of fruit and vegetables. I have 5 acres of vegetables, and I have been told by Chinamen that they have grown there as much as 14 tons of onions to the acre. I should also like to point out that for several years back I have had a small number of different kinds of fat stock. Owing to the dry summer it has been difficult to get them to market. The whole of that difficulty would be avoided if there were a railway to Grenfell. I consider I lose on the sheep quite a shilling a head by having to drive them to Young or Cowra. They are both 38 miles from my place. If there were a railway here, no doubt a lot of people would go in for poultry. I understand that already some people have as many as 2,000 fowls, and I see no reason why the number should not be increased to 5,000 or 6,000.
 How deep have you to sink for water? Eighteen feet; but we sink to 23 feet, allowing ourselves 5 feet of water.
 Is it brackish? No; it is good household water.
 How does this country compare with, say, Merrigal? That country is inferior to this for carrying stock.
 What stock can you carry to the acre? After the land in this district has been ringbarked for several years it will carry in an ordinary season, from a sheep to a sheep and a half to the acre.
 Have you erected any rabbit-proof fencing? No.
 Have you gone to much trouble in dealing with the rabbits upon your holding? No; they are increasing, of course; but up to the present we have taken no steps to destroy them.
 Have you tried dairying? No; not at my place; but I know that the country is suitable for it.
 What vegetables have you grown? Peas, turnips, carrots, onions, radishes, lettuce, beet, cabbage, cauliflower, and potatoes.
 And you find that they grow very well? Exceedingly well. They grow splendidly with sufficient moisture. Last year I had Swede turnips in my garden so big that you could put only one into a fair-sized bucket.
 How many men have you employed on wages? I keep three men on the station the whole year—two for the purpose of boundary riding and to look after the sheep, and the other is a groom and milkman.

If

If you carry out your idea of putting so many acres under cultivation it will mean the employment of a greater number of persons? So much so that when my 200 acres were planted with corn I had as many as seven men employed with double-furrow ploughs. At the time of sowing the corn there were twenty men employed in ploughing, sowing and harrowing. That number would be carried on proportionately as the acreage increased.

What did it cost you to clear your land? In regard to the 200 acres to which I have referred, I first of all Yankee grubbed it. That is, I burnt all the timber off the ground and picked up all the sticks at a cost of 3s. an acre. After that was done I had to grub it fit for the plough to the depth of 10 inches. The total clearing cost me 9s. per acre. The timber was dead and had been so for a number of years. The contracts I am letting now have ranged from 10s. to 12s. an acre for 400 acres. As to the green timbered land, the ringbarking costs 1s. an acre; then every eighteen months it will cost you 9d. or 1s. an acre to remove the suckers and pine seedlings. If you cleared out the green timber at once it would cost you not less than £2 an acre.

Have you adopted the "halves" system? My farming is entirely upon the "halves" system.

You have seen that others in the district have made it a success, and you are following in their footsteps? Yes.

By the time you have your 10,000 acres under crop you will be employing a big staff of men? I must necessarily do so.

451. Has anything occurred to cause you to alter your views since you gave that evidence? No; excepting that the 1,000 acres to which I referred on that occasion is now almost ready for ploughing. I shall still increase my area under cultivation if we get a railway from Koorawatha to Grenfell. I intend to keep on until I get about 10,000 acres under wheat.

452. If a railway were not constructed, would you have the same inducement to clear more land? No. It is the anticipation of the coming of the railway which has induced me to do what I am doing.

453. Will you state why you prefer the Koorawatha line to the line from Young? It is shorter, and I would expect to get my wheat cheaper to Sydney.

454. How far from Grenfell is your present holding? Five miles to the homestead, but my land is within 3½ miles. The Grenfell railway station would be 3½ miles from my land.

455. Is there any other reason why you prefer the Koorawatha route? I should have a better chance of sending to the Southern line as well as to the Western line if we were connected with Koorawatha. Of course, if the line went from Grenfell to Young it would be a more expensive matter to get our produce to the Western line.

456. Do you go in for sheep-farming? Yes.

457. Do you consider that wheat-growing would give a larger return than sheep-farming? If the price of wheat were as low as 2s. a bushel, I am satisfied that wheat-farming would pay much better than sheep-farming.

458. Do you think it will go as low as 2s. per bushel? We have seen it as low as 1s. 9d.

459. Would it save you a considerable amount in carriage to forward it to Koorawatha instead of to Cowra? Yes. Another advantage would be that we would be able to get rid of small numbers of fat stock. When our sheep are the fattest during summer we have the worst weather for sending them to market. Five days on the road would, I consider, reduce their value 1s. per head.

460. Have you anything further to state? If we get the line from Koorawatha to Grenfell, I think it will eventually go further to the west, and that will give us a further market in that direction. If the line comes here, I believe 300,000 acres will soon be put under wheat, immediately to the west of Grenfell. I may add that I have at present thirteen furrows at work, and in another month I will have twenty-five at work. I employ three hands the whole year round looking after the station, and sometimes I keep 25,000 sheep. When we put our corn in last year we had twenty hands at work. At present I have thirty men grubbing, and the number of men I should employ would increase in proportion to the number of acres I should clear and cultivate.

George Cousins, Secretary, Homeward Bound Gold-mining Company, Grenfell, sworn, and examined:—

461. *Mr. O'Connor.*] Did you give evidence on October last on the proposed railway from Condobolin to Euabalong? Yes; as follows:—

Chairman.] Have you been long engaged in the mining industry? I have been interested in it six years.

You have a good knowledge of the Grenfell district? I have taken an interest in it ever since I have been here.

How long has the Homeward Bound Company been working? For the past six years.

Your ground is payable, I presume? We had at the beginning of the year four men employed, and at the beginning of the month seventeen. We have paid them £210s. a week since the beginning of the year.

Are you working the claim with wages men? Yes.

The mine has paid wages and you have a small balance to the good? Yes, this year. We are finding gold now at the 450-ft. level. It goes 15 dwt.; the previous crushing gave 25 dwt. There is any quantity of stone.

Is the reef well defined;—are there good foot and hanging walls? Yes.

There is every prospect of permanence? Yes.

Have you any idea of the mining leases held in Grenfell? Yes; in 1895 there were 15; in 1896, 25; and there are, in 1897, 30.

Have you any idea of the number of men employed on the field in 1896 and 1897? There were 100 in 1896 and 120 in 1897. They were not fully employed on account of water being required for crushing purposes last year and at the beginning of this year.

Can you tell us the yield of gold for the past few years? In 1895 the value of the gold was £3,578; in 1896, £6,978; and up to date in 1897, £6,656. The two first returns I obtained from the mining registrar, and the last from the banks which purchased the gold.

Do you know of any new developments in mining between here and Wyalong or between here and Koorawatha? Developments have been caused by the cyanide process; there are 750,000 tons of tailings awaiting treatment. One cyanide works are being erected, and the others are finished. The works just starting are on a very large scale. A company is just about to develop the Enterprise mine by working it in a more systematic manner than it has hitherto been worked. There has been hitherto a very primitive method of working the gold; there has been no machinery to develop the deep mines.

Is the stone of a refractory nature? It is.

The return of 25 dwt. which you have mentioned might be materially increased if you had the best method of treating the stone? I have no doubt that that would be the case. If we had improved machinery we should get a much larger yield from the Homeward Bound. We get 3,000 gallons a day, and we know that a great deal of gold goes away in the tailings. During the last year we supplied the whole of the cattle in the town with water.

Are there any working outside the town of Grenfell? Yes; there is the Pinnacle Reef, 25 miles from here to the north-west. It is employing now 70 hands, and is putting through the 20-head stamper 200 tons a week.

That is not the only other mine in the locality? There is the Ironbark; they have also a battery, and are employing twelve men; Sandy Creek is also being developed.

That is in the same locality? Yes, it is in the same belt. It is only about 6 miles from Grenfell.

Is the Pinnacle mine being worked by a company? Yes; but the Ironbark and Sandy Creek are being worked by miners on their own account.

There is a belt of gold-bearing country running through there? Yes; the whole district is gold-bearing.

What is retarding the development of the industry, do you think? The want of capital is undoubtedly one of the causes; it is perhaps the chief cause.

You

W.
Richardson.
23 Feb., 1898.

G. Cousins.
23 Feb., 1893

G. Cousins. You think the construction of a railway would perhaps assist the industry? It would help us a good deal. The claim I represent sent yesterday to Cowra 6 tons of concentrates; the road carriage cost us a great deal more than the railway carriage down to the Illawarra works. We could send down three times as much if we had cheaper transit.

23 Feb., 1898.

You think that if there were a railway here capitalists might be induced to pay the field a visit, and look round? Yes; the coaching is quite enough to drive any person away. I might also mention that lime is here in abundance, and in good quality. It is used locally now; but if there were a railway it might be used extensively. There is also some kaolin, which has been proved by the Mines Department to be the best in New South Wales. There are large deposits of that. I suppose that if there were a railway pottery works might be established here to advantage? Yes; on account of the good quality of kaolin. Our opinion of Grenfell is that it is similar to Adelong. It only requires capital to develop it; there is any quantity of stone in sight. There are large bodies of stone which are gold-bearing, and if it could be got out and crushed cheaply, I should say that from 8 to 9 dwt. would pay. With a 4-foot reef, which is the average width in Grenfell, it would pay handsomely. Now that the new cyanide process has come into use, we are hoping that speculators will turn their attention to Grenfell, and that something will be done to develop the field. If companies of that kind came here there would be a certain amount of coal and other mineral traffic upon a railway.

462. Have you anything to add? At the close of my former evidence I mentioned that there was a probability, if a railway came here, of our mines being developed by companies. The new cyanide works which were then about to be started are now being worked, and the Homeward Bound mine, of which I am the secretary, hopes within the next month or so to be developed in a systematic manner. We have no machinery on the mine at present, but in a month's time we hope something will be done. We are in communication with a firm willing to put up the machinery.

463. Is yours a public company? Yes, with local shareholders.

464. What is the capital of the company? £2,500. The first question we are asked by the people with whom we try to deal is "How far are you from a railway?"

465. Have you any knowledge of the two routes? I have been along the two routes, and I naturally favour the shorter one.

466. Do you think it would be more advantageous to this district to have communication with Koorawatha than with Young? Yes.

John Bolton, hotelkeeper and farmer, Bogolong, sworn, and examined:—

J. Bolton.

23 Feb., 1898.

467. *Chairman.*] Where is Bogolong? About 5 miles from Grenfell.

468. How long have you been in the district? Thirty years.

469. What will be the effect of a railway on the farming settlement of this district? The cultivation of wheat during the last few years has been greatly increased, and I believe that if we get a railway to Grenfell it will increase tenfold. The want of communication is a great drawback. I believe the railway will be beneficial to mining as well, and it will pay the Government too. In anticipation of the proposed railway being constructed clearing is going on all over the country.

THURSDAY, 24 FEBRUARY, 1898.

[The Sectional Committee met at the Court-house, Grenfell, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Koorawatha to Grenfell.

Thomas Edward Arnfield, proprietor of the Cyanide Works, Grenfell, sworn, and examined:—

T. E. Arnfield.

24 Feb., 1898.

470. *Chairman.*] Have the Cyanide Works in Grenfell been established long enough to justify you in believing that they will be a success? Yes; their future is assured. I speak from local experience, and from my experience of the success which has attended the cyanide process elsewhere.

471. What amount of material have you to work upon at present? About 15 tons, stock on hand.

472. How many tons of tailings have you got? About 105,000.

473. How much do you think there is in the field? 230,000 tons similar to what I am using are close handy.

474. What do you mean by close handy? Within 1½ miles of our works.

475. Whence are you accustomed to obtain your supplies? From Sydney, *via* Cowra.

476. What have you already obtained? Up to the time we suspended operations on account of leakage in the vats, we had obtained 50 tons.

477. What do you pay for carriage? Thirty shillings per ton from Cowra by road.

478. Do you find it cheaper to get your material from Cowra than from elsewhere? Yes.

479. Is it the cheapest way to approach the Grenfell district? Yes.

480. For what period do you expect your works to be in process? With our present quantities it will take us three years to get through; but if we obtain the quantities for which we are in treaty it will take us five or six years.

481. That is, presuming there is no further development of the district? Yes; working with the stuff above ground at the present moment.

482. Then if there be developments in Grenfell your operations are practically unlimited? Yes.

483. The material to which you have made reference was, until you came here, refuse? Yes; it was lying there for thirty years.

484. How many men do you employ? Forty, when in full swing.

485. Could you increase that number if you were able to obtain a larger amount of tailings with which to work? Yes.

486. Will you make a brief statement as to what you intend doing when the tailings are exhausted? Whilst mining is carried on we shall always be in a position to treat tailings, whether we purchase them or treat them for the public. We have a mining lease in connection with the plant, which we intend to develop later on, but one of the chief disadvantages up to date has been the distance of a railway-station from

from Grenfell. When in town, in the early part of this month, I spoke to Mr. Peacock, the Chief Secretary of the Victorian Government, and he regarded the fact that we had to cart our material such a great distance as a great detriment, and he thought there would be a difficulty in obtaining enough capital with which to work the mine. Of course, if at any time the railway comes to Grenfell, that detriment will be removed, to the advantage of the mining industry here; but under any circumstances we are pretty permanent, and have come to stay. The experience of other mining centres, both in New Zealand and South Africa, is that the cyanide process has revolutionised the low grade ores, and if they can get large quantities they can make them pay very well. It is the introduction of the cyanide process into South Africa which has brought about the present prosperity of the Rand. The low grade ores in Grenfell would all pay for treating, provided we had easy communication with Sydney by rail. We could then get our mining supplies at a cheaper rate. The charge of 30s. a ton from Cowra is a great handicap to the mining industry.

T. E.
Arnfield.
24 Feb., 1898.

487. What capital have you invested in your plant? £5,000.

488. That is exclusive of wages? Yes; our wage-sheet amounts from £90 to £100 per week.

489. Has the question of the easy obtaining of coal or coke any bearing on your works? Yes, it enters largely into our operations.

490. Whence do you get your coke? We have been getting it from the Bathurst Gas Co.

491. Have you any idea of the amount of coke you will require? From 2 to 3 tons a month. Of course, we use wood for the engines.

492. It is, of course, of value to a gold-mining field to be in touch with a coal-mining district, but with the large quantity of wood you have here it is not so vital as it would be under other circumstances? That is so.

493. What is the best approach to the Grenfell district from the railways of the Colony? Undoubtedly from Koorawatha. If material is taken to Young there is 30 miles further carriage and more expense.

Thomas Bryant, farmer and carrier, Cowra, sworn, and examined:—

494. *Mr. Clarke.*] Have you any experience of the share system, which has been carried on here during the last few years? Yes.

T. Bryant.
24 Feb., 1898.

495. Will you give the Committee any results you have obtained from that system as opposed to the old system of grazing? From the first crop of wheat I made £1 an acre. In the second year I made £2 an acre.

496. Then your experience of the system, so far, has been satisfactory? Yes.

497. What area of land do you possess? 191 acres. I have been working on halves with Mr. Wood for the last two years.

498. Do you think the system is one which operates fairly? Yes.

499. Has it opened up a large quantity of land which was formerly vacant? Yes.

500. Does it employ a large number of labourers? Yes.

501. More than under the old system of grazing? Yes.

502. Do you consider the halves system an advantage to the district? Yes; it increases the population, and brings people to the district from other places.

503. In what portion of the district are you engaged in carrying? From Forbes to Cowra; Blayney to Cowra and Condobolin.

504. Have you carried anything from Grenfell to Cowra? Only wheat during the last season.

505. What is the rate of carriage to Koorawatha from Brundah? One shilling per bag for wheat, or 3d. per bushel.

506. If you had a good road to Koorawatha could the wheat be carried more cheaply? Yes; but a railway would be preferable.

507. Do you think it would be necessary, in the event of the proposed railway not being constructed, to have a good metalled road? It will.

508. If you had a railway would you be able to find a market for your straw? Yes.

509. Is the straw of any value at present? No; it is a dead loss; it is generally burnt off.

510. If you could find a market for the straw would there be any stripping? There would not be so much stripping. There would be more cut. Of course, if anyone had a very large area he would not cut the lot.

511. Have you any straw for market this year? No; I used the stripper.

Henry Allsopp, miller, Grenfell, sworn, and examined:—

512. *Mr. O'Connor.*] How long have you been in business in Grenfell? Nearly four months.

513. Were you in the same line of business before you came here? No; I was a journeyman miller for eleven years before coming to Grenfell, and I was for ten years a miller in England.

H. Allsopp.
24 Feb., 1898.

514. What is your opinion of the district for wheat-growing? I do not think it could be beaten.

515. Do you know the route of the proposed railway? I cannot say I know it; but I have been over it, and I consider it the best we could have.

516. What advantage would it be to you? It would be a great saving, in the first instance, in freight. The capacity of the mill is from 40 to 50 tons weekly, and I suppose one half or more of that would be sent away on trucks. All the surplus which is not consumed in the district would go to Sydney.

517. You have commenced business, I suppose, in a comparatively small way? Yes; we are not running night and day yet, but we intend to do so if we get the railway. At present we can scarcely compete with other mills, on account of the heavy carriage from Grenfell to Cowra. We never send anything to Young. The line would not only benefit me, but also a great many inhabitants of the district, including the growers. For instance, there would be a lot of wheat sent here from the Koorawatha side to be ground, and it would go back in the shape of flour, bran, and pollard.

George Henry Greene, Esq., M.P., Iandra, sworn, and examined :—

G. H. Greene,
Esq., M.P.

24 Feb., 1898.

518. *Mr. Fegan.*] Do you wish to supplement the evidence you have already given before the main Committee? Yes.

519. With reference to your agreements with your tenants, do you allow your tenants any room for stock? Yes. The conditions are specifically laid down, and it will be found that special arrangements are made to give their working stock access to grass and water. I hand in a copy of the agreement under which Mr. Suttor, Mr. Wood, Mr. Cameron, and myself work :—

ARTICLES OF AGREEMENT made the _____ day of _____ in the year one thousand eight hundred and ninety- between _____ of _____ in the Colony of New South Wales grazier (hereinafter called landowner) of the one part and _____ of _____ in the said Colony farmer (hereinafter called tenant) of the other part, witnesseth as follows :—

1. The said landowner agrees to let and the said tenant agrees to take on lease for the purpose of wheat-growing all that farm consisting of _____ acres or thereabouts on the _____ estate owned by the said landowner for a term of _____ seasons to be computed from _____ day of _____ 189 _____ at the rent of one-half of the entire crop harvested subject to the provisions of clause 12 of this agreement such rent to be payable annually during or immediately after the harvest and subject to the conditions following that is to say :—

2. That the said tenant shall not be entitled to erect any residence or other structure on or in connection with the said farm without first obtaining permission in writing from the said landowner nor shall the tenant be entitled to graze any stock on the said farm or elsewhere on the said estate except such horses as may be necessary for putting in or taking off crops and then only while farming operations are in progress.

3. That the said landowner shall be entitled to hold and depasture his stock on said farm at all times during which it is not under actual cultivation.

4. That said landowner shall during each season provide the said tenant with seed-wheat not exceeding one bushel per acre free of cost for the area the tenant has under cultivation such seed-wheat to be deliverable wherever the seed-wheat may be stacked on the estate and the tenant shall keep such seed-wheat properly protected from the weather and from any stock that may be in the neighbourhood.

5. That the said tenant shall commence ploughing with his full plant at or about the _____ or as soon thereafter as the ground should be workable except in the case of new ground about which special arrangements may be made and no crop may be sown after _____ and the tenant shall cultivate the whole area hereby let.

6. The said landowner shall give said tenant access to such grass and water as may in the opinion of the said landowner be necessary and available.

7. That said tenant shall cultivate the entire area of the cultivable land to a depth of not less than 4½ to 5 inches in a good and husbandmanlike manner and shall thoroughly harrow the land at least twice and keep the same in proper order and condition. That he shall have sufficient plant of good quality and to the satisfaction of the landowner to harvest the crop expeditiously so as to save loss of grain and that he shall commence to harvest the moment the crop is ready. The term harvest shall mean the proper stripping or reaping and threshing cleaning stacking and placing the produce in the best possible marketable condition.

8. That the said tenant shall remove from the ground all roots sticks and broken wires which the plough may unearth.

9. That the said landowner shall at all times have access to said farm and in default by the said tenant in properly cultivating it keeping it clean or harvesting any crop or if the said tenant shall not use due care diligence and dispatch in any of these matters the said landowner may if he deem it necessary and at the expense of the said tenant do all such things as he may think fit for proper cultivation keeping clean and harvesting the crop or crops and upon the crop or crops being harvested may sell the same and out of the proceeds first repay or reimburse himself all expenses incurred in respect thereof and shall then retain the rent due and shall thereafter account to the said tenant for his share if any of the said proceeds calculated on the basis hereinafter mentioned.

10. That before harvesting any crop the said tenant shall notify the landowner of his intention to do so in order to give him an opportunity of protecting his interests in respect of the crop and under no circumstances shall any of the crop be removed without previous sanction by the landowner.

11. That at each harvesting season the said landowner shall supply the tenant with sufficient bags and twine to meet the requirements of the landowner's portion of the crop.

12. That in the event of this agreement being fully complied with by the tenant he shall be allotted as a bonus the surplus over _____ bushels per acre while up to that amount the division shall be equal.

13. If within the time herein provided the tenant has not sown the whole of the land hereby agreed to be leased or if in the opinion of the said landowner the said tenant will be unable to sow the whole of the said land hereby leased within the time hereby provided the said landowner shall be at liberty to at once resume possession and relet or otherwise deal with the land not so sown as aforesaid or which in the opinion of the said landowner the said tenant will be unable to sow within the said time hereby provided.

14. That in the event of any addition being made to the area under lease to said tenant every such addition shall be deemed to be one farm with the original for all purposes of this agreement excepting only in the respective periods of currency.

15. That the tenant shall if required by the landowner in every year of the tenancy in due season cut for hay and properly gather in and securely stack the whole of that portion of the crop of wheat produced on the outer part of the said farm so that there may be a thoroughly clear strip of land one half chain wide round every portion of the said crop of wheat which shall be left standing after the cutting of such hay and in the centre of the strip so cut shall if required plough a strip at least twelve feet wide. Of the hay so made the tenant may keep two-thirds and the landowner one-third or the tenant may take the whole of such hay at the same value per acre as the remainder of the farm shall average under wheat. In the case of adjoining tenants it will be allowable to make any arrangement mutually which will give same protection to the crops.

16. In case the said landowner shall make any *bond fide* advances of money or goods to the said tenant or any moneys become due by the said tenant to the said landowner for agistment of stock or otherwise the said landowner shall have all the rights and privileges given to a lien over the crop or crops of the said tenant as if a lien on the crops had been duly made and registered under the Lien on Crops Act of 1862 with reference to entering into possession cutting carrying away and selling the crops and applying the proceeds as in the said Act is mentioned.

17. That the tenant shall not injure any green timber on the said estate and all erections made by him in connection with the said farm shall be removed by the tenant at the termination of his lease to the satisfaction of the landowner the tenant shall also pay to the landowner for any damage done by or loss sustained in consequence of damage done by his stock to gates fencing or other property.

18. That either party to this agreement may terminate the same at the end of any harvesting season by prompt notice in writing to the other party.

19. That for the convenience of loading the said tenant shall make the stacks of wheat in the field as large as possible and in every case said stacks shall be protected against fire by being separated for a distance of fifteen feet from the chaff and by having a strip at least twelve feet wide cleared of stubble round said stacks. All bags of grain harvested shall be stacked by tenant on timber and in manner approved by landowner the cost of said timber to be borne equally by landowner and tenant.

20. No smoking shall be permitted in the field during harvest unless under authorised conditions and specified times and the law relating to careless use of fire will be strictly enforced.

21. No stubble or chaff heaps shall be fired except with the consent of landowner previously obtained.
 22. Where arrangements for agistment of horses are made for the off season in each year the charge will be 20s. per head for the season.
 23. No dirty or otherwise objectionable horse feed shall be used by said tenant on the estate.
 24. That in case of failure of the tenant to comply with any of the conditions herein contained the landowner may by notice in writing forthwith determine this agreement and may take possession relet or otherwise deal with the said farm as if this agreement had not been entered into.

G. H. Greene,
Esq., M.P.

24 Feb., 1898.

As witness the hands of the parties the day and year first before written.

Signed by the said }

I wish to state distinctly and emphatically that we all look upon the share-farming industry as absolutely permanent. It has been stated in a very reckless way that we propose to utilise the land for four or five years, and then let it go back to pasture. That statement is absolutely untrue in the sense in which it has been sought to be made use of. If we let it go back temporarily—as no doubt will be the case under suitable conditions, for the purpose of restoring the land by rotation of crops, which will clean the ground, the dirty work being the result of bad farming—it will be more with the view of permanency than anything else. It has also been claimed that the small farmers on another line are permanently settled on the land, and will be driven, of necessity, to observe a higher system of cultivation. That I absolutely repudiate. All our experience here and elsewhere has gone to prove that large areas are necessary to ensure a perfect rotation of crops, and also that capital must be available in order to induce the higher methods of farming and the higher class of agricultural employment. With reference to statements that have been made about the floating nature of the population brought about by the share system, I desire to deny those statements altogether, for this reason: that although at times men may leave their holdings because they are handicapped by being unable to do good work, or the owners may find it does not pay to keep useless and incompetent men, as years go on the demand on the part of good men for these lands is ever increasing. At this moment I am informed—and I believe it absolutely—that arrangements have been made on my own land, at Iandra, for about forty farmers. The bulk of these are men who have been on the land for a considerable time, and they are the best men who went there. Some have gone at their own desire to other places—perhaps for family reasons, or to be nearer town; but others have taken other places; and not only that, but the amount of ground let for cultivation this year is larger than it has ever been before. I have looked into the matter during the last few moments, and I find that the amount of cultivation will probably be between 12,000 and 13,000 acres—nearly an average of 320 acres to each tenant—that is, supposing there are forty tenants. As nearly all these men are married men with families, I average each farm as supporting a family of five people. Thus we practically get a settled population of 200 people for a start. This, of course, does not include the paid labour put on the land. It only includes the father, mother, and an average of three children to each family, whilst all the paid labour will be additional. It will be perfectly obvious that, although the same men will not always be in the same place, there will always be someone there. This is also irrespective of the labour done in connection with tank-sinking, the subdivision of fences, and clearing, which will go on side by side with this work. I may point out that there is nothing whatever in the agreement or in contemplation to make a tenant give up his land at any time. There is only one limit, and that is the agreement between the two. The agreement is terminable by either party at the termination of harvesting, as we find that, no matter what agreement we have, if the tenant is not satisfied with the owner, or the owner is not satisfied with the work done by the tenant, it is of no use binding them by an ironclad agreement. Thus both sides are perfectly free. With regard to the alienation of land by the owners, it is the intention of the whole of us to subdivide our holdings and cut them up, and give the men who happen at the time to be farming the first opportunity of buying. I may say that every pledge that has been made in the past by those who are working on the share system—I mean the owners—in regard to the increase of cultivation, the efficiency of work, and so on, has not only been fulfilled to the letter, but has been exceeded.

520. I notice that under the agreement you do not allow a person to keep a cow or two? That is all a matter of arrangement. We are not bound by the agreement to do it for this reason: that if you give an inch to some people they will take an ell. Everything varying from the agreement is a personal matter. I would draw attention to this point: that there is a clause in the agreement which might be misconstrued, viz., that the tenants are not allowed to put up dwellings or erect buildings without the consent of the landowner. That provision was inserted for this reason: that we found that without it men would put up buildings in the most unsuitable places. They would put up wretched humpies and places near to where the stock came to the tanks for water. They would also keep their ducks and poultry there, regardless of the effect on the stock. Experience teaches us that all these matters must be arranged for in each special case. Although we are willing to give every facility of the kind that may be required, we claim the right to say where a building must be put up, what character of building it shall be, and how it shall be utilised. In many instances, in putting up their buildings they make use of our wire-netting fences, or would do so if they were allowed. They also put their agricultural implements against the fences, and tear them down.

521. Under the agreement, what is to hinder the owner of the land from becoming cantankerous in the same way as the men whom you depict, and saying that the men are not doing the work required of them;—who is to be the arbitrator? If a man cannot get on, he himself gives notice and terminates his lease.

522. We will suppose that a man has ploughed 200 acres to a depth of 4 or 5 inches as required by the agreement;—for some reason or other the owner may say “You have not farmed this land properly.” The result may be that according to the terms of the agreement the owner may bring all his stock on the land and plough it over again at the tenant's expense? Any dispute must be settled by arbitration.

523. You do not say so in the agreement? I thought it was there. It was in the old agreement.

524. It is left with the owner to say whether the ground is or is not properly ploughed;—there is nothing to protect a man even though he has ploughed 100 acres? I can only state that that agreement was arrived at after a most careful and painstaking consideration, not only between ourselves as landowners, but between the landowners and tenants. The terms were made known, not only after they were put in the form of an agreement, but while they were being formed. The old agreement where it was found faulty was altered to meet the altered and altering conditions.

G. H. Greene, Esq., M.P.
24 Feb., 1898.

525. What power has the tenant of appealing or of having any complaint he has to make settled? The power of the law, which should make both parties keep their agreement. Of course, this is my agreement and my tenant's agreement; we are mutually bound. Take clause 7 for instance:—

The said tenant shall cultivate the entire area of the cultivable land to a depth of not less than $4\frac{1}{2}$ to 5 inches in a good and husbandlike manner, and shall thoroughly harrow the land at least twice, and keep the same in proper order and condition. That he shall have sufficient plant of good quality, and to the satisfaction of the landowner to harvest the crop expeditiously so as to save loss of grain, and that he shall commence to harvest the moment the crop is ready. The term harvest shall mean the proper stripping or reaping and threshing, cleaning, stacking, and placing the produce in the best possible marketable condition.

526. If the tenant does not do this you have the right to come with your horses and plant, without arbitration being referred to, and plough the land up at his expense? Yes.

527. Should a circumstance like that occur what arrangements have you made to settle your difficulties in a court of law, because the tenant has no standing outside the agreement? I do not consider that either of us have any standing outside the agreement. I cannot break it, and I claim that my tenant cannot break it. There is always the law of common sense which will prevent a landowner hunting away good men, and asking them to do impossibilities. No law was ever framed which could guard against all possible contingencies. Inasmuch as the agreement is only binding for one year, if compliance with it is irksome to a man he can throw it up at the end of one year.

528. There is really nothing, then, to enable a neighbouring farmer to come in and arbitrate between a disaffected tenant and landowner? No; it appears not. I thought there was; but it seems not. But I can force a tenant to do nothing to which he has not agreed, nor can he force me to do anything to which I have not agreed.

529. There is no protection except within the covers of the agreement for a man who is one of your tenants? There is no other protection than the law for a tenant or for myself. I have no protection further than that agreement.

530. This agreement is made between you and the tenant farmers? Yes.

531. Are they satisfied as a rule? Yes.

532. Do they take your land readily? Yes; there are more applications than I can supply.

533. *Mr. Clarke.*] And you select those whom you consider are best suited to the work? Yes; if there is nothing against them they are taken in the order in which they come.

534. *Mr. O'Connor.*] Are the conditions of the agreement explained to them? Yes; they are fully explained. I may mention that last year the ploughing was not done under those conditions, and that the conditions all through never have been fulfilled. But as men of ordinary intelligence and practical experience, we do not ask men to do impossibilities. It is of no use sending "Tom" away to replace him by "Jack," if we think "Jack" cannot do better work than "Tom."

John Quayle Wood, pastoralist, Brundah, sworn, and further examined:—

J. Q. Wood,
24 Feb., 1898.

535. *Chairman.*] Do you wish to make a statement? Yes. I omitted in my evidence at Koorawatha to mention the number of landowners in the Bimbi district who would be benefited by the line to Koorawatha. The number is forty-one, which, with the 198 already referred to, makes 239 landowners.

If we add to this the forty tenant farmers on Iandra and twenty-five on Brundah, we reach a total of 304 persons who will be directly benefited by the Koorawatha line. With regard to the statements that these large estates will soon be exhausted for wheat-growing, I wish to endorse what Mr. Greene has said. The same argument would apply to all land, wherever it is. I think production should be considered, and not merely the question of ownership of land. You may have large areas cut up (say) into 50 acres per man, and a large population who are doing no good with those areas. Both from a national and local point of view one large estate which is producing largely will be of more advantage to the country than a number of small areas with a large number of settlers who are not producing. That is a matter which, I think, should be considered. The mere question of ownership should be second to the question of production. Nearly all landowners, large and small, are being helped by financial institutions. What is being done with them by financial institutions is being done by the landowners here for share farmers. It has been stated that it is only the landowners' produce which will be carried on the railway in the event of its being constructed. I may state that half of the produce is the share farmer's property. My argument is that if he is a producer he is as much entitled to consideration as the landowner, and more so if the landowner is not a producer.

536. On which route is the more cultivation—from Koorawatha to Grenfell, or from Young to Grenfell? There is no question that there is immeasurably more between Koorawatha and Grenfell, viz., 34,000 acres.

537. It is a question, then, after all, whether the produce is raised primarily by tenant farmers or by men possessing their own estates? Quite so.

538. Whether the land is worked by a tenant farmer or by the owner the amount of labour in the production of wheat will be the same? Yes.

539. And the amount of carriage will be the same? Yes.

540. It resolves itself, then, eventually, into a question of the ownership of wheat? Yes.

541. Your contention, I take it, is that whereas for certain advances in money and in kind portion of the wheat when produced by the half-share man belongs to the pastoralist; in the other instance it belongs to the financial institution, or possibly some storekeeper who has advanced money, although under a different species of agreement, to keep him going? That is exactly my contention.

542. You contend that the tenant farmer, as the producer, is as much entitled to consideration as any other man? Exactly the same.

543. You contend that the State should be as much interested in a man who is a tenant farmer as in a man who is an owner? Yes, if he is producing.

544. *Mr. Clarke.*] Do you think the land is worked under the share system to better advantage than if it were worked by small settlers? Yes, I am sure of it.

545. It has been stated that small farmers are better able to look after their own land than after land under the share system? Experience shows quite the reverse.

William

William Jones, farmer, Warradery, sworn, and examined :—

546. *Mr. Clarke.*] Where is Warradery? Twelve miles north of Grenfell.
547. What quantity of land do you cultivate? I had 440 acres of wheat and 60 acres of corn under crop last year.
548. Would a railway from Koorawatha be advantageous to you and other residents of the district? Yes.
549. Do you find it a difficult matter to get produce to market? I am the only one at Warradery who has sold any wheat this year.
550. Where did you sell your wheat? The mill at Grenfell.
551. In that case you are restricted to the one market? I fill the mill up. The owner could not buy any more, because he could not send it away, owing to the want of a railway. If we had a railway we should have the Sydney and Bathurst markets to go to.
552. Which route do you prefer? The route to Koorawatha. It is shorter, and there would be a difference of 4s. a ton in the freight. Again, if we did not sell in Sydney, we should have markets on the western line.
553. Do you think the cultivation of wheat in this district will be permanent? I think so. I have lived on wheat for twenty-one years.
554. Would your neighbours follow your example? Yes; they tell me they will extend their area if it will pay. I have more under crop this year than I had last year.
555. Is it not the practice in this district to lay wheat land down for a few years with lucerne? No; that starves the land altogether unless you lay it down to make manure. I cut the hay off it and plough it. As soon as I strip my wheat I plough the stubble in, and it is ready again about the middle of June, and then I replough it.
556. Is it not a fact that some of the land about Grenfell and district is laid down with lucerne for a few years and then ploughed up again? It may be so, but I do not do it. Personally, I do not approve of it. Of course, you could put sheep upon the land for a few years and afterwards plough it, and put it under wheat again, but it has to be tried. When my land gets dirty, I cut it for hay and then plough it in. I reckon that my land will stand for forty years the way I treat it.
557. Have you any land on shares? No.
558. Do you think the share system is a good one where there is a large quantity of land to be put under cultivation? Yes; people say it will not last long, but I am sure it will.
559. Have you heard of any complaints between the owners of the land and the tenants? No; they have all made a lot of money from it. Men, who were very poor five years ago now carry their cheque-books.
560. Do you think the land would be better cultivated by small farmers living on their own land than by the share system? Personally, I would sooner be on my own land; but my position is different from that of others. If I only had 40 acres of land I would go in for the share system.
561. It has been stated that small farmers working on their own land would get on better than they would under the share system? I do not think so.
562. *Mr. Fegan.*] Have you come here as the mouthpiece of your neighbours? Yes; of a few of them.
563. Whom do you represent to-day? My brother, Mr. C. Jones, who will extend his area if the railway is constructed. He has about 400 acres under crop this year, and will have 500 acres. Then there are William Jannon and Toohey Brothers. The latter are big farmers. Then there is Mr. McLeod.
564. Do you know anything about the Young route? Yes.
565. Do you send any produce to Young? No.
566. Do you know the Koorawatha route? Yes, I was over it four years ago. Of course, there was not much wheat grown there then.
567. Do you know of anyone who has given up his holding and gone in for the half system? No.
568. Do you consider this a better district than Goulburn? Yes; I have grown as much as 40 bushels to the acre, and at Goulburn I have not got more than 15 or 16 bushels.
569. What did you get last season? About $11\frac{1}{2}$ bushels. It was a bad season. If I had had a fair season last year, I should have got 18 bushels. If there had been one shower of rain in October, I would have got that. Fifteen or sixteen bushels is a fair average.
570. How many sheep do you run to the acre? Three. Of course, that is on the well-improved land.
571. What is the lowest price at which you could grow wheat profitably? Two shillings a bushel, delivered in Grenfell.
572. Could you send it to Sydney for that price? No; if it could be delivered in Sydney at 6d. a bushel, I could make good wages out of wheat at 2s. 6d. a bushel.
573. If the price of wheat goes below 2s. 6d. a bushel, will it stop wheat-growing in this district? I do not think so. If we clear the land we shall have to put the wheat in, whatever it fetches.
574. Would wheat at 2s. a bushel be more profitable than sheep-rearing? Yes.
575. *Chairman.*] If a line were constructed from Koorawatha to Grenfell, would Grenfell be the nearest point at which you would reach it? Yes.
576. How far are you from Forbes? Thirty-five miles.
577. What is the freight for wheat to Forbes? There is no road from my place to it. To get there I should have to travel 50 miles.
578. How far are you from Cowra? Forty-four miles. I am 45 miles from Young and 12 miles from Grenfell.
579. Is Cowra your nearest railway station at present? Yes.

W. Jones.
24 Feb., 1898.

FRIDAY, 25 FEBRUARY, 1898.

[The Sectional Committee met at the Public Hall, Bulla Creek, at 2.30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Koorawatha to Grenfell.

John Napier, farmer, Grenfell Road, near Bulla Creek, sworn, and examined:—

J. Napier.
25 Feb., 1898.

580. *Chairman.*] What area do you hold? 400 acres in one block and 150 acres in another.
581. How long have you been in the district? Twenty-one years.
582. What are you doing with your land? I am farming it and running sheep. I cultivate 200 acres, and the rest I use for grazing.
583. How long have you been cultivating 200 acres? Close on two years. I took 20 bushels to the acre off the land the year before last, and 8 bushels to the acre last year, or an average of 14 bushels. Last year was a very bad one.
584. Do you intend to convey to us that the land in this vicinity is not easily exhausted? Yes.
585. To where do you send your wheat? To Young.
586. What do you pay for carriage? 1s. per bag from my house.
587. Where do you get your goods from? Sydney and Young. All my interest lies in Sydney.
588. Do the goods coming to Bulla Creek come through Grenfell or Young? Young.
589. Therefore all your trade is through Young or with Young? That is so. I may say that I don't think that I should ever have settled here had I not been led to believe by the Hon. Mr. Watson that there would be a railway some day from Young to Grenfell. Consequently all the land has been taken up, and substantial improvements have been made on every selector's residence. We have come to stay. Every farmer here is *bonâ fide*. We are not here to-day and gone to-morrow. We are not on the halves system, but we are cultivating for ourselves, and we should cultivate double the present quantity if we had a line to carry our produce to Sydney. Young cannot consume the whole of it. I cannot sell my wheat in the Young market. If a line came here it would do away with the charge of 1s. per bag by road. I could load here, and that would make a great difference.
590. The charge of 1s. per bag for the conveyance of your wheat to Young means that you are paying 3d. per bushel? Yes.
591. And with a railway you would save the difference between railway carriage and road carriage? That is so.
592. How many people are resident within 6 miles of Bulla Creek? On the eastern portion of Bulla Creek, coming from Grenfell, there is Mr. Dempsey—who holds 2,000 acres—Moses Shannon, Henry Myers, Mr. Rumble, John Baker, Edward Joyce, Mr. Nash, Mr. Frudenstein, William and Robt. Baker, Geo. Webb, Mr. Parnell and myself. I should prefer that Mr. Lynch gave the names of those on the other side.
593. Going towards Young from Bulla Creek, a distance of 12 miles, who are resident there? Herbert Webb, Job Fowler (sen. and jun.), Wm. Powderley, Christopher Powderley, Arthur Taylor, Mr. Marooney, Thos. Joyce, and Mr. Dongers. They are all *bonâ fide* farmers; some of them are gentlemen farmers.
594. You have given us the names of those on one side of the road for a distance of 12 miles;—how far does the area extend from the road? I do not think it will be more than 2 or 3 miles.
595. Are there squatters or selectors behind these people? Iandra lies behind.
596. Does Iandra back up the whole of that 12 miles? No, only 2 miles.
597. What backs up the area besides Iandra? Fowler and his son take in 5 miles of it.
598. Could you give us information with regard to the other side of the road? I could not. I wish to remark that the statement by Mr. Greene's manager, who stated that he knew of 10,000 acres, which the "white line" would pass through, which were in a bad state, is incorrect. I believe that such a class of settlement as that on Iandra is not permanent. Mr. Greene's tenants are not tenants at all. He does not allow them to erect even a slab hut on the land. They live in tents. Some of them live at Monteagle, and were never classed as farmers. They are simply birds of passage.

John Lynch, Burrumunda, sworn, and examined:—

J. Lynch.
25 Feb., 1898.

599. *Chairman.*] Where is Burrumunda? Five miles west from Bulla Creek.
600. *Mr. Clarke.*] Have you any statement to make? Yes. If the "white line" is not constructed, I consider that I as a settler, will have been unfairly dealt with. When my land came up for confirmation seven years ago, the Inspector of Conditional Purchases went into the witness-box and swore that the whole of the area in the conditional lease—846½ acres—was rich agricultural land, and within 4 miles of a surveyed line of railway, which, in all probability, would be built in the near future. The upshot was that the rent was appraised at 1s. an acre, and the local chairman, Mr. Moriarty, said that, considering the character of the land and the conditions of situation, it was, in his opinion, worth 2s. an acre more. I consider that by that act the Government took a portion of whatever increment might accrue through the building of a railway. Of course, I was compelled in a manner to make a conditional purchase of the whole of it after that decision.
601. Does the statement you have made apply to others as well as to yourself? It applies to others—the men who subsequently took up special areas at £2 10s. an acre.
602. What area of land did you take up? 1,169 acres.
603. How much have you under cultivation? 300 acres last year. We are putting an additional 150 acres under wheat and oats this year.
604. Do you consider wheat-growing, as a whole, a profitable industry in this locality? I should, if we had altered conditions; if we had our own market secured to us.

605.

J. Lynch.
25 Feb., 1898.

605. What means have you of getting to market at the present time? By teams to Young.
606. What is the distance from your farm to Young? Twenty miles.
607. What would you pay for carriage? One shilling per bag, or 3d. per bushel.
608. Would you save any distance by going to Young instead of to Grenfell? Yes; we cannot look for a market at Young. We must look to the seaboard.
609. You are further from Young, than from Grenfell? I do not think there is much difference either way.
610. I understand that the distance between Grenfell and Young is 32 miles? Yes.
611. Your farm is 20 miles from Young and 12 from Grenfell? We consider it 18 or 20 miles to Grenfell. The road being so much worse to Grenfell, more than compensates for the mile or mile and a half distance.
612. How many farmers are on the road between Bulla Creek and Young, or between Grenfell and Young? I do not know the whole of the holdings, but I can enumerate a number. Six miles west of Bulla Creek, beginning at the Tyagong, there are Messrs. Rumble, Barr, Aston, Alfred Marten, Jas. Gorman, Thos. Gorman, Rossiter, French, Dogherty, the Crows (there are six or eight of them), the three McNichols, with separate holdings, and the Kikiamah holding.
613. What areas do they hold? I could not say exactly. Kikiamah contains 17,000 acres, and Mr. Aston has 7,000 acres.
614. What do they cultivate? Mr. Doherty goes in for vine culture, the two Andersons, whom I did not enumerate, cultivate 60 or 70 acres of wheat each.
615. Would the "white line," if constructed, be to the benefit of the people whom you have described? Undoubtedly.
616. In what way? They would surely get a platform at Bulla Creek or Burrumunda, which means a saving of 20 miles of road carriage.
617. Would not the residents within 10 or even 15 miles of Grenfell be more benefited by a line from Koorawatha to Grenfell than by a line from Grenfell to Young? The difference in the carriage by team would more than compensate for the extra railage.
618. Would not the carriage 15 miles from the centre of each line be the same? Pretty well, if the roads are the same.
619. Are the roads better in one portion of the district than another? The nearer you approach to Young the better the road. Being the centre, more attention is paid to it.
620. Are you aware of the capabilities of the land between Koorawatha and Grenfell? Yes; I was tank-sinking there before there was any great amount of cultivation.
621. What is your opinion as to value of the land on the respective routes? My opinion is the same as that of the Government officials in the Lands Department. They set down the capital value of land reserved our way at 50s., whereas they fixed the upset price on homestead selections on the Iandra estate at £1 6s. 8d. I consider our land much superior.
622. I do not allude to the Iandra estate particularly, but to the whole of the land through which the proposed line will probably pass;—are you of opinion that the land through which the line will probably pass, between Koorawatha and Grenfell, is better or worse than the land on what is known as the "white line"? From an intimate knowledge of it, I think the land on the Koorawatha to Grenfell route is the worst, with the exception of the valley of the Tyagong, and some of the red land on Iandra. I consider it is inferior to our country, and that the best of it is only equal to ours. I consider we have a greater area of arable land further west, from the parish of Bribaree into the Bland country.
623. Have you completed your list of residents within a distance of 12 miles by 6? No; there are my three brothers; and then there are John Edward Cusack, Percy Light, Patrick Walsh, Thos. Kerns, Jas. Flanagan, Jno. Burns, Chris. Burns, Walter Hughes, Thos. Hughes, and Wm. Hughes, sen., Jas. Hargraves, Wm. Causer, sen. and jun., Mr. Edwards, Geo. McLachlan, Hugh McAlister, Geo. Burgess, Arthur Alchin, Geo. Hughes, Chas. Williams, Thos. Quin, Jno. Teddyman (Teddyman Brothers) these are all on the west side towards Young; Jno. T. Watson, Thos. West, the executors of the late Mr. Steel Caldwell, Jno. Hargrave, sen., Wm. Spring, Wm. Jarrard, Samuel Jarrard, Jno. Hurley, Burrumunda Troy, Wm. Powderley, Chris. Powderley, Wm. Finnigan, Thos. Madden, Jas. Cooper, Thos. Joyce, jun., Thos. Creighton, P. Powell, Henry King, Walter White, Patrick Hackett, and Rowell Douglass.
624. Are there many farmers occupying land on shares? They are only just beginning to follow the example of Mr. Greene, and Mr. Wood. We are very sorry to see the system.
625. Is it not preferable to working on small farms? It is not, inasmuch as the men have to a certain extent to subvert their independence.
626. Do you know the country between Grenfell and Mr. Aston's holding? Yes.
627. What is your opinion of it? I think the valley of the Burrangong Creek, to 5 miles west, cannot be beaten in the whole of the Colony for agricultural land.
628. What is the character of the land about Emu Creek? The Burrangong or Sandy Creek passes 3 or 4 miles south of Emu Creek, which enters into it lower down.
629. Do you consider that a good country for farming? Certainly.
630. The whole of it? Yes. There are little pieces, probably, which are not as good as others, owing to defective natural drainage or other causes.
631. *Chairman.*] What you wish to make clear appears to be this: that if the railway goes from Koorawatha to Grenfell this district is so far removed from Grenfell that we must eliminate from the returns anything in the district you have described? To a great extent.
632. Taking Bulla Creek as the centre, you believe that if the railway is constructed from Koorawatha to Grenfell, everything to the south of Bulla Creek will go to Young? I may say it will go that way for this reason—in the west they have equally good land, and have demonstrated the fact that they can grow equally good produce. Therefore, they will be able to supply any possible market there more advantageously than we can hope to do it. I wish to state that as far as the lower portion of the valley of the Tyagong, and the Iandra and Brundah estates are concerned, they will be almost as well served by the "white line" as by the other, so far as distance is concerned. I may mention that we are carrying on prospecting upon mining leases applied for under the Mining on Private Lands Act, upon Arramagong and Iandra West runs, but within half-a-mile of the "white line." The prospectors had a crushing. The first return was 2 oz. to the ton, the second, 13 dwt., and the third, 12 dwt. I have a few pounds weight
of

J. Lynch. of a sample which I sent to Sydney, and it was assayed as being worth from £36 to £48 a ton. It is practically new country, and we are only making an attempt to develop it. In connection with the Great Southern Silver Mine, about which so much was said a few years ago, and which was floated with a nominal capital of £80,000, I have had as fine a sample of silver as was ever discovered, but owing to the cash being utilised by the well-known Bell and Davis, the company was compelled to go into liquidation. The deepest shaft does not average more than 84 feet. Last year I had something to do with bringing an expert to inspect it. We are still endeavouring to get men connected with that class of mining to take an interest in it. I have a lease under the Mining on Private Lands Act of 10 acres on behalf of a syndicate, and we have two men engaged on the land prospecting. There are two or three other parties also who have similar leases. These leases are right on the "white line." Altogether, the prospects of gold, silver, and tin are favourable. Mr. Slec, the Chief Inspector of Mines, after visiting that part of the country gave a glowing account of its possibilities.

Peter Cramb, farmer and grazier, near Grenfell, sworn, and examined:—

- P. Cramb. 633. *Mr. O'Connor.*] Where is your residence? Seven miles from Grenfell.
 634. How long have you lived in the district? A little over twenty years.
 25 Feb., 1898. 635. Do you know the country between Grenfell and Young? Yes; pretty fairly.
 636. How have you been occupied during the last twenty years? Farming, and rearing sheep.
 637. Do you know the character of the country between Grenfell and Mr. Aston's residence, and also between Mr. Aston's residence and Bulla Creek? Yes.
 638. What is your opinion of the quality of the land we passed over to-day? Much of it is very good. Three-fourths of it are good.
 639. Would 8 acres out of 10 be fit for agricultural purposes? Yes.
 640. Do you know the land between Grenfell and Mr. Wood's? Yes.
 641. What do you think of the relative merits of the country between Grenfell and Mr. Wood's, and between Grenfell and Mr. Aston's residence? I should prefer the country between Grenfell and Mr. Aston's residence.
 642. How much land do you cultivate? Last year I cultivated 100 acres.
 643. What did you produce? Two bags, or 8 bushels to the acre; last year was a very bad year. In a normal year, I produce 14 bushels to the acre.
 644. How far do you reside from Young? Twenty-five miles.
 645. Would it be advantageous, to you personally to have a railway connected with Young? Yes.
 646. Are there many settlers round you? Yes, the place is well occupied.
 647. Do you agree with the evidence of Mr. Lynch, and Mr. Napier? Yes.
 648. Would the construction of a railway enable you to increase your production? Yes; I have 1,440 acres which I have cleared.
 649. How many acres have you under cultivation? 160 last year.
 650. If a railway were constructed, would you put 500 acres under cultivation? I cannot say.
 651. How far would you be from the route of the "white line"? About 1½ mile.
 652. How far would you be from the proposed line to Koorawatha? Grenfell, 7 miles away, would be the nearest point.
 653. Supposing there were a loop-line to Bimbi, how close would you be to it? Three miles.
 654. To where do you send your wheat? Usually to Young.
 655. What do you pay for carriage? 1s. per bag.
 656. From where do you get your store goods? Grenfell.

Robert Baker, farmer and grazier, Grenfell Road, sworn, and examined:—

- R. Baker. 657. *Chairman.*] How far is your residence from Bulla Creek? Two miles towards Grenfell.
 25 Feb., 1898. 658. *Mr. Fegan.*] What is the area of your holding? About 9,000 acres.
 659. How many acres have you under wheat? Three hundred, and the rest is used for sheep farming.
 660. How many acres had you under wheat last season? Two hundred and fifty.
 661. What did you obtain from it? Eight bushels to the acre; it was a bad season.
 662. Where was your market? Young.
 663. Did you sell all your wheat? Yes.
 664. I believe you are nearer to Young than to Grenfell? About half way.
 665. If a line be constructed from Young to Grenfell, how far will you be from the nearest point of it? It will run through my estate.
 666. Are you willing to give your land for the construction of a line? I do not know about giving it exactly.
 667. Has a deputation approached you on the subject? Yes.
 668. What was your answer to the deputation? I believe my brother did promise to give the land free.
 669. Are you and your brother working as partners? Yes.
 670. Did you acquiesce in what your brother said? Yes; but I did not sign any promise.
 671. But I suppose you look upon your promise as you would upon a signed agreement? Yes.
 672. If a line were constructed from Koorawatha to Grenfell, would it be of much use to you? No.
 673. How far would you be from the nearest point of the Koorawatha line? Grenfell would be the nearest point.
 674. How far are you from Brundah? Eight or ten miles.
 675. Personally, then, you are in favour of the construction of the line passing through your estate? Yes.
 676. If the Koorawatha line were constructed, would it cause you to grow wheat to a greater extent than you do at present? No.
 677. If a line were constructed from Young to Grenfell, would you grow more wheat? Yes.
 678. How long have you been growing wheat? Twenty years.
 679. What is the lowest figure at which you make wheat-growing pay? 3s. 6d. per bushel.
 680. If the price went below that, would you continue to grow it? I have not given the matter sufficient thought.
 681. I suppose the price of wheat has not often been so low as it is at the present time? No.
 682. And you have farmed wheat for twenty years? Yes.

683. Was it not during part of the time sold at 2s. per bushel? Yes.
684. Did it pay you when it was 2s. per bushel? No.
685. What is the lowest price from which you have been able to get a fair profit? Nothing under 2s. 6d.
686. Do you think if wheat goes below 2s. 6d. per bushel the farmers of this district will have to cease to cultivate it? I think so.
687. And you speak from an experience of twenty years as a wheatgrower? Yes.
688. How many sheep do you run on your holding? About 8,000. We have run more, but this being a dry season we do not run so many.
689. You run nearly a sheep to the acre? Yes.
690. What was the result of your shearing last year? About 4 lb. to the clip.
691. Where is your market for fat stock? Young and Sydney.
692. What have you to pay for the carriage of wheat from your place? One shilling a bag for wheat, and £1 per ton for wool.
693. So that if the line came within 7 or 8 miles of you it would make a difference? It would go to Young all the same.
694. Would you send more fat stock to market if you had railway communication? Yes.
695. *Chairman.*] From where do you get your stores? From Young and Sydney.

R. Baker.
25 Feb., 1898.

Thomas Nash, farmer, Iandra, sworn, and examined:—

696. *Chairman.*] Where is your residence? Four miles north from Bulla Creek, on the lower land of Iandra run.
697. What is the extent of your holding? 400 acres.
698. Is it your own property? Yes—conditional purchase and conditional lease.
699. How much wheat do you grow? 200 acres; and the residue—15 acres—is barley, lucerne, rye, and orchard.
700. Do you intend to extend your operations? Yes.
701. Has wheat-growing been fairly satisfactory? Yes; until the last two years. Last year I had a poor return on account of a bad season.
702. To where do you take your produce? To Young.
703. What does it cost you for carriage? One shilling per bag.
704. What distance are you from Young? Twenty miles.
705. And a railway will save you 16 miles carriage each way—that is 32 miles? Yes.
706. Have you had experience of any other farming in the district? I have been farming on the halves system with Mr. Greene. I had 36 acres under wheat with him last year, and Mr. Greene had £1 an acre rent for it.
707. And what had you? £1. I got two-and-a-half bags to the acre.
708. Did it pay you? If it had been necessary for me to employ labour, I do not think it would have paid. I had my sons working, and myself.
709. Have you a team and ploughs of your own? Yes.
710. Therefore, instead of working land on the halves system, and seeing that you have as good land yourself, you are going to get the whole of your profits for yourself? Yes.
711. I suppose you think that tenant farming is not so satisfactory as farming your own land, provided you are able to make a start? Yes; I may say that the wheat I grew on Mr. Greene's land went the shortest way to the railway. What I am growing this year I shall also send to Monteaale and Sydney.
712. Why did you go to Mr. Greene to farm in the first instance? Want of means to clear land for myself, and owing to small holding and dry seasons; want of pasturage for large stock and sheep which I then had.
713. How long were you working for him? Four years.
714. Do you consider that, on the whole, your transaction in farming on the halves system paid you? Yes.
715. *Mr. O'Connor.*] Did you find the conditions during the four years referred to in any way severe? I did not care very much about them. I think Mr. Greene's terms are rather hard on poor men. They do not give you much help. They give you the ground cleared and the seed wheat, but when I first started the ground was only half cleared. I cleared it myself.
716. But is it not a great advantage to a man having no capital to get a start in life? Yes. Mr. Greene went security for the plant. Some of the tenants work it off, and some have hardly done so after four or five years.
717. *Chairman.*] How do you get your store goods? Mostly from Grenfell.
718. How far are you from Grenfell? Fourteen miles.
719. How far are you from Young? Twenty miles.
720. If a line were constructed from Koorawatha to Grenfell, where would you send your produce? To Grenfell. I may say that the "white line," being within 2 miles of my property, would be a better line for me than the other, which would be 6 miles away.

T. Nash.
25 Feb., 1898.

Frederick Fowler, farmer, near Monteaale, sworn, and examined:—

721. *Chairman.*] How far do you reside from Bulla Creek? About 6 miles—within 2 miles of the "white line."
722. What area do you occupy? 680 acres.
723. How do you work your farm? It is nearly all under sheep farming. We are farming under the halves system adjoining our own property, on land closer to the "white line" than our own.
724. With whom do you farm on the halves system? Mr. Cockle.
725. Do you find that more advantageous than farming on your own account? We have only had one year's experience, and I think that by running the sheep on the land at home, and farming on the halves system at the same time, we should do fairly well.
726. Is it likely that you will ultimately work your own land in preference to sharing with others? We intend to go more largely into the share system.
727. Then you approve of the share system? Yes; we get the first 4 bushels. If there are 9 bushels to the acre we get $4\frac{1}{2}$ bushels, and so on.
728. Has the gentleman for whom you have been working on shares acted fairly towards you? Yes.

F. Fowler.
25 Feb., 1898.

- F. Fowler. 729. Until you get sufficient capital to enable you to clear your own land, do you prefer to work on shares? Yes.
- 25 Feb., 1898. 730. Which do you think would be more advantageous to yourself and to others who are in a similar position—working on your own land or working on shares? If a man has capital with which to clear his land, and he has the land to clear, it is better for him to work on his own account; but after a few crops the land gets worn out, and it pays better, I think, to run sheep upon it and to farm someone else's land.
731. According to your statement the land requires rest? Yes, or allowed to lie fallow.
732. Is it the practice of some of those who have let out land to grow lucerne, and afterwards break it up again? Yes.
733. Do you think the land through which the "white line" would pass is equal or superior in quality to the land through which the line from Koorawatha to Grenfell would pass? I think it is equal in fertility.
734. Are all the farmers on the "white line" in favour of it going through their land? I think so.
735. Are you aware of any who object to it going through their land? I believe there are odd ones.
736. What is your opinion as to the lowest price at which wheat could be properly cultivated to leave a fair return for your labour? That depends largely on the year—that is, on the crop you get. If you get a large crop you can grow the wheat cheaper than you can if you get a small crop. The general yield per acre, taking an average season, is about 12 bushels.
737. What is the lowest price at which wheat could be profitably grown in this district? I should think not less than 3s. per bushel.
738. Do you think the cultivation of wheat is more profitable than sheep-farming? Yes.
739. Are you aware that some gentlemen letting out land on shares have more applications for land than they can supply? I am not aware that they have more, but I know they have a lot of applications.
740. In the event of the "white line" being constructed, to where would you send your produce? To Young.
741. What distance are you from Young? Eleven or 12 miles. I am about 20 miles from Grenfell. We have 340 acres within 3 miles, and another 320 acres 2 miles further out, but closer to the "white line."
742. Would you not send your wheat grown nearer to Monteagle to the "white line"? We are not farming there now.
743. *Mr. Fegan.*] How far are you from Monteagle railway station, where you are farming on halves? Three miles. Our own area of 340 acres is within 4 miles of Monteagle.
744. Then you will have two railway stations close at hand, if a railway be constructed from Young to Grenfell? Yes.
745. Does all your produce go to Monteagle? Yes.
746. Where do your stores come from? Monteagle and Young.

John Cusack, farmer, Kikiamah, sworn, and examined:—

- J. Cusack. 747. *Chairman.*] How far is Kikiamah from Bulla? About 6 miles west.
- 25 Feb., 1898. 748. What area have you? 200 acres—a special area.
749. What are you paying for it? 35s. per acre.
750. What are you doing with the land? Clearing and cultivating it.
751. Where does your produce go to? Young.
752. What area of wheat have you under cultivation? 43 acres.
753. How far are you from Young? About 17 miles.
754. What does it cost you for carriage? 1s. per bag.
755. Therefore, a railway is worth 12 miles of road carriage to you, taking a load in and coming out? Yes.
756. Since you are only 17 miles from Young, even if a line were constructed from Koorawatha to Grenfell you would not use it? No; I would still draw my produce to Young.
757. From where do you get your stores? Young.
758. Do you know the route from Grenfell to Koorawatha? I have been on part of it—from Iandra to Koorawatha.
759. What is your opinion of the respective merits of the two routes? From what I have seen, I should prefer the land on the "white line."
760. Would you increase your area of farming if the "white line" were constructed? Yes; when we took the land up, we took it at the price mentioned on the understanding that the "white line" was going to run through.
761. *Mr. Fegan.*] Do you agree with the statement made by Mr. Lynch? Yes.
762. How far are you from Monteagle? Twenty-three or 24 miles.

Christopher Powderley, farmer, Bulla Creek, sworn, and examined:—

- C. Powderley. 763. *Mr. Fegan.*] Where is your residence? About 2 miles from Bulla Creek, along the "white line," towards Young.
- 25 Feb., 1898. 764. How far are you from Monteagle? About 5 miles.
765. How near would you be to a railway station if the "white line" were constructed? It runs through my land.
766. Have you promised to give the land required for construction? No; I should require some consideration in return.
767. How many acres have you? 440.
768. What do you do with it? We grow wheat and oats. We had 370 acres of wheat last year, and we obtained 6 bushels per acre from it.
769. Did it pay you? No.
770. Would it have paid you better if you had run sheep upon it? The result, I think, would have been about the same.
771. What is the lowest price at which you could grow wheat profitably? About 3s. per bushel.
772. And you have to carry it a distance of 5 miles to Monteagle? We do not send it there; it is a bad road, and therefore we send it to Young.
773. Are you farming on halves? Yes; we have 300 acres of Mr. Massey's at Burrumunda.
774. Can you say whether it will be a success? I cannot at present, as we have not tried it long enough.

Henry

Henry Doherty, farmer, Arramagong, sworn, and examined:—

775. *Chairman.*] How far is Arramagong from Bulla Creek? 12 miles.
 776. *Mr. Clarke.*] How many acres do you hold? 258.
 777. What area have you under wheat? 70 acres.
 778. Do you find wheat-growing more profitable than grazing sheep? On a small holding I think it is. I have also vines and fruit-trees planted, but they are not bearing yet.
 779. Are there any other farmers in your neighbourhood who are fruit-growing? Not in the immediate neighbourhood.
 780. How many acres have you under vines and fruit-trees? Fifteen. I have no doubt that fruit-growing will turn out profitably.
 781. What distance are you from Young? About 24 miles away. I am 10 miles from Grenfell, and about 20 miles from Monteagle.
 782. Does your wheat go to Young? Yes.
 783. Do you know anything of the proposed line between Koorawatha and Grenfell? I know a portion of the country.
 784. Is the land between Koorawatha and Grenfell of better quality than the land between Young and Grenfell? Taken as a whole, I think the land between Young and Grenfell is superior for agricultural purposes.
 785. Where does that particular land lie? Anywhere from McKinley's Creek towards Grenfell. I consider it is all good agricultural land.
 786. Do you consider the land which the Committee traversed this morning equal to the land between Grenfell and Koorawatha? I think it is superior.
 787. Has it been proved superior? No; but I think it is naturally superior land. I think there is more body in it, and I think it would stand more cropping.
